Van Schaack, PETER, LL. D.: lawyer and author; b. at Kinderhook, N. Y., in Mar., 1747; graduated at King's (now Columbia) College in 1766; studied law and was admitted to the bar in 1769, and began his practice in the city of New York; in 1773 was appointed to revise the statutes of the colony of New York, and was an active member of several colonial committees appointed to consider the measures of the British Government which led to the Revolution; in 1775 removed to Kinderhook, and in the following year lost the sight of his right eye. Although he considered the acts of the British Government unauthorized and unjust, he was on principle opposed to the Revolution, for which reason he was summoned before the committee on conspiracies Jan. 9, 1777, and on refusing to take the oath of allegiance to the State of New York was sent to Boston; in the next April he was allowed to return to his home on parole; in 1778, owing to the death of his wife, his unpleasant situation due to hostility to the Revolution, and his desire to seek medical advice to regain his eyesight, he sailed for England, having been previously summoned before the commissioners and ordered to be banished; in 1785 he returned, a special statute having been passed which restored him to the rights of citizenship, and upon his readmission to the bar took up the practice of law, acquiring a wide reputation as an instructor and practitioner. D. at Kinderhook, Sept.

27, 1832. He published *Laws of the Colony of New York* (2 vols., New York, 1773), and *Conductor Generalis, or the Duty and Authority of Justices, Sheriffs, Coroners, etc.* (1788). See his *Life*, by Henry C. Van Schaack (New York, 1842).
P. STURGES ALLEN.

Van Tromp: See TAOMP, van.

Vanuxem, LARDNER: geologist and chemist; b. in Philadelphia, Pa., July 23, 1792; trained for business pursuits, but abandoned them for scientific study, spending 1816-19 at the École des Mines, Paris, in the study of chemistry and natural history; Professor of Chemistry and Mineralogy 1820-26 in South Carolina College, Columbia, S. C.; studied the geology of New York, Ohio, Kentucky, Tennessee, and Virginia 1827-28, making a report thereon to the Legislature of New York; geologist of the State of New York 1836-42, having charge of work in the third district. He is best known through his report on the geology of New York, but among his publications is *An Essay on the Ultimate Principles of Chemistry, Natural Philosophy, and Physiology*, which is memorable in that it announces (in 1827) the qualitative interconvertibility of heat, light, electricity, and magnetism. D. near Bristol, Pa., Jan. 25, 1848. G. K. G.

Van Veen, ORHO, also called **OTTOVENIUS:** painter; b. in Leyden about 1556; studied in Liège, then for eight years in Rome; settled in Brussels as painter to Alexander Farnese; removed afterward to Antwerp, where he established a school in which Rubens received his first instruction; returned finally to Brussels, where he died as master of the mint about 1630. The most remarkable of his paintings are a portrait of Alexander Farnese and some religious pictures in Brussels and Antwerp.

Vanvitelli, LUIGI: architect; b. in Naples in 1700. He was the son of Gaspar van Witel (1650-1736), a Dutch painter who settled in Italy and whose name was Italianized to Vanvitelli. Although he painted from an early age and at twenty had already decorated the chapel of the relics in Santa Cecilia with frescoes, he preferred devoting himself to architecture, which he studied under Filippo Juvara. The Cardinal of San Clemente took him to Urbino to restore the Albani Palace there. He worked at the churches of San Francesco and San Domenico at the same time. At the age of twenty-six he was appointed architect of St. Peter's, and from that moment directed all the great works of his time. For St. Peter's he copied many pictures which were reproduced in mosaic in the nave. He fortified the cupola with iron bands, as there were cracks which threatened to extend themselves. The pope intrusted Vanvitelli with the works at Ancona. There he constructed a quay and a lazaretto, besides making many restorations in the chapel of the relics of San Ciriaco and in churches at Macerata, Perugia, Pesaro, Foligno, and Sienna. In 1745 he designed a façade for Milan cathedral in a style combining the Gothic with the Classic, but this project was not carried out. His fame was so great that Charles III., wishing to erect an unrivaled palace in Caserta, chose Vanvitelli for its architect. In this building he was eminently successful, as also in an aqueduct to join two mountains not far from the Caudine Forks, this structure having three rows of arches one above the other, rising to an immense height. D. in Naples, Mar. 1, 1773.
W. J. STILLMAN.

Van Wert: city; capital of Van Wert co., O.; on the Cin., Jack, and Mack, and the Penn. railways; 27 miles W. N. W. of Lima, 32 miles E. S. E. of Fort Wayne, Ind. (for location, see map of Ohio, ref. 3-C). It is in an agricultural region, and has 2 national banks with combined capital of \$160,000, and a daily and 3 weekly newspapers. Pop. (1880) 4,079; (1890) 5,512.

Vapereau, vaap' rō, LOUIS GUSTAVE: author and administrator; b. at Orleans, France, Apr. 4, 1819; completed his education at the École Normale in Paris; taught philosophy and German at the College of Tours 1843-52; settled in the latter year in Paris, and became in 1854 chief editor of the *Dictionnaire Universel des Contemporains* (1858; 6th ed. 1891-93). He also edited *Dictionnaire Universel des Littératures* (1876), and published *Année littéraire et dramatique* (11 vols., 1859-69) and *Éléments d'histoire de la littérature française* (2 vols., 1883-85). In 1870-71 he was successively prefect of Cantal and Tarn-et-Garonne; in 1877-88 was inspector-general of primary schools; then was appointed honorary inspector-general.

Vapors: the gaseous forms of substances which under normal conditions usually exist in a liquid or solid state.

They are distinguished from gases proper, which are elastic fluids under ordinary conditions. The vapor of water, called STEAM (*q. v.*), is a transparent gas, and should be carefully distinguished from the cloud produced by a jet of steam, which is condensed water.

DETERMINATION OF THE DENSITY OF VAPORS.—Owing to the near relations which the atomic weight of the elements and the composition of compounds bear to the specific gravity of their vapors, the accurate determination of the latter at a known temperature and pressure, in comparison with that of an equal volume of air at the same temperature and pressure, possesses very great importance. Of the numerous methods proposed for this determination, those suggested by Gay-Lussac and by Dumas are most often employed; other processes proposed by Deville and Troost, Regnault and Hofmann, and by Victor Meyer are also used for special purposes. In the determination of vapor-densities it is necessary that the substance be completely volatile without decomposition, that it be entirely free from bodies possessing lower or higher boiling-points, and that it be perfectly dry.

Gay-Lussac's method is employed in cases where the density of a liquid which boils at about 212° F. is to be determined. In it a known weight of the substance is converted into vapor at a definite temperature, and its volume accurately measured. The density is then calculated by dividing the weight of the substance by the weight of an equal volume of air at the same temperature and pressure.

Dumas's method consists in filling a glass bulb of known weight and known capacity with the vapor under investigation and weighing. From the data thus obtained the weight of a given volume of the vapor can be calculated, and therefore also the density.

Hofmann's method, which is based upon that of Gay-Lussac, is as follows: A graduated glass tube is first completely filled with mercury, and then dipped in a mercury bath, when a barometric vacuum of several millimeters will be formed in the top; this portion of the tube is then inclosed within another tube which is drawn out at its upper extremity to a conducting tube having a moderate width and bent at a right angle. This tube connects with a copper or glass vessel in which water or other liquids can be boiled. The outer tube is closed at the bottom with a cork having two openings, in one of which the barometric tube is inserted, in the other an escape-tube. In this way a current of vapor of water or other volatile liquid can be made to traverse the space between the two tubes, thus maintaining the upper part of the barometric tube at the temperature desired in the determination. The substance under examination is introduced into the barometric vacuum in a small glass tube provided with a ground-glass stopper, which is afterward forced out by the expansion of the vapor. In other respects the determination is made as in Gay-Lussac's method. The above method is very advantageous in that, under the very slight pressure to which the inclosed vapor is exposed, the determination may be made at a comparatively low temperature. The vapor-densities of liquids, for instance, which boil as high as 300° F., can be ascertained at the boiling-point of water.

Victor Meyer's method consists in heating a known weight of a substance above its boiling-point in a closed vessel so arranged that any air driven out of the vessel can be collected and measured. The volume of air displaced gives the volume of the vapor.

Revised by IRA REMSEN.

TENSION OF VAPORS.—If a closed vessel be partly filled with any liquid, the space above the surface of the latter being occupied by its vapor, it will be found that whatever temperature the vessel be subjected to, the vapor will exert a certain definite pressure which depends only upon the temperature and the nature of the vapor. The tension of vapors is easily demonstrated by the following experiment, in which three barometer tubes are filled and inverted with a common cistern. Into one of these, *b'*, is introduced a few drops of ether, into another, *b*, a little water. The result will be a depression of the two columns below the level of *b*. The tube containing ether will be lowered to about half its former height; that containing water will fall only 1 or 2 cm. For the measurement of vapor tensions as a function of the temperature more elaborate methods than the above must be employed. Important cases of vapor tension are those of water vapor and

of the vapor of mercury. The former is tabulated in the article on STEAM (*q. v.*), and the latter is given in Table I, while the tensions of a few other common vapors are given in Table II.

TABLE I.

Tension of mercury vapor (according to measurements by Regnault and by Hertz).

Temperature.	Tension (in cm. of mercury).	Temperature.	Tension (in cm. of mercury).
0° C.	0.00002	140° C.	0.194
20° C.	0.00013	200° C.	1.826
40° C.	0.00064	250° C.	7.575
60° C.	0.0026	300° C.	24.215
80° C.	0.0094	350° C.	66.318
100° C.	0.0287	400° C.	158.736

TABLE II.

Vapor tensions of several liquids.

Temperature.	Alcohol (in cm. of mercury).	Ether (in cm. of mercury).	Carbon dioxide (in atmospheres).	Ammonia (in atmospheres).	Sulphur dioxide (in atmospheres).
-20° C.	0.334	6.9	19.93	1.83	0.63
-10° C.	0.650	11.5	26.76	2.82	1.00

E. L. NICHOLS.

Var: department of France, bordering S. and S. E. on the Mediterranean; area, 2,349 sq. miles. It is mountainous, covered with spurs of the Alps, and rich in forests and useful minerals, especially coal and iron. In the valleys wheat, wine, olive oil, and all kinds of fruit are produced in abundance, and a considerable manufacturing industry is carried on, comprising silk and woolen goods, glass, pottery, and canned goods. There is considerable trade. Pop. (1896) 309,191. Capital, Draguignan.

Varagian Guards and Varangians: See NORMANS.

Varan'idæ [Mod. Lat., named from *Varanus*, the typical genus, from Arab. *waran*, *waral*, a kind of lizard]: a family of pleurodont lizards confined to the Old World. The body has the typical lizard form; the scales are small, roundish, and disposed in transverse lines; the head is covered above with small scales or shields, and bony superorbital plates are developed; the mouth is well cleft; the teeth attached to the inner side of the jaws; the tongue is long, slender, and bifid, and its base receivable in a membranous sheath; no femoral pores. The family includes some of the largest of known lizards; they are swift in their motions, and move in a somewhat serpentine manner; they feed chiefly on insects and the eggs of birds, reptiles, etc. The most noteworthy species is the monitor of Egypt (*Monitor niloticus*), so called because it was anciently supposed to give a warning or monitorial hissing or whistling noise on the approach of a crocodile. Modern Egyptians, it is said, believe that the species is a neglected young crocodile hatched on dry land. It is represented on ancient Egyptian monuments, probably because of the fact that it devoured the eggs of the crocodile. It lives near the water, and attains a length of 5 or 6 feet. Revised by F. A. LUCAS.

Varas, ANTONIO: statesman; b. at Canquenes, Chili, in 1817. He was educated at the national institute, in which he subsequently became a professor, also practicing law in Santiago. In politics he was an extreme conservative. Under President Bulnes, 1845-50, he was Minister of Justice; and during the presidential campaign for the election of Bulnes's successor he organized the party which is still known as the Montt-Varistas. Largely through his management Señor Montt was elected, and Varas was his chief minister from 1850 to 1856, when he resigned. In 1861 he was again chief minister for a short time, and declined a presidential nomination. Subsequently he was prominent in congress. He was one of the first jurists of Chili. D. at Santiago, 1886. II. H. S.

Varchi, VĀR KĀĀ, BENEDETTO: historian; b. in Florence, Italy, Mar. 29, 1503. He studied jurisprudence in Pisa, and became solicitor and notary in Florence; soon renounced the law, and led a wandering life for some years; was recalled to Florence by Cosimo I. in 1543, and charged with

the task of writing the recent history of the city; took holy orders at sixty-two years of age, but died in Florence, Dec. 18, 1565. His chief work is the *Storia fiorentina*, which covers the period from 1527 to 1538. Among his lesser writings are the *Ercolano* (1560), a dialogue on the proper name for the Italian speech; *Lezioni sul Dante e prose varie* (1543-45); the *Suoceca*, a comedy; and his *Sonnetti*. See the edition of the *Storia fiorentina* by Gaetano Milanese (Florence, 1857, life prefixed), and of prose works (Florence, 1841-42). J. D. M. FORD.

Var'dōe: island of Norway; in the Arctic Ocean; in lat. 70° 20' N., lon. 31° 10' E. It contains a town and fort, has a considerable commerce in fish and whale oil, and is one of the most northerly places in Europe that is inhabited. Pop. 2,200.

Varela, VĀ-RĀ-LĀĀ, HECTOR FLORENCIO: journalist, author, and diplomat; b. at Montevideo in 1833. He received his early education in his native city, but during the dictatorship of Rosas his father was assassinated, and he was forced to remove to Rio de Janeiro. After the fall of Rosas in 1852 he returned and founded *La Tribuna*, which became one of the most important journals in South America. In 1868 he left Montevideo, settling in Buenos Ayres, and has been active in politics, has held diplomatic positions in South America and Europe, and is a distinguished orator. His numerous published works include romances, sketches, criticism, and historical and political essays. II. H. S.

Varese, VĀ-RĀ-SE: town; province of Como, Italy; on one of the extreme spurs of the Rhaetic Alps; about 35 miles N. of Milan (see map of Italy, ref. 2-C). Its nearness to Lago Maggiore and Switzerland has made it a place of some trade, and the fine climate and scenery make it attractive as a summer residence. It has manufactures of silks and other articles. The sanctuary known as Sta. Maria del Monte, on a hill about 5 miles N. W. of the town, is an object of special attraction to the devout Roman Catholic, on account of an image of the Virgin consecrated by St. Ambrose. Varese was a Roman town of importance, and the small lakes near it were inhabited in prehistoric times. Pop. about 5,870. Revised by M. W. HARRINGTON.

Var'gas, JOSÉ: surgeon and politician; b. in Venezuela in 1786; was educated at the University of Caracas, and subsequently studied medicine in Edinburgh; after traveling in England, France, and Spain, entered upon practice in the island of Puerto Rico, becoming the foremost surgeon in the West Indies. Returning to Venezuela, he became Professor of Anatomy, Surgery, and Chemistry in the University of Caracas, of which he was subsequently rector. His lectures, which were published, were the text-books in the university, and he gathered the largest collection of plants and minerals and the finest private library in Venezuela. He also took an active part in public affairs; was a member of the first congress of the republic in 1821, president in 1834, and subsequently senator and counselor of state. D. in New York, July 14, 1854.

Vargas, LUIS, de: painter; b. at Seville, Spain, in 1502; studied painting in Italy, residing chiefly in Rome for nearly thirty years, after which he returned to his native city, where he executed large oil-paintings and frescoes for the churches; was regarded as the chief of the Seville school; hastened his end by his rigorous austerities, being accustomed, among other ascetic practices, to sleep in a coffin. Among his paintings are *Adam and Eve*, *Jesus bearing his Cross*, and *La Generación*, representing the parents and ancestry of Christ, all of which are preserved in Seville. D. at Seville, in 1568.

Variables [from Lat. *variabilis*, variable, admitting of variation, deriv. of *variare*, vary]: quantities which admit of an infinite number of sets of values in the same equation. Thus in the equation $y^2 = 2px$, x and y are variables, because there is an infinite number of sets of values of these quantities that satisfy the equation. If there are two or more variables in an equation, all but one may be regarded as *independent*; that is, we may assign values to them at pleasure, but the value of the remaining one must then be such as to satisfy the given equation. Because one variable always depends on the form of the equation, as well as on the values assigned to the others, it is called the *dependent* variable or the *function*. In the rectangular equation of lines, x , or the abscissa, is commonly taken as the independent variable, and y , or the ordinate, as the function; in the rectangular equation of surfaces, x and y , or the abscissas,

are taken as independent variables, and z , or the ordinate, as the function. In the polar equation of a line the radius vector is regarded as the function, and the corresponding angles are regarded as independent. These are the conventional rules, but any variable may be regarded as the function, the other varying elements being regarded as independent. See FUNCTION. Revised by S. NEWCOMB.

Variation: See DARWINISM and EVOLUTION.

Variation of the Needle: the changes in the declination, or deviation from the true meridian, of the magnetic needle. A daily variation of several minutes exists, owing to the influence of the sun; at about eight o'clock in the morning the needle is at its extreme eastern position, and at about one o'clock in the afternoon it is at its extreme western position. The amount of this daily variation is greater in summer than in winter, this constituting an annual variation of about $1\frac{1}{2}$ '. There are also variations corresponding to the period of solar rotation and to the lunar inequalities, but these are too small to be noticed except in observations with very precise apparatus. Irregular variations due to magnetic storms are of temporary duration and of uncertain amount. The secular variation of the declination is the most important, since by it changes of several degrees are produced. This is of a periodic character, a complete cycle being made in from two and a half to five centuries, at different places. Observations in Paris since 1540 have enabled the curve to be traced for nearly three-fourths of a cycle; in 1580 the extreme eastern declination of $9\frac{1}{2}$ ' E. was reached, and in 1810 the extreme western declination of $22\frac{1}{2}$ ' W. was observed, a semi-oscillation of $32'$ amplitude being completed in 230 years. In the U. S. the period is generally less than 300 years, although a complete cycle has not been observed in any place. In New York city the western elongation of $9\frac{3}{4}'$ W. occurred in 1630, and the eastern elongation of $4\frac{3}{4}'$ W. in 1789, a semi-oscillation of 5 taking place in 159 years. These secular changes cause a constant shifting of the lines of equal declination on an isogonic map (see map for 1890 in the article MAGNETISM, TERRESTRIAL), the amount of shifting being quite different for different localities. Formulas for the declination at numerous places have been deduced by the U. S. Coast and Geodetic Survey. For example, in Boston, Mass., the western declination is equal to

$$9.48 + 2.94 \sin(1.3m + 3.7'),$$

in which m denotes the number of years after 1850, or if taken with a minus-sign, the number of years before 1850. The probable year of maximum declination is found by making $1.3m + 3.7'$ equal to 90° , whence $m = 66$, and the year is $1850 + 66 = 1916$. By equating $1.3m + 3.7'$ to -90° the year of minimum declination is found to be 1778. The period of a semi-oscillation is then 138 years, with a total variation of $5.88'$. A secondary variation in the secular variation has been discovered at all places where observations have been long continued. In Paris this has a period of about sixty years and an amplitude of about $1'$. In the formula this secondary variation is expressed by adding a second term. Thus for Philadelphia, Pa., the formula is

$$5.36 + 3.17 \sin(1.50m + 26.1) + 0.19 \sin(4m + 146),$$

which shows that the secondary variation has a period of twenty-five years and an amplitude of $0.38'$. The *Report of the United States Coast and Geodetic Survey for 1888* gives a collection of observed magnetic declinations, together with formulas for sixty-six stations in the U. S. and fourteen stations elsewhere. MANSFIELD MERRIMAN.

Variations, Calculus of: the calculus by which the value of a function or the form of a curve or surface is determined, when certain conditions to which they must be subject are assigned. John Bernoulli proposed (1696) to the mathematicians of his day the following problem: Given, two points, A and B, in a vertical plane, to find the path or curve by which a body under action of gravity will descend from A to B in the least possible time. In this problem (since known as that of the *brachystochrone*—from Gr. *βραχυστος*, superlative of *βραχύς*, short + *χρόνος*, time) was the germ of the subsequently developed *calculus of variations*. The peculiarity of the problem lies in this, that a curve is to be found no element of which is given; no condition establishing directly a relation between its elements (or parameters); nor any relation governing the relative increments of its co-ordinates. It was thus taken out of the sphere of pure geometry, and was beyond the methods of the differential calculus. The new problem was to find a curve which

should fulfill a certain condition—i. e., that it should be the minimum-time path of descent, by action of gravity, of a body falling from one of its given points to the other and lower given point. Solutions were given by the proposer and his brother, James Bernoulli, and by the Marquis de l'Hôpital. Subsequently Euler took up the subject and developed what (in his predecessors) had been mere solutions of a particular problem into an almost complete science. But it remained for the illustrious Lagrange to separate the principles of the calculus of variations from the geometrical considerations from which his predecessors had derived them; to establish a pure analytic basis; to invent a simple and definite notation; and thus to open a new and extensive field for its future applications. To Lagrange, therefore, is usually attributed the calculus of variations as it is now presented. The *History of the Calculus of Variations* has been written by Todhunter. A standard English treatise is that of Jellett (Dublin, 1850). Carll's *Calculus of Variations* (New York, 1881) is the best work on the subject now at the command of the American student. It is remarkable for being the work of a blind man. Revised by S. NEWCOMB.

Varicose Veins [*varicose* is from Lat. *varicosus*, full of dilated veins, deriv. of *va rix*, *va ricis*, a dilated vein, deriv. of *va rus*, bent, stretched]; relaxation of the coats of the superficial veins, with increased caliber, occurring most frequently in the lower extremities. Gravitation, the weight of the venous blood-column above, and the difficulty of the ascent of blood from the feet to the body, determine the greater frequency of the disease in the veins of the legs. Varicose veins are common in aged men, the result of senile degeneration of the various tissues, including attenuation of the coats of vessels; less often it occurs in mid-life in robust men of the gouty habit, and those who are kept constantly standing; walking does not favor the condition, since the movements of the superficial muscles and tension of the integument help to lift the blood upward. Even in youth violent exercise, as in the gymnasium, by unduly taxing the tension of the vascular system, causes a breaking down of the valves in the veins and venous dilatation or varicosity. In women the chief and not unfrequent cause is pregnancy. Women who have borne several children will often have marked varicose veins, the result of the pressure of the gravid uterus upon the veins in the pelvic cavity, and consequent detention of the venous blood in the lower extremities. Varicose veins occur exceptionally in other parts of the body—upon the scalp and side of the neck, and upon the abdomen in the region of the groin. Varicocele in the male is a local varicosity of the spermatic veins. Hemorrhoids or piles are due to repeated passive congestions of the hemorrhoidal veins at the verge of the anus; obstruction to the portal circulation is the primary cause, which, if of frequent recurrence and long standing, leads to varicose veins, or piles. Varicose veins, as seen in the lower extremities, are increased in diameter with inequalities of caliber, and present nodular enlargements or pouches at intervals; there are greater relaxations at the site of former valves or at the points of division of veins. The veins are also tortuous, since the longitudinal fibers of the coat are relaxed no less than the circular; the tortuosity accommodates the increased length of the vessel and favors the ascent of the blood. Varicose veins do not necessarily indicate debility or degeneration, but should warn the patient at once to abandon vocations involving violent exertion, to regulate the diet and bowels habitually, and to neutralize and remove any rheumatic or gouty vice. The varicose limb may be benefited by daily friction, cold effusion, and salt bathing. But the extension of the disease is best checked, and the best prospect of cure insured, by constant external support. This is secured by uniform bandaging, or by wearing an elastic stocking or laced leg-corset. The elastic stockings made of silk and rubber webbing are of the greatest value to those who can afford to keep them constantly renewed when stretched by wear. An inferior stocking, by stretching at points, leaves bands of circular constriction which aggravate the disease rather than give the intended benefit. The cheapest and most efficient appliance is a case or corset of strong jean fitted to the shape of the limb and laced up in front. Varicose veins are radically cured by ligation and by hypodermic injection of styptics within the veins. Either process may result in local ulceration and failure. The latter method carefully performed may afford permanent relief; but in this it is necessary to

bandage the part tightly for several hours in order to prevent blood-clots from reaching the heart and vessels of the trunk.

Revised by WILLIAM PEPPER.

Varinas, or Barinas: See **BARINAS**.

Variola: See **SMALLPOX**.

Varius, LUCIUS RUFUS: a Roman poet of considerable reputation among his contemporaries; the friend of Horace and Vergil, who in conjunction with Tucca edited the *Æneid* after Vergil's death. He wrote epic poems in glorification of Caesar and Augustus, and a tragedy, *Thyestes*, highly esteemed by Quintilian. See Ribbeck, *Tragicorum Romanorum Fragmenta*, and Baehrens, *Fragmenta Poet. Rom.*

Varna (more correctly **Warna**); seaport-town of Bulgaria; on the west coast of the Black Sea between the Danube delta and the Bosphorus, on the Bay of Varna (see map of Turkey, ref. 3-E). Though its harbor is open, being sheltered only on the N. and N. E. from the dangerous winds of the Black Sea, it was entered in 1893 by 379 ships with a tonnage of 234,913. Since 1867 it has been connected with Rostchuk (115 miles distant) by a railway, and has a large export trade in wheat, barley, wool, leather, wax, honey, fruit, and wood with Constantinople and the west of Europe. More than 3,740,000 gal. of wine is produced annually within the district of Varna. There are rich industrial establishments, including breweries, distilleries, tanneries, soap-factories. The city is the seat of a Greek metropolitan and since 1870 of a Bulgarian bishop, has a gymnasium, 5 churches, and 8 mosques, and the tomb of Ladislaus III. of Poland and Hungary, who was slain at the battle of Varna (1444). Its strong fortifications were destroyed by the action of the Congress of Berlin in 1878, but have been replaced with earthworks by the Bulgarians, so that it forms with Shumla, Rostchuk, and Silistria the Bulgarian quadrilateral. Originally an ancient Milesian colony, *Odessus*, it is historically very memorable, having been the place where the allies organized the invasion of the Crimea during the war with Russia in 1854-55. Pop. (1893) 28,174. HERMANN SCHOENFELD.

Varnhagen, vārn-haa'-gen, FRANCISCO ADOLPHO, de: historian; b. at São João de Ypanema, São Paulo, Brazil, Feb. 17, 1816. His father was a German engineer in the Portuguese service. Young Varnhagen was early taken to Portugal, where he was educated in the royal military college and served in the army against Dom Miguel 1833-34. Subsequently he devoted himself to historical researches. Returning to Brazil he became a subject of that empire in 1841, and during most of the remainder of his life held diplomatic positions in South America and Europe. He was unquestionably the first of the Brazilian historians both in the profundity of his researches and in clearness of argument and statement; but he was somewhat dogmatic and impatient of opposition, clinging tenaciously to his own views on minor points, even when the weight of evidence was against him. His most important work is the *Historia geral do Brazil* (2 vols., 1854-57; revised ed. 2 vols., 1875). Others are *Historia das lutas com os Hollandezes no Brazil* (2d ed. 1874); several brochures on Vespuccius, and various papers in the *Revista do Instituto historico do Brazil* and other journals. He edited and published many important historical documents. He was created Baron and in 1874 Viscount of Porto Seguro. D. in Vienna, Austria, June 29, 1878. HERBERT H. SMITH.

Varnhagen von Ense, vārn-haa'-gen-fon-en'se, KARL AUGUST: soldier and author; b. at Düsseldorf, Feb. 21, 1785; was educated at Hamburg; studied medicine, then philosophy and literature at Berlin, Halle, and Tübingen, and published in 1804 a *Musenalmannich*, together with Chamisso. In 1809 he entered the Austrian army, fought in the battles of Aspern and Wagram, and after the conclusion of peace accompanied Gen. Prince Bentheim as adjutant on his diplomatic journeys to Prague and Paris. In 1812 he received a position in the Prussian civil service, but in 1813 entered the Russian army as a captain; served in Tottenborn's corps during its campaign from Hamburg to Paris, and wrote *Geschichte der Kriegszüge Tottenborns* (1814). After the fall of Paris, he accompanied Prince Hardenberg to the Congress of Vienna, and went in 1815 as Prussian minister to Carlsruhe, but removed in 1810 to Berlin, where he subsequently resided till his death Oct. 10, 1858, devoting himself to literature. In 1814 he married Rahel Levin, a rich Jewess (b. in 1771), much noted for the

chivalric homage which Prince Louis Ferdinand of Prussia (d. in 1807) had paid her, and most remarkable for the power and brilliancy of her intellect and for the energy and nobleness of her character. In Berlin she formed the center of a large circle encompassing all the greatest talents in art, literature, science, and politics; after her death (in 1833) her husband published *Rahel, ein Buch des Andenkens für ihre Freunde* (3 vols., 1834), containing selections from her posthumous papers, and *Galerie von Bildnissen aus Rahels Umgang* (2 vols., 1836), a series of literary sketches. This last kind of production, the biography, the literary portrait, was the true field for the talent of Varnhagen von Ense, and his *Goethe in den Zeugnissen der Mitlebenden* (1823) and *Biographische Denkmale* (5 vols., 1824-30) are, like most of his writings, highly important documents for the understanding of his time. The influence of his classical style and of his exquisite art of drawing literary portraits is very evident in the development of German historiography. After his death were published his *Tagebücher* (14 vols., 1861-72); *Blätter aus der preussischen Geschichte* (1868); *Biographische Porträts* (1871); *Briefe von Alexander von Humboldt 1827-58* (1860), etc., which works gave many surprising revelations with respect to characters and events of his time. Revised by JULIUS GOEBEL.

Varnish [M. Eng. *vernish*, from O. Fr. *vernis*, deriv. of *vernir*, to varnish < Late Lat. **vitri-ni-re*, deriv. of *vitri-nus*, glassy, deriv. of *vitrum*, glass]; a resinous solution employed for coating various objects in order to produce a thin, transparent, and hard surface, forming a protection against moisture and air. The principal resins employed are the gums copal, shellac, animé, mastic, and sandarac; the solvents being alcohol, wood-spirit, oil of turpentine, linseed, and other drying oils. From the nature of the solvent used varnishes may be conveniently divided into fixed-oil, spirit, volatile-oil, and ether varnishes.

Fixed-oil varnishes, which possess great durability and luster, are usually prepared from linseed oil, which, on being oxidized by the action of the air, is converted into a tough, elastic substance, the change taking place more rapidly in a boiled oil, which possesses greater siccativ power. In the preparation of the oil for the manufacture of varnish, it is boiled in a copper vessel in the presence of litharge, zinc oxide, or manganese dioxide, by the action of which the *linolein* of the oil is partially converted into linoxine. The resin is then fused in a caldron, and the boiled oil, heated to about 300° F., is gradually added, with constant stirring. As soon as a complete admixture between the resin and oil has been effected, the caldron is removed from the fire and allowed to cool partially, when heated oil of turpentine is added in a thin stream until the mixture acquires a proper consistence. The proper amount of linseed oil to be added to the resin can be determined by taking out a drop of the fluid every few moments and allowing it to cool on a glass plate, when, if the proportions of oil and resin are correct, it will remain limpid and wax-like; in case it becomes hard and brittle, more oil is required. It is considered necessary to boil the mixture of linseed oil and resin before adding the oil of turpentine. The quality of the linseed oil used is of importance; a pale limpid oil, which is prepared from full-grown and ripe seeds, and does not change the color of the varnish to any great extent, should be employed. The proportions by weight of the ingredients composing an ordinary oil varnish are as follows: resin (copal, amber, etc.), 10; boiled linseed oil, 5 to 25; oil of turpentine, 15 to 25. As a rule, varnishes of this composition improve with age. An amber varnish, which possesses great durability, but dries slowly, has the following composition: resin (*amber colophonium*), 1 lb.; boiled linseed oil, 10 oz.; oil of turpentine, 1 pint. A good carriage varnish is made from gum animé, 8 lb.; boiled linseed oil, 3 gal.; camphor, $\frac{1}{4}$ lb.; litharge, $\frac{1}{4}$ lb.; oil of turpentine, $5\frac{1}{2}$ gal. A black asphalt varnish, suitable for iron-work, can be made from asphalt, 3 parts by weight; boiled linseed oil, 4; oil of turpentine, 15 to 18; or from foreign asphalt, 45 lb.; linseed oil, 6 gal.; litharge, 6 lb.; boil, then add dark fused gum amber, 8 lb.; hot linseed oil, 2 gal.; boil again, remove from the fire, and thin down with oil of turpentine, 25 gal. A good wainscot or mahogany varnish is obtained from sorted gum animé, 8 lb.; clarified linseed oil, 3 gal.; litharge, $\frac{1}{2}$ lb.; dried lead acetate, $\frac{1}{4}$ lb.; oil of turpentine, $5\frac{1}{2}$ gal. The addition of India-rubber or gutta-percha to oil varnishes imparts further flexibility to the product.

Spirit varnishes (lac varnishes) differ from the preceding in being true solutions of resins. The solvents most employed are alcohol and wood-spirit. Acetone, benzene, etc., are also occasionally used. The gums chiefly employed are sandarac, mastic, shellac, and animé. Sandarac confers hardness on varnishes; mastic imparts a gloss. Shellac is rendered more soluble by being powdered and exposed to the air for a long time. The spirit used as the solvent should not be less than 95 per cent. in strength. In the preparation of spirit varnishes the resins, before being added to the solvent, should be well pulverized and mixed with sand or broken glass, in order to prevent the gum from agglutinating into lumps. The solution is accomplished in a still heated in a steam-bath, the varnish being filtered, first through silk, then through filter-paper. The tendency of the varnish to "chill" or give a rough surface is obviated by the addition of a little concentrated ammonia or gum sandarac, excessive brittleness being remedied by the addition of Venice turpentine. Sandarac varnish is prepared by dissolving 10 parts of the gum and 1 part of Venice turpentine in 30 parts of spirit. Ordinary copal varnish is made by first melting the resin at a gentle heat, then pulverizing and mixing it with sand, dissolving in strong alcohol, and filtering. Elemi resin, or solution of turpentine, is sometimes added to give greater softness. A colorless copal varnish is prepared by dissolving 6 parts of pulverized and fused copal in 6 parts of strong alcohol in a closed vessel, and adding 4 parts of oil of turpentine and 1 part of ether. Colored spirit varnishes, or *lacquers*,* are commonly used to impart a gold color to instruments made of brass and other base metals. Tinctures of gummy-gutta, dragon's blood, gamboge, coralline, picric acid, turmeric, Martins yellow, annatto, etc., are separately prepared and added in the proportions necessary to give the required color to a varnish consisting of seed-lac, 2 parts; sandarac, 4 parts; elemi, 4 parts; alcohol, 40 parts. The following mixture furnishes a good gold lacquer for brasswork; seed-lac, 3 oz.; turmeric, 1 oz.; dragon's blood, $\frac{1}{4}$ oz.; alcohol, 1 pint. Aniline colors have been employed to impart various tints to spirit varnishes, which are especially adapted to the coloring of glass, the bronzing of leather, etc.

Volatile-oil varnishes are prepared in the same manner as the preceding, the solvent being oil of turpentine. They are more durable than spirit varnishes, and are less brittle, but require more time in drying; they also differ from the latter in improving by age, whereas spirit varnishes usually deteriorate in quality. The resins employed (gum copal, gum damar, Canada balsam, etc.) are commonly directly dissolved in the oil of turpentine, with or without previous fusion, the usual proportions being about 5 lb. of the resin to 7 lb. of the solvent.

Ether varnishes consist simply of an ethereal solution of a resin. They have a very limited application. The following is sometimes used for the repairing of jewelry: copal, 5 parts; ether, 2 parts. A varnish for photographers' use is prepared by dissolving 3 or 4 grains of amber in 1 oz. of chloroform.

Besides the varieties of varnish already mentioned, numerous other preparations are used for specific purposes which can not well be classified under any of the above heads. A varnish consisting of 1 part gutta-percha dissolved in 5 parts oil of turpentine, to which 8 parts of hot linseed oil are added, does not scale, and is sometimes used for maps. Wax varnish, or milk of wax, is prepared by melting 1 lb. of white wax at a low heat, adding 1 pint of warm alcohol (90 per cent.), mixing, and pouring the liquid out on a cold porphyry slab, on which it is ground with a muller to a smooth paste. An emulsion with water is then made and strained through muslin. This preparation is extensively employed as a protective coating for old paintings, upon which it is first allowed to dry, and then equally fused by passing a warm iron over it. A varnish for covering zinc is obtained by dissolving equal parts of potassium chlorate and copper sulphate in hot water, and immersing the zinc in the solution for a few seconds; a coating of copper oxide is formed on the metal, which when dry is washed and polished, when it acquires an indigo-blue color. The preparations used for varnishing gums, engravings, leather, etc., differ little from those described above, although in the case of leather the article is usually dried in an oven after varnishing, the process being called *JAPANING* (q. v.).

Revised by IRA REMSEN.

* Japanese and Chinese lacquer-work is not included in this term. See LACQUER.

Varnish-tree: any one of the varnish-producing trees of the family *Anacardiaceæ*, especially the *Ilex verniceifera* of China and Japan, *Melanorrhæa usitata* of India, the *Stagmaria verniceiflora* of the Malay islands, and the *Semecarpus anacardioides* of Sylhet.

Varnum, JAMES MITCHELL: soldier; b. at Draent, Mass., Dec. 17, 1748; graduated at Rhode Island College (now Brown University) in 1769; studied law, and practiced at East Greenwich, R. I.; in 1774 headed a company called the Kentish Guards, which gave to the army over thirty commissioned officers; rose to the rank of brigadier-general, and commanded the troops on the Delaware when the British took possession of Philadelphia; was with the army at Valley Forge in 1778; took part in the battle of Monmouth, and afterward served under La Fayette in Rhode Island, resigning from the army in 1779. He was member of Congress from Rhode Island 1780-82 and 1786-87, and in 1788 was appointed a judge of the Supreme Court of the Northwest Territory. D. at Marietta, O., Jan. 10, 1789.

Varoli, COSTANZO: anatomist and surgeon; b. at Bologna in 1543; studied medicine at the university there, where he also taught anatomy for some time, but was invited to Rome by Pope Gregory XIII., and became his first physician. He made comprehensive investigations concerning the human brain, of which one part still bears his name, *pons Varolii*, and wrote *De Nervis Opticis, non-nullicque aliis, præter commune Opinionem in Humano Capite observatis* (1573), and *De Resolutione Corporis humani*, first published in 1591. D. in Rome in 1575.

Revised by S. T. ARMSTRONG.

Varotari, ALESSANDRO: commonly called IL PADOVANO; painter; b. at Padua, Italy, in 1590; the son of Paolo Varotari, also a painter. Alessandro lost his father at an early age and went to Venice, where he studied the works of Titian and Veronese, and painted in their manner. He went to Rome later, but spent most of his life in Venice and in Padua, where most of his paintings still exist. D. in 1650. Varotari was a most successful painter of children; his landscapes also are excellent. He painted frescoes in the Church of Sant' Andrea, at Bergamo. The *Marriage of Cana*, in the Academy at Venice, is considered his masterpiece. The National Gallery in London possesses two examples of his art; the Louvre only a drawing. See Ridolfi, *Le Maraviglie dell' Arte* (Venice, 1648); Orlandi, *Abecedario Pittorico* (Bologna: 1719); and Lanzi, *Storia Pittorica*. W. J. STILLMAN.

Varro, MARCUS TERENCE: author; b. B. C. 116 at the Sabine town of Reate, of an ancient family, probably of equestrian rank. He early devoted himself to antiquarian lore and to literature, but did not neglect his duties toward the state, and was often employed by Pompey on grave political occasions. When the civil war arose he espoused the republican cause, but was reconciled to the victorious Caesar, who made him librarian of his contemplated collection. He was a prolific writer, and versatile as well in matter as in form. Though a devoted patriot, he availed himself of Greek culture, but in style he always remained uncut and harsh. He was older than Cicero, who, with sentiments of admiration and fear, dedicated his *Academia* to him. He was styled by Cicero *homo polivraquátatos*, and by Quintilian *vir Romanorum eruditissimus*; he was a great favorite with the Christian Fathers, and especially with St. Augustine. His writings amounted to 74 different works in 620 books, of which 170 were in metrical form, if we include the *Satura Menippeæ* (150 books), so-called after Menippus, the cynic philosopher of Gadara. These latter, however, are a medley of prose and verse, treating a great variety of subjects, from philosophy to the commonest events of daily life, with much polemic and shrewd humor. His prose works embraced almost all branches of knowledge—grammar, rhetoric, geography, history, philosophy, jurisprudence, husbandry—but in his universal study he kept Rome and Roman interests always in view, and thus exerted an immense influence on his own and on subsequent times. D. B. C. 27. Of his works only two have been preserved: *De Lingua Latina* and *Rerum Rusticarum Libri III.* Of his 25 books on the Latin language only books 5-10 are extant, and these imperfect. His three books on husbandry we have complete, with the exception of a gap at the beginning of the second; this treatise is given in the form of a dialogue, like Cicero's philosophical writings, but with far more spirit and vigor. The other works of Varro do not appear to have been in existence beyond 600 A. D. Best

edition of the *De Lingua Latina* by Spengel (Berlin, 1885); of the *Rerum Rusticarum Libri III.* by H. Keil (Leipzig, 1884; commentary, 1891); of the *Satura Menippeæ* by Buecheler, with Petronius (Berlin, 1882). For other literature on Varro, see Teuffel's *Geschichte der römischen Literatur*, §§ 164-169. Revised by M. WARREN.

Varro, PUBLIUS TERENTIUS: author; called ATACINUS, from the river Atax (now Aude), in Gallia Narbonensis, where he was born in 82 B. C. D. in 37. Besides satires and an epic poem with an historical subject entitled *Belium Sequanicum*, he also made a translation of the *Argonautica* of Apollonius. For the few fragments, see Baehrens, *Fragmenta Poet. Rom.* (Leipzig, 1886). M. W.

Varus, PUBLIUS QUINTILIUS: Roman general, consul in 13 B. C., and afterward governor of Syria. In 7 A. D. he was made governor of the territory between the Rhine and the Elbe, which had been conquered by Drusus and Tiberius. The conquest was but superficial, however, and in the year 9 A. D. a secret insurrection against the Roman power was organized under the leadership of Arminius. Varus, with the Roman army, was lured into an ambush in the Teutoburg forest, and suffered total defeat, the leader, in despair, committing suicide. It was the greatest calamity of Augustus's reign, and the first time that Roman arms retreated from territory which they had once occupied. The region was never reconquered. G. L. HENDRICKSON.

Vasa, House of: a Swedish royal family. It came to the throne of Sweden in the person of Gustav Ericsson Vasa in 1523, and until 1654 ruled in the direct line. In that year the succession passed into a collateral female branch, and the same thing occurred in 1718, and again in 1751. On the death of Charles XIII. (1818) the house of Vasa ceased to reign, and Marshal Bernadotte came to the throne, though there was an heir, Prince Gustav of Vasa (1799-1877), the son of Gustavus IV. Adolphus, who was deposed in 1809. The most celebrated members of the family were Gustavus Adolphus and Charles XII. Queen Christina and Gustavus III. were also interesting characters, if not great, and Charles IX., X., and XI., as well as the founder, were very energetic and able rulers. Eric XIV. was mad; the Polish branch of the family was controlled by the Jesuits; and the last two rulers, Gustavus IV. Adolphus and Charles XIII., were weak-minded. See, further, the biographies under the separate headings. Revised by F. M. COLBY.

Vásárhely (full name, *Hód-Mező-Vásárhely*, hód me-ző-vaa'shár'hál', to distinguish it from Maros-Vásárhely, in Transylvania); city; in the county of Csongrád, Hungary; on the Hód Lake; station of the Alföld-Fiume Railway. The city is rapidly improving, and has many noteworthy public buildings, among them numerous churches, a Protestant gymnasium, a royal law court, and a town-hall, besides two banks, two hospitals, large breweries, and an oil-factory. It has a flourishing trade in the products of the fertile country surrounding it—wheat, grain, barley, oats, maize, fruits, white and red wine. Cattle and horses of the best breeds in Hungary are extensively raised. In spite of enormous dikes, the city frequently suffers from the inundations of the river Theiss. Pop. (1890) 55,475, mostly Magyars and Roumanians. HERMANN SCHOENFELD.

Vásárhely, Maros- (Germ. *Neumarkt*): chief town of the Szeklers, and capital of the county of Maros-Torda, Transylvania; on the left bank of the Maros river, and on the Kocsárd-Maros railway-line. It is the seat of the court of appeals for Transylvania, has a vast castle, containing barracks and the great reformed church, a reformed gymnasium, and a public library with a museum of natural history. Pop. (1890) 14,212. H. S.

Vasá'ri, GIORGIO: painter, architect, and biographer; b. at Arezzo, Italy, July 30, 1511, of a family of artists. He first studied under Guglielmo da Marsiglia, then went to Luca Signorelli, who was related to him; then to Andrea del Sarto and Michelangelo. In his early years he became discouraged, gave up painting for a time, and went to Florence, where he turned his attention to the goldsmith's art, but commissions at Pisa led him back to painting. He then worked at Arezzo. After this Cardinal Ippolito de' Medici took him under his protection and gave him opportunities for studying drawing and letters under the instruction of Ippolito and Alessandro de' Medici. In 1529 he went to Rome, where he worked, together with his intimate friend Salviati (see ROSSI, FRANCESCO, de'), at drawing ancient monuments with such assiduity that he fell ill of fever, and

had to return to his native city. After decorating a room in the Palazzo Medici that Giovanni da Udine had begun, he turned his attention to architecture, and soon became one of the most accomplished of his time in that department. On the death of his protectors, the Medici, he retired from the court, and was commissioned to paint frescoes at the Certosa, and also for the Olevetan, in Rimini and Bologna, and for the Santi Apostoli in Florence. He became famous, and commissions came to him from every part of Italy. His friend Pietro Aretino invited him to Venice, where he painted important works for the great patricians there. In 1542 he returned to Tuscany, and thence to Rome, where Michelangelo became his friend, and procured commissions from the cardinals and the pope for him, recommending him as an artist of the highest merit. He also worked in Naples for a year, but left incomplete works there, being driven away by the envy of his fellow artists. It was in Rome, while painting the scenes from the life of Paul III. in the Sala della Cancelleria of the Vatican, that he became known to Paolo Giovio, who seems to have suggested to him the writing of the work (*Lives of the Painters, etc.*) to which he chiefly owes his fame. Its full title is *Delle Vite de' più Eccellenti Pittori, Scultori, ed Architetti*. The first edition was published in 1550. The standard edition is by Milanese (1878-85). Many of the anecdotes it contained gave offense to artists who were still living, as also his criticisms of their work. He modified these judgments and suppressed the offensive parts in the second edition. Vasari was also the originator of the Florentine Academy, which was founded about 1561. D. in Florence, June 27, 1574. He was at the time painting the cupola of the cathedral, which he left incomplete. Besides his *Lives* he wrote several treatises on the fine arts. Vasari's paintings suffered from too facile and hasty execution, and from his employment of incompetent assistants. W. J. STILLMAN.

Vasco da Gama: See GAMA, VASCO, da.

Vasconcellos, JOAQUIM ANTONIO FONSECA, de: scholar; b. at Oporto, Portugal, Feb. 10, 1849. He received most of his earlier education at Hamburg, then pursued his university studies at Coimbra (1865-69). From 1871 to 1875 he traveled extensively in Germany, France, England, Spain, and Portugal. In 1883 he became Professor of German in the College of Oporto, and in 1889 he was also made director of the Museum of Trade and Industry in that city. His German education and his extensive knowledge of the world early put him out of sympathy with the intellectual superficiality of his countrymen, and in his organ, *A Actualidade* (The Present), he has steadily striven by criticism and admonition to give Portuguese scholarship the solidity and scientific accuracy demanded by the best ideals of the present. His own most important work as a scholar has been in the field of the history of art, and falls into two main parts, one dealing with music, the other with the other fine arts. To the first belong *Os musicos portugueses: Biographia-bibliographia* (Oporto, 1870); *Luiza Todt* (1873); *Ensaio sobre o catalogo da livreria de musica de el-rei D. João IV.* (1873); *Cartas curiosas do abbade Antonio da Costa* (1879). To the second group of works belong *Reforma do ensino de bellas artes* (3 vols., 1877-79); *Abrecht Dürer e a sua influencia na peninsula* (1879); *Francisco de Hollanda* (1879); *Goësiana* (4 vols., 1879-81). Besides these contributions to science, Vasconcellos has done much to spread a knowledge of German literature in Portugal. Here may be mentioned two works occasioned by the free and inaccurate translation of Goethe's *Faust* by Castilho; *O Faust de Goethe e a tradução de Castilho* (1872); and *O consummado germanista* (1879).—His wife, KAROLINA WILHELMIA MICHAELIS DE VASCONCELLOS, was born in Berlin, Mar. 15, 1851, and married him in 1876. The daughter of Prof. Gustav Michaelis, a well-known authority on stenography and the physiology of sound, she received an extensive linguistic and literary education at the Luisenschule at Berlin, under Mätzner and Goldbeck. She was early attracted by the languages and literatures of the Spanish Peninsula, and her investigations in this field have placed her among the first Romance philologists of the present day. Her first publication was a collection of the Spanish ballads dealing with the Cid, *Romancero del Cid* (Leipzig, 1870). Of her later works may be cited *Studien zur romanischen Wortschöpfung* (Leipzig, 1876); *Ein portugiesisches Weihnachts-Auto: Pratica de tres pastores* (Brunswick, 1879); *Versuch über den Palmeirim da Inglaterra* (Halle, 1883); *Poesias de Francisco de Sa de Miranda* (Halle, 1885); *Studien zur*

hispanischen Wortdeutung (Florence, 1886); and the admirable survey of Portuguese literature in Gröber's *Grundriss der romanischen Philologie*, vol. ii. To the list should be added numerous contributions in the *Revista Lusitana*, *Zeitschrift für romanische Philologie*, *Romanische Forschungen*, and other learned journals. A. R. MARSH.

Vasconcellos, SIMÃO, de: missionary and historian; b. at Coimbra, Portugal, in 1599. He entered the Jesuit order, was sent, about 1630, to Brazil, and passed the remainder of his life teaching in the colleges or laboring among the Indians. Vasconcellos published *Cronica da companhia de Jesus no Brazil* (1663; 2d ed. 1864); *Livros of Anchieta and Almeida*, etc. These books are well written, and are considered among the most important of the early works on Brazil, both for secular and for ecclesiastical history. D. in São Paulo about 1670. H. H. S.

Vascular Tissue: in plants, the fibro-vascular system, composed of vessels and ducts. See HISTOLOGY, VEGETABLE.

Vasey, GEORGE, A. M., M. D.: botanist; b. near Scarborough, England, Feb. 28, 1822. His family removed to the U. S. when he was an infant; he was educated in the schools of Oneida co., N. Y., the Oneida Institute, and the Berkshire Medical Institute in Pittsfield, Mass.; practiced medicine in Elgin, and Ringwood, Ill., from 1848 to 1866; botanist of Maj. John W. Powell's Colorado expedition 1868; editor, with Charles V. Riley, of *The American Entomologist and Botanist* (1869-70); botanist of the Department of Agriculture, Washington, D. C., 1872 to 1893. D. in Washington, D. C., Mar. 4, 1893. His publications relate largely to the grasses, to the study of which he devoted himself almost exclusively during the last fifteen years of his life. The more important are *A Catalogue of the Forest Trees of the United States* (1876); *Gramineæ* in Lieut. George M. Wheeler's *Report* (1877); *A Synopsis of the Tribes and Genera of the Grasses of the United States* (1883); *Agricultural Grasses of the United States* (1884; revised in 1889); *A Descriptive Catalogue of the Grasses of the United States* (1885); *Grasses of the Southwest* (part i. 1890, part ii. 1891); *Grasses of the Pacific Slope* (part i. 1892, part ii. 1893); *Monograph of the Grasses of the United States and British America* (1892, unfinished).

CHARLES E. BESSEY.

Vasquez de Coronado, VÁSŪS KÁTH-DĀ-KŌ-FŌ-NAĀ DŌ, FRANCISCO: explorer of New Mexico; b. at Salamanca, Spain, about 1500. He went to Mexico, probably with Viceroy Mendoza in 1535, and in 1539 was appointed governor of Nueva Galicia, then embracing all of Northwestern Mexico, with an indefinite extension northward. At this time extravagant ideas were current about the "seven cities" of Cibola (the Indian pueblos of Arizona) reported by Cabeza de Vaca and seen by Ntza (*q. v.*). Coronado organized an expedition for their conquest. He left Culiacan in Apr., 1540, with 300 soldiers and 800 Indians, taking Ntza as a guide. Crossing the deserts he reached the Cibola pueblos, but found none of the riches reported by Ntza. He then turned eastward, exploring the region now called New Mexico, and possibly penetrating to Kansas; but he was everywhere disappointed in his search for gold, and a large part of his force perished in the desert. He returned in Mar., 1542, and was employed in quelling the Culiacan revolt, but died not long after. See *The Gilded Man*, by Adolphe F. Bandelier (New York, 1893).

HERBERT H. SMITH.

Vasquez de Coronado, JUAN: administrator; b. at Salamanca, Spain, about 1525. He was of an illustrious family, and married a relative of Pedrarias, the governor of Panama. After studying law in the University of Salamanca, he went to Guatemala in 1550, and the *audiencia* of the Confines employed him in various important posts. He was *alcalde mayor* of San Salvador and Honduras, and later of Nicaragua; *alcalde ordinario* of the city of Guatemala; and in Apr., 1562, was named *alcalde mayor* of the provinces of Cartago and Costa Rica. He carried a large amount of supplies to the impoverished settlers of those regions; quickly reduced his territory to order, conciliating the Indians by his kindness and justice; and after thoroughly exploring Costa Rica and founding Cartago and other towns, he returned to Spain in 1564. It was adjudged that he had effected the pacification of Costa Rica, and he was appointed captain-general of that country for life and in hereditary, as well as governor of Nicaragua for three years. He set out for his domain with a large retinue, but was shipwrecked and drowned in Oct., 1565.

HERBERT H. SMITH.

Vassalboro: town; Kennebec co., Me.; on the Kennebec river, and the Maine Cent. Railroad; 12 miles N. by E. of Augusta (for location, see map of Maine, ref. 8-C). It was settled in 1760, incorporated in 1771, and had part of its territory taken to form the town of Sidney in 1792. It contains the villages of Vassalboro, East Vassalboro, South Vassalboro, North Vassalboro, Riverside, and Cross Hill; and has nine churches, Oak Grove Seminary, and a commercial college. Pop. (1880) 2,621; (1890) 2,652.

Vassar: village; Tuscola co., Mich.; on the Cass river, and the Flint and Pere Marq. and the Mich. Cent. railways; 23 miles S. E. of Bay City, and 27 miles N. W. of Lapeer (for location, see map of Michigan, ref. 6-K). It is in an agricultural and lumbering region, and has a national bank with capital of \$50,000, a private bank, a public high school, a weekly newspaper, several flour and lumber mills, foundries and machine-shops, woolen-mill, and other manufactories. Pop. (1880) 670; (1890) 1,682; (1894) 1,635.

Vassar, MATTHEW: founder of VASSAR COLLEGE (*q. v.*); b. at East Dereham, Norfolk, England, Apr. 29, 1792; was taken to the U. S. in 1796 with his father, who settled on a farm near Poughkeepsie, N. Y., and carried on an extensive brewery, acquiring a fortune in that business. D. at Poughkeepsie, June 23, 1868. He was a Baptist, and contributed much to the erection of a Baptist church in Poughkeepsie.

Vassar, MATTHEW, JR.: philanthropist; nephew of the founder of Vassar College; b. at Poughkeepsie, N. Y., May 11, 1809; educated in the common schools; treasurer and trustee of Vassar College from its beginning to his death. He, with his brother John Guy, erected the Vassar brothers' laboratory, for Vassar College, at a cost of \$20,000, also the Vassar old men's home in Poughkeepsie. He held many local and important offices in his native city, and was a man of great shrewdness and activity. He left nearly \$400,000 to be distributed among various institutions, corporations, and societies, of which \$85,000 was for a hospital in Poughkeepsie, to be called Vassar Brothers' Hospital. D. at Poughkeepsie, Aug. 10, 1881.—His brother, JOHN GUY VASSAR (b. at Poughkeepsie, N. Y., June 13, 1811; d. there Oct. 27, 1888) gave to the college a fine building for literary and scientific purposes. Ill health prevented steady application to business, and he traveled extensively. He published *Twenty Years around the World* (New York, 1861; 2d ed. 1862).

Revised by S. M. JACKSON.

Vassar College: an institution at Poughkeepsie, N. Y.; founded by Matthew Vassar in 1861, and opened to students in 1865. It was the first amply endowed and adequately organized college for women. The original gift was \$428,000, expended for buildings and other equipments. This was supplemented by a bequest of \$360,000. Matthew Vassar, Jr., subsequently left to the college \$130,000, and from the estate of John Guy Vassar it received \$444,000. By other gifts the endowment fund has reached the sum of \$1,020,000 (1894). The buildings, collections, and apparatus are valued at \$1,000,000 more. The buildings include three for residence, library, laboratories, museum and art gallery, gymnasium, conservatory, professors' residences, etc. The main building, which is 500 feet in length, is modeled after the Tuileries. The buildings are located in the midst of 210 acres of land, much of which is laid out as a park. It is 3 miles from the Hudson, and is connected with the river by an electric railway.

There are nineteen professorships, about equally divided between men and women, and twenty-six other officers and instructors. The course of study is similar to that of the best colleges in the U. S., and the requirements for admission are equal to theirs. No one is admitted, even for a special course, unless on the full requirements in force for the regular course. Lectures by specialists from other institutions supplement the work of the departments. The degree of A. B. is given on the completion of a four years' course, of which the first year and part of the second are prescribed, and the remainder, excepting a course in philosophy, is elective. The A. M. degree has never been given save on examination. One year of resident work, or two of non-resident, is requisite. There are several fellowships for graduate work. Music and painting are provided for, but the practice of these arts is not included in the work counted for a degree. The science and history of the arts are included in the curriculum. The college is non-sectarian. Its services of worship are conducted by the president and preachers of various denominations. The number of students in 1894 was 482.

JAMES M. TAYLOR.

Vassilkov': a town in the government of Kiev, Little Russia; on the Stugna, near its junction with the Dnieper; has tobacco and soap factories. Pop. 18,000, mostly engaged in agricultural pursuits.

Vasto (ancient *Histonium*): fortified town; in the province of Chieti, Italy; about a mile from the Adriatic, in the plain known as the Piano d'Aragona, connected by rail with Brindisi and Bologna (see map of Italy, ref. 5-F). The principal industries are olive-culture and the manufacture of earthenware, woolen cloth, and silk. Pop. 9,800.

Vater, *fin' ter*, JOHANN SEVERIN: theologian and philologist; b. at Altenburg, duchy of Saxe-Altenburg, Germany, May 27, 1771; studied theology and languages at Jena and Halle; was appointed Professor of Theology and Oriental Languages at Jena in 1796, at Halle in 1800, at Königsberg in 1809, and returned in 1820 to Halle. He published *Synchronistische Tafeln der Kirchengeschichte* (Halle, 1809; 6th ed. 1833; Eng. trans. by F. Cunningham, *Tables of Ecclesiastical History*, Boston, 1831). In his day he was widely known by his grammars of the Hebrew (1797), Polish (1807), and Russian languages (1809); his *Handbuch der hebräischen, sgrischen, chaldäischen und arabischen Grammatik* (1801); his continuation of Adelung's *Mithridates* (1806-17); his *Literatur der Grammatiken, Lexika und Wörtersammlungen aller Sprachen der Erde* (1815); and by his commentary on the Pentateuch (2 vols., 1802-05). D. at Halle, Mar. 16, 1826. Revised by S. M. JACKSON.

Vatican Codex: See CODEX VATICANUS.

Vatican Council [*Vatican* is from Lat. *Vaticānus* (se. *mons* or *collis*, hill), the Vatican Hill on the west bank of the Tiber, at Rome]: the twentieth œcumenical council of the Roman Catholic Church, deriving its name from the Vatican Basilica (St. Peter's), in Rome, where it was held. It was called by Pope Pius IX., through the encyclical *Æterni Patris Unigenitus Filius*, under date of June 29, 1868, and solemnly opened Dec. 8, 1869. In consequence of the Franco-German war and of the occupation of Rome by the Italian troops, the council was suspended Oct. 20, 1870. It has never been reconvened, nor has any œcumenical council been held since. The number of prelates who took part in the conciliar proceedings varied considerably. It was largest in the fourth general congregation (Dec. 28, 1869), when 727 were present; ranged subsequently between 500 and 650; and fell in the eighty-seventh congregation (Aug. 13, 1870) to 136. In the eighty-ninth and last (Sept. 1, 1870) only 104 members were present.

The subject-matter of the council had been arranged beforehand in *schemata*, which served as the basis of discussion. Each of the fathers received a copy of the *schema* wrote upon it such comments as he thought necessary, and sent it thus annotated to one of the four commissions (*deputationes*) especially charged to deal with questions concerning respectively faith, discipline, religious orders, and Oriental rites. Each commission consisted of twenty-four prelates, chosen by members of the council, and a cardinal president, appointed by the pope. The commission having modified the *schema* along the lines suggested by the fathers, issued the *schema reformatum* and submitted it for discussion in the general congregation. Here it was further modified, adopted, and formulated in decrees or canons. These were finally voted upon and solemnly promulgated in the public sessions, at which the pope presided. The deliberations of the council resulted in two constitutions. The first, on *Catholic Faith*, was promulgated in the third public session, Apr. 24, 1870. It embodies the doctrine of the Church concerning God the Creator, revelation, the nature of faith, and the relations between faith and reason. The positive statements on these points are followed by a series of "canons," in which errors regarding the same matters are condemned. The other constitution, on *The Church of Christ*, was promulgated in the fourth and last public session, July 18, 1870. It defines the primacy and infallibility of the Roman pontiff. (See INFALLIBILITY OF THE POPE.) These decrees occasioned considerable agitation both in political and in ecclesiastical circles. A number of prominent Catholics in Germany, with Döllinger at their head, refused to accept the decision of the council, and formed themselves into a body known as Old Catholics. This movement was favored by the Government; but, as the bishops had been practically unanimous in voting for the decrees, and as those who were absent from the council or opposed its action professed their adhesion in course of time, no schism of consequence ensued.

LITERATURE.—1. By Catholics: *Acta et Decreta Sac. Conc. Recentiorum—Collectio Lacensis* (vol. vii., Freiburg, 1890)—this is the most complete collection of documents; Cocconi, *Storia del Concilio Ecumenico Vaticano* (Rome, 1872-78, 4 vols., incomplete); Fessler, *Das vaticanische Concil, dessen äussere Bedeutung und innerer Verlauf* (Vienna, 1871); Martin, *Die Arbeiten des V. Concils* (Paderborn, 1873); Cardinal Manning, *The True Story of the Vatican Council* (London, 1877). 2. By non-Catholics: Joh. Friedrich, *Documenta ad illustrandum Concilium Vaticanum* (Nördlingen, 1871) and *Geschichte des vaticanischen Concils* (3 vols., Bonn, 1877-87); Emil Friedberg, *Sammlung der Actenstücke zum ersten vaticanischen Concil* (Tübingen, 1872); Thos. Frommann, *Geschichte und Kritik des vaticanischen Concils* (Gotha, 1872); E. de Pressensé, *Le Concil du Vatican* (Paris, 1872); L. W. Bacon, *An Inside View of the Vatican Council* (New York, 1872). For two remarkable discussions regarding the council, see (1) Döllinger's *Janus* (Leipzig, 1869); Hergenröther, *Antijanus* (Freiburg, 1870); and Friedrich, *Neubearbeitung des Janus* (Munich, 1892); (2) Gladstone, *The Vatican Decrees in their Bearing on Civil Allegiance*, with the replies of Archbishop Manning and Lord Acton (New York, 1874).

J. J. KEANE.

Vatican Palace: properly the pontifical palace of the Vatican, the well-known palace of the popes and their official residence since the fifteenth century. The Vatican Hill was not included in the ancient city of Rome, and the earliest wall that inclosed it was built under Pope Leo IV. about 850 A. D. Before that time the popes had a villa on this site because of its nearness to the Basilica of St. Peter. Their official residence was the Lateran Palace. When Gregory XI. (1370-78) returned to Rome from Avignon the Lateran was in a ruinous condition, and since then the Vatican has generally been the papal residence proper. Under Nicholas V. (1447-55) the rebuilding of the palace began in a serious fashion and on a large scale. Paul II. (1464-71) began the three-story buildings surrounding the court of S. Damaso and called the *loggie* of Bramante or of Raphael. Sixtus IV. (1471-84) built the Sistine chapel. Innocent VIII. (1484-92) began the court of the Belvedere. Alexander VI. (1492-1503) built many chambers and galleries, and either built or finished the covered passage which leads over the house-tops to the castle of Sant' Angelo. Julius II. (1503-13) finished the court of S. Damaso, and connected it with the distant court of the Belvedere by the long galleries which are now used for the museums. Paul III. (1534-49) built the Pauline chapel (Cappella Paolina) and the Sala Regia, which leads to it. Gregory XIII. (1572-85) continued the long galleries of Julius II. The buildings to the E. and S. of the court of S. Damaso which come close to the great colonnades that inclose the open place in front of St. Peter's church are the work of later popes, not having been finished until the reign of Pius IX. (1846-78). The well-known Braccio Nuovo, which connects the long galleries of the museum, and contains itself some of the most important sculptures, was built under Pius VII. (1800-23). The entire mass of buildings, inclosing and fronting on twenty different courts and roughly computed to contain 11,000 rooms, has no exterior architectural effect, but seems an accidental gathering of buildings of different characters. It contains, however, much architectural display in the buildings on the courts and in the interiors of halls and galleries, and is particularly noted for the wall-paintings, such as those by Perugino, Signorelli, Botticelli, Rosselli, Ghirlandajo, and Michelangelo in the Sistine chapel; those by Raphael and his pupils in the so-called Stanze di Raffaello; and by Giovanni da Udine and by Raphael himself and his other pupils in the *loggie* on the court of S. Damaso. The palace contains the largest collection of classical statuary in Europe, although most of the pieces are Roman copies of Greek originals. There is an Etruscan museum of great interest and a small Egyptian museum. The picture gallery contains few works, although they are of great importance. The tapestries in the Galleria degli Arazzi are notable. Ancient maps of interest are contained in the Galleria Geografica. The library is famous for its magnificent collection of manuscripts and its rare early printed books. In connection with the library is an immense collection of gems and small objects of value, Christian antiquities, and objects of art presented to different popes by sovereigns and others. The papal manufactory of mosaic is also contained in the palace. RUSSELL SURGIS.

Vattel, ELMERIC, de; jurist; b. at Chuvet, Neuchâtel, Switzerland, Aug. 25, 1714; studied philosophy and theology at Basel and Geneva, a large part of his literary work being done at the former place. In 1741 he published *Défense du Système Leibnizien*; in 1743, after having vainly sought a public position from Frederick II. at Berlin (Neuchâtel being at that time a Prussian possession), he went to Dresden, where he received a position in the civil service of Saxony, and three years after was made minister to Berne by the elector Augustus III. While residing at Berne he devoted himself assiduously to the writing of philosophical and legal works, publishing, besides several minor works, *Mélanges de littérature, de Morale, et de Politique*; *Loisirs philosophiques*; and his celebrated book, *Droit des Gens, ou Principes de la Loi naturelle appliqués à la Conduite et aux Affaires des Nations et des Souverains* (2 vols., 1758; Eng. trans. 1760, and again by Joseph Chitty, with the title *Law of Nations, or Principles of the Law of Nature applied to the Conduct and Affairs of Nations and Sovereigns*, 1797; the second translation has been reprinted several times, both in England and the U. S.). From Berne he returned to Dresden in 1758, where he became a privy councillor, but here his health failed and he was obliged to give up his duties in 1766. D. at Neuchâtel, Dec. 20, 1767. Vattel's last work was *Questions de Droit naturel, et Observations sur le Traité du Droit de la Nature par M. le Baron de Wolf* (Berne, 1762). Revised by F. STURGES ALLEN.

Vau, fow; the ancient Greek name of the sixth letter of the original alphabet, Gr. *Faō* or *Baō*. Its form *F* survives in the Latin *F*. On account of its shape it was sometimes called *digamma*, i. e. double *gamma* (Γ). After its sound *w* disappeared from the Ionic idiom, it was disused as a letter in the Ionic alphabet, which later became the standard alphabet of Greece, but it remained as a numeral sign (= 6), surviving in the form *ς* with the name *stigma*. B. I. W.

Vauban, vō būān, SÉBASTIEN LE PRESTRE, de; military engineer; b. at St.-Leger-de-Foucheret, near Saulieu, Burgundy, France, May 15, 1633; at the age of seventeen joined the Spanish troops under Condé on the Belgian border; was taken prisoner by the French in 1653, and enlisted in the French army; showed great skill as an engineer in the siege of Sainte-Menehould and other cities; was commissioned in 1655 *ingénieur du roi*; became governor of Lisle 1663, commissary-general of the fortifications of France 1678, governor of the maritime ports of Flanders 1689, marshal of France 1703. D. in Paris, Mar. 30, 1707. To his inventive genius is due the creation or perfection of the bastioned system of fortification, or that modification of mediæval forms which the invention of gunpowder and the perfecting of artillery imposed. Erard of Bois-le-Duc, the Chevalier Antoine de Ville, and the Comte de Pagan were his predecessors in this, Vauban following up principles suggested by Pagan, and putting them extensively into practice. He constructed thirty-three fortresses and repaired and improved about 100. He conducted fifty-three sieges, and shared in 140 battles and skirmishes; acquiring the fullest confidence of his sovereign, he attained, as marshal of France, the highest honor in the French army. Notwithstanding his eminence as an author and creator, almost, of the subsequent art of fortification, his success as engineer of sieges was even more marked. Engaged in the service of one of the most ambitious of monarchs, Louis XIV., it was on the offensive rather than the defensive that his services were called for. The inventor of parallels in sieges and of the ricochet fire, he developed that irresistible system of attack which has ever since been so successfully followed. He was eminent also as a civil engineer, and indeed the impress of his genius is still borne in the history of his country. Among other subjects not military to which he devoted himself, political economy may be mentioned. "Vauban," says Gen. Bardin, "has enjoyed an unparalleled fame; for a century and a half himself and his works have been the theme and study of Europe. Never before had engineer been able to obtain such consideration or to acquire so much experience." Allent (*Histoire du Corps du Génie*) affirms he wrote nothing on the tracé of fortifications; hence works thus attributed must be regarded rather as commentaries or exhibits by others of his methods. His principal military writings include *De l'Attaque et de la Défense des Places* (1736), and as *Œuvres militaires de Vauban* were edited by Gen. Latour Poissée (1796). He also left a work entitled *Mes Oisivetés*. See the *Notice historique sur Vauban*, by de Chambray (Paris, 1840).

Vaucanson, vō kāān sōn, JACQUES, de; mechanician, especially noted as an inventor of automatons; b. at Grenoble, department of Isère, France, Feb. 24, 1709; studied mechanics and anatomy for several years. His most famous works were his flute-player (1738), which played a flageolet with the left hand and beat a tambourine with the right, executing many pieces of music with wonderful accuracy; and a brass duck (1741), which could fly, quack, eat, and apparently digest and evacuate its bowels. Cardinal Fleury made him superintendent of silk manufactures, but his improvements on the machinery caused a riot among the workmen of Lyons; in order to avenge himself, he made an automaton ass which could weave flowered silks. His collection of automatons he bequeathed to the queen, but it subsequently became scattered. D. in Paris, Nov. 21, 1782.

Vaucluse, vō klüz'; department of Southeastern France, bordering W. on the Rhône and S. on the Durance. Area, 1,370 sq. miles. The eastern part is covered with spurs of the Alps; the western, along the Rhône, consists of low plains. The soil is not very fertile, and produces insufficient grain for home consumption. Wine and fruits are produced; bees and silkworms are extensively reared; some manufactures of silk, pottery, and chemicals are carried on. Pop. (1896) 236,313. Capital, Avignon.

Vaud, or **Pays-de-Vaud**, pā cō-de-vō (Germ. *Waadt*): canton of Switzerland; bordering S. on Lake Geneva and Valais, bounded N. by Neuchâtel, E. by Freiburg and Berne, and W. by France; area, 1,244 sq. miles. The surface is an elevated plateau between the Jura and the Bernese Alps, sloping S. toward Lake Geneva, N. toward Lake Neuchâtel. Near the mountains are regions of pasture-land where cattle-rearing and dairy-husbandry form the principal occupations; but the larger part of the plateau is under tillage and carefully cultivated. Wheat and wine are extensively produced, and the white wines of the canton are of superior quality. Salt mines in Bex are worked, and watches, music-boxes, and carved wood are manufactured to some extent. Along the north shores of Lake Geneva are numerous resorts that are frequented by foreigners. After the fall of the Roman empire the country belonged to the Burgundian kingdom, but in the thirteenth century it became a dependency of Savoy; and when the Duke of Savoy took part in the war between the Duke of Burgundy and the Swiss, in the fifteenth century, it was conquered by Berne. It became a part of Switzerland in 1803. Pop. (1894) 256,242, most of whom are Protestants and speak French. Capital, Lausanne. Revised by M. W. HARRINGTON.

Vandeville [believed to be from *Les Vaux de Vire*, two valleys in the Bocage of Normandy, where dwelt OLIVIER BASSELIN (*q. v.*) in the fifteenth century]; a name at first applied to satirical songs relating to current events, for the composition of which Olivier Basselin was famous. The name is now applied to a light kind of dramatic entertainment interspersed with music, and having humorous or satirical allusions to current topics of the day.

Vandois; another name for the Waldenses. See WALDENSIAN CHURCH.

Vaudreuil, vō drūil; the title of a French family, several members of which are notable. PHILIPPE DE RIGAUD, Marquis de, b. in France about 1641; entered the military service; rose to be a brigadier-general; went to Canada in 1687; served in various expeditions against the Seneca, Onondaga, and Oneida Indians; was made governor of Montreal in 1698, and Governor-General of Canada in 1703. His administration was vigorous and successful; he put a check to the influence of the English in the West, and, although unable to prevent the loss of Acadia, succeeded in thwarting a formidable naval expedition sent against Quebec. D. in Quebec, Oct. 10, 1725.—PIERRE DE RIGAUD, Marquis de, fifth son of Philip, b. in Quebec, Nov. 22, 1698; entered the French military service; was made governor of Three Rivers in 1733, of Louisiana in 1742, and, having in 1748 succeeded by the death of his brothers to his father's title, became in 1755 Governor-General of Canada. He made strenuous but unavailing efforts to avert the capture of Quebec by Wolfe, and afterward endeavored to recapture it; was successful in one engagement, but, receiving no support from the mother country, was obliged to capitulate. He returned to France, where an investigation was instituted, and his administration was fully justified. D. in Paris in 1764.—LOUIS PHILIPPE DE RIGAUD, Marquis de, nephew of Pierre, b. at Rochefort, France, Oct. 28, 1724;

entered the French navy, and commanded vessels in several important actions, notably in that between d'Estaing and Byron off Granada in 1779, and that between de Grasse and Graves in Chesapeake Bay; in the action with Rodney, Apr. 12, 1782, he saved his own squadron of the French fleet, with which he succeeded in reaching Boston. Returning to France, he became a member of the States-General in 1789, and in October defended the royal family against the populace; made his escape to England during the Reign of Terror, but returned to France after its close. D. in Paris, Dec. 14, 1802.

Revised by F. M. COLBY.

Vaughan, vawn or vaw'an, CHARLES JOHN, D. D. : preacher and author; b. at Leicester, England, in 1816; educated at Rugby under Dr. Arnold and at Trinity College, Cambridge, graduating as senior classic and chancellor's medalist in 1838; became a fellow of Trinity 1839; took orders in the Church of England; held the living of St. Martin's, Leicester (formerly his father's) 1841-44; was head master of Harrow School 1844-59, raising that institution from a comparatively low ebb to great prosperity; refused the bishopric of Rochester 1860; was vicar of Doncaster 1861-69; was made master of the Temple 1869, and chancellor of York Cathedral and chaplain in ordinary to the Queen; resigned the mastership of the Temple in 1894, retaining his place as dean of Llandaff, which he had held for a number of years in connection with his London charge; married a sister of Dean Arthur P. Stanley. He has enjoyed a high reputation as a pulpit orator and as a commentator, chiefly upon the Pauline Epistles. His published sermons and expository discourses exceed forty volumes.

Vaughan, HENRY: poet; b. at Newton St. Bridget, Brecknockshire, South Wales, in 1621; studied at Jesus College, Oxford, but did not graduate; qualified himself for the practice of medicine in London; was imprisoned as a royalist during the civil war, after which he passed his remaining years at his native place, enjoying great repute as a physician. D. at Newton, Apr. 23, 1695. He called himself the Silurist, after the Silures, an ancient British tribe of South Wales. He was the author of *Poems, with the Tenth Satyre of Juvenal Englished* (1646); *Olor Iscannus, a Collection of some Select Poems and Translations* (1650); *Silex Scintillans, or Sacred Poems and Private Ejaculations* (2 parts, 1650-55); *The Mount of Olives, or Solitary Devotions* (1652); *Flores Solitudinis, or Certain Rare and Elegant Pieces* (1654); and *Thalia Rediviva, the Pastimes and Diversions of a Country Muse, in Divine Poems* (1678). Vaughan's sacred poems have a mystical quality, and the best known of them, *The Retreat*, has often been compared with Wordsworth's *Ode on the Intimations of Immortality*. A *Memoir* by Rev. H. F. Lyte appeared in 1847.

Revised by H. A. BEERS.

Vaughan, HERBERT, D. D. : cardinal; b. at Gloucester, England, Apr. 15, 1832; educated at Stonyhurst College, Lancashire, Brugellette, Belgium, and at the Accademia dei Nobili Ecclesiastici in Rome; entered the priesthood, being ordained at Lucca Oct. 28, 1854; joined the Oblates of St. Charles at Bayswater, London. He was vice-president of St. Edmund's College, near Ware, for several years until 1862; founded St. Joseph's Missionary College at Mill Hill, Middlesex, 1869, and is still its president-general. He was elected Bishop of Salford, and consecrated Oct. 28, 1872; succeeded Cardinal Manning as Archbishop of Westminster, receiving the pallium Aug. 16, 1892; was called to Rome in Jan., 1893, to be created a cardinal. He has twice visited the U. S. in connection with his missionary work. He is the proprietor of *The Tablet* and of *The Dublin Review*; is prominent in temperance and rescue work, and is an eloquent preacher.

Vaughan, ROBERT, D. D. : preacher, editor, and author; b. in Wales in 1795; educated for the Independent ministry at Bristol College; was pastor of churches at Worcester and Kensington; Professor of Ancient and Modern History in London University 1830-42; president of, and Professor of Theology in, the Lancashire Independent College, Manchester, 1843-57; projected *The British Quarterly Review* as an organ of the Independents, and edited it 1845-65; preached at Uxbridge, at St. John's Wood, London, and at Torquay, where he died Jan. 15, 1868. He was the author of *John de Wycliffe, D. D., a Monograph, with some Account of the Wycliffe MSS.* (1853), which was a revised edition of an earlier *Life* (2 vols., 1828); and a bi-centenary memorial volume on *English Nonconformity* (1862), besides numerous other publications. Revised by G. P. FISHER.

Vaughan, Sir WILLIAM: poet and planter; b. at Golden Grove, Caermarthenshire, Wales, in 1577, brother of the first Earl of Carbery, the patron of Jeremy Taylor; educated at Oxford, where he graduated in law; became a physician about 1625; was the founder of a settlement called Cambriol in Newfoundland, and wrote the praises of that colony in a quaint tract in prose and verse called *The Golden Fleece, divided into Three Parts, etc.*, by Orpheus Junior (1626), written apparently to attract emigrants, and notable as the first volume of original poetry written in the British North American colonies. Vaughan returned to England, and died about 1640.

Revised by H. A. BEERS.

Vault: a roof or ceiling built of solid units kept in place mutually on the principle of the arch. There is no difference except of extent between an arch and a vault, but the mere fact of greater extent causes the existence of varieties in the vault. Thus a cupola or dome is a vault, but is very different in character from an arch in an ordinary wall. It is common, however, to separate vaults from cupolas and to classify them in the following way: A *wagon vault* or *cradle vault* or *barrel vault* is a simple arch made broader and is called by these names because such an arch is usually semicircular in upright section. An arch opened in a two-foot wall is not considered a barrel vault, but a precisely similar arch carried through a ten-foot or twenty-foot bank, as when a culvert is built under a railway embankment, is such a vault. A *rampant vault* is a similar vault not on a level, but sloping upward, as when a roof is built over a staircase so as to carry another flight of stairs above. A groined vault is one made by the intersection of two barrel vaults; the solid angles made where the one semi-cylinder cuts the other are called groins, and it will be observed that these groins are right-angular at bottom if the two barrel vaults meet at right angles, and grow more and more obtuse as they approach the crown or summit of the vault.

The palaces of the Assyrians and other Eastern nations of antiquity were unquestionably vaulted, partly with cupolas, partly with half cupolas having large semicircular openings, either toward the north, much as our modern north lights are arranged for artists, or toward the quarter of the prevailing winds, and so acting like the modern Persian *badjeer* or our wind-sail; and partly with barrel vaults. These structures were built of brick and mortar, forming very solid and adherent masses. A similar construction was used a thousand years later by the Byzantine builders, but previous to this the constructors of the Roman empire must have learned from their Eastern neighbors the secret of one of their systems of vaulting, as explained below. The Etruscans more than any other nation of antiquity used a vault of shaped stones or voussoirs (see ARCH), and the Roman builders followed them in this, but also used to a still greater extent the vault made of small irregular stones laid in a great abundance of mortar. It has been said that a vault is an enlargement of the arch, but when either the common arch or the vault is so firmly cemented together and so massive that it forms a solid and inelastic half ring, half cylinder, or, as it were, an inverted cup, it ceases to be either arch or vault in principle, while keeping its appearance and its name. Thus in the great basilica of Maxentius or of Constantine in Rome large parts of the vault have fallen, and are homogeneous masses of hardened mortar with small stones embedded in it. The vaults that still remain in place, six feet thick at the crown and equally homogeneous in material, can hardly be supposed to exercise any thrust horizontally or diagonally upon the walls which support them. The Romans used the cupola, the barrel vault, that modification of it called the rampant vault, another modification of it called the annular vault, which is the barrel vault carried on a rounded plan producing a ring-shaped surface, and finally the groined vault. This last, however, they used only when the two half cylinders intersecting one another were of equal radius. Whenever a narrower passage opened into a wider one or a hall, one of the half cylinders was kept so much lower than the other as to penetrate the vertical wall.

When the mediæval church-builders wished to vault their churches they were unable to imitate the immense solidity of the Roman imperial builders, and built their shell of vaulting of stones not larger than a man could handle, put together with mortar often poorly made and scanty. They were driven, therefore, to many expedients in the attempt to keep their vaults from falling. These experiments finally resulted in a vault carried on its own ribs—that is to say, a cage of arched ribs or narrow arches of cut stone, was built,

and the thin vaults of smaller stones rested upon these ribs. Every part of such a vault had a curved surface. Every square foot of its surface, in the upper part, where it approached the horizontal, was rounded up, and exercised a thrust upon all the ribs which supported it. The whole vault was very elastic, and would allow of some settlement or dislocation without falling. This vaulting was the great peculiarity of the Gothic style, all the character of that style coming, indeed, from the free use of these vaults and the necessary supports and counterpoises used to resist their thrust.

In modern times vaults are rarely used in northern countries, except in fortresses and the like; but in Italy and other Mediterranean countries they are still in use. Those now built are always of the Roman rather than the Gothic sort, without ribs and built in a solid and uniform shell. See also FIRE-PROOF BUILDING. RUSSELL STURGIS.

Vautier, vō ti-ā', BENJAMIN: painter; b. at Morges, Switzerland, Apr. 24, 1829; studied painting at Düsseldorf 1850-51, and acquired celebrity as a genre-painter. Among his pictures are *Devout Singers in a Church* (1858); *The Spinning-woman* and *The Surprise* (1863); *A Sunday Afternoon in Suabia* and *Cats in a Criminal Case* (1864); *Wake in the Bernese Highlands* (1866); *The First Dancing Lesson* (1868); *A Village Funeral* (1871); *Alsatian Woman* (1882).

Vaux, vawks, CALVERT: landscape-architect; b. in London, England, Dec. 20, 1824; was educated at Merchant Taylors' School, London, then became an articulated pupil of Lewis N. Cottingham, architect, London; went to the U. S. in 1850 as assistant to Andrew J. Downing, the landscape-gardener, who was at that time occupied with the Smithsonian grounds at Washington; was Mr. Downing's architectural partner at Newburgh, N. Y., until the latter's death, after which Mr. Vaux carried on the business. In 1857 he was engaged as architect for the Bank of New York, and settled in New York city. In partnership with Frederick L. Olmstead, Mr. Vaux made plans for Central Park, Riverside Park, and Morningside Park, New York city; Prospect Park, Brooklyn; parks at Chicago, Ill.; and Bridgeport, Conn.; the New York State reservation at Niagara Falls, and, in partnership with Samuel Parsons, Jr., made plans for Bryn Mawr College grounds, and for many country places of prominent men. Mr. Vaux was one of the architects for the first buildings for the Museum of Art in Central Park and the Museum of Natural History in Manhattan Square, New York city. He was a member of the consolidation inquiry commission of the Greater New York. As landscape-architect to the department of public parks of New York city he advanced the uncompleted design of Central Park by arranging extensions to the walk system in different parts of the park, and laid out the entire territory of Riverside Park between the drive and the river. Found drowned in Gravesend Bay, Long Island, N. Y., Nov. 21, 1895. He was the author of *Villas and Cottages* (New York, 1860).

Vaux, THOMAS, Lord: poet; b. at Harrowden, England, about 1510; educated at Cambridge; attended Cardinal Wolsey in his embassy to Charles V. 1527; succeeded to the title, and took his seat in the House of 1530; accompanied Henry VIII. to Calais and Boulogne 1532; became a Knight of the Bath and governor of the island of Jersey 1533. He was the author of a number of admired poems in the collection called *The Paradise of Daynty Devices* (1576), of which the best are entitled *The Assault of Cupid* and *The Aged Lover renounceth Love*, first published in Tottel's *Miscellany of Songs and Sonnets* (1557). D. in Oct., 1556. Revised by H. A. BEERS.

Vedānta, vā-dāntā: the most orthodox of the six orthodox Brahmanical philosophies. (See SĀṆKHYA, YOGA, NYĀYA PHILOSOPHY, VĀJESHIKA PHILOSOPHY, and MĪMĀṂSĀ.) Vedānta signifies properly the end (*anta*) or conclusion of the Veda, and is used (1) in this sense to denote an Upanishad which forms the end of a Vedic text; and (2) to denote the theologico-philosophical system which is founded on the Upanishads and appeals to them as "scripture" or "revelation" (*gruti*). These Upanishads, the oldest of which date from ante-Buddhist times, contain a disorderly mass of speculation upon ritualistic, theological, cosmogonical, and other questions; and the course of thought in them is often

obscure and contradictory. Their principal object, the one to which all others are subordinate, is the inquiry after the One Eternal, the Atman, or Brahman. The word *ātman* means originally breath, then principle of life, the innermost self, the soul. The ancient and venerable Upanishad called *Bṛhad-āraṅyaka* contains a legend representing the Atman as a mythological primeval being from which, in due order, all creatures proceed. But the idea of the Atman soon becomes dissociated from these rude conceptions, and the word *ātman* comes to mean the One Imperishable, the All-soul, or the Soul of the Universe. The word *brahman*, on the other hand, signified first devotion, prayer; then the power residing in prayer and all other sacred work; and finally the primeval, eternal, and infinite power which is the root of all existence. Having reached this point in the development of its meaning, this pregnant and momentous word *brahman* came to be completely identified with *ātman*. The originally objective Brahman became fused with the originally subjective Atman into one supreme metaphysical conception. By manifold likenesses the Upanishads endeavor to describe the nature of Brahman; but these endeavors culminate in the proposition that the innermost self of the individual is identical with that primeval and all-pervading power, a proposition which finds expression in the sentence, "That art thou"—*tat tvam asi*. Here, then, we have already the doctrine of the unity of the subject and the object.

This idealistic monism of the older Upanishads is methodically worked out and philosophically established in the Vedānta system proper. The origin of the Vedānta as a system is, in all probability, to be referred to the beginning of our era. Its reputed founder, or rather the first teacher who embodied the system in a fixed literary form of expression, was Bādarāyaṇa; and his Sūtra or compendium of the system is called the *Brahma-sūtra* or the *Vedānta-sūtra*, or the *Brahma-mīmāṃsā* or *Ārīraka-mīmāṃsā*—that is, the investigation concerning the Brahman or its embodiment. This compendium, like those of the other philosophical systems of India, is in the form of terse aphorisms, in themselves almost or quite unintelligible, so that we have to depend upon the native commentator for an accurate knowledge of the system. The most important among the expositors of the *Brahma-sūtra* is the exegete Āṅkara (written also Shankara), who lived about 800 A. D. His greatest work is his *Ārīraka-bhāṣya* or commentary on the *Brahma-sūtra*; but he wrote numerous commentaries on the Upanishads, as well as independent works on the Vedānta. It is highly probable, upon internal evidence, that Āṅkara's expositions agree in all essential points with the system as intended by Bādarāyaṇa in his compendium. About three-quarters of the adherents of the Vedānta system in India to-day follow Āṅkara in his interpretation of the system; while the remaining quarter are divided in their allegiance, and accept—some one, and some another—the various divergent views of the other commentators. Bādarāyaṇa's Sūtra, with Āṅkara's commentary entire, has been translated into German by Paul Deussen (Leipzig, 1887); and an English version of the greater part has been published by Georg Thibaut as vols. xxxiv, and xxxviii, of Max Müller's *Sacred Books of the East*. Deussen has also given us an exhaustive and admirable systematic treatise upon the Vedānta from Āṅkara's point of view in his *Das System des Vedānta* (Leipzig, 1883). The Sanskrit text of the *Brahma-sūtra* was published with Āṅkara's commentary in the *Bibliotheca Indica* (Calcutta, 1848-74), and also in Bombay (1888).

The Vedānta, like all the philosophical systems of India, has for its object the release of the soul from the bonds of corporeal existence and the teaching of the means of escape from the distressful round of rebirth. Since the seventh century before Christ, all Aryan India, with the exception of the materialists or Chārvākas, has been under the influence of the general belief in the transmigration of souls (*saṁsāra*), and in the after-effect of deeds in one existence as determining destiny in another (*karma*). This conviction, that each individual after death will be again and again reborn to a new existence in which he enjoys the rewards of previously accumulated merit and suffers the consequences of previous misdeeds, is a fundamental factor of Indian pessimism. According to the Vedānta, the only release (*mukti* or *moksha*) from this endless round of birth and death is to be won by the attainment of knowledge or *jñāna*.

The fundamental dogma of the Vedānta system, according to the teaching of the Upanishads, is this: That our

self is absolutely identical with Brahman. Now Brahman is eternal and infinite. But since everything which consists of parts or which is susceptible to change is transitory, therefore it is impossible that Brahman should consist of parts or suffer change. From this it follows that every one in his innermost essence must be, not a part of Brahman, but the whole indivisible Brahman. Any other reality than this there is not; and accordingly the contents of the Vedānta system as interpreted by Čaṅkara are often comprehended in the expression *a-dvāita-vāda* or doctrine of non-duality; and Brahman is said to be one only, without a second (*ekam eva, a-dvītiyam*).

But how, then, is the contradiction which common experience and the traditional belief in metempsychosis and karma arouse against the doctrine of this "Brahman without a second" to be laid? The Vedānta answers: Experience and traditional belief result from ignorance (*a-vidyā*), which is native to every one, and which hinders the soul from discriminating its very self from the body and the bodily organs, and from recognizing the empirical world as an illusion (*māyā*). In truth, the whole world of phenomena is a downright illusion; it may be likened to a mirage, which vanishes upon closer inspection; or to a vision, which seems real only to the sleeper, but no longer seems real to him when awakened. The ever-shifting forms that surround us are a figment of ignorance; there is only one thing in the universe that is not under this power of illusion, and that is our self, the soul. This self, indeed, can not be demonstrated; but it requires no demonstration, for it is itself the basis of the activity of demonstrating, and is accordingly already established before one sets about the work of establishing it. And it is also not to be denied, because whoever denies it, *eo ipso* presupposes it, and thereby attests its reality. The self can not differ from Brahman, because there is nothing really existent except Brahman. All that can be predicated of Brahman—purely spiritual nature, omnipresence, eternity—holds good of the soul. In this manner the ancient doctrine of the Upanishads is accepted and proved by Čaṅkara. The solution of the problem of existence, the recognition of the only true entity, is to be reached by man, according to this system, only in the depths of his own being.

Into the reason and origin of this "ignorance," which, working as a veil of illusion, conceals the real nature of the world, the Vedānta does not inquire. It simply teaches the fact of ignorance and that ignorance (*a-vidyā*) is destroyed by "knowledge" (*vidyā*) or the "universal understanding" (*samyag-darśana*), which comprehends the illusory nature of all that is not soul and the absolute identity of the soul with Brahman. By this "understanding" the conditions for the continued mundane existence of the soul are annulled. This existence is indeed naught but a false semblance—an illusion; and by the full realization of this truth release or final deliverance (*mokṣha*) is attained.

To the authority of the Upanishads Čaṅkara yields unqualified acceptance. But their teachings contradict bluntly some of the doctrines above propounded. Čaṅkara therefore has to settle his score with them as best he may. This he does by the establishment or allowance of two systems side by side. The essence of the one is the "higher" or esoteric "knowledge" (*parā vidyā*), which knowledge corresponds to the metaphysical point of view (*pāramārthikā vāsthā*), and recognizes the doctrine of "Brahman without a second" as the absolute truth. The other system is that of the "lower" or exoteric "knowledge" (*aparā vidyā*), which corresponds to the empirical point of view (*vyāvahārikā vāsthā*) of the masses, and offers a popular religious explanation of the world. To the higher knowledge, Brahman is divested of all attributes and qualities (*nirguṇa*); but by the lower knowledge he is invested with the attributes of personality (*saḡuṇa*). These are ascribed by ignorance to Brahman, because those men who can not rise to the height of the metaphysical point of view feel themselves to be in need of some object of worship. In the system of the lower knowledge, accordingly, Brahman appears as a personal God (*īśvara*), who creates and rules the world and rewards and punishes men according to their deeds. In the lower system the multiferm world passes for real; and for the statements of the Upanishads concerning the wandering of the soul through countless bodies, there is in the lower system no especial need of proof. The lower system teaches that the soul is restricted by the psychical apparatus, by the senses, by the life principle, and by its status as determined by karma; that it goes through the round of

transmigration under these restrictions; and that by faithful worship of the personal lower Brahman the soul, at the end of any particular corporeal existence, may attain into the lower Brahman. Such union with the lower Brahman, however, is only a transitory happiness; complete release or salvation—that is, the surcease of the metempsychosis—is attainable only by the "universal understanding" of the higher, attributeless Brahman, and from the metaphysical point of view. All that is taught by the lower system is utterly nugatory for him who has recognized his own self as the eternal and indivisible or impartiible Brahman. He who has attained to this supreme recognition is no longer befooled by the deceitful and illnsory semblances that surround him. Completely indifferent to the doings of the world about him, he calmly awaits his end. Life does not close immediately upon the attainment of the redeeming knowledge, but keeps on for a while, just as the potter's wheel keeps on turning for a little after he has finished the pot. But with death, the truly wise man loses himself in the supreme Brahman.

Of the interpreters of the Vedānta who differ from the great Čaṅkara and who give authoritative expression to the religio-philosophical views of certain sects, the most important is Rāmānuja, who lived in the first half of the twelfth century. His conception of the Vedānta approaches more nearly Čaṅkara's "lower system"; and he teaches that the individual souls are not identical with the supreme soul or God, and that salvation (which he regards as union with the Supreme) is to be attained only by faith in God and love to God. These views, which have some likeness to Christian views, were interpreted into Bādarāyaṇa's compendium by Rāmānuja because he belonged to the ancient Indie sect of Bhāgavatas or Pāncarātras, who professed an originally non-Brahmanical popular monotheism and looked for salvation solely in love to God or *bhakti*, properly love resting on faith. Rāmānuja's system is best set forth by R. G. Bhandarkar in his *Report on the Search for Sanskrit Manuscripts during the Year 1883-84* (Bombay, 1887).

For an admirable account of the system, see Deussen's *Kurze Uebersicht der Vedantalehre*, which forms an appendix to his *System des Vedanta*. The Vedānta philosophy has called forth a very extensive literature in India. Dr. Fitzedward Hall, in his *Bibliography of the Indian Philosophical Systems* (Allahabad, 1859), enumerates 310 Sanskrit works upon the Vedānta, and works upon this system appear every year in all parts of India, partly in Sanskrit and partly in the various vernaculars. The great majority of these modern publications are written from Čaṅkara's point of view; and they bear witness to the powerful influence which the spiritual pantheism of the Vedānta still exercises, as it did ages ago, upon the heart and mind of the thinking Hindu.

RICHARD GARBE.

Translated by C. R. LANMAN.

Veddahs: a primitive hill tribe of Ceylon, found only in the eastern part of the island, S. of Trincomali Bay, especially at the eastern foot of the central cluster of mountains. They numbered in 1881 2,228 individuals, of whom about 200 were wild, the remainder being in various stages of advance toward the Singhalese civilization. The interest in them lies in the fact that they are one of the rare remnants of the primitive types of mankind. They are small (men 5 ft. 2 in., women 4 ft. 10 in.), brown, with undulating hair; the capacity of the cranium is remarkably small, but the profile is straight and fine. The wild Veddahs are consummate archers, live by hunting, have the simplest possible dwellings, and wear little or no clothing. The internal government is patriarchal. The Veddahs make good husbands and fathers, and are very docile, somber, hospitable, courageous, honest, contented, very truthful, jealous, and vindictive—on the whole, much more like Rousseau's idealized primitive man than like the conventional savage. They form the subject of a considerable literature, some of it fanciful and apocryphal. The authoritative work on them is by the brothers Sarasin, entitled *Die Veddahs von Ceylon und die sie umgebenden Völkerschaften*, making vol. iii. of their *Ergebnisse naturwis. Forschungen auf Ceylon* (1892-93).

M. W. HARRINGTON.

Vedder, ELIHU: painter; b. in New York, Feb. 26, 1836; pupil of Picot, Paris; member of the Society of American Artists 1880; National Academician 1865; honorable mention, Paris Exposition, 1889. He went to Italy in 1856, and has resided almost continuously in Rome since then. He

illustrated *The Rubáiyát of Omar Kháyyám* (1883-84), and his designs for decorative work show fertility of invention and are excellent in composition. His pictures are remarkable for originality of conception. Among his best-known works are *Lair of the Sea Serpent*, in the Museum of Fine Arts, Boston; *Young Marsyas*, and *Cumtán Sibyl*.

W. A. C.

Ved'el, ANDERS SÖRENSEN; historian; b. at Veile, Denmark, Nov. 3 or 9, 1542. In 1561 he entered the university, and in 1562 accompanied Tycho Brahe to Germany, where, with the exception of a short visit home, he remained until 1567. In 1568 he was appointed court preacher to Frederik II., but on the death of his patron he fell into disfavor. His translation of *Saro* is the most important work of the century, from both an historical and a linguistic standpoint, marking the real beginning of modern Danish prose. At the suggestion of friends he began to collect material for an original history of Denmark, in Danish, from Saxo's time, but in 1595 he was compelled to deliver all his books and MSS. to one Niels Krag, who had been commissioned to prepare a similar work in Latin. This latter attempt proved unsuccessful, and after Krag's death Vedel's material was dispersed. Of hardly less interest than the *Saro* is *Et Hundrede udvalgte Ytser* (1591), the first printed collection of Danish ballads. In accordance with the practice of his contemporaries, Vedel wrote a number of funeral discourses, epitaphs, etc., and translated Latin poems. D. at Ribe, Feb. 13, 1616.

D. K. DODGE.

Veer: See CAMPVEER.

Vega, GARCILASO, de la: Spanish poet. See GARCILASO DE LA VEGA.

Vega, VĀGŪA, GARCILASO, de la; historian; b. at Cuzco, Peru, Apr. 12, 1539. His father, of the same name, was a distinguished Spanish officer, who served under Alvarado and Pizarro, and subsequently married a niece of the Inca Huaina Capac, whence the son commonly added Inca, or Ynea, to his name. As a boy he witnessed many events of the civil wars. His mother taught him the Indian language, and he frequently mentions an old uncle who related to him many customs and traditions of the race. Attaining manhood, he traveled over the old Inca realm, and became familiar with its people and monuments. His father died in 1559, and he himself, becoming an object of suspicion, went to Spain in 1560. There he served in the army as a captain, but after 1584 he devoted himself to literature. His *La Florida del Inca* (1605 and subsequent editions) is a narrative of Soto's expedition to Florida, and has considerable historical value. Much more important are his *Comentarios reales de los Incas* (1609) and *Historia general del Perú* (1617), both of which are well known from various later editions and translations. They are prime authorities on the early history of Peru, and generally painstaking and accurate, though naturally colored by the author's prejudices in favor of his race. Garcilaso resided for some years at Lisbon, in comparative poverty. He subsequently returned to Spain, and died in Cordova, or perhaps in Valladolid, after 1617.

HERBERT H. SMITH.

Vega, GEORG, von, Baron; mathematician; b. at Sagaritz, Carniola, Austria, in 1756; studied at the lyceum of Laibach; became Professor of Mathematics at the military academy; was made commander of a regiment of artillery, and fought with distinction in the wars against the Turks and the French; was embodied in 1806. He was murdered Sept. 26, 1802. His *Vorlesungen über die Mathematik* (4 vols.) has often been reprinted, and is still used as a textbook in mathematical instruction in many Austrian institutions. His *Logarithmentafeln* (2 vols., 1783) reached its 57th edition in 1876.

Vega Carpio, -kaár'pĕ-ō, FÉLIX LOPE, de; dramatist and poet; b. in Madrid, Spain, Nov. 25, 1562. He was very precocious, writing his first play at the age of eleven; studied at the University of Alcalá, where he took his bachelor's degree at sixteen; took part in the Spanish Armada in 1588; was secretary to several noblemen; married twice, becoming a priest and an inquisitor after the death of his second wife, before 1614; was made doctor of theology and a Knight of Malta by Pope Urban VIII. (whence his title of *Frey*), and for years before his death was the idol of the court and of the people of Madrid. D. in Madrid, Aug. 26, 1635. He is the most prolific writer known. He wrote, according to his own computation, 1,800 three-act plays, besides 400 *autos*, several long epic poems and prose romances,

and short dramatic interludes and lyric poems of all kinds beyond count. About 450 of his plays have been printed, 150 more are known to exist, but probably the greater part of his work is lost, even the titles of the plays being unknown. This is in part due to the little regard he had for his own dramatic work. In his own eyes and those of his contemporaries he was a great poet, "the phoenix of intellects," "the prodigy of nature," whose fame was assured by his great epic poems. He was a born improviser to whom every form of verse was equally easy, the native Spanish measures no less than the difficult Italian forms, drawing inspiration from all sources, from the Italian *novellieri*, from classical antiquity, from the Bible, and especially from Spanish life and history and popular poetry.

It is on his plays, however, that Lope's fame rests. He is the founder of the Spanish national drama. The forms and proportions he gave to it, the models set by him for development of plot and treatment of subjects, followed by his contemporaries and immediate successors, have remained substantially unaltered. Like the pastoral romance, the national drama of Spain had an important influence on the literature of France and of Italy. In depth of thought and in dramatic power Lope is surpassed by Calderon, in careful finish single plays of other authors are superior to his, but in originality, in fertility of invention, in the dash, constant action, and skillful management of plot essential to the drama of intrigue, he is unexcelled. One stage type, the *gracioso*, a parody on the heroic characters, he created. His *comedias* are almost all divided into three *jornadas* or acts, written usually in the four-foot verse of the ballads, which he breaks and varies as he pleases with every conceivable form of verse. The plot may be tragic. Ticknor divides the plays into *comedias de capa y de espada*, involved intrigues of love with a comic underplot, such as *The Slave of her Lover*, *The Whims of Belisa*, *The Gardener's Dog*, and *A Fool to others and Wise to herself*; *comedias heroicas*, in which the facts or at least the names are historical, such as *The Perfect Prince*, *Punishment without Vengeance*, and his masterpiece, *The Star of Seville*; *comedies of common life*, such as *The Captives of Algiers* and *The Water-girl*, in which Lope shows that he can draw real characters; and finally the *comedias de santos* and other religious plays, written when, after the prohibition of secular plays in 1598, Lope turned to the Bible and to the lives of the saints for his plots. Examples are *The Fair Esther*, *The Cardinal of Bethlehem*, and *San Isidro of Madrid*.

Pérez de Montalván's *Life of Lope*, written in 1636, is the foundation for all other biographies. That by C. A. de la Barrera (1893) is in vol. i. of the edition of Lope's works published by the Spanish Academy. *Lives* in English are by Lord Holland (1806), and by G. Ticknor, in vol. ii. of the *History of Spanish Literature* (6th Am. ed., 1888), the best of all accounts of Lope. Saucha published in 1776-79 the non-dramatic works in twenty-one volumes. Of the plays twenty-five (28) volumes were printed in Lope's lifetime. No other attempt at a collected edition was made before the new edition of the Academy, of which three volumes have appeared (1895). The only large available selection is by J. E. Hartzenbusch, forming four volumes of Rivadeneira's *Biblioteca de Autores Españoles*. G. BENDELARI.

Vegetable Alkali: another name for potash. See POTASSIUM.

Vegetable Butter: See BUTTER.

Vegetable Flannel: a material woven in Germany, Norway, and the U. S. from leaves of the pine (*Pinus sylvestris*) after the turpentine has been distilled off. The fabric is reputed to have useful medicinal properties, and is especially worn by persons suffering from rheumatic or pulmonary complaints.

Vegetable Gardening: See OLERICULTURE.

Vegetable Histology: See HISTOLOGY, VEGETABLE.

Vegetable Ivory: the hardened kernel of the corozonut, the fruit of *Phytelephas macrocarpa*, a South American tree; so called from its resemblance to ivory, for which it is extensively used as a substitute. Some specimens have a translucency entirely wanting in ivory.

Vegetable Kingdom: the plant world; the aggregate of organisms called plants. It is co-ordinate with the animal kingdom, and these two include all the forms of creature life on the earth. It is not possible to define precisely the line that separates the lower portions of these two king-

doms, and perhaps we may best regard them simply as branches of one great group, inseparable below, but widely divergent above. (See Fig. 1.) For a discussion of the differences between plants and animals, see the articles BOTANY and ANIMAL.*

FIG. 1.—Diagram to show the relation of the vegetable kingdom, V, to the animal kingdom, A.

The vast assemblage of plants constituting the vegetable kingdom includes, according to estimates made by Saccardo, about 400,000 species, less than half of which have been described. The principles of classification necessarily used in their consideration are set forth in the article BOTANY (*q. v.*). For a brief discussion of the genetic relationship of plants, see ANCESTRY OF PLANTS. The relationship of the larger groups may be graphically represented by the accompanying

FIG. 2.—Genealogical tree of the branches and classes.

diagram, but a plane figure can not properly represent the mutual relations of the diverging genetic lines. Moreover, no attempt has been made to represent the myriads of smaller branches and branchlets in this genealogical tree of plants. It now remains to present, in summary form, brief descriptions of the branches, classes, orders, and families of the vegetable kingdom. In doing so the sequence is from the primitive or simpler forms to those which are derived or more complex, and since it has frequently happened that two or more groups had a common origin, we are compelled again and again to return to the same point, in order to follow out successively the diverging genetic lines. Moreover, it must not be forgotten that in many cases the derived forms have suffered great degradation, as in the case of the hystero-phytes, where we must pass from the structurally more complex plants to the simpler ones. In the fungi, for example, the Rusts (*q. v.*) are structurally simpler than the Cup Fungi; but the latter are much nearer to the primitive type from which both they and the Rusts were derived, and hence must be described first in a natural system of classification. So, too, in the flowering plants, we find many cases of a progressive simplification as we follow genetic lines; thus the grasses and sedges, although bearing much simpler flowers than the lilies, are to be regarded as modified from the lily type. The grasses are thus further removed from the primitive monocotyledons, and are therefore in this sense higher than the lilies. Among the

* The reader is reminded that in this article, as elsewhere in this cyclopaedia, the SLIME MOULDS (*q. v.*) are regarded as falling outside of the limits of the vegetable kingdom.

dicotyledons there are numerous cases of simplification, many of which have been quite puzzling to systematists. The Apetale of the older botanists are very largely, if not entirely, modified from choripetalous and gamopetalous types. They constitute, in fact, many smaller divergent genetic lines, which pass out from points upon the larger stems of the *Choripetale* and *Gamopetale*.

Branch I. **PROTOPHYTA.** Protophytes; Water-slimes.

Single cells, or chains of cells, reproducing by fission and endospores. Plants minute, aquatic, and normally blue-green, brownish-green, or fuliginous. See PROTOPHYTES.

Class 1. **SCHIZOPHYCEÆ** (Cyanophyceæ). Fission Algae. Characters those of the branch. About 1,000 species are known.

Order **CYSTIPHORÆ** (Chroococcaceæ). Plants unicellular, single or associated in families.

Family **Chroococcaceæ.** Species of *Chroococcus*, *Glaucocapsa*, and *Merismopedia* are common in ponds and pools.

Order **NEMATOGENEÆ** (Nostochineæ). Plants multicellular, forming simple threads, which float on or in water, often forming large greenish or blackish masses.

Family **Nostocaceæ.** Threads mostly moniliform, with intercalated or terminal heterocysts. *Nostoc* is the principal genus.

Family **Oscillariaceæ.** Threads cylindrical, cells uniform (no heterocysts); often motile. *Oscillaria* and *Lyngbya* are common genera.

Family **Rivulariaceæ.** Threads mostly attenuated from a large basal heterocyst. *Rivularia* is the typical genus.

Family **Scytonemaceæ.** Threads cylindrical, with intercalated heterocysts, pseudo-ramose.

Family **Bacteriaceæ.** The bacteria are probably degenerated *Nostocaceæ* and *Oscillariaceæ*. See BACTERIA.

Branch II. **PHYCOPHYTA.** Phycophytes; Spore-tangles.

Single cells, chains, or masses, the latter sometimes forming a branching plant with rhizoids. Sexual reproduction by the union of two protoplasts to form a single resting-spore. See PHYCOPHYTES.

Class 2. **CHLOROPHYCEÆ.** Green Algae. Chlorophyll-green, one-celled or filamentous plants, rarely composed of a plate of cells. (A few hystero-phytes are chlorophyll-less). Nearly 7,000 species are known.

Order **PROTOCOCCOIDEÆ.** Plants unicellular, single or associated in families; sexual reproduction mostly by the union of zoöspores. Species from 550 to 600.

Family **Palmellaceæ.** The Green Slimes. Vegetative cells without cilia, not motile, mostly solitary or in loose families. *Protococcus*, *Palmella*, and *Tetraspora* are examples of the single-celled forms, while *Pediastrum*, *Senedesmus*, and *Hydrodictyon* are in families. See PROTOCOCCUS.

Family **Volvocaceæ.** Vegetative cells with cilia, motile, solitary or united into motile families. *Chlamydomonas* and *Hæmatococcus* (*H. lacustris*, the red snow-plant of the Arctic regions) are unicellular; *Pandorina* forms isogamic colonies, while *Eudorina* and *Volvox* form oögamie colonies. The last three are doubtfully vegetable in nature.

Family **Synchytriaceæ.** Vegetative cells, at first naked, spherical or ellipsoidal, parasitic in the cells of (mostly lower) plants and animals, without chlorophyll, at length forming a wall and becoming a zoösporangium, or forming a single thick-walled resting-spore. Nearly 100 species are known, inhabiting Diatoms, Pond Seams, etc. Species of *Synchytrium* are parasitic in the epidermal cells of flowering plants.

Family **Chytridiaceæ.** Vegetative cells with a wall, usually elongated or filiform, parasitic in the cells of (mostly lower) plants and animals, without chlorophyll, forming zoösporangia or one or more thick-walled resting spores. About 100 species (of *Lagenidium*, *Ancylistes*, *Rhizophidium*, *Chytridium*, etc.) are known, inhabiting diatoms, desmids, and other aquatic plants. It is quite probable that some of the forms here brought together are degraded *Siphonææ* and *Conferoideææ*.

Order **CONJUGATÆ.** Plants unicellular, or cylindrical unbranched chains of cells (rarely branching tubes), reproducing sexually by the direct union of the contents of two cells. Species about 5,250.

Family **Desmidiaceæ.** The Desmids. Plants unicellular, bilobed, or fusiform, free, rarely united in chains, walls of cellulose only. See DESMIDS.

Family **Diatomaceæ.** The Diatoms. Plants unicellular, free or less commonly united in chains; walls siliceous. See DIATOMS.

Family *Zygnemaceae*. The Pond-scums. Plants consisting of chains of cylindrical cells. *Spirogyra*, *Zygnema*, and *Mougeotia* are typical genera.

Family *Mucoraceae*. The Black Moulds. Mostly saprophytic plants (rarely parasitic upon one another), filiform, branching, sparsely septated, without chlorophyll; conidia formed internally (in a "sporangium") or by abstriction. See MUCORACEAE.

Family *Entomophthoraceae*. The Insect Fungi. Parasites inhabiting the bodies of insects; filaments very short, branching, septated (or the cells separate), without chlorophyll; conidia formed singly by abstriction. See FLY FUNGUS.

Order SIPHONEE. Plants tubular (or lobed), branching, partitions rarely formed; sexual reproduction by the union of zoöspores, or the fertilization of oöospheres by antherozoids. About 250 species are known.

Family *Hydrogastreae*. Plants terrestrial, minute, globose, with branching rhizoids; sexual reproduction isogamic. But one genus, *Botrydium*, is known.

Family *Phyllosiphonaceae*. Minute, green, branching plants, parasitic in the tissues of aquatic plants, evidently related to the preceding family.

Family *Udoteaceae*. Plant compound, consisting of di- or trichotomous tubes, always incrustated with lime; sexual reproduction isogamic. Marine.

Family *Spongodiaceae*. Plant compound, spongy, spherical or cylindrical, simple or dichotomously branched, consisting of many branching intertwined tubes; sexual reproduction isogamic. Marine.

Family *Caulerpaceae*. Plant a horizontal tube with rhizoids, and bearing erect lobulated or pinnatifid branches; sexual reproduction isogamic. Marine.

Family *Bryopsidaceae*. Plant pinnately branched; sexual reproduction isogamic. Marine.

Family *Derbesiaceae*. Plant filiform, simple, or irregularly branched; sexual reproduction isogamic. Marine.

Family *Dasycladiaceae*. Plant filiform, with short verticillate branches; sexual reproduction isogamic. Marine.

Family *Vaucheriaceae*. The Green Felts. Plant filiform, irregularly branched; sexual reproduction oögamie. The thirty to forty species belong to the genus *Vaucheria*; they occur in fresh or marine waters, and even on moist soil.

Family *Saprolegniaceae*. The Water-moulds. Aquatic plants parasitic or saprophytic in the tissues of animals, filiform, irregularly branched, and without chlorophyll; sexual reproduction oögamie. See WATER-MOULD.

Family *Peronosporaceae*. The Downy Mildews. Plants parasitic in the tissues of higher plants, filiform, irregularly branched, and without chlorophyll; sexual reproduction oögamie. See MILDEW.

Order CONFEROIDEAE. Plant a cylindrical chain or a plate of cells; sexual reproduction by the union of zoöspores or the fertilization of oöospheres by antherozoids. Species from 850 to 1,000.

Family *Ulvaceae*. Sea-lettuces. Plant a plate of a single layer of cells, or a tube of cells, or by collapsing a plate of two layers; sexual reproduction isogamic. Mostly marine.

Family *Ulotrichiaceae*. The Confervas. Plant filiform, mostly simple, with lateral rhizoids; cell-walls thin; sexual reproduction isogamic. Mostly in fresh water. See CONFERVA.

Family *Chroolepidiaceae*. Plant minute, epiphytic or aërial, filiform, branching; from yellow to red in color; sexual reproduction isogamic.

Family *Cladophoraceae*. The Water-rannels. Plant filiform, mostly branching, with lateral rhizoids, cell-walls thickened and lamellated; sexual reproduction isogamic. Mostly in fresh water.

Family *Pithophoraceae*. Plant filiform, branching, ending below in simple or branching colorless rhizoids; sexual reproduction isogamic. In fresh water.

Family *Sphaeropleaceae*. Plant filiform, simple, free-swimming; sexual reproduction oögamie, gametes biciliated, oöospheres several in each oögone. In fresh waters.

Family *Cylindrocapsaceae*. Plant filiform, simple, at first attached, then free-swimming; sexual reproduction oögamie, gametes biciliated, oöospheres one in each oögone. In fresh waters.

Family *Edogoniaceae*. Plant filiform, simple or branched, attached below by rhizoids; oöospheres large, not ciliated, one in each oögone; antherozoids with a crown of cilia. In fresh waters. The principal genus is *Edogonium*.

Class 3. PLEOPIHYCEAE. Brown Alge. Olive-green

filamentous or more commonly massive plants with rhizoids, having in their cells, in addition to chlorophyll, a brown coloring-matter (phycochrom). About 1,100 species are known, marine (with a very few exceptions).

Order PLEOSPORIEE. Plant from a minute filament to a large flat or much-branched thallus, producing zoöspores in two kinds of zoösporangia: (1) simple, containing one zoöspore; (2) compound, containing many zoöspores; sexual reproduction by the union of zoöspores; asexual reproduction by the direct growth of zoöspores.

Family *Ectocarpaceae*. Plant filamentous, monosiphonous or polysiphonous; zoösporangia in or on the filaments, the simple globose or cuboidal, the compound muriform. Mostly small or even microscopic plants, resembling the *Confervoideae*. In at least one genus there are fresh-water species.

Family *Mesoglycaceae*. Plant mostly gelatinous, globose, irregular or cylindrical, composed of a basal or axial mass of cylindrical cells, covered by a cortex of closely packed vertical rows of cells; both kinds of zoösporangia produced among the cortical cells. Mostly small plants, forming gelatinous masses on larger seaweeds.

Family *Punctariaceae*. Plant simple or branched, membranaceous, cylindrical or filamentous; zoösporangia in superficial sori, the simple spherical, the compound (where known) ellipsoidal and few-celled. Plants often of considerable size, 10 to 20 cm. or more.

Family *Arthrocladiaceae*. Plant filiform, branching, composed of an axial row of large cells covered with several layers of polygonal cortical cells; compound zoösporangia moniliform, on slender branches, the simple unknown. Plants often of considerable size, 20 to 30 cm. or more.

Family *Sporochneaceae*. Plant upright, cylindrical or compressed, solid or hollow, consisting of several layers of polygonal cells; both kinds of zoösporangia in external, scattered sori, intermixed with jointed paraphyses. Plants often of considerable size, 10 to 100 cm. or more.

Family *Scytosiphonaceae*. Plant unbranched, membranaceous or tubular; compound zoösporangia densely covering the whole surface, intermixed with club-shaped paraphyses, the simple unknown. Plants 10 to 30 cm. or more in length.

Family *Laminariaceae*. Plant large, flat or cylindrical, composed of many layers of cells; simple zoösporangia in large sori, bands, or over the whole surface, intermixed with club-shaped paraphyses, the compound unknown. These are the KELPS (*q. v.*), which include common species several meters in length, and a Pacific Ocean species 100 or more meters long.

Family *Ralfsiaceae*. Plant parenchymatous, horizontally expanded, sometimes crustaceous; both kinds of zoösporangia spheroidal, in wart-like sori, the simple intermixed with jointed paraphyses, the compound without paraphyses. Small plants attached to stones and shells.

Family *Lithodermaceae*. Plant parenchymatous, horizontally expanded, crustaceous; both kinds of zoösporangia in superficial sori, the compound with intermixed, jointed paraphyses. Small plants attached to stones and shells, all marine, with the exception of two species.

Family *Cutteriaceae*. Plant parenchymatous (not crustaceous), flat, erect or prostrate; zoösporangia in superficial sori, the simple without and the compound with jointed paraphyses. In this family a differentiation into oöospheres and antherozoids is attained, the simple zoösporangia producing the former and the compound the latter. The plants are from 1 cm. or so to 30 or 40 in height, and are mostly natives of the warmer seas.

Order DICRYOTEAE. Plant flat, parenchymatous; sexual (?) reproduction by the fertilization of motionless oöospheres by motionless antherozoids; asexual reproduction by means of motionless tetraspores.

Family *Dictyotaceae*. Plants of considerable size, from a few centimeters to a meter or more in length, often beautifully marked with colored zones, and remarkable in showing affinities to the *Phaeophyceae* and *Rhodophyceae*.

Order FUCOIDEAE. The Fucoids. Plant a more or less branching massive thallus; sexual reproduction by the fertilization of a motionless oöosphere by motile antherozoids; asexual reproduction wanting.

Family *Fucaceae*. Plant of considerable size, from a few centimeters to a meter in length, common on rocks between tide-marks, hence called Rockweeds. See FUCOIDS.

Branch III. CARPOPHYTA. Carpophytes; Fruit-tangles.

Chains, plates, or masses of cells, the latter often forming a branching plant with rhizoids. Sexual reproduction

(where known) by the union of two dissimilar protoplasts to form a spore-fruit. See CARPOPHYTES.

Class 4. COLEOCHÆTEÆ. Simple Fruit-tangles. Chlorophyll-green plants, consisting of jointed, irregularly branched, radiating filaments, sometimes compacted into a flat plate; spore-fruit simple, consisting of a large spore (carpospore) inclosed in a subsequently formed layer of cells. About a dozen species are known.

Order COLEOCHÆTACEÆ. Minute plants, 6 mm. or less, with the characters of the class.

Family *Coleochutaceæ*. Aquatic, attached to the surfaces of water-plants, some of the cells with colorless, bristle-like protuberances growing from narrow sheaths.

Family *Mycoidaceæ*. Parasitic in the leaf tissues of higher plants; bristle-like protuberances wanting. Doubtfully referred to this class.

Class 5. ASCOMYCETEÆ. Sac Fungi. Chlorophyll-less plants (hysterophytes) consisting of jointed, branching filaments, sometimes compacted into parenchymatous masses; spore-fruit spherical, cup-shaped, or irregular, simple or compound, always including one or more spore-sacs (asci) containing spores (ascospores). Nearly 20,000 species are now known, to which may be added about 12,000 more of the "imperfect fungi," here included in this class. See FUNGI.

Order PERISPORIACEÆ. Simple Sac Fungi. Plant filamentous (the mycelium), producing minute, simple, mostly spherical closed spore-fruits, consisting of one to many asci inclosed in a hard cellular shell (perithecium). Species about 500.

Family *Erysiphææ*. Superficial parasites upon higher plants, with abundant simple vertical conidiophores, the blackish fruits with radiating, usually forked appendages. These are the Powdery Mildews. See MILDEWS.

Family *Perisporiææ*. Mostly saprophytes, with the yellow or black fruits, usually without appendages. Not well defined from the *Erysiphææ* by structural characters.

Order TUBERODEÆ. Subterranean Sac Fungi. Plant filamentous (mostly subterranean), producing spheroidal, compound (usually large) spore-fruits, containing internally many spherical cavities in which are the asci; species about 130.

Family *Onygenaceæ*. Parasitic or saprophytic on horns, bones, etc.; fruit waxy, at length pulverulent.

Family *Elaphomycetaceæ*. Fruit subterranean, woody or crustaceous.

Family *Tuberaceæ*. Fruit subterranean, fleshy. The most important genus is *Tuber* with about fifty species, including the truffles (*T. estivum*). See FUNGI and TRUFFLE.

Order PYRENOAMYCETEÆ. Black Fungi. Plant filamentous (in many "lichens" compacted into a thallus), producing spheroidal simple or mostly compound spore-fruits, consisting of a hard cellular mass (stroma) in whose surface the perithecia are partially imbedded. Species about 9,000.

Family *Sphuriaceæ*. Simple or compound; perithecia black, membranaceous, coriaceous or carbonaceous, differing in substance from the stroma; ostiole round.

Family *Hypocreaceæ*. Simple or compound; perithecia mostly reddish, sub-carnose or waxy membranaceous, differing in substance from the stroma; ostiole round.

Family *Verrucariaceæ*. Lichen-forming fungi, with globular fruits; ostiole round. See LICHENS.

Family *Dothidiaceæ*. Compound; perithecia black, coriaceous or carbonaceous, confluent with the stroma; ostiole round. See PLUM KNOT.

Family *Microthyriaceæ*. Simple; perithecia black, sub-superficial, membranaceous or carbonaceous; no ostiole.

Family *Lophiostomaceæ*. Simple; perithecia black, adnate at base or sub-superficial, mostly carbonaceous; ostiole elongated.

Family *Hysteriaceæ*. Simple; perithecia mostly blackish, erumpent superficial, horizontally oblong or linear; ostiole a long fissure.

Family *Laboulbeniaceæ*. Minute and greatly reduced sac fungi, with simple fruits, parasitic externally upon the bodies of insects.

Order DISCOMYCETEÆ. Cup Fungi. Plant filamentous (in many "lichens" compacted into a thallus), producing mostly cup-shaped or disk-shaped fruits, the asci and intermixed paraphyses closely pressed together, and constituting the hymenium. Species about 7,000.

Family *Cyrtariaceæ*. Fruit globose or ovoid, hollow or solid, sub-sessile, fleshy, plurilocular externally.

Family *Helvellaceæ*. Fruit vertical, stipitate; mitrate, clavate, capitate or lacunose-gyrose; fleshy or waxy.

Family *Pezizaceæ*. Fruit cup or disk shaped, fleshy or waxy, stipitate or sessile; asci not readily escaping; growing on decaying vegetable matter.

Family *Ascobolaceæ*. Fruit cup or disk shaped, fleshy or waxy, sessile; asci readily escaping; growing on dung.

Family *Dermateaceæ*. Fruit cup or urn shaped, sub-sessile or stipitate, cæspitose, corky, coriaceous or horny, usually scurfy externally.

Family *Bulgariaceæ*. Fruit top, cup, or disk shaped, sessile or sub-stipitate, gelatinous, at length horny or cartilaginous.

Family *Stictidaceæ*. Fruit minute, immersed; peridium reduced or evanescent; mostly saprophytic.

Family *Graphidaceæ*. Lichen-forming fungi with immersed, rounded or mostly elongated blackish fruits; peridium (exciple) often evanescent. See LICHENS.

Family *Phacidaceæ*. Fruit minute, immersed, black, more or less coriaceous; mostly parasitic.

Family *Parmeliaceæ*. Lichen-forming fungi with shield-shaped fruits, bordered by a thalline exciple. See LICHENS.

Family *Lecidiaceæ*. Lichen-forming fungi with disk-shaped fruits, bordered with a proper exciple. See LICHENS.

Family *Putellariaceæ*. Fruit minute, superficial, shield or cup shaped, mostly sessile, generally black, coriaceous or horny, glabrous.

Family *Caliciaceæ*. Lichen-forming fungi with top or pear shaped mostly stipitate fruits, the spores free by the breaking of the spore-sacs. See LICHENS.

Family *Cordieritaceæ*. Fruit minute, branching-stipitate, corky or horny carbonaceous.

Family *Gymnousseaceæ*. Extremely degraded parasites, producing single asci upon very short filaments. See PLUM POCKETS.

Family *Saccharomycetaceæ*. Yeast-plants. Extremely degraded saprophytes, few-celled or unicellular, eventually producing few-spored asci. See FERMENTATION and FUNGI.

Order UREDINEÆ. Rusts. Plant filamentous, parasitic in the tissues of higher plants, producing reduced, persistent asci ("telentospores") in poorly defined fruits; conidia (æcidiospores) and stylospores (uredospores) usually present. Species about 1,500.

Family *Uredinaceæ*. With the characters of the order. See RUSTS.

Order USTILAGINEÆ. Smuts. Plant filamentous, parasitic in the tissues of higher plants, producing reduced, deliquescent asci, in vaguely defined fruits; conidia and stylospores mostly wanting. Species about 300. See SMUTS.

Family *Ustilaginaceæ*. Promycelium septate, bearing lateral sporidia.

Family *Tilletiaceæ*. Promycelium non-septate, bearing terminal sporidia.

"Imperfect Fungi," doubtfully referred to this class: Order SPHEROSIDEE. Plant filamentous, producing "perithecia" (but no spore-sacs) in which are conidiophores bearing conidia.

Family *Sphurioidaceæ*. Perithecia membranaceous, carbonaceous, or coriaceous, black, globose to disk shaped, immersed or superficial.

Family *Nectrioidaceæ*. Perithecia fleshy or waxy, whitish to yellow, red or orange, globular to horizontally elongated, erumpent or superficial. Probably imperfect forms of *Hypocreaceæ*.

Family *Leptostromaceæ*. Perithecia membranaceous or carbonaceous, black, shield-shaped, erumpent or superficial.

Family *Excipulaceæ*. Perithecia membranaceous or carbonaceous, black, cup or disk shaped, or horizontally elongated, erumpent or superficial.

Order MELANCONIEÆ. Plant filamentous, producing sub-entaneous sori (not "perithecia") of conidiophores bearing conidia.

Family *Melanconiaceæ*. With the characters of the order.

Order HYPHOMYCETEÆ. Plant filamentous, producing isolated, sometimes clustered, superficial conidiophores bearing conidia; "perithecia" and sori wanting.

Family *Mucedinaceæ*. Filaments white or slightly colored, weak, separate; conidia of the color of the filaments.

Family *Dematiaceæ*. Filaments blackish or black (rarely subhyaline), separate; conidia blackish.

Family *Stilbaceæ*. Filaments white or blackish, cohering in dense, elongated, stalk-like fascicles.

Family *Tuberulariaceæ*. Filaments white or blackish, cohering in dense, wart-like masses.

Class 6. **BASIDIOMYCETEE.** Higher Fungi. Chlorophyll-less plants (hysterophytes) consisting of jointed, branching filaments, sometimes compacted into parenchymatous masses; spore-fruit spherical, pileate, or irregular, always including enlarged end-cells (basidia) bearing external spores. About 10,000 species are known. See FUNGI.

Order **GASTEROMYCETEE.** Basidia internal, lining the walls of tortuous cavities. See PUFF-BALLS.

Family *Hymenogasteraceae*. Spore-fruit subterranean, spheroidal, fleshy, not becoming pulverulent.

Family *Lycoperdaceae*. Puff-balls. Spore-fruit above ground, spheroidal, sessile, or stipitate, at first fleshy, later pulverulent.

Family *Nidulariaceae*. Bird's-nest Fungi. Spore-fruit top-shaped, coriaceous, partially deliquescent to form "sporangioles."

Family *Phallaceae*. Stink-horns. Spore-fruit at first spheroidal, fleshy, at maturity partly deliquescent, rupturing and elongating. See STINKHORN FUNGI.

Order **HYMENOMYCETEE.** Basidia developed upon surfaces (hymenia) which eventually or from the first are external. See MUSHROOMS.

Family *Agaricaceae*. Toadstools. Hymenium on radiating lamellae (gills).

Family *Polyporaceae*. Pore Fungi. Hymenium lining tubes or pores.

Family *Hydnaceae*. Prickly Fungi. Hymenium superficial on prickles or protuberances.

Family *Thelephoraceae*. Hymenium on the smooth expanded surface of the lower side of the spore-fruit.

Family *Clavariaceae*. Hymenium on all sides of the fleshy, usually erect, branching spore-fruit.

Family *Tremellaceae*. Hymenium on all sides of the gelatinous, irregular-shaped spore-fruit.

Class 7. **RHODOPHYCEE.** Red Seaweeds. Red or purple plants, whose cells contain, besides chlorophyll, a red or purple coloring-matter (phycoerythrin), filamentous, cylindrical or membranaceous, simple or branched; spore-fruit spherical or flattened, with or without a cellular covering, always including certain end-cells which separate as spores by abstriction. About 2,000 species are known. See RED SEAWEEDS.

Order **FLORIDEE.** But one order is known, having the character of the class. By Agardh it is divided into six series as follows:

Series I. GONGLYOSPERMEE. Spore-fruits external or immersed in the substance of the thallus, surrounded by a gelatinous envelope; spores irregularly arranged; plant mostly filamentous, sometimes solid or compressed.

Family *Ceramiceae*. Spore-fruits external.

Family *Cryptonemiaceae*. Spore-fruits immersed in the substance of the thallus.

Series II. COCCIOSPERMEE. Spore-fruits immersed in the swollen thallus, forming rounded conceptacles; spores irregularly arranged; plant terete or flattened, fleshy or hardened.

Family *Gigartineae*. Spore-fruits immersed in ordinary branches of the thallus.

Family *Furcellariaceae*. Spore-fruits immersed in pod-like "receptacles" at the ends of the branches.

Series III. NEMATOSPERMEE. Spore-fruits external, with a cellular pericarp, or sometimes immersed in the thallus; spores in chains radiating from a central cell; plant filamentous, solid, or membranaceous.

Family *Dudresnayaceae*. Spore-fruit sub-external upon the articulated, branching thallus.

Family *Dumontiaceae*. Spore-fruit immersed in the tubular or solid, branching thallus.

Family *Spyridiaceae*. Spore-fruit sub-terminal on the branches of the more or less articulated and always corticated thallus.

Family *Arcehougiaceae*. Spore-fruit sub-external on the tubular or solid thallus.

Family *Champiaceae*. Spore-fruit external on the tubular-cellular nodulose-diaphragmed thallus.

Family *Rhodymeniaceae*. Spore-fruit external on the filiform, tubular or solid thallus.

Series IV. HORMOSPERMEE. Spore-fruits external or immersed, mostly with a pericarp; spores in short chains or single; plant membranaceous, cylindrical, or flattened.

Family *Squamariaceae*. Plants forming horizontally expanded crusts, composed of short vertical filaments, sometimes calcareous; spore-fruit containing few spores in short chains.

Family *Corallinaceae*. Plants encrusted with lime, horizontally expanded or slender branching, sometimes articulated; spore-fruits external or immersed, containing pear-shaped spores on short filaments.

Family *Sphaerococcoidae*. Plants without lime; external cells round; spore-fruits external, hemispherical, or flask-shaped, containing many spores in moniliform filaments.

Family *Delesseriaceae*. Plants without lime; external cells angled; spore-fruits external, hemispherical, or flask-shaped.

Series V. DESMIOSPERMEE. Spore-fruits external or immersed, mostly with a pericarp; spores borne on central or parietal, simple or branching placentae; plant filamentous, cylindrical or compressed.

Family *Helminthocladaceae*. Plant filamentous; spore-fruits immersed; spores in chains radiating from a central cell.

Family *Chatangiaceae*. Plant tubular, or solid and cylindrical or compressed; spore-fruits external or partly immersed; spores parietal.

Family *Gelidiaceae*. Plant filiform or compressed, of dense cartilaginous structure; spore-fruits immersed in special branches, spores on axile or parietal placentae.

Family *Hypnaceae*. Plant filiform or sub-compressed; spore-fruits external or partly immersed; spores in tufts on branching placentae.

Family *Solieriaceae*. Plant filiform or compressed; spore-fruits immersed; spores in short filaments on a central cell or placentae.

Series VI. CORYOSPERMEE. Spore-fruits external, with a pericarp; spores borne on a cellular, basal placentae; plant filamentous, or solid and cylindrical.

Family *Wrangeliaceae*. Plant jointed, naked or corticated; spore-fruit external, consisting of one or more naked spores.

Family *Spongiocarpeae*. Plant solid, cylindrical, branching; spore-fruit in wart-like protuberances; spores axile.

Family *Lomentariaceae*. Plant filamentous, tubular-cellular, branching, hollow, with constricted nodes; spore-fruits external; spores axile.

Family *Chondriaceae*. Plant tubular or solid; spore-fruits external or partly immersed spores from a basal placentae.

Family *Rhodomeleaceae*. Plant filiform-branching, or membranaceous; spore-fruits external, with a distinct ovate or urn-shaped pericarp; spores pyriform, stalked, upon a basal placentae.

Class 8. **CHAROPHYCEE.** Stoneworts. Chlorophyll-green plants, consisting of single rows of elongated cells (often corticated) bearing whorled branches; spore-fruit ovoid, consisting of a large spore (carpospore) inclosed in a previously formed layer of elongated cells. Species about 150.

Order **CHARACEE.** With the characters of the class. See STONEWORTS.

Family *Nitelleae*. Plant not corticated; crown of spore-fruit of ten cells.

Family *Characeae*. Plant often corticated; crown of spore-fruit of five cells.

Branch IV. **BRYOPHYTA.** Bryophytes. Mossworts.

Masses of cells, forming a flat branching plant with rhizoids, or a leafy stem (the oöphore); sexual reproduction by the union of two protoplasts and the formation of a leafless, spore-bearing stem (the sporophore). See Mossworts.

Class 9. **HEPATICEE.** Liverworts. Plant body mostly bilateral, a thallus, or leafy axis with mostly two-ranked, veinless leaves; root hairs one-celled; spore-fruit indehiscent or two- to four-valved, mostly containing elaters. Species about 3,500.

Order **MARCHANTIACEE.** Spore-fruits indehiscent, with or without elaters; plant thallose.

Family *Niccioeae*. Crystalworts. Small, mostly radiate-thallose plants; spore-fruits sessile in the upper surface of the thallus; no elaters.

Family *Targoniaceae*. Branching thallose plants; spore-fruits single, short-stalked; elaters present.

Family *Marchantiaceae*. Liverworts proper. Branching thallose plants; spore-fruits clustered on the under side of a peduncled "receptacle"; elaters present.

Order **ANTHOCERATACEE.** Horned Liverworts. Spore-fruits with a columella, two-valved, with elaters; plant a thallus.

Family *Anthocerotaceae*. Small thallose plants, with slender club-shaped spore-fruits growing from the upper surface.

Order **JUNGERMANNIACEE.** Scale-mosses. Spore-fruits

stalked, four-valved, containing elaters; plants mostly leafy-stemmed.

A. *Thallose Scale Mosses*.—Plant a thallus.

Family *Metzgeriæ*. Archegonium (and spore-fruits) on the under side of the midrib; involucre single.

Family *Aneuræ*. Plant without midrib; archegonium marginal; involucre single.

Family *Haplolenæ*. Archegonium sunken in the upper side of the thallus; involucre single.

Family *Diplomitriæ*. Archegonium on the upper side of the thallus; involucre double.

Family *Codonieæ*. Pseudo-foliaceous, with leaf-like lobes; archegonium terminal or dorsal.

B. *Foliose Scale Mosses*.—Plant usually with two-ranked leaves; archegonium mostly terminal; involucre mostly double.

Family *Haplomitriæ*. Plant upright, with three-ranked leaves.

Family *Jubuleæ*. Leaves overlapping upward (incubous); spore-fruit splitting half way down.

Family *Platyphyllæ*. Plant without runners; leaves entire, overlapping upward; spore-fruit splitting to the base.

Family *Ptilidiæ*. Plant without runners; leaves three to four dentate or divided, overlapping upward; spore-fruit splitting to the base.

Family *Lepidoziæ*. Plant with leafless runners; leaves overlapping upward; spore-fruit splitting to the base.

Family *Geocalyceæ*. Leaves overlapping upward or downward; spore-fruit growing from a pendent sac at the side of the stem.

Family *Jungermanniæ*. Leaves overlapping downward (succubous); involucre double.

Family *Gymnomitriæ*. Leaves overlapping downward; involucre single.

Class 10. MUSCI. Mosses. Plant body a leafy axis, rarely bilateral, with mostly three to many ranked leaves, usually with a midrib; root-hairs a row of cells; spore-fruit mostly opening by a circular lid; no elaters. Species about 4,500.

Order ANDREÆACEÆ. Black Mosses. Small plants with thickish leaves of similar cells; spore-fruit on a pseudopodium, dehiscing by four (or six) longitudinal slits.

Family *Andreaeæ*. With the characters of the order. A small group of rock-loving mosses, confined to the single genus *Andreaea*.

Order SPHAGNACEÆ. Peat-mosses. Large plants with thick leaves, containing two kinds of cells; spore-fruit on a pseudopodium, dehiscing by a circular lid; no peristome.

Family *Sphagnaceæ*. With the characters of the order. A small group of bog-mosses, confined to the single genus *Sphagnum*.

Order ARCHIDIACEÆ. Small plants with thin leaves of similar cells; spore-fruit sessile, rupturing irregularly.

Family *Archidiæ*. With the characters of the order. A small group of earth-loving mosses, confined to the single genus *Archidium*.

Order BRYACEÆ. True Mosses. Small to large plants, with mostly thin leaves of similar cells; spore-fruit mostly long-stalked, generally opening by a circular lid; peristome usually present.

Series I. CLEISTOCARPÆ. Spore-fruit indehiscent, not opening by a lid.

Family *Phasceæ*. Plants minute; leaves soft, loosely areolate; spore-fruit globular, immersed, sessile to short-stalked.

Series II. STEGOCARPÆ. Spore-fruit opening by a circular lid.

A. *Acrocarpæ*.—Spore-fruit terminal.

Family *Weisiæ*. Leaves costate, areolation quadrate above, oblong-hexagonal below; spore-fruit small, ovate to cylindrical pedicellate, erect or pendent; peristome single (of sixteen or thirty-two teeth) or none; calyptra cucullate.

Family *Pottiæ*. Leaf areolation quadrate-hexagonal; spore-fruit erect, narrow or cylindrical; peristome single (of sixteen or thirty-two teeth) or none; calyptra mitriform.

Family *Grimmiæ*. Leaves opaque, areolation minutely round-quadrate; spore-fruit regular, on a straight or curved pedicel; peristome single (of sixteen teeth); calyptra mitriform.

Family *Orthotrichæ*. Leaves costate, areolation minutely round-quadrate; spore-fruit erect, symmetrical; peristome single or double (of eight or sixteen teeth in each row); calyptra mitriform.

Family *Tetraphidæ*. Lower leaves small, upper larger, tufted, areolation equal; spore-fruit cylindrical or oval; peristome single (of four teeth); calyptra conical, mitrate.

Family *Discelesiæ*. Leaves ecostate, areolation loose, of long hexagonal-rhomboidal cells; spore-fruit oval, stalked; peristome single (of sixteen teeth); calyptra split down one side and attached below to the pedicel.

Family *Schistotegaceæ*. Plants annual from a persistent protonema; leaves with loose areolation; spore-fruit subglobose, soft; peristome none; calyptra minute, mitriform.

Family *Splachnaceæ*. Leaves costate, areolation of large cells; spore-fruit with an enlarged base (apophysis); peristome single (of sixteen teeth); calyptra cucullate or mitriform.

Family *Physcomitriæ*. Leaves costate, areolation of large hexagonal or rhomboidal cells; spore-fruit oval or spherical, erect; peristome none, or single (of sixteen teeth) or double (of sixteen outer teeth and an inner divided membrane); calyptra cucullate or mitriform.

Family *Bartramieæ*. Leaves costate, areolation minute and quadrate above, loose hexagonal-rectangular below; spore-fruit spheroidal, nodding or erect; peristome single (of sixteen teeth) or double (of sixteen outer and sixteen or thirty-two inner teeth); calyptra small, cucullate, fugacious.

Family *Meesiæ*. Leaves lanceolate or linear-oblong; spore-fruit long-stalked and long-necked, nodding; peristome double (of sixteen outer and sixteen inner teeth); calyptra fugacious.

Family *Bryaceæ*. Leaves costate, areolation uniform, parenchymatose; spore-fruit globose to pear-shaped, mostly nodding; peristome usually double (of sixteen outer, and sixteen or thirty-two inner teeth); calyptra cucullate.

Family *Polytrichaceæ*. Leaves thick, costate; spore-fruit long-stalked, erect or nodding, cylindrical or angular; peristome single (of thirty-two or sixty-four teeth); calyptra cucullate.

Family *Buxbaumieæ*. Leaves thick, costate; spore-fruit large, oblique, sessile or short-stalked; peristome double (the outer rudimentary, the inner of sixteen or thirty-two teeth); calyptra very small, conical.

B. *Pleurocarpæ*. Spore-fruits lateral, in leaf axils.

Family *Fontinellæ*. Aquatic plants, with thin ecostate leaves; spore-fruit sessile, emersed; peristome double (of sixteen outer and sixteen inner teeth); calyptra conical or cucullate.

Family *Neckeraceæ*. Leaves mostly costate, areolation minute, rhomboidal or short-linear; spore-fruit erect, symmetrical (or curved), generally emersed; peristome single or double (or none).

Family *Leucodontæ*. Leaves sub-scarious, usually costate, areolation narrowly linear or vermicular; spore-fruit soft, oval-oblong, erect, more or less long-stalked; peristome single or double; calyptra cucullate.

Family *Hookeriæ*. Plants small and soft, with narrow or broad leaves, having a large areolation; spore-fruit long-stalked, sub-erect, nodding or horizontal; peristome large, double; calyptra conical or mitrate.

Family *Fabroniæ*. Plants very small, with crowded leaves, having a loose rhomboidal areolation; spore-fruit ovate, erect, short-stalked; calyptra cucullate.

Family *Leskeæ*. Leaves costate, areolation minute, hexagonal; spore-fruit symmetrical, erect or curved; peristome double (of sixteen outer and sixteen inner teeth); calyptra cucullate.

Family *Orthotheciæ*. Leaves costate, bicostate, or ecostate, areolation narrowly rhomboidal or linear; spore-fruit erect or sub-inclined; peristome double; calyptra from small to large.

Family *Hypnæ*. Leaves costate or ecostate, areolation narrowly rhomboidal or linear; spore-fruit long-stalked, nodding or horizontal; peristome double (of sixteen outer and sixteen inner teeth); calyptra cucullate.

Branch V. PTERIDOPHYTA. Pteridophytes. Fernworts.

Masses of cells, forming a flat plant usually with rhizoids (oöphore); sexual reproduction by the union of two protoplasts and the formation of a stem with roots and spore-bearing leaves (sporophore). See FERNWORTS.

Class 11. FILICINÆ. The Ferns. Stems of the sporophore solid, leaves usually large, with broadly expanded blade, and elongated petioles. Species about 3,500.

Order OPHIOGLOSSACEÆ. Adder's-tongues. Spores developed from cells in the tissue of the leaf; leaves erect in the bud (not circinate).

Family *Ophioglossæ*. With the characters of the order.

Order MARATTIACEÆ. Ringless Ferns. Spores developed in external sporangia, originating by the division of internal

cells of the lower side of the leaf; leaves circinate in the bud.

Family *Angiopterideae*. Sporangia five to twenty, separate, sessile in an elongated sorus, splitting longitudinally on the inner side.

Family *Marattiev*. Sporangia four to fifteen, sessile or short-stalked, united into elongated or circular sori, splitting longitudinally on the inner side.

Family *Danuvaceae*. Sporangia sessile, many, united in elongated sori, opening by an apical pore.

Order *FILICES*. True Ferns. Spores developed from cells in specially modified hairs (sporangia), usually on the under side of the leaf, and collected into sori; leaves circinate.

Family *Osmundaceae*. Sporangia globose, mostly stalked with but a trace of a ring, splitting vertically.

Family *Gleicheniaceae*. Sporangia globose, sessile, with a horizontal ring, splitting vertically.

Family *Selizaceae*. Sporangia ovate or sub-globose, sessile, with an apical horizontal ring, splitting vertically.

Family *Hymenophyllaceae*. Sporangia compressed, sessile upon an elongated involucre marginal receptacle; ring horizontal or oblique; splitting vertically.

Family *Cyatheaceae*. Tree-ferns. Sporangia compressed, sessile on a low involucre receptacle on the leaf surface; ring vertical or oblique; splitting transversely.

Family *Polypodiaceae*. Sporangia compressed, mostly stalked, collected in sori which are often covered or surrounded by an involucre (indusium); ring vertical; splitting transversely.

Order *HYDROPTERIDEAE*. Water-ferns. Spores of two kinds (macrospores and microspores), developed from cells in sporangia inclosed in modified leaves ("conceptacles").

Family *Salvinaceae*. Each conceptacle containing but one kind of spore. Small, floating aquatics.

Family *Marsiliaceae*. Each conceptacle containing both kinds of spores. Semi-aquatic plants rooting in the mud.

Class 12. *EQUISETINEAE*. The Horsetails or Joint Rushes. Stems of the sporophore hollow, jointed, the joints solid; leaves rudimentary, whorled. Species, 20.

Order *EQUISETACEAE*. Spores developed in sporangia on the under surface of modified (pettate) leaves at the summit of the stem.

Family *Equisetaceae*. With the characters of the order.

Class 13. *LYCOPODINEAE*. The Lycopods. Stems of the sporophore solid, dichotomously branched, leaves small, narrow, and scattered or crowded. Species, 482.

Order *LYCOPODIACEAE*. Club-mosses. Leafy, branching plants; sporangia single in the axils of the small upper leaves; spores all alike.

Family *Lycopodiaceae*. With the characters of the order.

Order *SELAGINELLEAE*. Little Club-mosses. Leafy, branching plants; sporangia single in the axils of the small upper leaves; spores of two kinds, viz., macrospores and microspores.

Family *Selaginellaceae*. With the characters of the order.

Family *Isoetaceae*. With the characters of the order.

Branch VI. *ANTHOPHYTA*. Anthophytes. Flowering Plants.

Oöphore small, permanently inclosed within the spore-wall; sexual reproduction by the union of two protoplasts and the formation of a sporophore consisting of roots, stem, and leaves, some of the latter spore-bearing (forming the "flowers"); microspores (pollen-cells) free, macrospores permanently inclosed in the sporangium. See *ANTHOPHYTES*.

Class 14. *GYMNOSPERMEE*. The Gymnosperms. Spore-bearing leaves (carpels) of the sporophores open; seeds naked. Species, 420.

Order *CYCADEAE*. The Cycads. Stem simple or rarely branched, not resinous; pith large; leaves large, pinnately compound, crowded upon the upper part of the stem. See *CYCADS*.

Family *Cycadaceae*. Carpellary leaves developed on the main axis.

Family *Zamiaceae*. Carpellary leaves developed on axillary, deciduous axes.

Order *CONIFERAE*. The Conifers. Stem branched, usually resinous; pith slender; leaves small, simple, mostly crowded upon the stem, sometimes scattered. See *CONIFERS*.

Family *Taxaceae*. Carpellary leaves solitary; seeds with a fleshy aril.

Family *Pinaceae*. Carpellary leaves clustered on an axis, forming a cone; seeds without an aril.

Order *GNETACEAE*. The Joint Firs. Stem usually branched, not resinous; pith slender; leaves (mostly) small, opposite, upon elongated internodes, or large, and only two on a short thick stem. See *JOINT FIRS*.

Family *Gnetaceae*. With the characters of the order.

Class 15. *ANGIOSPERMEE*. The Angiosperms. Spore-bearing leaves (carpels) of the sporophore folded so as to inclose the ovules in a cavity, thus constituting the pistil; seeds inclosed. Species about 100,000.

The relationship of the orders of this class may be indicated by the accompanying diagram (Fig. 3). The orders

Fig. 3.—Diagram showing the relationship of the orders of the Angiosperms.

on the left constitute the Monocotyledons, those in the center and to the right the Dicotyledons. There are thus several diverging genetic lines from a common point of origin.

Sub-class *MONOCOTYLEDONEAE*. The Monocotyledons. Leaves of young sporophore alternate; leaves of mature sporophore usually parallel-veined; fibrovascular bundles of the stems scattered, not arranged in rings. See *MONOCOTYLEDONS*.

Order *APOCARPEAE*. Pistils separate, superior to all other parts of the flower.

Family *Alismaceae*. Aquatic or paludose herbs, with mostly radical, often large, leaves; flowers small to large; perianth in two whorls of three leaves each (calyx and corolla). See *WATER-PLANTAIN FAMILY*.

Family *Triurideae*. Very small, pale, leafless plants growing in wet places in tropical countries.

Family *Naiadaceae*. Aquatic or paludose herbs, with mostly alternate stem-leaves; flowers mostly small and inconspicuous; perianth none, or of one to six leaves in one or two whorls. See *PONDWEED FAMILY*.

Order *CORONARIEAE*. Pistils united (usually three), forming a compound pistil, superior; flower-leaves (usually six in two whorls) delicate and corolla-like.

Family *Roxburghiaceae*. Pistil one-celled; stamens four; perianth of two similar whorls, each of two similar leaves.

Family *Liliaceae*. Pistil mostly three-celled; stamens six; perianth of two similar whorls, each of three similar leaves. See *LILY FAMILY*.

Family *Pontederiaceae*. Aquatic herbs, with a three or one celled pistil; stamens six or three; perianth of two similar whorls, each of three similar or dissimilar leaves.

Family *Philydraceae*. Pistil three-celled; stamen one; perianth of two similar whorls, each of two dissimilar leaves.

Family *Nyctaginaceae*. Rush-like plants, with a one-celled or incompletely three-celled pistil; stamens three; perianth of two dissimilar whorls, each of three similar leaves.

Family *Mayaceae*. Slender, creeping, moss-like plants, with one-celled pistil; stamens three; perianth of two dissimilar whorls, each of three similar leaves.

Family *Commelinaceae*. Succulent herbs, with a three or

two celled pistil; stamens six; perianth of two dissimilar whorls of three similar leaves.

Family *Rupaleaceae*. Tall, sedge-like marsh-herbs, with a three-celled pistil; stamens six, in pairs; perianth of two dissimilar whorls, each of three similar leaves.

Order NUDIFLORÆ. Compound pistil, tricarpeillary, superior; flower-leaves reduced to scales or entirely wanting.

Family *Pandanaceae*. Shrubs or trees with spirally crowded, narrow, stiff leaves on the ends of the branches; pistil one-celled; ovules one or three.

Family *Cyclanthaceae*. Mostly herbaceous plants, with broad, petioled leaves having parallel venation; pistil one-celled; ovules many, on four parietal placentæ.

Family *Typhaceae*. Aquatic or padulous herbs, with linear, sheathing leaves; pistil one-celled; ovule one. See CAT-TAIL.

Family *Aroideae*. Mostly herbaceous plants, with broad, petioled leaves, having reticulate venation; pistil one to four celled; ovules one or more.

Family *Lemnaceae*. Very small, floating, aquatic herbs; pistil one-celled; ovules one or more.

Order CALYCINÆ. Compound pistil tricarpeillary, superior; flower-leaves reduced to rigid or herbaceous scales.

Family *Flagellariaceae*. Erect or climbing herbs, with long, narrow leaves; pistil three-celled; ovules solitary; fruit a one or two seeded berry.

Family *Juncaceae*. The Rushes. Herbs with narrow leaves; pistil one to three celled; ovules solitary or many; fruit a dry three-valved pod. See RUSH.

Family *Palmaceae*. The Palms. Trees or shrubs with compound leaves; pistil one to three celled; fruit a one-seeded berry or drupe (rarely two to three seeded). See PALM FAMILY.

Order GLUMACEÆ. Compound pistil reduced to one or two carpels (rarely tricarpeillary); ovules solitary; flower-leaves reduced to small scales, or entirely wanting.

Family *Eriocaulaceae*. Rush-like herbs, with flowers in close heads; perianth segments six or less, small; pistil three or two celled; ovules orthotropous, pendulous.

Family *Centropideaceae*. Small rush-like herbs, with flowers in spikes or heads; perianth none; pistil one to three celled; ovules orthotropous, pendulous.

Family *Restiaceae*. Rush-like herbs or undershrubs, with spiked, racemed, or paniced flowers; perianth segments six or less, chaffy; pistil one to three celled; ovules orthotropous, pendulous.

Family *Cyperaceae*. The Sedges. Grass-like herbs, with three-ranked leaves; perianth segments bristly, or none; pistil one-celled; ovules anatropous, erect. See SEDGE FAMILY.

Family *Gramineae*. The Grasses. Mostly erect herbs, with hollow, jointed stems, and two-ranked leaves; perianth segments of two to six thin scales, or none; pistil one-celled; ovules anatropous, ascending. See GRASSES.

Order HYDRALES. Compound tricarpeillary pistil inferior to all other parts of the flower; flower-leaves in each whorl alike in shape (flower regular); seeds without endosperm.

Family *Hydrocharideae*. Small aquatic herbs, mostly inhabiting the fresh waters of temperate climates.

Order EPIGYNÆ. Compound tricarpeillary pistil inferior; flower-leaves in each whorl mostly alike in shape (flower regular); seeds with endosperm.

Family *Dioscoreaceae*. Mostly twining herbs, with broad, petioled, longitudinally veined leaves; pistil three-celled; ovules two in each cell; stamens six.

Family *Taccaceae*. Stemless herbs, with broad, pinnately parallel-veined leaves; pistil one-celled; ovules many; stamens six.

Family *Amaryllidaceae*. Leaves narrow, or the blades broad with longitudinal veins; pistil three-celled; ovules many; stamens six (or three). See AMARYLLIS FAMILY.

Family *Iridaceae*. Leaves sword-shaped; pistil three-celled; ovules many; stamens three. See IRIS FAMILY.

Family *Hamodoraceae*. Leaves sword-shaped; pistil three-celled; ovules one to many; stamens six.

Family *Bromeliaceae*. Leaves mostly rosulate; external perianth-whorl calycine; pistil three-celled; ovules many; stamens six. See BROMELIA FAMILY.

Family *Scitamineae*. Leaves mostly ample, pinnately parallel veined; external perianth-whorl calycine; pistil three-celled or becoming one-celled; stamens mostly one (rarely five). See BANANA.

Order MICROSPERMÆ. Compound tricarpeillary pistil inferior; flower-leaves in each whorl mostly unlike in shape (flower irregular); seeds without endosperm.

Family *Burmanniaceae*. Flowers regular; stamens three or six.

Family *Orchidaceae*. The Orchids. Flowers irregular; stamens one or two. See ORCHIDS.

Sub-class DICOTYLEDONEÆ. The Dicotyledons. Leaves of young sporophore opposite; leaves of mature sporophore usually reticulate-veined; fibrovascular bundles of the stems in one or more rings.

A. CHORIPETALE. Inner perianth-whorl (corolla) of separate leaves (petals), frequently rudimentary or wanting; ovules usually with two coats.

Order THALAMIFLORÆ. Outer perianth-whorl (calyx) usually of separate leaves (sepals), and with the other parts of the flower inserted on the flower axis (torus).

Sub-order RANALES. Pistils one to many, monoarpeillary (or rarely united); stamens generally indefinite; embryo mostly small in copious endosperm.

Family *Ranunculaceae*. Mostly herbs with alternate leaves; petals present in one whorl or absent; sepals deciduous. See CROWFOOT.

Family *Dilleniaceae*. Mostly shrubs and trees, with alternate leaves; petals present, in one whorl; sepals persistent.

Family *Calycanthaceae*. Shrubs with opposite leaves; petals present in many whorls; seeds without endosperm. See CALYCANTHUS.

Family *Magnoliaceae*. Shrubs and trees with alternate leaves, and usually large flowers; petals present in one to many whorls; receptacle usually elongated. See MAGNOLIA FAMILY.

Family *Anonaceae*. Shrubs and trees with alternate leaves; petals present in two whorls of three each; endosperm ruminated. See PAPAWE.

Family *Myristicaceae*. Trees or shrubs with alternate leaves, and small and inconspicuous diceious flowers; petals absent; pistil one (or a second rudiment), one-seeded; endosperm ruminated. See NUTMEG.

Family *Monimiaceae*. Trees and shrubs with opposite or whorled leaves and diclinous flowers; petals absent; pistils many, one-ovuled, imbedded in the receptacle.

Family *Chloranthaceae*. Mostly trees and shrubs with opposite leaves and small flowers. No perianth whatever; pistil one, with one ovule.

Family *Menispermaceae*. Twining shrubs with alternate leaves and small diclinous flowers; petals present in two whorls.

Family *Berberidaceae*. Mostly shrubs with alternate leaves and perfect flowers. Petals usually present in one to three whorls; pistil one (rarely more) with many ovules. See BARBERRY FAMILY.

Family *Nymphaeaceae*. Aquatic herbs with floating leaves; petals present in one to many whorls; pistils several or united. See WATER-LILY FAMILY.

Sub-order PARIETALES. Pistil of two or more united carpels, mostly one-celled, with parietal placentæ; stamens indefinite or definite; endosperm none or copious.

Family *Sarraceniacae*. Herbs with pitcher-shaped leaves, sepals four to five, petals five or none; stamens indefinite; pistil three to five carpellary. See PITCHER-PLANTS.

Family *Papaveraceae*. Mostly milky-juiced plants, with alternate leaves; sepals two to three, petals four or more (or none); stamens indefinite; pistil two to many carpellary. See POPPY FAMILY.

Family *Cruciferae*. Herbs, rarely shrubs, with alternate (or opposite) leaves; sepals four, petals four; stamens six or four; pistil two-carpellary. See MUSTARD FAMILY.

Family *Capparidaceae*. Herbs, shrubs, and trees with alternate (or opposite) leaves; sepals four, petals four (or none); stamens four (or many); pistil two to six carpellary.

Family *Resedaceae*. Herbs and shrubs with scattered leaves; sepals four to eight, petals four to eight (or two, or none); stamens three to forty; pistil two to six carpellary. See MIGNONNETTE and WELD.

Family *Cistaceae*. Herbs and shrubs with opposite (or alternate) leaves; sepals three to five; petals five; stamens many; pistil three to five carpellary.

Family *Violaceae*. Herbs and shrubs with alternate (or opposite) leaves; sepals and petals five, irregular; stamens five; pistil three-carpellary. See VIOLET FAMILY.

Family *Canellaceae*. Aromatic trees with alternate leaves; sepals four to five; petals four to five (or none); stamens twenty to thirty; pistil two to five carpellary.

Family *Bixaceae*. Shrubs and trees with alternate leaves; sepals three to seven; petals various (or none); stamens indefinite; pistil two to many carpellary.

Family *Samydaceae*. Trees and shrubs with alternate leaves; sepals three to seven; petals three to seven (or none); stamens definite or indefinite; pistils three to five carpellary.

Family *Laecistemaceae*. Shrubs and trees with alternate leaves; perianth none; stamen one; pistil three or two carpellary.

Family *Nepenthaceae*. Undershrubs with pitcher-shaped leaves; sepals four or three; petals none; stamens four to sixteen; pistil four to three carpellary. See PITCHER-PLANTS.

Sub-order POLYGALALES. Pistil mostly of two united carpels, two-celled; stamens as many or twice as many as the petals; seeds endospermous.

Family *Pittosporaceae*. Trees and shrubs with alternate leaves; sepals, petals, and stamens five each. See PITTOSPORUM FAMILY.

Family *Tremandraceae*. Small shrubs with alternate, opposite, or whorled leaves; sepals and petals three, four, or five each; stamens twice as many.

Family *Polygalaceae*. Herbs, shrubs, and trees with alternate leaves; sepals five; petals three to five; stamens usually eight.

Family *Vochysiaceae*. Shrubs and trees with opposite or whorled leaves; sepals five; petals one, three, or five; stamens several, usually but one fertile.

Sub-order CARYOPHYLLALES. Pistil usually of three or more united carpels, mostly one-celled, with a free central placenta and many ovules (sometimes with parietal placenta, or reduced to a one-celled, one-ovuled ovary); stamens as many or twice as many as the petals; seeds endospermous, usually with a curved embryo.

Family *Frankeniaceae*. Herbs and undershrubs with opposite leaves; petals four to five, long-stalked; ovules many on two to four parietal placentae.

Family *Caryophyllaceae*. Herbs (and shrubs) with opposite or whorled leaves; petals three to five, stalked or not; ovules many on a central placenta. See PINK FAMILY.

Family *Portulacaceae*. Mostly succulent herbs, with alternate leaves; petals four to five; ovules many on a central placenta. See PURSLANE FAMILY.

Family *Tamariscaceae*. Shrubs and herbs with minute alternate leaves; petals five; ovules many on central or parietal placenta. See TAMARISK FAMILY.

Family *Salicaceae*. Shrubs and trees with alternate leaves; perianth none; ovules many on two to four parietal placentae. See WILLOW FAMILY.

Family *Ficoidea*. Herbs and undershrubs with alternate, opposite, or whorled leaves; petals indefinite or none; seeds many on parietal placenta, or one, and erect.

Family *Nyctaginaceae*. Herbs and shrubs with opposite leaves; petals none; sepals petaloid; ovule one, erect.

Family *Illiciaceae*. Herbs (and shrubs) with opposite leaves; petals scale-like or none; ovule one, erect or pendulous.

Family *Amaranthaceae*. Herbs (and shrubs) with mostly alternate leaves; sepals three to five, dry and scarious; petals none; ovules one or more, basal, campylotropous. See AMARANTH FAMILY.

Family *Chenopodiaceae*. Herbs, shrubs (and trees) with mostly alternate leaves; sepals five or less or none, greenish or succulent; petals none; ovule one, basal, campylotropous. See CHENOPODS.

Family *Phytolaccaceae*. Herbs, shrubs, and trees with usually alternate leaves; petals none (or four to five); carpels several, distinct or nearly so; one-ovuled. See POKEWEEF FAMILY.

Family *Batideae*. Shrubs with opposite leaves; petals none; ovary four-celled; ovules solitary, erect.

Family *Polygonaceae*. Herbs, shrubs (and trees) with alternate leaves; petals none; ovule one, erect, orthotropous. See BUCKWHEAT FAMILY.

Sub-order GERANIALES. Pistil of several carpels, on the more or less enlarged, annular or glandular base (disk) of the receptacle; ovules one to two (or many), mostly pendulous.

Family *Linaceae*. Herbs and shrubs with alternate, simple leaves; pistil three to five celled; endosperm fleshy or none. See FLAX FAMILY.

Family *Humiriaceae*. Trees with alternate, simple leaves; pistil five to seven celled; endosperm copious.

Family *Malpighiaceae*. Trees and shrubs with usually opposite, simple or lobed leaves; pistil tricarpeillary; endosperm none.

Family *Zygophyllaceae*. Herbs and shrubs with usually opposite, compound leaves; pistil lobed, four to five celled; endosperm copious or none.

Family *Geraniaceae*. Herbs, shrubs, and trees with opposite or alternate compound (or simple) leaves; torus elongated; pistil lobed, three to five celled; endosperm sparse or none. See GERANIUM FAMILY.

Family *Rutaceae*. Herbs, shrubs, and trees with glandular-dotted, opposite, simple or compound leaves; pistil lobed, four to five celled; endosperm fleshy or none. See RUE.

Family *Simarubaceae*. Trees and shrubs with generally alternate, non-glandular, simple or compound leaves; pistil lobed, one to five celled; endosperm fleshy or none.

Family *Ochnaceae*. Shrubs and trees with alternate, coriaceous, simple leaves; pistil lobed, one to ten celled; endosperm fleshy or none.

Family *Bursaceae*. Balsamic trees and shrubs with alternate, compound leaves; pistil two to five celled; endosperm none.

Family *Meliaceae*. Trees and shrubs with alternate, compound leaves; pistil three to five celled; endosperm present or none.

Family *Chaillotiaceae*. Trees and shrubs with alternate, simple leaves; pistil two to three celled; endosperm none.

Sub-order GUTTIFERALES. Pistil mostly of two or more carpels, two-celled, with axile placentae; stamens usually indefinite; endosperm usually wanting.

Family *Elalineae*. Small marsh-herbs or undershrubs, with small, opposite or whorled leaves; inflorescence axillary; petals imbricated; stamens four to ten.

Family *Hypericaceae*. Herbs, shrubs (and trees) with opposite or whorled, glandular dotted leaves; inflorescence dichotomous or paniculate; petals contorted or imbricated; stamens in three to five clusters. See ST. JOHN'S-WORT FAMILY.

Family *Guttiferae*. Trees and shrubs with opposite or whorled leaves; inflorescence often trichotomous; petals imbricated or contorted.

Family *Ternstroemiaceae*. Trees and shrubs usually with alternate leaves; inflorescence various; petals imbricated. See TEA FAMILY.

Family *Dipterocarpeae*. Trees and shrubs with alternate leaves; inflorescence panicle; petals contorted, fruiting calyx enlarged in fruit.

Family *Chloraceae*. Trees and shrubs with alternate leaves; inflorescence dichotomous; petals contorted.

Sub-order MALVALES. Pistil usually of three to many carpels with as many cells (sometimes greatly reduced); ovules few; stamens indefinite, monadelphous, branched, or by reduction separate and few; endosperm present or absent.

Family *Malvaceae*. Herbs, shrubs, and trees with alternate leaves; flowers perfect, with petals; stamens monadelphous, one-celled; pistil five to many celled; endosperm little or none. See MALLOW FAMILY.

Family *Sterculiaceae*. Trees and shrubs with alternate leaves; flowers perfect, or diclinous, with or without petals; stamens monadelphous or polyadelphous, two-celled; pistils four to many celled; endosperm present or none.

Family *Tiliaceae*. Trees, shrubs (and herbs) with mostly alternate leaves; flowers mostly perfect, with petals; stamens polyadelphous or free two-celled; pistil two to ten celled; endosperm present or none. See LINDEN.

Family *Euphorbiaceae*. Herbs, shrubs, and trees, mostly with a milky juice, and alternate or opposite leaves; flowers diclinous, with a perianth of one or two whorls, or none; stamens two-celled, free or united; pistil usually three-celled; endosperm copious. See SPURGEWORTS.

Family *Balanopseae*. Trees and shrubs with alternate leaves; flowers dioecious, apetalous, the staminate in catkins, the pistillate solitary, producing acorn-like, two-celled, two-seeded fruits; seeds endospermous.

Family *Empetraceae*. Heath-like shrubs with small leaves; flowers small, mostly dioecious, solitary or in heads; petals present; stamens two or three, two-celled; pistil two to many celled; seeds solitary, endospermous.

Family *Urtiaceae*. Herbs, shrubs, and trees with alternate (or opposite) leaves; flowers mostly diclinous, without petals; stamens few, two-celled; pistil monocarpeillary, one-celled, mostly one-seeded; endosperm none. See NETTLEWORTS.

Family *Platanaceae*. Trees with alternate leaves and monocious flowers in globose heads; perianth none; pistil one-celled, one-ovuled; endosperm minute. See PLANT-TREE FAMILY.

Family *Leitneriaceae*. Shrubs with alternate leaves and

dioecious flowers in catkins; perianth minute or none; pistil one-celled, one-ovuled; endosperm minute.

Family *Ceratophyllaceae*. Aquatic herbs with verticillate, divided leaves; flowers dioecious; perianth none; pistil one-celled, one-ovuled; endosperm none.

Family *Piperaceae*. Herbs, shrubs, and trees with alternate (or opposite) leaves; flowers perfect or dichinous, mostly spicate; perianth none; pistil one-celled, one-ovuled; endosperm present. See PIPERACEÆ.

Family *Podostemaceae*. Small, aquatic, sometimes thallose plants; flowers perfect or dichinous; perianth none; pistil one to three celled; ovules many; endosperm none.

Order CALYCFLOREÆ. Calyx usually of united sepals; petals and stamens inserted on the calyx or the adherent disk; ovary mostly inferior.

Sub-order ROSALES. Flowers usually perfect, regular or irregular; pistils separate or more or less united, sometimes united with the calyx tube; styles usually distinct.

Family *Connaraceae*. Trees and shrubs with alternate, compound leaves; stamens definite; pistils one to five, free; ovules two, ascending orthotropous.

Family *Rosaceae*. Herbs, shrubs, and trees with mostly alternate leaves; stamens usually indefinite; pistils one to many, free (or coalesced and inferior); ovules usually two, anatropous. See ROSE.

Family *Mimosaceae*. Trees, shrubs (and herbs) with alternate, pinnately compound leaves, often reduced to phyllodes; flowers regular; petals valvate; stamens mostly indefinite, usually free; pistils monoecarpellary, usually one (rarely five to fifteen); ovules anatropous.

Family *Caesalpiniaceae*. Trees, shrubs, and herbs with mostly alternate, pinnately compound leaves; flowers mostly irregular; petals imbricate; stamens ten or less, usually free; pistil one, monocarpellary; ovules anatropous.

Family *Papilionaceae*. Trees, shrubs, and herbs with mostly alternate, simple or compound, often tendril-bearing leaves; flowers irregular (papilionaceous); petals imbricate; stamens usually ten, commonly monadelphous or diadelphous; pistil one, monoecarpellary; ovules amphitropous.

NOTE.—The three foregoing families are usually considered to be sub-families of the LEGUMINOSÆ (q. v.).

Family *Saxifragaceae*. Herbs, shrubs, and trees with alternate or opposite leaves; stamens mostly definite; pistil usually compound; ovules indefinite. See SAXIFRAGE FAMILY.

Family *Crassulaceae*. Mostly fleshy herbs, with opposite or alternate leaves; stamens definite; pistils several, free or little united; ovules indefinite.

Family *Droseraceae*. Gland-bearing marsh-herbs; stamens mostly definite; pistil syncarpous, one to three celled, superior; ovules many, on basal, axile or parietal placentae. See DROSERA and INSECTIVOROUS PLANTS.

Family *Hamamelidaceae*. Shrubs and trees with mostly alternate leaves; stamens few or many; pistil bicarpellary, its ovary inferior; ovules solitary or many.

Family *Bruniaceae*. Heath-like shrubs with small leaves; stamens definite; pistil mostly three-celled, inferior to superior; ovules one to many, pendulous.

Family *Haborageae*. Aquatic or terrestrial herbs with mostly alternate leaves; pistil one to four celled, inferior; ovules solitary, pendulous.

Sub-order MYRTALES. Flowers regular or nearly so, usually perfect; pistil of united carpels, usually inferior; placentae axile or apical (rarely basal); style one (rarely several); leaves simple, usually entire.

Family *Rhizophoraceae*. Trees and shrubs with mostly opposite leaves; stamens two to four times the number of petals; pistil two to six celled, usually inferior; ovules two, pendulous. See MANGROVE.

Family *Combretaceae*. Trees and shrubs with opposite or alternate leaves; stamens usually definite; pistil one-celled, inferior; ovules two to six, or solitary, pendulous.

Family *Myrtaceae*. Trees and shrubs with opposite or alternate leaves; stamens indefinite; pistil two to many celled, inferior; ovules two to many, placentae basal or axile. See MYRTACEÆ.

Family *Melastomaceae*. Herbs, shrubs, and trees with mostly opposite leaves; stamens usually double the number of petals; pistil two to many celled, free or adherent to the calyx tube; ovules minute, numerous, on axile or parietal placentae.

Family *Lythraceae*. Herbs, shrubs, and trees usually with opposite leaves, and four-angled branches; stamens definite or indefinite; pistil two to six celled, free; ovules numerous, on axile placentae.

Family *Onagraceae*. Herbs (shrubs and trees) with opposite or alternate leaves; stamens one to eight, rarely more; pistil usually four-celled, inferior; ovules one to many, on axile placentae.

Family *Aristolochiaceae*. Herbaceous or shrubby plants with alternate leaves; petals absent; stamens six, rarely more; pistil four or six celled, inferior; ovules numerous, on axile (or protruding parietal) placentae. See BIRTHWORTS.

Family *Cytinaceae*. Fleshy, parasitic herbs, leafless or nearly so; petals four or none; stamens eight to many; pistil one-celled, or imperfectly many-celled, inferior; ovules minute, very numerous, on parietal or pendulous-folded placentae. See VINE RAPES.

Sub-order PASSIFLORALES. Flowers usually regular, perfect or dichinous; pistil syncarpous, one-celled, its ovary usually inferior; placentae parietal; styles free or connate; leaves ample, entire, lobed.

Family *Loasaceae*. Herbs with opposite or alternate leaves; flowers perfect; sepals and petals dissimilar; stamens indefinite; endosperm fleshy or none.

Family *Turneraceae*. Herbs and shrubs with alternate leaves; flowers perfect; sepals and petals dissimilar; stamens definite; ovary free; endosperm copious.

Family *Passifloraceae*. Climbing herbs, shrubs (and trees) with alternate leaves; flowers perfect; sepals and petals similar; stamens definite; ovary free; endosperm fleshy. See PASSION-FLOWER FAMILY.

Family *Cucurbitaceae*. Mostly climbing or prostrate herbs and undershrubs, with alternate leaves; flowers dichinous; stamens definite (usually three); ovary inferior; endosperm none. See CUCUMBER FAMILY.

Family *Begoniaceae*. Mostly herbs with alternate leaves; flowers dichinous; stamens indefinite; ovary inferior, usually triangular; endosperm little or none. See BEGONIACEÆ.

Family *Dalisiaceae*. Herbs or trees with alternate leaves; flowers mostly dichinous; stamens four to many; ovary inferior, usually gaping at the top; endosperm scanty.

Sub-order CACTALES. Flowers regular or nearly so, and perfect; pistil syncarpous, one-celled, with parietal placentae, its ovary inferior; style divided at the apex; endosperm present or none; embryo curved. Fleshy-stemmed, mostly leafless plants.

Family *Cactaceae*. With the characters of the sub-order. See CACTUS FAMILY.

Sub-order CELASTRALES. Flowers usually regular; disk of the receptacle from glandular to annular or tumid, sometimes adnate to the calyx tube or the pistil, or rudimentary or entirely wanting; pistil one to many celled (rarely apocarpous); ovules one to three, pendulous or erect; endosperm present or none.

Family *Oleaceae*. Trees and shrubs with usually alternate simple leaves; disk free or adnate to the calyx; petals present; pistil one to three celled, ovules two or three, pendulous; endosperm fleshy.

Family *Hicnieae*. Trees and shrubs with alternate or opposite, simple leaves; disk obsolete; petals present; pistil three to many celled; ovule one, pendulous; endosperm fleshy. See HOLLY FAMILY.

Family *Celastraceae*. Shrubs and trees with usually alternate, simple leaves; disk fleshy; petals present; pistil two to five celled; ovules usually two, erect or pendulous; endosperm fleshy. See SPINDLE-TREE FAMILY.

Family *Stackhousieae*. Herbs with simple, alternate leaves; disk thin, on the base of the calyx; petals present; ovary two to five celled; ovule one, erect; endosperm fleshy.

Family *Rhamnaceae*. Trees and shrubs with usually alternate simple leaves; disk adnate to the calyx; petals present; pistil two to four celled; ovules one or two, erect; endosperm fleshy. See BUCKTHORN.

Family *Ampelideae*. Shrubs and trees with alternate, simple or compound leaves; disk adnate to the calyx; petals coherent; valvate; pistil two-celled, two-ovuled (or three to six celled, one-ovuled); endosperm often ruminant. See VINE FAMILY.

Family *Lauraceae*. Aromatic trees and shrubs, with alternate, simple leaves; disk none; petals none; pistil one-celled; ovule one, pendulous; endosperm none. See LAUREL FAMILY.

Family *Proteaceae*. Shrubs, trees (and herbs) with scattered, simple, usually coriaceous leaves; disk none; petals none; pistil one-celled; ovules one, erect or pendulous; endosperm little or none.

Family *Thymelaeaceae*. Shrubs, small trees (and herbs)

with scattered or opposite, usually coriaceous, simple leaves; disk none; petals none; pistil one-celled; ovule one, pendulous. See DAPHNE.

Family *Penæaceæ*. Evergreen, heath-like shrubs, with small, opposite leaves; disk none; petals none; pistil four-celled; ovules two, erect; endosperm none.

Family *Elæagnaceæ*. White- or brown-scurfy trees and shrubs, with alternate or opposite simple leaves; disk lining the perianth tube; petals none; pistil one-celled; ovule one, ascending; endosperm none or scanty. See ELÆAGNACEÆ.

Family *Santalaceæ*. Parasitic herbs, shrubs, and trees, with alternate or opposite simple leaves; disk epigynous; petals none; pistil one-celled; ovules two to five, pendulous; endosperm present.

Family *Loranthaceæ*. Parasitic herbs or shrubs, with opposite or alternate simple leaves, often reduced to bracts; disk epigynous; petals none; pistil one-celled, inferior; ovule one, erect; endosperm present. See MISTLETOE.

Family *Balanophoraceæ*. Parasitic, leafless herbs, monoecious or dioecious; disk none; petals none; pistil one-celled, inferior; ovule one, erect; endosperm present.

Sub-order SAPINDALES. Flowers usually regular, often much reduced; disk of the receptacle tumid, adnate to the calyx, lining its tube, or rudimentary, or entirely wanting; pistils one to several celled; ovules one or two, erect, ascending or pendulous; endosperm mostly none.

Family *Sapindaceæ*. Trees and shrubs with alternate (or opposite), mostly compound leaves; disk present or none; petals three to five, or none; pistil one to four celled; ovules one or two, ascending; endosperm usually none. See SOAPWORT.

Family *Sabiaceæ*. Trees and shrubs with alternate, simple, or compound leaves; disk small; petals present; pistil two or three celled; ovules one or two, horizontal or pendulous; endosperm none.

Family *Anacardiaceæ*. Trees and shrubs with alternate, usually compound leaves; disk usually annular; petals three to seven, or none; pistil one to five celled; ovules solitary, pendulous (or erect); endosperm scanty or none. See SUMACH FAMILY.

Family *Juglandaceæ*. Trees and shrubs with alternate, compound leaves; disk forming a cupule; petals none; pistil one-celled, inferior; ovule one, erect, orthotropous; endosperm none. See WALNUT FAMILY.

Family *Myricaceæ*. Shrubs and trees with alternate, simple leaves; disk none; petals none; pistil free, one-celled; ovule one, erect, orthotropous; endosperm none.

Family *Cupulifera*. Trees and shrubs with alternate, simple leaves; disk none; petals none; pistil two to six celled, inferior; ovules two, erect or pendulous; endosperm none. See OAK.

Family *Casuarinaceæ*. Shrubs and trees with striate stems, bearing whorls of reduced scale-like leaves; disk none; petals none; pistil one-celled; ovules two, lateral, half anatropous; endosperm none. (Treb's studies seem to indicate a nearer relationship of this family with the Gymnosperms.) See BEEFWOODS and CASUARINA.

Sub-order UMBELLALES. Flowers regular, usually perfect; stamens usually definite; pistil syncarpous, one to many celled, its ovary inferior, ovule solitary, pendulous; styles free or united at the base; endosperm copious; embryo usually minute.

Family *Cornaceæ*. Shrubs and trees (rarely herbs) with usually opposite leaves; flowers umbellate, capitate, or corymbose; ovary two to four celled; fruit drupaceous. See CORNEL and DOGWOODS.

Family *Araliaceæ*. Trees, shrubs (and herbs) with alternate leaves; flowers in umbels, heads, or panicles; ovary two to fifteen celled; fruit a berry with a fleshy or dry exocarp. See GINSENG FAMILY.

Family *Umbellifera*. Herbs (shrubs and trees) with alternate leaves; flowers small, mostly umbellate; ovary two-celled; fruit splitting into two dry indehiscent mericarps. See UMBELLIFERS.

B. GAMOPETELÆ. Leaves of inner perianth-whorl (corolla) grown together into one piece, sometimes wanting; ovules usually with but one coat.

Order HETEROMERÆ. Pistil of three or more united carpels, its ovary generally superior; stamens as many or twice as many as the corolla lobes.

Sub-order PRIMULALES. Flowers regular, mostly perfect; stamens mostly opposite to the corolla lobes; ovary pluricarpellary, one-celled; with a free central placenta.

Family *Plumbaginaceæ*. Herbs with alternate or clus-

tered leaves; stamens opposite to the petals; ovule one, basal, anatropous; fruit capsular; dehiscence valvate, or irregular.

Family *Plantaginaceæ*. Herbs with alternate or clustered leaves; stamens alternate with the petals; ovary mostly two-celled; ovules many; placenta axile; fruit a circumscissile capsule. See PLANTAIN FAMILY.

Family *Primulaceæ*. Herbs with alternate or opposite, sometimes clustered, leaves; stamens opposite to the petals; ovules many; fruit a capsule dehiscing longitudinally from the apex, or circumscissile. See PRIMROSE FAMILY.

Family *Myrsinaceæ*. Trees and shrubs with alternate (or opposite) leaves; stamens opposite to the petals; ovules usually few; fruit a drupe or berry.

Sub-order ERICALES. Flowers regular, perfect; stamens alternate with the corolla lobes; cells of the ovary or placenta two to many; seeds minute.

Family *Vacciniaceæ*. Shrubs and trees with mostly alternate, evergreen leaves; ovary inferior, two to ten celled; fruit fleshy or succulent; anthers dehiscing by an apical pore.

Family *Ericaceæ*. Shrubs and trees (a few herbs) with alternate, opposite or whorled, mostly evergreen leaves; ovary superior, two to twelve celled; fruit usually a capsule; anthers dehiscing by an apical pore. See HEATH FAMILY.

Family *Monotropææ*. Pale, leafless, parasitic herbs; ovary superior; one to several celled; fruit a capsule; anthers dehiscing by a slit.

Family *Epacrideæ*. Shrubs and small trees with mostly alternate, evergreen leaves; ovary superior, mostly two to ten celled; fruit capsular or drupaceous; anthers dehiscing by a slit.

Family *Diapensiaceæ*. Low undershrubs with alternate, evergreen leaves; ovary superior, three-celled; fruit a capsule; anthers dehiscing by a slit. See DIAPENSIA.

Family *Lennoaceæ*. Parasitic leafless herbs; ovary superior, ten to fourteen carpellary, twenty to twenty-eight celled; ovules solitary; anthers dehiscing by a slit.

Sub-order EBENALES. Flowers regular, perfect, or dichinous; stamens opposite to the corolla lobes; ovary two to many celled; seeds mostly solitary or few, usually large.

Family *Sapotaceæ*. Trees and shrubs with mostly alternate leaves; flowers mostly perfect; stamens attached to the corolla; ovary superior. See STAR-APPLE FAMILY.

Family *Ebenaceæ*. Trees and shrubs with mostly alternate leaves; flowers mostly dioecious; stamens usually free from the corolla; ovary superior. See EBONY.

Family *Styracaceæ*. Trees and shrubs with alternate leaves; flowers mostly perfect; stamens attached to the corolla; ovary usually inferior. See STYRACACEÆ.

Order BICARPELLATÆ. Pistil of two united carpels, its ovary generally superior; stamens as many as the corolla lobes or less.

Sub-order POLEMONIALES. Corolla regular; stamens alternate with the corolla lobes and of the same number; leaves mostly alternate.

Family *Polemoniaceæ*. Herbs (and shrubs) with alternate or opposite leaves; corolla lobes contorted; ovary tricarpellary, three-celled; ovules two or more. See PHLOX FAMILY.

Family *Hydrophyllaceæ*. Herbs with radical or alternate (rarely opposite) leaves; corolla lobes imbricated (or contorted); ovary one or incompletely two celled; ovules two or more.

Family *Boraginaceæ*. Herbs, shrubs, and trees with alternate leaves; corolla lobes imbricated (or contorted); ovary bicarpellary, four-celled, four-lobed; ovules solitary. See BORAGE FAMILY.

Family *Convolvulaceæ*. Herbs, shrubs (and trees) with alternate leaves; corolla limb more or less plicate (rarely imbricated); ovary two (or three to five) celled; ovules few. See MORNING-GLORY FAMILY.

Family *Solanaceæ*. Herbs, shrubs (and trees) with alternate leaves; corolla limb more or less plicate (rarely imbricated); ovary mostly two-celled; ovules many. See NIGHTSHADE FAMILY.

Sub-order GENTIALES. Corolla regular; stamens alternate with the corolla lobes and usually of the same number; leaves opposite (rarely alternate).

Family *Oleaceæ*. Shrubs and trees (rarely herbs) with mostly opposite leaves; corolla lobes valvate or wanting; stamens two (or four); ovary two-celled; ovules one to three. See OLIVE FAMILY.

Family *Salvadoraceæ*. Shrubs and trees with opposite,

undivided leaves; corolla lobes imbricated; stamens four; ovary two-celled; ovules two.

Family *Apocynaceae*. Milky-juiced trees, shrubs, and herbs, with opposite, simple leaves; corolla lobes contorted or valvate; stamens five, with granular pollen; ovary two-celled or the carpels separating; ovules many. See *APOCYNACEAE* and *DOGbane*.

Family *Asclepiadaceae*. Milky-juiced herbs and shrubs, with opposite (or alternate) leaves; corolla lobes contorted; stamens five, with agglutinated pollen; ovary of two separated carpels; ovules many. See *MILKWEED FAMILY*.

Family *Loganiaceae*. Herbs, shrubs, and trees with mostly opposite, simple leaves; corolla lobes imbricated or contorted; stamens four or five (or indefinite); ovary two to four celled; ovules one to many.

Family *Gentianaceae*. Mostly herbs, with usually opposite undivided leaves; corolla lobes contorted, valvate, or induplicate; stamens four or five (or indefinite); ovary usually one-celled; ovules many. See *GENTIAN*.

Sub-order *PERSONALES*. Corolla mostly irregular or oblique; stamens fewer than the corolla lobes, usually four or two; ovules numerous; fruit mostly capsular.

Family *Scrophulariaceae*. Herbs (shrubs and small trees) with alternate, opposite, or whorled leaves; ovary two-celled with an axile placenta; seeds with endosperm. See *FIGWORTS*.

Family *Orobanchaceae*. Leafless, parasitic herbs; ovary one-celled; placenta parietal; ovules minute, numerous.

Family *Lentibulariaceae*. Aquatic or marsh herbs with radical or alternate leaves; ovary one-celled with a globose basilar placenta. See *BLADDERWORT*.

Family *Columelliaceae*. Trees and shrubs with opposite, evergreen leaves; ovary two-celled, with an axile placenta.

Family *Gesneriaceae*. Herbs, shrubs (and trees) with usually opposite leaves; ovary one-celled, with two parietal placenta; seeds numerous; endosperm scanty or none.

Family *Bignoniaceae*. Trees, shrubs (and herbs) with opposite or whorled leaves; ovary one or two celled, with parietal or axile placenta; seeds numerous, without endosperm. See *BIGNONIA FAMILY*.

Family *Pedaliaceae*. Herbs with mostly opposite leaves; ovary one, two, or four celled, with parietal or axile placenta; seeds one to many, without endosperm.

Family *Acanthaceae*. Herbs (shrubs and trees) with opposite leaves; ovary two-celled; placenta axile; seeds two to many, without endosperm. See *ACANTHUS FAMILY*.

Sub-order *LAMIALES*. Corolla mostly irregular or oblique; stamens fewer than the corolla lobes, usually four or two; ovules mostly solitary; fruit indehiscent.

Family *Myoporineae*. Shrubs and trees with mostly alternate leaves; flowers axillary.

Family *Selaginiae*. Heath-like shrubs, or perennial or annual low herbs, with mostly alternate leaves; flowers small, in terminal spikes or heads.

Family *Verbenaceae*. Herbs, shrubs, and trees with usually opposite leaves; stigma usually undivided. See *VERBENA FAMILY*.

Family *Labiatae*. Mostly aromatic herbs, shrubs (and trees), with opposite or whorled leaves; stigma usually bifid. See *MINT FAMILY*.

Order *INFERE*. Pistil of two or more united carpels, its ovary inferior; stamens usually as many as the corolla lobes, mostly attached to the corolla.

Sub-order *RUBIALES*. Flowers regular or irregular; stamens attached to the corolla; ovary two to eight celled; ovules two to many.

Family *Cuprifoliaceae*. Herbs (shrubs and small trees) with mostly opposite leaves; flowers usually irregular, with imbricated corolla lobes; style usually with a capitate, undivided stigma; fruit a berry. See *HONEYSUCKLE FAMILY*.

Family *Rubiaceae*. Trees, shrubs, and herbs with opposite or whorled leaves; flowers usually regular, with valvate, contorted, or imbricated corolla lobes; style simple, bifid, or multifid; fruit a capsule, berry, or drupe. See *MADDER FAMILY*.

Sub-order *CAMPANALES*. Flowers mostly irregular; stamens usually free from the corolla; ovary one to many celled; ovules one to eight.

Family *Styliaceae*. Herbs with tufted, radical, and scattered stem-leaves; flowers usually irregular; stamens (two) connate with the style.

Family *Goodenovieae*. Herbs (and shrubs) with alternate (or opposite) leaves; flowers usually irregular; stamens five, free from the style.

Family *Campanulaceae*. Mostly milky-juiced herbs, shrubs (and small trees), with alternate (or opposite) leaves; flowers regular or irregular; stamens usually five, free from the style. See *BELLWORTS*.

Sub-order *ASTERALES*. Flowers regular or irregular; stamens attached to the corolla, their anthers usually connate; ovary one-celled, one-ovuled.

Family *Valerianaceae*. Herbs (and shrubs) with opposite leaves; flowers cymose, corymbose, or solitary; anthers free; ovule pendulous.

Family *Dipsacae*. Herbs (and shrubs) with opposite or whorled leaves; flowers in involucrate heads; anthers free; ovule pendulous. See *TEASSEL FAMILY*.

Family *Calyceraceae*. Herbs with alternate leaves; flowers in involucrate heads; anthers connate; ovule pendulous.

Family *Compositae*. Herbs, shrubs (and trees) with opposite or alternate leaves; flowers in involucrate heads; anthers connate; ovules erect. See *COMPOSITES*.

LITERATURE.—De Candolle's *Prodromus Systematis Naturalis Regni Vegetabilis* (1824-73); Endlicher's *Genera Plantarum* (1836-40); Bruch, Schimper, and Gumbel's *Bryologia Europaea* (1836-55); Torrey and Gray's *Flora of North America* (1838-43), continued as Gray's *Synoptical Flora of North America* (1878-84); Walpers's *Repertorium Botanices Systematicae* (1842-47); Gottsche, Lindenbergh, and Nees ab Esenbeck's *Synopsis Hepaticarum* (1844); Harvey's *Phycologia Britannica* (1846-51); Walpers's *Annales Botanices Systematicae* (1848-68); Agardh's *Species, Genera et Ordines Algarum* (1848-80); Nylander's *Synopsis Methodica Lichenum* (1858); Harvey's *Nereis Boreali-Americana* (1858) and *Phycologia Australica* (1858-63); Bentham and Hooker's *Genera Plantarum* (1862-83); Sullivan's *Icones Muscorum* (1864-74); Baillon's *Histoire des Plantes* (1866-); Tuckerman's *Genera Lichenum* (1872); Du Mortier's *Hepaticae Europa* (1874); Schimper's *Synopsis Muscorum Europaeorum* (1876); De Candolle's *Monographie Phanerogamarum* (1878-); Eaton's *Ferns of North America* (1879-80); Schenk's *Handbuch der Botanik* (1879-90); Van Henrek's *Synopsis des Diatomées de Belgique* (1880-85); Braun's *Fragmente einer Monographie der Characeen* (1882); Tuckerman's *Synopsis of the North American Lichens* (1882-88); Saccardo's *Sylloge Fungorum* (1882-95); Hooker and Baker's *Synopsis Filicum* (1883); Lesquereux and James's *Manual of the Mosses of North America* (1884); Underwood's *Descriptive Catalogue of the North American Hepaticae North of Mexico* (1884); Rabenhorst's *Kryptogamen-Flora von Deutschland, Oesterreich und der Schweiz* (1884-); vol. i., *Pilze* (Winter, Fischer, and Rehm); vol. ii., *Meeresalgen* (Hauck); vol. iii., *Farnpflanzen* (Luerssen); vol. iv., *Laubmoose* (Limpricht); vol. v., *Characeen* (Migula); Goebel's *Outlines of the Classification and Special Morphology of Plants* (trans. by Garnsey and Balfour, 1887; German ed. 1882); Wollé's *Fresh-water Algae of the United States* (1887); Baker's *Handbook of the Fern Allies* (1887); Engler and Prantl's *Die Natürlichen Pflanzenfamilien* (1887-); Durand's *Index Generum Phanerogamarum* (1888); Allen's *Characeae of America* (1888-); De Toni's *Sylloge Algarum* (1889-); Wollé's *Diatomaceae of North America* (1890); Wollé's *Desmids of the United States* (2d ed. 1892); Ellis and Everhart's *North American Pyrenomycetes* (1892); Masseur's *British Fungus Flora* (1892-95); Underwood's *Our Native Ferns and their Allies* (4th ed. 1893); Hooker and Jackson's *Index Kewensis* (1893-95).

CHARLES E. BESSEY.

Vegetable Physiology: See *PHYSIOLOGY, VEGETABLE*.

Vegetable Silk: See *PULU* and *FIBER*.

Vegetable Tissue: See *BOTANY* and *HISTOLOGY, VEGETABLE*.

Vegetable Wax: the product of various plants, used as a substitute for beeswax. (1) Myrtle wax, produced from the bayberry or wax-myrtle, *Myrica cerifera* of the U. S. It is of a greenish hue, and is used in pharmacy as a vehicle. Candles made of it emit a pleasant odor, but do not give a good light. (2) The wax of the Carnahuba palm, *Copernicia cerifera* of Brazil. It is used in Europe in candle-making and for waxing floors and furniture. (3) The abundant and rather resinous product of *Ceroxylon andicola*, a fine palm-tree of the Andes, is used for candles when mixed with tallow. (4) The Japan wax, produced by boiling the seeds of *Rhus succedanea*, a sumach-tree. It closely resembles beeswax, and is used in candle-making. It should not be confounded with China wax, which is an insect product.

Vegetarianism [deriv. of *vegetarian*; *vegetable* + *-arian*, a suffix denoting one addicted to or believing in anything]: a view according to which vegetable substances ought to form the sole food of man, while the use of all animal substances, or at least of meat proper, ought to be avoided in the diet as something wrong, both physiologically and morally. Many of the ancient philosophers—as, for instance, Plato—encouraged a vegetable diet as the most suitable for the well-being of man, physically and morally; and some of them—as, for instance, Pythagoras—absolutely forbade the use of animal food. In modern times the view found eloquent advocates in Rousseau, Shelley, and others, and in 1847 a society for the propagation of vegetarianism was formed at Manchester, England. A similar society was formed in the U. S. in 1850. Since then the movement has attained considerable proportions.

Vegetius, FLAVIUS REXATUS: author; b. probably in Rome in the latter part of the fourth century A. D.; wrote an *Epitome (Institutionum) Rei Militaris*, dedicated to an emperor whose name is not given, possibly Theodosius II. (408-450). The work is in four books, and is chiefly a compilation from previous writers. The first book treats of the levying and training of soldiers; the second of the early discipline and of the formation of the Roman army; the third of strategy; the fourth of the art of defending and of assaulting fortified places and of naval warfare. From some expressions of Vegetius it is believed that he was a Christian. Best editions by Schwabel, with the notes of Oudendorp and Bessel (Strassburg, 1806), and with revised text by C. Lang (Leipzig, 1885). A veterinary treatise under the title *Mulo medicina* is probably by the same Vegetius. It is printed in Schneider's *Scriptures rei rustice* (Leipzig, 1794-97). Revised by M. WARREN.

Veglia, vā'lyā: an island of Austria, belonging to the government of Trieste, in the Gulf of Quarnero, an inlet of the Adriatic. It is 23 miles long, 12 miles broad, mountainous, and produces timber, wine, silk, marble, and salt. Pop. about 18,000, including four towns of between 1,600 and 2,200 inhabitants.

Vehicle: See EXCITEMENT.

Vehmic Court, or Vehmgericht: See FERMIC COURT.

Velise, vā'ze, KARL EDUARD: historian; b. at Freiberg, Saxony, Dec. 18, 1802; studied jurisprudence in Leipzig and Göttingen; was appointed assistant keeper of the royal archives in Dresden in 1825; published his *Geschichte Kaiser Ottos des Grossen* in 1828, and became chief of the archives in 1833. In 1838 he resigned his office and went to America, but returned in 1839; settled in 1843 in Berlin, but was arraigned for some passages in his *Geschichte der deutschen Höfe* (48 vols., 1851-58), condemned to six months' imprisonment, and banished from Prussia. Settled in 1856 in Switzerland; lived in Italy 1857-62. D. near Dresden, Saxony, June 18, 1870. He also wrote *Shakspeare als Protestant, Politiker, Psycholog und Dichter* (2 vols., 1851).

Veins [from O. Fr. *veine* < Lat. *vēna*, artery, vein, for **ve'na*, deriv. of *ve'here*, *ve'ctum*, carry; Eng. *wagon*, *way*]: the companion vessels to the arteries, distributed throughout the body for the purpose of returning the venous or impure blue blood from the extremities, surfaces, and viscera to the right auricle of the heart, and the purified blood from the lungs to the left auricle. They are membranous canals, essentially devoid of elasticity and without pulsation. They arise from venous capillaries which collect from the tissues the blood recently brought to them by the arterial capillaries, richly freighted with oxygen and nutritive matter. These venous capillaries unite to form ultimate veins, which still again unite, and form successively larger branches and trunks as they approach

Valves of veins.

the center of the circulation. The motion of venous blood is secured in part by the *vis a tergo*, or power of the capillary chemico-vital nutritive processes, in part by the pressure of the moving muscles and viscera between which the veins are imbedded, the veins being provided with valves which

permit of blood-currents toward the heart, but not the reverse. Veins have three coats—internal, middle, and external. The veins are not uniform, symmetrical cylinders, like the arteries, but have pouches or sinuses adjacent to the valves, so that a vein distended resembles a bamboo stick with bulbous or knotted joints. The veins, like the arteries, have nutrient vessels, or *vasa vasorum*, in their walls. The veins of bones are termed sinuses, their outer coat being replaced by the endosteum or fibrous lining of the bone, as in the great sinuses of the skull. The venous blood returned by the veins from above the region of the heart is united in one great vein, the *vena cava superior*, all from below entering by the *vena cava inferior*. The *vena azygos* collects the blood from the chest-walls and other structures which does not flow into either of the *vena cava*. The portal vein receives the venous blood from the intestines, and conveys it to the liver. The pulmonary vein and branches go from the lungs to the left auricle of the heart, carrying the blood that has been re-vivified by the oxygen of inspired air. See CIRCULATION OF THE BLOOD. Revised by WILLIAM PEPPER.

Veintemilla, vā-cēn-tā-meel yā, IGNACIO: general and politician; b. at Cuenca, Ecuador, in 1830. He was the leader of the extreme liberals who revolted against Borrero 1876-77. Borrero was deposed after a civil war, and in 1878 Veintemilla was made president with extraordinary powers by a convention that met at Ambato; at the same time a new constitution was adopted. Some reforms were instituted, the revenues were increased, and an attempt was made to secularize education. Disorders continued; the president assumed dictatorial powers Mar. 2, 1882, but conservatives and liberals united against him, and he was deposed in July, 1883, fleeing from the country. H. H. S.

Veit, fit, PHILIPP: painter; b. in Berlin, Prussia, Feb. 13, 1793; was educated by Friedrich Schlegel, who became his stepfather, and exercised a decisive influence on the peculiar cast of his mind; made his first art-studies in Dresden; joined afterward Cornelius and Overbeck in Rome, and became one of the most vehement champions of the Catholic romantic school in painting. In 1830 he was appointed director of the Stüdel institute of art in Frankfurt-on-the-Main, but resigned this place in 1843 because the institute bought Lessing's picture of *Huss before the Council of Constance*, and removed his studio to Saehsenhausen, opposite Frankfurt. He painted in both fresco and oil. Among his most remarkable pictures are the *Seven Years of Plenty*, in the Villa Bartholdy in Rome; *Christianity bringing the Fine Arts into Germany*, in the Stüdel institute of Frankfurt; the *Assumption of the Virgin*, in the Cathedral of Frankfurt; and the *Egyptian Darkness*, for the King of Prussia. D. at Mentz, Germany, Dec. 18, 1877. Revised by RUSSELL STURGIS.

Veitell, veech, JONX: philosopher; b. at Peebles, Scotland, Oct. 24, 1829; educated in the grammar school of that place and in the University of Edinburgh; was assistant in logic and metaphysics in that university 1855-60; became Professor of Logic, Metaphysics, and Rhetoric in the University of St. Andrews 1860, and Professor of Logic and Rhetoric in the University of Glasgow 1864. He translated Descartes's *Discourse on Method* (Edinburgh, 1850), and the same author's *Meditations and Selections from the Principles of Philosophy* (1853); prepared a *Memoir of Dugald Stewart* for the revised edition of the *Complete Works* of that philosopher (vol. x., 1858); was joint editor with Dean Henry L. Mansel of Sir William Hamilton's *Lectures on Metaphysics and Logic* (Edinburgh and Boston, 4 vols., 1859-60), and wrote a *Memoir of Sir William Hamilton* (Edinburgh, 1869); *History and Poetry of the Scottish Border* (1877; new ed. 1892); and *Merlin and other Poems* (1889). D. Sept. 3, 1894. Revised by J. M. BALDWIN.

Vela, BLASCO NUÑEZ: See NUÑEZ VELA.

Vela, VINCENTO: sculptor; b. at Ligurnetto, canton of Ticino, Switzerland, in 1822; was trained as a stone-cutter in the quarries of Viggio; went to Milan in 1836, where he studied drawing; worked in the studio of Caeciatori, and made models for jewelers; removed in 1847 to Rome; won a prize in 1848 at Venice by his bas-relief, *Christ raising the Daughter of Jairus*; volunteered in the Italian war against Austria in 1848; settled permanently in Turin, and attracted general attention by his statues *A Prayer* and *Spartacus*. Among his later works are *Harmony in Tears* (1855), for the monument of Donizetti, at Bergamo; *France and Italy*, a group (1863), presented by the ladies of Milan

to the Empress Eugénie: *Columbus and America* and *The Last Days of Napoleon*, in the Corcoran Gallery, Washington, D. C. The two last-named works and *Spring* at the Paris Exhibition of 1867 won for their author the rank of officer of the Legion of Honor. D. at Bellinzona, Ticino, Oct. 3, 1891.

Revised by RUSSELL STURGIS.

Velars [Lat. *velum*, veil, the soft palate]: a technical term of phonetics, applied to denote the series of back-gut-tural sounds, *q*, *qh*, *g*, *gh*, etc., produced between the back of the tongue and the soft palate, as *c* in *cat*, *g* in *got*, etc., and distinguished from the palatals or front gutturals, such as *k* in *kin*, *g* in *gear*, etc. B. I. W.

Velasco: town (laid out in 1891); Brazoria co., Tex.; on the Brazos river, 5 miles from its mouth, and on the Velasco Terminal Railway; 20 miles S. of Columbia (for location, see map of Texas, ref. 6-1). It is the outgrowth of a successful attempt to secure a deep-water shipping-point on that part of the Texas coast by jetty-work at the mouth of the river. A private corporation expended over \$1,500,000 on this work, and vessels of the deepest draught now load and unload at the wharves of the town. Velasco has thus become an important point for the shipment of cotton, cottonseed oil, cake, and meal, coal, and other productions of Texas. The town has 5 churches, several public and private schools, a national bank with capital of \$50,000, 2 weekly newspapers, ice-factory and refrigerator plant, planing-mill, brick-yards, electric-light and power plant, and large coal elevator. Pop. (1895) estimated, 1,500.

EDITOR OF "WORLD."

Velázquez, *vā-lāth'kāth*, DIEGO, de: conqueror of Cuba; b. at Cuéllar, Segovia, Spain, in 1465 (according to others, in 1458). He served in the conquest of Granada, and in 1493 went to Española with Columbus. There he was prominent in the wars against the Indians, received large *encomiendas*, and became wealthy. In 1511 he was commissioned by Diego Columbus to conquer Cuba. Leaving Española at the end of the year with 300 soldiers, he landed near the eastern extremity of Cuba and speedily defeated the cacique Hatuey, who was cruelly put to death. Thereafter Velázquez intrusted much of the active campaign work to his lieutenant, Panfilo de Narvaez. The unarmed natives were easily conquered, and, as usual, reduced to the slavery of the *encomiendas*, in which most of them soon perished. Velázquez founded Trinidad, Matanzas, and other places, and made his first capital Santiago. Though nominally a deputy of Diego Columbus, he practically assumed independent command. In 1517 he was a partner in the slave-seeking expedition of Cordova, which resulted in the discovery of Yucatan. Elated with the hope of new conquests, he fitted out Grijalva's expedition in 1518; and on receiving certain information of the rich Aztec empire, he prepared a strong fleet for its conquest, giving the command to Cortés (*q. v.*). The latter, on his arrival at Vera Cruz, assumed independent command, and Velázquez sent Panfilo de Narvaez (1520) with orders to bring Cortés back a prisoner. Narvaez was defeated by Cortés, and all efforts of Velázquez to secure the Mexican conquests for himself failed. Vexation for his loss was the reputed cause of his death in Havana, 1522 or 1523.

HERBERT H. SMITH.

Velázquez, DIEGO RODRÍGUEZ DE SILVA; b. of Portuguese parents, at Seville, Spain, June 5, 1599. Herrera el Viejo was his first master in art. He left the latter for the studio of Francisco Pacheco, who recognized the great genius of Velázquez, and whose daughter he married (1618). Velázquez visited Madrid in 1622, but after some months returned to Seville. The next year he was called there to be introduced to King Philip IV., who appointed him court painter and showed him marks of the greatest favor. It was at this time (1623) that Velázquez painted a portrait-sketch of Charles I. as Prince of Wales. Velázquez first went to Italy in 1629, and spent a year in Rome and also some time in Naples, where he met the Spanish painter Ribera, whose work influenced his own considerably. He was again in Italy in 1648, sent by the king to purchase works of art. During this visit Velázquez painted the famous portrait of Pope Innocent X., now in the Doria Gallery, at Rome. The office of *apoyentador mayor* was conferred upon him on his return, as well as the Cross of St. Iago. The duty attached to this office was the providing for the king's lodgment during his absence from the capital, and his death is attributed to his exertions in providing the royal quarters at the conference in Turin. Velázquez died Aug. 6, 1660, on his return to Madrid, and was buried with

great pomp in the Church of St. Juan. His wife died of grief a week after him. He was an unrivaled portrait-painter; unlike his brother artists, he rarely touched religious subjects, and his mythological compositions were treated in a realistic spirit, the figures being dressed in the costume of his time. The technique of Velázquez is so marvelous that Mengs said of him: "Velázquez seems to have painted with his will only, without the aid of his hand." His work can be best judged of in Madrid, although splendid examples have found their way to the Louvre, the London National Gallery, the Capitol and Palazzo Doria in Rome, and many European collections. For details of his life and works, see Curtis, *Velazquez and Murillo* (London, 1883); Stirling Maxwell, *Velazquez and his Works*; L. Viardot, *Notices sur les principaux peintres de l'Espagne*; C. Blanc, *Velazquez à Madrid*; *Gazette des Beaux-Arts*, vol. xv., p. 65; R. Lefort, *Velazquez*, in *Gazette des Beaux-Arts*, second period, vols. xix., xx., xxi., and following (years 1879-82).

W. J. STILLMAN.

Velde, *vel'de*, ADRIAN, van de: painter; b. in Amsterdam, Holland, in 1635. He studied first under his father, then with Wynants and Wouwerman. He became one of Holland's most accomplished "little masters." He painted landscapes with cattle, frost and snow scenes, human figures, with equal skill, realism, and poetry. Ruysdael, van der Heyde, and Hobbema often employed him to paint figures in their landscapes. D. in Amsterdam, Jan. 21, 1672. He is well represented in the National Gallery, London, in the Dresden Gallery, in the Louvre, and in the Six Collection and the museum in Amsterdam. Van de Velde was also a most skilled engraver; twenty-nine of his plates are well known.

W. J. S.

Velde, WILLEM, van de: See VANDERWELDE.

Veldeke, *vel'de-ke*, HEINRICH, von: poet; b. at Veldeke, near Maestricht, Netherlands; lived in the latter half of the twelfth century, and was present at the great gathering of princes and knights under Frederic I. at Mentz in 1184. He was familiar with Latin and French, wrote *Servatius*, the story of a saint, following a Latin original, and translated the French *Roman d'Énéas* of Benoît de Sainte-More in his famous *Eneide*. The last-named work was finished previous to 1190. Veldeke is praised by Gottfried von Strassburg as the first who introduced the court epic in Germany, and Rudolf von Ems lauds him as a reformer of the metrical form who first among German poets used perfect rhymes. These opinions exactly describe Veldeke's position in the history of German literature. While he was mediocre as a poet he had the good fortune to appeal to the tastes and demands of his contemporaries, who saw in him the beginning of a new literary era. As a writer of minnesongs Veldeke was less influential, though he was here also among the first to introduce French models. See Behaghel, *Heinr. v. Veldekes Eneide* (1882); R. von Muth, *H. v. Veldeke* (Vienna, 1870); Scherer, *Deutsche Studien*. J. GOEBEL.

Veley, VICTOR HERBERT, M. A., F. R. S.: chemist; b. at Chelmsford, England, Feb. 10, 1856; educated at Rugby and at University College, Oxford; public examiner in the Honour School of Natural Science 1887-90; became demonstrator and lecturer at the University Museum, Oxford, 1887; lecturer of Queen's College 1891; and tutor to the delegacy of the non-collegiate students 1890. Author of numerous papers on theoretical, physical, and applied chemistry, contributed to the *Proceedings* of the Royal Society and to various periodicals.

Vélez, *vā'lāth*: town of Santander, Colombia; in the southern part of the department, on a mountain-side, 7,185 feet above the sea (see map of South America, ref. 2-B). It is surrounded by precipices and can be reached only over dizzy mountain roads. It was founded in 1539, its singular situation being then an advantage for defensive and strategic purposes. During the colonial period it was important, and it is still one of the first towns of the department. The vicinity is noted for many natural curiosities and magnificent scenery. Pop. about 11,000. H. H. S.

Vélez Málaga: town; province of Malaga, Spain; on the river Vélez, near its mouth in the Mediterranean (see map of Spain, ref. 19-E), in a plain of the highest fertility, producing sugar, cotton, and rice, besides wine and fruits. The town itself is old and somewhat decadent, but it is rich and carries on an important trade. It contains the ruins of a Moorish castle and two fine old churches. Pop. (1887) 23,425.

Velia, or **Elea**: an ancient Greek city. See **ELEA**.

Veliger [Mod. Lat., veil-bearing; Lat. *velum*, veil + *gerere*, to bear]: an embryonic stage in the development of many molluscs, succeeding the trochophore stage.

Velius Longus: a Latin grammarian of the time of Trajan, author of a commentary on Vergil's *Æneid*, and a treatise *De Orthographia*, which is still preserved. See Keil, *Grammatici Latini*, vol. vii.

Velleius Paterculus: See **PATERCULUS, GAIVS VELLEIVS**.

Velle'tri (anc. *Vellitra*): town; province of Rome, Italy; on a spur of Monte Artemisio, about 26 miles S. E. of Rome (see map of Italy, ref. 6-10). Velletri was one of the most conspicuous of the Volscian cities and one of the most restless and rebellious under the Roman yoke. The Octavian family is said to have transferred itself from Velletri to Rome during the reign of Tarquinius Priscus, and to have been immediately admitted, as one of the chief heads of the Volsci, to the full rights of Roman citizenship. The modern town, though near the Pontine Marshes, is healthful. The cathedral and other churches contain ancient marbles, pictures, and other mediæval objects worthy of notice. The town is supplied with water by a subterranean aqueduct about 8 miles in length, constructed by Fontana. Pop. about 13,500.

Revised by M. W. HARRINGTON.

Vellore': town; in the Arcot district of Southern India; on the banks of the Pālār; 80 miles by rail W. of Madras (see map of S. India, ref. 6-12). It has a strong fort surrounded by a deep moat excavated out of the solid rock. The European quarters of the town are spacious and pleasant. Vellore contains a fine temple to Vishnu, and has considerable trade. Tippu Sahib used to live a great part of each year at this salubrious station. In 1780-82 the fortress was held by the British against Hyder Ali. Pop. (1891), including cantonment, 44,925.

Vellum: See **PARCHMENTS**.

Velocim'eter [Lat. *velox*, *velocis*, swift + Gr. *μέτρον*, measure]: an instrument for measuring with extreme accuracy the velocity of projectiles by means of electricity. It was invented by Wheatstone in 1840, and received ingenious improvements from Col. J. G. Benton of the U. S. ordnance department. A simpler form, called a chronograph, has been devised by Capt. Le Boulengé of Belgium, and is extensively used in the U. S. and in Europe. Several others of greater complexity have also been invented and used. See **CHRONOGRAPH** and **CHRONOSCOPE**.

JAMES MERCUR.

Velocipede [Lat. *velox*, *velocis* + *pes*, *pedis*, foot]: originally a vehicle invented in 1816 by Baron Drais de Sauerbrunn, of Mannheim, consisting of a seat resting upon two wheels, one before the other. The rider sat astride the seat, and propelled the vehicle by striking the ground with his toes. Later velocipedes were propelled by the action of the feet upon a crank attached to the axle of the forward wheel. Velocipedes are now called unicycles, bicycles, tricycles, or quadricycles, according to the number of wheels. (See **CYCLING**.) Few things are more puzzling to an ordinary observer than the self-balancing or self-sustenance of the bicycle. If he makes the experiment, he finds his forebodings, founded upon the absence of base for stable equilibrium in the two wheels in the same fore-and-aft plane, but too well verified. The principle by which the skilled rider sustains himself is perhaps best illustrated by reference to the familiar experiment of balancing a long pole in a vertical position on the chin or end of the finger. The equilibrium of a pole thus balanced (supposing it to be perfectly so, which it never is) is unstable; but in its almost vertical (or balanced) position the motion of fall is extremely slow; the holder is easily able to detect it, and to move his finger (or chin) so as to counteract it. The process for the bicycle is not identical, but analogous; the experienced rider feels such incipient tendency of the vehicle to fall either way, and by an acquired habit, which becomes instinctive, checks it through the guiding-wheel, slightly varying his direction. The centrifugal force due to the deflection of his moving velocity thus brought into action counteracts each incipient falling tendency. Perhaps it would be more proper to say that what is, in statics (without motion), a position of unstable equilibrium is made kinetically (i. e. through motion) stable.

Revised by R. H. THURSTON.

Velocity: See **MOTION, ACOUSTICS, FALLING BODIES, GUNNERY, LIGHT**, etc.

Velvet: See **TEXTILE FABRICS**.

Venable, CHARLES SCOTT, LL. D.: educator; b. in Prince Edward co., Va., Apr. 19, 1827; educated at Hampden-Sidney College, the University of Virginia, and Berlin and Bonn, Germany. He became Professor of Mathematics at Hampden-Sidney College in 1847, of Physics and Chemistry, University of Georgia, 1859, and of Mathematics and Astronomy, University of South Carolina, 1860. At the outbreak of the civil war he became captain of engineers and served at New Orleans and Vicksburg; in June, 1862, was appointed to the staff of Gen. R. E. Lee (major A. D. C.); and in 1864 was promoted lieutenant-colonel and assistant adjutant-general. Since Oct., 1865, he has been Professor of Mathematics in the University of Virginia. He is the author of a series of mathematical text-books.

Vena Contracta: the contraction of a stream of water issuing from an orifice in a thin plate. Newton first made measurements of the contracted vein. Its area is about 62 per cent. of the area of the orifice. See, further, the article **HYDRAULICS**.

M. L.

Venantius: See **FORTUNATUS, VENANTIUS HONORIUS CLEMENTIANUS**.

Vena'tion [from Lat. *vena*, a vein]: in botany, the manner in which the fibrovascular bundles (veins) are arranged in leaves. The veins are more properly parts of a framework, and not of a circulatory system, as the name might imply. In the growth of the young leaf of the higher plants one or more columns of meristem cells develop into fibrovascular tissues, the so-called veins. These are connected below with the fibrovascular system of the stem. As the leaf enlarges, its veins develop accordingly. Where the leaf-growth is mainly longitudinal, as in the grasses and sedges, the veins are necessarily longitudinal and more or less parallel; but where the growth is in all directions, the veins have a net-like arrangement, as in pumpkin-leaves and grape-leaves. Descriptive botanists distinguish two principal kinds of venation, viz., parallel and reticulated or netted, each having a number of varieties. Thus in parallel venation we distinguish the longitudinal (from base to apex, Fig. 1, A), transverse (from midrib to margin, Fig. 1, B),

FIG. 1.—Parallel venation: A, longitudinal; B, transverse; C, flabellate.

flabellate (radiating from the summit of the petiole, Fig. 1, C). In the reticulated venation we may distinguish the pinnate (from midrib to margin, Fig. 3, A), radiate or pal-

FIG. 2.—Reticulated venation: A, pinnate; B, radiate.

FIG. 3.—Forked venation: A, free; B, reticulated.

mate (from the base to the margin, Fig. 3, B). The veins of many ferns are forked, dividing once or more and running free to the margin without uniting again (Fig. 2, A), or uniting and forming the reticulated venation (Fig. 2, B).

CHARLES E. BESSEY.

Vendace: the *Coregonus vandesius*, a trout-like fish of the family *Coregonidæ*, found in the lakes of Scotland and

The vendace.

Sweden. Its introduction into Scotland is ascribed to Mary Queen of Scots. It is a fine table-fish, and is caught in nets, since it never takes the hook. Revised by F. A. LUCAS.

Vendée, La, lä-vañ'dä': department of France; bordering W. on the Bay of Biscay. Area, 2,588 sq. miles. The coast is either sandy or occupied by salt-marshes, from which it has received the name of *Marais*. The northern part, the *Bocage*, is more elevated, but the ground is covered either with heath or with pine forest. The rest of the department, the *Plaine*, is fertile land, eminently well suited to agriculture. In spite of all disadvantages, both the *Marais* and the *Bocage* are well peopled and carefully cultivated; flax, hemp, and vegetables are produced in the former, honey, fruit, and hops in the latter, and wine in both districts. In the *Plaine* much wine, wheat, and fruit are produced, and many cattle are fattened for the Paris market. Iron and coal are found. La Vendée is noted for the vigorous resistance offered by its inhabitants to the Revolution. Devoted to the Church and the Bourbon monarchy, the peasantry broke out in revolt on Mar. 10, 1793, and headed by CATHELINEAU and LA ROCHEJAQUELEIN (*qq. v.*) defeated the forces of the Government at every point, till Kléber and Marceau took the field against them with a large army. At Le Mans they were defeated with great loss, and after Dec., 1793, ceased to be formidable. A second revolt broke out in 1795, but was put down by Hoche. During the Hundred Days they supported the restored Bourbon monarchy, but were held in check by Napoleon's general Lamarque. Pop. (1896) 441,735. Capital, La Roche sur Yon. See Beauchamp, *Histoire de la Guerre de la Vendée et des Chouans* (1807), and Bonnemère, *Les Guerres de la Vendée* (1884). Revised by M. W. HARRINGTON.

Vendémiaire [Fr., from Lat. *vindēmia*, vintage; *vinum* + *de mere*, remove]; in the French revolutionary calendar the period from Sept. 23 to Oct. 21. It was the first month in the revolutionary year.

Vendet'ta [Ital.]: a feud or condition of private war in which the nearest kinsman assumes the duty of avenging an injury to a member of the family. The term originated in Corsica, where it has played a most important part in social life. When a murder has been committed, the murderer is pursued not only by the officers of justice whose duty it is to punish offenses against society, but also by the relatives of the slain, upon whom the received views of social duty impose the obligation of personally revenging his death. In such a case the relatives of the murdered man take up arms and hasten to pursue the murderer. If he succeed in eluding their pursuit, the murder may be revenged upon his relatives; and, as the vengeance may be taken whenever an opportunity occurs, the relatives of a murderer whose crime is unavenged have to live in a state of incessant precaution. Similar customs have marked a certain stage in the history of every civilized nation in its progress toward the establishment of the administration of justice on its modern basis, and are still to be found among the less advanced peoples, such as the Montenegrins, Albanians, Druses, Bedouins, etc. F. M. COLBY.

Vendôme, vañ'dôm [Lat. *Vindocinnum*, originally a Gallic *oppidum*]: capital of an arrondissement in the French department of Loir-et-Cher; on the Loir, 20 miles N. W. of Blois, and on the Orleans Railway and the State Railway (see map of France, ref. 4-E). It has a lyceum and a library of 15,000 volumes, and is an industrial center, its manufactures including leather, gloves, cotton goods, and paper. Pop. (1891) 9,538. Parts of the castle of the Dukes of Vendôme date from the eleventh century. Several battles were fought

in the vicinity in 1870 between the army of the Loire and the Tenth Prussian Corps.

Vendôme: an ancient countship of France, founded about the end of the tenth century, corresponding nearly to the present department of Loir-et-Cher; raised to a peerage duchy in 1515 by Francis I. and given to Charles of Bourbon. It reverted to the crown on the accession of Henry IV., the grandson of Charles, in 1589, but in 1598 he bestowed it on his eldest son by Gabrielle d'Estrées, César (b. in 1594; d. in 1665), from whom descended the house of Vendôme. During the minority of his half-brother Louis XIII., César played a conspicuous part in the intrigues and conspiracies against Richelieu, later against Mazarin and in the entanglements of the Fronde, but having become reconciled to the court, he defeated, as great-admiral of France, the Spanish fleet off Barcelona in 1655. César left two sons, LOUIS, Duc de Vendôme (b. in 1612; d. Aug. 6, 1669), and FRANÇOIS DE VENDÔME, Duc de BEAUFORT (see BEAUFORT), nicknamed *Roi des Halles* on account of his sympathy with the people during the disturbances of the Fronde. Louis, Duc de Vendôme, had the title of Duc de Mercœur during his father's lifetime. He served with distinction in the wars of Louis XIII., and was made viceroy of conquered Catalonia in 1649 by Mazarin. He married Laura Mancini, one of Cardinal Mazarin's nieces, but became a priest after her death in 1656, and was made a cardinal in 1667. He left two sons, LOUIS JOSEPH, called till his father's death the Duc de Penthièvre (b. in Paris, July 1, 1654; d. at Tñaroz, in Valencia, June 11, 1712), and PHILIPPE DE VENDÔME, great prior of the Knight Templars in France (b. Aug. 23, 1655; d. Jan. 24, 1727), with whom the family became extinct.

Louis Joseph began his military career in 1672 under Turenne, in the Netherlands, Germany, and Alsace, and under Créqui in Flanders before the peace of Nymwegen (1688). He won great renown in the war of the Palatinate (concluded by the Peace of Ryswick in 1697), serving under Luxembourg in the Netherlands, participating in the sieges of Mons and Namur, and in the battles of Leuze and Steenkerk, then serving under Catinat in Italy, where he commanded the left wing in the battle of Marsaglia (Oct. 4, 1693). Owing to the duke's careless and sensual nature, Louis XIV. hesitated long before intrusting him with an independent command. In 1696, however, he was given command of the army in Spain, began the siege of Barcelona, defeated an approaching Spanish army, and forced the fortress to surrender Aug. 10, 1697, which glorious event enabled Louis XIV. to negotiate the favorable Peace of Ryswick (1697). He was sent to Italy in 1702, during the Spanish war of succession, to supersede Villeroy, who had been captured at Cremona; he reorganized the demoralized army, fought Prince Eugene of Savoy at Luzzara (Aug. 15, 1702) without being defeated; tried to pass through the Tyrol into Germany in the spring of 1703, but was prevented by the bravery of the Tyrolians and the revolt of the Duke of Savoy in his rear. At Trent he turned round, defeated the Piedmontese completely, took several fortresses, and began the siege of Turin. In the spring of 1706 he defeated the Austrians under Reventlow at Calcinato, and drove them beyond the Adige, taking advantage of Eugene's absence in Vienna. From this brilliant campaign he was called to the Netherlands to make amends for Villeroy's defeat at Ramillies, but he was himself completely defeated by Marlborough and Eugene at Oudenarde (July 11, 1708), and lost his command owing to the intrigues of Mme. de Maintenon, who bitterly hated him. In 1710 the situation of the French party in Spain became so desperate that Philip V. thought he could be saved only by Vendôme, who was accordingly sent to Spain by Louis XIV. He created an army, defeated the English at Brihuega, the Austrians under Stahrenberg at Villaviciosa (Dec. 10, 1710), carried the king back to Madrid, and finished the war. Shortly afterward he died, and the duchy of Vendôme reverted to the crown of France. Philip V. had his body interred in the Escorial. HERMANN SCUENFELD.

Vendor's Lien: (1) the lien of the vendor on lands for purchase-money which is unpaid and unsecured save by the purchaser's verbal or written promise. It is available against any one but a purchaser for value without notice. (See LIEN, *Equitable Liens*.) (2) The term is also applied to the lien of the seller of personal property. This, however, is a common-law or possessing lien, and entitles the seller to retain possession of the property until payment or tender

of the price, where the sale is for cash, or where it was on credit but the term of credit has expired, or when the buyer has become insolvent. While possession of the goods by the seller is essential to this lien, it does not matter that he has possession as agent, bailee, or custodian of the buyer. It is available against any part of the goods remaining in the seller's possession, unless the portion delivered was intended to represent the whole, in which case the lien will have been waived. See STOPPAGE IN TRANSITU.

FRANCIS M. BURDICK.

Venedey, vā'ne-dī, JAKOB: author; b. at Cologne, May 24, 1805; studied law in Bonn and Heidelberg, and began to practice as an advocate in his native city, but fled to France in 1832 on account of an injunction against his *Ueber Geschworenengerichte* and other conflicts with the Prussian police; settled in Paris, and began in 1835 to issue a monthly paper, *Der Geächete*; was twice banished from Paris, but finally allowed to live there by the intervention of Arago, Mignet, and others whose interest he had gained by his work, *Römerthum, Christenthum, Germanenthum* (1840); returned to Germany in 1848, and sat in the national assembly in Frankfurt, where he voted with the radicals; was banished from Berlin and Breslau; went to Zurich, but settled finally in Oberweiler, Baden. After a visit to England (1843-44), he wrote *Irland* (2 vols., 1844) and *England* (3 vols., 1845); he also wrote *Geschichte des deutschen Volks* (4 vols., 1854-62). D. at Oberweiler, Feb. 8, 1871.

Veneering [from Germ. *furnieren*, veneer, from Fr. *fournir*, furnish]; in cabinet-work, the art of laying thin leaves (usually) of some valuable wood or other material upon a foundation of inferior material. It was known to the Romans, and is referred to by Pliny as a novelty. The plates were formerly sawn by hand, but in 1806 Brunel introduced a method of splitting them from straight-grained wood, and employed circular saws for carved and knotted wood. Veneers of ivory and bone are now largely used for some purposes. The finer processes are called MARQUETRY and BUNL-WORK (qq. v.)

Venegas, vā-nā gūās, FRANCISCO JAVIER, de; general and administrator; b. at Cejiza, Spain, about 1760. He attained the rank of lieutenant-general in the wars with France, and was Viceroy of Mexico Aug., 1810 to Mar., 1813. This period embraced the first revolutionary struggles. (See HIDALGO Y COSTILLA and MORELOS Y PAVÓN.) The viceroy did not take the field personally, but he was responsible for many of the cruelties which characterized the war; he was constantly hampered by the intrigues of his principal general, Calleja, who finally supplanted him. On his return to Spain he acknowledged the rule of Joseph Bonaparte and was created Marquis of La Reunion in honor of his supposed pacification of Mexico. D. about 1820.

HERBERT R. SMITH.

Veneréal Ulcer, or Chancreid [Fr. *chancre*; Ital. *cancro* < Lat. *cancer*, crab, ulcer; cf. Eng. doublet *canker*]; a certain acute, contagious ulceration that results from venereal contact. It is a purely local disease, possessing symptoms that entitle it to be considered the highest type of acute ulcerative action. In the majority of cases it is the result of inoculation of the purulent secretion of an already existing ulcer of a similar character. It is commonly established upon an abrasion of the skin or mucous membrane produced *in coitu*. On application of the purulent secretion of the venereal ulcer to an abrasion, either on the person already affected or on one previously free from the disease, congestion, inflammation, suppuration, and rapid destruction of tissue follow in quick succession. Chiefly characterized by its contagious property, the venereal ulcer is seldom single, several distinct lesions usually presenting at the same time. Occurring under circumstances of good general health, cleanliness, and temperate living, its progress is usually self-limited. It gradually increases from two to five weeks, and the loss of tissue is then slowly restored. When acquired under unfavorable conditions, such as a depraved constitution, irregular life, filth, and alcoholic excess, the chancreid assumes its most vicious type.

The venereal ulcer or chancreid, in its early stages, is promptly amenable to judicious remedial measures. The application of any caustic, of sufficient power to destroy completely all the tissue which has been implicated in the diseased action, suffices to change the contagious venereal ulcer to a simple sore, when it goes on to recovery without other treatment than such simple sores require. It is also found that the particular lesion which may be present par-

takes in great degree of the activity which characterized the lesion from which it was derived, so that every grade from the simple excoriation to the sharply defined and most active ulcer may be met. In the milder varieties the judicious application of antiseptic, sedative, and astringent agents may suffice to bring about an arrest and cure.

In regard to its history, the venereal ulcer or chancreid is conceded to be of ancient origin, even to antedate the advent of syphilis. It has various synonyms—viz., pseudo-syphilis, soft chancre, non-infecting chancre, chancreid, etc. It is known almost universally at the present day by the last term. It was distinctly recognized and described by the ancients as a disease known from the earliest times. Notwithstanding this, shortly after the recognized appearance of syphilis in Europe in 1494, it became confounded with that disease. Its purely local character was lost sight of, and it was subjected to constitutional treatment as a form of syphilis. Its chief characteristics, however, always most marked, were never quite lost sight of. Evincing its destructive property at once on inoculation of its secretion upon healthy tissue, and commonly associated with inflammatory enlargement and suppuration of contiguous lymphatic glands, it was thus directly opposed to the sluggish course of the syphilitic local affection and its non-suppurating glandular concomitants. Yet it was so often found associated with and followed by the constitutional manifestations of syphilis that its distinctive significance was doubted; and when, after a time, the well-known acute venereal ulcer was occasionally observed to exchange its soft edge and base for the indurated tissue known to characterize the early syphilitic lesion, the fallacious theory of *post hoc ergo propter hoc* prevailed, and thus the confusion of the two distinct diseases became complete. From this time all the contagious venereal diseases, gonorrhœa, chancreid, and syphilis, were accepted as practically identical, requiring the same constitutional treatment. John Hunter in 1786 was the first to recognize publicly the value of the induration characteristic of the venereal sore which was followed by constitutional syphilis, thus making the first positive step toward identifying and restoring to the different venereal disorders their distinctive individuality. In 1798 Benjamin Bell, of London, claimed a simple origin of gonorrhœa, and in 1830 Ricord, of Paris, after a series of observations and elaborate experiments in inoculating the purulent fluid of gonorrhœas and of the soft and hard venereal lesions, demonstrated the purely simple, non-specific nature of gonorrhœa, thus completely and forever eliminating it from among the manifestations of syphilis. Finally Basset, of Paris (a pupil of Ricord), in 1852 demonstrated the fact that in the disease then known as syphilis, comprising the soft local venereal ulcer and the indurated infecting venereal sore with its consequences, two separate diseases existed. Observations have shown that the mucopurulent secretion from non-specific nasal catarrh will sometimes produce excoriations of sound cuticle, and that contact with secretions from non-specific leucorrhœas will sometimes promptly cause pustular eruptions (*herpes*) of the preputial mucous membrane of the male; and these more or less rapid in development and progress according to the degree of activity of the inoculating secretion—in some instances so simple that they are scarcely more than sero-purulent vesicles, and in other cases observed so vicious that in appearance they do not differ at all from the typical chancreid, the secretion being also *auto-inoculable*, as proven by the occasional occurrence of similar lesions upon opposing surfaces.

The venereal ulcer or chancreid acquires its chief importance from its liability to be mistaken for and treated as the initial lesion of syphilis; and the more so as it is often through the lesion established by the destructive agency of the chancreid that the syphilitic principle or disease-germ is permitted entrance into the system. The distinction between the two lesions at the outset is often impossible. The active characteristic of the chancreid is recognized as a necrosis—that of the syphilitic lesion one of growth or proliferation. The surface of a sore, then, may be the field of chancreoidal action, while the living tissue beneath may be at the same time a center of proliferation of syphilitic disease-germs, which are constantly gaining access to the general circulation through the contiguous lymphatic vessels. These germs may be originally deposited upon a simple abrasion or one already the seat of chancreoidal action, or may be subsequently inoculated through the breach of tissue made by the chancreid. If the former,

the imposition of the secretion of a chancreoid upon the same point, if the disease-germs have been freshly deposited, might cause their destruction, and thus leave only the chancreoid element; but once the syphilitic principle has extended below the surface and has entered a lymphatic vessel (see SYPHILIS), it has gone beyond the sphere of action of the chancreoid.

The frequent association of chancreoid with syphilis will never lead to mistaken identity if it is constantly borne in mind that syphilis is always, in all its manifestations, a process of growth, of proliferation, of exaggerated life. The most scientific and critical examination of the products of syphilis, from the initial lesion to the gummy tumor, has never been able to detect any abnormal material—nothing but excessive accumulations of tissue-building cells. Chancreoid, on the other hand, from its inception to its cicatrization, is a process of necrosis—literally, death of tissue. So that syphilis is always and only in relation to chancreoid as life to death—each the highest type of its own peculiar action.

Venezuela, Span. pron. *vā-nāth-wā-lāā* (officially, *Estados Unidos de Venezuela*): a republic in the northern part of South America; bounded N. by the Caribbean Sea, N. E. by the Atlantic, E. by British Guiana, S. by Brazil, and W. by Colombia. Area, officially claimed, 597,960 sq. miles; but this includes a tract extending eastward to the river Essequibo, now held by Great Britain as a part of British Guiana, and a vast unsettled tract in the south which is claimed by Brazil. The area of the undisputed territory probably does not exceed 400,000 sq. miles.

Regional Divisions.—Venezuela is naturally divided into four very distinct regions: 1. The mountainous belt of the north and northwest, including, as a sub-region, the lowlands around Lake Maracaibo; this is the agricultural zone and contains at least five-sixths of the civilized population. 2. The llanos, a broad belt, hardly above sea-level, between the mountains and the Orinoco; this is the pastoral zone, thinly settled, but supporting vast herds of cattle. 3. The forest-covered plains of the southwest, almost without civilized inhabitants, but rich in rubber and other natural products. 4. The highlands of Venezuelan Guiana, settled only near the Orinoco, but known to contain valuable deposits of gold.

1. **The Mountain Zone**.—The Eastern Cordillera of the Andes, entering Venezuela from Colombia, divides into two branches, between which is the low basin occupied by Lake Maracaibo and the surrounding swamps. The western branch runs northward, forming the boundary between the two countries, and terminating near the coast. The other, which trends northeastward, covers a wide extent of country, and contains the highest mountains in Venezuela, with extensive high valleys and arid plateaus (*páramos*): five of the peaks rise above the limit of perpetual snow, and one, the Sierra Nevada de Merida, attains 15,400 feet. On approaching the coast this branch ties in with another mountain system which skirts the northern coast from near Lake Maracaibo to Cape Paria, but has an important break near lon. 65° W. This coast mountain region is not very wide, and it generally shows two parallel chains inclosing a fertile valley. The highest peaks are Naiguatá, 9,127 feet, and the Silla of Caracas, a little lower. The name Andes is restricted in Venezuela to the branches of the Cordillera, though geographers have sometimes extended it to the coast system. Neither here nor elsewhere in the country are there any active or quiescent volcanoes; but the whole mountain region appears to be peculiarly subject to earthquakes, and these have occasionally been very destructive. Hot springs are numerous. The mountain lands reach to the coast itself, often rising precipitously from the sea, or broken into deep bays and gulfs which follow the east and west direction of the chains; such are the Gulfs of Cariaco (Cumaná) and Paria, the latter converted into an inland sea by the island of Trinidad to the E. of it. In the N. W. the peninsulas of Goajira and Paraguaná—the latter almost an island—stand out boldly from the coast-line, inclosing the Gulf of Maracaibo. Lake MARACAIBO (*q. v.*) communicates

with this gulf and occupies, as we have seen, a depression between two branches of the Cordillera; it is the largest lake in the northern part of South America, and is an interior waterway, its outlet forming an important harbor. Other excellent harbors are those of Puerto Cabello and Cumaná. The most important commercially is La Guaira, which, unfortunately, has few natural advantages, but has been improved by art. Several islands adjoin the northern coast, but the only important one belonging to Venezuela is MARGARITA (*q. v.*). The numerous streams of the mountain zone are short, and, with few exceptions, unnavigable; a large number flow into Lake Maracaibo. Much of the land was originally covered with forest, which remains on the higher slopes. The climate varies greatly with elevation, exposure, and the nature of the soil, but in general the higher lands are temperate and salubrious, while the coasts and the whole basin of Lake Maracaibo are among the hottest regions in South America; in the hot months they are often visited by swamp fevers and dysentery, but severe epidemics of yellow fever are not common. The rainy and warmest months are generally from April to October, varying somewhat with locality. The dry season is well marked.

2. **The Llanos**.—These open pasture-lands are described in a separate article. (See LLANOS.) Though portions might be used for agriculture, they are now exclusively devoted to cattle-raising, and the hardy race of half-breed herdsmen (*llaneros*) inhabiting them has played an important part in the history of Venezuela. Many portions of the plain are even hotter than the Maracaibo basin. During the rains immense areas are flooded, and swamp fever and dysentery are then very common. The principal towns are near the mountain belt. The great delta of the Orinoco is a labyrinth of channels and swampy islands, mainly covered with forest, swarming with mosquitoes, and inhabited only by a few Indians.

3. **The Upper Orinoco Region**.—This region, occupying the southwestern part of Venezuela, is unexplored except near the Orinoco and a few of its branches. The known portion, above the junction of the Meta, is a plain, somewhat higher than the llanos, with some isolated hills or low mountains, and generally covered with forest. A few canoes ascend the river every year to gather rubber and trade with the Indians. Much of this territory is claimed by Brazil or Colombia.

4. **Venezuelan Guiana**.—The southeastern part of the republic, within the great curve of the Orinoco, is physically a part of GUIANA (*q. v.*). It is a region of plateaus and low mountains or mountain-like ridges, some parts, it is said, exceeding 7,000 feet in altitude. So far as known, it contains much open land, interspersed with scrubby growth and forest. The climate, except near the rivers, is temperate and salubrious. The only town is Angostura, on the Orinoco. Some districts near the Orinoco are occupied for cattle-breeding, and rich gold mines have been found near the frontier of British Guiana.

Rivers.—The great river system is that of the ORINOCO (*q. v.*). The main stream and its eastern branches lie entirely in Venezuela, but the western affluents are partly in Colombia. Steamboats ascend to the Atures rapids, and by the Apure and other branches penetrate the interior nearly to the mountains. The remarkable channel connecting the upper Orinoco with the Río Negro and Amazon is above the rapids and beyond the reach of regular commerce; eventually this and the Colombian affluents must become very important. As it is, the Orinoco is the outlet of the whole republic, excepting the northern mountain region and those portions of the llanos adjoining it.

Natural Productions.—The plants and animals are those of the neotropical region (see AMERICA, SOUTH), closely resembling or identical with the forms found in Brazil. Jaguars, tapirs, various species of deer, etc., are common, except in the more thickly settled regions. The fisheries of the coast and the Orinoco furnish an important food-supply for the poorer classes. Formerly the pearl-fisheries of Margarita, Cumaná, etc., were celebrated, and the name Pearl Coast survives in many maps, but the industry has lost its prestige. The forest products, but little utilized, include rubber, vanilla, tonka-beans, various drugs, and many beautiful cabinet woods. The minerals are important. Gold is widely distributed in the highland districts, and mines were opened soon after the conquest; at present the principal workings are near Carupano, and especially in Venezuelan Guiana, where the famous mine called El Callao has yielded over \$3,000,000 a year. The Aroa copper mines, 70 miles W.

of Puerto Cabello, are regularly worked by a British company, and other deposits are reported. Coal of inferior quality is mined near Barcelona. The salt-beds of the Araya peninsula have been worked since the sixteenth century; from these and other salines over 100,000 tons are extracted in favorable years. Asphalt is obtained near the Orinoco delta and around Lake Maracaibo. Guano, phosphate rock, jet, kaolin, lead, tin, etc., are reported. The salt mines are a monopoly of the federal Government, which controls concessions for all other mining enterprises.

Industries.—Agriculture is the leading industry, but is almost confined to the northern mountainous belt; the principal products are coffee, cacao, and tobacco for exportation, and maize, yucca, sugar, beans, etc., for home consumption. Wheat is cultivated on some of the higher plateaus. With few exceptions the agricultural methods are crude and wasteful. Sheep and goats are largely bred, especially in the northwestern districts, where goat-skins (known as Curaçoa kid-skins) are an important article of export. The great herds of cattle on the llanos have nearly disappeared twice—during the war for independence and in the civil wars of 1858–63—but they are now rapidly increasing, and the stock has been improved. In 1888 it was estimated that the country had over 8,000,000 head of horned cattle, 5,700,000 sheep and goats, 2,000,000 swine, 400,000 horses, 300,000 mules, and 860,000 asses. Manufactures on a large scale are almost unknown.

People, Government, etc.—The population (partly estimated, 1891) is 2,323,520; the civilized, originally of Spanish origin, has become more or less mixed with Indian blood, and this mixture exists even in the most prominent families. The Negro element is comparatively small, and is nearly confined to the coast cities. Civilized or semi-civilized Indians, originally gathered in mission villages, still maintain separate communities in some districts; those of the Guajira peninsula are practically independent. The wild tribes, now reduced in numbers, are chiefly confined to the upper Orinoco basin. Immigration heretofore has been scanty. As elsewhere in Spanish America, the cultivated and wealthy class is comparatively small. Slavery was abolished peacefully in 1854. Venezuela is composed of eight states, a federal district, and several territories dependent on the federal Government; formerly there were twenty states. Capital, Caracas. The government is a federative republic, closely modeled after that of the U. S.; but practically the central or state power preponderates according to the party which is in power, and frequently the presidency degenerates into a dictatorship. By the constitution promulgated July 20, 1893, the president is elected for four years. Congress consists of two houses. The Roman Catholic is the common and, to a certain extent, the state religion, but all other cults are protected, and liberty of speech and of the press is guaranteed by the constitution. Primary instruction is free and nominally obligatory; in 1891 there were 1,415 Government, 151 state, and many private schools. The Government maintains a university at Caracas and a smaller one at Merida, several normal and soldiers' schools, academy of fine arts, nautical school, lycæums (*colegios*), seminaries for girls, etc. Caracas has a college of engineers, national library, museum, and observatory. Many Venezuelans finish their education in Europe.

Finances.—The monetary unit is the *bolívar*, or *peseta*, equal to 19 $\frac{2}{3}$ cents U. S. currency (gold). Silver and gold are coined, and there are two banks of issue, now practically controlled by the Government. The federal revenue is derived chiefly from import duties. The entire foreign and domestic debt in 1894 was 134,787,750 bolívares or about \$26,000,000, and as the revenue has frequently exceeded the expenditures (including the service of the debts), this amount could be easily borne. Owing, however, to several defaults and the lack of stability of the Government, Venezuelan bonds are generally far below par in the market.

Commerce, Roads, etc.—The exports amount to about \$20,000,000 annually, and the imports are several million dollars less. Coffee is by far the largest item of export, exceeding \$14,000,000; others, in the order of their importance, are cacao, gold, hides and skins, copper ore, tonka-beans, dye-woods, and rubber. The countries holding most of the trade are England, the U. S., Germany, and France. Much of the coasting and river trade, partly on vessels flying the Venezuelan flag, centers in the British colony of Trinidad. A railway runs from La Guaira to Caracas, and another from Puerto Cabello to Valencia, with branches; an extended railway system is projected. The common roads are

generally bad. Steamboats regularly ascend the Orinoco and some of its tributaries; and there is steam and telegraphic communication with Europe and the U. S.

The metric system of weights and measures is adopted for all Government and legal transactions, and is coming into general use.

History.—The Venezuelan coast was discovered by Columbus in July, 1498, and soon after was frequented by Spanish traders and pearl-fishers. Ojeda, observing Indian houses built on piles near Lake Maracaibo, fancifully compared that region to Venice, and called it *Venezuela* (Little Venice), a name subsequently adopted for the whole country. Las Casas was granted the right to settle Cumana, but his missionary colony was destroyed by the Indians in 1522. Soon after Charles V. farmed out the country to a German commercial house, the *Welsers*; expeditions sent by them founded Coro (1527), which became the center of exploration and settlement. The Indian tribes were destroyed or reduced to slavery during the succeeding forty years; Caracas was founded in 1567. Subsequently Venezuela was much neglected; it was ruled by captains-general who, in the eighteenth century, were partly controlled by the viceroys of New Granada. Venezuela was one of the first colonies to revolt from Spain in 1810, and independence was declared in 1811. The movement, of which Miranda became the leader, failed, partly owing to the great earthquake of Mar. 26, 1812, which destroyed Caracas and other cities; the patriots were impoverished and many, supposing that the disaster was a token of divine wrath against rebellion, joined the royalists. The war broke out afresh, the colony uniting with New Granada in the republic of Colombia; the principal patriot leader and first president was the Venezuelan BOLIVAR (*q. v.*). After many vicissitudes Bolívar's victory at Carabobo, June 25, 1821, broke the Spanish power. In 1830 Venezuela seceded from Colombia, and she has since remained independent. Except for transient revolts and a more serious one in 1848–49, the country enjoyed peace until 1859; a civil war then broke out which, after four years, resulted in the overthrow of the Government and the accession to power of Falcon and his successor, Guzman Blanco. Since then there have been frequent disturbances, and in 1892 President Andueza Palacio was overthrown by Gen. Joaquín Crespo, who was regularly elected president under the new constitution in 1894. The question of the boundary with British Guiana has long been a cause of dispute between Venezuela and Great Britain. For the literature of Venezuela, see SPANISH-AMERICAN LITERATURE.

Venezuela, Gulf of: See MARACAIBO, GULF OF.

Venial Sin [*venial* is viâ O. Fr. from Lat. *venia*'tis, pardonable, deriv. of *venia*, pardon, remission]; a term used in Roman Catholic theology, in contradistinction to mortal sin, to denote those lesser transgressions of the laws of God or the Church, which, though blamable, are not sufficient to destroy the union of friendship existing between God and the soul. J. J. KEANE.

Venice [Ital. *Venezia*; cf. Lat. *Venetia*, country of the *Veneti*]; a city and fortress of Italy, once the capital of a rich and powerful republic, now the chief town of the province which bears its name (see map of Italy, ref. 3-D). It lies in the Adriatic on 118 small islands and shoals in the Gulf of Venice, between the mouth of the Piave on the N. and the Adige on the S. These islets in the lagoons, made on piles petrified by time and by the deposits of the Brenta and other affluents of the Adriatic, are connected by 378 bridges, sufficiently elevated to allow boats to pass freely under them. By means of the small strips of land artificially built on piles around the edifices, and about 200 smaller or greater open spaces called *campes*, as well as the bridges, a slender land communication is kept up through the city, but most of the business and amusement is carried on through the 157 canals which not only form the highways, but also penetrate every alley of the city. The Grand Canal divides the city into two unequal portions and is spanned by the magnificent Ponte-Rialto, a marble arch built by Antonio da Ponte in 1588–91, and two iron bridges built in 1854 and 1858. Since 1845 Venice has been connected with the mainland by a railway bridge 21 miles long, and is thus brought

within an hour's ride from Padua. This bridge is built on some 80,000 piles and consists of 222 circular arches of about 33 feet span each. The supply of drinking-water is now brought from the mainland.

Institutions, Industries, and Commerce.—The population of Venice had dwindled from 190,000 in the fifteenth century to half that number at the beginning of the nineteenth century, but has risen again to 150,900 (Dec. 31, 1893). Venice is the seat of a prefect, supreme court, a Catholic patriarch, and an Armenian archbishop, and has an academy of sciences, one of the richest libraries in Europe, a conservatory of music, the Academy of Beaux-Arts with extremely valuable collections of painting, an archaeological museum, a permanent art exposition, and several schools, besides five theaters. Since Venice has been connected by the railway bridge with the railway system on the mainland and since the opening of the Suez Canal, commerce has greatly increased; in 1885 2,732 ships with a tonnage of 824,291 entered the harbor. This, however, can not be compared with the trade of the city in 1421, when it gave employment to 3,345 ships with 36,000 sailors and 16,000 dock-laborers. The trade is principally in grain, oil, hemp, cotton, raw silk, wine, and petroleum. The chief articles of manufacture are glass and mosaic wares, artificial pearls, silk, velvet, lace (this famous industry having been revived), wax, soap, artistic furniture, jewelry, and artificial flowers. Venice is connected with Trieste and the Orient by steamship lines. Coal and iron have to be imported, chiefly from Great Britain, as Italy produces but little of these articles. Ship-building is carried on at six wharfs.

Churches and other Public Buildings.—There are few squares and gardens of any extent in Venice; chief among them are the Giardino Pubbico at the eastern end of the city and the grounds adjoining the royal palace. The Piazza San Marco on the Rivo Alto (Rialto), surrounded by palaces and archways and paved with trachyte and marble blocks, is the great square of Venice and the center of its life. At the eastern end of the Piazza stands that wonderful monument of Oriental Greek architecture and Roman style combined, the Basilica of San Marco, begun in 828 and built during 976-1071 to receive the bones of the evangelist St. Mark, which are believed to have been brought there by the Doge Giustiniano Partecipazio (827-830) from Alexandria, Egypt. The facade of this church, dating from the fourteenth century, is composed of two tiers of round arches, five in each tier, the center arch of both rows being larger than the others. These arches are supported by innumerable columns of great beauty; the spaces over the doorways, etc., are covered with rich mosaics and other most elaborate ornamentation; and above the central portal stand four bronze horses, brought from Constantinople in 1204, and undoubtedly of Hellenic workmanship. The whole edifice is surmounted by pinnacles and domes so perfect in form and arrangement as to produce a finish of the most exquisite symmetry and fitness. The vestibule is entered by five bronze doors of superb workmanship, is vaulted with mosaics from designs by Titian, and contains very interesting sepulchral monuments, splendid columns, and other architectural features, and countless objects of veneration collected in the various chapels, in the sacristy, and elsewhere. On the right of the Basilica of San Marco, to the rear, rises the Torre dell' Orologio, or Clock Tower (1494), with its gorgeous dial-plate of blue and gold, above which stand the famous bronze Moors with iron hammers. Besides San Marco there are ninety-eight other Roman Catholic churches, several Protestant and Armenian churches, and seven synagogues. Noteworthy among the first-named is the Chiesa dei Frari (1250), which contains, besides exquisite pictures by G. Bellini, Titian, etc., several very remarkable tombs of great artistic merit and two modern monuments, one in honor of Titian, the other in memory of Canova. In the conventual buildings connected with this church are kept the archives of Venice, said to contain at least 140,000 documents of all dates from the ninth to the nineteenth century. Among the architectural features of Venice the Palazzo Ducale, or doge's palace, is conspicuous. Begun in 1350 by Filippo Calendario, it was completed in 1442, and holds a high rank with its superb works of art and impressive beauty. In its court is the famous giant stairway with its colossal statues of Neptune and Mars. It has on the east the famous Bridge of Sighs (*ponte dei sospiri*) leading to the ancient state prisons, known as the *piombi* (lead-roofs). The magnificent hall of the Great Council, with the adjoining rooms, has held since 1812 the famous Library of St. Mark, with its MS.

treasures and its many pictures, including Tintoretto's *Paradise*, the largest oil-painting in the world. In the eastern wing of the palace is the Archæological Museum, with Greek works of sculpture. Opposite the Palazzo Ducale is the ancient library building, now a royal palace, the masterwork of Sansovino, to the right the magnificent mint (*la Zecca*), built by Sansovino. There are many other magnificent palaces in Moorish, Gothic, and early Renaissance styles. The two granite columns (brought from the East in 1127) at the southern end of the Piazzetta, the one surmounted by a statue of St. Theodore and the other by the Lion of St. Mark, were considered as especially symbolic of the republic, and were copied in many of her subject cities.

History.—This began when the Veneti, probably of Illyrian stock, lived on the northeastern bay of the Adriatic. In 452 Attila, King of the Huns, destroyed Aquileja and conquered all the country as far as the Po. At that time fugitives from all parts of the ravaged countries concealed themselves in the lagoons, and gradually founded island-towns like Grado, Heraclea, Malamocco, and Chioggia, governed by tribunes. After the downfall of the Western Roman empire in 476 the Venetian islands were subjected to Odoacer, then to the Ostrogoths, and finally to the Byzantine empire. Even after the invasion of the Lombards in 568 they remained under Byzantine dominion, but repeated wars with the Lombards made a closer union and a uniform government a necessity. Therefore all the classes of the island communities elected in 697 A. D. Paoluccio Anafesto as their supreme chief for life under the title of duke or doge. The ducal residence was at first Heraclea, after 742 Malamocco, but was removed in 810 to the heretofore deserted island of Rialto, which became the central island of the city of Venice, connected by the Doge Agnello Partecipazio with all the neighboring islets by means of many bridges. In 827 the body of St. Mark was surreptitiously taken from Alexandria in Egypt and transported to Venice. The apostle became the patron saint of the republic, and the Cathedral of St. Mark was immediately designed and begun. A period of peaceful development followed for the republic, which skillfully used its advantageous position between the Western and Eastern empires to become the richest and most powerful commercial city of Europe, and to expand its mercantile relations so far as the Crimea and Tartary. Its fleets fought successfully against the Normans and Saracens of Southern Italy, as well as against the Slavonic pirates of the Adriatic Sea; Istria was conquered, and the towns of the Dalmatian seacoast subjected themselves voluntarily to the protection of Venice in 997. Though actually independent, the republic still maintained the appearance of a political union with the Byzantine empire for commercial reasons. During the crusades Venice spread its influence over the entire Levant in spite of the competition of Pisa and Genoa. Meanwhile internal dissensions between the aristocratic and democratic factions brought about an insurrection; the Doge Vitale Micheli was killed and the so-called *Great Council*, consisting of elected *Nobili*, was established in 1172 to limit the well-nigh absolute power of the doges and the signoria (of six counselors). Under this constitutional aristocracy legislation and administration developed a more liberal spirit.

In 1204 the Doge Enrico Dandolo, with the aid of French crusaders, conquered Constantinople and acquired the lion's share of the Græco-Latin empire and the island of Candia (Crete). The art-treasures of the East were carried to Venice, and a noble school of artists sprang up to celebrate the royal grandeur of the doges. The republic, however, was unable to prevent the overthrow of the Latin empire at Constantinople in 1261, and the Genoese, with whom Venice had been at war since 1256, then gained the favor of the Byzantine emperors. In the meanwhile the oligarchic constitution at home was becoming more firmly fixed, and at the end of the century Venice had really ceased to be a democracy. The Doge Marino Falieri, having conspired against the aristocracy, was executed in 1355. The changed relations to the Orient induced the republic to replace the losses sustained in the Levant by gains in Italy, especially after the final defeat of Genoa in 1381. Its possessions on the mainland became more and more considerable. Vicenza, Verona, Bassano, Feltre, Belluno, and Padua with their territories, were gained in 1404 and 1405, Friuli in 1421, Breiscia and Bergamo in 1428, Crema in 1448, the Ionian islands in 1483, and Cyprus was ceded to the republic by Catarina Cornaro, the widow of the last king, in 1489.

Thus the republic flourished at the end of the fifteenth

century in material wealth and power, as well as in art and science; its people were the most educated in Christendom; its commerce and industry spread all over the then known world. But after da Gama's discovery of the maritime route to Eastern India in 1498, Venice gradually lost its important Indian trade. The westward advance of the Turks, especially after the fall of Constantinople in 1453, ruined Venetian commerce in the enormous sphere of Turkish influence in Europe, Asia, and Africa; the republic lost its possessions in the Archipelago and Morea, also the Albanian territory and Negropont. The League of Cambrai, necessitating a wavering policy between Charles V. and Francis I., and incessant collisions at home and abroad, reduced the republic for a time to the verge of destruction, and ruined its commerce and industry. In spite of the greatest heroism in the wars of the republic against the Turks, Cyprus was lost in 1571, and after a twenty-four years' war in which Candia was most heroically defended, this island was surrendered in 1669, although several fortresses were held by the Venetians till 1715. Morea, which had been reconquered by Venice in 1687, was lost forever in 1718 by the treaty of Passarowitz. Here ended the international importance of the republic, which endeavored from this time on to preserve its old constitution and its home possessions in perfect neutrality, i. e. Venetia, Istria, Dalmatia, and the Ionian islands, with about 2,500,000 inhabitants; but when the republic in 1796 sought an alliance with Austria against Napoleon, a fierce war began, which ended with the resignation of the last doge, Ludovico Manin, the dissolution of the Great Council May 12, 1797, and the occupation of the city by the French.

By the treaty of Campo Formio, Oct. 17, 1797, the Venetian territory on the left of the Athesis, with Istria and Dalmatia, was ceded to Austria, and there began the most unfortunate period in Venetian history, a succession of secret conspiracies and revolutions against Austrian domination. After the heroic revolution of 1848, which was suppressed by the famous Austrian general Radetzky, Venice once more fell into the hands of the exasperated Austrians, who held it in a state of siege till 1854. Even the combined forces of Napoleon III. and Victor Emmanuel of Sardinia in 1859 did not relieve Venice from the Austrian dominion. With the mainland up to the Mincio river it remained Austrian until the unnatural relation was dissolved in 1866, owing to Austria's war with Prussia. Emperor Francis Joseph of Austria was successful against the Italians when they crossed the Mincio, yet, owing to the defeat of the Austrian arms on the battle-fields of Bohemia, ceded Venice to Napoleon III., who turned it over to Victor Emmanuel, King of United Italy. On Nov. 7 the king entered the city in solemn procession.

Venice white: See BARYTA.

Veni Creator Spiritus [Lat., Come Creator Spirit, the opening words of the hymn]: a hymn of the Roman Breviary; probably composed by Pope Gregory I. (540-604), though it was once ascribed to Charlemagne. It is written in correct meter, according to the quantity of the syllables, and its Latinity is good. It is used in the ordinals of Anglican and American churches. Dryden's translation of it is one of the best. The shorter of the two forms of this hymn, found in the office for "the Ordering of Priests" and "the Consecration of Bishops" is more generally used; the longer form being rather a paraphrase than a translation. When used it is sung or said line by line alternately by the bishop, and the clergy and congregation. It is not infrequently used in the American Church at the administration of con-

firmation as indicating the *quasi* setting apart and ordination of the laity to a spiritual kingship and priesthood. There are several other English translations. The two most commonly found in hymnals begin "Come, O Creator Spirit, blest," translated by Rev. Edward Caswall in 1849, and "Come, Holy Ghost, all-quickening fire," translated by Bishop John Cosin in 1627. This and the Creator Sancti Spiritus are of the "seven great hymns of the mediæval Church." See STABAT MATER.

Revised by W. S. PERRY.

Venire facias, ve-ni rée-fa-shi-ás, or (more commonly) simply **Venire**: an ancient common-law judicial writ directed to the sheriff, commanding him to select and cause to come (*venire facias* is Lat. for "cause to come") from the body of the court on a day named a specified number of qualified citizens to act as the jurors at such court. At the common law the selection of the jury is left entirely in the hands of the sheriff, who upon receiving the writ selects and summons the proper number from among the citizens of the county, and returns their names with the writ. This method has been abolished or modified by statute in Great Britain and in most, if not in all, of the States of the U. S., but it still prevails wherever not abrogated by statute, and in case of emergency may still be used where it is so supplanted. The statutes generally provide that from the lists of qualified persons, prepared at stated intervals (usually once a year) and kept by certain officials in each county, the *panel*—that is, the requisite number of jurors for a court—shall be drawn by lot. The list thus drawn is certified to the sheriff, who summons the persons named therein without a regular venire being issued to him, though the venire may still be necessary when, the original panel having been exhausted, additional jurors must be summoned in special cases. The common-law mode of obtaining additional jurors, in case of failure to secure a sufficient number from those summoned, was by selecting from such bystanders as were competent enough persons to fill up the number of the jury, and this method is still generally used, unless expressly prohibited by statute. The term *venire facias de novo*, or *venire de novo*, is the old technical expression for a venire issued when a verdict has been set aside and a new trial ordered because it is so imperfect or ambiguous that no judgment can be given on it, or issued when there has been some fatal irregularity or impropriety in returning the jury under the first venire. The term *venire facias* is also applied to a writ issued as the first step in outlawry proceedings for a misdemeanor in England. See Stephen's *Commentaries on the Laws of England*; Forsyth's *History of Trial by Jury*; Bigelow's *History of Procedure in England*.

F. STURGES ALLEN.

Veni Sancte Spiritus [Lat., Come Holy Spirit, the opening words of the hymn]: a hymn of the Roman Missal; ascribed to King Robert II. of France (d. 1031 A. D.). It is in the mediæval Latin, is rhymed, and its meter is not according to quantity. It is a sequence in the Mass for Whitsunday and its octave, and is one of the loveliest and most tender of the Latin hymns.

Venloo, ven-lō, or **Venlo**: town; province of Limburg, Netherlands; on the Meuse; 60 miles N. W. of Cologne (see map of Holland and Belgium, ref. 8-II). It is narrow and irregularly built, is an important railway center, and contains an arsenal, powder-mills, magazines, and hospitals. Its manufactures include cigars, needles, and gin. Pop. (1890) 11,397.

Venn, HENRY; clergyman and author; b. at Barnes, Surrey, England, Mar. 2, 1724; educated at Bristol and at Jesus College, Cambridge, where he graduated 1745; took orders in the Church of England; became fellow of Queen's College 1749, curate of Clapham 1754, vicar of Huddersfield, Yorkshire, 1759, and rector of Yelling, Huntingdonshire, 1771. He was a leader among the Evangelicals. D. at Clapham, June 24, 1797. He was the author, among other works, of *The Complete Duty of Man, or a System of Doctrinal and Practical Christianity* (1763), a Calvinistic work which obtained great popularity and was often republished (9th ed. 1807). His *Life and Letters* were published in 1834 by his grandson, Rev. Henry Venn. Revised by S. M. JACKSON.

Venn, JOHN, Sc. D., F. R. S., F. S. A.; logician; b. at Kingston-on-Hull, Yorkshire, England, Aug. 4, 1834; educated at schools in London, and in Caius College, Cambridge. He has been lecturer in Moral Science in Caius College since 1862; was Hulsean lecturer 1867-70, etc. His principal works are *Logic of Chance* (1866; 3d ed. 1887);

Characteristics of Belief (Hulsean Lectures, 1870); *Empirical Logic* (London, 1889); *Symbolic Logic* (1881; 2d ed. 1894). J. M. B.

Venom [M. Eng. *venim*, from O. Fr. *venim*, *venin* > Fr. *venin* < Lat. *venenum*, poison]: the poison elaborated as a normal secretion by certain glands of animals, as distinguished from *virus*, the virulent liquid excrementitious or abnormal product of animals or man, usually a product of disease. Some insect stings are virulent, though as a rule they are mild and relieved by simple measures. A bee or wasp usually leaves its sting in the wound it inflicts; this should be extracted, and the wound protected from the air and bathed in cooling and stimulating evaporating lotions; weak ammonia is a useful application. The scorpion is dangerously venomous in the tropical regions of the Indies and Africa, but in the milder climates it inhabits it does little harm. The tarantula's venom, contrary to the fabulous accounts, rarely causes death, and seldom occasions even alarming symptoms. In nearly all countries there are venomous serpents, their number diminishing with an increase of population and a high cultivation of the soil. Islands are comparatively free. Ireland is said to be quite free, and England has but one, the viper. The chief venomous serpents of the U. S. are the rattlesnake, moccasin, copper-head, harlequin, and adder. The phoora of India and the cobra are exceedingly virulent. The venom of serpents is elaborated in special glandular apparatus adjacent to the mouth, stored in a sac or canal, and reserved for sudden voluntary ejection as a part of the reptile's means of defense and offense. See POISON OF SERPENTS.

Revised by E. T. REICHERT.

Venosa, *vā-nō'siā* (anc. *Venusium*): commune and city of the province of Basilicata, in Southern Italy; about 20 miles N. of Potenza (see map of Italy, ref. 7-G). It is celebrated as the birthplace of the poet Horace and as the scene of the defeat and death of the Roman consul Metellus in a battle with the Carthaginian troops under Hannibal. Venosa is mentioned by Diodorus and Dionysius as a town of great antiquity and importance, but we know nothing of the details of its early history, except that it belonged to the Samnites before its incorporation into the Roman state. It lies in a salubrious, fertile, and picturesque region. Pop. about 8,000.

Revised by M. W. HARRINGTON.

Venous Blood [*venous* is from Lat. *venōsus*, veiny, full of veins, deriv. of *ve'na*, vein. See VEINS]: the dark-colored fluid collected from every part of the system by the veins. It subsequently becomes mixed with the *chyle*, or nutritious portion of the food, and is ultimately exposed to the modifying influences of the air as it passes through the lungs, whereby it is converted into bright-red arterial blood. (See BLOOD.) Besides the difference between venous and arterial blood in color, several distinctions in physical and chemical properties are presented. The specific gravity of venous blood is greater than that of arterial blood; it does not coagulate so rapidly, and contains more corpuscles, but less fibrin. Its serum contains less water and extractive matter, but more fat, than that of arterial blood. Corpuscles from venous blood contain 3.57 per cent. of fat; those from arterial blood contain but 1.84 per cent. The differences in color presented by the blood-corpuscles appear to be dependent, to a certain extent, upon their shape and upon the amount of hæmatin present. The florid color of arterial blood is due to oxidation of the hæmoglobin. Venous blood contains more carbonic acid, but less oxygen, than arterial. In 100 volumes there exist—nitrogen, 13; carbonic acid, 71.6; oxygen, 15.3; arterial blood containing nitrogen, 14.5; carbonic acid, 62.3; oxygen, 23.2. Venous blood does not evolve oxygen when placed in an atmosphere of nitrogen, as is the case with arterial blood.

Ventilation: See WARMING AND VENTILATION.

Ventricles: See HEART.

Ventri'loquism [deriv. of *ventrilogy*, from Mediæv. Lat. *ventrilogus*, one who (apparently) speaks from the belly; Lat. *venter*, belly + *loqui*, speak]: the art of so managing the voice as to cause the illusion that its origin is from some other source than the vocal organs of the speaker. It was undoubtedly known to the ancients. The etymology of the word indicates the idea formerly entertained in relation to the nature of the performance, but it is now well known that the sound does not come from the abdomen. Again, it was conceived that the ventriloquist spoke during inspiration instead of expiration, and that thus illusions in regard

to locality and distance were produced. It is undoubtedly true that modulated voice may be formed by inspiring air through the vocal organs, but it is equally certain that the sounds which result have little or no analogy with those of the ventriloquist, and are not calculated to cause the deceptions which the accomplished performer so readily produces. In reality, the words uttered by the ventriloquist are formed in precisely the same manner as in ordinary articulation, the difference consisting mainly in the mode of respiration. A very full inspiration is taken, and then the air is expired slowly through a narrowed glottis, the diaphragm being kept in its depressed condition and the thoracic muscles alone being used to empty the lungs. At the same time the lips are scarcely moved, and the deception is still further facilitated by the attention of the auditors being directed to the object which the performer wishes to be regarded as the source of the voice.

Ventura, Cal.: See SAN BUENA VENTURA.

Ventura de Raulica, -*rowlōe-kāi*, GIOACCHINO: preacher; b. in Palermo, Sicily, Dec. 8, 1792; was educated by the Jesuits, but entered the order of the Theatines; became general of the order in 1824, and settled in Rome, where he enjoyed the confidence of Popes Leo XII., Pius VIII., and Gregory XVI., and exercised considerable influence even on the diplomatic business of the papal government. He was a disciple of Lamennais. "The pope and the people" was his device; the establishment of free institutions under the tutelage of the Roman Catholic Church was his ideal; but his work *De Methodo Philosophandi* (1828) in defense of the scholastic philosophy provoked an attack by Lamennais, who afterward openly rebelled against the Church. Ventura attempted to bring about a reconciliation, but failed, and retired from the papal court in 1836. For about ten years he devoted himself to literary work and to preaching. His eloquence as an orator earned for him the title of the "Italian Bossuet." With the accession of Pius IX. he returned to the court, and his influence, as well as his popularity, grew rapidly. In 1847 he delivered a funeral oration over O'Connell, which gave him great influence with the people, and when, in 1848, the revolution against the Bourbons broke out in Sicily, he openly espoused the cause of his countrymen with great fervor, and wrote *On the Independence of Sicily, On the Legitimacy of the Acts of the Sicilian Parliament, and Mensonges diplomatiques*. But the revolution in Rome and the flight of Pius IX. to Gaeta destroyed his hopes. On May 4, 1849, he fled from Rome; settled in Montpellier, and removed in 1851 to Paris, where he preached in French to large audiences in the imperial chapel in the Tuileries and in the Madeleine, and published many voluminous works, including *Histoire de Virgine Bruni, Les Femmes de l'Évangile, La Raison philosophique et la Raison catholique, Sur l'Origine des Idées, and La Femme catholique*. D. at Versailles, Aug. 2, 1861.

Revised by F. M. COLBY.

Ventu'ri, LUIGI: author; b. at Pavia, Italy, 1812; was educated in the *scuole pie* of Florence; took service at the ducal court, and, during the troubles of 1859, held an important position under the Archduke Leopold II.; afterward engaged in literary pursuits. D. in 1890. Some of his publications are *l'uomo, i canti biblici* (Pisa, 1866), in verse; *Similitudini dantesche* (Florence, 1874), a collation of parallel passages from Dante and other poets; *Michael Angelo Buonarroti, Ricordo al popolo italiano*, biographical and other remarks upon the artist and poet, furnished for the Michelangelo celebration of 1875; *Alessandro Manzoni, gl'inni sacri ed il cinque Maggio* (Florence, 1876), a commentary; *Gl'inni della Chiesa* (Florence, 1877), with translations and explanations. Nearly all his works have gone through several editions; an early collection is *I versi e prose di Luigi Venturi* (Florence, 1871). J. D. M. FORD.

Venue [from O. Fr. *venue*, a coming, deriv. of *venir* (partic. *venu*) < Lat. *venire*, come]: originally the neighborhood or place where the facts are alleged to have occurred, and from which, therefore, the jury was to come that should try the issue. In the later meaning of the term, and the one which it now has, it denotes the county or jurisdiction in which a cause is to be tried. In indictments the venue is given in a marginal notation; and in common-law practice the declaration designates the place in which the cause is to be tried, the term *venue* being applied also to the designating part of the indictment or declaration.

In criminal actions the venue must be the county where the act was committed, except in the case of continuing

offenses, those done partly in two or more counties, etc., in which cases the venue may be chosen from among the counties in which any part of the offense was committed. By the common law a grand jury could not indict or present any offense which did not arise within the county or precincts for which they were returned, but the powers of the jury have been extended in some cases by statute.

In civil cases the venue was, at common law, either local or transitory, according as the action itself was local or transitory. Local actions were those which necessarily referred to some particular locality, as in the case of trespass upon land, and in these the venue had to be laid in the county in which the cause of action arose. Transitory actions were those which might take place anywhere, such as trespass to goods, batteries, etc., and in these cases the venue could be laid in any county at the plaintiff's option, and no venue could be changed except by order of a court or judge, or by the consent of the parties. These rules still prevail except where abolished by statute. In England it is provided that, except in specified cases, there shall be no venue for any civil action, and that when the plaintiff proposes to have the action tried in any other county than Middlesex he shall name the proposed county or place in his statement of claim or complaint. In the U.S. most of the States have statutes regulating the subject, and in general providing that the venue, especially in the lower courts, must be laid in either the county where one of the parties resides, or where the cause of action arose. The venue may be changed in civil causes to prevent great inconvenience to witnesses, and in both civil and criminal causes to promote the ends of justice. The causes, occasions, and modes of change are regulated by statute.

See Stephen's *Commentaries on the Laws of England*; the treatises of Gould, Chitty, and Stephen on *Pleading*; and the statutes of the various States.

F. STURGES ALLEN.

Venus: in Roman mythology, the goddess of spring, generation, sensual love, etc. She seems to have played no very prominent part in the oldest epoch of Roman civilization, but became afterward completely identified with Aphrodite, the Greek goddess of love, and appropriated to herself all the myths belonging to the Greek deity, without adding a single one of Roman origin—her birth from the foam of the sea, her coming from Cyprus or Cythera, her marriage with Hephaestus (Vulcan), her amours with Ares (Mars), Hermes (Mercury), Adonis, Anchises, and others. Of special Roman interest was her adventure with Anclisus, to whom she bore Aeneas, the founder of Rome. Originally, however, Aphrodite was not a Greek creation either, but was introduced to Greece from Asia, where she was worshiped under a variety of names. The myth of Adonis is also of Asiatic origin.

Revised by J. R. S. STERRETT.

Venus [= Lat., named from the Roman goddess *Vēnus*]: the second planet in order of distance from the sun, and the next neighbor of the earth within its orbit. Venus travels at a mean distance from the sun of about 67,000,000 miles, and the eccentricity of the orbit being only 0.006845, its greatest distance exceeds its least distance by only 917,000 miles. Venus when nearest to the earth, at a distance of about 25,000,000 miles, is invisible, being lost in the sun's rays, and it is most favorably placed for observation when near its elongations, when it appears like a half moon, or slightly gibbous or slightly horned. It lies then much farther from the sun's place in the heavens than Mercury when that planet is at its elongations, for the elongations of Venus range from about 45° to about 47½°. Venus completes a sidereal revolution in 224.7008 days on a path inclined 3° 23½' to the ecliptic, but its synodical revolution is much greater, amounting to 583.920 days, which is the mean interval between successive inferior conjunctions or between successive superior conjunctions. Half this period, or 291.960 days, is the interval between successive conjunctions, which are of course alternately inferior and superior. Between inferior conjunction and the next superior conjunction Venus is a morning star, while between superior conjunction and the next inferior conjunction it is an evening star. Venus has a diameter estimated at about 7,650 miles. Its density is slightly less than the earth's. The telescopic study of this beautiful planet has not been attended by results so interesting as might have been expected from its proximity. Some astronomers, indeed, claim to have seen spots and markings upon the surface of Venus; but the best observers, using the most powerful telescopes, have uniformly failed to see what inferior observers have imagined they have discerned

with relatively imperfect instruments. Sir John Herschel remarks that "the surface of Venus is not mottled over with permanent spots like the moon; we perceive in it neither mountains nor shadows, but a uniform brightness, in which we may indeed fancy obscurer portions, but can seldom or never rest fully satisfied of the fact." Still, observations have led to results tolerably accordant *inter se*. Thus the elder Cassini deduced a period of 23 hours. Bianchini indeed inferred from his observations the monstrous rotation-period of 24 days 8 hours, but the younger Cassini showed that all Bianchini's observations could be reconciled with the elder Cassini's by taking for the rotation-period 23 hours 21 or 22 minutes; and as Bianchini's observations were not continued during several consecutive hours at each sitting, owing to the want of sky-room at his place of observation, this interpretation must be accepted as the more probable. Later, the industrious Schröter attacked the problem, and reduced the supposed rotation-period to 23h. 21m. 19s., while de Vico, by combining his own observations with those of Bianchini and Cassini, deduced the rotation-period 23h. 21m. 15s. Later, Schiaparelli, of Milan, published a series of papers in which he claims that Venus always presents the same face to the sun, just as the moon does to the earth. This conclusion is not yet established by other observers, and the above-quoted view of Sir John Herschel still expresses the best opinion on the subject.

Venus, like Mercury, transits the face of the sun, but at longer intervals. Its transits are more important than those of Mercury, because, being nearer to us when in transit, its position on the sun is different for observers differently placed on the earth. Transits of Venus occur only when the planet is in inferior conjunction near one of its nodes. These lie in longitudes 75° 19' and 255° 19', and the earth passes these longitudes respectively on or about Dec. 7 and June 6, so that transits can occur only near these dates. If a conjunction has occurred near the place for December transits, another will occur there 243 years later under very nearly the same conditions; but usually a pair of transits will occur near this date, separated by eight years, so that, for instance, we have a December transit in 1631 and another in 1639, followed by a transit like the first of the pair in 1874 (1631 + 243), and a transit like the second of the pair in 1882 (1639 + 243). The following are the dates of these transits during seven centuries:

1631, Dec. 7.	2004, June 8.
1639, Dec. 4.	2012, June 6.
1761, June 5.	2117, Dec. 11.
1769, June 3.	2125, Dec. 8.
1874, Dec. 9.	2247, June 11.
1882, Dec. 6.	2255, June 9.

See SOLAR PARALLAX and TRANSITS OF VENUS and MERCURY.

Revised by SIMON NEWCOMB.

Venus's Flower-basket: the *Euplectella speciosa*, a siliceous sponge found near the Philippine islands, consisting of a delicate lace-like skeleton or framework, which, when the enveloping animal tissue is removed, forms a cornucopia 12 or 15 in. high and 2 in. wide. J. S. K.

Venus's Fly-trap: See DIONÆA.

Venus's Girdle: See CTENOPHORA and GIRDLE OF VENUS.

Vera: town; in the province of Almeria, Spain; on the Almanzora, near its entrance into the Mediterranean (see map of Spain, ref. 19-G). It has a small harbor, through which it carries on some export and import trade. Its manufactures of niter are important and its fisheries considerable, and there are many mines in the vicinity. Pop. (1887) 8,610.

Vera Cruz, Span. pron. vā räa-krooth': an eastern maritime state of Mexico, surrounded by the Gulf of Mexico, Tabasco, Chiapas, Oajaca, Puebla, Hidalgo, San Luis Potosí, and Tamaulipas. Area, 27,454 sq. miles. It forms a long strip, extending southeastwardly along the Gulf, with an average width of about 50 miles. Near the coast the surface is generally low, flat, or rolling, with occasional hills and extensive swamps and lagoons. Northwardly this coast strip includes nearly the whole width of the state, but elsewhere it is narrowed, rising to high mountains on the western and southwestern frontier. Orizaba, on the Puebla boundary, is the highest peak in Mexico and possibly in North America. Spurs and isolated peaks break the lowlands on the southeastern part, and one mass, the volcano of Tuxtla, near a headland on the coast, rises to a height of almost 5,000 feet. The extreme southeastern end of the state

includes the eastern part of the Isthmus of TEHUANTEPEC (q. v.). Numerous short rivers flow down from the mountains, the most important being the navigable Panuco on the northern frontier; the lagoon of Tamiagua is also navigable and forms a means of interior communication. The climate of the coast belt is warm and in the summer months often insubrious, yellow and swamp fevers prevailing. The higher lands are temperate and healthful. Heavy forests cover the mountain-sides, extending in some places to the coast. Much of the land is very fertile. Vera Cruz is an agricultural state, and is especially noted for the excellence of its tobacco and coffee. These, with sugar, cotton, and vanilla and cabinet-woods from the forest districts, are largely exported. There are considerable manufactures, especially of coarse cotton cloths and cigars. The mines at present are unimportant. Pop. (1893) estimated, 641,824. The official capital is Jalapa, but the legislature often meets at Orizaba.

HERBERT H. SMITH.

Vera Cruz: the most important port of the state of Vera Cruz and of Mexico; on an indentation of the Gulf coast; about 180 miles (263½ miles by railway) E. of Mexico city (see map of Mexico, ref. 7-1). Here a small and badly sheltered harbor is formed by a narrow channel between the beach and a line of low reefs. It is open to the N., and during the "northers" or winter storms, common on this coast, vessels have frequently been wrecked before the city. At such times it is impossible to land freight or passengers, and steamers commonly put out to sea until the storm has passed. Vessels drawing 26 feet can pass behind the reef, but large ones often anchor in the open roadstead. A breakwater now (1895) in course of construction will make the harbor safer, but it can never be a commodious one. The city is built on flat and barren land, and it has no notable buildings. The chief attraction is a shaded square near the water front. The climate is unpleasantly warm, and Vera Cruz is one of the most unhealthful places in Mexico. Epidemics of yellow fever occur regularly every summer, and there are occasional cases even in the winter. Notwithstanding these disadvantages, Vera Cruz has always been the chief commercial gate of Mexico, a great part of its import and export trade centering here. The railway to Mexico, completed in 1873, gave it a great impetus. An interoceanic line to Acapulco, passing through Jalapa and Puebla, is (1895) nearly finished, and others are projected. The city has important manufactures of cigars. Vera Cruz is the oldest Spanish settlement in Mexico, having been the landing-place of Cortés when he began the conquest. The first town, called Villa Rica de Vera Cruz, was moved soon after to the harbor of Bernal, and in 1525 to another point now called Old Vera Cruz. The present town dates from 1599. It was sacked by corsairs in 1653 and 1712; was taken by the French in 1838; bombarded and taken by the U. S. fleet and forces Mar., 1847, and became Gen. Scott's base of supplies during his march to Mexico; and was again taken by the French in Dec., 1861. It has repeatedly figured in the war for independence and the civil struggles. During the "reform war," 1859-60, it was the headquarters of Juárez. On one of the reefs fronting the city is the celebrated fort or castle of San Juan de Ulúa, built in the seventeenth century as a protection against pirates. It was the last post held by the Spaniards in continental North America, surrendering Nov. 18, 1825. It has long been a place of confinement for political prisoners. Pop. of Vera Cruz (1895) about 30,000.

HERBERT H. SMITH.

Veragua, vā-rah'gwā: originally a part of the Caribbean coast of Central America, including Southeastern Costa Rica and part of the Isthmus of Panama; so called by its discoverer, Columbus, probably from an Indian village. Later the dukedom of Veragua was created for the heirs of Columbus (see COLUMBUS, Luis), and they still hold the title. At first they had a grant of land in this region, and some attempts were made to found settlements. The grant was eventually given up. During the colonial period Veragua or Veraguas corresponded to the western part of the isthmus, and was attached to New Granada. H. H. S.

Verandrye, PIERRE GAUTIER DE VARENNES, de la: explorer; b. at Three Rivers, Lower Canada, Nov. 17, 1685; entered the French army and served in the war against Great Britain. He subsequently returned to Canada; in 1731, with an escort of fifty men, crossed Lac de la Pluie, W. of Lake Superior, and built Fort St. Peter; in 1732 built Fort St. Charles on the west shore of the Lake of the Woods; in 1733 passed down the Winnipeg river to Winni-

peg Lake, and built Fort de la Reine upon the site of Portage la Prairie. Subsequently he and his sons continued their explorations W. until they reached the Rocky Mountains. In 1736 one of his sons, a Jesuit priest, and twenty others were massacred by Sioux on an island in the Lake of the Woods. He ascended the Saskatchewan river to the Forks in 1749 and erected Fort Dauphin there. D. in Quebec, Dec. 6, 1749. The King of France conferred on him the Cross of St. Louis.

NEIL MACDONALD.

Vera Paz: See COBAN.

Vera'trine: a mixture of alkaloids used in medicine. It is obtained from cevadilla-seeds (fruit of *Asagra officinalis* and *Veratrum sabadilla*). Pure veratrine occurs in commerce as a white powder, but can also be obtained in rhombic crystals. It has no smell, but has a bitter, acrid taste, and is very irritating to both tongue and nostrils. It is scarcely soluble in water, but dissolves in alcohol and ether. Upon the animal system veratrine acts as an intense local irritant, and if taken internally produces also the same peculiar constitutional effects as *Veratrum viride*. Veratrine is too irritating to warrant its use as an internal medicine, but is considerably employed externally as a local application for the relief of neuralgias. For such use it is made into an ointment with a convenient vehicle. See ASAGRÆA and VERATRUM.

Revised by H. A. HARE.

Vera'trum [Mod. Lat., from Lat. *vera'trum*, hellebore]: a genus of plants of the family *Liliaceæ*. *Veratrum viride*, or American hellebore, called also Indian poke, poke-root, swamp-hellebore, is indigenous in the U. S., growing in damp soil from Canada to the Carolinas. It is an herbaceous perennial, with a thick fleshy root-stock, from which rises a round, solid stem, from 3 to 6 feet high, bearing bright, green leaves, larger below than above, and surmounted by a panicle of greenish-yellow flowers. The root-stock is used in medicine, its activity residing in two alkaloids, *jervine* and *veratroidine*. It is a powerful drug, lowering the force and frequency of the heart-beats and respirations, and having a strong tendency to produce severe nausea and vomiting, with great muscular weakness and relaxation. In overdose it produces alarming prostration and feebleness of the heart, but from the prompt vomiting which large doses occasion, cases of fatal poisoning are exceedingly rare. There is no antidote to the poison, and after evacuation of the dose from the stomach, perfect rest on the back and the use of restorative means, such as alcoholics, ammonia, artificial respiration, etc., constitute the treatment. As a medicine, *Veratrum viride* is used to reduce the force and frequency of the pulse where the same is much above the normal standard, but like all remedies of its class its use requires caution. *Veratrum album*, white hellebore, is a native of Europe and Asia, and is closely allied to the foregoing in botanical characters. The root-stock contains the alkaloid *jervine*, like *Veratrum viride*, and has been commonly supposed to yield also the alkaloid *veratrine*, found in cevadilla-seeds, but recent analyses make this doubtful. White hellebore affects the animal system much in the same manner as *Veratrum viride*, but is more violent and locally irritating, producing in overdose, in addition to the symptoms already described, severe pain in the abdomen, and even gastro-intestinal inflammation. On account of these properties, white-hellebore root is now almost wholly obsolete as a medicine with American physicians. *Veratrum sabadilla* is a native of Mexico, and is said to be a source of cevadilla-seeds.

Revised by H. A. HARE.

Verazzano, or **Verrazano,** vār-rāat-saa'nō, GIOVANNI, da: navigator; b. near Florence about 1480, of a noble family settled in Val di Greve. It is said that he traveled in Egypt and Syria, engaged in traffic in spices, silks, and other Oriental productions, and entered the French maritime service about 1505; made a voyage to the East Indies in 1517 in a Portuguese vessel; became an expert navigator; was employed as a corsair or privateer by the French Government in 1521 and the following years; took many prizes of Spanish vessels returning from the West Indies, and captured in 1523 the treasure-ship in which Cortés had sent from Mexico to Charles V. a large portion of the personal spoils of Montezuma, valued at \$1,500,000. He sailed from the Madeira islands Jan. 17, 1524, on a voyage of exploration to North America; discovered land at a point near Cape Fear; coasted thence northward, discovering a bay, either that of New York or Narragansett Bay; proceeded thence 150 leagues N. E. to lat. 50° N.; returned thence to France, and addressed a letter to King Francis I. from Dieppe July 8

(o. s.), 1524, claiming to have discovered 700 leagues of coast, of which he gave a confused description. Of his later history it is only known that he communicated to persons in England a map of his alleged discoveries, and signed in 1526, with Admiral Philippe Chabot, Jean Anco, merchant of Dieppe, and other partners, an agreement to undertake a voyage to the Indies for spices, with which was combined the purpose of capturing Spanish merchantmen. This voyage seems, however, to have been interrupted by his capture on the southern coast of Spain, and he was executed as a pirate at the village of Pico, near Colmenar de Arenas, New Castile, in Nov., 1527. His exploits as a corsair, his capture and execution are narrated by Pietro Martire d'Anghiera, Bernal Diaz, and other Spanish chroniclers, who call him Juan Florin or Florentin, and it was not till the eighteenth century that this corsair was identified with the navigator by Barcia. No evidence concerning his discoveries has been found in the French archives, and they rest entirely upon the letter mentioned above, which was published at Venice, in an Italian version, by Ramusio, in 1556, no French original being known. In 1835 George W. Greene discovered in the Strozzi Library, at Florence, a MS. copy of this letter, varying somewhat in text from the Ramusio version, and containing some additional paragraphs. This was published, with a translation, in the *Collections of the New York Historical Society* in 1841. In 1864 the genuineness of this letter was attacked in a paper read before that society, and subsequently in other monographs. The letter, however, found an able defender in J. Carson Brevoort, who published an elaborate memoir entitled *Verrazano the Navigator* (1874), giving an account of a planisphere of the supposed date of 1529, found at Rome, signed by Hieronimo Verrazano, and containing a map of the coast discovered by Giovanni. Henry C. Murphy, in his *Voyage of Verrazano* (1875), has impugned the authority of this map, which he considers based upon the discoveries of Estevan Gomez in 1525. A document discovered at Rouen in 1876 proves that the navigator had a brother Hieronimo (Jerasme de Varasenne), to whom he executed a power of attorney May 11, 1526. The account of the voyage published by Ramusio, whether true or fictitious, may probably be traced to the efforts of this Hieronimo to popularize in Italy his brother's fame as a discoverer; and to him may be ascribed the statement given by Ramusio, that Verazzano was killed by savages during another voyage to America.

Revised by M. W. HARRINGTON.

Verb [viá Fr. from Lat. *verbum*, word, verb, used to translate the Greek technical term for verb, *ῥῆμα*]; that part of speech which commonly serves to denote the nucleus of what is stated about the subject.

Distinction between Noun and Verb.—The verb names a phenomenon temporarily exhibited in the subject. The noun is the substratum or substantial framework on which the phenomenon expressed by the verb is exhibited. Thus in *the tree grows*, the phenomenon of growth is displayed in the case of the tree. Other nouns set about the verb help to make more precise the exhibition of the phenomenon or temporary attribute. Thus in *John strikes the dog with a stick*, the phenomenon of *striking*, which for the time makes *John a striking John*, is more definitely set forth by the naming of other objects concerned in enacting it. Both nouns and verbs are names, and both may be names of actions, but nouns are names of things in and through which the state expressed in the verb is set forth or exhibited.

Impersonal Verbs.—The impersonal verb offers an apparent exception; it *rains, pluit, ſea*, etc. These are cases where the verb contains in itself a sufficient suggestion of the thing in which the action is exhibited, so that the name thereof is suppressed. It is not "understood." It is latent in the verb. The verb, e. g. *pluit*, embodies the undifferentiated noun and verb.

Transitive and Intransitive Verbs.—A transitive verb is one which commonly requires the addition of an object-noun as complement in order to fully set forth the action it expresses; thus in *he fells a tree*, *fells* is transitive; in *the tree falls*, *falls* is intransitive. A verb commonly transitive may often be used in a sense which makes the verb complete in itself; thus in *she writes a letter*, *writes* is transitive, but in *she writes for a living* the object is implicit in the verb just as much as the subject is implicit in an impersonal verb. An object which is naturally left implicit in a verb may for purposes of emphasis or special effect be formally expressed, in which case it is called a cognate

accusative; thus in *to dream a dream, to swear an oath, to fight a battle*.

Connective Verbs.—Some verbs merely serve formally to introduce the real predication, and are only in that sense the nucleus of what is stated about the subject. Such a verb is the copula *am, is*, which is little more than a connective; cf. *John is lame, he is eating, he is mayor, he becomes mayor, he turns traitor, he grows tall, he grows old*. In each of these cases the two last words together express a verbal idea. The expression *further grows old* is, e. g., in Latin, *pater senescit*. The copula or other "link-verb" serves merely the purpose of throwing the substance of the verb into relief by isolation; cf. Gr. *ἔσθ' ἐχων = ἔχει*.

Compound Verbs.—It is often necessary to add to a verb a defining word in order to express the exact sense in which it admits a complimenting object. These are called compound verbs; cf. Lat. *consilii obstaré, Casar omnem agrum Picenum percurret*. In the latter example *agrum* is adjusted to its office as complement of *currere* only by aid of *per-*; *percurret* is rendered in English by the transitive verb *traversed*. In *he laughed at it, what are you laughing at?* the verb *laugh-at* is a compound verb in the same sense as *percurret*, and may be inflected in the passive voice, *it was laughed at*. In *he laughed at it* the thing which is predicated of *he* is *at-laughing*. Adverbial elements thus used are called, in deference to their appearance as prefixes in, e. g., the classical languages, preverbs. Through continual use with different verbs a preverb tends to detach itself from the verb and develop a closer connection with the nouns it introduces. It is then called a preposition. It is not always easy to draw the line absolutely between preverbs and prepositions.

Voice.—Most languages possess devices for expressing with some added precision the relation which the action set forth through the subject bears to that subject. This differentiation in the aspect of the verb is called *voice* (Gr. *διάθεσις*, Lat. *genus*). The assertion of a *man-washing*—i. e. of the act of washing displayed in the case of a man—may mean (1) that the man does the washing, either without further information concerning the object, leaving that to inference or passing it as not involved in the matter to be stated, as in *the man washes*—i. e. *is a washer*—or with statement of the object, as in *the man washes the door*; this is called the active voice. (2) That the man is himself the object or beneficiary of the washing—i. e. that the act completes itself upon the subject or within the sphere of the subject, as in *the man washes* in the sense of *takes a bath*. Thus Gr. *λούω τοὺς πόδας* (active), I wash the feet (of some one else), but *λούομαι τοὺς πόδας* (middle), I wash my feet, *λούομαι*, I take a bath; this is called the middle voice. (3) That the man is the object upon which the action of washing completes or satisfies itself, as in *the man is washed*, the subject being left unstated. If it is necessary to state it, a phrase is added, as *the man is washed by somebody*. This is called the passive voice, and is a linguistic device for avoiding the necessity of stating the subject or for throwing the object of the action into prominence by making it the subject of the sentence.

Mood.—The mood of a verb concerns the attitude or tone of the assertion. The predicate may be asserted of the subject in various attitudes or moods; thus it may be asserted as a reality or as a conception of the mind—that is, as an idea. As a conception of the mind, it may be surmised, believed (as an opinion), willed, promised, wished, demanded. The indicative is the mood which presents the assertion in the guise of reality; it introduces the assertion as a reality. The term subjunctive is variously applied. In the strictest sense and as used in comparative syntax the subjunctive is the mood of the *willed* idea—i. e. it involves assurance, promise, and a consciousness of personal control, which is not present in the mere desire of the optative mood. The term subjunctive is used in a much wider sense in Latin grammar. Here it designates a class of grammatical forms in which the subjunctive and optative uses have nearly blended. It is therefore in Latin the mood of the non-real. It introduces the assertion as a conception of the mind. The optative mood represents the predicate as a desire. The imperative asserts a demand. It demands that the predicate be true of the subject.

Tense.—The tense of a verb concerns the relation of the verbal action to the matter of time. Tense may express (1) the date of action—i. e. its location in time; hence tenses are either past, present, or future. (2) The duration of the action; thus tenses may indicate an action as having continu-

ance either in past, present, or future, as being completed in past, present, or future, or as simply occurring in past, present, or future without reference either to continuance or completion. The inflectional languages have generally an insufficient supply of forms to serve for all these categories; hence two or more are frequently quartered upon a single form. Thus the Latin perfect may express either completion in the present or occurrence in the past.

BENJ. IDE WHEELER.

Verbeck, GUIDO FRIDOLIN, D. D.: missionary, and one of the organizers of the national system of education now in use in Japan; b. at Zeist, Holland, Feb. 1, 1830; educated in the Moravian Academy at Zeist, and the Theological Seminary in Auburn, N. Y. (1859); followed mechanical engineering in Wisconsin and Arkansas 1852-56; missionary in Japan of the Reformed Church in America from 1859. In 1863 he entered upon educational work for the Japanese Government, and from 1869 to 1873 was superintendent of teachers and instruction in the foreign department of the Imperial University at Tokio. Thereafter, and almost until he resumed his missionary work in 1879, he was engaged in translation work and organizing work for the Government. In 1891 he became a teacher of theology in the *Meiji Gakuin*, but still carried on his other missionary labors and his work as one of the translators of the Old Testament and as a member of the New Testament revision committee. Between 1873 and 1878 he made, in connection with Japanese scholars, many translations for the Government. Among these *The Code Napoleon*; Bluntschli's *Staatsrecht*; *Two Thousand Legal Maxims*, with comments; with forest laws, and constitutions of various European countries. In the line of original work, in addition to many memorials and pamphlets, he published a *History of Protestant Missions in Japan* (1883). In 1877 he received the third-class decoration of the Rising Sun.

WILLIS J. BECHER.

Verbeck, REINIER DIRK M.: mining engineer; b. at Maarsen, Holland, Sept. 5, 1841; educated at the University of Liège, Belgium, and at the mining academies of Clausthal, Hanover, and Freiberg, Saxony; took his degree at Freiberg 1864; has lived for many years in the Dutch East Indies; became superintendent of the Geological Survey of Sumatra 1875; has published papers on the mining laws of the Netherlands, on the mineral resources of the East Indian Archipelago, on the eruption of Krakatoa, and on various geological subjects.

Verbena Family [*verbena* is Mod. Lat. (with meaning from Eng. *vervain* and Fr. *verveine*), from Lat. *verbēna*, foliage, herbage, sacred boughs, (also) a class of plants used in medicine as cooling remedies]; the *Verbenaceae*, or *Vervain* family; a group of 740 species of gamopetalous, dicotyledonous herbs, shrubs, and trees mainly of the tropics and south temperate zone. The corolla is more or less two-lipped or irregular; the stamens four or two; the ovary superior, four-carpellary, not lobed, and few-ovuled; style terminal. The plants of this family are nearly related to the mints (*Labiatae*), with which they agree in their opposite leaves and in most of their floral characters, but they usually lack an aromatic foliage. About forty species are natives of North America, nearly one-half of which belong to *Verbena*. South American species of verbena are well-known ornamental plants, as are also the lemon verbena (*Lippia citriformis*) from Chili, *Lantana*, *Clerodendron*, and others. The teak-tree of India is the *Tectona grandis*. Species of *Vitex* in New Zealand are large and valuable timber trees. Some of the wild species of verbena are somewhat used as domestic medicines under the name of *Vervain*.

CHARLES E. BESSEY.

Verboeckhoven, ver-book'hō-ven, EUGÈNE JOSEPH: animal-painter; b. at Warneton, West Flanders, June 9, 1799; pupil of his father, Barthélemi Verboeckhoven; member of Brussels, St. Petersburg, Antwerp, Amsterdam, and Ghent Academies, the Legion of Honor, and Order of the Iron Cross, and commander in the Orders of Leopold of Belgium and Francis Joseph of Austria. D. in Brussels, Jan. 19, 1881. His pictures of sheep are widely known, and he enjoyed a great reputation in his lifetime. Pictures by him are in the National Gallery, Berlin, the Städel Gallery, Frankfurt, and in the museums at Brussels, Leipzig, Ghent, Königsberg, Amsterdam, New York, and Hamburg.

W. A. C.

Vercelli, vār-chel'lē (anc. *Vercellū*): capital of a district in the Piedmontese province of Novara, Italy; near the right bank of the Sesia; in a marshy, unhealthy plain (see

map of Italy, ref. 3-B). Its manufacturing industries, especially silk-spinning, and its commerce are thriving; the district produces rice, hemp, flax, silk. The town is the center of an extensive railway system, and has a large market-place with a statue of Cavour (erected 1864), fourteen churches, several of which, as well as the Galleria dell' Istituto di Belle Arti, contain fine frescoes by Gaudenzio Ferrari, one of the foremost painters of the Vercelli school (fifteenth and sixteenth centuries). The magnificent cathedral, dating from the sixteenth century, contains an excellent library with ancient and valuable MSS., including the *Codex Vercellensis*, one of the most important MSS. of the old Latin version of the Gospels, written by Eusebius, Bishop of Vercelli in the fourth century A. D., and the *Vercelli Book*, an invaluable collection of the remains of Anglo-Saxon literature. There are in Vercelli a lyceum, a gymnasium, a technical school, a theological seminary, two hospitals, an orphan asylum, and a theater. Pop. 29,244 (commune). The town was the capital of the Libici in Gallia Transpadana; later a fortified *municipium* of the Romans. A little S. E. from it, on the Raudian fields (*Campi Raudii*), Hannibal won his first victory on Italian soil in 218 B. C., and Marius routed the terrible Cimbric in 101 B. C. The city became a possession of the house of Savoy in 1429.

HERMANN SCHOENFELD.

Verd Antique, or Verde Antico [*verd antique* is from Fr. *vert antique*, liter., antique green; *vert*, green + *antique*, ancient]: a fine green stone mottled with white and brown; greatly esteemed for decorative work. It is a kind of serpentine. Five specimens of it have been found among the ruins of Roman buildings, or have been taken from their walls to be used in modern structures. Green marbles and other stones of good green color and taking a polish have been called by this name. A stone quarried at Roxbury, Vt., and a marble at Milford, Pa., are both sold as *verd antique*.

R. S.

Verde, Cape: See CAPE VERDE.

Verden, fār'den. ancient fortified place, now a town; province of Hanover, Prussia; on the Aller, near its influx in the Weser (see map of German Empire, ref. 3-E). It has a fine cathedral, large breweries, tobacco manufactures, and valuable fisheries. Pop. (1890) 8,719.

Verdi, GIUSEPPE: composer; b. at Roncole, in the duchy of Parma, Italy, Oct. 9, 1813; received his first lessons in music from the organist of the village church; attracted the attention of an amateur musician, who sent him to Milan, where, from 1833 to 1836, he studied under Lavigna, head of the Scala theater. Verdi's first opera was *Oberto, conte di San Bonifazio*, produced in Milan Nov. 17, 1839. Since then he has composed about twenty-six operas, the best known of which are *Il Trovatore*, *La Traviata*, *Rigoletto*, *Ballo in Maschera*, *Aida*, *Otello*, and *Falstaff* (1893). One large work for the Church should also be mentioned—namely, a *Grand Requiem Mass*. A large number of his works have been received with enthusiasm in all civilized lands. An additional proof of his talent is the fact that the quality of his work has not fallen off during the long period of his professional activity, but has kept pace with the great changes which have affected the dramatic stage since his youth.

DUDLEY BUCK.

Verdict [(with *c* restored from Lat.) from O. Fr. *verdit* < Late Lat. *verdic tum*, *veredic tum*; *vere*, truly + *dictum*, said, neut. perf. partic. of *dicere*, *dic tum*, say]: in law, the decision rendered by a jury according to law, as to the matters in issue submitted to them, in respect of which they have been sworn to find and declare the truth.

The jury, after the proofs are summed up, may render their verdict, and if they desire may withdraw from the court to consider it. The jury while considering the verdict are laid under severe restrictions as to secrecy, communication with third parties, etc., and a certain amount of pressure may be brought to bear upon them by keeping them confined in order to make them agree upon a verdict. These restrictions are now less severe than they were formerly, the law having been that they should be kept confined by themselves, and should not eat or drink except by the consent of the court till they had rendered a verdict, and that if they had not agreed upon a verdict at the time when the judge was about to leave for another place on his circuit he could carry them about with him in a cart. At present it is the custom to keep the jury together a reasonable length of time, and then, upon their failure to agree, either to

discharge them with or without the consent of the parties, or to allow a juror to be withdrawn by the consent of the parties, so that no verdict can be rendered.

When the jury have agreed upon a verdict they must, in general, deliver it in open court in the presence of the plaintiff or his representative. In common-law procedure, if the plaintiff is not present in person or by attorney no verdict is rendered, but he is non-suited; but this matter is now frequently regulated by statute. If the plaintiff appears, the jury by their foreman deliver their verdict, declaring that they find "for the plaintiff" or "for the defendant," as the case may be, and if for the plaintiff in certain actions at the same time assessing the amount of damages sustained by him by reason of the injury alleged in his complaint. In a criminal case the verdict is generally either "guilty" or "not guilty."

A verdict is *general* when by it the jury render a complete decision on the facts presented in connection with the law applicable to them, as laid down by the court in the charge. In some cases, as when the application of the law to the facts is so difficult that it is advisable to leave this to the court, the jury may be instructed to bring in a *special* verdict, which is one in which the jury simply find the facts, setting them forth in a detailed manner and form, but do not apply the law to them so as to render a final decision in favor of either party. In Scotland a form of special verdict in criminal cases is that of "not proven," which does not acquit the prisoner, but does protect him from a second trial for the same offense.

A verdict to be valid must be unanimous, and as a general rule must be received by at least one of the judges before whom the action was tried, and be returned before the end of the trial term at which the action was tried. The weight of modern authority is that the verdict may be returned and received by the court on Sunday.

If the jury agree upon their verdict after the adjournment of the court for the day, they are permitted to reduce it to writing, sign, and seal it up, and then separate; or they may be directed by the court to render a sealed verdict. In such case they must be present at the reassembling of the court, when their sealed verdict will be opened and announced. After a verdict of guilty in criminal prosecutions, the jury may be "polled" by the prisoner—that is, each juror may be asked by name if the verdict thus announced is his verdict; and this privilege is given by statute in civil actions in many instances to the losing party.

See Stephen's *Commentaries on the Law of England*; the treatises of Stephen, Gould, and Archbold on *Pleading and Practice*; Macdonald's *Treatise on the Criminal Law of Scotland*. F. STURGES ALLEN.

Ver'digris: See ACETATE.

Verdon, SIR GEORGE FREDERIC, K. C. M. G., C. B., F. R. S.: b. in Lancashire, England, Jan. 21, 1834; educated at Rossall College, Lancashire; went to Melbourne, Australia, 1851; engaged in business; was called to the bar of Melbourne 1853; became chairman of the municipal council of Williamstown; led a volunteer company in the suppression of the outbreak of convicts 1857; elected member for Williamstown 1859; minister of the crown 1860-68; went to Great Britain in 1866 as a representative of the Government and Legislature of Victoria to urge upon the home Government the defense of the colony; soon after was appointed permanent agent-general of Victoria in Great Britain, but resigned in 1872; represented the British Royal Commission of the International Centennial Commission held at Melbourne 1888-89; aided in establishing and equipping the observatory at Melbourne. D. Sept. 13, 1896.

Verdun, vār'dūn' (anc. *Verodunum*): town; department of Meuse, France; on the Meuse; 35 miles by rail W. of Metz (see map of France, ref. 3-II). It is one of the numerous minor fortresses of the old system, the see of a bishop, the seat of a court of first resort, and of an ecclesiastical seminary. There are manufactures of iron, leather, beer, liquors, and sweetmeats. Pop. (1891) 18,195. In 843 an important treaty was made here between the Emperor Lothaire and his brother Ludwig the German. (See TREATIES.) During the Franco-German war Verdun resisted a *coup-de-main* (Aug. 24, 1870) and an investment and bombardment, surrendering Nov. 8, 1870. Subsequently it was the last place held by the Germans and was given up in Sept., 1873.

Vere, SIR AUBREY HUNT, de: b. at Curragh Chase, County Limerick, Ireland, Aug. 20, 1788; son and heir of Sir Vere

Hunt, first baronet, to whose title he succeeded 1818, and subsequently took the name De Vere. He was an enthusiastic disciple of Coleridge. He was the author of two dramatic poems, *Julian the Apostate* (1822) and *The Duke of Mercia* (1823), and *A Song of Faith, Devout Exercises, and Sonnets* (1842). D. July 5, 1846. His works have frequently been ascribed to his son, AUBREY THOMAS DE VERE (q. v.), and vice versa. Revised by H. A. BEERS.

Vere, AUBREY THOMAS, de: author; son of Sir Aubrey Hunt de Vere; b. at Curragh Chase, Ireland, Jan. 10, 1814; educated in Trinity College, Dublin. He became a Roman Catholic in 1851 and much of his poetry is religious in character. He was an intimate friend and connection by marriage of Sir Henry Taylor; has published *The Waldenses* (1842); *The Search after Proserpine, and other Poems* (1845); *English Miscrude and Irish Miscrudes* (1848); *Pictureque Sketches of Greece and Turkey* (2 vols., 1850); *Poems, Miscellaneous and Sacred* (1856); *May Carols* (1857); *The Sisters, etc.* (1861); *The Infant Bridal, etc.* (1864); *The Church Settlement of Ireland, or Hibernia Paucanda* (1866); *Irish Church Property, and the Right Use of it* (1867); *Plans for Secularization* (1867); *Irish Odes, and other Poems* (1869); *The Legends of St. Patrick* (1872); *Alexander the Great, a Dramatic Poem* (1874); a poem on the centenary of Daniel O'Connell (1875); *Saint Thomas of Canterbury* (1876); *Antar and Zaru* (1877); *Legends of the Saxon Saints* (1879); *The Foray of Queen Meane* (1882); *Poetical Works* (1884); *Ireland and Proportional Representation* (1885); *Essays chiefly on Poetry* (1887); *Essays chiefly Literary and Ethical* (1889); *Religious Poems of the Nineteenth Century* (1893). Revised by H. A. BEERS.

Vere, EDWARD, de: seventeenth Earl of Oxford; b. in England about 1540; educated in St. John's College, Cambridge; was in high repute as a wit and a poet at the court of Queen Elizabeth, and was famous for the prodigality of his living; had an encounter, not much to his credit, with Sir Philip Sydney; married Anne, the eldest daughter of William Cecil, Lord Burleigh; is alleged to have treated her inhumanly to revenge himself upon Burleigh for not interfering to save the life of his relative, Thomas Howard, Duke of Norfolk (beheaded for treason 1572); was made lord high chamberlain, and in that capacity sat on the trials of Mary Queen of Scots (1586) and the Earls of Arundel (1589), Essex, and Southampton (1601), and held a command in the fleet sent against the Spanish Armada (1588). He wrote a number of comedies, not extant, and contributed poems to Richard Edwards's *Paradise of Daynty Devises* (1576) and other collections of that period. D. in London in July, 1604. His wife (d. June 6, 1588) also wrote verses, some of which are in John Southern's *Pandora* (1584). Revised by H. A. BEERS.

Vere, SIR FRANCIS: soldier; b. in England about 1560 (some authorities say 1554); grandson of John de Vere, fifteenth Earl of Oxford; served in the army in the Netherlands under the Earl of Leicester 1585, and subsequently under Lord Willoughby; was knighted for gallantry at the defense of Bergen-op-Zoom 1588; relieved the garrison at Berg on the Rhine 1589; contributed to the capture of Zutphen; was instrumental in the retaking of Deventer and in the defeat of the Prince of Parma near Nymwegen 1591; was lord-marshal in the expedition against Cadiz 1596; distinguished himself at Turnhout, and became governor of Brill 1597; was recalled to England during the threatened Spanish invasion 1599; was severely wounded at Nieuport, where he determined the victory for Prince Maurice, July 5, 1600, and successfully defended Ostend against great odds 1601-02. D. in London, England, Aug. 28, 1608, and was buried in Westminster Abbey. His *Commentaries*, narrating his services in the Netherlands, were published in 1657. —His younger brother, HORATIO, b. at Kirby Hall, Essex, in 1565, distinguished himself under his brother's command in the Netherlands, and commanded the English auxiliaries in Germany 1620-23; was created Baron Vere of Tilbury July 25, 1625, and became master of the ordnance 1619. D. in London, May 2, 1635. See Markham, *The Fighting Veres* (1888). Revised by F. M. COLBY.

Vere, MAXIMILIAN, Freiherr von SCHELE de: scholar; b. near Wexjö, Sweden, Nov. 1, 1820; was educated in Germany and served in the Prussian military and diplomatic service; removed to the U. S. in 1842; Professor of Modern Languages in the University of Virginia 1844-61; entered the Confederate service as a captain; subsequently was appointed commissioner to Germany to further the cause of

the Confederate States; lived in Europe for several years studying literature and social questions; resumed his professorship after the war; has translated works from the French and German, and has written a number of books, including *Outlines of Comparative Philology* (New York, 1853); *Grammar of the Spanish Language* (1854); *Stray Leaves from the Book of Nature* (1856); *Romance of American History* (1872); *Americanisms* (1873); and *Modern Magic* (1874).

Verestcha'gin, VASILII: genre and military painter: b. at Tcherepovets, Russia, Oct. 26 (N. S.), 1842; studied at St. Petersburg Academy and under Gérôme in Paris; has traveled much in the East, and painted pictures and studies in India and Turkestan. He served with the Russian army in Turkestan and during the Russo-Turkish war, and was severely wounded; painted a series of pictures representing battles and episodes of that campaign. His works, many of which are of immense size, have been called realistic by some critics, and by the exhibition of his pictures in a complete collection in the principal cities of Europe and in the U. S. his name has become widely known. WILLIAM A. COFFIN.

Verga, vār'gāa, GIOVANNI: novelist: b. at Catania, Sicily, in 1840. Much of his life has been spent at Florence and Milan. He began his literary career with two stories, which he has since repudiated, calling them the "two sins of his youth." *Il Carbonari della Montagna* (1865) and *Storia di una peccatrice* (1865). He first showed real power in the *Storia di una capinera* (1869), a romance in epistolary form, containing much delicate psychologic observation. He did not, however, at once follow the vein he had struck in this book, but in a series of romances of Italian high life allowed himself to be influenced by the French sensational novel. To this period belong *Era* (5th ed. 1880); *Nedda* (1874); *Eros* (1875); *Tigre reale* (1875); *Primavera* (with other stories, 1877). Gradually, however, the influence of the naturalistic movement in fiction, as well as his own proper aptitudes, led him to seek artistic success less from ingenious plots and sensational situations than from a rendering in exact and adequate terms of such life as he had actually seen and known. The volume of short tales, *La vita dei campi* (1880), takes the reader among the peasants of Sicily, and gives him glimpses of their narrow yet passionate existence, their fierce loves and yet fiercer hates; in short, the humble but often terrible tragedy of their lives. Among these tales is that entitled *Cavalleria rusticana*, used by the composer Mascagni as the basis of his now famous opera. Since the appearance of this collection, Verga has published a long series of romances and collections of tales: *Il Malavoglia* (1881); *Il marito di Elena* (1882); *Il come, il quando ed il perchè* (1882); *Pane nero* (1882); *Novelle rusticane* (1883); *Per le vie* (1883); *Vagabondaggio* (1887); *Maestro Don Gesualdo* (1889); *I ricordi del capitano d'Arce* (1892); *Cavalleria rusticana ed altre novelle (Vita dei campi*, 6th ed. 1892); *Don Candeloro e C.* (1893).

A. R. MARSH.

Vergennes, ver-gez': city: Addison co., Vt.; on the Otter creek, and the Cent. Vt. Railroad; 7 miles from Lake Champlain, and 33 miles S. W. of Montpelier (for location, see map of Vermont, ref. 5-A). It has regular steamboat communication with the lake ports during the summer; has good water-power from a creek which here falls over 30 feet; and contains the State Reform School, graded public school, parochial school, public library, 5 churches, 2 national banks with combined capital of \$225,000, and a weekly paper. It is noted as the building-place of the fleet with which Capt. MacDonough captured a British squadron off Plattsburg Sept. 11, 1814. Pop. (1880) 1,782; (1890) 1,773.

Vergennes, vār'zhen', CHARLES GRAVIER, Comte de: statesman; b. at Dijon, department of Côte-d'Or, France, Dec. 28, 1717; entered very early on a diplomatic career; was minister at Treves 1750-55, at Constantinople till 1768, at Stockholm 1771, and became Minister of Foreign Affairs in 1774. He concluded the treaty of alliance with the Swiss cantons in 1777, and with the American colonies in 1778, to which he was very friendly, and negotiated the Peace of Teschen (May 13, 1779), which ended the war of the Bavarian succession, and the Peace of Versailles (Sept. 3, 1783). He was an adroit negotiator, but a mediocre statesman, and his meddling with the finances became fatal to France; he drove Necker out and brought Calonne in. D. at Versailles, Feb. 13, 1787.

Vergier de Hauranne: See DUVERGIER DE HAURANNE.

Vergil (full Latin name, *Publius Vergilius Maro*; the spelling *Virgil*, Lat. *Virgilius*, arose in the Middle Ages by popular etymological connection with Lat. *vir'ga*, rod, magician's wand, Vergil being regarded as a magician); the most celebrated Latin poet; b. at Andes, near Mantua, Oct. 15, B. C. 70. His parents lived in humble circumstances, but he received a careful education. His paternal estate was assigned (B. C. 41 and 40) to the veterans of Octavianus, but his application to the emperor effected a restoration of his lands or an indemnification for them. From this time Vergil lived partly in Rome, partly at Naples, always suffering from delicate health, but in the possession of sufficient means. He was himself a gentle and amiable character, and as a poet most successful in subjects which admit of genial treatment, as inanimate nature, one's native country, family ties, and love, but he allowed himself to be led on to subjects too grand for him; for, though pleasing in his episodes, he was hardly equal to majestic occasions. He collected his materials with great diligence, and polished his verse with extreme care; and this faithful labor won for him that elegance in style and correctness in meter which made him the standard of classicality in Roman poetry for a long period. Before the lapse of a century Vergil's works were used, as they are to this day, as text-books in schools for learning Latin, and in subsequent times his writings were drawn upon for *centos*, superstition consulted them as an oracle, and upon his name the nations of the West accumulated their fictions and legends in the Middle Ages. During the Renaissance his works exercised a great influence on Italian literature, and partly through that literature, but more by direct study, also on French and on English poets. He died at Brundisium, Sept. 21, B. C. 19, and was buried near Naples, where his tomb is still shown.

Vergil's extant poems are (1) *Eclogue*, ten bucolics, written B. C. 41-39, imitations, and to some extent translations, of Theocritus, but with an admixture of persons and events of his own time and country. Though Vergil can hardly be said to have improved on his original, yet these have always been regarded as very graceful and pleasing compositions, and themselves inspired one of the most brilliant and charming works of Pope, his *Pastorals*. (2) *Georgica*, in four books, composed B. C. 37-30, the first on agriculture, the second on the culture of trees, the third on domestic animals, and the fourth on bees. The prostrate condition of husbandry at the end of the civil wars induced Mæneas, the influential favorite of Augustus, to propose husbandry to Vergil as the subject of a didactic poem. The task suited the taste of the poet, and he devoted himself to it with earnestness and enthusiasm. So successful was this attempt that in the *Georgics* we have confessedly the most perfect production of Roman art in this kind. In handling this theme Vergil could avail himself of his own personal experience in youth, but his studious bent would incline him also to consult and appropriate the works of others on this subject, which abounded in Greek and Latin, as of Hesiod, Aratus, Nicander, and Xenophon, of Cato, Mago, and Varro. (3) *Æneis*, in twelve books, begun about B. C. 29, but not finished when the poet died (B. C. 19), yet made public by his executors, L. Varius and Tucca, contrary to the express desire of the author. The *Æneid* turns on the fate of Æneas, the founder of a second Ilium and indirectly of Rome, and the ancestor of the Julian family. In this work Vergil in part had recourse to Greek sources and models, and in part relied on his own extensive study of Italian legends, history, and localities, thus blending Hellenic and Latin elements. According to Donatus (*Vit.* 46), Vergil read to Augustus books ii., iv., and vi., which, in the judgment of posterity, are, the first two the most real, and the last the most curious and interesting of all. The style of the *Æneid* in general is rather somber and unnatural, but always dignified; and we can not but feel the fascination of its graceful and sonorous lines. Indeed, whatever faults criticism may have pointed out in this work, it has secured to its author an undisputed place among the few great epic poets the world has yet seen. Vergil derived from the Iliomic poems the plan and style of the *Æneid*, as well as numerous details. Book vi. is quite in the manner of *Odyssey* xi., and the first half of the *Æneid* may be said to be in imitation of the *Odyssey*, as the rest is of the *Iliad*: the subject of book ii. is drawn from the Cyclic poems, and book iv. is imitated from Apollonius Rhodius. Of the Roman poets, Vergil has chiefly imitated Ennius (see, e. g., vi., 846), as Servius and Macro-

bius remark. Aulus Gellius (i., 21) says: *Non verba sola, sed versus prope totos et locos quoque Lucreti plurimos sectatum esse Vergilium*; and Vergil himself in turn has been copied more or less by all the Latin epic and didactic poets, as Persius, Silius Italicus, Valerius Flaccus, Statius, Ausonius, and Prudentius.

Besides these great and genuine works of Vergil, certain minor poems have come down to us under his name: (1) *Culex*, a description of Hades. It is certain that Vergil in his youth wrote a brief epic of this name, but the general character of the poem which we have, especially its frequent imitations of the writings of Vergil, chiefly of the vi. *Ecl.* and the vi. *Æn.*, renders it probable that a new work, composed, however, soon after Vergil's death, occupies the place of the original. The extant poem, though puerile in composition, is masterly in metrical treatment. (2) *Ciris*, an account of the treacherous conduct of the Megarian princess Scylla against her father Nisus, and her transformation into the bird *Ciris*. This poem seems to have arisen in the circles of Messala, being dedicated to his son, who was consul a. c. c. 751. The author draws largely on Vergil, but also imitates Catullus, and reminds us here and there of Lucretius, Tibullus, and some of the Augustan poets. Metrically, this piece is less correct than Vergil, but in style it is more lively. (3) *Moretum*, a pleasing idyl, believed by Lachmann to belong to the time of Vergil, and perhaps translated by him from a Greek poem of Parthenius. It is vivid in description, amiable in spirit, and elaborate in form. (4) *Copa*, a short elegy of the best period, Vergilian in style, but more sprightly in tone. (5) *Catalepton*, fourteen poems in elegiac and iambic meter on various subjects. Only two are well attested as coming from Vergil, two alone can be proved not to be by him, and they all certainly belong to his period.

Of Vergil's prose, we know only of his correspondence with Augustus, which was probably published by the emperor's order. Seneca the Elder (*Exc. Contror.*, iii., 8) says of it: *Vergilium illa felicitas ingenii in oratione sobrita reliquit*. Specimens of it are given in Donati, *Vita Vergiliana*, and in Macrobius, i., 24.

As to the form of his name, the inscriptions of the time of the republic and of the first centuries after Christ are in favor of *Vergilius*, and so the older MSS., as the Medicean. The Greeks also generally wrote Βεργίλιος or Ούβεργίλιος. The earliest dated instances of the form *Virgilius* are of the fifth century. In the Middle Ages, about the ninth century, this form began to be common, and in the fourteenth and fifteenth centuries it prevailed, though the Italian scholar, Angelo Poliziano, proved it to be wrong. Editions by O. Ribbeck (3 vols., Leipzig, 1859-68; new ed. begun in 1895); Conington and Nettleship, with commentary (3 vols., London, 1881-83); text alone, Thilo (Leipzig, 1886). See also Sellar, *The Roman Poets of the Augustan Age: Virgil* (Oxford, 1877); D. Comparetti, *Virgilio nel medio evo* (Livorno, 1872); J. S. Tunison, *Master Virgil, the Author of the Æneid, as he seemed in the Middle Ages* (Cincinnati, 1888). Revised by M. WARREN.

Vergil, POLYDORÉ: author; b. at Urbino, Italy, about 1470; became a priest and acquired a considerable literary reputation by his *Proverborum Libellus* (1498), several times reprinted in the sixteenth century, and by a treatise on the discovery of arts and sciences, *De Rerum Inventoribus* (1499); was sent by Pope Alexander VI. to England to collect the papal tribute called "Peter's pence" 1501, being the last to hold that office; remained in England for the most of his life; was made rector of Church Langton, Leicestershire, archdeacon of Wells, prebendary of Hereford, and of Lincoln, all in 1507; exchanged the latter prebend for one in St. Paul's, London, 1513; was an intimate friend of Erasmus and the great scholars of the time; wrote, besides many miscellaneous treatises, a voluminous Latin history of England, *Historia Anglica Libri XXXVI* (Basel, folio, 1533; best ed. Leyden, 1651), and edited Gildas's *De Calamitate, Excidio et Conquestu Britannia* (1525). He returned to Italy in 1550, and died probably at Urbino about 1555. Two volumes of an old English translation of his *Historia* were edited by Sir Henry Ellis for the Camden Society (1844-46), and a translation by John Langley of his *De Rerum Inventoribus* was edited for the Agathynian Club by Dr. William A. Hammond, who prefixed an *Account of the Author and his Works* (New York, 1868).

Verginia: a Roman maiden. See VIRGINIA.

Vergniaud, vār'nyi-ō, PIERRE VICTURNIEN: revolutionist; b. at Limoges, France, May 31, 1753; studied law in his native city and in Paris, and settled in 1781 as an advocate in Bordeaux. Elected a deputy to the Legislative Assembly of 1791 from the department of Gironde, he became the leader of a great majority, the so-called Girondist party, and on Oct. 31 president of the Assembly. On Mar. 24, 1792, the king dismissed the Girondist ministry, and the negotiations which were carried on between the king and Vergniaud by de Boze and Thierry having failed, on Aug. 10 Vergniaud himself proposed the suspension of the royal power. In the National Convention, which opened on Sept. 21, the Girondists still had the majority, but not the real power. In the trial of the king, Vergniaud supported by a brilliant speech the proposition of an appeal to the people; but when the proposition fell, he voted for the execution without delay (Jan. 30, 1793). In the contest which now took place between the Girondists and the Jacobins, Vergniaud time after time swayed the whole assembly by the force of his eloquence, but he finally broke down before the argument which Marat used—the introduction of a howling, maddened mob into the very hall of the Convention. The Jacobins finally succeeded (June 1) in carrying a decree for the arrest and trial of the Girondists. On Oct. 24 the trial began, and Vergniaud, who for some time had fallen into a kind of mental insensibility, rose once more to the full height of his genius, and terrified the Jacobins by his speeches of defense. The trial was stopped, the sentence pronounced without scrutiny, and Vergniaud was guillotined Oct. 31, 1793. Several of his speeches are found in Barthe's *Les Orateurs français* (4 vols., Paris, 1820), and in *Choix de Rapports, Opinions et Discours* (Paris, 1818-25). See also Touchard-Lafosse, *Histoire parlementaire et Vie in-lime de Vergniaud* (Paris, 1848); Vatel, *Vergniaud: Manuscrits, Lettres et Papiers* (1875); and Stephens, *The Principal Speeches of the Statesmen and Orators of the French Revolution* (1892). Revised by F. M. COLBY.

Verhas, JAN: genre-painter; b. at Termonde, Belgium, Jan. 9, 1834; pupil of his father, head of the School of Design at Termonde, and of Nicaise de Keyser in Antwerp; studied also in Italy; received a second-class medal at the Paris Salon 1881, and a first-class medal at the Paris Exposition 1889; became member of the Legion of Honor in 1881. A large picture, *Procession of School Children at Brussels*, is in the British Museum. W. A. C.

Veria, or **Kara Feria**: town of European Turkey; in the vilayet of Salonica; the *Bereu* of Acts xvii. 10; has many antiquities. The inhabitants manufacture a mixed woolen and linen stuff for bathing-clothes and quarry red marble from Mt. Bermios. Pop. (1889) 5,800. E. A. G.

Verification: (1) in common-law pleading, the statement with which a party alleging new matter is obliged to conclude his averments, to the effect that he stands ready to establish the truth of the matters thus set forth—the ordinary form of this statement is "and this he is ready to verify"; (2) in equity and code pleading, the affidavit which a party is required to annex to a pleading, as an answer, complaint, petition, etc., swearing that the matters alleged are true to the knowledge of the deponent, except where stated to be alleged upon information and belief. Under the code procedures a defendant served with a sworn complaint must serve a sworn answer or suffer judgment to be taken in default of so doing. The verification must generally state the sources of the deponent's information and the grounds of his belief. See Stephen's *Principles of Pleadings in Civil Actions*; Daniell's *Chancery Practice*; and the various codes. F. STURGES ALLEN.

Verjuice [from O. Fr. *verjus* < Lat. *viride jūs*, green broth]: the acid or sour juice of unripe grapes, formerly used in Europe as a beverage, especially as an astringent or refrigerant in medicine. The term also includes the fermented juice of crab-apples, which is used as a flavoring agent in cooking, as for sauces, called also *agresta* and *omphacium*.

Verkolie, ver-kōl'yē, JAN: painter; b. in Amsterdam, Netherlands, Feb. 9, 1650; son of a blacksmith. At the age of ten he injured his foot and was confined to his bed for three years, during which time he copied engravings and prints and thus found out his aptitude for drawing. Shortly after his recovery he entered the school of John Lievers, who found him so skillful that he set him to finish some pictures Gherardt von Zeÿl had left incomplete. Verkolie

afterward painted an original picture that was mistaken for the work of this artist. He married at Delft in 1672 and established himself there, painting portraits for the most part and employing his leisure in painting historic and mythological subjects which he engraved in mezzotint, an art he taught himself. D. at Delft in 1693, leaving two sons. One of these, NICHOLAS (b. at Delft, 1673; d. in Amsterdam, 1746), became a good painter, chiefly of historical subjects, and also was a noted engraver.

W. J. STILLMAN.

Verlaine, PAUL: French poet; b. at Metz, Lorraine, Mar. 30, 1844; devoted himself to letters and early distinguished himself among the young poets who, starting from the *Parnassians*, separated themselves consciously from them in search of novelty of form and profundity of meaning, and have been called *Symbolistes* and *Décadents*. He was regarded by them with great admiration, and exercised a real influence upon French poetry. D. in Paris, Jan. 8, 1896. Among his works are *Poèmes saturniens* (1865); *Fêtes galantes* (1869); *La bonne Chanson* (1870); *Sagesse* (1881); *Jadis et Naguère* (1885); *Romanes sans Paroles* (1887); *Amour* (1888); *Parallèlement* (1889); *Chansons pour Elle* (1891). A *Choix de Poésies* of Verlaine was published in 1891. See Ch. Morice, *Paul Verlaine* (Paris, 1894); Jules Lemaitre, *Les Contemporains*, vol. iv. A. G. CANFIELD.

Vernéjo, vār-mā'khō (sometimes written *Bermejo*): a river of South America; one of the western branches of the Paraguay. It rises in Southern Bolivia, receiving affluents from the mountain regions of Salta and Jujuy, Argentine Republic; flows S. E. through the plains of the Argentine Chaco, and joins the Paraguay by a network of channels a little above the confluence of the latter with the Paraná. In its middle course it is very tortuous and the channel is frequently lost in swamps; hence it is not available for navigation and various schemes for its canalization have come to nothing. It separates the territories of Chaco and Formosa. Length over 800 miles. H. H. S.

Vermes (Lat.): See WORMS.

Vermicelli: See MACARONI.

Vermifuges [Lat. *ver'mis*, worm + *fung'ere*, put to flight]; medical remedies intended to remove worms from the stomach and intestines. See ANTHELMINTICS.

Vernigli, vār-meē'l yē, PIETRO MARTIRE, generally known as PETER MARTYR; theologian; b. in Florence, Sept. 8, 1500; entered the order of St. Augustine in 1516, and made a comprehensive study of theology and philosophy. While prior of the monastery of St. Peter ad Aram, near Naples, he became acquainted with several converts to the Reformed Church, among them Juan Valdes, and with the writings of Luther and Zwingli, and in 1541, when removed to the monastery of San Frediano, near Lucca, began to preach openly the doctrines of the Reformed creed. The Roman Inquisition soon became aware of the movement which took place in Lucca, but Vernigli succeeded in escaping; fled to Switzerland in 1542, and was made Professor of Theology soon after in the University of Strassburg. In 1547 he went to England on the invitation of Cranmer, and lectured on theology in Oxford, but on the accession of Queen Mary (1553) returned to Strassburg; in 1556 was made Professor of Theology in Zurich, where he died Nov. 12, 1562. He was considered one of the most learned theologians of his age, and besides commenting on various parts of the Bible, especially the Old Testament, he took part largely in the theological controversies of his time. A selection of his works was published in 1575 by Robert Masson, and forms one of the principal sources of information concerning the theology of the Reformed Church of the sixteenth century. See his *Life*, by K. Schmidt (Elberfeld, 1858). Revised by S. M. JACKSON.

Vermilion: See CINNABAR.

Vermillion: city; capital of Clay co., S. D.; on the Vermillion river, and the Chi., Mil. and St. Paul Railway; 30 miles S. E. of Yankton, 35 miles N. W. of Sioux City, Ia. (for location, see map of South Dakota, ref. 8-G). It is in an agricultural region, is built on a table-land overlooking the valleys of the Missouri and Vermillion rivers, has an abundance of good water, and has a national bank with capital of \$50,000, a State bank with capital of \$40,000, and a monthly, a semi-monthly, and 3 weekly periodicals. Vermillion is the seat of the University of South Dakota (see SOUTH DAKOTA, UNIVERSITY OF). Pop. (1880) 714; (1890) 1,496; (1895) State census, 1,757.

EDITOR OF "DAKOTA REPUBLICAN."

Vermont: one of the U. S. of North America (North Atlantic group); the first State admitted into the Union after the adoption of the Federal Constitution by the original thirteen States; popularly known as the "Green Mountain State." Capital, Montpelier.

Location and Area.—It lies between lat. 45° 3' and 42° 44' N., and lon. 71° 30' and 73° 25' W.; is bounded N. by the province of Quebec, E. by New Hampshire, S. by Massachusetts, W. by New York; extreme width, 90 miles; minimum width, 41 miles; extreme length, 158 miles; area about 10,200 sq. miles (6,586,880 acres).

Physical Features.—The surface of the State is everywhere irregular and broken; mountains, valleys, lakes, rivers, hills, cliffs, plains, and meadows combine to produce varied and beautiful scenery. The northern portion, where the main range of the

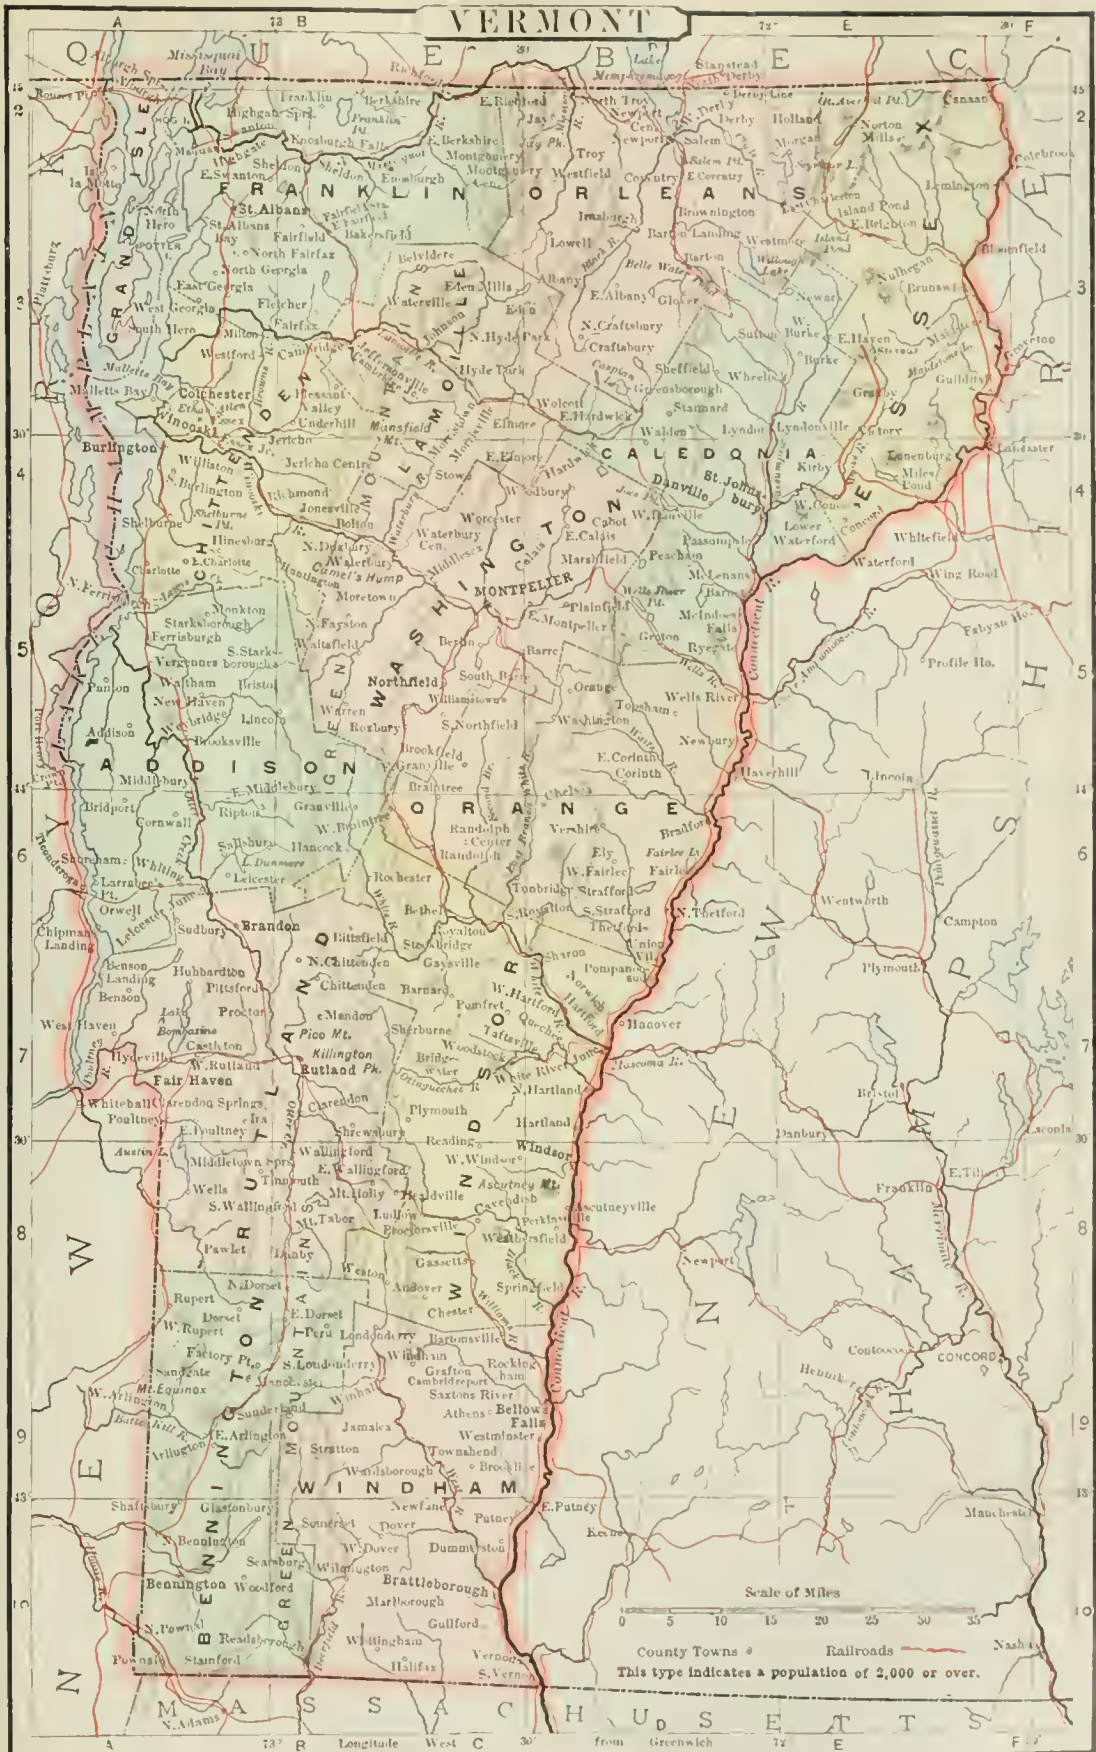

The seal of Vermont.

Green Mountains is re-enforced by several parallel ranges, is more rugged than the southern, but nowhere are there plains of large extent. The highest point of the range is the so-called Clin on Mt. Mansfield, which is 4,389 feet above the sea. Other high peaks are Camel's Hump, 4,188; Killington, 4,380; Mansfield Nose, 4,071; Lincoln, 4,024; Jay Peak, 3,861; Equinox, 3,847; and Asectune, 3,300; and there are many summits over 3,000 feet high. With the exception of a very few of the highest peaks, these mountains are covered with dense forests of evergreen trees, chiefly spruces, whence the name. The drainage of the State is chiefly from the mountains E. and W. The Missisquoi, Lamolle, Winooski, Otter, and Poultney rivers flow into Lake Champlain; the Mulhegan, Passumpsic, Wells, Ompompanoosic, White, Quechee, Black, Williams, West, and Deerfield into the Connecticut; the Clyde, Barton, and Black into Lake Memphremagog; and the Battenkill and Hoosac into the Hudson. Lake Champlain is 126 miles long, with extreme width of 13 miles. The islands—Grand Isle, North Hero, Isle la Motte, with the Alburgh peninsula—form one of the counties. About three-fourths of this lake and one-fourth of Memphremagog are in Vermont. Of the lakes wholly within the State the principal are Bombazine, Willoughby, Salem, Seymour, Dunmore, and Groton, each several miles in length and breadth, and there are over 200 smaller lakes and ponds.

Geology.—A large part of the rocks are metamorphic. In the vicinity of Lake Champlain there are outcrops of stratified rocks, and the headlands that are seen along the eastern shore are of these rocks, as are the islands. These strata present a conformable series from Lower Cambrian through the Calciferous, Chazy, and Trenton, to the Cincinnati, and upon the often grooved and polished surfaces of these ledges rest the deposits of the Quaternary. In a few limited areas there are Tertiary strata, the most important of which are at Brandon. The Cambrian beds include the Georgia slates, famous for *Olenellus* and other Primordial fossils, and the great Red Sandrock formation, including the Swanton and Mallett Bay marbles, which extends along Western Vermont for about 90 miles, with a thickness of several thousand feet. The Calciferous is also largely developed in the lake region, and the larger islands are mainly composed of this and the Chazy. On Owl's Head, near Memphremagog, there is a small area of Upper Helderberg strata, and on the southern border a small patch of Lower Helderberg. A few miles eastward from Lake Champlain the rocks become metamorphic, and the sandstones and limestones are transformed into schists, slates, marble, granite, gneiss, etc. The Green Mountains are made of these, the crystallization and metamorphism of the Cambrian and Silurian strata having occurred at the close of the Lower Silurian, and the elevation of the mountains at the same time. The Champlain valley appears to have been connected with the valley of the Hudson and with that of the

St. Lawrence during its early history, the land between Whitehall and Troy having been raised in the later Quaternary. The drift, sands, gravel, bowlders, clays, and terraces of the Quaternary are everywhere abundant.

Soil and Productions.—Although much of the soil is stony and sterile there is considerable that is productive, and the average yield of many crops to the acre is greater than the average for the U. S. The State is an agricultural one, and the most important agricultural interest is that of dairying. Besides private dairies there were in operation in 1894 204 creameries, capable of using the milk of 81,388 cows, and the annual production of butter is 23,314,063 lb. and of cheese 609,586 lb. Along the shores and on the larger islands of Lake Champlain there are large and productive apple and pear orchards. The sugar-maple grows in most parts of the State, and the production of sugar and sirup from the sap is one of the great industries. In 1889 there were made 14,123,921 lb. of sugar and 218,252 gal. of sirup, the whole valued at \$1,248,856.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms.....	35,522	32,573	8.3
Total acreage of farms.....	4,882,588	4,395,646	10.0
Total value of farms, including buildings and fences.....	\$109,346,110	\$80,427,490	26.4

* Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	41,976	1,835,021 bush.	\$1,266,164
Wheat.....	7,268	164,084 "	110,539
Oats.....	113,060	3,719,671 "	1,897,034
Rye.....	3,144	41,186 "	30,066
Barley.....	18,124	505,660 "	303,306
Buckwheat.....	12,237	271,109 "	156,242
Potatoes.....	29,706	3,690,984 "	1,624,033
Hay.....	908,126	1,089,751 tons	19,832,125
Totals.....	1,136,701		\$16,219,599

On Jan. 1, 1895, the farm animals comprised 93,877 horses, value \$4,304,596; 253,403 milch cows, value \$6,925,504; 146,574 oxen and other cattle, value \$3,039,814; 226,938 sheep, value \$363,464; and 77,931 swine, value \$730,007—total head, 797,823; total value, \$15,363,385.

Flora and Fauna.—The forests, which cover vast areas on the mountain slopes, are largely of spruce and fir, with hemlock and pine on the lower slopes. The hillsides bear groves of maple, beech, and birch (white, black, and yellow), and on the lowlands are walnut, ash, several species of oak, butternut, poplar, and elm. In all there are some fifty species of native trees and twice as many of large shrubs, with about 1,300 species of herbaraceous plants. On the higher mountains near their summits are found arctic plants, such as *Saxifraga aizoon*, while on the sandy shores of Lake Champlain are sundry plant reminders of ancient days when the water was salt. The general flora shows a mingling of Canadian, Southern, and Western species. The larger wild animals formerly common in the State have either disappeared or become very rare. The panther, black bear, and deer are still occasionally found, and the raccoon, otter, mink, muskrat, porcupine, skunk, woodchuck, squirrels, etc., are more or less common. Among birds there are the golden and the white-headed eagle, the former very rare, the latter common in the lake region, numerous hawks, owls, ducks, and other water-birds, besides many species of song-birds. The waters of the larger lakes and streams supply many varieties of fish, such as trout, muskelonge, pike, bass, pickerel, whitefish, sturgeon, etc.

Mineral Productions.—The rocks of Vermont constitute an important part of its wealth. There are about 170 quarries, some of them very large, from which great quantities of marble, granite, slate, and soapstone are obtained. More than two-thirds of all the marble quarried in the U. S. is taken from these quarries. The capital invested in the marble quarries and mills of the State is over \$19,000,000, and the annual production is valued at nearly \$4,000,000. Most of this is found in Rutland and Addison Counties, the principal quarries being at Dorset, West Rutland, Proctor, Pittsford, Middlebury, and Brandon. The marble from these quarries varies from the purest statuary, through that in

which black or dark veining are increasingly abundant, to that which is very dark or almost black. These marbles appear to be metamorphic Chazy limestone. From the unaltered limestone fine jet-black marble is obtained in several localities, and there are quarries of serpentine, verd antique, and other varieties, but these are worked only to a limited extent. Granite of excellent quality is found in many localities, and the quarries are becoming more and more numerous and important. The principal quarries in operation are at Barre, Ryegate, Hardwick, and Brunswick. The annual output is valued at about \$1,000,000. Roofing-slate is found in three areas or belts; the chief quarries are at Castleton, Fair Haven, and Northfield; and the annual output is valued at about \$800,000. Soapstone is quarried at Athens, Perkinsville, Cambridgeport, and elsewhere, the annual product being worth about \$20,000. Vermont is not rich in mines. The largest ones are in Corinth and Vershire, where for many years chalcopryite has been mined for copper. Gold, silver, lead, iron, and manganese are found in limited quantities. Many minerals of interest to the scientist, though of little commercial value, are found, such as talc, calcite, rutile, actinolite, chrysoprase, tourmaline, epidote, cyanite, garnet, etc.

Climate.—The climate is variable and liable to sudden changes. The northern and eastern portions of the State are colder than the western. At Burlington the mean annual temperature is 45° F. The highest temperature is seldom above 80° F., the lowest not often below -15° F., though there are days in which the thermometer exceeds these limits. Lake Champlain usually freezes over, the average date of closing being Jan. 29, that of opening Apr. 15. The average monthly temperature and rainfall at Burlington in 1873-93 were as follows:

MONTHS.	Temperature.	Rainfall.	MONTHS.	Temperature.	Rainfall.
January.....	19 75° F	1 82 in.	July.....	70 62° F	3 60 in.
February.....	21 21	1 20	August.....	67 91	3 49
March.....	28 52	1 76	September.....	60 81	3 48
April.....	43 10	1 82	October.....	48 35	3 03
May.....	56 35	2 80	November.....	36 30	2 67
June.....	66 80	3 47	December.....	47 50	1 94

The average temperature in most other parts of the State is three or four degrees lower and the rainfall rather greater.

Divisions.—For administrative purposes Vermont is divided into fourteen counties as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1880.	Pop. 1890.	COUNTY-TOWNS.	Pop.† 1890.
Addison.....	5-A	24,173	22,277	Middlebury.....	2,793
Bennington.....	9-B	21,950	20,448	Bennington.....	6,391

Totals.....		332,286	332,422		

* Reference for location of counties, see map of Vermont.
† Including township.

Principal Cities and Towns, with Population in 1890.—Burlington, 14,590; Rutland, 11,760; St. Albans, 7,771; Brattleboro, 6,862; Barre, 6,812; St. Johnsbury, 6,567; Bennington, 6,391; Montpelier, 4,160; Brandon, 3,310; Swanton, 3,231.

Population and Races.—In 1860, 315,098; 1870, 330,551; 1880, 332,286; 1890, 332,422 (native, 288,334; foreign, 44,088; males, 169,327; females, 163,095; whites, 331,418; colored, 1,004, including 937 persons of African descent, 33 Chinese, 34 civilized Indians).

Industries and Business Interests.—In 1890 there were in operation 3,031 manufacturing establishments, with a capital of \$32,763,291, employing 21,894 persons, paying \$10,096,549 for wages and \$20,433,174 for materials, and producing goods of the value of \$38,340,066. Some of these, as the scale-works in St. Johnsbury, the organ-works in Brattleboro, the scale-works in Rutland, and the agricultural-impliment

works in Bellows Falls, are very extensive. Aside from the quarry and dairy products, as well as those of the establishments already mentioned, the principal articles manufactured are woollens, cotton, leather, paper, furniture, lumber, and drugs.

Commerce.—A commerce of considerable importance is carried on through Lake Champlain, and there is also a large traffic with Canada. Burlington is the only port of entry on the lake, but there are custom-houses at fourteen other places on the Canadian border. In the calendar year 1894 the imports aggregated in value \$4,392,555, and the exports \$7,004,401.

Finance.—In 1893 the assessed valuation of all property, real and personal, was \$171,283,543, and the estimated true valuation \$265,567,323. The receipts of the treasury for 1894 were \$1,913,718; disbursements, \$1,569,707. The only liability is the Agricultural College fund, represented by bonds for \$135,500, bearing 6 per cent. interest.

Banking and Insurance.—In 1895 there were 49 national banks with combined capital of \$7,010,000, 40 savings and trust companies, with accumulated funds amounting to \$1,583,382, and deposits in 1895 of \$27,966,855, and 3 home fire-insurance companies with combined gross assets of \$364,493.

Post-offices and Periodicals.—In Jan., 1895, there were 561 post-offices, of which 36 were presidential (1 first-class, 8 second-class, 27 third-class) and 525 fourth-class; of the total, 255 were money-order offices and 3 were limited money-order offices. Of newspapers and periodicals in 1895, there were 4 daily, 1 semi-weekly, 61 weekly, 1 semi-monthly, and 13 monthly publications—total, 80.

Means of Communication.—The railways are under the supervision of three commissioners appointed by the Governor and Senate. Most of the lines are operated by the Central Vermont and the Boston and Maine railway companies. In 1890 there were in use 1,217 miles of road, including sidings.

Churches.—The U. S. census of 1890 gives the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic	79	79	42,810	\$866,400
Congregational	198	220	20,465	1,318,100
Methodist Episcopal	228	212	17,268	758,800
Baptist	100	105	8,933	584,500
Protestant Episcopal	63	65	4,335	472,050
Universalist	65	62	2,409	285,000
Free-will Baptist	43	40	2,325	94,375
Spiritualist	10	10	1,966	23,250
Advent	28	26	1,079	26,000
Unitarian	9	10	968	112,500

Schools.—As early as 1761 land was set apart for educational purposes, and this was increased from year to year as the State grew. The district system of common schools prevailed until 1870, when the town system was adopted. The public schools are under the direction of a superintendent, elected by the Legislature, and one supervisor in each county, elected by the people. In 1894 there were 80,152 children of school age, of whom 65,548 attended the public schools, 1,865 the academies and seminaries, and 3,118 the parochial schools. There were 3,728 public-school teachers and 2,292 public schools. The expenditures of the year were \$783,805, of which \$561,809 was for teachers' salaries. The higher educational institutions include the State University (see VERMONT, UNIVERSITY OF); Middlebury College, chartered in 1800, with collegiate and scientific courses, and 8 instructors and 88 students in 1894; and Norwich University, a military institution with a corps of 13 instructors and 58 students. There are 3 normal schools supported by the State and 27 academies not under State control.

Libraries.—Public libraries are found in ninety-two towns, and all the larger schools have their own libraries.

Charitable, Reformatory, and Penal Institutions.—The greater number of charitable institutions are near Burlington. Here are the Mary Fletcher Hospital (endowment, \$470,000); a Home for Destitute Children (endowment, \$230,000); the Providence Orphan Asylum (value of property, \$50,000); the Howard Mission House (endowment \$60,000); the Adams Mission Home (property, \$15,000); the Cancer Relief Association; the Home for Aged Women; the Home for Friendless Women (property, \$20,000); a Young Men's Christian Association (building valued at \$105,000), besides several private retreats and hospitals. At Bennington is a

Soldiers' Home supported by the State; at Westminster is Kurn Hattim, a home for friendless boys; at St. Albans is a hospital and the Warner Home for Destitute Children; at Brattleboro is an insane asylum, partly supported by the State, though the institution is not under State control; and at Waterbury is a State asylum. There is in Vergennes a Reform School for wayward boys and girls, and at Rutland a House of Correction for adults convicted of minor offenses. The State prison is at Windsor. The State provides for the small number of blind, deaf, and dumb in its care by sending them to institutions in adjoining States.

Political Organization.—Since 1870 the State officers and Legislature have been elected biennially. The Senate is composed of thirty members, apportioned among the different counties according to population, and the House of one representative from each town without regard to population, there being in all 244. State elections are held in September in even years. The judiciary is elective throughout, the chief justice and six assistant justices of the Supreme Court being elected by the Legislature in joint session; the assistant judges of the county courts by popular vote in the several counties; and justices of the peace by popular vote in the towns.

History.—The French explorer Champlain discovered the lake which bears his name in 1609. At that time, and for many years after, the territory of Vermont was not occupied by permanent villages, but was a battle-field and hunting-ground traversed by wandering parties, at one time by Iroquois, at another by Algonkims, and later by armed bands of French or English. As all the Indian names of lakes, streams, etc., which have been retained are Algonkin, it seems probable that these people held original possession of the territory. Fort St. Anne, on Isle la Motte, was built by the French in 1665, and was the first white settlement, though not a permanent one. Fort Dummer, built near what is now Brattleboro in 1724, was probably the first English settlement. Bennington was settled in 1761 on land granted in 1749 by Gov. Wentworth of New Hampshire, and in 1762 a few families settled in Newbury. Gov. Wentworth claimed the whole territory as a part of New Hampshire, and in time 138 townships were deeded by him in the "New Hampshire Grants." Trouble arose when the Governor of New York also claimed jurisdiction over the same territory under letters from Charles II. Proclamations and counter-proclamations were issued, but the settlers, most of whom had paid the Governor of New Hampshire for their titles, sided with Gov. Wentworth and resisted the claims of New York, and the quarrel which followed continued many years. In 1776 the people of the New Hampshire Grants applied to the Federal Congress for admission to the confederation, but through the influence of New York they were refused. They then formed an independent republic, at first called New Connecticut, but later Vermont. As an independent State Vermont continued thirteen years. Finally, after again being refused a place with the other States in 1789, Vermont was received as the fourteenth State and the first under the Federal Constitution in 1791. Notwithstanding the exclusive policy of the other States, Vermonters bore their full share of hardships, losses, and expenses of the war of the Revolution. The State also took active part in the war of 1812. In the war of 1861-65 Vermont did more than its share. In proportion to the population its loss in hospital and on battle-field was larger than that of any other Northern State; it furnished 1,500 more men than were called for under all demands; its money contribution to the expenses of the war amounted to over 12 per cent. of the total property valuation; and out of a population of 315,098, having less than the average number of men liable to military duty, it sent 33,288, or more than one-tenth of the entire population. Since the civil war the population and industries of many portions of the State have decreased, but efforts have been made to revive the former activity in farming and manufactures, and with considerable success.

GOVERNORS OF VERMONT.

Thomas Chittenden	1778-89	Samuel C. Crafts	1828-31
Moses Robinson	1789-90	William A. Palmer	1831-35
Thomas Chittenden	1790-97	Silas A. Jenison	1835-41

GEORGE H. PERKINS.

Vermont: village; Fulton co., Ill.; on the Chi., Burl. and Quincy Railroad; 15 miles N. E. of Rushville, 24 miles N. of Beardstown (for location, see map of Illinois, ref. 5-C). It is in an agricultural region, and has a private bank, a weekly newspaper, and manufactories of carriages, spokes, brick, and tile. Pop. (1880) 1,133; (1890) 1,158.

Vermont, University of: an institution of learning situated at Burlington, Vt.; chartered in 1791 and endowed by Gen. Ira Allen with £4,000; faculty organized in 1800; graduated its first class in 1804. Medical instruction was given 1823-34; after a suspension of twenty years this department was reorganized in 1854, and has now (1894-95) 22 instructors and 160 students; students are admitted to lectures only by diploma or upon examination. The academic staff numbers 26 professors, with 228 students in academic courses; the total attendance in all departments is 438. The State Agricultural College was incorporated with the university in 1865, and with this is connected the State experiment station. The university offers the usual courses in arts, in civil, electrical, and mechanical engineering, in chemistry, and agriculture. After the first year the student's work may be specialized, if desired, by means of elective courses. Women are admitted to all departments except the medical. The buildings are mainly new or recently reconstructed. The Billings Library is not surpassed in beauty by any college library structure in the U. S. An elegant dormitory of marble and a fire-proof science building were added in 1895. The library contains 47,500 volumes, including the choice collection made by the Hon. George P. Marsh. This is supplemented by the free library of the city (25,000 volumes). President since 1871, Matthew H. Buckham, D. D. Since 1880 there has been a doubling both of the teaching staff and of the attendance. The income in 1894 was \$61,000.

JOHN E. GOODRICH.

Vermuyden, vār-mī-den, Sir CORNELIUS: engineer; b. in Zealand, Holland, about 1590; was employed in his native country in raising embankments against the sea; was invited to England in 1621 to repair a breach in the embankment of the Thames; conducted many drainage operations in England up to 1653; published *A Discourse touching the Draining of the great Fennes* (London, 1642). He died on the Continent about 1660.

M. M.

Vernal Grass: See ANTHOXANTHUM.

Verna'tion [Lat. *verna'tio*, deriv. of *vernare*, be like spring, bloom, renew itself, (of a snake) shed the skin, slough, deriv. of *ver*, spring]: the arrangement of leaves in the bud, sometimes called profoliation. When applied to the arrangement of the floral leaves it is usually called aestivation or praefloration. In general, leaves in the bud may be *alternate* (Fig. 1, A), *opposite* (Fig. 1, B), or *whorled* (Fig. 1, C) upon the axis. With respect to one another they may be *imbricated*, with their edges lapping (Fig. 1, D), or *valvate*, with their edges touching, but not lapping (Fig. 1, E).

FIG. 1.

The individual leaves may be plane, where the leaves are not folded at all (Fig. 2, A); *conduplicate*, folded lengthwise along the middle so that the upper surfaces of the two halves are together (Fig. 2, B); *plinate* or *plaited*, folded lengthwise along several ribs (Fig. 2, C); *involute*, rolled inward

FIG. 2.

on both margins (Fig. 2, D); *revolute*, rolled outward on both margins (Fig. 2, E); *convolute*, rolled inward from one margin (Fig. 2, F); *reclinate*, *replicate*, or *inflexed*, folded transversely so that the upper portion lies upon the lower, or upon the petiole (Fig. 2, G); *circinate*, rolled from the apex downward (Fig. 2, H).

CHARLES E. BESSEY.

Verne, JULES: author; b. at Nantes, France, Feb. 8, 1828; studied law in Paris, and made his *début* in literature in 1850 with a comedy in verse, *Les Pailles rompues*; wrote subsequently several other plays, and began in 1863, with his *Cinq Semaines en Ballon*, the vein of surprising adventures based more or less plausibly upon facts of science, which he has since pursued with great success. His most popular work is the *Tour du Monde en 80 Jours* (Around the World in Eighty Days), which was dramatized in 1874, and produced in the Porte St.-Martin theater in Paris. He also wrote *Voyage au Centre de la Terre*; *Vingt Mille Lieues sous les Mers*; *De la Terre à la Lune*; *Le Docteur Ox*; an illustrated geography of France, with Théophile Lavallée (1867-68); *Michel Strogoff*; *Le Rayon Vert* (1882); *Christophe Colomb* (1883); *L'Étoile du Sud* (1884); *Le Château des Carpathes* (1892), and many other books. Most of his works have been translated into English and other languages. He is a member of the Legion of Honor. Revised by A. G. CANFIELD.

Verner, KARL ADOLPH: comparative philologist; b. at Aarhus, in Juland, Denmark, Mar. 7, 1846; studied in the University of Copenhagen; assistant in the university library in Halle 1876-83; since 1883 Professor of Slavonic Languages in the University of Copenhagen. In 1875 he published in *Kuhn's Zeitschrift* an article entitled *Eine Ausnahme der ersten Lautverschiebung* (see VERNER'S LAW), which proved of far-reaching importance not only for Teutonic philology, but also for the methods as well as results of Indo-European comparative grammar. In recognition of this service he was awarded by the Berlin Academy the Bopp premium in 1877, and in 1887 made honorary Ph. D. by the University of Heidelberg. He is author of several other brief articles in linguistic journals.

B. I. W.

Verner's Law: a law of sound so named from the discoverer, Karl A. Verner. The discovery was first published in *Kuhn's Zeitschrift* in 1875. It embodies an explanation of certain apparent exceptions to the laws for the first shifting of consonants (see GRIMM'S LAW), affecting the representation in Teutonic of the Indo-European voiceless explosives (tenues) *k*, *t*, *p*, and the voiceless sibilant *s*. It appeared, namely, that I.-E. *k*, *t*, *p* produced not only Teutonic *h*, *þ* (*th*), *f*, as set forth in Grimm's law, but also *g*, *d*, *b*, and that *s* was represented by both *s* and *z*. The essential point of Verner's discovery consisted in the recognition that this diversity was connected with a diversity of the original word-accent of Indo-European. The syllable upon which this accent fell differed in different words and in different forms of the same word, i. e. it was "free." This method of accentuation is partially preserved to us in Sanskrit and Greek, as well as in the Balto-Slavic languages: cf. Skr. *dāca*: Gr. *δέκα*; Skr. *astá*: Gr. *ἀστῶ*; Skr. *pāñca*: Gr. *πέντε*; Skr. *ātí*: Gr. *ἄτι*; Skr. *ahám*: Gr. *ἄγῶ*; Skr. *jānas*: Gr. *γένος*; Skr. *nāras*: Gr. *νέος*; Skr. *svādū-s*: Gr. *ῥόδός*; Skr. *yugá-m*: Gr. *ζυγόν*; Skr. *pád*, *pádam*, *padás*: Gr. *πόδος*, *πόδα*, *πόδος*, etc. (cf. Wheeler, *Griech. Nominal-Accent*). Verner's law is this: I.-E. medial *k*, *t*, *p*, *s* become Teutonic *h*, *þ* (*th*), *f*, *s*, which then, if associated with voiced sounds, become voiced (*g*, *d*, *b*, *z*), when the I.-E. accent rested upon any other than the preceding syllable; or, to state it in another form, I.-E. *k*, *t*, *p*, *s* appear as *h*, *th*, *f*, *s*, when the I.-E. accent immediately preceded, otherwise (except before *s* or *t*) as *g*, *d*, *b*, *z*. Examples:

Skr. *svāgura-s*: Germ. *schwäher*, "father-in-law," on the other hand, Skr. *svagrā*: Germ. *schwieger* (-mutter), "mother-in-law"; Gr. *θεός*: Goth. *tigus*, Eng. -*ty* in *thirty*; Skr. *bhrātara*, brother: Gr. *φράτωρ*: Goth. *brōþar*: Germ. *bruder*, but Gr. *πατήρ*: Goth. *fadar*: Germ. *vater*; Gr. *ἕκαστον*: Goth. *hund*: Eng. *hund-red*; Skr. *kūḥ-s*: Goth. *hāidus*: Eng. -*hood*: Skr. *damitā-s*: Eng. *tamed*. Causative verbs in I.-E. were accented on the syllable following the root. Hence from the I.-E. root *wert-*, "turn," of Lat. *verto*, Skr. *vartātē*, Goth. *wairþan*, Germ. *werden*, is derived the causative verb *wortēyeti*, "make turn," cf. Skr. *vartāyati*, Goth. *fra-wartjan*, spoil; from the root *leit-*, go, toil, of Goth. *leiþan*, Germ. *leiden*, is derived the causative *loitēyeti*, "cause to go," cf. Eng. *lead*, Germ. *leiten*.

The Teutonic *z* which results from *s* before the accent becomes in German and Eng. *r*; hence from root *nes-*, return, in Gr. *νεόμαι*, *νόστος*, Goth. *ganisan*, Germ. *genesen*, we have the causative I.-E. *nosēyeti* of Germ. *nähren*; from the root *leis-*, follow a path, experience, in Lat. *lira*, "furrow," Germ. *geleise*, the causat. *loisēyeti*, cause to experience or to know, cf. Goth. *laisjan*, Germ. *lehren*, Eng. *lore*.

The interchange of *s* *r* in Eng. *was*: *were* is due to the I.-E. usage of accenting the perf. (pret.) on the root in the singular and on the ending in the plur.; cf. Skr. *vēda*: *vidmā*. To a similar variation of accent are due the phenomena of grammatical interchange (*grammatischer Wechsel*) in, e. g., *ziehen*: *gezogen* (I.-E. *dukonōs*); *schneiden*: *geschitten*; *leiden*: *gelitten*; Eng. *lose*: *forlorn*; *selte*: *solden*, etc.

Vernet, vār'nā', ANTOINE CHARLES HORACE, called CARLE VERNET: painter; b. in Bordeaux, France, Aug. 14, 1758; son and pupil of Claude J. Vernet, studied also with Lépicié. He painted pictures concerning the republic and the empire of Napoleon, and under the restoration he was still in favor and was made Chevalier of the Order of St. Michael. Under Louis Philippe he became a member and then an officer of the Legion of Honor. D. in Paris, Nov. 17, 1836. In the Louvre, Paris, is the large and interesting picture *Charles X. hunting at Ville d'Arvay*, including portraits of the king and members of the royal family. R. S.

Vernet, CLAUDE JOSEPH, called JOSEPH VERNET: painter and engraver; b. at Avignon, Aug. 14, 1714. He was the son of a decorative painter who taught him and sent him to Rome, during which journey he seems to have been impressed by the artistic possibilities of sea-painting, and accordingly, after painting under the instruction of his Roman masters, he devoted himself almost exclusively to marine subjects. D. in Paris, Dec. 3, 1789. In the London National Gallery is the *Castle of San' Angelo* and *A River Scene*. In the Louvre, Paris, there are forty-one pictures, including a series of the *Seaports of France*, which were ordered especially by Louis XV. R. S.

Vernet, ÉMILE JEAN HORACE, generally called HORACE VERNET: painter; b. in Paris, June 30, 1789. He was the son of Carle Vernet and grandson of the celebrated Claude Joseph Vernet. It was intended that Horace should study painting, but he failed to obtain the prize and traveling stipend of the Academy and became a conscript; served in the army as a soldier; married, and began to paint battle-pictures entirely according to his own ideas. In 1810 he exhibited *The Capture of a Redoubt*; in 1811, *The Dog of the Regiment* and *The Hall of French Soldiers*; in 1812, *The Taking of an Intrenched Camp*, for which the Academy gave him a medal. The impression that these pictures produced was most extraordinary. Instead of the conventional manner in which the members of the school of David used to imagine a battle, Vernet painted war-scenes and soldiers exactly as he had seen them himself, and through engravings and the newly invented art of lithography his enthusiastic representations of the grand army and its exploits, *The Death of Poniowski*, *The Bridge of Arcola*, *The Soldier of Waterloo*, etc., passed into the hands of the humblest Frenchmen, and produced their effect. In 1822 his pictures were refused admittance to the exhibition of the Academy on account of their Bonapartist tendency, but Vernet opened a private exhibition. Charles X. sent him in 1827 to Rome as director of the French school there. In 1831

he returned to Paris. His relations with Louis Philippe soon became very friendly, and the king succeeded in alluring the artist's imagination to the conquest of Algeria. Vernet resided in Algeria 1833-35, and visited it again in 1837, 1845, 1853, and oftener. He continued to paint Napoleon—the battles of Jena, Friedland, Wagram, etc.—but from 1836 to his death he chiefly treated subjects of the Algerian campaigns—*The Capture of the Smala*, *The Battle of Isly*, *The Siege of Constantine*, etc. Besides battle-pieces, he painted a number of pictures, half genre and half historical, such as *Rebecca at the Well*, *The School of Raphael*, *The Lion-hunt*, etc.; several portraits, among which were those of Napoleon I., of Louis Philippe, and of Napoleon III.; and gave a great number of illustrations. D. in Paris, Jan. 17, 1863. See Durande, *Joseph, Carle et Horace Vernet* (Paris, 1815).

Revised by R. STURGIS.

Vernier [named for the inventor, Pierre Vernier]; an instrument for measuring a fractional part of one of the equal divisions of a graduated scale or arc. It consists of an auxiliary graduated scale, the divisions of which differ from those of the primary scale. The vernier scale is formed by taking a space equal to an exact number of parts of the primary scale, and dividing it into a number of equal parts, either greater by 1 or less by 1 than the number that it covers on the primary scale. The former is the method of division usually adopted, and the vernier as thus divided is the one here explained:

Let A K be a scale of equal parts, and let each part represent 1 foot; let C D be a parallel scale, such that it is exactly equal to 9 parts of the primary scale; suppose C D to be divided into 10 equal parts: then each part will represent $\frac{1}{10}$ of 1 foot. By means of these scales one can measure distances to within $\frac{1}{10}$ of 1 foot. Suppose the 0 of the vernier in the first instance to coincide with the division 17 of the primary scale; then the distance from the 0 of the scale to the 0 of the vernier is exactly 17 feet. If we suppose the vernier to slide along the primary scale till the division 1 coincides with 18, the distance from the 0 of the scale to the 0 of the vernier will obviously be equal to 17.1; if it slides along till the division 2 coincides with 19, the distance between the 0 of the scale and the 0 of the vernier is 17.2, and so on. In the present position of the vernier the reading is 17.3. This is obvious, for the distance from the 0 to the divisions which coincide is 20, and the distance from the 0 of the vernier to the same division is three times $\frac{1}{10}$, or 2.7; hence the difference is 17.3.

The difference between one space on the limb and one space on the vernier is called the *least count*; this is always equal to one space on the limb divided by the number of spaces on the vernier. To read an instrument by means of a vernier, we have the following rule: Read the principal scale up to the last division preceding the 0 of the vernier, and call the result the reading on the limb; then look along the vernier for the division that coincides most nearly with a space on the limb, and multiply the number of that division by the least count; this result is called the reading on the vernier; the sum of the two readings will be the true reading of the instrument.

Vernon: town (taken from Bolton and incorporated in 1808); Tolland co., Conn.; on the N. Y. and New Eng. Railroad (for location, see map of Connecticut, ref. 7-1). It contains the city of ROCKVILLE (*q. v.*) and the villages of Vernon, Vernon Center, and Talcottville; had an assessed valuation in 1894 of \$2,907,813; and is principally engaged in agriculture and the manufacture of woolen, silk, and cotton goods. Pop. (1880) 6,915; (1890) 8,808.

Vernon: town (founded in 1881); capital of Wilbarger co., Tex.; on the Pease river and the Ft. Worth and Denver City Railway; 167 miles N. W. of Fort Worth (for location, see map of Texas, ref. 1-G). It is in an agricultural and stock-raising region, and has 5 churches, high school, 4 grain elevators, 2 flour-mills, cotton-gin, 2 ice-factories, a private bank, and 4 weekly newspapers. Pop. (1890) 2,857; (1895) estimated, 3,500. EDITOR OF "GUARD."

Vernon, EDWARD: naval officer; b. at Westminster, England, Nov. 12, 1684. His father, James Vernon, was Secretary of State 1697-1700. Young Vernon was educated at Westminster and Oxford, but in accordance with his earnest

desire his father secured him a commission in the navy in 1702. During the same year he was present in the action off Vigo, and in 1704 he served under Sir George Rooke in the sea-fight off Malaga. He became rear-admiral in 1708, and remained in active service until 1727, when he was elected to Parliament. As a member of the opposition he became prominent. In 1730, when the question of reprisals against Spain was agitated, he declared that Porto Bello (on the Isthmus of Panama) could be captured with six ships. The Government took him at his word, giving him command of a squadron, with the rank of rear-admiral of the blue. On Nov. 20, 1739, he appeared off Porto Bello with six ships, entered the harbor on the 21st, and laying his vessels close alongside the strongest fort, bombarded it so severely that the Spaniards were driven from their guns and a party of marines carried it under cover of the fire. The other forts surrendered next day, but Vernon, who had no land force, blew them up and abandoned them. He then bombarded Cartagena, New Granada, but was unable to carry the fortifications. He captured the castle of San Lorenzo at the mouth of the Chagres river. These exploits gave Vernon unbounded popularity, and he was commissioned to assemble a powerful force at Jamaica. In Jan., 1741, he sailed from that island with 29 ships of the line and 80 other vessels, carrying 15,000 sailors and 12,000 soldiers, including a contingent from the North American colonies. The land forces were under the separate command of Gen. Wentworth. It was believed that this expedition, in conjunction with that of Anson in the Pacific, would break the Spanish power in America. Vernon appeared off Cartagena Mar. 4, but the harbor was strongly fortified and ably defended, and the divided command of the British foredoomed them to failure. After performing prodigies of valor, the forces were attacked by pestilence: over 5,000 soldiers were lost, and at the end of April the attack was abandoned. Smollett and Lawrence Washington (elder brother of George) took part in this expedition. The former has described it in his novel, *Roderick Random*, and the latter, who conceived a strong admiration for the admiral, named in his honor the estate of Mt. Vernon. Vernon made an unsuccessful attempt against Panama in 1742, and soon after he was recalled to England, where he was charged to guard the southern coast against an expected attack of the Pretender. His popularity continued to be great; but in Apr., 1746, owing to a quarrel with the admiralty, he was dismissed from the service. He continued to sit in Parliament, however. In 1740 he published a *History of Jamaica*. D. at Naeton, Suffolk, Oct. 29, 1757. HERBERT H. SMITH.

Vernon, GEORGE JOHN WARREN, Fifth Baron: scholar and philanthropist; b. at Stapleford Hall, England, June 22, 1803. One of the richest men in England, his life was spent in public services, philanthropy, and devotion to letters. From 1830 to 1835 he was a Member of Parliament, being one of the ardent supporters of the Reform Bill. In 1835, on the death of his father, he became a peer and member of the House of Lords. This interfered with the activity of his political life, but to his death he preserved an eager interest in the liberal progress of his country. As a philanthropist he was deeply beloved, and the memory of his generosity and personal sacrifices at the time of the cotton famine in Lancashire in 1862-63, caused by the civil war in the U. S., still survives. He will be longest remembered, however, for his studies upon Dante and for his generous patronage of important but costly publications concerning that poet. He began his labors in this field with the publication in 1842 of *I primi sette canti dell' Inferno di Dante Alighieri disposti in ordine grammaticale*, a work later enlarged to include the entire *Inferno*, and provided with a volume of notes and dissertations and another of plates, with suitable comments (3 vols. fol., 1858-65). In 1845 he published *Petri Allegheri super Dantis ipsius genitoris Comediam Commentarium* (ed. by V. Nannucci). This was followed by *Chiose sopra Dante: Testo inedito* (1846); *Chiose alla cantica dell' Inferno di Dante Alighieri attribuite a Jacopo suo figlio* (1848); *Comento alla cantica di Dante Alighieri di autore anonimo* (1848); and *Le primi quattro edizioni della Divina Commedia letteralmente rismampate* (supervised by Antonio Panizzi, London, 1858). Besides these scholarly publications Lord Vernon wrote in Italian *Ottava rima* a romance of chivalry, *Fobus e Brius*, which was accepted by the Accademia della Crusca as a *testo di lingua*. D. May 31, 1866. A. R. MARSH.

Vernon, ROBERT, F. S. A.: art-collector; b. in England in 1774; was at one time a dealer in horses; acquired in commercial pursuits a large fortune, which he expended in the purchase of pictures, chiefly by British artists, being a generous patron of artists and literary men of genius, and formed a vast collection of works of art at his country-seat of Ardington House, Berkshire. The best portion of this, comprising 162 pictures and several pieces of statuary (valued at £150,000), he presented to the nation Dec. 22, 1847, to be known as the Vernon Gallery, which now forms the nucleus of the National Gallery of British Art at South Kensington Museum. D. in London, May 22, 1849. A portrait of Vernon by Pickersgill and a bust by Boehm, the latter presented by the Queen, are in the National Gallery.

Vernon-Harcourt, LEVISON FRANCIS: civil engineer; b. in London in 1839; educated at Harrow School and Balliol College, Oxford, taking first class in mathematics and natural science; a pupil of Sir John Hawkshaw from 1862 to 1865, and afterward his assistant. In 1875 he established himself in London, his practice being chiefly hydraulic and maritime work; was expert before committees of the House of Lords on canals, rivers, and water-supply, notably on the Manchester ship-canal in the interest of the Mersey dock board and Northwestern Railway, but supported the revised plans; is Professor of Civil Engineering in University College, London. He has published *Rivers and Canals* (1882); *Harbors and Docks* (1885); *Achievements in Engineering* (1891); *River Engineering and Water Supply*, in *Encyclopædia Britannica*; *Canals*, in *Chambers's Encyclopædia*; and papers in the *Proceedings of the Institution of Civil Engineers*. He has received one Telford medal, three Telford premiums, and the Manly premium. Two papers on his *Investigations on the Effects of Training Walls*, made on models of the Seine and the Mersey estuaries, which have attracted much attention, were read before the Royal Society 1889-91. He became associate of the Institution of Civil Engineers in 1865, member in 1871; vice-president permanent committee of the International Maritime Congress of Paris. W. R. HUTTON.

Véron, ve-rōn', LOUIS DESIRÉ: journalist; b. in Paris, Apr. 5, 1798; studied medicine; served in various hospitals, and published *Observations sur les Maladies des Enfants* (1825); wrote absolutist-ultramontane articles in different papers, and was appointed physician at the Royal Museum in 1824; purchased an interest in a medicine, "Pâte Regnaud," which, by his connections with the press, resulted in large sale with corresponding profit, and founded the *Revue de Paris* in 1829, which was devoted to the creation of new celebrities; became director of the grand opera in 1831, as a privileged manager; brought out the opera *Robert le Diable* and the ballet *La Sylphide*, and retired in 1835 with a fortune; bought in 1839 a controlling share of the *Constitutionnel*, the organ of Thiers; became its sole proprietor in 1844; brought it into a flourishing condition by publishing in its columns *Le Juif Errant*, by Eugene Sue, and was introduced in the highest circles of French society by Thiers; became the enthusiastic eulogizer of the *coup d'état* of Dec. 2, 1851; was elected to the Legislative Assembly as a candidate of the Government, and sold the *Constitutionnel* at an enormous profit; endowed anonymously several second-rate literary associations in Paris; published *Mémoires d'un Bourgeois de Paris* (6 vols., 1854); the novel *Cinq cent mille Francs de Rente* (2 vols., 1855); the political history, *Quatre ans de Règne* (1857); and *Les Théâtres de Paris de 1806 à 1860* (1860). D. in Paris, Sept. 27, 1867. Revised by A. G. CANFIELD.

Verona: the capital of the province of Verona, Italy. It is situated at the base of the spurs of the Southern Alps, on the Upper Italian Railway, 72 miles W. of Venice (see map of Italy, ref. 2-10), in a fertile plain, and is divided by the Adige (Lat. *Athesis*) into two parts, which are connected by six bridges (three of iron, one, medieval, of stone). As a fortress Verona constitutes with Peschiera, Mantua, and Legnano the historically famous Quadrilateral, and is the key to the Tyrol from the south. It is surrounded by a circle of forts. Considerable trade in grain, hides, flax, hemp, marble, silk, velvet, linen, and woolen goods is carried on. There are flourishing institutions for science and art, a public library with a remarkable MSS. collection, a picture gallery mostly of old Veronese masters, an agricultural academy (1768), a botanical garden, various good colleges, including a theological seminary and lyceum, and a private institute for poor girls, founded by Nicolo Mazza, where admirable embroidery

in silk and gold is done and artificial flowers manufactured. Of the many interesting buildings the chief is the old Roman amphitheater (*Arena*) built between 81 and 117 A. D. and wonderfully preserved, with a seating capacity of 60,000 people. The Porta de' Borsari and the Arco de' Leoni are fine Roman gateways, both of the Roman imperial time; the Porta Nuova and the Porta Pallio were built by Sanmicheli. The Piazza delle Erbe, originally the Forum, now a market-square, and the Piazza dei Signori, surrounded by many fine mediæval buildings, with the city-hall (Palazzo del Consiglio) and a monument of Dante (erected 1865), are the most remarkable among the many great squares. There are forty-eight churches, some of them with beautiful works of art, besides a cathedral. The latter was consecrated in 1187 by Pope Urban III., and is decorated with Lombardic sculpture. The ancient basilica of S. Zeno and the Dominican church of S. Anastasia in semi-Gothic style contain early examples of painting and sculpture. Near the old Friar monastery the so-called tomb of Shakspeare's Juliet is shown. Among recent structures the Municipio, the theater opened in 1846, the Teatro Filarmonico, and the railway station (built in 1850) are conspicuous. Verona became a Roman colony with the title *Augusta* in 89 B. C., was the birthplace of Catullus, and probably of Cornelius Nepos; was of greatest importance during the Gothic-Longobardian times, especially as the residence of the Ostrogoth Theodoric, the celebrated Dietrich von Bern (i. e. Verona) of the Germanic saga. It passed from Milanese into Venetian hands, and became Austrian in 1814 and Italian in 1866. Pop. (1893) 69,900. HERMANN SCHOENFELD.

Verona: borough; Allegheny co., Pa.; on the Allegheny river, and the Allegheny Val. Railway; 12 miles E. N. E. of Pittsburg (for location, see map of Pennsylvania, ref. 5-B). It has a national bank with capital of \$50,000, a weekly paper, and manufactories of railway-cars, glass, springs, dynamite, powder, and tools. Pop. (1880) 1,599; (1890) 1,477.

Verona, Congress of: a meeting of the European powers in 1823 with the especial design of taking action in regard to the revolution in Spain, where the Bourbon king, Ferdinand VII., had been forced to sign the constitution of 1812 and was at the mercy of the radicals. As at Laibach, the spirit of the congress was reactionary, and, true to the principles of the HOLY ALLIANCE (*q. v.*), its members favored intervention on behalf of the Spanish sovereign. The czar hoped to be the agent to carry out the decree of the congress, but abandoned the project upon learning that France would not permit the passage of Russian troops through her territory. The protest of Great Britain through her envoy, Wellington, prevented the congress from taking formal action against the Spanish revolutionists like that taken against the Neapolitans at the congress of Laibach, but it could not prevent the consent of the powers to the intervention of France as the power chiefly endangered by the revolution. As a result of the congress the Duc d'Angoulême invaded Spain at the head of a large army in 1823, and the despotism of the Bourbons was fully restored.

Veronese, vā-rō-nā'se, PAUL, properly PAOLO CALIARI [called Veronese because a native of Verona]; painter; b. in 1528. He was the son and nephew of artists, and grew up in practice of engraving, modeling, and painting. When at the age of twenty-six he settled in Venice, he had already done independent work in Mantua and in Vicenza. In Venice he was employed upon important work, and he seems to have been recognized from the first as great, even among the great painters of the Venetian school. Titian was then seventy-eight years old, but full of power and at the height of his fame; Tintoretto, sixteen years older than Veronese, was in great favor and producing wonderful pictures; and it must have seemed to their contemporaries that all the power in art not still held by the aged Titian had passed to his energetic, tireless, most original, and most aggressive young rival. (See ROBUSTI.) That Veronese should have been at all recognized as a rival to these two men is a remarkable proof of the power he had already shown and was ready to show at a comparatively early age. His first Venetian work was in the Church of San Sebastiano, the *Coronation of the Virgin*, on the ceiling of the sacristy; soon after came the altarpiece of the high altar, *The Virgin in Glory, with Four Saints*, and the pictures on the side walls of the sanctuary, the *Martyrdom of St. Sebastian* and the *Martyrdom of St. Mark*. The same year he painted the altarpiece *Christ on the Cross, with the Three Marys*. These

three last-named pictures may be called the masterpieces of his early time. About 1562 he painted *The Adoration of the Magi*, for the ceiling of the old library in the ducal palace, and in that year he began and finished the *Marriage of Cana*, for the monastery of San Giorgio Maggiore, on the island, but this is now in the *Salon Carré* of the Louvre. This famous picture was a part of the tribute that Bonaparte levied on Venice in 1797; it is about 32 feet long by 20 feet high. In 1565 Veronese was in Rome. In 1570 he painted the picture now in the Academy at Venice, the *Feast in the House of Levi*. This was painted for the convent of SS. Giovanni e Paolo; it is 46 feet long by about 20 feet high; the canvas is filled with an immense architectural composition with three arcades, and the supper-table is beneath this and at the head of a stately flight of steps. The Saviour, with Peter and John, is in the very center of the picture, and this single group is almost as famous a composition as the whole huge picture. A noble figure in a rich green dress, standing in front of one of the great piers of the architecture, is popularly taken for a portrait of Paolo himself, and is known in Venice as *The Green Man*. Immediately after this he painted its rival, *Christ in the House of Levi*, which Venice gave to Louis XIV. in 1665. This is now in the Louvre; it is as long though not as high as the *Marriage of Cana*. In 1573 he painted for a church in Murano the picture in the Venice Academy, *The Virgin in Glory, with Saint Dominic*. In 1577 there was a fire in the ducal palace, in which priceless pictures were destroyed, among them some of Veronese's; but immediately afterward he was employed on the ceiling of the largest hall, the *Sala del Maggior Consiglio*. The oval central compartment, which in itself is an immense picture, is *Venice Triumphant*. In this way his life is to be written, as a mere series of artistic undertakings and the production of splendid pictures. He devoted himself to painting, and there has never been a painter whose work is more uniform in excellence. The museums of Europe are full of his works, many of them enormously large, and yet very many remain in the buildings for which they were painted. Of the great Venetian colorists, the greatest colorists in the world, he was one. Loving daylight more than twilight, he does not give the glow and depth of Titian, but he gives something as fine, a system of daylight color never surpassed for beauty. His painting has stood the test of time and exposure exceedingly well. His composition, in line and mass, and also in color, is perfectly easy, natural, and spontaneous. His design is also peculiarly attractive, his men and women are splendid beings, almost more than human in their health and power and stately grace, his costumes are superb, his architectural backgrounds unequalled in painting. He could draw anything with equal ease, and knew as well as any painter who ever lived how to make one touch or one tint do the work of many. In fact, he was one of the five or six greatest painters known to us, and his work must always be a source of delight to those who care for painting for its own sake, as a fine art, having its own special charm, not needing to borrow the means and methods of other arts. He died suddenly in Venice, in the full maturity of his talents, Apr. 19, 1588, and was buried in the Church of S. Sebastiano among his own numerous and splendid works. RUSSELL STURGIS.

Veronica: the name given in Christian legend to the woman whose issue of blood was cured by Jesus (Matt. ix. 20), and who afterward, being in Jerusalem, saw him pass to his crucifixion, and gave him her handkerchief that he might wipe his sweaty and bloody brow. He accepted the kindness, and returned the cloth with the impress of his face upon it. The cloth was endowed with curative properties, and wrought many miracles. By order of the Emperor Tiberius Veronica went to Rome, to cure him of leprosy, and prevailed upon him, out of gratitude, and because he was by the miracle convinced of the divinity of Christ, to exile Pilate. She gave the cloth in her will to Clement, the successor of Peter, and it is now preserved in St. Peter's and exhibited at intervals. In the Middle Ages it became the fashion to call the cloth "Veronica." In other forms of the legend she is the niece of Herod, is known as Berenice, and again is an Antiochene martyr. Perhaps the genesis of the legend is to be sought in the story that Jesus sent Abgarus of Edessa his *vera icon*, his true likeness. See K. Pearson, *Die Fronica, ein Beitrag zur Geschichte des Christusbildes im Mittelalter* (Strassburg, 1887). Eusebius (*Church History*, viii., 18) says that he saw at Paneas statues of the woman and Christ. SAMUEL MACAULEY JACKSON.

Verplank', GULIAN CROMMELIN: author and statesman; b. in New York, Aug. 6, 1786; graduated at Columbia College 1801; studied law, and after being admitted to the bar spent several years in Europe; was in 1804 a candidate of the so-called Malecontents for the New York Legislature, to which he was elected many years later, in 1820, when he was chairman of the committee on education; was Professor of the Evidences of Christianity in the General Protestant Episcopal Seminary, New York, in 1821-25; was a member of Congress 1825-33; of the New York Senate (1838-41), in the judicial duties of which he took a principal part; was one of the governors of the New York Hospital, vice-chancellor of the State University, president of the New York board of emigration commissioners 1846-61, of which body he prepared nearly all the *Annual Reports*. D. in New York, Mar. 18, 1870. He was the author of *The Bucktail Bards* and *The Epistles of Brevet Major Pindar Puff*, political satires; *Evidences of Revealed Religion* (1824); *An Essay on the Doctrine of Contracts* (1825); *Discourses and Addresses* (1833); of nearly half the *Talisman* (1819), an annual; of several college addresses, reports, speeches, and papers, and of numerous contributions to magazines. He edited *Shakspeare's Plays, with his Life* (3 vols., 1844-47).

Verrazano, GIOVANNI, da: See VERAZZANO.

Ver'es: Roman governor of Sicily (73-71 B. C.). He was at first a member of the Marian party, but afterward went over to the side of Sulla, who rewarded him with a share of the confiscated estates of the proscribed party. He was elected praetor in 74 B. C., and in the following year he was sent to Sicily, where he remained three years, amassing an enormous fortune by plundering the inhabitants. The Sicilians succeeded in bringing him to trial, in spite of his wealth and powerful connections. Cicero was his accuser, Hortensius his defender. Before the trial came to a close, Verres fled from Rome. He settled in Gaul, near Marseilles, and brought along with him enough of his wealth to live in luxury and opulence for the rest of his life, and even to excite the greed of Antony, by whose proscription he was put to death in 43 B. C.

Verrius Flaccus: a Roman grammarian. See FLACCUS, MARCUS VERRIUS.

Verrocchio, vār-rōk'kō-ō, ANDREA, del: sculptor and painter; b. in Florence in 1435. His first training in art was as a goldsmith. Baldinucci affirms that he was a pupil of Donatello's, together with Pollaiuolo. The marble basin still existing in the sacristy of S. Lorenzo was made at that time, and was his first important work. He is said to have cast the bronze doors modeled by Luca della Robbia for S. Lorenzo. He also cast the bronze ball that Brunelleschi designed for the dome of the Cathedral of Florence. Verrocchio was commissioned by the Medici to make the tomb of Piero and Giovanni de' Medici in the sacristy of S. Lorenzo, which he completed in 1482. Later he was employed in the decoration of their villa at Careggi, and for them also he made the bronze David now in the Bargello in Florence. The tomb of Francesca Tornabuoni, executed in Rome in 1477, was Verrocchio's first great work in marble. The reliefs for this are now in the museum in Florence. From this date till 1484 Verrocchio divided his time between Rome and Florence. He executed some large silver statues of the apostles for the Sistine chapel, of which no trace remains. About 1480 he made the silver bas-relief of the *Beheading of St. John* for the altar of the baptistery in Florence, now the only remaining example of his goldsmith's work. In 1483 he completed the group of the *Incredulity of St. Thomas* for Orsanmichele. From 1484 to 1488 he worked chiefly on the equestrian statue of Colleoni in Venice. He caught a cold during its casting, and died from its effects in 1488. Verrocchio, although chiefly a sculptor, had more to do with forming the art of painting for his successors than any artist of his time. He was evidently much influenced in his method by Fra Filippo. Of Verrocchio's pictures there is authentic evidence only as to *The Baptism of Christ*, in the Accademia in Florence, of which Vasari says it was in part painted by Leonardo. It is known that many Madonnas were sent out of his studio, and there are several attributed to him by various critics. Verrocchio takes rank among the greatest of the artists of the Renaissance. He was the master of Leonardo da Vinci, of Perugino, and of Lorenzo di Credi, and was a musician and mathematician as well as a sculptor and painter. See CROWE and CAVALCASSELLE, and VASARI.

W. J. S.

Versailles, vār-sā'ā': capital of the department of Seine-et-Oise, France; 11 miles S. W. of Paris (see map of France, ref. 3-F). It is regularly built, with broad and straight streets, and intersected by elegant avenues planted with trees. It has few manufactures and little trade. The chief attractions of the place are the palace and the park. The palace, an enormous pile, 1,400 feet long, was erected by Louis XIV., and was the residence of the French kings till 1792. In 1837 Louis Philippe transformed it into a national museum, to commemorate the glories of France. The park, with its terraces, alleys, and fountains, was long considered a model of landscape-gardening. Versailles has a national college, a normal school, numerous literary and scientific societies, and a public library of 75,000 volumes. It was here that the German empire was founded in 1871. During 1871-79 it was the seat of the National Assembly and Government of France. Pop. (1896) 54,874.

Revised by M. W. HARRINGTON.

Versailles, ver-sā'z': town (laid out in 1794) and capital of Woodford co., Ky.; on the Rich., Nicholas, Irv. and Beattyv. and the Southern railways; 15 miles S. E. of Frankfort (for location, see map of Kentucky, ref. 3-H). It is in an agricultural and stock-raising region; contains Rose Hill Seminary (Christian, opened in 1875), 3 State banks with combined capital of \$210,000, and several factories; and has a weekly newspaper. Pop. (1880) 2,126; (1890) 2,575.

Versailles: town; capital of Morgan co., Mo.; on the Mo. Pac. Railway; 30 miles S. E. of Sedalia, 40 miles S. W. of Jefferson City (for location, see map of Missouri, ref. 5-G). It is in an agricultural, grazing, and mining region; yields coal, iron, lead, copper, and kaolin; and has a male and female institute, 2 State banks with combined capital of \$45,000, and 2 weekly newspapers. Pop. (1880) 578; (1890) 1,211.

Versailles: village (founded in 1851); Darke co., O.; on the Cin., Day, and Chi. and the Cleve., Cin., Chi. and St. L. railways; 41 miles N. W. of Dayton (for location, see map of Ohio, ref. 5-C). It is in an agricultural region, and has five churches, a public and a parochial school, a private bank, and a weekly paper. Pop. (1880) 1,163; (1890) 1,385; (1895) estimated, 1,450.

EDITOR OF "POLICY."

Verse [Lat. *versus*, a turning]; a line of poetry usually forming a well-rounded rhythmic period. The maximum length assigned by the ancients was thirty or thirty-two moræ or short syllables (a long being counted as twice a short). In lyric poetry and in systems a period often exceeds this length, and the cola, or groups of cola, are written as verses. Each verse is theoretically marked by one chief stress, and regularly has a slight pause at the end not included in the rhythm. (See PROSODY and METRES.) "Verse" is often used for "stanza," and also is used collectively in the sense of "poetry," but usually in reference to the mere form.

MILTON W. HUMPHREYS.

Versceez, or **Wershutz**, ver-shets': town; in the county of Temes, Hungary; on the Temesvár-Bazias Railway (see map of Austria-Hungary, ref. 9-I). It has a Greek theological seminary, a real-school, is the seat of a Greek bishopric, and the center of an extensive trade in silk and wine. The town was taken by the Austrians in 1849. Pop. (1890) 22,122 (57.5 per cent. Germans).

Vertebra: See OSTEOLOGY and SPINAL COLUMN.

Vertebra'ta [Mod. Lat.; in form, liter., neut. plur. of Lat. *vertebra tus*, jointed (deriv. of *vertebra*, joint, joint of the spine), in meaning deriv. of Mod. Lat. *vertebra*, vertebra]; the highest and most important branch of the animal kingdom. In common with the other CHORDATA (*q. v.*) the vertebrates are segmented animals which possess a primary axial skeleton (notochord) between the digestive and nervous systems, a nervous system which is not traversed by the alimentary tract, and gill-slits, at least in the embryo, leading outward from the throat. Indeed, the term *Vertebrata* is often used as synonymous with *Chordata*. A strict limitation, however, excludes the *Tunicata*, *Enteropneusti*, and *Leptocardii*.

The vertebrates are bilaterally symmetrical. The body is covered with an epidermis several cells in thickness, from which or from the subjacent dermis may be developed protective structures—scales, feathers, or hair. The central nervous system consists of an anterior enlargement, the brain, and a posterior prolongation, the spinal cord. The latter is markedly segmented, and from each segment arises a pair of spinal nerves, which are distributed to the parts of the corresponding body segment. Each of these nerves

arises by two roots, which differ in character. The dorsal root has an enlargement or ganglion, and is sensory in function, while the ventral root lacks a ganglion, and is motor in nature, influencing the action of the parts to which it is supplied. In the brain corresponding segments are not easily recognized, and the nerves which arise from this region are not easily brought into harmony with the spinal nerves. In the brain five regions may be distinguished; in front, a pair of cerebral hemispheres, next an unpaired optic thalamus, third the optic lobes, fourth the cerebellum, and lastly the medulla oblongata, an expansion of the spinal cord. Both brain and cord are traversed by a canal, and in certain regions of the brain this expands into "ventricles." Of these there are four, one in each cerebral hemisphere, one in the thalamus, and one in the cerebellum and medulla.

There are three sensory outgrowths which arise from the brain, the paired eyes and the pineal or PARIETAL EYE (*q. v.*), which is probably functional in no existing vertebrate. From the cerebral lobes arise the olfactory nerves, which go to the nose; from the thalamus arise the optic and pineal nerves; from the optic lobe region, the oculomotor nerves; while the remaining nerves—eight pairs in the higher vertebrates—start from the medulla. From the floor of the thalamus a curious downgrowth—the infundibulum—occurs. Its nature is problematical. The special sense-organs are three—the nose, eyes, and ears. In the lampreys the nose is median; in the other forms it is paired. In only the higher vertebrates is there a passage through the nose to the throat. For the details of EYE and EAR, see those articles. In the aquatic vertebrates another set of sense-organs—those of the lateral line—need mention. They are tubular structures distributed over the head and extending along the side of the body and opening to the exterior by pores. They are supplied by branches of the tenth (vagus) and fifth (trigeminal) nerves.

The vertebrate skeleton may be divided into axial and appendicular portions. The axial consists of the vertebrae, skull, and ribs; the appendicular—lacking only in the lampreys and some snakes—supports the appendages. Each vertebra consists of a centrum, which arises in the tissue around the notochord, and a neural arch which arises from the centrum and incloses the spinal cord. The vertebrae are intersegmental in position, alternating with the spinal nerves. Besides the neural arch there may be a similar arch arising from each centrum below (hæmal arch), and forming the ribs in fishes, or there may be transverse outgrowths from the sides, the distal portions of which may become jointed, giving rise to the ribs of the higher vertebrates. By a fusion of the lower ends of the ribs a breast-bone or sternum may be formed. The vertebrae, ribs, and sternum are at first cartilage, and in many forms (e. g. sharks, lampreys) are never converted into bone. The SKULL (*q. v.*) is laid down in cartilage. In it may be recognized a capsule for the protection of the brain and sense-organs (eranium) and the face, including the jaws. These may all persist as cartilage, or they may be ossified and re-enforced by other bones developed in the skin, and later united with the skull. In the more primitive forms the number of separate bones is large; ascent in the scale is usually accompanied by a fusion of separate elements. Thus the single sphenoid bone of man is represented by about twenty distinct bones in lower forms. In the facial region the jaws are the center about which the most modification arises, and in connection with them are to be mentioned the skeletal supports of the gills (gill-arches). Usually the mouth is armed with teeth, and these may occur in other parts than the jaws proper. It is of interest to note here that the teeth are probably to be regarded as modified scales, for in their structure and development they are closely similar to the scales of the sharks. The appendicular skeleton consists of the supports to the fore and hind limbs. There is a girdle of bones (pectoral or pelvic) surrounding the body, and consisting, in its extreme development, of three bones on either side. These are the scapula (or shoulder-blade) above, and the coracoid and clavicle, in the pectoral girdle; and the dorsal ilium, and the ventral pubis and ischium in the pelvic girdle. At the junction of these elements arises the skeleton of the limb proper, which in the swimming forms has a low development, but which in all others can be more or less closely compared to that of man. For details of the skeleton, see OSTEOLOGY and SKELETON.

The digestive system begins with the mouth, after which come in order pharynx, œsophagus, stomach, and intestines, the last frequently showing differentiation into several por-

tions. These either open directly to the exterior or terminate in a cloaca which also receives the urinary and genital ducts. From the intestinal region are developed as outgrowths two special digestive glands, the pancreas and liver. In the water-breathing forms the sides of the pharynx are perforated by gill-slits, the walls of which are covered by delicate plates or fringes in which the blood circulates, while water coming in through the mouth passes to the exterior through the slits, and is thus brought into close connection with the blood, so that an exchange of oxygen and carbon dioxide is readily effected. In the higher forms these gill-slits persist for but a short time, and in the mammal or bird one only can be found in the adult—the Eustachian tube—which, closed at the outer end, connects the middle ear with the throat. In the air-breathing vertebrates the gills are replaced by lungs, a pair of organs developed from the floor of the throat, just behind the gill-slits and extending back into the body. The connection of these with the air-bladder of fishes is very uncertain. The heart, the central organ of circulation, is primitively placed below the alimentary tract, just behind the gill-slits. It receives blood from behind, and in its simplest form consists of two chambers, an auricle which receives the blood and a ventricle which propels it forward. Passing from the heart, the blood in all gill-bearing forms passes into a ventral aorta, which gives off arteries passing up through the solid walls between the gill-slits. These arteries give off smaller vessels, which, after passing through the gills, unite above the pharynx in the dorsal aorta, which runs backward through the body. From this simple system are developed by modification and suppression of parts the circulatory organs of all vertebrates. In the highest air-breathing forms a partition forms, dividing the auricle and ventricle, thus giving rise to the four-chambered heart. From the posterior artery through the gills is developed the artery leading to the lungs, while the other gill-arteries are variously modified or suppressed. There is, besides, a so-called lymph system, consisting of vessels and spaces ramifying all parts of the body, and communicating, here and there, with the blood-circulatory system. In certain forms, portions of this lymph system become specialized into contractile organs, the lymph hearts. A portion of the lymph system, the chyle ducts, play an important part in transferring the products of digestion into the general circulation.

The body cavity (CELOM, *q. v.*) is well developed. It arises as a series of small paired cavities, the upper parts of which become obliterated while the lower parts flow together, giving rise to the pleuro-peritoneal cavity of the adult. A portion of this is always cut off to form the pericardial cavity surrounding the heart, and in the higher vertebrates the remainder is divided by a muscular partition—the diaphragm—into pleural and peritoneal chambers. These cavities surround the digestive canal.

The excretory system in the lower forms consists of a paired series of funnels connecting the body cavity with a longitudinal tube leading back to open near the vent. Connected with the funnel tubes are capillary networks (glomeruli), through which nitrogenous waste is passed from the blood into the excretory canals, the whole being strikingly similar to the nephridia of the Annelids. In the higher vertebrates this system undergoes complex modifications, the duct becoming divided into two tubes, the Wolffian and Müllerian ducts, which are variously related to reproduction and excretion in the two sexes. The sexual organs are paired, and in only rare instances are the two sexes united in the same individual. The sexual products are carried to the exterior by the modified excretory ducts, and in certain forms—some sharks, skates, fishes, Batrachia, and mammals—a portion of the duct is specialized into a uterus, where a part of the development of the egg takes place.

The branch of vertebrates is divided into the Cyclostomata, including the lampreys and hag-fishes (see MARSIPPOBRANCHIA), in which no true jaws are developed, and the Gnathostomata, with jaws, including all other forms. For the divisions of the latter, see the articles FISHES, AMPHIBIA, SAUROPSIDA, and MAMMALS.

Vertebrates, Fossil: the remains of vertebrate animals found in the geological formations of the earth.

The geological succession of vertebrate life, especially in America, deserves an important place, for without it as a foundation no clear idea can be obtained of ancient life itself. The recent discoveries in this department of biology in North America alone have been so extensive, and include so many new and interesting forms of animal life, that these will be mainly used as types to illustrate the subject, rather than those longer known from other parts of the world.

Another point of much importance, which can only be mentioned in the present statement, is the genetic relations of the various extinct vertebrates that have left their remains so abundantly in the successive strata of the earth. That the older forms are the ancestors of the later ones can be accepted as established, but in most series the exact lines of descent remain unknown. The progressive development of each group follows a certain law. The older forms are, as a rule, less specialized than their successors, and it is possible to determine with much certainty the approximate

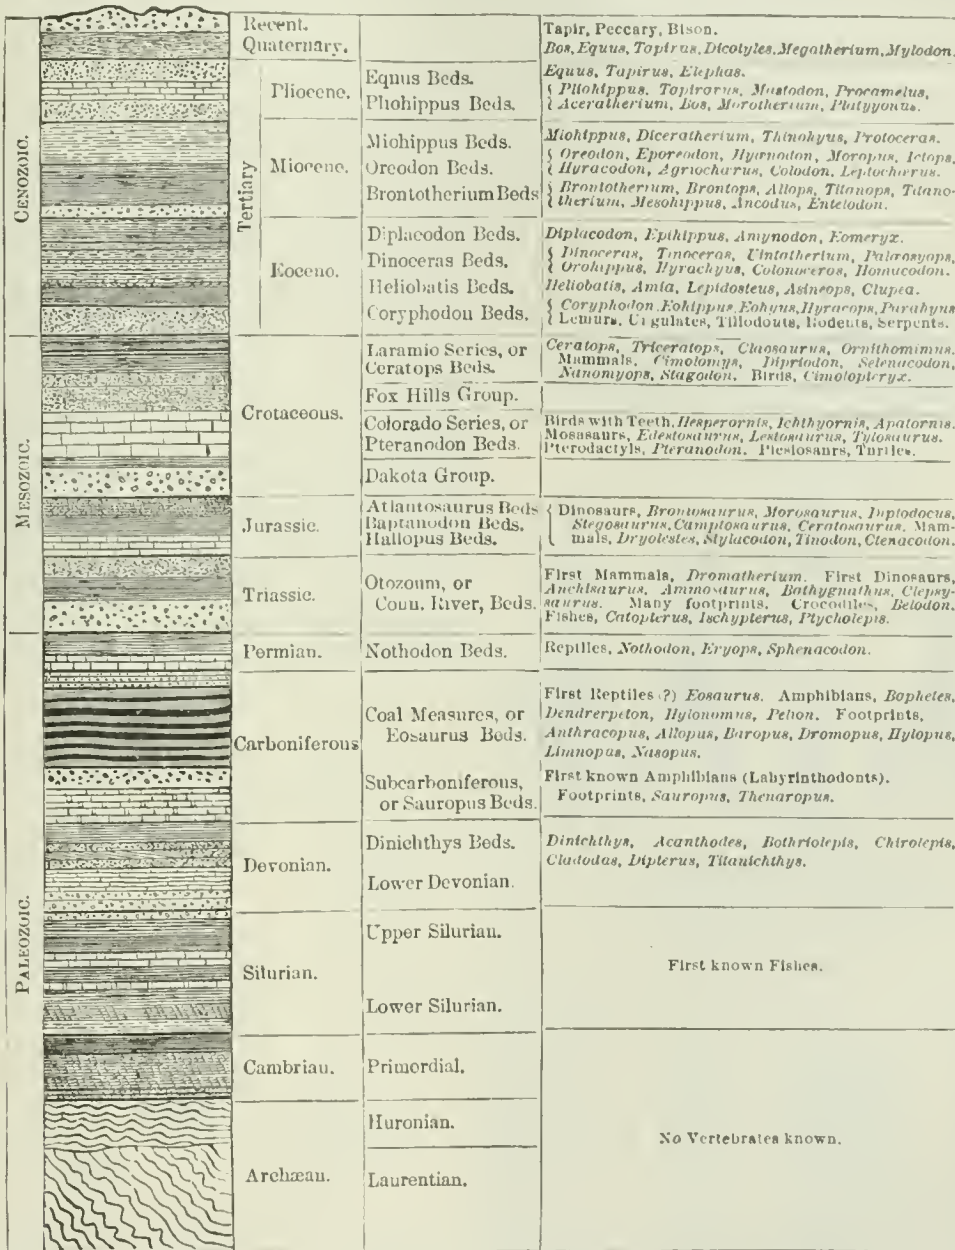

FIG. 1.—GEOLOGICAL HORIZONS OF VERTEBRATE FOSSILS IN NORTH AMERICA.

The diagram given above represents the principal geological horizons of vertebrate fossils in North America, as determined by the writer, and, if examined, will be found to be a synopsis of the subject. The first appearance, so far as known, of each important group of vertebrate animals may be approximately ascertained from the data given. Some of the succeeding genera of each group are also recorded, with the period in which they lived. The geological horizons of vertebrate life in other parts of the world have not been accurately determined, but some of the main divisions coincide in general with those here represented.

geological age of any vertebrate by the degree of modification it has undergone from the more primitive ancestral types. This is especially true of mammals, but can also be distinctly recognized in the other classes. Another fact that gives to vertebrate animals especial value in marking geological time is their high organization, which makes them more sensitive to climatic and other changes than invertebrates or plants, and thus their remains are better evidence in the determination of geological horizons. This general fact, now well established, has already proved of much service to both geologists and paleontologists.

Fishes.—No vertebrate life is known to have existed on the continent of North America in the Archæan or Cambrian periods, yet during this time half the thickness of American stratified rocks was deposited. It does not follow that vertebrate animals of some kind did not exist in those remote ages. Fishes are known from the Silurian of Europe and North America, and there is some probability that they will yet be discovered at a lower horizon. In the shore deposits of the early Devonian sea, characteristic remains of fishes were preserved, and in the deeper sea that followed, this class was well represented. During the remainder of the Devonian, fishes continue abundant, and, so far as now known, were the only type of vertebrate life. These fishes were mainly Ganoids, a group represented by the existing gar-pike and sturgeon, but in the Devonian sea chiefly by the Placoderms. With these were Elasmobranchs, or the shark tribe, and among them a few Chimæroids. The Placoderms were the monarchs of the ocean. All were well protected by a massive coat of armor, and some attained huge dimensions. The American Devonian fishes now known are not so numerous as those of Europe, but they were larger in size and mostly inhabitants of the open sea.

The more important genera of Placoderms are *Dinichthys*, *Aspidichthys*, and *Diplognathus*, the largest Palæozoic fishes. Others are *Acanthaspis*, *Acantholepis*, *Coccosteus*, and *Onychodus*. Among the Elasmobranchs were *Cladodus*, *Ctenacanthus*, *Rhynchodus*, and *Ptyctodus*, the last two being regarded as Chimæroids. The Dipterian family includes *Dipterus*, *Heliodus*, and possibly *Ceratodus*. Species of the European genera *Bothriolepis* and *Holoptychius* have likewise been found in America.

FIG. 2.—Tooth of *Otodus appendiculatus* (Agassiz).
FIG. 3.—Another tooth of same species.
FIG. 4.—Tooth of *Corax heterodon* (Reuss).
FIG. 5.—Tooth of *Oxyrhina mantelli* (Agassiz).
FIG. 6.—Tooth of *Lamna texana* (Roemer); front view.
FIG. 7.—The same tooth; side view.
(2, after Gibbs; 3-7, after Roemer.)

With the close of the Devonian came the almost total extinction of the great group of Placoderms, while the Elasmobranchs increase in numbers and size, and appear to be represented by sharks, rays, and Chimæras. Among the members of this group from the Carboniferous were numerous Cestracions, species of *Cochliodus* of large size, with others of the genera *Deltodus*, *Helodus*, *Psammodus*, and *Sandalodus*. Of the Petalodonts, there were *Antliodus*, *Chomatodus*, and *Petalodus*; and of the Hybodonts, the genera *Cladodus*, *Carcharopsis*, and *Diplodus*. These Elasmobranchs were the rulers of the Carboniferous open sea. The Ganoids, although still abundant, were of smaller size, and lived in the more shallow waters. The latter group of fishes was represented by true *Lepidostida* of the genera *Palæoniscus*, *Amblypterus*, *Platysomus*, and *Eurylepis*. Other genera are *Rhizodus*, *Megalichthys*, *Ctenodus*, *Edestus*, *Orodus*, and *Ctenacanthus*. Most of these genera occur also in Europe.

In the Mesozoic age the fishes of North America begin to show a decided approach to those at present existing. From the Triassic rocks, Ganoids only are known, and they are all more or less closely related to the modern gar-pike, or *Lepidosteus*. They are small, and the number of individuals preserved is large. The characteristic genera are *Catopterus*, *Ischypterus*, *Ptycholepis*, and *Turseoodus*. From the Jurassic deposits only a few remains of fishes are known, but in the Cretaceous ichthyic life assumed many and vari-

ous forms, and the first of the Teleosts, or bony fishes, the characteristic fishes of the present, make their appearance. In the deep open sea of this age Elasmobranchs were the prevailing forms, sharks and Chimæroids being most numerous. In the inland Cretaceous sea of North America true osseous fishes were abundant, and among them were some of carnivorous habits and immense size. The sheltered bays and rivers were shared by the Ganoids and Teleosts, as their remains testify. The more common genera of Cretaceous Elasmobranchs were *Corax*, *Otodus*, *Oxyrhina*, *Galeocerdo*, *Lamna*, and *Ptychodus*. Among the osseous fishes, *Beryx*, *Enchodus*, *Portheus*, and *Saurocephalus* were especially common, while the most important genus of Ganoids was *Lepidodus*. The Tertiary fishes are nearly all of modern types, and from the beginning of this period there was little change. In the marine beds, sharks, rays, and Chimæroids maintained their supremacy, although Teleosts were abundant, and many of them of large size. The Ganoids were few in number. In the earliest Eocene fresh-water deposits the modern gar-pike and *Amia*, the dogfish of the Western lakes, which by their structure seem to be remnants of an early type, are represented by species so closely allied to them that only an anatomist could separate the ancient from the modern. In the succeeding beds these fishes are abundant, and with them are Siluroids, related to the modern catfish (*Pimelodus*). Many small fishes, allied apparently to the modern herring (*Clupea*), left their remains in great numbers in the same deposits, and with them a landlocked ray (*Heliobatis*).

The almost total absence of remains of fishes from the Miocene lake-basins of the West is a remarkable fact. These basins were probably so impregnated with mineral matters as to render the existence of vertebrate life impossible. In the Pliocene lake-basins of the same region remains of fishes are common. These are all of modern types, and many of them are Cyprinoids, related to the modern carp. The Post-Pliocene fishes are essentially those of to-day.

Amphibians.—The Amphibians, the next higher class of vertebrates, are so closely related to the fishes in structure that some peculiar forms of the latter have been considered as belonging to this group. The earliest evidence of Amphibian existence on the continent of North America is in the Subcarboniferous, where footprints have been found

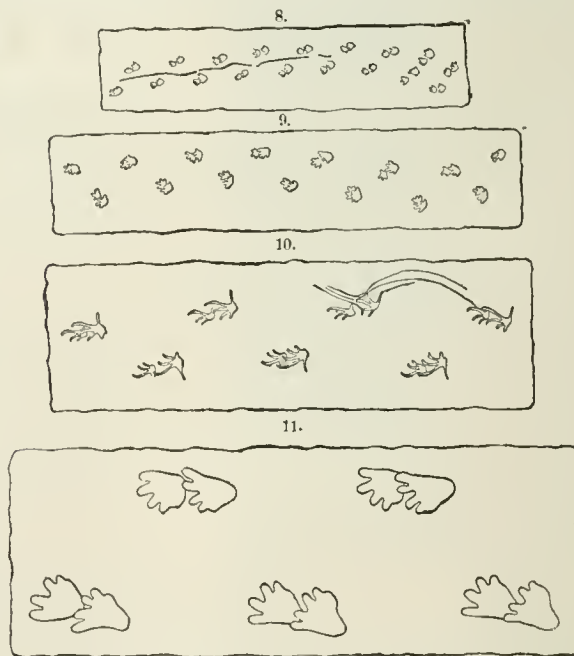

FIG. 8.—Footprints of *Nasopus caudatus* (Marsh).
FIG. 9.—The same of *Limnopus vagus* (Marsh).
FIG. 10.—The same of *Dromopus ogilis* (Marsh).
FIG. 11.—The same of *Baropus lentus* (Marsh).
(All one-eighteenth natural size.)

which were probably made by Labyrinthodonts, the most ancient representatives of the class. Remains are abundant in the Coal Measures, and show that the Labyrinthodonts differed in important particulars from all modern Amphib-

ians, the group which includes frogs and salamanders. Some of these ancient animals resembled a salamander in shape, while others were serpent-like in form. None yet discovered was without a tail. All were protected by pectoral bony plates and an armor of small scutes on the ventral surface of the body. The walls of their teeth were more or less folded, whence the name Labyrinthodont. The American Amphibians known from osseous remains are all of moderate size, but the footprints attributed to this group indicate animals larger than any of the class yet found in the Old World. The Carboniferous Amphibians were abundant in the tropical forests of that period, and their remains have been found imbedded in the coal, as well as in hollow stumps of trees. The principal genera from American Carboniferous rocks are *Bufo*, *Dendroperpeton*, *Hylonomus*, *Hylorpeton*, *Raniceps*, *Pelion*, *Leptophractus*, *Molgophis*, *Phyonius*, *Amphibamus*, *Cocytinus*. Among the interesting forms known only from footprints are *Baropus*, *Dromopus*, *Nasopus*, and *Limnopus*. Some other genera known from fragmentary remains or footprints in this formation have likewise been referred with doubt to the true reptiles. In the Triassic, some remains of *Amphibia* have been found, but, although apparently all Labyrinthodonts, the specimens preserved are not sufficient to add to a knowledge of the group. The Triassic footprints which have been attributed to Amphibians are still more unsatisfactory. From the Jurassic and Cretaceous beds of North America a few remains of Amphibians are known. Some have also been found in the Tertiary, all of modern types.

Reptiles.—Reptiles form the next great division of vertebrates, and their extinct forms are of much interest. There is no evidence of the existence of this group in American rocks older than the Carboniferous; there is doubt in regard to their appearance even in this period. Various footprints which strongly resemble those made by lizards, a few well-preserved remains similar to the corresponding bones in that group, and a few characteristic specimens nearly identical with those from another order of this class, are known from American Coal Measures. In the Permian rocks of North America and of Europe true reptiles have been found. The

In the same strata remains of Dinosaurs are found, and it is an interesting fact that these reptiles should make their appearance, even in a generalized form, at this stage of the earth's history. The Dinosaurs, true reptiles in all their more important characters, show certain points of resemblance to existing birds. During Triassic time, the Dinosaurs attained in America a great development, both in variety of forms and in size. Although few of their bones have been discovered in rocks, they have left unmistakable evidence of their presence in the footprints and other impressions upon the shores of the waters that they frequented. The Triassic sandstone of the Connecticut valley is famous for its fossil footprints, especially the so-called "bird-tracks," which were supposed to have been made by birds. A careful investigation proves that there is no evidence that any of these impressions were made by birds. Most of these three-toed tracks were certainly not made by birds, but by reptiles which usually walked upon their hind feet alone, and only occasionally put to the ground their smaller anterior extremities. These double impressions are precisely the kind which Dinosaurian reptiles would make.

FIG. 15.—Skull of *Ceratosaurus nasirocorus* (Marsh, one twelfth natural size).

The principal genera of Triassic Dinosaurs known from osseous remains in North America are *Anchisaurus* and *Amnosaurus*, from the Connecticut valley; *Bathygnathus*, from Prince Edward island; and *Clepsysaurus*, from Pennsylvania. A restoration of *Anchisaurus* is shown in the accompanying plate, Fig. 1. In the Jurassic the Dinosaurs attained in North America a remarkable development, and appear to have reached their culmination. The *Theropoda*, or carnivorous forms, which were abundant but of moderate size in the Triassic, were represented in the Jurassic by many species, some minute and others of gigantic size. *Allosaurus*, *Ceratosaurus*, and *Hallopus* are among the genera of special interest, and *Compsognathus* and *Megalosaurus* in Europe. The restored skeleton of *Ceratosaurus* is given on the same plate, Fig. 6. The herbivorous Dinosaurs of this period, however, were the most remarkable of all, some surpassing in bulk any known land animals. Others of huge dimensions were clad in coats of mail, while others, diminutive in size and light and graceful of form, were so much like birds that only an anatomist could tell one from the other. The *Sauropoda* were the largest of all land animals, some reaching a length of from 60 to 80 feet. All the

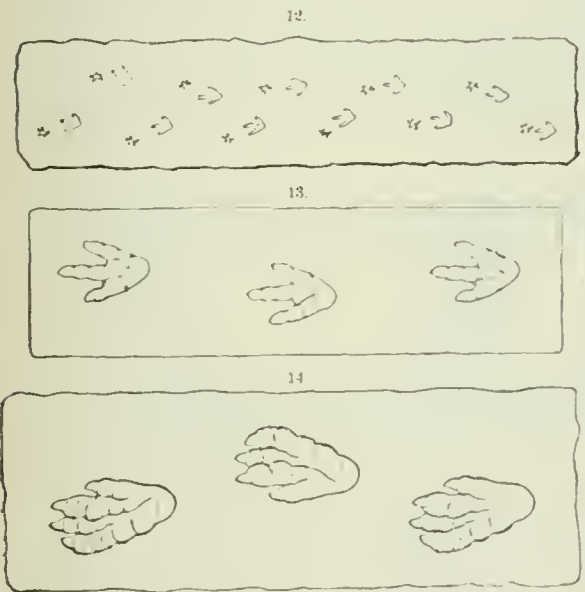

FIG. 12.—Footprints of small Dinosaur; showing impressions of fore and hind feet (one-twelfth natural size).
 FIG. 13.—Footprints of large bipedal Dinosaur (*Brontozoum*, one-twenty-eighth natural size).
 FIG. 14.—Footprints of large Dinosaur (*Otozoum*); showing impressions of hind feet alone (one-twenty-eighth natural size).

Mesozoic period has been called the Age of Reptiles, and during its continuance some of the strangest forms of reptilian life made their appearance and became extinct. Near its beginning, while the Triassic shales and sandstones were being deposited, true reptiles were abundant. Among the remains discovered are those of the genus *Belodon*, which is well known also in the Trias of Europe. It belongs to the division of reptiles which have teeth in distinct sockets, and its nearest affinities are with the *Crocodylia*, of which order it may be considered the oldest known representative.

FIG. 16.—Tooth of *Brontosaurus excelsus* (Marsh, natural size: a, outer view; b, end view).
 FIG. 17.—Tooth of *Diplodocus longus* (Marsh, one-half natural size).
 FIG. 18.—Tooth of *Comptosaurus medius* (Marsh, natural size).

known members of this group were quadrupedal, with the fore and hind limbs nearly equal in length. The head was very small and the neck long, with the vertebrae opisthocœlian and lightened by inner cavities, thus allowing free motion. The limb-bones were large and solid, and the feet

plantigrade, with five toes on each. The tail was especially long and massive. The general form and proportions are indicated in the accompanying plate, Fig. 2, which represents a skeleton of a species of *Brontosaurus*, a typical genus of the *Sauropoda*. Other American genera of this group are *Atlantosaurus*, *Apalosaurus*, *Diplodocus*, *Morosaurus*, and *Pleurocelus*. Allied genera from Europe are *Cardiodon*, *Cetiosaurus*, *Ornithopsis*, and *Pelorosaurus*. One of the most remarkable of the herbivorous Dinosaurs that lived in Jurassic time was *Slegosaurus*, huge in size, with fore and hind limbs nearly equal in length, and all the bones of the skeleton solid. The animal was protected by a coat of armor, and the tail, armed with a series of enormous spines, was a powerful weapon of offense. A restoration of one species of this remarkable genus is shown in the same plate, Fig. 5. *Hyllosaurus*, *Omosaurus*, and *Scelidosaurus* are allied forms in Europe. Among the smaller bird-like Dinosaurs of this period were those belonging to the genera *Camplosaurus*, *Laosaurus*, and *Nanosaurus*, the last being about as large as a domestic fowl. Restorations of *Camplosaurus* and *Laosaurus* are represented in the plate, Figs. 3 and 4. *Iguanodon* and *Hypsilophodon* are corresponding genera in Europe. The Cretaceous Dinosaurs were nearly all of large size, and most of them walked on the hind feet alone, like modern struthious birds. Three well-marked types may be distinguished among the remains discovered in deposits of this age. The herbivorous forms are represented mainly by *Claosaurus*, a near ally of the *Iguanodon* of Europe; and by *Triceratops*, a gigantic horned reptile quite unlike any other animal known. Restorations of both are given in the accompanying plate, Figs. 7 and 8. Their carnivorous enemies were *Dryptosaurus* and *Ornithomimus*. No Dinosaurs are known from any strata later than the Cretaceous.

FIG. 19.—Skull of *Claosaurus annectens* (Marsh, one-fifteenth natural size).

A feature of the American Mesozoic fauna, as contrasted with that of Europe, is the almost entire absence of species of *Ichthyosaurus* and *Plesiosaurus*, which abound in many other regions, but in North America seem to be replaced by the Mosasaurs. A few remains have indeed been referred to these genera, but the determination may be questioned. The genus *Baptanodon*, from the American Jurassic, is essentially an Ichthyosaurian without teeth. The order *Plesiosauria* is well represented, but mainly by forms more nearly related to *Pliosaurus* than to the type of the group.

FIG. 20.—Tooth of *Triceratops serratus* (Marsh, natural size), showing two roots.

FIG. 21.—Series of teeth of *Claosaurus annectens* (Marsh, one-half natural size).

FIG. 22.—Tooth of *Stegosaurus unguilatus* (Marsh, twice natural size): a, outer view; b, end view.

These were marine reptiles, all of large size, while some of them attained vast dimensions. So far as at present identified, they may be referred to the genera *Cimoliosaurus*, *Dis-*

cosaurus, and *Pantosaurus*. The number of species is comparatively small, and none is known above the Cretaceous.

In the Jurassic strata of the Rocky Mountain region, remains of *Chelonia*, or turtles, make their first appearance. Some of the earliest forms are allied to the modern genus *Trionyx*, and the best-known genus is *Glyptops*. In the higher Cretaceous beds, some Chelonians of enormous size have been found. They belong to the genus *Allantocheleys*, which has the ribs separate as in the existing *Sphargis*. A few genera appear to be related to the modern genus *Chelone*. The remaining Cretaceous species were mostly of the Emydoid type, and others were related to *Chelydra*. The more important genera of Cretaceous Chelonians known from characteristic specimens are *Allantocheleys* (*Proto-stega*), *Adocus*, *Bothremys*, *Compsemys*, *Plastomenus*, *Osteopygus*, *Propleura*, *Lytoloma*, and *Taphrosphys*. Most of these genera were represented by several species, and the individuals were numerous. No land-tortoises have as yet been found in this formation. In American Tertiary deposits, Chelonians are abundant, especially in the fresh-water beds. They all show near affinities with modern types, and most of them can be referred to existing genera. In the Tertiary lake-basins of the West, land-tortoises are very numerous, and with them are many fresh-water forms of *Trionyx* and allied genera.

FIG. 23.—Left hind paddle of *Baptanodon discus* (Marsh, one-eighth natural size).

The reptiles most characteristic of American Cretaceous strata are the *Mosasauria*, a group with few representatives in other parts of the world. In the Cretaceous seas they ruled supreme, as their numbers, size, and carnivorous habits enabled them to easily vanquish all rivals. Some were

FIG. 24.—Tooth of *Mosasaurus princeps* (Marsh, one-half natural size).

FIG. 25.—Right paddle of *Lestiosaurus sinus* (Marsh, one-twelfth natural size).

at least 60 feet in length, and the smallest 10 or 12. The Mosasaurs were essentially swimming lizards, with four well-developed paddles, and they had little affinity with modern serpents, to which they have been compared. The species are quite numerous, but they belong to comparatively few genera, of which *Mosasaurus*, *Tylosaurus*, *Lestiosaurus*, and *Edestosaurus* have alone been identified with certainty. The genus *Mosasaurus* was first found in Europe. All the known species of the group are Cretaceous.

The *Crocodylia* are abundant in rocks of Mesozoic age in America, and two distinct types are represented. The older type, which is foreshadowed by *Belodon* of the Trias, has biconcave vertebrae, and shows marked affinities with the genus *Teleosaurus*, from the Jura of Europe. The best-known genus is *Hyposaurus*, more or less resembling in form the modern gavial of the Ganges. The second type, which now makes its appearance for the first time, has procoelian vertebrae, and in other respects resembles existing crocodiles. The genera described are *Bollosaurus*, *Holops*, and *Thoracosaurus*, none of which, so far as known, passed above the Cretaceous. In the Eocene fresh-water beds of the West, Crocodylians are especially abundant, and all belong apparently to the genus *Crocodylus*, although some species show points of resemblance to existing alligators. The Miocene lake-basins of the same region contain no remains of crocodiles, so far as known, and the Pliocene deposits have afforded only a single species. The Tertiary marine beds of the Atlantic coast contain few Crocodylian remains, and all are of modern types, the genus *Gavialis* having one Eocene species, and the alligator being represented only in the later deposits.

True *Lacertilia*, or lizards, and a few serpents have been detected in American Cretaceous strata. In the Eocene lake-basins of Western North America, remains of lizards are numerous, and indicate species much larger than any now existing. Some of these, the *Glyptosauridae*, were protected by a highly ornamented bony coat of mail, and others were covered with scales, like recent lizards. A few resembled, in their more important characters, the modern iguana. The genera best represented in the Eocene are *Glyptosaurus*, *Iguanavus*, *Oreosaurus*, *Thinosaurus*, *Tinosaurus*, and *Saniva*. Some of these genera appear to have continued into the Miocene, but here, as well as in the Pliocene, few remains of this group have been found.

doubtless inhabitants of the sea. In the fresh-water Western Eocene, remains of snakes are abundant, but all are of moderate size. The largest of these were related to the modern boa-constrictors. The genera described are *Boavus*, *Lithophis*, and *Linnophis*. The Miocene and Pliocene snakes from the same region are known only from a few remains. The *Pterosauria*, or flying-lizards, are among the reptiles of Mesozoic time, and make their first appearance in the Jurassic. Many of them left their remains in the soft sediments of the inland Cretaceous sea. These were veritable dragons, having a spread of wings of from 10 to 25 feet. They differed from the smaller Pterodactyles found in the Old World, in the entire absence of teeth, showing in this respect a resemblance to modern birds; and they possessed other distinctive characters. They have therefore been placed by the writer in a new order, *Pteranodontia*, from the typical genus *Pteranodon*, of which five species are known. The only other genus is *Nyctosaurus*, represented by a single species. One of the European forms is shown in the plate, Fig. 9.

Birds.—The first known appearance of birds in America was during the Jurassic period, although announcements have been made of their existence in preceding epochs. *Laopteryx* is the oldest genus in North America, and *Archaeopteryx* in Europe. The earliest American forms from the Cretaceous are the *Odontornithes*, or birds with teeth, which have been exhumed from the chalk of Kansas, and fully described by the writer. The two genera *Hesperornis* and *Ichthyornis* are types of distinct orders, and differ from each other and from *Archaeopteryx* much more than do any existing birds among themselves.

Hesperornis was a large aquatic bird, nearly 6 feet in length, with a strange combination of characters. The jaws were provided with teeth, set in grooves; the wings were rudimentary and useless; while the legs were very similar to

FIG. 26.—Skull and lower jaw of *Pteranodon longiceps* (Marsh, one-eighth natural size).
 FIG. 27.—Lower jaw of *Hesperornis regalis* (Marsh, one-half natural size).
 FIG. 28.—Lower jaw of *Ichthyornis victor* (Marsh, twice natural size).

The first American serpents, so far as now known, appear in the Laramie, where the genus *Coniophis* has recently been discovered. In the Eocene of the Atlantic border the

FIG. 29.—Vertebra of *Coniophis precedens* (Marsh, three times natural size): a, front view; b, side view; c, bottom view; d, back view.

genus *Titanophis* (*Dinophis*) is represented by several species of large size, one at least 30 feet in length, and all

those of modern diving birds. *Ichthyornis*, a small flying bird, was stranger still, as the teeth were in sockets, and the vertebrae biconcave, as in fishes and a few reptiles. *Apatornis* and other allied forms occur in the same beds, and probably all were provided with teeth. It is strange that the companions of these ancient toothed birds should have been Pterodactyles without teeth. In the later Cretaceous beds of the Atlantic coast, remains of aquatic birds have been found, but all are apparently distinct from those of the West. The known genera of American Cretaceous birds are *Apatornis*, *Baptornis*, *Cimolopteryx*, *Coniornis*, *Circulavus*, *Hesperornis*, *Ichthyornis*, *Laornis*, *Lestornis*, *Peleobringa*, and *Telmatornis*. These are represented by some twenty species. In Europe, several species of Cretaceous birds are known, based upon fragmentary specimens. Restorations of the skeletons of *Hesperornis* and *Ichthyornis* are given in the plate, Figs. 10 and 11.

During the Tertiary period birds were numerous in North America, and all discovered belong to modern types. The Eocene species described are mostly wading birds, but here, and in the later Tertiary deposits, some characteristic American forms make their appearance, strongly foreshadowing the present avian fauna. The extinct genera are the Eocene *Uintornis*, related to the woodpeckers, and *Aletornis*, which includes several species of waders. Among the existing genera found in Tertiary beds are *Aquila*, *Bubo*, *Meleagris*, *Grus*, *Graculus*, *Puffinus*, and *Catarractes*. The great auk (*Alca impennis*), once very abundant on the northeast coast, has become extinct.

Mammals.—The extinct mammals of North America are numerous, and present many and varied types. The oldest are from the Triassic, and the best representative now known belongs to the genus *Dromatherium*. In Europe and in South Africa a few remains have been found. In the Jurassic, mammalian life was probably abundant, as the number of specimens found in the West is quite large. All these fossils belonged to small animals of a low, primitive type, related to the existing Monotremes and Marsupials.

FIG. 30.—Right lower jaw of *Dromatherium sylvestre* (Emmons, twice natural size). (After Marsh.)

The principal genera from the Jurassic of the U. S. are *Allodon*, *Asthenodon*, *Ctenacodon*, *Diplocynodon*, *Dryolestes*, *Menacodon*, *Laodon*, *Priacodon*, *Stylacodon*, and *Tinodon*. Allied genera from Europe are *Amphilestes*, *Bolodon*, *Paramus*, *Phascolotherium*, *Plagiular*, *Stylodon*, and *Stereognathus*.

FIG. 31.—Right lower jaw of *Tinodon bellus* (Marsh, three times natural size).

FIG. 32.—Left lower jaw of *Stylacodon gracilis* (Marsh, three times natural size).

FIG. 33.—Left lower jaw of *Laodon venustus* (Marsh, four times natural size).

FIG. 34.—Right lower jaw of *Ctenacodon serratus* (Marsh, four times natural size).

The Cretaceous mammals now known from North America are small and low in type, but show some advance over those from the lower formations. The principal genera are as follows: *Allacodon*, *Camptomus*, *Cimolestes*, *Cimolomys*, *Batodon*, *Didelphops*, *Dipriodon*, *Halodon*, *Oracodon*, *Nanomyops*, *Selenacodon*, *Stagodon*, *Telacodon*, and *Triprio-*

don. From the Cretaceous of Europe only a few fragments of mammals are known.

FIG. 35.—Upper jaw of *Allacodon pumilus* (Marsh, three times natural size): a, seen from below; b, end view; c, side view.

FIG. 36.—Lower jaw of *Cimolodon agilis* (Marsh)—a, natural size; b, c, d, three times natural size.

FIG. 37.—Fourth lower premolar of *Halodon sculptus* (Marsh, twice natural size).

In the lowest Tertiary beds of North America a rich mammalian fauna makes its appearance, and, from that time through the age of mammals to the present, America has been constantly occupied by this type of life in the greatest diversity of form. A nearly continuous record of this life is now accessible, and insures great additions to a knowledge of the genealogy of mammals, and perhaps the solution of more profound problems. One family, the *Coryphodontidae*, well represented at this horizon both in America and Europe, possesses some characters which point to a

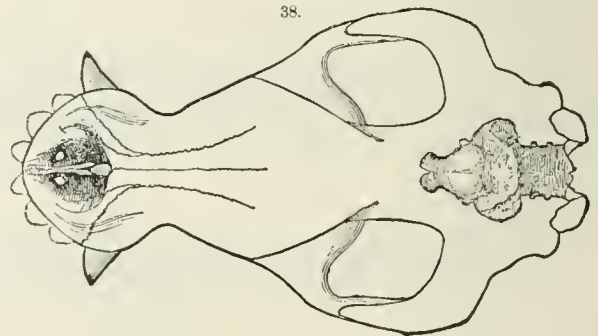

FIG. 38.—Skull, with brain-cast, of *Coryphodon hamatus* (Marsh, one-sixth natural size).

primitive Ungulate type from which the present orders have been evolved. Among these characters are the diminutive brain, which in size and form approaches that of the reptiles, and also the five-toed feet, from which all the forms of the mammalian foot have been derived. Of this family, only a single genus, *Coryphodon*, is known, but there are several species. They were the largest mammals of the lower Eocene. In the middle Eocene, W. of the Rocky Mountains, a remarkable group of Ungulates makes its appearance. These animals nearly equaled the elephant in size, but had shorter limbs. The skull was armed with two or three pairs of horn-cores, and with enormous canine tusks. The brain was proportionally smaller than in any other land mammal. The feet had five toes, and in their general structure were like those of *Coryphodon*, thus indicating an affinity with that genus. These mammals resemble in some respects the Perissodactyles, and in others the Proboscidiens, yet differ so widely from any known Ungulates, recent or fossil, that they must be regarded as a distinct order, the *Dinocerata*. Only three genera are known, *Dinoceras*, *Tinoceras*, and *Uintatherium*, but a number of species have been described. During the later part of the middle Eocene these animals were abundant, and then became extinct, leaving apparently no successor, unless the Proboscidiens are their much-modified descendants. Restorations of *Coryphodon* and *Tinoceras* are shown in the accompanying plate, Figs. 12 and 13.

The oldest representative of the horse at present known is the diminutive *Eohippus*, from the lower Eocene. Sev-

FIG. 39.—Skull of *Dinoceras mirabile* (Marsh, one-tenth natural size).

eral species have been found, all about the size of a rabbit. Like most of the early mammals, these Ungulates had forty-four teeth, the molars with short crowns, and quite distinct in form from the premolars. The ulna and the fibula were entire and separate, and there were four well-developed toes and a rudiment of another on the fore feet, and three toes behind. In the structure of the feet, and in the teeth, the *Eohippus* indicates unmistakably that the direct ancestral line to the modern horse has already separated from the other Perissodactyls. In the next higher division of the Eocene, another genus, *Orohippus*, about as large as a fox, makes its appearance, replacing *Eohippus*, and showing a greater resemblance to the equine type. The rudimentary

only the middle one, corresponding to the single toe of the horse, comes to the ground. This genus resembles most nearly the *Hipparion* of Europe. In the Pliocene is the last stage of the series before reaching the horse—the genus *Pliohippus*, which has lost the small hooflets, and in other respects is very equine. Only in the upper Pliocene does the true *Equus* appear, and complete the genealogy of the horse, which in the Post-Tertiary roamed over the whole of North and South America, and soon after became extinct. Besides the horse and his congeners, the only existing Perissodactyls are the rhinoceros and tapir. The latter is the older type, but the rhinoceros had near allies throughout the Tertiary.

FIG. 41.—Skull of *Brontotherium ingens* (Marsh, one-twelfth natural size).

FIG. 45.—The same skull; top view.

At the bottom of the Eocene, in the Western lake-basins of the U. S., the tapiroid genus *Helalobes* is found, represented by numerous small mammals hardly larger than the diminutive horses of that day. In the following epoch of the Eocene the closely allied *Hyrachyus* was one of the abundant animals. This genus was nearly related to the *Lophiodon* of Europe, and in its teeth and skeleton strongly resembled the living tapir, whose ancestry, to this point, seems to coincide with that of the rhinoceros. Strangely enough, the rhinoceros line, before it becomes distinct, separates into two branches. In the upper part of the Dino-

FIG. 46.—Skull of *Eporodon major* (Leidy, one-fourth natural size). (After Marsh.)

ceras beds occurs the genus *Colonoceras*, which is really a *Hyrachyus* with a transverse pair of very rudimentary horn-cores on the nasal bones. In the lower Miocene W. of the Rocky Mountains, this line seems to pass on through the genus *Diceratherium*, and in the higher Miocene this genus is well represented. Some of the species nearly equaled in size the existing rhinoceros, which *Diceratherium* strongly resembled. The main difference between them is a most interesting one. The rudimentary horn-cores on the nasals, seen in *Colonoceras*, are in *Diceratherium* developed into strong bony supports for horns, which were placed transversely, as in the ruminants, and not on the median line, as in all existing forms of rhinoceros.

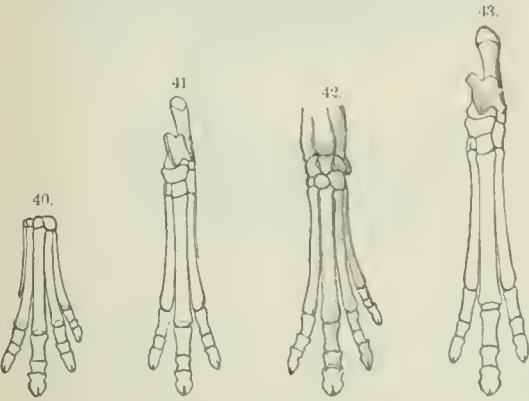

FIG. 40.—Left fore foot of *Eohippus pennix* (Marsh).
 FIG. 41.—Left hind foot of same.
 FIG. 42.—Left fore foot of *Orohippus agilis* (Marsh).
 FIG. 43.—Left hind foot of same.
 (All two-thirds natural size).

first digit of the fore foot has disappeared, and the last premolar has gone over to the molar series. *Orohippus* was little larger than *Eohippus*, and in most respects very similar. Several species have been found in the same horizon with *Dinoceras*. In the upper Eocene, with *Diplacodon*, another equine genus, *Ephippus*, has been found, nearly related to *Orohippus*, but more specialized.

Near the base of the Miocene, in the Brontotherium beds, is a third genus, *Mesohippus*, about as large as a sheep, and one stage nearer the horse. There are only three toes and a rudimentary splint bone in the fore feet, and three toes behind. Two of the premolar teeth are quite like the molars. The ulna is no longer distinct, or the fibula entire, and other characters show clearly that the transition is advancing. In the upper Miocene a fourth form, *Miohippus*, continues the line. This genus is near the *Anchitherium* of Europe, but presents several differences. The three toes in each foot are more nearly of a size, and a rudiment of the fifth metacarpal bone is retained. All the species of this genus are larger than those of *Mesohippus*, and none passed above the Miocene. The genus *Protohippus*, of the lower Pliocene, is yet more equine, and some of its species equaled the ass in size. There are still three toes on each foot, but

Among the large mammals in the lower Eocene is *Limnohyus*, a true Perissodactyle. In the next higher beds this genus is well represented, and with it is found a nearly allied form, *Palaeosyops*. In the upper Eocene both have left the field, and the genus *Diplacodon*, a very near relative, holds the supremacy. The line seems clear through these three genera, but on crossing the break into the Miocene, there are apparently, as next of kin, the huge *Brontotherida*. These strange beasts show in their dentition and other characters the same transition steps beyond the *Diplacodon* which that genus had made beyond *Palaeosyops*. The *Brontotherida* were nearly as large as the elephant, but had shorter limbs. The skull was elongated, and had a transverse pair of large horn-cores on the maxillaries, in front of the orbits, like the middle pair in *Dinoceras*. There were four toes in front and three behind, and the feet were similar to those of the rhinoceros. There are several genera in this group, *Brontotherium*, *Brontops*, *Allops*, *Titanotherium*, and *Megacerops*, which have been found only in the lowest Miocene, E. of the Rocky Mountains. A restoration of *Brontops* is given in the plate, Fig. 14. In the other branch of the rhinoceros group, which left their remains mainly E. of the Rocky Mountains, all the known forms are hornless. The upper Eocene genus, *Amygodon*, is the oldest known rhinoceros, and by far the most generalized of the family. The premolars are all unlike the molars; the four canines are of large size, but the inner incisor in each jaw is lost in the fully adult animal. The nasals were without horns. There were four toes in front and three behind. The genus *Hyracodon*, of the Miocene, which is essentially a rhinoceros, has a full set of incisor and canine teeth. In the higher Miocene beds occurs a larger rhinoceros, which has been referred to the genus *Aceratherium*. This form has lost the canine and one incisor above, and two incisors below. In the Pliocene are several species closely related, and of large size. Above the Pliocene in America no vestiges of the rhinoceros have been found.

FIG. 47.—Skull of *Entelodon crassus* (Marsh, one-eighth natural size).

The Artiodactyles, or even-toed Ungulates, are the most abundant of the larger mammals now living; and the group dates back at least to the lowest Eocene. Of the two well-marked divisions of this order, the Bunodonts and the Selenodonts, the former is the older type. In the Coryphodon beds of New Mexico occurs the oldest Artiodactyle yet found, but it is known only from fragmentary specimens. These remains are Suilline in character, and belong to the genus *Eohyus*. In the beds above, the genus *Helohyus* is not uncommon, and several species are known. *Homacodon* is an allied genus from the middle Eocene. In the upper Eocene the true Selenodonts appear in the genera *Eomeryx*, *Hymeryx*, *Oromeryx*, and *Parameryx*. In the Miocene, *Oreodon*, *Eporeodon*, *Entelodon*, and *Thinohyus* are important genera. The skeleton of one species of *Entelodon* is shown on the accompanying plate, Fig. 15.

The Proboscidians make their appearance in North America in the lower Pliocene, where several species of *Mastodon* have been found. A restoration of one species of this genus is shown on the same plate, Fig. 16. (See also the article *MASTODON*.) This genus occurs also in the upper Pliocene and in the Post-Tertiary; although some of the remains attributed to the latter are undoubtedly older. The Pliocene species have a band of enamel on the tusks, and other peculiarities observed in the oldest mastodons of Europe, which are from essentially the same horizon. Two species of this genus have been found in South America, in connec-

tion with the remains of extinct llamas and horses. The genus *Elephas* is a later form, and has not yet been identified in North America below the upper Pliocene, where one gigantic species was abundant. In the Post-Pliocene remains of this genus are numerous. The hairy mammoth of the Old World (*Elephas primigenius*) was once abundant in Alaska.

Perhaps the most remarkable mammals as yet found in America are the *Tillodontia*, which are comparatively abundant in the lower and middle Eocene. These animals seem to combine the characters of several different groups, viz., the Carnivores, Ungulates, and Rodents. In the genus *Tillotherium*, the type of the order and of the family *Tillotherida*, the skull resembles that of the bears; the molar teeth are of the ungulate type, while the large incisors are similar to those of Rodents. The skeleton resembles that of the Carnivores, but the scaphoid and lunar bones are distinct, and there is a third trochanter on the femur. The feet are plantigrade, and each had five digits, all with long, pointed claws. In the allied genus *Stylinodon*, which belongs to a distinct family, the *Stylinodontidae*, all the teeth were rootless. Some of these animals were as large as a tapir. The genus *Dryphodon* has been found only in the Coryphodon beds of New Mexico, while *Tillotherium* and *Stylinodon* occur in the middle Eocene of Wyoming. The order *Toxodontia* includes two genera, *Toxodon* and *Nesodon*, which have been found in the Post-Tertiary deposits of South America. These animals were huge, and possessed such mixed characters that their affinities are a matter of considerable doubt. They are believed to be related to the Ungulates, Rodents, and Edentates.

FIG. 48.—Skull of *Tillotherium fodiens* (Marsh, one-sixth natural size).

In the lower Eocene of New Mexico are representatives of the earliest known Primates, and among them are the genera *Lemuravus* and *Limnotherium*, each the type of a distinct family. These genera became abundant in the middle Eocene of the West, and with them are found others—all included in the two families *Lemuravidae* and *Limnotheriidae*. *Lemuravus* appears to have been nearly allied to the lemurs, and is the most generalized form of the Primates yet discovered. It had forty-four teeth, forming a continuous series above and below. The brain was nearly smooth, and of moderate size. The skeleton most resembles that of the lemurs. An allied genus, belonging to the same family, is *Hyposodus*. *Limnotherium* also is nearly related to the lemurs, but shows some affinities with the South American marmosets. This genus had forty teeth. The brain was nearly smooth, and the cerebellum large, and placed mainly behind the cerebrum. The orbits are open behind, and the lachrymal foramen is outside the orbit. Other genera belonging to the *Limnotheriidae* are *Notharctos*, *Hipposyops*, *Microsyops*, *Palaeocodon*, *Thinolestes*, and *Telmatolestes*. Besides these, *Antiacodon*, *Bathrodon*, and *Mesacodon* should be placed in the same group. All the Eocene Primates known from American strata are low generalized forms, with characters in the teeth, skeleton, and feet that suggest relationships with the Carnivores, and even with the Ungulates. In the Post-Pliocene deposits of the Brazilian caves, remains of monkeys are numerous, and belong to extinct species of *Callithrix*, *Cebus*, and *Jacchus*, all living South American genera. Only one extinct genus, *Protopithecus*, which embraced animals of large size, has been found in this peculiar fauna. It is a noteworthy fact that no traces of any Anthropoid apes, or of any Old World monkeys, have yet been found in America. O. C. MARSH.

Vertigo [Mod. Lat., from Lat. *verti go*, whirling, dizziness, giddiness, deriv. of *ver tere*, turn, whirl]: a subjective or apparent impairment of the equilibrium of the body. It assumes two principal forms: in one it appears to the subject as if the objects in his vicinity were whirling about him; in the other, he fancies that he is forced to fall in some definite direction, forward, backward, or to either side. Vertigo is rarely if ever continuous, but occurs in paroxysms provoked by some appreciable cause, as changing posture, eating, using the eyes, etc. The subjects of vertigo often stagger or fall in consequence of the sensation of motion. Vertigo is sometimes the expression of disease of the brain, or of interference with the circulation of blood in that organ, but more usually it is a sympathetic disorder, caused by indigestion, anemia, sudden impairment of parallelism between the two eyes, disease of the internal organs of hearing, etc. Vertigo may be artificially produced by the administration of stimulants (alcohol) and by the application of galvanism to the head in a transverse direction or to the superior ganglion of the cervical sympathetic nerve. A variety of subjective unsteadiness, without definite direction to the apparent movement, is better designated as dizziness. Vertigo is not a disease, but a condition common to a number of diseases. Revised by WILLIAM PEPPER.

Vertot d'Auboeuf, vār'tō dō bōf, RENÉ AUBERT, de: historian; b. at the château of Benetot, department of Eure, France, Nov. 25, 1655; became first a Capuchin, then a Premonstratensian monk, and was appointed secretary to the general of the latter order, but resigned this position afterward and became a secular priest in the neighborhood of Rouen; published in 1689 *Histoire des Révolutions de Portugal*, which attracted much attention, and in 1696 *Histoire des Révolutions de Suède* (2 vols.), which also proved a success; was elected a member of the Academy of Inscriptions in 1701; removed to Paris; published in 1719 *Histoire des Révolutions dans le Gouvernement de la République romaine* (3 vols.); became historiographer of the Knights of St. John, and received access to their archives; published in 1726 *Histoire des Chevaliers de St. Jean de Jérusalem* (4 vols.). D. in Paris, June 15, 1735. His first work is distinguished by a fluent and elegant style, the last rests on actual study of sources, but none of his works combines these qualities. P. M. COLBY.

Vertue, GEORGE: engraver and antiquary; b. in Westminster, England, in 1684; enjoyed the favor of Sir Godfrey Kneller and the patronage of Lord Somers and other wealthy nobles; was an original member of the Academy of Painting 1711; became engraver to the Society of Antiquaries 1717; made many journeys through England during forty years, taking drawings of churches, monuments, and ruins as materials for an intended history of the fine arts in England, for which he accumulated 13 folio vols. of MSS.; was a strict Roman Catholic and a man of singular piety, modesty, and artistic conscientiousness. D. in London, July 24, 1756, and was buried in Westminster Abbey. Among his best-known works are sets of twelve *Portraits of Poets* (1730), ten *Portraits of Charles I. and his Friends*, and the series of *Kings of England in Rapin's History*. His extensive materials fell into the hands of Horace Walpole, and a portion of them were published by him as *Anecdotes of Painting in England*, etc. (Strawberry Hill, 5 vols. 4to, 1762-71), to which was appended his *Catalogue of Engravers who have been Born or Resided in England*. The latter work was separately published, with an *Account of Vertue's life and works* (Strawberry Hill, 1763), by Walpole. Revised by RUSSELL STURGIS.

Vertumnus, or **Vortumnus** [Lat., deriv. of *ver tere*, turn, change]: in Roman mythology, the god of the seasons, and, as the husband of Pomona, more especially the god of fruit. He was of genuine Italian origin. A feast, *Vertumnalia*, was celebrated in his honor on Aug. 23. By artists he was generally represented as resembling Saturn.

Verulam, BARON: See BACON, FRANCIS.

Verus, LUCIUS: See ANTONINUS, MARCUS AURELIUS.

Vervain: See VERBENA FAMILY.

Verviers, vār'vi-ā': town; province of Liège, Belgium; on the Vesdre; 15 miles by rail E. S. E. of Liège (see map of Holland and Belgium, ref. 11-H). It is the center of a cloth-manufacturing industry which employs most of the people in the city and adjacent district; there are also some machine-shops. The town has a public library and a picture-gallery. Pop. (1891) 48,907.

Very, JONES: poet; b. at Salem, Mass., Aug. 28, 1813; made several voyages to Europe with his father, who was a sea-captain; graduated at Harvard 1836; was Greek tutor there 1836-38; published a volume of *Essays and Poems* (1839); was licensed as a preacher by the Cambridge (Unitarian) association 1843, but never held a pastoral charge, and lived a retired life at Salem, occasionally contributing to the Salem *Gazette* and to the religious organs of his denomination. D. at Salem, May 8, 1880. Posthumous editions of his *Poems* were published in 1883 and 1886, with memoirs of the author. His religious sonnets are marked by great spiritual refinement and depth of feeling.

Revised by H. A. BEERS.

Vesalius, ANDREAS: anatomist; b. in Brussels, Belgium, Dec. 31, 1514; studied medicine at Louvain, Cologne, Montpellier, and Paris; lectured on anatomy at Basel, Pavia, Bologna, and Pisa; was surgeon to the imperial army in Netherlands; was appointed physician to Charles V. in 1544, and afterward to Philip II.; was accused of heresy by the Spanish Inquisition and condemned to death, but the sentence was commuted to a pilgrimage, and in 1563 he went to the Holy Land, returning from which he suffered shipwreck at Zante, and died from starvation Oct. 15, 1564. His *De Corporis Humani Fabrica* first appeared at Basel in 1543, and formed the foundation of the modern science of anatomy. It rests on actual observations made by dissection of the human body, and was received with the fiercest opposition by the Galenian school, who derived all their knowledge from dissections of the lower animals. His complete works appeared in two folio volumes at Leyden in 1725. See the monograph by Roth (Basel, 1886).

Vesicants [from Lat. *vesica*, blister]: in medicine, agents that produce blistering. Very many local irritants are capable of raising a blister, but many of these are too harsh and violent for medicinal use. For the ordinary purposes of blistering a preparation of cantharides (see CANTHARIS) is commonly used; but where haste is urgent, cotton soaked in ammonia water may be employed or a hot iron momentarily applied to the skin. Both these means produce a blister, but they are painful and may cause severe inflammation, and are used only where a small blister is desired. Blistering, as a remedy, is seldom employed, being at best a painful and debilitating procedure. It is capable of doing great good, however, in well-selected cases. For the management of the ordinary cantharidal blister, see BLISTERS. Revised by H. A. HARE.

Vespasian (full name *Titus Flavius Sabinus Vespasianus*): emperor; b. at Reate, Italy, Nov. 17, 9 A. D. of a family in ordinary circumstances; entered the army; held superior commands under Claudius in Germany and Britain; governed Africa as proconsul under Nero, and was sent by him in 66, at the head of a large army, to suppress the rebellion in Judæa. When, after the murder of Galba, the civil war broke out between Otho and Vitellius, Vespasian was proclaimed emperor (July 1, 69), by his own army, and shortly after was recognized by the whole eastern part of the empire. He left the final reduction of Judæa to his son Titus, and proceeded to Rome, where, after the murder of Vitellius, he was immediately recognized by the senate. A great change now took place in the government of the state. The new emperor was frugal and unostentatious in his personal habits, honest and open in his dealings with all persons. The character of the senate was restored and the worst elements in it expelled. A firm discipline was established in the army. In his external policy he was also successful. Jerusalem, and with it the whole of Judæa, were taken in 70; an insurrection in Gaul was speedily suppressed; new conquests were made in Britain and Germany. For the city of Rome he did much. He rebuilt the capitol, which had been burned by the adherents of Vitellius; he erected a temple of peace, began the Colosseum, and encouraged the restoration and rebuilding of those parts of the city which had remained in ruins since the great conflagration under Nero. D. at Reate, June 24, 79.

Revised by G. L. HENDRICKSON.

Vespers [from Late Lat. *ves pera*, vespers, liter., plur. of Lat. *ves pera*, evening; Gr. *εσπέρα*]: in the Roman Breviary, the last but one of the canonical hours, the one preceding compline and following the none. It is celebrated in public in the churches, often with brilliant music. The service occurs about the time of the lighting of the lamps, being theoretically proper to sunset, and varies with the day of the week.

Vespertilion'ida [Mod. Lat., named from Lat. *vesper-tilio*, bat, so named from its flying in the evening, deriv. of *vesper*, evening]; a family of bats devoid of a nose leaf and having the nostrils opening by simple crescentic or round apertures at the end of the muzzle. The ears are moderate or large, mostly free, sometimes united, and each provided with a well-developed tragus; the teeth are normally developed, the molars with W-shaped ridges, the canines moderate, the incisors of the upper jaw in two groups separated by a median hiatus, in the lower jaw present all round; the wings are large; the middle finger generally provided with two phalanges, and with the first phalanx extended, in repose, in a line with the metacarpal bone; the stomach is saciform, and the two extremities approximated; the premaxillary bones are small, and separated by a wide median interspace. The family is cosmopolitan in its range, and embraces most of the species flourishing in the northern temperate countries. About twenty genera have been described, but almost, if not quite, the most comprehensive is *Vespertilio*. Most of the species found in the U. S. belong to *Vespertilio*, *Scotophilus*, *Nycticejus*, *Atalapha*, *Corynorhinus*, and *Antrozous*. Revised by F. A. LUCAS.

Vespucci, ves-poot'chee, AMERIGO (Latinized *Americus Vesputius*): navigator; b. in Florence, Italy, Mar. 9, 1451. He was educated by his uncle, a Dominican, was employed in the commercial house of the Medici at Florence, and about 1491 went to Cadiz, Spain, where he engaged in trade. Later he was connected with Juanato Berardi, a Florentine merchant, who had settled at Seville, and who fitted out the second expedition of Columbus in 1493, and in 1495 made a contract with the Spanish Government to prepare another fleet for western exploration; by his death the execution of this contract fell to Vespucci, and it is known that he was employed on it in 1496. Subsequently he was engaged in some or all of the voyages mentioned below; he was for several years in the employ of Portugal, and on Mar. 22, 1508, he was appointed chief pilot of Spain. As America was named in honor of Vespucci, and as he was supposed by many to have been the first discoverer of the continent, his voyages have been a subject of endless disputes; the question of their authenticity never has been settled satisfactorily. The only direct authorities for them are letters attributed to Vespucci himself, and probably never intended for publication. These letters were addressed to different persons, one series to a friend of Vespucci, Pietro Soderini, gonfaloniere of Florence. The originals are unknown, and even the language in which they were written is a matter of conjecture. Translations were published at different times and in different languages from 1504 to 1507; but these differ considerably from each other, and all are very obscure, especially in their descriptions of the first two voyages. In these letters Vespucci states that he made four voyages, two by order of the King of Spain, beginning May 10 (or 20), 1497, and May, 1499; and two for Portugal, beginning May, 1501, and May, 1503. In all he appears to have held a subordinate position, perhaps that of pilot or factor. The first expedition consisted of four ships, and Vespucci says they reached land "upon a coast which we thought to be that of a continent." This land is conjectured by some to have been the northern coast of South America, by others Central America and Mexico. In either case the date given—twenty-seven days from the Canaries—would make the landfall several weeks earlier than the discovery of the North American continent by Cabot, and fourteen months earlier than the discovery of South America by Columbus. But there are no contemporary notices of this expedition. Muñoz proved, or thought he proved, that Vespucci was in Spain from May, 1497, to Oct., 1498; and there are many other reasons for supposing that this voyage was never made, or has been ante-dated in the extant accounts. Humboldt supposed that it was the same as the so-called second voyage of 1499; but this is contradicted by Vespucci's repeated statements that there were four voyages. As for the second voyage, the description of it agrees fairly well with the exploration made by Pinzon about this time; but there is independent testimony that in 1499 Vespucci was with Ojeda on the coast of Venezuela. The third voyage, or the first for Portugal, agrees with what is known of the expedition sent from Lisbon in 1501 to follow up Cabral's discovery of Brazil. Vespucci says that after exploring the Brazilian coast the ships sailed S. to lat. 52°, and that he discovered land, which may have been South Georgia. The fourth voyage was, pretty clearly, that of

Gonzalo Coelho, who went to Brazil in 1503. Vespucci states that he became separated with two ships, one of which was wrecked, and that the crew of this wrecked ship was left in a fort (near Cape Frio?). In one of his letters he mentions his intention to write "a little book" on the voyages; but if this was ever published it is now unknown. Latin translations of the letters were added as an appendix to the treatise *Cosmographiæ introductio*, published by Martin Waldseemüller ("Hylacomylus"), at St.-Die, in 1507. In this work, now extremely rare, Waldseemüller says: "And the fourth part of the world having been discovered by Americus, it may be called Amerige; that is, the land of Americus, or Ameica." This idea, originating in an obscure work, was generally adopted within a few years, the name being first applied to South America and subsequently extended to the whole continent. It should be noticed that Vespucci never claimed the honor of the discovery for himself, nor as a subordinate could he properly do so. It is known, also, that he was on friendly terms with Columbus. On the other hand, Vespucci's letters, obscure as they were, were the first published notices of a western continental region; he can not be accused of originating the name, which did not come into general use until after his death. Conservative critics are inclined to relieve him from any charge of deliberate falsification, and to attribute much of the confusion to careless translations and editing of the letters. Vespucci died in Seville, Spain, Feb. 22, 1512. See Humboldt, *Essays Critique*, vols. iv, and v.; Viscount of Santarem, *Recherches sur l'Amérique Vespuce et ses Voyages* (1842; English translation 1850); Major, *Prince Henry the Navigator*, pp. 367-380 (1868); Varnhagen (Viscount of Porto Seguro), various opuscles on Vespucci; S. H. Gay, *Americo Vespucci* (in *Narrative and Critical History of America*, vol. ii.). HERBERT H. SMITH.

Vest, GEORGE GRAHAM: U. S. Senator; b. at Frankfort, Ky., Dec. 6, 1830; graduated at Centre College, Kentucky, in 1848; studied law, and removed to Missouri to practice; was elected to the Missouri House of Representatives in 1860; favored secession, and was a member of the Confederate Senate. In 1879 he was elected as a Democrat to the U. S. Senate, where he has been prominent in many important debates. He was re-elected in 1885, in 1891, and 1897.

Vesta [= Lat.: Gr. *Ἑστία*, *Vesta*, liter., personification of *ἑστία*, hearth]; in Roman mythology, the goddess of the home or hearth, corresponding to the Greek Hestia. Very few and unimportant myths were formed on the idea of this deity, but the grave and sublime rites which her worship developed show that of the whole religious feeling which underlay the Roman mythology she formed the center. She was not represented by any statue or image in her temples, but a perpetual fire burned on her altars, and each Italian city or community had raised an altar to her. The Vesta of the Roman empire had her temple at Lavinium, on the Via Appia, 20 miles from Rome, and hither the consuls and other high officials of the republic went to offer up their sacrifice before entering on their duties. The Vesta of the city of Rome had her temple in the Forum, near that of the Penates, and here she was served by her own priestesses, the vestal virgins, and a festival, the *Vestalia*, was celebrated in her honor on June 9. The number of the vestal virgins was originally four, but afterward six. They were chosen by the pontifex maximus when between six and ten years old, and they served the goddess for thirty years, spending ten years in learning their duties, ten in the actual performance of them, and ten in teaching them to the novices. Their principal duty consisted simply in keeping alive the sacred fire on the altar of the goddess, but thereby the guardianship of the holiest which Roman life contained was intrusted to them; and although it has become impossible to us to discern clearly the whole bearing of this institution on the life of the community, numerous well-ascertained facts indicate the great importance ascribed to it. When a consul met one of the vestal virgins in the streets, he bowed with reverence, and the lictors lowered the fasces while she passed by. When a convict was seen by one of the virgins, he was immediately released if she demanded it. If the sacred fire went out from neglect, the priestess during whose watch it happened was stripped and scourged by the pontifex. If one of them committed adultery, she was buried alive and her seducer was flogged to death in the Forum. The temple of Vesta was purified on June 1, and the fire was renewed on Mar. 1. Revised by J. R. S. STERRETT.

Vestals, or **Vestal Virgins**: See VESTA.

Vestments, Ecclesiastical [*vestments* is from O. Fr. *vestement*, *vestment* < Lat. *vestimentum*, clothing, deriv. of *vestire*, clothe]; the dress appropriated to those who minister in the divine offices—viz., bishops, priests, deacons, sub-deacons, acolytes, servers, and choristers. The employment of vested choristers is a peculiarity of the English Church. In the papal chapels, and generally on the continent of Europe, men are employed as singers, and in some of the French churches, and in the Roman Catholic churches in the U. S., the singers are of both sexes, but they are not considered among the ministers of the altar. In English cathedrals, and in many parish churches, the singers, men and boys, are vested in cassock and surplice, and sit in a part of the church appropriated to their use, called the choir, between the presbytery, the place of the clergy, and the nave, the place of the people. The cassock (Fr. *soutane*) is a long coat reaching from the shoulders to the heels, with a low-standing collar, and fastened through its entire length by a row of small buttons. The English cassock, however, is more properly made double-breasted and secured with hooks and eyes. A band around the waist, tied at the left side, called the cincture, serves to keep it in its place. The surplice is a linen garment hanging loose about the person and having large sleeves. The Anglo-Saxon surplice is large and full; it reaches nearly to the feet, and when it is properly made, without any opening in front, falls into ample and graceful folds. These surplices are still in use in the English Church, at least by the clergy. Choristers' surplices are generally made shorter and less full, approaching more nearly the form called *cotta* on the Continent. The Roman cottas are usually very small, reaching but little below the waist, and are sometimes made entirely of lace. The rochet and the alb are modifications of the surplice. The former is a short and the latter a long surplice, with close sleeves. The rochet is commonly considered as the episcopal form of the surplice, but it is sometimes worn by acolytes. The alb is a eucharistic vestment. The surplice is worn by the clergy in the choir offices or daily services, and in the ministrations of all rites and sacraments except the holy communion. On solemn occasions the principal minister wears also a cope and biretta. The cope is a cloak cut in such a way that when it is spread out the lower line forms half a circle, of which the front is the diameter. An opening, half an ellipse, is cut in the straight side for the head, and the garment is fastened in front by a large buckle called a morse. The cope is usually made of some valuable material, and is richly embroidered. One given by Queen Philippa (1328-69) to Durlam Cathedral is kept there in excellent preservation. The biretta is a four-sided cap with a flat top, and ridges on it extending from the corners to the middle—four for doctors of divinity, and three for ordinary clergymen. A ridgeless biretta appears to have been formerly common in England, and is often seen in old sculpture and in paintings. A stole is also worn at baptisms, marriages, and similar functions, but not, according to the old English rule, at the daily service. In the churches of the Roman obedience the public recital of the daily offices has so long been obsolete that the tradition seems to have been lost. The old rule, however, is probably the same as the English. This stole is 2½ inches wide and about 2½ feet long. It is usually made of silk, and is frequently embroidered.

The eucharistic vestments are the amice, the alb, the girdle, the maniple, the eucharistic stole, and the chasuble. The amice is a square piece of linen, embroidered on one side, which the priest rests for a moment on his head, and then spreads over his shoulders. It is seen as an embroidered collar above the alb. The alb is a long garment with close sleeves, secured about the waist with a girdle. It is commonly made of linen, but occasionally of lace, and it may have embroideries on the sleeves and lower part, called apparels. The Greek alb (*chitonion*) is sometimes made of richer materials, and is colored. The girdle is also of linen, and is made of strands of twisted cord. In the East a broad band (Gr. *zone*) is sometimes worn instead. The maniple (*sudarium*; Gr. *epimanikion*) was originally of linen, but is now made of the same materials and in the same form as the stole. It is worn upon the left wrist. The eucharistic stole (Gr. *orariion*) is 3 yards long and nearly 3 inches wide, sometimes widened at the ends to make room for embroidered crosses. It is crossed over the breast and secured by the girdle. The chasuble (Lat. *casula*; Gr. *phelonion*; in old English, the vestment) is worn over all. It was originally, and is still sometimes in the Greek Church, cut in the form of a complete circle, in which form its ample folds are

extremely graceful. It was at a later time made like an ellipse, or rather like the *vesica piscis*, which was a favorite shape in England. The modern Roman chasuble is very much cut away in front. In England, France, and Belgium a cross is commonly affixed to the back; in Italy and other Roman Catholic countries in the West, to the front of the chasuble. This is properly of the shape known as the Y-cross. The deacon (in England, the "gospeller") wears over his alb a dalmatic (Gr. *stoucharion*), and the sub-deacon (in England, the "epistoler") wears a tunicle, but no chasuble, which is reserved exclusively to the celebrant. The dalmatic is a coat partly open at the sides, with wide sleeves. The tunicle is a garment very similar to the last, but less highly ornamented. The deacon wears his stole over his left shoulder; the ends are brought together and fastened under his right arm. The sub-deacon wears no stole. In the Western Churches acolytes at a high mass (in England, solemn service) wear albs and amices. At a low mass (plain service), where there are neither ministers nor choir, but only a single priest with a server, the latter wears a cotta or rochet over his cassock, which last is usually crimson. In the Greek Church servers and low masses are unknown. The priest is always attended by a deacon vested in alb and dalmatic. When a bishop is the celebrant, he wears a dalmatic in addition to the priestly vestments, to signify, it is said, that all the offices of the ministry are united in his person. The Western bishops also wear, instead of the biretta, a mitre, either plain or decorated; the former is of white linen, the latter of gold and precious stones. The pall, pectoral cross, ring, gloves, sandals, and staff also appertain to the bishop.

In the churches now or formerly of the Roman obedience the color of the cassock is, for choristers, servers, or acolytes, crimson; for the principal acolyte, sometimes purple. Sub-deacons, deacons, and priests wear black, bishops purple, and cardinals crimson. The pope alone wears white. The surplice, cotta, rochet, alb, and amice are properly made of white linen, though in the West all except the last are sometimes made of lace. The maniple, stole, tunicle, dalmatic, and chasuble vary in their colors, following what is called the sequence of the seasons. The Roman sequence is now generally adopted in the West. This gives white for Christmas, Easter, and saints' days, purple for Advent and Lent, red for Pentecost and feasts of martyrs, black for Good Friday, and green for ordinary days. The color for *feria* or week-days usually follows that of the preceding Sunday. The English or Salisbury (Sarum) sequence differs from the Roman not only in the use of more colors—brown or gray being allowed instead of purple, blue instead of green, and yellow instead of white on the feasts of confessors—but also in the order in which the colors are used. According to this sequence, all Sundays at the festal seasons are white, and all other Sundays are red. White Sundays are followed by white feria, but at the seasons of Advent and Lent the feria are purple; at those of Epiphany, after the octave, and Trinity, they are blue or green. The old Sarum tradition, however, has been lost, and it has probably been only partially recovered. The Eastern calculators do not appear to recognize any uniform sequence of colors.

This account includes all the vestments which are received by Catholic tradition, both in the Eastern and Western Churches. There are, however, local variations, and there are other vestments which have been worn only at particular times and places. The Western mitre is unknown in the East, except among the Armenians; the Oriental bishops wear a peculiar cap. The Patriarch of Alexandria wears a cap resembling a crown, which he never removes during the whole liturgy. The Eastern bishops wear attached to the stole a square ornament called the *epimatium*. This was originally merely a handkerchief, but it is now made of some stiff material like brocade, and richly decorated. The stole itself is joined together for nearly its entire length, and an opening is left at the top through which the head is put. Two maniples are worn instead of one. The Greek priest's cap is not square, but round. There are also local peculiarities in the West. The rochet and chimere worn by the English bishops are a modification of the daily dress, or perhaps the parliamentary robes, of their predecessors. The simple linen sleeves of the rochet have been superseded by lawn, and the chimere of scarlet silk by one of black satin or velvet. A black gown was formerly worn by some English preachers. The rival derivations of it from the gown worn by Calvin at Geneva or from the dresses of the mediæval monks may be dismissed as witty inventions. It is probably merely the academic gown which English clergymen

were formerly accustomed to wear when they went about their parishes. The square cap and the hood, much worn by the English clergy, are academic vestments. Hoods also form parts of several monastic dresses, which, however, are for the most part modifications of the cassock. The amys (which is not to be confounded with the amice) was at one time a favorite choir-vestment in northern countries. It was in form not unlike a small chasuble, and was usually made of gray fur. It was only worn at the daily service.

Of the origin of the vestments little is certainly known. The linen ones have probably been inherited by Christians from the Hebrew Church. The others Dr. Rock believes to have been adopted from garments worn in daily life, retained by the Church after others had laid them aside, adorned and beautified and consecrated to sacred uses. Mr. Marriott states more specifically that they were dresses worn by persons of condition on state occasions, which were gradually adopted by the Church. This view is strengthened by the fact, alluded to by Mr. Planché, in his *Cyclopaedia of Costume*, that emperors and kings were long allowed to wear the chasuble, and afterward the dalmatic and tunicle, at their coronations and when assisting at high mass. According to the view of Mr. Marriott, most of the vestments were introduced into the Church in the interval between the ninth and the twelfth centuries. Others, he thinks, can be traced back to the fourth, and some to the first century. He is also of the opinion that the color of all ecclesiastical vestments was originally white. As Mr. Marriott has made a careful study of the subject, the present writer thinks it fair to state his views, without, however, in all respects adopting them. The chief value of his work lies in the illustrations and in the elaborate quotations from ancient authors. The literature of the subject is extensive. Marriott's *Vestiarium Christianum*, Rock's *Hierurgia*, Neale's *Holy Eastern Church*, and Blunt's *Annotated Book of Common Prayer* are perhaps the best modern authorities. They contain full references to the older writers. To sum up the whole matter, it is only necessary to add that the same vestments have been in use from time immemorial in both the Eastern and Western Churches, and that, though they may have been, and doubtless were, introduced gradually in the way already mentioned, they varied from each other only in matters of detail or in bearing different names in different times and places. The idea of a dress peculiar to the ministers of religion at their ministrations is older than Christianity itself, and is recognized not only by Roman Catholics, but by several denominations of Protestants.

The vestments of the altar include a cere-cloth of waxed linen, which is spread over the stone slab (*mensa*), fitting it closely to protect it from the damp. Over this is placed the superfrontal, hanging down about 10 inches in front. Before the altar hangs the frontal, reaching nearly to the ground, and embroidered with two broad stripes called orphreys. Both superfrontal and frontal may have a rich fringe, and both are usually of the color of the season. The former, however, may with propriety be always red. Over all are placed three linen cloths. Two of these are of the exact size of the mensa, but the third is much longer, and hangs nearly to the ground at both ends. It is embroidered in a particular manner, and is usually adorned at the edges with lace. When the altar is not in use, a green covering of silk or baize or some similar material is laid upon it.

BEVERLEY R. BETTS.

Ves'tris: a famous family of dancers, originating in Florence, Italy, but settled in Paris. The two most celebrated members of the family were—(1) GAETANO APOLLINO BALDASSARE VESTRIS (b. Apr. 18, 1729, d. Sept. 27, 1808), ballet-master and first dancer at the opera in Paris from 1749 to 1781; and (2) MARIE AUGUSTE VESTRIS-ALLARD, or VESTRIS II. (b. Mar. 27, 1760, d. Dec. 6, 1842), a natural son of Gaetano by the celebrated Madame Allard (first dancer at the opera from 1780 to 1816), and professor at the Conservatory till 1828. The ballet compositions of the Vestrís family were insignificant, but their style of ballet-dancing became predominant on all stages of Europe, and reigned for more than a century, largely influencing also the social dances of the higher classes.

Vesunna: See PERIGUEUX.

Vesu'vian, or Id'ocrase [*vesuvian* is deriv. of *Vesuvius*; *idocrase* from Gr. *είδος*, form + *κράσις*, mixture, deriv. of *κεραννίνα*, mix]: a hard calcium aluminium silicate, with iron and manganese, sometimes used as a gem, but not much esteemed. It is of various colors.

Vesu'vius: a volcano standing on the southwestern shore of Italy overlooking the Bay of Naples. In the midst of a densely populated district, and in full view from routes of commerce on the Mediterranean, it has been more fully studied and its history is better known than that of any other volcano. There are two mountain-masses. That which is at present the higher is conical in form, with a crater at the top, and has an altitude above the sea of about 4,000 feet, the height varying with the progress of eruption. The other mass is a crescent-shaped ridge partly surrounding the cone, and has an extreme altitude of 3,730 feet. It is called Monte Somma, and it is part of the rim of an ancient crater about 3 miles in diameter.

During the period of early Roman history Vesuvius is not mentioned as a volcano, and its fires had been dormant for so many centuries that its volcanic character was not generally understood, although suspected by a few scientific travelers. On its outer slopes were vineyards and gardens, and the interior of its crater was a plain several miles in width, partly covered by wild vines. It is related that Spartacus and his followers took refuge in this crater, where they were besieged by a Roman army. In the year 63 and afterward there were earthquakes in the vicinity, and in 79 an explosion, followed by explosive eruption, covered the surrounding country with volcanic ashes and volcanic mud. The cities of Herculaneum and Pompeii were destroyed and so deeply buried that even their sites were unknown for several centuries. There ensued a period of quiet, followed by an explosion in the year 203, and other explosions or violent eruptions are historically recorded in the years 472, 512, 685, 993, 1036, 1138, 1306, 1500, and 1631. There were probably other eruptions during this time of which no record has been discovered, but it is nevertheless true that there were a number of periods a century or more in length during which the volcano was not active. From the year 1666 to the present time the activity has been nearly continuous, the longest intervals of rest covering not more than four or five years. The activity of the last 1,800 years has been confined to the conical mountain, which bears specifically the name Vesuvius, and the mountain has been built up during that period by ejections of ashes and lava. Its summit has been repeatedly blown off by great explosions, after which new cones have been built within the crater. Monte Somma is part of the rim of the crater existing before the catastrophe of 79, and has had no share in the later activity. The fullest account of the mountain in the English language is contained in Lobley's *Mount Vesuvius* (London, 1889).

G. K. GILBERT.

Vesz'prim (Germ. *Weissbrunn*): capital of the county of Veszprim, Hungary; on the Stuhlweissenburg-Kisczell Railway, about 65 miles S. W. of Budapest (see map of Austria-Hungary, ref. 6-G). The town is the seat of a Roman Catholic bishopric (founded about 1000 A. D.), and has a magnificent cathedral and other memorable buildings, a theological seminary, a gymnasium, many churches, and monasteries. The ancient town, known to the Romans by the name of Cimbría, became Hungarian in 1683 after the defeat of the Turks before Vienna. Pop. (1886) 14,800, mostly agriculturists and agricultural traders.

H. S.

Vetan'cirt, or Vetancour, AGUSTIN, de: missionary and author; b. at Mexico city in 1620. He joined the Franciscan order at Puebla, became a noted linguist and teacher, and was a member of the provincial chapter and commissary-general of the Indies. His most important work is the *Teatro Mexicano* (4 parts, 2 vols., Mexico, 1697-98; reprint, 1870-71), a collection of treatises on Mexican geography and history and on the history of his order. Some of it is compiled from Torquemada, but there is much valuable original matter. Other works are *Arte de Lengua Mexicana* (1673), various biographies, theological essays, etc. D. in Mexico, 1700.

HERBERT H. SMITH.

Vetch, Fitch, or Tare [*fitch* is M. Eng. *fieche*, *feche*, for *veche*, from O. Fr. *veche*, *vesce* > Fr. *vesce* < Lat. *vi'cia*; *tare*, cf. M. Eng. *tare-fitch*, wild vetch]: any one of several leguminous climbing herbs of the genus *Vicia*. North America and Europe have each several species, some common to both continents. One of the most important is *Vicia sativa*, extensively cultivated in Europe as a forage-plant, and also occasionally grown in the U. S. The bitter vetches (*Orobis tuberosus*, etc.) are also leguminous forage-plants of Europe. The tubers of some sorts are used as food. Other so-called vetches are the genus *Lathyrus*, often called vetchlings.

Revised by L. H. BAILEY.

Vetch, JAMES, F. R. S.: engineer; b. at Haddington, Scotland, May 13, 1789; educated in the Royal Military Academy at Woolwich; was engaged upon trigonometrical surveys 1806-24; was manager of silver mines in Mexico 1824-35; constructed in Mexico many roads and other public works; became consulting engineer to the admiralty, conservator of harbors, metropolitan commissioner of sewers, and royal commissioner of harbors of refuge. He was the author of *An Inquiry into the Means of Establishing a Ship-navigation between the Mediterranean and the Red Sea* (1843). D. Dec. 7, 1869.

Veterinary Medicine [*veterinary* is from Lat. *veterinarius*, a physician for animals, deriv. of *veterinus*, for carrying or drawing burdens (used with *bestia, pecus, veterinaria*, beasts of burden or draught, probably deriv. of *vetus*, old, i. e. suited only for carrying burdens); medicine as applied to animals. The term *veterinarius* was at first applied to all who had to do with animals, but was later applied only to those who treated their diseases and conducted the *veterinaria*, or places in which diseased and injured animals were cared for.

Early History of the Science.—The beginning of veterinary medicine may be traced to the earliest time of which we have a record. The chief wealth of the ancient nomadic tribes was in the possession of their flocks and herds, and when these were diseased or wounded, efforts were made for their restoration. Some of the oldest carvings of Egypt and India depict men in the act of administering medicine to cattle, dogs, and fowls. At first, all medicine, including the treatment of human beings and animals, was in the hands of one class; but with increased knowledge and experience the most famous physicians confined themselves to the treatment of people, and the diseases of animals were relegated to those less competent. On account of religious prejudices the human body was not dissected by the ancients; hence, for many centuries, all accurate anatomical knowledge was based on the dissection of animals, and this branch of veterinary science was developed very early.

In India, great attention was devoted to the diseases of animals as early as 1000 B. C., and many veterinary hospitals were established, of which the most famous was that of Surate. The Medes and Persians were much interested in animals, and it is known that there was a class of men in the oldest times who devoted themselves to curing their diseases. The Jews for a period of several centuries from the time of Abraham lived a nomadic life and were chiefly herdsmen and shepherds. The laws of Moses show that these people possessed some knowledge of the diseases of animals, and realized the importance of subjecting all food flesh to a most careful examination.

Veterinary medicine received many additions and much advancement from the Greeks, and the most authentic records of early veterinary progress are from this source. Vergil relates that Melampus, a Greek shepherd who was widely known for his great success in curing the diseases of animals, was called by King Proteus to treat his insane daughter. Having observed that hellebore was of value in similar conditions in sheep, Melampus administered it to the girl and effected a cure.

Chiron, who lived between 1400 and 1300 B. C. and was renowned as the teacher of Æsculapius, was both a physician and a veterinarian; he was called the Centaur, because he devoted so much attention to animals. One of his books on horses and their treatment in disease was, according to Kircher, translated into Arabic. Chiron is credited with having domesticated the horse and trained him to useful work.

For several centuries medical thought in Greece was governed by the Æsclepiadae, but there is nothing to indicate that they applied their skill to animals, although it is probable that there were veterinarians then, for, according to G. Teugler, the medals of that time that bear a figure of a horse, the fore part of which is human and holds a staff about which a snake is coiled, are the insignia of veterinary medicine.

Hippocrates, the father of medicine, born in 460 B. C., was the first to break away from the superstitions and mysticisms of the disciples of Æsculapius and to place medicine upon a new footing, the basis of which was experience. Of the numerous books that have been ascribed to Hippocrates many are spurious, and among these is the work on equine pathology (*hippiatrica*). Since Hippocrates was unable, on account of his religious belief, to dissect human cadavers he derived

his knowledge of anatomy from the dissection of animals, and thus incidentally learned much comparative pathology. Among the diseases he studied and described are hydatid cysts in the lungs, dislocations of the joints of oxen, ascites of the ox and dog, epilepsy of goats and sheep, and fever of all of the domesticated animals.

One of Hippocrates' contemporaries was Xenophon, who was famous both as a general and as a horseman. Xenophon was a breeder of horses, and wrote a large work on the art of horsemanship, a part of which is devoted to the diseases and injuries most commonly met with. The descriptions of the exterior of the horse and the advice as to veterinary hygiene are most excellent, and can be observed with profit at the present time. Of the diseases of horses, a few are described in a very clear way, and the treatment advocated consists chiefly in the application of hygienic measures.

Aristotle, born 384 B. C., was not only the father of zoölogy and comparative anatomy, but was also a productive worker in the field of veterinary science. He described a number of diseases of the pig, dog, ox, ass, and horse. He said that the principal diseases of the horse were asthma, colic, tetanus, and founder; of the ass, glanders; and of the ox, pneumonia and foot and mouth disease. He knew that mules were sterile and described several operations on animals.

The Romans devoted considerable attention to veterinary medicine, a fact which is explained by the great love of the people for agriculture, cattle-breeding, and war. It is evident, also, that the old Romans appreciated the financial value of having their valuable animals well treated, and every large estate had buildings for the accommodation of sick animals and slaves, and the diseases of both of these classes of creatures were treated of in the works on agriculture. Cato the elder described some of the diseases of the domesticated animals in *De re rustica*; but his work is valueless, since he was a very poor observer of symptoms and was guided by the prevalent Roman superstitions; for example, for all diseases of cattle his advice was to order the administration of a raw egg by a servant who must be fasting at the time.

Columella, who wrote about the middle of the first century, was one of the most learned and practical agricultural and veterinary authors of ancient times. Of his thirteen books on agriculture and allied subjects, the sixth and seventh are devoted to veterinary subjects. The principles of hygiene are dwelt upon at great length, and especial attention is called to the need of proper buildings, good air and food, and care of the skin. The fact that some diseases of animals are contagious is recognized, and directions are given to separate diseased from healthy cattle. In describing symptoms he was especially clear, and his treatments were rational and free from the superstitions then so prevalent. In this last respect he was more advanced than the physicians of his time, for they still clung to charms and incantations as an important part of their therapeutics. The work of Columella elevated veterinary medicine by a longer step than that of any other Roman author.

Absyrus, who lived some 250 years later, was the greatest veterinarian of his time. He was attached to the army of the Emperor Constantine, and his writings are in the form of letters to veterinarians. Absyrus was more free from superstition than the contemporary physicians and more than their equal as a scientist. He was a veterinarian solely, and the first, of whom we have an authentic record, who devoted himself exclusively to this work. His predecessors had combined agriculture, natural history, breeding, etc., with veterinary medicine. The letters of Absyrus are very numerous and cover a great variety of diseases. They show him to have been a popular teacher and a man of great experience. His greatest service to his profession was that he separated it from the medicine of physicians, which was then sinking into the depression of the Middle Ages.

Other veterinarians of this time whose writings still exist were Hierocles, Theonestus, and Vegetius. The last was the most prolific author, and left the most extensive and comprehensive work of the ancients.

In the Middle Ages.—During this period veterinary medicine made but little progress in respect to scientific growth, but the standing and social position of the veterinarian advanced materially. Every nobleman or wealthy person maintained a large estate, among the chief features of which was a stud and collection of a large variety of animals. Everything that pertained to the animals of sport—

the horse, dog, and falcon—received the greatest consideration, and it thus happened that the masters of the horse, who were the veterinarians of the period, belonged to one of the most honored callings.

The Emperor Constantine Porphyrogenitus (911-959) ordered the compilation of a large work on the diseases of animals, and in this we find that ancient sources are used almost exclusively. This work, known as the *Hippiatrica*, was translated into French, Spanish, German, and later into Italian. It was the standard veterinary work for several hundred years.

During the scholastic epoch that followed the founding of the University of Bologna, a number of famous scholars studied veterinary science and produced veterinary works. Of these, Albertus Magnus (1193-1280), Bishop of Regensburg, was one of the best known. Jordanus Rufus, the master of the horse of Frederick II., wrote a book entitled *De Medicina Equorum*, which appeared about 1250. Rufus was skilled in surgery and in horseshoeing, and his book contains much that was original and valuable. Theodore (1205-98), Bishop of Cervia, was also a writer on veterinary medicine.

Veterinary medicine first received legal recognition as a profession in Spain in the fourteenth century. It was then classed with medicine and pharmacy, and those who wished to engage in the practice of veterinary medicine were obliged to undergo an examination before a government board, and unless properly qualified the right to practice was denied. This custom was continued until 1835, when this function was transferred to the veterinary schools.

In Modern Times.—The first important advance in veterinary science in modern times may be traced to the production of a work by Carlo Ruini in 1590 on the anatomy and diseases of the horse. This work was most excellent, and marks an epoch in the history of veterinary medicine. It is illustrated with wonderfully good plates, showing all of the muscles of the horse, and the descriptions are remarkable for their accuracy. From the publication of this work until the founding of the first veterinary school in 1762 but little that was original was produced. Most of the writings of this period were plagiarisms from the ancients or from Ruini. A number of short books or monographs which were of some value had, however, been published, and these, with the accumulated traditional experience of the centuries, constituted the growth of the period preceding the establishment of the first veterinary school.

The annual plagues were at this time (the eighteenth century) very prevalent in Europe, and had occasioned enormous losses. Rinderpest, lung plague, anthrax, sheep-pox, foot and mouth disease, glanders, and numerous other affections had extended into nearly every agricultural district, and the stock-raisers found their occupation threatened and in many cases ruined. The armies, also, were in great need of competent men to direct the care of the horses and to treat those that were diseased. Hence the time was ripe for the founding of an institution where systematic instruction in veterinary medicine could be given.

Veterinary Schools.—Claude Bourgelat (1713-79) was originally a lawyer, but, becoming dissatisfied with his profession, he entered a cavalry regiment as an officer and afterward became director of a riding-academy in Lyons. His passion for anatomy and pathology was cultivated by a study of the old books on hippiatry, and by the famous surgeon Ponteau. He published books in 1747 and in 1753 which showed him to be a great reformer in veterinary medicine. In 1762 the French Government decided to open a veterinary school in Lyons, and Bourgelat was selected to conduct it. The fame of this school and its director were so great that students came from all over Europe, and the first year there attended it Danes, Swedes, Prussians, Austrians, and Swiss. Many of these were sent by their respective governments, and afterward entered government service. Indeed, it was the custom for a great many years for all veterinary teachers to make a pilgrimage to Lyons or to Alfort and to study veterinary medicine at the fountain-head. In this way French views and French methods have become intimately incorporated with almost every veterinary school in existence. The success of this venture was so great that the king, Louis XV., ordered the establishment of another school in the north of France, and for this object the Castle of Alfort was bought and converted into a veterinary school, Bourgelat was transferred to Alfort and the Lyons school was placed in other hands.

The example of France was quickly followed by other coun-

tries, and before the close of the eighteenth century nearly every European country had established a veterinary school. The system of instruction has been changed from time to time, and the course of study has been lengthened, from one year to three and a half in Germany, to four years in France and England, and to five years in Russia.

One of the best of the existing schools is that of Berlin. The Imperial Veterinary High School of Berlin was established in 1790 by men who had studied at Alfort. At present it has ten professors, eighteen demonstrators, and about 400 students. The school is situated in a park of about 5 acres near the heart of the city. It is equipped with four commodious buildings besides two large hospitals, one for dogs, which can accommodate about fifty patients, and one for horses, with about eighty stalls. The students are divided into two classes, civil and military; the former are subject to no special restrictions, while the latter, who are educated at the expense of the Government for service in the army, are quartered together in a large dormitory and are subject to military discipline. The instruction is very thorough in all of its departments, and comprises, in addition to the branches usually taught in medical schools, such subjects as horseshoeing, meat inspection, zootechnics, etc., and every step is illustrated in a practical way. The large clinics are used freely in giving practical instruction. This plan, more or less modified by local conditions, is followed in a general way by all European veterinary schools.

The first veterinary school in the U. S. was established in Boston in 1835, but its career was not prosperous and it soon passed out of existence. Since 1857 eighteen veterinary schools have been established in the U. S. and three in Canada. Some few of these are unfortunately operated on a purely commercial basis, they require no entrance examination, and attendance upon instruction for but a few months; while others require a strict entrance examination and a thorough course of three years. Four of the large universities have departments of veterinary medicine, i. e. Magill University, Harvard University, the University of Pennsylvania, and Cornell University. In each of these the course of study covers three years.

Veterinary medicine as a real science dates only from the establishment of the schools. Since this time (1762), if the work of Carlo Ruini and Bourgelat be excepted, all of the permanently valuable advances have been made. The literature that has sprung up during this period is quite voluminous and comprises special works on every branch of veterinary science. Most of these have been written in Germany and France and by professors in the veterinary schools. This is no doubt due to the fact that in these countries the schools are more generously supported by the Government than is the case in Great Britain and America, and the facilities and conditions for original work are therefore better. The first veterinary books of the new era were founded upon the old empiricism and the works of physicians. They had many deficiencies and errors, and it was not until the mistaken parallels from human medicine and surgery had been eradicated that veterinary literature was erected upon an independent basis.

It is natural that comparative pathology and bacteriology should have received much attention from veterinarians, and it results that many of the best-known investigators in these subjects belong to the veterinary profession. Among them are Chauveau, Nocard, Ereolani, Perroncito, Schuetz, Rabbe, Johne, Kitt, McFadyean, Salmon, and Law.

Results.—One of the chief results of the growth of veterinary science has been the progressive decline of animal plagues. From a distribution so great that almost every part of every civilized country suffered and from losses that amounted to millions of dollars each year, these diseases have been so restricted and, in some cases, exterminated, that present losses from diseases then prevalent bear but a small ratio to those then incurred. Rinderpest is stamped out everywhere but on the steppes of Russia. Lung plague has been exterminated in the U. S., and in Europe it is a rare disease, foot and mouth disease has been greatly restricted, glanders is all but extinct in the U. S., and the districts formerly infested with anthrax are much restricted. But the veterinarian has not yet fulfilled his function, for many new problems have arisen during the past few years, some of which are already partly settled, but others are still awaiting a solution. These are in reference to such diseases as Texas fever, hog cholera, swine plague, tuberculosis of cattle, actinomycesis, etc., diseases that are comparatively new or which have become prominent recently.

All of the European countries have regularly appointed district veterinarians whose duty it is to stamp out contagious diseases, to look after the general hygienic conditions of the live stock, to supervise the markets and fairs, and see that no animals suffering from contagious diseases are offered for sale, and to make a periodical report upon the health of the district. It is through the efforts of these officers that such great success has been achieved in combating contagious diseases.

All countries have veterinarians attached to the armies to look after the health of the horses. In Great Britain the army veterinarians rank as officers; the chief of the veterinary service of each regiment has the rank of captain, and the head of the veterinary department of the army ranks as colonel. In Russia the chief of the army veterinary department has the rank of general. In the U. S. army the veterinary department is not thoroughly organized, and a civilian veterinarian is employed by each cavalry regiment.

In the U. S. measures directed against the diseases of animals are originated and carried out by the bureau of animal industry of the Department of Agriculture. Nearly every State has an official State veterinarian who is appointed by the Governor, and who maintains a general oversight over the health of the domesticated animals and enforces State measures for the eradication or restriction of disease. Several States, as Maryland, Ohio, Pennsylvania, and New York, have enacted laws requiring all prospective practitioners of veterinary medicine to be examined by a State board of veterinary examiners. Every large city employs one or more official veterinarians, and the U. S. Government employs many for the inspection of meat that is exported to foreign countries. There are many local veterinary societies in various parts of the country, and the U. S. Veterinary Medical Association, which has members in all parts of North America, is a flourishing and influential organization.

The principal works on the history of veterinary medicine are J. M. Kreutzer's *Grundriss der gesammten Veterinärmedizin* (Munich, 1853); Tisserant, *Histoire abrégée de la médecine vétérinaire* (Paris, 1855); Eichbaum, *Grundriss der Geschichte der Thierheilkunde* (Berlin, 1885); Baranski, *Geschichte der Thiersuchen und Thiermedizin im Alterthum* (Vienna, 1886); Postolka, *Geschichte der Thierheilkunde* (Vienna, 1887).

LEONARD PEARSON.

Vétillart, vä'tö'laar', MARIE MICHEL HENRI: civil engineer; b. in Le Mans, France, Sept. 5, 1818; educated at the École Polytechnique and École de Ponts et Chaussées, Paris, leaving the latter in 1874 at the head of his class; resident engineer of the port and canals of Calais 1875-86; engineer-in-chief of the ports of Boulogne and Calais 1886-92; French delegate to the International Maritime Congress of Washington 1889; engineer-in-chief of Havre and the other ports of the lower Seine since 1892. His principal constructed works are the new port of Calais, the widening and deepening of the canal of Calais, and the completion of the Boulogne breakwater. His published works are *Fouage des pieux par injection d'eau* (1877); *Le port de Calais* (1889); *Fondations en terrains de sable des quais et écluses du port de Calais* (1889); *Les dragages* (at the Congress of Manchester, 1891); *La navigation sur États-Unis* (1892); *Notice sur le port de Havre* (Congress of London, 1883). His most remarkable work was the sinking the foundations of large piers and lock walls by means of the water-jet, which had previously been applied only to the sinking of piles.

W. R. HUTTON.

Veto [from Lat. *vetō*, I forbid]: the constitutional power of an officer or assembly to deny validity to a legislative or administrative act, or to prevent its execution. The magistrates of the Roman republic, and particularly the tribunes, possessed this power, although its limits and the mode of its exercise were quite different from those sanctioned by modern public law.

Under the British Constitution the crown has an absolute veto on the acts of Parliament and on those of colonial legislatures. The latest exercise of this right to deny validity to an act of Parliament occurred in 1707, and this royal prerogative is deemed practically obsolete. Over colonial legislation the veto is exercised in one of two ways—by the governor, who represents the crown, or by the crown in council.

The president of France does not possess either an absolute or a qualified veto upon the legislature. He is empowered, however, to demand a reconsideration of any measure by the legislative chambers; but if it is duly passed

again, he is bound to promulgate it as a valid law. While he is denied a veto over the acts of the national legislature, he has authority to use it upon various resolutions passed by the general councils of departments.

By the imperial constitution of Germany no right of veto upon legislation is given to the emperor directly. There is provision, however, for an absolute veto by him, as King of Prussia through his representatives in the Federal Council, upon measures relating to the military and naval system and to the imperial taxes.

In the U. S. a qualified veto is given to the President by the Federal Constitution, and quite generally by State constitutions to the Governor, as well as to the mayors of cities by statute. The Federal Constitution (Art. I, § 7) requires every bill passed by Congress, and every order, resolution, or vote to which the concurrence of both houses is necessary, except on a question of adjournment, to be presented to the President, who is authorized to return it with his objections to the house in which it originated. When so returned it must be reconsidered and passed by a two-thirds vote of each house in order to become a law. The framers of the Constitution appear to have conferred this power upon the President for the supreme purpose of enabling the executive department to protect itself against encroachments by the Legislature; but they intended also that it should be used to prevent the enactment of improper laws. (*The Federalist*, No. 73.) Its frequent employment by a President has aroused criticism at times, and called out strenuous arguments for the limitation of its exercise. (See *Webster's Works*, vol. i, p. 267; 17 *Congressional Record*, p. 835, *et seq.*) It seems to be conceded generally, however, that the President, in vetoing a bill which has been presented to him, is acting in a legislative capacity. Any considerations, therefore, which ought to influence him, if he were a Senator or a Representative, may properly control his exercise of the veto. He is at liberty even to return a bill which he believes to be unconstitutional, although the question of constitutionality may have been decided by the Supreme Court of the U. S. in opposition to his view. See Cooley, *Principles of Constitutional Law* (Boston, 1880); Anson, *Law and Custom of the Constitution* (part i, Oxford, 1886); Dicey, *The Law of the Constitution* (London, 1885); Burgess, *Political Science and Constitutional Law* (Boston, 1890); Goodnow, *Comparative Administrative Law* (New York, 1893).

FRANCIS M. BURDICK.

Vettori: See VICTORIUS, PIERRES.

Veuillot, vä'yö', LOUIS: author; b. at Boynes, Loiret, France, Oct. 11, 1813, in humble circumstances; grew up in Bercy, a Parisian suburb; obtained in 1832, through a public labor bureau, employment on one of the ministerial provincial papers; gained notoriety by his polemical aptitude and his readiness to fight duels; was advanced by the Government from one paper to another, from one position to another, and became in 1833 editor of *L'Univers Religieux*. During a visit to Rome in 1838 he was so impressed by the religious ceremonies of Holy Week that he turned to serious things, and began to write religious romances—*Pierre Saintine* (1840), *L'Honnête Femme* (1841), etc.—and books of education—*Les Pélerinages de Suisse* (1838), etc. His polemical talent, however, suffered nothing from his conversion, and many of his articles, collected in several volumes under the title *Mélanges religieux, historiques et littéraires*, and of his books, *Les Livres penseurs* (1848), *L'Esclavage Vindicté* (1849), *Le Parfum de Rome* (1861), *Les Odeurs de Paris* (1866), etc., in which he championed the ideas of the Ultramontanes, and advocated a social order based on the monk and the soldier as its main supports, are conspicuous by their acridity. D. in Paris, Apr. 7, 1883. (See Jules Lemaitre, in the *Revue Bleue*, Jan., 1894.)—His brother, LOUIS ÉUGÈNE VEUILLOT, b. at Boynes, Oct. 7, 1818, was his collaborator in the *Univers*, and published *Histoire des guerres de la Vendée et de la Bretagne* (1817) and other works.

Revised by A. G. CAMERON.

Vevay, or Vevy, ve vä': town; canton of Vaud, Switzerland; on the north shore of the Lake of Geneva, at the mouth of the Veveyse (see map of Switzerland, ref. 6 C). It has manufactures of watches, jewelry, leather, and weavers, and a trade in wine. It is a favorite residence for foreigners, is a health resort, and has many schools. Pop. (1888) 8,144.

Revised by M. W. HARRINGTON.

Vevay: city; capital of Switzerland co., Ind.; on the Ohio river; about midway between Cincinnati and Louisville (for location, see map of Indiana, ref. 9-6). It was

settled by Swiss colonists in 1805, laid out in 1813, and given a city charter in 1877. It has 7 churches, several graded schools, water-works, electric-light plant, a national bank with capital of \$50,000, and a semi-weekly and 3 weekly newspapers. Large quantities of fruit, tobacco, hay, wheat, and Indian corn are shipped here, and there are saw, planing, and flour mills, tobacco warehouses, furniture-factory, and brick-works. Pop. (1880) 1,884; (1890) 1,663; (1895) 1,874.

EDITOR OF "TWICE-A-WEEK."

Veytia, vī-tee'ān, MARIANO: historian; b. at Puebla, Mexico, in 1718. He studied law at Mexico, and by special license was admitted to the bar at the early age of nineteen. Subsequently he traveled for several years in Europe, and at Madrid became intimate with the celebrated Boturini. Mainly through his influence Veytia devoted the remainder of his life to the study of Mexican Indian history, in which he is said to have been greatly aided by the manuscripts collected by Boturini and left in Mexico. His principal work (interrupted by his death) is the *Historia antigua de México*. The completed portion, first published in 1836, covers the period from the Nahuatl invasion of Mexico to the middle of the fifteenth century, and treats principally of Texcucan history. D. in Puebla in 1779. HERBERT H. SMITH.

Vezin, HERMANN: actor; b. in Philadelphia, Pa., Mar. 29, 1829; son of a merchant; graduated at the University of Pennsylvania 1847; went to England to study for the stage, and after filling an engagement at York appeared at the Princess's theater, London, 1852; with the exception of a year (1855-58) in the U. S., has remained in Great Britain, playing chiefly in London. In 1863 he married Mrs. Charles Young, the actress. Among the parts played by him are Hamlet, Macbeth, Othello, Shylock, Marc Antony, Dan'l Druce in Gilbert's drama of that name, De Taldé in *The Danicheffs*, and Dr. Primrose in Wills's drama of *Olivia*.

Viaduct [Lat. *via*, way, road + *ducus*, a leading, deriv. of *du cere*, lead]: a structure by which a road is carried over a valley, the word being usually restricted to the case of a deep valley where the piers are a more prominent feature than the bridge proper. In such cases the bridge spans are short in order that they may be erected without other false works than the piers themselves afford. On account of the height of the piers they were formerly built of timber, but iron or steel is now employed. Until the construction of the Pecos river viaduct in 1892, the Kinzua viaduct on the New York, Lake Erie and Western Railway, in the northern part of Pennsylvania, built in 1882, was the highest in the U. S. The roadway is 302 feet above the water of the creek, while the tallest pier is 297 feet high, and the total length is 2,052 feet, divided into 21 spans. The Kentucky river bridge on the Cincinnati Southern Railway is 275 feet high, and has only three spans, although the total length is 1,238 feet; it was erected without false works in 1875. The Pecos river viaduct on the Southern Pacific Railway, completed in 1892, is 2,180 feet long, and has 48 spans; the roadway is 328 feet above the surface of the stream, 26 feet higher than the Kinzua viaduct; most of the spans are plate girders, but the channel span is a cantilever structure 185 feet in length. Other large iron viaducts are those at Malleco, in Chili, 1,140 feet long and 250 feet high; at Loa, in Bolivia, 800 feet long and 336 feet high; and at Garabit, in France, 1,852 feet long and 406 feet high. The last has an arch for its principal span. (See BRIDGES.) At Souleuvre, in France, is a stone viaduct 1,200 feet long and 247 feet high.

MANSFIELD MERRIMAN.

Viardot, vē'ār'dō', LOUIS: journalist and art critic; b. at Dijon, France, July 31, 1800; studied law in Paris; engaged in journalism; was manager of the grand opera from 1838 to 1841; founded in 1841 the *Revue Indépendante* in connection with George Sand and Pierre Leroux; visited most of the European capitals in company with his wife, the celebrated singer, Michelle Pauline Garcia. (See VIARDOT-GARCIA, MICHELLE PAULINE.) Besides numerous translations from the Spanish and Russian, he published *Études sur l'Histoire des Institutions et de la Littérature en Espagne* (1835); *Histoire des Arabes et des Maures d'Espagne* (2 vols., 1851); *Les Merveilles de la Peinture* (1868, seq.), of which a part, *Wonders of Italian Art*, was translated into English in 1870. D. in Paris, May 5, 1883.

Revised by A. G. CANFIELD.

Viardot-Garcia, MICHELLE PAULINE: opera-singer; b. in Paris, July 18, 1821; daughter of MANUEL GARCIA (*q. v.*); became proficient in modern languages and the practice of

the fine arts, especially music, which she began to study when very young. She visited England, the U. S., and Mexico with her parents, returning to Europe in 1828. Having studied pianoforte-playing under Meysenberg and later under Liszt, she appeared at the concerts of her sister, Madame Malibran. After her father's death she lived in Brussels with her mother, continuing her studies, and in 1839 made her *début* in London in *Otello* and *La Cenerentola*. Her appearances in subsequent years at Paris, Vienna, St. Petersburg, and other European cities were occasions of triumph. She created the part of Valentine in *Les Huguenots* and that of Fidès in *Le Prophète*. Her voice was a mezzo-soprano, having a compass of three octaves. She retired in 1862. She has written some important compositions, including *L'Ogre*, produced at Baden, 1868, and *Le Dernier Magicien* (1869). In 1840 she married LOUIS VIARDOT (*q. v.*).

Viareggio, vē-ā-red'jō (anc. *Viaregium*): town; province of Lucca, Italy; on the seashore, 13 miles by rail N. N. W. of Pisa (see map of Italy, ref. 4-C). A century ago Viareggio was a small, unhealthy hamlet, containing about 300 inhabitants; now it is one of the most salubrious and frequented bathing-places of the Peninsula. This change is due to the hydraulic operations of the engineer Zendrini, who drained the stagnant pools which had poisoned the air of the neighborhood, and thereafter its advantages as a place for sea-bathing attracted attention. The accommodations for visitors are excellent, and the constant agitation of the water at this point on the coast is believed to add to the efficacy of the baths. The Ospizio Marino is a charitable establishment intended for poor children of scrofulous constitutions, and it receives from 400 to 500 every season. There is considerable activity in the docks of Viareggio, but the land here is said to advance on the sea at the rate of 6 feet a year from the deposits of the Arno, Serchio, and Magra. Pop. 9,570. The baths are annually visited by about 10,000 strangers. Revised by M. W. HARRINGTON.

Viaticum [= Lat., traveling-money, provision for a journey, liter., neut. of *viaticus*, pertaining to a journey, deriv. of *via*, way, journey]; in the Roman Catholic Church, the Eucharist as administered to a dying person. If life be prolonged, the viaticum may be repeated from time to time, if so desired by the sick person, provided the mental faculties are preserved. In the early Church the term was applied both to baptism and the Lord's Supper, and sometimes even to absolution and reconciliation. J. J. KEANE.

Viát'ka, or **Vyatka**: a northeastern government of European Russia; bounded by Vologda, Perm, Ufa, Kazan, Nijni-Novgorod, and Kostroma. Area, 59,117 sq. miles. The Kama and Viatka are navigable streams. The eastern part is occupied by spurs of the Ural Mountains, the other parts are level or undulating. Lakes and marshes are numerous; three-quarters of the area are covered with forests of fir, pine, and birch. The soil is fertile, especially in the southern valleys, producing rye, barley, oats, buckwheat, and potatoes. Cattle-breeding and horse-raising are largely carried on. The manufactures include iron, chemicals, glass, soap, cotton, and paper; timber and other raw produce are exported. Pop. (1890) 3,020,700, more than 80 per cent. Great Russians, the rest aborigines, Tartars, and about 100,000 Mohammedans. HERMANN SCHOENFELD.

Viátka: capital of the government of Viatka; on the Viatka, a tributary, through the Kama, of the Volga, 280 miles N. E. of Nijni-Novgorod (see map of Russia, ref. 6-G). It has several educational institutions, insignificant manufactures, but carries on an active trade in grain, leather, tallow, soap, wax, timber, iron, and furs. There are eighteen churches (among them a cathedral with an altar of solid silver), a gymnasium, and a seminary. Pop. (1888) 25,702. H. S.

Viand, LOUIS MARIE JULIEN: See LOTI, PIERRE.

Viazem'skii, PETR ANDREEVICH, Prince: writer; b. in Moscow, Russia, July 24 (n. s.), 1792. Shortly after graduating at the University of Moscow he served in the defense of his country against Napoleon, and was present at the battle of Borodino, where he had two horses killed under him. In 1824 he became an editor of the *Moscow Telegraph*, and in the following years he was intimate with the brilliant circle of which Pushkin was the center. In 1846 he entered the Government service; in 1855 was made assistant of the Minister of Public Education. D. Nov. 10, 1878. While still a child he wrote verses and began an active literary career that

lasted nearly seventy years. As a poet he showed graceful fancy, with fine command of language; as a satirist he attacked with great skill and success the prevailing absurdities of his time. He also wrote critical essays on literature. His complete works (10 vols.) were published in Moscow in 1889.

Vibert, vé bār', JEHAN GEORGES; genre-painter; b. in Paris, Sept. 30, 1810; pupil of Picot and Barrias; received medals at the Salons of 1861, 1867, and 1868, and a third-class medal at the Paris Exposition of 1878; became officer of the Legion of Honor 1882. He is fond of painting priests and Spanish scenes, and his pictures are often satirical. He is an excellent technician, and his drawing is correct and exact in detail, but his color is sometimes crude. *The Grasshopper and the Ant* (1875); *Committee on Moral Books* (collection of Mrs. W. H. Vanderbilt, New York); *Spanish Diligence Station* and *The Missionary's Story* (1888) are among his best-known works. He paints cleverly in water-colors. His studio is in Paris.

WILLIAM A. COFFIN.

Viborg: one of the oldest towns of Denmark, on a small lake nearly in the center of Jutland. It has a cathedral, carries on some manufacturing industry on a small scale, and has a general trade. Pop. (1890) 8,352.

Vibration: the rapid reciprocating movement consequent upon the tendency of a body, or parts of a body, disturbed from a position of equilibrium, to recover that position again; such are the rapid motions of a tuning-fork or tightened string. Sound is due to the vibrations of air, etc., while light is due to vibrations of ether. See ACOUSTICS, LAURE, and WAVES.

Vibroscope [Lat. *vibrare*, vibrate + Gr. σκοπεῖν, view, observe]; an instrument, invented in 1840 by Dubanel, for registering the vibrations of a sounding body graphically on smoked paper. See also STROBOSCOPE.

Viburnum [= Lat., wayfaring-tree, which belongs to this genus]; a genus of shrubs and trees of the family *Cuprifoliaceae*. It includes about eighty species, mostly natives of the north temperate zone, some occurring in the Andes of South America, and a few in the West Indies and Madagascar. They have opposite, simple leaves, corymbose or thyrsoid inflorescence, rotate or short-tubular corolla, five stamens, one to three celled ovary, and solitary ovules. About a dozen species are natives of the U. S., including *V. prunifolium* (black haw) and *V. lentago* (sheep-berry), both with sweetish edible berries, and *V. opulus* (the cranberry-tree), with sour edible berries. A cultivated form of the last named is the well-known SNOWBALL (*q. v.*). Several species are in common cultivation as ornamental shrubs.

CHARLES E. BESSEY.

Vicar: See PARSON.

Vicar-apostolic: a person generally in episcopal orders, of some see in *partibus infidelium*, who holds from the pope episcopal authority over a district known as a vicariate-apostolic, usually an inchoate, new, and temporary, or a disordered and suppressed diocese. Missionary dioceses are usually vicariates-apostolic, and as such must report to the College of the Propaganda. In 1838 the difficulties between the King of Portugal and the pope with regard to the East Indian bishoprics led to the abolition of nearly all of them, and the substitution of vicariates-apostolic.

Vicar-capitular: the administrator of a diocese, chosen by the chapter in case of a vacancy. He can perform acts for the government of the diocese, but has no episcopal authority.

Vicar-forane [Lat. *vicarius*, vicar + Late Lat. *foraneus*, situated outside, rural, liter., situated out of door-]; the delegate of a bishop who exercises certain episcopal rights in a part only of the diocese. (See VICAR-GENERAL.) Not all dioceses possess such officers. They do not exist in the Roman Catholic dioceses of the U. S.

J. J. K.

Vicar-general: an officer under a bishop, who as the representative of his superior exercises authority in all parts of the diocese. Every Roman Catholic bishop is expected to appoint a vicar-general, and some dioceses have two or more. Sometimes the jurisdiction is divided, and one vicar-general is appointed for spiritual, another for temporal matters.

J. J. K.

Vicars, JOHN; preacher and author; b. in London, England, in 1582; educated at Christ's Hospital, London, and Queen's College, Oxford; was for many years an usher of Christ's Hospital, a Presbyterian preacher, and a violent

writer on religious and political subjects. He was the author of *Jehova's Birth, God in the Mount; or, England's Remembrance* (1611); *God's Arke overlapping the World's Waves* (1616); and *The Burning Bush not Consumed* (1616), which were published together under the title of *Magnalia Dei Anglicani, or England's Parliamentary Chronicle* (1616); a curious book on *Prodigies and Apparitions* (1613); *England's Worthies* (1617); and other works. D. in 1652.

Vice-admiral: formerly the second in rank of the line officers in the U. S. navy. This rank, as well as that of admiral, was created in 1861 as a reward for war service, and was held by David D. Porter and Stephen C. Rowan. The vice-admiral's pay at sea was \$9,000 a year, on shore duty \$8,000, and while awaiting orders \$6,000. The offices of vice-admiral and admiral in the U. S. navy were abolished by the operation of law when the places became vacant by death. The distinction that prevailed in the British navy of vice-admirals of the red, the white, and the blue, has been abolished. See ADMIRAL.

Vicente, vîc-sen tã, GIL; the founder and most noted representative of the Portuguese drama; b. in 1470. He was in the service of Queen Leonora, widow of John II., first as a goldsmith highly esteemed for his fine artistic work, then from 1493 also as poet of the court. In the latter capacity he composed, between the years 1502 and 1536, a considerable number of dramatical plays, of which only forty-two have been preserved, consisting of religious pastoral plays, comedies, and festival plays. Though they plainly show the influence of Juan de la Encina, the father of the Spanish drama, they are far superior to the latter's works, both for originality of invention and for artistic merit. Inasmuch as Vicente wrote more than half of his plays in Spanish, which was the favorite language of the Portuguese court, he deserves a prominent place in the history of the earlier Spanish drama, upon which he no doubt exercised considerable influence, his works being known and performed in Spain as well as in Portugal. Gil Vicente's plays are thoroughly national in character, embodying the poetical forms, the ideas, and traditions of the Portuguese people, and preserving in the lyric poems introduced into them, valuable specimens of the oldest popular lyric poetry of the north-western part of the Spanish Peninsula. With Camoens and Almeida-Garrett, Vicente stands foremost among the national poets of eminence that Portugal has produced. The best edition of his works is still that of Barreto Feijo and Monteiro (3 vols., Hamburg, 1834). Some valuable contributions to his biography were made by Th. Braga in the journal *O Positivismo*. D. probably at Evora between 1536 and 1540.

HENRY R. LANG.

Vicenza, vîc-çent zã; capital of the province of Vicenza; in Northern Italy; on the river Bacchiglione and near Monte Berico; 12 miles by rail W. of Venice (see map of Italy, ref. 3-D). Vicenza is known for its palaces constructed by Palladio, a native of the town (1518-80), which, though condemned by critics and somewhat fallen into decay, are justly admired for their proportions and decorations. The cathedral has pictures and terra-cottas, and is of fifteenth century Gothic. San Lorenzo is a fine Gothic edifice with modern restorations. La Santa Corona, also Gothic, has remarkable sepulchral monuments. There is a good collection of pictures in the magnificent Pinacoteca Civica. The sanctuary on Monte Berico is approached by an arcade of 168 arches, contains some good pictures, and is visited for the sake of its beautiful view, which embraces a wide range of Alpine peak and fertile plain. At the foot of Monte Berico is the stripped and mutilated villa of Palladio, once one of the most splendid monuments of modern architectural art, and still retaining its fine proportions and most important features. Vicenza is well provided with educational institutions, and has manufactures of silk, linen, earthenware, and paper. Pop. 27,700. Revised by M. W. HARRINGTON.

Vicenza, DUKE OF: See CAULAINCOURT, ARMAND AUGUSTIN LOUIS, de.

Vice-President: an officer of the U. S. Government, chosen at the same time and in the same manner as the President. (See the article CONSTITUTION, Twelfth Amendment.) His only official duty is to preside over the Senate. In case of a failure of the electors to choose a Vice-President, a majority of the votes of the Senators (a quorum of two-thirds being present) will elect him; or if there be no majority, he is chosen from the two candidates who have

received the highest number of Senatorial votes. In case of a vacancy in the presidency he becomes President of the U. S. As president of the Senate he has a casting vote in case of a tie. His salary is \$8,000 a year.

Vieh, or **Vique**, *veek*: town; province of Barcelona, Spain; at the foot of the Pyrenees, 40 miles N. of Barcelona (see map of Spain, ref. I3-K). It has cotton and flax-weaving factories, tanneries, potteries, and other manufactures; its sausages are well-known. The cathedral, begun in 1040, with alterations made in the eighteenth century, has fine Gothic cloisters. Pop. (1887) 11,640.

Vichy, *vee shee'*: town; department of Allier, France; on the Allier, nine hours by rail from Paris (see map of France, ref. 6-G). It is beautifully situated, and is celebrated for its mineral springs and bathing establishments. The mineral waters are both hot and cold, and are alkaline, containing chiefly sodium carbonate. They are charged with carbon dioxide. The waters are valued for diseases of digestion, and about 2,250,000 bottles are shipped annually. The celebrity of the place dates from the times of the Romans, but its modern reputation resulted from the visits made to it by Napoleon III. Pop. (1891) 10,605, which is increased to 40,000 during the season.

Vicksburg: city (founded in 1826); capital of Warren co., Miss.; on the Mississippi river near its junction with the Yazoo, and on the Queen and Cresc. Route and the Yazoo and Miss. Val. Railroad; 45 miles W. of Jackson, the State capital, and 235 N. W. of New Orleans (for location, see map of Mississippi, ref. 7-E). The city forms an irregular parallelogram of $1\frac{1}{2}$ sq. miles, and occupies the summit and slopes of a lofty range of hills. The site is highly picturesque, and the city has many fine drives, including one to the National Cemetery, where 17,000 Union dead are buried. Among the public buildings the U. S. Government building and the county court-house are imposing edifices. There are 7 churches for white people—2 Protestant Episcopal, 2 Methodist Episcopal, a Roman Catholic, a Baptist, and a Presbyterian—and several for Negroes. The public-school system comprises a high school and 3 grammar school buildings, property valued at over \$35,000, an enrollment of over 2,000 pupils, and an annual revenue of over \$25,000. There are 2 Roman Catholic parochial schools, liberally endowed and with fine buildings, St. Francis Xavier's Academy, and St. Aloysius's commercial college. The principal benevolent institution is the Charity Hospital, maintained at an annual cost of \$12,000.

The city is lighted with gas and electricity, and has an improved system of water-works, affording an abundant supply under high pressure. The annual revenue is about \$150,000; expenditure, \$145,000; total debt (1895), \$517,000; and assessed valuation (one-half actual value), about \$5,000,000. There are 2 national banks and 3 State banks with combined resources of \$2,525,000. The city has a board of trade and a cotton exchange, both influential bodies. About 60,000 bales of cotton are here shipped annually, besides large quantities of lumber, cottonseed oil and cake, and general produce. There are extensive railway-shops, 3 cotton-oil mills, and many smaller industries.

Vicksburg suffered severely during the civil war. In 1876 the river cut through a neck of land, leaving the city on an inland lake. Since then the U. S. Government has been carrying on operations to divert the Yazoo river past the city and to restore the harbor, at an estimated cost of \$1,250,000. Pop. (1880) 11,814; (1890) 12,353; (1895) estimated, with suburbs, 20,000. J. F. BATTLE.

Vicksburg, Campaign and Siege of: military operations which took place during the civil war in the U. S. After the capture of New Orleans (Apr., 1862) Vicksburg was the only strong point on the Mississippi held by the Confederates. It was well provided with batteries on the river front and along the Yazoo up to Haines's Bluff. Subsequently a continuous line of works was constructed in rear of and surrounding the city. On May 18, 1862, Flag-Officer Farragut, coming up the river, demanded the surrender of Vicksburg, which was refused. He returned on June 26 with Flag-Officer Porter's mortar flotilla, whereupon the bombardment of the city began and was continued until about July 22. On June 28 Farragut ran past the batteries with two ships and five gunboats, and on July 1 was joined above the city by Capt. Charles H. Davis with his fleet, which had come down from Memphis. A land force under Gen. Thomas Williams, of about 3,000 men and 1,200 Negro laborers, was meanwhile trying to cut a canal,

for the passage of gunboats and transports, across the peninsula opposite Vicksburg; but before its completion a rise in the river destroyed all that had been done. On the night of July 15 Farragut's fleet ran down past the batteries, engaging them and the ram *Arkansas* on the way, and on July 27, having taken Williams's troops on board, withdrew to Baton Rouge and New Orleans. On the same day Davis's fleet went up the river to Helena, and the first attack was ended. The Confederate reports state that comparatively little damage was done by the bombardment. On Nov. 26, 1862, Gen. Grant started from Grand Junction, intending to advance along the Yazoo and attack Vicksburg from the rear; but on Dec. 20 Gen. Earl Van Dorn captured his *dépôt* at Holly Springs and compelled his withdrawal. Gen. William T. Sherman, however, starting from Memphis on Dec. 20, moved down the river and on the 29th assaulted Chickasaw Bluffs, but was repulsed with much loss by Gen. John C. Pemberton, who was in command at Vicksburg. Sherman withdrew to Millikin's Bend, and was relieved by Gen. McClelland, Grant subsequently taking command in person. Grant, wishing to get a footing on the high ground in the rear of Vicksburg which touches the river below the city, made an attempt to cut a canal near the one previously begun by Williams, and afterward tried to find a water-route through the bayous, lakes, etc., on both the right and left banks of the river, by which he could move his army, on transports, below or in rear of the city. He failed in all these, but as the river fell enough to make the roads passable, he marched his army by land on the right bank to De Schroons, where on Apr. 30 it embarked on the fleet which under Porter had run down past the batteries of Vicksburg on Apr. 16, and bombarded Grand Gulf Apr. 29. Grant moved down the river, landed at Bruinsburg, and marched toward Jackson, severing his connection with the river on May 11. The battle of Raymond was fought and won on the 12th. Jackson was captured on the 14th, and the battles of Champion Hill and Big Black River were won on the 16th and 17th respectively. On the 18th Grant was in front of Vicksburg with his communications re-established. On the 19th he made an assault which gave him a better position, and on the 22d a general assault was made which was repulsed with great loss. The regular siege then began and continued until the city surrendered on July 4, 1863. The total force surrendered by the Confederates was over 31,000 men and 172 guns; their previous losses during the campaign and siege exceeded 10,000 men and 90 guns. Grant's total losses in this campaign and siege were about 10,000 men; his total force near Vicksburg was between 60,000 and 70,000 men. The fall of Vicksburg was followed on July 9th by that of Port Hudson. This opened up the Mississippi, and on July 16th the steamer *Imperial* arrived at New Orleans from St. Louis. Although the banks of the river were at times occupied by guerrillas and cavalry raiders, no serious interruptions to its commerce were caused by the Confederates after this date, and the Confederate States on the west were separated from those on the east up to the close of the war.

JAMES MERCUR.

Vico, *vee kō*, FRANCESCO, *dj*: astronomer; b. at Macerata, Naples, May 19, 1805; was director in 1839 of the observatory of Rome; discovered several comets, and acquired celebrity by his observations of the spots of Venus; was expelled with the other Jesuits from Rome in 1848; died in London, Nov. 15, 1848. Revised by S. NEWCOMB.

Vico, GIOVANNI BATTISTA: jurist, philosopher, and critic; b. in Naples, June 23, 1668; was educated by the Jesuits; studied law; lived for several years in the house of the Bishop of Ischia as tutor to one of his nephews; was appointed Professor of Rhetoric at Naples 1697, and in 1735 royal historiographer. D. in Naples, Jan. 20, 1744. His great work, *Principi di una Scienza Nuova d'intorno alla Comune Natura delle Nazioni*, appeared at Naples in 1725, and in enlarged editions in 1730 and 1745. It represents Divine Providence as the governing power in the history of mankind, and demonstrates the formation, development, and decay of nations as realizations of ideas pre-existing in the Divine Mind. It is often obscure, but it is as often bold and striking, anticipating the results of later researches; and it exercised great influence when, in the beginning of the nineteenth century, it became thoroughly known in Europe, introduced in Germany by Weber, in France by Michélet. Complete editions of his works were published by Villa Rosa (1818) and Ferrari (1834). See Flint's *Vico* (Edinburgh and London, 1884). Revised by S. M. JACKSON.

Vico Equense.—*ŭ-kwen sŭ* (anc. *Vicus Æquensis*); town; province of Castellamare, Southern Italy; about 4 miles S. W. of the town of Castellamare; on a rocky cliff that overlooks the Bay of Naples and commands magnificent views of Vesuvius, Naples, and the neighboring islands. It was built by Charles of Anjou about 1300, and was afterward a favorite resort of the Aragonese princes, but the numerous remains of ancient constructions found near it prove that it once had a dense population. Vico Equense is noted for its wines and rich fruits. Pop., with commune, 10,940.

Revised by M. W. HARRINGTON.

Victor [= Lat., liter., conqueror, victor, deriv. of *vincere*, *victum*, conquer]; the name of three popes. **VICTOR I.** reigned, according to some, 185-197; according to others, 187-200, or 190-202. He was an African by birth, and showed something of the temper of his native climate in the paschal controversy, threatening to excommunicate all bishops who would not accept the Roman computation of Easter. The harshness of such a measure was condemned by many Western bishops, and he was finally induced by Irenæus to refrain from carrying it out. The epistle of the latter concerning the case has been preserved by Eusebius. Pope Victor was also involved in the Monarchian controversy and excommunicated Theodotus, the leader of the Monarchians.—**VICTOR II.**, a German whose real name was Gebhard, reigned 1055-57, was a relative and intimate friend of Henry III., and Bishop of Eichstätt before his election to the papal see, but accepted nevertheless the ideas of Hildebrand concerning simony and the marriage of priests, holding several councils against these practices.—**VICTOR III.** (1086-87) was abbot of Monte Cassino when the dying Gregory VII. recommended him to the cardinals as his successor. A year elapsed, however, before he consented to accept the election. During the half year of his pontificate he was faithful to the spirit of Gregory's policy.—Two antipopes have borne the name of Victor IV., but neither was of much importance.

Revised by F. M. COLBY.

Victor, AURELIUS: See AURELIUS VICTOR.

Victor, CLAUDE PERRIN, Duke of Belluno; general; b. at Lamarche, department of Vosges, France, Dec. 7, 1764; entered the army in 1781; was created a brigadier-general in 1793 for bravery at the siege of Toulon, general of division in 1797, marshal and duke after the battle of Friedland, and after the Treaty of Tilsit, governor of Berlin; commanded in Spain from 1809 to 1812, where he gained the victories of Ucles and Medeflin, but was defeated at Talavera; fought with distinction in the Russian and German campaigns 1812-14; adhered to the Bourbons during the Hundred Days, and became afterward conspicuous on account of his harshness toward those generals who returned to Napoleon; was Minister of War from 1821 to 1823; accompanied in the latter year the French army to Spain as commander under the Duke of Angoulême, but was recalled on account of suspected connivance at the fraudulent contracts obtained by Ouvrard for supplying the army. He was major-general of the Royal Guard at the time of the Revolution of 1830, but afterward lived in retirement. D. in Paris, Mar. 1, 1841.

Victor, CLAUDIUS MARIUS; Christian poet of the fifth century; b. in Marseilles. His poem entitled *Alabina*, in three books, is a rendering into verse of the first nineteen chapters of Genesis, interspersed with various reflections and digressions, showing considerable power of imagination and expression. The best edition is by C. Schenkl (Vienna, 1888).

M. W.

Victor Amadeus, the name of three sovereigns of the house of Savoy, of whom the first bore the title of Duke of Savoy, the last two that of King of Sardinia. **VICTOR AMADEUS I.**, b. May 8, 1587, succeeded his father, Charles Emmanuel the Great, as Duke of Savoy in 1630; was forced by Richelieu into an alliance with France against Austria and Spain; gained the victories of Fornaveno and Montebaldone, but died at Verceil, Oct. 7, 1637.—**VICTOR AMADEUS II.**, b. May 14, 1666, a grandson of the preceding, succeeded his father, Charles Emmanuel II., in 1675, and married in 1684 Anne Marie of Orleans, a niece of Louis XIV. Nevertheless when Louis sought to reduce Savoy to the position of a vassal state, Victor Amadeus joined the Augsburg League against him, and although Catinat overran both Savoy and Piedmont after the battle of Marsaglia (Oct. 4, 1693), in which the duke lost 10,000 men, he still kept up the contest, and compelled Louis XIV. to buy him off by returning to him important territories and paying a handsome sum of

money. After the peace his eldest daughter was married to the Duke of Burgundy, by whom she became mother of Louis XV., and the younger to Philip of Anjou, afterward King of Spain. In the Spanish war of succession, however, the duke allied himself again with Austria. His country was the scene alternately of the exploits of Eugene and Vendôme, but by the Peace of Utrecht (1713) he recovered all his possessions, and in addition received Sicily and the title of king. In 1720 he exchanged Sicily for Sardinia, and on Sept. 2, 1730, abdicated. Next year he made an attempt to regain the royal power, but was imprisoned at the château of Moncalieri, where he died Oct. 31, 1732.—**VICTOR AMADEUS III.**, b. June 26, 1727, a grandson of the preceding, succeeded his father, Charles Emmanuel III., in 1773; declared war against the French republic, but was compelled by Scherer and Bonaparte to accept the Peace of Paris (1796), by which he lost Savoy and Nice. D. Oct. 16, 1796.

Revised by F. M. COLBY.

Victor Emmanuel I.: King of Sardinia (1802-21); b. July 24, 1759, the second son of Victor Amadeus III.; ascended the throne on the abdication of his brother, Charles Emmanuel IV., June 4, 1802, and resided at Cagliari till 1814, his possessions on the mainland being occupied by the French. By the Congress of Vienna his hereditary lands were restored to him, and the duchy of Genoa was added to his dominions; but the reactionary measures he introduced caused a violent revolution, and he abdicated Mar. 13, 1821, in favor of his brother Charles Felix. D. at Moncalieri, Jan. 10, 1824.

Victor Emmanuel II.: King of Sardinia from 1849 to 1861, and thereafter King of Italy; b. at Turin, Mar. 14, 1820, the eldest son of Charles Albert; received an excellent education, both scientific and military; married (Apr. 12, 1842) Archduchess Adelheid of Austria; commanded the Savoy brigade in the campaigns against Austria in 1848-49, and distinguished himself by his brilliant personal valor in the battles of Goito and Novara. On the very evening of the disastrous battle of Novara (Mar. 23, 1849) Charles Albert abdicated in favor of his son, and Victor Emmanuel ascended the throne under very critical circumstances. Peace had to be bought of Austria with great pecuniary sacrifices, and in the interior the state was divided into many contending political factions. The young king himself was as yet by no means popular. As the husband of an Austrian princess and a pupil of the Jesuits he had to earn the confidence of his subjects. Nevertheless, from the very first day of his reign the policy which he adopted, and which he invariably pursued, though at times it led him into very strange combinations, tended toward the establishment of the national unity of Italy and the elevation of the Italian people through free institutions. Supported by his celebrated minister Cavour (*q. v.*), he succeeded in restoring the finances to order, reorganized the army, concluded commercial treaties with foreign powers, limited the privileges of the clergy, secularized the Church property, and established a system of popular education independent of the control of the Church. The pope excommunicated him, but all intelligent men in Italy began to look on him as the coming liberator, the more so that he with great boldness gave all political refugees from the other Italian states an asylum in his dominions. By his participation in the Crimean war he secured for the kingdom of Sardinia a recognition as part of the political system of Europe, and finally, in 1859, he was able to renew the contest with Austria by the aid of France. By the Treaty of Villafranca (July 11) and the Peace of Zurich (Nov. 10, 1859) Lombardy was added to his dominions. The aid of France was secured at the cost of Savoy and Nice, and in spite of Napoleon's promises Venetia still remained an Austrian province; but at the same time Parma, Modena, Tuscany, and parts of the Papal States annexed themselves to Sardinia; and soon afterward the campaign of Garibaldi in Sicily and Naples produced the same result with respect to the whole southern part of Italy. On Mar. 17, 1861, Victor Emmanuel assumed the title of King of Italy, and early in 1865 the royal residence was removed from Turin to Florence. Meanwhile the situation continued to be very difficult. Venetia and Rome were still wanting, and great success had at once made the Italian people very impatient and the relations to other powers, even to France, very delicate. As France was not likely further to support the Italian movement, Victor Emmanuel sought and found an ally in Prussia; and although the Italians lost the battle of Custoza (June 24, 1866), by

the Peace of Vienna (in October) Austria ceded Venetia. When, during the Franco-German war, the French garrison was withdrawn from Rome, the city annexed itself by a popular vote to Italy, and on July 2, 1871, Victor Emmanuel entered the city and took up his residence in the Quirinal Palace. By his first wife (d. Jan. 20, 1855) he had two sons—Humbert, his successor, and Amadeus, for a time King of Spain; and two daughters—Clotilde, married to Prince Napoleon, and Pia, married to the King of Portugal. He married,morganatically, Rosa Vercellana, Countess of Miraflore, D. in Rome, Jan. 9, 1878. Revised by F. M. COLBY.

Victoria: a British colony occupying the southeastern part of Australia; the first of the seven Australasian colonies in density of population, the fourth in order of establishment, and the sixth in area; triangular in form, with the apex at Cape Howe, and the base on the meridian of 141° E.; separated from New South Wales by the Murray river. Area, 87,884 sq. miles. It resembles California in many respects, but is only about half as large, with nearly double the density of population.

Coasts.—The coast-line is about 800 miles long, and there are few islands. Wilson's Promontory, the southernmost point of Australia, separates the waters of the Pacific from those of the Southern or Indian Ocean, and divides the coast-line of Victoria into two nearly equal but dissimilar parts. To the E. is a long, gentle sweep of low sandy shores, backed by low sandhills, behind which is a series of lakes and coastal lagoons, accessible to commerce only with difficulty and danger. The coast W. of Wilson's Promontory is divided by Cape Otway, the terminus of a bold mountain range, whose heavily timbered capes rise directly from the water. Nearly midway between the two capes is the narrow entrance of Port Phillip Bay, giving admission to Melbourne on the Yarra Yarra river, 4 miles from the head of the bay. The bay is about 40 miles long by 30 broad, and has abundantly deep water and several ports on its shores. Melbourne, the capital of the colony, is accessible to vessels drawing 19 feet of water. E. of Port Phillip Bay is Western Port, a large shallow bay, half filled by Phillip and French islands, and of little use for navigation. W. of Cape Otway the coast is generally bold.

Surface.—The eastern part is mountainous, with plains along the coast, and the western part is an extended plain. The Australian Alps enter the colony near the head of the Murray river, coming from New South Wales, where they culminate. The highest point in Victoria is Mt. Bogong, 6,508 feet, and there are nearly a score of peaks with elevations of more than 5,000 feet. It is a wild complex of ranges, generally covered with dense vegetation, including the enormous tree-growths for which Victoria is famous, for the most part nearly impassable, and to a great extent still unexplored. These mountains produce a series of plateaus whose elevation gives them a more temperate climate than belongs to the latitude, and which form attractive agricultural lands where not too wild for settlement. Westward from the Alps extends the Dividing Range, 1,500 to 3,000 feet high, passing in the western part of the colony into the Australian Pyrenees, and terminating in several cross-ranges, of which the Grampians are the last and highest (Mt. William, 3,600 feet). To the S. of the Pyrenees are the mountains of Cape Otway, wild and picturesque, reserved by the state because of their forests. The western plains are slightly undulating, with open, grassy timberlands in the S., but in the N. flat, dry, often sandy, in some places bare, in others covered with a dense scrub.

Rivers.—The mountains just described form the watershed between the Murray basin and the direct coast drainage. The MURRAY RIVER (*q. v.*) is the principal stream of Australia. On the Pacific versant the most important stream is the Snowy river (300 miles long, 180 in Victoria). Farther W. a series of smaller streams drain the fertile Gippsland and terminate in the littoral lakes and lagoons already mentioned. The next largest coast river is the Glenelg (280 miles long), in the extreme west of the colony. The Victorian streams generally vary much with the season, and are subject to heavy annual overflows.

Climate.—In temperature and rainfall Victoria much resembles Central California. The worst season is the summer, when the heat is sometimes excessive, due to hot northerly winds, lasting only a day or two. The most agreeable season is the autumn. The mean temperature of Melbourne is 57° F.; the highest observed in the shade 111°, and the lowest 27°. The rainfall is greater in the E., and decreases

to the N. W.; it is greatest on the table-lands (40 inches), and falls to 10 inches or less on the lower Murray. Snow is common in the mountains, but very rare at sea-level, and has been observed only twice at Melbourne. The average annual rainfall at Melbourne is 25 inches.

Flora and Fauna.—The dominating forest forms are the gum-trees of the genus *Eucalyptus*, and the *E. amygdalina* in the mountains attains an enormous size, surpassing the big trees of California. In some districts the trees are said to average 300 feet in height. The largest recorded is one found prostrate, which measured 470 feet in length, and 81 feet in girth near the roots. These trees have a white, slender, smooth trunk, running up 60 or 70 feet to the first branch, and a forest of them has a singular and beautiful appearance. There are many species of *Eucalyptus*, and they vary greatly in size and in qualities. The dense "mallee" scrub, which covers many thousand acres in the N. W., is formed by the *E. dumosa*. The blue-gum is the species now generally introduced into warmer America and Europe. The red-gum, or "hardwood," makes a highly prized lumber, because it is almost unaffected by atmospheric humidity or fresh or salt water. The myrtle family has many other species, and other characteristic plants are acacias, casuarinas, and tree-ferns.

The native mammals are of the Australian marsupial type—the kangaroo, wallaby, wombat, bandicoot, and opossum. The birds and reptiles are numerous, and some species of the latter are venomous. Many European species have been introduced, and have promptly become perfectly acclimated. The rabbit has found itself so much at home and multiplied in such prodigious numbers as to have become a serious pest. The camel has been found well adapted to the interior plains, the African ostrich seems to prosper, and the Asiatic elephant has been imported. The trout has been acclimated, and has taken possession of some of the streams.

Mining.—This colony leads the seven Australasian colonies in the production of gold, of which it has furnished nearly two-thirds of the entire Australian output, but of late years the Queensland annual production of this metal has nearly equaled the Victorian. The Victorian product in 1895 was 740,085 oz., valued at £2,960,340. The total production to the end of 1895 was 60,198,372 oz., valued at £240,793,000. The number of gold-miners in 1895 was 29,897, of whom 2,014 were Chinese. The mining was at first in surface placers, but for alluvial mining it is found necessary to sink shafts to the beds of ancient rivers. Quartz-mining is gradually taking the place of alluvial, but with increase of depth the profit is steadily diminishing. The auriferous fields of Victoria occur over the area bounded on the W. by the Avoca river and on the S. by the parallel of Melbourne. Over the area thus defined the fields are thickly distributed, and fully one-third of the colony is believed to be capable of gold production. Great discoveries of coal were announced in 1894, and it is hoped that the colony can soon furnish what is needed for her own consumption. The deposits of iron have attracted some attention, and small quantities of other minerals are found.

Agriculture.—About 20 per cent. of the colony is considered suitable for tillage, and 28 per cent. for grazing. Only about 5 per cent. of the entire acreage has been alienated. The number of cultivated holdings in 1893-94 was 34,547. The chief crops, in the order of their importance and with the yield to the acre, for 1894 were: Wheat, 10·4 bush.; hay, 1·2 tons; oats, 22·6 bush.; barley, 20·5 bush.; potatoes, 3·5 tons. Tobacco is cultivated to a considerable extent. In 1894 the vine covered 32,327 acres, and, though the phylloxera has been introduced, the wine product was in considerable quantity and fine quality. The fruits of Europe have been introduced, and most of them are productive.

On Mar. 31, 1894, the colony was estimated to possess 463,903 horses, 1,817,291 horned cattle, 13,098,725 sheep, and 328,162 swine. Victoria is the most closely stocked of the seven colonies. Its wool brings a higher price than that of the others, and it devotes more attention to dairy products than any other except New Zealand.

Extensive districts of the colony do not receive sufficient rainfall for agriculture, and irrigation has been extensively tried by private enterprise, especially in the basins of the Goulburn, Loddon, Wimmera, and Avoca rivers. The most successful irrigation settlement is that of Mildura, in the Swan Hill district, on the Murray river, just below the Loddon. This was a desert and valueless tract until water was brought on it (from the Murray), when it was found to be

of extraordinary fertility. The settlement has (1894) about 3,500 inhabitants, devoted especially to the raising of grapes and manufacture of raisins. Its success has been noteworthy, but the expenditure required was very great.

Population.—The estimated population on June 30, 1896, was 1,177,114. At the census of Apr. 5, 1891, there were found 598,414 males and 541,991 females. In 1893 there were 36,552 births (of which 1,997 were illegitimate), 16,508 deaths, and 7,004 marriages. Of the population in 1891 63 per cent. were born in Victoria, 7 per cent. in other Australasian colonies, and 26 per cent. in the United Kingdom. The Chinese numbered 9,377, materially less than at the preceding census. The aborigines are of the Australian race. On the arrival of the first colonists they were variously estimated at from 6,000 to 15,000. In 1851 they numbered 2,693; in 1871, 1,330; in 1881 780; in 1891, 565.

About five-ninths of the population are in the towns, and in 1893 about two-fifths were in Melbourne. From 1838 to 1874 167,000 immigrants received aid from the public funds, but state-aided immigration ceased in the latter year. In 1893 there were 74,007 immigrants and 80,460 emigrants, a surplus of 6,453 of the latter. There is no state church, and no assistance from public funds is given to religious institutions. The Anglican Church embraces 37 per cent. of the population, other Protestant sects 38 per cent., Roman Catholic 22 per cent. Education is entirely secular, and primary education compulsory. There is a full complement of schools of all grades, and the percentage of illiteracy for all over 14 years of age is 2.3. Melbourne University is both an educational and examining body, with power to grant all degrees except in divinity. It was opened in 1855, and receives annually £13,750 from the public funds. It had 639 students in 1893. The public library at Melbourne has about 367,000 volumes and pamphlets, and at the beginning of 1893 there were in the colony 419 other public libraries, with an aggregate of about 560,000 volumes. In 1895 Melbourne had a population of 447,565; Ballarat, 45,326; Sandhurst, 42,381; Geelong, 24,575. No other town had 10,000 inhabitants.

Commerce.—Imports are subject to a heavy tariff, averaging in 1895 about 15 per cent. of their value. The total imports for that year (including bullion and specie) amounted to £12,472,344, almost exactly the same as in the preceding year, but £811,470 less than in 1893, and £9,239,264 less than in 1891. The chief articles of import are wool and woolen goods, cottons, sugar, coal, tea, live stock, timber, iron, and steel (in the order of importance). Nine-tenths came from the United Kingdom and the other colonies, about one-half from each. Less than 3 per cent. came from the U. S. The value of the exports was £14,547,732, a slight increase over 1894, but £1,459,011 less than in 1891. About half the exports go to Great Britain. The staple exports are wool (about 45,000,000 annually, but a part is from New South Wales) and gold (about £3,000,000 annually). Next in importance are wheat and its products, tallow, leather, and preserved and frozen meats. The value of the last has fallen off largely.

The registered shipping in 1894 consisted of 439 craft (157 steamers), aggregating 93,193 tons burden. In 1893 1,889 vessels entered and 1,887 cleared from the ports of the colony—about 20 per cent. less than for the year before. About 1,600 of these vessels entered and cleared at Melbourne.

The railways belong to the colony, and the network is the most complete of the seven colonies, besides connecting Melbourne with Sydney and Adelaide. On June 30, 1895, 3,120 miles of railway had been completed at a total cost of £37,909,626, nearly all borrowed money. The net profit for the year ending at that date was £1,038,918, or enough to pay 2.75 per cent. on the borrowed capital, drawing an average of nearly 4 per cent. There were 7,091 miles of telegraph line with 14,409 miles of wire; also 10,822 miles of telephone wire with over 4,200 telephones.

A branch of the royal mint was established at Melbourne in 1872, and from this down to the end of 1895 £67,055,209 worth of coin and bullion had been issued. Silver and bronze money are not issued here. During the first quarter of 1896 there were eleven banks of issue in the colony, with note circulations aggregating £986,761.

Administration.—The constitution dates from 1851. The legislative power rests in a parliament of two chambers—the legislative council, of 48 members, from whom a property qualification is required, elected for six years by special electors with either property or educational qualification; and a legislative assembly, of 95 members (1893), elected for

three years without special qualification by general suffrage of adult males. Clergymen are ineligible to either house. The executive power is vested in a governor appointed by the crown, and assisted by a cabinet of ten responsible ministers. Local government is representative, and ratepayers have a number of votes gauged by the rates paid.

The public revenue for the year ending June 30, 1896, was £6,361,142 and the expenditure £6,573,647, in both cases less than for the preceding year. The revenues are derived from the railways, the post, the telegraphs, from crown lands, and from taxation. The taxes include customs, excise, inheritance fees, stamp-duty, land-tax, etc., named in the order of their capacity for producing revenue. The chief expenditure is in payment of interest and other expenses due to the public debt. This on June 30, 1896, was £46,886,211, bearing an average interest of nearly 4 per cent. It was nearly all incurred for railways and other public works. The land force at the end of 1894 consisted of 5,388 men, of whom 391 were permanent, 3,197 militia, and the rest volunteers. The navy consisted of 1 ironclad, 2 steel and 3 iron gunboats, and a few torpedo-boats.

History.—Colonization began in 1826; Melbourne was founded in 1836; and the colony was erected at the expense of New South Wales in 1850. The discovery of gold in paying quantities in 1851 led to an enormous influx of population. Except for a somewhat painful recovery from the attack of "gold fever," the colony progressed steadily for the next forty years without especially noteworthy incidents, becoming eventually the leading colony in density of population and in wealth. The financial and commercial distress following 1891, which was more keenly felt in Australia than most other parts of the world, especially distressed Victoria, and most of all Melbourne, where there had been a systematic course of booming of real estate. As a result, increased attention has been directed to the colony's natural resources.

MARK W. HARRINGTON.

Victoria: capital of the British colony of HONGKONG (*q. v.*).

Victoria: capital and principal port of the state of Espirito Santo, Brazil; on a bay in lat. 20° 19' S. (see map of South America, ref. 6-11). The harbor, surrounded by precipitous hills, is safe and good, admitting vessels of 20 feet draught. The town is beautifully situated, but is hot and somewhat unhealthful. The principal exports are coffee and sugar. Victoria was founded in 1535. Pop. about 7,000. H. H. S.

Victoria: a town of the state of Pernambuco, Brazil; about 30 miles W. S. W. of the city of Pernambuco, with which it is connected by rail (see map of South America, ref. 4-11). It was named in honor of a victory gained there over the Dutch in 1645, and is the center of one of the richest sugar districts in the state. Pop. about 9,000. H. H. S.

Victoria: capital of Tamaulipas, Mexico. See CIUDAD VICTORIA.

Victoria: the capital of the province of British Columbia, Dominion of Canada; at the southeast extremity of Vancouver island, on the Strait of Fuca, in lat. 48° 27' N., lon. 123° 25' W. (see map of Canada, ref. 8-D). It is the southern terminus of the Esquimalt and Nanaimo and the Victoria and Sidney railways, and is only 3 miles from Esquimalt. Victoria has an inner and an outer harbor, the former being shallow, while the outer can accommodate the largest Pacific steamers. The climate resembles that of the southern part of England, but is more rainy in winter and drier in summer. Winters are not severe, and snow seldom lasts more than three or four days. The city, like most English towns, is built without reference to any plan, but possesses many wide streets, the business portion being well built and the suburbs being intersected with picturesque drives lined with handsome residences. Among the finest buildings are the Provincial Legislative Assembly (built at a cost of \$500,000), post-office, custom-house, supreme court-house, Government House, the official residence of the lieutenant-governor, the city-hall, the Roman Catholic Cathedral, the Protestant Orphans' Home (with extensive grounds), and the public schools. There are 5 Episcopal, 3 Presbyterian, 2 Methodist, 2 Roman Catholic, and 2

Baptist Churches. Free educational requirements are provided for by 1 high school and 8 ward schools, at which the average number of pupils attending during 1894 was 2,044. These schools are maintained out of the provincial and city funds jointly at an annual cost of \$50,000. Besides the above, there are 2 private colleges for boys and 3 private schools for girls. Among the charitable institutions are the Protestant Orphans' Home, the Home for the Aged and Infirm (maintained by the city), the Samaritan Home, the Refuge Home, the Provincial Royal Jubilee Hospital, erected in commemoration of Queen Victoria's "Jubilee," and now consolidated with the French Hospital and the St. Joseph's Hospital. The penal institutions consist of the city and provincial jails and a juvenile reformatory.

The financial position of Victoria on Dec. 31, 1894, was as follows: Receipts for 1894, \$342,935; expenditures, \$338,400; net debt due for loans raised under authority of all the various bylaws, \$1,874,000, bearing average interest of about 4½ per cent., while the property assessed for payment of taxes was valued at \$20,914,385, consisting of land valued at \$13,774,365 and improvements \$7,140,020. The city owns its own water-works and electric-light works, and its own isolation hospital for infectious diseases. There are 3 chartered banks, 1 savings-bank, and several incorporated loan and investment associations.

Among the business enterprises in the city are 4 lumber-yards, 4 sash and door factories, 2 tanneries, 4 breweries, 3 iron-foundries, 2 shipyards, 1 pottery, 4 book-binding establishments, 1 trunk-factory, 1 biscuit-factory, 2 electric-light works, 2 daily and 4 weekly newspapers, an electric tramway company operating 12 miles of road, gas-works, rice-mill, 2 flour-mills, chemical works, and 2 cold-storage warehouses. Lines of steamers ply fortnightly between Victoria and China and Japan, another line runs to Australia, a third plies bi-weekly to San Francisco, a fourth to Alaska, while there is a daily service between Victoria and New Westminster and Vancouver on the mainland of British Columbia (connecting with the Canadian Pacific Railway at Vancouver), and Seattle and Tacoma in the State of Washington.

On the confederation in 1871 Victoria ceased to be a free port, and annually contributes to the Dominion treasury \$1,800,000 for import duties.

History.—Victoria was originally simply a trading-post of the Hudson's Bay Company, established in 1843. Vancouver's island was leased by the crown to the company from 1848 to 1859; at the expiration of the lease the island became a crown colony with Victoria as its capital, and when the island united with the mainland in the formation of the colony of British Columbia in 1866 Victoria became the capital of the colony and was declared the capital of the Province of British Columbia on confederation with the Dominion of Canada in 1871. It first grew into importance on the discovery of gold in Cariboo. It was the headquarters of the Pacific sealing-fleet, wherein several thousand men were employed until the industry was crippled by the promulgation of the Bering Sea regulations. The population, according to the Dominion census taken in 1891, was 16,800, while according to a city census taken later the same year, it was 23,000.

J. STUART YATES.

Victoria: city; capital of Victoria co., Tex.; on the Guadalupe river, and the Southern Pac. Railroad; 30 miles N. W. of Port Lavaca, 100 miles E. S. E. of San Antonio (for location, see map of Texas, ref. 6-1). It is in an agricultural (sugar-cane and cotton-growing) region, and contains a high school, Nazareth Academy, St. Joseph's College and Diocesan Seminary (Roman Catholic), a national bank with capital of \$150,000, a private bank, and a daily, a semi-weekly, a monthly, and three weekly periodicals. Pop. (1899) 3,046.

Victoria (or as baptized, *Alexandrina Victoria*): Queen of Great Britain and Ireland and Empress of India; b. at Kensington Palace, London, May 24, 1819; only child of Edward, Duke of Kent, fourth son of George III., and of his wife, Victoria Mary Louisa, daughter of the Duke of Saxe-Coburg-Saalfeld, and sister of Leopold, King of the Belgians. Her father having died Jan. 23, 1820, she was educated under the care of her mother and of the Duchess of Northumberland; became heiress-presumptive to the crown on the accession of William IV., in 1830, and on his death without issue (June 20, 1837) assumed the throne of Great Britain and Ireland, that of Hanover falling by the law excluding females to her uncle, the Duke of Cumberland.

She was crowned in Westminster Abbey June 28, 1838; was directed in politics by Lord Melbourne, the head of a Whig administration, a statesman to whom she was personally and politically much attached; was married at St. James's Palace to her cousin, Prince Albert of Saxe-Coburg-Gotha, Feb. 10, 1840; has enjoyed a reign of peace and prosperity unexampled in the annals of England under the successive administrations of Lord Melbourne (1835-41), Sir Robert Peel (1841-46), Lord John Russell (1846-52, and as Earl Russell 1865-66), Earl Derby (1852, 1858-59, and 1866-68), Earl Aberdeen (1852-55), Lord Palmerston (1855-58 and 1859-65), Benjamin Disraeli (1868, and as Earl of Beaconsfield 1874-80), W. E. Gladstone (1868-74, 1880-85, 1886, and 1892-93), Marquis of Salisbury (1885-86, 1886-92, and 1895-), Earl of Rosebery (1893-95). Among the events of her reign have been the repeal of the corn-laws (1845), the Irish famine and emigration to the U. S. (1847), the Chartist agitation (1848), the Crimean war (1853-55), the Indian mutiny (1857-58), the assumption of the direct government of India (1859), the "cotton famine" and the delicate relations with the American belligerents (1861-65), the Mexican intervention and its rupture (1861-62), the Reform Bill of 1866, the confederation of British North America, the disestablishment of the Irish Church, the abolition of religious tests at the universities and of the system of purchase in the army, the Alabama Claims Treaty (1871), the introduction of the ballot, the wars in Abyssinia, Ashantee, Egypt, and Sudan, the assumption of the title of Empress of India (1876), the creation, rapid growth, and organization of the Australasian colonies, the remarkable development of public education as shown in laws of 1870 and 1872, and the prolonged agitation of the subject of home rule in Ireland. In 1876 the agitation upon the massacres in Bulgaria presaged important action upon the "Eastern question." The loss of her mother (Mar. 10) and of her husband, Prince Albert (Dec. 14, 1861), within a few months, affected her with such profound grief that, although performing all the duties of sovereignty, she did not appear in public, as before, for nearly fifteen years, having spent much of the intervening time at her favorite residence, Balmoral Castle, in the Highlands of Scotland. She has had nine children. Queen Victoria is beloved for her admirable personal qualities, and beyond any other monarch has given evidence that she regards her royal authority as held in trust for the people. She has also been a pattern of every domestic virtue. The progress made by the nation during her reign has been due in no small measure to her wisdom, tact, and devotion. She has also given evidence of literary culture by the publication of *Leaves from the Journal of Our Life in the Highlands* (1868), *More Leaves from the Journal, etc.* (1884), and by supervising two biographical sketches of Prince Albert, *The Early Days of his Royal Highness, the Prince Consort* (1867), by Gen. C. Grey, and the *Life of the Prince Consort* (1874), by Theodore Martin. The completion of the sixtieth year of her prosperous and beneficent reign was most enthusiastically celebrated throughout her wide dominions June 22, 1897. The pageant in London is said to have been the most magnificent the world has ever seen. Every part of the vast British empire was represented by troops and civil dignitaries, and princes and special ambassadors from every country of Christendom united, with her own loyal subjects of every race, language, color, and creed, in acclaiming her goodness and greatness as woman and monarch.

Authorities.—McCarthy, *History of Our Own Times* (1879-97); Ward, *Reign of Victoria* (1887); also *Lives of the Queen* by Mrs. Greenwood (1883); G. Barnett Smith (1886); Dr. Macaulay (1887); J. C. Jeaffreson (1893). C. K. ADAMS.

Victoria. GUADALUPE; general, and first president of Mexico; b. in Durango, 1789. His real name was Manuel Felix Fernandez, but he changed it during the war for independence in honor of the patron saint of Mexico and of a victory over the Spaniards. He was one of the first to join the patriots in 1810, rose to be general, and, after the defeats of 1816-19, was a fugitive in the mountains of Vera Cruz during thirty months, enduring the greatest hardships, but refusing to ask for royal clemency. Subsequently he was prominent in the events which led to independence, but, as a republican, he refused to acknowledge Iturbide as emperor; was one of the chiefs of the army which overthrew him in 1823, and a member of the provisional government then formed. In politics he adhered to the federalists, and that party preponderating, he was elected president for the term of four years beginning Apr. 1, 1825, entering

upon his duties by special act Oct. 10, 1824. As an executive, he was upright and able, and for several years the country was very prosperous. In 1828-29 it was disturbed by revolts, the results of a contested election, and these were the prelude to a long series of civil wars. At the end of his term Victoria retired to private life in comparative poverty. D. at Perote, Mar. 21, 1843. HENRIET H. SMITH.

Victoria Cross: a British decoration instituted at the close of the Crimean campaign in 1856, and given only to those who have performed in the enemy's presence some signal act of bravery or patriotic devotion. It may be granted to a soldier or sailor of any rank, or to a volunteer in service against an enemy. It is in the form of a Maltese cross, and is made of bronze, having the royal crown in the center, surmounted by the lion, and on a scroll below the words, "For valour." The ribbon worn is blue for the navy and red for the army. On the clasp are two branches of laurel, from which hangs the cross. A pension of £10 a year accompanies the decoration. C. H. THURBER.

Victoria Falls: falls formed by the Zambesi in the middle of its course; in lat. 17° 55' S. and lon. 26° 32' E. At that point the river—a powerful but somewhat sluggish stream nearly a mile wide—rushes down into a chasm 400 feet deep surrounded by perpendicular walls of basalt. The native name is *Moss-i-ot-tunia*, or Roaring Smoke. See ZAMBESI.

Victoria Land: an extensive unexplored region in the Antarctic Ocean, discovered in 1842 by Ross, who sailed along its eastern coast as far S. as lat. 78° 9' 30", where the twin volcanoes of Erebus (12,000 feet) and Terror (11,000 feet) send forth their smoke and fire. Other peaks are Sabrina, 11,000 feet, and Melbourne, over 13,000 feet in height.

Victoria Nyan'za: the largest lake in Africa, the second fresh-water lake in size in the world, and the principal source of the Nile; known to the inhabitants on its shores as *Ukerewe Nyanza* (Ukerewe Lake), from the name of its largest island. The equator passes through its northern portion; area about 27,000 sq. miles; altitude above the sea (Havenstein, 1889), 3,880 feet. Considerable evidence, perhaps best summarized by Dr. Conrad Ganzemüller (*Zeitschrift für wissenschaftliche Geographie*), shows that the lake is identical with the eastern Nile sources of Ptolemy, with the "Crocodile Lake" of an unknown Greek writer, and with the "Kura Kavar" of the Arabs, and that fairly accurate knowledge of the territory of the Nile sources was formerly possessed, but subsequently was lost. The lake was discovered in 1858 by Capt. Speke, and in his second journey (1862) he practically solved the question as to the sources of the Nile, identifying the outflow of Victoria Nyanza as the upper course of the river. Speke saw the lake only at one point on its southern coast and along its north-western and north central shores, and his map showing its approximate shape and extent is a remarkable production, considering that it was based almost wholly upon native information. Henry M. Stanley's map, the result of his boat survey (1875), is still the basis of mapping, though it has been changed in important respects. It has been found, for instance, that his map extended the lake too far to the N. E., covering with water a large part of the country of Kavirondo. He also missed the southwestern prolongation of the lake, first mapped (1891) by Father Sebyse. Every fresh exploration shows that the present surveys are by no means adequate. Dr. Baumann discovered on the south-west coast a gulf which required five days to walk around. It first appeared on the maps in 1894 as Baumann Gulf.

The lake is imbedded, for the most part, in gneiss formations and schists. Porphyritic granite is particularly prominent on the south coast, and also forms a remarkable island—the Makoko, or White Rocks. On the north shore there are great outcrops of honeycombed iron-stone and lava blocks, and the rich tropical vegetation there is in marked contrast with the sterile, arid wastes characteristic of most of the south coast. Along much of the west coast cliffs come down sheer to the water's edge, with deep water close to the shore. On the northwest and east shores there are long stretches of comparatively low land, and water so shallow that only light-draught vessels can approach within some miles of the shore.

The lake is very deep in places. The water is fresh and pure, though insipid to the taste. Fish are plentiful, and are caught mostly with hook and line, though natives in the N. E. use grass mats as a sort of net, and the islanders of the great Sesse Archipelago use basket-traps. The lake is in-

fested with alligators, making it dangerous for any one to enter the water. Hippopotami are not plentiful except along the coast and rivers, but those found in the open water are extremely vicious, and are much feared by canoe-men. It is doubtless due to the presence of these dangerous animals that most of the natives, even the islanders, are unable to swim. Another large animal is the silurus, which has been mistaken for the porpoise, owing to its shiny black body and its habit of playing at the surface in calm weather. Violent storms sweep across the lake at times, raising tremendous seas, which often engulf small craft that are caught away from the land. A curious feature, also observable in Lakes Tanganyika and Nyassa, is the periodical rise and fall of the waters, which, according to the natives, takes place about once in twenty-five years. These changes in level are distinctly shown by water-marks on the stones. Mr. E. Gedge reported (1891) that the lake was then between 8 and 9 feet below high-water mark. "The people told me that certain lands, then under cultivation, would again be flooded in due season, and that the peninsula on which my camp was pitched would again become an island."

Another peculiarity of the lake is the very limited area included in its drainage-basin. The entire north coast to the Nzoia, in the northwest, receives no river worthy of the name, the drainage, except along a narrow coast margin, flowing N. and joining the Nile. The main visible sources for the water-supply of the great reservoir are the Kagera, Nzoia, and Ngure Darash rivers. The Kagera is by far the most important feeder, and recent research indicates that its volume is only about a third less than that of the outlet—the deep, broad Somerset Nile—which flows away toward Egypt, a giant at its birth. The Kagera, with considerable improvement, it is thought, may be made a valuable commercial highway to within five days' march of Lake Tanganyika; but it seems probable that all the other streams, together with the rain that falls into the lake, supply hardly sufficient water to counterbalance the evaporation. It is suggested (Gedge, Lugard, and others) that, as the visible, inflowing streams seem totally inadequate to keep up the supply of water in the lake, there are probably large springs at its bottom that make up the deficiency.

The lake and all its shores are in the hands of Great Britain and Germany, the boundary between their possessions crossing the Nyanza on the parallel of 1° S. lat. A few sailing vessels of European construction have been introduced, but the waters are navigated chiefly by fleets of native canoes, many of which hold forty or fifty men.

C. C. ADAMS.

Victoria Regia: See WATER-LILY FAMILY.

Vicōrīnus (Vettori), PETRUS: classical scholar; b. at Florence, Italy, July 11, 1499; studied in Pisa and Rome. After a somewhat checkered career as a soldier, diplomat, and tutor in a ducal family, he returned to his native city as a teacher of Greek and Latin. D. Dec. 18, 1584. Vicōrīnus was the greatest philologist and critic of the Italian Renaissance. His text editions and commentaries on Cicero and some of the works of Aristotle, of which he made elegant translations, are epoch-making. Other editions by him are those of Æschylus, Sophocles (the *Electra* being the *editio princeps*), Xenophon's *Memorabilia*, Terence, Sallust, Varro's *De re rustica*, Demetrius's *De elocutione*, Dionysius, Isaus, Dinarchus, Hipparchus, commentary to Eudoxus and Aratus, and Clemens Alexandrinus. But the greatest testimony to his critical genius and to the encyclopedic reach of his reading is furnished by his *Varie Lectiones*, 38 books (Florence, 1582; Strassburg, 1609). See Bandini, *Petri Vicōrīni vita* (Florence, 1758); H. Kämmer, *Jahn's Jahrbücher*, xvi. (1865), pp. 545 ff., xvi. (1866), pp. 133 ff., 325 ff., 421 ff.; Fr. Creuzer, *Opuscula*, ii., pp. 21-36. ALFRED GUDEMAN.

Victor Vilen'sis: Latin historian of the end of the fifth century. He wrote an account of the persecution of the Church in Africa by the Arian Vandals in three books. The best edition is by M. Petschenig (Vienna, 1881). M. W.

Vicuña, or Vicugna, vee-kōon-yāñ: the *Auchenia vicugna* (family *Camelidae*), an extremely wild and active animal of the Andes, somewhat smaller than the alpaca. It is of a uniform brown color, and great numbers are annually killed for the sake of the hair, which is even more valuable than that of the alpaca. F. A. L.

Vicuña Mackenna, BENJAMIN: Chilean historian and politician; b. at Santiago, Chili, Aug. 25, 1831. Descended

from a rich and influential family, he studied at the National Institute and the University of Chili, and early became known as a writer on national history. He took an active part in the liberal revolt of 1851-52; was at one time imprisoned and condemned to death, and finally fled from the country, traveling extensively in North America and Europe. He was allowed to return in 1856, and shortly after was admitted to the bar, but was exiled for political reasons during 1859-63. Subsequently he was elected deputy, and in 1865-66 was special envoy to Peru and the U. S., editing a Spanish paper for a short time in New York. In 1870-71 he traveled in Europe, and made an important collection of documents relating to Chili. He was senator 1871-76, and *intendente* of Santiago 1872-74; in the latter capacity he did much to beautify the city, and the greatly admired pleasure-grounds of Santa Lucia are due to his private munificence. In 1875 he was the liberal candidate for the presidency, but was defeated. Mackenna is best known as the author of numerous works on the history of Chili; while exhibiting less profundity of research than those of Barros Arana, they are generally accurate, and always readable, and they have had a wide circulation. Among the most important are *El Ostracismo de los Carreras* (1857); *El Ostracismo del General O'Higgins* (1860); *Historia de la administracion Montt* (1862); *Historia de Chile* (1868); and *Campañas de Arica y Tacna* (1881). He also published various books of travel, works on Chilean mines, etc., edited or collaborated in several prominent journals, and contributed an article on Chili to the *Encyclopædia Britannica*. D. near Santiago, Jan. 25, 1886.

HERBERT H. SMITH.

Vida, vee'daä, MARCO GIROLAMO: Latin poet of the Renaissance; b. at Cremona about 1480; studied philosophy, political science, and theology at Padua and Bologna; became canon of St. John Lateran in Rome, and was apostolic secretary under Clement VII., who in 1532 made him bishop of Alba, where he died Sept. 27, 1566. His smooth versification and lucidity of style, though worthy of admiration, scarcely atone for the lack of originality in thought and diction which characterizes all his poetry. Cicero, Quintilian, and above all, Vergil, are the fountains of his inspiration. He wrote a theological epic, *Christias*, in six books; *Bombyx*, a didactic poem on silkworms, in the manner of Vergil's *Georgics*; and a versified description of the game of chess, entitled *Scacchie Ludus*. The work upon which his fame is chiefly dependent is *De arte poetica*, in three books, containing 1,698 hexameters, eulogized by Pope in his *Essay on Criticism* (vss. 697-708), and pronounced by Warton to be perhaps the very first piece of literary criticism of the Renaissance. For an analysis of the poem, easily accessible in Cook's *The Art of Poetry* (with Pitt's translation, Boston, 1892), see A. Baldi, *Die Ars Poetica des M. Hieronymus Vida* (Würzburg, 1881); and in general, Lancetti, *Della vita et degli scritti di Vida* (Milan, 1840); Roscoe, *Life of Leo X.*, vol. ii.; J. A. Symonds, *Renaissance in Italy*, vol. ii. A complete collection of Vida's writings was published in London (2 vols., 1732).

A. GUEDEMAN.

Vidal, vee'daal', PEIRE: Provençal troubadour; flourished about 1175 to 1215. He was a native of Toulouse, the son of a furrier. He was one of the most prolific of the troubadours, though he seems all his life to have been on the verge of insanity. The famous Blacatz, patron of the troubadours, expressed wonder in one of his own poems that Vidal should have sense and talents in poetry, but madness in everything else. The contemporary accounts of his life are so full of fantastic episodes that we should incline to regard them as pure inventions were not many of the details confirmed by the poet himself. He led an extremely vagrant life, appearing at the courts of Alfonso II. of Aragon, Barral, Viscount of Marseilles, Raymond VI., Count of Toulouse, Boniface II., Marquis of Montferrat, Emmerich, King of Hungary, and perhaps Richard I., Count of Poitiers (later King of England). The most indulgent of these patrons seems to have been Barral of Marseilles, though finally the poet was obliged to leave his court, owing to the over ardor of his devotion to the Countess Adalasia, into whose apartment he penetrated early one morning and awoke her with a kiss. The number of his love adventures was very great, and in many of them he conducted himself most fantastically. The climax of his folly was reached, however, during the crusade of King Richard (1190), which he had joined. Arriving in Cyprus, the poet did not continue to the Holy Land, but married a Greek lady, and turned back to Europe. In some way he became persuaded

that his wife was the daughter of the Greek emperor at Constantinople, and that he had therefore rights to the Greek throne. He determined to assert these, and, assuming the imperial arms, he made those about him call him emperor, sat upon a throne, and fitted out a fleet in order to win his kingdom. The end of his career is veiled in obscurity. Despite his vagaries, Peire Vidal was one of the most original of the Provençal poets of his time, and many of his verses are remarkable for vigor of feeling and beauty of diction. See *Die Lieder Peire Vidals*, ed. by Karl Bartsch (Berlin, 1857); Sigmund Schopf, *Beiträge zur Biographie und zur Chronologie der Lieder des Troubadours Peire Vidal* (Breslau, 1887).

A. R. MARSH.

Vidar: in Norse mythology, the god of silence, son of Odin and the giantess Grid.

Vidaurre, vee-dow'ree, SANTIAGO: b. in the present state of Nuevo Leon, Mexico, about 1803; received a good education; became a lawyer; filled many minor offices; took part in several civil wars, in which he rose to the rank of general; became about 1853 governor of Nuevo Leon, to which he forcibly annexed (1856) the state of Coahuila; exercised for some years a species of dictatorship over the northern states of Mexico, where he was more than once suspected of intending to found the independent "republic of Sierra Madre"; aided in the campaign for the overthrow of Santa Anna 1854-55, though without political combination with Alvarez and Comonfort, his "plan" being distinct from that of Ayntla; was a candidate for the presidency at the junta of Cuernavaca Oct., 1855. He did not recognize the government of Comonfort until Nov., 1856; held the northern states against Zuloaga and Miramon during the "war of reform" 1857-60, and took part in the war against French intervention 1862-64, but was induced to recognize the empire of Maximilian, of whom he ultimately became a cabinet minister; was captured at the fall of the city of Mexico, and shot there as a traitor Aug. 8, 1867.

Vidocq, vee'dök', EUGÈNE FRANÇOIS: detective; b. at Arras, department of Pas de Calais, France, July 23, 1775; while a boy robbed his father's shop and ran away from home. He soon spent his money, and after a period of vagabondage and misery entered the army, but deserted to the Austrians; left them too, and served again in the French army. After many adventures of a discreditable sort he was sentenced to eight years' imprisonment; escaped before his time was up, and was employed in 1809 by the secret police of Paris; was made chief of the *brigade de sûreté*, consisting of convicts and other notorious characters as spies, and fully pardoned in 1818; left the service of the police in 1827, and settled at St. Mandé, near Paris, as a paper manufacturer; failed in business, and opened a *bureau de renseignements* in Paris for the recovery of stolen goods, but came into conflict with the police, and was compelled to close his office; lived afterward in obscurity and poverty, and died in Paris, Apr. 28, 1857. His *Mémoires* (4 vols., 1828; translated into English in the same year) are not without interest, but their contents are considered unreliable, and even their authorship is doubted. His name is associated with many fictitious adventures, and occurs continually in detective literature.

Revised by F. M. COLBY.

Vieira, vee-ä-ee-raä, ANTONIO: author, orator, and statesman; b. in Lisbon, Portugal, Feb. 6, 1608. In 1615 his family moved to Bahia, Brazil, where he attended the Jesuit schools, entered the order in 1627, and at the age of nineteen taught rhetoric and philosophy. He was ordained presbyter in 1635, and preached at Bahia and in the neighboring villages. His eloquence attracted the attention of the governor, Mascarenhas, who, on his return to Europe in 1641, took him to Lisbon. There Vieira quickly attracted crowds to his sermons, and took rank among the foremost pulpit orators of the world. He was nominated royal preacher in 1644, entered the royal council in 1646, and was for a time practically prime minister, exercising great influence over the affairs of Europe. In 1647-49 he was ambassador to Paris and The Hague, also visiting London. In 1650 he was sent to Rome on an important secret mission connected with the relations of Portugal and Spain. For reasons now unknown, he fell into disgrace with his order, was threatened with expulsion, and in 1652 was thrown into comparative obscurity by being made director of the missions in Northern Brazil. There he showed great zeal in protecting the Indians, and made a voyage to Portugal to secure royal aid for them (1654), but in 1661 was seized by the colonists, and sent a prisoner to Lisbon. He was quickly released, but lost his

influence at court. In 1665 one of his writings was condemned by the Inquisition, and he was imprisoned for two years. In 1670-75 he was in Rome, where he preached with great satisfaction in Italian and Latin. In 1681 he returned to Brazil, where he became provincial of his order (1688). D. at Bahia, July 18, 1697. Vieira's principal published works are his *Sermons* (1679-99), which are regarded by many as the greatest prose masterpieces of the Portuguese language. A good selection in six volumes was published in Lisbon in 1852-53. His *Letters*, scattered through various locations, are often of great historical importance. H. H. S.

Vielé, veé'lä, EOBERT LUDOVICKUS: soldier; b. at Waterford, N. Y., June 17, 1825; graduated at the U. S. Military Academy July 1, 1847, when commissioned brevet second lieutenant of infantry, and ordered to the seat of war in Mexico, serving at the capital 1847-48; in campaign against Indians 1848-52. He resigned June 1, 1853, to enter upon the profession of civil engineering; was State engineer of New Jersey 1854-56; chief engineer of Central Park, New York, 1856-57, preparing the original plan, which was adopted. He also designed Prospect Park in Brooklyn, N. Y. On the outbreak of the civil war he entered the Union army, and in Aug., 1861, was appointed brigadier-general U. S. volunteers; was second in command of the land forces in the capture of Port Royal, chief in command in the investment of Fort Pulaski, Ga., planned and led the march on and capture of Norfolk, Va., and was military governor of that city 1862-63; resigned Oct., 1863, and resumed his profession of engineering at New York; became park commissioner in 1883; M. C. 1885-87; since then has devoted his leisure to professional and literary pursuits. Author of *Handbook of Active Service* (New York, 1861); *A Topographical Atlas of the City of New York* (1865); and various professional papers and reports.

Vien, veé'än', JOSEPH MARIE: painter and teacher of painting; b. at Montpellier, France, June 18, 1716. In 1743 he won the great prize of Rome at the School of Fine Arts in Paris, and on reaching Rome he was strongly drawn toward the study of the masters who stood for antiquity and classical art, among whom he himself names Raphael, Caracci, Domenichino, and Michaelangelo. His feeling was that he must avoid the art, then so popular, of Boucher, Pigalle, Fragonard, and Greuze, and he turned to that which was stately and dignified, both in subject and in treatment. He did not reach great excellence as an artist; his paintings are inferior to those of the men whom he preached against; but he was made director of the French school of art in Rome in 1775, and at once began the effort of his life. Among other improvements, he required his students to draw and to paint from the living model for a day at least three times a week. He also taught the closest adhesion to the classical style as he had built it up for his pupils from his study of the earlier Italian masters. His chief pupil was Jacques Louis David, who joined in the general approval of his old master, even when he became the head of a school, so that it was as the master of David that Vien became especially famous. He returned to Paris, and was ennobled by Louis XVI., and after the Revolution was employed and honored by Napoleon. D. in Paris, Mar. 27, 1809. His best-known pictures are *St. Germain l'Auxerrois* and *St. Vincent and The Sleeping Hermit*, both in the Louvre. There are also pictures in the gallery of Montpellier and in other museums in France. RUSSELL STURGIS.

Vien'na (Germ. *Wien*, a word of Celtic origin): the imperial capital of Austria-Hungary; on the right bank of the Danube, in lat. (new observatory) 48° 13' 55" and lon. 16° 20' 18" E.; 340 miles S. S. E. of Berlin (see map of Austria-Hungary, ref. 5-E). Here occurs the only break in the great chain of the Alps and Carpathian Mountains, which divide the northwestern from the southeastern part of Central Europe. Hence it was chosen by the Romans, about the beginning of our era, as a place especially worthy of settlement and fortification against the tribes N. of the Danube. During the Middle Ages it became a great center of trade between North and South, East and West, and thus acquired a cosmopolitan character which renders it to-day one of the most interesting and beautiful cities of Europe. It is traversed by a navigable canal, called the Little Danube to distinguish it from the Great or main Danube, whence its waters are drawn. The *Wien* is an insignificant streamlet flowing through the city, and would long ago have been degraded to the condition of a sewer if it were not for the great freshets to which it is periodically subject. The city lies at the

base of the double-peaked *Kahlenberg* (Bald Mountain), on which is seen the border of the famous *Wiener Wald* (Viennese Woods), whose beauty renders the environs of the city among the most attractive in the world.

Climate.—The extremes of temperature for 1890 were zero and 92° F.; the mean, 48°; the prevailing winds are west; the average moisture for eleven years, 75 per cent.; the average rainfall for forty years, 24 inches; with rain on 149 days in the year (mean of thirty years).

Streets, Parks, etc.—There are 2,214 streets, alleys, and squares. The Ringstrasse is the finest boulevard; it occupies the site of the old walls, averages about 150 feet in width, has shady promenades and a bridle-path, as well as broad sidewalks and ample room for cars and carriages. On or near it are situated most of the finest buildings of the city, and several of the parks and handsome squares border upon it. The largest of the ten parks in Vienna is the Prater, in one part of which is the fashionable drive; another portion is known as the Wurstel-Prater, or Punch and Judy Park, where a great variety of cheap shows is offered to the masses. The World's Fair of 1873 was held in the Prater, and the rotunda of the main building still remains. Near by is the race-course, where all classes of the population are largely represented at the semi-annual meets. The city streets are mostly paved with granite blocks, and are kept remarkably clean at an annual cost (1890) of 884,205 gulden; the summer sprinkling costs 183,994 gulden. Under the streets are 290 miles of gas-pipe and (old part) 485 miles of sewers. There are more than 800 electric arc-lamps and 36,000 incandescent lights.

Means of Transit; Water-supply.—The street-railways have a combined length of 62 miles, and carried in 1890 nearly 53,000,000 passengers. There are 63 omnibus routes, provided with 619 omnibuses, 954 faeces, or two-horse public conveyances, 1,221 one-horse hacks, and 1,217 other public conveyances. On the various street corners are to be found 1,600 street porters, who go on errands and carry packages at fixed, moderate prices. Vienna is supplied with pure mountain spring-water, brought to the city in an aqueduct 60 miles long, which was built in 1870-74 at a cost of 24,000,000 gulden; the reservoirs hold 45,000,000 gal., the average daily supply (1890) was 18,000,000 gal., and the water is conveyed to 12,329 houses through 207 miles of pipe, varying from 2½ to 37½ inches in diameter. There are 7 river baths, one of which is free, and 25 city baths, two of which are magnificent establishments, luxuriously fitted up.

Public Buildings, Monuments, and Palaces.—The public and private buildings of Vienna include some of the finest products of modern architecture. The Parliament building, designed by Theophil Hansen, is an immense white marble structure in Greek style, elaborately ornamented with colossal statues and reliefs. The Rathhaus (municipal hall), of yellow sandstone, is a magnificent adaptation of Gothic motives to secular needs, by Friedrich Schmidt. The court theater is of white marble, in Renaissance style, and its sculptures, in numerous portraits and allegorical figures, tell the story of the world's drama. The *Triumph of Bacchus*, which ornaments the blocking-course of the main façade, is one of the grandest of all modern reliefs. The University building, with its nine courts, is a beautiful example of Renaissance design by Heinrich Ferstel, although unfortunately carried out only in brick and stucco; it has great marble stairways, fine halls of ceremony, and an extensive library and large reading-room. These structures are on the four sides of the Rathhaus Square, with its shady walks and wealth of flowering trees. The two imperial museum buildings, of great extent and elaborate ornamentation, face each other across a square, in the center of which stands the great monument to Maria Theresa, surrounded by flower-beds and shrubbery, amid which play the waters of four exquisite marble fountains. Other noteworthy monuments are those to Schiller, Beethoven, Haydn, Schubert, Archduke Charles, Prince Eugene of Savoy, Prince Schwarzenberg, the Emperors Joseph and Francis, and the later ones to Tegetthoff, Liebenberg, Grillparzer, and Radetzky; also the Trinity column. The third side of this square is occupied by the imperial stables, in which are housed several hundred fine horses and an immense collection of carriages, saddles, etc. The fourth side is to be occupied by the imperial palace, now (1895) in process of building, whose estimated cost is said to be 40,000,000 gulden. Behind this is the Burg, a great cluster of buildings which have been erected from time to time since Duke Leopold the Glorious built his castle here about 1220, a portion of which still exists in the tract known as

the Schweizerhof. In the Burg are the imperial residence and the great halls of ceremony; the Schatzkammer or superb collection of crown jewels, together with many beautiful objects of semi-precious stones; the winter riding-school, an imposing wing of the palace, designed by Fischer von Erlach; the court library, the ceiling of whose great hall is adorned with the chief work of the painter Daniel Gran. There are many other palaces in the city, among which are the Belvedere, with its extensive garden, built by Prince Eugene of Savoy, 1724; that of Archduke Albrecht (d. 1895), famous for its art collection, known as the Albertina; Prince Liechtenstein's, with its choice picture-gallery; and those of Counts Harrach and Esterhazy, also containing noteworthy art collections. Other noteworthy buildings are the court opera-house, the Academy of Fine Arts, the Austrian Industrial Museum, the Bourse and Commercial Museum, the Arsenal, and the Palace of Justice.

Churches.—Of the churches the grandest is St. Stephen's Cathedral, whose corner-stone was laid in the twelfth century, but which was altered and greatly enlarged from the fourteenth to the sixteenth centuries. Its graceful tower rises 453 feet above the street, and is crowned with a gilded double-headed eagle, surmounted by a cross. The most beautiful ecclesiastical structure is the Votive church, ornamental Gothic in style and of exquisite proportions, designed by Ferstel, and erected in commemoration of the escape of the Emperor Francis Joseph from death by assassination in 1853. The vaults of the Capuchin church are interesting as the last resting-place of many of the Hapsburgs, whose remains are inclosed in bronze caskets, some of which are extremely elaborate. In the Augustine church is the celebrated monument to the Archduchess Christina, which is one of the most beautiful works of Canova. Churches are not numerous in Vienna (63), and as a rule contain but little to interest the traveler. There are 16 monasteries, the oldest of which dates from 1158; in 1890 they were occupied by 520 brethren of various orders. There were also 20 nunneries, with 1,563 inmates.

Education.—Schools are provided by public, private, and corporate means, and give instruction in every department, from hair-dressing to theology. In 1855 a concordat was entered into with the pope, placing education entirely under the supervision of the Church; but in 1865 the public demand for its abolition became irresistible, and in the following year a new school law was passed providing for the entire secularization of the public schools, but furnishing at suitable times religious instruction in both Roman Catholic and Protestant faiths, according to the desires of parents. At the close of 1890 the city possessed 300 primary schools, attended by 75,000 boys and 76,000 girls, with 1,993 male and 1,025 female teachers; of these, 403 were for religious instruction. There were 24 technical schools for teaching book-binding, printing, glove-making, gardening, glass-blowing, the making of fans, optical instruments, etc., and these were provided with 82 instructors and attended by 6,274 pupils; 29 middle and high schools (*gymnasia*) had 677 instructors and 9,642 pupils; the city Commercial College had 36 instructors and 890 pupils, besides which there were other commercial schools, with 124 teachers and 2,991 scholars. The Agricultural College had 46 instructors and 224 students; the Academy of Fine Arts, 25 instructors and 274 students; the Polytechnicum, 97 instructors and 836 students; and the Protestant Theological Seminary (the Roman Catholic forms one faculty of the university), 7 instructors and 38 students. The Theresianum is a school founded by Maria Theresa to prepare noblemen's sons for public service. Since the revolution of 1848 it has received also students not of noble birth. One department of it is known as the Oriental Academy, where students are prepared for diplomatic and consular service in the Orient, and before graduating must have a good knowledge of law in its various branches, of political science, and at least a reading knowledge of ten modern languages. The university offers instruction by 385 teachers, and in the winter of 1890-91 was attended by 6,220 students—the largest attendance at any institution where German is spoken. It was founded in 1365, has passed through many vicissitudes, was under Jesuit domination for a century, and has been greatly improved since 1870. Its medical faculty has enjoyed worldwide fame for a hundred years.

Libraries, Museums, and Art Galleries.—The city is well supplied with libraries, the largest of which is the imperial, which contains 400,000 volumes and 20,000 MSS. There is also an imperial private library, which contains 80,000 vol-

umes, including 800 incunabula; also 26,000 maps and plans, 50,000 copper plates and drawings, and over 180,000 portraits. The Albertina contains 40,000 volumes, largely if not exclusively pertaining to matters of art, 23,000 maps and plans, 90,000 engravings exclusive of those in books, and 15,800 leaves of drawings by noted artists. There are also more or less extensive libraries in connection with the university, Theresianum, Academy of Fine Arts, Rathhaus, and the Polytechnicum, besides a music archive of 12,000 volumes, and 15 private circulating libraries. The newspaper and periodical publications number 863, of which 32 are dailies. Censorship of the press still exists, and is at times rigorously exercised. The Academy of Sciences, founded in 1847, has numbered among its members many scientists of international reputation, including Bancroft and Agassiz. Its work embraces the preparation and publication of the *Fontes rerum Austriacarum*, the *Acta conciliorum sæculi xv.*, a *Corpus* of the critically justified texts of the Latin Church Fathers, and a collection of Greek epitaphs. The imperial art collections have a magnificent home, and are said to surpass all other collections in pictures by Rubens, Dürer, and Van Dyke, and to be remarkably rich in paintings by Titian, Tintoretto, Holbein, and Clouet. In the possession of portraits of children by Velasquez, Vienna is said to rival Madrid itself. Under the same roof stands Canova's greatest work, *Theseus and the Centaur*; there is also a collection of Egyptian antiquities, of coins and medallions, the famous Ambras collection of arms, and many interesting articles illustrative of history from the Middle Ages to the present. In the companion building, the dome of which, painted by Makart, contains what is believed to be the largest pictorial canvas in the world, the natural history collections are scientifically and artistically arranged, and offer the student almost unlimited opportunities for investigation. Among other valuable collections are the Austrian Industrial Museum, the Commercial Museum, the Army Museum in the arsenal, the Anatomical and Pathological, the Technical, and the City Historical Museums. The city has established also a permanent educational exposition, containing about 18,000 objects of educational value, and has constituted a central commission for investigating and preserving monuments of art and history.

Music and Drama.—The love of music is strong in the Viennese; and here, where Gluck, Haydn, Mozart, Beethoven, Schubert, Wagner, Brahms, Strauss, Lanner, Millöcker, and Suppé have made their home, music of all kinds is enthusiastically cultivated, as is attested by the existence of 100 music schools, 60 musical societies, and a large number of concert-halls, not to mention the court opera and the great Music Hall. There are seven theaters, with audience room for 11,289 persons. During the year 1890 the court opera gave 61 different grand operas, 13 operettas, and 15 ballets; and the court theater gave 106 different pieces.

Population.—The population (census of Dec. 31, 1890) is 1,364,548, and there are 40,000 more females than males, notwithstanding the presence of more than 22,000 soldiers. The Roman Catholics number 1,195,175; Old Catholics, 1,264; Jews, 118,495; and Protestants, chiefly of two denominations, 41,943. Added to the representatives of all the various nationalities which constitute the Austrian-Hungarian empire are 18,328 persons of other nationalities. The people are good-natured and polite, spend much of their leisure in cafés and restaurants, and love amusements, especially music and dancing.

Commerce.—The commercial supremacy of Vienna received a serious blow when in 1867 Hungary was given a constitution which made it practically independent of Austria; and the more recent Bohemian contention for autonomy has caused Prague to be favored more or less at the expense of Vienna. The international seed-market of Vienna has acquired great importance; the export of shoes to Australia, of men's clothes to the Orient, of hats to all parts of Europe, and imitations of Oriental rugs to the U. S., is very extensive. In 1890 the railways shipped from the city 1,143,128 tons of freight, and brought to it 3,543,951 tons, besides 55,000 and 129,000 tons, respectively, of express matter. The private railways sent 72,839 passenger-trains out of the city with 4,598,888 passengers, and 73,742 trains into the city with 4,652,066 passengers. Owing to the new system of "zone" tickets, the state railways are not able to report the passenger traffic to and from the city. The year's product of beer was 32,429,683 gal., much of which was exported. The consumption of beer, domestic and imported, was 28,322,035 gal.; of wine, 10,086,433 gal. Tobacco is a Government

monopoly, and in the governmental retail store of Vienna there were sold in 1890 Havana and domestic cigars, cigarettes, and smoking tobacco and snuff, the proceeds of which amounted to 1,405,197 gulden. To the retailers were sold cigars, cigarettes, smoking tobacco and snuff, from all which the proceeds were 14,072,061 gulden.

Banks, etc.—The city has its official savings-banks, deposits in which on Dec. 31, 1890, were 11,904,357 gulden, from 24,623 depositors. The First Austrian Savings-bank had deposits of 184,005,731 gulden from 491,970 depositors. Fifteen banks have a paid-up capital of 267,900,000 gulden, divided into 1,348,600 shares, which pay an average profit of 8.2 per cent. Their resources in 1890 were 1,493,884,427 gulden, with a gold and silver stock of 244,490,368 gulden; the outstanding bank-notes amounted to 445,934,210 gulden. The city conducts a pawn institute, which had outstanding loans of 174,045 gulden; the state has another, whose loans were 4,826,000 gulden; while the Allgemeine Verkehrsbank had loans amounting to 17,000,000 gulden, of which 6,500,000 were on jewels. Besides these there were thirteen private pawnshops.

Industries.—In the manufacture of silk goods, of fine instruments for surgical, mathematical, and physical work, of pianos, violins, and other musical instruments, of fancy leather goods, of amber and meerschaum goods, of embroideries, including hose in gold and silver, Vienna holds an important place. There are several organizations for securing employment for those out of work. In 1890 these reported 9,184 applications and 4,748 vacancies, of which they filled 3,409. The Government has established industrial courts of arbitration, which held in 1890 1,040 sessions and received 2,505 complaints, of which they settled more than 1,600. There are 62 insurance companies of all kinds, including one against storm and hail, one for looking-glasses, and one for steam-boilers.

Postal and Telegraph Service.—The postal service is excellent, with 92 post-offices and 1,009 letter-boxes in the city, besides 25 stations of the pneumatic post for quick delivery. During 1890 the last named handled 1,330,352 letters and cards, besides 1,821 cards with prepaid answer. The post-office guarantees registered letters, and has a system of "money letters," the value of the contents of which is written on the envelope, and their safety guaranteed by the Government. The government owns also most of the telegraph lines, and has in the city 118 offices, through which 7,400,000 messages passed in 1890.

Public Finance.—Taxes on articles of consumption are still imposed at the entrances to the city, but have been greatly simplified. The public income in 1890 was 21,000,000 gulden, the expenses being 20,883,000 gulden; the value of city property, including all public buildings, furnishings, parks, streets, bridges, sewers, etc., was estimated at 120,000,000 gulden; and the city debt was 55,000,000 gulden.

Charity.—Much is done for the poor, 6,500,000 gulden being expended on them in 1890. Sixty-eight hospitals have 6,702 beds, of which the General Hospital furnishes 3,000. During 1890 there were 68,809 indoor patients, of whom 41,385 were cured. There are 8 orphan asylums, and many other charitable institutions, and 375 charitable organizations.

Government.—The city government consists of a burgo-master, two vice-burgomasters, a city or select council, and a large common council. The burgo-master is chosen by the electors, and his appointment must be confirmed by the emperor. The police system is well organized, and is partly under state control.

History.—The Roman camp Vindobona, sometimes called Vindomina, grew in importance and strength, became a *municipium* (city), and was the scene of the death of the Emperor Marcus Aurelius in 180. Later it fell into obscurity so complete that for five centuries nothing whatever is known of it. In 1030 it was mentioned under its present name, and it was then a walled place of considerable importance. The Celts of this region were conquered by Charlemagne, and afterward German settlers came. The whole is supposed to have passed into German possession by the eleventh century. The Babenberger margraves were the rulers, and in 1096 St. Leopold built a castle for his official residence on Leopoldsborg, or that part of the Kahlenberg nearest the Danube. About 1160 Henry II. erected a castle just outside the walls of Vienna, which from 1142 has been designated as a city. In 1221 it received its first recorded *Stadtrecht*, or charter of privileges; in 1237 a *Freibrief* was given it by Frederick of Hohenstaufen, which

is still preserved. In 1276 Vienna, with Austria, Styria, etc., passed into the hands of Rudolph of Hapsburg. From 1485 to 1490 the city was occupied by the powerful and learned Hungarian king, Matthew Corvinus. In 1526 a new city ordinance was issued by the Archduke Ferdinand, which is known as "the grave of the city's freedom," under which the city was practically ruled until the revolution of 1848. In 1529 and in 1683 Vienna was besieged by the Turks. The successful defense against the first siege was under the leadership of Count Nicholas Salm. The second siege was ended by the victory of a relief army consisting of 84,000 troops, 27,000 of whom were commanded by Duke Charles of Lorraine, 31,000 by different petty princes, and 26,000 by John Sobieski, King of Poland. In the winter of 1805-06, and the summer of 1809, French troops occupied the city, and Napoleon resided in the neighboring palace of Schönbrunn. His fate was sealed at the congress which met here in 1814-15. During the troubled times of 1848 Vienna was for a time the hope of the European revolutionists; but it was bombarded and taken by the imperial troops Oct. 31. A new constitution was given Mar. 17, 1849, but did not become valid until 1861. On Dec. 20, 1857, the emperor signed the decree for the removal of the city walls, which has contributed much to the beauty of the city. On Dec. 19, 1890, he signed the document on which is founded the incorporation of nine new districts into the city proper, which now covers 63.7 sq. miles, and is divided into nineteen wards.

WALTER B. SCAIFE.

Vienna, Concordat of: See CONCORDAT.

Vienna, Congress of (Sept., 1814, to June, 1815): a congress of the European powers to readjust the affairs of Europe after the Napoleonic wars. There were present the monarchs of Austria, Prussia, Russia, Denmark, Bavaria, and Würtemberg, besides a crowd of minor princes and diplomatic representatives of all European states except Turkey—Talleyrand from France, Castlereagh from England, Metternich from Austria, Nesselrode from Russia, Hardenberg from Prussia, Münster from Hanover, etc.—besides many diplomatists without any distinct official character, such as Stein, Wilhelm von Humboldt, Pozzo di Borgo, etc. During the congress Vienna was the scene of continual festivities of the most sumptuous kind, the Austrian court spending about \$50,000 a day for a considerable period in the entertainment of the visitors. The business of the congress was hindered by intrigues and petty jealousies which were cleverly fostered by Talleyrand for the advantage of France, and at one time war seemed inevitable, but the news of the return of Napoleon from Elba in Mar., 1815, frightened the assembled statesmen into more harmonious action. At first the two most serious questions before the congress were those respecting Poland and Saxony. Russia claimed the former, Prussia the latter, while the other powers were divided on both questions. Talleyrand, advancing the theory of *legitimacy* as the principle that should guide the congress, sided with Austria against Prussia on the Saxon question, and raised France from the state of a discredited and neglected power to a position of controlling influence in the congress. Finally, a compromise was reached, giving the lion's share of the duchy of Warsaw to the czar, to be formed into the kingdom of Poland, and dividing Saxony almost equally between Prussia and the Saxon king. The pope was reinstated in all his possessions, with the exception of Avignon and Venaisin, which were given to France, and some small Italian districts, which were given to Austria. These sessions, however insignificant, were nevertheless too much for his holiness, who protested in a most solemn manner against the whole congress. The rest of Italy was again parceled out in domains for French and Austrian princes. Austria was re-established in its old glory as an utterly artificial agglomeration of different nationalities. Norway was taken from Denmark and added to Sweden, in order to pay Bernadotte for turning against Napoleon, and Denmark was paid with Lauenburg and other German districts. The Spanish Netherlands (Belgium) were added to the Dutch Netherlands, and the whole formed into the kingdom of Hol-

land, in spite of the radical differences in language, religion, and economical interests; but it was the only way in which England could retain the Dutch colonies which she had conquered during the Napoleonic wars. To restore the German empire was found impossible, on account of the rivalry between Prussia and Austria, but, having restored some of the petty princes, the congress manufactured a *Bund*, which remained the sole central government for Germany till 1866. See *Akten des Wiener Kongresses* (9 vols., Frankfurt, 1815-35); *Uebersicht der diplomatischen Verhandlungen des Wiener Kongresses* (Frankfurt, 1816); Flassan, *Histoire du Congrès de Vienne* (3 vols., Paris, 1829); Lagarde, *Fêtes et Souvenirs du Congrès de Vienne* (2 vols., Paris, 1843); and *Correspondence between Talleyrand and Louis XVIII.* (Eng. trans., 1881).

Revised by F. M. COLBY.

Vienna Green: See SCHWEINFURTH GREEN.

Vienna Paste, or Vienna Caustic: a mixture of caustic potash and quicklime used in medicine as a caustic.

Vienne, vè'en: an inland department of Western France; on both sides of the river Vienne, an affluent of the Loire; area, 2,691 sq. miles. The surface presents an elevated plain, with a general slope to the N. The soil is not very fertile, yet more wheat and wine are produced than necessary for home consumption. Hemp, flax, and chestnuts are also extensively raised, and good breeds of mules and horses are reared. Much iron is mined, and building-stone and lithographic stones are quarried. Pop. (1896) 338,114. Capital, Poitiers.

Vienne (anc. Vienna): an ancient town of France; department of Isère, on the Gère, near its influx in the Rhône; 19 miles by rail S. of Lyons (see map of France, ref. 6-II). It contains many interesting remains of the Roman epoch, such as a triumphal arch, an amphitheater, and a temple. Pilate is said to have been banished to this place. It was the cradle of Western Christianity. The fifteenth œcumenical council of the Roman Catholic Church met here in 1311-12. There are rich silver and iron mines in the vicinity, and an excellent wine is produced. The manufactures include woolen and linen fabrics of different descriptions, cutlery and hardware, iron, glass, and leather. The trade is brisk. Pop. (1891) 22,814. Revised by M. W. HARRINGTON.

Vienne, Haute: See HAUTE-VIENNE.

Viersen, feer'sen: town and railway junction of Rhenish Prussia; 20 miles by rail N. W. of Düsseldorf (see map of German Empire, ref. 4-C). It has manufactures of woolen, cotton, linen, plush, and silk fabrics, ribbons, leather, tobacco, vinegar, soap, and straw hats. Pop. (1890) 22,198.

Vierzon, vè'är'zôn: town; department of Cher, France; at the confluence of the Yèvre and Cher; 20 miles by rail N. W. of Bourges (see map of France, ref. 5-F). It has cannon-foundries, tanneries, and manufactures of linen, woolen, and silk fabrics, glass, and porcelain. It is divided administratively into *Vierzon-Ville*, *Vierzon-Village*, and *Vierzon-Bourgneuf*, making together an industrial group of importance with a population of (1891) 19,958. M. W. H.

Vieta, vè-ä'tä, or Viète, vè'ät', FRANÇOIS: mathematician; b. at Fontenay-le-Comte, department of Vendée, France, in 1540; held various offices in the civil service of the French Government during the reigns of Henry III, and Henry IV. D. in Paris, Feb., 1603. It is as a mathematician, however, that he has been known since. Most of his works were collected by Van Schooten and published at Leyden in 1646.

Vienssens, vè'ö'sän', RAYMOND: physician; b. in the county of Rouergue, present department of Gironde, France, in 1641; graduated in medicine in Montpellier, where he held for many years a position in the hospital of St. Eloi, and acquired great reputation for his investigations of the brain (the *valve of Vienssens*) and the spinal cord. He wrote *Neurographia Universalis* (1685) and *Traité des Liqueurs du Corps humain* (1715). D. at Montpellier in 1720. S. T. ARMSTRONG.

Vigevano, vè-jä'-vää-nö (anc. *Vicus Veneris*): town; in the province of Pavia, Italy; district of Mortara (Lomellina); on the right bank of the Ticino, 24 miles S. W. from Milan; on the Mortara-Milan Railway (see map of Italy, ref. 3-B). The adjacent country is very fertile, and is famous for game. Vigevano is a well-built town, with a cathedral, churches, and palaces; and the castle, modified by Bramante under Ludovico il Moro, was a grand building, but is now used as cavalry barracks. The Piazza del Duomo is a large rec-

tangular space flanked on three sides with porticoes supported by solid granite columns, the fourth being occupied by the cathedral. Vigevano was originally settled by a race of Ligurians; then it passed under Roman, Lombard, Gothic, and Frankish rule; governed itself independently for several centuries, after which, having been obliged to accept the Visconti and Sforza as lords, it shared the fortunes of Milan. It is now an active town, with manufactures of silk, velvet, linen, cotton, etc., and produces excellent macaroni. The town is the seat of a bishopric, and has excellent schools, one of which has a fine building of red granite. Pop. 20,100 (commune). Revised by HERMANN SCHOENFELD.

Vigfusson, vig'foos-sün, GUDBRAND: Scandinavian scholar; b. at Frakkanes, Iceland, Mar. 13, 1827; educated in the schools of Bessastad and Reykjavik, and studied in the University of Copenhagen. He published *Timatal*, an essay in Icelandic on the chronology of the Icelandic sagas (Copenhagen, 1855); *Biskupasögur* (1858); *Fornsögur*, in conjunction with Th. Möbius (Leipzig, 1860); *Flateyrbók* (with Unger, Christiania, 1860-68); *Eyrybyggja Saga* (Leipzig, 1864); and other works. In 1864 he went to England, was from 1865 to 1874 engaged in completing the great *Icelandic Dictionary*, begun by Richard Cleasby, and published, in 1878, *Sturlunga Saga*, with a sketch of the literary history of Iceland as an introduction; in 1883, *Corpus Poeticum Boreale*, in conjunction with F. Yorke Powell, a collection of the poetry of the old Northern tongue from the earliest times to the thirteenth century, with translations, notes, and excursus (2 vols.). He also published (jointly with F. Yorke Powell) *An Icelandic Reader* (1879). He was appointed Professor of Icelandic Language and Literature at Oxford in 1884. D. at Oxford, Jan. 31, 1889.

Revised by BENJ. IDE WHEELER.

Vigil [from Lat. *vigilia*, waking, watching, (later) watch on the eve of a day, eve, vigil; cf. Eng. *wake*]; in ecclesiastical language, the evening before any church fast, festival, or other important day of the calendar. Special services are appointed in the Roman Catholic Church for the more important vigils. Vigils are retained in the English calendar, but no particular service is directed for any one of them.

Vigil, FRANCISCO DE PAULA GONZALEZ: See GONZALEZ VIGIL.

Vigilius, POPE (537-555): a native of Rome; was appointed a deacon by Boniface II., and accompanied Agapetus to Constantinople in 536. Here Boniface died Apr. 22, 536, and by the intrigues of Theodora, Vigilius was appointed pope by Justinian, on the condition that he should lend his authority to those measures by which the emperor hoped to reconcile the Monophysites with the orthodox Church. On his return to Rome, however, he found the papal see occupied by Sylvester. He obtained the aid of the Byzantine commander at Ravenna, and Sylvester was expelled. Vigilius was a rapacious and ambitious man, without talent or character, and probably also without convictions. D. June 7, 555.

Vignaud, vin-yö, HENRY: diplomat and author; b. in New Orleans, Nov. 27, 1830; teacher in public schools in that city 1852-56; also did journalistic work; edited at Thibodeaux, La., *L'Union de Lafourcher* 1857-60; aided in founding in New Orleans *La renaissance Louisianaise*, a weekly review; captain in the Confederate army during the civil war; in 1863 assistant secretary of the Confederate diplomatic commission in Paris; in 1869 secretary of the Roumanian legation in Paris; in 1872 official translator of the Alabama commission in Geneva; in 1873 U. S. delegate to the international metric conference, and in 1882 to the international conference for the protection of submarine cables; has been connected with the U. S. embassy in France since 1875, either as second secretary, first secretary, or *chargé d'affaires*. He published *L'Anthropologie* (1861), and has contributed memoirs to various learned societies.

THEODORE STANTON.

Vignola, GIACOMO BAROZZIO, da: See BAROZZO, JACOPO.

Vigny, vè'n'yee', ALFRED VICTOR, Comte de: poet; b. at Loches, Indre-et-Loire, France, Mar. 27, 1799; entered the royal guard in 1816, but retired from military service in 1828, and devoted himself exclusively to literary pursuits. D. in Paris, Sept. 18, 1863. His *Poèmes* (1822), among which are *Hélène, La Fille de Sephté, La Femme adultère*, etc., and his *Poèmes antiques et modernes* (1824-26), among which are *Moïse, Le Déluge, Éloa, Dolorida*, etc., passed by almost

unnoticed, though they belong to the best which the romantic school has produced in France, and entitle him to rank among the first half-dozen French poets of the century. But in 1826 his historical novel *Cinq-Mars* attracted much attention, and was translated into various languages; and in 1835 his drama *Chatterton* made his name celebrated. He also wrote *Stello* (1832); *Servitude et Grandeur militaires* (1835), short stories tinged deeply with pessimism; *Les Destinées*, a philosophical poem, published after his death, etc. A complete edition of his works appeared in 6 vols. in 1863-66. See A. France, *Alfred de Vigny* (Paris, 1868); L. Dorison, *Alfred de Vigny* (Paris, 1892).

Revised by A. G. CANFIELD.

Vigo, vē'gō: town; province of Pontevedra, Northwestern Spain; beautifully situated on the Bay of Vigo; 20 miles by rail S. W. of Pontevedra (see map of Spain, ref. 13-A). It has some sardine and tunny fisheries. It is irregularly built, and old but picturesque, and its attractive surroundings are rich in wine, oil, and fruits. Pop. (1887) 15,044.

Vihāra, vē-haa'raā [Sanskrit, pleasure, relaxation]: in post-Vedic times in India, a pleasure-ground or place of relaxation. After the rise of Buddhism the term was applied to Buddhist temples, these being at first only meeting-places for the Buddhist monks; but after images of Buddha began to be put up, and dwellings for the monks to be permanently erected around the image-house, the word *vihāra* was used, as it still is, to denote, first and more exactly, the temple itself, or, secondly and more generally, the whole monastic establishment. This usually consists, in all Buddhist countries alike, of one or more of the following buildings: (1) The image-house, containing one or more figures of Buddha, represented standing, sitting cross-legged, or lying on his side; before these images, or before the *dāgaba*, or before the bo-tree, the pious Buddhist goes through his simple worship, bowing with his palms placed together and raised to his forehead, repeating the creed or some moral sentences from the Buddhist books; (2) the *dāgaba*, a solid bell-shaped dome, sometimes of enormous dimensions, under which some relic of Buddha is supposed to be buried; (3) the sacred Bo-tree (*q. v.*), round which is raised a stone terrace; it is always supposed to be a descendant of the tree under which Buddha attained to Buddhahood, and holds the same position among the Buddhists as the cross does among Christians; (4) a *preaching-hall*; (5) an *assembly-hall* for the monks; and (6) their *sleeping apartments*. T. W. RUIJS DAVIDS.

Viking, vī'king [from Icel. *vīkingr*, deriv. of *vīk*, bay, inlet, creek; named from using the creeks and fiords as lurking-places. According to this derivation, it may also mean "the men from the fiords." The fact that the old Irish called the Norsemen *Lochlennoch* and Norway *Lochlan* is a curious coincidence. The Norwegian linguist S. Bugge suggests the derivation *vig-gengr*—i. e. one going to slaughter—in which case *viking* means simply warrior]: the name applied to those vast numbers of Scandinavian naval warriors who, in the ninth and tenth centuries, made the waters of Europe, and particularly those of Western Europe, unsafe. The ninth and tenth centuries are usually styled the viking age. The Scandinavian vikings were excellent ship-builders and expert seamen. By the aid of the sun, moon, and stars they were able to navigate in the open sea. They were the first to venture out of sight of land in ships, and thus became the discoverers of pelagic navigation. None other than coast navigation had ever been attempted by any people before the vikings found their way across the open North Sea to Great Britain, to the Faeroes, to Iceland, Greenland, and Vinland. The occupation of the viking was regarded as a highly honorable one. The viking went in search of "fee and fame," wealth and reputation. RASMUS B. ANDERSON.

Vilaine, vē'lān': a river of France; rises in the department of Mayenne, flows W. and S. S. W., and enters the Atlantic Ocean at Penestin, in the department of Morbihan. Its length is about 130 miles, and it is navigable 80 miles.

Vilas, vī'lās, WILLIAM FREEMAN: U. S. Senator; b. at Chelsea, Vt., July 10, 1840; removed in 1851 to Wisconsin; was educated at the University of Wisconsin; studied law and began practicing in Madison; fought in the civil war as colonel of the Twenty-third Regiment of Wisconsin Volunteers; returned to his law business after the close of the war, and took an active part in politics. He became Postmaster-General in 1885 and was Secretary of the Interior 1888-89. In 1891 he was elected U. S. Senator.

Vilayet: a province of Turkey, ruled by a vali. The corresponding division in former times was called an eyalet.

Vilers, vē'lār', CHARLES MARIE LE MYRE, de: diplomatist; b. in France in 1833; began his career in the navy in 1849; subsequently entered the civil service and proceeded to Algeria. In 1879 he was appointed civil governor of Cochin-China, where he suppressed an insurrection and introduced several reforms. He was recalled to France in 1882, and in 1888 he was sent to Antananarivo as minister plenipotentiary. There he distinguished himself by his patriotic resistance to British interests and missionaries in Madagascar, and finally succeeded in obtaining the consent of the Hova Prime Minister to his demand that the French plenipotentiary should have the right to grant the exequatur to the representatives of foreign countries. For these services he was promoted to be grand officer of the Legion of Honor. In 1889 he was elected deputy for Cochin-China, and in 1893 went to Siam, where he successfully negotiated a convention. In 1894 he returned to Madagascar, where, with the object of reducing that country to the position of a French dependency, he made demands which led to the invasion of the island in 1895.

Villa Bella de Goyaz: See GOYAZ, VILLA BELLA DE.

Villa Encarnación: See ITAPUA.

Villafran'ca: a small town of Northern Italy; about 11 miles S. of Verona and 12 miles N. of Mantua (see map of Italy, ref. 3-D). It is a well-built and flourishing town, with a fine castle of the fourteenth century. It was here that Napoleon III. terminated the war which he had begun against Austria "to liberate Italy from the Alps to the Adriatic," by negotiating, without the participation or knowledge of his ally, King Victor Emmanuel, a preliminary treaty with the Emperor of Austria, in which, though Lombardy was taken from the Austrians, the latter were allowed to retain Venetia. These provisions were afterward ratified in the treaty of Zurich. Pop. 3,990.

Villagran, vē'l-yaā-graan', or **Villagra**, FRANCISCO, de: soldier and governor of Chili; b. at Astorga, Leon, Spain, in 1507. He was with VALDIVIA (*q. v.*) in Peru, and one of his principal lieutenants in the conquest of Chili (1540-45). While Valdivia was in Peru, 1547-49, Villagran acted as deputy governor; during this period he condemned Pedro Sanchez de Iloz to death for instigating a rebellion. Subsequently he was prominent in the Indian wars, and when Valdivia was killed in the great Araucanian uprising of 1553-54, he assumed the governorship in accordance with a previous arrangement. He immediately marched against the Araucanians, but was disastrously defeated at Mariguenu Feb., 1554, and soon after was forced to abandon Concepcion. Having received re-enforcements, he marched to the succor of Valdivia and Imperial, the only Spanish posts remaining in the Araucanian country. The Indian forces being scattered, he was able to carry on a war of extermination for many months. In 1556 he defeated and killed the celebrated chief Lautaro at Mataquito. The new governor, García Hurtado de Mendoza, arrived in Apr., 1557, and immediately sent Villagran a prisoner to Peru, ostensibly because he had held command without authority, but really to get rid of him. He was released, went to Spain, and in 1561 returned to Chili with a royal commission to succeed Mendoza. During his term conquests were continued beyond the Andes, and there were new troubles with the Araucanians, in which Villagran's son was killed. D. in office at Concepcion, July 15, 1563. H. H. S.

Villain: See VILLEIN.

Villalobos, vē'l-yaā-lō'bōs, FRANCISCO LOPEZ, de: author; b. in Toledo, Spain, 1478; was perhaps of Jewish extraction; studied medicine and became physician to Ferdinand the Catholic and Charles V. successively. D. probably several years before 1549. Some of his writings deal with medicine as practiced according to the principles of the time, and therefore have little value now. More important than these are several works of a didactic nature, such as *Problemas* (1515), the *Tratado de los Tres Grandes Vicios*, and the *CanCIÓN* with its gloss. The plan of the *Problemas* resembles that of Dante's *Convivio*. In forty-one meters Villalobos proposes *problems* in physics or morals, which he seeks to solve in a gloss appended to each meter. The *Tratado* treats of the three great vices of loquacity, disputation, and excessive laughter; and the *CanCIÓN*, written, it is said, when the Empress Isabella died, bids farewell to the world and welcomes death. A noteworthy addition to the

Spanish drama is his *Anfitrión*, a translation of the comedy of Plautus; it seems, however, never to have been appreciated. See A. M. Fabié, *Vida y escritos de P. L. de V.* (Madrid, 1886); *Biblioteca de autores españoles*, vol. xxxvi., 405 ff. J. D. M. FORD.

Villa'ni, GIOVANNI: historian; b. at Florence about 1275; occupied a prominent place in his native city, and held various offices, military and diplomatic, as a member of the Guelph party. D. at Florence from the plague in 1348. He wrote a chronicle of Florence, *Cronaca Fiorentina*, in 12 books, from biblical times to 1346, to which his brother Matteo added a thirteenth book, carrying the narrative down to 1363. Matteo's son Filippo also wrote a continuation. According to the style of composition then reigning: this history of Florence is also a history of the world, but whenever the author speaks of Florence or of his own time, the book is considered to have great historical value. Its principal merit, however, is its simple and noble style. See U. Balzani, *Early Chronicles of Italy* (1883).

Revised by F. M. COLBY.

Villanovanus, ARNALDUS: See ARNALDUS VILLANOVANUS.

Villanneva, věčl'-yā-nwā'vā, JOAQUIN LORENZO: patriot, poet, and scholar; b. at Jativa, Valencia, Spain, Aug. 10, 1757; took orders, and was court preacher and confessor to the king when, in 1808, the revolution took place. Then he represented his province in the Cortes and advocated the principles of the constitutionalists, on which account, after the return of the king (1814), he was confined for six years in the monastery of Salceda. Again in the Cortes after 1820, he conferred with the pope on behalf of his party in 1822; and in 1823, upon the return of Ferdinand, fled to Ireland. D. in Dublin, Mar. 26, 1837. His principal works are *El año cristiano de España* (19 vols., Madrid, 1791-99); the treatise *De la lección de la Sagrada Escritura en lenguas vulgares* (Valencia, 1791), in which he took occasion to assail the Inquisition from the political side; *La angélicas fuentes ó El Tomista en las Cortes*, a defense of constitutionalism based upon arguments drawn from St. Thomas Aquinas; and his *Poesías escogidas* (London, 1833; printed in the *Biblioteca de autores españoles*, lxxvii., p. 583 ff.). Also noteworthy are the essay *Ibernia phœnicæ, seu Phœnicum in Ibernia incolatus* (Dublin, 1831; trans. *Phœnician Ireland*, London, 1832), on Irish antiquities, and his autobiography (London, 1825). Another work, translated into English (London, 1825), bears the title *Observations on the Answers of Doyle, Titular Bishop of Kildare and Leighton, to the Committee of the House of Commons* (concerning the discipline and government of the Roman Catholic Church).

J. D. M. FORD.

Villa Real, věčl'-yā-rā-aal': an old but handsome and regularly built town of Spain, province of Castellon; on the Mijares, near its mouth in the Mediterranean (see map of Spain, ref. 16-1). It has distilleries and factories of woolen fabrics. Pop. (1887) 13,750.

Villa'ri, PASQUALE: author; b. at Naples, Italy, Oct. 3, 1827. Educated in his native city under Basilio Piroti and de Sanetis, he took an active part in the Neapolitan revolution of 1848-49, and on its failure was obliged to flee to Florence. Here he lived in needy circumstances, giving private lessons and devoting himself to the study of history. After some years the fruit of his efforts appeared in the work *Storia di Girolamo Savonarola e de' suoi tempi* (2 vols., 1859-61; Eng. trans. by his wife, Linda Villari), which at once obtained recognition throughout Europe and brought the author an appointment as Professor of History in the University of Pisa (1859). During the next years Villari produced a number of treatises, some critical and educational, others inspired by his eager interest in the political welfare of Italy. Among these may be mentioned *La civiltà latina e germanica* (1861); *Leggende che illustrano la Divina Commedia* (1865); *Saggi critici* (1868); *Scritti pedagogici* (1868); *Arte, storia, e filosofia* (1884); *Nuovi scritti pedagogici*; and the pamphlet *Di chi è la colpa?* The last, written in 1866, after the national disasters of that year, deeply moved the Italians by its admonitions and warnings as to their own moral and political shortcomings. In this same year, 1866, Villari was drawn from Pisa to the chair of History in the Istituto di Studi Superiori at Florence, which he has since held, except when called away by duties of a public character. In 1869 he was general secretary of Public Instruction; in 1884 he was made senator; in 1891 he

was Minister of Public Instruction; he has several times been deputy in the Italian Parliament. Despite these engrossing professional and public labors, however, Villari has continued to be an earnest historical investigator and writer. In 1877-82 appeared his *Niccolò Machiavelli e i suoi tempi* (3 vols.; Eng. trans. by Linda Villari, rev. ed., 2 vols., London, 1892), a work of first-rate importance. In 1878 he published *Le lettere meridionali ed altri scritti sulla questione sociale in Italia*; in 1890, *Le origini del comune di Firenze* (in the volume *Gli Albori della vita italiana*); and *Saggi storici e critici*. In 1893-94 appeared *I primi due secoli della storia di Firenze* (2 vols., Florence; Eng. trans. by Linda Villari, entitled *The Two First Centuries of Florentine History*, London and New York, 1894). Deserving of mention is his edition of the *Dispacci di Antonio Giustiniano, ambasciatore veneto in Roma dal 1502 al 1505* (3 vols., 1876). A. R. MARSH.

Villa Rica, věčl'-yā-ree-kaā': a town of Paraguay, 92 miles by rail E. S. E. of Asuncion; near the forest-covered edge of the plateau or so-called mountain district (see map of South America, ref. 7-E). It is the most important place in the interior of the republic, the center of a fertile agricultural district which is especially noted for its tobacco, and the market most frequented by gatherers of maté, or Paraguay tea. Pop. about 12,000. H. H. S.

Villars, vēč'laar', CLAUDE LOUIS HECTOR, Duc de: marshal of France; b. at Moulins, department of Allier, France, May 8, 1653; was educated as a page at the court of Louis XIV.; entered the army in 1672; fought with distinction under Turenne, Luxembourg, and Créqui; was also employed with great success in diplomatic negotiations, especially as ambassador to Vienna, 1699-1701, and received in 1702, in the Spanish war of succession, his first independent command, Oct. 14, 1702, he defeated Prince Louis of Baden at Friedlingen, and was made a marshal; next spring he penetrated through the passes of the Black Forest and joined the Elector of Bavaria, but although, on Sept. 20, 1703, he won a new victory over the imperial forces under Styrum at Höchstädt, he nevertheless resigned his command and returned to France, disgusted at the follies of his ally, the elector. Having distinguished himself greatly at various points in the theater of war as a commander of minor corps, he succeeded Vendôme in 1709 in the command of the grand army in the Netherlands, numbering 120,000 men, but was defeated and severely wounded at Malplaquet Sept. 12, 1709. Having recovered, he again took command of the grand army, now the last which France was able to raise, and gained a brilliant victory over the allied English-Austrian force under the Earl of Albemarle at Denain July 24, 1712, which contributed much to the conclusion of the Peace of Utrecht. After a successful diversion against Prince Eugene, he finally negotiated and signed the Treaty of Rastadt (Mar. 6, 1714). During the regency and the reign of Louis XV. he continued to have much influence on the foreign policy and all military affairs, and when, in 1733, a war with Austria broke out, he was placed in command of the army in Northern Italy and received the title of marshal-general. Although eighty-one years old, he still displayed remarkable energy; but disagreement with the King of Sardinia caused him to resign his command. D. at Turin, June 17, 1734. His *Mémoires*, published after his death, are only partially genuine. His biography has been written by Anquetil (1784), Giraud (1881), and de Vogüé (1888).

Revised by F. M. COLBY.

Villefranche, věčl'-frānsh': town; department of Aveyron, France, at the confluence of the Aveyron and the Alzon (see map of France, ref. 8-F). It has iron-works and manufactures of copper-ware. Pop. (1891) 7,588.

Villefranche-sur-Saône, -sūr-sōn': town; department of Rhône, France; on the Saône, 20 miles N. W. of Lyons (see map of France, ref. 6-II). It manufactures cottons, spirits, leather, and trades in cattle and Beaujolais wine. Pop. (1891) 12,493.

Villegaignon, věčl'-gā'nyōn', NICOLAS DURAND, Chevalier, de: adventurer and colonizer; b. in Provence, France, in 1510. He was early noted for his exploits by land and sea, fought against the Turks and Algerians, and is said to have conveyed Mary Queen of Scots from Dumbarton to France in 1548. In 1555 he was chosen by Coligny to found a French colony in Brazil, the admiral hoping not only to gain a foothold in South America, but also to attract French Protestants thither by securing to them the free exercise of

their religion. Villegaignon left Havre on July 12, 1555, with two ships, and in November occupied and fortified the island still known by his name in the Bay of Rio de Janeiro. Friendly relations were established with the Indians, but dissensions soon broke out between the the Roman Catholic and Protestant colonists, and these were increased on the arrival of re-enforcements and Protestant missionaries. Villegaignon, whose acts were ill-judged and often tyrannical, finally expelled the Calvinists, and some of them died of starvation during their return to France. He himself went to France in 1559 to seek re-enforcements, but never returned, and in 1667 the colony was broken up by the Portuguese. D. near Nemours, Jan. 9, 1571. H. H. SMITH.

Villegas, vël-yá'gáns, ESTEBAN MANUEL, de; poet; b. at Najera, Old Castile, Spain, in 1595; received a good classical education in Madrid; studied law at Salamanca; remained poor all his life, and died, the incumbent of a small office in his native town, Sept. 3, 1669. The influence of the classics worked very strongly upon him, and caused him to oppose with vigor the movement of Lope de Vega and his school. The beauty of his poems, which are mostly erotic and in the spirit of Horace and Anacreon, has long been recognized. They appeared under the title of *Amatorius*, at Najera, in 1618, and together with a translation of the *De Consolatione Philosophiæ* of Boethius, have been several times reprinted. See the edition by Vicente de los Rios, *Las eróticas y traducción de Boccio*, 2 vols., Madrid, 1774 (has a good life prefixed); and that by M. J. Quintana, *Poesías selectas*, Madrid, 1807, especially vol. i., pp. 348-378; also *Biblioteca de autores españoles*, vol. xliii., pp. 552 ff. J. D. M. FORD.

Villehardouin, vël'har'doo-än, GEOFFROY, de; historian; b. at the castle of Villehardouin, near Troyes, in Champagne, France, about 1160. Almost all that is known of his life is gathered from his chronicle, the *Histoire de la Conquête de Constantinople*, which is one of the chief historical works of the Middle Ages, and the earliest chronicle written in the French language. It narrates the story of the fourth, or, as some historians reckon it, the fifth crusade (1202-04) which, diverted from its original purpose, never reached the Holy Land, but became a mere chivalrous enterprise for the capture of Zara and Constantinople. Villehardouin took the cross in 1199, and was one of the deputies to negotiate with the Venetians for ships to transport the crusaders. He fought at the siege of Constantinople, but seems to have been especially distinguished for his skill as a diplomatist, being employed in many difficult negotiations with the Eastern court and in the settlement of disputes among the crusaders themselves. After the establishment of the Latin Empire he was appointed marshal of Romanie, fought with honor against the Bulgarians and in the naval battle at Cibotus, and received for his services the fief of Messinople. From this time little is known of his career. The date of his death is uncertain, but is thought to be 1213. The *Histoire de la Conquête de Constantinople*, which covers the period from 1198 to 1207, is the best picture that has been preserved of the life and spirit of the age of chivalry. The first printed edition extant is dated 1585. Another appeared at Lyons in 1601, but the best of the earlier editions is that of du Cange (1657). The best modern edition is by Natalis de Wailly (1872-74; 3d ed. 1882). See Sainte-Beuve, *Causeries de Lundi*, vol. ix. F. M. COLBY.

Villein, or **Villain** [from O. Fr. *vilain*, *vilain* < Late Lat. *villanus*, farm-servant, deriv. of Lat. *villa*, farm]; primarily and strictly, the servile peasant of the feudal era in England; in a secondary and wider sense, any person, bond or free, who held land by the tenure or upon the conditions of the servile peasantry. The term *villanus*, adopted and fixed by the *Domesday Book*, is constantly employed in this double sense in the manorial and legal records of the thirteenth and fourteenth centuries.

At no time during the Middle Ages was the Christian society of Europe free from servile elements. The feudal system did not create, nor, as is commonly supposed, did it necessarily involve the existence of a servile class. On the contrary, that system found unfree men in every country of Europe, from the Anglo-Saxon thrall and Danish bondman (*bondus*) to the *servi* and *coloni* of the Mediterranean states. Moreover, it was solely by the operation of the laws governing the development of feudal society, and not as a result of humanitarian enterprise, that these servile classes were gradually transformed into a free peasantry. If it is true that in no country of Europe was this process of emancipation more rapidly effected and attended with more beneficial and

permanent consequences than in England, it is no less true that nowhere else did the feudal system have so rapid and complete a triumph. The truth is that there was no room for serfdom in the feudal organization of society. This society had not an industrial, but a military basis, and the services which it required were easily obtainable from, and could in general be better performed by, free men than by the unfree. It is obvious that a social order in which the most personal and menial services are voluntarily performed by free men as a part of the service which they owe for their tenure of lands (see *TENURE*) has no interest in maintaining a distinct class of servile dependents. This characteristic of the feudal system is well illustrated in the status of the villein and in the history of his relations to the society and to the soil to which he appertained.

It should be said, in the first place, that the villein, though a bondman, was not a slave. The man who held him in subjection was his lord and master, but not his owner. The villein was not a chattel, nor, indeed, was he property of any kind, although, being attached to the manor (*adscrip-tus glebæ*), he constituted a sort of appurtenance to the soil. He could not as an individual be sold and removed from the land to which he belonged, but if the land was sold he passed with it under the dominion of the new tenant or lord. He could acquire no property, real or personal, which his lord could not assume at pleasure; he was obliged to perform a variety of services which, though not necessarily menial in themselves, were regarded as the badge of his servile condition; the same may be said of certain payments which he was compelled to make to his lord (as *marchet*, or the fine for marrying his daughter), and which, though not differing very widely from the more burdensome incidents of free tenure, were regarded as the tribute of a bondman. Moreover, he could not lawfully leave the manor to which he belonged, and he held the cottage and plot of ground which he possessed completely at the will of his lord.

On the other hand, it was only in these personal relations to the lord and as an appurtenance of the manor that the villein was subjected to the conditions of servitude. As regarded all other persons and, under some circumstances, even in his relations to his lord, he had the legal status of a freeman. The king's courts were open to him and the king's law protected him as well from breach of contract by his lord, as from the forfeiture of his *wainage*, or instruments of labor, and from injury to life and limb. As to all other persons he could acquire, hold, and transmit real and personal property, and could maintain all the usual actions at law for its defense and recovery. Moreover, as Medley (*English Constitutional History*) has expressed it, "beyond the bounds of the manor and away from the power of the lord the influences which made for freedom were irresistibly strong." There was considerable migration, notwithstanding the efforts that were constantly made to restrain it, and once away from his manor a villein was regarded as a freeman. If his lord attempted to recover him he had the common-law presumption in favor of freedom to overcome, and could succeed only by indisputable proof of the servile status of the ancestors of the person claimed. It was not enough to show that the latter was a fugitive from the plaintiff's manor, and that he had there occupied the position of a villein. If a villein took holy orders, or if he lived for a year and a day in a chartered town, or if his lord enfeoffed him of a freehold, he became a free man.

Such was in legal theory the status of the villein. But it must be remembered that when we speak of legal theory we mean the doctrine of the king's courts, and that these courts stopped at the threshold of the manor. The internal affairs of the manor, especially the relations of the villeins to the lord and the land, and the terms and conditions on which they possessed their holdings, were, in theory at least, wholly within the control of the lord of the manor. In fact, however, it must always have been true that these matters were largely regulated and determined by the custom of the manor, and when that custom found official and effective expression through the manorial courts it came to have very much the effect of real law in determining the relations of the lords to their villein tenants. In this way then, by the recognition of the binding force of manorial custom, the status of the villein tenant came to have some of the characteristics of a lawful tenure, which under the description of villeinage was enjoyed by many persons who were not villeins in fact. It is, of course, in what has been described above as the secondary sense of the term villein that we find such expressions employed as a "full villein," a "half vil-

lein," and the like, referring not to the personal status of the individual in question, but to the size of the plot of ground held by him, the normal ("full") villein tenement being a *virgate* (about 30 acres), or one-fourth of a *hide* (120 to 180 acres). "It was on these two units, the hide and the virgate," says the authority from whom quotation was made above, "that all calculations of services were made; and, although the acquisition of villein land by freeholders and *vice versa* must necessarily have slightly altered the position of the lord toward the individual holders, the duties remained as a fixed quantity entered in the manorial rolls and subject neither to increase on the part of the lord nor to substantial diminution on that of the tenant." When the conditions of villein tenure reached the state here described, nothing was needed to convert it into one of the recognized forms of free tenure but its adoption by the courts of common law. See TENURE.

For brief but trustworthy accounts of the villein, especially in his legal relations, consult Digby, *History of the Law of Real Property*; Medley, *English Constitutional History*; and Pollock and Maitland, *History of English Law*; for his industrial and social position, see Andrews, *The Old English Manor*, and Ashley's *English Manor* (in the English edition of Fustel de Coulange's *Origin of Property in Land*). The whole question has been most thoroughly considered, from the legal as well as the industrial and social side, by Prof. Paul Vinogradoff, in his work on *Villainage in England*. GEORGE W. KIRCHWEY.

Villèle, vē'lāl', JEAN BAPTISTE SÉRAPHIN JOSEPH, Comte de; statesman; b. at Toulouse, department of Haute-Garonne, France, Aug. 14, 1773; entered the navy in 1791; went to the West Indies, and remained there during the Revolution; returned in 1807 with a fortune, and settled in his native city; was elected a member of the Chamber of Deputies in 1815, and became in a few years the leader of the ultra-royalist party. After the murder of the Duc de Berry and the fall of Decazes in 1820 he entered the cabinet as minister without a portfolio, and became Minister of Finance in 1821, and president of the council in 1822. An able financier, he brought the finances of France into an orderly shape; but his reactionary measures made him very odious to the people, without fully satisfying the court. In 1823 occurred the war with Spain for the reinstatement of Ferdinand VII., the complete success of which gave him a strong majority in the elections of 1824. Taking advantage of the popularity of the ministry, he tried to secure an indemnity of one milliard to the *émigrés*, and the measure, at first rejected by the House of Peers, was finally voted after the accession of Charles X. Among the other measures of his administration were the lowering of the interest on the public debt to 3 per cent., the prolongation of the electoral term for the Chamber of Deputies to seven years, the re-establishment of the right of primogeniture, the limitation of the freedom of the press, the law of sacrilege, and the dissolution of the national guard of Paris. In Jan., 1828, he was compelled to give way to the cabinet of Martignac. He was created a count when he entered the ministry, and a peer when he left it. After 1829 he lived in retirement in Toulouse, and died there Mar. 13, 1854. F. M. COLBY.

Villemain, vē'l mān', ABEL FRANÇOIS; scholar and critic; b. in Paris, June 11, 1790; studied first law, afterward literature and philosophy; was appointed Professor of Rhetoric at the Lycée Charlemagne in 1810; won the prize of the Academy three times—in 1812, 1814, and 1816—for his *Éloge de Montaigne*, *Avantages et Inconvénients de la Critique*, and *Éloge de Montesquieu*; published in 1819 his *Histoire de Cromwell* (2 vols.); received in 1820 a position in the Department of the Interior as *chef de l'imprimerie et de la librairie*, and was shortly after made *maître des requêtes* to the council of state. His connection with politics soon carried him into the ranks of the opposition, and in 1827 the Academy, to which he had been chosen in 1821, commissioned him, together with Laetzel and Chateaubriand, to draw up its protest against the re-establishment of the censorship of the press. He now lost his position in the Government, but his lectures at the Sorbonne gathered immense audiences, and greatly contributed, like those of Guizot and Cousin, to foment the movement which terminated with the Revolution of 1830. In 1831 he became a member of the council of public instruction; in 1832 was created a peer and chosen perpetual secretary of the Academy; in 1839-40 and 1840-41 was Minister of Public Instruction. But of all the *doctrinaire* leaders he proved

the one least fitted for actual government. Unable to take or to keep a firm position between the conflicting interests of the Church and the university, the liberals and the conservatives, etc., he resigned his office in 1845, and retired altogether from politics in 1848, devoting himself exclusively to literature. He is especially known for his criticism, which by its brilliancy, breadth, and wide sympathy was a powerful force in French letters in the period of romanticism. Among his works are *Cours de Littérature française* (5 vols., 1828-29; later editions 6 vols.); *Discours et Mélanges littéraires* (1823); *Études de Littérature ancienne et étrangère* (1846); *Souvenirs contemporains d'histoire et de Littérature* (1856); *Histoire de Grégoire VII.*, with an introductory chapter on the history of the papacy (2 vols., 1873). All these except the last he altered and enlarged in later editions. D. in Paris, May 8, 1870.

Revised by A. G. CANFIELD.

Villena, vēl-yā'nā, DON ENRIQUE DE ARAGON, Marqués de (title of marquis disputed); author; b. in Spain in 1384; was a scion of the royal family of Castile and Aragon. Deprived of his estates by Henry III. of Castile, he was made grand-master of the Order of Calatrava; but was deposed in 1407, and left in want until relieved by the Queen Regent of Castile, who gave him the small seigniorship of Iniesta. D. in 1434. Eager for knowledge, he plunged into all the known sciences, particularly into astrology, on account of which he gained the ill repute of being a sorcerer. The belief in his nefarious character led to the burning of most of his books after his death. He favored the Provençal poetic art, advocating its principles in two treatises, the *Capítulos del Gay Saber* and the *Arte de Trovar*, and upholding the *Consistorio del Gay Saber* of Barcelona. He admired Dante, and made a translation of the *Divina Commedia*, in 1428 (lost). Above all, he heralded the Renaissance by translating the *Æneid* (nine books preserved) and other Latin classics, and by drawing from them in the poem *Façanhas de Ércules* (lost), and the prose moralization, the *Doce Trabajos de Hércules*. The last named and a treatise on carving, the *Arte cisoria*, are extant. J. D. M. FORD.

Villeneuve-sur-Lot, vēl'nōv'sūr-lō': town; department of Lot-et-Garonne, France; on the Lot, which here is crossed by a remarkable bridge (built in the thirteenth century) which spans the river by one single arch (see map of France, ref. 8-E). The chief manufactures are faïence, tiles, and bricks, and a lively trade in wine, fruits, and other products of the adjoining districts is carried on. Pop. (1891) 9,339.

Villers, vē'lyā', CHARLES FRANÇOIS DOMINIQUE, de; soldier and author; b. at Boulay, Lorraine, Nov. 4, 1765; educated at the school of artillery in Metz, and entered the army in 1782, but emigrated in 1793; served for a short time in the army of Condé; lived in various places in Germany, and settled in 1797 in Lubeck, devoting himself to literature. He published *La Philosophie de Kant* (2 vols., Metz, 1801; 2d ed. Utrecht, 1830-33); *Essay on the Spirit and Influence of the Reformation of Luther* (Paris, 1804; 5th ed. 1851; Eng. trans., London, 1805; abridged ed. 1836); *Comp d'eil sur les Universités de l'Allemagne protestante* (1808); but his *Lettre à Madame la Comtesse Fanny de Beauharnais*, in which he describes the atrocities committed by the French soldiers at the storming of Lubeck in 1806, drew upon him the hatred of the French army, and exposed him to many persecutions. On the annexation of the Hanseatic cities to France in 1811, he removed to Göttingen, where he died Feb. 26, 1815. Revised by S. M. JACKSON.

Villiers, vil'yēz, CHARLES PELHAM, P. C.; statesman; b. Jan. 3, 1802; brother of the fourth Earl of Clarendon (see CLARENDON, GEORGE); educated at Haileybury and St. John's College, Cambridge; called to the bar at Lincoln's Inn 1827; became a member of the House of Commons for Wolverhampton as a free-trader in 1835 and retained his seat, being returned in 1892 as a Liberal-Unionist; appointed judge-advocate-general 1853; president of the Poor-law Board 1859-66; became a member of Palmerston's second administration in 1859. He was one of the leaders of the anti-corn-law agitation, and introduced and carried through Parliament the Union Chargeability Bill (1865). A marble statue of Villiers was unveiled at Wolverhampton 1879, and his jubilee as member for the borough was celebrated in 1885.

Villiers, FREDERIC; journalist; b. in London in 1852; was educated in France; studied in the South Kensington schools of art and at the Royal Academy. In 1876 he was

special artist and correspondent of *The Graphic* in the campaign in Servia, and throughout the Russo-Turkish war 1877-78. In the latter year he went to Afghanistan, and was present during the military operations there until the signing of the treaty of Gandamak. In 1882 he left England for Egypt; was on board H. M. S. Condor during the bombardment of Alexandria, and was present during the Egyptian campaign, receiving the order of the Medjidié and the khedive's medal. In 1884 he went to Suakim, and was present during the operations against the Arabs, and in the following year he accompanied the expedition for the relief of Khartoum. He then accompanied the Servian forces in their campaign with the Bulgarians, and immediately afterward went to Burma in the service of *The Graphic*. During the Chinese-Japanese war of 1894-95 he was correspondent of *Black and White*. Since 1887 he has delivered lectures on his varied experiences in England, the U. S., and Canada.

Villiers, GEORGE: See BUCKINGHAM, GEORGE VILLIERS, DUKE OF.

Villiers, GEORGE WILLIAM FREDERICK: See CLARENDON.

Villis'ca: city; Montgomery co., Ia.; at the junction of the east and west branches of the Nodaway river; on the Chi., Burl. and Quincy Railroad; 16 miles N. of Clarinda, and 18 miles E. by S. of Red Oak (for location, see map of Iowa, ref. 7-E). It has 7 church organizations, high and grammar schools with 14 teachers and nearly 600 pupils, water-works, an electric-light plant, a national bank with capital of \$50,000, a private bank, and 2 weekly newspapers. Fire, paving, and building brick and tile are made from large local deposits of soapstone and clay. The city is a shipping-point for live stock, grain, fruit, butter, poultry, and eggs. Pop. (1880) 1,299; (1890) 1,744; (1895) State census, 2,034.

EDITOR OF "LETTER."

Villoison, vōl' wāw'zōn', JEAN BAPTISTE GASPARD D'ANSSE, de: Greek scholar; b. at Corbeil-sur-Seine, France, Mar. 5, 1753; became a member of the Académie des Inscriptions at the age of twenty-three; was sent by the French Government to Venice to examine the MSS. of the library of St. Mark. The *Anecdota Græca* (2 vols., 1781) embodies the results of his study, the most famous being the publication, with learned comments, of the *Codex Venetus*, containing the text of Homer and the *scholia* which furnished F. A. Wolf with material for his *Prolegomena*. The iconoclastic nature of this treatise of the German scholar is said to have so disturbed Villoison that he ever afterward regretted the publication of these *scholia*. Villoison subsequently traveled through Greece (1785-88). The French Revolution having broken out shortly after his return to Paris, he was banished, with others of the nobility, to Orleans. In 1800 he was recalled as professor at the Collège de France. D. in Paris, Apr. 26, 1805. Other noteworthy publications, are his edition of the *Homeric Lexicon* of Apollonius (2 vols., 1773) and Longus's *Pastoralia*. See Dacier, *Notice historique sur Villoison* (1806); Chardon de la Rochette, *Mélanges des critiques* (vol. iii., pp. 1-61).

ALFRED GUDEMAN.

Villon, vōl' lōn', FRANÇOIS: poet; b. in Paris in 1431. His real name was de Montcorbier, and he had several aliases, the name he is known by being taken from a benefactor, Guillaume de Villon. He studied at the university, and became a master of arts in 1452. In 1455, in consequence of having killed a priest in a street brawl, he was obliged to flee, and was sentenced to banishment. On proof that he had been attacked by the priest he received a pardon in the following year. He now devoted himself to writing his *Petit Testament*. But he was soon in trouble again, this time of the *cherchez la femme* kind, and he fled to Angers. Henceforward his life was such as has been associated with his name; whether it was caused by the pressure of want or the conviction that his ridding the world of a worthless priest had rendered the Church his enemy we have no means of knowing. Shortly after his arrival at Angers the chapel of the college of Navarre was robbed of 500 crowns, and the theft was traced to a band of student robbers, one of whom accused Villon of being their leader, and asserted that he had planned similar burglaries at Angers. Villon was caught, tortured, and with five others was sentenced to be hanged. On this occasion he composed his *Ballade des Pendus*, an epitaph by anticipation on himself and his comrades swinging on the gibbet. He escaped this picturesque fate, however, by appealing to the parliament of Paris, which, perhaps on the intercession of a friend, commuted

his sentence to banishment. Of the next four years of his life we have little information, but on his reappearance in 1461 he is found spending the summer in the prison of the Bishop of Orleans at Meung. His crime was probably sacrilege or burglary. This time he owed his escape to a jail delivery at Meung on the accession of Louis XI. He now wrote his last and greatest work, his *Grand Testament*, and it is probable that he did not survive much longer, worn out, as he admits himself to be, by excesses, prison life, and perhaps consumption.

Villon's poetry may be considered as marking an era in the literature of Europe. In it we find the personal note, so wanting before his time, a strong capacity of feeling and expression, and a mournful tone, arising from the poet's sense of the vanity of the joys of mere life and perhaps from his own hopeless immersion in vice. It has thus proved intensely interesting and even attractive, in spite of its realistic atmosphere of libertinism, which at least is not assumed, as in the case of a modern school of eccentric poets. Besides the two testaments, there are a number of ballads, among which is the well-known *Ballade des Dames du Temps Jadis*, with its burden of *Mais où sont les neiges d'antan*. In addition, there is a collection in argot, partly due to him, called *Le Jargon* (it is mostly unintelligible at the present day), and *Les Repues Franches*, a series of stories dealing with the cheating of tavern-keepers, etc., many of them probably written before Villon's time.

The first dated edition of Villon's poems is of 1489, and numerous editions have been published since, especially in the eighteenth century. See A. Longnon, *Etude Biographique sur François Villon* (1877); W. Bijvanek, *Essai Critique sur les œuvres de François Villon* (Leyden, 1883). English translations have been made by John Payne (1878; expurgated ed. 1881), Swinburne, Andrew Lang, and others.

R. A. ROBERTS.

Vil'na, or Wilna (Polish Wilno): general government of Western Russia, formerly the grand duchy of Lithuania; area, 16,421 sq. miles. It is mostly level, broken at places by low hills of clay and sand, but often occupied by marshes and lakes or covered with extensive forests. The climate is mild and damp in summer, but severe in winter. The soil is generally fertile and produces rye, barley, oats, potatoes, flax, hemp, and tobacco. These products, together with timber, honey, wax, tar, potash, skins of elks, bears, wolves, and martens, are the principal articles of export. The Niemen and its tributary, the Wilija, and the Dwina are the chief channels of trade. Pop. (1890) 1,367,100.

H. S.

Vilna (Polish Wilno): capital of the general government of Vilna, Russia, and a great railway center; on the Wilija; 436 miles S. W. of St. Petersburg (see map of Russia, ref. 7-B). It has very few manufactures, but an extensive trade in grain and timber. Vilna was the capital of Lithuania from 1323, when the Lithuanian state extended from the Baltic to the Black Sea, and is still very rich in historical monuments and associations. Its university, founded by Stephen Bathori in 1576, was suppressed after the revolution of 1830; but a medical academy and an astronomical observatory still exist, besides two gymnasiums, religious seminaries, and a museum with a public library and valuable historical collections. The Cathedral of St. Stanislaus contains the silver sarcophagus of St. Casimir. Among the twenty-two Roman Catholic and about a dozen Greek churches are several magnificent, old, and historic buildings. Vilna's scientific societies are among the most noted in the Slavonic world. Pop. (1891) 109,363, chiefly Polish.

H. S.

Vimeira, vōe-mā'cē-raū: town; in the province of Estremadura, Portugal; on the coast; 7 miles N. of Torres-Vedras (see map of Spain and Portugal, ref. 16-A). It is noted for a battle which took place Aug. 21, 1808, between the French under Junot and the British under the Duke of Wellington, in which the French were defeated.

Vimeur, DONATIEN, de: See ROCHAMBEAU.

Vinalhaven: town (settled in 1765, incorporated in 1789); Knox co., Me.; comprising several islands in Penobscot Bay; 15 miles E. of Rockland (for location, see map of Maine, ref. 9-E). It contains valuable granite-quarries, 2 churches, high school, public library, and 2 hotels. Pop. (1880) 2,855; (1890) 2,617.

Vincennes, Fr. pron. vān'sen': a commune (or township) of France; adjoining Paris on the E.; noted for its château and forest (Bois de Vincennes). The present château was begun by Philip de Valois (1333), and constitutes

a fortress, in form a parallelogram 1,200 by 670 feet. An interior fort, "the donjon," was flanked by nine towers, all of which except one were removed in 1818 in remodeling the work, it having become the chief arsenal of Paris. The château of Vincennes was, up to the time of Louis XI., a royal residence. Subsequently, it became a state prison. The list of prisoners contains some of the greatest names of France. The unfortunate Duc d'Enghien (see ENGHUEN) was shot here in the moat at the southeast angle. The church (La Sainte Chapelle) where his remains are deposited contains a monument to his memory. There are extensive barracks and stables for cavalry; and, besides being a great arsenal, Vincennes comprises the shooting-school where officers from all regiments are sent to learn the use of modern arms, and to which the regiments of the garrison of Paris and environs send their contingents for practice both with artillery and small-arms. The Bois de Vincennes is a park, covering an area of nearly 4 sq. miles, that is much resorted to by the middle classes of Paris. Pop. (1891) 24,626.

Revised by M. W. HARRINGTON.

Vincennes, vin-senz': city; capital of Knox co., Ind.; on the Wabash river, and the Balt. and Ohio S. W., the Cleve., Cin., Chi. and St. L., the Evansv. and Terre Haute, and the Penn. railways; 51 miles N. of Evansville, and 150 miles E. of St. Louis (for location, see map of Indiana, ref. 9-B). It occupies a dry, level, and elevated plain; is surrounded by prairie-lands; and is laid out regularly in 300-foot squares, with streets nearly parallel and generally 50 feet wide. It contains Harrison Park, Court-house Square, and City-hall Plaza; and its notable public buildings include the Harrison house, erected by Gov. Harrison in 1804, St. Francis Xavier Cathedral, Knox County court-house (cost \$400,000), city-hall (cost \$100,000), 4 public high schools, and the buildings of Vincennes University. There are 16 churches and chapels, several public and denominational schools, 4 libraries, 3 national banks with combined capital of \$300,000, St. Vincent's Orphan Asylum for Boys (Roman Catholic), an Orphan's Home, and a quarterly, a monthly, 4 weekly, and 2 daily periodicals. The city has an assessed valuation of \$5,051,405; gas and electric-light plants, electric street-railway, water-works, 3 grist and 3 saw mills, 3 foundries and machine-shops, sewer-pipe works, brewery, and manufactories of wrapping-paper, brick, tile, plaster, cement, stoves, wagons, and a large variety of articles of iron, wood, and tin. Vincennes was founded in 1702 by French troops for a fort; was surrendered by the French to the British in 1763; by the British to Virginia troops in 1779; and was ceded to the U. S. by Virginia in 1783. It is the oldest settlement in Indiana, and, excepting Detroit and Kaskaskia, the oldest in the territory comprising the States of Ohio, Michigan, Illinois, Indiana, and Wisconsin. It was the capital of Indiana from 1800 to 1813. On the southeast side of the city and visible from any part of it are five of the most perfect specimens of the works of the mound-builders. Pop. (1880) 7,680; (1890) 8,853.

HENRY S. CAUTHORN.

Vincennes, vän'sen', JEAN BAPTISTE BISSOT, Sieur de: explorer; b. in Quebec, Canada, in Jan., 1688; son of a wealthy merchant of Quebec; was a near relative of Joliet; took part from childhood in expeditions to the Western country; fought against the Iroquois at Mackinac in 1698; entered the army as ensign; resided long among the Miami Indians, with whom he was a great favorite; rescued some Iroquois prisoners from the Ottawas 1704; came in collision with La Mothe Cadillac, the commander at Detroit; rendered valuable services against the Foxes by saving Detroit 1712; built soon afterward a fort and trading-post on the site of the city of Vincennes, Ind., and in 1736 joined the expedition of d'Artagnette against the Chickasaws, by whom, after several victories, he was taken prisoner and burned alive, along with d'Artagnette, Père Senat, and several others.

Vincent, CHARLES EDWARD HOWARD, C. B.: member of Parliament; b. at Slinfield, Sussex, England, May 31, 1849; son of Rev. Sir Frederick Vincent; educated at Westminster School and the Royal Military College, Sandhurst; served in the army 1868-73; captain in the Royal Berks Militia 1873-75; lieutenant-colonel Central London Rangers 1875-78; appointed director of criminal investigations 1878; called to the bar 1876; special correspondent of *The Daily Telegraph* in Berlin 1871; military commissioner of *The Daily Telegraph* at the outbreak of the Russo-Turkish war in 1877; reorganized the detective system of the metropoli-

tan police, 1878, and was given absolute control over the criminal investigations; resigned to enter Parliament 1884; appointed colonel commandant of the Queen's Westminster Volunteers; returned to Parliament as Conservative member for the central division of Sheffield 1885, 1886, and 1892; is identified with the fair trade movement, united empire trade, and British labor questions. Author of *Elementary Military Geography, Reconnoitring and Sketching* (1872); *Procédure d'Extravallation* (1880); *A Police Code and Manual of Criminal Law*, and other works.

Vincent, SIR EDGAR, K. C. M. G.: financier; educated at Eton; second lieutenant in the Coldstream Guards 1877-82; was appointed in 1880 private secretary to Lord Edmund Fitzmaurice, commissioner for Eastern Roumelia, and in 1881 assistant to the commissioner for the evacuation of the territory ceded to Greece by Turkey; appointed representative of Great Britain, Belgium, and the Netherlands on the council of the Ottoman public debt held at Constantinople 1882, and financial adviser to the Egyptian Government 1883; subsequently was appointed governor of the Imperial Ottoman Bank. He reformed the currency of Egypt, restored the financial prosperity of that country, and also freed Turkey from financial embarrassment.

Vincent, JOHN HEYL, S. T. D., LL. D.: bishop; b. at Tuscaloosa, Ala., Feb. 23, 1832; educated at the academies at Lewisburg and Milton, Pa., and Wesleyan Institute (Newark, N. J.); joined the New Jersey Conference in 1853; ordained deacon in the Methodist Episcopal Church in 1855 and elder in 1857; transferred to the Rock River Conference, Illinois, in 1857; held pastorates in Chicago, Galena, and elsewhere; and became distinguished by his efforts to improve the organization and literature of Sunday-schools. In 1866 he founded the *Sunday-school Teacher* at Chicago, Ill.; in 1868 was placed by the General Conference in the Sunday-school work of the Methodist Episcopal Church; with Lewis Miller, of Akron, O., established the Chautauqua Assembly, of which he is now chancellor. In 1888 he was elected bishop with official residence at Buffalo, N. Y.; in 1892 became a resident of Topeka, Kan. He is the author of *The Modern Sunday-School* (New York, 1887); *The Church School and its Officers* (New York, 1872); *The Chautauqua Movement* (Boston, 1886); *The Revival and After the Revival* (New York, 1883); *The Home Book* (New York, 1887); *Better Not* (New York, 1888); *Pedagogy* (New York, 1890); *Sunday-School Institute and Normal Classes* (New York, 1872); *Studies in Young Life* (New York, 1890); *To Old Bethlehem* (Meadville, 1890); *My Mother* (Meadville, 1892); *In Search of His Grave* (Meadville, 1893); *The Story of a Letter* (New York, 1893); *The Holy Waiting* (Cincinnati, 1893); *Earthly Footsteps of the Man of Galilee* (St. Louis, 1894); and numerous text-books for Sunday-schools and the literary work of the Chautauqua system. Revised by A. OSBORN.

Vincent, MARVIN RICHARDSON, D. D.: minister and professor; b. at Poughkeepsie, N. Y., Sept. 11, 1834; educated at Columbia College; Professor of Latin in Troy University 1858-61; pastor of First Presbyterian church, Troy, N. Y., 1863-73; Church of the Covenant, New York, 1873-88; and since 1888 has been Professor of Sacred Literature in Union Theological Seminary. Dr. Vincent translated, with Prof. Charlton T. Lewis, Bengel's *Gnomon of the New Testament* (2 vols., Philadelphia, 1860), and has published *Amusement a Force in Christian Training* (1867); *The Two Prodigals* (New York, 1876); *Gates into the Psalm Country* (New York, 1878; new ed. 1893); *Stranger and Guest* (New York, 1879); *Faith and Character* (New York, 1880); *The Minister's Handbook* (New York, 1882); *In the Shadow of the Pyrenees* (New York, 1883); *God and Bread* (New York, 1884); *The Expositor in the Pulpit* (New York, 1884); *Christ as a Teacher* (New York, 1886); *The Covenant of Peace* (New York, 1887); *Word Studies in the New Testament* (3 vols., 1887-90); *Exegesis* (New York, 1891); *The Student's New Testament Handbook* (New York, 1893); *Bible Inspiration and Christ* (New York, 1895); and *That Monster—the Higher Critic* (New York, 1895). C. K. HOYT.

Vincent, Cape: See CAPE VINCENT.

Vincent de Paul: See PAUL, ST. VINCENT, de.

Vincentians: a congregation of secular Roman Catholic priests not under a monastic rule, but under special obligations to preach and hear confession among the poor, to assist in the education of clerics, and to further the annual devotion called the "ecclesiastical retreat."

Vinci, LEONARDO, da: See LEONARDO DA VINCI.

Vindictive Damages: See DAMAGES, MEASURE OF.

Vine, Sir JOHN RICHARD SOMERS, C. M. G., F. S. S.: statistician; b. at Wells, Somerset, England, Dec. 10, 1847; educated at the Grammar School, Spalding, and at a private school in Cambridge; became a journalist; was private secretary at the Mansion House to the lord mayors of London 1871-75; city and official agent to the International Fisheries, Health, and Inventions Exhibitions 1883-85, and to the royal commissioners for the Colonial and Indian Exhibition 1886; knighted 1886; became assistant organizing secretary to the proposed Imperial Institute as the national memorial of the Queen's reign 1886, and for his services to that institution was created a Companion of the Most Distinguished Order of St. Michael and St. George. He is prominent as a Freemason, is a past grand deacon, and was founder and first elected master of the Savage Club Lodge. He has published a number of statistical works, including *English Municipal Institutions* (1878), and *The English Municipal Code* (1882), and was the projector of *The Imperial Institute Year-Book*, first issued in 1892.

Vine-culture: See GRAPE.

Vine Family, or Grape Family: the *Ampelidæ*; a small group (435 species) of choripetalous, dicotyledonous, woody plants, mostly climbing, with 4- or 5-merous flowers, stamens opposite the petals, ovary superior, of 2 to 6 carpels, as many cells, and few ovules. They are most numerous in the tropics; twenty species are natives of North America. Many species of *Vitis*, the GRAPE (*q. v.*), are grown for their delicious berries. The Virginia creeper (*Parthenocissus quinquefolia*, or *Ampelopsis quinquefolia*) of the U. S. and the Japanese creeper (*P. tricuspidata*) of Eastern Asia and Japan are well known ornamental climbers.

CHARLES E. BESSEY.

Vinegar [M. Eng. *vinegre*, from O. Fr. *vinagre*; Ital. *vinagro*; Provenc. *vinagre-s*; Span. *vinagre* < Lat. *vinum acre*, sour wine]: a dilute solution of ACETIC ACID (*q. v.*), mixed with small quantities of sugar and other organic and vegetable matters, produced by the oxidation of alcoholic solutions. The oxidation is effected by an organism called *Mycoderma aceti*. Pasteur showed that this organism acts as the oxygen-carrier in the reaction. The tough gelatinous mass often found in the vessels used in the manufacture of vinegar, and known as mother-of-vinegar or vinegar-plant, is a distinct ferment, which, like the *Mycoderma aceti*, has the power to convert alcohol into vinegar. It can also cause other changes, as that of dextrose into cellulose. The formation of vinegar occurs more readily when, in addition to the presence of the *Mycoderma*, the following conditions prevail: The alcoholic fluid should be sufficiently dilute, not containing more than 12 per cent. of alcohol; the temperature should not be much below 70° F.; air (oxygen) should be supplied in abundance, and come into intimate contact with the solution to be acetified. During the oxidation of alcohol to acetic acid an increase of the temperature and specific gravity of the liquid occurs. In France and Germany the greater part of the vinegar is made from inferior grades of wine; in England infusions of malt and soured beers are extensively employed; while in the U. S. cider and alcoholic liquors are largely used.

Wine vinegar is manufactured in Paris by the following process: The wine is first mixed with wine-lees, and is then put into sacks, which are placed in a large vat and submitted to pressure from above. It is next introduced into large upright casks having an opening at the top, and allowed to acetify. The regulation of the temperature exerts an important influence upon the quality of the vinegar produced. In summer, when the casks are exposed to the heat of the sun, the oxidation is usually completed in two weeks, but in winter, when they are placed in a warmed chamber, a month's time is often required. The liquid is then run off into barrels containing shavings of birch-wood, in which it is allowed to remain for two weeks, when the vinegar will be clarified and ready for use. In Orléans, where the best vinegar is made, the casks used, which have a capacity of about 400 pints, are placed in rows, one over the other. The wine used is preserved in a vat containing beech-shavings, by which it is separated from the lees and clarified. About 100 pints of boiling vinegar is first introduced into each cask, where it is allowed to remain for several days, after which a small quantity (10 pints) of the wine is gradually added until the casks are filled, when they are

allowed to remain at rest for fifteen days. Half of the vinegar is then drawn off and stored, and more wine is added to the remainder in the same manner as before. In this way the process is continued uninterruptedly, often for as much as ten years, at the end of which time, however, a sediment of yeast, argol, etc., accumulates, rendering a cleansing of the entire vessel necessary. Although in the above operation no extensive contact between the wine and air is apparent, a change of the surface of the fluid is constantly taking place, owing to the greater density of the vinegar formed; a continuous circulation of air is also produced, as the air from which the oxygen has been absorbed acquires a lower specific gravity, and therefore rises upward through the casks. Usually, wines a year old furnish the best vinegar; those of a greater age, which have lost their extractive matter, are not suitable for use. Vinegar prepared from wine is either white or red according to the color of the wine from which it is made. It contains, in addition to acetic acid and water, small quantities of acetic ether, potassium bitartrate, and aldehyde; its specific gravity ranges from 1.014 to 1.022. The process just described is termed the *old method*; it is also occasionally used in the manufacture of vinegar from malt. The *quick or German process* (*Schnellessigbereitung*), which is based upon the older method of Boerhaave (1720), and was first introduced by Schützenbach in 1823, effects the oxidation of the alcohol to acetic acid in the most rapid and complete manner possible by bringing an enlarged surface of the liquid into intimate contact with the air. This is accomplished by causing the alcoholic liquor to fall in drops and meet an ascending current of air. The vessel employed consists of a large vat about 8 feet in height, and having a diameter of 3½ feet at the top and 3 feet at the bottom. About a foot from the real lower bottom it contains a false bottom, similar to a sieve in construction, which supports a layer of beech-shavings extending nearly to the top of the vat. Between the true and false bottoms a row of air-holes half an inch in diameter is bored in a slanting direction from the outside downward. The beech-shavings are first boiled in water and dried; they are then "soured," or allowed to soak in warm vinegar for twenty-four hours, with which they become impregnated. The vinegar employed to acetify the shavings should not contain any mineral acid; it should also be free from essential oils and pyroligneous acid, the presence of which greatly retards acetification. At a short distance (8 inches) from the top of the vat a perforated wooden disk is fitted in, the perforations of which have about the diameter of a goose-quill (¼ inch); this also has several larger orifices including glass tubes which permit the escape of the air from below. The space about the disk is filled with cotton batting or yarn, which becomes swollen and penetrates through the holes for a short distance, thus causing the liquid to trickle slowly upon the shavings. At the top of the vat is a close-fitting wooden lid, having in its center a circular hole through which the liquid is introduced. During the oxidation of the alcoholic liquid a large amount of heat is developed in the interior of the cask, whereby the air is made to ascend, and fresh air to enter at the lower air-holes, a constant circulation being produced. After the shavings have been "soured," the liquid to be converted into vinegar—usually diluted spirits—is poured into one vat, and, as it flows off, is introduced into a second. If not over 4 per cent. of alcohol is contained in the original liquid, that drawn off from the second vat will be converted into good vinegar. The vinegar, as it collects between the true and false bottoms of the vat, is removed by a tap, which is so constructed that its end dips in the lower stratum of the liquid (that is, in the strong vinegar), and has its exterior end raised so that the liquid can not flow out until quite a layer has accumulated, the presence of which assists in the process of acetification by evolving acid vapors, which ascend to the upper part of the vat. The temperature of the vinegar-room should be from 75° to 85° F., that of the vat from 95° to 100° F. Occasionally, a layer of white sand is introduced just above the lower false bottom, which is then covered with a flannel cloth to prevent the holes from becoming obstructed. This arrangement assists in the clarification of the vinegar. The composition of the liquid to be acetified varies greatly. The following mixtures are frequently used: (1) 60-per-cent. whisky, 50 gal., beer or malt wort, 37 gal. (also employed to sour the beech-shavings); (2) common whisky, 3 gal., prepared vinegar, 4 gal., pure water, 33 gal.; (3) brandy, 20 parts, vinegar, 40 parts, water, 120 parts; to which an infusion of a mixture of

bran and rye meal is first added in order to promote the formation of the *Mycoderma aceti*. It is usual to draw off 4 gal. of the vinegar every hour, the same quantity of one of the above mixtures being added, together with an additional quart to compensate for the waste in manufacture. The prepared vinegar is preserved in a large vat with each half a gallon of molasses is added every day, until a layer having a thickness of 2 to 3 inches is formed; in this way a fine color is imparted to the product. Owing to the development of heat in the vats, a loss of alcohol, aldehyde, and acetic acid by evaporation occurs in the above-process, frequently amounting to 10 per cent. This objection is remedied in Singer's generator, which consists of a number of vessels, one placed above the other, connected by wooden tubes, through which the liquid slowly trickles from one vessel into the other, a longitudinal slit being cut in each tube, thus permitting a free circulation of the air. The quick method of vinegar-making has largely superseded all others, and is in general use in the U. S.

Malt vinegar, which is the variety chiefly used in Great Britain, is generally prepared by submitting the wort obtained by mashing malt or a mixture of malt and barley to vinous fermentation, and oxidizing the resulting alcoholic liquor. This latter process can be effected as in the preparation of wine vinegar, or by repeatedly passing the liquid through vats containing beech-shavings, as in the quick process. Singer's generator is also often employed. Dilute solutions of sugar, and even mixtures of starch with yeast, furnish good vinegar. A good article for domestic use can be made by adding $\frac{1}{2}$ pint of yeast to a solution of 1 $\frac{1}{2}$ lb. of sugar in 1 gal. of water, allowing the mixture to stand for three days at a temperature of 80° F., then drawing off into a ripening-cask, and adding 1 oz. of bruised raisins and 1 oz. of crude tartar. Malt vinegar possesses a yellowish-red color and an aromatic odor, which is imparted to it by the acetic and other ethers present. It is sold of four degrees of strength, known in the trade as Nos. 18, 20, 22, and 24. The last, which is the strongest and contains 5 per cent. of real acetic acid, is called *proof vinegar*; its sp. gr. is 1.019. The putrefactive fermentation of vinegar was formerly thought to be prevented by sulphuric acid, the addition of $\frac{1}{1000}$ part of which is allowed by law in England; but this is now known to be unnecessary, and the practice has been discontinued.

Cider vinegar, if made from good, sweet, and ripe apples, is perhaps the most agreeable variety in use; it is met with chiefly in the U. S. In its preparation fresh cider is allowed to ferment in barrels having the bung-holes open, and exposed either to the heat of the sun or to that of a warm cellar. It is well to allow several separate fermentations to take place, fresh quantities of cider being added to the barrels every two weeks; the acetification of the cider is also greatly accelerated by the addition of mother-of-vinegar. Cider vinegar contains, in addition to acetic acid, varying proportions of acetic ether and malic acid.

Pasteur has suggested a process of vinegar-making by the direct acid of the *Mycoderma aceti*. This fungus is first propagated in an aqueous solution containing 2 per cent. of alcohol, 1 per cent. of vinegar, and small amounts of potassium, calcium, and magnesium phosphates. The plant soon spreads out, and ultimately covers the entire surface, the oxidation of the alcohol being at the same time gradually effected. When one-half of the alcohol has been acetified, small quantities of wine or alcohol, mixed with beer, are daily added, the complete conversion of the alcohol into vinegar being allowed to take place as soon as the acetification becomes weaker. The vinegar formed is then drawn off, and the plant again used in the same apparatus. The vessels employed are circular or rectangular shallow wooden tanks, into which the air is allowed access by means of two small apertures at the side, and are covered with lids. The alcoholic liquid is introduced through two gutta-percha tubes, which connect with the vessels at their bottoms. Wine or malt liquors can be directly converted into vinegar by this process; but when only alcohol is used, the addition of ammonium sulphate and potassium and magnesium phosphates and a little vinegar is necessary in order to furnish the organic and inorganic food needful for the vinegar-plant.

A vinegar-making process in which the oxidation of the alcohol is effected with the aid of finely divided platinum was first proposed by Döbereiner. Several shelves are arranged in a tall glass case, and on them are placed a number of porcelain capsules containing alcohol. Directly over

each capsule is a tray supported on a tripod, containing a little platinum black or spongy platinum. At the top and bottom of the case ventilators are so constructed that the access of air can be easily regulated. Upon heating the apparatus, by placing it in the sunshine or by means of a steam-pipe, to about 85° F., the alcohol is slowly evaporated, and on coming in contact with the platinum is oxidized to acetic acid. So long as the ventilation is maintained, the platinum retains its property of conveying oxygen to the alcohol; when the acetification is completed, fresh air is admitted and the process begun again. The vapors of alcohol and acetic acid carried off by the outgoing current of air can be collected by a condensing apparatus. Vinegar prepared from pure alcohol does not possess the pleasant flavor of that obtained from wine and cider, but the addition of a little acetic ether renders it more agreeable in taste. Small quantities of fusel oil, oil of cloves, or butyric ether are also occasionally added to the alcohol to be acetified in order to impart a fine aroma.

In countries where a high duty on alcoholic liquids exists, table vinegar is frequently prepared from wood-vinegar or pyroigneous acid. For this purpose the crude acid is carefully purified, either by conversion into sodium acetate and distillation with sulphuric acid, or by saturation with lime, then adding hydrochloric acid, removing the tarry matters separated, and distilling. It is afterward further deodorized and purified by distillation with potassium dichromate and filtration through animal charcoal. Small quantities of acetic ether and burned sugar are often used to impart flavor and color.

Distilled vinegar, which is generally employed for pharmaceutical purposes, is weaker than ordinary vinegar, since the boiling-point of concentrated acetic acid is above that of water. It is often contaminated with small quantities of alcohol, aldehyde, and empyreumatic substances.

The quantity of acetic acid in vinegar differs greatly. The specific gravity is not an accurate indication of the strength, owing to the presence of foreign bodies. A preferable method consists in determining the amount of a standardized alkaline solution necessary to saturate the acetic acid present. (See ANALYSIS, VOLUMETRIC.) The results given by this test are, however, not absolutely correct, as neutral alkaline acetates possess an alkaline reaction. The vinegar can also be supersaturated with a baryta water, the excess of the salt eliminated by a current of carbon dioxide, and the barium salt in the filtrate precipitated as sulphate, from which the amount of acetic acid is calculated by multiplying by 0.515. Sulphuric acid, added to increase the acidity of vinegar or for other purposes, is best detected by boiling the suspected vinegar with a small quantity of potato-starch, and, after the *complete cooling*, adding a solution of iodine; if the vinegar be pure, the blue color of iodide of starch will become apparent; but if sulphuric (or hydrochloric) acid be present, the starch will be converted into dextrine by the boiling, and the blue coloration will fail to appear. Free sulphuric acid can also be detected by means of calcium chloride, which causes a precipitation of calcium sulphate in presence of the free acid, but not in that of the minute quantities of sulphates generally present. Hydrochloric acid is indicated by a white precipitate with silver nitrate; nitric acid can be detected by a yellow color when the vinegar is boiled with indigo, or by the delagration of the residue obtained by evaporating with a little sodium carbonate. Such acrid substances as red pepper, mustard, etc., are recognized by evaporating the vinegar to an extract, which if they are present will possess a biting taste. Copper is detected by the formation of a brown precipitate upon addition of potassium ferrocyanide; lead, by the black precipitate produced by hydrogen sulphide, and the yellow one given by potassium iodide.

Vinegar-plant: See VINEGAR.

Vineland: borough; Landis township, Cumberland co., N. J.; on the Cent. of N. J. and the W. Jersey railways; 12 miles E. of Bridgton, 34 miles S. E. of Philadelphia (for location, see map of New Jersey, ref. 7-B). The borough comprises only the central part of the township, which is 1 mile square, and was founded in 1861 by Charles K. Landis. It is laid out with principal avenues 100 feet wide, and others 66 feet; has 15 churches, a central high school (building cost over \$35,000), several public and private schools, and a kindergarten, a public library, a national

bank with capital of \$50,000, a State bank with capital of \$28,900, and 2 daily, 3 weekly, and 2 monthly periodicals; and is principally engaged in the cultivation of small fruits, and the manufacture of machinery, flour, lumber, shoes, gloves, buttons, carriages, clothing, paper boxes, plows, linoleum, Smyrna rugs, and chenille curtains. Pop. (1880) 2,519; (1890) 3,822; (1895) 4,126.

EDITOR OF "EVENING JOURNAL."

Viner, CHARLES: law-book writer; b. about 1680. He was the author of *A General Abridgment of Law and Equity, Alphabetically Digested under Proper Titles*, upon which he labored for more than fifty years, having it printed in his own house on paper manufactured for the purpose. The work was based upon Rolle's *Abridgment*. It contains almost everything of value in the previous abridgments of the law of England, or in the printed reports, besides considerable from MS. reports. The work is chiefly valuable by reason of its fullness, being of little weight in itself, as it is inaccurate in its citations and cumbersome and irregular in its execution. The work was first published in twenty-four volumes (1741-51), and later a reprint was issued (1792-94), followed by a supplement of six volumes by various authors (1799-1806). He bequeathed £12,000 to endow fellowships and scholarships, and to establish a professorship of common law at Oxford University. The first incumbent of the professorship was Sir William Blackstone (1758), who was followed by others much less prominent, including Robert Chambers (1760), Richard Wooddson (1777), and James Blackstone (1793). D. at Aldershot, Hampshire, June 5, 1756. F. STURGES ALLEN.

Vine-rapes: the *Cytinaceæ*; a small family (twenty-seven species) of herbaceous, parasitic dicotyledons, probably related to the myrtles (*Myrtaceæ*) and evening primroses (*Onagraceæ*), but so much degraded and modified that their true relationship is greatly obscured. They have an inferior, one-celled, plurilocular ovary containing innumerable, minute ovules; stamens eight to many; perianth sim-

Giant vine-rape (*Rafflesia arnoldi*).

ple and fleshy. The stems and leaves are usually much reduced, the flowers often appearing to be sessile upon the host. The vine-rapes are natives of the warm regions of both hemispheres. The most remarkable is the giant vine-rape (*Rafflesia arnoldi*, see figure) of Sumatra, whose expanded flower is nearly 40 inches in diameter, with five red-mottled petals. It is parasitic upon a woody climbing plant (*Cissus angustifolium*), a near relative of the grape. See RAFFLESIA.

CHARLES E. BESSEY.

Vines, RICHARD: colonist; b. near Bideford, Devonshire, England, about 1585; received a medical education; was sent by Sir Ferdinando Gorges in 1614 or 1616 to act as his agent in planting a settlement on Saco Bay, Me.; spent there the winter of 1616-17, during the great pestilence which decimated the New England Indians; gave them medical assistance; ascended the Saco river in a canoe to Crawford's Notch 1617; was the first white man who visited and described the White Mountains; received from the council of the Plymouth Company in 1630 a grant of land on the Saco river, where, with John Oldham, he founded the towns of Bideford and Saco. He was the principal superintendent of the plantation until 1645; was then made deputy-governor, but resigned the same year; returned to England, but soon settled in Barbados as a planter and physician. D. in Barbados, Apr. 19, 1651.

Vines, SYDNEY HOWARD, F. R. S.: botanist; b. in London, England, Dec. 31, 1849; educated privately; began the study of medicine at Guy's Hospital 1869; graduated at Cambridge 1876, and became a fellow of and lecturer at Christ's College; took the degree of D. Sc. at Cambridge

1884, having been elected reader in botany in the same year; became a fellow of Magdalen College, Oxford, and Sherardian Professor of Botany 1888; aided in founding the *Annals of Botany*, of which he is an editor, and has published *Lectures on the Physiology of Plants* (Cambridge, 1886).

Vinet, véc nā, ALEXANDRE RODOLPHE: theologian; b. at Ouchy, canton of Vaud, Switzerland, June 17, 1797; studied at Lausanne; was appointed Professor of the French Language and Literature in the Gymnasium of Basel 1817, whence he went in the same capacity to the University of Basel 1835; was made Professor of Practical Theology at Lausanne in 1837. In 1819 he had been ordained, and he took an increasing interest in ecclesiastical politics. His opposition to state interference at last led him to the decisive step of leaving the clergy of the national church in the Vaud canton (1840) and becoming a layman. In 1845 he joined the Free Church of Vaud, which had just been formed, and resigned his theological professorship. He was, however, immediately appointed Professor of French Literature in the Lausanne Academy. The next year (1846) the radical party compelled his resignation. He is known to theological students by his excellent works on homiletics (Eng. trans. 1853) and pastoral theology (Eng. trans. 1852), but to a much wider circle as a brilliant, learned, and judicious critic of French literature. There are translations of his *History of French Literature in the Eighteenth Century* (1854) and *Studies in Pascal* (1859). D. at Clarens, on the Lake of Geneva, May 4, 1847. See his *Life* by Laura M. Lane (Edinburgh, 1890). Revised by S. M. JACKSON.

Vineur, JEAN BAPTISTE DONATIEU: See ROCHAMBEAU.

Vineyard Sound: the passage between Martha's Vineyard and the Elizabeth islands, on the south coast of Massachusetts. It is 20 miles long and 6 broad, and is a great thoroughfare for coasting vessels.

Vinland [Icel. *vin*, wine + *land*, land]: that part of the coast of North America which was visited by the Norsemen in the year 1000. Bjarne Herjulfson saw this country in 986, when he was on his way to Greenland, but did not land. Fourteen years later LEIF ERIKSON (*q. v.*) made an expedition thither, and on account of the abundance of grapes growing there he named the country Vinland. The oldest evidence of the discovery of Vinland is that given by ADAM of BREMEN (*q. v.*) in his book *On the History of the Bremen Church and on the Geography of the Countries of the North*. He enumerates the islands of the sea N. and W. of Norway, and among them he mentions Greenland and Vinland. Iceland's oldest historian, Are or Ari (see ARI THE WISE), who wrote about 1120-30, speaks of the discovery of Vinland, and he got his information from his uncle, Thorkel Gelleson, at Ælgafell, who in his youth, 1060-70, had lived in Greenland, and had there gathered knowledge of the discoveries, partly from an old man who had himself accompanied Erik the Red from Iceland in 986, and thus had witnessed Leif Erikson's return from Vinland. From Are the Wise, directly or indirectly, are derived all the later accounts of the discovery of Vinland, found in manuscripts of the thirteenth, fourteenth, and fifteenth centuries. The principal sources of information in regard to the discovery and settlement of Vinland are found in two noted collections of manuscripts, viz., the *Flatey-árbók* and the *Hauksbók*. The *Flatey-árbók* was secured by Bishop Brynjulf Sveinsson from a peasant on Flatey, an island on the west coast of Iceland. It was put in writing in the latter part of the fourteenth century by the priests Jón Thordson and Magn. Thorballson. A photographic facsimile of this interesting work has recently been published in Copenhagen. In the *Hauksbók* there is an account of the discovery of Vinland under the heading *Thorfin Karlsefni's Saga*, but the correct old name of this is the *Saga of Erik the Red*. This story of the Vinland voyages dates from the second half of the thirteenth century—that is to say, from the golden period of the saga age.

The countries visited by Leif Erikson were called by him Helluland, Markland, and Vinland. The description of Helluland applies to Newfoundland, that of Markland to Nova Scotia, and that of Vinland to New England. Leif Erikson came to Vinland by sailing on in a southwestern direction from Markland. Prof. G. Storm has attempted to show that Helluland, Markland, and Vinland are to be identified as Labrador, Newfoundland, and Nova Scotia; but this is impossible, since Nova Scotia has never been known to produce wild grapes. Taking all things into considera-

tion—the circumstances of the voyages, the course of the winds, the direction of the currents, the time spent between each sight of land, the description of the different lands and their products—all point to New England as the site of Vinland. And if some spot on the New England coast should be given a preference, the basin of the Charles river should be selected as the most probable scene of the visits of Leif Erikson, Thorvald Erikson, and Thorfin Karlsefni in the tenth and eleventh centuries. (See NORUMBEGA.) The accounts given of the natives, of the corn, grapes, and fish, all apply to this locality.

BIBLIOGRAPHY.—C. C. Rafn, *Antiquitates Americanae* (Copenhagen, 1837); A. M. Reeves, *The Finding of Vinland the Good* (London, 1890); G. Storm, *Studier Over Vinlands-reisene* (Copenhagen, 1888); Fiske, *The Discovery of America* (Boston, 1892); R. B. Anderson, *America not Discovered by Columbus* (Chicago, 1874). RASMUS B. ANDERSON.

Vinnitza: a district-town of the Russian government of Podolia; on the Bug; 120 miles S. W. of Kiev (see map of Russia, ref. 9-C). It has a gymnasium, distilleries, and a large trade in grain. Pop. (1888) 23,441.

Vinton: city; capital of Benton co., Ia.; on the Red Cedar river, and the Burl., Ced. Rapids and N. Railway; 25 miles N. of Cedar Rapids, 31 miles S. S. E. of Waterloo (for location, see map of Iowa, ref. 5-I). It is in an agricultural region, is the site of the Iowa College for the Blind, and the Tilford Collegiate Academy, and has 3 churches, 2 large public-school buildings, a State bank with capital of \$65,000, a loan and trust company with capital of \$65,000, a private bank, and a semi-weekly, a semi-monthly, and 3 weekly periodicals. There are several flour-mills, mineral paint-works, corrugated steel-works, and a creamery. Pop. (1880) 2,906; (1890) 2,865; (1895) State census, 3,150.

EDITOR OF "EAGLE."

Vinton, ALEXANDER HAMILTON, M. D., S. T. D.: clergyman; b. at Providence, R. I., May 2, 1807; studied at Brown University; graduated at the Yale Medical School 1828; practiced as a physician in Pomfret 1828-32; pursued a theological course in the Protestant Episcopal Seminary at New York; was ordained priest 1836; became prominent as a leader of the Low Church party; was pastor of churches at Portland, Me., 1835-36, Providence, R. I., 1836-42, Boston, Mass., 1842-58, Philadelphia, Pa., 1858-61, New York 1861-70, Boston 1869-77. He published a volume of *Sermons* (1855). D. in Philadelphia, Apr. 26, 1887.

Vinton, DAVID HAMMOND: soldier; b. at Providence, R. I., May 4, 1803; graduated at the U. S. Military Academy in 1822, and entered the Fourth Artillery; transferred to the infantry in 1823. After a term of garrison and special duty, he was sent to Florida in 1836, where employed on quartermaster duty, and in 1837 made quartermaster-general of Florida. He remained in the same service until 1846, when he was made chief quartermaster on the staff of Gen. Wool, with rank of major, serving with him in Mexico; was chief quartermaster of the department of the West 1852-56, of the department of Texas 1857-61, and was taken prisoner upon the surrender of Twiggs. Exchanged soon after, he was in Aug., 1861, made deputy quartermaster-general, and as chief quartermaster at New York during the civil war rendered valuable service. Promoted to be colonel of volunteers in 1864, in 1866 he became assistant quartermaster-general and colonel on the staff, and the same year was placed on the retired list. For faithful and meritorious services he was breveted colonel, brigadier-general, and major-general. D. at Stamford, Conn., Feb. 21, 1873.

Revised by JAMES MERCUR.

Vinton, FRANCIS, S. T. D., D. C. L.: clergyman; brother of Gen. David H. Vinton; b. at Providence, R. I., Aug. 29, 1809; graduated at West Point 1830; became second lieutenant of artillery; was stationed at Fort Snelling, Minn.; at Fort Independence, Boston harbor, during which time he studied law at Harvard Law School; acted as civil engineer to several railroads; was admitted to the bar at Portsmouth, N. H., 1834; served in the war with the Creek Indians in Alabama and Georgia 1836; left the army in that year; studied in the General Theological Seminary, New York; was ordained priest 1839; was successively rector of churches at Providence and Newport, R. I. (1840-44), and Brooklyn, N. Y. (1844-56); declined the bishopric of Indiana 1847; became assistant minister of Trinity church, New York, 1855, and Professor of Ecclesiastical Law and Polity at the General Theological Seminary 1869. D. in

Brooklyn, Sept. 29, 1872. He was the author of *Arthur Tremaine, or Annals of Cadet Life* (New York, 1830); *Lectures on the Evidences of Christianity* (New York, 1865); and a *Manual Commentary on the General Canon Law of the Protestant Episcopal Church in the United States* (New York, 1870), and various pamphlets.

Vinton, FREDERIC PORTER: portrait-painter; b. in Bangor, Me., Jan. 29, 1846; pupil of Bonnat and Jean Paul Laurens, Paris; became member of the Society of American Artists 1880; National Academician 1891; received honorable mention at the Paris Salon of 1890. His portraits are notable for their life-like aspect and vigorous drawing and modeling. His studio is in Boston. W. A. C.

Vio, THOMAS, de: See CAJETAN.

Viola, or Tenor Violin: a very large violin, having four strings, two of catgut alone and two wound with wire; it stands an octave above the violoncello, and is employed almost exclusively for playing the middle part in orchestral music. The earlier composers about the time of Gluck made but little use of this instrument, except to strengthen the basses by doubling it in unison or the octave. Modern composers demand from it an independent agility equal to that of the violins. Its tone has a distinct character of melancholy as compared with that of other stringed instruments. Revised by DUDLEY BUCK.

Violet: any species of *Viola*, a genus of dicotyledonous herbs, having irregular flowers, consisting of five sepals, five petals (the lower one spurred), five stamens, and a single tri-lobed pistil, having three parietal placentae. About a hundred species are known, of which sixty are natives of north temperate countries, thirty of the mountainous regions of South America, two of Africa, and eight of Australia and New Zealand. There are from thirty to forty species in the U. S. The pansy (*V. tricolor*) and sweet violet (*V. odorata*), both from Europe, are common in cultivation.

CHARLES E. BESSEY.

Violet Family [*violet* is from O. Fr. *violette*, dimin. of *viole* < Lat. *viola*, violet; cf. Gr. *iov*, for **Flou*, violet]; the *Violaceæ*; a small group (270 species) of choripetalous, dicotyledonous herbs and shrubs, which are widely distributed in all climates. The flowers are usually hermaphrodite and irregular, with pentamerous calyx, corolla, and andræcium, the last with connivent or connate anthers; ovary superior, tricarpellary, with parietal placentae and many ovules. The best-known representatives of the family are the species of *Viola*, the VIOLET (*q. v.*), of which thirty-three are natives of North America. An emetic and laxative principle in these plants has given some value to the root of a Brazilian shrub (*Ipodidum ipecauanha*), known in pharmacy as white ipecauanha. C. E. B.

Violin [from Ital. *violino*, deriv. of *viola*, violin; O. Fr. *viele* > Fr. *viola*. The word is of Teutonic origin; cf. M. H. Germ. *videle* > Mod. Germ. *fiel*; O. Eng. *fīdele* > Eng. *fiddle*. Other authorities derive the Romance words from a Lat. **vitula*, deriv. of *vitulāri*, celebrate a festival]; a musical instrument with four strings, played with a bow. It consists of three parts—the neck, the table, and the sounding-board; has at its side two S-shaped apertures of unequal size. Above these is a bridge, over which pass the strings from the lower extremity or tail-piece to the neck, where they are tightened or loosened by means of turning-pins. The violin is tuned in fifths, E-A-D-G, the lowest string (wound with wire) giving this tone:

It is considered the most perfect of musical instruments, on account of its capabilities of fine tone and expression, and forms with its cognates, the viola, violoncello, and double-bass or bass-viol, the main element of all orchestras. It is of considerable antiquity, being traced in England to the twelfth century. The most prized instruments are those made in the seventeenth and eighteenth centuries in Italy by the Amatis at Brescia, Stradivari and the Guarneris at Cremona, and Stainer in the Tyrol. Revised by D. BUCK.

Violle, vœ'ôl, JULES: physicist; b. at Langres, France, in 1841. He was educated in the Ecole Normale Supérieure in Paris; received the degree D. Sc. in 1870; was appointed Professor of Physics at Lyons in 1883, at the Ecole Normale in 1890, and in the Conservatory of Arts and Trades in Paris in 1891. Violle is chiefly known through his extended researches upon the laws of radiation and upon the measurement of high temperatures, including that of the sun; upon which subjects, as well as in other departments

of physics, he has published numerous papers. He is the inventor of the absolute standard of light adopted by the second Paris congress of electricians. The first volume of *Cours de Physique* was published in 1881, and later parts have appeared at intervals since then. E. L. NICHOLS.

Violet-le-Duc, vē'ō'lä le-dük', EUGÈNE EMMANUEL: architect and writer on art; b. in Paris, Jan. 27, 1814. He became early a remarkable draughtsman of architecture and ornament. From 1836 to 1840 he traveled a great deal in France, Italy, and Sicily. In 1840, when the Sainte Chapelle in Paris was being restored under the direction of Félix Duban, he was made an inspector of the work, and as at this time the mediæval buildings of France were exciting a great deal of attention, he was employed for the care and restoration of the abbey church of Vézelay, the Cathedral of Carcassone, Notre Dame of Paris, and the abbey church of St. Denis, and later the ancient walls of Carcassone, the synodal hall at Sens, the Cathedral of Châlon, and the castle at Pierrefonds. Besides these important buildings he restored wholly or in part a number of smaller structures. He built a few buildings of his own design, but they have had no great reputation. About 1850 he began the extraordinary series of books and minor writings on architecture and decorative art which are so widely known. He had become extremely well versed in the theory of building and scientific construction, and his responsible task of restoring ancient buildings had taught him how even in minute details the builders had proceeded. He had a ready and fluent style, and his writings often suffer from excessive length; nevertheless his descriptions and explanations are models of clearness. His extraordinary gift as a draughtsman added much to the value of his books. No artist has ever been known who was his equal in making intelligible drawings explanatory of construction and design, and it is known that he made these with extraordinary rapidity. At the breaking out of the war of 1870 he became lieutenant-colonel of a volunteer regiment of engineers, serving in the defense of Paris. He was actively employed to the end of his life, and died at Lausanne, Switzerland, Sept. 17, 1879. His most important books are *Dictionnaire raisonné de l'architecture française du XI^e au XVI^e siècle* (Paris, 1854-69, 10 vols.); *Dictionnaire du mobilier français de l'époque carolingienne à la Renaissance* (1855); *Entretiens sur l'architecture* (1858-68, 2 vols.); *Histoire d'une maison* (1873); *Histoire d'une forteresse* (1874); *Histoire d'un Hôtel-de-ville et d'une cathédrale*; *Histoire d'un Dessinateur*. RUSSELL STURGIS.

Violoncello: a bass violin with four strings tuned in fifths, A, D, G, and C, and the two last strings being wound with wire.

Vioménil, vē'ō'mā'neel', ANTOINE CHARLES DU HOUX, Baron de; soldier; b. at Fauconcourt, Vosges, France, Nov. 30, 1728; entered the army and served in Holland, Hanover, and Corsica, gaining the rank of field-marshal; was sent to Poland, where he aided the confederation of Bar against Russia 1770, and captured the castle of Craew; went to the U. S. in 1780 as second in command to Count Rochambeau; distinguished himself at the siege and capture of Yorktown 1781, where he led his troops in the storming of the redoubt; was promoted to a lieutenant-generalship; returned to France and became governor of La Rochelle 1782; was so severely wounded while defending the king during the assault upon the Tuileries, Aug. 10, that he died a few weeks later in Paris, Nov. 9, 1792.—His brother, CHARLES JOSEPH HYACINTHE DU HOUX, Marquis de Vioménil, b. at Ruppes, Vosges, France, Aug. 22, 1734, served in Germany during the Seven Years' war; was a major-general under Rochambeau in the U. S. 1780-82, bearing the title of baron; was at Yorktown; was governor of Martinique 1789-90; emigrated from France as a royalist 1791; served under the Prince of Condé 1792-97; afterward held military commands in Russia and Portugal; became a peer 1814, a marshal of France July 3, 1816, and a marquis 1817. D. in Paris, Mar. 5, 1827.

Vionville: See MARS LA FOUR.

Viper: See VIPERIDE.

Viper'idae [Mod. Lat., named from *Vipera*, the typical genus, from Lat. *vīpera*, viper]: a family of poisonous snakes embracing the viper of Europe and related species. The form is typified by the common viper; the scales on the back and sides are oblong and imbricated, those on the abdomen transverse scutellæ; the eyes have, mostly, elliptical pupils; no lachrymal fosse are developed; the poison-fangs are destitute of external grooves. The family includes a number of poisonous serpents peculiar to the Old World, and is at first sight distinguishable from the *Crotalidae* (rattlesnakes, etc.) by the want of the deep pits between the eyes and nostrils which so much enhance the vicious look of the latter. The most notable species are the viper of Europe (*Vipera berus*), the cobra de capello (*Naja tripudians*), and the Egyptian *Naja haje* and *Cerastes hasselquistii*, or *egyptica*, each of which has been supposed by different writers to have been the asp fatal to Cleopatra. Revised by F. A. LUCAS.

Vique: See VICH.

Virehow, vē'r chō, RUDOLF, M. D.; pathologist; b. at Schivelbein, Pomerania, Oct. 13, 1821; graduated M. D., University of Berlin, in 1843; in 1844 was Froberg's assistant at Charité Hospital, in 1846 was prosecutor, and in 1847 a lecturer at the university. In 1847 he established the *Archiv für pathologische Anatomie und Physiologie*, of which he is still editor (1895); was sent in 1848 by the Prussian Government to Silesia to investigate a typhoid fever raging there; was dismissed from Berlin University in 1849 for political reasons; was Professor of Pathological Anatomy at the University of Würzburg 1849-56; in 1852 was sent by the Bavarian Government to the Spessart to investigate a famine fever which had broken out there; returned to the University of Berlin in 1856, and acted as director of the hospitals during the campaigns of 1866 and 1870-71, taking part all the while with great energy in the political movements as a representative of the city of Berlin in the Prussian house of representatives. He is the creator of the cellular theory in pathology, which he has developed in *Die Cellularpathologie in ihrer Begründung auf physiologische und pathologische Gewebelehre* (1858). This is a biological principle establishing the fact that the laws working in disease are not different from those in operation in health, but that they are subject to different conditions. He also wrote *Handbuch der speciellen Pathologie und Therapie* (3 vols., 1854-62) and *Vorlesungen über Pathologie* (4 vols., 1862-67), besides a great number of minor essays on various subjects, among which are *Goethe als Naturforscher* (1861); *Ueber Pfahlbauten und Hüenegräber* (1866); *Ueber Erziehung des Weibes für seinen Beruf* (1865); and *Die altindischen Schädel zu Kopenhagen* (1871). He has been one of the most earnest advocates in Germany of sanitary reform and has done an immense amount of work to attain it. For more than twenty years he has been one of the aldermen of Berlin, and his liberalism in politics has exercised a potent influence in practical municipal work. Revised by S. T. ARMSTRONG.

Virden: city; Macopin co., Ill.; on the Chi. and Alton and the Jack., Louisv. and St. L. railways; 21 miles S. W. of Springfield, 31 miles E. S. E. of Jacksonville (for location, see map of Illinois, ref. 8-D). It is in a coal-mining region, and contains a high school, 2 private banks, 2 weekly newspapers, brick, and tile works, and poultry-packing house. Large quantities of grain are here shipped. Pop. (1880) 1,608; (1890) 1,610.

Vireon'idae [Mod. Lat., named from Lat. *vireo*, a kind of bird, perhaps the greenfinch; cf. *vire're*, be green]: a family of *Passeres* related to the shrikes. The bill is much compressed, decurved at the end and notched. The nostrils are lateral and overhung by membrane; the frontal feathers are bristly and erect, or bent slightly forward; the wings have mostly ten primaries, but the spurious one is wanting in certain Vireos; the tarsi have the lateral plates undivided, except at the extreme lower ends, and they are longer than the middle toes with the claws; the three anterior toes are extensively attached to one another. The family is peculiar to America, and comprises about fifty species of small singing birds. For the nest of the solitary vireo, see NESTS OF BIRDS. F. A. LUCAS.

Virgil: another spelling of VERGIL (*q. v.*).

Virgil'ia: a genus of South African leguminous trees, to which the American yellow-wood (*V. lutea*) was referred by Michaux, but Rafinesque named it *Cladrastis tinctoria*, the name by which it is usually known. It is a beautiful tree, about 40 feet in height, with flowers in loose pendent racemes 20 inches long; is much prized for lawn-planting, and is hardy and easily grown from the seed. L. H. B.

Virgin'ia [for Lat. *Virgī'nea* (sc. *civitas*, state), liter., fem. of *virgī'neus*, of or belonging to a virgin, deriv. of

virgo, virginis, maiden, virgin. Named in honor of Elizabeth, the virgin queen; one of the U. S. of North America (South Atlantic group); the tenth of the thirteen original States that ratified the Federal Constitution; popularly known as the Old Dominion State and as the Mother of Presidents.

Location and Area.—Virginia lies between 36° 31' and 39° 27' N. lat., and between 75° 13' and 83° 37' W. lon. On

The seal of Virginia.

the S. it adjoins North Carolina for 326 miles and Tennessee for 114 miles; on the W. and N. W. it adjoins Kentucky for 115 and West Virginia (by a very irregular line) for 450 miles; on the N. W. and N. it is separated from Maryland by the Potomac river and Chesapeake Bay for 205 miles and by a line of 25 miles across the eastern shore; and E. and S. E. it is bordered by the Atlantic for 125 miles. The boundary-line of the State measures about 1,400 miles. The longest line in the State from the Atlantic S. W. to Kentucky is 476 miles; the longest from N. to S., 192 miles; area, 42,450 sq. miles (27,168,000 acres), of which 2,325 sq. miles are water surface.

Physical Features.—There are six natural divisions of Virginia, extending across the State from N. E. to S. W., nearly parallel to each other, and corresponding to the trend of the Atlantic coast on the E. and the Appalachian system of mountains on the N. W., known in the order of succession from the ocean as (1) the Tidewater country, (2) Middle Virginia, (3) the Piedmont section, (4) the Blue Ridge country, (5) the Great Valley of Virginia, (6) the Appalachian country. These divisions occupy different levels above the sea, rising to the W. in terraces, and differ in climate, soil, productions, etc. In the Tidewater country every portion is penetrated by the tidal waters of the Chesapeake Bay and its tributary rivers, creeks, bays, and inlets. The united waters of nearly all this section, with those that drain 50,000 sq. miles of country, flow out through the channel, 12 miles wide, between Capes Charles and Henry. The Middle Virginia region is a great, moderately undulating plain from 25 to 100 miles wide, rising to the N. W. from an elevation of 150–200 feet above tide at the rocky rim of its eastern border to 300–500 feet along its northwestern. The Piedmont section is one in which the mountains present themselves in their grand as well as their diminutive forms—gradually sinking into the plains, giving great diversity and picturesqueness to the landscape. The Blue Ridge country, for two-thirds of its length (310 miles), is embraced in the Valley and Piedmont counties that have their common lines upon its watershed; it is only the southwestern portion, where it expands into a plateau, with an area of some 1,230 sq. miles, that forms a separate political division. This division contains the counties of Floyd, Carroll, and Grayson, all watered by the Kanawha or New river, a tributary of the Ohio, and its branches, except a little valley in the southwest corner of Grayson County, which sends its waters to the Tennessee. The Great Valley is a continuous one, clearly defined by the surrounding mountains, but it is really the valley of five rivers. These, with their lengths are, from the N. E.: The Shenandoah, 136 miles; the James River, 50 miles; the Roanoke River, 38 miles; the Kanawha or New River, 54 miles; and the Holston, or Tennessee, 52 miles—total, 330 miles. As a whole, the valley rises to the S. W., being 242 feet above the tide where the Shenandoah enters the Potomac and the united rivers break through the Blue Ridge at Harper's Ferry, and

1,687 feet where the waters of the Holston enter Tennessee. The Appalachian country succeeds the Great Valley on the W., and is traversed its whole length by the Appalachian system of mountains. It is a series of long, narrow, parallel valleys, extending N. E. and S. W., separated from each other by mountain ranges that are generally equally narrow, long, and parallel, and quite elevated.

The only lake in the State is Lake Drummond, in the southeastern part (Dismal Swamp). The waters belonging to the Atlantic system drain six-sevenths of the State. The principal stream is the Potomac, with its large branches, the Shenandoah and the South Branch, and its prominent smaller ones, Potomac creek, Ocoquan river, Broad Run, Goose, Catoctin, and Opequan creeks; the Rappahannock, with the Rapidan and numerous other branches, flows from the Blue Ridge across the Piedmont, Middle, and Tidewater divisions; the Plankatauk drains a portion of Tidewater; and Mobjack Bay and its rivers furnish deep entrances to the Gloucester peninsula. The York, with its Pamunkey and Mattaponi branches, and many tributaries, flows through a considerable area of Middle and Tidewater country. The James,

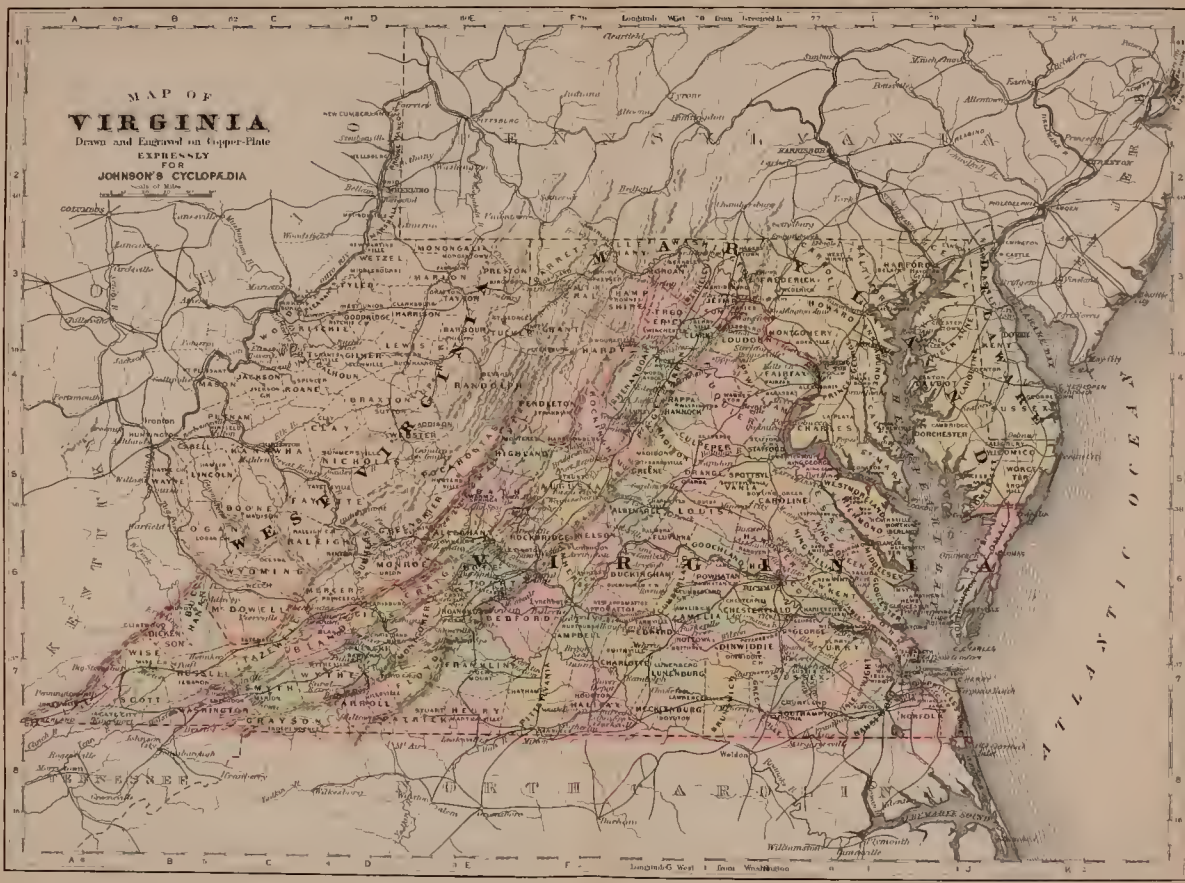

with the Chickahominy, Elizabeth, Nansemond, Appomattox, Rivanna, Willis, Slate, Rockfish, Tye, Pedlar, North, Cowpasture, Jackson, and other streams drains more of the State than any other river. The Elizabeth is a broad arm of the Hampton Roads estuary of the James, extending for 12 miles. All these flow into Chesapeake Bay. The Chowan, through its Blackwater, Nottoway, and Meherrin branches and their affluents, waters portions of Middle and Tidewater Virginia. The Roanoke, called the Staunton from the mouth of the Dan to the Blue Ridge, receives the Dan, Otter, Pig, and many other streams from the Valley and Piedmont and Middle Virginia, and then flows through North Carolina to Albemarle Sound, joining the Chowan. The waters of the Ohio system drain the remaining seventh of the State. The principal streams are the Kanawha or New river, which rises in North Carolina, flows through the plateau of the Blue Ridge, from which it receives Chestnut, Poplar Camp, Reed Island, and other creeks, and Little river; across the Valley, where Cripple, Reed, and Peak's creeks join it; across Appalachia, from which Walker, Sinking, Big and Little Stony, and Wolf creeks, and East and Bluestone rivers flow into it; and then through West Virginia into the Ohio. The Holston, through its South, Middle, and North Forks, Moccasin creek, etc., drains the southwestern portions of the Valley and Appalachia; and the Clinch, by its North and South Forks, Copper creek, Guest and Powell rivers, and other tributaries, waters the extreme southwest of the Appalachian country. These flow into the Tennessee. A portion of the mountain country gives rise to the Louisa and Russell's Forks of the Big Sandy river, and to some branches of the Tug Fork of the same river.

Mountains extend W. from the foot of the low broken ranges that, under the names of Catoctin, Bull Run, Yew, Clark's, Southwest, Carter's, Green, Findlay's, Buffalo, Chandler's, Smith's, etc., cross the State S. W. from the Potomac, near the northern corner of Fairfax County, to the North Carolina line, forming the eastern outliers of the Appalachian system. The Blue Ridge, where the Potomac breaks through, attains an elevation of 1,450 feet; Mt. Marshall, near the S. of Front Royal, is 3,369 feet high; Rockfish Gap is 1,996 feet; and James river, where it passes through the Ridge, is 706 feet above tide. The Peaks of Otter, in Bedford County, are 3,393 feet, and the Balsam Mountain, in Grayson, is 5,700 feet high. The distant ranges W. of the Great Valley are called the Appalachian, Kittany, or Alleghany Mountains. Many are bold, but only one peak, Elliott's Knob, in Augusta County, vies with the high peaks of the Blue Ridge. Few States have more wonderful and interesting natural curiosities than Virginia. Its caves, natural bridges, and waterfalls alone repay the tourist for an extended trip.

Geology and Mineral Resources.—The geology of the State was determined by Prof. William Barton Rogers in 1835–40. The formations, like the geographical divisions,

ATLANTIC OCEAN

succeed each other in belts, either complete or broken, nearly parallel with the Atlantic coast. The formations in their order, from the Atlantic at the Virginia capes to the N. W. across the State, are as follows: Tidewater: 1, Quaternary; 2, Upper Tertiary; 3, Middle Tertiary; 4, Lower Tertiary. Middle: 5, Triassic and Jurassic; 6, Azoic and granitic. Piedmont: 7, Azoic, Epidiotic, etc. Blue Ridge: 8, Azoic and Cambrian. The Great Valley: 9, Cambrian and Silurian. Appalachia: 10, Subcarboniferous and Devonian; 11, Silurian; 12, Devonian and Subcarboniferous; 13, Great Carboniferous.

The mineral resources are, in Tidewater Virginia, several kinds of marls, greensand, etc., highly esteemed as fertilizers, and choice clays, sand, and shell-limestone for building purposes; in the Middle section, granites, gneiss, brownstone, sandstone, brick and fire clay, soapstone, marble, slate, epidote in various forms, limestone, gold, silver, copper, red and brown hematite, magnetic and other ores, and bituminous coal; in Piedmont Virginia, granite, marble, sandstone, brick and fire clays, epidiotic rocks and limestone, hematite, magnetic and other iron ores, barytes, lead, and manganese ores; in the Blue Ridge district, copper ores, red and brown hematite, and other iron ores, greenstone, sandstone, freestone, glass sand, manganese ores, and brick and fire clays; in the Great Valley, limestone for building and agricultural uses, marble, slates, freestones, sandstones, brick and fire clays, kaolin, hematite, lead and zinc ores, tin ore, semi-anthracite coal, and travertine marls; in the Appalachian country, limestones, marbles, freestones, slates, calcareous marls, brick clay, red, brown, and other iron ores, salt, and bituminous coal. In the Middle Virginia, Piedmont, and Great Valley divisions are choice mineral waters.

Soil and Productions.—In the Tidewater division the soil of the low, flat, sandy shores is naturally thin, light, and soft; at the same time it is warm and under the influence of a mild climate. The second bottoms (a second terrace above the water) are the rich lands of the country; they are composed of loams of various qualities, all highly valuable, the subsoil being a dark-red or yellow clay. Along the streams of the Middle country transported materials of decomposed rocks have been deposited, giving everywhere rich soils in the bottom-lands. The soils of the Piedmont division are much more epidiotic and therefore more fertile than those farther E. The red and chocolate soils of this section, formed from the decomposed dark greenish-blue sandstone, are generally considered the most fertile. The other soils of this region are grayish or yellowish, and less fertile. The Blue Ridge is composed of much the same material as the Piedmont, but it is richer in the abundance of greenstone rocks, which impart to the soil a wonderful fertility and adapt it to the growth of rich grasses, vines, and orchards. The soils of the Great Valley, generally limestone, are well adapted to the growth of grass and grain.

The forests of Virginia are large in extent and the timber is greatly varied, including several species of pine, oak, hickory, elm, poplar, willow, beech, birch, walnut, maple, cedar, mulberry, locust, sycamore, and other timber-trees, besides the juniper, chestnut, cypress, mulberry, linden, catalpa, persimmon, cottonwood, dogwood, sassafras, numerous nut-trees, and a considerable range of fruit-trees.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.
Total number of farms.....	118,517	127,600	* 7.7
Total acreage of farms.....	19,835,785	19,104,951	+ 3.7
Value of farms, including buildings and fences.....	\$216,028,107	\$254,490,600	* 17.8

* Increase. † Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	1,685,647	32,195,858 bush.	\$15,132,053
Wheat.....	730,342	6,995,249 "	3,917,339
Oats.....	450,042	5,400,504 "	1,998,186
Rye.....	44,694	393,307 "	212,386
Buckwheat.....	4,856	71,383 "	38,547
Tobacco.....	54,592	35,593,984 lb.	2,135,639
Potatoes.....	39,928	2,355,752 bush.	1,319,221
Hay.....	692,412	498,537 tons.	5,927,605
Totals.....	3,708,513		\$30,680,976

The cotton crop in 1894 was 11,625 bales.

On Jan. 1, 1895, the farm animals comprised 253,656 horses, value \$11,327,410; 38,634 mules, value \$2,244,254; 273,851 milch cows, value \$5,014,212; 394,566 oxen and other cattle, value \$5,731,856; 449,357 sheep, value \$974,027; and 957,037 swine, value \$4,041,567—total head, 2,367,101; total value, \$29,333,326.

In 1893 the production of coal was 820,339 short tons, valued at \$692,748, an increase of 145,134 tons over the output of the previous year. The largest production since 1880 was in 1888, 1,073,000 short tons. Virginia and West Virginia together in 1893 produced 41,665 long tons of red hematite iron ore, 568,800 tons of brown hematite, and 6,500 tons of magnetite—total production, 616,965 tons; value, \$1,050,977. Of the total, Virginia produced 612,465 tons, ranking first of the States in yield of brown hematite. Virginia also ranked first in production of manganese ore, 4,092 long tons, value \$30,802; its highest production was in 1886, 20,567 tons. Other productions were: Granite, output valued at \$103,703, a large decrease caused by the business depression; slate, \$117,347, principally for roofing, also a decrease; limestone, \$82,685; sandstone, \$3,830; and gypsum, 7,014 short tons, valued at \$24,359. Tin-mining, carried on at the head-waters of Irish creek, in the northeastern part of Rock-bridge County, was hindered by litigation. There were 42 mineral-spring resorts, and 29 mineral springs whose waters were bottled and sold, the principal ones being scattered over fifteen counties.

Climate.—The climate ranges from the temperate of the plains in the S. E., fronting the Atlantic, to the cold of the northwestern mountain plateaus, is generally dry and mild, and is healthful the year round. The mean annual temperature for twenty years is 57°. For 1893, annual, 54.6°; monthly, January, 25.6°, July, 76.7°. Annual average mean for Tidewater division, 56°; Middle Virginia, 55°; Piedmont and Blue Ridge, 54°; the Valley, 52°; Appalachia, 51°. From tabulated returns of observations made at thirteen stations, representing nearly all the sections of the State, the mean annual average of rainfall for twenty-one years (1872-92) was found to be 42.99 inches.

Divisions.—For administrative purposes Virginia is divided into 101 counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1880.	Pop. 1890.	COUNTY-TOWNS.	Pop. 1890.

* Reference for location of counties, see map of Virginia.
 † Formerly in Chesterfield, Dinwiddie, and Prince George Counties; now independent.
 ‡ Exclusive of part of Petersburg city District.

Principal Cities and Towns, with Population in 1890.—Richmond, 81,388; Norfolk, 34,871; Petersburg, 22,680; Lynchburg, 19,709; Roanoke, 16,159; Alexandria, 14,339; Portsmouth, 13,268; Danville, 10,305; Manchester, 9,246; Staunton, 6,975; Charlottesville, 5,591; Winchester, 5,196; Fredericksburg, 4,528; and Newport News, 4,449.

Population and Races.—In 1860, 1,219,630; 1870, 1,225,163; 1880, 1,512,505; 1890, 1,655,980 (native, 1,637,606; foreign, 18,374; males, 824,278; females, 831,702; white, 1,014,680; colored, 641,300, of whom 640,867 were persons of African descent, 50 Chinese, 13 Japanese, and 370 civilized Indians).

Industries and Business Interests.—In 1890 the census returns showed that 5,915 manufacturing establishments reported. These had a combined capital of \$63,456,799; investment in plants, \$34,962,393, including value of machinery, tools, and implements, \$18,348,110; employed 59,591 persons; paid for wages \$19,644,850, for materials used \$50,148,285, and for miscellaneous expenses \$7,421,087; and had an output of goods valued at \$88,363,824. These totals show an increase over those for 1880 as follows: Number of establishments, 205; capital employed, \$36,487,809; persons employed, 9,407; amount of wages paid, \$12,219,589; and value of manufactured output, \$36,583,132. In 1880 the principal manufactures were of tobacco, flour and grist, iron and steel, lumber, cotton goods, machine-shop products, leather, and agricultural implements. The following table shows the manufactures of which the output was valued at \$1,000,000 and upward each in 1890:

MANUFACTURES.	Estab-lish-ments.	Persons employed.	Wages paid.	Cost of ma-terials.	Value of output.
Tobacco, chewing, smoking, and snuff.	93	10,085	\$2,142,385	\$4,825,432	\$11,804,813
Flour and grist mill products.	1,179	2,200	657,591	9,849,144	11,716,356
Tobacco, stemming and rehanding.	101	1,821	433,685	5,420,492	6,487,643
Lumber-mill products from logs and bolts.	638	5,980	1,361,638	2,905,958	5,541,825
Iron and steel.	17	1,483	633,444	2,943,216	4,104,850
Tobacco, cigars, and cigarettes.	102	2,428	785,187	1,463,878	3,727,842
Fondry and machine-shop products.	59	2,082	1,034,024	1,206,227	2,739,695
Fertilizers.	28	687	260,939	1,739,138	2,475,638
Planing-mill products	65	1,272	567,071	1,252,291	2,350,281
Nails and spikes.	4	1,504	578,716	1,343,406	2,068,734

Printing and publish-ing.	205	1,373	674,553	397,307	1,626,938
Brick and tile.	88	2,441	607,211	214,553	1,343,598
Boots and shoes.	7	272	139,888	874,564	1,279,069
Leather, tanned and carried.	82	459	159,026	805,487	1,224,800

In 1893 there were 32 blast furnaces, 10 rolling-mills and steel-works, 146 cut-nail machines, and a large wire-nail factory in operation. The production of pig iron was 302,856 long tons. Two coking plants had 594 ovens in operation and 206 other ovens were being built. During the year 194,059 tons of coal were used, from which were produced 125,092 short tons of coke, valued at \$282,898. In the fiscal year 1893-94 the internal revenue collections on taxable manufactures aggregated \$2,548,051. Tidewater Virginia has large interests in the oyster, clam, terrapin, and turtle industries, and in the herring, shad, and menhaden fisheries. The proceeds of the fisheries, according to the census, were valued at \$4,816,425 in 1890.

Commerce.—During the fiscal year ending June 30, 1894, the imports of foreign merchandise at the ports of Alexandria, Newport News (changed from Yorktown in 1888), Norfolk and Portsmouth, and Richmond aggregated in value \$484,257, and the exports of domestic commodities \$28,666,261. Virginia also has a large interstate traffic by rail and water, receiving and shipping raw materials and manufactured articles, and shipping large quantities of lumber, vegetables, and other productions.

Finances.—The assessed valuations in 1893 were: White taxpayers, real property \$296,371,055, personal \$90,373,044, total \$386,744,099; colored taxpayers, real property \$9,829,583, personal \$3,465,370, total \$13,294,953; total real property \$306,200,638, total personal \$93,838,414; grand total \$400,039,052. In 1894 the totals were: Real property \$310,201,514, personal \$86,590,188; grand total \$396,791,702. The total public debt on Oct. 1, 1894, was \$23,704,029, which included \$16,359,860 in bonds issued under the debt-settlement legislation, and the net debt was \$23,367,029.

Banking.—In 1893 there were 36 national banks with combined capital of \$4,796,300, individual deposits of \$12,463,724, and surplus and profits of \$3,279,783, and 90 State banks with combined capital of \$6,388,588, deposits of \$13,746,018, and surplus of \$2,427,167.

Post-offices and Periodicals.—In Jan., 1895, there were 3,139 post-offices, of which 57 were presidential (3 first-class, 9 second-class, 45 third-class) and 3,082 fourth-class, and of the total 432 were money-order offices, 5 money-order stations, and 6 limited money-order offices. Of newspapers and periodicals reported in 1895, there were 34 daily, 2 tri-weekly, 4 semi-weekly, 181 weekly, 1 semi-monthly, 44 monthly, 2 bi-monthly, and 4 quarterly publications—total, 272.

Means of Communication.—In 1893 there were 3,863 miles of railway track. The main systems having large connections outside the State were the Chesapeake and Ohio, the Norfolk and Western, the Southern, the Atlantic Coast Line, and the Baltimore and Ohio. Two of the trunk lines extended through the great coal-fields and terminated at Hampton Roads, taking numerous coal-trains to Newport News on the north shore and Lambert's Point and Norfolk on the south, and connecting with regular lines of ocean steamers. There are steamboat lines running regularly between Norfolk and Philadelphia, Baltimore, Washington, Richmond, Petersburg, North Carolina ports, and Fredericksburg; also between Richmond and New York, and Fredericksburg and Baltimore.

Churches.—The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Baptist, Regular, Colored	1,046	1,052	203,048	\$1,257,035
Methodist Episcopal South	1,172	1,155	105,892	2,183,565
Baptist, Regular, South	787	800	92,693	1,859,392
Presbyterian in the U. S.	290	363	26,515	1,180,576
Protestant Episcopal	245	334	30,371	1,697,375
Methodist Episcopal	316	316	16,764	329,144
Disciples of Christ	161	148	14,100	240,929
Roman Catholic	69	69	12,356	458,800
African Methodist Episcopal	67	102	12,314	187,245
African Meth. Episcopal Zion	72	72	11,765	68,449
Lutheran, United Synod in the South	145	140	11,196	314,200
Baptist, Primitive	226	222	9,608	90,005
Dunkards, Conservative	42	94	6,659	73,523
United Brethren in Christ	71	68	5,306	65,910
Methodist Protestant	57	57	4,154	94,000
Reformed Church in the U. S.	20	22	1,819	44,800
Christian Connection	23	21	1,390	8,875
Colored Methodist Episcopal	18	18	1,351	33,150

The whole State constitutes the Protestant Episcopal diocese of Virginia (organized in 1785). The eastern part comprises the Roman Catholic diocese of Richmond (established in 1821), and the remainder of the State is in the diocese of Wheeling (established in 1850).

Schools.—The public-school system is administered by a State board of education, consisting of the Governor, the attorney-general, and the superintendent of public instruction. This board controls the State school fund, and appoints and removes county and city superintendents, subject to confirmation by the Senate. The schools are free to all children between five and twenty-one years of age. Equal educational privileges are secured by law to white and colored children, with the provision, however, that they shall be taught in separate schools. In 1893 there was a school population of 377,595 white children and 275,831 colored (653,426), of whom 227,696 white and 120,775 colored (348,471) were enrolled in the public schools, and 130,398 white and 63,745 colored (194,143) were in average daily attendance. There were 5,679 schools for white pupils and 2,064 for colored (7,743), and 5,868 white teachers and 2,064 colored (7,932). The appropriation for public-school purposes was \$932,367, and the value of school property was estimated at \$2,763,584. Of institutions for higher instruction there were 4 normal schools; 59 endowed academies, seminaries, and private secondary schools; 15 colleges for women; 8 universities and colleges of liberal arts; and numerous professional and other special schools. The universities and colleges of liberal arts were the State University (see VIRGINIA, UNIVERSITY OF); HAMPDEN-SIDNEY COLLEGE (*q. v.*), at Hampden-Sidney; WASHINGTON and LEE UNIVERSITY (*q. v.*), at Lexington; RANDOLPH-MACON COLLEGE (*q. v.*), at Ashland; RICHMOND COLLEGE (*q. v.*), at Richmond; ROANOKE COLLEGE (*q. v.*), at Salem; Emory and Henry College (Methodist Episcopal South, chartered 1837), at Emory; and the Polytechnic Institute, at New Market. State aid is given to the State University, the Virginia Military Institute, the Virginia Agricultural and Mechanical College, the State Female Normal School, the College of William and Mary (State Male Normal School, see WILLIAM AND MARY, COLLEGE OF), the Medical College of Virginia, the Virginia Normal and Collegiate Institute, and the Hampton Normal and Agricultural Institute. The Miller Manual Labor School, at Crozet, is a notable institution, and has an endowment of \$1,300,000.

Libraries.—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Virginia had 50 libraries, containing 340,110 bound volumes and 30,800 pamphlets. The libraries were classified as follows: General, 6; school, 13; college, 13; college society, 5; law, 2; theology, 3; Y. M. C. A., 3; scientific, 2; historical, 1; garrison, 1; and society, 1. The State Library was completed in 1894, at a cost of \$174,200.

Charitable, Reformatory, and Penal Institutions.—Among these are the Virginia Institution for the Education of the Deaf and Dumb and the Blind, at Staunton; four State asylums for the insane, the Western, at Staunton, the Eastern, at Williamsburg, the Southwestern, at Marion, and the Central, near Petersburg; an Industrial Reform School for white boys, at Laurel; a penitentiary, at Richmond; and county and city jails and almshouses.

Political Organization.—The executive power is vested in a Governor, elected for four years and ineligible for a second consecutive term, who must be a citizen of the U. S., thirty years old, and a resident of the State for three years prior

to his election. If foreign born, he must have been a resident of the U. S. for ten years. A Lieutenant-Governor is elected at the same time, for the same term, and under the same qualifications as the Governor, and succeeds the Governor on his death or removal from office. Other State officers are a secretary of the commonwealth, treasurer, first and second auditors, register of the land office, superintendent of the penitentiary, railway commissioner, and public printer, each elected for two years by the General Assembly, and a commissioner of agriculture appointed by the Governor. The legislative authority is vested in a General Assembly, consisting of a Senate of 40 members and a House of Delegates of 100 members, each elected for two years. The judicial authority is vested in a supreme court of appeals of five judges, elected by the General Assembly for a term of twelve years; circuit courts, of which there are sixteen judges, elected by the General Assembly for a term of eight years; and county courts of one judge each, similarly elected for six years. The elective franchise is given to all males twenty-one years old and upward who are citizens of the U. S. and residents of the State one year, of the county three months, of the town three months, and of the precinct thirty days prior to the election, excepting idiots, lunatics, persons convicted of bribery in any election, embezzlement of public funds, treason, felony, or petty larceny, and persons engaged in dueling as principals or abettors. A modification of the Australian ballot law is in force.

History.—Virginia was the earliest settled of the English colonies. On May 13, 1607, a party of 105 persons, sent out by the London Virginia Company, landed at what is now known as Old Jamestown. It was mostly composed of needy adventurers, and the whole company would have perished but for the enterprise of Capt. John Smith. Smith took command of the colonists, and held it until the officers appointed by the London Virginia Company should make their appearance. Nine vessels had been sent out by the company with 500 colonists, but the one bearing the officers was wrecked on the Bermudas, and one of the other vessels was lost. The remaining seven arrived safely at Jamestown, but the new settlers were as worthless as their predecessors. Having been severely wounded by an accident, Smith was compelled to return to England in Dec., 1609. He left 500 colonists well supplied with all necessities. Six months later the number had dwindled to 60, and these were on the verge of starvation. At this time (June, 1610), Newport, Gates, and Somers arrived at Jamestown with 150 men and a moderate store of supplies, but finding the colonists in so sad a plight they resolved to abandon Virginia. As they descended the river, they met Lord de la Warr with three ships, bringing supplies and settlers. They then returned to Jamestown, and Lord de la Warr established a trading-post at Hampton. Lord de la Warr's health failing, he returned to England, leaving Capt. George Percy as his deputy. New settlements were made at Henrico and at what is now City Point, and the lands, which had previously been held in common, were divided among the settlers. Lord de la Warr returned to resume the governorship, but died at the entrance of the bay. Sir George Yeardley, who succeeded him, was more popular. The culture of tobacco became profitable; favorable laws were made; servants of two kinds began to come into the colony in 1619—felons or convicts sent over from English prisons and sold to the planters for a term of years, and Negro slaves brought by Dutch vessels from the African coast. In 1624–25 the Virginia Company was dissolved by writ of *quo warranto*, and the colony reverted to the crown. In 1652 the colonists reluctantly submitted to the rule of Cromwell, but in 1660 they reaffirmed their loyalty to the Stuart dynasty. Bacon's Rebellion, which occurred in 1676, was the result of the rapacity of Gov. Berkeley and two favorite courtiers of Charles II. (Arlington and Culpeper), to whom he had given a patent of the Virginia colony. In 1689 the colony reluctantly acknowledged the accession of William and Mary. There were occasional conflicts with the Indians, but these were not serious until 1754, when the French war began. Virginia resented the levying of taxes by the mother country without representation as warmly as did Massachusetts, and in 1765 adopted resolutions denying the right of any foreign body to levy such taxes. The colony was not represented in the first colonial congress of Oct., 1765, but approved its action, and asserted strongly, four years later, its rights and liberties. It was not until the accession of Lord Dunmore as Governor in 1772 that the opposition to the measures of the British ministry began to be generally manifested. Lord Dunmore

became at length so obnoxious to the people by his tyranny that he took refuge on board a British man-of-war off Yorktown, and in June, 1775, sailed down the river, and was declared by the General Assembly to have abdicated his office. He subsequently attacked with a British and Tory force several of the towns along the coast, but was eventually driven south with heavy losses. In May, 1776, a convention of delegates met at Williamsburg, issued a declaration of rights, and on June 12 adopted a State constitution. Committed thus to the Revolution, Virginia was one of the fields of the Revolutionary war, especially toward its close. Naval attacks were made on Norfolk, Portsmouth, and Gosport in 1779, and Benedict Arnold captured and burned Richmond in Jan., 1781. The battle of Jamestown was fought July 9, 1781, and the surrender of Cornwallis (with which the war ended) took place at Yorktown Oct. 19 of the same year. Virginia was prominent in the national convention which framed the Constitution of the U. S., and ratified that Constitution June 25, 1788. In 1784 she ceded to the U. S. her claims to the lands lying N. W. of the Ohio, and soon after this she gave up the territory which forms the present State of Kentucky. In 1849 she changed her constitution, extended the suffrage, and codified her laws. In 1860 and 1861 the people of Virginia were divided in their views on the subject of secession. The convention, called Feb. 13, 1861, to consider the subject, was composed of three classes—unconditional Unionists, unconditional secessionists, and conditional Unionists; the last-named were largely in the majority. There was a long discussion, but on Apr. 17, three days after the capture of Fort Sumter, the ordinance of secession was passed by 88 yeas to 55 nays. It was subsequently submitted to the people, and a majority of 94,000 was said to have declared in favor of secession. The western counties opposed it, and as a result the State of West Virginia was formed in October of the same year. Richmond became the capital of the Confederate States in the summer of 1861. The State was occupied by hostile armies during the whole of the civil war that followed, and many of the most important actions of the war, together with the final surrender of Lee's forces at Appomattox, took place within its borders. (See CONFEDERATE STATES.) During a part of this time there were two State governments, the counties which were loyal and under Federal control having instituted a State government at Alexandria in 1863, and Francis H. Pierpont being elected Governor. The legislature of this State government called a convention, which met Feb. 13, 1864, and abolished slavery. After the close of the war, an attempt was made to convene the old Virginia legislature to restore the State to the Union, but, as it was believed that that legislature would act in hostility to the government, its assembling was prohibited, the Pierpont government recognized by President Johnson May 9, and Gov. Pierpont made provisional governor. The State was under military control till Jan. 26, 1870, when it was restored to the Union by Congress under a constitution adopted by the people July, 1869. During Holliday's term as Governor (1878-82) there arose a contest over the State debt which was not settled till 1892, when the debt was adjusted and bonded.

GOVERNORS OF VIRGINIA.

<i>Officers under the Virginia Co.</i>	
Edw. M. Wingfield, pres.	1607
John Ratcliffe, pres.	1607-08
Capt. John Smith, pres.	1608-09
Sir George Percy, pres.	1609
Thomas West, Lord de la Warr, gov.	1609-11
Thos. Dale, high marshal.	1611-16
George Yeardley, lt.-gov.	1616-17
Captain Samuel Argall, lt.-gov.	1617-19

THOMAS WHITEHEAD.

Virginia: city (laid out in 1836); capital of Cass co., Ill.; on the Balt. and Ohio S. W. and the Chi., Peo. and St. L. railways; 13 miles E. by S. of Beardstown, 33 miles W. by N. of Springfield (for location, see map of Illinois, ref. 6-C). It is in an agricultural region, and has a public high school, library of the Central Illinois Science Society, 2 national banks with combined capital of \$100,000, a private bank, and 2 weekly newspapers. Pop. (1880) 1,420; (1890) 1,602.

Virginia, or Virginia: a Roman maiden, daughter of Lucius Virginus, a patrician, and betrothed to Lucius Iulius, a popular democratic leader who had signalized himself in the office of tribune by procuring the passage of the law assigning the Aventine Mount to the plebeians. According to the ordinary histories—which, however, do not merit great confidence—the decemvir Appius Claudius, captivated by the beauty of the maiden, devised with one of his clients an infamous plot to obtain possession of her, under pretense that she was a slave; and when, in spite of all the efforts of the maiden's father and lover, the decemvir had in his magisterial capacity adjudged her to be the slave of his accomplice, Virginus plunged a knife into his daughter's breast in the midst of the Forum. The people, excited by this tragedy, overthrew the government of the decemvirs, re-established the consulate, and made Virginus tribune, by whom Appius was thrown into prison, where he committed suicide (B. C. 449). Revised by G. L. HENDRICKSON.

Virginia City: city (settled in 1859, incorporated in 1861); capital of Storey co., Nev.; on the eastern slope of Mt. Davidson, and on the Virginia and Truckee Railroad; 15 miles N. E. of Gunnison City, 200 miles N. E. of San Francisco (for location, see map of Nevada, ref. 5-E); elevation 7,825 feet above sea-level. It is the largest city in the State; was settled on the discovery of the famous Comstock silver lode; and is built over mines from which over \$350,000,000 in gold and silver bullion has been taken. The city has a daily supply of 10,000,000 gal. of water for use for domestic and mining purposes, brought from the Sierra Nevada mountains, 30 miles W., at a cost of \$2,500,000, and the principal mines are tapped by the Sutro drain tunnel (4 miles long, cost \$4,500,000) at a depth of 1,650 feet. The deepest mining-works have a depth of 3,000 to 3,350 feet. There are in the city numerous great mining-plants erected at a cost of from \$350,000 to \$1,000,000 each. There are 4 churches, 2 public-school buildings (cost \$20,000 and \$60,000 respectively), several private schools, branches of two San Francisco banks, county court-house (cost \$250,000), county hospital, St. Mary's Hospital, gas and electric-light plants, and a weekly and 2 daily newspapers. Pop. (1880) 10,917; (1890) 8,511; (1895) estimated, 6,800, the decrease being due to the decline in the price of silver. GOLD HILL is a mining town 1 mile S. of the city, and was once a place of much importance. DAN DE QUILLE.

Virginia Creeper: See *AMPELOPSIS*.

Virginia Deer: the *Cariacus virginianus*, or common deer of the Eastern U. S. See *DEER*.

Virginian Snake-root: See *ARISTOLOCHIA*.

Virginia, University of: an institution of learning at Charlottesville, Albemarle co., Va.; chartered in 1819 through the influence of Thomas Jefferson, its first rector, who drew up all the statutory enactments relating to it, as well as its basis of organization, code of government, and original plan of studies. It was opened in 1825, and had among its faculty several young English professors, two of whom, George Long and Thomas Hewitt Key, subsequently achieved eminence in connection with London University. Among the peculiar features which distinguish the University of Virginia from all other American institutions, the principal are its division into separate, independent schools, twenty-two in number, each under the charge of a professor, who in several instances has assistant instructors, and the freedom of election in studies granted the student. There is no general curriculum, but students select their schools, usually three in number, for each year, and receive upon examination their respective degrees—namely, for proficiency in separate branches, for graduation in a single school, for the degrees of bachelor of arts, of master of arts, and of doctor of philosophy. The university has also medical, pharmaceutical, law, agricultural, and engineering departments with corresponding degrees. The academic head of the university is the chairman of the faculty, annually chosen by the board of visitors composed of a rector and eight members, appointed by the Governor of Virginia, and confirmed by the Senate, in whom the government is vested. The institution is under State patronage, having enjoyed from the beginning an annual appropriation of \$15,000, a sum which in 1875 was increased to \$30,000 on condition of free tuition in the academical schools for suitably prepared students who are residents of the State. The annual appropriation was raised to \$40,000 in 1884. The gifts in equipments and endowments (including an endowed observatory and an extensive museum of natural history and geology) since 1869 by William W. Corcoran, Lewis Brooks, Leander J. McCormick, William H. Vanderbilt, and others, amount to \$600,000. To this is to be added an estate in remainder left by Arthur W. Austin, of Massachusetts, in 1884, valued at \$420,000. The department of agriculture was founded in 1869 by Samuel Miller, of Lynchburg, with an endowment of \$100,000. The library contains about 54,000 volumes; the number of alumni is about 15,000; and the number of students for the year 1894-95 was 575, under the tuition of 25 professors and 15 assistants.

WILLIAM M. THORNTON.

Virgin Islands (so-called by Columbus in honor of the Eleven Thousand Virgins): a group of islands in the West Indies, forming the northwestern extremity of the Caribbean chain, and lying immediately E. of Puerto Rico. The most important are St. Thomas, Santa Cruz (*qq. v.*), and St. John, belonging to Denmark. Tortola, Anegada, Virgin Gorda, and some islets, belong to Great Britain, and are attached to the Leeward islands colony; they have an aggregate area of 58 sq. miles, and a population (1891) of 4,639. Culebra, Vieques, etc., are dependencies of the Spanish colony of Puerto Rico. All the islands are hilly or mountainous. Total area about 250 sq. miles; total pop. about 55,000. H. H. S.

Virgin Mary: See *MARY, THE BLESSED VIRGIN*.

Virgin's Bower: See *CLEMATIS*.

Virgo: the sixth sign of the Zodiac, which the sun enters about Aug. 20; also a constellation which formerly marked this sign, but is now in the sign Libra. It is on the meridian during the evenings of May and June, and contains the bright star Spica. S. N.

Viriathus: a Lusitanian herdsman, who became a leader in the guerrilla war which was carried on in the middle of the second century B. C. on the border between Lusitania and the Roman province of Spain. After some years of guerrilla warfare, in which for the most part Viriathus was signally successful, a peace was concluded with the Romans, by which the Lusitanians were acknowledged as an independent nation and the allies of Rome. But in 140 the consul, Q. Servilius Cæpio, saw fit to invade Lusitania, bribed some persons to murder Viriathus while sleeping, and subjugated the country. Revised by G. L. HENDRICKSON.

Viro'qua: city; capital of Vernon co., Wis.; near the Kickapoo river, and on the Chi., Mil. and St. Paul Railway;

30 miles S. E. of Lacrosse, 35 miles S. of Sparta (for location, see map of Wisconsin, ref. 6-C). It is in an agricultural and lumbering region, and has a high school, a State bank with capital of \$25,000, and two weekly papers. The neighborhood is a favorite one among sportsmen because of the trout and game that abound. Pop. (1880) 762; (1890) 1,270; (1895) 1,630.

EDITOR OF "VERNON COUNTY CENSOR."

Virus [from Lat. *vīrus*, slime, slimy liquid, stench, poison; Gr. *ἴος* (for **Fίος*): Sanskr. *viṣa-*, poison]: animal fluids produced in diseased conditions or by morbid processes, and capable of developing disease when transmitted to other animal bodies. Thus man may be inoculated by the virus of human origin, smallpox, syphilis, etc., vaccinia of the cow, glanders of the horse, and rabies canina or hydrophobia. (See *INOCULATION* and *VACCINATION*.) A minute amount of the virus gaining access to the body is sufficient to infect the entire volume of the blood and contaminate every part of the body. Peculiar organisms, having vitality and tendency to reproduce themselves, constitute the active elements of all viruses. (See *BACTERIOLOGY*.) Having gained entrance to the system, they for a time seem dormant, but are really multiplying, and this period is well designated as one of "incubation." Thus smallpox appears twelve or more days after admission of virus, vaccinia within a week, hydrophobia on an average in forty days. Hygienic and supporting measures may prepare the body to meet those effects and pass safely through, but, with the exception of malaria and a few other diseases, no specifics are known which are capable of destroying the virus.

Visalia: town; capital of Tulare co., Cal.: on the Kaweah river, and the Visalia and Tulare Railroad; 18 miles N. E. of Tulare, 40 miles S. of Fresno (for location, see map of California, ref. 9-E). It was founded in 1852, made the county-seat in 1853, and incorporated in 1874. There are 6 churches, thirteen-room public-school building, 3 State banks with combined capital of \$250,000, and 2 daily and 2 weekly newspapers. It is principally engaged in agriculture and fruit growing and canning. Pop. (1880) 1,412; (1890) 2,885; (1895) estimated, 3,400. EDITOR OF "DELTA."

Vishy: ancient town of Sweden. See *WISBY*.

Viseacha, or Biseacha: See *LAGOTIS*.

Viscell'nius, SPURIUS CASSIUS: a Roman statesman and general of the earliest period of the republic, who has received scant justice from the imperial annalists, but deserves to be considered one of the greatest and most illustrious historical figures of the early republic. In his third consulship, in 486 B. C., he made the league with the Hernicians which was the basis of Roman success for the century following. His importance in Roman history is due to the fact that he was the first to introduce an agrarian law which should compel the rich patricians to give up the public land which they held, and rent it out for the benefit of the public treasury, and also divide it in part among needy citizens. His attempt failed, although his law was passed, and in the year after his consulship he was accused of aiming at royal power and was put to death (485 B. C.). G. L. H.

Vischer, fish er, FRIEDRICH THEODOR: critic and poet; b. at Ludwigsburg, Würtemberg, June 30, 1807; studied theology and philosophy at Tübingen; was appointed Professor of German Literature and Æsthetics at Tübingen in 1837; traveled in Italy and Greece, where he studied art; was suspended from his professorship on account of his radical views on religion; was elected a member of the national assembly of Frankfurt-on-the-Main in 1848; accepted in 1855 a professorship at the polytechnical school of Zurich, and in 1866 was appointed Professor of Æsthetics and German Literature at the polytechnical school of Stuttgart. D. at Gmunden, Sept. 14, 1887. In 1837 Vischer published his *Ueber das Erhabene und Komische*, a preliminary study in the philosophy of the beautiful, in which he sketches the plan of the chief work of his life, the *Æsthetik oder Wissenschaft des Schönen* (4 vols., 1846-57). The first part of this classic, in which, on the basis of Hegel's philosophy, the metaphysics of the beautiful is given, must be considered antiquated; but the parts containing the discussion of the single arts of sculpture, painting, poetry, and music are unequalled for depth of thought, æsthetic insight, and suggestive criticisms. Vischer was the greatest German critic, after Lessing and Schiller, and many of his minor essays collected in *Kritische Gänge* (2 vols., 1846, with 5 vols. of new additions, 1860-66), *Altes und Neues* (1881-82), are

masterpieces of their kind. A great admirer of Goethe and his drama *Faust*, as shown by *Goethes Faust, Neue Beiträge zur Kritik des Gedichts* (1875), he was not blind to the deficiencies of the second part of the great drama, and ridiculed the extreme enthusiasts among the interpreters in his witty satire, *Faust, Der Tragödie dritter Theil*. That Vischer was also a poet of great talent and exquisite humor is evident from his novel, *Auch Einer* (1879), and his collection of poems, *Lyrische Gänge* (1882). See Hse Frapan, *Vischer-Erinnerungen* (1889); Julius Ernst v. Günthert, *Friedrich Theodor Vischer* (1889); Fr. Spielhagen, *Technik des Romans*, 101 ff.; Victor Hehn, *Gedanken über Goethe*, 181 ff.

JULIUS GOEBEL.

Vischer, PETER: sculptor and worker in bronze; b. at Nuremberg, Bavaria, in 1455; d. there Jan. 7, 1529. His father was a worker of reputation in bronze. Of his own life not much is known (see *Die Nürnberger Künstler, geschildert nach ihren Leben und Werken*, 1831), but he attained a great fame as an artist, and received orders from both German and foreign princes. Of his numerous works, the tomb of St. Sebaldus, in the Church of St. Sebaldus in Nuremberg, is the most celebrated (1506-19), containing seventy-two figures, besides those of the apostles and prophets. Other works only less celebrated are, in Röhmbild, the tomb of Count Hermann von Henneberg and his wife: three monuments in Bamberg to three bishops of the cathedral; in Heehingen, the tomb of Count Eitel Fritz von Zollern and his wife; and especially two of the splendid statues which decorate the tomb of the Emperor Maximilian I. at Innsbruck.

Revised by RUSSELL STURGIS.

Viscon'ti [from the Lat. *vicecomites*, viscounts]: an old Lombard family, said to descend from King Desiderius. Possessing large estates bordering on Lakes Como and Maggiore, it obtained, in course of time, the sovereignty of Milan, and extended its power over the whole of Northern Italy, from Venice to Florence. One member of the family, OTTONE, is mentioned in 1078 as Viscount of Milan, and another Ottone was appointed Archbishop of Milan in 1263 by Pope Urban IV. This appointment by the pope, and not by the chapter, was considered an infringement on the rights of the people, and occasioned a popular rising under the leadership of the family of the Torriani, or Della Torre. A civil war ensued, which was brought to an end in 1311, when the Emperor Henry VII. expelled the Torriani from the city, and confirmed MATTEO as Viscount of Milan, also making him imperial vicar in Lombardy. Between Matteo and Pope John XXII. a controversy arose regarding the appointment to the archbishopate of Milan, and Matteo was forced to resign a short time before his death. In 1322 the pope excommunicated the Viscontis, and in 1323 a crusade was preached against them, but by the aid of the Emperor Louis of Bavaria, GALEAZZO I. succeeded in completely defeating the holy army at Vavrio, on the Adda, in 1324, and in 1327 became imperial vicar of Milan. The power of the family now increased rapidly. Its members were conspicuous as shrewd politicians, able generals, and great patrons of literature and art; but they were generally unscrupulous and cruel, and conspiracies, depositions, and assassinations fill the pages of their history. With GIOVANNI GALEAZZO (1378-1402) the power of the family culminated. He was a son of GALEAZZO II., the patron of Petrarch, the founder of the University of Pavia, and the inventor of the famous process of torturing called Galeazzo's seat; and the son evinced all the father's virtues and vices on a grand scale. He founded the library at Pavia, re-established the university at Piacenza, founded the Cathedral of Milan, built the Certosa and the bridge across the Ticino at Pavia, etc. He conquered Padua, Verona, Vicenza, etc., bought the title of Duke of Milan from the Emperor Wenceslas, and aspired to the royal crown of Italy, when he suddenly died from the plague. His daughter, Valentina, married Louis, Duke of Orleans, and was the grandmother of Louis XII., King of France. On the death of his son, Filippo Maria, in 1447, the male line of the family became extinct, but his natural daughter, Bianca, married to Francesco Sforza, retained Milan and a large part of the family inheritance.

Revised by F. M. COLBY.

Visconti, ENNIO QUIRINO: archaeologist; b. in Rome, Nov. 1, 1751. At an early age he became the conservator of the Capitoline Museum, and rose to the place of Minister of the Interior and of consul. At the approach of the Neapolitan army (1799) he went to Paris, where he was appointed director of the antiquities of the Louvre and Professor of

Archæology. In this capacity he issued the celebrated *Catalogue of the Museum* (1801-03), and published the two works upon which his fame rests, the earlier having been instigated by Napoleon and published at his expense. The *Iconographie Grecque* was issued in three volumes in 1808, followed twelve years later by the *Iconographie Romaine*, also in three volumes. A collection of all his minor treatises was made by Labres (Milan, 1808). D. in Rome, Feb. 7, 1818. His son, LOUIS TULLIUS JOACHIM, b. in Rome, Feb. 11, 1791, studied at the School of Fine Arts in Paris, and was much employed as practical architect by Louis Philippe and Napoleon III. He erected in Paris the fountains of Gaillon, Molière, Louvois, and St. Sulpice, the tomb of Napoleon I. in the Hôtel des Invalides, and the Collet Palace on the Quai d'Orsay. He also furnished the plans for the completion of the Louvre, which, however, he did not live to see executed. D. in Paris, Dec. 1, 1853. ALFRED GUDEMAN.

Visconti-Venosta, EMILIO, Marquis: statesman; b. at Milan in 1829. He wrote for various literary and political periodicals, and was at first a supporter of Mazzini. In 1859 Cavour appointed him royal commissioner at the headquarters of Garibaldi in Lombardy, and he acted, in conjunction with the dictator Farini, in measures for the annexation of Central Italy to the kingdom of Sardinia. In 1860 he was associated with Pepoli in a mission to Paris and London, and after his return held office in the ministry of Foreign Affairs; accompanied Farini to Naples as legal and diplomatic counselor on the annexation of that kingdom to Italy; was three times Minister of Foreign Affairs, in 1863-64, 1866-67, and 1869-76. In 1886 he became a senator.

Viscos'ity [from Lat. *viscosus*, sticky, viscous, deriv. of *viscum*, bird-lime; cf. Gr. *ἰξός* (for *ἰξός*)]: a term in physics denoting that property of matter in accordance with which the relative motion of its parts tends to diminish. It is exemplified in the dying away of sound and the gradual disappearance of the waves caused by an object thrown into water. The kinetic theory of gases gives us a simple explanation. If contiguous layers of gas are moving with different velocities, the diffusion of molecules across the space between them will tend to produce an equalization of velocity—that is, by increasing the velocity of the slower layer and diminishing the velocity of the swifter one. The viscosity is thus a diffusion of momentum, and may be measured by the rate at which the momentum is equalized across unit areas. If we cause a layer of gas to pass over another in parallel planes, the action of viscosity engenders a definite resistance. The same action takes place, but in a less degree, in liquids, and to a much smaller extent in solids. This property may be explained by Maxwell's theory of the constitution of bodies, according to which the difference between gases, liquids, and solids depends upon the readiness with which groups of molecules can be broken up. With every such breaking up of groups and assumption of new relative positions energy is expended and motion lost. Thus suppose that in the case of an elastic solid the mutual relations of groups of molecules are disturbed by stresses, then by the action of elasticity these relations are restored, but not perfectly, owing to viscosity. For instance, in the case of an oscillating tuning-fork, there is, independently of the resistance of the air, a tendency to the evanescence of motion in consequence of the deformation of the material itself.

R. A. ROBERTS.

Viscount, vī'count [originally a *vice-count*, or earl's deputy]: in the British peerage, the title of a nobleman higher in rank than a baron and lower than an earl. There is a corresponding title in the nobility of several other European nations. See NOBILITY.

Viscous Fermentation: See FERMENTATION.

Viscum: the genus of parasitic plants to which the MISTLETOE (*q. v.*) belongs.

Vishnu: the second person of the Hindu Trimūrti. While Brahmā is said to create, and Śiva to destroy, the chief function of Vishnu is said to be preservation. In tracing the history of the god, it can plainly be seen that the reason for nominating Vishnu as the Supreme Preserver lies in the fact that in his avatars he appears as an almighty Deliverer, the last savior of gods and men. If we are to believe his votaries he stands alone, as the incomparable chief of the Hindu pantheon. But, unfortunately, zealous advocates of Saivism are as extravagant in the praise of Śiva, their own deity, and declare that he is so potent that he is worshiped by Vishnu. As for Brahmā, he is rather a venerated name

that is encircled by shadowy awe, and which looms through the mists of tradition, than a living power to whom daily prayers and sacrifices must be offered up.

Vishnu is usually represented with four hands, and as riding on the Garuda, a being which is half bird and half man. He has 1,000 names. His wife is LAKSHMI (*q. v.*). The most remarkable thing about Vishnu as a god is his avatars or incarnations. Taking them in the order in which they are generally commented on, we come first to the incarnation in which Vishnu took the form of a fish. This is called the *Matsya avatar*. There are many indications that the history of this avatar has some connection with that of the Hebraic account of the Deluge. The origin of the avatar appears to have been the necessity for avenging the loss of the four *Vedas* which proceeded from Brahmā's four mouths. Brahmā, we are told, fell asleep, and a demon who saw him thus unconscious took the opportunity to steal the *Vedas*. The demon succeeded, but was caught in the act by Vishnu, who determined to slay him. He appears, however, to have taken a long time about it, and to have gone about his work in a very roundabout way. Vishnu took the form of a fish, and slipping into the hands of the sage Manu while he was performing his religious ablutions, addressed him and claimed protection from the larger fishes. Manu consented, and placed it in his pitcher of water. But the fish grew so large that he placed it in a pond. Then the pond was found too small, and the fish was placed in a lake. Then nothing but the sea would contain the enormous creature; whereupon Manu became convinced of the divine character of the fish, and after he had paid his adoration to the god, Vishnu revealed to him the imminence of a deluge which would destroy the world, and told him that a large vessel would appear to him, in which he was to embark, together with the seven Rishis, taking with him all the plants and all the seeds of created things. Manu obeyed the behest of the god, and when the water covered the face of the earth, Vishnu again appeared to him in the shape of a golden fish, with a single horn 10,000 miles long, and to this horn Manu attached the vessel, Vishnu's serpent serving as a cord. While thus floating in the vessel, Manu was instructed by the fish-god in the philosophical doctrines and the science of the Supreme Spirit; and after the deluge had subsided, the fish-god killed the demon, restored the *Vedas* to Brahmā, and taught them to the Manu Satyavrata.

Next comes the tortoise avatar. The gods becoming aware of their mortality, desired to discover some elixir by which they might become immortal. After solemn consultation they repaired to the omnipotent Vishnu, who directed them to churn the ocean of milk, with the mountain *Mandara* for their churning-stick. This was to be stuck down into the sea, cone downward, and the long serpent of Vishnu, *Vāsuki*, to be coiled round the mountain. The demons were to pull at the head of the snake, and the gods to pull at the tail, each alternately, so that the mountain should revolve in the sea of milk, and churn it. Vishnu himself, taking the form of a tortoise, descended to the bottom of the sea to support the mountain on his back while it revolved on the pivot of his scales. From the ocean thus churned was produced the desired amrita or ambrosia, and thirteen other things.

We now come to the *Varāha*, or boar avatar, in which Vishnu, taking the form of a boar, dived down to the bottom of the great ocean, and after a contest of 1,000 years rescued the earth which had been carried off by the demon Hiranyakasha. In the *Vāmana-avatāra*, Vishnu appears as a dwarf. The demon *Bali* was so powerful a monarch that he overcame *Indra* himself, and had gained possession of heaven, earth, and hell, and the gods knew not how to recover them. Vishnu appeared before him in the form of a dwarf, and did him reverence. *Bali* was pleased, and asked the little Brahman what he would like for a gift. The dwarf said, "Only as much ground as I can cover by taking three steps." This request was at once granted, when the god leapt up as the mightiest of the host of heaven, and placing one foot on earth, one on the middle space, and one over heaven, gained to himself the three worlds, leaving only hell to *Bali*.

In the next avatar Vishnu appears as a man-lion, and this incarnation is called *Narasinha-avatāra*. In it the Pre-server is represented as saving the gods from the might, acquired by the most rigorous penances, of *Hiran-ya-Ka'si-pu*. He had forced from Brahmā the gift of a life which could not be destroyed by any created being. The moment he obtained this invulnerability, he began to molest the gods and

to persecute the votaries of Vishnu. At length, Vishnu took upon himself to slay this demon without there being any need for Brahmā's vow being broken. He came, therefore, not in the form of a being which had been "created," but as a new creation, a man-lion, and tore the heart of the demon from out of his breast with his sharp claws.

In the *Parasu-Rāma* avatar of Vishnu is accomplished the liberation of the universe from Arjuna of the thousand arms, a man of the military class who, by deeds of unexampled piety, had acquired great power of malignancy, and Vishnu vowed to extirpate him and his whole caste. Using an axe or a bow he did this. It has been supposed that the legend is in essence historical, and records a great struggle in primeval times between Brahmans and Kshatriyas.

The avatar of Vishnu as Rama is given in full in the *RAMĀYANA* (*q. v.*).

The eighth avatar is that of Krishna (the most popular form of Vishnu), who first comes to earth as the opponent of *Kansa*, the fiend-king, who terrorized over gods and men. To annihilate *Kansa*, he, with *Balarāma*, determined to become incarnate. *Kansa* had news of this, and killed every child born as soon as he could. But by means of stratagems and concealment *Balarāma* and *Krishna* escaped and grew up, and after many pranks and wonderful deeds at length slew their great enemy *Kansa*, after having killed two of his pugilists before thought to be invincible.

The ninth avatar is that of Buddha. It is evidently a late invention of the Jains, who tried to reconcile Brahmanism with Buddhism. The last avatar is yet to come, when the great god with the four hands, and seated on a white horse, will descend and will destroy the universe. This is called the *Kalki* avatar.

Revised by R. LILLEY.

Visible Speech: a system of symbols (devised by the writer of this article) in which every possible articulate utterance of the organs of speech is represented. In the ordinary writing of languages the letters which represent sounds have no relation to the mechanism of the sounds—unless, perhaps, in the single case of O, which may be held to be pictorial of the rounded aperture of the lips. Some letters have their distinctive parts low, as in d b; others high, as in q p; some to the left, as in e q d; others to the right, as in p b; but there is no organic significance attached to the variations. In the system of letters called visible speech every letter, as well as every part of every letter, is organically significant.

In a certain sense all writing may be called visible speech, because letters are the visible forms by which articulate sounds are conventionally expressed; but the title of this system conveys a very different idea. Speech consists of definite movements of the throat, the tongue, and the lips, and in different countries the same letters are associated with different sets of movements, or the same movements are associated with different sets of letters, so that one may know the letters perfectly in connection with one language, and yet be unable to pronounce them in any other language. Visible speech consists of writing which depicts the actual movements of the organs of speech in all their modes of action; and as the same organs are common to all men, and the effect of every action is the same in all mouths, the letters have a universal meaning, which is independent of differences of language or conventional associations. In this respect visible-speech letters resemble musical notes or arithmetical numbers. Like musical notes they have, everywhere, a uniform value in relation to sound; and, like the Arabic numerals, they have everywhere an absolute value in relation to meaning. For example, the symbol for the English sound of l directs the learner to "raise the point of the tongue against the palate and sound

CONSONANTS

VOWELS

the voice over the sides of the tongue"; and the symbol for the sound of M expresses to the eye the practical direction,

"close the lips and sound the voice through the nose." However variously these directions might be put in words in different languages, the effect of following the directions will, obviously, be the same in all mouths in every country.

The basis of the visible speech symbolism will be understood from the diagrams on the preceding page, the first of which refers to consonants, the second to vowels. All consonants are represented by *curves* which have the outline of the organs they symbolize. Thus:

- C, back of tongue. U, point of tongue.
- Q, top of tongue. O, lips.

These curves all imply omission of compressed breath over the organ symbolized. Thus:

- C, German *ach*. U, English *r* in *road*.
- Q, English *y* in *yes*. O, German *w* in *wie*.

Five additional varieties of curves suffice to express all oral consonants. Thus:

- C, mixed. U, shut.
- Q, divided. O, shut and nasal.
- E, mixed divided.

Mixed curves denote that two parts of the mouth are simultaneously employed in forming the sound; as:

- C, back of tongue and lips. U, top and point of tongue.
- Q, lips and back of tongue. U, point and top of tongue.

Divided curves show that the breath, instead of passing through a central channel, issues through side channels. Mixed divided curves show that, along with divided breath, two parts of the mouth are employed. Shut curves denote that the mouth-passage is closed by means of the organ symbolized. Shut and nasal curves show that, while the mouth-passage is closed, the breath escapes through the nose; as:

- E, *ng*; U, *n*; O, *m*.

Voice is symbolized by a straight line. This, added within any curve, denotes the addition of vocality to the consonant action. The relation of *b* to *p* (B O), *d* to *t* (D U), *g* to *k* (E U), *v* to *f* (B B), *z* to *s* (U U) is in this way clearly indicated.

A straight line is the basis of all the vowel symbols (see diagram). A distinctive sign added on the left of the line denotes the back of the tongue; on the right of the line, the front of the tongue; and on both sides of the line, the middle of the tongue. Thus: I I I. When the distinctive sign is at the top of the line it shows that the tongue is high, or near the palate; when at the bottom of the line, that the tongue is low, or farthest from the palate; and when at both ends of the line, that the tongue is in an intermediate position. Thus:

	Back.	Mixed.	Front.	
High	I	I	I	(as in <i>eel</i>).
Mid	J	I	I	(as in <i>ale</i>).
Low	J	I	I	(as in <i>ell</i>).

The vowels range themselves in pairs, the second of each pair being indefinite in quality as compared with the first: as in *eel*, *ill*; *pool*, *put*; *all*, *on*. The secondary vowels in these pairs are said to be of "wide" formation, because the cavity of the mouth behind the vowel aperture is expanded, so as to weaken the organic quality of the vowel. The "wide" vowels are uniformly distinguished by an open hook, instead of a solid point on the vowel-stem. Thus:

- I (i), I (ii), J (ah).

Certain vowels are modified by the lips. These labialized vowels are uniformly denoted by a short line crossing the vowel-stem; as in I (oo), f (ü). The lips form three apertures, as in *ooze*, *old*, *all*; the first, or narrowest, is associated with "high" vowels; and the last, or broadest, with "low" vowels. Thus the vowel *oo* has the "high-back" position of the tongue, with narrow labial aperture; and the vowel *aw* (F) has "low-back" position of the tongue, with broad labial aperture. The vowel *õ* (J) is intermediate between *oo* and *aw*.

In this outline the aim has been to give the reader a general idea of the nature and capabilities of visible speech. The application of the system to the teaching of speech to deaf-mutes must be obvious to every one, even if experience had not demonstrated the fact. But the method is equally applicable to the teaching of foreign sounds to English and American learners, or to the teaching of English sounds to

foreigners. The English language is advancing rapidly to universality, and the only impediment to its progress is found in the mode of writing it. If visible speech is used as a key to English sounds all initiatory difficulty will be removed.

In the meantime the symbols may very advantageously be used for the transcription of foreign words and proper names which so greatly perplex the reader in books of travel, etc. For this purpose a font of these physiological types would have to be added to the equipments of newspaper and book printing-offices.

Visible speech as a key to universal phonetics fulfills a function which has never before been possible. Objections have been urged against the employment of the system for the ordinary writing of languages, on the ground that the mechanism of familiar sounds, as embodied in the symbols, is not required to be constantly shown. This is true. After the local pronunciation of letters has been communicated by the visible-speech key, any established system of letters may be freely continued. For the representation of unwritten tongues, however, and for such languages as Chinese, Japanese, etc., the advantages of visible speech should only require to be known to be adopted.

The following works may be consulted for further details: *Sounds and their Relations*, a revision of the basis of visible speech; *Lectures on Phonetics*, delivered at Johns Hopkins University, Baltimore, and in Oxford University, England; *English Visible Speech in Twelve Lessons*, etc.

Visigoths: See GOTHs.

Vision [viâ O. Fr. from Lat. *visio*, *visio'nis*, a seeing, deriv. of *vide're*, *vi sum*, see; cf. WITNESS]; perception by the sense of sight. The organ of vision is the eye. The immediate cause of the perception in normal vision is found in the action of waves of light upon the terminal expansion of the optic nerve. The sensation conveyed to the brain by this nerve is highly specialized, different from the deliverance of any other nerve, and has thus far been found incapable of analysis. The existence of such sensation has to be accepted as an ultimate and inexplicable fact in nature.

Construction of the Organ of Vision.—The eye is a product of organic development, and, like all such products, it is by no means an ideally perfect instrument, even when quite free from such defects as are ordinarily recognizable. Optically it is a camera obscura with a very imperfect lens and a receiving-plate that is far from being uniformly sensitized, but with such ready mobility and capacity for quick adjustment that no artificial camera can be compared with it in general availability for practical use. In shape it is nearly spherical, resting on a fatty cushion within its bony socket. The outer covering of the eyeball is a tough, fibrous white tunica, known as the sclerotic coat. Upon its exterior are attached six muscles, which oppose each other by pairs. By means of these, motion can be given it about a vertical axis, a horizontal axis, and a slightly oblique axis. The front portion of the sclerotic forms the visible white of the eye. About the center of this is a portion slightly more protuberant than the rest, and quite transparent; it is known as the cornea.

Within the sclerotic is a second coat, the choroid, which is dark in tint and nearly covered with a network of blood-vessels and nerve filaments. Its continuation in front be-

FIG. 1.—Vertical section of the eye.

neath the cornea is a colored curtain, the iris, perforated with a central opening, the pupil. This curtain is provided

with two sets of muscular fiber; one of these is ring-like and the other radial. By variation in the tension of these fibers the size of the pupillary opening is varied, and the quantity of light thus admitted to the eye is to a limited extent under control.

The space within the globular chamber is filled with transparent matter, which with the cornea makes up the converging optical system that serves the purpose of a lens. This matter is varied both in consistency and in density. Most of it is jelly-like, and receives the name of vitreous humor. The portion just behind the cornea is thin and mobile like water, and is hence called aqueous humor. Between the aqueous and vitreous humors is the crystalline lens. This is held in a light transparent capsule, and surrounded at the edges with the fibrous tissue of the ciliary muscle. It is made up of transparent layers which increase in density from surface to center. It is moreover elastic, so that its form is capable of modification by varying the contraction of the ciliary muscle. For further anatomical details, see EYE.

Optical Character of the Eye.—To bring rays of light to a focus it is necessary that the converging system shall be denser than the medium through which waves are propagated from the radiant source, and that one or both of two opposite surfaces shall be appropriately convex. The measure of density, optically considered, is the index of refraction. (See REFRACTION.) Assuming that of the air as unity, the refractive index of the aqueous humor has been found by Listing to be 1.338; of the vitreous humor, the same, and the mean index of the crystalline 1.455; these measurements being of course for the brightest part of a luminous spectrum, corresponding to the line of sodium light. (See SPECTRUM.) The optical density of the aqueous and vitreous humors is thus a trifle greater than that of water, while the density of the crystalline is less than that of ordinary crown glass. Assuming the thickness of the cornea to be uniform, so that it produces no effective deviation of light, but only determines the limiting surface of the aqueous humor within, the effect is sensibly the same as if the light should fall on a converging surface of water, then upon the denser crystalline immersed in this, and be brought to a focus in the water. The deviating effect depends jointly upon the density of the medium and the curvature of the refracting surfaces. The radius of curvature of the cornea, and therefore of the liquid surface which it bounds, is somewhat variable; a mean value is about 8 mm. The convexity of the rear surface of the crystalline is more abrupt than that of its front surface, its radius of curvature being 6 mm., while that of the latter is 10 mm. The interval between the front surfaces of cornea and crystalline is 4 mm., and the thickness of the crystalline about the same. Taking all these elements into consideration, the final effect is the same as if the light were focalized by a single lens whose optical center is a trifle in front of the rear surface of the crystalline, and whose focal length is 16 mm. (about $\frac{2}{3}$ ths of an inch). The crossing-point of rays within the crystalline is called the nodal point.

If then a beam of homogeneous yellow light coming from a distant point should fall upon an eye of average dimensions, like that just described, and if there be no irregularities of structure in this, the back of the eye should be $\frac{2}{3}$ ths of an inch behind the nodal point in order to receive a sharp image. If the distance be too small, the converging rays will be caught upon a definite area without being brought to a focus; if too great, they will cross and be diffused over a definite area on the surface beyond. Such areas are approximately circular, and are called diffusion circles. If the light radiates, not from a single point, but from a collection of these forming a surface, the image will also be a surface, which will be sharply or badly defined in proportion to the absence or presence of diffusion circles. From the elementary principles of refraction it is obvious that the image must be inverted, and that its linear dimensions must be as much less than those of the object as its distance from the nodal point is less than that of the object. That this is the case was proved theoretically by Kepler in 1604, and practically by the Jesuit Scheiner in 1625. The latter removed the sclerotic from the back of the eye of a recently killed animal, and through the thin residual membrane the inverted image was found to be visible. The same experiment was then successfully performed upon the human eye.

Accommodation of the Eye to Varying Distance.—From the elementary theory of lenses (see LENS), it follows that if a screen be properly placed to receive a sharp image of a

distant luminous point, then if this point be brought near to the lens the screen must be moved farther back to maintain distinct focalization. A child with good normal vision secures a distinct image of an object only 3 or 4 inches in front of the face with apparently as much ease as when the object is remote. Sixty years afterward the same person finds it impossible to obtain distinct vision of an object a yard away without the aid of spectacles, although the distance from nodal point to retinal expansion of the optic nerve has changed but little, if at all. The eye therefore has some power of accommodation to varying distance, but this power diminishes with increasing age.

In the photographer's camera the distance between lens and sensitized plate may be varied at will. In the camera of the eye this is not possible. The passive condition of a normal eye is that of accommodation to an infinite distance, so that parallel rays are focalized as accurately as possible on the retina. If the object be at some finite distance, then theoretically the interval between nodal point and retina must be increased by a calculable amount. But practically the necessary rate of recession may be disregarded for distances in excess of 20 feet. For example, if we assume the focal length of the eye to be five-eighths of an inch and a luminous point to be brought up from infinity to a distance of 20 feet, then an application of the formula for lenses shows that the retinal screen would need to be moved back less than $\frac{1}{300}$ th of an inch. If brought up from 20 feet to 1 inch, distinct focalization would require a backward movement of the screen through a little more than an inch. Since, however, no such motion is possible for the retinal screen, the practical effect is the production of diffusion circles, small enough to be disregarded in the first case, and in the second case so large as to make distinct vision impossible even for an infant. With change of distance, therefore, accommodation is possible only by corresponding change in the converging power of the ocular lens system.

Prior to the middle of the nineteenth century absolutely nothing was known regarding the mechanism of visual accommodation, but the subject had stimulated speculation to the utmost. Many denied completely the necessity for it and the existence of any variation in the refraction of the eye. Some maintained that the contraction of the pupil would suffice to produce approximate accommodation; others that it was due to variation in curvature of the cornea, to displacement of the crystalline, to change of form of the crystalline or of the eyeball. For the solution of the problem credit is due a number of investigators, but especially Laugenbeek, Cramer, Helmholtz, Donders, and Knapp. Helmholtz in 1851 invented the ophthalmoscope, by which the interior of the living eye could be examined (see OPHTHALMOSCOPE), and shortly afterward the ophthalmometer, by which measurements are made upon the living cornea and the two surfaces of the crystalline without touching these bodies. As far back as 1837 the observation was made by Sanson, a French surgeon, that under appropriate conditions, if a light be held near the eye faint reflected images of it are formed by the front and rear surfaces of the crystalline, which thus serve as mirrors. Cramer and Helmholtz independently applied this method in the study of accommodation. They established the fact that, when the eye is changed from a passive condition to that of accommodation to secure distinct vision of a near object, the surface of the cornea remains unchanged, but the convexity of the front of the crystalline is increased, while that of its rear is but slightly affected. Helmholtz's explanation is that the lens is kept continually in a state of tension by its attachment to the encircling ciliary body. When the ciliary muscle contracts, the lens in virtue of its own elasticity becomes more convex than when the eye is passive. Its converging power is thus increased, and the adaptation for near objects is hence effected. During childhood the crystalline is comparatively soft, and it responds readily to variations of tension. With the lapse of time it gradually hardens so that during old age no effort of the ciliary muscle is sufficient to modify its form. The power of accommodation is then wholly lost, and increase of converging power is attained only by the use of convex spectacle glasses to aid the crystalline. The distance at which distinct vision is most comfortable for the normal eye is ordinarily assumed to be 10 inches. The selection of this distance is quite arbitrary. For a child of ten years the distance of the "near point" of distinct vision is about 3 inches; for a man of forty-five years, 12 inches; for one of eighty years, infinity. These estimates are applicable only to the normal eye.

The Retina.—This is the membranous expansion of the optic nerve spread over the inner surface of the choroid coat. The nerve itself extends from the base of the brain, and as a bundle of fibers inclosed in a protecting sheath it enters the eyeballs on the inner or nasal side of the middle of the sclerotic at the rear. From the end of this cable the fibers are spread out. Their terminals are connected, some with ganglionic cells and others with the minute rods and cones that compose the so-called bacillary layer. The length of one of these rods is about 0.07 mm., its thickness 0.0015 mm.; the cones are shorter, thicker, and flask-shaped. (An inch is barely more than 25 mm.) The rods and cones are packed together over nearly the entire surface of the retina, with their ends pointing toward the crystalline. This bacillary layer has been proved to be the part of the retina sensitive to light, while the fibers serve to convey the sensation to the brain.

On the outer or temporal side of the entrance of the optic nerve, about 3 mm. distant, is a small area which, on account of its color, is ordinarily named the yellow spot. At its center is a minute depression, less than 1 mm. wide, called the *fovea centralis*. Within this pit the rods are absent, but the cones are crowded together and reduced in diameter, and no blood-vessel enters. This pit is remarkable on several accounts; through it passes the optical axis of the lens system, and therefore upon it is focalized the image of any single bright point to which the attention is directed. Here it is that the most exact discrimination of distances is made, and here the sensitiveness to color is a maximum, while the sensitiveness to light is less than in the surrounding neighborhood.* The sensitiveness to light reaches its maximum on the temporal side of the fovea about 8° or 10° away; and here it is many times as great as within the fovea. It then diminishes with increasing distance, vanishing near the equator of the eye. The limit of the ocular field of view is therefore vague. While the visual line passes from fovea through nodal point to some external "point of fixation," the attention may at the same time be given to other points in the neighborhood of the latter; but the perception of impressions produced by such indirect vision is wanting in definiteness. This is easily tested. Let a disk of red cardboard, a few inches in diameter, be held at arm's length and aligned with some object in front which may serve as a distant point of fixation. On moving the disk horizontally outward the perception of its color quickly becomes less vivid and of its outline vague. Its tint changes through brown to black, and it becomes invisible when the arm is pointed about 90° away from the constant visual line.

In marked contrast with the yellow spot is the end of the nerve cable where the optic nerve enters the eye. Since this is wholly fibrous and devoid of rods and cones, it is incapable of receiving luminous impressions. The blindness of this fibrous bundle is easily tested. Let the right eye be directed to the cross in the accompanying cut, while the left

FIG. 2.—Detection of the blind spot.

is closed, the line connecting the two pupils being parallel to the lines of print. Keeping the point of fixation constant, the white circle at the right is seen by indirect vision, but it disappears when the interval between eye and page is 7 or 8 inches. The angular diameter of this insensitive area on the spherical surface within the eye is nearly 8°, which corresponds to a linear diameter a little in excess of 2 mm.

Optical Faults of the Normal Eye.—The eye is very faulty if judged by the standards applied in the construction of optical instruments. Considering it as a camera, the receiving-plate of this should be uniformly sensitized, and its lens system should be free from errors of refraction. The retinal receiving-plate, with its large "blind spot," its cones sensitive to variations of color chiefly, its rods sensitive to variations in intensity of light, but this sensitiveness diminishing outward from the yellow spot and vanishing in marginal regions, comes far short of fulfilling the requis-

itions of optical science. The retinal blood-vessels, moreover, cover many of the rods and cones, and under appropriate conditions the shadows caused by them may be projected outward and made perceptible. Similarly, shadows may be outwardly projected due to fibers, streaks, and clots in the vitreous humor. If the head be thrown back and the gaze be directed upward toward a bright sky, these obstructions often float into the field of view, and flit from side to side with the motion of the eye.

In addition to these minor defects the material composing the cornea and crystalline lens is not uniformly clear, and their surfaces are not regular. When a strong light is used to examine these bodies they are found to be fluorescent (see FLUORESCENCE), especially if blue or violet light be employed. Fibers and spots in the crystalline obstruct the light transmitted and partially scatter it. This lens is an aggregation of layers, whose fibers are arranged around six or more axes that render uniformity of structure impossible. A beam from a luminous point therefore is not accurately focalized to a point, but to a line, or group of intersecting lines, or an irregular small area. The stars on this account, though practically infinitely distant, appear not as points of light, but more or less radiated in form. The surface of a lens thus built up can only imperfectly approximate toward that of a mathematically regular curve. Measurements made on the surface of the cornea by means of the ophthalmometer have shown that irregularities here are even more conspicuous than on the crystalline, and that the axes of cornea and crystalline rarely ever quite coincide. These imperfections of structure necessitate a perceptible degree of astigmatism in nearly all eyes. (See ASTIGMATISM). Light coming from a point nearer than that of distinct vision is hence projected on the retina, not as a diffusion circle, but as a surface with irregular outline, often roughly elliptic.

Artificial lenses are usually made of glass clearer and more nearly homogeneous than the media of the eye, and with surfaces whose curvature is spherical. With such a single lens it is impossible to bring a sheaf of parallel rays accurately to a single focus, for both spherical and chromatic aberration need to be corrected. (See ABERRATION.) By combining two or more lenses made of properly selected but different kinds of glass, both of these defects may be almost wholly corrected. The refracting media of the eye are provided with no arrangement for the correction of either spherical or chromatic aberration, and on this account, aside from all other defects, distinct vision is impossible.

These defects belong to all human eyes. The existence of several of them may be demonstrated by an easy experiment. A tube is provided, an inch or two in width, and 3 or 4 inches long, open at one end and closed at the other. Through the middle of the closed end a perfectly circular small perforation is made with a needle, and a bright white surface is looked at through this opening, extraneous light being excluded by having the open end of the tube next to the eye. The light from the perforation is collected upon the retina as an approximate diffusion circle; but its boundary is irregular, its area is mottled and its border is fringed with orange and red light. In most cases the general outline is roughly elliptic rather than circular. That the eye is not achromatic is further ascertained by regarding a window of stained glass transmitting various tints. The blue and violet parts will appear more remote than the red parts. The indices of refraction for the extremes of the spectrum being different, the accommodation of the eye has to be varied, and this produces the illusion of variation of distance.

The defects of the normal eye are usually not noticed, because test conditions are not involved in ordinary natural vision. What the eye ordinarily sees is that small part of the field of view upon which the attention is fixed. The defects pass unnoticed if attention is not specially drawn to them. Standards of comparison are needed in order to become aware of defects of any kind. Those of the eye are largely offset by its extraordinary capacity for rapid motion in its orbit. When any object is regarded we habitually direct the visual line to various parts of it in succession, and thus secure the best image of each that is possible under the circumstances. Every portion of it is thus quickly focalized on the most sensitive part of the retina. Variations of accommodation, moreover, are accomplished by the eye many times more quickly than is possible with any other optical instrument. The angular diameter of the

* Eugen Fick, *Studien über Licht- und Farbenempfindung in Pfügers Archiv*, vol. xliii., p. 441 (1888).

field of view, about 160° horizontally, and 120° vertically for each eye, is far in excess of that of any other instrument. While there is no approximation to theoretical perfection, its practical excellences are such that in comparison with them the defects of the normal eye are unimportant.

Sharpness of Vision.—Assuming an object at a standard distance and under standard illumination, the more this object can be reduced in size without loss of distinct vision, the keener is the sight of the observer. The standard of distance conventionally adopted is 20 feet. No more definite standard of illumination than ordinary diffuse daylight is generally employed: indeed the attainment of an available and practically invariable standard of illumination is exceedingly difficult. The absence of such standard explains the very diverse conclusions reached by competent authorities regarding the dimensions of the *minimum visible*; for the apparent size of a small object, seen by the same eye under changing illumination, varies between very considerable limits. This process is called irradiation, and examples of it are abundant. If a post is aligned between the eye and the globe of an electric street-lamp, it appears much thinner where the bright light of the globe is seen on each side of it. If two small circles of the same size, one white on a black ground, the other black on a white ground, be brightly illuminated and viewed close together from a distance, the white circle will always appear the larger of the two. This follows naturally from what has been said about the fluorescence of the crystalline, the irregularities and numerous faint obstructions to light in it, and the general optical defects of the lens system. Each ray is more or less scattered before it reaches the retina, so that the bright focus is surrounded by a halo which is scarcely perceptible if the light be faint, but noticeable if it be intense. It is commonly assumed that for a normal eye one minute of arc measured on the *fovea centralis* corresponds to the smallest interval that can be distinguished between two bright points. Assuming the nodal point to be 15.7 mm. distant in front of the fovea, this angular interval corresponds to 0.0045 mm. Two points separated by the same angular interval a mile away in front of the eye would be rather more than 100,000 times as far apart, or about half a yard. If nearer together than this, they would appear as a single point. By applying this datum with the assumption that at least two rods or cones must be impressed at the same time in order to distinguish any interval, the limiting diameter of the rods and cones has been estimated. But such estimates are exceedingly uncertain, because so much depends upon intensity of illumination. For short distances and moderate illuminations, the assumption may be sufficiently near the truth for a working hypothesis, but it fails when applied to distant self-luminous points on a dark background. Very rarely can a person be found who is able with the unaided eye to distinguish the third and fourth moons of Jupiter. The nearer of these is five minutes distant from the planet, and the other about twice as far.

The assumption that one minute of arc is the measure of the *minimum visible* has been applied by Snellen in the construction of letters and numerals, which are now universally employed as tests in measuring sharpness of vision. For examination the subject is placed 20 feet away in front of various sizes of test type well illuminated by diffuse daylight. The size of the smallest type that he can read correctly affords the means of expressing his sharpness of vision in comparison with that of the normal eye.

Remediable Defects of Vision.—Upon the tombstone of an Italian, Salvino Armati, who died in Venice in 1317, is an inscription in which he is designated as the inventor of eye-glasses. Not until 1604 was the correct theory of these given by Kepler, yet it is probably safe to say that during the last three or four centuries they have been generally used to supplement defective accommodation for the eyes of the aged. But only since the new era introduced by Cramer, Helmholtz, and Donders has it been possible to determine with accuracy the defects of abnormal eyes, and the steps to be taken for the correction of errors of refraction. The noteworthy increase in the use of eye-glasses during the present generation is not an indication that the conditions of modern life are specially damaging to eyesight, but only that defects of vision are now detected and corrected which were formerly unsuspected or deemed incapable of explanation or correction. After defective vision has been detected by the use of test type, it remains to determine the nature of the defects. The oculist tries upon the subject a variety of glasses, convex, concave, and cylin-

drical, of successively diminishing radii of curvature, to ascertain which of these, or what combination of them, effects the greatest improvement in vision. He is enabled thus to prepare a formula for each eye, in accordance with which an eyeglass may be specially ground to correct its defects.

The chief defects of vision are (1) near-sightedness or myopia, which may be remedied by the use of concave glasses of proper focal length. (2) Oversightedness or hyperopia, which may be remedied by the use of convex glasses of proper focal length. (3) Astigmatism, which is due chiefly to unequal curvature of the cornea in different planes, and may be regarded merely as hyperopia or myopia in a special plane. The remedy is to wear a convex cylindrical glass, whose radius of curvature is so adjusted as to collect the rays sufficiently in a vertical plane without affecting those in a horizontal plane. (4) Old-sightedness or presbyopia, which is due to the hardening and unequal shrinking of the crystalline which is developed during old age. The distance of the near point of distinct vision becomes inconveniently great, so that convex glasses are needed for vision of near objects, as in ordinary reading. This necessity is largely removed in the case of those who are naturally near-sighted; but for such persons concave glasses are still needed for vision of distant objects. For further details, see OPHTHALMOLOGY, SPECTACLES, and VISION, DEFECTS OF.

Visual Sensation.—Only a small part of the waves emitted by a source of radiant energy are capable of producing the sensation of light. The retina is insensible to many of those which affect the photographic plate, and equally so to those which produce heat. By placing an iodine cell in front of an electric lantern Tyndall* cut off the rays of light and converged those of heat to a focus. His eye was then put at this focus, with such precautions as to protect the external parts but transmit the concentrated beam of dark heat through the pupil to the retina. No damage was done, and no consciousness of heat was received through the optic nerve. Removing the eye, he substituted a sheet of platinum, which soon became red hot. Energy-waves longer than 0.00076 mm. or shorter than 0.00039 mm. thus fail to affect the retina. But within these limits, if sufficiently intense, radiant energy may be destructive. Plateau lost his eyesight through the inflammation produced by looking directly at the sun.

The sensation of light may be produced by other agencies besides radiant energy. An electrical current, even when very weak, produces the subjective sensation of a flash of light when passed through the eye. A blow upon the eye causes the recipient to "see stars." Poison in the system, such as may be due to excessive use of alcohol or opium, or mere fever, may induce the sensation of spectral images that are as real to the sufferer as if occasioned by external agency. Pressure upon the eyeball produces "phosphenes," visions of successively changing color that may last for several minutes. If the gaze be fixed for half a minute upon any object that is sharply defined and well lighted, then on changing the direction of the visual line a complementary "after-image" comes into view and may continue visible through some seconds, even in absolute darkness. Whatever is capable of exciting the optic nerve can produce the impression of light; and radiant energy of special wavelength is only one of many such agencies. But the optic nerve is the only one which this special mode of energy seems capable of exciting.

Upon the rods and more especially the cones of the retina of a normal eye the quality of sensation varies with the wave-length. The longest light-waves produce the sensation recognized as red, and from this the passage through orange, yellow, green, blue, and violet brings us to a limit of invisibility. (For details on this topic, see COLOR and COLOR-BLINDNESS.) The passage from one tint to another is quite imperceptible, but it is easy to specify three or four as specially prominent, and these have been called primary colors. Regarded from the standpoint of the artist, light was thought by Brewster † to be resolvable into three primary colors, red, yellow, and blue. From pigments of these three tints all other necessary tints may be produced by mixture, though deficient in brightness; but the mixture of red, yellow, and blue lights can not produce white. Young ‡ had previously selected red, green, and violet; for by mixture of these lights white can be produced. He supposed that in the retina are three kinds of nerve-

* Rede lecture on Radiation (Cambridge, 1865).

† A Treatise on Optics (Edinburgh, 1831).

‡ Lectures on Natural Philosophy (London, 1807).

fibers. The first of these are excited most by light-waves of greatest length, red, and in less degree by those of shorter period. The second are in like manner most sensitive to waves of green light and less to those of red and violet. The third are most sensitive to the shorter waves of violet light, and less to those of green and red. When all are simultaneously excited the resultant sensation is that of white. If one of these sets of nerves be wanting or deficient in sensitiveness the result is partial color-blindness. This theory, long forgotten, was revived by Helmholtz,* and with slight modification is now quite generally accepted by physicists. Among physiologists some adhesion seems to be given to a theory more recently advanced by Hering,† who regards white and black as primary color-sensations, to which he adds two complementary pairs, red and green, yellow and blue. To secure satisfactory objective proof of this, or indeed of any other theory of color-sensation, is difficult. The subject is fruitful of speculation rather than demonstration.

Visual Perception.—From the time that Kepler demonstrated the inversion of the retinal image of external objects, it became a troublesome source of debate to explain why we do not see all objects inverted. Accepting the fact, Brewster‡ formulated what he called the law of visible direction, claiming that "the line of visible direction does not depend upon the direction of the ray, but is always perpendicular to the retina." The mathematical relation implied in this statement was disproved by Ferrel,|| but it is in accord with all human experience to refer the source of an impression to the direction from which it comes. The line of visible direction is determined by the direction of the ray entering the eye. We are wholly unconscious of the inverted retinal image. The perception is mental; the thing perceived is the object; and the retinal image, reversed both vertically and laterally, is an intermediate step in a process that in no way rises into consciousness. Whether personal experience has any influence in determining the perception, or whether it is the outcome of intuition, is a question on which there has been much hot debate, and which, if satisfactorily answered at all, can be determined only by cumulative evidence. The object perceived occupies an external position in space, and the perception is one of locality as well as form. The theory of intuition assumes that the conception of locality is innate, and that impressions from external points are automatically transmitted to corresponding points on the retina. The empirical theory assumes that our sensations give us only signs of external objects, and that we learn to interpret these signs only by experience and practice.

Binocular Vision.—The contrast between the two theories of visual perception is yet more brought out by the special characteristics of single vision with two eyes. So long as we are dealing with but two dimensions in space, and considering surfaces like the retina which have length and breadth but no appreciable depth, there is perhaps little ground for choice between the two theories. We may admit a fundamental correspondence between certain retinal points and external points, or that the point of intersection of the visual line with the retina may be regarded as corresponding with every point along the direction of that line. But in looking with two eyes at the same object two retinal images of it are formed; yet ordinarily we do not see double. To explain this it is assumed on the intuitional theory that every point on the one retina has its corresponding point on the other, these corresponding points being so related that when simultaneously impressed they transmit but a single impression to the brain. In support of this view the fact is cited that the optic nerves of the two eyes cross before reaching the brain; and there is good reason for the belief that nerve-fibers from the right half of each retina extend together to the right hemisphere of the brain, and from the left halves to the left hemisphere. But there is no anatomical proof that fibers from corresponding retinal points are brought thus together by pairs.

According to the empirical theory there is no necessary and invariable correspondence between retinal points, but the subjective "sign," whether simple or complex, is recognized by experience as the index of that which has produced it. This implies no analysis of phenomena, no consciousness of retinal images, whether erect or inverted, whether in one

eye or both eyes. The visual education by which this interpretation of signs is acquired begins from the hour of birth. A new-born infant gives no evidence of knowing how to direct its eyes or interpret what it sees, but the sense of touch is conjoined with that of sight in the unconscious education of the eye; and this education is acquired with exceeding rapidity. The co-ordination of impressions, the correction of illusions by conjoint application of different senses, goes on throughout life; but the capacity to acquire and to modify habit is incomparably greatest in infancy, and learning how to see is probably one of the earliest of all acquisitions.

The intuitional and empirical theories are not quite mutually exclusive. Man is a product of development. There is no sharp division-line between automatic and volitional actions, between instinct and reason, between the outcome of inheritance and that of habit. Whatever may be the inherited tendency to special modes of action, we may be quite sure that there is acquired very early in infancy the habit of associating mentally together the impressions produced by a single external object upon parts of the two retinas which, according to the intuitional theory, are called corresponding points, with the reservation that this does not imply any necessary anatomical relation, and that they will not necessarily convey the same impression to the brain when binocular vision is had under abnormal conditions, but that they very generally do so under normal conditions.

It is particularly in the perception of the third dimension in space, that of solidity or depth, that binocular is superior to monocular vision. With a single eye it is quite possible to obtain definite perception of distance or depth in space. Advantage is taken of all those elements that are combined in representing perspective in a landscape painting. The relative position of the different objects in the field of view may be estimated in terms of some arbitrary standard if they are not aligned exactly with the eye. The most important of these elements may be enumerated as follows:

1. Near objects subtend larger visual angles than remote objects of the same size. The visual angle gives thus the means of estimating the distance of objects of known size.
2. Near objects are seen more distinctly than those which are remote. The illusion of distance may hence be produced by decreasing the brightness of the object viewed and rendering its outlines hazy.
3. Near objects that are almost aligned with those at a distance, partly cover them. Covering objects are judged nearer than those covered.
4. Familiarity with the dimensions of known objects when near enables us to compare them when remote, and thus judge their relative distance.
5. We may move from one standpoint to another and compare the new view with what is retained in memory of the previous one. The difference of direction thus attained is called parallax of motion. It contributes in a very important degree to the judgment of both distance and form.

All of these elements except the last may be applied in a picture, and are equally effective in monocular and binocular vision, especially when considerable distances are represented. Their sum may for convenience be called physical perspective. For distances in excess of a few hundred feet it makes little difference whether vision is monocular or binocular if the illumination is good. But if an object is quite near—for example, a few feet or inches away—a new element of exceeding importance is introduced when the vision is binocular. Each eye occupies a standpoint sensibly different from that of the other, and therefore the retinal pictures are different, but cover very nearly the same retinal areas. On the whole, the impression carried to the brain is that of a single object, but the right eye sees more of its right side, the left eye more of its left side, and both eyes equally see the side directly turned toward the observer's face, but at different angles. The view is much more comprehensive than is possible for a single eye, and the knowledge of the body's total form, especially of the relation between nearer and remoter parts of its surface, is much more thorough. But in this experiment there is no consciousness of the simultaneous use of two eyes. Subjectively the two are united into a single binocular eye, in which are combined the diverse impressions of two dissimilar retinal pictures. The distance of the object is so small that the elements of physical perspective are almost wholly excluded. The superior knowledge of form in tri-dimensional space,

* *Handbuch der Physiologischen Optik* (Heidelberg, 1866).

† *Zur Lehre vom Licht-Sinne* (Vienna, 1878).

‡ *A Treatise on Optics* (1831), chap. xxxv.

|| *On Vision*, *Nashville Journal of Medicine and Surgery* (1855).

given under these circumstances, may be called binocular perspective. Most of our judgments of distance and form are due to the application of both physical and binocular perspective together.

It is easy to demonstrate that, when the two eyes are directed to a point on the nearer side of an object binocularly viewed so that its images fall on corresponding retinal points, the images of a point farther away can not fall on corresponding retinal points, and hence double vision must ensue. Let two pencils be held vertically in front of the face, one behind the other, with an interval of a few inches between them and a bright surface, such as a white wall, for a background. When the gaze is fixed upon the nearer pencil the farther one is by indirect vision seen double, so that the illusion is that of three pencils. Or, if the gaze is on the farther pencil, then the nearer one is seen double. The essential condition under which the binocular perception of depth in space is attained is that, while perfect fusion of retinal images is secured from points in one part of the tridimensional field of view, there shall be imperfect fusion of such images from points either more remote or less remote. This is most conveniently studied by use of the stereoscope (see STEREOSCOPE), for unless the eyes have received some training it is not usually easy to fix the attention upon such double images. The effect of this imperfect fusion is the perception of depth, but the existence of such duplication of images is usually not suspected. The observer is as unconscious of them as he is of the inversion of the retinal image. In studying them by means of the stereoscope the stereograph should consist of a pair of properly constructed outline drawings, from which the elements of physical perspective have been carefully excluded. It will then be found that, while duplication is perceived, the effect is to mar the binocular perspective unless the eyes are directed in rapid succession to different parts of the field of view. Fusion of images representing foreground and background is thus secured with quick alternation, and the gradation from perfect to imperfect fusion at any moment is imperceptible. Nevertheless, motion of the eyes is by no means indispensable, for the perception of binocular perspective has been repeatedly attained with only momentary illumination by the electric spark, lasting less than a thousandth of a second.

That the impressions on corresponding points of the two retinas are not necessarily always fused by the brain into a single sensation is shown by the phenomena of stereoscopic luster, discovered by Dove,* and of binocular combination of colored fields in the stereoscope. Let binocular combination of the two halves of the accompanying cut be attained by directing the right eye to the middle of the larger circle on the right, and the left eye to that on the left. This is easily done by looking through a pair of tubes. The right eye is impressed for the most part with a black field, the left eye with one that is white. The result is a lustrous appearance like that of graphite, rather than the uniform dull gray

FIG. 3. — Binocular production of luster.

that would be the effect of mixture. One eye receives regularly reflected light and the other does not. The surface hence appears much brighter to one eye than the other, and the resulting appearance is that of lustrous polish imposed upon what alone would be dull. If the one field is bright red and the other greenish blue, the resultant impression carried to the brain is not gray, such as would be attained by mixture of lights, but retinal conflict of impressions. The field of view appears first of one color, then of the other, and while this alternation is going on each tint grows dull on account of retinal fatigue. Corresponding retinal points

are simultaneously impressed without complete unification of the two sensations. In like manner stereoscopic relief may be produced without the production of double images that can possibly be traced as such. While performing the experiment for the development of luster there is binocular combination of the circles, of which there are two small ones on the right and one of the same size on the left. The latter is binocularly combined simultaneously with both of the former, so that the resultant impression is that of two circles in space, one nearer and the other farther than the plane of the paper. If such fusion were due to the unconscious perception of double images, we should admit that the same circle belongs to two opposite kinds of double image at the same moment. The effect is instantaneous, being attainable by use of the electric spark.

In conclusion, it may be said that the binocular union of dissimilar retinal images to produce a single sensation is a purely mental act, independent of anatomic structure. Corresponding retinal points are those which are usually impressed simultaneously, and which usually, but not invariably, carry to the brain sensations which are mentally united.

BIBLIOGRAPHY.—The most important treatise on vision is Helmholtz's *Handbuch der Physiologischen Optik* (1866; rev. ed. 1894). It contains nearly all that is at present known on the subject, apart from its applications to medical and surgical science.

A mere list of those who have written on vision would cover several pages. A few of the more prominent in Europe have been: Maurolycus, 1575; Baptista Porta, 1583; Kepler, 1604-09; Aguilonius, 1613; Scheiner, 1619; de la Hire, 1709; Berkeley, 1709; R. Smith, 1738; Porterfield, 1759; Thomas Young, 1801-09; Purkinje, 1819-25; Johann Muller, 1826-37; Volkmann, 1836-66; Brücke, 1841-66; Listing, 1845-51; Donders, 1847-66; Wheatstone, 1838-52; Brewster, 1849-56; Cramer, 1853-55; Knapp, 1860; Fechner, 1838-64; Meissner, 1854-56; Du Bois-Reymond, 1848; Dove, 1846-70; Wundt, 1859-80; Claudet, 1856-58; Hering, 1859-90; Girard Teulon, 1861; A. von Graefe, 1856-65; E. Javal, 1865-94; and A. König, 1885-95.

Among American writers, aside from those who have treated of ophthalmic surgery, may be mentioned Joseph Le Conte, whose popular treatise on *Sight* was published in 1881. Many articles have been published, chiefly in the *American Journal of Science*, by W. B. Rogers, E. Emerson, O. N. Rood, J. Le Conte, W. Ferrel, A. M. Mayer, C. F. Himes, W. Le Conte Stevens, E. L. Nichols, C. Ladd Franklin, G. Stanley Hall, and E. S. Ferry. W. LE CONTE STEVENS.

Vision, Defects of: These are due either to (1) errors of refraction; (2) opacities of the refracting media; (3) lesions of the optic nerve, retina, or choroid; (4) continued exclusion of the eye from the visual act; or (5) affections of the visual centers in the brain, which may be acquired or congenital.

(1) When the refraction of the eye is in its normal condition, the eye is said to be *emmetropic*; i. e. the principal focus lies on the retina, the length of the visual axis corresponds exactly with the focal length of the dioptric apparatus when at rest, and the eye is adapted to bring parallel rays to a focus on the retina. When these conditions are not fulfilled the eye is said to be *ametropic*. Ametropia is of three kinds: (a) The refractive power of the eye is too weak, or the axis is too short, so that the principal focus of the eye falls beyond the retina. This condition is called *hypermetropia*, or far-sightedness. (b) The refractive power of the eye is too strong, or the axis of the eye is too long, causing the principal focus to fall in front of the retina. This condition is called *myopia*, or near-sightedness. (c) The refractive condition of the eye is such that a luminous point, e. g. a star, forms an image on the retina, the shape of which image is a line, an oval, or a circle, according to the situation of the retina, but never a point. This condition is termed *astigmatism*. Usually the seat of astigmatism is in the cornea, and is due to the fact that the cornea is more curved in one meridian than in another. The astigmatism may be *regular*, when the meridians of the cornea progress evenly in their refraction from the lowest to the highest, or *irregular*, when the curvature in different parts of the same meridian varies. In regular astigmatism one principal meridian may be emmetropic and the other ametropic (hypermetropic or myopic). This is *simple astigmatism*. Again, both meridians may be ametropic (hypermetropic or myopic), one being more ametropic than the other, but of the same character. This is *com-*

* *Ueber die Ursache des Glanzes und der Irradiation, abgeleitet aus chromatischen Versuchen mit dem Stereoskop*, in Poggeendorff's *Annalen*, lxxiii., 169 (1850).

pound astigmatism. Finally, one principal meridian may be hypermetropic and the other myopic. This is *mixed astigmatism.*

In moderate degrees of ametropia, and with the coats of the eyeball in a healthy condition, the normal standard of vision may always be reached by the prescription of suitable glasses—convex glasses for hypermetropia, concave for myopia, and cylindrical glasses for astigmatism. When there are very high degrees of ametropia, it is not always possible to give the patient full acuity or sharpness of vision even with proper correcting lenses. Very often high degrees of myopia and astigmatism are accompanied with serious changes in the coats of the eyeball which interfere with vision, and make it impossible to reach a full standard of vision with the glasses. It is difficult and often impossible to correct accurately with glasses those defects of vision arising from irregular astigmatism. It is important to correct refractive defects, particularly astigmatism, especially in early life, so that the retina may be properly educated by receiving accurate images of external objects, and to avoid the consequences of eye-strain.

(2) Serious defects of sight may arise from opacities of the cornea, so slight that they can be perceived only by the aid of the ophthalmoscope or of a powerful convex lens. Again, the cornea may be entirely white and opaque, owing to former ulceration, and thus reduce the vision to a bare perception of light. Where the pupil is covered with opaque cornea and another part of the cornea is transparent, vision is often in a great measure restored by making an artificial pupil immediately behind the clear portion of the cornea. Opacities of the crystalline lens and its capsule constitute CATARACT (*q. v.*), a condition which seriously interferes with sight. Occasionally the pupil is covered by the unabsorbed remains of the so-called pupillary membrane, which is a structure of fetal life. The pupil may also be occluded by a deposition of inflammatory material which has resulted from an inflammation of the iris or of the ciliary body. Opacities of the vitreous may be due to hæmorrhage from the retinal or choroidal vessels, and the consequent mingling of blood with the vitreous humor, or to inflammatory or degenerative changes in the humor itself. Sometimes the vitreous contains numerous brilliant crystals of cholesteroline, presenting a brilliant ophthalmoscopic picture, like a shower of sparkling meteors.

(3) Inflammation or atrophy of the optic nerve, or of either of the coats forming the back wall of the eye, separation of the retina from the choroid, tumors of the choroid and retina, hæmorrhages into the substance of the retina, and a great variety of inflammatory and degenerative changes in these structures—all produce grave defects of vision, and can be diagnosed only by means of the ophthalmoscope.

(4) In cases of squint of one eye, either convergent or divergent, the image of the object formed upon the retina of the deviating eye is often involuntarily suppressed or disregarded. Thus the eye is excluded from vision and gradually loses the power of performing its function, as would be the case with any other unused organ. (See SQUINTING.) Sometimes vision can be improved in eyes of this character by restoring the visual axis to parallelism by an operation after correction of the refractive defect. Very often, however, no such improvement occurs. Again, especially in young people, when one eye is very ametropic and the other one nearly normal, the defective vision of the affected eye may sometimes be improved by excluding the good eye from sight, and forcing the imperfect organ to perform visual functions. Curiously enough, defective vision of one eye may often exist for years without knowledge on the part of the patient. The defective vision of a squinting eye often, and perhaps usually, depends upon imperfect development of the visual centers, i. e. the amblyopia causes the squint.

(5) In certain diseases of the brain the centers which preside over vision are affected. The lesion may be of such character as to cause complete blindness of one or both eyes, or it may be so situated that it causes the remarkable condition of half-blindness, or *hemianopsia*. Under these circumstances one-half of each field of vision is obliterated. It may be that corresponding halves of the retina lose their functions, and the equivalent portions of the field of vision are darkened. Thus if the left half of each retina is paralyzed, the right half of each field of vision will be lost. Again, the lesion in the brain may press upon a point which causes loss of function of the left half of one retina and the right half of the other retina. This will make both of the temporal fields of vision dark. A lesion in the brain which

presses on the optic chiasm at the base of the brain would cause this condition. A lesion which pressed upon any portion of the visual tract in the brain back of the optic chiasm, that is the parts which are called the optic tracts, the optic radiations, and the occipital lobes of the brain, would cause the other type of half-blindness. Practically, a condition of this kind is incurable, although in rare instances recovery has come about.

G. E. DE SCHWEINITZ.

Visitation and Search: a war right, the theory of and limitations upon which are explained under *Search* in the article INTERNATIONAL LAW (*q. v.*). Some details of the way in which it is exercised are here added. Although confessedly necessary for the enforcement of a belligerent's war rights upon the sea, search is at best a serious interruption and annoyance to neutral commerce, and should be exercised as mildly and reasonably as possible. Only ships bearing a commission from the state have the right of search. There seems to be no valid distinction between visitation and search, the two being successive steps in a single act having as its sole object the discovery of the character of a ship and its cargo. In the absence of treaty regulation the usual method is to hoist a flag and fire a gun, which is equivalent to an order to the merchantman to heave to, the visiting ship doing the same at some little distance. An officer and boat's crew are then sent to make the examination. The chief points of interest are the nationality of the merchant-ship, her real destination, and the character of her cargo. These facts will all appear from her papers, her register, sea-letter, log-book, charter-party, invoices, and bills of lading. If these are regular and no ground for suspicion appears, she should be allowed to proceed; but if otherwise, an actual examination of the facts in the case may follow. All of this must be submitted to under penalty of capture. Many treaties, however, attempt to lay down exactly how a visit shall be made, at what distance the visiting ship shall lie, and so on. The U. S. has a dozen or so of these, nearly all with the smaller powers. These reciprocally provide that the searching ship shall remain at "a convenient distance" or "out of cannon-shot," or at the greatest distance compatible with the state of wind and weather; that only two or three men shall accompany the visiting officer; and that the examination shall be conducted with as little annoyance and disturbance as possible. Of course, the absence of ship's papers, carrying false papers, or, as has sometimes happened, their attempted destruction, are very suspicious circumstances, and will warrant arrest. A previous bad reputation will naturally direct suspicion to a ship; but constructive or probable guilt should not be too much relied on. During the civil war in the U. S. the U. S. cruisers had a number of ships black-listed, and apparently were ready to send any ship on this list in for adjudication, though some were probably free from guilt. At all events, previous wrongdoing is wiped out by the completion of a round trip, and a ship has a right to be judged on its present merits after that. An improper exercise of the right of search founds a claim for damages against the cruiser's government. See also CONVOY and SLAVE-TRADE. THEODORE S. WOOLSEY.

Visitation Nuns: a religious order first established in 1610 at Ancey, Savoy, by St. Francis de Sales and St. Jane Frances de Chantal; received papal approbation in 1626; introduced into the U. S. in 1808 by Teresa Lalor. The order has numerous convents in the U. S. and in Europe.

Vistula (Pol. *Wista*; Germ. *Weichsel*): a river of Central Europe and the principal river of Poland. It rises in the Yablunka Mountains, in Austrian Silesia, 3,600 feet above sea-level, traverses Galicia, Russian Poland, and Prussia, and enters the Baltic Sea by several mouths. The main stream divides into two branches, which flow into the Gulf of Dantzie (Pol. *Gdańsk*) at Weichselmünde and the Frisches Haff respectively. The entire length of the Vistula is 650 miles, and it is navigable at Cracow for small vessels, and after it is joined by the San for large vessels. Its principal tributaries on the right are the Dumajec, San, Wieprz, Bug, and Drewenz, on the left the Pilica and Brahe. It is connected on the W. by the Bromberger Canal with the Oder, and on the E. with the Dnieper and the Niemen. The Vistula is the great artery of extensive trade for Austrian, Russian, and Prussian Poland, passing the large commercial cities of Cracow, Sandomierz, Warsaw, Modlin, Plock, Thorn, Kulm, Graudenz, Marienburg, and Dantzie. See Kalbus and Brandstätter, *Die Weichsel von ihrem Ursprung bis zu ihrer Mündung* (Dantzie, 1852). HERMANN SCHOENFELD.

Vita'cœæ: another name for the *Ampelideæ* or VINE FAMILY (*q. v.*).

Vitalis: See SJÖBERG.

Vita'lis Orde'ri'ens: historian: b. at Ateham, Shropshire, England, in 1075; educated in Normandy, where at an early age he entered the monastery of St. Evroul. Little is known of his life except that despite the strict rules of the order he managed to revisit England twice and to travel in France. D. about 1143, leaving the *Historia Ecclesiastica*, a Latin chronicle of ecclesiastical history from the birth of Christ to the year 1141. One portion of the work is devoted to the annals of the monastery of St. Evroul, but the greatest historical value attaches to the part that deals with the history of Western Christendom from the Carolingian period to his own time, especially to his descriptions of the social condition of France and England. See A. Le Prévost's edition of *Historia* (1838-55). There is an English version of Guizot's translation in Bohn's *Antiquarian Library*.

Vital Statistics [*vital* is from Lat. *vita*, pertaining to life, deriv. of *vi*, life;] a term sometimes defined as "the science of numbers applied to the life-history of communities and nations," or as "statistical ratios relating to the average course of life," but used in this article in the restricted sense of "statistics of deaths, births, and marriages." Reference is also made in the article to the statistics of disease; the statistics of more or less permanent mental or physical disabilities, such as insanity, idiocy, deaf-mutism, etc., however, are excluded.

Conclusions of Vital Statistics.—The data of vital statistics are derived from the records of individuals, but the conclusions relate to groups of people, and their scientific value consists in the results obtained by comparison of the conclusions derived from different groups living under different circumstances, with reference to determining the influence which these circumstances, taken singly or in groups, may have upon the life of communities. The conclusions of vital statistics are therefore expressions of probabilities with regard to masses of men and not with regard to individuals. These conclusions are for the most part given in the form of ratios, such as death-rates, birth-rates, or marriage-rates; and it is a matter of fundamental importance that these rates should be derived from corresponding figures of results, and of the causes presumed to have been those chiefly efficient in producing these results. For example, the number of births in a given place during a given time should be compared with the number of women of child-bearing ages—that is, between fifteen and fifty years of age—in that place, in order to obtain a scientific birth-rate—that is, one which can be fairly compared with the corresponding rate for another locality or for the same locality at another time. The birth-rate commonly given is that derived from a comparison of the number of births with the total population, and is of little interest.

Calculation of Mortality.—The unit of quantity used in vital statistics is one year of life, and the ratios are usually given as per 1,000 of population, which means per 1,000 years of life. Mortality means death-rate, not number of deaths, as natality means birth-rate, in the sense in which these words are used in this article. The gross mortality of a place is found therefore by multiplying the number of deaths occurring in it during a given time by 1,000, and dividing the product by the amount of life in that place during that time expressed in years of life. If the time was one year, the number of deaths 12, and the mean population for the year 600, then (the number of years of life being the same as that of the population, i. e. 600), the mortality ($12 \times 1,000 \div 600$) was 20 per 1,000. With a mean population of 12,000 and number of deaths during one month (calling a month $\frac{1}{12}$ th of a year) 15, the number of years of life during this period was 1,000, and the death-rate was therefore 15 per 1,000. In general, if the time for which birth, death, or marriage rates are to be calculated is less or greater than a year, the result must be reduced to an annual ratio. Thus if the calculation be for one week, the result must be multiplied by 52.177, the number of weeks in a year, to give the annual rate. A more convenient and sufficiently accurate method in such a case is to divide the mean population for the year by 52 and to use the quotient as the divisor.

The essential data of vital statistics are derived from enumerations of living populations and from records of births, marriages, and deaths. The numbering of the people is effected by a CENSUS (*q. v.*). From the point of view

of the vital statistician it is important that the results of a census shall be comparable in details with the results of the records of births, marriages, and deaths which are available for his work. The details which are of special importance are the unit of area, the age, the sex, the race, the marital condition, and the occupation. In the U. S. the units of area of the U. S. decennial census are the ward of a city, the city, the county, and the State. For the purposes of vital and medical statistics these units of area are often very unsatisfactory, because the boundaries of wards, cities, counties, and States are fixed with reference to political or sociological considerations rather than with reference to altitude, drainage, character of habitations or of the people, all of which are important factors in the causation of disease and death. Moreover, the political boundaries of wards and cities vary, often changing in the interval between two censuses, thus making it difficult or impossible to compare the results of one census with that of another, or, which is more important, to determine the mean population for any given period. As a census rarely occurs in the middle of the period for which it is desired to compute vital statistics, it is usually necessary to compute the mean population from the data furnished by two successive counts, upon the assumption that the population of a place increases according to the law of geometrical progression. To do this the first step is to ascertain the annual ratio of increase, which is done by the following formula: Let r = annual ratio of increase, p = population at last census, p' = population at next to last census, and n = number of years between these two censuses; then, using the logarithms of these numbers,

$$\log r = \frac{\log p - \log p'}{n}.$$

Having thus found the ratio, let x = the mean population sought, and m = the number of years between the time for which the population is sought and the last preceding census. If p is the population at the last census then $\log x = \log p + m \log r$.

The mean population for any period of time, as found by this geometrical progression formula, is rarely absolutely correct, since the rate of growth of a place is subject to many changes. If it were uniform the population found by the formula would be greater than the population actually living in the middle of the period, and less than the arithmetical mean of the populations at the beginning and end of the period; but if the period does not exceed two years the differences are so small that either figure may be used.

Estimates of population based on the number of voters, or of school children as found by a police census, or upon the data of city directories, are almost invariably in excess of the true figures, and whenever a city official uses these instead of the figures derivable from the U. S. or State censuses, it is safe to assume that the death-rates he obtains from them are considerably lower than the true rates.

The difficulties in the way of obtaining fairly reliable estimates of the mean population of a given locality for a given period, although often considerable, are small in comparison with the difficulties in ascertaining the mean number of persons of special age, sex, race, or occupation-groups living during such a period. If all the data for such purposes are furnished by each of two preceding censuses, the computations for each group may be made by the above formula—as for children under five years of age, for women between fifteen and fifty years of age, etc., for different units of area; but the sum of all these will not correspond to the sum obtained for the gross mean population, and there are special difficulties in ascertaining the mean population of children under one and under five years of age.

The number of births, deaths, and marriages occurring in a given population during a given time can be obtained with accuracy only by means of formal official registration of these events made at the time when they occur. It is utterly impossible to obtain by any system of enumeration or inquiry made at the end of a year records of more than 70 per cent. of the births and deaths which have occurred in any large group of population during the preceding year, and often not more than half of them can be thus ascertained. The only way to secure a complete registration of deaths is to forbid absolutely the burial or removal of dead human bodies without a permit for this purpose issued from a central office, which permit is issued only on the certificate of a person competent to state the cause of death, or as the result of a legal inquiry made by a coroner or special examiner. Most European countries have such a system, but it exists in but a few of the States composing the U. S., although it is carried out in most of the large cities.

MARRIAGES.

The usual mode of stating marriage-rates is to give the number of marriages annually per 1,000 of living population, although the correct method would be to give the annual number of marriages per 1,000 of unmarried males and of unmarried females of marriageable ages. The following table shows the annual marriage-rates per 1,000 of living population for certain countries and States:

COUNTRY.	Average rate for 20 years, 1871-90.	1880.	1890.	1891.
England and Wales.....	15.6	14.9	15.5	15.6
Scotland.....	13.9	13.2	13.7	13.9
Ireland.....	9.0	7.8	8.9	9.2
France.....	15.4	14.9	14.0	15.0

Switzerland.....	14.7	13.7	14.1	14.3
Sweden.....	13.1	12.6	12.0
Massachusetts.....	* 19.08	17.42	18.62
Rhode Island.....	† 18.9	20.0	18.4	18.5

* Forty years, 1851-90. † Thirty-two years, 1860-91.

BIRTH-RATE OR NATALITY.

The following table gives the birth-rates per 1,000 of total population of several countries for the twenty years 1871-90, and for the years 1880, 1890, and 1891:

COUNTRY.	Average rate for 20 years, 1871-90.	1880.	1890.	1891.
England and Wales.....	34.0	34.2	30.2	31.4
Scotland.....	33.6	33.6	30.2	31.2
Ireland.....	24.9	24.7	22.3	23.1
France.....	24.6	24.5	21.8	22.6
Belgium.....	31.0	31.1	28.7	29.6
Prussia.....	38.2	37.8	36.6	37.7
Austria.....	38.6	38.0	36.7	38.1
Italy.....	37.3	33.9	35.9	37.3
Switzerland.....	29.4	29.6	26.6	28.2
Sweden.....	29.8	29.4	28.0
Massachusetts.....	* 26.5	24.8	25.8	28.1
Rhode Island.....	24.7	22.7	24.7	26.5

* Forty years, 1851-90.

In no part of the U. S. is there an accurate and complete registration of births, and the only means of obtaining an approximate estimate of the annual number of births in the whole country or in the great majority of the States is to take the number of children under one year of age reported as living at the date of the census, and add to this the number of children born during the preceding year who died during the year. Using this method we find that the birth-rate per 1,000 of total population in the U. S. was 31.4 in 1880 and 26.8 in 1890. The figures for the different States are shown by the following table:

STATES AND TERRITORIES.	Birth-rate per 1,000 of population, 1880.	Birth-rate per 1,000 of population, 1890.
Alabama.....	37.8	30.39
Arizona.....	19.3	24.94
Arkansas.....	42.7	33.79
California.....	23.7	19.41
Colorado.....	21.7	25.09
Connecticut.....	22.5	21.26
District of Columbia.....	30.7	23.06
Delaware.....	28.7	24.88
Florida.....	34.8	28.30
Georgia.....	37.3	30.31
Idaho.....	28.5	27.14
Illinois.....	31.2	29.59
Indiana.....	30.6	25.29
Iowa.....	31.3	26.15
Kansas.....	35.2	28.16
Kentucky.....	34.9	29.45
Louisiana.....	35.7	29.57
Maine.....	20.9	17.79
Maryland.....	31.6	25.87
Massachusetts.....	21.0	21.51
Michigan.....	28.0	24.80
Minnesota.....	33.8	29.94
Mississippi.....	38.2	30.10
Missouri.....	33.1	28.72
Montana.....	22.6	22.81
Nebraska.....	36.9	28.42
New Hampshire.....	19.1	18.37
New Jersey.....	27.5	25.16
New York.....	25.7	23.28
Nevada.....	22.2	16.35
New Mexico.....	33.6	34.08

STATES AND TERRITORIES.	Birth-rate per 1,000 of population, 1880.	Birth-rate per 1,000 of population, 1890.
North Carolina.....	37.2	29.90
North Dakota.....	*	36.86
Ohio.....	28.4	24.08
Oklahoma.....	26.69
Oregon.....	28.8	22.49
Pennsylvania.....	29.4	25.69
Rhode Island.....	24.6	22.38
South Carolina.....	38.1	31.07
South Dakota.....	*	32.75
Tennessee.....	38.0	30.60
Texas.....	41.3	31.26
Utah.....	41.9	31.20
Virginia.....	35.4	27.12
Vermont.....	22.1	18.51
Washington.....	29.7	23.54
Wisconsin.....	30.6	27.00
West Virginia.....	36.3	30.41
Wyoming.....	27.1	21.78

* Dakota, 1880, 33.4.

The true birth-rates are probably about 15 per cent. greater than those indicated by the above figures; that is, the birth-rate of the U. S. in 1880 was about 36 and in 1890 31 per 1,000 of total population. The birth-rates in other countries also diminished in the same decade, as will be seen by the following table:

COUNTRY.	BIRTH-RATE PER 1,000 OF POPULATION.	
	1880.	1890.
England and Wales.....	36.0	30.7
Scotland.....	33.6	30.3
Ireland.....	24.7	22.3
France.....	24.5	21.8
Belgium.....	31.1	28.7
German empire.....	37.6	35.7
Austria.....	38.0	36.7
Switzerland.....	29.6	26.6
Netherlands.....	35.5	32.9

The causes of this decrease in birth-rates are diminishing marriage-rates and an increasing tendency to voluntary avoidance of child-bearing on the part of married people. The general rule is that the birth-rate is a little more than twice as great as the marriage-rate, but to this there are many exceptions.

As explained above, birth-rates thus calculated are not satisfactory, and a much better form is shown in the following table, given by Jacques Bertillon, in the *Encyclopédie d'hygiène* (Paris, 1890), vol. i., p. 179:

NATALITY IN CERTAIN COUNTRIES OF EUROPE.

COUNTRY.	Period of observation.	ANNUAL BIRTH-RATE PER 1,000 WOMEN FROM 15 TO 50 YEARS OF AGE.					
		Total.		Legitimate.*		Illegitimate.*	
		Still-born included.	Still-born excluded.	Still-born included.	Still-born excluded.	Still-born included.	Still-born excluded.
France.....	1878-82	103	99	173	166	17.5	16.1
Alsace-Lorraine.....	138	133	264	255	19.9	18.9
Belgium.....	138	132	275	263	20.1	18.9
Holland.....	158	150	308	292	9.7	9.0
Italy.....	149	144	249	242	24.7	23.7
Switzerland.....	122	117	249	240	10.9	10.2
Germany.....	158	152	278	265	29.5	28.0

Saxony.....	171	164	273	263	48.0	45.8
Bavaria.....	164	158	285	276	43.3	41.7
Württemberg.....	169	163	300	290	30.1	28.9
Baden.....	149	144	275	266	22.4	21.6
Austria (excl. Hungary).....	152	148	350	241	46.0	34.3
Finland.....	146	142	264	257	21.8	20.8
Sweden.....	121	118	245	239	22.1	21.3
Norway.....	136	131	283	274	30.2	19.2
Denmark.....	135	131	248	240	27.0	25.9

* In the above table the legitimate birth-rate is calculated by comparing the number of legitimate births with the number of married women between fifteen and fifty years of age, and the illegitimate birth-rate by comparing the number of illegitimate births with the number of unmarried women of the same age-group.

DEATHS.

For reasons given above, the death-rate of the U. S. and of the great majority of the several States can not be accurately determined; but for the whole country it was about 18 per 1,000, both in 1880 and in 1890. During the year ending May 31, 1890, the general death-rate was, in Connecticut, 19.4; in Delaware, 18.5; in Massachusetts, 20.2; in New Hampshire, 18.8; in New Jersey, 21; in Rhode Island, 21.9 per 1,000 of population.

The following table shows the death-rates of certain countries per 1,000 of total population:

COUNTRY.	Average rate for 20 years, 1871-90.	1890.	1890.
England and Wales	20.3	20.5	20.2
Scotland	20.4	20.5	19.7
Ireland	18.0	19.8	18.2
France	22.8	22.8	22.6
Belgium	21.4	22.3	20.6
Prussia	25.6	25.5	24.1
Austria	30.6	29.8	29.4
Italy	28.6	30.8	26.4
Switzerland	22.1	21.9	20.9
Sweden	17.6	18.1	17.1

In England and Wales during the five years 1886-90, inclusive, the general death-rate was, for males 20, for females 17.8; the death-rate for children under 5 years of age was, for males 61.9, for females 52; for those from 5 to 9 years of age, 4.9 for both males and females; for those from 10 to 15 years of age, for males 2.8, for females 2.9; from 15 to 20 years, males 4.1, females 4.1; from 20 to 25, males 5.5, females 5.2; from 25 to 30, males 7.4, females 6.9; from 35 to 45, males 12, females 10.3; from 45 to 55, males 19.4, females 15; from 55 to 65, males 35.2, females 28.8; from 65 to 75, males 72.1, females 61.7; from 75 to 85, males 147.9, females 132.9; 85 and over, males 313.8, females 276.2.

The death-rate of males is greater than that of females, and the death-rates in infancy and in old age are vastly greater than those of persons between five and fifty-five years of age; hence the death-rate of a particular group of persons depends largely on the proportion of infants and old persons in that group. For example, the death-rate of the foreign-born population in any State or city in the U. S. is less than the death-rate of the natives, because the latter class includes a much greater proportion of children; while, if the rates be compared by age-groups, as under five, five to fifteen, fifteen to forty-five, etc., the death-rate in each group will usually be found to be higher among the foreign-born. The death-rate in the Western States and in newly settled regions is usually below the average, because of the comparatively large number of adults, who have low death-rates, found in such localities.

During the year ending May 31, 1890, in those States having a fairly complete system of registration of deaths, the gross death-rate was 20.38; for children under 5 years of age, 75.36; for those between 15 and 45 years of age, 9.39; for those between 45 and 65, 21.36; and for those 65 years of age and upward, 76.83 per 1,000 of population of the same ages.

The following table gives statistics for each of the twenty-eight cities in the U. S. having a population of 100,000 and upward on June 1, 1890:

CITIES.	DEATH-RATES PER 1,000; STILL-BIRTHS EXCLUDED.						
	Aggregate.	Age-groups.					
		Under 1 year.	Under 5 years.	Under 15 years.	15 to 45 years.	45 to 65 years.	65 years and over; excl. unknown.

The gross death-rates of different localities may be made somewhat more fairly comparable by reducing the distribution of the several populations according to age-groups to one uniform standard, as is done in the reports of the registrar-general of England for the principal cities and towns, twelve age-groups being used for this purpose. Prof. Körösi proposes four age-groups for this purpose, viz., under 1, 1 to 20, 20 to 50, and 50 and upward, the standard to be under 1, 2.65 per cent.; 1 to 20, 39.81 per cent.; 20 to 50, 28.62 per cent.; 50 and over, 18.92 per cent. Taking the population of New York city as a standard, at the age-groups proposed by Körösi, the following table shows, for fifteen of the largest cities in the U. S., the gross and the corrected death-rates for the year ending May 31, 1890:

CITIES.	Gross death-rate.	Corrected death-rate.
Newark	29.04	29.13
New York	28.63	28.63
New Orleans	28.40	28.88
Jersey City	27.51	27.56
Washington	25.85	26.96
Brooklyn	25.54	25.39
Boston	24.79	25.39
Baltimore	24.75	24.91
Denver	24.21	26.69
San Francisco	23.61	25.39
Philadelphia	22.67	22.53
Cincinnati	22.36	22.32
Providence	22.36	22.64
Cleveland	21.95	21.83
Pittsburg	21.82	21.78

In comparing the death-rates of different localities, or of the same locality at different times, the best means of eliminating the influence which differences in the proportion of persons of various age-groups exercise upon the death-rates is by the preparation of life-tables, from which can be calculated the expectation of life at each age.

The following table shows the approximate expectation of life, in years, at each of certain ages, for certain cities and States, at certain periods of time:

LOCALITIES.	AGES.							
	At birth.	5.	10.	15.	25.	35.	45.	65.
New York city, 1879-81:								
Male	29.04	44.85	42.40	38.24	31.18	25.29	19.50	9.89
Female	32.77	47.71	45.27	41.15	33.95	28.13	22.35	11.15
Boston, 1880:								
Male	37.04	50.71	47.49	43.20	36.40	30.22	23.51	11.93

Female	48.05	55.66	52.52	48.40	41.15	34.37	27.24	13.63

Different races in the U. S. differ considerably as to death-rates and expectation of life. The death-rate of the colored is greater than that of the whites, especially among children under five years of age, and among adults the death-rate of the Irish is greater than that of the Germans, which, in its turn, is greater than that of persons whose parents were born in the U. S. The Jewish race has a lower death-rate than any other.

It is in most cases impossible to distinguish the influence upon the duration of life and liability to death exerted by those hereditary peculiarities of bodily structure which

make up race differences, and the influence exerted by the place and mode of life of the great masses which constitute different races. For example, the average annual death-rates in New York city for the six years ending May 31, 1890, among those fifteen years of age and upward, were, for the whites whose mothers were born in Ireland, 28.61; for those whose mothers were born in Germany, 17.04; for those whose mothers were born in the U. S., 15.91; for those whose mothers were born in Russia and Poland—that is to say the Russian and Polish Jews—6.21 per 1,000. The last-named class lived in overcrowded tenement-houses and were poor, so that in this case the low death-rate may be fairly attributed to race peculiarities. The heavy death-rate among the Irish adults was largely due to tuberculosis, to pneumonia, and to the immediate or remote effects of alcoholic drinks; but it is hard to distinguish between the effects of race *per se* and the effects of poverty, uncleanness, and intemperance in this class.

The death-rates of single adults twenty-five years of age and upward are greater than those of the married; thus in New York city the death-rate of white single males forty-five years of age and upward is, for native-born, 39; for Irish, 82; and for Germans, 65; while for the married of the same age-group it is, for native-born, 31; for Irish, 44; and for Germans, 37 per 1,000. A part of this difference is no doubt due to the fact that feeble, sickly, and indolent persons are to be found in larger proportion among the single than among the married.

As no country or city has a system of registration of cases of sickness, except of cases of certain contagious diseases, it is impossible to give sickness-rates for any large population. From data obtained from army and navy records, from mutual benefit societies, and a few other sources, it has been estimated that for every death in a community there are two persons constantly sick, or, in other words, there is an average of two years' sickness to each death. If by "sickness" is meant disease or injury which makes a person unable to work or to do business, this is an excessive estimate for the U. S., and one and one-half years' sickness to each death is probably nearer the truth. It must be remembered, however, that this applies only to the total of sickness and injuries, and not to individual diseases, as, for example, to cancer and to pneumonia.

Occupation as Influencing the Death-rate.—The occupation of a man may affect his health and length of life directly or indirectly. The direct influence of occupation is due to its bringing the person into relation with certain special causes of disease or of death, such as chemical poisons, dusts acting by their physical characters upon the lining membranes of the air-passages, noxious vapors, unusual temperature or atmospheric pressures, pathogenic micro-organisms, accidents, injuries, etc. The indirect influence of a given occupation upon health is exerted through the social condition and general method of life connected with that occupation, which depend, to a considerable extent, although by no means exclusively, upon the remuneration which it gives.

Certain trades or occupations are selected by people with reference to their own physical strength and powers of endurance, since those trades which require much muscular exertion can not be followed by feeble or sickly persons; and hence those employed in such trades are, to a certain extent, picked men, while, for the same reason, some of the lighter occupations are apt to be followed by persons among whom there is more than the usual proportion of weakly people. The difficulties in obtaining reliable and useful statistics of sickness and death rates pertaining to different occupations are many and great. The nomenclature and classification of occupations used in different countries do not agree, and each of them is confused and unsatisfactory from the point of view of the vital statistician. The age-grouping of the persons engaged in a particular occupation has a great influence upon the sickness and death rates pertaining to it; a man often changes his occupation as he becomes old, and many persons have two or more occupations which they follow at different seasons of the year.

The modern applications of machinery in manufactures have tended to produce simplicity and monotony in occupations, and to confuse the nomenclature of trades; they have, in fact, created a new class, who may be called machine-feeders, the precise nature of the material furnished the machine being a matter of secondary importance, so far as the health of the workman is concerned. The occupation of a man reported as a shoemaker to-day, either on a cen-

sus schedule or on a death certificate, may be quite different from that implied by the same term used in 1875.

Effect of Sedentary Occupations.—As a rule, those occupations which involve work out of doors are more healthful than those which are carried on indoors, and those which require a certain amount of muscular exercise, especially of a varied character, are more healthful than those which call for little muscular effort and are often spoken of as sedentary occupations. For example, in England, during the years 1880, 1881, 1882, if the average annual death-rate for males from twenty-five to sixty-five years of age be taken as equal to 1,000, then the rate during the same period for men of the same age-group was, for clergymen, priests, and ministers, 556; for gardeners and nurserymen, 599; for farmers and graziers, 631; for agricultural laborers, 701; for schoolmasters and teachers, 719; for ship-builders, 775; for fishermen, 797; for carpenters, 820; for lawyers, 842; for shopkeepers, 877; for printers, 1,071; for cotton manufacturers, 1,088; for physicians, 1,122; for butchers, 1,170; for brewers, 1,361; for file-makers, 1,667; for Cornish miners, 1,839; and for innkeepers and inn-servants, 2,205.

The following table is an extract from one prepared by Jacques Bertillon, showing for the years 1885 to 1889 the average annual death-rate per 1,000 in certain occupations for males in Paris with distinction of four groups of ages:

OCCUPATION.	AGES.			
	20-29.	30-39.	40-49.	50-59.
Average for all males of Paris	11.1	14.9	21.2	31.2
Physicians and surgeons	9.9	11.3	9.8	21.9
Lawyers	9.8	11.6	11.1	22.8
Clergymen and members of religious orders	5.0	8.2	9.0	30.5
Drivers and carmen	17.6	21.5	26.7	30.4
Jewelers, watchmakers, and fine-metal workers	9.7	14.0	14.9	24.7
Printers, lithographers, and engravers	17.8	23.7	26.7	40.6
Liquor-dealers and eating-house keepers	12.0	21.2	25.7	30.2
Bakers	12.4	16.2	24.4	39.0
Barbers, hair-dressers, wig-makers	14.8	14.2	18.1	33.2
Boot and shoe makers	13.4	19.2	20.4	35.3
Stair-builders, plumbers, plasterers	15.0	22.3	25.2	44.1
Painters, glaziers, decorators	14.8	23.0	28.8	42.0
Masons and stonecutters	9.5	16.0	23.7	31.4
Carpenters and joiners	10.5	18.8	24.3	30.7
Tanners and curriers	9.1	10.5	15.9	26.4
Founders, heavy-metal workers	9.4	11.4	15.4	22.6
Mechanists	12.7	16.2	21.2	36.0
Horticulturists	11.1	13.6	21.6	30.0

The diseases which are more than usually prevalent among the clergy are diseases of the nervous system, including diabetes and insanity with suicidal tendencies, heart disease, diseases of the kidneys, and clergyman's sore throat. Among the legal profession heart disease and diseases of the nervous system, especially apoplexy, cause more than the average number of deaths. Medical men suffer especially from diseases of the heart and nervous system, and from specific, contagious, and infectious diseases, including pneumonia.

Effects of Materials Used.—Of the trades in which the workmen are most liable to be affected by the poisonous nature of the materials with which they work, may be mentioned the manufacture of white lead, file-making, painting and glazing, glass-polishing, and the plumber's trade, as giving rise to lead-poisoning in the forms of colic, paralysis, or various affections of the nervous system and of the kidneys. Gilders, looking-glass makers, furriers, and hatters are liable to chronic mercurial poisoning; match-makers, to necrosis of the jaws, produced by phosphorus; workers in chromic acid and dichromates, to a peculiar ulceration in the nostrils; workers in colored paper and feathers, to arsenical poisoning; workers in kerosene oil and paraffin, to a peculiar eruption of boils; workers in eosin, to excessive sweating of the hands, followed by tenderness and fissures of the skin.

The occupations which have a special tendency to produce disease through the dusts connected with them and inhaled by the workmen are numerous, including coal-mining, the manufacture of earthenware, china, and cutlery, of cotton and woolen goods, and of bleaching-powder, rag-sorting, etc. When the dusts act solely or mainly as mechanical irritants to the air-passages, their first effect is to produce congestion or a low grade of inflammation, which makes the tissues specially susceptible to the influence of the bacillus of tuberculosis, and hence consumption is more than usually prevalent among workers in such trades, as will be seen by the table in the next column, given by Dr. Ogle.

COMPARATIVE MORTALITY OF MALES IN CERTAIN DUST-INDUCING OCCUPATIONS FROM PHTHISIS AND DISEASES OF THE RESPIRATORY ORGANS.

OCCUPATION.	COMPARATIVE MORTALITY FROM		
	Phtisis.	Diseases of respiratory organs.	Phtisis and diseases of respiratory organs.
Coal-miners	64	102	166
Carpenters, joiners	108	67	170
Bakers	107	94	201
Masons, bricklayers, builders	127	102	229
Wool, worsted-workers	130	104	234
Cotton-workers	137	137	274
Quarrymen	156	138	294
Cutlers	187	197	384
File-makers	219	177	396
Earthenware-makers	239	326	565
Cornish miners	349	231	580
Fishermen	55	45	100

Effects of Vapors and Gases.—Offensive and more or less noxious vapors or gases are produced in many processes of manufacture. The fumes of mercury, arsenic, zinc, and copper are always more or less harmful. The effluvia connected with decaying animal and vegetable matters, or produced in manufacturing processes in which such articles are employed, as, for example, in the production of fertilizers, in bone-boiling, soap-making, etc., often are very offensive, and appear to be injurious to the general health of those exposed to them, although they do not seem to produce specific diseases. Habit has much to do with the effects which they produce; the laborers in such establishments do not notice odors which produce nausea, headache, etc., in persons not accustomed to them. The vapor of carbon disulphide, given off in the manufacture of India-rubber, produces various disorders of the nervous system, beginning usually with persistent headache, followed by vertigo, cramps, muscular tremor, and debility, and finally by great mental and physical depression. Hydrogen sulphide, when pure, is a highly poisonous gas, but the evidence is conflicting as to its effects when considerably diluted. It is given off in considerable quantity from the waste heaps of alkali-works. The manufacture of illuminating-gas involves the production of dangerous and offensive gases, but the laborers do not appear to suffer especially from their occupation.

Effects of High Temperatures.—The effects of exposure to excessively high temperatures are seen in firemen and stokers, and in workers in foundries, glass-works, and in certain hot mines; but it is often difficult to distinguish these from the results of other causes of disease, such as intemperance, etc. The immediate effects of exposure to high heat are those of congestion of the brain, or more commonly those due to feeble action of the heart, corresponding to the two forms of sun or heat stroke. Remoter effects are seen in the liability to pulmonary disease and to rheumatism.

The effects of variations in atmospheric pressure are seen in those who work in compressed air, as in caissons or in diving-bells. Besides pain in the ear due to tension of the membrana tympani, as a result of the unequal atmospheric pressure on its surfaces, which sometimes produces rupture of the drum, these effects include feeble action of the heart, local congestions, headache, pains in the limbs, and paralysis. The worst effects are produced by a too rapid change from compressed air to air of ordinary pressure, which may produce death by effusion of blood at the base of the brain and in the spinal cord.

Effects of Micro-organisms.—The effects of pathogenic micro-organisms, excluding those in which special exposure to such organisms is due to locality, are seen in butchers, whose wounds are liable to septic infection and to inoculation with anthrax; in those who handle hides and skins, who are liable to anthrax in the form of malignant pustule, and in rag and wool sorters, who are liable to smallpox and internal anthrax.

JOHN S. BILLINGS.

Vitascope: See the Appendix.

Vitebsk' (Polish, *Witebsk*): a government of Western Russia; area, 17,440 sq. miles. It formerly belonged to the grand duchy of Lithuania. The surface is mostly flat, covered with forests and immense marshes, with about 2,600 small lakes. The Dwina, with its navigable tributaries and connecting canals, is an excellent artery for export trade. Flax, linseed, timber, and hides are the chief articles of export; rye, oats, and potatoes are the chief agricultural products. Pop. (1890) 1,341,100, chiefly White Russians and Letts.

Vitebsk: capital of the government of Vitebsk; on both sides of the Dvina, and on the Smolensk-Riga Railway (see map of Russia, ref. 7-C). It is an old town, once of some importance, but it now has no manufactures. There is, however, an active trade with Riga in grain, flax, hemp, timber, and cattle. Vitebsk was annexed by Russia in 1772 at the first partition of Poland. Pop. (1890) 58,179, one-half being Jews. II. S.

Vitellin [from Lat. *vitellus*, yolk of an egg]: the albuminoid or proteid constituent of the yolk of eggs. See ALBUMINIDS and YOLK.

Vitellius, AULUS: emperor; b. in Rome, Sept. 24, 15 A. D.; was a great favorite with Caligula, Claudius, and Nero, who bestowed the highest offices and greatest honors on him, although he was a man of sluggish and profligate character, and quite without ambition. Galba sent him to Germany in Dec., 68, as commander of the legions there, and here he was proclaimed emperor by the soldiers Jan. 3, 69. His friends urged him forward, and fortune favored him. Galba was murdered Jan. 15, and Spain and Gaul recognized Vitellius. In Rome Otho had assumed the imperial dignity, but he was defeated at Bedriacum by Vitellius's generals, and stabbed himself. In July Vitellius entered Rome at the head of an army, or rather a loose band, of about 60,000 soldiers. He made very few confiscations or executions; he seemed bent only on gluttony and excesses, and for these purposes he spent fabulous sums. Meanwhile VESPASIAN (*q. v.*) had been proclaimed emperor by the armies of the East, and his generals approached Italy. Vitellius now found nothing but indifference or treachery. He tried to negotiate, but failed. He offered to resign, but too late. He was found hiding in a corner of the deserted palace, was dragged out into the Forum, and put to death by a common soldier in Dec., 69. Revised by G. L. HENDRICKSON.

Vitellus: the yolk of an egg. See EMBRYOLOGY and YOLK.

Viterbo: city and commune in the province of Rome, Italy; 42 miles N. W. of Rome; at the northwestern base of Monte Cimino (see map of Italy, ref. 5-D). It is in a fertile region which yields abundantly grain, hemp, tobacco, olives, and wine. There are in the vicinity numerous mineral springs of various kinds. Among these is the *Bulicame*, a large hot spring in constant ebullition, mentioned by Dante. The city has several beautiful fountains and magnificent palaces. The Gothic cathedral contains the tombs of three popes; and on the steps of the high altar Henry, nephew of Henry III. of England, was murdered by Guy de Montfort. The Churches of Santa Rosa, S. Francesco, and of the Osservanti del Paradiso are famous for their tombs of saints and popes, as well as for their paintings and frescoes. In the old episcopal palace, a Gothic building of the thirteenth century, several elections of popes took place. Etruscan cemeteries and some Etruscan sarcophagi in the town-hall make the city particularly interesting. Viterbo is supposed to occupy the site of the ancient *Favum Voltumne*, the place of the Etruscan general assembly. Pop. 16,320; commune 19,655. Revised by HERMANN SCHOENFELD.

Vitet, *vœ'tā'*, Louis: author; b. in Paris, Oct. 18, 1802; was educated as a teacher, but took up journalism and literature; became a contributor to the *Globe*, and published with considerable success the dramatic poems *La Journée des Barricades* (1826), *Les États de Blois* (1827), and *La Mort de Henri III.* (1829). From the Revolution of July, 1830, to the *coup d'état*, Dec. 2, 1851, he held various offices in the civil service, but retired then into private life, and devoted himself exclusively to literature. His principal works are *Eustache Lesueur* (1843), a biography; *Monographie de l'Église de Notre-Dame de Noyon* (1845); *Fragments et Mélanges* (2 vols., 1846); *Essais historiques et littéraires* (1862); *Études sur l'Histoire de l'Art* (1864); *Lettres sur le siège de Paris, 1870-71.* D. in Paris, June 5, 1873. The posthumous *Études philosophiques et littéraires* (1874) contains a biographical notice by Guizot.

Revised by A. G. CANFIELD.

Viti Islands: See FIJI ISLANDS.

Vitiligo: See OLD AGE, DISEASES OF.

Vitis: See GRAPE.

Vitoria: fortified town of Spain; capital of the province of Alava; 29 miles S. of Bilbao (see map of Spain, ref. 12-G). It consists of an old town, narrow, gloomy, and dirty, and a new town, open, airy, and elegant, on a lower level, with

many fine buildings and beautiful promenades. Articles of brass, iron, ebony, earthenware, leather, and chocolate are manufactured, and a brisk trade in oil, wine, fruits, and grain is carried on. Here on June 21, 1813, the allied British and Spanish army under Wellington gained a victory over the French under Jourdan. Pop. (1887) 27,660.

Vitré, *vœ'trā'*: town; department of Ille-et-Vilaine, France; on the Vilaine; 24 miles by rail E. of Rennes (see map of France, ref. 4-C). It is a curious old place, with manufactures of leather and woollens, and some trade in wax, honey, and grain. Pop. (1891) 9,270.

Vitrification: the process of converting into GLASS (*q. v.*).

Vitrified Forts [*vitrified* is Lat. *vitrum*, glass + *facere*, make]: a remarkable class of prehistoric fortifications almost peculiar to Scotland and its islands. They are made of siliceous stone, and the inside—in some cases the outside, or indeed the whole mass—has been vitrified by the action of fire and of wood-ashes, the stone being transformed into a kind of glass. Whether the vitrification was intentional or not is a moot question.

Vitriol [viā O. Fr. from Late Lat. *vitriolum*, liter., neut. of *vitriolus*, *vitreolus*, dimin. of *vitreus*, glassy, deriv. of *vitrum*, glass]: a generic name among the earlier chemists for the *sulphates*, often still applied in common language. Thus iron sulphate is *green vitriol* or iron vitriol, copper sulphate is *blue vitriol* or copper vitriol, zinc sulphate is *white vitriol* or zinc vitriol, etc. Sulphuric acid was also called oil of vitriol for the reason that it was made from iron vitriol.

Vitriol, Oil of: See SULPHURIC ACID and SULPHATES.

Vitruvius Pollio: a Roman architect and author of a treatise on architecture in ten books dedicated to the Emperor Augustus. The place of his birth is uncertain, but from the testimony of an inscription found in Verona, this place has been suggested. His work appears from internal evidence to have been composed about B. C. 14. In respect to its subject it is very important, as it is the only one of the kind that has come down to us, and it is expressly mentioned by Pliny as one of his authorities. His chief sources, apart from his own experience, were Greek writers, but his knowledge of Greek seems deficient. Though he possessed varied learning and a philosophic turn, he appears to have been an unpracticed author, and frequently fails to express himself intelligibly. Some things, indeed, are obscure from our own want of information on this subject at this distance from the period of the writer. There is an abridgment of the work by a very ancient but unknown author, who has preserved the arrangement of the original, but has limited the subject to private buildings. Vitruvius has been translated by Newton in 2 vols. fol., with 47 plates (London, 1771-91), and by Gwilt (London, 1826; improved ed. 1860). The best edition of the original is by Schneider (3 vols., Leipzig, 1807).

Vittrōria: town; province of Syracuse, Sicily; about 20 miles N. W. of Modica (see map of Italy, ref. 10-F). In the neighboring plains are raised vast quantities of the soda-plants, the ashes of which are exported to Marseilles for the use of the soap-factories of that city. This town received its name from a victory obtained by Roger over the Arabs in 1092. Pop. 21,760.

Vittoria, ALESSANDRO: architect and sculptor; b. at Trent, Austria, in 1525. He went to Venice at the age of fifteen and became a pupil of Sansovino. His work is to be found in Venice, Vicenza, Padua, Treviso, Brescia, and Verona. Although much that he did has been destroyed, much still remains, for instance the caryatides at the side of the door of the Marciana library, as also the stucco ornaments of its staircase and those of the Scala d'Oro of the ducal palace in Venice; also the stucco ornaments of several rooms in the Trevisano palace at Murano. He worked with Paolo Veronese at the decorations of Palazzo Morosini, also in SS. Giovanni e Paolo in Venice. The Chapel of the Rosary, Venice, contains several statues of saints by Vittoria, and three are in the second chapel to the right of the entrance in San Francesco della Vigna, in the same city, besides two statues in bronze on the column near the font of holy water. Vittoria was a skillful medalist as well. It is recorded that, notwithstanding the immense number of commissions given him, he appealed in 1585 for exemption from taxation on the plea that times were so bad he could not make both ends meet. D. May 27, 1608, leaving a large fortune. For further details, see Temenza, *Vita di Alessandro Vittoria* (Venice, 1827). W. J. STILLMAN.

Vittoria Colonna: See COLONNA, VITTORIA.

Vivanco, věe-vān'kō, MANUEL IGNACIO; general; b. at Lima, Peru, in 1806. He left the University of San Carlos to join the patriots in 1820; served through the war for independence and continued in the army under Gamarra and Santa Cruz. In Jan., 1841, he declared against Gamarra at Arequipa, assuming the title of supreme chief; but he was defeated, and fled to Bolivia. In 1842 he returned, and at first supported Vidal; but after the resignation of the latter he headed another revolt, occupied Lima Apr. 8, 1843, and remained in power until July 17, 1844, when he was defeated by Castilla at the battle of Carmen Alto and forced to fly from the country. In 1851 he was an unsuccessful candidate for the presidency, and in 1856-58 he headed a revolt which was temporarily successful at Arequipa, and was suppressed only after much fighting. Subsequently he was prominent in the senate and as a diplomatist. D. in Chili, Sept. 1873.

HERBERT H. SMITH.

Vivarini, vēe-vā-ree'nēe, ANTONIO; also called ANTONIO DA MURANO; eldest of a family of painters born at Murano, Italy, in the fifteenth century. The name of this painter is first found on certain pictures painted between 1440 and 1446, with a certain Joannes. They are signed *Joannes et Antonius de Muriano fecerunt*. One of the finest examples of this master's work is the great altarpiece on canvas, painted in 1446, now in the Venetian Academy. After 1450 Antonio seems to have painted with his younger brother Bartolommeo, as the name of Joannes no longer appears. An altarpiece, commissioned by Pope Nicholas V. in commemoration of Cardinal Albergati, and the inscription on the picture indicates, is signed by the two brothers, and is in the Pinacoteca of Bologna. In the Lateran at Rome is an altarpiece by Antonio alone, originally in Sant' Antonio at Pesaro. In the Berlin Museum there is an *Adoration of the Kings* by this master, and a fragment of a picture is in the London National Gallery. D. in 1470.—BARTOLOMMEO VIVARINI, the younger brother of Antonio, seems to have studied at Padua in the school of Squarcione; the lengthened forms, the severity of type in the male heads in the altarpiece in the Bologna Gallery, indicate a new influence; the use of gold and of garlands of fruit and flowers and fluttering ribbons is borrowed from the Paduans. Bartolommeo's power of coloring obtained for him a high reputation among early Venetian painters. Two triptychs in the Frari at Venice are among his best works, but the great inequality of painting in the pictures bearing his name would lead to the conviction that some were executed by assistants. The last date on his work is 1499. Nothing is known of his subsequent life.

W. J. STILLMAN.

Viver'ridæ [Mod. Lat., named from *Viver'ra*, the typical genus, from Lat. *viver'ra*, ferret]: a family of carnivorous mammals containing the civets and allied types. The form is generally more or less elongated, somewhat similar to that of the weasels; the head is long and terminates in a prominent snout; the feet are neither typically digitigrade, as in the cats and dogs, nor plantigrade, as in the bears, but rather intermediate; the toes are mostly well developed, the claws sharp; the tail more or less elongated; the teeth thirty-six to forty in number, and moderate in size (L. $\frac{3}{3}$; C. $\frac{1}{1}$; P. M. $\frac{4}{4}$, exceptionally $\frac{3}{3}$; M. $\frac{2}{2}$, rarely $\frac{1}{1}$); the true molars of the upper and last of the lower jaw tubercular; the auditory bullæ are divided internally and are externally constricted; the intestinal canal is generally provided with a cæcum. The family is peculiar to the Old World, and especially the tropical portions of Asia and Africa. The species are numerous, of small or moderate size, mostly ranging from the dimensions of a weasel to those of a dog. They are all carnivorous, preying on small animals of various kinds, some attacking chiefly, by preference, birds, others serpents, others insects, and still others eating eggs; but they often fail to discriminate, and may take to either kind in the absence of a choice. The paradoxure (*Paradoxurus typus*) of India is a typical species. It is about the size of a cat, but has a longer tail; the fur is harsh, blackish gray, with darker bands, and there is a light spot on the forehead and under each eye. It is less carnivorous than many of the other species and, like others of the genus, is somewhat arboreal in its habits. See also BINTURONG, CIVET, GENET, ARCHNEUMON, and MUNGOOS. F. A. LUCAS.

Vives, vēe ves, JUAN LUIS, D. C. L.; educator and classical scholar; b. at Valencia, Spain, Mar. 6, 1492; studied at the Universities of Paris and Louvain; was called to England by Henry VIII. as tutor to the Princess Mary in 1523.

for whose use he wrote his *De ratione studii puerilis*, the *De institutione fæmine Christiana*, and the *Satellitium animi*, a collection of apothegms (re-edited in 1883 by Wychgram); was disgraced and imprisoned for having argued and written against the divorce of Queen Catharine of Aragon (1528). On his release (1529) he became a classical teacher at Bruges, where he died May 6, 1540. He was an intimate friend of Erasmus and Budæus, and his writings contributed not a little to the revival of letters in his time. Among these are the commentaries to St. Augustine's *De civitate dei* (1522), his masterpiece; *De anima et vita* (1538), the first exegetical edition of this Aristotelian treatise; *In Bucolica Vergilii interpretatio; De disciplinæ libri XV.* (1531); *De ratione dicendi* (1533); *Lingua Latinæ exercitatio* (1539, and frequently republished); *De subventione pauperum* (1526), one of the earliest essays on this subject. His entire works were collected by Mayani (8 vols., Valencia, 1790). See A. J. Namèche, *Mémoire sur la vie et les écrits de Vives* (Brussels, 1841).

ALFRED GUDEMAN.

Vivien de Saint-Martin, vēe-vyān'de-sān'māar'tān', Louis; geographer and author; b. at St.-Martin-de-Fontenoy, France, May 17, 1802. He early engaged in literature as a profession, removing to Paris; his first publication, was a *Carte Electorale* (1823), and his second an atlas, one of the best of its time (1825). A geographical journal, the *Bibliomappe*, which he founded in 1828, was given up in 1830; and thereafter, during many years, he accepted such tasks as the publishers gave him; these included a work on agriculture, a revision of Verger's *Dictionnaire français*, translations of Scott's novels, *Histoire générale de la Révolution française* (4 vols., 1840-42), and *Histoire de Napoléon* (2 vols., 1843). In 1845 he became editor of the *Nouvelles Annales de Voyages*, and was thus able to devote his time to his favorite geographical studies. A great work, the *Histoire universelle des découvertes géographiques des nations européennes*, was planned, but was interrupted by the revolution of 1848, after two volumes had appeared. It was followed by several important works on historical geography, the latest being *Histoire de la géographie et des découvertes géographiques* (with atlas, 1873). From 1863 to 1876 he edited the *Année géographique*, relinquishing it to direct the *Nouveau Dictionnaire de géographie universelle*, a monumental work. After two volumes had been published he resigned the editorship to Roussellet.

H. H. S.

Vivisection [Lat. *viv'us*, alive + *sect'io*, a cutting, deriv. of *seca re*, *sectum*, cut]: literally, the "opening of the living body," in contradistinction to that of the dead body (*sectio cadaveris*). The examination of the interior of the dead body, both in animals and in man, is resorted to for purposes of anatomical research, and also to ascertain the changes produced by disease. Vivisection, on the other hand, is employed for investigating, in the lower animals, the action of the organs during life. The term, however, though strictly applicable, in its etymological sense, only to cutting operations, is used to designate all experiments of a scientific nature performed upon living animals, whether they consist of division of the parts by cutting instruments, or their compression by ligatures, or the subjection of the animal to special conditions of food, temperature, or respiration, or to the action of drugs and medicines. In all these cases the object of the experimenter is to ascertain some fact in physiology or pathology which can not be otherwise investigated.

The necessity of resorting to experiments upon living animals in physiology and the allied sciences depends upon the obvious fact that these sciences have to deal with the actions and phenomena of life; and consequently, in order to study them successfully, the necessary investigations must be made while life is going on. Examination of the dead body reveals the form and structure of the internal parts, but it does not yield a knowledge of their physiological actions, because these actions have ceased and the organs have relaxed into a quiescent condition. Where the necessary steps of an experiment are of a nature to cause pain to the animal, as in cutting operations, this is generally avoided by the use of ether or chloroform, in the same manner as when these anesthetics are administered for surgical operations upon the human subject. Pain, to a great extent, vitiates the results of most experiments, so that the investigator is naturally led to adopt every possible measure to prevent it. The results which have been attained by means of experiment upon the living body constitute nearly the whole of the actual knowledge possessed

in physiology, of the action of medicines, and of the germs that cause disease.

The earliest investigator of note who employed this method was Galen, and his discovery of the true function of the *arteries*, about the year 150 of the Christian era, forms a striking illustration of its necessity and usefulness. Previously to that time the arteries were thought, as their name indicates, to be air-tubes for distributing throughout the body the air taken in at the lungs; while the veins were regarded as the only channels for the conveyance of blood. This conclusion was naturally derived from the appearance of the two sets of vessels in the dead body; for at the time of death the blood leaves the arteries in great measure and accumulates in the veins, and when the body is opened and the arteries cut across, they resume their tubular form, owing to the elasticity of their walls. Thus the dissector of the dead body found the veins containing blood and the arteries containing air. When an artery was accidentally wounded during life and discharged blood, it was thought that it had first emptied itself of the air, and that the blood was afterward drawn into it from other parts. But Galen experimented upon this subject by exposing an artery in the living animal, and including a portion of it between two ligatures placed a certain distance apart. He then opened it between the ligatures, and showed that it discharged no air, but only blood. Consequently, it must have contained blood beforehand. This was the first demonstration of the important fact that the arteries are blood-vessels, and that there are in the body two kinds of blood—namely, venous blood in the veins and arterial blood in the arteries. William Harvey in 1628 completed our fundamental knowledge of the circulation by his discovery that the blood, after passing from the heart outward through the arteries, returns again to the heart by the veins, thus moving in a continuous round through the vascular system. This discovery was also the fruit of experimentation on living animals; and it was by the same means that other eminent physicians of the time, who at first doubted Harvey's doctrine, were finally enabled to convince themselves of its truth. The real action of the heart as a propelling organ for the blood and the true nature of the arterial pulse were both parts of the same discovery, and were ascertained in a similar way.

The knowledge thus gained of the circulation was not only of the highest value in itself, but soon led to other important results, one of which was the possibility of the *transfusion of blood* from one animal to another. This was first demonstrated in 1665 by Richard Lower, who succeeded in transferring blood from the vessels of one dog into those of another, the second dog being allowed to bleed freely at the same time, but being kept alive by the blood received from the first. This showed that death from hemorrhage might be prevented by the introduction of blood from another animal of the same species. After a variety of successes and failures in applying this operation to the human subject, the matter was again investigated experimentally by Dr. Blundell in 1824, and has been the subject of numerous later researches. They have resulted in improved methods of performing the operation, and in greater knowledge of its proper application as a remedy. It is now a recognized means of preserving life in cases of exhaustion from abundant or long-continued hemorrhage.

The function of *respiration*, which is immediately essential to life, has come to be understood mainly through experiments upon animals. The first important knowledge in regard to it was obtained in 1670 by the Hon. Robert Boyle, who inclosed animals of various kinds in the receiver of the air-pump, then a recent invention. He demonstrated in this way not only that atmospheric air is necessary in all cases to the maintenance of life, but also that when confined in a limited space it becomes vitiated by continued respiration, and that in order to maintain life the vitiated air must be removed and be replaced by a fresh supply. It was soon afterward found by MAYOW (*q. v.*) that the air thus vitiated by the respiration of animals was also diminished in volume; and he concluded, accordingly, that something in it was consumed or used up by the process of respiration. Lavoisier in 1777 discovered, by experimenting with sparrows, that the respirable ingredient of the air could be removed by the calcination or oxidation of mercury; showing that the substance (oxygen) which combined with the metal was the same as that absorbed by animals in the process of breathing. But if he set free the oxygen from its metallic combination, and

added it to the irrespirable residue of the air, the mixture again became respirable and capable of supporting life. He further proved that the animals in breathing not only consumed the oxygen of the atmospheric air, but at the same time exhaled another gas—namely, carbonic acid—which could be made to unite with lime water and form calcium carbonate. In this manner it was ascertained that the process of respiration consists essentially in the absorption of oxygen and the exhalation of carbonic acid. Without the knowledge of such fundamental facts all further discovery in this direction would be impossible; but since the time of Lavoisier many important particulars have been, and are still being, added to physiology, as to the time, place, and quantity, of the absorption and discharge of the gases of respiration, their relation to each other, the mode of their consumption and production in the body, and their influence upon the fitness of the air for breathing. The whole subject of ventilation and its practical application for the preservation of health depend upon a distinct knowledge of the composition of the air and its physiological properties in regard to respiration.

The functions of the *nervous system* have been the subject of experimental investigation from very early times. Galen showed that the nerves are the channels through which the commands of the will are conveyed to the muscles, and that the spinal cord is the conductor for voluntary impulses proceeding from the brain to the nerves of the body and limbs. The researches of modern physiologists have been directed to ascertain the special functions residing in particular nerves or nerve-centers. The localization of definite functions to definite parts of the nerve-centers, the different properties of the anterior and posterior roots of the spinal nerves—of which the former serve for motion and the latter for sensation—the distinction between the motor and sensitive nerves of the face, the connection of the medulla oblongata with various important functions, and the influence of the pneumogastric nerve on the movements of the chest and the action of the heart—are a few examples among many of the important discoveries effected in this way. A knowledge of these details is essential for the medical practitioner, since it is only by their aid that he can learn from the external nervous symptoms what is the nature of the internal injury or where it is located.

The natural mode of the *reproduction of bone* when a portion of its substance is destroyed or removed was discovered by a series of researches extending from 1740 to 1858, and conducted mainly by Dubamel, Hunter, Syme, and Ollier. When a bone is broken into small pieces, or when it is otherwise so injured that a considerable part of it must be removed, the remnants generally fail to unite with each other by solid tissue, and the limb, remaining permanently flexible at the point of fracture, is accordingly of no value for practical purposes. Formerly, such a limb was often amputated, in preference to leaving it as a useless incumbrance to the patient. But it was discovered by the experiments above mentioned that if the fibrous covering of the bone, or its "periosteum," were left behind in such cases, while the broken fragments were removed, new bony tissue would be produced and a solid union effected. This method of practice was consequently adopted in the treatment of fractures in the human subject, and has been the means of saving many limbs which in the absence of such treatment would have been left in a state of deformity or wholly sacrificed.

The foregoing illustrations indicate the manner in which experimentation on animals has been rendered serviceable to physiological science and to practical medicine. It has also produced results of value in other directions, among which may be mentioned the practice and usefulness of *artificial respiration* in cases of drowning, hanging, suspended animation of newly born infants, and in poisoning; the improved surgical operation for the cure of *aneurism*; the successful study of the various *digestive secretions*; the investigation of *infectious and contagious diseases*; the best treatment for *venomous wounds*, like those of the rattlesnake; and the action of *poisons, drugs, and medicines*, with their uses in disease and their antidotes.

Moreover, the enormous advances in recent years in brain surgery, abdominal surgery, the pathology and treatment of disease, etc., have been wholly or largely due, directly or indirectly, to the results of vivisection. It is only by such means that we can hope for radical and rapid advances in medical science.

Revised by EDWARD T. REICHERT.

Vizagapatam': town; presidency of Madras, India; the capital of the district of Vizagapatam; at the entrance of the Veragatum into the Bay of Bengal; in lat. 17° 41' N. (see map of S. India, ref. 4-G). It has a good harbor, sheltered by the Dolphin's Nose, a cliff about 1,500 feet high, and is a military station. Near the latter is the suburb occupied by Europeans, called Valteru, and considered very healthful. Pop. (1891) 34,487.

Vizeino, včeth-kān-ee-nō, SEBASTIAN; navigator; b. at Huelva, Spain, about 1550. He was long prominent in Mexico, made an unsuccessful attempt to explore the peninsula of Lower California 1596-97, and in 1602-03 successfully explored the same coasts to lat. 42° N., one of his ships going on to lat. 43°, now included in the coast of Oregon. In 1610 he commanded an expedition to Manila; thence he went on to Japan, taking two Franciscan missionaries to that country, and attempting to open commercial relations with the people. He returned to Acapulco in 1614, and died there shortly after. H. H. S.

Vizier, vi-zeer' [from Arab. *wazīr*, liter., bearer of burdens, porter, deriv. of *wazara*, bear a burden]; the title of many high dignitaries in Mussulman countries; first conferred by Abul Abbas, the first Abbassid caliph, on his Prime Minister (752). In the Ottoman empire since 1327 the grand vizier has been the representative of the sultan in temporal affairs and the chief Minister of State. Alaeddin (d. 1359), elder brother of Sultan Orkhan, was the first Ottoman grand vizier. E. A. G.

Vlaar'dingen: town of the Netherlands; province of South Holland; on the Meuse; 5 miles W. of Rotterdam (see map of Holland and Belgium, ref. 6-F). It has a good harbor, and carries on an extensive herring-fishery and some ship-building and shipping business. Pop. (1890) 12,947.

Vladikavkaz, vlaš-dčē-kāv-kkaats': fortified capital of the Terek province of Cis-Caucasia, Russia; at the elevated northern base of the Great Caucasus chain, and at the opening of the Terek valley from the mountain tracts (see map of Russia, ref. 11-G). It is the terminus of the railway system to the south, at the northern entrance to the pass to Tiflis and the Southern Caucasus. Its population (33,981 in 1886, 46,345 in 1892) has steadily grown with the commerce between Russia and the Caucasus, the carrying of merchandise to Tiflis and again northward being the chief occupation of the inhabitants. H. S.

Vladimir, vlaš-dčē-meer': a government of Central Russia, comprising the greater part of the old principality of that name; area, 18,864 sq. miles. The country is mostly level, partially traversed by undulating hills, and extends over the eastern parts of the central plateau of Middle Russia. It is watered by the middle Volga and its chief affluent, the navigable Oka, which there unites with the Klyasma. The soil is fertile, more than half is adapted for cattle-rearing and agriculture, producing rye, oats, wheat, barley, flax, hemp, fruit; about 32 per cent. is covered with forests. In industrial pursuits Vladimir is second only to Moscow, having about 1,800 industrial establishments, mostly cotton (four-ninths of the entire Russian cotton production comes from Vladimir) and linen factories, manufactures of glass and chemicals, iron-works, distilleries, and tanneries. Iron ore, china-clay, and gypsum are common. Pop. (1890) 1,456,600, mostly Great Russians. HERMANN SCHOENFELD.

Vladimir: capital of the government of Vladimir; on the Klyasma; 120 miles by rail N. E. of Moscow (see map of Russia, ref. 7-E). It was founded about 1120, and was the capital of the principalities of Vladimir, Suzdal, and Rostoff (1157-1328). The ancient Kremlin, containing the Uspenskij Cathedral (built 1150), where all the princes of Vladimir have been buried, and the Golden Gate, an ancient triumphal gate and fortification, are the principal historical edifices. The city, connected by rail with Moscow and Nijni-Novgorod, has some manufactures, though but little trade, and several churches that date from the twelfth century, a theological seminary, a gymnasium, and several high schools. Pop. (1888) 20,235. H. S.

Vladimir the Great: See RUSSIA.

Vladislav: another spelling of LADISLAV (*q. v.*).

Vladivostok' (i. e. the ruler of the east): capital of the Primorskaya, or Coast Province, in Eastern Siberia, and the chief naval station of Russia on the Pacific coast (see map of Asia, ref. 4-1). The town is on the northern shore of the hilly peninsula of Muraviev-Amursky, which is filled

by the Russians the Golden Horn (*Zolotoi Rog*). Its harbor on Golden Horn Bay, with a depth of from 5 to 13 fathoms, is protected from wind and breakers by the opposite island of Dundas, and is spacious enough to hold a large fleet; but a crust of ice forming along the shore in December keeps vessels icebound for over a month. The Gulf of Peter the Great, in the Sea of Japan, which is divided by the peninsula of Muraviev into the large Amur and Ussuri Bays, was mapped in 1859 by the Russian ships *America* and *Strel'ok*. The town was founded in 1861, and became a naval station for the Siberian fleet in 1870. The naval workshops were transferred at that time to Vladivostok from Nikolaievsk, and large machine-shops for steamers, repair-shops, and docks established. The first batteries were built in 1876-77, in order to be ready in case of emergency, as in the event of a war with Great Britain. Vladivostok became the terminus of the overland telegraph line via Irkutsk and Kuchta, and is connected by a cable with Nagasaki (completed 1871) and Shanghai. The Great Siberian Railway (see *Engineering Magazine*, July, 1894), which is being pushed forward with great energy, will give to Vladivostok, as the terminus of the railway, an international importance, and, as the port for vessels carrying freight to and from Japan and the U. S., a degree of commercial prosperity heretofore impossible. In 1887 the imports to Vladivostok amounted to \$2,890,500 (\$2,150,000 from non-Russian, especially Chinese quarters). The exports fell from \$209,500 in 1886 to \$64,000 in 1887. The city on the Golden Horn, defended by strong batteries, is of irregular construction, and has but one street, the Svietlianskaya, along the harbor. There is a pro-gymnasium, a girls' high school (founded in 1862, the only one in the province), two naval schools, and a scientific society for the study of the Amur region. Pop. 14,440, nearly half Manchus and Koreans. See SIBERIA. HERMANN SCHOENFELD.

Vlissingen, or **Vliessingen**: See FLUSHING.

Voadica: See BOADICEA.

Vocative [Lat. *vocati'vus*, deriv. of *voca're*, to call]: an interjectional form of the noun. It is used to attract the attention or to retain the interest and sympathy of the person addressed, or may be used in the third person as a mere exclamation. The highly inflected languages of the Indo-European, while frequently using for this purpose the form of the nominative, have especially appropriated to it a form of the noun-stem without special case-ending, as Greek *σῶτερ*, *Ἀπολλων*, *Σόκρατες*, *ἔδελφε*. B. I. W.

Vode'na: town; in European Turkey, vilayet of Salonica, on the Vistritza. Though occupying the site of Edessa (*q. v.*), there are few antiquities. Pop. about 10,000.

Vogel, fō'gel, ALFRED, M. D.: paediatrist; b. at Munich, Germany, Mar. 31, 1829; son of the chemist Heinrich von Vogel; studied medicine at the Universities of Munich, Berlin, and Würzburg, graduating M. D. at the former in 1852; became docent in that university in 1855, and professor extraordinary in 1865; accepted a call to Dorpat University in 1866 to fill the professorship of special pathology, remaining there until 1886. While there he was decorated with several orders by the czar, and became a member of the privy council. In 1886 he returned to Munich to fill the post of honorary professor and president of the paediatric clinic. His most important publication was *Das Lehrbuch der Kinderkrankheiten* (1860), which passed through eleven editions, and was translated into most of the languages of Christendom. D. Oct. 9, 1890. S. T. A.

Vogel, EDUARD: traveler; b. at Crefeld, Rhenish Prussia, Mar. 7, 1829; was educated in Leipzig; studied astronomy and natural science there and in Berlin under Encke; assisted Hind for two years in his labors at Bishop's observatory in London, and went in 1853 to Africa, with the support of the British Government, to join the expedition of Clapperton, Barth, and Overweg. Feb. 20, 1853, he sailed from England to Tripoli; Aug. 5 he reached Murzuk, and Jan. 13, 1854, Kuka, the capital of Bornu. From this place he undertook various expeditions to the adjacent countries; met Barth at Bundi Dec. 1, 1854; visited Yacoba, and returned to Kuka Dec. 1, 1855. At this date his own notes stop, but it was afterward ascertained that on Jan. 1, 1856, he started eastward, penetrated to Wara, the capital of Waday, and was assassinated there Feb. 8, 1856. His notes were published by his sister, Elise Polko, in her *Erinnerungen an einen Verschollenen* (Leipzig, 1853).

Revised by M. W. HARRINGTON.

Vogel, Julius, K. C. M. G.: statesman; b. in London, 1835; educated at London University School, and at the Royal School of Mines, where he gave particular attention to the assaying and testing of the precious metals; went to Melbourne about 1851, intending to put his knowledge to practical use in the gold-fields of Australia, but becoming interested in politics was elected a member of the provincial council; became head of the provincial government; also became a member of the New Zealand house of representatives, removing to Auckland in 1869; was successively colonial treasurer, postmaster-general, commissioner of customs, prime minister (resigning 1876), and agent-general (1876-81) for New Zealand; again held a Government position in New Zealand 1884-88; then returned to England. He was instrumental in furthering immigration into New Zealand, the construction of railways, and the passage of the act for inscribing colonial stocks. He has published a handbook of New Zealand, several pamphlets and papers, and a novel, *A. D. 2000*.

Vogelweide, Walther von der: See WALTHER VON DER VOGELWEIDE.

Vogesen: See VOSGES MOUNTAINS.

Voghera, vō-gā-rā (anc. *Fria*): town; province of Pavia, Italy; in the rich and highly cultivated plain between the Po and the Apennines (see map of Italy, ref. 3-C). The Via Emilia passes directly through the town, which is also connected by railway with Genoa, Milan, etc. There are manufactures of hempen, linen, and cotton fabrics, and the hats of Voghera are exported even to America. The agriculture of the vicinity is prosperous. Voghera was settled before the Roman period, and was a place of some importance when destroyed by the northern invaders early in our era. Its mediæval history is closely connected with that of Milan and Genoa. Roman antiquities are found in and near the town. Pop. 12,790. Revised by M. W. HARRINGTON.

Vogt, fōkht, KARL, M. D.: naturalist; b. at Giessen, Germany, July 5, 1817; graduated in medicine at Berne in 1833; in 1839 was associated with Agassiz in the publication of *L'Histoire naturelle des poissons d'eau douce de l'Europe centrale*; in 1847 became Professor of Zoölogy at the University of Giessen, a position which he lost a little later on account of his political opinions; in 1849 became Professor of Geology at the University of Geneva, and held the position until his death, which occurred at Geneva, Switzerland, May 6, 1895. He was the author of numerous papers and books on anthropology, comparative anatomy, geology, and zoölogy. Among his principal works are *Physiologische Briefe* (1845-46); *Lehrbuch der Geologie und Petrofaktkunde* (Brunswick, 1846); *Ocean und Mittelmeer* (1848); *Die Säugethiere in Wort und Bild* (Munich, 1883). F. A. LUCAS.

Vogüé, vō-gü'ā, CHARLES JEAN MELCHIOR, Marquis de: archaeologist; b. in Paris, Oct. 18, 1829; studied the religious history and arts of the East; traveled in Syria and Palestine 1853-54, and was elected a member of the Academy in 1868 for his publications dealing with these countries. He was ambassador of France at Constantinople from 1871 to 1873, when he was transferred to Vienna. He was made a commander of the Legion of Honor in 1879. Among his works are *Les Églises de la Terre-Sainte* (1859); *Le Temple de Jérusalem* (1864-65); *L'architecture civile et religieuse dans la Syrie Centrale* (1865-77); *Mélanges d'archéologie orientale* (1869); *Inscriptions sémitiques* (1869-77).

Vogüé, EUGÈNE MARIE MELCHIOR, Vicomte de: critic and historian; b. at Nice, France, Feb. 25, 1848; served in the Franco-German war; in 1871 entered the civil service in the Department of Foreign Affairs; became *attaché* at Constantinople in 1873, and secretary of legation at St. Petersburg in 1876; retired in 1882 and devoted himself to literary and historical work, contributing frequently to the *Revue des Deux Mondes*. He was chosen to the Academy in 1888. He has protested against the materialism and pessimism of recent currents of French literature, and was one of the inaugurators of the movement sometimes called neo-Christian. Among his works are *Syrie, Palestine, Mont Athos* (1876); *Histoires orientales* (1879); *Les Portraits du siècle* (1883); *Histoires d'hier* (1885); *Le Roman russe* (1886); *Souveurs et Visions* (1887); *Heures d'histoire* (1893). A. G. CANFIELD.

Voice [M. Eng. *vois*, from O. Fr. *vois, voiz* > Fr. *voix* < Lat. *vox, vō'is*; Gr. *ὄψ, *Fōψ*, voice; Sanskr. *vāc-, speak*; cf. Gr. *ἔπος, *Fēpos*, word, and Lat. *vocā're*, call]: in the ge-

nerie sense, a property of all living animals which are structurally endowed with a capacity to produce sounds uttered from the mouth; articulate voice, the organ of language, the vehicle of thought and feeling, belongs to man alone. The methods by which the intellectual attainments of any one member of the human family may thus become the possession of all are two—viz., *speaking* and *singing*.

These must have been almost coeval in their origin; for, as the deductions of reason prove that the social necessities of the race must have very early given rise to spoken language, so a universal experience unites with remotest tradition in ascribing to every human being a religious impulse which finds its most adequate expression in song. The least-civilized tribes have always celebrated their festivals of worship with rhythmic chants, while the cultivated nations of all time have cherished music as the ethereal medium of poetry and a potent agent in the culture of the soul. For the musical side of vocal art science has already done much by defining its forms and improving its processes. Mathematics and physics have expounded the laws of sound; philosophers have discovered the immutable principles upon which melody, harmony, and rhythm depend; and the definite nature of the work to be accomplished in giving force and expression to the singing voice has made it possible to conduct that work on a well-ascertained scientific basis. But to the cultivation of speech, a faculty normally universal, and hence much more intimate and important in its relations to man, its more complicated mechanical processes and the less definite character of its melodic scale have hitherto presented the most formidable obstacles.

The human voice may be treated from a physical, a physiological, and psychological point of view; in other words, we may consider (1) the instrument, (2) its mechanical uses and processes, and (3) those intellectual laws by which it is made to convey thought and emotion to the human soul.

1. Of the physical apparatus employed in the production of voice the merest outline of description must suffice. Any good manual of anatomy will furnish the inquirer with the detailed dissection he may desire. If we begin to construct the mechanism of the voice as we would build an organ (to which it bears some analogy), we find at the base, in the human chest, the lungs, which perform the office of a bellows to furnish air for the instrument above. This air is forced through bronchial tubes, which, extending upward through either lung, gradually converge until they meet in a single tube, called the *trachea*, or windpipe, consisting of incomplete cartilaginous rings lying horizontally one above the other. At the upper end of the trachea is a funnel-shaped piece of mechanism, enlarging upward and composed of various cartilages connected by ligaments, and moved by muscles. This is called the *larynx*. Through its center, in continuation of the air-tube, runs a passage, which terminates in a triangular opening. Across this passage are stretched two pairs of tense elastic membranes—the *chordæ vocales*. Of these, however, only the lower pair is immediately concerned in the production of tone. These are called, therefore, the true vocal cords. Between their fine edges there is a narrow opening or chink, called the *glottis*; and as these cords are at will made more or less tense, the wind that is forced through the opening causes them to vibrate audibly with various degrees of force and pitch.

This is the genesis of voice; from this point the tone here generated undergoes only modifications of fullness and quality and such as combine to effect articulation. The voice now passes into the *pharynx*, a membranous bag which leads both into the mouth and into the nose. The curtain of the palate hangs between the pharynx and the mouth. It rises as a valve to cover the inner ends of the nostrils for purely oral sounds, and it falls to uncover the same for nasal sounds. The pharynx, together with the space between the two constrictions of the larynx—the upper or false vocal cords and the lower or true vocal cords,—and the anterior cavity of the mouth, with the frontal cavities over the eyes and in the cheek-bones, constitute a resonance apparatus, a species of sounding-board, by which the voice is modified in respect to fullness and quality.

II. Sound comes to the ears in two forms—as *tone* and as *noise*. Tone is sound caused by the regular periodic vibrations of the sounding body, such as are given out by musical instruments. Noise proceeds from irregular vibrations of the sounding body. The crash of thunder, the rattling of street traffic, the discord which results from striking all the keys of a piano at once—these are noises. The sounds made in speaking consist of both tones and noises.

Helmholtz, in his *Lehre von den Tonempfindungen*, showed that for the production of every vowel-sound the cavity of the mouth is definitely tuned by the disposition of its various parts—the teeth, the tongue, the lips, the soft palate, the pharynx, etc. The air confined in the cavity of the mouth has, like any other body of confined air, its own rate of vibration, and hence its own pitch, which varies with the variation of the cavity. The vowel-sound, therefore, is independent of the musical tone produced by the larynx, and is always the same, whether in the mouth of man, woman, or child. This is true also of some of the consonant sounds, while others are merely noises produced by the breath vibrating at points of resistance in partly closed organs. Thus every element of language has its own peculiar type—or *Klang*, as it is called by the Germans—which distinguishes it from all others. These characteristic sounds may be heard even in whispering. In speaking aloud they are combined with the noises (also formed in the mouth-cavity) and supported by the tones of the larynx. Speech thus results from the combined working of two very different actions of the vocal organs. The difference between singing and speaking is that the first employs pure tones, each of definite pitch and level throughout its duration, and that the second employs unlevel tones which taper to a more acute or grave pitch at their termination. These speaking tones are called inflections. In speaking, noises predominate, and tone asserts itself mainly in occasional prolongation of the vowel-sounds.

Tone has three properties—strength, pitch, and quality, called by the Germans *Klangfarbe* (tone-color), and by the French *timbre*. The strength of a tone depends upon the amplitude, its pitch upon the rapidity, and its timbre upon the form of the vibrations which produce it. As the strength of the tone depends upon the breadth of the sound-waves, this, in its turn, depends primarily upon the structure, and then upon the disposition or adjustment, of the vocal organs and of the resonance apparatus. Much misdirected labor is sometimes expended in attempting to increase the power of the voice by straining exercise of its muscular organism. In view of the delicacy and tenderness of these ligaments such a process must be worse than useless. When once these parts are fully developed it is not possible in this way to make a strong voice out of a weak one. The tone may indeed be re-enforced by adding to the impulse which produces it a greater exertion of the diaphragm and abdominal muscles, and by a proper adjustment of the vocal cords and management of the breath; but the less of effort in the muscles of the throat and chest, and in the force of breath, the more will a sweet and agreeable quality be communicated to the voice, together with that reach and ring which comprise all the best effects of power.

The pitch of a tone depends upon the number of the vibrations in a given time by which it is produced; the more rapid the vibrations, the higher the pitch. Variations of pitch in the human voice are due exclusively to the action of the glottis and the ligaments of the larynx, and are subject to the uniform laws by which the tones in hollow tubes ascend or descend according to the different lengths of the air-columns they contain, and in stringed instruments according to the greater or less tension, the extent, and the degree of vibrating surface in their strings. By means of the LARYNGOSCOPE (*q. v.*) the various movements of the larynx and vocal cords have been accurately inspected and recorded. It is found that in giving forth the lowest tones of what is called the *chest-voice* the windpipe is enlarged to its utmost capacity, the vocal cords are moved throughout their whole length with large, loose vibrations, which are communicated to all the interior parts of the larynx, and, by resonance, to the confined air in the cavity of the chest. When to this is added a peculiar expansion of the pharyngeal cavity, that full, rich quality of the voice is produced to which Dr. Rush gave the name of *orotund*, and to which the dramatic artist is indebted for some of his finest effects. As the scale is ascended the vocal cords swiftly meet and separate at each new tone, and are shortened and made more tense; as the strings of a violin are controlled by the fingers of the player. The tones of the *head-voice* (as it is usually styled) are produced by vibrations of the inner edges only of the *chorda vocales*. This, however, is but a general and imperfect view of a very complicated process, and makes no account of the expansion and contraction of the trachea, with the consequent rise and fall of the larynx, and some other important modifications; for it is of less importance at present to give an accurate description of the physiological processes

than to expound the physical laws relating to them, in obedience to which the phenomena of voice are produced.

The division of the vocal scale into registers (chest-voice, head-voice, falsetto, etc.), their points of transition, and the treatment of the singing voice with regard to them, about which a wide difference of opinion exists, are less important in elocution, because the scale employed is more limited, little beyond the lower and a part of the middle register requiring cultivation, and that of a simpler character. Men speak (normally) an octave lower than women, employing usually only the chest-tones, rarely the head-tones, and never the falsetto. The usual range of the male voice is from the low F to A. Women use mostly the upper part of the chest register and the lower part of the falsetto, ranging from A below the line to B in the treble clef. Little children speak entirely in the falsetto.

The upper part of the chest register—that is, the middle voice—is best adapted to public speaking, being most capable of inflection, farthest of reach, and most easily sustained. If the voice is pitched too high, when excitement supervenes it will tend to break into a scream, while for low-keyed voices it is usually very difficult to rise out of a tedious monotony. The middle voice gets all the advantage from chest-resonance, and at the same time has room to rise or fall when emotion or occasion demands. The accomplished speaker should have full control over the pitch of his voice, and be able to modulate its key at will, so as to adapt it to all external circumstances.

The increase of the compass of the voice is not so important in elocutionary as in musical instruction. A judicious practice of the scale under the guidance of a skillful master will accomplish all that is necessary in this respect, and at the same time tend to improve the voice in flexibility and purity.

The most important thing to be considered in the culture of the voice is timbre or quality. All bodies and instruments employed for producing musical sounds give forth, besides their fundamental tones, certain other tones due to higher orders of vibration. It is the intermixture of these with the fundamental tone which determines the *quality* of the sound and distinguishes instruments from each other—a clarinet from a flute (for example), both these from a violin, all of them from the human voice, and different voices from one another. These are the *harmonics* of the fundamental tone—called by the German physicists the *harmonic overtones*. Though feeble in comparison with the primary tone, they may, with a little practice and attention, be heard when, for instance, one of the lower notes is struck upon a pianoforte. Above every tone of a determined pitch may be traced a whole series of "harmonic overtones," rising according to the "acoustic series" before indicated—viz., first the octave, then the fifth, etc.

The timbre of a tone, as has been said, depends on the *form* of the waves of vibration. As the surface of water is moved into waves of a different form according to the object which agitates it—whether a falling stone, a rustling wind, or a diving keel—so the movements of the air take different shapes according to the way in which they are excited, whether by the violin-string under the rasp of the bow, the harp-string plucked by the finger, or the reed of the clarinet vibrated by the breath. These varieties are infinitely numerous, and are distinguished by the different relations which they cause between the fundamental tone and the overtones. The most beautiful timbre is found to result from that form of the vibratory waves which produces the primary and its harmonics in the intervals of the major chord to the sixth above, the former sounding most loudly and the latter gradually decreasing. As the overtones increase in strength in relation to the fundamental tone, the sound grows shrill; and if the higher overtones, which lie close together and are dissonant, overpower the fundamental, the quality of the sound becomes harsh and disagreeable.

The timbre of the voice depends on the manner in which the tone begins, the management of the breath in producing it, the direction given to the column of air which carries it, and the disposition of the anterior cavities by which it is tuned for the various elements of speech. It has been found that the form of vibration most favorable to a pleasing as well as far-reaching quality of voice is a *round* form—i. e. one which sends the sound-waves out upon the air in such a way as to allow of their circulation in all directions with the least obstruction; and that this form is best produced by a light, elastic impulse, like that made by the sudden

fall of a pebble into the smooth surface of a lake—with the difference that sound spreads out in the air like a sphere, while the waves of water extend only in circles. This light impulse is to be accomplished by a careful adjustment of the vocal organs, so as to allow just the quantity of breath to escape which is necessary for the production of the tone. If too little breath is used, the vibrations will be feeble; if too much, the vibrations will be distorted from the form most favorable to an agreeable and effective quality. An excessive pressure of the breath drives the sound-waves forth in a single direction, instead of allowing them to expand, and the low harmonic overtones disappear, while the high dissonant overtones disagreeably assert themselves. Every particle of the column of air expired should vibrate, or of course it is lost to sound; besides that, the escape of unvoiced air along with the vibrating air makes itself manifest in a certain wheezing very detrimental to the purity of the tone. The first impulse of the voice, then, should be sudden, light, and made with a moderate expenditure of breath. By this method the sound takes on a round and even form, which may be by due precautions maintained and the timbre kept always at its best; while the same process is most favorable also to the reach of the sound, as more speed and power can be generated by a quick, elastic blow than by the steady pressure of a heavier force.

Again, both theory and experience teach that, for purposes of purity in tone, the air-column from the larynx should be directed, both in speaking and singing, to the front of the mouth, and concentrated there above the upper teeth, whence it should rebound to form continuous vibrations in the various resonance apparatus behind. If this rebound takes place farther back the inharmonic overtones become prominent, and various discordant qualities result. Among the well-known faults of vocal quality—such as nasal, guttural, husky, thin, strained, metallic—the greater part have too often been deemed organic and unalterable, but they are (with the exception of rare instances of structural defect) due to misuse of the vocal apparatus, and may, by proper treatment, be greatly modified or entirely obviated.

Finally, the form given to the mouth-cavity, by which it is tuned for the elements of articulation, has not a little influence on the timbre of the voice. For, however excellent the tone may be in its origin, the form of the vibrations—on which, as we have seen, the quality depends—must be affected by the passages through which they proceed on their way to the lips. Care must always be taken to give room in the mouth-cavity for the proper formation of the vowel by expansion of the faucal passage; for the more room given for vowel-sounds, the more will musical tones predominate, and the richer, fuller, and sweeter will be the utterance. So true and so important are these injunctions that it has been said that the quality of a good voice has its origin in the mouth-cavities rather than in the vocal cords, as commonly supposed.

One of the most wonderful and interesting results of scientific voice-culture may be seen in what it has accomplished for the instruction of deaf mutes. The occasional attempts hitherto made by these unfortunates to utter speaking sounds have resulted only in discordant tones, entirely uncontrollable in the essential particulars of pitch and quality; but by many years of minute investigation and unwearied experiment, assisted by an ingenious system of diacritic symbols, Prof. A. Graham Bell, of Boston, has been enabled to teach the deaf not only to produce all the sounds of speech, but to appreciate and to modify the quality of their voices, to sustain or to vary the pitch, and, in short, to fulfill all the conditions of a correct and pleasing utterance. The symbolic system alluded to was invented by Prof. A. Melville Bell. It is called VISIBLE SPEECH (*q. v.*), and consists of a series of signs which indicate, by their form, the exact method by which all the sounds possible to human speech must be produced.

III. It remains to consider speech psychologically: as the medium of expression, the vehicle of thought and emotion. If we view the vocal elements combined in syllables and words and sentences as constituting the form of the art, we inquire now after the animating spirit which is to imbue that form with beauty and power. This influence is to be found, primarily and comprehensively, in the largest general culture—intellectual, aesthetic, moral. Cicero demanded for the orator the most consummate and various wisdom, and Quintilian contended that he should be also a good man; and even for the reader or the actor, who but

embodies in his utterance the sentiments of another, it is clear that intelligence and sensibility to appreciate the language he employs is absolutely indispensable to the successful performance of his task. This psychological fitness makes itself immediately felt in an infinite variety of vocal inflections, some of them so minute as to defy analysis and almost to elude observation. These subtle phenomena some elementary writers have endeavored to classify, but, while the attained results are undoubtedly valuable to students, the rules for the modulation of the voice can not be conscientiously carried into actual delivery. Indeed, they are not intended to be so; their object is merely to cultivate the vocal powers and to open the mind to a recognition of the possibilities of expression. Notwithstanding the nearness of the subject to all human interests, it is not to be denied that the formal study of elocution as a branch of education has never been popular. There is a latent suspicion in the common mind that the subtleties of thought and emotion, and the innumerable varieties of vocal inflection which are the exponents of these, are incapable of analysis and mechanical production; that they must result from the intuitive agency of the intellect and the heart; and that without this spontaneous energy no artificial system is competent to create them. If the culture of delivery, according to the supposition of Archbishop Whately, the eminent formulator of the doctrine of *laissez aller* in this branch of rhetorical study, necessarily involved the careful attention of the speaker, *while in the act of speaking*, to rules of tone, emphasis, and inflection, the question would be answered in the statement of it. But the technique of this, as of all other arts, is to be taught and wrought into a habit, so that the learner comes to conform to its minutest requirements automatically. The test of excellence in this art, more than in any other, is the concealment of all artifice, and any disclosure by speaker or reader of his technical sub-processes is fatal to success. On the other hand, it is not easy to see why this, more than any other art, should be held as entirely independent of technical knowledge and skill. Notwithstanding the elaborate effort of the distinguished critic in question to show a difference between this and the art of composition, it appears to the writer that the analogy is complete, and that his objection holds equally good against the study of the rules of grammar and rhetoric, which would doubtless prove mere impediments to the orator who should make conscious use of them in the pulpit or on the rostrum.

On the other hand, it must be acknowledged that there has been a tendency in elocution, as usually taught, to fix the attention of the pupil too exclusively upon a prescribed set of modulations, apt to become mechanical, and so to shut the avenues of his soul against that infinite variety of delicate suggestions which nature is wont to make to cultured sensibility, and which can never be reduced to system. The question has been asked "What distinction of grave, or acute, or circumflex, for example, can inspire the actor to the proper utterance of the *ΕΙ ΤΥ. ΒΡΥΛΕ?* of the dying Caesar, adopted from Plutarch by Shakspeare? Here is a single word the just delivery of which all the systems of all the schools can never define." The answer to this question is that notations for expression furnish a means of varied exercise in different modes of delivering the same language, and that the student does not merely follow a prescribed set of modulations, but simply from them acquires the ability to govern his voice in any way his judgment may approve. We may at least admit that no analysis of the voice in delivery can be exhaustive, or be allowed to supersede a constant fresh application to the oracles of nature for inspiration to the best utterance.

Attempts have been made at different times, both in the U. S. and in Europe, to define and regulate expression by intervals identical with those which exist in music, and to indicate the modulation by musical notation. One of the most eminent of these theorists was Dr. James Rush, of Philadelphia, who in 1827 published a *Philosophy of the Human Voice*, and who deserves mention as one of the first in the U. S. to give impulse to the investigation of this subject, and for the many valuable contributions to the art of vocal culture which his work contains. This writer, having observed the diphthongal character of some of the vowels, gave the name of *radical* to the first and of *vanish* to the latter of the two elements, and asserted that the voice spans the interval of a musical tone in passing from one to the other. From this he proceeded to construct the theory that all the intervals of speech may be determined by musical analogies; and he elaborated a system by which all the

variations of the voice, in every phase of expression, may be measured by the degrees of the musical scale and marked by a quasi-musical notation. This theory was advanced before the more thorough investigations of modern science had better explained some of the imperfectly observed facts on which it rests. Its practical value may be estimated by the fact that not one of the notated phrases by which it is illustrated can be read by the musical symbols without first appealing to the independent action of the mind for a key; and also by the fact that of all the teachers who have professed to base their instruction upon the *Philosophy* of Dr. Rush, not one, apparently, has ever made a serious and persistent attempt to carry this portion of it into practice. It is but just to add that all through his rather voluminous work are scattered valuable suggestions of a general nature, and that his analysis of the vocal elements has been found useful for the acquisition of a correct and forcible utterance.

There is another system which is less open to the objection of artificiality. It is that which derives the law of delivery from the structure of the sentence. This idea was first advanced by Walker in his *Elements of Elocution*, but its fuller development was reserved for Dr. Henry Mandeville, of Hamilton College, New York. The latter carried out the principle of modulation based upon sentential structure (not forgetting the special influence of emphasis, of which he presents an acute and exhaustive discussion) through a very wide induction of sentences selected from English literature. This method of instruction, in causing the arts of composition and delivery to go hand in hand, restores elocution to its ancient dignified alliance with rhetoric. But rules for delivery founded on sentential construction are not to be accepted as sufficient guides; for the fact is patent that grammatical constructions of any given kind may require very opposite expressions in different cases. Thus interrogative construction may require to be pronounced assertively and *vice versa*. The governing principle is rather that the meaning intended to be conveyed dictates the method of delivery, irrespective of sentential construction. The laws of vocal expression are in this way proved to be the true regulators of delivery. Hence is obvious the paramount importance of the cultivation of the voice, and the mastery of its movements.

The whole matter of the advisability of formal education in elocution may be summed up in the well-worn maxim of Ovid: "The safest path lies midway of extremes." The true doctrine is thus well expressed by another: "To be able to act upon the souls of men with an elevating and informing power, it is first of all necessary that an artist should cultivate the form of his art to its greatest possible perfection, and have such perfect command of it that the practical application of it is as natural to him as to breathe. For, empty and dead as all technical knowledge is unless it is animated with a soul, yet no product of art aesthetically beautiful is possible without a perfect technique."

For details, see Helmholtz's *Lehre von den Tonempfindungen*; Dr. Oscar Wolf's *Sprache und Ohr*; Carpenter's *Human Physiology*; and the writings of Max Müller, Czernak, Du Bois-Reymond, etc.; for popular reading, Tyndall's *Lectures on Sound*; Emma Seiler's *The Voice in Singing and The Voice in Speaking*, which present the results of scientific investigation so far as practically valuable to the ordinary student; also Dr. Mandeville's *The Elements of Reading and Oratory*.

Revised by ALEXANDER MELVILLE BELL.

Voice (in music): The singing voice is divided into six classes, viz., three female, SOPRANO, MEZZO, and ALTO, and three male, TENOR, BARYTONE, and BASS (*qq. v.*). The mezzo-soprano, as the name denotes, is a voice of not quite so high a range as the true or high soprano, but generally counterbalances this by a few added low notes, and not infrequently by a richer quality in the middle range. In like manner all the various species of voice approach each other in some one direction, so that the specific name does not signify a given limit of compass as applied to each and every individual. Thus the barytone as a familiar division between true tenor and true bass is not infrequently subdivided by the Germans and spoken of in given instances as bass-barytone and tenor-barytone. There is also a difference among tenors, as the *tenore leggero* (light tenor) and the *tenore robusto*. The difference between the two, however, lies rather in the volume and force of the latter voice than in a difference of compass.

DUDLEY BUCK.

Voice (in grammar): See **VERB**.

Voice, Loss of: See **APHONIA**.

Voir Dire, vwaâr-deer. [O. Fr., to say the truth; *voir* < Lat. *verus*, true + *dire* < Lat. *dîcere*, say]; in law, an ancient technical term derived from the Norman French, and denoting the preliminary examination of a witness or juror on a judicial trial in order to ascertain whether he is competent. At the common law no person pecuniarily interested in the event of a suit was eligible as a witness on the side where his interest lay. If an individual was called on a trial and offered as a witness, the other party, suspecting him to be interested, might require that he should be specially sworn and examined touching his interest. This preliminary proceeding was called an examination on his *voir dire*, or simply the *voir dire*. By modern statutes the incapacity resulting from interest has been almost entirely abolished. The *voir dire* examination, therefore, if used at all, must be for the purpose of ascertaining other grounds of incompetency whenever and wherever any such exist. The practice survives mainly and is of the most practical utility at the present time in ascertaining the competency of jurors in criminal cases, though it is, as thus employed, liable to great abuse.

Revised by G. W. KIRCHWEY.

Voisin Bey, vwaâ'zâin'bâ', FRANÇOIS PHILIPPE: civil engineer, inspector-general of bridges and highways; b. at Versailles, France, May 20, 1821; entered the *École de Ponts et Chaussées* in 1840; was ordinary engineer in 1846, chief engineer in 1866, and inspector-general in 1880; director-general of the works of the Suez Canal from 1861 to their completion in 1870; Professor of the Course on Maritime Works at the *École de Ponts et Chaussées* from 1873 to 1881. He has published *Ports de Mer* (1883; Germ. trans. by Franzuis, director of imperial maritime constructions and professor at the Maritime Academy of Kiel) and *Notice sur les travaux à l'embouchure du Danube* (1893). He is an officer of the Legion of Honor.

W. R. HUTTON.

Vokes, ROSINA: actress; b. in London, 1854. She was the youngest of the company of actors known as the Vokes family, consisting of Frederic and his sisters, Jessie, Victoria, Rosina, and Fawdon Vokes, the latter's real name being Fawdon. From childhood they all had a taste for the stage. They learned elocution and stage action at Plymouth, England, joined a pantomime troupe, and met with success throughout Great Britain, making their professional *début* in London at the Lyceum theater in *Humpty Dumpty* Dec. 26, 1868. The Vokes family crossed the Atlantic a number of times. The most successful of their pieces was *The Belles of the Kitchen*. The company played in every city of importance in Great Britain, Ireland, the U. S., and Canada. In 1877 Rosina Vokes was married to Cecil Clay, an English barrister, and retired from the stage for several years. In 1886 she organized a company and visited the U. S. regularly every season, playing farces and short comedies in all the principal cities. D. at Torquay, England, Jan. 27, 1894.

B. B. VALLENTINE.

Volapük, vō-lā-pük', [world's language; *vola*, genitive of *vol*, world + *pük*, language, words fashioned after English *world* and *speak*]; an artificial language invented by a clergyman, Johann Martin Schleyer, of Litzelstetten, in Baden, and given to the public in 1879. It first spread to Austria, and a society was formed for its propagation in Vienna in 1882. It was also studied extensively in Holland, Belgium, and especially France, but was not so successful in English-speaking countries. Its purpose was to facilitate ordinary intercourse between peoples of various tongues by affording a linguistic medium purged of all the irregularities and inconsistencies which characterize natural or traditional speech. Basing in general upon the English, it sought to utilize the convenient uniformity of the agglutinative type of languages, especially in regard to word-formation. The number of those who have studied the language has been estimated at over 200,000, and there have been many periodicals devoted to the interests of Volapük, and printed in that language.

Sounds of Letters.—These have in general their familiar continental values, but *c* = Eng. *j* in *joke*, *h* = Germ. *ch* in *ach*, *j* = Eng. *sh* in *she*, *v* = Eng. *w* in *wel*, *y* = Eng. *y* in *yet*, *z* = Eng. *ts* in *hats*. The sound *h* is denoted by the Greek *spiritus asper*, as 'ap, harp; *c'* = Eng. *ch* in *child*. Words are accented on the final syllable.

Word-formation.—Words are formed from monosyllabic roots which themselves often serve as words. Derivatives

are formed by the use of prefixes and affixes of constant value, possessing entire monopoly of their office. Thus :

not, information.	pen, pen.	lab, possession.	jep, herd
notik, public.	penik, feathered.	labik, mighty.	jepik, in flocks.
notön, announce.	penön, to write.	labön, possess.	jepön, to watch.
notel, informer.	penel, writer.	label, possessor.	jepel, shepherd.
notam, N. B.	penam, the writing.	labam, the taking.	jepam, protection.
notad, publication.	penad, writing.		
noted, remark.	pened, letter.	labeled, property.	

The prefix *lu-* indicates weakened or debased quality; thus *sanel*, doctor; *lusanel*, quack; *vok*, sound, voice; *lurok*, shriek; *man*, man; *lumun*, rascal. The prefix *le-* magnifies, as *jul*, school, *lejul*, university; *dom*, house; *ledom*, palace. Diminutives are formed by adding *-il*, as *bod*, loaf; *bodil*, small loaf; *kat*, cat; *katil*, kitten. Comparatives end in *-ikum*, superlatives in *-ikün*, as *dib*, depth; *dibik*, deep; *dibikum*, deeper; *dibikün*, deepest. Feminine names are formed from the corresponding masculines by prefixing *ji-* (pronounced *she*), as *fat*, father; *jifat*, mother; *gam*, bridegroom; *jigam*, bride; *blod*, brother; *jiblod*, sister.

Inflexion.—The inflexion of nouns is as follows:

Singular.	Plural.
Nom. <i>buk</i> , book.	<i>buks</i> , books.
Gen. <i>buka</i> , of a book.	<i>bukas</i> , of books.
Dat. <i>buke</i> , to a book.	<i>bukes</i> , to books.
Acc. <i>buki</i> , book.	<i>bukis</i> , books.

The pronouns follow the nouns both in formation and inflexion, thus *ob*, I; *om*, he; *obs*, we; *oms*, they; *obik*, my; *omik*, his; *obsik*, our; *omsk*, their.

The inflexion of the verb may be illustrated by the following examples:

Present.	Imperfect.	Perfect.	Pluperfect.	Future.
<i>löfob</i> , I love.	<i>olöfob</i> .	<i>elöfob</i> .	<i>ilöfob</i> .	<i>olöfob</i> .
<i>löfom</i> , he loves.	<i>olöfom</i> .	<i>elöfom</i> .	<i>ilöfom</i> .	<i>olöfom</i> .
<i>löfobs</i> , we love.	<i>olöfobs</i> .	<i>elöfobs</i> .	<i>ilöfobs</i> .	<i>olöfobs</i> .

Optative (3 sing.), *löfomös*; imperative, *löfomöd*; infinitive, *löfor*; participle, *löfol*.

Sprague, *Handbook of Volapük*, a complete grammar, with exercises and vocabulary (1888); K. A. Linderfelt, *Volapük* (2d ed. 1888); K. Dornbusch, *Abridged Grammar of Volapük*, by Prof. Kerekhoffs, adapted to the use of English-speaking people (1887); S. Huebsch, *Volapük* (1887). BENJ. IDE WHEELER.

Volatile Oils: See ESSENTIAL OILS.

Volcanism: See GEOLOGY.

Volcanoes [from Ital. *volcano*, *volcano*, orig. the volcano of Mt. Etna, fabled to be the abode of Vulcan, the Roman god of fire and the lower world < Lat. *Vulcanus*, Vulcan]: (1) openings in the earth from which molten lava or other highly heated substances are discharged; or (2) mountains or hills from which such substances are or have been discharged. The typical shape of a volcanic mountain is a truncated cone, the apex being replaced by a conical cavity called a crater; but the form is often less simple. At the bottom of the crater is the opening, or vent, from which the discharges or eruptions usually take place. The body of the volcano is composed of erupted material which accumulates about the vent, gradually building up the conical mass.

PHENOMENA OF VOLCANIC ACTIVITY.—*Effusive Eruption.*—A large part of the material discharged from a volcano is liquid or pasty, consisting of melted rock or lava. The kinds of rock which are erupted differ from the ordinary stratified or sedimentary rocks in composition and structure. They are composed chiefly of silica and various silicates, which are sometimes amorphous or glassy, but more commonly crystalline. (See ROCKS.) The varieties containing much silica are said to be *acid*, those with comparatively little silica *basic*. The basic varieties are heavier than the acid. They are also more fusible and as a class they are darker. When erupted a basic lava is heated much above the temperature of fusion, so as to be quite liquid. It flows down the slopes adjacent to the vent in a thin stream, or if issuing on a plain spreads into a broad lake. As it flows the superficial part is rapidly cooled and a solid crust is soon formed. This crust may move onward with the current, in which case it is rolled under it at the end, or it may adhere at the sides and become fixed, permitting the liquid portion to flow on beneath it. The liquid by cooling is gradually rendered viscous, and at the extreme point to which it flows is usually so stiff as to hold a wall 30 or 40 or

even 100 feet high. Sometimes the crust of a narrow stream will become so strong as to be self-supporting, and the liquid beneath may then flow out from under it, leaving a cave or tunnel.

An acid lava usually issues in a pasty or viscous condition, flows but a short distance, and comes to rest in a sheet several hundred feet in thickness. Sometimes it does not flow at all, but remains in a bulbous mass over the vent.

Each eruption adds a layer of solid lava to the country adjacent to the vent. Where a series of eruptions take place from the same vent, each successive discharge flows toward the lowest tract, and in this way the country is built up somewhat evenly on all sides, the result being a conical mountain. Usually after an eruption the liquid lava retreats down the funnel, leaving a crater at the top of the cone, but acid lavas sometimes produce dome-like mountains without craters.

Expulsive Eruption.—Molten rock when subject to great pressure is able to absorb much water in the form of steam, and a certain amount of moisture is contained in all lavas. It is only those in which the quantity of steam is small that well out quietly, as described in the preceding section. When a large quantity of steam is present the phenomena of eruption are very different. As the lava rises toward the surface the pressure on it becomes gradually less, and the diminution of pressure affects the condition of the steam. Under great pressure it is dissolved or occluded by the lava, and is inert; under small pressure it exhibits the elasticity characteristic of gases, and expands. Thus as the lava approaches the surface it becomes filled with bubbles and these bubbles continually grow. The lava is thereby made lighter and its upward motion is increased. Arriving at the surface it is torn to fragments by the steam, and these fragments are thrown high in the air. In the extreme case they are so fine as to constitute a dust which is floated off by the wind and descends gradually to the earth, covering a large district with a thin sheet. Usually the fragments are larger and fall to the ground near the vent. They may be in a pasty condition, so as to adhere, or they may have cooled in their transit through the air so as to accumulate in a loose heap. They are more or less spongy in structure, being filled with bubbles, and for this reason they are ordinarily called cinders, or, when minute, ashes.

The cinders are thrown some hundreds or thousands of feet into the air, and on descending fall upon a circular tract about the vent. The vent itself receives no deposit, as the particles falling toward it are thrown back by the rising steam, and the accumulation is thus given the form of a ring with the vent in the center. From the crest of this ring there is a steep slope toward the vent, and all particles falling on this slope roll into the vent, to be again thrown

FIG. 1.—A cinder cone of the Franciscan group, Southern Arizona. Fresh lava stream near base at right.

out. There is also a steep slope outward which joins the surrounding plain by a curve. The cratered cone thus formed is known as a cinder cone, and is one of the most frequent results of eruption.

When the quantity of steam in the lava is moderate, the bubbles forming within the liquid at some distance beneath the surface gradually coalesce, making great bubbles which rise and burst with violence, throwing up fragments of the viscous and frothy films that surrounded them, and thus building up the slopes of the cone.

The tendency of the escaping steam to rise and of the ejected cinders and ashes to fall, ordinarily leads to their rapid separation, so that the deposit on the cone is dry; but it sometimes happens that the steam is soon condensed to rain which falls on the cone, and is thus reunited with the solid discharges, constituting a mud which flows down the slopes.

While a mountain is in strong expulsive eruption a continuous column of steam and dust rises from its crater to a height of several thousand feet, and then, having reached an air stratum of its own density, spreads as a horizontal cloud or is drifted away by the wind. Its color is black or white, as dust or steam predominates. About the column stones are seen to fall, and from the cloud may fall a shower of dust or

FIG. 2.—Vesuvius in eruption, April 26, 1872.

rain. At night the column and cloud are lighted up by the glow from the crater, and flying stones within the column are seen to be self-luminous.

Explosion.—Yet another phase of volcanic activity is exhibited when lavas rising through the crust do not actually reach the surface, but stopping at some lower point heat the water contained in the adjacent rocks far above the temperature at which, under ordinary conditions, it is converted into steam. This conversion is prevented by the weight of the overlying rocks, and also by their strength, until a large amount of energy is thus stored and concentrated. When at last the rocks above yield to the strain and are broken, the steam is suddenly expanded, producing an explosion. The underlying rocks are torn out, leaving a crater, and the rocks which were saturated by superheated steam are torn to powder and thrown high into the air. The explosion of Krakatoa in 1883 was one of the most notable catastrophes of this class, the finer dust being carried to the upper layers of the atmosphere, where it floated for many months, producing red skies that were observed throughout the world. See **KRAKATOA**.

Rhythm and Alternation.—In various ways volcanic activity is rhythmic. Most volcanoes have periods of absolute rest and quiet, during which the subterranean conduits are sealed by the congealation of the lava. These periods are often so long that traditional history retains no record of their beginning, and the catastrophes in which they sometimes terminate are the more disastrous because unsuspected. It is usually after such an interval that the most violent explosions occur.

During active periods the degree of activity varies from day to day and from year to year. The bursting bubbles are larger and smaller, more frequent and less frequent, and for a time they may cease altogether, the crater retaining only a pool of hot lava in gentle ebullition. The pool may rise until it overflows the rim of the crater, or it may retreat far down the conduit. The size of the conduit varies, becoming smaller by growth of its solid walls when the activity is feeble, and growing larger by fusion of its walls when activity is vigorous. Sometimes the pool expands into a lake, eating its way into the body of the mountain.

From large volcanoes effusive eruption is not always over the crater rim. The pressure from the lava column and the stresses from unequal heating may crack the mountain, letting the lava escape from the flank. The lateral discharge draws down the pool in the crater, and may continue for a long time, but eventually the cracks are sealed, and the lava again rises in the crater.

Still further variety is given by the alternation of different phases of activity. There are many vents which have yielded but a single eruption. Sometimes that eruption has

been explosive, sometimes effusive, and sometimes it has changed during its progress from the expulsive to the effusive type. There are also a few localities at which the only volcanic event has been an explosion. Often, however, eruptions recur at the same spot, or so nearly at the same spot that the discharged material combines in the formation of a single volcanic mountain. In such cases the successive events are rarely of the same type. Effusion and expulsion alternate, and a long period of rest is apt to be ended by an explosion, partially destroying the heap already accumulated. Within the great crater of explosion new cones are built by expulsion and effusion, and these cones may eventually grow so large as to bury the remnants of their predecessors.

Accessory Phenomena.—For a discussion of earthquakes, which often precede the renewal of eruption, see **EARTHQUAKES**. These are sometimes accompanied by the drying up of springs and wells. After each principal epoch of a volcano's activity, and also at the close of its life, the slow dissipation of the heat within it is manifested in various ways at the surface. Springs in the vicinity are apt to be thermal and highly charged with minerals in solution. Sometimes they take the form of geysers. In craters and near the summits of volcanic mountains, steam or warm moist air may issue from crevices, or there may be extensive chemical reactions resulting in the decomposition of rocks, the concentration of various minerals, and the escape of acid gases.

DISTRIBUTION OF VOLCANOES.—Prof. Judd estimates the number of great habitual vents at from 300 to 350. If to these are added the volcanic mountains whose slopes show so little erosion that the date of latest eruption can not be more than a few centuries ago, the number is perhaps doubled, and it is still more greatly increased if there be added the subsidiary vents on the flanks of great volcanoes, and minor vents of brief activity.

There are volcanoes in all the great divisions of the world; the eastern hemisphere contains about as many as the western, the northern as the southern. But their distribution in detail is far from equable. They are gathered in groups or lines, and these are arranged in belts or systems, so that in a general way the surface of the earth may be classified in volcanic districts and non-volcanic districts. This classification is rendered more definite by including with active volcanoes all those which have perfect craters, or are otherwise so well preserved as to indicate somewhat recent activity. More than one-half the whole number constitute islands of the ocean, or occur on islands of moderate size, and of the remainder by far the greater number occur near the shores of the ocean. One of the principal belts surrounds the Pacific Ocean. Starting at the South Shetland islands it may be traced along the western coast of South America, Central America, and North America, and through the Aleutian islands, Kamchatka, the Kurile islands, Japan, Formosa, the Philippines, the Moluccas, Solomon islands, the North Hebrides, Kermadec islands, and New Zealand, to South Victoria Land. Within this circuit the Ladrone, Hawaiian, Galapagos, Samoan, Tonga, and Fiji archipelagoes, beside many smaller groups, are volcanic, and with them may be classed the coral islands of Polynesia, which probably rest in great part on volcanic foundations. From the Moluccas a branch belt extends eastward by way of the Banda islands through Java and Sumatra. The margins of the Atlantic are comparatively free from volcanoes, the principal exceptions being the Antilles, off the coast of South America, and the Canaries, off the coast of Africa. An irregular, submerged ridge traversing the Atlantic Ocean from north to south bears the volcanic mountains of Jan Mayen, Iceland, the Azores, the Cape Verde islands, Ascension, St. Helena, Tristan da Cunha, and at the extreme south the Sandwich islands. Between Ascension and the Cape Verde group there have been several submarine eruptions. The volcanic belt of Europe follows the shore of the Mediterranean, and is continued in Eastern Asia in the mountains of Armenia and Western Arabia. There is a belt of extinct volcanoes near the Persian Gulf, and a few active and extinct volcanoes are reported in Tibet and Manchuria. The principal groups of the Indian Ocean are on the Mascarene and Comorin islands, and Madagascar, and there is an important though straggling chain of volcanic islands along the borders of the Indian and Southern Oceans. In Australia, in the central and eastern parts of North America and South America, and in Northern Asia there are no volcanic districts.

In the geologic ages volcanoes appear to have been quite

as abundant as now, and their distribution was so varied from period to period that it is fair to assume there is no part of the earth's surface which has not at one time fallen within a volcanic district. In the U. S. there were extensive eruptions about Lake Superior in Algonkian time. During and after the deposition of the Newark system there were many volcanoes along what is now the eastern seaboard from Connecticut to South Carolina. In the Cenozoic era the mountainous regions W. of the Great Plains was characterized by great volcanic activity.

THE QUESTION OF CAUSE.—The stores of volcanic material manifestly lie many miles below the surface of the earth. The cause of volcanic action, having its seat in regions remote and inaccessible, is shrouded in mystery, and attempts to discover it have been far from satisfactory. In early days, when the properties of matter were little known, it was easy to believe that the heat exhibited by volcanoes had its origin in fire. The black cloud of dust and the illumination of its rising column by the glowing lava of the funnel were readily mistaken for smoke and flame, and the imagination completed a theory by peopling the nether regions with blacksmith gods. In the early days of chemistry it was discovered that certain substances might be produced by the union of oxygen with metals and that great heat was evolved in the process, and for a time volcanoes were ascribed to combustion of this character. When, however, it became fully understood that there is everywhere downward increase of temperature, and that the interior of the earth must be exceedingly hot, the apparent necessity for the production of heat disappeared, and theories of combustion were supplanted by others. The abundance of volcanoes near the shores of the sea, and the abundance of steam in volcanic discharges gave rise to a theory that water was the cause of eruption, the hot rock of the earth's interior being in some way rendered eruptible by the access of water. This idea for a time prevailed, and is still widely entertained, but serious difficulty is found from the consideration of two facts: First, that there are some volcanoes hundreds of miles not only from the sea, but from all other large bodies of water; second, that some lavas contain only a minute quantity of water, the amount being so small that it manifestly can play no important part in the chemistry or physics of eruption. Steam, indeed, has much to do with many volcanic eruptions, and is essential to explosion and the process of expulsive eruption, but the fact that it is not always present in notable quantities shows that it is not a factor essential to the uprising of lava.

In the judgment of the present writer an important step toward the understanding of volcanism was made by Clarence E. Dutton in pointing out a condition imposed by gravitation. Gravity is a feeble force, so feeble that it is overcome by all others in the various dynamic processes which pertain to the modification of the earth's surface, but in subterranean processes the masses involved are enormous, and gravitation, which is proportional to mass, acquires the highest importance. It is gravitation that gives general form to the earth, and all the greater features of continent and ocean bed are conditioned by its law of equilibrium. Strength of material is in comparison a vanishing quantity. It results from this general fact that a great body of molten rock which is lighter than the earth material above is powerfully urged to change its position by rising through the upper rock and spreading over it at the surface. If a conduit is open the rising of the liquid is inevitable, and if no way is open the liquid may be able to make one. On the other hand, a liquid which is heavier than the material above has no tendency to rise through it, and will not rise even if a passage is open. If urged by stresses originating elsewhere, it will lift the ceiling of its chamber instead of passing through it. It is therefore essential to volcanic discharge not merely that the lava be liquid, but that it be relatively light, and all volcanism is thus conditioned by a quasi hydrostatic law. As eruptions not only begin but end, it follows that each eruption results from some change of condition whereby a limited quantity of subterranean material is fitted for upward flow. The change of condition may be liquefaction, or it may be the expansion of a rock already liquid. The introduction of this condition does not solve the problem of the volcano, but changes its character, limiting inquiry to the mode in which rocks are rendered eruptible.

Several suggestions have been made of possible causes for the change in the condition of rock: (1) It is possible that some chemical reaction or the addition of water renders

rocks fusible or lighter. (2) Of the same tendency, and more readily comprehended, is the addition of heat. It has been suggested that the temperature of subterranean tracts may be made to rise by the addition of deep sediments above. As the temperature of the surface is maintained nearly constant by radiation, a heavy sedimentary deposit would act as a blanket, and cause a rise of the isothermals. (3) Heat may be produced dynamically in connection with diastrophic movements. Whatever the process by which mountains are made and the heights of continents are changed, great stresses and strains arise, and wherever strains are relieved heat may be evolved. (4) Heat may be produced by tidal action. The differential attraction which produces oceanic tides must also produce bodily tides of the earth and a corresponding system of strains. If it be true, as some physicists have inferred, that the nucleus and outer crust are highly rigid as compared to an intermediate zone, then tidal stresses may accomplish work in the intermediate zone, and thus produce the excess of heat manifested in volcanic activity. While none of these suggestions is entirely satisfactory, and no one of them appears competent to explain all volcanic occurrences, it is nevertheless possible that there are true causes among them, and that collectively they are sufficient.

Vole [Fr.]: the name given in England to rodents of the genus *Arvicola*, which is the type of the sub-family *Arvicolinae*, belonging to the family *Muridae*. The related species found in the U. S. are generally known under the name of field-mice, but are thus confounded with species of the sub-family *Murinae*. See **MURIDÆ**.

Volga: the largest river of Europe. It rises in the marshes of the western Valdai plateau (government of Tver), Russia, not more than 550 feet above sea-level, and after a winding and tortuous course of 2,325 miles, it enters the Caspian Sea near Astrakhan by some 200 mouths and rivulets. Its basin covers about 563,300 sq. miles, with a population of over 40,000,000. Among the hundred or more navigable tributaries of the Volga the most important are the Oka (longer than the Rhine), draining 97,800 sq. miles, and the Sura from the right, and the Tvertsa, Mologa, and Kama (with a course of 1,120 miles) from the left. The Volga is joined to the Neva by a system of canals, and thus connects the Caspian with the Baltic, and Astrakhan with St. Petersburg. By less important canals the Volga is connected with the Dwina and the White Sea, i. e. Riga and Archangel, while a perfect railway system completes the body of arteries. Among the cities built on or near its banks or within the Volga basin, are Tver, Yaroslav, Kostroma, Moscow, Nijni-Novgorod, Saratoff, Simbirsk, Kazan, Astrakhan; all of which owe their wealth and importance to the Volga or its tributaries. The period during which the river is closed by ice lasts from 90 to 160 days, according to climatic conditions. The chief Volga traffic is up-river, the amount of merchandise reaching St. Petersburg by way of the canals being about fifteen times more than that reaching Astrakhan. Half a million tons of fish (especially immense quantities of salmon and sturgeon), salt, and naphtha are sent from Astrakhan, besides enormous amounts of grain, flax, and other produce, 465,000 tons reaching Riga. The traffic down the river consists chiefly of wood and timber to supply the southern provinces and the lower Don, which have been almost entirely deprived of their wealth of forests by destructive mismanagement. The trade down-river in manufactured goods is important, and is mostly distributed at Nijni-Novgorod. HERMANN SCHÖENFELD.

Volhyn'ia: a government of Western Russia; bounded S. W. by Galicia, W. by Poland, separated from the latter by the Bug; area, 27,743 sq. miles. In the N. and E. the land is low, level, and sandy, and there are extensive marshes and forests; the south and west are broken by spurs of the

Carpathian Mountains. Agriculture flourishes in the south; grain, timber, cattle, tallow, hides, tar, and potash are largely exported to Odessa, Galicia, Poland, and Prussia (by way of the Bug). Volhynia possesses the finest studs in the empire—those of the Princes Sangusko and the Czartoryskis. Mills and manufactures are increasing yearly. Pop. (1890) 2,407,800, Russians, Poles, Lithuanians, Jews, Germans, and Tartars. Capital, Zhitomir. H. S.

Volition: See WILL.

Volkelt, fōl'kelt, JOHANNES, Ph. D.: professor of philosophy and pedagogy; b. at Liprik, Galicia (Austria), July 21, 1848; studied at the Teschen Gymnasium, Silesia, and at the Universities of Vienna, Jena, and Leipzig; privat docent at Jena, 1876-79; extraordinary professor, Jena, 1879-83; Professor of Philosophy, Basel, 1883-89, Würzburg, 1889-94; Professor of Philosophy and Pedagogy, Leipzig, since Easter, 1894. Volkelt is an energetic critic of positivism in philosophy, and has won especial favor in Germany by his contributions to the theory of cognition and to aesthetics. As the successor to Masius in Leipzig, his lectures on theoretical pedagogy mark him a leader of liberal educational thought. His principal works are *Das Unbewusste und der Pessimismus* (Berlin, 1873); *Der Symbol-Begriff in der neuesten Aesthetik* (Jena, 1876); *Immanuel Kants Erkenntnistheorie nach ihren Grundprincipien analysirt* (Leipzig, 1879); *Erfahrung und Denken: Kritische Grundlegung der Erkenntnistheorie* (Hamburg and Leipzig, 1886); *Franz Grillparzer als Dichter des Tragischen* (Nördlingen, 1888); *Vorträge zur Einführung in die Philosophie der Gegenwart* (Munich, 1892). J. E. RUSSELL.

Volkman, fōl'k'mān, RICHARD, von, M. D.: surgeon and author; b. in Leipzig, Germany, Aug. 17, 1830; son of Alfred Wilhelm Volkman, the physiologist (1801-77). He studied in the Universities of Halle, Giessen, and Berlin; became assistant in Blasius's surgical clinic; was privat docent of surgery at Halle 1857-67; in the latter year became Professor of Surgery and chief of the surgical hospital; was connected with the German army during the wars of 1866 and of 1870-71, in the latter being surgeon-general of the Fourth Army-corps. In 1882 he was offered the professorship of surgery in the University of Berlin, but he declined to leave Halle. He was one of the first to introduce Lister's methods of surgery into Germany. His investigations in surgery and surgical pathology are of importance, and as a lecturer he was unsurpassed. While serving as army surgeon he wrote a work, under the pseudonym of Richard Leander, entitled *Träumereien an französischen Kaminen, Märchen*; it was originally intended for his children, but has passed through fourteen editions. His other works in general literature are *Aus der Burschenzeit* (Halle, 1876); *Gedichte* (Halle, 1877). Among his professional works are *Beiträge zur Chirurgie* (Leipzig, 1875); *Bemerkungen über einige vom Krebs zu trennende Geschwülste* (Halle, 1858); and numerous contributions to medical journals. D. at Jena, Nov. 28, 1889. S. T. ARMSTRONG.

Volkman, WILHELM FRIDOLIN, Ritter von Volkmar: psychologist; b. in Prague, Bohemia, Sept. 25, 1821; was educated at the University of Prague, where he became docent in 1849, and later professor. He remained teaching philosophy until his death, on Jan. 13, 1877. His principal works are *Die Lehre von den Elementen der Psychologie als Wissenschaft* (Prague, 1850); *Grundriss der Psychologie auf Grundlage des philosophischen Realismus* (Halle, 1856); *Lehrbuch der Psychologie vom Standpunkte des Realismus und nach genetischer Methode* (4th ed. 2 vols., Cöthen, 1894-95); *Die Grundzüge der Aristotelischen Psychologie, aus den Quellen dargestellt und kritisch beleuchtet* (Prague, 1858). J. M. B.

Vollon, vō'lōn', ANTOINE: still-life, figure, and landscape painter; b. in Lyons, France, Apr. 20, 1833; studied in the Academy at Lyons, went to Paris, and first exhibited at the Salon in 1864; received medals at the Salons of 1865, 1868, and 1869, and a first-class medal at the Paris Exposition of 1878; became officer of the Legion of Honor in 1878. He is one of the greatest modern masters of still-life painting, and a wonderful technician. His works are especially notable for strength and depth of color. His *Fisherman of le Pollet, Dieppe* (1876); *Curiosities* (1868); *Sea Fish* (1870); and *Armor* (1875) are in the Luxembourg Gallery, Paris. One of his most famous still-life pictures, *The Pumpkin*, was bought by William Schaus, New York, and is in a private collection in New York. WILLIAM A. COFFIN.

Volney, vōl'nā', CONSTANTIN FRANÇOIS CHASSEBEUF, Comte de: traveler and author; b. at Craon, department of Mayenne, France, Feb. 3, 1757; studied medicine and Oriental languages in Paris; spent several years in Egypt and Syria, and published after his return to France *Voyage en Égypte et en Syrie* (2 vols., 1787; translated into English in the same year), which gave him a great reputation. Elected a deputy for Anjou to the States-General of 1789, he advocated the ideas of the Revolution; published in 1791 *Les Ruines, ou Méditations sur les Révolutions des Empires* (translated into English, New York, 1796; London, 1827), for which he has chiefly his fame as an infidel writer, and *La Loi naturelle, ou Catechisme du Citoyen français* (1793), but was nevertheless imprisoned as a royalist, and saved only by the fall of Robespierre. In 1794 he was appointed Professor of History at the Normal School; traveled in the U. S. from 1795 to 1798, and was made a senator in 1799, and published in 1803 *Tableau du Climat et du Sol des États-Unis d'Amérique* (2 vols.; translated into English by C. B. Brown, Philadelphia, 1804). After the establishment of the empire, he retired from the senate, but Napoleon nevertheless made him a count in 1808, and Louis XVIII. a peer in 1814. In 1814-15 he published *Recherches nouvelles sur l'Histoire ancienne* (3 vols.; translated into English by Col. Corbet, London, 1819). His complete works appeared in 8 vols. (Paris, 1820-26). D. in Paris, Apr. 25, 1820.

Revised by A. G. CANFIELD.

Volog'da: northeastern government of Great Russia; bounded N. W. by Archangel, and stretching to the Urals; area, 155,498 sq. miles (one-fourth larger than that of Great Britain and Ireland). The eastern districts are covered with branches of the Ural Mountains, rising to an elevation of from 3,000 to 4,000 feet; but the greater part of the surface is an undulating, marshy plain, dotted with lakes and impenetrable forests of fir and pine, and having a very severe climate. The soil is mostly barren, except in the south, where grain is produced. The sparse population of these regions is of Finnish descent, and is occupied chiefly in hunting and fishing. The people are for the most part still nomadic in their habits, and have their homes in settlements along the rivers, among which are the Northern Dwina, the Suchona, and Petchora with its tributaries. Fur, timber, salt, iron, skins, tallow, and cheese are exported. Pop. (1890) 1,272,100. HERMANN SCHOENFELD.

Vologda: capital of the government of Vologda; on both banks of the river Vologda; 260 miles by rail N. E. of Moscow. It exports to St. Petersburg and Archangel its soap, potash, candles, leather, cordage, and ropes, as well as timber, tallow, and fur, to a considerable amount. Pop. (1888) 17,743. H. S.

Volsci: an ancient people occupying the southern and eastern portions of Latium. They were the hereditary enemies of the Latini and of the Romans, and allies of the Æqui. The Volsci for many generations harassed Rome in a series of bloody wars, but about 338 B. C. they were finally subdued, and became *Latini* (in a legal sense), and later full citizens of Rome. Revised by G. L. HENDRICKSON.

Volscian Language: See ITALIC LANGUAGES.

Volscinii: See BOLSENA.

Vol'sk: district town in the government of Saratoff, Russia; on the right bank of the lower Volga (see map of Russia, ref. 8-F). It carries on a lively trade on the Volga, especially with Nijni-Novgorod, and is surrounded with gardens and orchards, the produce of which forms the chief wealth of the town and the flourishing neighborhood. Pop. (1890) 39,995. H. S.

Volt [named from the Italian physicist ALESSANDRO VOLTA, q. v.]: in electricity, the practical unit of electromotive force or potential difference. With the growth of knowledge of the precise values of the absolute or C. G. S. units, upon which the system of practical electrical units is based, slight modifications in the definition of the volt have become necessary. The last authentic definition, that of the chamber of delegates of the Chicago congress of electricians (1893), is as follows:

The chamber recommends "as a unit of electromotive force the international volt, which is the electromotive force that, steadily applied to a conductor whose resistance is one international ohm, will produce a current of one international ampere." In this definition, as in all previous definitions of the volt, reference is made to the ampere and the ohm. The international ampere, as defined by the Chicago

Congress, is "one-tenth of the unit of current of the C. G. S. system of electromagnetic units." It is represented sufficiently well for practical purposes by the unvarying current which, when passed through a solution of nitrate of silver in water, deposits silver at the rate of 0.001118 gramme to the second. The international ohm, as fixed by the same congress, is the closest approximation which was attainable at that time to 10⁹ C. G. S. units of resistance. It is represented by the resistance offered to an unvarying electric current by a column of mercury, at the temperature of melting ice, 14.4521 grammes in mass, of a constant cross-sectional area and of the length of 106.3 cm." The ampere and ohm being thus definitely established, the volt is also established.

The volt may also be defined approximately, as was done by the Chicago congress, as "1/99th of the electromotive force between the poles or electrodes of the voltaic cell known as Clark's cell, at a temperature of 15° C.," and prepared in a specified manner.

E. L. NICHOLS.

Volta, ALESSANDRO: physicist; b. at Como, Italy, Feb. 18, 1745; was first Professor of Physics at Como and then in the University of Pavia, where he taught and studied for thirty years. In 1769 he published a dissertation, *De Vi attractivâ Ignis Electrici*; in 1775 invented the perpetual electrophore, in 1777 a lamp for inflammable gas, in 1782 the electric condenser, and finally arrived at the invention of the famous pile which bears his name, and was described by him in a letter to Sir Joseph Banks in the year 1800. Summoned to Paris by Napoleon I., he received the gold medal of the Institute, of which he became a member in 1802. Napoleon conferred upon him the title of count and a senatorship. The works of Volta were published at Florence in 5 vols. in 1816. D. at Como, Mar. 5, 1827.

Voltaic Battery and Voltaic Electricity: See ELECTRICITY and BATTERY, VOLTAIC.

Voltaire, vol-târ, FRANÇOIS MARIE AROUET, de, universally known by the name he assumed, Voltaire: poet, dramatist, historian, and philosopher; b. in Paris, Nov. 21, 1694, of parents of the middle class in comfortable circumstances. His education was received at the Jesuit college Louis-le-Grand; at the age of sixteen he left the college and at his father's wish began the study of law, though he had no taste for it. At the college he had allied himself with the sons of families of nobility, wealth, and distinction, and his great ambition was to shine in polite circles and enjoy to the full the gay life of the free-livers of the Temple. His wit and facility in turning verses made him a favorite in the houses of great lords like Sully and Villars, but also brought him into trouble with the authorities. Some scandalous lines on the regent led to his banishment from Paris to Sully-sur-Loire in May, 1716, and just a year later, for a satire that really was not his, he was sent to the Bastille. During his confinement of eleven months, wholly without rigor, he laid the solid foundations of his poetic fame, finishing the tragedy *Œdipe*, and beginning the heroic poem on Henry IV., the *Henriade*. In these works, but more especially in the occasional poems, epistles, epigrams, etc., that streamed from his pen, he showed himself the skeptical and railing critic of the religious and political traditions of his country, and provoked the enmity of the Church and that suspicious hostility of the censorship which never ceased to follow his works and denied most of them the privilege of open publication in France. The relations that he cultivated with the nobility exposed him to a rude insult from the Chevalier de Rohan, who had him beaten and then thrown into the Bastille when he showed himself revengeful. He was set free only on condition that he retire to England (1726). The three years spent there and the acquaintance they gave him with English literature, institutions, philosophy, and life were of the utmost importance for the development of his ideas and his criticism. Upon his return to France (1729) suspicion was still too alert against him to make his stay in Paris safe. After three years of almost continual movement, but great productivity, he settled down to a quiet and industrious life at Cirey with Mme. du Châtelet, where he remained till her death in 1749. In these years he was particularly interested in the study of the natural sciences, and his ambition was becoming more serious. He had already established relations by correspondence with Frederick II. of Prussia, and in 1750 accepted his invitation to live at his court. But rivalries and jealousies, his own duplicity and petulance, and the king's steady mastery, filled his stay in Berlin with irritations and quarrels. He fled in anger in 1753, launching satires against his enemies, among whom he now counted

the king. After some years of wandering he purchased an estate at Ferney, near Geneva, where the rest of his life centered. In these years Ferney became the resort of literary men from all parts of Europe, and the "patriarch of Ferney" was the foremost man of letters of the world. D. May 30, 1778, in Paris, where his reappearance three months before had provoked unbounded enthusiasm. An outward and formal submission to the requirements of the Church secured him absolution and Christian burial. The Revolution gave him the honor of public burial in the Pantheon. His mind was prodigiously active and supple and his industry tireless, and he achieved the highest distinction of his time in almost all forms of literature: in elevated poetry by the *Henriade* (1728); in light and satiric verse by a vast number of pieces; in tragedy by works such as *Œdipe* (1718), *Zaïre* (1732), *Azïrré* (1736), *Mahomet* (1741), *Méropé* (1743), *Sémiramis* (1748), etc.; in history by the *Histoire de Charles XII.* (1731), *Siècle de Louis XIV.* (1751), and others; in fiction by *Zaïdy* (1748), *Candide* (1759), *La Princesse de Babylone* (1768), etc.; in the political or philosophical essay or pamphlet by the *Essais sur les Anglais* (1831), *Discours sur l'homme* (1734-37), *Essai sur les mœurs et l'esprit des nations* (1756), *Dictionnaire philosophique* (1764); his contributions to the great *Encyclopédie* of Diderot, etc. His mind was not profound, but it was perfectly lucid and saw what it saw with perfect distinctness. He was not an original thinker, but appropriated ideas eagerly and swiftly, and by his remarkable power of clear and forcible expression he made them seem simple and easy. He turned the large coin of philosophy and criticism into small change of universal circulation. The alertness of his wit, the searching keenness of his satire, his exhaustless resources of ridicule and persiflage, powerfully seconded his appeal to reason against superstition and the oppression of traditional authority. Essentially a conservative in politics, an aristocrat by instincts and tastes, he yet contributed immensely to the revolutionary movement and the democratic idea by undermining the historic institutions by criticism from the standpoint of even and universal justice. He loved justice and did its cause direct practical service by his defense of Jean Calas. He was essentially epicurean in his view of life, and rebelled at the asceticism lurking in the Christian distrust of the body and its satisfactions; he was devoted to the luxurious accompaniments of civilization. So he was hostile to Protestantism and Jansenism for their moral severity, as to Catholicism for its intellectual tyranny and abuse of power. He was utterly without reverence, as was revealed in his scandalous travesty of the figure of Joan of Arc, *La Pucelle d'Orléans* (1730-39), as well as in his well-known enmity to religion. He held the theological conceptions of deism, but he was profoundly irreligious, and though he was thinking chiefly of the Church as an institution in his famous denunciation, *Écrasez l'infâme*, his attack involved the whole fabric of historical Christianity and even most exhibitions of the religious sentiment. The pert and superficially informed ridicule of religion current in certain classes in France is derived in great measure from him. In his personal relations he was capable of devotion and generosity, but was habitually suspicious and jealous, often deceitful and spiteful, and sometimes grossly untruthful, and apparently utterly selfish. By the universality and lucidity of his mind and, in spite of its superficiality, by the unflinching flash of his wit, by his prodigious literary cleverness, he deserves his rank as first man of letters of his time and one of the most powerful contributors to the work of enlightenment and intellectual enfranchisement which was the task of the eighteenth century.

LITERATURE.—All older editions of his works are superseded by the editions of Beuchot (Paris, 1828, *et seq.*, 70 vols., and 2 vols. index); Avenel (Paris, 1867, *et seq.*, 8 vols. 4to.); and L. Moland (Paris, 1877-83, 50 vols., and 2 vols. index). There is an English translation by Smollett and others (London, 1776, 37 vols.). Many single works have been frequently reprinted separately. See Longchamps and Wagnière (his secretaries), *Mémoires sur Voltaire et sur ses ouvrages* (2 vols., Paris, 1825); Villemain, *Tableau de la littérature du dix-huitième siècle*; G. Desnoiresterres, *Voltaire et la société française au XVIII^e siècle* (8 vols., Paris, 1867-76); Bengesco, *Voltaire, Bibliographie de ses œuvres* (4 vols., Paris, 1882-90); J. Morley, *Voltaire* (London, 1871); D. F. Strauss, *Voltaire* (Leipzig, 1870); James Parton, *Life of Voltaire* (2 vols., Boston, 1881); E. Champion, *Voltaire* (Paris, 1892); see also Carlyle's essay on Voltaire and Macaulay's essay on Frederick the Great.

A. G. CANFIELD.

Voltam'eter [from *voltaiic* (see VOLT) + Gr. μέτρον, measure]: an instrument for the measurement of the electric current by means of its electrolytic action. The principal forms are the water voltameter, the silver voltameter, the copper voltameter, and the zinc voltameter.

The *water voltameter* is usually given a construction similar to that shown in Fig. 1. The current is carried into the voltameter by means of the wire marked +, which is connected with a platinum electrode within the mouth of the inverted cylindrical tube O, which is nearly filled with water. The other electrode, which is connected with a wire marked —, through which the current leaves the voltameter, is similarly situated at the bottom of the inverted tube H. The passage of the current in the direction indicated decomposes the water in the two tubes, setting free oxygen in O, upon the surface of the + electrode and hydrogen in H at the surface of the — electrode. The measurement of the volumes of the gases liberated in a given time affords a measure of the average value of the current.

FIG. 1.

The *water voltameter* is subject to errors due to loss of gas by occlusion upon the surfaces of the electrodes and by absorption within the liquid of the voltameter. When these sources of error are avoided, and the amount of gas developed is determined by the exact methods of chemical gas analysis, the water voltameter becomes an instrument of precision. On account of the laborious character of the operations when thus carried out, however, it has been almost altogether abandoned in favor of more convenient forms.

The *silver voltameter* is perhaps the most exact of all known types. In its best-known form (Fig. 2) it consists of a platinum dish containing an aqueous solution of silver nitrate (AgNO₃). Below the surface of the solution is placed the losing electrode, which consists of a sheet or coil of wire of pure silver. To catch the granules of metal which are detached during electrolysis the terminal is wrapped in filter paper or other porous material. The platinum dish serves as a gaining electrode, and upon its inner surface the silver is deposited in shining crystals. The amount deposited in a given time is determined by weighing the platinum dish before and after the operation. The silver voltameter owes its accuracy to the insolubility of the deposit in the electrolyte, and to the fact that the former may be washed, dried, and weighed without loss, and also without gain by oxidation.

FIG. 2.

An ampere of current deposits silver at the rate of 0.00118 of a gramme per second. To get the best results, a silver voltameter for a circuit carrying 1 ampere, according to the specifications of the chamber of delegates of the Chicago congress of electricians, should have:

- (1) As kathode, a platinum bowl not less than 10 cm. in diameter and from 4 to 5 cm. in depth.
- (2) As anode, a plate of pure silver not less than 30 sq. cm. in area and 2 to 3 mm. in thickness.
- (3) As electrolyte, a neutral solution of pure silver nitrate containing about 15 per cent. by weight of the nitrate and 85 parts of water.

The *copper voltameter* is inferior to the silver voltameter in that the deposit is not altogether insoluble in the electrolyte, nor so free from oxidation within and without the solution. It possesses certain advantages, however, the chief of which are the cheapness of the apparatus and of the electro-

lyte, the non-corrosive character of the latter, and the firmly adherent quality of the deposit. With proper manipulation it is scarcely below the silver voltameter in accuracy, but as commonly used the errors sometimes amount to .01 or more. Two forms of the copper voltameter are shown in Figs. 3 and 4. The former consists simply of two copper plates submerged in a cell containing a solution of copper sulphate in water. A current sent through the voltameter from *a* to *k* carries copper with it at a rate which varies very slightly from .000323 gramme per ampere per second, according to the density of the current and the temperature of the solution.

FIG. 3.

FIG. 4.

With high values of the current density, the deposit upon the edges and corners of the gaining electrode becomes granular and non-adherent, and the indications of the voltameter begin to lose their accuracy. This source of error is avoided in the form of apparatus shown in Fig. 4. This instrument, which is due to Ryan, is known as the spiral-coil voltameter. The electrodes are coils of copper wire with a common vertical axis. Reasonable care in the handling of such an instrument affords uniformly consistent results, with errors not greater than .001 to .002.

The *zinc voltameter* is used solely in the measurement of the electric current for industrial purposes. It is one of the best-known types of electric meters (see WATT-METER), and is technically known as the chemical meter. For the purpose in question it has been found better adapted than other forms of voltameter, although inferior to them where a high degree of precision is required. See ELECTRICITY, ELECTROLYSIS, etc.

E. L. NICHOLS.

Volter'ra: a town in the province of Pisa, in Northern Italy; on the summit of a steep hill at the height of 1,800 feet above the sea, about 50 miles S. W. from Florence (see map of Italy, ref. 4-D). Volterra was the largest of the twelve capital cities of Central Etruria, and sustained a long struggle against Rome, but the time of its final conquest is not known. During the Middle Ages Volterra was alternately the spoil of popes and emperors. In the latter part of the fourteenth century it fell into the hands of the Florentine republic, and remained ever after a possession of Tuscany. Volterra still retains some of her ancient gates, and considerable fragments of the old Etruscan wall, built of huge blocks of stone without cement, and much more extensive than the mediæval fortifications. The population is thought to be of more unmixed Etruscan blood than that of other old towns of that people, and many of the names read on the ancient sepulchral monuments are those of families still existing in the city and territory of Volterra. The cemeteries have yielded rich contributions to Etruscan archaeology, and the city museum—which, among many other interesting antiques, contains not less than 400 cinerary urns and sarcophagi, chiefly of alabaster enriched with sculptures—is among the most important existing repositories of Etruscan art. In the neighborhood of Volterra are valuable salt springs, called by an Arabic name, *le maje*, yielding annually about 7,000 tons of salt. The Volterranean quarries of alabaster are among the finest known deposits of that stone, and articles manufactured from it find a market all over the world. The cathedral, enlarged by Andrea Pisano in 1254, is a fine structure, and contains good pictures. Pop., comprising the suburbs and some separate hamlets, 14,060. Revised by M. W. HARRINGTON.

Volterra. DANIELE, *di*, properly DANIELE RICCIARELLI: painter and sculptor; b. at Volterra, in Tuscany, in 1509; went to Rome when very young. Under the influence of Michelangelo and greatly befriended by him Daniele painted many large pictures. An *Assumption of the Virgin*, forming the altarpiece in the Church of SS. Trinità de' Monti, is especially famous, and in a chapel of the same church is a *Taking down from the Cross*, which is greatly injured, perhaps from having been transferred from the wall to canvas, but which was at one time called by critics who were admirers of a certain classical convention one of the three greatest pictures in the world, the others being Raphael's *Transfiguration* in the Vatican picture gallery and Michelangelo's *Last Judgment* in the Sistine Chapel. At a later time Daniele was employed to paint draperies about some of the nude figures in the last-named fresco, and from this he was called *Il Braghettone*, "the breeches-maker." On the death of Henry II. of France in 1559, his widow, Catharine de' Medici, tried to get an equestrian statue of the dead king from Michelangelo. The work was transferred to Daniele, who finished the horse and had it cast in bronze before his death. This horse stood for many years in the Place Royale in Paris and has disappeared, said to have been destroyed in the Revolution. Daniele died in Rome, Apr. 4, 1566. Pictures formerly ascribed to Michelangelo are now often attributed to Daniele. In the Uffizi at Florence there is a *Massacre of the Innocents*. In the store-rooms of the Louvre there is a *David and Goliath*, two renderings of the subject on the two sides of a slab of slate, a picture long called a Michelangelo. In the Farnese Palace in Rome there is a fine *Triumph of Bacchus*. RUSSELL STURGIS.

Voltri (Mediev. Lat. *Ultrivium*): town; province of Genoa, Italy; on the seashore between the Leira and the Cerusa; about 9 miles W. of the city of Genoa, with which, however, it is connected by an almost continuous line of houses (see map of Italy, ref. 3-D). Voltri has flourishing manufactures, contains some fine churches, and near it are charming villas, the most striking of which is the Brignole-Sale, on a hill commanding an exquisite view of this lovely coast. Voltri contains many paper-factories, and the sulphurous water employed in its manufacture is believed to protect the paper against the attacks of the book-worm, for which reason it is used by regulation in many of the public offices in England. It is also exported to the U. S. The mechanical power of the two torrents is also further utilized in the manufacture of cotton, wool, hemp, linen, leather, etc. The mineral springs near Voltri, known as Acqua Santa and Acqua della Penna, are much frequented. Pop. 6,360. Revised by M. W. HARRINGTON.

Voltur'no (anc. *Vulturinus*): the principal river of Southern Italy. It rises in Monte Santa Croce, near Castellone, flows first S. E., then W., through the plains of Campania, and enters the Gulf of Gaëta after a course of 100 miles. Along the Volturno was fought a series of battles between Garibaldi and the royal Neapolitan troops Sept. 19 and 21, and Oct. 1 and 2, 1866, in which the former was victorious.

Volume, Molecular or Specific: a value obtained by dividing the specific gravity of a substance in the form of liquid into its molecular weight. The study of specific volumes has led to the conclusion that a close connection exists between the values and the constitution of the substances.

Volumetric Analysis: See ANALYSIS, VOLUMETRIC.

Voluntary [from Lat. *voluntarius*, willing, deriv. of *volens* (*voluns*), pres. partic. of *velle*, will; so called from being at first extempore]; in music, a term originally signifying an extempore performance on the organ, usually before the opening or at the close of divine worship. In the pure voluntary the performer was unrestricted by any set form, rule, or style, but gave free scope to his imagination and to his skill in execution. In the present day the term "voluntary" is also applied to compositions of this class which are not extempore, but premeditated and carefully written. Large collections of them, composed by the best masters, have been published, and are extensively used under the names of organ-pieces, preludes, offertories, post-ludes, etc.

Voluntary Conveyance: in law, a deed of conveyance without the adequate consideration which the law deems valuable—that is, something upon which a pecuniary estimate can be placed. It is, therefore, a gift and is frequently made to some near relative of the grantor, in which case the consideration is love and affection, which is regarded as

"good," though not as "valuable." As such, it is entirely legal and valid as between the parties—except, of course, where obtained by fraud or undue influence—for the law permits gifts to be freely made so long as the creditors of the donor are not thereby defeated or delayed. The term voluntary conveyance is generally applied to such a deed of lands, but the same principles control all similar transfers of chattels and other forms of personal property. The peculiar legal interest connected with voluntary conveyances arises from their effect upon the rights of the creditors of the grantor or transferor, and all the modern law on that subject has practically originated from two statutes passed in the reign of Elizabeth and from subsequent legislation of the same import. These statutes and the rules of law derived therefrom are treated in the article on FRAUDULENT CONVEYANCE. Revised by FRANCIS M. BURDICK.

Voluntaryism: the theory and practice of the support and control of churches by the voluntary act of their adherents as opposed to support and control by the state. The theory is based on considerations drawn from Scripture, from history, and from social equity. Even under the theocratic system of the Old Testament religion presents certain voluntary aspects. And, turning to the New Testament, the whole movement of Christianity at the beginning was of the voluntary kind. It had no state support and no state control. Christ's kingdom was declared by himself to be "not of this world," and therefore its being linked to the secular government of a country, to be enriched and guided thereby, is entirely out of the question. Further, it is a fact of history that Christianity was more truly (i. e. more spiritually) prosperous before it was endowed by the state than afterward; that Constantine's was a fatal gift; that the union between the Church and the empire gave power to persecution; that now orthodoxy and then heterodoxy became established, and that each in turn oppressed the other through the enforcement of political laws; that during the Middle Ages the Church became miserably corrupted by its secular relations, and that some of the brightest spiritual lights of that long period are to be found among those who protested against the worldliness of the reigning religion, and promoted spiritual truth and life in voluntary ways. The establishments in Europe have been instruments of persecution, and in them the wealth of the Church, being in worldly hands, has been necessarily misapplied. A comprehensive church supported by the state so as to be truly national is an impossibility, and therefore every establishment is and must be more or less sectarian. It is the church of a party, not of a united people, and hence the unendowed and unpatronized are placed on terms of inequality, and consequently suffer a social wrong. Men ought not to be taxed for the support of creeds and systems in which they do not believe, and all such taxation involves social injustice.

The voluntary principle was implied, if not distinctly asserted, in some of Wycliffe's writings; still more clearly by Leonard Busher, a London citizen and Baptist, in a tract published in 1614; but most of all, in his own day, by Roger Williams in his *Bloody Tenet of Persecution* (1644). Not that the voluntary support of religion was prominently maintained in these works, but phases of religious liberty were unfolded which lead to such a conclusion. The Quakers, too, were among the pioneers of voluntaryism. On the other hand, the Puritans and Presbyterians generally advocated a state church; and some of the Independents and some of the Baptists accepted livings and emoluments in the Establishment. The Pilgrim Fathers and the founders of Massachusetts did not avoid state complications. Such Nonconformists as Watts and Doddridge based their non-conformity on other grounds than that of opposition to a legal establishment of religion. The clear enunciation of the principle in England began in the first quarter of the nineteenth century, and has ever since been gaining ground.

Nowhere is the practice of voluntaryism exemplified as it is in the U. S. Ever since the war of Independence closed and the U. S. became separated from Great Britain, religion has been left for its support to the willing offerings of Christian people. The establishments which once existed have disappeared. Magnificent churches, well-supported ministers, prosperous colleges, and religious societies of all descriptions attest the energy and power of voluntaryism.

The voluntary system has been at work in Great Britain by the side of the Establishment ever since nonconformity began. The practice preceded the theory. Before any

definite ideas on the subject obtained, proscribed sects were of necessity thrown upon their internal resources. Tithes and church-rates were beyond their reach had they wished for them. It is remarkable that those who practice the voluntary system, in a small minority 200 years ago, have so multiplied and increased as now to vie with the endowed Church in activity and influence. In England the Congregational, Methodist, Baptist, Presbyterian, and Roman Catholic Churches and other large bodies are all voluntary communities.

The voluntary system in Scotland has been widely extended since the Disruption of 1843. The Free Church, which exists all over Scotland, as well as the United Presbyterian and other unestablished religious bodies, is entirely dependent for support on contributions from members and friends.

Volunteers: See MILITIA.

Volvensus, FLORENTIUS: See WILSON, FLORENCE.

Volu'tidæ [Mod. Lat., named from *Voluta*, the typical genus, from Lat. *voluta*, spiral scroll]: a family of gastropod molluscs containing some of the most beautiful and esteemed of univalve shells. The animals have the normal gastropod form; the mantle is often more than usually well developed; the siphonal extension is short and recurved (generally provided with aricle-like appendages at the base); the head is large and probosciform; the tentacles mostly far apart and connected by a broad "veil" forming a hood over the head, sometimes (in *Volutamitra*) close together; the eyes sessile on the head, near the outer bases of the tentacles; teeth of the lingual ribbon are in a single longitudinal row, but diversiform in the several groups; the foot broad in front; an operculum is sometimes developed, but usually wanting; the shell is convolute or turreted, with a narrow aperture and an anterior notch, with the columella obliquely plaited anteriorly. Although the generally recognized constituents of the family seem at first to be naturally associated in a group of the rank in question, on account of the similarity of the shell, they differ so decidedly in dentition as to render it doubtful whether the association is of the value assigned. The representatives of the family are mostly confined to the tropical seas, and there they attain the largest size and exhibit the most beautiful colors. A few, however, are found in the temperate and even cold seas; the most northern species is a small shell, the type of the genus *Volutamitra*, the *V. grælandica* of authors. In time they have ranged from the Cretaceous period to the present, and in the Miocene epoch typical forms of the family extended much farther north in both hemispheres than at present. The species are carnivorous. The principal genera are *Yetus* (= Cymbium, boat-shells), *Voluta* (much subdivided), *Volutolyria*, *Lyrina*, *Enata*, and *Volutamitra*.

Revised by E. A. BIRGE.

Vomer [Mod. Lat., from Lat. *vomer*, plowshare]: in the mammalia one of the bones of the skull forming the septum of the skeleton of the nose. In reality it is a double bone arising as two separate elements, right and left, from the roof of the mouth. In the lower vertebrates these bones occupy that position permanently and frequently bear teeth. In transcendental anatomy it is considered the centrum of the first cephalic vertebra. It affords important characters in the classification of many fishes.

Vomiting [from Lat. *vomere*, *vomitum*, vomit; Gr. *εμεῖν* (whence Eng. *emetic*); Sanskr. *vam-*]: a reflex contraction of the muscular coats of the stomach, ejecting its contents. It is an involuntary and spasmodic act, but when established may be aided by voluntary effort. The contraction of the stomach and vomiting may be the result of disease of the brain, of the pneumogastric nerve, of the walls of the stomach, of catarrh or inflammation of its mucous lining; it may be the result of indigestible food, bile, or mucus in the cavity of the stomach, or a sympathetic reflex result of disease in other organs, as the uterus, ovaries, or liver. The vomiting of pregnancy and of uterine or ovarian disease, bilious vomiting, vomiting of gastric catarrh, the vomiting at the onset of acute fevers and eruptive diseases of children, and vomiting from surgical causes, as fracture at the base of the skull, or concussion and inflammation of the brain, are to be distinguished, each from the other, in some instances, by peculiar features of the act of vomiting, but more often by observation of the associated symptoms. (See STOMACH.) At the onset of vomiting the face may be deathly pale; the surface becomes cool and bathed with

clammy sweat; the pulse small and feeble; and great prostration results. In some instances faintness occurs, or even fatal syncope. An occasional accident during vomiting is the impaction of solid food or artificial teeth in the larynx, causing suffocation. Robust persons, but little depressed by vomiting, become red in the face during the effort, and later are cool and slightly pale. A person vomiting should have his clothes loose, the air in the room should be fresh, and cold water should be poured on the face if needed. Stimulants are sometimes necessary to counteract collapse. Ice, carbonic-acid water, creosote, oxalate of cerium, and dilute hydrocyanic acid are useful remedies to allay vomiting.

Vomiting of Blood: See HÆMATEMESIS.

Von'del, Joost, van den: Dutch poet and dramatist; b. at Cologne, Nov. 17, 1587; d. in Amsterdam, Feb. 5, 1679. His father, by trade a hatter, had fled to Cologne from Antwerp, on account of his faith. There he had married Sara Kranen, daughter of Peter Kranen, a man of some literary celebrity in his native city. In 1597 the poet's parents removed to Amsterdam and there established a hosiery-shop. This later passed to their son, and was his means of support until 1657, when it was swallowed up in bankruptcy caused by a reckless son of his own. It should be said, however, that the poet's wife was the business manager of the family, leaving him for the most part unmolested in his poetic pursuits. After experiencing bankruptcy, the poet was given a place as bookkeeper in the public loan office, receiving full salary even after his retirement in 1668 on account of old age. Vondel's life was thus in the main that of a quiet middle-class shopkeeper, and this shows itself clearly, and often with intention, in his poetic work. He knew agitations, however, particularly when he determined to give up his Arminian faith and turn Catholic (1640). His earliest work is strongly under the influence of the poetical school known as the *Rederijker*. To this period belong his first drama, *Het Pascha* (1612), and his earliest lyrics. Soon after the production of *Het Pascha*, however, he became intimate with the members of the group of Coster, particularly Hooft and Roemer Visseher. From these men he obtained a much greater knowledge of the classics than his meager education had given him; and he conceived an unbounded admiration for the masterpieces of the Greek and Latin drama, as well as reverence for the dramatic rules laid down by Aristotle in the *Poetics*. In his subsequent dramatic work, accordingly, he strove to conform to these rules, observed the unities, employed a chorus, etc. The result was not unhappy, owing mainly to the fact that his own genius was rather lyric than dramatic in the true sense. He liked also to use his plays for didactic and even controversial purposes. We have from him a double series of pieces, the first consisting of translations or imitations of classic plays; the second, of original dramas. To the first belong the *Amsterdamse Heecuba* (1625) and *Hippolytus* (1628), imitated from Seneca; the *Electra* (1638), *Koning Oedipus* (1660), and *Hercules in Trachin* (1663), from Sophocles; the *Ifigenie in Taurien* (1666) and *Feniciaensche Ifigenie* (1668), from Euripides. Of his original dramas the best are *Hierusalem verwoest* (1620); *Palamedes* (1625); *Grijsbrecht van Aemstel* (1637); *Maria Stuart* (1646); *Lucifer* (from which Milton has been thought to have borrowed, 1654); *Jephtha* (1659); *Adam in Ballingschap* (1664); *Zunghein* (1666); *Noah of ondergang der eerste werelt* (1667). Poetically quite as significant as the plays, however, are the lyric poems. Of these many, to be sure, were written to order, and sound hollow and pompous, after the manner of such verse. But in others the real delights and admirations of the man appear with power and beauty, his joy in Holland's greatness on the sea and in trade, his stalwart preference for bourgeois ideals of life, his simple gladness in the presence of nature. His genius here shows itself, flawed indeed by constant lack of taste and often curiously limited, but none the less true genius. And he still remains, on the whole, the greatest poet Holland has had. Vondel's works have been edited, with *Life*, by J. von Lennep (12 vols., Amsterdam, 1855-69; new ed. 1888, seq.). See also Baumgartner, *Joost van den Vandel* (Freiburg, 1882); Unger, *Bibliographie van Vondels werken* (Amsterdam, 1888); Looten, *Étude littéraire sur le poète néerlandais Vandel* (Brussels, 1889); D. Haek, *Justus van den Vandel: ein Beitrag zur Geschichte des niederländischen Schriftthums* (Hamburg, 1890); August Müller, *Ueber Milltons Abhängigkeit von Vandel* (1891). A. R. MARSH.

Von der Recke: See RECKE, ERNST, VON DER.

Von Buysum, JOHN: See BUYSUM, JOHN, VON.

Von Martins: See MARTIUS, CARL FRIEDRICH PHILIPP, VON.

Voorhees, DANIEL WOLSEY: U. S. Senator; b. at Liberty, Butler co., O., Sept. 26, 1827; graduated at Indiana Asbury (now De Pauw) University in 1849; was admitted to the bar in 1851; was U. S. district attorney for Indiana 1858-61; defended John E. Cook for participation in the Harper's Ferry raid 1859; was a Democratic member of Congress 1861-65 and 1869-71. He became U. S. Senator from Indiana in 1877, filling the vacancy caused by the death of Oliver P. Morton. One of his earliest speeches in the Senate was a plea for the free coinage of silver and the preservation of the greenbacks as full legal-tender money. He was re-elected to the Senate in 1879 (the rival candidate being Benjamin Harrison), 1885, and 1891.

Voragine, JACOBUS, de: See JACOBUS DE VORAGINE.

Vorarlberg, fō-raarl'bärch: extreme western province of Austria, between Switzerland and Tyrol; administratively associated with the latter. Chief town, Bregenz. See TYROL.

Vor'men: one of the principal rivers of Norway. It rises under the name of Lougen in the Lessö-Verks-Vand, at an elevation of more than 2,000 feet, flows through the narrow, wild, but beautiful Gudbrandsdale, forms the Lake of Mjösen, receives then the name of Vormen, and joins the Glommen. Lake Mjösen, about 80 miles long and 8 miles broad, and situated at an elevation of between 500 and 600 feet, is the scene of some traffic.

Voronej, or Voronez, vō-rō-nesh': a government in the south of Great Russia; on both sides of the Don; area, 25,443 sq. miles. On the southern slopes of the central Russian plateau its surface is hilly in the west, but flat to the E. of the Don. The soil, rich in black earth, is very fertile, and the climate mild. Voronej is drained by the Don and its principal tributaries. The former traverses the government from N. to S. W. for more than 400 miles, and is the principal channel for the export of grain, cattle, tallow, wool, fruit, skins, and other raw produce. Wood is imported from the north, less than one-tenth of the area being forested. The chief articles of manufacture are spirits, oil, sugar, woolens, and tallow. Cattle, sheep, and especially horses of excellent breed are largely raised. Pop. (1890) 2,755,400.

Voronej, or Voronez: capital of the government of Voronej; on the river of the same name, near its junction with the Don; 365 miles by rail S. of Moscow (see map of Russia, ref. 8-E). It is the seat of a military school and a gymnasium for boys and girls, and has an important theater. Its trade in grain, flax, tallow, hides, wood, and coal by way of the Don and the Moscow Railway to the Sea of Azov is important. Pop. (1892) 56,403. II. S.

Vörösmarty, MIHÁLY: poet; b. at Nyék, Hungary, Dec. 1, 1800; d. Nov. 19, 1855. He studied law at Pesth, but early turned to literature. This did not prevent him, however, from taking an ardent and active part in the struggle of Hungary for freedom. He was an eager revolutionist in 1848, and a member of the short-lived National Assembly. Twice he was condemned to death by Austrian tribunals and twice reprieved at the last moment. The failure of the revolution to obtain permanent success nearly broke his heart; he withdrew to his country estate and long refused even to write. For a brief period before his death, however, he had recovered somewhat his mental tone, and had begun a translation of Shakespeare, which was left at his death incomplete. His literary work was in many kinds and much of it excellent. His epic narrative *Zalán futása* (The Flight of Zalán, 1825) awakened great enthusiasm in Hungary by reason of its patriotic feeling. Of the same character is the shorter epic *Eger* (1827). As a dramatist he won great applause, though rather by the lyric fervor of his pieces than by their dramatic excellence. Perhaps the best of his plays are *King Solomon* (1821) and *Kont* (1825). Many of his minor poems have great beauty, and one among them, the patriotic song *Szózat* (1845), is almost a national hymn among the Hungarians. A complete edition of his *Works*, with *Life*, was edited by Paul Gyulai (10 vols., 1865-66; 2d ed. 12 vols., 1884). A. R. MARSII.

Vor'stins, CONRAD: theologian; b. in Cologne, Germany, July 19, 1569; studied theology at Heidelberg; lectured in Geneva; became Professor of Divinity at the Gymnasium

of Steinfurt 1596; in 1599 was acquitted of the charge of Socinianism, and in 1610 succeeded Arminius as Professor of Theology at Leyden. He got into controversy with the Gomarists and was deposed in 1612, and solemnly condemned as a heretic by the Synod of Dort in 1619. He fled from Holland, and lived in concealment until 1622, when the Duke of Holstein offered the Arminians an asylum, but Vorstins died shortly after at Tönningen, Schleswig-Holstein, Sept. 29, 1622. Revised by S. M. JACKSON.

Vos, GEERHARDUS, Ph. D., D. D.: professor of theology; b. at Heerenveen, Netherlands, Mar. 14, 1862; was educated at the Gymnasium of Amsterdam, Seminary of Holland (Christian Reformed Church, Grand Rapids, Mich., Princeton Theological Seminary, and the Universities of Berlin and Strassburg; was Professor of Theology in Seminary of Holland Christian Reformed Church 1888-94; since 1894 Professor of Biblical Theology in Princeton Seminary. Dr. Vos has published *The Mosaic Origin of the Pentateuchal Codes* (New York, 1886); *Die Kämpfe und Streitigkeiten zwischen den Banu Umajja und den Banu Hushim von Takijj addin al-Makrizijj* (Arabic dissertation, Leyden, 1888); *The Doctrine of the Covenants in Reformed Theology* (Grand Rapids, 1891); and *The Idea of Biblical Theology as a Science and as Theological Discipline: Inaugural Address* (New York, 1894). C. K. HOYT.

Vos, MARTIN, de: painter; b. in Antwerp in 1530; studied painting in his native city under Francis Floris, and in Venice under Tintoretto; formed a school in Antwerp. His best pictures, among which are *The Triumph of Christ, Caesar's Penny*, and *St. Luke painting the Portrait of the Virgin*, are in the museum in Antwerp. D. in Antwerp in 1603.

Vosges, vōzh: department of Eastern France; area, 2,266 sq. miles. The eastern portion of the department is occupied by the Vosges Mountains, which are partly covered with forests of oak, beech, and fir, and partly afford excellent pastures, where large quantities of superior cheese are produced. In the western portion, the Plaine, wheat, wine, and fruits are raised. Iron, copper, and silver are mined, and marble is quarried. Pop. (1896) 421,412. Capital, Épinal.

Vosges Mountains (Germ. Vogesen): a range of mountains on the left bank of the Rhine, situated partly in North-eastern France, partly in Southwestern Germany, and running parallel with the Black Forest on the opposite side of the Rhine in Baden, which they resemble, not only in direction, but also in form and geological structure. By the depression between Montbéliard and Mühlhausen they are sharply separated from the Jura Mountains, and their eastern slopes toward the plain of the Rhine are steep and abrupt. But to the N. they connect with the Harzt in Rhenish Bavaria, and to the S. W. by the plateau of Langres through the hills of Faucilles. They are generally rounded and of a regular shape, whence they are called *ballons*, covered with forests of oak, beech, and fir on the sides, and affording excellent pastures on their tops during the six months of the year in which they have no snow. Ballon de Guebville, the highest peak, reaches 4,700 feet; Ballon d'Alsace and Ballon de Servance are not much lower. Mineral and thermal springs are numerous, and copper, iron, and lead ores, and rock-salt abound. The Meurthe, Moselle, Saar, Ill, and Ognon descend from them. See Wolf, *The Country of the Vosges* (1891).

Revised by M. W. HARRINGTON.

Vosmaer, vōs'maar, CAREL: man of letters; b. at The Hague, Holland, Mar. 20, 1826; d. at Montreux, June 12, 1888. He studied jurisprudence at the University of Leyden, obtaining the degree of doctor; and was for many years attached to the court of cassation at The Hague. In 1873, however, he resigned, and gave the rest of his life to letters. His first serious production was *Eene studie over het schoone en de kunst* (Amsterdam, 1856), which showed artistic interests later of great importance in his work. His next success, however, was with a series of sketches published in the periodical *Nederland*, and collected in 1860 under the title *Eenige schetsen*. Of a similar character were *Vogels van diverse pluimage* (1872); *Een Zaaier: Studien over Maltatuli* (1874); and *Vlugmaren* (3 series, 1879-81-83). The romance of art, *Amazone* (1880), had very great success and has been translated into several languages (English, by Miss E. J. Irving, London, 1884). In verse also, which Vosmaer employed in his *Londinias*

(1873)—impressions of a journey to London—and *Nanno: Eine Griechische Idylle* (1882), he showed delicacy and technical skill of an unusual kind; though, on the whole, the best evidences of his imaginative powers are to be found in his translations of Homer's *Iliad* (1878-80) and *Odyssey* (1888). It is perhaps as a critic and historian of art that Vosmaer will be longest remembered. In this field his most important works are *Rembrandt Harmens van Rijn: ses précurseurs et ses années d'apprentissage* (1863); *Rembrandt Harmens van Rijn, sa vie et ses œuvres* (revision of the preceding, 1868; new enlarged ed. 1877); *Les œuvres de W. Unger* (1873-78); *Frans Hals* (1874); *Over kunst schetsen en studiën* (1882). A biography of Vosmaer, with bibliography of his works, is given by J. Ten Brink, *Geschiedenis der Noord-Nederlandsche Letteren in de XIX^e eeuw* (Amsterdam, 1888). A. R. MARSH.

VOSS, JOHANN HEINRICH: poet and scholar; b. at Sommersdorf, Mecklenburg, Feb. 20, 1751. The misfortunes of his father compelled him to become a tutor in order to obtain means to finish his education, but he nevertheless acquired a comprehensive knowledge in classical and modern languages and literatures, and had established relations with many of the leaders of German literature, when in 1778 he was appointed rector of the gymnasium at Otten-dorf in Hanover. In 1772 he removed to Eutin, near Lubeck, as rector of the gymnasium there. From 1802 to 1805 he resided in Jena, where he received a pension from the Grand Duke of Saxe-Weimar. In 1805 he accepted a chair in Classical Literature at the University of Heidelberg, and here he died Mar. 29, 1826. He had an uncommon mastery of the German language and a fine sense for the formal correctness of verses. His translation of Homer (4 vols., 1793) was the great work of his life. After numerous attempts to translate Homer in verse and prose, which had been made since the time of the humanists, Voss succeeded for the first time in making a classical version of the famous epics, and so great was the influence of his translation that it has frequently been compared with the influence of Luther's translation of the Bible. His translations of Virgil's *Ecloges* and *Georgics*, of Ovid's *Metamorphoses*, of Hesiod, Theocritus, Bion, Moschus, etc., were less successful. His power of imagination and emotion was not great. His translation of Shakspeare, finished by his son (9 vols., 1818-29), is unimpressive, and so are his own poems, collected in 4 vols. (1825), though one of them, the idyl *Luise*, became very popular. His critical works show the same character—his attack on Heyne, his polemics against Cruzer, *Mythologische Briefe* (2 vols., 1794), *Antisymbolik* (2 vols., 1824-26), etc. They are clear, and rest on solid knowledge, but they lack elevation and are singularly unsuggestive. A striking picture of the man's noble and open but somewhat circumscribed character is given in his *Wie ward Fritz Stolberg ein Unfreier* (1819), which he wrote when his friend Friedrich Stolberg was converted to Roman Catholicism. His letters were published by his son in 3 vols. (1829-33). See W. Herbst, *Johann Heinrich Voss* (1876); A. W. Schlegel, *Werke*, 10, 115; R. Prutz, *Der Göttinger Dichterbund*. Revised by JULIUS GOEBEL.

Vossius, GERARD JOHANNES: classical scholar; b. near Heidelberg, Germany, in 1577, of Dutch descent; studied classical languages and literature at Leyden and Dort; was appointed in 1600 rector of the school at Dordrecht, and in 1615 director of the theological school at Leyden, later also Professor of Eloquence at the university, but became entangled in the controversies between the Arminians and Gomarists. Through Archbishop Laud he received a prebend in the Cathedral of Canterbury, and in 1629 went to England to be installed, but returned to Holland and was made Professor of History (1631) at the newly founded College of Amsterdam, in which city he died Mar. 27, 1649. Vossius is the polyhistor of Dutch scholars. The most remarkable of his works are *Aristarchus sive de Arte Grammatica* (1635; 2 vols., 1834); *Etymologicum Linguae Latinae* (1662; 2 vols., Naples, 1763); *Commentariorum Rhetoricorum sive Oratoriarum Institutionum Libri VI.* (1606); *Ars Rhetorica* (1623); *De Historicis Graecis Libri II.* (1624; ed. by Westermann, 1838); *De Historicis Latinis Libri III.* (1627); *De Artis Poeticae Natura* (1847). His complete works appeared at Amsterdam in 6 vols. (1695-1701). His letters were published in two collections (London, 1690, and Angsburg, 1691). His rich collection of valuable MSS. are in the library of Leyden. See Toll, *De Vossio, perfecto grammatico* (Amsterdam, 1778).—His six sons were

all prominent men, but only the youngest, ISAAC VOSSIUS, survived him. He was born at Leyden in 1618, and received the instruction of his father. In 1648 he went to Stockholm on the invitation of Queen Christina, but fell out with Salmasius, and returned to Holland in 1658. In 1670 he removed to England, was made canon of Windsor in 1673 by Charles II., and died there Feb. 21, 1689. His principal works, besides editions of Justin, Catullus, and the geographers Scylax and Mela, are *De vera Aetate Mundi*; *De Septuaginta Interpretibus*; *De Sybillinis atisque Oraculis*; *De Poematum Cantu et Viribus Rhythmi*; and *Variarum Observationum Liber*. See de Crane, *De Vossiorum Juniorumque familia* (1820). Revised by ALFRED GUDEMAN.

Vote [Lat. *vo-tum*]; a suffrage; a statement of a choice by an individual who, with others having a like power, thereby renders a decision upon some pending question, or makes a selection of a person for some representative or official position. Although the terms voting and votes are frequently used in matters connected with the private law—as, for example, by the stockholders and directors of corporations—the terms are most frequently and significantly employed to describe the means and instruments by which many officials are chosen at public elections and measures are passed in legislative bodies. In Great Britain the voting for members of the House of Commons was for a long time *vivâ voce*. Each voter came up to the polling-place or booth, and cast his vote by naming aloud the candidate or candidates of his choice; and the names thus announced were immediately registered in the polling-book. This method was long upheld as being peculiarly in harmony with the English character, but it plainly subjected tenantry and others to an enormous political pressure from their superiors and landlords. Parliament finally abolished the whole system, except for the parliamentary elections in the universities, and introduced the ballot by the statute of 35 and 36 Vict., ch. 33, § 2 (1872), which goes to the very opposite extreme, and prescribes very minute and careful provisions for rendering the votes absolutely secret. At an early day after the adoption of the U. S. Constitution the *vivâ-voce* vote existed in a few of the States, but the ballot has long been established in the U. S., and now prevails in all elections, national, State, and municipal. (For an account of the means to insure secrecy and prevent fraud in voting, see the articles BALLOT REFORM and VOTING-MACHINES.) Another common and important species of vote is that used for the determination of questions—and especially for the passage of bills—in legislative assemblies. In the British House of Commons, in the U. S. Congress, and in all the State Legislatures the votes must be given by the members personally while present at a session, but in the British House of Lords votes by proxy are permitted. There are three forms of the legislative vote—by a rising and count, by a collective and simultaneous utterance of the *ay* or *no*, and by a call of the roll, each member responding "ay" or "no" when called, so that his name and response may be entered on the records. The U. S. constitutions, statutes, and parliamentary rules contain special provisions by which the latter form may or must be resorted to in the decision of certain classes of questions, and especially in the final passage of bills. Stockholders of corporations are generally permitted to vote by proxy in the election of trustees or directors and in the determination of other matters left to them by the charters. For an account of the methods of voting by which minority representation can be secured, see the article REPRESENTATION.

Revised by F. M. COLBY.

Voting-machines: contrivances by which voters may mechanically record their choice of candidates, and which usually also automatically count the votes. The introduction of practical voting-machines was an outcome of the general movement for ballot reform, which seeks independence and secrecy for the voter, and the prevention of fraud in casting and counting votes. The Australian ballot system has done much toward accomplishing all these results, but still further improvements appear to be possible by machine voting. Moreover, the habit of independence in voting which has been developed by the Australian system has itself generated the need for further improvement of voting methods. The separate marking of names, especially where a "split" ticket is cast, is far less simple and rapid than casting a straight party ballot. Machines help to simplify and shorten the process.

The general principle underlying the several machines in actual use is that of recording or registering votes for

candidates by pressing buttons, the names of all the candidates being displayed upon a face-plate, corresponding in arrangement to a blanket ballot (for description of which see **BALLOT REFORM**). Ballot-machines can be adapted to all the variations in form of which the blanket ballot is capable.

Chief Advantages.—The following are the chief advantages which, attained by different devices in the various machines, are secured by mechanical voting: (1) Independence. The voter may be required to indicate his choice for each office separately, and the names being all before him, it is as easy to cast a split ticket as a straight one; in other words, the machine has all the advantages of the blanket ballot in this regard. It may of course be arranged, if desired, so that pushing a single button casts a full party ticket, but this is not usual. (2) Secrecy. No one can tell what vote the person is casting at the time, nor can his ballot be afterward identified. This last has not always been accomplished by the secret paper ballots, as marks are sometimes made upon them by which they may be identified in the canvass, so that a bribed voter can give evidence of keeping his contract. (3) Simplicity of voting. Pushing a button is a simpler and more definite act than marking with a pencil. The voter can not by mistake vote for two candidates for the same office, or so mark his vote that his intention is doubtful, as often happens with the paper ballot. There is no need of writing or pasting in names, as in the separate party ballot system. If the voter is illiterate or needs time to decide upon his vote, he can, before voting, study the chart corresponding to the face of the ballot-machine, which is usually posted outside the poll. A voter who can not read may, by determining the relative location of the names, be sure of voting for the men he desires. Symbols or colors may be used to designate parties, as with the blanket ballot. (4) Impossibility of multiple voting. Mechanical devices prevent the casting of more than one vote by the same man, or render possible in canvassing its immediate detection. (5) Rapidity of voting. (6) Cheapness, saving largely, as it does, the cost of ballots and reducing the amount of clerical work, as well as other expenses. (7) Simplicity and rapidity of counting. Canvassing under the Australian system is very complicated and slow. By the machines the votes for each candidate are automatically registered by serial numbers, so that the total can be read

instantly, or they are all recorded in a row and can be rapidly counted. (8) Impossibility of fraud in counting. The complexity of the blanket paper ballot often renders it possible for corrupt election officers dexterously to change the count. This is probably impossible with the machines.

Types of Machines.—The use of three types of voting-machines has already received legislative sanction in different States. Others have been devised, but have obtained no general attention.

The Myers American ballot-machine was perhaps the first to claim public interest. It has been employed especially in New York State, where its use was first legalized in 1892. It consists of a small room or cabinet to conceal the voter, on one wall of which are the names of the candidates, with a push-knob opposite each. The names are arranged vertically according to parties, and horizontally according to offices, precisely as in a blanket ballot. By pushing a knob the voter makes one count for the desired candidate on the automatic register on the other side of the partition wall. By means of levers the pushing of one knob locks the knobs for all candidates for that office, but they are automatically set free by the closing of the door

FIG. 1.—McTammany voting-machine.

when the voter leaves the compartment. On opening the door which covers the back of the partition the result can

at once be read off. A further description of the Myers ballot-machine, with illustrations, is given in the article **BALLOT REFORM**.

The McTammany ballot-machine is made in Massachusetts, and its use was authorized by that State in 1893. It is much smaller than the Myers machine, consisting of a vertical steel box 14 inches square and 5 inches deep, fastened on a standard. Though the machine is in full view the ballot is secret. There is one slot on the face for each office only. Underneath this slot is a sliding card bearing the names of the candidates for that office, only one name being visible at a time. By turning a hand-wheel the voter brings into view the name of the desired candidate for each office, and then pushes a knob, making a hole in the proper column on the tally-sheet. When the voter has finished, an officer by means of a lever moves the tally-sheet forward, ready for the next voter. The vote for each candidate can be ascertained by counting personally the punches under his name; or the roll containing the tally can be placed in a mechanical ballot-counter, and, by turning the handle till the sheet is unwound, the vote for all the candidates will be automatically counted. It is evident that this machine, as now in use, is specially adapted to Massachusetts and other States having an educational suffrage qualification, as the voter must be able to read the names of the candidates. This corresponds precisely to the form of blanket ballot in use in Massachusetts.

FIG. 2.—McTammany ballot-counter.

The votograph, or American ballot protector and recorder, formerly known as the Rhines machine, was made legally usable in Michigan in 1893. It is a box with a horizontal face on which the names of the candidates are arranged, as with the Myers machine, by parties and offices. Slips bearing the names are inserted in the push-buttons themselves. Below are separate tally-rolls for each candidate, with serial numbers printed upon them in a vertical row. Pushing the button places a punch in position for each name desired, so that when all the candidates have been selected the closing of the machine lid puts a hole through the proper number on each roll. Mistakes can thus be corrected before closing the lid. When the election is over each roll is cut off ten numbers below the last one punched, so that it may be evident that it has not been divided in the midst of the votes. Over these blank numbers the election officers sign their names. The tally-sheet for each candidate will then appear as in the diagram.

Considering their recent invention, the extent to which voting-machines are in actual use is naturally comparatively slight. In no State had they been universally employed in the year 1895; nor was their use compulsory for any jurisdiction, but several States had made it a matter of local option. New York in 1892 authorized any town to adopt the Myers machine for town elections, and in 1894 permitted counties and cities, save New York and Brooklyn, to adopt it in both local and State elections. There was some doubt as to whether machine voting was voting "by ballot," and accordingly constitutional; and though no case was brought in the courts, the constitutional convention of 1894 inserted an

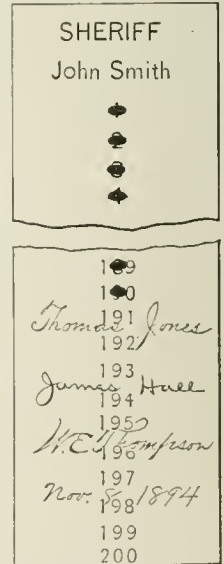

FIG. 3.—Votograph tally-roll.

amendment providing for the lawful use of any machine-voting system that secured the secrecy of the ballot. A similar constitutional amendment has been adopted in Delaware. Massachusetts has authorized towns to use the McTammany machine for local elections. Michigan permits the use of the Rhines votograph or of the Myers machine for town and city elections. Connecticut in 1895 legalized the use of either the McTammany or the Myers machine for local elections.

E. DANA DURAND.

Voucher [from O. Fr. *voucher*, *vocher* < Lat. *vocare*, call]: in the ancient common law, a term denoting a peculiar proceeding in an action brought to recover land, whereby the defendant "vouched," or summoned, his own grantor or lessor, who had warranted the title, to appear and defend his title against the attacks of the plaintiff. The defendant thus calling in his predecessor to defend the suit was also named the voucher, while the party summoned was styled the vouchee. This special process and the names belonging to it have been abrogated by the modern amendments made in the system of legal procedure. The term also denotes—and this is now its ordinary signification—any written memorandum, receipt, discharge, or evidence of the payment of money, and also the books of account in which are entered such payments and receipts, used in actions or other proceedings for the judicial settlement of accounts. Every writing showing the payment of money by the person whose accounts are investigated, and which thereby strengthens or even supplies the place of the oral testimony, is a voucher. *People vs. Green*, 5 Daly (N. Y.) 194.

Vouet, *voo'ã*, SIMON: painter; b. in Paris, Jan. 9, 1582; son and pupil of Laurent Vouet. He went to London when only fourteen years of age, already proficient in his art and able to earn his living. In 1611 he was taken by the Baron de Saucy, ambassador to the Sublime Porte, to Constantinople, where he received many commissions. He went to Venice in 1612 and studied the works of Paolo Veronese, and passed some time in Rome and Genoa. He was received with honor in both cities and named president of the Roman Academy. Louis XIII. recalled him to Paris and appointed him court painter. Vouet did much to advance the progress of art in France. Among his pupils were the Lebruns, Lesueur, and Mignard. D. in Paris, June, 30, 1649. For further information, see *The Historic Gallery of Portraits* (vol. iv., London, 1807).

W. J. STILLMAN.

Vourla: town; in Asia Minor, vilayet of Smyrna, on the south side of the Gulf of Smyrna. It exports large quantities of raisins and olives. Its excellent harbor, formed by the peninsula and the islands of Ourlac, is a favorite station of European men-of-war. The town occupies the site of ancient *Clazomenæ*, whose inhabitants, on the approach of Alexander the Great, removed to one of the Ourlac islands. The causeway, built out by the monarch to capture the city, still exists, and has become a sandy isthmus. Between Vourla and Smyrna there are numerous warm springs much used for bathing. Pop. 25,000.

E. A. GROSVENOR.

Voussoir: one of the ring-stones of an arch, the central one being the keystone. See ARCH.

Voysey, CHARLES; clergyman; b. in London, England, Mar. 18, 1828; educated at Stockwell Grammar School; graduated at St. Edmund Hall, Oxford, 1851; took orders in the Church of England; was curate of Hesse, near Hull, 1852-59, of Craigton, Jamaica, 1860-61; became incumbent of St. Mark's, Whitechapel, London, 1861; was ejected in consequence of having preached a sermon against the doctrine of endless punishment; held for a short time the curacy of Victoria Dock parish, London, and became vicar of Healaugh, Yorkshire, 1864. He began in 1865 the publication of *The Sling and the Stone* in monthly parts, each consisting of two sermons, and continued the series until 1871. In consequence of these sermons containing opinions which were held to be inconsistent with the Thirty-nine Articles, Mr. Voysey was prosecuted in the chancery court of York minster by the secretary of the Archbishop of York. Decision having been pronounced against him Dec. 1, 1869, he appealed to the judicial committee of the privy council, which confirmed the decision and sentenced the appellant to be deprived of his living and to pay the costs (Feb. 11, 1871), giving him, however, a week in which to retract his opinions. Since that date Mr. Voysey has preached and

lectured upon his own responsibility in halls in London, and since Apr., 1885, at the Theistic Church, Swallow Street, Piccadilly, being supported by the Voysey Establishment Fund, to which there were numerous and wealthy subscribers. His sermons, which were increasingly "heretical" in their tone, were printed weekly and had a wide circulation. He published some controversial pamphlets, and conducted for a few months in 1876 the *Langham Magazine*, an organ of free religious thought which had but a brief existence. He has written *The Mystery of Pain, Death, and Sin*, and *Theism, or the Religion of Common Sense*.

Revised by W. S. PERRY.

Vuillefroy, *vül'frwaa*, DOMINIQUE FÉLIX, de: animal and landscape painter; b. in Paris, Mar. 2, 1841; pupil of Hébert and Bonnat; received a medal at the Salon of 1870, a second-class medal in 1875, and a first-class medal at the Paris Exposition of 1889; became a member of the Legion of Honor in 1880. *The Return of the Herd* (1880) and *In the Meadows* (1883) are in the Luxembourg Gallery, Paris. Vuillefroy's work is virile in style and of excellent technical quality.

W. A. C.

Vulcan (Lat. *Vulcanus*): in Roman mythology, the god of fire, whether conceived of as a beneficent or as a devastating agent, and of those arts which depend on the use of fire. The principal celebration in the worship of the god was the Volcanalia, on Aug. 23. In course of time Vulcan became completely identified—in literature and art at least—with the Greek god ΗΕΡΜΕΥΣΤΗΣ (*q. v.*).

G. L. H.

Vulcan [named from Vulcan, the god of fire]: a planet supposed to be revolving around the sun, within the orbit of Mercury. About 1859 Leverrier announced that a certain motion of the perihelion of the orbit of Mercury could be accounted for by the existence of another planet still nearer the sun, even as the perturbations of Saturn had enabled him to discover the planet Neptune. The planet has been looked for on many occasions, especially during total eclipses of the sun, and some astronomers have believed that they saw it. But it is now fairly well settled that the supposed planet has no real existence, so well settled, in fact, that the question no longer appears in astronomical literature.

Vulcanite and Vulcanization: See INDIA-RUBBER and DENTISTRY.

Vulcano, or **Volcano**: the southernmost of the Lipari or Æolian islands; in the Mediterranean Sea; in lat. 38° 22' N., lon. 15° 0' E.; 12 miles off the northern coast of Sicily. It is 7 miles long and 3 miles broad, and contains, nearly in the center, a crater nearly 1,200 feet high and about one-fourth of a mile in circumference, which constantly emits smoke and vapors charged with sulphur, ammonia, vitriol, and alum. The southern part of the island is very fertile, and produces excellent grain, grapes, fruit, and flax. The interior is sterile, and on the northern side the island is connected by a row of low rocks with the Vulcanello, a minor crater, likewise emitting smoke and vapors. The eruptions of Vulcano (of which there was one in 1888) alternate with those of Stromboli.

Vulgar Fractions: See FRACTIONS.

Vulgate [from Late Lat. *vulgata* (*sc. editio*, edition), liter. fem. perf. partic. of *vulga re*, *vulgatum*, make common or popular, deriv. of *vulgus*, common people]: Latin translations of the Bible. The Latin is one of the three oldest versions of the Old Testament, the Greek, the Syriac, and the Latin, and one of the two oldest of the New Testament, the Syriac and the Latin. The history of its origin is lost, but it is certain that it was made in Africa, and in the second century. It would naturally be assumed that it was made in Rome, but at that period the Church in Rome was essentially Greek, the Roman bishops bore Greek names, the earliest Roman liturgy was Greek, and the few remains of Roman Christian literature are Greek. The same statements hold true of Gaul. The Church in Africa, however, seems to have spoken Latin from the first. At what exact time this Church was founded is not known, but at the close of the second century Christians were found there in all places and in every rank. Tertullian of Carthage, the first of the Latin Fathers, directly cites or alludes to every part of the New Testament which we now have, except the second and third Epistles of St. John, the second of St. Peter, and St. James. (See H. Rünsch, *Das Neue Testament Tertullians*, Leipzig, 1871.) This version, the *Velus Latina*, or *Old Latin*, was preserved generally unchanged in Northern Africa, but

when introduced into cultured Italy its provincial rudeness would offend, and the familiarity of the leading bishops there with Greek would make the revision, so likely to take place, easy of accomplishment. Hence in the fourth century a revision of the Gospels seems to have been made in Northern Italy, and to have been distinguished by the name *Itala, Italian*, although scholars are not agreed as to the exact meaning of this term. This version St. Augustine recommends for its accuracy and perspicuity (*De Doctr. Christ.*, ii., 15), and the text of the Gospels as quoted by him, on occasion, in his works bears out his representation; but in the other books the difference can not be traced with exactness. The Latin version of the New Testament appears to have arisen from individual and successive efforts; for St. Augustine says that any one in the first ages of Christianity who gained possession of a Greek MS., and thought he had a fair knowledge of Greek and Latin, ventured to translate it. And as the LXX. about a. c. 250 furnished the mould in which the thoughts and expressions of the Greek Testament are cast, so the LXX. may have taken a Latin form for the Latin-speaking Jews, and thus may have made ready a dialect for the Latin version of the New Testament. But however this may have been, there is found, in fact, a substantial similarity between the character of the Old Testament and the New Testament in Latin, and this justifies the belief that there was one Latin version of the Bible current in Africa in the last quarter of the second century.

The name Vulgate—that is *Vulgata editio*, the current text of Holy Scripture—originally answered to the designation of the Greek version of the Old Testament, the *κοινή ἑκδοσις*. As the *vetus versio* of the Old Testament was made from the LXX., and in substance identified with it, St. Jerome introduces Latin quotations from the Old Testament under the name of LXX. or *Vulgata editio* indifferently, and thus this term was transferred from the current Greek to the current Latin of the Old Testament. This use of the expression *Vulgata editio* continued to later times. It is found in St. Augustine, Ado of Vienne, and in Roger Bacon, and it is recognized even by Bellarmine. The Council of Trent, therefore, historically erred in styling St. Jerome's Bible *Vulgata editio*. The Latin Fathers themselves commonly spoke of St. Jerome's version as *nostra versio*, our version, or *nostris codicibus*, our books.

After the translation received a definite shape in Africa it was jealously guarded by ecclesiastical use, and was retained there even when St. Jerome's version was almost universally received elsewhere. But at the same time the text suffered by the natural corruptions of copying and by the interpolation of glosses, especially in the Gospels, and thus the different forms of the text became almost as numerous as the copies. The one remedy for this confusion was to go back to the first form in Greek.

St. Jerome had not been long in Rome (A. D. 383), when Pope Damasus applied to him for a revision of the current Latin version of the New Testament by means of the Greek original. St. Jerome undertook the work, and confined himself strictly to the labors of a reviser. In the prosecution of his work he collated early Greek MSS. and introduced the necessary changes, but he preserved the old renderings where the sense was not injured by it. Some of his alterations were made on purely linguistic grounds, but it is impossible to ascertain on what rules he proceeded; others involved questions of interpretation; the greater number, however, consisted in the removal of the interpolations by which the first three Gospels especially were corrupted. These interpolations must have been far more numerous than are found in existing copies, but instances still occur to show the service he rendered in checking the perpetuation of apocryphal glosses and additions.

St. Jerome's Preface, addressed to Damasus, speaks only of a revision of the Gospels; and St. Augustine, writing to St. Jerome, alludes to the Gospel, and there is no preface to any other book such as is elsewhere found before St. Jerome's versions or editions; but this omission is probably due to the fact that the rest of the New Testament was preserved comparatively pure. St. Jerome himself enumerates among his works his *Restoration of the New Testament to Harmony with the Greek*.

The old version of the Old Testament was made from the unrevised form of the LXX., and thus included many false readings and other imperfections. Therefore about the same period in which St. Jerome revised the New Testament he put his hand to the Old Testament. He first undertook and accomplished a revision of the Psalter. This

was done with the aid of the LXX., but not very thoroughly. It was called the *Roman Psalter*, probably because made for the use of the Church in Rome at the request of Damasus. Afterward, urged by Paula and Eustochium, he made a new and more careful version in 392, which became very popular, and which Gregory of Tours is said to have introduced into France, hence called the *Gallican Psalter*. From this work he proceeded to a revision of the rest of the Old Testament by means of the LXX., which he appears to have completed in four or five years. About the year 374 he had begun the study of Hebrew, which he zealously pursued for some years, and about 389 published several treatises connected with this study. These paved the way for his version of the Old Testament direct from the Hebrew, which he now undertook, and in about 405 seems to have completed. Portions of this, as the books of Solomon, Judith, and Tobit, were done in great haste, but the greater part was accomplished successfully.

The critical labors of St. Jerome were received with an outburst of reproach. He was accused, as other such laborers have been, of disturbing the peace of the Church and of undermining the foundations of the ancient faith. Acknowledged errors were looked upon as hallowed by usage, and few had either interest or courage to seek the purest text of Holy Scripture. Even St. Augustine was carried away by popular prejudice and endeavored to discourage St. Jerome from his presumptuous work, as it appeared to him; but the improved translation gradually came into use side by side with the old, and at length supplanted it; and thus it did without any direct ecclesiastical authority.

The Latin Bible which thus became current under the name of St. Jerome was a composite work containing elements that belonged to every period and form of the Latin version: (1) *Unrevised Old Latin*, Wisdom, Eccles., 1 and 2 Maccabees, and Baruch; (2) *Old Latin revised from the LXX.*, the Psalter; (3) *St. Jerome's Translation from the original Greek*, Judith, Tobit; (4) *St. Jerome's Translation from the original Hebrew*, the Old Testament except the Psalter; (5) *Old Latin revised from the Greek original*, the Gospels; (6) *Old Latin thus revised cursorily*, the rest of the New Testament.

The MS. remains of the Old Latin text of the Old Testament are very scanty. There still exist important MSS. of the New Testament: Of the *African text*, *Codex Verulensis*, at Vercelli, of the fourth century; *Cod. Claromontanus*, in the Vatican, of the fourth or fifth century; *Cod. Bobienseis*, at Turin, of the fifth or sixth century, a remarkable revision of this text; of the *Italic text*, *Cod. Brixianus* and *Cod. Monacensis*, of the sixth century. Of *St. Jerome's text* we have *Cod. Amiatinus*, at Florence, of the seventh or beginning of eighth century; *Cod. Toletanus*, now at Madrid, in Gothic letter, of about the tenth century (Berger would date it eighth century); and *Cod. Fuldenensis*, of the sixth century, containing the New Testament merely.

At the invention of the art of printing, St. Jerome's Bible was the first book produced from movable types, about 1455. It was printed again and again by various hands and in various forms, but it was not until the heat of controversy in the sixteenth century exaggerated the differences in the text and in the interpretation that an authorized edition was determined on for the Church of Rome. This was undertaken by Pope Sixtus Quintus, and put forth in 1590. Though declared by the pontiff *authentic and in a manner absolutely perfect*, it contained such typographical and other errors as to compel the publication of a second and revised edition in 1592, of another in 1593, and still another in 1598, with a triple list of *errata*, one for each of the preceding editions. This is the standard of the *Vulgate*, or Roman Catholic Bible, of the present day.

The MS. form of St. Jerome's Bible—which, upon the whole, stands highest in the estimation of scholars—is the *Codex Amiatinus*, mentioned above. The editors employed by Pope Sixtus rightly valued this MS., and in some passages solely or chiefly followed its authority. The portion containing the New Testament has been repeatedly published, and is easily accessible, as edited by Fleck (1840), common text with the Amiatine variations; by Tischendorf (1854 and 1873), Amiatine text with learned prolegomena. Facsimiles in Zangemeister and Wattenbach, *Exempla Codd.*, lat. pl. 35, and English Palaeographical Society, ii., pl. 65, 66. See also H. T. White, *The Codex Amiatinus and its Birth-place in Studia Biblica* (ii., p. 273, Oxford, 1890).

Some specimens of the diction of the Vulgate are subjoined, under different heads, extending over the first ten chapters of St. Matthew, as given in the Greek and the Latin text of Prof. Tischendorf in his *N. T. Triglotum*, published in 1854: (1) *It preserves the exact order of the original in very many instances.* At the opening of the Gospel we find *Liber generationis Jesu Christi filii David, filii Abraham. Abraham genuit Isaac, Isaac autem genuit Jacob.* This follows the Greek word by word: Βίβλος γενέσεως Ἰησοῦ Χριστοῦ υἱοῦ Δαυιδ υἱοῦ Ἀβραάμ. Ἀβραάμ ἐγέννησεν τὸν Ἰσαάκ, Ἰσαάκ δὲ ἐγέννησεν τὸν Ἰακώβ. So in clauses and phrases: vi. 6, *Σὺ δὲ ὅταν προσεύχη, Ἦν autem cum orabis*; iv. 22, *οἱ δὲ, illi autem.* The advantage of following the order of the Greek sometimes appears conspicuously, as in iv. 10, *Dominum Deum tuum adorabis et illi soli servies*—an order preserved in English only by the Rheims version, and far more forcible than the common order. In iii. 1, *Ἐν δι ταῖς ἡμέραις ἐκεῖναις* is given by *In diebus autem illis*: here (a) the postpositive particle *autem* stands for the postpositive δέ, but the Vulgate, faithful to Latin usage, puts it after the noun, not after the preposition, as in the Greek; and (b) the demonstrative follows its noun like the Greek; now, common as this order is in Greek, it is comparatively rare in Latin, though found in the best writers (Cicero, Livy). But we meet here and there with a departure from the arrangement of the Greek without apparent reason: in i. 12, *Μετὰ δὲ τὴν μετοικίαν* is given by *Et post transmigrationem*, instead of *Post transmigrationem autem*; and in ii. 5 and iv. 20, *οἱ δὲ* is given by *At illi*, instead of *Illi autem*; and this is the more strange, as the stricter form is common in the Vulgate.

(2) *Many of its renderings are peculiarly exact in sense or form, or both, in reference to the Greek.* In i. 11, *ἐπὶ τῆς μετοικίας Βαβυλῶνος*, is given by *in transmigratione Babylonis*, which, though unclassical, as mentioned again below, preserves the euphemism of the Greek Testament and of the LXX. for "captivity," and of all our versions. Wycliffe's and the Rheims alone have retained it. In ii. 19, *Τελευτήσατος δὲ τοῦ Ἡρώδου*, the gen. abs. is exactly given by the abl. abs., *Defuncto autem Herode*, and so in vi. 3. In iii. 2, *Μετανοεῖτε* is given by *Penitentiam agite*, and this Latin was rendered by Wycliffe "Do penance," which the Rheims followed; but, though this English phrase has now, even to the Roman communion, come to mean rather mortification of the body than sorrow of mind, yet the Latin is a good classical equivalent of the Greek, and is actually found in Petronius, *Sat.*, 132, in Tacitus, *De Orat.*, 15, in Pliny, *Ep.*, vii. 10, and has the express sanction of Quintilian in a critical observation in ix. 3, 12. In iii. 9, *μὴ δόξητε* is given in form by *ne relitit*, and *ne* is so used in v. 42; vi. 13; vi. 25, while, as mentioned below, the freer and quite classic *noli* and *nolite* with the inf. prevails in the Vulgate. In iii. 15, *Ἄφες ἔσται* is ingeniously rendered by *Sine modo*, and in iv. 17, *Ἀπὸ τότε* by *Exinde* (Plaut., Cic., Verg.), and vi. 25, *Διὰ τοῦτο* by *Ileo*. In iv. 16, *ὁ λαὸς ὁ καθήμενος* is nicely given by *populus qui sedebat*, who were sitting, and viii. 24, *ὥστε τὸ πλοῖον καλύπτεσθαι* by *ita ut navicula operiretur*, was being covered, while the A. V. has "sat," and "was covered." In viii. 16, *δαίμονιοι* is rightly rendered *daemonia habentes*, "possessed with demons," while all our versions have here "devils," as if it were the plural of *ὁ διάβολος*, the devil; but the plural in this sense nowhere occurs in Holy Scripture; and though "devils" is found also four times in our version of the Old Testament, the Vulgate has likewise *daemonia* uniformly there.

(3) *Certain of its renderings seem more or less inexact or faulty.* In i. 20, *Ταῦτα δὲ αὐτοῦ ἐνδυμηθέντος* is given by *Hec autem eo cogitante*, but this would be the proper rendering of the pres. participle, as is given by the Vulgate in Acts x. 19, while here the proper rendering would have been, *Cum autem huc cogitavisset*; we also find the aor. part. of the Greek given by the pres. part. in the Vulgate in i. 24; ii. 3, 4, 8, 9, 10, 11 bis, 16 bis, 21, 22, 23; iii. 7; iv. 3, 9, 21; v. 1, 2, 24. These instances are enumerated in full, because there is an impression, even among scholars, that our loose use in English of the pres. part. is largely due to the influence of the A. V.; yet against these twenty cases of such loose use in the Vulgate only four can be adduced from the same portion of the A. V., and one of these (iii. 15) is logically right: *Ἀποκριθεὶς δὲ ὁ Ἰησοῦς εἶπεν*, "And Jesus answering said." In ii. 8 the diminutive *παιδίον* is given by *puer*, instead of the dim. *puellus*, by which the Vulgate always renders this elsewhere, except in Tobit i. 8, where it uses *puerulus*.

(4) *Many of its renderings are strictly in accordance with Latin usage, even when this differs from the Greek.* We have the Greek part. given by *cum* and the subj.: (a) the aor. part., i. 18, *Μνηστευθεὶς γὰρ τῆς μητρὸς*, *Cum esset desponsata mater*, and so ii. 1, 9, 13, 19; iv. 2, 12; v. 1; (b) the pres. part., i. 19, *δικαίος ὢν*, *cum esset justus*. We have the Greek aor. part. given by the abl. abs.: *καλέσας τοὺς μαγούς*, *vocatis magis*; so ii. 11, 12; iv. 13, 22; v. 6. In i. 20, *μὴ φοβηθῆς* is given by the idiomatic *noli timere*; so v. 17; vi. 2, 7, 8, 19, 31, 34, but in iii. 9, as said above, and elsewhere, we find the Greek form imitated, *ne relitit*. In iv. 1 we have *πειρασθῆναι*, denoting a purpose, rendered by *ut temptaretur*, and in iii. 13, *τοῦ βαπτισθῆναι* by *ut baptizaretur*, though, as illustrated below, the Greek inf. of purpose the Vulgate commonly gives by an inf.

(5) *It not unfrequently gives literal renderings from the Greek in violation of the Latin idiom.* In i. 11, *ἐπὶ τῆς μετοικίας Βαβυλῶνος* is given by *in transmigratione Babylonis*, for *cum Babylona commigrasset* (Liv.); iii. 8, *ποιήσατε—καρπὸν*, *facite fructum*, for *edere, ferre fructum* (Cic., Quint.); iii. 12, *συνάξει—εἰς τὴν ἀποθήκην*, *congregabit—in horreum*, for *percipere, horreo condere* (Cic., Hor.); iii. 17, *ἐν ᾧ εὐδόκησα*, *in quo mihi complucui*, for *qui mihi complucuit* (this Greek was rendered literally only by the Vulgate and Wycliffe—"in which I have pleased to me"—and no one of our versions but Wycliffe's has here retained the past tense of the original); iv. 4, *οὐκ ἐπ' ἔργῳ μόνῳ—ἀλλ' ἐν παντὶ ῥήματι*, *non in pane solo—sed in omni verbo*, for the simple abl., *pane—verbo*; so v. 13, 28; vi. 7; iv. 19, *Δεῦτε ὀπίσω μου*, *Venite post me*, for *Sequiturini me*.

(6) *It employs some words, forms, and phrases of very unusual, but still of authorized Latin.* In i. 19 *αὐτὴν δεῖγματι*, *eam traducere*: this verb is so used by Livy and Martial; *ἰβ' ἀποδοῦσαι αὐτὴν*, *dimittere eam*: this is an early and late phrase, being found in Plautus and Suetonius; ii. 16, *ἀπὸ διετούς*, *a bimatu*: this noun is used by Varro and Pliny; v. 13, *ἐὰν δὲ τὸ ἄλας μωρανθῆ*, *si sal evanuerit*: Cic., in *Die*, ii. 17, says, *salsamentum* (the brine) *vetustate evanuit*; v. 43, *μισήσεις τὸν ἐχθρὸν σου*, *odio habebis inimicum tuum*: a phrase used by Plautus; v. 45 *ἴπῳ γένεσθε*, *ut sitis*, for *ut fiat*: *esse* is so used in Cic., *De Off.*, i. 11, and elsewhere.

(7) *It employs some words and phrases quite unexampled in Early or Classical Latin, and found only in Ecclesiastical and Later Latin.* In iii. 12, *διακαθαρίει*, *permundabit*: only Later Latin for *purgabit*; iv. 2, *νηστεύσας*, *cum jejunasset*: only ecclesiastical for *cum jejunus fuisset*; iv. 10, *Ἔπαγε*, *Vade*: only poetic and used in the sense of "Go!" for *Apate*, *Abi hinc*.

(8) *In the use of particles it commonly follows classical usage, even in nice points.* In iii. 11, *μὲν—δέ*, *quidem—autem*: employed by Cicero occasionally, and as if in imitation of the Greek formula; v. 13, *ἐὰν δέ*, *quod si*: used by the purest writers; *δέ* is regularly given by *autem*, and *καὶ* by *et*, but *δέ*, resumptive, in ii. 1 is well given by *ergo*.

(9) *Some of its uses of particles are uncommon, others unexampled.* In v. 29, *συμφέροι—σοὶ ἴνα—καὶ μή*, *expedit tibi ut—quam*, as now and then in Tacitus, for *magis quam*; vi. 14, *ἐάν—ἐάν δέ*, *si—si autem* for *si—sin or sin autem*; v. 12, *Χαίrete—ἔτι*, *Gaudete—quoniam*, for *quod, quia, or cum*; vi. 29, *οὐδὲ Σολομών*, *nec Salamon*, for *ne Salamon quidem*; nor is the familiar classical *ne—quidem* known to the Vulgate New Testament any more than our familiar *not even* is known to the Authorized Version of the New Testament, except once in a question (1 Cor. xi. 14); *nec—quidem*, however, is found in 1 Cor. iii. 2, and *ne—quidem* in the Vulgate Old Testament. One of the most remarkable peculiarities of the diction of the Vulgate remains to be noticed under this head. It is well known that verbs of hearing, saying, thinking, etc., are construed in Greek sometimes with *ἔτι*, "that," and a finite verb, and sometimes with the acc. and the inf.; while in Latin the latter is the regular construction. But besides its objective meaning, "that," *ἔτι* has, according to its context, a causal force, "because." The Vulgate, to preserve the exact form of the Greek, commonly construes these verbs with a particle, but, as if taking the wrong meaning of *ἔτι*, renders, for example, in ii. 22, *ἀκούσας ἔτι* by *audiens quia*; so v. 21, 27, 33, 38, 43; in ii. 16, *ἰδὼν ἔτι* by *videns quoniam*. There are at least fifteen similar examples of this use of *quia* and *quoniam* in ii.—vi. And in all this portion we find *quod* used only once in this relation, though at certain periods of the language and in certain cases this particle alone stood in such relation; that one instance is in iv. 12, where *Ἀκούσας δὲ ἔτι* is rendered *Cum audisset quod*.

(10) *In the use of the moods it generally conforms to classical usage.* Omitting illustrations of this conformity, the exceptions to this rule are as follows: In ii. 2, ἤλθομεν προσκυνήσαι αὐτῷ, *venimus adorare eum*; only a poetic construction for *ut adoremus*, and so v. 17; viii. 29; ix. 13; x. 34, 35; in iii. 11, εἰμὶ ἰκανός—*basitāai, sum dignus portare*; also poetic for *sum dignus qui portem*; in iv. 19, ποιήσω ὑμᾶς ἀλιεῖς ἀνδράπων, *faciam vos fieri piscatores hominum*; rare, but found in Varro and Sallust for *faciamus ut, etc.*; in three instances the subjunctive is strangely used after certain particles: ii. 16, *videns quoniam inlusus esset*; ii. 22, *audiens quia regnaret*; and iv. 12, *Cum audisset quod Johannes braditus esset*.

Such are some of the characteristics of the Vulgate appearing from an examination of a portion of one of the Gospels. Its excellences are great and marvelous, and even its defects, generally arising from a scrupulous desire to keep close to the side of the sacred original, often suggest or confirm points of the gravest importance. Prof. Lachmann, Prof. Tischendorf, and Dr. Tregelles, the three greatest names connected with the textual criticism of the Greek Testament in recent times, adopting the view of the learned Bentley, regarded the Latin in the purest and most ancient forms as the most important witness to the integrity of the New Testament next to the Greek MSS., nor did they fail to observe that the Latin in some places goes back to a period which no Greek MS. now extant represents.

The Vulgate is to a degree not generally understood the venerable parent of our own translation, the Authorized Version. The history of the English Bible begins with Wycliffe, and the Wycliffite version, as it is now more strictly called, was made directly from the Vulgate. All the partial and preliminary versions also of Cædmon, Aldhelm, Bede, and others, it is to be remembered, were made directly from copies of the Vulgate. The influence of the Wycliffite version, representing the whole Vulgate, has been great and constant on all the subsequent English versions and revisions, furnishing apt and established words and phrases, which the new translators and revisers were neither willing nor able to lay aside.

The above indicates our indebtedness to the Vulgate in general. To be more particular, when the Vulgate was turned into its earliest English form, the Anglo-Saxon version, it was hardly possible that this act should not have greatly modified our language by introducing new words, mostly religious, and by giving us new forms of construction; and again, this work would be carried further by the Wycliffite version, and was perhaps nearly consummated in the Rheims, the last great version that preceded our own. Our Christian nomenclature itself has thus in great measure been furnished to us by the Vulgate, and many of these precious words were either invented in Latin or there first used in their higher and spiritual sense; such as *regeneration, conversion, justification, sanctification, predestination, election, propitiation, reconciliation, Saviour, salvation, Redeemer, redemption, Mediator, Spirit, cross, faith, grace, revelation, inspiration, Scripture, Testament, communion, orders, congregation*; some words are Greek, but given to us through the Latin, as *baptism, Paraclete, and presbyter or priest*; while some were coined in Latin to copy the Greek, as *transgress* from *transgredior*, in imitation of *παράβαλω*.

If we say, as we may with truth, that Christianity in the first instance was received in the Greek language and through Greek thought, we may surely say that it was adopted in Europe chiefly in Latin forms: and the influence of the Vulgate upon the religious language, thought, and culture of Europe can hardly be overestimated. See Canon Westcott, *The Vulgate*, in *Smith's Dictionary*; Dr. Tregelles, *Horne's Introduction to the Scriptures*, vol. iv.; F. H. A. Scrivener, *A Plain Introduction to the Criticism of the New Testament*, 4th ed., edited by E. Miller (London, 1894), vol. ii., c. iii., pp. 43-90; *Two Letters on 1 John v. 7* (Discussion of N. African Latin), Card. Wiseman, *Essays* (vol. i., 1853); Kaulen, *Geschichte der Vulgata* (Mayence, 1868); Rönisch, *Itala und Vulgata* (Marburg, 1875); Rönisch, *Das Neue Testament Tertullians* (Leipzig, 1871); Ziegler, *Itala-fragmente* (1876); T. Berger, *Histoire de la Vulgate pendant les premiers siècles du moyen âge* (Paris, 1893); W. A. Copinger, *Incunabula Biblica, or The first*

half century of the Latin Bible, being a bibliographical account of the various editions of the Latin Bible between 1450 and 1500 (London, 1892); J. Wordsworth and H. J. White, *Novum Testamentum secundum editionem sancti Hieronymi* (Oxford, 1889-95—four parts, Matthew, Mark, Luke, and John—have appeared); Sabatier, *Bibliorum sacr. Latine versiones Ant. seu Vetus Italica, etc.* (3 vols., Rheims, 1743-49). A revised edition of this great work for the Old Testament is in course of preparation under the auspices of the Munich Academy, and the superintendence of Prof. E. Wölfflin. See also E. Nestle's *Ein Jubiläum der Lateinischen Bibel* (Tübingen, 1892), and the article BIBLE.

Revised by M. WARREN.

Vul'pius, CHRISTIAN AUGUST; author; b. at Weimar, Germany, Jan. 23, 1762; studied at Jena and Erlangen; received an appointment at the library in Weimar in 1797. D. in Weimar, June 26, 1827. He wrote a great multitude of operas, romantic dramas, romances, tales, etc., and edited *Curiositäten der physisch-litterarisch-artistisch-historischen Vor- und Mitwelt* (10 vols., 1810-23), and *Die Vorzeit* (4 vols., 1817-21), which contain some interesting materials. One of his original works became very famous—*Rinaldo Rinaldini, der Ränberhauptmann* (1797). It was republished over and over again, translated into many foreign languages, and imitated by all the scribblers of Europe. It is still of interest to the student, showing whither the imagination of that age liked to wander when it was unoccupied by real business and uncultivated by true art, making evident, besides, how limited the popularity of men like Goethe, Schiller, and Herder at that time must have been.—His sister, JOHANNA CHRISTIANE SOPHIE VULPIUS, b. at Weimar, June 1, 1765, met Goethe for the first time in the summer of 1788, when she addressed him in the park of Weimar, in order to present a petition to him; removed shortly after into his house; bore him a son, August von Goethe, Dec. 25, 1789, and was officially married to him Oct. 19, 1806, a few days after the battle of Jena. Goethe chose this time in order to attract as little attention to the affair as possible, since he had always considered her his lawful wife. While for a long time Christiane had to suffer from the malicious gossip that became current in Weimar, and was repeated even in biographies of Goethe, recent publications have proved that the poet's relations to her were of a most tender nature, and that she was an excellent wife and mother. When she died (June 6, 1816), Goethe mourned her sincerely, and she was spoken of with kindness and with respect by all his friends. See E. Brauns, *Christiane v. Goethe* (1881); K. Heinemann, *Goethe's Mutter* (1892); *Schriften der Goethe-Gesellschaft*, iv. (1889).

Revised by JULIUS GOEBEL.

Vulture [viâ O. Fr. from Lat. *vultur*; cf. *vellere, vulsum*, pluck, tear out]: any one of those birds of prey which have the head bare and feed on carrion. The vultures of the Old World and those of the New were, until recently, considered as nearly related, but the former belong in the family *Falconidae*, while the latter form a separate family, *Cathartidae*, which contains such birds as the CONDOR, KING-VULTURE, and TURKEY-BUZZARD (*q. v.*). The true vultures, like the other *Falconidae*, have a bony portion, or septum, separating the nostrils, and are considered as divisible into several genera—viz., *Vultur, Gyps, Pseudogyys, Otogyys, Lophogyys, and Neophron*. These essentially agree in habits, living for the most part on dead animal matter, and even appearing to prefer that which is putrescent, although not confining themselves to such. When an animal has died the carcass is soon discovered by these birds, and they fly from all points of the compass. After eating to satiety they rest in a lethargic manner near the remains of the carcass, and are scarcely able to fly, and when disturbed generally vomit their ingesta before they are able to take to wing. They are birds of bold flight and soar high in the air, scanning the ground in search of food, which they find much more by the sense of sight than by that of smell. They are particularly inhabitants of the tropical and warmer parts of Asia and Africa, but some species occur in Southern Europe, notably the griffon vulture (*Gyys fulvus*), the typical species of the group and one of the largest. It is, as the scientific name implies, of a fulvous ash color, with a ruff of soft white feathers; the primaries and tail are brownish black. The length is about 3½ feet, spread of wing 6 or 7 feet. See also BRUSH-TURKEY and EGYPTIAN VULTURE. F. A. LUCAS.

Vyatka: See VIATKA.

: the twenty-third letter of the English alphabet.

Form.—The form W is a ligature resulting from the doubling of V. This device was first employed in mediæval times to express with Latin letters the value of Germ. consonant -u (= *u*), and was continued in the writing of German

loan-words by those Old French dialects which preserved the sound; thence it passed into the Middle English orthography, displacing the Old English symbol *wēn* (P). The use of *wi* was also known in the oldest O. Eng. texts.

Name.—The name "double-u," which has displaced the older *wēn* since the fifteenth or sixteenth century, is descriptive of the appearance of the symbol. It of course antedates the differentiation of V and U.

Sound.—It denotes in general the consonant form of *u* (*oo*), being characterized by the high-back position of the tongue and lip-rounding. After initial *s, t, h*, it is voiceless, as in *suell, twenty, what* (for *hwat*), *wh* being a sign for voiceless *w*. The same sound is denoted by *u* after *g*, as in *question, quality, quack*. The letter is silent before *r*, as in *wreck, wrong*, and in *sword, toward, answer, two, who, whoop, whole, whose, Greenwich*, etc.

Source.—(1) Teutonic *w* < Indo-Europ. *y*; *wolf*: Sanskr. *vṛka-*; Gr. (Φ)λύκος; *word*: Lat. *verbum*; Lith. *vardas*. (2) Teuton. *zw* < Indo-Europ. *ǵ* before the accent, or *ǵh*; *saw*: Lat. *sequor*; *snow*: Goth. *snaiws* < Indo-Europ. *snoiǵhos* > Gr. *νίφα*, Lat. *nivem*. (3) *wh* < Teuton. *hw* < Indo-Europ. *ǵ*; *wheel* < O. Eng. *hwēol*; Sanskr. *cakrā-*; Gr. *κύκλος*. (4) In a few loan-words, as from Latin (early) *wine* (*vinum*), *wall* (*vallum*), *-wick* (*vicus*); Amer. Ind. *wampum, wigwam*; Celtic *well, whisky*. BENJ. IDE WHEELER.

Waagen, vaa'gen, GUSTAV FRIEDRICH: eritic and writer on art; b. in Hamburg, Germany, Feb. 11, 1794; was educated in Silesia, whither his father, a painter of some reputation, had removed in 1807; made the campaigns of 1813-14 as a volunteer; studied art subsequently under the influence of Ludwig Tieck, a relative of his, at Breslau, Dresden, Heidelberg, and Munich; was appointed director of the picture-gallery of the Museum of Berlin in 1830; became Professor of the History of Art at the University of Berlin in 1844. His principal works are *Kunstwerke und Künstler in England und Paris* (3 vols., Berlin, 1837-39), of which a much enlarged edition of the English part, *Treasures of Art in Great Britain*, appeared in 3 vols. in 1854, and a supplement in 1857; *Kunstwerke und Künstler in Deutschland* (2 vols., Leipzig, 1843-45); *Die Gemäldesammlung der kaiserlichen Eremitage in St. Petersburg* (Munich, 1864); *Die vornehmsten Kunstdenkmäler in Wien* (2 vols., Vienna, 1866-67). D. in Copenhagen, Denmark, July 15, 1868.

Revised by RUSSELL STURGIS.

Wahoo: See SPINDLE-TREE FAMILY.

Waal: river of the Netherlands: one of the principal arms of the Rhine; thrown off near the village of Tannenden, whence it flows past Nymwegen, Tiel, Nieuw-St. Andries, joins the Maas, and then receives the name of *Merwede*. The Merwede passes by Gorinchen and Dordrecht, and becomes the Oude, or Old Maas.

Wabash, waw'bāsh: city; capital of Wabash co., Ind.; on the Wabash river, and the Ft. Wayne, Cin. and Louisv. Railroad; 30 miles E. of Logansport and 42 miles W. S. W. of Fort Wayne (for location, see map of Indiana, ref. 4-F). It is in an agricultural region, and has high and grammar schools, 2 national banks with combined capital of \$195,000, a private bank, a daily, a monthly, and 3 weekly periodicals, railway repair and machine shops, woolen, flour, paper, and oil mills, planing-mills, shoe and hat shops, and carriage and spoke factories. Pop. (1880) 3,800; (1890) 5,105; (1895) estimated, 8,200. EDITOR OF "PLAIN DEALER."

Wabasha, waw'bāsh-aw: city; capital of Wabasha co., Minn.; on the Mississippi river, and the Chi., Mil. and St. P. Railway; 30 miles E. S. E. of Red Wing and 33 miles N. N. W. of Winona (for location, see map of Minnesota, ref. 10-G).

It is 3 miles below Lake Pepin; is an important grain-market and trade center; and has 4 churches, court-house (cost \$40,000), a national bank with capital of \$50,000, a State bank with capital of \$30,000, 2 weekly papers, foundry, railway machine-shop, church-furniture factory, roller flour-mill, oatmeal-mill, boat-yard, soap-works, and large lumber interests. Pop. (1880) 2,088; (1890) 2,487; (1895) 2,545.

EDITOR OF "WABASH COUNTY HERALD."

Wabash College: an institution of learning at Crawfordsville, Ind., founded in 1832; non-sectarian, but in close affiliation with the Presbyterian Church. The college grounds comprise 33 acres. There are five large college buildings; a museum in which are collections of minerals and botanical, geological, and archaeological specimens, and laboratories for the study of biology, geology, and other branches of science; Center Hall, containing the chapel, also recitation and society rooms; Peck Hall, with extensive laboratories for the study of physics and chemistry; and Yandes Library Hall, containing 33,000 volumes. The college offers three courses, leading to the degrees A. B., Ph. B., and B. S. In 1895 there were 16 professors, 11 assistants, and 270 students. George S. Burroughs, Ph. D., LL. D., was inaugurated president June 21, 1893. The amount of invested funds is nearly \$500,000. G. S. BURROUGHS.

Wabash River: a river which rises in Grand Reservoir, Mercer County, O.; flows at first N. to Wabash city, where it receives Big Beaver river; turning N. W., it sweeps in a devious course across Indiana, and during the last 120 miles of its course forms the boundary between that State and Illinois. It is the largest northern tributary of the Ohio. It has been navigated at high water by steamboats as far as Lafayette, Ind.; and from Terre Haute to Huntington, Ind., it is followed by the Wabash and Erie Canal. Length, 550 miles; area of basin, 31,500 sq. miles.

Waccamaw River: a river which rises in Waccamaw Lake and in the marshes of Bladen, Columbus, and Brunswick cos., N. C., flows into South Carolina in a direction nearly parallel to the coast, and at Mt. Gilead, S. C., after a course of 125 miles, unites with the Great Pedee, which indeed is usually called Waccamaw below the junction. It finally flows into Winyaw Bay. The Waccamaw proper is navigable to Conwayboro, S. C.

Wace, often called MASTER WACE (Waice, Gace, Guace, or Gasse): poet; b. in the island of Jersey about 1100; was taken in childhood to Caen, Normandy, where he began his studies. He was destined for the Church; continued his studies at Paris; returned to Caen, and was a reading-clerk (*clerc lisant*) in the royal chapel about 1135; was made canon of Bayeux by Henry II. of England about 1162; d. about 1175. He wrote two long poems, the *Brut*, or *Geste des Bretons*, a paraphrase, in 15,000 lines of eight syllables, of the *Historia regum Britannie* of Geoffrey of Monmouth, which he finished in 1155, and dedicated to Eleanor, wife of Henry II., and *Le Roman de Rou*, or *Geste des Normanz*, of nearly 17,000 lines, narrating the history of the Norman dukes to 1107, including the conquest of England, and valuable both as an historical source and as a monument of the Norman dialect of French. The *Brut* was edited by Le Roux de Lincy (2 vols., Rouen, 1836-38); the *Roman de Rou*, by F. Pluquet (2 vols., Rouen, 1827), more satisfactorily by H. Andresen (2 vols., Heilbronn, 1877-79). The portion of the latter work relating to the conquest of England was translated into English prose by Edgar Taylor, *Master Wace, his Chronicle of the Norman Conquest* (1837), and by Sir Alexander Malet, *The Conquest of England, from Wace's Poem, now first translated into English Rhyme* (London, 1860). We have also three shorter poems of Wace: *La Conception Notre Dame*, edited by Luzarche (Tours, 1859); *La Vie de Saint Nicolas*, edited by Delius (Bonn, 1850); and *La Vie de Sainte Marguerite*, edited by A. Joly (Paris, 1879). See *Romania*, vol. ix. A. G. CANFIELD.

Wace, HENRY: principal of King's College, London; b. in London, Dec. 10, 1836; was scholar of Brasenose College, Oxford, from which university he received B. A. 1860, M. A.

1873, B. D. 1882, D. D. 1883 (same degree from University of Edinburgh, 1882). He was curate of St. Luke's, Berwick Street, London, 1861-63, and at St. James's, Westminster, 1863-69; lecturer of Grosvenor chapel, South Andley Street, 1870-72; chaplain of Lincoln's Inn 1872-80, and since 1880 has been preacher of Lincoln's Inn. He was Professor of Ecclesiastical History in King's College, London, 1875-83, and has been principal since 1883. He delivered the Boyle lectures for 1874 and 1875 on the subject of *Christianity and Morality*, and in 1879 the Bampton lectures, on *The Foundations of Faith*. He was select preacher at Cambridge 1878 and 1890, and same at Oxford 1880-82; honorary chaplain to the Queen 1884-89, and since 1889 a chaplain in ordinary. Since 1881 he has been a prebendary of St. Paul's. In conjunction with Dr. William Smith, he edited the monumental *Dictionary of Christian Biography, Literature, Sects, and Doctrines, during the first Eight Centuries* (4 vols., 1880-87); with Prof. C. A. Buchheim, *First Principles of the Reformation, or the Ninety-five Theses and the Three Primary Works of Dr. Martin Luther, translated into English* (1883); with Dr. Philip Schaff, the first seven volumes of the second series of the *Select Library of the Nicene and Post-Nicene Fathers of the Christian Church* (1890-94); and alone, *The Bible (Speaker's Commentary on the Apocrypha* (2 vols., 1886). He is also the author of lectures delivered in 1881 at St. James's, Westminster, on *The Gospel and its Witnesses; Some of the Chief Facts in the Life of our Lord, and the Authority of the Evangelical Narratives* (1883); *Some Central Points of our Lord's Ministry* (1890).

SAMUEL MACAULEY JACKSON.

Wachusett Mountain: a mountain in the northern part of Princeton, Worcester co., Mass.; elevation, 2,018 feet. It is a detached peak, from whose top there is a wide and picturesque view.

Wack'ernagel, JACOB: philologist; b. at Basel, Switzerland, Dec. 11, 1853; studied at Basel, Göttingen, and Leipzig; privat doцент, afterward Professor of Greek, in the University of Basel; author of *De pathologiæ veterum initiis* (1876); *Der Ursprung der Brahminismus* (1877); *Das Dehnungsgesetz der griech. Composita* (1889); *Das Studium des klass. Alterthums in der Schweiz* (1891); also of numerous important contributions to philological journals. His work, the best of which is to be found in the journals, is characterized by great precision in treatment and by the most conscientious regard for the recorded facts of language.

BENJ. IDE WHEELER.

Waco: city (surveyed as a town in 1849, incorporated in 1850); capital of McLennan co., Tex.; at the junction of the Brazos (which divides it) and the Bosque rivers; on the Mo., Kan. and Tex., the St. L. S. W., the San Ant. and Aran. Pass., the Tex. Cent., and the Waco and N. W. railways; 43 miles N. W. of Bremond, 95 miles N. E. of Austin (for location, see map of Texas, ref. 3-II). It is the principal interior cotton-market of the State, and received and shipped 160,000 bales in the season of 1894-95. Since 1889 it has had an abundant supply of artesian water of high medicinal value, there being (1895) 24 flowing wells, each 1,820-1,850 feet deep, yielding 500,000-1,000,000 gal. daily, and having a pressure of 65 lb. The water is used for all domestic and public purposes and, instead of steam, for manufacturing. The city has 60 miles of water-mains, 35 miles of electric railway, gas and electric plants for lighting and power, and 40 miles of paved and graded streets.

Churches and Schools.—There are 29 church buildings, representing the principal denominations, which cost, with ground, \$500,000. The public-school system costs about \$60,000 annually, and comprises a central (graduating) building that cost \$40,000 and 14 ward schools that cost from \$5,000 to \$12,000 each. The institutions for higher education are BAYLOR UNIVERSITY (*q. v.*); Waco Female College (Methodist Episcopal South, established 1855), with grounds and buildings that cost \$80,000, and about 150 students; Paul Quinn College (African Methodist Episcopal), for colored youths of both sexes, with about 200 students; and the Academy of the Sacred Heart (Roman Catholic), a boarding-school, with an average of 200 pupils. Both Baylor University and Paul Quinn College have theological departments.

Public Buildings.—There are 3 bridges across the Brazos river here, one a suspension bridge, with 475 feet span, and two of iron for railway traffic. The city contains a U. S. Government building, county court-house, and public library.

Finances and Banking.—The municipal receipts and expenditures are each about \$315,000 annually; the assessed valuations aggregate \$15,000,000; the bonded and floating debt is about \$500,000. There are 4 national and 4 private banks, with combined capital of \$1,300,000, which in 1894 had clearings of \$62,300,000.

Business Interests.—The city has (1894) a retail trade of \$22,000,000 and wholesale trade of \$7,400,000. There are about 600 mercantile and business firms. The manufacturing employ a capital of about \$2,000,000 and about 1,500 persons. There are 3 cotton-compresses, 2 cottonseed oil-mills, 2 roller flour-mills, 3 iron and brass works, woolen-mill, cotton-mill, 2 ice-factories, and numerous minor plants. Pop. (1880) 7,295; (1890) 14,445; (1895) estimated, 24,500.

A. R. McCOLLUM.

Wadai, waa-daa'cē: the most powerful empire of the Central Sudan. It lies S. of the Sahara Desert, Darfur adjoining it on the E. Bargirmi and Kanem on the W. are tributary states. Area about 140,000 sq. miles. This large territory was wrested from its heathen possessors by the Arabs in the seventeenth century. Its conquerors made it a powerful Mohammedan state, and extended its boundaries and influence far beyond their present limits. At the beginning of the nineteenth century the greater part of the Middle and Eastern Sudan was controlled by the Sultan of Wadai. Much of his possessions has since been lost, but Wadai is still the most potent political influence in the Central Sudan. Sultan Ali, who ascended the throne in 1858, is said to be a shrewd and far-sighted ruler, under whose influence the country has made great progress in Arabic civilization and in agriculture. A large part of the country is very fertile, a great number of cattle and horses are raised, and agriculture and iron manufactures are leading industries. Wara was the former capital, but in 1863 the father of Sultan Ali removed the seat of government to Abeshr, ostensibly because evil spirits had rendered the old capital uninhabitable, but really because he desired to live at a greater distance from the most powerful of the ancient nobles of the country. Pop. of Wadai, about 2,600,000; of Abeshr, 15,000.

C. C. ADAMS.

Wad'dell, JAMES IREDELL: naval officer; b. at Pittsboro, Chatham co., N. C., July 13, 1824; entered the U. S. navy Sept., 1841; became a passed midshipman in 1847 and a lieutenant in 1855. At the breaking out of the civil war in 1861 he resigned his commission and returned to his native State. He entered the Confederate navy as lieutenant, Mar., 1862; in April was ordered to burn the unfinished ram Mississippi at New Orleans; served as ordnance-officer at Drury's Bluff on James river, Va., where the Federal iron-clad fleet was repulsed; was sent to Europe on special service in 1863, and took charge of the steamer Shenandoah on Oct. 19, 1864, near the island of Madeira. This vessel, originally called the Sea King, had left London on a voyage with British papers, but in the meantime was sold to an agent of the Confederate Government, and turned over to the command of Lieut. Waddell at the time and place stated, where, under her new name, she set out on a cruise against the commerce of the U. S. She first went to Melbourne, Australia, the only port she visited in a cruise of thirteen months. During this cruise she made 38 captures, valued at \$1,152,000. She destroyed 32 vessels, and released 6 on bonds. She visited every ocean except the Antarctic. She was the only vessel that carried the Confederate flag around the world, and bore it afloat six months after Lee's surrender. The last gun fired from her deck was on June 22, 1865. Commander Waddell having been informed at sea in Aug., 1865, by the master of the British bark Baracouta, of events in the U. S., desisted from all further belligerent acts, and proceeded to Liverpool with the Shenandoah, where by formal letter to the ministry on Nov. 5, 1865, she was turned over to the British Government, and, soon afterward, by it to the U. S. consul at Liverpool. Commander Waddell, after spending some time in Europe, returned to his native land. He was afterward engaged in the Pacific Mail Steamship Company's service as captain. D. at Annapolis, Md., Mar. 15, 1886.

Wadding, LUKE: ecclesiastic and author; b. at Waterford, Ireland, Oct. 16, 1588; studied theology in the Irish College at Lisbon and elsewhere in Portugal; joined the Franciscan order 1604; became Professor of Divinity at the University of Salamanca; accompanied as chaplain an embassy to Rome in 1618 for the settlement of the controversy relating to the doctrine of the Immaculate Conception, and

wrote the history of the mission in Latin; remained at Rome; founded in 1625 the College of St. Isidore for Irish Franciscans; was one of the papal counselors appointed in the settlement of the Jansenist controversy, in which his own opinions coincided with those of Jansen, but he retracted them upon the publication of the papal bull of condemnation; was procurator of his order at Rome 1630-34, and vice-commissary 1645-48, and refused a cardinal's hat. His works are numerous and voluminous. He edited from the MS. the posthumous *Concordantie Bibliorum* of Marius de Calasio (4 vols. folio, 1621) and the works of Duns Scotus (12 vols. in 11, fol., 1639), and wrote the history and bibliography of his order in the elaborate Latin works *Annales Ordinis Minorum* (Lyons, 8 vols. folio, 1625-40; new ed. by J. M. Fonseca, in 22 vols., Rome, 1731-45, continued by Michelesi to 1794) and *Scriptores Ordinis Minorum* (Rome, 1660; new ed. 1806). D. in Rome, Nov. 18, 1657.

Revised by J. J. KEANE.

Waddington, WILLIAM HENRY: statesman and author; b. at St.-Remi-sur-l'Avre, in the department of Eure-et-Loire, France, Dec. 11, 1826, of English parentage; graduated at the University of Cambridge 1849; was naturalized in France; spent some time in archaeological explorations in Asia Minor and Palestine; became in 1865 a member of the Academy of Inscriptions; was chosen to the National Assembly in 1871; was Minister of Public Instruction under Thiers for a few days in May, 1873, and again held that position under MacMahon in 1876, having in the meanwhile been elected senator. In the new cabinet of Dufaure, Dec. 14, 1877, he became Minister of Foreign Affairs and was the French plenipotentiary at the Congress of Berlin 1878. After the accession of President Grévy he was invited to assume the presidency of the council while still holding the portfolio of Foreign Affairs. His policy aroused vigorous opposition in both the Senate and the Chamber, and on Dec. 27, 1879, he resigned. He was ambassador to the court of St. James 1883-93. D. Jan. 13, 1894. Among his works are *Voyage en Asie mineure au point de vue numismatique* (1850); *Mélanges de Numismatique et de Philologie* (1861); and *Édit de Dioclétien* (1864). He continued the publication of *Le Bas's Voyage archéologique en Grèce et en Asie mineure* (1868-77).

Revised by F. M. COLBY.

Wade, BENJAMIN FRANKLIN: statesman; b. near Springfield, Mass., Oct. 27, 1800; worked on a farm during his early manhood, teaching district schools during the winters; removed with his parents to Ashtabula co., O., 1821. He was admitted to the bar in 1827, and was elected prosecuting attorney 1835, to which post he was twice re-elected; State Senator 1837; and president judge of third judicial district 1847. As U. S. Senator 1851-69 he was a firm opponent of slavery, and after Mr. Lincoln's election in 1860, on the question of compromise between the North and the South, he strongly opposed any concessions. The Homestead Bill, which he had for many years advocated, finally passed the Senate in 1862. As chairman of the joint committee on the conduct of the war, he advocated the vigorous prosecution of the war, and favored the confiscation of property in slaves; became president of the Senate *pro tempore* and acting Vice-President of the U. S. on the assassination of President Lincoln; and was one of the commission sent in 1871 to Santo Domingo to report upon the proposed acquisition of that island. D. at Jefferson, O., Mar. 2, 1878. See his *Life*, by Albert G. Riddle (Cleveland, O., 1888).

Wadesboro: town; capital of Anson co., N. C.; on the Atl. Coast Line and the Seaboard Air Line railways; 52 miles E. S. E. of Charlotte, 120 miles S. W. of Raleigh (for location, see map of North Carolina, ref. 4-F). It is in an agricultural region; contains Anson Institute (non-sectarian, opened in 1854), and a national bank (capital \$50,000); and has 2 weekly papers. Pop. (1880) 800; (1890) 1,198.

Wadi-Halfa (ancient name *Beheni*): a place in Nubia, near the second Nile cataract, at about 22° N. lat. On the west bank of the Nile are two temples, described by Champollion, one bearing the names of Usertasen I. (with a list of conquered tribes), Amenophis II., and Ramses I., and the other dedicated by Thothmes II. and III. to Horus of Beheni. A stele from the twenty-third year of Thothmes III. makes mention of victories over the Phœnicians and other eastern tribes.

C. R. G.

Wadsworth: village (settled in 1816, incorporated in 1865); Medina co., O.; on the N. Y., Penn. and Ohio Railroad; 14 miles W. of Akron, 33 miles S. of Cleveland (for

location, see map of Ohio, ref. 2-G). It is in an agricultural, coal-mining, and tobacco-growing region; has quarries of sandstone and deposits of salt, fire-clay, and other in its vicinity; and has 7 churches, normal school, public-school system of 12 departments, a semi-weekly and a weekly newspaper, and manufactories of steam-injectors, friction-clutch pulleys, flour, carriages and wagons, and door and window screens. Pop. (1880) 1,219; (1890) 1,685; (1895) 1,981.

EDITOR OF "BANNER."

Wadsworth, JAMES SAMUEL: soldier; b. at Geneseo, N. Y., Oct. 30, 1807; educated at Hamilton College and at Harvard University; studied law in the office of Daniel Webster; was admitted to the bar, but never practiced law as a profession. Applying himself to agricultural affairs, he was in 1842 elected president of the New York State Society of Federalist stock, he was a Democrat by conviction, but in the agitation of the slavery question in 1848 he supported the Free-soil party. In 1856 and 1860 he was a Republican presidential elector. On the outbreak of war and interruption of railway communication with the national capital, Wadsworth provisioned two vessels at New York, and accompanied them to Annapolis. At the battle of Bull Run he served as volunteer aide to Gen. McDowell. Commissioned a brigadier-general of volunteers in Aug., 1861, he commanded a brigade in front of Washington until Mar., 1862, when appointed military governor of Washington. While holding this command he received the Republican nomination for Governor of New York, but was defeated by Horatio Seymour. Applying for service in the field, he was assigned to the First Corps in Dec., 1862, participating in the battle of Fredericksburg. At Gettysburg, Wadsworth's division was the first one to engage the enemy on the morning of July 1, 1863, and in the struggle that ensued that day his division lost 2,400 out of 4,000. During the second and third days' fighting he rendered conspicuous service in maintaining the heights on the right of the line. In the Richmond campaign of 1864, Wadsworth commanded the fourth division of the Fifth Corps, which crossed the Rapidan May 5, and was engaged for several hours, sustaining severe loss. In the fighting which was renewed next morning he served with the Second Corps, and while endeavoring to rally his men was struck in the head by a bullet, which caused his death May 8, 1864, two days after being breveted major-general of volunteers.

Wafer [M. Eng. *wafre*, from O. Fr. *waufre*, *gaufre* > Fr. *gaufre*, honeycomb, wafer, from Dutch *wafel*; cf. Germ. *wabe*, honeycomb, and *weben*, weave]; the small circular disk of unleavened bread employed in the celebration of the Eucharist in the Roman Catholic Church. It is usually marked with emblematic figures.

Wager [M. Eng. *wager*, *wajour*, from O. Fr. *wagier*, *wajour* (> Fr. *gageur*), deriv. of *wagier*, *gagier* > Fr. *gager*, pledge, bet, from Teuton. **wadjan*, wager, pledge > Germ. *wetten*]; a promise to pay money or transfer property upon the determination or ascertainment of an uncertain event; the consideration for such a promise is either a present payment or transfer by the other party, or a promise to pay or transfer upon the event determining in a particular way. (Anson, *Law of Contract*, 173.) The early common law treated all wagering contracts as valid. During the eighteenth century, however, the courts became anxious to discountenance those in which the parties had no interest except that which was created by the wager, and were "astute even to an extent bordering on the ridiculous to find reasons for refusing to enforce them." (Parke, B., in *Egerton vs. Earl of Brownlow*, 4 House of Lords Cases 124.) Parliament has also declared void some forms of wagering contracts. As a result, wagers in which the parties have no interest are now unenforceable in Great Britain, although they are not illegal. Such has always been the rule in Scotland, the courts declaring that they were instituted to enforce the rights of parties arising from serious transactions, and would pay no regard to sporting agreements. Bell, *Principles of Law*, § 37.

The English common-law view was adopted by the courts in some parts of the U. S., notably in New York, but throughout New England and in most of the States that view was rejected, the courts holding that wagers were inconsistent with the established interests of society, in conflict with the morals of the age, and therefore illegal and void as against public policy. (*Bernard vs. Taylor*, 20 Oregon 416.) In accordance with this doctrine it has been decided that a broker who knowingly makes a wagering

contract and pays money for his principal thereon, can not recover it or his commissions from such principal. (*Irvin vs. Williar*, 110 U. S. 499.) It follows also from this doctrine that if the losing party notifies the stakeholder not to pay the money to the winner, and it is thereafter paid, the loser may recover it either from the winner who received it or from the stakeholder. *Love vs. Howey*, 114 Mass. 80; *Bernard vs. Taylor*, *supra*.

Nearly all of the States have statutes declaring void or illegal every species of wager. Occasionally the legislation is very drastic, not only declaring the wager itself illegal, but avoiding all securities given for money lost thereon, even negotiable paper in the hands of a *bona-fide* holder, and permitting the recovery from the stakeholder of money paid to the winner under the loser's directions. (N. Y. Revised Statutes, 8th ed., p. 2218; *Ruckman vs. Pitcher*, 1 N. Y. 392.) See BETTING.

FRANCIS M. BURDICK.

Wager-policy: in law, an instrument having the form of a policy of insurance, but without any legal interest held by the assured in the subject-matter of the contract or in the risk insured against. It is, therefore, merely a wager, according to the nature of the instrument, between the insurer and the assured, that the contingent event referred to will or will not happen—that the ship will or will not perform her voyage, that the house will or will not burn, or that the person will or will not die, as the case may be. The assured puts at risk or stakes the premium paid, and bets that the uncertain event will take place, while the insurer puts at risk or stakes the sum insured, and bets that such event will not happen. See INSURANCE (*Insurable Interests*).

Revised by FRANCIS M. BURDICK.

Wages [from O. Fr. *wage*, *gage*, pledge, guarantee, engagement; cf. Fr. *engager*. These words are from the Tent. **eadjo*-; Goth. *wadi*; Germ. *wette*]; in general, that which is paid for services rendered; in political economy, the share of the workingman in the wealth that his labor has contributed to produce.

Under the title POLITICAL ECONOMY (*q. v.*) the abstract theory of wages is treated briefly. In this place an account is given of the rates of wages at different times in the history of the U. S. Examining wages in this respect, that is, historically, it is found that there has been a persistent tendency upward, although the tendency has been broken here and there by industrial conditions. The rise has been gradual, although there have been long periods when but little, if any, change was noticeable.

Since the earliest colonial days rates of wages have been governed by economic laws and the conditions of business, but in those days attempts were made at frequent intervals to establish wage-rates by legislative action. Following the custom of the old country as it had prevailed at different periods, the Massachusetts Bay Colony, as early as 1633, by the action of the general court, made it a rule that carpenters, sawyers, masons, bricklayers, tilers, joiners, wheelwrights, mowers, and other master-workmen should not receive more than 2s. a day, the workman to pay his own board, but should be elect to board with his employer, then he was to receive 1*d.* a day. The rates of pay of inferior workmen in the occupations named were fixed by the constable. Skilled tailors were paid 12*d.* a day, and the poorer ones were paid 8*d.* with their living. The time of labor included the whole day, allowances being made for food and rest. An employer paying wages beyond the amounts established by law and a workman receiving extra wages were subjected to penalties. Idleness, even, was the subject of punishment. Such legislation, varying in quality and terms, continued for some years, one statute following another in the attempt to regulate the rates of wages, and the regulation applied first to one side and then to the other; that is, an employer was punishable if he paid too high a wage and an employee was punishable if he demanded a higher wage than that paid by law.

It is quite difficult to state with any definiteness the average wages paid to any class, but it is certain that for a long period after the settlement of the colonies 2s. a day was a fair average for mechanical labor, the variation from this depending much upon legislation, for the annoying regulations continued through the seventeenth century, even prohibiting excessive prices by dealers in order to regulate wages. At the close of the seventeenth century, however, common laborers were paid 2s. a day, the same as they had been paid forty years before. Women, when they went out to service, received from £4 to £5 a year. After the seven-

teenth century laborers were paid 3s. and sometimes as much as 4s. a day.

It is somewhat strange that wages remained as steady as they did during the whole of the seventeenth century, no great change coming until far into the eighteenth century, when the compensation of farm-laborers was very generally taken as the standard for wages paid to mechanics and tradesmen. When the colonial period closed, laborers on farms were paid about 40 cents a day, butchers only 3½ cents a day, carpenters 52 cents, ship and boat builders about 90 cents, shoemakers 73 cents, and blacksmiths only 70 cents. These illustrations are quite sufficient to show the general rates of wages during and at the close of the colonial period. Of course the value of a day's wage then, as now, should be estimated by its purchasing power, instead of by its nominal rate. To state with reasonable accuracy the purchasing power of money during the seventeenth century is a more difficult matter than to give the rates of wages. Quality can not be compared with quality, while the great variation in the price of an article on account of conditions and locality distorts any comparison even when quality can be ascertained. There was no market price. Wheat might bring 5s. per bushel in one place and at another point near by it might be sold at 10s. Taking the fairest possible quotations for the closing years of the seventeenth century and for 1890 for New England, covering some leading articles of consumption, some reasonably honest comparisons can be made. For instance, a dollar present money would have purchased a bushel of winter wheat or a gallon of common molasses or a bushel of barley at both periods, while of corn 1½ bush. could have been purchased in 1698 and 3 bush. in 1890; a dollar represented a bushel of rye in 1694 and nearly 2 bush. in the later period. A common grade of wheat flour brought about \$16 per barrel in 1697 and \$6 in 1890. Butter, cheese, and meats generally were considerably lower than now, butter selling for from 8 cents to 14 cents per pound, and meats for from 10 cents to 20 cents. Sugar, tea, and coffee, on the other hand, were very dear all through the earlier period, tea selling for from \$5 to \$10 per pound, while a good article could be obtained for 50 cents per pound in 1890. In the absence of price-lists for a large number of articles, classified according to importance in consumption, but using such fugitive material as exists, the conclusion must be reached that a dollar will purchase now a much larger quantity of the necessaries of life than during the last quarter of the seventeenth century, although the commonest things, those which nearly every family produced for home consumption, were quite low during the earlier period. An exceedingly limited market existed for any small surplus of products. Real wages, wages measured by purchasing power, were much lower than at present. It is to be regretted that many elements essential to fairly exact comparison are often lacking. The citations given, however, are representative of general conditions and show the upward tendency of wages.

Soon after the colonial period closed industry revived, and the factory system was established, and it may safely be stated that American industries were securely planted, so that from that time on there has been a very constant upward tendency in wages in all directions. The earlier part of this period, that following the establishment of the factory system, showed fair advance. Carpenters in 1790 were paid less than 60 cents a day; in 1800, over 70 cents; in 1810, \$1.09 on the average; in 1820, \$1.13; in 1830 about the same, although in the northern parts of the U. S. \$1.40 a day was the average for carpenters during the years from 1830 to 1840. There was not much change in this class of labor until 1860, since which date the average for carpenters has been raised constantly, until in 1880 it reached \$2.42, and now very often carpenters receive \$3.50 a day.

If we turn to laborers as in a fair way representing general conditions, the facts at command show that they received about 43 cents a day in 1790, 62½ cents in 1800, while from 1800 to 1810 their average pay in the Northern States was 82 cents a day. This was increased to 90 cents during the next decade, although from 1840 to 1860 the pay of common laborers varied from 87½ cents to \$1 a day. They receive from \$1.50 to \$2 a day at the present time.

Cotton-mill operatives, a class not much known in the U. S. until about 1820, received from that year until 1830 44 cents a day, on the average, while just prior to 1840 their pay was increased to 90 cents, and during the next decade their average pay was \$1.03 a day. The compensation of woolen-mill operatives was somewhat higher, for in the

early part of the factory period, that is, during the years just prior to 1880, they were paid a daily wage of \$1.12, but this was rarely reached again before 1880. In the latter year agricultural laborers were paid \$1.31, blacksmiths \$2.28, masons \$2.79, and shoemakers \$1.76. A general average wage for operatives, however, is misleading, and representative classes are better for a general conclusion; so specific rates have been given.

Carrying this comparison of actual wages for distinct classes into the building trades, it is found that a representative establishment in New York reports the pay for carpenters in 1840 at \$1.50 a day, and in 1891 at \$3.50 a day, while the hours of work were reduced from ten to eight. The pay of bricklayers and their helpers rose from \$1.75 and \$1 respectively in 1851 to \$4 and \$2.50 respectively in 1891, while the working time was decreased two hours. Railway employees experienced the same increase, locomotive engineers and firemen moving from \$2.14 and \$1 respectively in 1840 to \$3.77 and \$1.96 respectively in 1891. Passenger-car conductors had their average pay raised from \$2.11 to \$3.84 a day. These examples are taken from actual pay-rolls.

The great commercial convulsions of 1837 and 1857 caused a depression in wage-rates, and they did not fully recover prior to 1860; yet the averages for the decade from 1850 to 1860 were a very decided advance over those for the decade ending in 1830. The civil war caused great fluctuations in currency, while the financial crisis of 1873 had a powerful influence on wages, so that there were many changes. It is therefore better in these days to compare the averages for 1860 with those for 1880 and 1890. All these averages, wherever made, indicate a general increase in wages in all occupations during the fifty years from 1830 to 1880. Using the statements taken from actual pay-rolls and as made by the Senate committee on finance in its report on *Wholesale Prices, Wages, and Transportation* (Senate Report No. 1394, Fifty-second Congress, second session), one is able to make a general comparison of wages without much reference to occupations. This comparison, as made by the committee, is a most excellent one, and indicates the general course of wages better than any other statement yet made. The method was to put all wages that were paid in 1860 at 100. Starting from such a basis it was found that, taking the wages in 22 industries and comprehending about 100 distinct establishments, and reducing all the facts to simple averages, wages stood at 87.7 per cent. in 1840 as compared with 100 in 1860; in 1866 they stood at 152.4, and in 1891 at 160.7; that is to say, as compared with 1860 wages in 22 industries showed an increase of 60.7 per cent. in 1891, and as compared with 1840 wages were 73 per cent. higher in 1891. To be more correct, however, the rates should be taken in accordance with the importance of each industry relative to all industries. Taking 1860 as represented by 100 again, as in the former case, the general average of wages in 1840, on the basis of the importance of each industry as compared to all, is represented by 82.5 per cent., in 1866 by 155.6, and in 1891 by 168.6, there being some variation in the two methods. On the latter basis wages have increased 68.6 per cent. since 1860 and 86.1 per cent. since 1840. These two percentages, then—73 and 86.1—come into comparison. Probably the mean is more just, and thus it is fair to say that wages in the leading industries of the country are 80 per cent., at least, higher than they were in 1840. Very many wages are double what they were at that date. It is true that with this increase there has been, in every direction, a decrease in the working time of each day and a general decrease in the cost of living, taking all articles into consideration. The decrease in cost of living, however, has not been equal to the increase in wages. Rents are much higher, and so are meats and some other articles; but taking the wholesale prices of two hundred and twenty-three of the leading articles of consumption, it is found that there has been a decrease since 1860 of about 6 per cent. The general conclusion, therefore, is quite positive and absolute that, while the percentage of increase in prices may have risen at different periods, say in 1866 and along for ten years, far beyond the increase in wages, they had by 1891 fallen to a point lower, on the whole, than they were in 1840, and certainly 6 per cent. lower than in 1860, while wages had risen to a point even much above what they reached in the inflation period of 1866.

What is true of the U. S. is true of other countries engaged in mechanical industries as allied to agriculture. In Great Britain the increase in wages since about 1850, starting from a lower point, however, has quite kept pace, rela-

tively, with the increase in the U. S., whether taken on the basis of nominal wages—that is, the simple rates paid—or upon real wages—that is, the consuming power as governed by the prices of commodities.

For a general study of the rates of wages attention should be given to *Six Centuries of Work and Wages*, by J. E. Thorold Rogers, M. P.; the statistical statements of Dr. Robert Giffen, of the British Board of Trade; the reports of the British Department of Labor; the facts to be found in the *Historical Review of Wages and Prices, 1752-1860*, published by the Massachusetts bureau of statistics of labor; the report of the Senate committee on finance already referred to; and a work by the author entitled *The Industrial Evolution of the United States* (Meadville, Pa., 1895). For very full statements as to the wages in colonial days, given in more detail than in any other of the American works referred to, reference is made to Weedon's *Economic and Social History of New England, 1620-1789* (2 vols., Boston and New York, 1890). CARROLL D. WRIGHT.

Wagner, RUDOLF, M. D.: physiologist; b. at Baireuth, Bavaria, July 30, 1805; studied medicine at Erlangen and Würzburg, and comparative anatomy in Paris under Cuvier; was appointed Professor of Zoölogy at the University of Erlangen in 1833, and in 1840 at the University of Göttingen, where he died May 13, 1864. His principal works are *Lehrbuch der vergleichenden Anatomie* (2 vols., Leipzig, 1834-35); *Icones physiologicae* (Leipzig, 1839); *Lehrbuch der Physiologie* (Leipzig, 1839); *Handwörterbuch der Physiologie* (4 vols., Brunswick, 1842-53); *Neurologische Untersuchungen* (Göttingen, 1854); *Vorstudien zu einer wissenschaftlichen Morphologie und Physiologie des menschlichen Gehirns als Seelenorgans* (2 vols., Göttingen, 1860-62).—His younger brother, MORITZ FRIEDRICH WAGNER, b. at Baireuth, Oct. 3, 1813, studied natural science at Erlangen and Munich; accompanied the French army in Algeria 1837-38 as a member of the scientific commission; studied geology at Göttingen; was appointed professor at the University of Munich in 1860. Author of *Reisen in der Regenschaft Algier* (3 vols., Leipzig, 1840); *Der Kaukasus und das Land der Kosacken* (2 vols., Leipzig, 1848); *Reise nach dem Ararat und dem Hochlande Armeniens* (Stüttgart, 1848); *Reise nach Kolchis* (Leipzig, 1850); *Reise nach Persien und dem Lande der Kurden* (2 vols., Leipzig, 1852); *Reisen in Nordamerika* (with Scherzer, 3 vols., Leipzig, 1854); *Die Republik Costarica* (Leipzig, 1856); *Naturwissenschaftliche Reisen im tropischen Amerika* (1870); *Die Entstehung der Arten durch räumliche Sonderung* (1889). His *Travels in Persia, Georgia, and Koordistan* was translated into English in 3 vols. (London, 1854). D. in Munich, May 31, 1887. Revised by S. T. ARMSTRONG.

Wagner, WILHELM RICHARD: composer; b. in Leipzig, Germany, May 22, 1813; d. in Venice, Italy, Feb. 13, 1883. His father, who was a police actuary, died six months after Richard's birth. His mother married an actor and painter, and the family removed to Dresden. Richard's stepfather wished to make a painter of him, but he showed no aptitude for the painter's art. The boy played tunes on the piano at the age of seven; at nine he entered the Dresden Kreuzschule, and studied hard—not music, which he cared little for, but Greek, Latin, ancient history, and mythology. He made verses, longed to be a poet, translated twelve books of the *Odyssey*, took up English, and in his enthusiasm for Shakespeare projected a tragedy which was a compound of *Hamlet* and *Lear*. His passion for music was awakened by hearing Beethoven's music in Leipzig; he studied then in order to adapt his great tragedy for the lyric stage, but in a desultory and fitful way, which resulted in no solid attainment. He had no systematic instruction until his sixteenth year, and then his impetuous genius disdained rules; he preferred composing music to studying it. One of his boyish overtures was played in the Leipzig theater. Less than six months with Theodor Weinlig, spent in the study of counterpoint, was his first equipment for his extraordinary career. He was then nineteen. An overture composed at this time, after the model of Beethoven, was played and well received, he tells us, at one of the Gewandhaus concerts; a symphony, composed after Beethoven and Mozart, was performed at the Conservatory in Vienna, and later at the Gewandhaus in Leipzig. At this period Wagner visited Vienna, Prague, Würzburg, making the acquaintance of music and musicians, all the while undergoing the intellectual preparation which introduced his musical reform. At twenty-one he abandoned Beethoven as an operative model, and felt that a

new era in music was about to dawn. In 1834 he accepted the place of musical director at the theater of Magdeburg; completed and on ten days' notice presented an opera, *Das Liebesverbot*, and was not disheartened by its failure; went to Berlin with *Das Liebesverbot*, but met with no practical encouragement at the royal opera; asked for and received the position of musical director at Königsberg; in Dresden was moved by reading Bulwer's *Rienzi* to write an opera with that title, which, after some delay, was brought out in Dresden in 1842; visited London, and, being driven by a storm into a Norwegian port, caught the legend of *The Flying Dutchman*; went to Paris, but found no welcome; in 1839-40 composed an overture to the first part of Goethe's *Faust* and several songs; suffered from want to the degree that he was compelled to arrange music for all sorts of instruments. In 1842 the success of *Rienzi* at Dresden secured his appointment to the post of Kapellmeister at the Dresden opera-house. Here he finished *The Flying Dutchman*, and composed *Tannhäuser*. In 1849 his revolutionary enthusiasm forced him to take refuge in Zurich. There he became director of the musical society and of the orchestra of the theater; composed *Lohengrin*, and began the composition of the *Nibelungen*; in 1858 left Zurich, and resided for short periods in Italy, Paris, Vienna, Carlsruhe; attracted the attention of Ludwig II., King of Bavaria; established himself in Munich, and entered on his fame. *Tristan und Isolde* appeared in 1865; *Die Meistersinger von Nürnberg* in 1868, and *Rheingold*, the prelude to the *Nibelungen*, in 1869. At Munich was laid the plan so brilliantly carried out at Baireuth in the summer of 1876, where in a theater of his own design, with an orchestra composed of the best material Germany could furnish, and singers he had himself selected, was produced, under royal patronage and imperial countenance, with the moral and financial support of a large and distinguished public, the famous opera of the *Nibelungen Ring*, in which his musical theories first found full expression. Wagner's musical reform is not technical; it embraces the whole field of conception and expression. Disgusted with the Italian and French school of opera, while persuaded more and more that opera was the highest form of musical expression, loathing the silly *libretti* and disdaining the practice of making music subservient to the convenience of pet singers, he contended that the theme of opera should be poetic in the purest, deepest sense; that the poetry should be joined with fitting music, vocal and instrumental; and that the whole should be associated with the convictions and sympathies of humanity. Hence he took his themes from romance, legend, and popular myths, and in his musical adaptations consulted the intellectual demands of his theme, neglecting and even scorning the popular types of song and melody. Wagner was always his own librettist, and the text of his musical works has a very considerable poetic value. His many prose writings (collected in nine volumes) show that he would have made his mark as a philosophical and polemical essayist, had not music itself supervened. *The Flying Dutchman*, *Tannhäuser*, and *Lohengrin* were composed and performed prior to the works in which he more fully developed his art theories. These latter comprise the *Meistersinger*, *Tristan und Isolde* (1865), the *Nibelungen Ring*, and *Parsifal* (1882). The *Nibelungen Ring* is the collective name for four large works, each requiring an evening's performance, beginning with *Rheingold* as general preface to the story and followed successively by the *Walkyrie*, *Siegfried*, and the *Götterdämmerung* (Dusk of the Gods). Even prior to the performance of these colossal works Wagner had himself declared that *Tristan und Isolde* illustrated his theories fully, and by it he was willing to be judged. Here he said, "I moved with entire freedom and disregard of all theoretic scruples." Wagner resented the charge that his music is destitute of melody. "The one true form of music," he said, "is melody. Music that has no melody has no inspiration, no power over the feelings, no originality. But melody is something more than the fixed and narrow form that belongs to the childish stage of musical art—the dance form." "The wanderer in the wood becomes every moment more distinctly aware of endlessly varied voices that are audible in the forest. They grow louder and louder, and the voices, the separate tunes, he hears are so many that the whole music seems to him one grand forest melody. Yet he can not hum it over to himself; and to hear it again he must again go to the woods."

Wagner is without doubt the greatest musical genius that has arisen since Beethoven. He is the acknowledged master of orchestration and of dramatic construction for the stage.

In music he was a revolutionist and reformer. Like other reformers in other spheres than music he may have been too radical in certain directions, but the influence of his declared and marvelously exemplified principles will very largely affect the dramatic composition of the future. See, further, besides his own writings, *R. Wagner*, by F. Hueffer (London, 1874); *The Nibelungen Trilogy*, by G. Kobbé (New York); an exhaustive review by E. Dannreuther in Grove's *Dictionary of Music and Musicians*, with complete list of Wagner's compositions; and the best and most unbiased work, *Richard Wagner: his Life and Works*, from the French of Adolphe Jullien (Boston, 1892).

Wagons: See CARRIAGES.

Wagram, ваа граам: a village of Lower Austria; 12 miles N. E. of Vienna (see map of Austria-Hungary, ref. 5-F); famous for the victory which Napoleon gained here over the Austrians under the Archduke Charles July 6, 1809. After his severe repulse at Aspern (May 21-22) Napoleon retreated to the island of Lobau, which he fortified. On the night of July 4, having hastily thrown bridges over to the northern bank of the Danube, he marched toward the Austrian position with a force of about 180,000 men, and on the evening of the 5th ordered an attack on the enemy's center. The Austrians, numbering about 120,000, drove back the French, inflicting heavy losses, and on the morning of the 6th themselves assumed the offensive. Their right wing carried all before it, but their left was outflanked by the French. At this juncture Napoleon gathered all his available forces for an attack on the Austrian center, which the Archduke Charles had weakened in order to add to the strength of the wings. The French broke through the line and gained the day, but the Austrians retreated in good order. The loss in killed and wounded was about 24,000 on each side. It was one of the most hotly contested battles of the Napoleonic wars, and had the Archduke John with his 30,000 men re-enforced the Austrians, as was expected, the issue of the battle might have been different. An armistice was concluded at Znaim on July 12, and this was followed by the peace of Vienna Oct. 14, 1809.

F. M. COLBY.

Wagtail: any bird of the passerine genera *Motacilla* and *Budytes*. The wagtails have the bill slender and conical, with the upper mandible slightly notched at the tip; have long and pointed wings, each with nine primaries; the tail is slightly rounded, longer than, or equal to, the wings; the feathers are mostly broadest at the middle, and thence taper to the tips. The name is given in allusion to their habit of "wagging" their tail in a fan-like manner. They are active birds, at home equally in the air and on land; they fly by short undulating courses, and frequently emit, while on the wing, chirping notes: on the ground they run by a rapid succession of steps. The species are quite numerous, and naturally peculiar to the Old World and Australia, but *Motacilla alba* and *Budytes flava* stray into North America.

F. A. L.

Wah: See AILURUS.

Waha'bees, or Wahabites: a Mussulman sect founded about 1750 by Abd-el Wahab, an Arabian reformer. He taught no new doctrine, but strove to restore Islam to its original simplicity and austerity. He denounced as superstitious the veneration paid to the memory of the prophet and to relics and tombs esteemed holy, taught total abstinence from tobacco as well as from wine and opium, and demanded purity and frugality in life. He did not interfere in politics. Preaching was his principal weapon. Sououd, Sultan of Nedjed, speedily espoused the cause of the reform. From his capital, Derayah, it spread rapidly, and before the death of Wahab (1787) was accepted by the larger part of the peninsula. To Sououd, as to his successors, Abd-ul Aziz and Sououd II., the reform was a political engine which they employed with success to subdue their neighbors and to unite Arabia under their sway. Mecca (1803) and Medina (1804) were captured, and Bagdad was threatened. All pilgrimages were stopped. Thereupon the Ottoman sultan, Selim III., ordered his vassal MEHEMET ALI PASHA (*q. v.*) to chastise Sououd. Seven years were spent in preparation. Meanwhile Napoleon, who had not abandoned his scheme of uniting the Arabs in a grand expedition against the British in India, was negotiating with the Wahabees. They entertained his proposals favorably, but the ruinous Russian campaign (1812) intervened. Mecca and Medina were captured (1812) by Toussoum Pasha, son of Mehemet

Ali. Derayah was destroyed (1818) by Ibrahim Pasha, another son of Mehemet Ali, and Abdullah II, surrendered. He was sent to Constantinople, and beheaded in front of St. Sophia. The Wahabees seemed crushed. Nevertheless they speedily expelled their Egyptian governors, and in 1849 all attempts to subdue them were definitely abandoned. They have since remained undisturbed, and dominate the Nedjed. They probably number 1,500,000. They are accounted heretics. This is due rather to their political actions than to their doctrines, as they differ in few respects from the most orthodox Moslems. They are the Puritans of Islam. See Corancez, *Histoire des Wahabites depuis leur origine jusqu'à l'an 1809* (Paris, 1810); Palgrave, *Narration of a Year's Journey through Central and Eastern Arabia* (London, 1865); Burekhardt, *Notes on the Bedouins and the Wahabys* (London, 1830); Sedillot, *Histoire des Arabes* (Paris, 1850).

EDWIN A. GROSVENOR.

Wahehe: another spelling of UHEHE (*q. v.*).

Wahoo' [Amer. Ind.]: (1) the *Euonymus atropurpureus*, a fine ornamental shrub of the U. S. belonging to the family *Sapindaceæ*, and often called burning bush and spindle-tree. Its bark has considerable use in medicine as a diuretic, tonic, and alterative, with cathartic powers. (2) The winged elm, *Ulmus alata*, a small tree of the Southern U. S. Its wood is much valued for timber. Its branches have singular corky wings.

Wahoo: city; capital of Saunders co., Neb.: on the Cottonwood creek, and the Burl. Route, the Fre., Elk and Mo. Val., and the Union Pac. railways; 18 miles S. S. W. of Fremont, 50 miles W. of Omaha (for location, see map of Nebraska, ref. 10-G). It is in an agricultural and stock-raising region, and has 11 churches, 2 public-school buildings, Luther Academy (Evangelical Lutheran, chartered in 1883), 2 national banks with combined capital of \$180,000, a private bank, and 4 weekly newspapers. Pop. (1880) 1,064; (1890) 2,006; (1895) estimated, 2,500. EDITOR OF "WASP."

Wah'peton: city (founded in 1875, incorporated as a village in 1881, as a city in 1884); capital of Richland co., N. D.; at the junction of the Red River of the North and the Sioux Wood river; on the Chi., Mil., and St. P., the Great North., and the N. Pac. railways; opposite Breckenridge, Minn., 45 miles S. of Fargo (for location, see map of North Dakota, ref. 4-F). It has 8 church organizations, the Red River Valley University (Methodist Episcopal), public-school system of 6 departments, parochial school of 4 departments, county court-house, water-works system (cost \$85,000), electric lights, and 3 weekly newspapers. It is principally engaged in shipping agricultural produce, and has large flour-mills, grain elevators, and grain warehouses. Pop. (1880) 400; (1890) 1,510; (1895) estimated, 2,200.

EDITOR OF "GAZETTE."

Waiblingen, w'bling-en: town of the kingdom of Würtemberg, in the circle of the Neckar, on the Rhems; 2 miles N. E. from Stuttgart, in an exceedingly fertile region (see map of German Empire, ref. 7-D). It is a central station on the Würtemberg state railways, and has tanneries, manufactures of silk, wool, and linen, and four large factories of bricks and pottery. The town, originally a settlement on the Roman high-road to Germany, was an imperial palace (*Pfalz*) under the Carolingians, passed to the Salian emperors, who took from it the name of Waiblingen, and then to the house of Hohenstaufen. Their name of Waiblingen became Italianized into *Ghibellines* as the designation of the Hohenstaufen party against the Guelphs. Pop. (1890) 4,786.

Waice: See WACE.

Waihu Island: See EASTER ISLAND.

Waiilatpu'an Indians [*Waiilatpuan* is from *Wayi'tel-pu*, the plural of *Wa-i'tel*, one Cayuse man]: a linguistic family of North American Indians established by Hale, who placed under it the Cailloux (or Cayuse or Willétpoos), and the Molele (or Molale).

The Cayuse occupied the region between Des Chutes river and the Blue Mountains, Ore., adjoining the Nez Percé and Walla Walla Indians. According to Maj. Alvord, in 1853 they resided chiefly on Umatilla river, claiming a large area from Willow creek (in Morrow County) on the S. W. to the Blue Mountains and including the Grande Ronde, and northward to within 15 miles of Fort Walla Walla. According to the census of 1890, there were 415 Cayuse Indians on the Umatilla reservation, although these speak the Umatilla language instead of their own.

The Molele form the western division of this family. They were originally an offshoot of the Cayuse, and, as the latter state, lived with them in their country S. of the Columbia. In 1853, according to Maj. Alvord, there were many Molele on the upper Des Chutes river, wanderers from the body of the tribe, whose proper haunts were W. of the Cascade Mountains. The Molele appear to have been essentially mountain Indians, and to have lived in the Cascade Mountains, Oregon, at various points between Mts. Hood and Scott (the latter in Klamath County). They appear never to have been numerous, and at present are almost extinct. Their common name is derived from a creek in Clackamas County, Ore., S. of Oregon city, and was applied to a band of these Indians who dispossessed the original occupants. Subsequently the name was extended to the various bands. In 1889 there were thirty-one Molele on Grande Ronde reservation, Ore., and a few in the mountains W. of Klamath Lake.

Both the Cayuse and Molele appear to have been brave and warlike, and to their frequent warfare was probably due their small and, during historical times, constantly decreasing numbers. The Cayuse were frequently at war with the Blackfeet, and used to levy tribute on the Dalles Indians, claiming the fishery. They were intimately associated with the Nez Percé and Walla Walla, with whom they have so often intermarried that they have become practically extinct as a tribe. See INDIANS OF NORTH AMERICA.

JAMES OWEN DORSEY.

Wainwright, JONATHAN MAYHEW, D. D., D. C. L.: bishop and author; b. in Liverpool, England, Feb. 24, 1792, of American parents, his mother being a daughter of Rev. Dr. Jonathan Mayhew, of Boston; went with his parents to the U. S. 1803; graduated at Harvard 1812; was tutor there in rhetoric and oratory 1815-17; took orders in the Protestant Episcopal Church 1816; became rector of Christ church, Hartford, Conn., 1816; assistant minister of Trinity church, New York, 1819; rector of Grace church, New York, 1821, of Trinity church, Boston, Mass., 1834, and again assistant minister of Trinity church, New York, 1838, having especial charge of St. John's chapel; visited Europe and the East 1848-49, and Europe again in 1852, when the University of Oxford conferred upon him the doctorate of civil and canon law; he received the doctorate in divinity from Union College in 1823, and from his *alma mater* (Harvard) in 1835; was many years secretary to the House of Bishops; was chosen provisional bishop of New York in October, and consecrated Nov. 10, 1852; was a fine musician, and an admired pulpit orator. D. in New York city, Sept. 21, 1854. He published a *Book of Chants* (1819); *Music of the Church* (1828); *The Pathways and Abiding-places of our Lord* (illustrated, 1851); *The Land of Bondage, a Journal of a Tour in Egypt* (1852); several liturgical compilations; and, with Dr. W. A. Muhlenberg, *The Choir and Family Psalter* (1851). He edited Bishop Ravenscroft's *Memoir*, and the *Life of Bishop Heber, by his Widow* (2 vols., 1830), and the magnificently illustrated volume, *Our Saviour with Prophets and Apostles* (1850). A controversy between him and Rev. Dr. Potts on the possibility of "a Church without a bishop" was issued in a volume 1844. A *Memorial Volume* containing thirty-four of his sermons appeared in 1856, with a memoir by Bishop Doane; and another *Life* was prepared by Rev. John N. Norton, and published in New York in 1858.

Revised by W. S. PERRY.

Wait, WILLIAM: law-writer; b. at Ephratah, N. Y., Feb. 2, 1821; studied law, and was admitted to the bar in 1846; was district attorney in 1848; took up the compilation and publishing of law-books, for which he was especially adapted by his accuracy and thoroughness. D. at Johnstown, N. Y., Dec. 29, 1880. Besides other works, he published *The Code of Civil Procedure of the State of New York*; *Law and Practice in Civil Actions and Proceedings in Justices' Courts and on Appeals to County Courts in the State of New York*; *Practice at Law, in Equity, and in Special Proceedings in all the Courts of Record in the State of New York*; *Treatise upon some of the General Principles of the Law, whether of a Legal or an Equitable Nature, including their relations and application to Actions and Defenses in General* (generally known as *Wait's Actions and Defenses*).

F. STURGES ALLEN.

Waite, MORRISON REMICK, LL. D.: jurist; b. at Lyme, Conn., Nov. 29, 1816; attended Bacon Academy at Colchester, Conn., and graduated at Yale College in 1837; took up the practice of law with his father, but in 1838 removed to

Maumee City, O., where he entered the law office of Samuel M. Young, and, being admitted to the bar in the following year, entered into partnership with Mr. Young; in 1850 removed with Mr. Young to Toledo, and later entered into partnership with his younger brother, continuing the partnership until made chief justice in 1874. He soon became the acknowledged leader of the Ohio bar, and declined a seat on the Supreme Court bench of that State; in 1849 was elected to the Ohio Legislature, and held some other public positions, but refused to sacrifice his legal work to take an active part in politics. He gained a national reputation as one of the counsel for the U. S., together with William M. Evarts, in the arbitration on the Alabama claims in Geneva, Switzerland, 1871-72; in 1873 was president of the Ohio constitutional convention; in 1874 was nominated and unanimously confirmed to fill the vacancy in the Supreme Court created by the death of Chief Justice Chase; in 1876 declined to allow his name to be used as a candidate for President of the U. S. In his position as chief justice of the Supreme Court of the U. S. he wrote many of the most important decisions of the court, among which are those on the head-money tax cases (1876), the election laws (1880), the power of removal of the President (1881), the Civil Rights Act (1883), the Alabama claims and the Legal Tender Act (1885), the express companies and extradition cases (1886), the Virginia debt cases and the affair of the Chicago anarchists (1887). He was a firm believer in the doctrine of State rights. In politics he was a Whig until the disbandment of the Whig party, and from that time he was a Republican; but in his decisions he was never influenced by political considerations or fear of public opinion. He was remarkable not so much for brilliancy and extraordinary learning as for administrative ability and for persistent attention to all the details and intricacies of any case in hand; and in administering the affairs of the court he rigidly enforced the rules of practice. In private life he was very unassuming and of a genial disposition. D. in Washington, D. C., Mar. 23, 1888. F. STURGES ALLEN.

Waits [M. Eng. *waite*, *waite*, from O. Fr. *waite*, *gaite*, watchman, guard, from O. H. Germ. *wahita* > Germ. *wacht*, guard, watch]: a class of watchmen in English and Scotch towns who formerly at certain fixed hours of the night played upon the pipe and other instruments. In London and many other places the waits were officially recognized until toward the middle of the nineteenth century, and even later in some places. In London there are still companies of men called waits who, during the Advent season, frequently serenade the citizens, and on Christmas morning call for a Christmas-box.

Waltz, GEORG: historian; b. at Flensburg, Schleswig, Oct. 9, 1813; studied law and history at the Universities of Kiel and Berlin; visited numerous cities in Germany, France, and Scandinavia, investigating their archives; was appointed Professor of History at Kiel in 1842, at Göttingen in 1849, and removed in 1875 to Berlin, as editor of the *Monumenta Germaniæ Historica*. His principal works are *Deutsche Verfassungsgeschichte* (4 vols., 1843-61); *Die Schleswig-holsteinische Geschichte* (2 vols., 1851-54); *Lübeck unter Jürgen Wullenweber* (3 vols., 1855-56); *Grundzüge der Politik* (1862); besides numerous minor essays, monographs, and editions of documents relating to the history of Germany. As an historian he is a pupil of Leopold von Ranke. As a practical politician he belonged to the school of Gagern, and in 1849 he attended as a delegate the diet that met in Frankfort-on-the-Main, but, together with his master, resigned from that body. D. at Berlin, May 24, 1886. Revised by J. GOEBEL.

Waltz, THEODOR: psychologist and anthropologist; b. at Gotba, Germany, Mar. 17, 1821; studied at Leipzig and Jena; traveled in 1842-43 in France and Italy; published in 1844-46 a critical edition of Aristotle's *Organon* (in 2 vols.), and was appointed in 1848 Professor of Philosophy at the University of Marburg, where he died May 21, 1864. He wrote *Grundlegung der Psychologie* (Hamburg, 1846; 2d ed. 1878); *Lehrbuch der Psychologie als Naturwissenschaft* (Brunswick, 1849); *Allgemeine Pädagogik* (Brunswick, 1852; 3d ed. 1882); and *Die Anthropologie der Naturvölker* (6 vols., Leipzig, 1859-71; 5th and 6th edited by Gerland). Revised by J. M. BALDWIN.

Waizen, or **Waizen**, vi'tsen (Hung. *Vác*): town; in the Hungarian county of Pesth-Pilis-Solt; on the left bank of the Danube, 20 miles by rail N. of Pesth (see map of Austria-Hungary, ref. 5-11). It has been a Roman Catholic bishopric

since 1075, has many Roman and mediæval monuments, several educational and charitable institutions, and a large trade in cattle and wine. Pop. 13,190. H. S.

Waiver [from O. Fr. *weyver*, *guesver*, waive, refuse, abandon; cf. Eng. *wai*, orig., goods abandoned by a thief in flight]: the voluntary relinquishment of a private right. The right may be conferred by a constitutional or a statutory provision, or by a common-law rule, or it may originate in a contract. In either case it may be waived, provided it is a private right. If, however, the right involves a matter of public morals or policy it can not be waived. Hence the defendant in a criminal case can not waive a trial by a common-law jury in a jurisdiction where trial by jury is guaranteed by a constitutional provision. (*In re Staff*, 63 Wis. 285.) But the right to have judicial proceedings in a civil action conducted in a prescribed manner may be waived by becoming a party to such proceedings without seasonably objecting to the irregularities. So the right to have a statute declared unconstitutional may be waived by accepting the benefits of legislation based upon its assumed validity. *Mayor vs. Manhattan Railway*, 143 N. Y. 1.

If the right originates in a contract it can be waived only by an agreement of the parties based on a consideration, or by acts of the possessor of the right operating by way of ESTOPPEL (*q. v.*). Such is the general rule. If the right in question, however, is that of forfeiture—for example, the forfeiture of an insurance policy by the non-payment of a premium—there is considerable authority for the view that the waiver of it need not be based on a contract or an estoppel. If in any negotiations or transactions with the insured, after knowledge of the forfeiture, the insurer recognizes the continued validity of the policy, or does acts based thereon, the forfeiture is as a matter of law waived. (*Titus vs. Glens Falls Ins. Co.*, 81 N. Y. 410.) In Great Britain another exception to the rule exists in the case of negotiable paper. The holder of such paper may waive his rights against any party thereto before or after maturity, without consideration, by an absolute renunciation thereof. This doctrine "seems to have been consciously imported into the law merchant from French law." (See opinion of Parke, B., in *Foster vs. Darber*, 6 Exchequer, at p. 852, A. D. 1851.) By the Bills of Exchange Act, 1882, § 62 (1), the renunciation is required to be in writing. In the U. S. this exception is not recognized generally. The weight of authority is in favor of applying the general rule, even to commercial paper, that a right of action can be discharged only by contract or estoppel. 1 Daniels, *Negotiable Instruments*, § 544.

Whether the right is conferred by law or by contract, the facts upon which it is based must be known to its possessor in order that his acts relating to it should operate as a waiver; but it is not necessary that he know the legal effect of the facts or of his acts. This is well illustrated by the case of an indorser of commercial paper. If the paper is not duly presented for payment and the indorser duly notified of its dishonor, he is discharged from liability. This discharge may be waived by the indorser's promising to pay the paper, provided he knows the facts, although he is ignorant that the legal effect of these facts was to discharge him. (*Rindskopf vs. Doman*, 28 Ohio St. 516.) Waiver of presentment and notice is discussed in BILL OF EXCHANGE (*Presentment for Payment*), and waiver of tort in QUASI CONTRACTS. FRANCIS M. BURDICK.

Waizen: See WAITZEN.

Wakash'an Indians [*Wakashan* is from *wakash*, the Nootka word for "good," mistaken for the name of a tribe]: a linguistic stock of North American Indians, also called Nootka. The languages spoken by the Aht of the west coast of Vancouver island and the Makah (Kaasath or Klayaht) of Cape Flattery, congeneric tribes, and the Haultzuk and Kwakiutl peoples of the east coast of Vancouver island and the opposite mainland of British Columbia, were at first regarded as representing two distinct families, but through the investigations of Dr. Franz Boas it is now possible to unite them on the basis of radical affinity. The Wakashan family, thus constituted, comprised about 8,000 Indians in 1890; it consists of two groups of tribes—the Aht, including twenty-two tribes, with over 3,600 members, and the Haultzuk, including about twenty tribes, among them the Haultzuk proper, the Wikeno (these two being often called Belbela or Millbank Sound Indians), and the three tribes commonly called Kwakiutl.

Habitat.—The tribes of this family occupy a large part of the west coast of Vancouver island, extending from Woody

Point on the N., in about lat. 50° 7', to Nitinaht Bay on the S., in lat. 48° 40'. They also occupy the adjoining islands and the opposite mainland coast of British Columbia from about Bate Inlet, in 50° 10' N. lat., to Millbank Sound. The tribes of the Aht division are confined chiefly to the west coast of Vancouver island. They range as far N. as Cape Cook, the northern side of that cape being occupied by tribes of the Haeltzuk division. On the S. they reached nearly to Sooke Inlet, that inlet being in possession of the Soke, a Salishan tribe. The neighborhood of Cape Flattery, Wash., is occupied by the Makah or Tlaasath, one of the Aht tribes, who probably wrested this outpost of the Wakashan Indians from the Clallam, a Salishan people, who next adjoin them on Puget Sound. The Haeltzuk tribes occupy the northern part of Vancouver island, adjoining the Aht and Salishan territories, and the west coast of British Columbia, having the Chimmesyan Indians on the N., the Taculli tribes (Athapasean) and the Bilqula (Salishan) on the N. and E., and Salishan tribes on the S. E.

General Characteristics.—All the tribes derive the greater part of their subsistence from the sea. Armed with harpoons of their own manufacture they frequently attack and overcome the whale. They appear to have been always aggressive and warlike, and are very conservative in changing their habits and adapting themselves to the ways of civilization. Their houses are large communal structures covered with boards of their own manufacture, which are carried from place to place as they change their residence. They are especially skillful in basket-making. Head-flattening prevails among them to some extent, though not so largely as among the Chinook and some other tribes. Slavery largely prevailed among all the tribes. The women and children taken in war or obtained by purchase seem to have been invariably used as slaves, as also all the captured men who were not killed out of revenge. The language possesses a number of dialects which probably do not differ greatly. According to Sprout, the Nitinaht language (this tribe is one of the Aht group) is understood throughout the group. In the essentials of life the Haeltzuk tribes do not differ markedly from their neighbors of the Aht division, or from the Haida. The Wakashan Indians are skilled in the various rude arts practiced by barbaric peoples, but they do not exhibit the same superiority in carving, boat-building, etc., that distinguishes the Haida. The villages consist usually of a single row of houses facing the sea and placed upon the edge of the beach. The various practices relating to the custom of "potlatch"—that is, the free distribution of property on certain ceremonial occasions—prevail as extensively among these tribes as among the others of this region. Among the Haeltzuk tribes, as among the Kuluschan, the Haida, and the Chimmesyan, territorial rights are peculiarly well defined. Not only has each tribe its own sea-fishing grounds, its own salmon-streams from which it alone has a right to take fish, and its own hunting and berry grounds, but within the tribe each gens likewise has its own territory. According to Boas, descent and inheritance among the Haeltzuk tribes are in the male line. Comparatively little is known of the Haeltzuk language, but a sufficient number of vocabularies have been gathered to show the existence of several dialects. There is no social or political bond of union between the various tribes of this family of late years, as several of the smaller tribes have decreased in numbers, moved from their old territory, and become amalgamated with stronger tribes, so that in a number of cases the main or winter village is occupied by several tribes. See INDIANS OF NORTH AMERICA.

JAMES OWEN DORSEY.

Wake [from O. Eng. *wacu* (in *nicht-wacu*), a watch, deriv. of *wacan*, wake; cf. Lat. *vigil*, wakeful, watchful, *vigilia*, a watch, wake]; in old English usage, the equivalent of *VIGIL* (*q. v.*). In many British parishes the term and custom still survive in the "country wakes," festivities of ancient origin which are kept up on the eves of certain saints' days. The *lyke-wake*, in which the neighbors of a deceased person hold a watch over the dead body, is a custom of entirely different character. It is found among the lower classes in several countries, notably among the Irish.

Wake, WILLIAM, D. D.: archbishop; b. at Blandford Dorsetshire, England, in 1657; studied at Christ Church, Oxford; graduated 1676; took orders in the Church of England; became chaplain to the English embassy in France; had a theological controversy with Bossuet, arising from what he claimed to be a misrepresentation of the doctrine of the Church of England, 1686-88; became

preacher to Gray's Inn, canon of Christ Church 1689, chaplain to King William, rector of St. James, Westminster, 1693, dean of Exeter 1701, Bishop of Lincoln 1705, Archbishop of Canterbury 1716, and discussed with Dupin a project for the union of the English and Gallican Churches 1718. He was author of several controversial publications against Bishop Atterbury, three volumes of *Sermons*, and an excellent translation of the *Apostolical Fathers* (1693). D. in his palace at Lambeth, London, Jan. 24, 1737.

Revised by S. M. JACKSON.

Wakefield: capital of the West Riding of Yorkshire, England; on the Calder; 9 miles S. S. E. of Leeds (see map of England, ref. 7-11). The cathedral, a Perpendicular building, was founded in 1329 and restored 1857-86. A town-hall, French Renaissance in style, was erected in 1880. Wakefield has been the seat of a bishopric since 1888. Its manufactures of cloth and yarn have declined, but are still considerable. The Yorkist forces suffered a defeat here Dec. 31, 1460. Pop. of the parliamentary borough, returning one member (1891), 37,269.

Wakellfield: town (incorporated in 1868); Middlesex co., Mass.; on the Boston and Maine Railroad; 10 miles N. of Boston (for location, see map of Massachusetts, ref. 2-11). It contains the villages of Wakefield, Greenwood, and Montrose; has electric lights, electric street-railway, fine water-supply, two large lakes, public park, high school, 26 district schools, public library of about 12,000 volumes, a national bank with capital of \$100,000, a State bank with capital of \$10,000, a savings-bank, and a daily and 3 weekly papers. There are manufactures of rattan goods, pianos, and shoes, and iron and brass foundries. Pop. (1880) 5,547; (1890) 6,982; (1895) 8,304.

EDITOR OF "CITIZEN AND BANNER."

Wakefield: village; South Kingstown township, Washington co., R. I.; at the head of Point Judith inlet and on the Narragansett Pier Railroad; 5 miles S. of Kingston, 30 miles S. by W. of Providence (for location, see map of Rhode Island, ref. 10-N). It is principally engaged in farming and in the manufacture of cotton and woolen goods, and has a trust company with capital of \$100,000 and a weekly newspaper. Pop. (1890) 2,200.

Wakefield, EDWARD GIBBON: writer on theories of colonization; b. in London, England, Mar. 26, 1796; educated to the business of a land-surveyor; was brought into public notice in 1826 from having eloped to Gretna Green and there married an heiress fifteen years of age, for which act he was tried and sentenced to confinement for three years. During his imprisonment he studied colonial questions, and after his liberation took part in promoting the colonization of South Australia. In 1838 he accompanied the Earl of Durham to Canada as his private secretary, and rendered valuable service in the introduction of the new form of government, and subsequently removed to New Zealand, a colony which owed its existence largely to his efforts, and where his brother, Col. William, and his son, Edward Jerningham, had been (1839) pioneer settlers. D. at Wellington, New Zealand, May 16, 1862. The distinctive principle of the Wakefield system much resembles that of the homestead and pre-emption legislation of the U. S., consisting in selling lands in small lots and at low prices to actual settlers, and employing the proceeds as a fund for the transportation of fresh emigrants.

Wakefield, GILBERT: classical scholar and theologian; b. at Nottingham, England, Feb. 22, 1756; graduated at Cambridge; appointed curate of Stockport, Cheshire, and of St. Peter's, Liverpool, 1778, but resigned and did not join any other religious body; classical tutor at the Nonconformist Academy at Warrington 1779-83, and at the Unitarian College at Hackney 1790-91; engaged in bitter controversies with Porson and other classical scholars (see his voluminous correspondence with Charles James Fox, published 1813); was imprisoned in Dorchester jail from 1798 to May, 1801, for a "seditious" political pamphlet, written in reply to Bishop Watson's *Address to the People of Great Britain*. D. at Hackney, Sept. 9, 1801. Wakefield's chief publications are a *Translation of the New Testament* (3 vols., 1791); *An Enquiry into the Expediency and Propriety of Social Worship* (1793) answering the question negatively; *Silva Critica* (5 parts, 1789-95); *Tragicorum Delectus* (2 vols., 1794); *Horace* (2 vols., 1794); *Virgil* (2 vols., 1796); and especially a once highly esteemed critical and exegetical edition of *Lucretius* (3 vols., 3d ed. 1821). See his *Autobiography* (2 vols., 1792; 2d ed. 1804).

ALFRED GUEDEMAN.

Wakley, THOMAS, M. D.: surgeon; b. at Membury, Devonshire, England, in 1795; studied medicine and surgery in London, attending the lectures of Sir Astley Cooper 1815; practiced some years as a surgeon in London; retired from active practice in 1823, when he founded in London *The Lancet*, a weekly medical journal, which he edited nearly forty years, and which has been instrumental in promoting many reforms in surgery and medicine. Dr. Wakley was coroner for Middlesex 1839-62, and sat in Parliament 1835-52. D. in the island of Madeira, May 16, 1862.—His son, JAMES GOODCHILD WAKLEY (b. at Brompton, London, England, in 1825; d. in London, Aug. 30, 1886), succeeded him in the editorship of *The Lancet*.

Walafridus Strabus: See STRABO, WALAHFRID.

Walcheren, wāl'cher-en: island of the Netherlands, forming part of the province of Zeeland, between the East and West Scheldt and the North Sea. It is 11 miles long and 10 miles broad, with an area of 81 sq. miles, and has 45,000 inhabitants. The chief town is Middelburg. It is low, and is protected against inundation partly by natural dunes, partly by immense dikes, the rupture of which has on more than one occasion been most disastrous, but it is very fertile, and contains fine tracts both of meadow and arable land. The northern part of the island is well wooded. Walcheren is famous in military history for the disastrous expedition of the British under Lord Chatham and Admiral Straehan in 1809. It was aimed against Antwerp and might, if successful, have roused North Germany against Napoleon, but it was late in starting, and time was wasted in trying to reduce Flushing. Lord Chatham was utterly incapable as a leader, and Lord Castlereagh, who had planned the expedition, failed to provide the necessary supplies. After the delay at Flushing the army was quartered in the island of Walcheren. By the time Chatham was ready to attack Antwerp, Bernadotte had come to its assistance, and, as the British forces had been greatly reduced by disease, success was hopeless. It was decided, however, to retain possession of Walcheren, and it was garrisoned by a force of 15,000 men until Dec., 1809. Over 7,000 men lost their lives in the expedition, which was an utter failure.

Revised by M. W. HARRINGTON.

Walekenae, wāl-ke-naar, CHARLES ATANASE, Baron; scientist; b. in Paris, Dec. 25, 1771; was drafted into the army in 1793; became a mayor of Paris in 1816; entered the civil service during the Restoration, and was appointed prefect of the department of Nièvre in 1824 and of that of Aisne in 1826; retired from public life in 1830, and devoted himself exclusively to science; was chosen perpetual secretary of the Academy of Inscriptions in 1840. His most remarkable works are *Faune parisienne des Insectes* (1805); *Tableau des Aranéides* (1805); *Histoire naturelle des Insectes aptères* (1837); *Le Monde maritime* (1818); *Géographie historique et comparée des Gaules* (1839); *Histoire de la vie et des ouvrages de La Fontaine* (Paris, 1820); *Mémoires* on Madame de Sévigné (5 vols., 1842); he also published *Nouvelle Collection de Voyages* (21 vols., 1826-31). D. in Paris, Apr. 27, 1852. Revised by A. G. CANFIELD.

Walcott, CHARLES DOOLITTLE: paleontologist and geologist; b. at New York Mills, Oneida co., N. Y., Mar. 31, 1850; became assistant to Prof. James Hall, State geologist of New York, in 1876; entered the U. S. Geological Survey in 1879 as assistant geologist, and became paleontologist 1883, chief paleontologist 1891, geologist in charge of geology and paleontology 1893, and director 1894. Among his writings are *The Trilobite: New and Old Evidence Relating to its Organization* (Bull. Mus. Comp. Zool., vol. viii., No. 10, 1881); *Paleontology of the Everett District, Nevada* (Monograph 8, U. S. Geol. Surv., 1884); *The Cambrian Faunas of North America* (Bull. 10, U. S. Geol. Surv., 1885); *Second Contribution to the Studies of the Cambrian Faunas of North America* (Bull. 30, U. S. Geol. Surv., 1886); *The Taconic System of Eimons* (Am. Jour. Science, vol. xxxv., 1888); *The Fauna of the Lower Cambrian or Olenellus Zone* (10th Ann. Rept., U. S. Geol. Surv., 1890); *Correlation Papers, Cambrian* (Bull. 81, U. S. Geol. Surv., 1891).

Waldeck, wāl'dek, JEAN FRÉDÉRIC, de; traveler, archaeologist, and artist; b. in Paris, Mar. 16, 1766. When a young man he was with Devaillant in South Africa; subsequently he studied art, but during the French Revolution he entered the army, served under Bonaparte in Italy, and followed him to Egypt in 1798, though he was not in active service there. On the failure of the Egyptian expedition Waldeck, with

four companions, undertook a perilous exploration over the desert of Dongola, from which he alone returned. Later he was at Mauritius, and in 1819 went with Cochrane to Chili, whence he passed to Central America. He settled as an engraver in London in 1822, but in 1825 returned to Central America, and, aided by a small grant from the French Government, spent twelve years studying the ruins of Southern Mexico and Guatemala, and making careful drawings of them. A large portion of his notes and drawings were lost; the remainder were sold to the French Government, and from them he lithographed many of the plates for the *Monuments anciens du Mexique*, published in 1866, after he had passed his hundredth year. He published independently *Voyage archéologique et pittoresque dans le Yucatan* (1837). D. in Paris, Apr. 29, 1875. H. H. S.

Waldeck-Pyrmont: a principality of Northwestern Germany with one vote in the federal council and one in the imperial diet. It consists of two separate parts—the former county of Waldeck, surrounded by Prussian territory, with an area of 407 sq. miles and 57,281 inhabitants (1890), and the principality of Pyrmont, 30 miles to the N., between Hanover, Lippe, and Brunswick, with an area of 26 sq. miles and 8,104 inhabitants. Waldeck is, for the most part, hilly. The rivers Diemel and Eder in Waldeck and the Emmer in Pyrmont belong to the Weser system. The mountainous parts are not fertile, only 55.5 per cent. of the soil being utilized for fields, gardens, and pastures, while 36 per cent. is forest-land. Grain, especially rye and oats, potatoes, and flax, are the principal products; wood, iron, salt, slate, marble, and sandstone form the chief exports; cattle-raising is extensively carried on. The chief drawback of the country is the absence of railways, the Prussian railway system touching only the extreme southeastern part of the principality. The capital and residence of the prince is Arolsen, in Waldeck, with (1890) 2,620 inhabitants, but the government is practically in Prussian hands under a *Landesdirektor*.

HERMANN SCHOENFELD.

Walden: village; Orange co., N. Y.; on the Walkill river, and the Walkill Valley Railroad; 12 miles N. W. of Newburgh, and 73 miles N. by W. of New York (for location, see map of New York, ref. 7-7). It contains woolen-mills, cutlery-works, foundries, manufactories of engines and soap, a national bank (capital \$50,000), and a savings-bank, and has two weekly newspapers. Pop. (1880) 1,804; (1890) 2,132.

Walden, or Walden'sis, THOMAS, whose family name was NETTER; ecclesiastic; b. at Saffron Walden, Essex, England, about 1375; educated at Oxford; entered the Carmelite order in London, and was ordained sub-deacon 1395; was at the Council of Pisa 1409; on his return became and remained a leading prosecutor of the Wyclifites or Lollards, and is known to have been present at the trials of William Tailor (1410) and Sir John Oldcastle (1413); and to have publicly rebuked Henry V. because he was slow about punishing the heretics. He became a provincial prior of the English Carmelites 1414; attended in that capacity the Council of Constance 1415; went to Lithuania 1419; founded there several houses of his order, and negotiated a peace between the King of Poland and the Teutonic Knights; converted the Duke of Lithuania to the Catholic Church, whence he was styled the "Apostle of the Lithuanians"; was confessor to Henry V., whom he attended on his deathbed (1422), and became confessor to his son Henry VI.; accompanied Henry VI. to France, and died at Rouen, Nov. 2, 1430. He instituted the order of Carmelite nuns in England, and in many other ways served his order, which in gratitude has enrolled him among the saints. He was the author of treatises, *Doctrinale antiquum Fidei Ecclesie Catholice contra Wiclevistis et Husitas*, and *De Sacramentis*, and is supposed to have been the writer of the series of tracts entitled *Fasciculi Zizaniorum Johannis Wyclif* (Bundles of Wyclif's Tares), consisting of seven portions, the first two of which were first edited by Dr. W. W. Shirley in the Rolls Series (1858).

Revised by S. M. JACKSON.

Walden'sian Church [named from Peter Waldo (see below)]; the oldest Protestant Church in the world, and one of the three native Evangelical churches in Italy, the others being the Evangelical Church of Italy, which was organized in 1865, and the Reformed Catholic Church, a branch of the old Catholic movement which originated in Germany with Döllinger.

Origin and Home.—The Waldensian valleys are in the north of Italy in the midst of the Cottian Alps, about 30 miles S. W. of the city of Turin, the capital of Piedmont.

The territory occupied by Waldenses is from 24 to 25 miles in length and from 14 to 15 in breadth. The chief place is Torre Pellice, with 5,000 inhabitants, where there is a college for boys and a high school for girls. The Waldenses, numbering from 25,000 to 26,000, are chiefly peasants living in small villages. It is now generally agreed among church historians that there is no evidence that the Waldenses were in existence as a separate organization before the days of Peter Waldo, who is accordingly said to be their founder. The question, however, is far from being settled. But even if the connection between Waldo and the Waldensians be denied, it is proper here to say a few words about a reformer whose doctrines are so much like those professed by the Waldenses themselves. Peter Waldo, rich and respected by his fellow citizens of Lyons, was one day in 1173 conversing with friends, when suddenly one of them fell dead at his feet. That tragical event was the means of turning his attention to spiritual things. He engaged at once two ecclesiastics to prepare for him a vernacular translation of several portions of the Holy Scriptures and of the Fathers. He began to read the word of God in his own tongue, but found no peace. One day he saw a large crowd of people listening to a minstrel who was singing the praises of St. Alexis, who had left all and had gone to the East to do penance. Waldo thought it his duty to do the same, and was confirmed in his opinion by a canon whom he had consulted, who said to him, "If thou wilt be perfect, go and sell that thou hast, and give to the poor." He then gave part of his property to his wife and to his daughters, and part to the poor, and began to preach in the streets of Lyons. His aim was to revive the fervent, simple, self-denying piety of the primitive Church. He emphasized the right and duty of every Christian to study the Scriptures for himself. His followers styled themselves The Poor, others called them Leonists, from Lyons, or Sabatati, because they wore *sabots*, or wooden shoes. Waldo, silenced by the Archbishop of Lyons, appealed to the pope, Alexander, who gave him a cordial reception, approved his vow of poverty, but advised him not to preach unless he had the permission of the local clergy. In 1184 he was condemned by the Council of Verona and anathematized by Pope Lucius III. The date of his death is not known. His followers increased greatly, and some crossed the Alps and joined the Waldenses, who were steadily spreading over the north of Italy.

History to 1848.—Every period in the history of the Waldenses is marked by a new persecution by Rome and by the Dukes of Savoy, who too often were but the humble servants of the popes. In 1487, under Pope Innocent VIII., Alberto Cataneo invaded the valleys at the head of 18,000 regular troops; being repulsed, he crossed the Alps and avenged himself by destroying the Waldenses of Val Louise. In 1655 occurred the most severe trial to which the Waldenses were subjected. An army, composed partly of French troops of Louis XIV., partly of Irish soldiers, entered the valleys and spread destruction on every side. They treated the people with terrible barbarity, so that the conscience of Europe was aroused, and England under Cromwell called on the Protestant powers to join in remonstrance to the Duke of Savoy and the French king. The massacre to which the people were subjected called forth Milton's immortal sonnet beginning, "Avenge, O Lord, thy slaughtered saints." In 1686 the Waldenses, obliged by Victor Amadeus II. to choose between their religion and their country, after a hard struggle went into exile in Switzerland and Germany. In 1689 one of their pastors, Henry Arnaud, led a band of 800 men to the reconquest of their country, and succeeded. For a while the Waldenses were left in peace, but not long afterward all the Protestants who were not born in the valleys were obliged to leave them, and emigrated to Würtemberg. Henry Arnaud, the brave leader and faithful pastor, being born in France, was obliged to accompany them. He died in Schönberg, Sept. 8, 1721, after a faithful ministry. In short, it may be said with truth that the only time in which the Waldenses, during their long and eventful history, enjoyed real freedom was during the French Revolution and when Napoleon I. ruled over Italy. At last, on Feb. 17, 1848, King Charles Albert proclaimed the constitution and granted them religious toleration, toleration which now, by the force of events, has been changed into freedom.

Doctrinal History, Development, and Polity.—It is commonly asserted that the Waldensian Church was never reformed because it did not need reformation, having kept the Gospel in its purity. That opinion, so fondly enter-

tained by many, is not in accordance with the facts. The fundamental doctrines of the early Waldenses were: "We must obey God rather than man; we must follow Christ in his poverty and reclaim a crooked generation by the free preaching of the Gospel. Two are the ways, one leads to perdition, the other to eternal life. Purgatory exists, but in this life only. The intercession of saints is useless, and useless their worship." They had the triple vow of chastity, poverty, and obedience. They worshiped God, and held the Virgin Mary in veneration. They practiced confession, but their teachers pronounced the absolution in this way, "May God absolve thee from thy sins." They disapproved of capital punishment. Their missionary spirit was great, and their knowledge of the Scriptures was wonderful for the times. Later on, when persecution had crushed so many of them, they were more lax in their observances; their ideas about many points of doctrine were confused, as appears from a letter which two delegates, Maurel and Masson, laid before the Swiss and German reformers. From that letter it would appear that the Waldenses received the sacraments of baptism and Holy Communion from the regular priesthood; that they acknowledged the seven sacraments of Rome, but gave them a spiritual meaning; that clerical celibacy was their rule, though they admitted that it created a great many disorders. The reformers, Oecolampadius, Bucer, Farel, advised and enlightened them on many points. "We admit," they said, "but two sacraments, baptism and the Lord's Supper, and they are symbolical. The canon of Holy Scriptures must be expunged, and the apocryphal books left aside. It is not against the Gospel to take an oath, matrimony is honorable for every man, the apostle did not prescribe celibacy; you must not outwardly submit to the ordinances of the Church." "God," said Oecolampadius, "is a jealous God, and does not permit his elect to put themselves under the yoke of Antichrist." At a synod held at Chanforans in 1532 in the valley of Angrogna a new confession of faith was adopted, which assimilated the practices of the Waldenses to those of the Swiss congregations, renounced for the future all recognition of the Roman communion, and established their worship no longer as a secret meeting of a faithful few, but as public assemblies for the glory of God. Henceforth the Waldenses were absorbed in the general Protestant movement of Europe. At the same synod 500 pieces of gold were set aside by the small Church for the purpose of having the Bible translated and printed in French. In due time the Bible of Olivetan was published at Neuchâtel, Switzerland, with this date, "From the Alps, the 12th of February, 1535." At the beginning of the nineteenth century the piety and the missionary spirit of the Waldenses had lost much of their former fervor. Félix Neff revived their faith; Canon Gilly, of Durham, by his book, *A Visit to the Valleys of Piedmont*, drew the attention of the Christian Church to this interesting people. Moved by that book, which he chanced to see in the library of the Duke of Wellington, Col. Beckwith visited the Waldenses in 1827, settled among them, and for thirty-five years devoted himself to the promotion of their welfare. He married an accomplished Waldensian lady, lived among the people, established 120 primary schools, and was the means of building the fine Waldensian church in Turin.

Ecclesiastical Polity.—This is now undoubtedly Presbyterian, very much resembling that of the Church of Scotland. The Waldenses are admitted in the Pan-Presbyterian council as a Presbyterian body. But it is by no means proved that this was their primitive form of government. Gilly, an Episcopalian, intimates that Presbyterianism was thrust upon them in the year 1630. In that year all the pastors, with but three exceptions, were removed by the plague which devastated the valleys. Recourse was had to Geneva and France for a supply of preachers, and those who were sent being Presbyterians, brought with them and established in Piedmont that form of Church polity which now prevails. The Moravian Brethren go so far as to affirm that their first bishop received the Episcopal ordination from Stephanus, bishop of the Valleys. Whether that opinion is true or not can not be affirmed with certainty. The fact is that the Waldenses, although Presbyterian, differ somewhat from the Presbyterian Churches in some respects. They keep Christmas, Good Friday, Easter, and Ascension Day. They have the rite of confirmation as in the Episcopal Church; they have a liturgy, and the ministers are at liberty to use it or not. Their Synod, which corresponds to the General Assembly of the Presbyterian Church, meets

once a year and is composed of all the ordained ministers of the home church and of the mission field. The lay deputation is composed of two delegates (not necessarily ruling elders) from every parish in the valleys and one delegate for every 400 communicants in the mission field. During the interval between two synods the administration of the home church rests on a board of five members, and the administration of the mission field on the Committee of Evangelization, composed of seven persons. The seminary of the Church is in Florence. Those who wish to be enrolled as regular theological students must have a Government diploma which corresponds to the degree of M. A. in England. The curriculum lasts three years, nine months every year. There are three professors.

History since 1848.—After the Waldenses received their civil and religious freedom in 1848 they began a work of evangelization among their countrymen. Amidst great difficulties they have succeeded in establishing in the Italian Peninsula and in the islands of Elba, Sardinia, and Sicily, 44 churches, ministered to and superintended by 43 pastors. Kindred to these there are also 47 stations with 47 evangelists and 8 teacher evangelists. The number of communicants in the mission field is 5,018, the number of adherents 55,000; the contributions from the mission churches \$15,200. Connected with the missions there are 29 day-schools, with 54 teachers and 2,397 scholars. There are also 12 night-schools for adults, and specially for workmen whose education has been insufficient or utterly neglected in their boyhood. In these schools there are 370 scholars. There are 61 Sunday-schools with 3,119 pupils.

The 25,000 or 26,000 Waldenses living in the valleys, of whom 14,248 are church-members, have 20 pastors, 17 parishes, 4,804 children in the day-schools, with 300 teachers and 3,290 children in the Sunday-schools. The contributions from the churches for all purposes were in 1894 \$14,000. Besides the Waldenses in the valleys, there are at least 2,000 in the city of Turin and some hundreds scattered throughout Italy, engaged either in business or in teaching. There is a large colony in Marseilles. About 1850 several hundreds left their mountains and went to colonize Rosario in the Argentine Republic. They number now 2,500, have two pastors and good schools, and are prospering. In the U. S. there are two colonies of Waldenses, one in Monett, Mo., and one in North Carolina.

BIBLIOGRAPHY.—The literature is copious. Space permits mention of only the more important of the numerous books. For convenience of reference these are arranged alphabetically: Henri Arnaud, *Histoire de la glorieuse rentrée* [1689] *des Vaudois dans leur vallées* (Cassel, 1710; n. e. Neuchâtel, 1845; Geneva, 1879; Eng. trans. *The Glorious Recovery by the Vaudois of their Valleys*, London, 1827); Amedeo Bert, *I Valdesi ossiano i Cristiani-Cattolici secondo la Chiesa primitiva abitanti le così dette Valli di Piemonte* (Turin, 1849); Cesare Cantù, *Gli Eretici in Italia; discorsi storici* (3 vols., Turin, 1865-67); Emilio Comba, *Henri Arnaud, sa vie et ses lettres* (La Tour, 1889); the same, *Storia dei Valdesi* (Turin, 1893); Teofilo Gay, *Il rimpatrio dei Valdesi* (Turin, 1879); Pierre Gilles, *Histoire ecclésiastique des Églises Reformées, recueillies en quelques vallées du Piémont . . . autrefois appelées Églises Vaudoises, commençant dès l'an 1160 . . . et finissant en l'an 1643* (Geneva, 1644); William Stephen Gilly, *Narrative of an Excursion to the Mountains of Piemont, and Researches among the Vaudois, or Waldenses* (London, 1824; 3d ed. 1826); the same, *Waldensian Researches during a Second Visit to the Vaudois of Piemont, with an Introductory Inquiry into the Antiquity and Purity of the Waldensian Church* (1831); Christoph Ulrich Bahin, *Geschichte der Waldenser und verwandter Sekten* (1847; vol. ii. of his *Geschichte der Ketzler im Mittelalter, besonders im 11., 12., und 13. Jahrhundert*, Stuttgart, 1845-50, 3 vols.); Johann Jacob Herzog, *Die romanischen Waldenser, ihre vorreformatorischen Zustände und Lehren, ihre Reformation im 16. Jahrhundert und die Rückwirkungen derselben* (Halle, 1853); Antoine Monastier, *Histoire de l'Église Vaudoise*, etc. (2 vols., Paris, 1847; Eng. trans., *A History of the Vaudois Church from its Origin, and of the Vaudois of Piedmont to the Present Day*, London, 1848); Samuel Morland, *The history of the Evangelical Churches of the valleys of Piemont, containing a . . . description of the place, and a faithfull account of the doctrine, life, and persecutions of the ancient inhabitants: . . . with a . . . relation of the . . . bloody massacre in 1655* (London, 1658); Alexis Muston, *L'Israël des Alpes*, etc. (4 vols., Paris, 1851; Eng. trans., *The Israel of the Alps: a Com-*

plete History of the Vaudois of Piedmont and their Colonies, Glasgow, Edinburgh, and New York, 1857; n. e. enlarged, London, 1863); the same, *Gian Luigi Paschale* (Turin, 1893); Frantisek Palacky, *Ueber die Beziehungen und die Verhältnisse der Waldenser zu den ehemaligen Sekten in Böhmen* (Prague, 1869); Jean Paul Perrin, *Histoire des Vaudois* (Geneva, 1619; Eng. trans., *Luther's Forerunners*, London, 1624); Albert de Rochas d'Aiglun, *Les Vallées Vaudoises* (Paris, 1880); C. H. Strong, *Brief Sketch of the Waldenses* (Lawrence, Kan., 1893); Felice Tocco, *L'Eresia nel Medio Evo* (Florence, 1884); James Henthorne Todd, *The Waldensian MSS. preserved in the Library of Trinity College, Dublin* (London and Cambridge, 1865); B. Tron, *Pierre Valdo et les Pauvres de Lyon* (Pignerol, 1879); August Wilhelm, *Die Waldenser im Mittelalter* (Göttingen, 1851); Jane Louisa Williams, *A Short History of the Waldensian Church* (London, 1855; 3d ed. by Mrs. Matheson, 1879); James Aitken Wylie, *History of the Waldenses* (London, 1880). D. 1665); the *Bulletin de la Société d'Histoire Vaudoise*, annually published at Torre Pellice, and *Bulletin du Bi-centenaire de la Glorieuse Rentrée* (Turin, 1889). FRANCESCO ROSTAN.

Waldensis: See WALDEN, THOMAS.

Waldersee, ALFRED, Count von; soldier; b. in Potsdam, Germany, Apr. 8, 1832; entered the army in 1850 and served with distinction in the campaigns of 1866 and 1870-71. In 1881 he was appointed quartermaster-general, and became deputy of Count von Moltke, whom he finally succeeded as chief of the general staff of the German army in 1888. Count von Waldersee married in 1874 the widow of Prince Frederic of Schleswig-Holstein-Sonderburg-Augustenburg, *née* Mary Esther Lee, of New York.

Waldeyer, HEINRICH WILHELM GOTTFRIED, M. D.: anatomist; b. at Hehlen, Brunswick, Germany, Oct. 6, 1836; studied mathematics and natural sciences at the University of Göttingen, but subsequently applied himself to medicine; studied anatomy under Henle at the University of Greifswald, and then went to the University of Berlin where he graduated M. D. in 1861. From 1862-64 he was an assistant to von Wittich in the physiological institute of the University of Königsberg; from 1864-65 he was assistant to Heidenhain in the University of Breslau, where in 1865 he was made extraordinary and in 1867 regular professor of pathological anatomy. In 1872 he was appointed Professor of Anatomy in the University of Strassburg, leaving in 1883 to go to the University of Berlin. He is the author of a number of monographs on anatomy and embryology, and assistant editor of the *Archiv für mikroskopische Anatomie*. S. T. ARMSTRONG.

Waldo, PETER: See WALDENSIAN CHURCH.

Waldoboro: town (settled by Germans in 1749, incorporated in 1773); port of entry; Lincoln co., Me.; on the Medomak river, and the Maine Cent. Railroad; 19 miles W. of Rockland, 19 miles E. N. E. of Wiscasset (for location, see map of Maine, ref. 10-D). It is in an agricultural region, was formerly noted for its ship-building interests, has a U. S. custom-house, public high school, a national bank with capital of \$50,000, and a weekly newspaper, and is principally engaged in the manufacture of shoes and clothing. Pop. (1880) 3,758; (1890) 3,505.

EDITOR OF "LINCOLN COUNTY NEWS."

Waldseemüller, or Waltzeemüller, vaalt zä-mül-ler, MARTIN (in the Greek form, which he adopted in accordance with the fashion of his time, *Hydrocomylus*); geographer; b. at Freiburg, Germany, about 1470. During several years, from 1504, he was Professor of Geography in the College of St. Dié in the Vosges. There, in 1507, he published a small treatise in Latin, entitled *Cosmographie introductio*, with translations of the letters of Vespucci as an appendix. This work is chiefly remarkable because the name America was first proposed in it. (See VESPUCCI.) Several editions of it were printed on the college press, but all are now extremely rare; the few copies in American libraries have been purchased for enormous prices and are treasured with great care. In conjunction with other scholars at St. Dié, Waldseemüller prepared an edition of Ptolemy, which was published at Strassburg in 1513; it is remarkable that the name America does not appear in this work, though it has some curious maps of the New World. HERBERT H. SMITH.

Waldstein: See **WALLENSTEIN**.

Wales [from O. Eng. *wealh*, plur. *wealas*, foreigner, especially a Celt or Welshman (: O. H. Germ. *wealh*) whence by deriv. *welisc*, foreign, especially Celtic (> Eng. *Welsh*): Germ. *wälisch*, foreign]: a principality; since 1282 an integral part of the kingdom of England. It has an area of 7,363 sq. miles.

Physical Features.—The two-horned peninsula of Wales extends from Liverpool Bay to Bristol Channel, and is bounded on the W. by St. George's Channel, which separates it from Ireland (see map of England and Wales). The fertile plain of Cheshire and the valley of the Severn form the natural boundary between England and the mountain region of Wales, but the present political boundary lies much farther to the W. The Welsh Hills or Cambrian Mountains attain their greatest height in Snowdon (3,570 feet), close to Menai Strait, which separates the mainland from the dependent island of Anglesey. A depression at the head of the Severn separates North from South Wales, and the hills of the latter are particularly distinguished by their barrenness, their highest range being known as Black Mountains (Brecknock Beacon, 2,910 feet), from the color of the heather which covers them. The only level tract of any extent is the Vale of Glamorgan on the Bristol Channel, but there are many valleys distinguished for their loveliness, especially those of the Wye in the south and of the upper Dee in the north. The coast is generally bold and rugged. At the southwest extremity of the peninsula a fiord, known as Milford Haven, penetrates far inland, and forms one of the most secure harbors of the British islands, although, owing to its remoteness, it is but little used.

The Dee, Severn, and Wye rise in Wales, but in each case the lower, navigable course is through England, and except the Tawe, Taff, and Conway, none of the exclusively Welsh rivers is navigable. The only lake of any size is that of Bala.

Geologically, Wales is the most ancient soil of Great Britain, and its mountains, built up of Laurentian, Cambrian, and Silurian rocks, reared their summits long before England emerged above the sea. These ancient rocks are pierced, as in Scotland, by granite, porphyry, and other igneous rocks, and in the south a belt of Devonian rocks intervenes between them and the coal-basin of Glamorgan-shire.

Industries.—Wales is in the main a pastoral country, for of its area only 20 per cent. is under the plow, while 41 per cent. consists of grass-lands and 9 per cent. of mountain pasture. The woods cover 35 per cent. The live stock includes 666,000 head of cattle and nearly 3,000,000 sheep. Coal and iron abound, Glamorgan-shire alone raising nearly 22,000,000 tons of the former, half of which is exported annually through Cardiff, the greatest coal-exporting port of the United Kingdom. Lead, copper, and gold are found, and roofing-slates in large quantities are exported from North Wales. Iron and steel works have sprung up in the coal-basins, but among other industries that of flannels and woollens is of most importance.

Population.—The population between 1881 and 1891 increased from 1,360,513 to 1,518,914 souls, but the increase was confined to the counties of Glamorgan (increase, 175,785), Carmarthen, and Denbigh, while throughout the remainder of the principality there was a decrease. The only large towns are Cardiff (128,849), Swansea (90,423), and Merthyr Tydvil (58,080).

English is the language of commerce and of culture, but Welsh is still spoken by 51 per cent. of the population. The Church of England is still the established church in Wales, but in the greater part of the country the majority of the people have turned their backs upon it, and adopted the teaching of various Dissenting bodies, among which the Calvinistic Methodists are the most numerous. Education is not as far advanced as in England, but there are 4 university colleges (91 professors, 929 students), of which one has the power to confer degrees, 10 theological colleges, 4 training institutions, and 12 public grammar schools. See **WELSH LANGUAGE** and **WELSH LITERATURE**.

History.—Wales from the most remote time was divided into a number of petty kingdoms or principalities, and only at long intervals did its tribes submit to the authority of a single ruler. Under the Romans, who established themselves in the country about 50 A. D. after the defeat of the Silures and Ordovices, Wales, or rather Cambria, formed part of Britannia Secunda. Isea (now Caerleon), Venta Si-

lurum (Caerwent), and Segontium (near Carnarvon) were the principal towns. Christian missionaries first arrived in the fourth century. After the retirement of the Romans the wars between the Welsh and Saxons were incessant. Athelstan (925-941) imposed a tribute upon the Welsh, which they paid, however, only for a time. William the Conqueror (1066) again reduced them to obedience, and his son, William I., settled the Lords Marchers along the borders of Wales to protect England against their incursions, and founded a Flemish colony in Pembroke-shire. On the accession of Edward I. (1272) the Welsh prince Llewelyn (Llywelyn ap Gruffydd) refused to do homage; but, after the betrayal and murder of that prince (1282) and the execution of his brother David at Shrewsbury, the nobility of Wales submitted to the king, and Wales was finally united with England, the title of Prince of Wales being bestowed upon the king's infant son, then recently born at Carnarvon Castle. The last effort of the Welsh to recover their liberty was made in 1400 under the leadership of Owen Glendower (Owain Glyndwr), a descendant of the old princes. In 1546 Henry VIII. abolished the government of the Lords of the Marches, united Monmouth-shire, and divided the rest of Wales into twelve shires. Since that time Welshmen have in all respects enjoyed the rights of Englishmen. See Woodward, *The History of Wales* (1853); Borrow, *Wild Wales* (1888); Doran, *The Book of the Princes of Wales* (1860). E. G. RAVENSTEIN.

Wales, Prince of: See **ALBERT EDWARD**.

Wales, Princess of: See **ALEXANDRA**.

Walewski, wã-lev'skëe, ALEXANDRE FLORIAN JOSEPH COLONNA, Count; statesman; b. at Walewiec, Poland, May 4, 1810; reputed to be the son of Napoleon I. and the Countess Walewska; was educated at Geneva; fought in the ranks of the Polish patriot army in 1831, and was sent in the same year to London to solicit a British intervention; went to France after the fall of Warsaw; entered the army as a captain, but soon gave up the military career, and devoted himself to politics and literature; wrote *Un Mot sur la Question d'Afrique* (1837), *L'Alliance anglaise* (1838), also a drama, *L'École du Monde* (1840), and founded the *Messenger*, which he sold in 1840 to Thiers; entered the diplomatic service, and was chargé d'affaires to Buenos Ayres at the outbreak of the Revolution of 1848; from 1849 to 1854 was ambassador to Florence, Naples, and London, successively; was Minister of Foreign Affairs May 7, 1855-Jan. 4, 1860, Minister of State Nov. 24, 1860-June 23, 1863, and president of the Legislative Assembly Sept. 1, 1865-Apr. 2, 1867. The emperor bestowed on him the title of duke in 1866. D. at Strassburg, Oct. 27, 1868.

Revised by F. M. COLBY.

Walhalla or **Valhalla**, wãl-haal lã [= Germ., from Icel. *valhöll*, liter., hall of the slain; *valr*, slain + *höll*, hall]; a marble temple of fame, built to commemorate the wars between Germany and France which ended with the downfall of Napoleon I. in 1815. It was begun in 1830, and finished in 1842. It stands on a hill on the Danube, at a place called Donaustauf, a few miles below Regensburg. It was conceived by Louis I. of Bavaria and planned by Leo von Klenze. It is a copy of the Parthenon, and is 232 feet long, 110 feet wide, and 63 feet high. Visitors ascend by marble steps from the foot of the hill, and the substructure and surroundings greatly enhance the grandeur and beauty of the building proper. The bas-reliefs, statues, and groups which adorn the edifice are the works of Schwanthaler, Rauch, and Johann Martin von Wagner. This temple was made for busts and statues of all the great men and women produced by Germany. It now contains 163 busts, and also a number of marble tablets giving the names of persons of whom no reliable portraits could be procured. It is one of the most remarkable buildings in all Germany. See **VALHALL**.

RASMUS B. ANDERSON.

Walk: See **GAITS**.

Walker, AMASA, LL. D.; political economist; b. at Woodstock, Conn., May 4, 1799; educated in the common school at North Brookfield, Mass.; became a merchant at Boston 1825; was a prominent advocate of the construction of the Western Railroad, an influential member of the early anti-slavery circles, and a leader in the cause of temperance, and visited Europe 1843 and 1849 as delegate to peace conventions. He was Professor of Political Economy at Oberlin College, O., 1842-49; representative in the Massachusetts Legislature 1848, member of the State Senate 1849,

Secretary of State 1851-1852; member of the State constitutional convention 1853, of Congress 1862-63, and of the Philadelphia loyalists' convention 1866; and lecturer on political economy at Amherst College in 1861-66. D. at North Brookfield, Mass., Oct. 29, 1875. He published *The Science of Wealth* (1866), and was one of the editors of the *Transactions of the Agricultural Society of Massachusetts* (7 vols., 1848-54). Revised by FRANCIS A. WALKER.

Walker, FRANCIS AMASA, Ph. D., LL. D.: soldier and statistician; son of Amasa Walker; b. in Boston, Mass., July 2, 1840; graduated at Amherst 1860; studied law under Judges Devens and Hoar at Worcester; entered the army 1861 as sergeant-major of Devens's regiment; became assistant adjutant-general of Couch's brigade Sept. 14, 1861, adjutant-general of Couch's division Aug. 11, 1862, lieutenant-colonel on staff of Second Army-corps Jan. 1, 1863, and brevet brigadier-general 1865; wounded at Chancellorsville; taken prisoner at Reams's Station, and confined in Libby prison, where his health was shattered; was a teacher at Williston Seminary, Easthampton, Mass., 1865-68; an editor of the *Springfield Republican* 1868-69; became chief of the bureau of statistics of the Treasury Department at Washington 1868; was superintendent of ninth U. S. census (1870); commissioner of Indian affairs 1871-72, and became in 1872 Professor of Political Economy and History in the Sheffield Scientific School of Yale College. He edited three 4to volumes of *Census Reports*, compiled a *Statistical Atlas of the United States* (1874), and published *The Indian Question* (Boston, 1874); *The Wages Question* (1876); *Money* (1878); and *Money, Trade, and Industry* (1879). Between 1879 and 1881 he conducted the tenth census, and superintended the preparation of the reports; was chosen president of the Massachusetts Institute of Technology in 1881; elected a correspondent of the Institute of France 1883. He published *Political Economy* (New York, 1883); *Land and its Rent* (1883); *History of the Second Army Corps* (1886); *Life of Gen. Winfield S. Hancock*, in the Great Commander Series (New York, 1894); and *The Making of the Nation* (1895). D. in Boston, Mass., Jan. 5, 1897.

Walker, FREDERICK: painter; b. in Marylebone, London, May 24, 1840; studied at the Royal Academy; became a wood-engraver; furnished drawings for several magazines; contributed to the exhibitions of the Society of Painters in Water-colors; and was made an A. R. A. in 1871. D. at St. Fillans, Perthshire, June 4, 1876. Among his oil-paintings, which are remarkable for their peculiar color effects, are *The Bathers*, *The Vagrants*, *The Old Gate*, *The Plough*, *The Harbor of Refuge*, and *The Right of Way*. There was an exhibition of about 200 of his pictures in London in 1876.

Walker, GEORGE, D. D.: the defender of Londonderry; b. in County Tyrone, Ireland, about 1650; educated at the University of Glasgow; took orders in the Church of England; was rector of Donoughmore, near Londonderry, Ireland, when James II. laid siege to that city 1689; gallantly defended Londonderry after it had been abandoned by its governor, and held out until the siege was raised, after 105 days' investment. He received the thanks of the House of Commons, and was nominated to the bishopric of Derry by William III. He was killed at the battle of the Boyne, July 1, 1690. He published *A True Account of the Siege of Londonderry* (1689) and a *Vindication*. His statue surmounts a lofty pillar at Londonderry.

Walker, Sir HOVENDEN: naval officer; b. in Somersetshire, England, about 1660; entered the navy at an early age; became a captain 1692, rear-admiral of the red 1709, and of the white 1710; was knighted by Queen Anne 1711; commanded in that year the unfortunate naval expedition which sailed from Boston against Canada; lost half his vessels by shipwreck on the Isle aux Oufs, and had to abandon the enterprise; attributed his failure to lack of support on the part of the New England colonists; afterward suffered the loss of his ship, the *Edgar*, which blew up at Spithead 1715, and he was thereupon dismissed from the service; subsequently settled in South Carolina as a planter, and published *A Journal or Full Account of the Late Expedition to Canada* (London, 1720). D. in Dublin, Ireland, in Jan., 1726.

Walker, JAMES, D. D.: preacher and educator; b. at Burlington (then Woburn), Mass., Aug. 16, 1794; graduated at Harvard College 1814; studied theology at Cambridge; was pastor of the Unitarian church in Charlestown, Mass., 1818-38; editor of *The Christian Examiner* 1831-39; Al-

ford Professor of Moral and Intellectual Philosophy at Harvard 1838-53, and president of Harvard University 1853-60. D. at Cambridge, Dec. 23, 1874. He left his valuable library and \$15,000 in money to the university. He was the author of *Sermons preached in the Chapel of Harvard College* (1861); *A Memoir of Daniel Appleton White* (1863); *A Memoir of Josiah Quincy* (1867); and a posthumous volume of *Discourses* (1876); delivered three series of *Lectures on Natural Religion* and a course of Lowell lectures on the *Philosophy of Religion*; published a number of occasional sermons and addresses, and edited as college text-books Dugald Stewart's *Philosophy of the Active and Moral Powers of Man* (Cambridge, 1849) and Dr. Thomas Reid's *Essays on the Intellectual Powers*, abridged, with *Notes and Illustrations from Sir William Hamilton and others* (Cambridge, 1850). Revised by J. W. CHADWICK.

Walker, JAMES BARR, D. D.: clergyman and author; b. in Philadelphia, Pa., July 29, 1805; became an operator in a factory at Pittsburg; subsequently was a printer; was clerk to Mordecai M. Noah in New York city; principal of an academy at New Durham, N. J.; studied law at Ravenna, O.; graduated at Western Reserve College, Hudson, O., 1831; edited successively *The Ohio Observer* at Hudson, the *Watchman of the Valley* at Cincinnati, and the *Watchman of the Prairies* (now *The Advance*) in Chicago, all religious newspapers; was also engaged in the book-trade; studied theology; was licensed to preach 1841, and was for a time a lecturer at Oberlin College and Chicago Theological Seminary. He was the author of *The Philosophy of the Plan of Salvation* (Boston, 1855), published anonymously under the editorship of Prof. C. E. Stowe, of which many thousand copies were sold in the U. S. and England, and which was translated into five languages; *God Revealed in Nature and in Christ* (1855), intended as a refutation of the development theory; *Philosophy of Scepticism and Ultraism* (1857); *The Philosophy of the Divine Operation in the Redemption of Man* (London, 1862); and *The Living Questions of the Age* (Chicago, 1869). D. at Wheaton, Ill., Mar. 6, 1887. Revised by GEORGE P. FISHER.

Walker, JOHN: dictionary-maker; b. at Colney Hatch, near London, England, Mar. 18, 1732; was in early life engaged in mercantile pursuits, and was subsequently an actor; established in 1767 a school at Kensington, and from 1769 devoted himself to lecturing on elocution in England, Scotland, and Ireland, a profession in which he achieved great success. Author of a *Rhyming Dictionary* (1775); *Elements of Elocution* (1781); *Rhetorical Grammar* (1785); and of a *Critical Pronouncing Dictionary and Expositor of the English Language* (1791), which was long the standard work of its class and has passed through forty editions. D. in London, Aug. 1, 1807.

Walker, JOHN GRIMES: U. S. naval officer; b. Mar. 20, 1835, at Hillsboro, N. H.; graduated at the Naval Academy in 1856; during the civil war served on the Atlantic coast blockade in 1861, and was transferred to the western Gulf blockading squadron in 1862; served with distinguished gallantry at the taking of New Orleans and Vicksburg, and in almost all the battles on the Mississippi river and its tributaries during the years 1862 and 1863, and commanded the gunboat *Shannut* at the taking of Wilmington, N. C., in 1865. He was secretary of the lighthouse board 1873-78; chief of bureau of navigation Oct. 22, 1881-89; commanding South Atlantic station, with rank of acting rear-admiral 1889-93; rear-admiral and president of the naval retiring board in Washington in 1895.

Walker, LEROY POPE: lawyer and soldier; b. near Huntsville, Ala., July 8, 1817; became a lawyer; early entered public life; was speaker of the Alabama House 1847-50; a judge of the State circuit court 1850-53; became a prominent advocate of the internal improvement of the State and of the policy of secession; was Confederate secretary of war 1861-62; served afterward as a Confederate brigadier-general, and after the civil war resumed legal practice at Huntsville, Ala., where he died Aug. 22, 1884.

Walker, ROBERT JAMES: statesman; b. at Northumberland, Pa., July 19, 1801; graduated at the University of Pennsylvania in 1819 with the highest honors, and in 1821 was admitted to the bar at Pittsburg; entered upon political life as a Democrat; in 1826 removed to Natchez, Miss., where he practiced law. He opposed the nullification movement of South Carolina, and, heading the opposition to Itou. George Poindexter, was in 1836 elected to the U. S.

Senate; and in that year brought forward, without success, the first Homestead Bill. In the Senate he at once took a prominent position. In 1837 he brought forward and carried through the resolution recognizing the independence of Texas, and in the same year he ably advocated the Independent Treasury Bill. In 1841 he originated the Pre-emption Act. In 1844 he published a cogent letter in favor of the "reannexation" of Texas, but recommended the gradual emancipation of slaves as a condition of her admission as a State. In 1845 he was appointed Secretary of the Treasury, an office which he filled with distinguished ability until 1849. The revenue tariff of 1846, the warehouse system, the independent treasury, and the establishment of the Department of the Interior were measures proposed by him. In 1857-58 he was, by appointment of President Buchanan, Governor of Kansas at a most difficult crisis, and was soon at variance with the administration over its policy toward Kansas. He opposed the Lecompton constitution and resigned his office. On the breaking out of the civil war he sustained the Federal Government, and in 1863-64 was financial agent of the U. S. in Europe, negotiating the sale of \$250,000,000 in Government bonds. In the latter part of his life he was successfully engaged in the practice of law at Washington, D. C., where he died Nov. 11, 1869.

Revised by F. M. COLBY.

Walker, SEARS COOK: astronomer; b. at Wilmington, Mass., Mar. 28, 1805; graduated at Harvard 1825; taught school in Boston and Philadelphia 1828-36; founded the observatory of the Philadelphia High School 1837; was actuary to an insurance company in Philadelphia 1836-45; was employed at the Washington observatory 1845-47, where he took a leading part in inventing the electro-chronograph and applying the telegraph to the determination of longitudes; investigated the orbit of Neptune and identified that planet with a star discovered by Lalande in May, 1795, and had charge of the longitude department of the Coast Survey from 1847 to his death, at Cincinnati, Jan. 30, 1853. His most important scientific works were published by the Smithsonian Institution, or in the *Transactions and Proceedings of the American Philosophical Society* and in Gould's *Astronomical Journal*. Revised by S. NEWCOMB.

Walker, WILLIAM: filibuster; b. at Nashville, Tenn., May 8, 1824. He studied medicine in Europe, and practiced for a short time in Philadelphia; subsequently he was admitted to the bar, and resided for several years at New Orleans, where he was connected with the *Crescent* journal. In 1850 he went to California, where he settled at Marysville as a lawyer and editor. In July, 1853, he organized an expedition for the conquest of Northwestern Mexico, where he proposed to found a Pacific Republic. Eluding the vigilance of the authorities, he sailed from San Francisco in October, and landed in Lower California with 170 men. There he proclaimed himself president of the new republic; but a strong Mexican force was sent against him. The party suffered great hardships in attempting to make its way overland to Sonora, and he finally crossed the frontier and surrendered to the commander of the U. S. forces at San Diego. He was tried in San Francisco for violation of the neutrality laws but was acquitted. In 1855, on the invitation of some American adventurers in Nicaragua, he agreed to join the democratic faction, which was carrying on a civil war in that country, his ultimate object being to establish an independent government under his own control. He landed on the Pacific coast of Nicaragua with fifty-eight men, and was at first repulsed, but, aided by numerous malcontents and by parties of filibusters who came to his aid, he eventually defeated Gen. Guardiola at La Virgen (Sept. 3, 1855), and soon after occupied Granada, the capital. Corral, his principal opponent, was forced to treat with him in October, and Walker acknowledged Rivas as president, but with the nominal title of commander-in-chief he really retained all the power. Within a few days he accused Corral of corresponding with the legitimists, and the unfortunate man was found guilty by a court martial and shot. Being now master of a great part of the country, Walker proclaimed himself a candidate for the presidency, and all opposition being suppressed, he was elected. Practically he was dictator, and though some of his acts were wise, many of them were arbitrary and tyrannical; among other decrees he issued one restoring slavery. But all Central America was now roused against the invaders. Costa Rica sent a force to aid the legitimists, and her example was soon followed by the other states. From July, 1856,

Walker was repeatedly defeated. In Jan., 1857, he abandoned Granada, after setting the town on fire; on May 1, 1857, he took refuge on a U. S. vessel, and was landed at Panama. He made two other attempts to invade Nicaragua, but was prevented from doing so by the interposition of the U. S. authorities. In June, 1860, he invaded Honduras with the intention of fomenting a revolution, but he met with a vigorous resistance, was eventually forced to surrender to the commander of the British vessel *Tearus*, was by him turned over to the government of Honduras, and was tried and shot at Trujillo, Sept. 12, 1860. He published *The War in Nicaragua* (Mobile, 1860), a work showing considerable literary ability. See also Wells, *Walker's Expedition to Nicaragua* (1856); H. H. Bancroft, *History of Central America*, vol. iii. (1887). HERBERT H. SMITH.

Walker, WILLIAM SIDNEY: author; b. at Pembroke, Wales, Dec. 4, 1795; educated at Eton and at Trinity College, Cambridge; graduated in 1819; was fellow at Trinity 1822-29, during which period he became blind; afterward gained a scanty subsistence by his pen in London, where, after years of suffering from strange hallucinations due to a painful disease, he died Oct. 15, 1846. At the age of seventeen Walker published an epic poem, *Gustavus Vasa* (1813); translated while an undergraduate *Poems from the Danish* (1816); subsequently edited a *Corpus Poetarum Latinorum* (Cambridge and London, 1827; new ed. 1854); and left in MSS. *Shakspeare's Versification* (1852; 3d ed. 1859), and *A Critical Examination of the Text of Shakspeare*, etc. (3 vols., 1859), both edited by W. N. Lettson. See his *Poetical Remains, with a Memoir*, edited by Moultrie (1852).

Revised by H. A. BEERS.

Walkerton: town; capital of Bruce County, Ontario, Canada; on Saugeen river, 30 miles from Saugeen (Southampton), and on the Wellington, Grey, and Bruce branch of the Grand Trunk Railway (see map of Ontario, ref. 3-B). It is in an agricultural region, and has three weekly newspapers, important manufactories, an active trade, and a considerable water-power afforded by the river. Pop. (1881) 2,604; (1891) 3,061.

Walkerville: village; Essex County, Ontario, Canada; on the left bank of the Detroit river, opposite Detroit and adjoining Windsor on the N.; and on the Grand Trunk and the Lake Erie and Det. Riv. railways (see map of Ontario, ref. 6-A). It has large distilleries and storage warehouses, the latter containing 4,000,000 gal.

Walking: See GAITS.

Walking-leaf: the *Camptosorus rhizophyllus*, a curious fern found in the northern and middle parts of the U. S. It derives both its common and its scientific name from the peculiarity of propagating by touching the ground with the tips of its leaves, where they take root and give origin to new plants.

Revised by CHARLES E. BESSEY.

Walking-stick: any one of several orthopterous insects, which with their long bodies and protective coloration closely resemble the green or dry twigs among which they live. Their motions are slow, the wings rudimentary or lacking, and they owe their safety from the attacks of enemies to their mimicry of other objects. One common species, *Diapheromera femorata*, which lives on the oak, is about 3 inches in length, but in the tropics there are species 8 or 10 inches long.

J. S. K.

Wallaby [the Australian name]: any kangaroo of the genus *Halmaturus*. Wallabies are of moderate size, ranging up to 50 lb. in weight. The upper incisors of the third pair are comparatively elongate, and have rather narrow crowns and deep grooves, and the premolars are well developed and mostly persistent through life. The wallabies mostly "have a bridle-mark behind the shoulder and a horizontal stripe across the haunch." They are chiefly nocturnal in their habits. The largest species live in Tasmania; the smallest are found in New South Wales and in West Australia.

Revised by F. A. LUCAS.

Wallace, ALFRED RUSSEL, LL.D.: naturalist; b. at Usk, Monmouthshire, England, Jan. 8, 1822; educated at the grammar school of Hertford; was articled to an elder brother as land-surveyor and architect; abandoned that profession to devote himself to natural history; undertook in 1848, with Henry W. Bates, an exploration of Northern Brazil; resided some months at Pará; explored the Amazon and Negro rivers; obtained numerous vocabularies of Indian tribes, and made extensive collections in ornithology and botany, which were mostly lost at sea; returned to

England 1852; published *Travels on the Amazon and Rio Negro, with Remarks on the Vocabularies of the Amazonian Languages* (1853), aided in the linguistic part by Robert G. Latham, and *Palm Trees of the Amazon* (1853); spent eight years in exploring the islands of the East Indies, especially the Moluccas, Celebes, and New Guinea. He arrived, independently of Darwin's researches, at a theory of natural selection, which he embodied in a paper, *On the Tendency of Varieties to depart indefinitely from the Original Type*, read before the Linnean Society July 1, 1858, simultaneously with Darwin's paper *On the Tendency of Species to form Varieties*, etc., being the first public announcement of the so-called Darwinian theory. In 1862 he brought from the East Indies more than 8,000 birds and more than 100,000 entomological specimens; was occupied for several years in the study and classification of his vast collections; published *The Malay Archipelago* (2 vols., 1869) and *Contributions to the Theory of Natural Selection* (1870); was awarded in 1868 the medal of the Royal Society, and in 1870 the gold medal of the Geographical Society of Paris. Wallace has become noted for his investigations of spiritualism, in which he is a believer, as shown by his *Miracles and Modern Spiritualism* (1875). In 1876 he issued, simultaneously in English, French, and German, his work *On the Geographical Distribution of Animals* (2 vols.). In 1880 followed *Island Life*, in 1882 *Land Nationalization*, in 1889 *Darwinism*, and in 1893 *Australia and New Zealand*. He has also published many papers in scientific periodicals. Revised by J. S. KINOSLEY.

Wallace, HORACE BINNEY: author and law editor; b. in Philadelphia, Pa., Feb. 26, 1817; was the youngest son of John Bradford Wallace; studied for two years at the University of Pennsylvania; graduated at Princeton 1835; studied medicine, chemistry, and law, but never adopted a profession; contributed largely to literary periodicals; published anonymously a novel, *Stanley, or the Recollections of a Man of the World* (1838); edited, in conjunction with Judge Hare, *American Leading Cases in Law* (2 vols., 1847; 3d ed. 1852); *Smith's Leading Cases* (4th Amer. ed., 2 vols., 1852); and *White and Tudor's Leading Cases in Equity* (2d Amer. ed., 3 vols., 1852), all copiously annotated; aided Rufus W. Griswold in his *Napoleon and the Marshals of the Empire* (2 vols., 1847); traveled in Europe 1849-50 and again 1852, giving assiduous study to philosophical problems. In a fit of insanity resulting indirectly from overwork he committed suicide in Paris, Dec. 16, 1852. Two posthumous volumes of his miscellaneous writings were published—*Art and Scenery in Europe, with other Papers* (1855) and *Literary Criticisms and other Papers* (1856). Revised by F. STURGES ALLEN.

Wallace, Sir JAMES: naval officer; b. in Great Britain about 1730; became post-captain in the navy 1771; commanded the fleet on the Newport station 1775, and conducted the naval expedition up the Hudson river Oct., 1777, when Kingston was destroyed and several other towns laid waste; was captured in the Experiment by d'Estaing Sept. 24, 1779; commanded the Warrior in Rodney's victory over De Grasse, Apr. 12, 1782; was governor of Newfoundland 1793-95; became rear-admiral 1794, vice-admiral 1795, and rear-admiral of the blue Jan. 1, 1801. D. in London, Mar. 6, 1803.

Wallace, LEWIS: lawyer, soldier, and author; son of David Wallace (1799-1859), jurist; b. at Brookville, Franklin co., Indiana, Apr. 10, 1827; served as lieutenant in the Mexican war, 1846-47; then studied law, which he practiced till Apr., 1861, when he was appointed adjutant-general of Indiana. In three days he organized six regiments—the quota of the State under the first call for troops—and was appointed colonel of the Eleventh Indiana. He served in West Virginia, where he defeated the Confederates at Romney. The regiment re-enlisted on completion of its term, and he continued as its colonel. He was commissioned brigadier-general of volunteers on Sept. 3, and stationed in Kentucky. He commanded a division in the taking of Fort Donelson, Feb. 16, 1862; in recognition of his services on that occasion was appointed major-general of volunteers (Mar. 21). In the succeeding battle of Shiloh (Apr. 6-7) his division was not engaged during the first day's fighting, but on the second day he led the attack and took part in the subsequent advance on Corinth. He saved Cincinnati from capture by Gen. Kirby Smith (Sept., 1862), and was subsequently president of the court to investigate the conduct of Gen. Buell (Nov., 1862). In 1864 he commanded the middle department and Eighth Corps, and by

the desperate battle of Monocacy (July 9) prevented the capture of Washington and Baltimore by Gen. Jubal Early. He was a member of the commission which tried the assassins of President Lincoln, and in the same year president of the commission which tried Capt. Wirz, commandant of Andersonville prison. In 1866 he was sent to Mexico on a secret diplomatic mission to President Juarez; was appointed governor of New Mexico, 1880; and was U. S. minister to Turkey in 1881-85. When not engaged in public service, Gen. Wallace has practiced law, and devoted himself to literature. He published *The Fair God* (Boston, 1873); *Ben-Hur, a Tale of the Christ* (New York, 1880); *The Life of Gen. Benjamin Harrison* (Philadelphia, 1888); *Commodus, a Tragedy* (New York, 1889); *The Boyhood of Christ* (New York, 1889); and *The Prince of India* (New York, 1893). Already a larger number of copies of *Ben-Hur* have been circulated than of any other American romance except *Uncle Tom's Cabin*.—The wife of Gen. Wallace, Mrs. SUSAN ARNOLD (Elston) WALLACE, is an original and graceful writer. Among her published works are *The Storied Sea* (Boston, 1883); *Ginevra, or the Old Oak Chest* (New York, 1886); *The Land of the Pueblos* (1888); and *The Repose in Egypt* (1888). She has also contributed largely to periodicals and reviews. EDWIN A. GROSVENOR.

Wallace, Sir WILLIAM: patriot; b. in Scotland about 1270; younger son of Sir Malcolm Wallace of Elderslie, Renfrewshire. The early part of his life is involved in obscurity; the story of his flight after killing a fellow student in Dundee is doubtful, but it is probable that he had done something to anger the English, and was thus driven to armed resistance. He first appears in authentic history in 1297 as leader of a large band of insurgents against the authority of the English king, Edward I, who claimed the throne of Scotland. Emboldened by the success of several preliminary skirmishes, he attacked the town of Seone, where an English justiciary was holding court, and killed or captured many of the English. Edward thereupon sent into Scotland a considerable force under the command of Sir Henry Percy and Sir Robert Clifford, who successfully repulsed a night attack made by Wallace near Lochnaber, and drove him back into Ayrshire, and received, by a treaty at Irvine, the submission of most of the Scottish leaders. Wallace and Sir Andrew Moray alone refused to lay down their arms, and withdrew to the Northern Highlands, where they organized large forces and captured nearly all the English garrisons in Scotland. Edward I. was at this time in Flanders, but his general, John de Warrenne, Earl of Warrenne and Surrey, who in the previous year had been appointed guardian of Scotland, gathered a powerful army and advanced toward Stirling, whereupon Wallace abandoned the siege and marched against him. After a vain attempt at negotiation, Surrey was completely defeated at Stirling Bridge, Sept. 11, 1297, and pursued to Berwick. Wallace passed the border and ravaged Cumberland and Northumberland. On his return, he was recognized in Scotland as guardian of the realm in the name of John Baliol, then a prisoner in the Tower of London. In the following year Edward proceeded to Scotland with a force numbering, according to Scottish accounts, 80,000 infantry and 7,000 cavalry, and gained over Wallace a decisive victory at Falkirk July 22, by which the English rule in Scotland was re-established. From this time little is known of his career except that he led a wandering life, heading occasional forays against the English, and that he visited France. He took part in the Scottish revolt of 1303, though not in any conspicuous capacity; was declared an outlaw on account of his refusal to respect the treaty between Edward and John Comyn, Earl of Badenoch (1304), large rewards being offered for his capture; was betrayed by Sir John Menteith into the hands of the English near Glasgow early in 1305; was taken to London, tried for treason in Westminster Hall, condemned Aug. 23, 1305, and hanged, drawn, and quartered at West Smithfield on the following day. His head was placed above London Bridge and his limbs sent to Newcastle, Berwick, Perth, and Stirling. See J. Stevenson, *Documents Illustrative of Sir William Wallace* (Maitland Club, 1841); A. Brunton, *Sir William Wallace* (Glasgow, 1881); H. Gough, *Scotland in 1298* (Paisley, 1888); J. Moir, *Sir William Wallace* (Aberdeen, 1888).

Revised by F. M. COLBY.

Wallace, WILLIAM HARVEY LAMB: soldier; b. at Urbana, O., July 8, 1824; removed to Illinois with his father in 1833; studied law, and was admitted to the bar in 1846;

served in the war with Mexico; became district attorney of the ninth Illinois district in 1853; in May, 1861, was appointed colonel Eleventh Illinois Volunteers, and at Fort Donelson (Feb., 1862) commanded a brigade in McClelland's division with ability, and was appointed brigadier-general of volunteers in March. In the succeeding battle of SHELLOH (*q. v.*), Wallace commanded Smith's old division, which withstood for nearly six hours the furious assaults of the enemy, and was the last to leave the field, Wallace falling mortally wounded in an ineffectual attempt to resist the enemy. D. at Savannah, Tenn., Apr. 10, 1862.

Wallaceburg: village and port of entry; Kent County, Ontario, Canada; on the Sydenham river and the Erie and Huron Railway; 14 miles N. W. of Chatham (for location, see map of Ontario, ref. 6-B). It has saw and grist mills, tannery, several hotels, and a weekly and a monthly periodical. Pop. (1881) 1,525; (1891) 2,726.

Wallachia: See **ROMANIA**.

Wallack. JAMES WILLIAM: actor; b. in London, England, Aug. 24, 1795; son of William Wallack, a comedian and vocalist, and of Elizabeth Field, who for several years played leading women characters with Garrick; made his appearance on the London stage at the age of seven years; was engaged by Sheridan at Drury Lane; played with Edmund Kean in Shakspearean dramas; went to the U. S. 1818; appeared as Macbeth at the Park theater, New York, Sept. 7, 1818; became stage manager at Drury Lane 1820; lived alternately in England and the U. S. for several years; opened in 1837 the National theater, New York, burned down in 1839; established in 1852 Wallack's Lyceum, afterward Wallack's theater, on the corner of Broadway and Broome Street, rebuilt in 1861 at the corner of Broadway and Thirtieth Street, and later located at Broadway and Thirtieth Street. The name of this theater was changed to "Palmer's" in 1888. He was a superior comedian and manager, owing much of his success to his care in the selection of competent supporters and to his regard for artistic proprieties in the details of stage costumes and scenery. D. in New York, Dec. 25, 1864.—His son JOHN LESTER, b. in New York, Jan. 1, 1820, known for some time as J. W. Lester, afterward as Lester Wallack, became proprietor of the theater, maintained its reputation, and adapted some French comedies to the American stage. D. at Stamford, Conn., Sept. 6, 1888. See his *Memoirs of Fifty Years* (New York, 1889).
Revised by B. B. VALLENTINE.

Wallaroo': a name given to two species of kangaroos, constituting a section of the genus *Macropus*—viz.: (1) *Macropus antipolius*, the red wallaroo, and (2) *Macropus robustus*, the black wallaroo; the former inhabits the country about Fort Essington, and the latter the mountain ranges of the coast of New South Wales.

Walla Walla: city: capital of Walla Walla co., Wash.; on the Walla Walla river, and the Wash. and Col. River and the Oregon Railway and Nav. Co.'s railways; 75 miles W. S. W. of Lewiston, Id., and 160 miles E. by N. of The Dalles, Or. (for location, see map of Washington, ref. 7-1). It is in an agricultural, fruit-growing, and stock-raising region, and is the trade center of that part of the State, of Northern Idaho, and of Northeastern Oregon. The name is Indian, meaning "many waters," and was applied to the whole valley because of the numerous springs which flow down the sides of the surrounding mountains. The settlement was originally known as Waitatipa; was incorporated as a town and made the county-seat in 1859, and was incorporated as a city in 1862. It contains Methodist Episcopal churches of both the Northern and Southern branches, Baptist church and a mission, two Presbyterian churches, Advent Christian, Congregational, Lutheran, Protestant Episcopal, and Roman Catholic churches, and Salvation Army barracks. The educational institutions comprise the Baker Public School, Paine High School (building cost \$30,000), Advent College, Whitman College (Congregational), Empire Business College, St. Vincent's Academy for girls, and St. Patrick's School for boys. Among the public buildings are those comprising the U. S. military post, Fort Walla Walla, the State penitentiary, and the U. S. penitentiary. The city has excellent water-power, foundry, flour-mills, machine-shops, 2 national banks with combined capital of \$200,000, a State bank with capital of \$50,000, a savings-bank with capital of \$90,000, and 2 daily and 3 weekly newspapers. Pop. (1880) 3,588; (1890) 4,709; (1895) 7,770.

EDITOR OF "STATESMAN."

Wallenstein, raäl len-stin, or Waldstein, räält stin, ALBRECHT WENZEL EUSEBIUS, von; soldier; b. on the family estate of Hermanitz, Bohemia, Sept. 14, 1583; was educated in the Protestant faith, but came after the death of his parents under the guardianship of his uncle, Albrecht von Slavata, who sent him to the Jesuit Academy of Olmütz, where he was converted to Roman Catholicism. After studying at the Universities of Padua and Bologna, and traveling through Italy, Spain, France, and Holland, he served in Hungary against the Turks in the army of the Emperor Rudolf, under Gen. Basta, and married in 1606 an old widow, by whose death in 1614 he inherited very extensive estates in Moravia. On his uncle's death he became proprietor of one of the largest landed estates in Moravia and Bohemia. In 1616 he organized a regiment of dragoons at his own expense, and hastened to the rescue of the city of Gradisca, which was besieged by the Venetians. The emperor now made him a count, and by his marriage with the daughter of Count Harrach he obtained connections and influence at the court of Vienna. When the revolution which opened the Thirty Years' war broke out in Bohemia in 1618, he sided with the emperor, saved the imperial treasury containing a large sum from falling into the hands of the insurgents, equipped a new regiment of dragoons, and when, after the battle of the Weissenberg—in which, however, he was not present—enormous confiscations took place in Bohemia, he bought of the emperor estates to the value of 7,290,228 florins. In 1623 the emperor created him prince, and in the following year hereditary Duke of Friedland. With his success his ambition increased. In 1625, when the Protestant princes of Northern Germany, under the leadership of Christian IV. of Denmark, and in alliance with Bethlen Gabor, of Transylvania, arose against the emperor, Wallenstein offered to organize an army of 50,000 men and lead it according to the orders of the emperor. After some negotiations the offer was accepted, and in an incredibly short time he actually created an effective army of about 40,000 men. Apr. 25, 1626, he defeated Count Mansfeld, one of the most famous generals of the time, at Dessau, and pursued him through Silesia into Hungary, where this part of the war ended with the dissolution of Mansfeld's army and an advantageous peace with Bethlen Gabor. Returning through Silesia, Wallenstein occupied Brandenburg and Pomerania, expelled the refractory Dukes of Mecklenburg, penetrated through Holstein and Schleswig into Jutland, and compelled Christian IV. to conclude peace. In reward the emperor created him Duke of Mecklenburg in 1629. At this moment his career received a severe check. His army, now numbering about 100,000 men, was supported at the expense of the districts in which it was stationed, and the people complained of the burden that this imposed. Moreover, it was seen that he was possessed with an insatiable ambition, and permitted no scruple to stand in the way of its gratification. In Sept., 1630, he was dismissed and his army dissolved. He retired to his estates in Bohemia, where he lived in royal splendor, occupied with the administration of his vast property, with astrological studies, and with schemes of the most daring ambition. When Gustavus Adolphus appeared successful in Germany, Wallenstein proposed to raise an army and attack the emperor in joint operation with him, but the Swedish king had no confidence in him, and dropped the negotiations. Meanwhile, after the defeat of Tilly and the annihilation of his army, when the Saxons invaded Bohemia and the Swedes penetrated into Bavaria, the situation of the emperor became almost desperate, and the reinstatement of Wallenstein in power seemed almost the only means of escape. Wallenstein received the supreme military authority in Germany, the right of appointing his own officers, the rights of confiscation, amnesty, and pardon—even the right of negotiating peace. But two months after his appointment there was a new army ready for battle. In the spring of 1632 the Saxons were expelled from Bohemia, and Wallenstein occupied a strongly fortified position at Nuremberg in front of the army of Gustavus Adolphus. The attempt of the Swedes to dislodge him (Sept. 3) failed. Both the armies moved into Saxony, and on Nov. 16, 1632, the battle of Lützen took place. Gustavus Adolphus fell, but Wallenstein was defeated. He retreated into Bohemia, and here he remained inactive for over a year, in spite of the entreaties and positive orders of the emperor. He opened negotiations with the Swedes, the Saxon princes, and Richelieu. His plan was by an alliance with these powers to compel the emperor to accept such a peace as they would grant him, and the special goal of his

personal ambition seems to have been the acquisition of the Bohemian crown. At last his intrigues became known to the emperor, who placed Count Gallas in command of the army, and afterward declared Wallenstein a traitor. On Feb. 23, 1634, he fled from his headquarters at Pilsen to seek rescue and support by the Swedish corps which approached under Duke Bernhard, but two days afterward he was assassinated at Eger by some of his officers. His *Lectures* have been published by F. Förster in 3 vols. (1828-29), and monographs on his life and character have been written by Förster (1834 and 1844), Aretin (1846), Hurter (1855), Dudik (1858), Fiedler (1860), Ranke (1869), Gindely (1886), and Meyer (1886). See also Schmid, *Die Wallenstein Literatur* (1878), Schiller's trilogy (*Wallensteins Lager, Die Piccolomini, and Wallensteins Tod*), and the article THIRTY YEARS' WAR.

Revised by F. M. COLBY.

Waller, EDMUND: poet; b. at Coleshill, Hertfordshire, England, Mar. 3, 1606, of an ancient and wealthy family; was first cousin, through his mother, of John Hampden, and distantly related to Cromwell; educated at Eton and at King's College, Cambridge; inherited in boyhood an estate of £3,500 a year; was chosen to Parliament for Agmondesham at the age of nineteen, on the accession of Charles I. (1625), and sat in that body much of the time for sixty years; married in 1631 a London heiress, who soon died; became noted as a writer of elegant and rhythmical verses, most of which were in praise of Sacharissa (Lady Dorothy Sidney) and Amoret (Lady Sophia Murray), to whom he unsuccessfully paid court; married Miss Mary Bresse, by whom he had thirteen children; was appointed after the battle of Edgehill (1642) one of the Parliamentary commissioners to negotiate with the king at Oxford; was gained over by the royalists, and entered into a conspiracy known as "Waller's plot" for the restoration of royal authority; but the plot having been discovered May 31, 1643, he was imprisoned for a year, fined £10,000, and banished the kingdom, only saving his life by abject humiliation before the House of Commons, confessing his guilt and incriminating his companions, three of whom were hanged; spent eight years of exile in France and Italy; was allowed to return about 1653, when he became a favorite with Cromwell, who several times visited his mother (a determined royalist) at Beaconsfield, where Waller now took up his abode. Waller was commonly regarded in the eighteenth century as the first correct versifier, who used the heroic couplet with the smoothness and balance which Dryden and Pope brought to a degree of mechanical regularity. (See *From Shakespeare to Pope*, by Edmund Gosse, London, 1885.) He was a general favorite with all parties on account of his wit and eminent social qualities; published a volume of his poems in 1645, and again in 1664, which ran through many editions. D. at Beaconsfield, Oct. 21, 1687. Of the twenty-five or more editions of his poems, the most valued are that of 1711, edited by Bishop Atterbury, and containing two portraits of the poet, and that of 1729, with a *Life* by Fenton and a portrait by Vertue. There are modern *Lives* by Bell (1853) and Gilfillan (1857), accompanying editions of the *Poems*.

Revised by H. A. BEERS.

Waller, THOMAS McDONALD: lawyer; b. in New York about 1840. Left an orphan in childhood, he became a newsboy; was adopted by a citizen of New London, Conn., whose name he assumed; studied law and was admitted to the bar in 1861; was in the Connecticut Legislature in 1867, 1868, 1872, and 1876, and was speaker in his last term; became Secretary of State in 1870 and mayor of New London in 1873, and was State Attorney in 1876-82. In the latter year he was elected Governor of Connecticut as a Democrat; in 1885 he was appointed U. S. consul-general in London, England, and on the expiration of his term he resumed professional practice.

Waller, Sir WILLIAM: general; b. in Kent, England, in 1597; educated at Magdalen College and Hart Hall, Oxford, and at Paris; served in Germany during the early part of the Thirty Years' war; and on the outbreak of the civil war in England was appointed general and second in command of the Parliamentary forces under the Earl of Essex (1642). He was defeated by the royalists at Lansdowne, near Bath, July 5, 1643, and again at Roundway Down, near Devizes, July 13, but gained a signal victory at Cheriton (or Cherrytown) Down, Alresford, near Winchester, Mar. 29, 1644; was defeated by Charles I. in person at Cropredy Bridge, near Banbury, Oxfordshire, July 29; was deprived of his military command by the "Self-denying Ordinance" Apr., 1645, but

continued to be a leader of the Presbyterians in Parliament; was one of the eleven members of Parliament who were impeached of high treason by the army June, 1647, and expelled and twice imprisoned, but was soon readmitted to his seat; was a second time expelled, together with all the Presbyterians, by Col. Pride, Dec., 1648; remained in retirement until the Restoration, when he sat as a member of the council of state Feb., 1660, and of the Convention Parliament Apr. to Dec., 1660. D. at Osterley Park, Middlesex, Sept. 19, 1688. He left in MS. a *Judication*, published in 1793, and *Divine Meditations*, printed in 1680.

Wall-flower: the *Cheiranthus cheiri*, a European half-shrubby cruciferous plant, often growing on old walls, whence the name. It is a popular garden-flower, having blossoms single or double, of varied colors, and of a rich fragrance. The Western wall-flower, or "yellow phlox" of the U. S., is *Erysimum asperum*, a fine cruciferous plant.

Wallich, NATHANIEL, M. D.: botanist; b. at Copenhagen, Denmark, Jan. 28, 1786; studied medicine; went to India 1807 in the employment of the Danish Government at Serampore; devoted himself to botany, and after the transfer of the Danish possessions to England transferred his services to the East India Company, and was superintendent of the Calcutta botanic garden from 1815 to 1846, when he returned to Europe and settled in London; vice-president of the Linnean Society 1849. He contributed to the *Transactions of the Asiatic Society of Calcutta* and of the Linnean Society, and to Hooker's *Journal of Botany*; added a supplement to Roxbury and Carey's *Flora Indica* (3 vols., 1832); author of *Tentamen Florae Nepalensis Illustratae* (Calcutta and Serampore, 1824-26); *A Numerical List of Dried Specimens of Plants in the East India Company's Museum* (1828); and *Plantae Asiaticae Rariores* (3 vols., 1830-32), with 300 colored plates. D. in London, Apr. 28, 1854.

Revised by CHARLES E. BESSEY.

Wallin, våal-leen', JOHAN OLOF: poet; b. in Dalarna, Sweden, Oct. 15, 1779. The son of a poor peasant, his early life was full of hardships. In 1815 his poetical genius, which had developed early, first won general recognition in the didactic poem *Uppfostraren* (The Educator), which received the highest prize of the Academy. Of special interest is his dithyrambic poem to Washington, which is permeated with a warm love for liberty. During the latter part of his life he confined himself wholly to the composition of sacred poetry. To the Swedish hymnal, which was published under his direction (1819), he contributed over a hundred original hymns, besides revising and translating a number of others. He richly deserves the title, conferred on him by Tegnér, of David's Harp of the North. After filling several important positions in the Swedish Church he was consecrated Archbishop of Upsala (1837). D. June 30, 1839. D. K. DODGE.

Wallingford: town (named in 1670); New Haven co., Conn.; on the Quinnipiac river, and the N. Y., N. H. and Hart. Railroad; 12 miles N. of New Haven, 23 miles S. of Hartford (for location, see map of Connecticut, ref. 10-G). It contains the borough of Wallingford and the villages of East Wallingford and Yalesville. The streets of the borough are wide and laid out regularly, many of them lined with stately elms. There are 5 churches, a national bank with capital of \$150,000, a savings-bank, and a weekly newspaper. The town has a private and 11 public schools, a grand list of \$3,191,959, public debt of \$75,000, and rate of taxation, 7 mills. The borough has a grand list of about \$2,500,000, a water-works debt of \$169,500, other debts \$74,320, and rate of taxation, 5 mills. The village of Yalesville, in the north-west part of the town, is on the Quinnipiac river, the N. Y., N. H. and Hart. Railroad, and an electric railway connecting Wallingford borough with Meriden; has 3 churches, and is engaged in the manufacture of piano-stools, augers, edge-tools, and ironware. Wallingford borough is noted for its manufactures of britanna, nickel, sterling silver, silver-plated, and light brass goods, rubber goods, wheels, and ironware. A branch of the ONEIDA COMMUNITY (*q. v.*) was established here in 1850. The State Masonic Home is now established on the old community property. Pop. (1880) town, 4,686, borough, 3,017; (1890) town, 6,584, borough, 4,230.

W. S. RUSSELL, M. D.

Wallingford: town; Rutland co., Vt.; on the Otter creek, and the Bennington and Rutland Railway; 9 miles S. of Rutland, 59 miles S. W. of Montpelier (for location, see map of Vermont, ref. 7-B). It contains the villages of Wallingford, East Wallingford, and South Wallingford, and has

a public high school, several district schools, 4 churches, and 2 hotels. There are manufacturers of collars and caskets, harness, ox-bows, snow-shovels, stoves, tinware, and hay and manure forks. Pop. (1880) 1,846; (1890) 1,733.

Wallis: See VALAIS.

Wallis, JOHN, D. D., F. R. S.: mathematician; b. at Ashford, Kent, England, Nov. 23, 1616; graduated at Cambridge about 1636; became a fellow of Queen's College; took orders in the Church of England 1640; was secretary to the Westminster Assembly of Divines 1644; became Savilian Professor of Geometry at Oxford 1648, and keeper of the archives at Oxford 1658; was one of the founders of the Royal Society 1662; had a controversy with Hobbes, who pretended to have discovered the quadrature of the circle 1655-63; was one of the revisers of the Book of Common Prayer 1661. D. at Oxford, Oct. 28, 1703. He was the author of *Grammatica Lingue Anglicane* (Oxford, 1653; 6th ed. 1765); *Mathesis Universalis* (1657); *Institutio Logicæ ad Communem Usus accommodata* (1687; 5th ed. 1729); and other works, collectively published as *Opera Mathematica et Miscellanea* (Oxford, 3 vols. folio, 1695-99).

Revised by S. M. JACKSON.

Wallkill River: a river which rises in Sussex co., N. J., and flows N. N. E. through Orange and Ulster cos., N. Y., joining the Rondout. It furnishes considerable water-power. The Wallkill valley is a famous dairy region.

Wallon, wā'lōn', HENRI ALEXANDRE: historian and statesman; b. at Valenciennes, France, Dec. 23, 1812; was educated in the Normal School of Paris, and became Professor of Modern History and Geography at the Sorbonne in 1840; was elected a member of the Legislative Assembly of 1849, but resigned his seat in 1850 on account of restrictions under which the Assembly placed the suffrage; was again elected a member of the National Assembly of 1871, and contributed much to the final establishment of the republic by the famous *amendement Wallon*, which was carried by a majority of one vote Jan. 30, 1875; became Minister of Public Education in 1875, and member of the Senate in 1876. Among his works are *De l'Esclavage dans les Colonies* (1847); *Histoire de l'Esclavage dans l'Antiquité* (3 vols., 1847-48); *Jeanne d'Arc* (2 vols., 1860); *La Vie de Jésus et son nouvel Historien* (1864), against Renan; *Richard II., Episode de la Rivalité de la France et de l'Angleterre* (2 vols., 1864); *La Terreur, Études critiques sur l'Histoire de la Révolution française* (1872); *Saint Louis et son Temps* (1875); *Histoire du Tribunal révolutionnaire de Paris avec le Journal de ses actes* (1880); and *Les Représentants du peuple en mission, etc.*, 1793-94 (1888-90).

Revised by F. M. COLBY.

Walloons' [from O. Fr. *Wallon. Gualon* (Dutch, *Walen*); cf. Lat. *Gallus*]: the people occupying the tract along the German speech-boundary in the Southern Netherlands, from Dunkirk (Dünkirchen) to Malmédy, more especially in the Ardennes, parts of the French departments of Pas-de-Calais, Nord, and Aisne, Southern Brabant, Hainault, Namur, Liège, Luxembourg (except the German eastern part), and some places around Malmédy in Rhenish Prussia. These people, belonging to the great Gallo-Romanic stock—about 2,250,000 in BELGIUM (*q. v.*)—are descended from the old Gallic Belgæ (with a considerable admixture of Teutons), who in the forests of the Ardennes resisted the barbarous onslaughts of the Germans, mixed themselves with Roman elements, their language becoming Romanized to such an extent that it appears now completely as a French dialect (patois), containing, however, more Germanic and Gallic elements than any other French dialect. Though closely akin to their Gallo-Roman neighbors in France, and though French is the conversational and literary language of the educated Walloons, they have many distinctive traits of their own; they are persevering, patient, and industrious, but at the same time excitable and passionate; the Belgian revolution and the separation of Belgium from Holland is pre-eminently their work. They form the leading element in Belgium, the leading statesmen and men of mark belonging to their nationality. Against this prestige of the Walloons with their French sympathies there is a strong antagonism among the Flemish population, which belongs to the Low German stock; the Flemish movement since 1840 has struggled with success against the suppression of the Flemish language and nationality and its submersion in the French spirit. The first permanent colony that settled in New York and also the first in Brooklyn consisted largely of Walloons.

See Grandgagnage, *De l'origine des Wallons* (Liège, 1852); *Dictionnaire étymologique de la langue wallonne* (Liège, 1847-50, continued by Scheler, Brussels, 1880); J. Sigart, *Dictionnaire du Wallon de Mons* (Brussels, 1870); Forir, *Dictionnaire Liégeois-Français* (2 vols., Liège, 1866-74).
HERMANN SCHOENFELD.

Wall-papers: See PAPER-HANGINGS.

Wall-pepper, or **Stonecrop**: a creeping plant (*Sedum acre*) with small, fleshy, acid-tasting leaves, and yellow, five-petaled flowers, belonging to the family *Crassulaceæ*. It is related to the live-forever (*S. telephium*), house-leek (*Sempervivum tectorum*), *Echeveria*, *Bryophyllum*, and other common succulent plants of conservatories. C. E. B.

Wallsend' [so called from being at the end of Hadrian's wall]: town of England, county of Northumberland; 4 miles N. E. of Newcastle (see map of England, ref. 3-II). It is famous for the excellent coal which is raised in its collieries. Pop. (1891) 11,620.

Walnut [O. Eng. *wealh-hnutu*; *wealh*, foreign + *hnutu*, nut. See WALES]: the common name of trees of the genus *Juglans* (family *Juglandaceæ*), and also of their fruit. In some localities the name is locally extended to the hickories, which are of an allied genus. The English walnut or madeira-nut is the fruit of *Juglans regia*, a stately tree producing excellent timber. The nuts are very good eating, and the kernels yield a fixed drying oil prized by artists and makers of varnishes. In the eastern parts of the U. S. grows the black walnut, *J. nigra*, which yields a very valuable dark-colored timber, used for furniture, joinery, gunstocks, etc. The black walnut produces a strong and very oily nut. The butternut, *J. cinerea*, called also oilnut and white walnut, produces a useful timber. Its nuts are more prized than those of the black walnut, and its inspissated sap, or a decoction of the bark of the root, is a useful cathartic. The Japanese walnut, *J. sieboldiana*, now frequently planted, bears its fruit in long clusters.

Revised by L. H. BAILEY.

Walnut Family: the *Juglandaceæ*, a very small group (thirty-five species) of dicotyledonous trees with monoecious, apetalous flowers, the staminate in catkins, and usually with many stamens, the pistillate usually solitary with a single, inferior, bicarpellary, one-celled ovary, containing a single, erect, orthotropous ovule. The leaves are alternate and pinnately compound, and the young shoots and foliage are usually strong-scented or resinous-aromatic. They are found principally in the northern temperate zone, being about equally divided between North America and Asia. The family is important as yielding valuable timber and edible nuts, the important genera being *Juglans* (the walnuts, of seven or eight species) and *Hicoria* or *Carya* (the hickories, of about ten species, all of North America).

CHARLES E. BESSEY.

Walpole: town (incorporated in 1724); Norfolk co., Mass.; on the N. Y. and New Eng. and the N. Y., N. H. and Hart. railways; 8 miles S. E. of Dedham, 19 miles S. W. of Boston (for location, see map of Massachusetts, ref. 5-I). It contains the villages of Walpole, East Walpole, and South Walpole; has a high school, 13 district schools, public library, 2 weekly newspapers, and 6 churches; and is principally engaged in the manufacture of paper, binder's board, seersucker, clothing, and school furniture. In 1894 the town had an assessed valuation of over \$2,000,000. Pop. (1880) 2,494; (1890) 2,604; (1895) 2,994.

Walpole: town (founded about 1745, site granted by Massachusetts in 1735 and by New Hampshire in 1752); Cheshire co., N. H.; on the Connecticut river, and the Fitchburg Railroad; 4 miles below Bellows Falls, 20 miles N. W. of Keene (see map of New Hampshire, ref. 9-C). It is in an agricultural region, is a noted summer resort, and has 5 churches, a high school, 5 graded schools, 16 district schools, a public library with 5,000 volumes, and a weekly newspaper. Pop. (1880) 2,018; (1890) 2,163; (1895) estimated, 2,200.

EDITOR OF "GAZETTE."

Walpole, HORACE, Fourth Earl of Orford: author; third son of Sir Robert Walpole; b. in London, England, Oct. 5, 1717; educated at Eton and at King's College, Cambridge; received from his father several lucrative sinecures; traveled on the Continent 1739-41, accompanied by the poet Gray, with whom he quarreled at Reggio; had a seat in Parliament 1741-68, but took little part in politics; purchased an estate near Twickenham 1747; was occupied for many years in the erection and decoration of a strange, irregular Gothic

mansion, which he called Strawberry Hill and which he filled with a library and a museum of pictures, armor, antiquities, and miscellaneous objects; set up a private press in 1757, on which, among others, he printed several of his own works; succeeded his nephew as Fourth Earl of Orford 1791, but never took his seat in the House of Lords. D. in London, Mar. 2, 1797. He was never married. He compiled *A Catalogue of the Royal and Noble Authors of England* (1758); *Anecdotes of Painters in England* (1761-71); *Historic Doubts on the Life and Reign of Richard III.* (1768), and other works; wrote *The Castle of Otranto*, a romance (1764); *The Mysterious Mother*, a tragedy (1768); *Memoirs of the Last Ten Years of the Reign of George II.* (1822), and other works, but will be best remembered by his voluminous and interesting letters. His *Entire Correspondence* (9 vols., 1857-59) was edited by Peter Cunningham. See the *Memoirs* edited by Warburton (1852), and Dobson's *Horace Walpole* (1890).

Walpole, Sir ROBERT, Earl of Orford: premier; b. at Houghton, Norfolk, England, Aug. 26, 1676; educated at Eton and at King's College, Cambridge; was elected to Parliament for Castle Rising 1701, and for King's Lynn 1702; became Secretary at War 1708, and Treasurer of the Navy 1709. Failing to prevent the proceedings against Dr. Sacheverell in 1710, he acted with his fellow Whigs, and was one of the managers for the House of Commons at the impeachment. On the overthrow of the ministry he showed great energy in opposition, and incurred the hatred of the majority in the House. He was found guilty of "a high breach of trust and notorious corruption"; was expelled the House and sent to the Tower Jan. 17, 1712, the condemnation being due to partisan animosity. He was soon released and on the accession of George I. became privy counselor, and afterward paymaster-general of the forces. On the impeachment of Bolingbroke and the late Tory ministers through his efforts, he became Chancellor of the Exchequer and First Lord of the Treasury, with the rank of Prime Minister, Oct. 11, 1715; resigned office in consequence of disunion in the cabinet in Apr., 1717; was the determined enemy of the South Sea scheme; became again paymaster-general in 1720; returned to power as Prime Minister and First Lord of the Treasury in Apr., 1721, and was the virtual ruler of England for the ensuing twenty-one years. During his ministry Great Britain was kept free from foreign complications. Peace and sound finance were the chief aims of his administration. There is no doubt that he was not above the lax morality of the time in the matter of bribe-giving, and that he sometimes maintained his power by this means, but the popular impression of the extent of his personal corruptions was greatly exaggerated. In 1733 he suffered a severe check in his attempt to pass the Excise Bill, and after the death of Queen Caroline his influence began to decline. His fall from power was hastened by his peaceful foreign policy, which provoked sharp attacks by Pitt and the Grenvilles, and lost him the favor of the people. He resigned in Feb., 1742, having been created Earl of Orford two days before. D. at Houghton, Mar. 18, 1745. F. M. COLBY.

Walpole, SPENCER: historian; b. Feb. 6, 1809; was educated at Eton; was appointed inspector of fisheries in 1867, lieutenant-governor of the Isle of Man in 1882, and secretary to the post-office in 1893. The most important of his works is *A History of England from the Conclusion of the Great War in 1815* (1878-86). Among his other works are *The Electorate and the Legislature* (1881); *Life of Lord John Russell* (1889); and *The Land of Home Rule* (1893).

Walpurgis (zaal-poor'gis) Night: the evening before May 1, the vigil of the old festival of St. Walpurgis (Walpurga, Walburga; French forms, Gualbourg, Falbourg, Vaubourg, and Avongour), who died Feb. 25, 779, and is commemorated on that day in some places, but generally on May 1. She was an Englishwoman of the royal blood of Wessex, b. in Sussex, educated at Winburn, Dorset, where she was a nun for twenty-seven years. She then went to Bishofsheim in the diocese of Mentz and established a nunnery (752); after two years (754) she removed to Heidenheim in Bavaria, and became abbess of the Benedictine nunnery of Heidenheim, where was a monastery under her brother, Winebald, in her other brother's (Willibald) diocese. In 760 Winebald died, whereupon she became superintendent, and retained the charge of both monks and nuns until her death. She had a great reputation for sanctity. Her relics were put in a cave at Eichstädt, from which exuded a kind of bituminous oil. This soon got the name

Walpurgis oil, and was supposed to have miraculous properties. The cave became a place of pilgrimage. Walpurgis Night is celebrated as the season of the supposed annual celebration of the "witches's sabbath" on the Brocken in the Harz Mountains. St. Walpurgis had no connection with this ancient superstition, except a partly accidental one. In fact, the old May-day festival was a heathen one, like that of midsummer (which became the feast of St. John), and the traditions with regard to Walpurgis Night have a dim reference to the old heathen practices. The life of St. Walpurgis, written in the ninth century, by Wolfhard, is found in *Acta Sanctorum, O. B.*, ed. Mabillon, iii., 2, 260, seq. See HALLOWEEN. Revised by S. M. JACKSON.

Walrus [from Norweg. *walros*, liter., whale horse; *hval*, whale (: Eng. *whale*) + *ros*, horse (: Eng. *horse*)]; the morse, sea-horse, or sea-cow; a pinniped of the family *Odobenidae*, distinguished by having the upper canines developed as large tusks which point downward. There are two species—one (*Odobenus rosmarus*) inhabiting the northern Atlantic, and the other (*O. obesus*) the northern Pacific. The species attain a large size, old males sometimes reaching, or even exceeding, 12 or 13 feet in length, and their girth is nearly as great; they are therefore very obese, and consequently inefficient on land, but in water their movements are easy and not ungraceful. They swim entirely under water, rising only occasionally to breathe, when they blow somewhat like a whale. The females are smaller than the males, and have much smaller tusks. They feed chiefly upon shellfish—clams, mussels, etc., but also on the bulbous roots of plants which grow in the lagoons and bays. It is chiefly by means of their tusks that they unearth the clams and drag them from their holes. The walrus was first pursued by the Norwegians along the coast of Finnmark, then about the shores of Nova Zembla, finally around Spitzbergen and the adjacent islands, where walruses are still found in limited numbers. The fishery is also prosecuted along the coast of Greenland, and as far to the northward as the animals are

The walrus.

to be found. From 1600 to about 1770 the Magdalen islands and other places in the Gulf of St. Lawrence yielded vast numbers of walruses, as many as 1,500 having been killed on one drive, but it has been many years since a walrus has been seen, even on the coast of Labrador. In the Pacific the hunting-grounds are in Bering Sea and the Arctic Ocean, especially on the Asiatic side. The Atlantic walrus-fishery was originally prosecuted from small vessels, and the animals were mostly killed on shore with lances or by shooting; by the Norwegians they were also taken with harpoons from large boats. Vast herds of walruses are no longer found, and at present the walrus-fishery is carried on as a mere adjunct to the whale-fishery, and the animals are either taken with harpoons or shot with rifles while on the ice. This latter method is that almost exclusively followed in the Pacific, where a large share of the walruses taken are killed while the whalers are waiting an opportunity to get north. One or two men, armed with rifles, are landed near a small herd, and it is not uncommon for a skillful hunter to kill from forty to eighty in succession. Walrus-blubber makes a good quality of oil, the tusks are largely used in the manufacture of umbrella-handles, and the hides also are an article of commerce. The walruses, especially those of the Pacific coast, are threatened with extinction. See ODOBENIDÆ. F. A. LUCAS.

Wal'sall: town; in Staffordshire, England; 8 miles N. N. W. of Birmingham (see map of England, ref. 9-G). It stands on the border of the South Staffordshire coal-field, and has large brass and iron foundries, and manufactures of cutlery and hardware. Its tanneries, malt-houses, and manufactures of harness and saddlery are also extensive. Walsall returns one member to Parliament. Pop. (1891) 71,791.

Walsh, ROBERT: journalist; b. at Baltimore, Md., in 1784; educated in the Roman Catholic college at Baltimore and the Jesuit college at Georgetown, D. C.; spent several years in Europe, returning 1809; studied law, but abandoned the profession; became a writer for *Dennie's Portfolio*; published *A Letter on the Genius and Disposition of the French Government, including a View of the Taxation of the French Empire* (1810), which in six weeks ran through twelve editions in London; conducted from 1811 to 1813 the first quarterly attempted in America, *The American Review of History and Politics*, in which most of the articles were from his pen; issued *Correspondence respecting Russia between R. G. Harper and Robert Walsh, Jr.* (1813), and an *Essay on the Future State of Europe* (1813); wrote biographical prefaces to an edition of the English poets in fifty small volumes, and *An Appeal from the Judgments of Great Britain respecting the United States of America* (1819); conducted *The American Register* (1817-18); *The Museum of Foreign Literature and Science* (1 vol., 1822); *The American Quarterly Review* (22 vols., 1827-37); and *The National Gazette* (1821-37); and published *Didactics: Social, Literary, and Political* (2 vols., 1836), a selection of aphorisms from his newspaper articles and MSS. In 1837 he removed to Paris, where he was U. S. consul during 1845-51, and where he resided until his death Feb. 7, 1859.

Walsh, WILLIAM PAKENHAM, D. D.: prelate; b. at Mote Park, County of Roscommon, Ireland, May 4, 1820; had a brilliant career at Trinity College, Dublin; became canon of Christ church, Dublin, 1872; dean of Cashel 1873; and Bishop of Ossory, Ferns, and Leighlin 1878. He has written several books, among them *Christian Missions* (Dublin, 1862); *Heroes of the Mission Field* (London, 1879; 2d ed. 1882); *Modern Heroes of the Mission Fields* (1880; 3d ed. 1888); *Voices of the Psalms* (1889). S. M. J.

Walsingham, Sir FRANCIS: one of Queen Elizabeth's principal Secretaries of State; b. at Chislehurst, Kent, England, about 1536; studied at King's College, Cambridge; traveled on the Continent, and remained there during the reign of Mary; acquired the favor of Cecil, Lord Burleigh, by his political abilities and his knowledge of foreign languages; was sent three times on missions to the court of France, where he resided 1570-73; was on Cecil's recommendation knighted, sworn of the privy council, and made one of the principal Secretaries of State 1573; was sent on important embassies to the Netherlands 1578, to France 1581, and to Scotland 1583; was a man of strict morals and undoubted integrity, addicted to religious meditation and to the Puritanic party in the state, but displayed as a statesman a consummate craftiness, bordering on duplicity; was said to have had in his pay in foreign countries many agents and spies, through whom he was quickly informed of the secrets even of hostile courts; was an uncompromising political adversary, if not a personal enemy, of Mary Queen of Scots, whom for years he surrounded with spies and informers, who endeavored to inveigle her into real or pretended plots and conspiracies in order to intercept her letters; had in his pay a servant of the French ambassador, Castelnau, and Gray, the envoy of the Duke of Guise to the Scottish court, who was employed in managing the correspondence of Mary and James with their friends in France, thus discovering the so-called "Babington's plot" 1586; was a member of the commission for the trial of the Queen of Scots at Fotheringay Oct., 1586; was charged by her with having forged the correspondence produced against her—a charge which he of course solemnly denied. About this time he was made Chancellor of the Duchy of Lancaster, and soon afterward withdrew from the management of public affairs. He received but a scanty pecuniary reward for his services, and was in debt at the time of his death, which occurred at Barn Elms, near London, Apr. 6, 1590. He was buried in St. Paul's Cathedral. A tolerably full account of Walsingham's French embassy (1570-73) is given in Sir Dudley Digges's *Compleat Ambassador* (folio, 1655). He was the chief patron of Richard Hakluyt in his enterprise of collecting and publishing the voyages and discoveries of the sixteenth century. Revised by F. M. COLBY.

Walter, JOHN: journalist; b. in England in 1739; became a printer in London; bought in 1780 two patents issued to Henry Johnson for logography, or the art of using entire words, their radices, and terminations, instead of single letters, in arranging and composing for printing; endeavored to introduce that invention by the establishment of a newspaper, *The London Daily Universal Register*, of which the first number appeared Jan. 18, 1785. Though the system of printing proved a comparative failure, the newspaper itself prospered, especially after a change of title was made to *The Times* (Jan. 1, 1788), and it gradually rose to the rank it now holds as one of the leading periodicals of the world. Mr. Walter acquired a considerable fortune. D. at Teddington, Middlesex, Nov. 16, 1812. His son John (1784-1847) and his grandson John (1818-94) in turn succeeded to the proprietorship of *The Times*.

Walter, THOMAS USTICK, LL. D.: architect; b. in Philadelphia, Pa., Sept. 4, 1804; became Professor of Architecture in the Franklin Institute, Philadelphia; designed the Philadelphia county prison 1831, Girard College 1833, the U. S. Capitol extension 1851-65, Treasury building and Government hospital for the insane at Washington. As engineer he designed a breakwater at La Guyra, on the coast of Venezuela, and as consulting architect he was employed upon the public buildings at Philadelphia. He was one of the founders of the American Institute of Architects, and president for some years before his death. D. in Philadelphia, Oct. 30, 1887.

Walterboro: town (founded about 1800); capital of Colleton co., S. C.; on the Charleston and Savannah Railway (Plank system); 30 miles W. of Charleston (for location, see map of South Carolina, ref. 7-E). It is in an agricultural region; has Baptist, Methodist Episcopal, Presbyterian, and Protestant Episcopal churches, a graded school, a State bank with capital of \$25,000, a loan and savings bank, and two weekly newspapers; and has large naval stores and lumbering interests, dry-kiln and planing-mills, and cotton-mills. Pop. (1880) 691; (1890) 1,171; (1895) estimated, 1,500.

EDITOR OF "PRESS AND STANDARD."

Waltham: city (set off from Watertown and incorporated as a town in 1737; chartered as a city in 1884); Middlesex co., Mass.; on both sides of the Charles river, and on the Boston and Maine and the Fitchburg railways; 10 miles W. of Boston (for location, see map of Massachusetts, ref. 2-H). It is connected by electric railways with Newton and Boston; is compactly built, with two principal streets, a common in the central part, and a fine park in process of construction on the west of the city. There are thirteen churches, representing the Baptist, Roman Catholic, Universalist, Protestant Episcopal, Methodist Episcopal, Presbyterian, Unitarian, Swedenborgian, and Congregational denominations; 57 public day-schools and 3 evening-schools, with an enrollment of 3,328, maintained at an annual cost of \$61,255; a parochial school with 1,000 pupils, a Swedenborgian school with 70 pupils, a free public library of 23,000 volumes, a weekly and 3 daily newspapers, and a hospital supported in part by the city. The Massachusetts School for the Feeble-minded is here. Waltham's assessed valuation is \$18,766,060; debt, \$1,026,508. In 1895 there were a national bank with capital of \$150,000, and a savings-bank with deposits of \$2,689,232. There are two watch-making works, one, the American Waltham, in which the manufacture of watch-movements on a large scale by machinery was first attempted, being probably the largest in the world; a cotton-mill, erected in 1814, with bleachery and dye-works attached, in which cotton cloths were first made in the U. S. from the raw fiber under one roof; and ten other manufacturing corporations. Pop. (1880) 11,712; (1890) 18,707; (1895) 20,876. W. R. BUTLER.

Waltham Abbey, or Waltham Holy Cross: town of Essex, England; on the river Lea; 13 miles N. by E. of London. It has Government powder mills, and Enfield, where the royal small-arms factories are situated, is in the immediate vicinity of the town. The town took its name from the ancient monastery founded here by Harold Harefoot. Pop. (1891) 6,066.

Walther, CARL FERDINAND WILHELM, D. D.: theologian; leader of the large body of so-called Missouri Lutherans; b. in Langenchursdorf, Saxony, Oct. 25, 1811; the son, grandson, and great-grandson of Lutheran pastors; studied at Leipzig; pastor at Bräunsdorf, Saxony, 1837; emigrated with a colony of six clergymen and 800 people to America

in Jan., 1839, settling first in Perry co., Mo., and becoming pastor in St. Louis 1841. He founded *Der Lutheraner*, 1844, to which was added in 1855 the theological journal *Lehre und Wehre*; in 1846 he organized the Missouri Synod, which numbered in 1895 344,000 communicants; and was professor in the Theological Seminary at St. Louis from its founding in 1850 until his death, May 7, 1887. His later years were marked by a controversy on predestination that divided the Synodical Conference of the Lutheran Church, in which he was charged with holding Calvinistic principles, a charge which he denied, and which could not be reconciled with the doctrine of the universality of redemption that he taught. Among his works are *Kirche und Amt* (Erlangen, 1852; 3d ed. 1875); *American Lutheran Pastoral Theology* (1872); and numerous volumes of sermons. See biography (*Lebensbild*), by his colleague Martin Günther (St. Louis, 1890); also Brömel, *Homiletische Charakterbilder* (Leipzig, 1874).

HENRY E. JACOBS.

Walther von der Vogelweide, wäl ter-fön-där-fö'gel-rī-de; poet and minnesinger; b. about 1170, probably in Austria. He came from a noble but poor family, and learned the art of poetry in Austria, presumably from Reinmar der Alte, the famous minnesinger at the court of Vienna. Walther seems to have remained at Vienna until after the death of Duke Frederick I. in 1198. In Sept., 1197, Emperor Henry VI. had died, and a time of great political confusion ensued. Walther wandered from court to court through various parts of Germany, singing his beautiful love-songs and stirring up the conscience of the nation by his political poems. Despite the prominent part which Walther played in art and politics, he remained a poor wandering minstrel, gaining his livelihood by the favor of his patrons, until finally, in 1220, Emperor Frederick II. granted him a small property, probably near Würzburg. In 1227, when the emperor contemplated his long-delayed crusade, Walther composed his famous *Kreuzlied*, but did not personally participate in the expedition of 1228. He died probably in the same year, and presumably at Würzburg, where a stone is pointed out in the Laurence Garden of the Neumünster as marking his grave. The contemporaries of Walther all praise his greatness, and his fame as the foremost of the mediæval German lyrics has steadily increased. In his poetry, as preserved in the best manuscripts, we may distinguish three periods. During the first of these he shows the influence of Reinmar der Alte; like him, Walther is fond of analyzing his feelings and giving his subjective reflections, though gifted with a far deeper feeling for nature than his teacher. It is, however, a proof of his greatness as a man and as a poet that he felt the unnatural and even immoral basis upon which the artistic minnesong of Reinmar and his predecessors was built, and openly in his songs opposed it. With this strong and manly protest begins the second period in Walther's poetic development. He attacks his former teacher and model, parodies the latter's poems, and ridicules their sentimentality. But Walther was not only a severe critic of his degenerated times; he was also one of its leaders, who in the depth of his soul had discovered new paths which he was eager to point out to his fellow men. Thus matured and in full possession of his great gifts he entered the third and most important period of his life. In order to comprehend the power of his ethical feeling one must study his so-called *Sprüche*, didactic poems which he developed to classic perfection. These are mostly political and religious, and convey the convictions of a true patriot and a Christian of broad human feelings. No man before Luther attacked the pope and the Roman clergy as fearlessly as Walther did. The best and most perfect of his lyric poetry belongs to the last period of his poetic activity. In 1889 a statue was erected to him at Bozen, Tyrol.

BIBLIOGRAPHY.—The best critical edition of Walther's poems is that by K. Lachmann (1827); later editions by Waekernagel and Rieger (1862), Pfeiffer (1864), Wilmauns (1883), and Paul (1882). Of the many translations into modern German the best are by K. Simrock (1833) and Ed. Samhaber (1882). There are biographies by L. Uhland (1822), Menzel (1865), Burdach, *Reinmar der Alte und Walther von der Vogelweide* (1880), Wilmanns (1882), A. Schönbach (1890). See also the article **MINNESINGERS**.

JULIUS GOEBEL.

Walton: village; Delaware co., N. Y.; on the Delaware river, and the N. Y., Ont. and West. Railway; 17 miles S. W. of Delhi, 180 miles N. W. of New York (for location, see map of New York, ref. 6-11). It is in an agricultural and dairy-

ing region, and has 7 churches, high school, union school, 2 banks, 4 hotels, electric lights, 2 water companies, 2 foundries and machine-shops, tannery, baby-carriage factory, novelty manufacturing-works, and 3 weekly newspapers. Pop. (1880) 1,389; (1890) 2,299; (1895) estimated, 3,500.

EDITOR OF "REPORTER."

Walton, BRIAN, D. D.: bishop and biblical scholar; b. at Seymour, in Cleveland, Yorkshire, England, 1600; educated at Magdalene College and Peterhouse, Cambridge; was a curate in Suffolk and in London; was successively rector of St. Martin's, Orgar, London, of Sandon, Essex, and of St. Giles-in-the-Fields, London; became prebendary of St. Paul's and chaplain to Charles I. 1639. During the ascendancy of the Puritans his livings were sequestered (1642). He was forced to flee to Oxford, where he devoted ten years during the civil war and the Protectorate to the preparation of his great work, the *Biblia Sacra Polyglotta* (London, 6 vols. folio, 1657), including the Hebrew original of the Old Testament, the Samaritan Pentateuch, the Chaldee, Syriac, Arabic, Persian, and Latin Vulgate, with various readings, notes, etc., constituting one of the chief monuments of Oriental scholarship in England, and still considered "the most complete biblical apparatus in any language." In its preparation Dr. Walton received aid from Archbishop Usher, John Selden, Samuel Clarke, Drs. Edmund Castell, Thomas Hyde, Edward Pocock, and John Lightfoot, and several other noted Orientalists, and for its publication subscriptions to the amount of £9,000 were made. He wrote in 1658 his *Dissertatio* on the antiquity and authority of his texts, usually styled in later editions the *Prolegomena*, and in reply to the attack made by the celebrated Dr. John Owen in his *Vindication of the Purity and Integrity of the Hebrew and Greek Texts, etc.* (1658), wrote his conclusive treatise, *The Considerator considered, etc.* (1659). Walton became chaplain to Charles II. at the Restoration, was consecrated Bishop of Chester Dec. 2, 1660, and took part in the Savoy Conferences 1661. D. in London Nov. 29, 1661. *Memoirs* of his life and writings (2 vols., 1821) were written by Henry John Todd. The *Prolegomena* was republished in the original Latin, edited by Francis Wrangham (2 vols., Cambridge, 1827-28). Revised by S. M. JACKSON.

Walton, GEORGE: signer of the Declaration of Independence; b. in Frederick co., Va., in 1740; was apprenticed to a carpenter; acquired a tolerable education by private study; was admitted to the bar and settled in Savannah, Ga., 1774; was one of the four persons who called the first public meeting at Savannah (July 27, 1774) to concert measures for the defense of that colony; drew up the resolutions passed on that occasion; was a delegate to the Continental Congress 1776-81, and signed the Declaration of Independence and the Articles of Confederation; was colonel of militia in the defense of Savannah Dec., 1778, when he was dangerously wounded, and was a prisoner until Sept., 1779; was chosen Governor of Georgia in Oct., 1779, and again 1789; became chief justice of Georgia 1783, and was U. S. Senator 1795-96. D. at Augusta, Ga., Feb. 2, 1804.

Walton, IZAAK: author; b. at Stafford, England, Aug. 9, 1593; became a linen-draper in Fleet Street, London, 1624, and acquired a competency, upon which he retired in 1644; sympathized with the royalist cause in the great rebellion, and from that time "lived mostly in the families of eminent clergymen of England, of whom he was much beloved," devoting himself to literature, the contemplation of nature, and the pleasures of the fishing-rod. He wrote *Lives* of Dr. John Donne (1640), Sir Henry Wotton (1640), Richard Hooker (1662), George Herbert (1670), and Dr. Robert Sanderson (1678), which have often been published together, and are known collectively as *Walton's Lives*. *The Compleat Angler, or the Contemplative Man's Recreation* (1653), has been many times reprinted, and is one of the best-known works of the seventeenth century, perhaps the quaintest treatise of the pleasures of fishing ever penned, and made specially fascinating by charming descriptions of nature. D. at Winchester, Dec. 15, 1683. He left a son Izaak, who became a clergyman. A *Life of Izaak Walton, including Notices of his Contemporaries* (1823), was published by Thomas Zouch, D. D.

Waltzeemüller: See WALDSEEMÜLLER.

Walworth, CLARENCE ALPHONSUS: Paulist priest; b. in Plattsburg, N. Y., May 30, 1820; son of Reuben Hyde Walworth; graduated at Union College; studied law, and was admitted to the bar in 1841; practiced law one year, and

then entered the general theological seminary of the Protestant Episcopal Church in New York city; after three years joined the Roman Catholic Church; studied abroad, and after traveling abroad and in the U. S. returned to Saratoga, and later became rector of St. Mary's parish in Albany. He has written *The Gentle Skeptic* (New York, 1860); *The Doctrine of Hell Ventilated in a Discussion between Rev. C. A. Walworth and William H. Burr, Esq.* (1874); besides various poems and essays. He is one of the founders of the Paulist order in the U. S. F. S. A.

Walworth, REUBEN HYDE, LL. D.: lawyer and judge; b. at Bozrah, Conn., Oct. 26, 1789; passed his early years on a farm at Hoosick, N. Y.; was for the most part self-educated; was admitted to the bar in 1809; settled at Plattsburg, N. Y.; was an officer of volunteers 1812, and acting adjutant-general of New York militia during the British campaign against Plattsburg 1814; became master in chancery and county judge 1811; took a high position at the bar; in 1823 removed to Saratoga; was a member of Congress 1821-23; was a circuit judge 1823-28; was chancellor of New York 1828-48, taking rank as a master of equity jurisprudence. During the twenty years of his chanceryship he resided in Albany, but upon retiring returned to Saratoga, and acted for some years as chamber counsel and referee, being the referee in the famous "Spike case" of *Burden vs. Corning*. During his last years he prepared an elaborate genealogy of his mother's family, *The Hyde Genealogy, or the Descendants, in the Female as well as in the Male Line, from William Hyde of Norwich* (2 vols. 8vo, 1864, with twenty-two steel portraits). On the bench he was somewhat stern, and often anticipated the remarks of counsel. His decisions as circuit judge are in Cowen's *Reports* (9 vols., 1824-30); those pronounced as chancellor are contained in Paige and Barbour's *Reports* (14 vols., 1830-49); and his opinions delivered as an *ex-officio* member of the court for the correction of errors may be found in the *Reports* of Wendell, Hill, and Denio (38 vols., 1829-50). D. at Saratoga, Nov. 21, 1867. Besides the *Genealogy* he was the author of *Rules and Orders of the Court of Chancery of the State of New York* (Albany, 1829).
Revised by F. STURGES ALLEN.

Wame'go: city; Pottawatomie co., Kan.: on the Kansas river, and the Union Pac. Railway; 15 miles E. of Manhattan, 37 miles W. by N. of Topeka, the State capital (for location, see map of Kansas, ref. 5-II). It is in an agricultural region; has a public high school, national bank with capital of \$75,000, a private bank, and two weekly newspapers; and is an important grain-market. Pop. (1890) 1,473; (1895) 1,410. EDITOR OF "KANSAS AGRICULTURIST."

Wampum [from Amer. Ind., signifying white; cf. Mass. *wampi*; Del. *wāpe*, white]: the strings and belts of beads used as money by some tribes of North American Indians. The shells of *Venus mercenaria*, the round clam, or quahaug, were the favorite material. These were drilled lengthwise and strung upon a thread. Wampum was either white or of a black or violet-purple color, the last being valued twice as highly as the first. The wampum-belt served not only as money, but as an ornament, and the beads seem to have been used as counters or aids to memory in such simple computations as the Indians made.

Wan'amaker, JOHN: merchant; b. in Philadelphia, Pa., July 11, 1838; engaged in business on his own account in 1861, and became a successful and widely-known merchant of Philadelphia; began mission work there in 1858; founded Bethany Presbyterian church and its great Sunday-school, and became prominent in benevolent and missionary work; was one of the founders of the CHRISTIAN COMMISSION (*q. v.*); president of the Y. M. C. A. of Philadelphia 1870-83; and U. S. Postmaster-General 1889-93. In 1896 he established himself in New York as the successor of A. T. Stewart.

Wandering Cells: See HISTOLOGY (*Connective Substances*).

Wandering Jew: the hero of a legend which first appeared in the middle of the thirteenth century in the chronicle of Matthew of Paris, who professes to have received his information from the lips of an Armenian bishop, to whom the Wandering Jew himself had communicated the events. According to this version, he was a servant in the house of Pilate, by the name of Cartaphilus, and gave Christ a blow when he was dragged out of the palace to be executed. According to another version—probably of the fifteenth century and of German origin—he was a shoemaker by the name of Ahasuerus, and refused Christ permission to sit

down and rest when, on his way to Golgotha, he passed by his house. All versions, however, agree with respect to the verdict of Christ, that he should remain wandering on the earth until the second coming, and consequently the myth-forming imagination immediately went to work to narrate his travels. Now and then a man appeared who claimed to be the Wandering Jew. Thus in the sixteenth century Ahasuerus was seen in Hamburg and other German cities, and held long conferences with Dr. Paulus von Fitzen, Bishop of Schleswig. In the beginning of the eighteenth century Cartaphilus appeared in London in the higher circles, and communicated to the most learned professors of Oxford, who came to see him, anecdotes from his personal acquaintance with the apostles, Mohammed, Tamerlane, and others. He has figured very largely in works of fiction by Schubart, A. W. Schlegel, Julius Mosen, Lenau, Klingemann, Edgar Quinet, Béranger, Eugène Sue, H. C. Andersen, and other writers of the nineteenth century. See M. D. Conway, *The Wandering Jew* (London, 1881); L. Neubaur, *Die Sage vom ewigen Juden* (Leipzig, 1884).

Revised by S. M. JACKSON.

Wanderley', JOÃO MAURICIO: statesman; b. at Barra do São Francisco, Pernambuco, Brazil, Oct. 23, 1815. He studied law at Pernambuco; joined the Conservative party; was elected deputy 1842 and repeatedly re-elected; was senator from 1856, and president of the senate 1882 and 1885. In 1868 he was created Baron of Cotegipe, by which title he is best known. He held portfolios in most of the prominent conservative cabinets from 1854, and was minister to the Platine republics in 1870, signing the treaty of peace with Paraguay. On Feb. 25, 1885, he organized the ministry which carried through congress the general emancipation law; this cabinet remained in power until May 10, 1888. D. at Rio de Janeiro, Feb. 13, 1889. II. II. S.

Wanderoo' [from Cingalese, *wandaru*, monkey]: (1) a monkey of the coast of Malabar (*Macacus silenus*); distinguished by its long hair and venerable appearance, whence it has been also called *Silenus vetus*. The head is oblong and the face rather produced; the hair on each side of the face and on the neck and chest is elongated and forms a sort of ruff round the face, and is of a gray or whitish color; the face about the eyes is naked and flesh-colored; the snout black; the fur is mostly black on the back and sides, and whitish beneath and inside the limbs; the tail is rather short and tufted; it is chiefly brown, but its tuft is whitish. The wanderoo lives in the depth of the forests, and its appearance has given rise to several legends, and to the idea that it is the lord of the monkey race. These monkeys were known to the ancients, and have been supposed to be the "race of men" described by Ctesias as "inhabiting the mountains of India, having heads like dogs, but with larger teeth. They have nails, but larger and more rounded. They bark, but do not talk; they have tails like dogs, but more hairy." The wanderoo attains a length of about 18 inches. (2) The name is also given to, and in fact appears to have been primarily employed for, species of the genus *Semnopithecus*, and especially for the *S. leucopyrmus* of Ceylon.
Revised by F. A. LUCAS.

Wanklyn, JAMES ALFRED, M. R. C. S.: chemist; b. at Ashton-under-Lyne, England, in 1834; received a thorough scientific education; studied chemistry at Heidelberg under Bunsen; made several important discoveries in chemistry, especially in settling the relation of the sugar group to the alcoholic series, and the ammonia process of water-analysis; became demonstrator of chemistry at the University of Edinburgh in 1859; Professor of Chemistry at the London Institution 1863-70; lecturer on chemistry and physics at St. George's Hospital 1877-80; has been public analyst for the county of Buckingham and for several boroughs; in 1871 conducted for the Government the analysis of the milk supplied to the London workhouses. Author of treatises on *Water Analysis* (1868; 7th ed. 1889) and *Milk Analysis* (1873); *On Tea, Coffee, and Cocoa* (1874); *Bread Analysis* (1881); *The Gas Engineer's Chemical Manual* (1886); and of *Air Analysis* (1890).
Revised by IRA REMSEN.

Wapakone'ta: village (laid out in 1833); capital of Auglaise co., O.; on the Auglaise river, and the Cin., Ham. and Dayton Railroad; 12 miles S. by W. of Lima, 31 miles N. of Piqua (for location, see map of Ohio, ref. 4-D). It is in an agricultural, natural-gas, and petroleum region, and has 2 public-school buildings, county court-house (cost \$260,000), 2 national banks with combined capital of \$200,000, 3 weekly newspapers, and manufactories of churns, wheels, and

furniture. The site was an ancient Indian capital, was the scene of the signing of the treaty by which the Senecas and Shawnees gave up their lands to the U. S. in 1831, and was the last point in Ohio occupied by the Indians. Pop. (1880) 2,765; (1890) 3,616; (1895) 4,080. EDITOR OF "REPUBLICAN."

Wa'pello: town; capital of Louisa co., Ia.; on the Iowa river, and the Burl., Ced. Rap. and N. Railway; 21 miles S. by W. of Muscatine, 30 miles N. of Burlington (for location, see map of Iowa, ref. 6-K). It is in a grain, vegetable, and fruit-growing and stock-raising region, and has a large public-school building, 4 churches, 2 weekly newspapers, a flour-mill, plow and wagon factories, and fruit and vegetable canneries. Pop. (1880) 928; (1890) 1,009; (1895) 1,290. EDITOR OF "RECORD."

Wap'iti [from Amer. Ind. (Cree) *wapitik*, liter., white deer; cf. WAMPUM]: the *Cervus canadensis*, or large deer of the Northern U. S. and British provinces. It is more generally called elk, but that name belongs by right to the *Alces melchis*, otherwise called moose. The wapiti is very closely related to the common red deer or stag of Europe, but is a still larger and more noble-looking beast, attaining

The American elk or wapiti.

the dimensions of a moderate-sized horse. The color above and about the lower jaw is yellowish brown; the circles around the eyes brown; the rump has a large pale disk extending far above the base of the tail, with a black streak on each side of it; the tail is very short; the hoofs are broad and semicircular. Such are the chief characters alleged to differentiate the species from the *Cervus elaphus* of Europe. Revised by F. A. Lucas.

Wappäus, väp'pöis, JOHANN EDUARD: geographer; b. at Hamburg, Germany, May 17, 1812. He studied at the Universities of Göttingen and Berlin; traveled in the Cape Verde islands and Brazil 1833-34; became a tutor at Göttingen

volumes on Universal Geography (1849), North America (1855), Central and South America (1867), and Brazil (1871). D. at Göttingen, Dec. 16, 1879. JI. H. S.

Wappers, GUSTAVE: painter; b. at Antwerp, Belgium, Aug. 23, 1803; studied painting in his native city and in Paris, and attracted general attention in 1830 by his *Devotions of the Burgomasters of Leyden*; became the first representative and the founder of the romantic school of painting in Belgium, and was made director of the Academy of Antwerp in 1840, and a baron in 1847. In 1853 he resigned his position in the academy, and in 1855 removed to Paris, where he died Dec. 6, 1874. Of his pictures, chiefly consisting of historical pieces and portraits, some of the most remarkable are *Charles I. taking Leave of his Children*, *Charles IX. on the Night of St. Bartholomew*, *Execution of Anne Boleyn*, *Defence of Rhodes by the Knights of St. John*, for Louis Philippe, now at Versailles; *The Great Fishery of Antwerp*, for Queen Victoria. His influence on the development of Belgian art was very considerable.

Wap'ingers Falls: village; Dutchess co., N. Y.; on the Wappinger creek, and an electric railway connecting the village with Poughkeepsie; 2 miles from the Hudson river (for location, see map of New York, ref. 6-J). It has 6 churches, 2 public schools, a parochial school, public library, print-works (established in 1834), overall and sheeting factory (established in 1871), and a weekly newspaper. Three different steamboat lines make daily landings at New Hamburg, 2 miles distant. Pop. (1890) 3,718; (1895) estimated, 4,500-5,000. EDITOR OF "CHRONICLE."

War [O. Eng. *werre*; O. H. Germ. *werra*, strife; cf. Germ. *wirren*, *verwirren*, confuse; Fr. *guerre* is a loan-word from Teutonic]: a contest between different states or between different parties in the same state carried on by force of arms. The history of war is the history of the human race. Civilized men regard it as a great evil, yet some one of the leading nations of the world is nearly always engaged in it; and it may safely be said that the sun never sets upon a world wholly at peace. Its permanence is thoroughly believed in by those who seem most competent to judge, as will become evident by a brief review of the armies of civilized powers.

Review of Existing Armies.—The population of the leading powers, their peace forces, annual expenditure exclusive of interest on public debt, etc., are shown with sufficient approximation in the table inserted below. A standing army drains the resources of a state in two ways—negatively, by withdrawing its numbers from industrial pursuits, and positively, by the expenditure necessary for its support. It is generally supposed that the maximum number of men which any state can keep permanently under arms is about 1 per cent. of its entire population. A glance at the table will show which nations have reached this limit, and which have passed it. Nevertheless, these figures indicate merely the number actually present with their colors in time of peace, and not the number of trained soldiers that can be called upon in time of war. The principal European nations, except Great Britain, are at this time engaged in organizing and arming their entire able-bodied population. The system by which this is done was originated and perfected by Prussia. The other nations have based their organization upon hers, and have not yet completed it. Accordingly, an examination of the Prussian system as applied to the German empire will be most profitable, and will give a good general idea of the others in their present or future condition.

	Population.	Army.	Navy.	Number of men in army and navy.	Per cent. of population.	Total annual expenditure, exclusive of interest on public debt.	Cost of army and navy.	Per cent. of annual expenditure.
Russia	113,354,649	868,672	31,529 (?)	900,201	0.79	\$421,344,000	\$163,042,000	38.7

United States	62,622,250	27,160	12,656	39,816	0.06	339,684,000	66,382,000	19.5

* This includes about 75,000 men the cost of whom is borne by the Indian exchequer.

1838, adjunct professor 1845, and full professor in the same university 1854. His works on geography and history include *Untersuchungen über die geographischen Entdeckungen der Portugiesen unter Heinrich dem Seefahrer* (1842); *Deutsche Auswanderung und Kolonisation* (2 vols., 1846); and *Atgemeine Bevölkerungsstatistik* (2 vols., 1859-61). He is best known for his edition of Stein and Hirschelmann's *Handbuch der Geographie und Statistik*, for which he wrote the

The Prussian system is based upon the theory that military service is not a trade or craft, to be followed by a portion of the population, but a duty owed by every male citizen to his country. Only members of the reigning or mediatized princely families are exempt, and in time of peace an only son of a widow or chief support of a family, an owner of a factory who would be unable to carry on his business, a sole assistant of a father in business, a property-holder whose

property would snuff, and a student of theology. Every able-bodied man, with these exceptions, between the ages of 20 and 32, forms part of the army. No substitute or exemption by payment is permitted. All others between the ages of 17 and 45 are liable to be called out upon occasions of great emergency, but they are not regularly organized, although they are enrolled; they are called *Landsturm*. The standing army consists of the active army and the *Landwehr*. The active army comprises the field army and the reserves. Every man upon reaching the age of 20 must enter the active army, and serve with it seven years; he serves the first three years continuously in the field army, after which he becomes part of the reserves, and is placed on furlough for the remaining four years. While in the reserves he is bound to take part in not more than two manoeuvres, neither of which is to exceed eight weeks; he is recalled to active service whenever an increase of the field army becomes necessary. At the expiration of his seven years in the active army he becomes part of the *Landwehr*, and so continues for five years, when at the age of 32 he is freed from liability to service except as part of the *Landsturm*. Students of medicine are allowed to enter the army as surgeons, apothecaries, or veterinary surgeons. Educated young men who provide their own equipment and subsistence are required to serve only one year in the field army, and they may postpone entering it until the age of 23, having been examined, however, at the age of 20. This exception is made on the supposition that superior talents render the acquisition of the necessary military training possible in one year. These men furnish most of the officers of the *Landwehr*.

The whole army, including the *Landwehr*, is divided into 20 army-corps, 1 of the guards and 19 of the line. The corps of the guards is somewhat larger than the others, and is recruited from the empire at large. Each of the other corps belongs to a particular province, where it is always kept. Thus the First Corps belongs to the province of Prussia, and the Fifteenth and Sixteenth to Alsace-Lorraine. The corps never leaves its province except for war, and then it draws all its re-enforcements and recruits from it. These provinces are subdivided to correspond with the subdivisions of the army itself. Each corps in time of peace consists of 2 divisions; each division of 2 brigades of infantry and 1 of cavalry; each brigade of 2 to 4 regiments; each regiment of 3 battalions; each battalion of 4 companies; each company of 129 men. There are attached to each corps also 1 battalion of rifles, 1 battalion of pioneers, 1 battalion of military train, and 1 brigade of artillery. Each army-corps district is divided into 4 brigade districts, corresponding to its 4 infantry brigades. Each brigade district is divided into *Landwehr* battalion districts, and these again into company or levying districts. In the states which are divided into circles each company district is composed of 1 circle, and in general the districts coincide with the civil divisions. Each regiment of the line receives its recruits from its own district, in which it is quartered and from which it is rarely moved; it has a reserve battalion, consisting of men who have served in its own ranks, upon which it relies to increase its strength to a war-footing. It also has its own *Landwehr* battalions attached to it, bearing the same number and provincial designation. As before stated, the *Landwehr* and reserve battalions are not kept under arms; the reserves are on furlough, and the *Landwehr* is something like the militia of the U. S. Generally there are 2 *Landwehr* battalions to each regiment of the line. Each of these *Landwehr* battalion districts is provided with a permanent staff, consisting of 1 commander, 1 adjutant, 2 sergeants, 3 corporals, and 6 men as orderlies, with 1 sergeant and 1 corporal for each company district. It is the duty of this staff to keep the necessary clothing and equipments, and to have everything prepared in time of peace for the formation of the *Landwehr* battalions. *Dépôts* and magazines of arms and equipments for soldiers of the *Landwehr* are established at the headquarters of the *Landwehr* battalion districts. Those of the reserves are at the headquarters of the regiments of the line.

The field army in time of peace is always ready to take the field. It consists of 479,220 enlisted men. A part of this number, the non-commissioned officers, are encouraged to remain, but the greater portion, probably 90 per cent., is renewed every three years, and about 30 per cent. every year. The number of young men who reach the age of twenty each year is rather more than sufficient to recruit this force. Selection is made by lot, those not chosen being

then considered as a special reserve, called the restoration (*ersatz*) reserve. The latter includes also those men who have claimed exemption on account of family circumstances, and those who have been exempted on account of slight bodily defects. The mobilization of the army, or placing it on a war-footing, consists of filling up the field troops to their war-strength, and the formation of *dépôt* troops and of garrison troops. The field troops are placed on a war-footing by increasing the strength of the regiments. For this purpose each infantry regiment calls in about 500 reserves per battalion; this absorbs most of the reserves, and what are left are employed as *dépôt* troops. Each cavalry regiment calls in about 40 reserves, the peace-strength of cavalry being nearly as great as the war-strength. The field artillery calls in all the reserves and many of the *Landwehr*. The *dépôt* troops are intended for filling up vacancies as they occur in the field army. In a year of war the infantry loses 40 per cent., and the cavalry, artillery, and pioneers 20 per cent., of their strength. Each infantry regiment forms a fourth battalion, which it leaves behind as a *dépôt* battalion; each cavalry regiment leaves a *dépôt* squadron; each field artillery regiment a *dépôt* division of four batteries; and each pioneer battalion a *dépôt* company. As soon as a regiment has lost one-tenth of its men, it calls for that number from its *dépôt*, and receives them thoroughly prepared for the field. Their places at the *dépôt* are at once filled by recruiting from the *ersatz* reserve, and, when that is exhausted, from the youngest men of the *Landwehr*. Should the fourth battalion be required to join the army, a fifth battalion is formed for the *dépôt* from the *Landwehr*. The troops required for the garrisons and for guarding the lines of communication are taken from among the *Landwehr*.

The officers of the field army are permanent, and are usually taken from the aristocratic class. Officers of the reserve are appointed from among officers who have left the field service, or from among very meritorious soldiers whose active service has expired. Officers of the *Landwehr* are obtained by transfer from the reserve and by promotion from the ranks. At the mobilization some officers of the field army are always transferred to each infantry and cavalry regiment of *Landwehr*, and each company receives two or three non-commissioned officers from the line.

By this system Germany can now put into the field within two weeks over 1,700,000 men, about 1,000,000 of whom are in the highest state of instruction and discipline, and the balance are inferior only from being out of practice. Including the entire *Landwehr* and reserves, this total is increased to nearly 2,500,000 men, with about 1,800,000 men of the *Landsturm* in addition who have received military instruction and are well qualified for local defense. For the manner in which this force can be applied see FRANCO-GERMAN WAR.

The people of the U. S. and Great Britain resemble each other in their jealousy of large standing armies and their abhorrence of a system of universal service, as well as in their warlike spirit and self-sacrificing patriotism. Their military systems are explained in the article MILITIA. The result of such systems is that the army, having to compete with other employments for its recruits, is in time of peace much more expensive per man than that of continental powers, while the cost of carrying on war is enormously greater. It is safe to say that the civil war in North America cost the U. S. double what it would, had it had such an organization as Germany. The chance of a collision between the U. S. and a power so prepared is very remote, but not so with Great Britain. What would be the result of such a collision is a question which causes some anxiety to the friends of the latter.

The natural result of a perfect preparation for war is a less reluctance to enter upon it. Fortunately, these great preparations carry with them a restraining influence—viz., the increased cost of war. We have considered only the organization of the men or the scale upon which modern war is waged, but all the implements of war (see ARTILLERY, SMALL-ARMS, MAGAZINE-GUNS, MACHINE AND RAPID-FIRE GUNS, etc.) have increased in efficiency and expense in full proportion to the perfection of organization. The wars of Napoleon in thirteen years (1802-15) cost France about \$1,000,000,000. The civil war in North America cost the U. S. Government in four years about \$4,000,000,000, or thirteen times as much a year as Napoleon's, or, allowing one-half of the expense for waste, it cost more than six times as much a year as Napoleon's wars. The work of

war is therefore accomplished in less time, and although the total amount of damage that nations inflict upon each other is probably about the same as formerly, there are more years of peace.

Art of War.—The art of war consists of rules for raising, arming, organizing, recruiting, administering, feeding, and fighting armies in the most efficient and economical manner. It includes, therefore, the fabrication and perfection of arms and equipments, the construction of fortifications, the establishment of military institutions, and the preparation of the soldier for duties in the field. These are the preparations for war, and have been more or less fully treated in the articles ARMY; ARTILLERY; BRIDGES, MILITARY; CAVALRY; ENGINEERS, CORPS OF; FORTIFICATION; INFANTRY; MILITARY ACADEMIES; MILITIA; SAPPERS, MINERS, AND PONTONIERS; SMALL-ARMS; TORPEDOES; etc. We are here concerned with war itself, or the actual employment of armed forces. Some of its details are touched upon in BOMBARDMENT; ESCALADE; ENGINEERING, MILITARY; SIEGE; TACTICS, etc.

The problem is to direct and estimate the effect of forces the energies of which are only partially known, and the resistances to which are known still less. The data for its solution are obtained from military history. Although it is not possible to establish rules to fit every case, nevertheless certain general principles underlie the operations of war, and these give rise to rules which are useful for pointing out the errors to be avoided, if for nothing else. These fundamental principles are—(1) that to insure success the heaviest force must be brought to bear upon the weakest point of the enemy; and (2) that this force must act with the greatest possible velocity. It was one of Napoleon's maxims that the force of an army, like the quantity of motion in mechanics, is measured by the mass multiplied by the velocity.

An army in the field has constant wants which can not be supplied from the enemy's country, such as ammunition, arms, recruits, medical stores, etc., and frequently also food and forage. It is essential to its existence that it should keep open communication with some part of its own country. That part immediately in rear of the army and covered by it is generally selected, and here are collected special dépôts for supplies. This strip of territory is the foundation of the army, or, as it is technically called, its *base*. The roads leading from the position of an army to its base are called *lines of communication*, or, simply, *communications*.

The great aim in war is such destruction of the enemy's military power as will compel him to peace. The defeat and dispersion of his troops is not always sufficient: it must generally be accompanied by the occupation of a portion of his country, thus cutting off his sources of recuperation and his power to raise new armies. And it is evident that such cutting off of resources before the dispersion of his troops will facilitate the latter operation. Accordingly, while the defeat of the enemy's army is the first consideration, effort is generally made at the same time to get possession of some important strategic point, such as his capital or great commercial centers. This point is called the *objective*. The line of direction of the objective from the base is called the *line of operations*. It is not a mathematical line, but it may include several parallel roads not farther apart than one or two days' march when they are employed by the different divisions of the same army. Lines of operation are *simple* when the army is not divided into large independent bodies; *double*, when two armies, either independent or commanded by the same general, proceeding from the same frontier, are widely separated for a long interval of time. Double lines are said to be *interior* when used by one or two armies against several hostile bodies, and having such direction that the masses can be concentrated in less time than the enemy would require to collect a greater force; *exterior*, when the army acts at the same time against both extremities of the enemy; *concentric* or *converging*, when, starting from widely separated points, they meet at the same point; *diverging*, when, leaving a given point, they are directed upon several distinct points. The choice of the line of operations is the most important problem in strategy. The object sought for is to place the army where a victory will be decisive. This will be the case if the enemy's communications are seized, and this object must always be kept in view. At the same time, it must be remembered that the great advantage of the offensive lies in a sudden, unexpected attack—that wide

detours are therefore out of place, and the shortest road to the enemy is, other things being equal, the best. In every case, except that of vastly preponderating forces, the line must be directed upon the center or one of the extremities of the enemy, and not upon all at the same time. If the enemy's front is widely extended, the best direction will be upon the center; otherwise, upon one of his flanks, and then upon his rear. The latter may expose the assailant's own communications, and he must take care to preserve a safe line of retreat either to the rear or to the right or left. A single line is preferable to double lines, and the latter are adopted only when the topography of the country makes it necessary, or when double lines have been adopted by the enemy and it has become necessary to oppose each of his masses; and then interior are preferable to exterior lines. In the case of converging lines care must be taken that the junction can be made before the armies are separately exposed to the combined masses of the enemy. When the enemy's forces have been separated, diverging lines may be usefully employed to increase the dispersion; they are then interior lines. All other things being equal, the richest provinces are selected to operate in, as facility of subsistence promotes rapidity of movement. Keeping the army concentrated and giving it a proper direction are not the only requisites for success. There must be no hesitation, no rest. The result of slow and hesitating movements is to find the enemy prepared at all points. No time must be lost in opening the campaign, and when a success is obtained it must be followed up with energy. Fortifications must be observed by detachments, and must not be allowed to check the main advance.

In presenting these simple rules of strategy the offensive has been principally considered, because that is the normal characteristic of war, and is the positive side of it. The defensive is the result of necessity, and is therefore negative. It is generally acknowledged that politically a defensive war is the only legitimate one, but a war politically defensive is not necessarily conducted by defensive campaigns. The offensive preserves the assailant's country from devastation and raises the *morale* of his army, while it is the direct road to the object of the war—viz., the destruction of the enemy's military power. On the other hand, the defensive has the advantage of fortifications, knowledge of the country, and facilities for obtaining information of the enemy's movements; and it is frequently assumed at the beginning of a campaign with a view to taking up the offensive as soon as the enemy shall have expended a part of his strength. As a rule, however, it is employed only in case of reverses or decided inferiority, and then it must not be passive. Minor points are neglected to concentrate upon the decisive ones. Fortifications being intended to occupy a considerable part of the enemy's army in their capture, advantage must be taken of this time to beat the other part. Accordingly, the fortifications with their defenders are left to draw off such portions of the enemy's force as they can, and battle is offered at a distance in rear, and not in front of them. Every effort must be made to strike the enemy's communications and compel him to retreat. "Retreats," says Napoleon, "cost many more men and much more material than the bloodiest battles, with this difference—that in a battle the enemy loses nearly as much, while in a retreat the loss is all on one side." But a simple repulse is not sufficient; for unless the blow is returned, the enemy may renew it, and the war being thus carried on at the expense of the defenders, they will in the end succumb.

The fundamental principles of war, concentration upon the decisive point and velocity, apply to battles (see TACTICS) as well as to strategy, but the resulting rules are modified by the differing circumstances, as one deals with the theater of operations and the other with a battle-field. Good strategy attempts to place the force in the midst of the enemy's masses, but this does not place it in immediate contact with all of them; while in tactics it probably would, on account of the shorter distances involved and the difficulties of preserving secrecy. Hence in the offensive battle effort is made to overwhelm only one wing at a time. The main force is concentrated upon this effort, while a few troops are employed to occupy the enemy at other points. A great success can be obtained only by depriving the enemy of his line of retreat. This can be attained by attacking his flank or his rear, but the first consideration is to beat him, for a vigorous pursuit can change an indecisive victory into a decisive one.

The application of these principles requires a knowledge

of the topography of the country, a perfect familiarity with tactics, and experience in administering and feeding troops. These acquirements are within the reach of men of no extraordinary capacity. There have been many great generals who were not men of learning, or even men with great powers of understanding. The question at once suggests itself, Why is it, then, that there are so few great generals? A glance at some of the difficulties met with at every step in actual campaigning will give the answer. A complete list of them would not be practicable, but the following are given as examples: (1) There are comparatively few men whose minds are not somewhat clouded by the presence of danger; great moral and physical courage are therefore necessary. (2) There is total or partial ignorance of the enemy's condition and intentions, and information is contradictory. The natural anxiety as to the correctness of our conjectures upon these points leads, with an ordinary man, to hesitation and doubt, and these are fatal. Perfect self-reliance and calm adherence to original plans are here demanded. (3) There is nearly always some miscalculation in the difficulties of a road or the strength of a post. Expecting to reach a point at a given time, a commander finds himself a long distance from it. Great energy, strong will, even some severity to obtain the utmost exertions of the troops, are here necessary. (4) The movements of an enterprising enemy call constantly for new combinations, and these must be made and acted on without hesitation. This demands great decision of character. (5) To insure the full support of troops, the general must be able to impress upon them his own spirit. This requires a deep knowledge of men. (6) There is always the element of chance; a sudden rain-storm or a fog may neutralize the greatest efforts.

The following are some of the principal maxims of war, in addition to those already given: (1) Foresee everything that the enemy may do, and provide means to thwart him. (2) The forces employed must be proportionate to the obstacles to be overcome. (3) Debate well at the outset whether to assume the offensive or defensive; but the offensive having been selected, pursue it to the last extremity. The evils of retreats have been referred to above. (4) Be ready to meet the enemy at all hours of the day or night, whether on the march, at a halt, or in camp. (5) With an army inferior in numbers avoid a general battle, and supply the place of numbers by rapidity of marching. (6) The honor of his arms is a general's first consideration, the lives of his men secondary, though the two are entirely consistent with each other, for safety to the whole is found in audacity and persistency. (7) Never do what the enemy wishes you to, for the reason merely that he desires it. (8) When surprised by a superior enemy, a bold attack will generally disconcert him. (9) On the day of battle neglect no chance of success; a battalion sometimes decides the day. O. H. ERNST.

THE MODERN LAWS OF WAR.

The history of the world since 1860 shows clearly that the dreams of peace enthusiasts are not yet realized; that neither arbitration nor any other panacea has been able to avert war. Within this period there have been no less than ten distinct wars between civilized states, contests with barbarous or half-civilized nations without number, and internal conflicts not a few. However much peace may be desired, then, the fact of war is constantly to be faced, so that except to the most visionary it has seemed to promise more practical good to accept this fact of war and try to mitigate the conditions under which it is waged, than to agitate for its entire abolition. Beyond question there is a decided tendency toward a more humane system of war. This means more than the mere fact that wars are less barbarously conducted as regards both persons and property than they formerly were. It implies a change of sentiment in human society which has brought such results to pass. This changed spirit, brought face to face with the slave-trade, the sufferings of the wounded in battle, the horrors of an invasion, human misery of any kind, has a legitimate field to work in. Here is one cause of the growth of milder methods of warfare. Another cause is an economic one. It lies in the appreciation of the frightful waste involved in war. As regards the belligerents, there are costly standing armies lessening production and increasing taxation. In actual war-time there is the destruction of war material and of the property affected, crops, railways, houses, bridges; the waste of productive human life; the diversion of labor from a profitable to a wasteful occupation. The neutral also loses. Now the neutral is the whole commercial world

not in arms. His trade is interrupted, his communications broken, his carrying trade cut into, one branch of industry ruined, another perhaps unduly stimulated, both to his loss. Still a third reason is found in the different military system now prescribed by policy. There must be an organized commissariat, a paid soldiery; the fighting is at long range; war is more of a game of skill and less of a hand-to-hand combat.

These two sets of causes, one sentimental in a good sense, the other economic, have worked in corresponding directions to better the treatment of the person and to lessen the destruction of property and interruption of trade. Preserving this natural division of the subject, the first question of interest is as to the treatment of the person by the rules of modern warfare. Here at the outset will be noticed the more marked distinction between combatants and non-combatants. The former, comprising the armed forces of a state and its officers of government, are alone the objects of attack. The *projet* of the Brussels Conference, § ii., declares that "the operations of war should be aimed exclusively against the forces and military resources of the enemy state, and not against its subjects so long as the latter take no active part in the conflict." The hostile armies fight out the quarrel to a finish, while the persons of women and children, of the workmen in shop and field, of all those connected with religious, charitable, educational, and scientific establishments, are absolutely secure. And, further, the list of non-combatants has been greatly enlarged. For, under the Geneva Convention, all nurses, surgeons, and chaplains in the field, together with their military hospitals and ambulances, are exempt from the operations of war, and neutralized by the use of the recognized sign of a red cross on a white ground. (See GENEVA CONVENTION OF.) The labor of an enemy's peasantry is not even to be employed on the military works of the invader. They are absolutely at liberty to engage in their normal occupations. And they are to live and work under their local laws. The status of territory occupied by an invading army is rather anomalous. The sovereignty to which their real allegiance is due has no longer the power to enforce its rights, nor has a new allegiance replaced the old because that is a matter to be adjusted at the close of the war. Meanwhile martial law governs. But it should and will govern largely through the local channels and agents, so that by modern usage an invaded province, after the tide of war has flowed past, resumes its customary life and laws and labor, instead of being harried by its conqueror. All this so long as the province takes no part in the operations of war. For along with these immunities goes a very strict obligation. The conquered people must play no double part. The rustic who sells produce to the invader by day and picks off his stragglers by night is not a warrior, but an assassin, punishable with death. And the provincial government which connives at the attacks upon trains, the breaks in railway communications, the sudden descents upon isolated bodies of soldiers, can and should be brought up sharply through personal or pecuniary penalties. This was repeatedly the case in the Franco-German war.

If, however, the inhabitants of an invaded province band together to resist invasion or rise to drive out the invader, the case is different. It was decided at the Brussels Conference (1874) that the inhabitants of an *unoccupied* territory who took part in such a popular rising or *levée en masse* should be considered as belligerents; and in 1880 this limitation to unoccupied territory was removed by a committee of the Institute of International Law, appointed to draft a code to govern the conduct of war. This probably reflects the present usage. See BRUSSELS CONFERENCE and OCCUPATION.

The rules as to lawful weapons adopted by the ST. PETERSBURG DECLARATION (*q. v.*) have been reaffirmed in all these later attempts at codification. In the Brussels code, after reciting the fact that belligerents have not an unlimited choice of the means of injuring an enemy, the following are forbidden: The use of poison or of poisoned weapons; the treacherous murder of enemy-subjects; the killing of an unarmed enemy; the refusal to give quarter; the employment of arms, projectiles, or substances likely to cause unnecessary suffering, and of small explosives; the abuse of the flag of truce, of the enemy's flag or uniform, or of the red-cross badge of the Geneva Convention. It may be added that the use of half-civilized troops is forbidden unless they are so officered and disciplined as to insure their observance of the rules of civilized warfare.

In the conduct of sieges and bombardments the modern usage displays great consideration not only for persons but property. All pillage is unlawful, however prolonged the resistance; unnecessary destruction of property is forbidden; quarter must be given, and killing cease as soon as resistance stops. Churches, hospitals, establishments devoted to charity, the arts, or to scientific use should be marked by the proper flag and spared as much as practicable. Notice that a bombardment is intended is usually given, that non-combatants may be sheltered from its effects. And, moreover, it is only fortified places that can be shelled. For a hostile fleet to bombard New York, so long as the city is undefended, would be an atrocious violation of the laws of war. When with these rules are contrasted the scenes of the Peninsular war, the burning of Washington, the threat of the French Directory to refuse quarter to a besieged town in case of twenty-four hours' resistance, the change is seen, and these rules are not merely on paper; they have been fairly well observed. Another noteworthy advance is seen in the rules relating to prisoners of war. There must be nothing penal in their treatment. They are in the power of the government of the enemy, not of his troops or of individuals. If not paroled or exchanged, they are confined in the interior of the captor state, and maintained at the cost of their own country, humanely, being allowed to do such work for their support as their rank and bodily condition permit. The prison ships of the Revolution are gone forever: the horrors of Libby and Andersonville can never shock society again. There has also been a decided increase in the efficiency of the care of the wounded, since under the Geneva Convention and the *régime* of Red Cross societies neutral aid has been accepted and permitted to carry out its humane desires on the field of battle. See RED CROSS.

In naval warfare the same tendencies appear, though less marked. On the sea there has not been the same likelihood of atrocities, nor do those who follow the sea call out our sympathies as do the inhabitants of invaded territory. There are no homes to be burned, no fields to be laid waste. There is less to reform. Yet here, as in land warfare, while the destructiveness of war has increased, its barbarity has been lessened. The application of the Geneva Convention to naval war was a step forward. Great Britain no longer impresses seamen out of neutral ships. The crews of blockade runners and ships carrying contraband can not be punished. Quarter is never denied.

Turn now to the other, perhaps the more important, branch of the subject, the laws of war which affect property. Here the tendency toward a humaner, a less destructive system is not only noticeable in the theories of jurists, but has also in many cases been accurately laid down and agreed to by treaty. In Napoleon's time war was made as productive as possible. Indemnities, contributions, exactions of all kinds marked his pathway. Many of the great pictures of Europe were for a time in the possession of France as the spoils of war. Pillage was a means of paying an army. In lieu of pillage towns were heavily fined. Now pillage is forbidden; private property is sacred, unless requisitioned by proper authority, and a receipt given. If a thirsty soldier in a foreign land in time of war wishes a pot of beer he must pay for it; if he takes it by force he may be shot. Contributions may still be levied upon towns or districts, not in lieu of pillage, but as a fine for misbehavior. This is the readiest way of punishing infractions such as broken railways or bridges, attacks upon communications, the killing of stragglers or small parties of soldiers in an occupied territory, where the connivance of the local officials is apparent. Unhappily, indemnities are also still exacted, as the French, Turkish, and Chinese nations know to their cost. In theory an indemnity is a nation's fine for levying unjust war against the victor. But the victor will always hold *his* cause the just one, and indemnities are sure to be abused. They represent a pernicious practice which may well be the next to disappear. The rules which have been indicated forbid waste as a war measure. This, so recently as in the civil war in the U. S., was advocated by the highest military authorities. Through it an enemy was forced to realize the severities of war in order to compel an earlier ending of it. Sheridan in the Shenandoah and Sherman in Georgia ravaged the country far and wide. Sherman estimated that of the \$100,000,000 worth of property destroyed by him, only \$20,000,000 benefited his own army. The humaner spirit now prevailing is likely to be permanent.

It is curious that while enemy's private property, not contraband, on land is inviolable, at sea the same property in

an enemy's ship is still subject to capture. The reason given for this hard discrimination is that capture at sea involves but little suffering while greatly weakening a foe's power of resistance. In theory, property under both conditions is confiscable, but this right is not enforced on land from reasons of humanity. The result of this is to cause the goods of belligerents to seek the protection of a neutral flag temporarily; for by the Declaration of Paris of 1856, the signatories were granted that privilege: the neutral flag covers enemy's goods, except contraband of war.

Although there was much in this declaration to benefit the U. S., the Government of that country has never acceded to it, preferring to cling to the right of privateering and to press the adoption of the Marcy Amendment. (See PRIVATEERING.) Although this temporary gain of an enemy's carrying trade may benefit the neutral, yet it is of far less advantage to him than unrestricted trade and the freedom of the enemy's goods would be. The neutral may not be a carrier or a seafaring state: what trade desires is that its conditions shall be constant, capable of being foreseen, and as unrestricted as possible. This Marcy Amendment, therefore, may very well be the next step in the neutral programme. As it is, the Declaration of Paris was a wonderful stride forward—it is the Bill of Rights of a trading state. See DECLARATION OF PARIS.

In one class of restrictions upon neutral trade there is no softening, and should be none. On the contrary, there seems a tendency to make the rules governing captures for carrying contraband and for breach of blockade more and more stringent. It is but fair when a neutral's innocent trade is enlarged that his guilty trade should be restricted. As yet the burden of prevention in these cases lies on the shoulders of the belligerent. The neutral subject is merely warned that he engages in such trade at his own risk, under penalty of capture. But it has been urged that the neutral government ought to prevent its subjects from engaging in a traffic which directly assists one of its friends in injuring another, and which it may not itself lawfully pursue. Formerly a ship of war, not equipped and manned for service, but simply intended as a commercial venture, was considered contraband merely. Now, as between Great Britain and the U. S. under the three rules of the Treaty of Washington, to permit the sailing of such a ship is a breach of neutrality. The application of the doctrine of continuous voyages by U. S. courts during the civil war tends in the same direction.

For further discussion of the usages of war, as affecting both neutral and belligerent, see the articles INTERNATIONAL LAW, NEUTRALITY, CONTRABAND, BLOCKADE, etc.

THEODORE S. WOOLSEY.

Varasdin', or Varasdin': county in Croatia-Slavonia; separated from Styria in the west by the Matzel Mountains; irrigated by the Drave; is fertile in producing grain, tobacco, wine, and fruits, and rich in cattle, game, and fish. It is the most densely populated county of the Hungarian crown (in 1890, 257,168). The capital, Varasdin, a royal free city, on the right bank of the Drave, 40 miles N. E. of Agram (see map of Austria-Hungary, ref. 7-E), has many Roman Catholic churches and cloisters, a synagogue, and a fortified castle. Its trade in wood and fruits is brisk, and it has factories of tobacco, rosolio, liquor, and vinegar. Pop. 10,370.

H. S.

Warbeck, PERKIN: a pretender to the crown of England who personated Richard, Duke of York, the younger of the two princes supposed to have been murdered in the Tower in 1483. He was said to have been the son of a Jew of Tournay. In 1490 he appeared at the court of Burgundy, where his extraordinary resemblance to Edward IV. was noted, and it is supposed that he was then instructed in the part he was to play on a future occasion. In 1492, in anticipation of the outbreak of hostilities between England and France, he landed at Cork, Ireland, and was joined by numerous partisans, but was soon obliged to fly to France, where he was acknowledged by Charles VIII. as Duke of York, received a pension, and was assigned a body-guard. After the Peace of Etaples he had to leave France; repaired again to Flanders 1493, where he was recognized by Margaret, the duchess-dowager (sister of Edward IV.), as her nephew. After being repulsed from the coast of Kent in July, 1495, and from Ireland in 1496, he proceeded to Scotland; was acknowledged by James IV., and married to Lady Catharine Gordon, daughter of the Earl of Huntley; invaded England with Scottish forces Oct., 1496, and again in the spring of 1497, when he besieged Norham Castle;

landed in Ireland July 30 of that year; proceeded thence to Cornwall, landing at Bodmin Sept. 7; assumed the title of Richard IV., and gathered around him 7,000 men, with whom he besieged Exeter, but was driven back to Taunton. Being hard pressed by the royal forces, he took sanctuary in Beaulieu Abbey, Hampshire; was induced to give himself up by the promise of a pardon; confessed his imposture, and was committed to the Tower in October; escaped to the sanctuary of Sheen June 9, 1498; was retaken in the following year, placed in the stocks at Westminster and at Cheapside, forced to read aloud his confession, and recommitted to the Tower, where, being soon afterward detected in another plan to escape, along with his fellow prisoner, Edward, Earl of Warwick, son of the Duke of Clarence, he was hanged, drawn, and quartered at Tyburn Nov. 23, 1499, Warwick being beheaded five days later. Revised by F. M. COLBY.

Warbler [deriv. of *warble* < M. Eng. *werbelen*, from O. Fr. *werbler*, quaver, trill, from O. H. Germ. *wirbilōn* (> Germ. *wirbeln*, warble, trill, liter., whirl); any small bird of the families *Mniotiltidae* or *Sylviidae*. Why the popular name was given it is hard to say, as very few of the warblers sing. The *Mniotiltidae* have nine primaries, a slender, unnotched bill, and scutellate tarsi. They are a peculiarly American group, comprising over 120 species, all of small size, under 6 inches in length, and many of bright but not gaudy plumage. They are active, largely insectivorous in diet, and vary greatly in their nesting habits, some making simple nests, others structures which rival those of humming-birds in beauty. The *Sylviidae* have ten primaries, a slender but rather broad, notched bill, and booted or scutellate tarsi. The family contains about 150 species, mostly of Old World birds, and generally of subdued colors. In habits they largely resemble the *Mniotiltidae*. F. A. LUCAS.

Warburton, ELIOT BARTHOLOMEW GEORGE: author; b. at Aughrin, County Galway, Ireland, in 1810; studied at Cambridge; was called to the Irish bar, but soon relinquished that profession to devote himself to the care of his estates. He traveled in the East in 1843; published on his return *The Crescent and the Cross, or Romance and Realities of Eastern Travel* (2 vols., 1844), which obtained immense popularity; settled in London 1844; published *Memoirs of Prince Rupert and the Cavaliers* (3 vols., 1849); *Reginald Hastings* (3 vols., 1850), a novel of the great rebellion; *Memoirs of Horace Walpole and his Contemporaries* (2 vols., 1851); *Darien, or the Merchant Prince, an Historical Romance* (3 vols., 1851); and *A Memoir of Charles Mordaunt, Earl of Peterborough* (3 vols., 1853). He perished in the burning of the steamer Amazon off Land's End Jan. 4, 1852. Revised by H. A. BEERS.

Warburton, WILLIAM, D. D.: Bishop of Gloucester; b. at Newark-upon-Trent, Dec. 24, 1698, where his father was an attorney and town-clerk; attended school at Newark and Oakham; in 1719 began the practice of law at Newark, but in 1723 abandoned the law and took deacon's orders; in 1727 was ordained priest, and made vicar of Gryesly, Nottinghamshire; became rector of Brant Broughton, Lincolnshire, 1728; preacher to the society of Lincoln's Inn, London, 1746; prebendary of Gloucester 1753; king's chaplain in ordinary 1754; prebendary of Durham 1755; dean of Bristol 1757, and in 1760 Bishop of Gloucester, where he died June 7, 1779. His spirited defense, in 1739-40, of Pope's *Essay on Man* against the charge of atheism made the poet his ardent and lifelong friend. He published *Miscellaneous Translations in Prose and Verse* (1723); *An Inquiry into the Causes of Prodiges and Miracles* (1727); *Alliance between Church and State* (1736); *Divine Legation of Moses demonstrated, on the principles of a religious Deist, from the omission of the doctrine of a future state of reward and punishment in the Jewish Dispensation* (his greatest work, 1738-41; 10th ed. 3 vols., 1846); a very poor edition of *Shakespeare* (1747); *Judith, or a Discourse concerning the Earthquake and Fiery Eruption which defeated the Emperor's Attempt to rebuild the Temple at Jerusalem* (1750); an edition of *Pope's Works* (1751); Pope, in his will, left him the copyright of his MSS., and appointed him their editor; *View of Bolingbroke's Posthumous Writings* (1754; contains a defense of revelation, which is "universally allowed to be a most masterly performance"); *The Doctrine of Grace* (1762). His own works were published by his friend Bishop Hurd, with a *Memoir* prefixed (7 vols., 1788-94). His *Letters to Hurd* appeared in 1808, and *Literary Remains* in 1841. See the *Life* by Rev. John Selby Watson (1863). Revised by S. M. JACKSON.

Ward [O. Eng. *weard*, keeping watch, guard (: O. H. Germ. *warta*, deriv. of *wardian*, to guard, watch; O. H. Germ. *wardōn* < Teuton. **ward-*, deriv. of *war-* > Germ. *wahren*, *bewahren*, heed; Eng. *wary*; cf. Gr. *δρᾶν*, **Fopān* < Indo-Eur. *gor-*]; in feudal law, the heir of the king's tenant in capite during his non-age, but in general language the term is applied to all infants under the power of guardians. See GUARDIAN.

Ward, ADOLPHUS WILLIAM: literary historian and biographer; b. at Hampstead, London, England, Dec. 2, 1837; educated in Germany and at Peterhouse College, Cambridge, and became Professor of History at Owen's College, Manchester, in 1866; afterward was principal of the college. Besides contributions to the *Encyclopaedia Britannica* and leading English reviews, he is author of *The House of Austria in the Thirty Years' War* (1869); *Dramatic Literature of the Age of Elizabeth* (2 vols., 1875); and *Lives of Chaucer* (1879) and *Dickens* (1882), in the English Men of Letters series; translator of Curtius's *History of Greece* (5 vols., 1868-74); and editor of *Pope's Poems* (Globe ed. 1869) and of the Chetham Society's edition of *Byron's Poems* (1894). Revised by H. A. BEERS.

Ward, ANN: See RADCLIFFE, ANN.

Ward, ARTEMAS: soldier and jurist; b. at Shrewsbury, Mass., Nov. 27, 1727; graduated at Harvard 1748; served in the French and Indian war, becoming lieutenant-colonel; was appointed a general officer by the Massachusetts provincial congress Oct. 27, 1774, and commander-in-chief of Massachusetts forces May 19, 1775; was in nominal command at the battle of Bunker Hill, though he remained at headquarters at Cambridge, and had no actual share in determining the events of that day; was appointed by the Continental Congress first on the list of major-generals June 17, 1775; was in command of the forces besieging Boston until the arrival of Gen. Washington, after which he was second in command; resigned Apr., 1776, in consequence of ill health; was chief justice of common pleas for Worcester County, 1776; president of the Massachusetts executive council 1777; sat in the Legislature sixteen years; was Speaker of that body 1785, and member of Congress 1791-95. D. at Shrewsbury, Oct. 28, 1800.

Ward, ARTEMUS: See BROWNE, CHARLES FARRAR.

Ward, EDGAR MELVILLE: genre-painter; b. in Urbana, O., Feb. 24, 1839; studied at the National Academy of Design, New York, and under Cabanel, in Paris; National Academician 1883. His pictures of scenes of country-life in the U. S. are good in the rendition of character. *Brittany Washerwomen* (1876), *The Sabot Maker* (1878), *The Collar Shop* (collection of T. B. Clarke, New York), and *The Quilling Party* (1892) are some of his principal works. His studio is in New York. WILLIAM A. COFFIN.

Ward, EDWARD MATTHEW, R. A.: painter; b. at Pimlico, London, England, in 1816; was a nephew of Horace and James Smith, authors of the *Rejected Addresses*; became in 1834 an art student at the Royal Academy, where he enjoyed special instruction from Wilkie, and exhibited a decided talent for original composition and color; studied at Rome 1836-39, gaining the silver medal of the Academy of St. Luke 1838; pursued a course of fresco-painting under Cornelius at Munich; exhibited his first picture at the Royal Academy 1839; presented unsuccessfully his *Boadicea* in the cartoon competition at Westminster Hall 1843; was brought into favorable notice by his *Dr. Johnson reading the MS. of the Vicar of Wakefield* (1843), *Goldsmith as a Wandering Musician* (1844), and *Dr. Johnson in the Anteroom of Lord Chesterfield* (1845); devoted himself successfully to the illustration of English and French history by a series of large pictures; was commissioned to paint eight pictures in oil for the corridor of the House of Commons 1852, three of which have since been reproduced in fresco and two in water-glass. He exhibited frequently in the Royal Academy, was made an associate in 1847, and became an Academician 1856. D. at Windsor, Jan. 15, 1879.

Ward, ELIZABETH STUART (Phelps): novelist and poet; b. at Andover, Mass., Aug. 13, 1844; daughter of Prof. Austin Phelps of the Andover Theological Seminary. She has resided mostly at her native place, devoting herself to the pursuit of letters and to various philanthropic and reform movements. In 1888 she was married to Rev. Herbert D. Ward, of New York. Her story *The Gates Ajar* (1868) made a strong impression, and has been followed by *Men, Women, and Ghosts* (1869); *The Silent Partner* (1870); *The*

Trotty Book (1870); *The Story of Avis* (1877); *Old Maids' Paradise* (1879); *Beyond the Gates* (1883); *Dr. Zay* (1884); *The Gates Between* (1887); and, in collaboration with her husband, *The Master of the Magicians* (1890), and *Come Forth* (1890). She has contributed many short stories to the magazines, and published a volume of essays, *The Struggle for Immortality* (1889); *Poetic Studies*, verse (1875); *Songs of the Silent World* (1885), etc. Religious earnestness and a certain tenseness of the conscience and the emotions, characteristic of New England and of Puritan inheritance, distinguish the work of this very popular writer. H. A. B.

Ward, FREDERICK TOWNSEND: b. at Salem, Mass., Nov. 29, 1831; educated at the Salem High School; was a lieutenant in the French service during the Crimean war; was with Walker in Nicaragua; became admiral-general in the service of the Emperor of China; organized the Chinese soldiers by modern methods, and won many victories over the rebel Taipings, but was killed in an engagement with them near Ningpo, Sept. 21, 1862.

Ward, HENRY AUGUSTUS: naturalist; b. at Rochester, N. Y., Mar. 9, 1834; educated at Williams College and at the Lawrence Scientific School of Harvard University, where he became assistant to Prof. Agassiz in the museum of comparative zoölogy; went to Europe in 1854; studied zoölogy at Paris and mineralogy at Freiberg; traveled in Palestine, Arabia, Egypt, Nubia, and the west coast of Africa, ascending the Niger; subsequently visited the West Indies, Central America, and the Western Territories of the U. S. as a mining engineer; was Professor of Natural Sciences at Rochester University 1860-75; established there a laboratory for the production of facsimiles of rare fossils, since extended to include various branches of natural history; made an extensive collection of modern zoölogy; was naturalist to the U. S. expedition to Santo Domingo 1871; and has since traveled extensively in various parts of the world. The Ward cabinets of mineralogy and geology at the University of Rochester occupy a large portion of Sibley Hall. Revised by F. A. LUCAS.

Ward, Mrs. HUMPHRY: See WARD, MARY AUGUSTA.

Ward, JOHN QUINCY ADAMS: sculptor; b. at Urbana, O., June 29, 1830. About 1849 he went into the studio of HENRY KIRKE BROWN (*q. v.*) and assisted him in some of his works, especially the equestrian statue of Washington in Union Square, New York. Between 1857 and 1861 he resided chiefly in Washington, D. C., where he made portrait-busts of some of the leading public men. During the excitement of the breaking out of the civil war he modeled his celebrated statuette of *The Freedman*, which represents a Negro breaking his manacles. This work became very popular because of its subject, and was of real excellence; many copies were sold in bronze, as well as in other material. In 1863 he modeled the *Indian Hunter*; he visited the western frontier that he might see the American Indians at home and found great instruction and inspiration in the opportunities there afforded him of studying the nude form of man in vigorous action. In 1864 the *Indian Hunter* was cast in bronze and put up in Central Park, New York city. Before this time Ward had opened a studio in New York, where he has since resided. Of figures of life size and larger he has completed for New York city the *Seventh Regiment Monument*, consisting chiefly of a colossal figure of a uniformed soldier of the regiment; a bronze statue of Shakspeare, in Central Park; a seated figure of Horace Greeley, in front of the office of *The New York Tribune*; a statue of Senator Conkling, in Madison Square; a statue of William E. Dodge, at Broadway and West Thirty-fourth Street; a statue of Washington, in front of the Sub-Treasury in Wall Street, on the spot where Washington took the oath of office as the first President of the U. S. in 1789; *The Pilgrim*, a bronze statue larger than life, erected in 1885 to commemorate the landing of the Pilgrims on Plymouth Rock. There is also a bust of Alexander L. Holley in Washington Square. His colossal statue of Henry Ward Beecher stands in front of city-hall in Brooklyn. One of his most important works is the equestrian statue of Gen. George H. Thomas, in Thomas Circle, Washington. In the same city is the statue of President Garfield, with three colossal emblematic figures at the base of the pedestal. In Boston is a large group commemorative of the discovery of the anæsthetic properties of ether; it represents *The Good Samaritan*, and was erected about 1865. The statue of Gen. John F. Reynolds, at Gettysburg, the statue of Israel Putnam, at Hartford, Conn., those of Gen. Lafayette, at Burlington,

Vt., and of Gen. Daniel Morgan, at Spartansburg, S. C., and very many portrait-busts are included in his works. He was president of the National Academy of Design 1872-73, and has always been active in the management of that institution. He was one of the founders of the National Sculpture Society in 1893; was its first president, and was re-elected to that office in Jan., 1895. RUSSELL STURGIS.

Ward, LESTER FRANK: geologist and botanist; b. at Joliet, Ill., June 18, 1841; attended various schools in the early part of his life; served in the Union army during the civil war; graduated at Columbian University, Washington, in 1869, and later received LL. B. and A. M. from that institution. Since 1865 he has lived in Washington, D. C., holding various civil positions—chief of the navigation division and librarian of the U. S. bureau of statistics—and in 1881 he entered the U. S. Geological Survey, where he has had charge of the paleobotany. He is also honorary curator of fossil plants in the U. S. National Museum. His scientific papers, etc., number about 400. In 1869 he conceived, and in the following years outlined, an extensive work on social science, which culminated in the publication of his *Dynamic Sociology* (2 vols., New York, 1883), and in 1893 he published *The Psychic Factors of Civilization* (Boston). Aside from these, his more important papers are a pamphlet entitled *Haeckel's Genesis of Man* (1879); *Guide to the Flora of Washington and Vicinity* (1881); *Sketch of Paleobotany* (Fifth Annual Report U. S. Geol. Survey, 1885); *The Geological Distribution of Fossil Plants* (Eighth Annual Report U. S. Geol. Survey, 1889); *The Course of Biologic Evolution* (1890); and *Neo-Darwinism and Neo-Lamarckism* (1891). He also contributed the botanical matter to *The Century Dictionary* from H to Z, and the article on *Plants, Fossil*, to *Johnson's Universal Cyclopaedia* (1895).

Ward, MARY AUGUSTA (Arnold): novelist; b. at Hobart, Tasmania, in 1851; eldest daughter of Thomas Arnold and niece of Matthew Arnold. Her father returned to England in 1856, and in 1872 she was married to Thomas Humphry Ward. She published *Milly and Otty* (1881); *Miss Bretherton* (1884), the heroine of which was popularly identified with Mary Anderson, the actress; a translation of *Amiel's Journal* (1885); *Robert Elsmere* (1888), a story dealing with religious doubt, which made a powerful impression and had an enormous circulation in England and the U. S.; *The History of David Grieve* (1892); *Marcella* (1894); and *The Story of Bessie Costrell* (1895). In 1890 she aided in establishing University Hall, in London, a settlement among the poor, and remains its honorary secretary. HENRY A. BEERS.

Ward, NATHANIEL: author; b. at Haverhill, Suffolk, England, about 1578; studied at Emmanuel College, Cambridge; graduated 1603; was for some years a lawyer, but later became preacher at St. James's, Duke's Place, London, and afterward rector of Standon Massaye, Essex. He became connected with the Massachusetts Company in 1630, emigrated to Massachusetts in 1634, and immediately became pastor at Agawam or Ipswich; resigned his charge on account of ill health Feb., 1637; took part in the settlement of Haverhill (named from his native place) May, 1640; was the author of the *Body of Liberties* adopted Dec., 1641, being the first code of laws established in New England; returned to England 1646; took part as a pamphleteer in the great political struggle then going on; became pastor of Shenfield, Essex, 1648, and died there in Oct., 1652. He was the author of *The Simple Cobbler of Agawam* (1647), a quaint political satire; *Mercurius Anti-Mechanicus, or the Simple Cobbler's Boy, with his Lap full of Caveats* (1648); *A Religious Retreat Sounded to a Religious Army* (1647); and a *Sermon before Parliament* (1647). A *Memoir* by John Ward Dean was published at Albany in 1848.

Revised by H. A. BEERS.

Ward, ROBERT PLUMER: author; b. in London, England, Mar. 19, 1765; educated at Oxford; was admitted to the bar in 1790, and wrote a number of juristic works which brought him into favorable notice. He sat in Parliament for Cokeremouth 1802-05, and was afterward Under Secretary of Foreign Affairs; was member of Parliament for Haslemere 1807-20; became Lord of the Admiralty in the Portland administration 1807; was clerk of the ordinance 1811-23, and auditor of the civil list from 1823 to 1831, when he retired from political life on a pension of £1,000, and spent his remaining years in literary work. D. at Okeover Hall, Staffordshire, Aug. 13, 1846. Among his juristic writings were *An Inquiry into the Foundation and History of the Law of Nations*, etc. (1795) and *A Treatise of the*

Relative Rights and Duties of Belligerents and Neutral Powers in Maritime Affairs, etc. (1801). He published anonymously *Tremaine, or the Man of Refinement* (1825), and *De Vere, or the Man of Independence* (1827), novels which had extraordinary popularity as delineations of English society, and subsequently issued *De Clifford* (1841) and other novels, and *An Historical Essay on the Real Character and Amount of the Precedent of Revolution of 1688* (2 vols., 1838). See E. Phipps, *Memoirs of the Political and Literary Life of Robert Plumer Ward, Esq.* (1850).

Revised by F. M. COLBY.

Ward, WILLIAM: missionary; b. at Derby, England, Oct. 20, 1769; learned the printer's trade; was licensed as a Baptist preacher; was sent in both capacities as a missionary to India 1799; settled at Serampore; printed numerous religious works in the Bengali language; wrote *An Account of the Writings, Religion, and Manners of the Hindoos, including Translations from their Principal Works* (Serampore, 4 vols. 4to, 1811; 5th ed. Madras, 1863); visited England, Holland, and the U. S. 1819-21, delivering addresses upon the cause of missions, and printed *Farewell Letters to a Few Friends in Britain and America, on Returning to Bengal in 1821* (London, 1821). D. of cholera at Serampore, Mar. 7, 1823. His *Account* was long a leading authority upon Indian matters, and may still be profitably consulted upon some points, although later works have revealed many inaccuracies in the description of native religions, and still more in the translations. A volume of *Memoirs* (1825) was prepared by Samuel Stennett, and a more adequate biography is in the *Life and Times of Carey, Marshman, and Ward, embracing the History of Serampore Mission* (2 vols., 1859; abridged ed., New York, 1867), by John Clark Marshman.

Revised by S. M. JACKSON.

Ward, WILLIAM HAYES, D. D., LL. D.: Orientalist and editor; b. at Abington, Mass., June 25, 1835; graduated at Amherst College 1856, at Andover Theological Seminary 1859, ordained in 1859, and became acting pastor of the Congregational churches of Oskaloosa and Grasshopper Falls, Kan.; in 1857-58 taught the natural sciences in Beloit College; in 1862 became teacher of sciences in the Utica Free Academy; in 1865-68 was Professor of Latin in Ripon College, Wisconsin; in 1868 joined the editorial staff of the *New York Independent*, of which he became superintending editor in 1870. He is a member of the American Oriental Society, and in 1889 was elected its president. He has published various articles in the *Bibliotheca Sacra* and in other journals on biblical criticism and Assyriology. The second statement of the American Palestine Exploration Society contains a paper of his on the Hamath inscriptions. In 1884 he led an exploring party to ancient Babylonia, of which he published a report in pamphlet form.

Revised by GEORGE P. FISHER.

Warden, DAVID BAILLIE, M. D.: author; b. in Ireland in 1778; emigrated to the U. S. in youth; received a classical education; graduated at the New York Medical College; was appointed secretary of legation to France 1804, and resided at Paris forty years, filling most of the time the office of U. S. consul; was well known in literary circles, and formed two libraries of American books which were acquired respectively by Harvard College (1823) and by the New York State Library (about 1840). He was the author of *A Statistical, Political, and Historical Account of the United States of North America* (Edinburgh, 3 vols., 1819), also published in French (Paris, 5 vols., 1820) and in German (Ilmenau, 1824); *L'Art de vérifier les Dates, Chronologie historique de l'Amérique* (Paris, 10 vols., 1826-44); *Bibliotheca Americana septentrionalis, etc.* (1820); and *Bibliotheca Americana* (1831); *Recherches sur les Antiquités de l'Amérique septentrionale* (Paris, 1827), which originally appeared in *Antiquitates Mexicanae* (Paris, 2 vols. folio, 1834-36); and several other minor publications. D. in Paris, Oct. 8, 1845.

War Department: in the U. S., an executive department of the Government, having control of military affairs; under the supervision of the President, as commander-in-chief of the army, and under the immediate direction of the Secretary of War, an officer of the cabinet appointed by the President by and with the advice and consent of the Senate. The chief functions of the secretary are the supervision of all estimates of appropriations for the expenses of the department and of the administration of the military service, the control of the board of ordnance and fortification, the supervision of the U. S. Military Academy at West

Point, and the general direction of all matters relating to river and harbor improvements. In the performance of his duties he is aided by an assistant secretary and a chief clerk. The department is subdivided into military bureaus, each under the direction of an officer of the regular army. These officers are the adjutant, inspector, quartermaster, commissary, surgeon, and paymaster generals, the chief of engineers, the chief of ordnance, the judge-advocate-general, and the chief signal officer.

F. M. C.

Wardian Case [named from Nathaniel Bagshaw Ward, its inventor, an Englishman]: a box whose sides and top are of glass, containing at the bottom a layer of earth, and used for growing ferns and other plants in parlor-culture. Probably from the fact that the air within is highly charged with moisture, many beautiful plants thrive well in Wardian cases which can not be grown in the open air.

Wardlaw, RALPH, D. D.: preacher and professor of theology; b. at Dalkeith, Midlothian, Scotland, Dec. 22, 1779; educated at the University of Glasgow and at the divinity school of the United Secession Church, for the ministry of which he was intended, but joined the Independent or Congregational denomination; in 1803 was ordained pastor of the North Albion Street chapel, Glasgow, Scotland, where, and at the chapel of the same congregation in West George Street, he labored through life, filling also gratuitously from 1811 the professorship of Systematic Theology in the Independent Theological Academy of that city. In 1853 the fiftieth anniversary of his ministry was celebrated by a public meeting and the formation of a fund for the establishment of the "Wardlaw Jubilee School and Mission-house" at Dove Hill, Glasgow. He was for many years the recognized head of the Independent body, which through his influence was widely extended through Scotland. He was the author of several treatises on the Socinian controversy, infant baptism, and Christian ethics, of *Expository Lectures on the Book of Ecclesiastes* (2 vols., 1821); *Lectures on Systematic Theology* (3 vols., 1856-57); and other works. D. at Glasgow, Dec. 17, 1853. His *Life* was written by Rev. Dr. W. L. Alexander (1856). Revised by S. M. JACKSON.

Ware: town of England; county of Herts.; on the Lea; 2½ miles E. N. E. of Hertford (see map of England, ref. 11-K). St. Mary's church, portions of which date from 1380, was restored in 1885-86. The great bed of Ware referred to in *Twelfth Night* has been taken to Rye House, 2 miles distant. Ware has breweries and malting establishments, and is celebrated in Cowper's poem, *John Gilpin*. Pop. (1891) 5,121.

Ware: town (made a precinct in 1742, a district in 1761, and a town in 1775); Hampshire co., Mass.; on the Ware river, and the Boston and Albany and the Boston and Maine railways; 12 miles N. of Palmer, 25 miles N. E. of Springfield (for location, see map of Massachusetts, ref. 3-E). It has an elevation of 550 feet above sea-level, is compactly built, and has narrow but well-graded streets and sidewalks, an excellent water-supply, and gas and electric-light plants. There are 8 churches, high school, 28 district schools, public library of 12,000 volumes, Roman Catholic parochial school, and a weekly newspaper. The town has annual receipts and expenditures balancing at about \$86,000; net debt, \$145,900; assessed valuation, over \$4,000,000. There are a national bank with capital of \$300,000, and a savings-bank with deposits of nearly \$3,500,000. The principal industry is the manufacture of cotton and woolen goods. Pop. (1880) 4,817; (1890) 7,329; (1895) 7,651.

EDWARD H. GILBERT.

Ware, HENRY, D. D.: theologian; b. at Sherburne, Mass., Apr. 1, 1764; graduated at Harvard 1785; pursued the study of theology 1785-87; was ordained pastor of the first church at Hingham, Mass., Oct. 24, 1787; was a leader in the direction of the Unitarian opinions then becoming prevalent among the Congregationalists of New England; precipitated the theological crisis by his acceptance of the Hollis professorship of Divinity in Harvard University 1805, but took no part in the controversy thereby excited until some years later, when he published *Letters to Trinitarians and Calvinists, occasioned by Dr. Wood's Letters to Unitarians* (Cambridge, 1820), followed by *An Answer to Dr. Wood's Reply* (1822) and *A Postscript to an Answer, etc.* (1823). He printed a number of single sermons, and issued in 1842 one of his courses of theological lectures with the title *An Inquiry into the Foundation, Evidences, and Truth of Religion* (Cambridge and London, 2 vols., 1842).

In addition to his professorship, which he resigned in 1840 in consequence of the loss of his sight, he had charge of the Harvard Divinity School from its foundation in 1826 to his death at Cambridge, July 12, 1845. His opinions were conservative among Unitarians, and he became a founder of that "Unitarian orthodoxy" which Channing heartily condemned and which Andrews Norton defended against Emerson and Ripley in 1839—men whose intellectual freedom he had inspired by his critical studies.

Revised by J. W. CHADWICK.

Ware, HENRY, Jr., D. D.: preacher and author; son of Henry Ware, theologian; b. at Hingham, Mass., Apr. 21, 1794; graduated at Harvard 1812; taught at Phillips (Exeter) Academy 1812-14; studied theology under his father's direction; was ordained pastor of the Second church (Unitarian) at Boston, Jan. 1, 1817; took an active part in the formal organization of the Unitarian body, editing its organ, the *Christian Disciple*, which afterward became the *Christian Examiner*; visited Europe 1829-30; resigned his pastorate on account of ill health 1830, and filled the Parkman professorship of Pulpit Eloquence in the Divinity School of Harvard University 1830-42. He was the author of *Hints on Extemporaneous Preaching* (1824); *Recollections of Jotham Anderson, Minister of the Gospel* (about 1824); *On the Formation of the Christian Character* (1831); *Life of the Saviour* (1832; new ed. New York, 1868); *The Feast of the Tabernacles* (1837), a poem prepared for an oratorio; *Memoirs of Rev. Dr. Parker* (1834), Dr. Noah Worcester, Dr. Joseph Priestley, and Oberlin; and *Scenes and Characters illustrating Christian Truth* (2 vols., 1837), besides miscellaneous poems and single sermons. D. at Framingham, Mass., Sept. 22, 1843. A *Memoir* was published by his brother, John Ware, M. D. (Boston, 1846). Four volumes of selections from his writings were edited by Rev. Chandler Robbins (1846-47).

Revised by J. W. CHADWICK.

Ware, WILLIAM: author; son of Henry Ware, theologian; b. at Hingham, Mass., Aug. 3, 1797; graduated at Harvard 1816; taught school at Hingham 1816-17; studied theology under his father's direction, graduating at Cambridge 1819; preached successively at Northboro, Mass., Brooklyn, Conn., and Burlington, Vt.; was pastor of the First Unitarian church in New York city from Dec. 18, 1821, to Oct. 19, 1836; preached at Brookline, Mass., 1836-37, at Waltham 1837-38; settled without pastoral charge at Jamaica Plains 1838, and at Cambridge 1839; was editor and proprietor of the *Christian Examiner* 1839-44; was pastor of a church at West Cambridge 1844-45; resigned on account of failing health; settled again at Cambridge, where he occasionally preached; spent a year in Europe, chiefly in Italy, 1848-49. He was the author of *Letters from Palmyra* (New York, 2 vols., 1837), which appeared in the *Knickerbocker Magazine* the previous year, and were subsequently republished in London and New York with the title *Zenobia, or the Fall of Palmyra* (new ed. 1868); *Probus, or Rome in the Third Century* (2 vols., 1838), subsequently republished as *Aureliian* (new ed. 1868); *Julian, or Scenes in Judea* (New York, 2 vols., 1841); *Sketches of European Capitals* (1851); *Lectures on the Works and Genius of Washington Allston* (1852); and a *Life of Nathaniel Bacon*, in Sparks's series; editor of *American Unitarian Biography* (2 vols., 1850). D. at Cambridge, Mass., Feb. 19, 1852. Revised by J. W. CHADWICK.

Wareham: town (incorporated in 1739); Plymouth co., Mass.; on Buzzard's Bay, and the N. Y., N. H., and Hart. Railroad; 16 miles N. E. of New Bedford, 49 miles S. E. of Boston (for location, see map of Massachusetts, ref. 5-1). It contains the villages of Wareham, West Wareham, South Wareham, East Wareham, and Onset; has 4 churches, high school, 18 district schools, public library, national bank with capital of \$100,000, and a savings-bank; and is principally engaged in cranberry-growing and iron-manufacturing. In 1894 it had an assessed valuation of nearly \$2,000,000. Pop. (1880) 2,896; (1890) 3,451; (1895) 3,367.

Warehouseman: one who receives and stores goods as a business for compensation. He is a bailee for hire, and is bound to take ordinary care of the property intrusted to him. (See BAILMENT and NEGLIGENCE.) According to the prevailing view in the U. S., the business of a warehouseman may be so affected with a public interest as to justify the Legislature in fixing his charges. Hence statutes declaring grain elevators public warehouses, regulating their use, and prescribing schedules of charges have been held constitutional, even though the elevators in question were not practical monopolies to which the citizens were compelled

to resort, and by which a tribute could be exacted from the community. (*Brass vs. Stoerer*, 153 U. S. 391, A. D. 1894, four judges dissenting.) The correctness of this view has been strenuously denied. "The vice of the doctrine is," said Justice Brewer, dissenting in *Budd vs. New York*, 143 U. S. at p. 548, "that it places a public interest in the use of property upon the same basis as a public use of property. . . . I believe the time is not distant when the evils resulting from this assumption of a power on the part of government to determine the compensation a man may receive for the use of his property or the performance of his personal services will become so apparent that the courts will hasten to declare that government can prescribe compensation only when it grants a special privilege, as in the creation of a corporation, or when the service which is rendered is a public service, or property is in fact devoted to a public use." This opinion, as well as the dissenting opinion of Judge Peckham in the same case, in 117 N. Y. 34-71, will repay the most careful perusal.

FRANCIS M. BURDICK.

Warehouse Receipts: documents issued by warehousemen, reciting that certain goods have been received by them and are deliverable upon the indorsement and return of the receipts and the payment of charges. Such instruments are frequently declared negotiable by statute or by the agreement of the parties. Their indorsement and delivery operate as a symbolical delivery of the goods to which they refer. Hence the owner of goods who sells and gives a warehouse receipt for them loses his vendor's lien, although they remain in his warehouse, if the receipt is transferred by the purchaser to a *bona-fide* holder. (*Greenbaum vs. A. Furst Distillery Co.* (Ky.), 25 S. W. R. 498.) When they are negotiable, their transferee may acquire rights which the transferor did not have. For example, if they describe the goods as deposited in a free warehouse—that is, one where they are free from taxes or duties—their *bona-fide* purchaser will be entitled to recover the goods from the warehouseman without paying such taxes or duties, although his vendor knew the taxes or duties had not been paid, and was under an obligation to pay them.

These receipts, however, are not treated as negotiable paper in the full sense of that term. They are not representatives of money, nor securities for the payment of money. Those who issue them are not guarantors that the persons to whose order the goods to which they refer are deliverable are the owners of such goods. *Insurance Co. vs. Kiger*, 103 U. S. 352.

FRANCIS M. BURDICK.

Warehousing System: a credit system, whereby the Government extends the time for the payment of duties and revenue upon goods, retaining them in its possession meanwhile, to secure such payment. Duties on imports or on manufactures naturally fall due as soon as the goods arrive in the port or are produced on the soil of the government imposing them. But the economy and convenience of importing and manufacturing articles in great quantities and in advance of their actual requirement for consumption is so great, and the immediate payment of duties upon them would often involve such a large and unremunerative investment of the capital of importers and manufacturers, that the principle of warehousing goods in Government custody, with a reasonable extension of time for the payment of the duties and other Government charges, has been adopted by all the leading commercial nations. The payment of the duties is secured by a bond given by the importer or owner of the goods to the Government, with sufficient sureties, stipulating for the payment of the duties within the credit period provided by law. The goods are then said to be "in bond," the period allowed for the payment of the duties, etc., is the "bonded period," and the places of deposit are known as "bonded warehouses," or, less frequently, as "bonded stores." The importer or owner has access to the goods for the purpose of disposing of them at any time during the bonded period, and he thus practically pays the duties when he sells the goods. Under the statutes providing for such a system the duties, although levied at the time when the goods are received at the port of entry or when the manufacture of them is completed, do not become payable until the withdrawal of the goods or the expiration of the whole term of credit, and consequently the consignee or owner is free from any interest charges upon the duties payable by him.

The system is of comparatively recent origin, having been first adopted in Great Britain in 1802. It is now governed in that country by the Customs Consolidation Act of 1853.

and its amendments. In the U. S. the system, notwithstanding its manifest conveniences, was not established till 1846, though it had for more than a score of years been persistently urged upon the attention of Congress by the leading commercial bodies of the country. Confined at first to the warehousing of imported merchandise, it has been developed by subsequent legislation into a very elaborate and somewhat complicated system for the Government control, in its own or in private warehouses, of nearly all classes of dutiable and taxable goods, whether imported or of domestic production. This system will be better understood if the two classes are considered separately.

I. BONDED WAREHOUSES FOR IMPORTED GOODS.

The warehousing system, when finally established, did away entirely with the old system of credits on imports, the immediate payment of duties being postponed only on those goods that were stored in the Government warehouses. The original act, passed Aug. 6, 1846, has been extensively modified by subsequent legislation, especially by an act passed Mar. 28, 1854, and the tariff law of 1890 (the McKinley Act). Under these statutes an elaborate official classification of bonded warehouses has been adopted. As the several classes are usually designated by the numbers assigned to them, it is necessary to enumerate them here, notwithstanding the fact that the original classification has become defective, and does not include several classes which have been created by recent acts of Congress. This classification is as follows:

Class I. Government Bonded Warehouses.—These are maintained by the Government in buildings owned or leased by it, and exist only in those ports in which there are no private bonded warehouses, or where the latter are not adequate to transact the business of the port. They are in the immediate and exclusive custody of the collector, who conducts a general storage business for dutiable goods in behalf of the Government.

Class II. Importers' Bonded Warehouses.—These belong to the class of private warehouses, and may be established by the Secretary of the Treasury in certain cases where it seems desirable to make special provision for the warehousing of the goods of a large importer or purchaser of imported goods. The building employed as a warehouse must be exclusively devoted to that purpose, and the owner or importer pays for the services of the customs' officer in charge of the same.

Class III. Private Bonded Warehouses.—These were authorized by the act of 1854, above referred to, and, under Government supervision, do the bulk of the warehousing business in the ports of entry of the U. S. They are owned and conducted by private parties, who carry on an ordinary storage business for their own profit, the Government extending its authority over them and retaining a virtual possession of and control over the goods stored therein. No person has a right to keep a warehouse for the storage of dutiable goods unless appointed by the Secretary of the Treasury, who may revoke such appointment at his pleasure.

Class IV. Private bonded warehouses, consisting of yards or sheds of suitable construction for the storage of wood, coal, mahogany, dyewoods, lumber, molasses, sugar in hogsheads and tierces, railroad, pig, and bar iron, anchors, chain cables, and other articles specially authorized. These yards or sheds must be built and inclosed in a prescribed way.

Class V. Private bonded warehouses, consisting of bins or parts of warehouses or elevators separated from the rest of the building, and used exclusively for the storage of grain.

Class VI. Private bonded warehouses, consisting of cellars or vaults, used exclusively for the storage of imported wines and distilled liquors.

To the foregoing enumerated classes of bonded warehouses should now be added two non-enumerated classes of more recent origin, viz.:

(a) *Importers' bonded warehouses,* created by act of Mar. 24, 1874, for the storing and cleaning of rice, which has been imported for the purpose of cleaning and re-exporting the same; and

(b) *Bonded manufacturing warehouses,* created by the Tariff Act of 1894 (See, 9), for the manufacture of articles in whole or in part of imported materials, or of materials subject to internal-revenue tax, and intended for exportation.

II. BONDED WAREHOUSES FOR DOMESTIC PRODUCTS.

In addition to the foregoing classes of bonded warehouses provided for the storage and custody of dutiable imports,

the Treasury Department has, under the authority of successive acts of Congress, established the following classes of warehouses for the storage of domestic products which are subject to internal-revenue taxes.

A. Distillery Warehouses.—The creation of bonded warehouses for the storage of distilled spirits formed an important part of the internal-revenue system, established by the so-called Internal Revenue Act of July 20, 1868. The warehouses provided for by this act were, in respect of their ownership, custody, and regulation, similar to those of the second and sixth classes above described. They consisted of buildings or parts of buildings, belonging to the distiller, exclusively devoted to the storage of the product of the distillery to which they belonged, but under the immediate and constant supervision of the internal-revenue collector of the district. The spirits, as soon as stored, passed into the legal possession and control of the Government.

B. Special Bonded Warehouses.—The development of the industry of manufacturing spirits from grapes and other fruits led to the enactment, Mar. 3, 1877, and Oct. 18, 1888, of laws authorizing the establishment by collectors of internal revenue of warehouses for the storage of brandy made from such fruits.

C. General Bonded Warehouses.—These are intended to supplement and perhaps, in most cases, to supersede the distillery warehouses above described. The authority for their establishment is contained in the Tariff Act of Aug. 27, 1894, known as the Wilson Act. They are to be used exclusively for the storage of spirits distilled from materials other than fruit, and it is provided that such spirits may be transferred by the collector from the distillery warehouses to the warehouses established under the act.

D. Bonded Manufacturing Warehouses.—These have already been briefly referred to above, in connection with the system established by Congress for the warehousing of imported goods. The act creating or authorizing them (Tariff Act of 1894) exempts from internal-revenue taxation articles otherwise subject thereto, which are employed in the manufacture of goods intended for exportation. Warehouses of this class are established to provide for Government supervision of such articles until thus manufactured and exported.

The rules governing the reception and custody of goods and the rights of the Government in the same, in these several classes of warehouses, are substantially identical. Merchandise of a perishable nature and gunpowder and other explosive substances, except firecrackers, are not entitled to storage. If any such articles are deposited, either in public or private stores, the collector is required to sell them forthwith. The right of the importer or owner to withdraw goods upon payment of the duties and charges is limited to the credit period provided by the statute. At the end of that period—which is now (with an exception to be noted hereafter) uniformly fixed at three years—the goods are forfeited to the Government, and must then be sold and the proceeds paid into the Treasury. There is no right of redemption, and the owner can not prevent such sale by tendering the amount due after the bonded period has expired. However, the Secretary of the Treasury is authorized to pay over the proceeds, after deducting all duties, charges, and expenses, to the consignee or owner of the goods. Until 1890 an additional duty of 10 per cent. was added to the original duty on imported goods which were allowed to remain in storage longer than one year, but the Tariff Act of that year, as interpreted by the Treasury Department, impliedly repealed this provision. It is obvious that, in the absence of express legislation, the duty or tax for which goods are liable is such as is in force and is levied at the time when the goods are received or produced, and that subsequent changes in the tariff, made while the goods are in bond, will not affect them. However, there is nothing to prevent Congress from subjecting merchandise on which the duty has not already been paid to the altered rate of a new tariff act, and this was, in fact, done in the case of distilled liquors, by the Tariff Act of 1894. Such liquors then in bond were expressly included within the terms of the increased internal-revenue tariff, and, in consideration thereof, the bonded period of such liquors was extended from three to eight years.

Inasmuch as duties and other revenue taxes are levied on goods imported or manufactured for home consumption, such taxes are withdrawn, even after having been once levied, from goods which are thereafter exported. Accordingly, there is nothing to prevent an importer who desires to avail

himself of a favorable change in the tariff, effected while his goods are in bond, from exporting those goods again and then reimporting them under the new rate. Of course this would be a profitable transaction only in the unusual event of a tariff reduction so great as to more than neutralize the cost of handling and shipping the goods twice over the route of exportation. The foregoing principle (exempting from duty goods imported for the purpose of exporting them again, has been extended, in a few cases, so as to permit the temporary withdrawal of merchandise from bonded warehouses for the purpose of treating it and changing its commercial form and then of re-exporting it. Thus metals imported for the purpose of smelting and refining and then of exporting the same may be withdrawn from bond without the payment of duty thereon. Such cases are exceptional, however, the general rule being that goods can not be withdrawn from store to make a change in their condition (as sugars to be refined), or for temporary use, and then returned. Thus in 1889 the Treasury Department was called upon to decide that the proprietors of a hippodrome could not be permitted to withdraw the hippodrome and its paraphernalia from bond for the purpose of exhibiting the same and then of exporting it again, and also that there was no authority, under which the Madison Square Garden in New York could be made a bonded warehouse so as to allow the said hippodrome to be entered under bond for performance there.

The materials for a more detailed study of the warehousing system are to be found in the U. S. statutes at large and the decisions of the Treasury Department.

GEORGE W. KIRCHWEY.

Warfield, BENJAMIN BRECKENRIDGE, D. D., LL. D.: educator and author; b. at Lexington, Ky., Nov. 5, 1851; graduated at Princeton College 1871, at Princeton Theological Seminary 1876; studied at Leipzig University 1877; pastor of First Presbyterian church, Dayton, O., 1876-77; of First Presbyterian church, Baltimore, Md., 1877-78; instructor in New Testament Literature and Exegesis in Western Theological Seminary, Allegheny, Pa., 1878-79; professor of same 1879-87; became Professor of Didactic and Polemical Theology in Princeton Theological Seminary 1887; author of *The Divine Origin of the Bible* (Philadelphia, 1881); with Dr. Hodge, of *Inspiration* (Philadelphia, 1881); *Introduction to the Textual Criticism of the New Testament* (London and New York, 1886); *Augustine's Anti-Pelagian Treatises* (New York, 1887); *The Idea of Systematic Theology considered as a Science*, an inaugural address (New York, 1888); *On the Proposed Revision of the Westminster Confession* (New York, 1891); *The Development of the Doctrine of Infant Salvation* (New York, 1891); *The Canon of the New Testament* (Philadelphia, 1892); *The Gospel of the Incarnation* (New York, 1893); edited *Princeton Sermons*, chiefly by the professors in Princeton Theological Seminary; managing editor with Charles A. Briggs, D. D., of *The Presbyterian Review* (1889); managing editor since 1890 of *The Presbyterian and Reformed Review*.

Warfield, ETHELBERT DUDLEY, LL. D.: educator and author; b. at Lexington, Ky., Mar. 16, 1861; graduated at Princeton College 1882; pursued a graduate course at Wadham College, Oxford, England, and in Germany; graduated at the law school of Columbia College, New York; admitted to the bar 1884; practiced law until called to the presidency of Miami University, Oxford, O., 1888; became president of Lafayette College, Easton, Pa., Sept., 1891. In both institutions he joined to the duties of president the headship of the department of history. Author of *The Kentucky Resolutions of 1798* (New York, 1887), and of various contributions to periodicals. C. H. T.

Warm-blooded Animals: those vertebrates possessed of warm blood, which is such simply by virtue of a complete circulation of the fluid, and its aëration through the medium of lungs at each revolution. The animals must consequently all breathe air direct, and this is done by the fish-like whales and porpoises as well as by the true terrestrial quadrupeds and birds. The only warm-blooded animals are the mammals and birds, and these were almost always associated by the older naturalists under the above name or its equivalents, *Calida animalia*, *Hæmatotherma*, etc. This combination is now known, however, not to be a natural one, inasmuch as the birds are much more nearly related to the reptiles than to the mammals, and the character combining them is a mere physiological adaptation for the same functions of life.

Warming and Ventilation: In cold and temperate climates the heating and the ventilation of buildings must be considered together, because the amount and arrangement of the heating surfaces depend largely upon the amount of ventilation to be provided for, and the arrangements for securing ventilation depend, to a considerable extent, upon the methods of heating employed.

By ventilation is meant a regular and continuous change of air in a room or inclosed space. The objects of ventilation are to remove offensive or dangerous gases, foul odors, dusts, and moisture, to supply oxygen, and to regulate temperature. As applied to human habitations and public buildings, it is intended to bring into a room the external air in sufficient quantity to dilute the products of respiration and exhalation of the occupants to a certain degree, and to remove from the room a corresponding quantity of the vitiated air. It is a very common idea that ventilation means simply the removal of foul air, and that if an opening, tube, or flue is provided for this purpose all that is necessary has been done. Most of the so-called patent ventilators are contrivances of this character. But it is the securing of the admission and proper distribution of a sufficient quantity of fresh air that is the real problem, and if this be done the getting rid of the foul air is a comparatively easy matter.

In the process of animal respiration, and in the combustion of wood, coal, oil, or illuminating-gas, a part of the free oxygen of the atmosphere combines with carbon, forming carbon dioxide. A certain amount of free oxygen is necessary for the maintenance of animal life, and when the proportion of this gas in the inspired air falls below this amount death rapidly follows. In 100 parts of ordinary free atmosphere there are about 20.96 parts of oxygen, 78 parts of nitrogen, 1 part of argon, and .04 part of carbon dioxide, these gases being a mixture and not in chemical combination. In 100 parts of air expired from the human lungs there are about 16.03 parts of oxygen, 78.2 parts of nitrogen, 1 part of argon, and 4.77 parts of carbon dioxide. If a man be inclosed in an air-tight space and compelled to rebreathe the air which he has inhaled, the free oxygen continues to diminish and the carbon dioxide to increase until the oxygenation of the blood in the lungs, which is necessary to life, can no longer be effected, and death from suffocation follows. On the capture of Fort William, in Calcutta, in 1756, 146 Europeans were pressed into a chamber scarcely 20 feet square, with two small windows. The next morning only 23 were alive, and these were greatly exhausted. This incident of the "Black Hole of Calcutta," and a somewhat similar occurrence on the steamer Londonderry, when, out of 150 passengers confined in a small cabin for several hours, 70 died, illustrate the effects of air rendered excessively impure by respiration and bodily exhalations. A much smaller amount of such impurity in the air is sufficient to produce discomfort, and, if its inspiration is long continued, disease; but definite information is wanting as to the precise nature of the disorder which is thus produced, or as to what may be called the permissible limit of deterioration of the air. The vital statistics of soldiers living in unventilated barracks and of the occupants of crowded and ill-ventilated tenement-houses show that such persons have a high death-rate, due mainly to consumption, pneumonia, and other diseases of the lungs; but how far this is due to changes in the gaseous constituents of the air, and how far to increased risk of inhaling the bacteria of tuberculosis, pneumonia, etc., in such uncleanly localities, is uncertain. Carbon dioxide, in the proportion in which it is found in the most crowded barrack or lodging-room, does not appear to be, in itself, poisonous; at all events, it may be inhaled in such proportion for days together without producing any apparent effects, provided that the proportion of oxygen is nearly normal. It has been commonly supposed that expired air contains volatile organic matters which are poisonous, but careful experiments have recently shown that this is very doubtful so far as the lower animals are concerned, and that if such matters do exist in expired air it must be in extremely small quantity. The discomfort produced in crowded and badly ventilated assembly-halls appears to be largely due to excessive temperature and moisture, but it may also be in part due to changes in the composition of the air itself. In a railway-car running between St. Petersburg and Moscow, and carrying eighty third-class passengers, at the end of nine hours—with an outside temperature of -22° F., a temperature in the upper part of the ear of 21° F., and at the floor of -6° F., the carbon dioxide being 94 per 10,000—a chemist could no longer endure the foul air, although the

peasants did not seem to be materially affected. The rule that is usually accepted is that when the air in a room occupied by human beings has a decidedly close and musty odor to a person coming in from the outside air—that air is so impure as to be probably injurious to health. Under ordinary circumstances of humidity and temperature such an unpleasant odor will exist when the proportion of carbon dioxide in the air has risen to 8 or 9 parts per 10,000. As the proportion of carbon dioxide in air can be measured with comparative ease and accuracy, such proportion is taken as the index of the other impurities, and it is generally agreed that this proportion should not exceed 7 parts in 10,000, while English sanitarians, following Parkes and de Chaumont, fix the limit at 6 parts in 10,000. An adult male gives off from '6 to '7 cubic foot, and a female from '4 to '5 cubic foot of carbon dioxide an hour, the mean for a mixed assembly being about '6.

The amount of air-supply to be provided for a room depends on the purposes for which it is to be used—whether it is to be occupied for hours continuously, like a sleeping-room or hospital ward, or only for an hour or two. Assuming that no reliance is to be placed on cracks and crevices, and that the walls will be made practically air-tight by paper or paint, the following table shows the amount of air which should be supplied to different kinds of rooms to secure freedom from odor and satisfactory ventilation:

Character of rooms.	Cubic feet of air an hour.
Hospitals	3,600 per bed.
Legislative assembly-halls	3,600 " seat.
Barracks and bedrooms	3,000 " person.
Schools and churches	2,000 to 2,400 " "
Theaters and ordinary halls of audience	2,000 " seat.
Office rooms and dining-rooms	1,800 " person.

These quantities are nearly double the amounts usually supplied, but they are the quantities which should be used by the architect in calculating sizes of flues, registers, and heating apparatus for new buildings.

As a rule, the amount of air required for diluting the products of respiration is also sufficient to maintain combustion of fires and lights; but if the number of lights be large in proportion to the number of persons, a special supply of air for them may be desirable; 1,000 cubic feet of air per hour per gas-burner is sufficient. Electric lights require no provision for air-supply.

Men require fresh air not only for respiration, but to carry off the heat which they produce, and the warmer and moister the air the more is required to secure comfort. In a hot, moist day without wind, sufficient ventilation can not be secured out of doors. Ventilation implies movement of air due to some force, usually that due to differences in weight of two adjacent columns of air, such difference being due to differences in temperature. Air expands about $\frac{1}{273}$ of its volume for each degree Fahrenheit, or $\frac{1}{273}$ of its volume for each degree centigrade, that it is heated; and the cause of the ascent of warm air in a flue is the greater weight of the column of outside air of the same height, but of a lower temperature, and therefore denser and heavier, which falls toward the opening at the bottom of the flue and pushes upward the warmer and lighter air. The differences in pressure between the two columns in any given case are indicated by the velocity with which the warm air ascends, and this, in

feet per second, is equal to $8\sqrt{\frac{(t-t')h}{491}}$, in which t is the

temperature of the warm air in the flue, t' the temperature of the colder air outside, both in degrees Fahrenheit, and h the height of the flue in feet.

The velocity thus determined is the theoretical velocity, and the real velocity is usually from 20 to 30 per cent. less. Knowing the velocity and the area of the cross-section of the flue, the quantity of air that is passing up is easily determined. The cause of wind is the same as that of the current at the base of a heated flue.

The ventilation which is produced by currents of air due to wind, or by the warming of the air by ordinary heating apparatus, is called natural ventilation; while that which is produced by power which is independent of the heating apparatus or of wind, and which is applied expressly for the purpose, is called artificial or forced ventilation. Forced ventilation may be produced by heating the air in the outlet flue or chimney being expanded and rarefied by means of coils of steam-pipe, called accelerating coils, or by gas-jets, or by small furnaces, and the velocity of the air-current being thus increased as well as the aspirating power at the

openings into the flue from the rooms to be ventilated; or it may be produced by fans or blowers driven by steam or water power, or by inducing currents of air by means of jets of steam, or of compressed air, or by a stream of falling water. In seasons when artificial heat is not required, the wind is one of the most powerful and useful means of ventilation, since an enormous amount of air is moved by a gentle wind acting through open windows and doors; but it is irregular in its action, and often fails when it is most needed.

Systems of Artificial Ventilation.—While natural ventilation is still relied upon for almost all dwelling-houses, engineers are resorting more and more to the use of some form of fan or blower to insure and regulate the proper flow of air in schools, hospitals, theaters, and other large buildings where many persons are assembled. Such fans or blowers are often so placed as to force a current of air through a series of coils of steam-heated pipes, and thence through galvanized iron ducts to the rooms which are to be warmed, forming what is known as a hot-blast system. Such fans are usually comparatively small, are run at high speed, and, to save expense, the ducts are made as small as possible, thus necessitating considerable velocity in the currents passing through them to furnish the requisite supply. This involves great loss of force from friction, especially in the smaller ducts, and what is gained in cheapness of first cost of construction by making the fan and flue small is much more than lost in a few years by the increased consumption of fuel to furnish power. As a general rule, air-flues, especially the smaller ones, should have such dimensions that the requisite amount of air may be obtained through them with a velocity of not more than 480 feet per minute, and a velocity not to exceed 400 feet per minute is more economical in the long run. In an ordinary chimney-flue, without a forced draught, the velocity of the ascending current averages about 6 feet per second.

When the air is forced into a room by means of a fan or blower it is called a plenum system, and this is what is usually employed for halls of assembly. When the air is drawn from the room by a fan or heated chimney, it is called an aspirating system. Sometimes both systems are employed together. As electricity has become more available as a source of power, the use of small electric aspirating fans is increasing, and they may often be made useful; but to effect a really useful change of air they must have some opening for discharge of air outside the room, because if they are used merely to stir the air and produce a current in the room they contribute nothing to its ventilation.

Methods of Warming Buildings.—The artificial heating of a room or building is effected in several different ways, technically known as direct radiation, indirect radiation, and direct-indirect radiation, or by combinations of these. In heating by direct radiation the heating surfaces are placed in the room to be warmed, and are not connected with the air-supply. This includes fireplaces, ordinary stoves (see STOVE), pipes, or radiators placed in the room and heated by steam, hot water, or electricity, and methods of heating the walls and floors of a room as a mass. Of these the fireplace, or open grate, is the only one which really heats entirely or mainly by radiant heat, in which the heat passes in straight lines through the air until it is intercepted by some solid or liquid, which it warms. Such heat does not appreciably warm the air through which it passes. Much the greater part of the heat furnished by stoves and heated pipes or other surfaces is convected heat—that is, heat conveyed by particles of air which come in contact with the hot surface and then pass off in currents, conveying this heat to the colder surfaces in the room against which they strike. Heating by indirect radiation is the heating by hot air, which air has been warmed by heating surfaces placed in some other room, usually in the basement or cellar, and which are heated either directly as in a furnace, or by steam or hot water. In heating by direct-indirect radiation the heating surfaces are placed in the room to be warmed, but are so arranged, usually against the outer wall or beneath the windows, that fresh cold air is brought in around them in order that it may be warmed.

Direct-radiation heating by means of fireplaces is the cheapest as regards construction, but much the most costly as regards fuel. It is an agreeable and desirable addition to other means of heating, furnishes a good outlet flue, and should be placed in all sitting-rooms and bedrooms; but it is dangerous, and is now rarely relied upon as the sole source of heat.

Direct-radiation heating by means of steam is now more used in large buildings than any other, because the apparatus is cheaper to construct than that for steam or hot water indirect radiation, and can also be run with less cost if there is little or no fresh air to be heated.

The great majority of small dwelling-houses in the U. S. are heated by stoves, and have no provisions for ventilation. In houses of a somewhat better class the hot-air furnace is very commonly employed, and of this there are many patterns. As a rule, they are too small, and in very cold weather the heating surfaces must be raised to a high temperature to secure comfort, the joints soon become leaky and allow carbonic oxide and sulphur compounds to pass into the air-supply, which is excessively hot and dry, and is apt to produce headache, languor, and unpleasant sensations of various kinds. As furnaces are usually set, the only way to prevent the room from becoming too warm is to shut off the air-supply of the room. The source of the fresh-air supply to a furnace is often unsatisfactory, and is contaminated with cellar air. So far as comfort and health are concerned, the best mode of heating a first-class dwelling-house, or a hospital, is by indirect radiation from surfaces heated by water to a temperature not to exceed 180° F., and usually not exceeding 150° F. The object of this method is to warm all the air required for heating and ventilation to the temperature desired and no more. In steam heating with ordinary forms of radiators, the temperature of the radiators must be about 210° F. while steam is circulating, hence the air must be heated more than is desirable, and the requisite temperature obtained by mixture with cooler air. As a hot-water apparatus must have a greater amount of radiating surface and larger flow and return pipes than one for steam, it is more expensive, the extra cost being from 25 to 35 per cent.; but, on the other hand, it uses less fuel, and requires less skilled management.

The force which produces the circulation in a hot-water apparatus is very slight, being merely the difference in weight of two columns of water, one of which is from ten to twenty degrees warmer than the other; the boiler must be at the lowest part of the system, and the grades of the pipes must be uniform. In a steam apparatus the boiler may, if necessary, be higher than some of the heating surface, and accurate gradation of the pipes, while desirable, is not essential. Where steam-power is required for machinery, elevators, dynamos, etc., the waste steam from the engine can often be usefully employed for heating.

A steam-heating apparatus is a little more dangerous than a hot-water one, although the difference may be small; and it is much more apt to produce unpleasant noises and jarring, technically known as "water-hammer," but this can be avoided if the apparatus be properly constructed. The differences in steam-heating plants are very great as to efficiency, durability, original cost, and cost of running, and those which are cheapest at first often prove to be much the most expensive in the end. The covering of boilers and of steam-pipes in places where heat is not wanted, as in cellars and basements, with some non-conducting material, such as asbestos or magnesia, is an important matter for saving fuel, especially in large plants with much surface in the supply and return mains.

A steam or hot-water heating apparatus is composed of radiators, supply and return pipes, and boiler. The amount of radiating surface required to heat a room is computed in various ways. If direct radiation only is called for, and no provision to be made for fresh air, the rule of thumb of the shops is to allow 1 sq. foot of radiating surface to each 100 cubic feet of space to be heated. In heating by indirect radiation the amount of radiating surface is to be doubled. A much better way is to calculate for both loss of heat through windows and walls, and for heating the air-supply required. Taking the thermal unit as the amount of heat required to raise 1 lb. of water from 50° to 51° F., the external temperature as zero F., and the internal temperature of the room as 70° F., the number of thermal units transmitted each hour through each square foot of surface is approximately as follows: Windows, 55; doors, 29; brick wall 12 inches thick, 22; brick wall 12 inches thick, plastered, 12; same, hollow wall, 16 inches thick, or furred out and plastered, 7.

In a well-constructed dwelling-house, school, church, or hospital, the loss of heat through 1 sq. yard of wall may be taken as equal to that through 1 sq. foot of glass—it being, in fact, a little more. The amount of heat given off each hour from 1 sq. foot of steam-heated radi-

ating surface in a room at 70° F. is about 130 thermal units, or a little more than enough to supply the heat lost through 2 sq. feet of window surface with the external temperature at zero. For a stove or furnace 1 sq. foot of radiating surface is usually reckoned as equal to 6 sq. feet of steam-heated surface at 210° F. Hence the rule: Take the number of square feet of window surface plus the quotient of the number of square feet in the outer walls divided by 9, and multiply this by $\frac{7}{8}$ for hot water or by $\frac{1}{2}$ for steam; supposing the lower temperature of the outside air to be zero F., the product is the number of square feet of radiating surface required to keep the room at 70° F., with no allowance for change of air. For air-heating, multiply the number of cubic feet of air to be heated in each hour by the number of degrees Fahrenheit to which it is to be heated, and divide the product by 12,500. The quotient is the number of square feet of radiating surface required.

The heat which passes off through walls and windows produces no useful effect, and involves a necessary waste; but the heat which passes off with the warmed air, however it may have been warmed, is doing good work if it causes the movement of this air required for ventilation. If, however, the warmed air is removed by a fan, its heat is also wasted. When chimneys and upcast flues are placed in outside walls there is waste of heat.

In heating dwelling-houses and the majority of other buildings, by steam, what is called a low-pressure apparatus should be used. By this is meant that the maximum pressure at the boiler shall not exceed 10 lb. to the square inch; that a pressure of 1 lb. to the square inch shall give a complete circulation of steam throughout all pipes and radiators; and that the condensed water shall flow back by gravity to the boiler, which must, therefore, be below the level of the lowest radiators. In a one-pipe system the condensed water passes down in the same vertical pipe in which the steam ascends; in a two-pipe system the water returns in an entirely distinct system of pipes; and this is much the best, although the one-pipe system is the cheaper. The supply-pipe, or main, being that which conveys the steam from the boiler to the radiators, should rise as soon as possible after leaving the boiler to the highest point to which it is necessary to carry it, and from this point should begin to slope downward to the most distant radiator and the connection with the return-pipe, which, in its turn, should steadily descend to the boiler. This is to insure that the steam and condensed water in the pipes shall always move in the same direction.

To secure a satisfactory circulation with low pressure the supply-main must be comparatively large, the usual rule being that its diameter in inches should equal one-tenth of the square root of the number of square feet of radiating surface which it is to supply. The return-pipe for condensed water may be smaller than the flow-main. There are many kinds of boilers for steam-heating in the market. For plants which supply 1,500 or more square feet of radiating surface, the ordinary horizontal flue boiler is in most cases preferable, because it wears well, and is easily cleaned and repaired by ordinary workmen. If a part in a patent boiler gives way it may be difficult and expensive to replace it.

For small dwelling-house plants, however, some of the forms of vertical boilers with drop tubes answer very well, and take up much less floor space than the horizontal form. If heating from a zero temperature is to be provided for, the boiler should have 1 sq. foot of heating surface to each 6 sq. feet of the radiating surface which it is to supply.

When exhaust steam from an engine is to be used for heating, a back-pressure valve is placed in the exhaust-pipe, and from below this valve a pipe is taken through a grease separator to the pipe supplying the radiators, which are arranged for a low-pressure system. Reference has been made above to the hot-blast system of heating, in which a fan or blower is used to force air through a single centralized coil or stack of radiators. This is one of the cheapest systems so far as cost of plant is concerned, because by concentrating the radiating surface, the cost of connecting mains and returns is much diminished; it does not take up much room in the basement, and hence it is a favorite system with contractors. It is most applicable to buildings which are to be occupied for only a few hours at a time; but it is not an economical apparatus for hospitals, asylums, prisons, or other buildings which are to be constantly occupied.

Some of the practical applications of the above statements

with regard to warming and ventilation will now be considered. In the great majority of buildings heated by direct radiation only, whether by stoves or steam, no special provision is made for fresh-air inlets; but in a few the fresh air is admitted through tubes or ducts arranged so that in winter the cold air shall enter the room in an upward direction, and mingle with the warm air at the top of the room before it comes in contact with the persons of the occupants.

If the floor of a room be constructed of brick, cement, tiles, etc., in such a way that it can be warmed as a whole, after the manner of the Roman hypocaustum, or as is done in some of the wards in the Hamburg Eppendorf Hospital, it is possible to maintain comfort while air at about 50° F. is supplied for respiration; but such arrangements are costly, and there is no evidence that they are more comfortable or healthful than the method of heating by indirect radiation with a large air-supply. In deciding on the position of fresh-air inlets to a room it is important to remember that air, like other fluids, has a decided tendency to adhere to the surfaces with which it comes in contact. When a jet or stream of air strikes a wall or floor it does not rebound from it as a ball would do, but spreads out over it, as a stream of water does. If the surface is of limited extent, the atmospheric pressure on the opposite side of the surface is diminished, as may be seen by holding a card near a candle and blowing obliquely against the card. The flame of the candle will be drawn toward the card. In like manner, if the wind blow strongly against the north side of a house, all openings on the south side are under diminished atmospheric pressure, and may become outlets for the air in the house, although intended to serve as inlets. Under such circumstances a furnace may work backward, as it is said, and a direct-indirect radiator on the lee side of a room may draw air from within and discharge it outside, thus tending to cool rather than to warm the room. The mouth of the air-duct of a hot-air furnace should therefore be on what is usually the windward side of the house in cold weather, and the inlets to radiators should be lessened or closed when they are on the leeward side in a strong wind.

As a rule, in heating by indirect or by direct-indirect radiation the air-supply is taken at the nearest point directly from the exterior of the building; but in cities, if the opening is near the ground on the street, the air is liable at times to contain much dust, and may become contaminated with sewer air. For some large buildings, such as assembly-halls, hospitals, etc., a special single inlet in the form of a shaft or tower is sometimes provided, the air being drawn down it by mechanical means. Such a shaft should usually be about 25 feet high.

Sometimes provision is made for the filtration of the incoming air in order to remove soot, dust, and fog, and this is specially desirable for chemical and bacteriological laboratories, and for picture-galleries and libraries. This can be done by screens covered with coarse cotton cloth, or, for a large building, by drawing the air through a water spray or a moistened screen, as is done in the Glasgow Infirmary. Dry filtration causes much less obstruction to the air-current than a wet screen, and hence the dry screen may be smaller, but it must be changed more frequently.

The position of fresh-air inlets within the room depends largely upon the purpose for which the room is to be used, and must be considered in connection with the position of outlets and the means employed to secure the movement of the air. In dwelling-houses heated by indirect radiation the inlets for warm air are usually in the floor or near the floor in a chimney, while the outlets are also near the floor, being open fireplaces or grates. This secures a fairly good circulation in rooms occupied by but few persons, the warm air rising to the top of the room and slowly descending to take the place of the air which has been cooled by windows and walls and is being drawn off through the chimney-flue. It is, however, not desirable to place fresh-air inlets in floors, because the dust and dirt from the floor is continually falling into the fresh-air ducts through these inlets, and is being returned in the air-currents.

A current of air with a velocity of $\frac{1}{2}$ feet per second is not perceptible unless it is very cold or very warm, while a current of 2 feet per second is just perceptible at ordinary temperatures; and therefore this is usually taken as the limit of the velocity which a current issuing from a fresh-air opening should have if any one is to be seated where it will strike him. If we allow three-quarters of a cubic foot of air per second per person (2,700 cubic feet per hour), it follows that to obtain the requisite supply with a velocity of 2 feet per

second there must be a register opening equal to 0.37 sq. foot, or a little over 53 sq. inches per person. As about one-half of the surface of an ordinary register is occupied with ironwork it follows that 100 sq. inches of register surface per person would be requisite at this velocity, and that in a schoolroom containing thirty-six children the fresh-air registers, if placed near the floor, would occupy 25 sq. feet of surface. In schoolrooms or other rooms occupied by a number of persons it is usually better to place the fresh-air inlets at a height of about 6 feet from the floor, and let the air pass through them with the same velocity that it has in the flues, viz., about 6 feet per second. In hospitals, however, it is better to put the fresh-air inlets in the wall near the floor, in order to be able to control the temperature in the vicinity of each bed to a certain extent. In winter the position of the outlets should usually be near the floor, for reasons given above; but in summer the outlets should be near the top of the room to allow the heated impure air to escape as rapidly as possible. The size of the outlets should be calculated for a velocity of air-current of from 4 to 6 feet per second. To prevent loss of heat, and consequent checking of draught, vertical foul-air flues should be placed in interior walls as far as possible, and each should have two inlets from the room which it is to serve, one near the floor and the other near the ceiling. Both inlet and outlet flues should have smooth surfaces, and to secure this they are often lined with tin or light galvanized iron.

With the exception of coal mines, the ventilation of which is often peculiar, the most difficult problems in heating and ventilation relate to large assembly-halls in which a number of persons are seated on the floor and in the galleries. The fresh air for those seated near the center of the room should be brought either from below or from above, and not by lateral currents passing over the bodies of other persons and thereby becoming contaminated with their exhalations. To avoid unpleasant draughts the air-currents which may strike a person must not have a velocity of over 2 feet per second. The increase of temperature and moisture of the air from the bodies of persons in the room must be met by arrangements for furnishing cooler air after the audience has assembled and the room is thoroughly warmed. Illumination should be by electric lights, or, if gas must be used, ample facilities should be provided for the escape of the heated and impure air from such lights. It is to be remembered that the waves of air which transmit sound are not only retarded if they travel against an air-current, but that they become confused and irregular in passing through layers of air of different densities. In assembly-halls in which the speaker occupies one part of the room only, as in churches and theaters, the air should be so introduced that there shall be a constant and uniform current from the speaker toward the audience; but in legislative halls, where the speaker may occupy any part of the room, care is to be taken to secure as far as possible air of a uniform temperature moving in the same direction throughout the lower part of the room, and especially to avoid local columns of heated air rising from registers in the floor. Finally, no system of ventilation can be made to give entire satisfaction unless operated by a thoroughly competent manager. J. S. BILLINGS.

Warner: town (founded in 1735); Merrimac co., N. H.; on the Boston and Maine Railroad; 18 miles N. W. of Concord (for location, see map of New Hampshire, ref. 8-E). It contains the villages of Warner, Roby's Corner, Melvin's Mills, Waterloo, and Davisville; has two churches, high school, Pillsbury Free Library (founded in 1891), and a weekly newspaper; and is principally engaged in lumbering and in the manufacture of gloves and mittens. Pop. (1880) 1,537; (1890) 1,383; (1895) estimated, 1,550.

EDITOR OF "KEARSARGE INDEPENDENT AND TIMES."

Warner, CHARLES DUDLEY; author; b. at Plainfield, Mass., Sept. 12, 1829; graduated at Hamilton College 1851; in 1853 and 1854 was a member of a surveying party in Missouri; studied law in New York; was admitted to the bar in Philadelphia 1856; practiced in Chicago until 1860, when he became assistant editor, and in 1861 editor, of the *Hartford Press* (consolidated in 1867 with the *Hartford Courant*). He has traveled much, and has published several volumes of travel, humorous sketches, essays, novels, and other writings, including *My Summer in a Garden* (1871); *Saunterings* (1872); *Back-log Studies* (1872); *The Gilded Age* (with S. L. Clemens, 1873); *Baddeck and That Sort of Thing* (1874); *Mummies and Moslems* (1876); *In the Levant* (1876); *In the Wilderness* (1878); *Washington Irving*

(1881); *Their Pilgrimage* (1886); *On Horseback* (1888); *A Little Journey in the World* (1892); and *The Golden House* (1894). He conducted the Editor's Drawer in *Harper's Magazine* 1884-92; then succeeded William D. Howells as conductor of the Editor's Study. HENRY A. BEERS.

Warner, SETH: soldier; b. at Roxbury, Conn., May 17, 1743; settled at Bennington, Vt., 1765; was a leader of the "Green Mountain Boys" in the conflicts of jurisdiction with the New York authorities, by whom he was outlawed; was second in command to Ethan Allen at the capture of Ticonderoga and Crown Point 1775; was chosen colonel of Vermont troops July 27, 1775; took part in Montgomery's campaign in Canada; rendered good service in the retreat to Ticonderoga May, 1776; commanded in a sharp engagement at Hubbardton July 7, 1777; participated in the battle of Bennington, and continued in the service until 1782, when he retired because of ill health, and returned to Roxbury, Conn., where he died Dec. 26, 1784. A *Memoir* by Daniel Chipman was published at Middlebury in 1848.

Warner, SUSAN: novelist; b. in New York, July 11, 1819; published *The Wide, Wide World* (1850), a novel which had great success in both Great Britain and the U. S., reaching a sale of 250,000 copies in the U. S. alone; *Queechy* (2 vols., 1852); *The Hills of the Shatemuc* (1856); a volume of *Lyrics from the Wide, Wide World*; *The Golden Ladder* (1862); *The Old Helmet* (1863); *Wych Hazel* (1876); and other works, among which are a theological treatise of some importance, *The Law and the Testimony* (New York, 1853), and an essay on *American Female Patriotism*. She published her novels under the pen-name of Elizabeth Wetherell. D. at Highland Falls, N. Y., Mar. 17, 1885.—Her younger sister, ANNA BARTLETT, b. in New York in 1820, also acquired a name as a novel-writer. Among her works are *Dollars and Cents* (2 vols., New York, 1853), a representation of political life in America at that time; *My Brother's Keeper* (2 vols., 1855); *Mr. Rutherford's Children* and *Stories of Vinegar Hill* (6 vols., 1871). She wrote under the name Amy Lothrop.

Revised by H. A. BEERS.

Warner, WILLIAM: poet; b. in Oxfordshire, England, about 1558; educated at Magdalen College, Oxford; became an attorney, and is supposed to have spent most of his life as business agent of Henry Carey, Lord Hunsdon. He was the author of *Pam, his Spruce* (1584), a pastoral novel, and *Albion's England, a Continued History of the same Kingdom from the Originals of the First Inhabitants thereof*, etc. (1586), a long poem in rhymed fourteen-syllable lines, and combining history, legend, and anecdote, which enjoyed contemporary popularity, passing through nine editions, the last of which was in Chalmers's series (1810). D. at Amwell, Hertfordshire, Mar. 9, 1609. H. A. B.

War of Succession: See SUCCESSION WARS.

Warrant: any one of various writs, precepts, or writings by which a person or court legally authorizes or directs a person or officer to do some act; specifically, an order or writ or process (which must be under seal unless the use of a seal has been dispensed with by statute) issued by some court or justice or officer having authority so to do, authorizing and directing the person to whom it is addressed to arrest or take some person named therein and bring him before a court, judge, or magistrate for examination, trial, or sentence, or otherwise legally dispose of him, or to take certain goods named, or to search for the person or property named and take the same. A warrant issued by a court is called a *bench warrant*, and such warrants are generally used for the purpose of apprehending a criminal who is at large either on bail or otherwise for an examination, indictment, or trial, or when he has committed an offense in the presence of the court. A warrant to discharge from prison a person who has been bailed is called a *warrant of deliverance*. A warrant authorizing the levy of a penalty by distress and sale of goods is called a *warrant of distress*. There are various other species of warrants.

The *issuing of warrants* is mostly regulated by statute both in Great Britain and in the U. S. In Great Britain a warrant of arrest may be granted in case of treason or other like offense by the privy council or by one of the secretaries of state, and in case of any person charged with a felony, by any judge of the Queen's Bench Division of the High Court of Justice; and under statutory provisions—48 Geo. III., c. 58 (c)—any such judge may grant the warrant in certain specified cases in order that a person charged with an offense which may be prosecuted by indictment or informa-

tion (on being satisfied that the indictment or information has been found or filed) may be held to bail or committed to trial. But in the ordinary case the writ is issued by a justice of the peace out of sessions under the statute 11 and 12 Vict., c. 42 (c), by which act it is provided in general that when a charge or complaint is made before any justice of the peace, alleging that any person has committed or is suspected of having committed any treason or felony or any indictable misdemeanor or offense, and is, or is suspected to be, within his jurisdiction, such justice may issue to the constable or other peace officer of the county or jurisdiction a warrant for his apprehension, and may cause him to be brought before him or some other justice to answer and to be dealt with according to law. A justice of the peace may also issue a warrant for search for stolen goods. A warrant from any judge of the Queen's Bench Division of the High Court of Justice extends over all England; but the warrant of a justice extends only over one county, although it may be executed in any other county if simply "backed" or indorsed by a justice of that county, by a custom which long prevailed and was finally authorized by 11 and 12 Vict., c. 42, and 14 and 15 Vict., c. 55, s. 18. Warrants issued in England or Wales are backable in Scotland, Ireland, or the Channel islands, and *vice versa*. A summons may be issued instead of a warrant, and may be granted on a parol or unsworn information or complaint, unlike a warrant, which must be upon information or complaint in writing and under oath except when the offense was committed in the presence of the court. In the U. S. the statutes of the various States vary in details, but the general procedure is essentially the same as in Great Britain, the ordinary warrant being obtained from a justice of the peace or other magistrate of corresponding jurisdiction upon a sworn complaint or information.

The officer receiving the warrant is bound to execute it in any place to which the jurisdiction of the magistrate and himself extends, and he may break open doors in order to execute it in case of treason, felony, or other indictable offense, provided that no admittance can be obtained on demand, and there is in these cases no immunity from arrest either in the night-time or on Sunday. The officer must make return of what he has done, either that he has executed the warrant partially or completely as directed or has been unable so to do by reason of failure to find the person or property named or for some other reason. The illegal or oppressive issuing of warrants has given rise to some of the gravest questions and conflicts in English history. General warrants have never been recognized as legal in England, except that under the acts regulating the press a practice obtained in the office of the Secretary of State of issuing general warrants to take up (without mentioning any persons in particular) the authors, printers, and publishers of obscene or seditious libels mentioned; but in a case which arose in 1763 the court said they were void, and such general warrants were expressly declared to be illegal by a vote of the House of Commons in 1766. The constitutions of most of the States and the Constitution of the U. S. provide that general warrants shall not be issued. See the articles on ARREST, SHERIFF, JUSTICE OF THE PEACE, etc.

Warrant of attorney was formerly the same as *POWER OF ATTORNEY (q. v.)*. This expression is now the general term, both in England and in the U. S., for a written authority addressed by a person to an attorney specified (in England an attorney of the court to which it is intended that judgment shall be entered up), or to any attorney, authorizing the attorney to appear for him in an action brought, or to be brought, and confess judgment in favor of some person named, or suffer the judgment to go by default. When given after the action has been commenced a warrant of attorney is distinctively called a *COGNOVIT ACTIONEM (q. v.)*. The giving of a warrant of attorney is generally regulated and restricted by statute. In England an attorney of one of the superior courts must be present and advise the person giving it, and must subscribe his name to show due execution thereof, and the warrant must be filed in court within twenty-one days. In the U. S. in some States judgment by confession or warrant of attorney is not allowed; in others it is allowed, but regulated and more or less restricted by statute.

See Archbold's *Criminal Practice and Pleading*; Archbold's *Criminal Pleading and Evidence*; Bishop's *New Criminal Procedure*; Stephen's *Commentaries on the Laws of England*; Alison's *Practice of the Criminal Law of Scotland*. F. STURGES ALLEN.

Warranty [from O. Fr. *warrantie*. See GUARANTY]: in law, a name given to a class of agreements which are always based upon and collateral to some other and principal contracts. There are three distinct species in common use to which the term is applied.

Warranty on the Sale of Land.—This is an express covenant contained in a deed of conveyance, whereby the grantor binds himself and his representatives to warrant and defend the grantee, his heirs and assigns, in the quiet and peaceable possession of the land conveyed against any one claiming the same by a title paramount to that of the grantor. Another form protects the grantee against persons only claiming under the grantor himself. This covenant does not purport to guard the grantee against the acts of mere trespassers, or of those who have no valid superior claim to the land; it becomes operative against the grantor only when the grantee or his assigns are evicted, either in fact or in contemplation of law, from the premises or a portion thereof, by virtue of a valid paramount title or outstanding prior incumbrance. See COVENANT and DEED.

Warranty on the sale of chattels is discussed in the article on SALE (*Condition and Warranty*).

Warranties in Policies of Insurance.—These are stipulations by the assured which constitute the conditions upon which the policy is issued. See INSURANCE (*The Policy and Representations and Warranties therein*).

Revised by FRANCIS M. BURDICK.

Warren: village; Jo Daviess co., Ill.; on the Chi., Mil. and St. Paul and the Ill. Cent. railways; 26 miles N. W. of Freeport, 27 miles E. by N. of Galena (for location, see map of Illinois, ref. 1-C). It is in a lead-mining, tobacco-growing, stock-raising, and agricultural region, and has Methodist Episcopal, Presbyterian, Free Baptist, and Roman Catholic churches, high school, academy, public library, a private bank, 2 weekly newspapers, large creamery, and steam flour-mill. Pop. (1890) 1,172; (1895) estimated, 1,870.

EDITOR OF "SENTINEL."

Warren: town (founded in 1833); Huntington co., Ind.; on the Salamonie river, and the Tol., St. L. and Kan. City Railroad; 14 miles S. by E. of Huntington, the county-seat (for location, see map of Indiana, ref. 4-F). It is in an agricultural, natural-gas, and petroleum region, and has 3 churches, a public school, a private bank, 2 weekly newspapers, manufactories of flour, lumber, and hoops, and large grain, corn, hay, and live-stock interests. Pop. (1880) 503; (1890) 1,120.

EDITOR OF "REPUBLICAN."

Warren: town; Knox co., Me.; on the St. George's river, and the George's Val. and the Maine Cent. railways; 9 miles W. of Rockland (for location, see map of Maine, ref. 9-D). It was formerly known as the Upper Town of St. George, was known as a trading-post as early as 1631, settled in 1736, and incorporated in 1776. The town contains the villages of Warren, North Warren, South Warren, West Warren, Pleasantville, Highlands, and East Waldoboro; is in a limestone region; has good power for manufacturing; and contains 2 churches, high school, public library, and 2 hotels. Pop. (1880) 2,166; (1890) 2,037.

Warren: town (incorporated in 1834); Worcester co., Mass.; on the Quabog river, and the Boston and Albany Railroad; 26 miles N. E. of Springfield, 28 miles S. W. of Worcester (for location, see map of Massachusetts, ref. 3-F). It contains the villages of Warren and West Warren; has 6 churches, high school, 23 district schools, public library with about 9,000 volumes, a savings-bank, and a weekly newspaper; and is principally engaged in dairying and the manufacture of cotton and woolen goods, stationary engines, and steam-pumps. Pop. (1880) 3,889; (1890) 4,681; (1895) 4,430.

EDITOR OF "THE WARREN HERALD."

Warren: city (founded in 1799); capital of Trumbull co., O.; on the Mahoning river, and the Erie, the Penn., and the Pitts. and W. railways; 14 miles N. W. of Youngstown, 52 miles S. E. of Cleveland (for location, see map of Ohio, ref. 2-J). It is in an agricultural, coal-mining, iron-mining, and dairying region, and has 7 churches, 10 stone and brick school buildings, electric lights, electric street-railways, improved water and sewerage plants, 3 national banks with combined capital of \$350,000, a State bank with capital of \$50,000, a monthly, 2 daily, and 3 weekly periodicals, flour, rolling, and planing mills, machine-shops, tin and wood novelty-works, and electric-lamp factories. Pop. (1880) 4,428; (1890) 5,973; (1895) estimated, corporation 7,000, with suburbs 7,500.

EDITOR OF "CHRONICLE."

Warren: borough; capital of Warren co., Pa.; on the Alleghany river, and the Dunk., Alle. Val. and Pitts., the Penn., and the West N. Y. and Penn. railways; 29 miles E. by S. of Corry, 35 miles N. E. of Titusville (for location, see map of Pennsylvania, ref. 2-C). It is the center of the oil-trade of a large region, and has Presbyterian, Methodist Episcopal, German Methodist, Lutheran, Roman Catholic, Scandinavian, and other churches, 4 public schools, a parochial school, 3 national banks with combined capital of \$350,000, a State bank with capital of \$100,000, 3 daily and 4 weekly newspapers, iron-works, foundries, and machine-shops, table-factory, curative-oil works, and a consumption cure. The village of Glade was annexed in 1895. Pop. (1880) 2,810; (1890) 4,332; (1895) estimated, 8,000.

EDITOR OF "MIRROR."

Warren: town (incorporated in 1746-47); Bristol co., R. I.; on Narragansett Bay, and the N. Y., N. H. and Hart. Railroad; 10 miles S. E. of Providence (for location, see map of Rhode Island, ref. 8-C). It has an excellent harbor, cotton, braid, and twine factories, the George Hale Free Library, three national banks with combined capital of \$480,000, a savings-bank with deposits of over \$1,000,000, and a weekly newspaper. Pop. (1880) 4,007; (1890) 4,489; (1895) 3,826.

Warren, FRANCIS E.: politician; b. in Hinsdale, Mass., June 20, 1844; received an academic education; enlisted in 1862 in the Forty-ninth Massachusetts Volunteers, and served as private and non-commissioned officer in that regiment till it was mustered out of the service; was afterward captain in the Massachusetts militia; was engaged in farming and stock-raising in Massachusetts till early in 1868, when he removed to Wyoming (then a part of Dakota); was president of the council, Wyoming Legislature, in 1873, and member of the council in 1884; was mayor of Cheyenne, and served as treasurer of Wyoming; was a delegate to the national Republican convention in Chicago in 1888; was appointed Governor of Wyoming by President Arthur and removed by President Cleveland; was again appointed Governor of Wyoming by President Harrison and served till the Territory was admitted as a State, when he was elected Governor Sept. 11, 1890; was elected to the U. S. Senate in 1890 and was re-elected in 1895.

Warren, GOUVERNEUR KEMBLE: soldier; b. at Cold Spring, N. Y., Jan. 8, 1830; graduated at the U. S. Military Academy July 1, 1850, and entered the Corps of Topographical Engineers; was employed on surveys of the delta of the Mississippi river 1850-53; topographical engineer of Sioux expedition 1855; in charge of surveys, and preparing reports and maps thereon, of Dakota and Nebraska Territories 1855-59, in connection with the Pacific Railway exploration; Assistant Professor of Mathematics at West Point 1859-61; lieutenant-colonel of the Fifth New York Volunteers May, 1861. Promoted colonel of his regiment in August, he served in the construction of the defenses of Baltimore until the spring of 1862, when his command was united with the Army of the Potomac. He was assigned to the command of a brigade in the Fifth Corps in May, 1862, and distinguished himself at Gaines's Mills (for which he was promoted brigadier-general of volunteers Sept. 26, 1862), Malvern Hill, Manassas, and Fredericksburg. In 1863 he became chief topographical engineer under Hooker, which place he held until after the battle of Chancellorsville, when he was made chief engineer of the Army of the Potomac. At the battle of Gettysburg he seized Little Round Top, the key to the entire national position, was wounded, and breveted colonel U. S. army for gallant and meritorious services. He was now promoted major-general of volunteers to date from Chancellorsville, and Aug. 12 assigned to command of the Second Corps. In Mar., 1864, the First Corps was united with the Fifth Corps and Warren assigned to this command, which he held through the campaign of 1864, participating with most marked ability, energy, and gallantry in all the battles from the opening of the Wilderness campaign through the siege of Petersburg, and until the close of the battle of Five Forks (Apr. 1, 1865), when he was deprived of his command by Sheridan, owing to an unfortunate misunderstanding between them; was assigned Apr. 2 to the command of the troops between the Appomattox and the James, and Apr. 3 placed in command of Petersburg. Ordered to command the department of the Mississippi May 14, he held this till May 27, when he resigned his volunteer commission, and was breveted major-general for gallant and meritorious service in the field. Returning to duty as major of engineers, to which rank he had

attained June, 1864, he had charge of various harbor and river improvements, bridge constructions and investigations, and fortifications in course of construction and modification, and on other works of survey, improvement, and construction. He was promoted lieutenant-colonel of engineers Mar., 1879. D. at Newport, R. I., Aug. 8, 1882. Author of numerous reports and of a pamphlet on the battle of Five Forks. Member of National Academy of Sciences, American Association for Advancement of Science, and other scientific associations.

Revised by JAMES MERCUR.

Warren, HENRY WHITE, D. D., LL. D.: bishop; b. in Williamsburg, Mass., Jan. 4, 1831; graduated at Wesleyan University, Middletown, Conn., in 1858; was for two years Professor of Ancient Languages at Wilbraham Academy, Massachusetts; joined the New England Conference of the Methodist Episcopal Church in 1858, and was pastor of various churches in New England; pastor of Arch Street church in Philadelphia 1871-74. From there he was sent to St. John's church, Brooklyn, N. Y., but in 1877 again became pastor of Arch Street church; was afterward appointed to Spring Garden church in the same city; is author of *Sights and Insights* (1874); *Studies of the Stars* (1878); *Recreations in Astronomy* (1878); *The One Book: Lectures on the English Bible* (1892); *The Bible in the World's Education* (1893). He was elected bishop May 12, 1880.

Revised by ALBERT OSBORN.

Warren, JOHN COLLINS, M. D.: surgeon; son of Dr. John Warren (1753-1815); b. in Boston, Mass., Aug. 1, 1778; graduated at Harvard 1797; studied medicine with his father, also at Edinburgh and in the hospitals of London and Paris; began practice in Boston 1802; was Assistant Professor of Anatomy and Surgery in the Harvard medical school 1806-15, and professor (as successor to his father) 1815-47, and emeritus professor 1847-56; was one of the founders of the Massachusetts General Hospital 1820, and of the McLean Asylum for the Insane; founder and editor of the Boston *Medical and Surgical Journal* (1828); president of the Massachusetts Medical Society 1832-36; president for many years of the Massachusetts Temperance Society and of the Boston Society of Natural History; carried into effect (1846) the successful application of ether in a surgical operation at the Massachusetts General Hospital; was a member of scientific societies in the U. S. and Europe, and made collections of comparative anatomy, osteology, and paleontology. D. in Boston, May 4, 1856. By his will he ordered his body to be given for examination to the medical school, and that his skeleton should be deposited in its museum. He was one of the editors of the *Monthly Anthology and Boston Review* (1804) and of the *Gospel Advocate* (1821-22); published numerous and valuable professional monographs, a *Genealogy of Warren, with some Historical Sketches* (1854); and several addresses before scientific bodies. See the *Life, chiefly compiled from his Autobiography and Journals* (Boston, 2 vols., 1860), by his brother, Edward Warren, M. D. Revised by S. T. ARMSTRONG.

Warren, JOSEPH: patriot; b. at Roxbury, Mass., June 11, 1741; graduated at Harvard 1759; studied medicine under Dr. Lloyd; began practice at Boston 1762; delivered in 1772, and again in 1775, the civic oration on the anniversary of the "Boston Massacre"; was a member of the provincial committee of correspondence in 1772; chairman of the committee of public safety 1774, and in 1775 president of the provincial congress, being thus the virtual executive of a *de facto* government at the outbreak of hostilities with Great Britain; was efficient in organizing the volunteers after the battle of Lexington; was chosen major-general by the provincial congress June 14, and took an active part as a volunteer, declining the command at the battle of Bunker Hill, at which he was killed June 17, 1775, falling near the spot where the Bunker Hill Monument now stands. A statue by Dexter was erected on Bunker Hill June 17, 1857. A *Life* by A. H. Everett may be found in Sparks's *American Biography*, and another by Richard Frothingham was published at Boston in 1865.

Warren, MERCY (Otis): poet and historian; sister of James Otis, orator; b. at Barnstable, Mass., Sept. 25, 1728; married James Warren about 1754; became a zealous patriot; corresponded with Samuel and John Adams, Thomas Jefferson, and other leaders of the Revolution; wrote several dramatic and satirical poems against the royalists (1773-75), which, with two tragedies, were included in a volume of *Poems, Dramatic and Miscellaneous* (1790), and published *A History of the Rise, Progress, and Termination of the*

American Revolution, interspersed with Biographical, Political, and Moral Observations (Boston, 3 vols., 1805). D. at Plymouth, Oct. 19, 1814. The *Correspondence of John Adams and Mercy Warren* was published by the Massachusetts Historical Society in 1878. Revised by H. A. BEERS.

Warren, MINTON, Ph. D.: educator and author; b. in Providence, R. I., Jan. 29, 1850; educated at Tufts College (1866-70), Yale College, graduate department (1871-72), Leipzig, Bonn, and Strassburg Universities (1876-79); Ph. D., Strassburg, 1879; associate at Johns Hopkins University 1879-82; Associate Professor of Latin in the same institution 1883-92; and Professor of Latin since 1892; author of *The Eucletic in Early Latin in American Journal of Philology*, ii. (Baltimore, 1881); *Bentley's English MSS. of Terence*, same journal (1882); *Latin Glossaries with especial reference to the Codex Sangallensis 912*, edited for the first time with notes, in *Transactions of the American Philological Association*, vol. xv. (1885); *On the Contribution of Latin Inscriptions to the Study of the Latin Language and Literature*, in same (1895).

C. H. T.

Warren, SAMUEL: lawyer and author; b. at Raere, Denbighshire, Wales, May 23, 1807; educated at the University of Edinburgh; began the study of medicine, but soon abandoned it for that of the law, which he pursued at the Inner Temple, London, 1828-30; contributed to *Blackwood's Magazine* the story *Blucher, or The Adventures of a Newfoundland Dog* (1824), when he was only seventeen years of age, and afterward his well-known *Passages from the Diary of a Late Physician* (1830-31); wrote several legal works; *On the Duties of the Attorneys and Solicitors, Select Extracts from Blackstone's Commentaries, Popular and Practical Introduction to Law Studies* (with J. W. Smith), etc.; became queen's counsel 1851; was recorder of Hull 1854-74; sat in Parliament as a Conservative 1856-59, and was appointed master in Lunacy Feb., 1859; published *Ten Thousand a Year* (1839), a successful novel, and *Now and Then* (1847), an unsuccessful one; collected from the pages of *Blackwood* 2 vols. of *Miscellanies, Critical and Imaginative* (1854), and was author of various other literary productions, including the pamphlet *The Queen and the Pope* (1850) a violent attack on the pretensions of the Roman Church. D. in London, July 29, 1877.

Revised by H. A. BEERS.

Warren, SAMUEL PROWSE: organist; b. at Montreal, Canada, Feb. 18, 1841; educated in Montreal till 1861, then in Germany till 1864. Returning to America he settled in New York, and in 1868 was appointed organist of Grace church, which position he resigned in 1894. He has played at many organ recitals and concerts. His compositions include much church music, organ arrangements, some songs both for solo and concerted voices, mixed and male part-songs, etc.

D. E. HERVEY.

Warren, WILLIAM: actor; b. in Philadelphia, Pa., Nov. 17, 1812; made his first appearance on the stage at the Arch Street theater as Young Norval Oct. 27, 1832; played an engagement at the Park theater in New York in 1841; in 1845 appeared in London at the Strand theater; in Oct., 1846, appeared as Sir Lucius O'Trigger in *The Rivals* on the opening night of the Howard Athenæum, Boston, where he won an immediate success. In Aug., 1847, he became a member of the Boston Museum company, appearing Aug. 23 as Billy Lackaday. From that time until he retired, in 1882, with the exception of a brief interval when he made a tour of the principal cities of the U. S., he performed continuously at the Museum with unvarying popularity and success, representing probably in that time a greater variety of characters, and appearing a greater number of times, than any other living actor. In the old English comedies he was unrivaled, while the hits he made in special character parts were numerous. D. in Boston, Mass., Sept. 21, 1888.

Revised by B. B. VALENTINE.

Warren, WILLIAM FAIRFIELD, S. T. D., LL. D.: minister and educator; b. at Williamsburg, Mass., Mar. 13, 1833; graduated at Wesleyan University, Middletown, Conn., 1853; became a preacher in the New England Methodist Conference 1855; subsequently studied theology at Andover, Berlin, and Halle; traveled in the East; was Professor of Systematic Theology in the Methodist Mission Institute at Bremen, Germany, 1861-66; acting president of the Boston Theological Seminary from 1866 until chosen president of Boston University 1873. He is the author of treatises on logic (1864) and on systematic theology (1865), both in German. Other works are *True Key to Ancient Cosmology*

and *Mythological Geography* (1882); *Paradise Found: the Cradle of the Human Race at the North Pole. A Study of the Prehistoric World* (1885; trans. into French by Count Sopotia); *In the Footsteps of Arminius* (1888); *The Story of Gottlieb*, a study of ideals (1891; trans. into Arabic and German); *Constitutional Law Questions in the Methodist Episcopal Church* (1894). *The Quest of the Perfect Religion* (1887) was translated into many languages, and prepared the way in some degree for the Parliament of Religions held in Chicago in 1893.

Warrensburg: city; capital of Johnson co., Mo.; on the Black river, and the Missouri Pac. Railway; 29 miles W. of Sedalia, 64 miles E. S. E. of Kansas City (for location, see map of Missouri, ref. 4-E). It is in an agricultural region, has large sandstone quarries, and is a noted health and pleasure resort with several valuable springs. The city contains the South Missouri State Normal School, 3 public-school buildings, and 4 State banks with combined capital of \$127,000, and has electric lights, water-works, flour and woolen mills, grain elevator, carriage and wagon factories, foundry and machine-shop, and 2 daily and 4 weekly newspapers. Pop. (1880) 4,049; (1890) 4,706; (1895) estimated, 6,000. EDITOR OF "STAR."

Warrenton: town; capital of Fauquier co., Va.; on the Southern Railway; 50 miles W. by S. of Washington, D. C. (for location, see map of Virginia, ref. 4-G). It is in an agricultural region in the foothills of the Blue Ridge Mountains; for many years has been a popular summer resort; and has 7 churches, 3 public and 3 private schools, gravity water-works, private bank, building and loan association, and 2 weekly papers. Pop. (1880) 1,464; (1890) 1,346; (1895) 1,615. JOSEPH A. JEFFRIES, FOR EDITOR OF "TRUE INDEX."

Warrington: town; in Lancashire, England; on the Mersey; 18 miles E. of Liverpool (see map of England, ref. 7-F). The parish church is a Decorated building with a spire 300 feet high. There are manufactures of fustians, twills, corduroy, and other cotton goods, glass, leather, soap, and many kinds of tools. Pop. of the parliamentary borough, returning one member (1891), 55,349.

Warsaw (Polish, *Warszawa*; Germ. *Warschau*; Fr. *Varsovie*): the capital of the Russian general government of the Vistula provinces, and formerly the fortified capital of the kingdom of Poland; on the left bank of the Vistula, below its junction with the Pilica and Weprz (see map of Russia, ref. 8-A). It stands on a hill which gradually descends into a flat plain, and consists of the old town, the new town, and suburbs, of which the most important is Praga, on the right bank of the river, and connected with the city proper by two iron bridges—one of them 500 meters long, built in 1859-64, the other completed in 1876. The city is surrounded with walls and ditches, having at its lower end the Alexander citadel, built 1832-35, with a monument of Alexander I. Since the insurrection of 1830 the suburb Praga has been strongly fortified, and the head of the bridge protected by the fort Sliwizki, so as to control the city proper; in 1883 a circle of fortifications was begun, eleven on the left, four on the right bank of the Vistula. Warsaw is the seat of the governor-general of the Tsarstvo of Poland with royal military powers, of a civil governor, and of a Roman Catholic and a Greek Catholic archbishop. The location of Warsaw is of great commercial importance. The navigable Vistula, the highroads running in all directions, the railway lines to Moscow, to St. Petersburg (built 1862), to Vienna (1848), to Dantzic, to Berlin by way of Lodz (which connects it with the rich coal-fields of Kielce), the Warsaw-Terespol (1867), and the Vistula Railway (Kowel-Mlawa, 1877), combine to make the city a commercial center, and the entrepôt of the European-Asiatic traffic. The city is traversed by street-railways, connecting the stations of the various railways. Manufacturing industries flourish. Linen and woolen cloths, carpets, boots, leather goods, saddlery, cotton and silk fabrics, pianos, carriages, furniture, goldware and silverware, machinery, chemicals, sugar, and tobacco are manufactured, and extensive distilleries and breweries are in operation. The transaction of business is facilitated by many banks that are under strict state supervision. There is much export trade in grain, flax, cattle, and horses, and in coal, while the finer manufactured goods are imported. Weekly markets and annual fairs attract thousands of Russian and foreign tradesmen. In architectural respects Warsaw has been greatly improved; formerly wretched and dirty huts alternated with magnificent palaces. Some portions of the city, like the Cracow suburb, with

the statue of Copernicus by Thorwaldsen, and the New World, with their splendid buildings and streets, are very beautiful, and are not surpassed by those of any other European city. Warsaw has twelve public squares, full of historical monuments; among them are the Saxon Square, the Krasinski Square, and the Sigismund Square, with the column of Sigismund III., erected in 1643. Cracow Street is adorned with the equestrian statue of King Poniatowski by Thorwaldsen. Among the public buildings that show the fondness of the old nobility for display is the royal palace, built by Sigismund II., embellished by Augustus II. and Stanislas Augustus, with its famous senate-hall, deputy-hall with historical pictures and sculptures, unique library, and the Polish archives. A beautiful park adjoins St. John's Cathedral, built in 1360, which contains fine pictures and many tombs of celebrated Poles, and which is the most remarkable of the 179 Catholic churches. The Saxon, the Brühl, and many other palaces are royal in their magnificence. The Belyedere, the residence of Grand Duke Constantine till the outbreak of the great insurrection, the city-hall, the mint, and the theaters are beautiful edifices. The Greek Catholic Cathedral, completed in 1842, is in the modern style; the Lutheran church is one of the finest buildings in the city. Among the scientific institutions, which are numerous and excellent, is the university, founded in 1817, suppressed in 1832, and re-established in 1869 in the Kasimirovski Palace; it has about 1,000 students, and its avowed purpose is to Russianize the Poles. The university library contains more than 350,000 volumes, and is rich in works of Polish literature and history and law, though its contents were confiscated in 1794, and transferred to St. Petersburg, and it was again ransacked in 1831 for the same purpose. Other valuable possessions of the university are the numismatic cabinet, the museum of antiquities, the ethnographical museum, the zoological and mineralogical collections, the botanical garden, and the observatory. Besides a public art gallery there are private art collections belonging to the Ossolinski, Potocki, Dombrowski, and other families.

There is documentary evidence of Warsaw's existence in 1224, and in 1339 it was surrounded with walls and strongly fortified. It was the residence of the Dukes of Masovia till their extinction in 1526. Sigismund Augustus made it the residence of the Polish kings instead of Cracow. At Wola, a village near Warsaw, the elections of the kings formerly took place. The Swedes under Charles IX. Gustavus conquered the city in 1655, lost it again next year, but reconquered it after the murderous three days' battle at Warsaw (July 28-30, 1656). By the third partition it fell to Prussia, and by the Vienna Congress in 1815 it became definitely Russian. After the insurrection of 1830 it was stormed and crushed by Paskevitch, and again in 1863 a revolution was suppressed and the Siberian prisons and mines filled with Polish patriots. Still the vitality of the city and the nation was such as to recover and to increase even in spite of the most unfavorable political conditions. Warsaw is the center of the Polish nation, full of national spirit, learning, and culture. Pop. (1891) 490,417 (including garrison, 523,133), more than 50 per cent. Roman Catholics, 33 per cent. Jews. HERMANN SCHOENFELD.

Warsaw: city; Hancock co., Ill.; on the Mississippi river, and the Tol., Peoria and West. Railway; 3 miles below Keokuk, 40 miles above Quincy (for location, see map of Illinois, ref. 5-B). It is an important shipping-point for hay and general produce; is largely engaged in cooperage; and has flour and woolen mills, manufactories of agricultural implements and stove-polish, large pickle-works, public park, Masonic and Odd Fellows halls, 4 public-school buildings, Roman Catholic and Lutheran schools, public library, a private bank, and 2 weekly newspapers. It is the site of Forts Edward and Johnson, erected early in the nineteenth century. Pop. (1880) 3,105; (1890) 2,721; (1895) estimated, 3,000. EDITOR OF "BULLETIN."

Warsaw: city; capital of Kosciusko co., Ind.; on the Tippecanoe river, and the Cleve., Cin., Chi. and St. L. and the Penn. railroads; 40 miles W. of Fort Wayne, 109 miles E. of Chicago (for location, see map of Indiana, ref. 2-E). It is in an agricultural and lumbering region, and has 9 churches, 3 public-school buildings, court-house (cost \$250,000), 2 State banks (combined capital, \$160,000), a daily and 2 weekly papers, Spring Fountain Park, large canning and pickling works, flour and saw mills, and manufactories of flour-mill machinery and furniture. Pop. (1880) 3,123; (1890) 3,574; (1895) estimated, 4,100. EDITOR OF "TIMES."

Warsaw: village (founded in 1803); capital of Wyoming co., N. Y.; on the Buffalo, Roch. and Pitts. and the Erie railways; 44 miles S. W. of Rochester, 48 miles E. of Buffalo (for location, see map of New York, ref. 5-D). It is in an agricultural region, with extensive deposits of salt in its vicinity, and has a national bank with capital of \$100,000, a private bank, public union school with library, sanitarium, and salt baths, iron-foundry, map-roller factory, wagon and broom factories, numerous salt-works, and two weekly newspapers. Pop. (1880) 1,910; (1890) 3,120; (1895) estimated, 3,500.

EDITOR OF "WESTERN NEW YORKER."

Wars of Succession: See SUCCESSION WARS.

Warta: the largest tributary of the Oder; rises about 33 miles from Cracow, passes through Poland and the Prussian provinces of Posen and Brandenburg, where it joins the Oder at Cüstrin after a course of 445 miles, of which 265 are navigable. Through its chief affluent, the Netze, the Bromberg Canal, and the Brahe river, the Warta is connected with the Vistula, and forms the principal waterway of the province of Posen. H. S.

Wartburg, *wärt'boorch*: a castle near Eisenach, in Saxe-Weimar; founded in 1067 by Ludwig the Leaper, Landgrave of Thuringia, and for several centuries the residence of his successors. After passing through many vicissitudes it was restored with great magnificence and exquisite taste by Charles Alexander, Grand-Duke of Saxe-Weimar. It exercises, however, a much greater attraction by its historical remembrances than by its architectural merits. Here the famous contest between the minnesingers took place in the time of Landgrave Hermann I., about 1206 (see Lucas, 1838; Plötz, 1851), an event which forms the subject of the singular epic *Der Krieg von Wartburg*, probably written about 1260, edited by Ettmüller in 1830, and translated into modern German by Simrock in 1858. It was the residence of Elizabeth of Hungary (1207-31), the wife of Landgrave Louis II., and afterward one of the most renowned saints of the Roman Catholic Church; and Luther was kept concealed in the castle from May 4, 1521, to Mar. 3, 1522, while finishing his translation of the Bible. It is also famous for the festival held there by the Burschenschaft on Oct. 18, 1817, to celebrate the third centenary year of the Reformation and the recent liberation of the country from the French yoke. In the excitement of the moment the enthusiasm for liberty and fatherland ran a little high. Some books which were considered illiberal and unpatriotic were burned, and some plans were proposed for the reformation and elevation of the students' life at the universities, more especially for the abolition of the old traditional barriers which separated the students of various German countries from each other. The whole affair was harmless, in spite of some exaggerations, but the German princes, alarmed by this attempt to revolutionize and republicanize Germany, and influenced by the reactionary warnings of Metternich, made it the occasion of severe measures against the liberals. See Keil, *Die burschenschaftlichen Wartburgfeste von 1817 und 1867* (Jena, 1868). F. M. C.

Wartenburg, York von: See YORK VON WARTENBURG.

Wart-hog: any wild hog of the genus *Phacochoerus*, family *Phacochoeridae*. The popular name was given on account of the large, fleshy projections on the sides of the face. The body is stoutly built, legs small, head disproportionately large, with a small but prominent eye set far up and back on the head. The snout is large, upper canines or tusks curved upward and outward, and sometimes of enormous size. Two species are known, *Phacochoerus africanus* or *aliana*, quite widely distributed over the northern parts of Africa, and *P. athiopicus*, confined to South-east Africa. F. A. LUCAS.

Warton, JOSEPH: poet and critic; b. at Dunsford, Surrey, England, in 1722; brother of Thomas Warton, poet, and son of Thomas Warton (d. 1746), vicar of Basingstoke, Hampshire, and of Cobham, Surrey, and Professor of Poetry at Oxford 1718-28; educated at Winchester School; studied at Oriel College, Oxford; graduated 1744; took orders in the Church of England; was curate to his father at Basingstoke 1744-46; curate at Chelsea 1746-48; became rector of Winslade, Hampshire, 1748; traveled on the Continent with his patron, the Duke of Bolton, 1751; obtained the rectory of Tunworth 1754, that of Wickham 1782, and of Upham 1788; was second master of Winchester School 1755-66, and head master 1766-93; became chaplain to Sir George (afterward Lord) Lyttleton 1756, prebendary of St.

Paul's, London, 1782, and of Winchester 1788. He published *Odes on Various Subjects* (1746); a poetical translation of the *Eclagues and Georgics of Vergil* (1753); an *Essay on the Genius and Writings of Pope* (2 vols., 1756-82); contributed twenty-four critical papers to *The Adventurer* (1753-56), and edited the works of Pope (9 vols., 1797) and Dryden, the latter completed after his death (4 vols., 1811). D. at Wickham, in Hampshire, Feb. 23, 1800. A volume of *Biographical Memoirs* (1806) was published by Rev. John Woolf. The Warton brothers were scholars of antiquarian tastes, leaders in the English romantic movement, elegant critics, and imitative poets. Revised by H. A. BEERS.

Warton, THOMAS: poet; brother of JOSEPH WARTON (q. v.); b. at Basingstoke, Hampshire, England, in 1728; studied at Trinity College, Oxford; graduated about 1747; became a fellow there 1751; took orders in the Church of England 1755; was Professor of Poetry in the university 1757-67; became Camden Professor of Ancient History and poet-laureate 1785; and obtained the livings of Kiddington 1771 and Hill Farrance 1782. D. at Oxford, May 21, 1790, having resided for forty years in Trinity College. He was the author of *Observations on the Faerie Queene of Spenser* (1754); *The Life of Sir Thomas Pope* (1772); and of a valuable *History of English Poetry* (3 vols., 1774-81), intended to extend to the beginning of the eighteenth century, but never continued beyond the Elizabethan age. Revised editions were issued in 1824, 1840, and 1870. Warton edited the Greek *Anthology* (1766), the works of Theocritus (Oxford, 2 vols., 1770), and the *Minor Poems of Milton* (1785; 2d ed. 1791), and published several occasional poems, of which a collection appeared in 1777. His *Poetical Works* (1802) were edited, with a sketch of his life, by Richard Mant, D. D., Bishop of Down. They have also been included in Chalmers's *British Poets* (1810).

Revised by H. A. BEERS.

Warts, or Verrucae [*wart* < M. Eng. *werte* < O. Eng. *wearde*; O. H. Germ. *warza* (> Mod. Germ. *warze*); Icel. *varlu*; *verruca* is plur. of Lat. *verruca*, wart]: small circumscribed excrescences or elevations on the skin, developed by hypertrophy or abnormal growth of the papilla of the skin. They may be round and ovoid or conical, thread-like, or broad and flat. The so-called "seeds" or points of a dry wart correspond to the number of papilla which have become elongated and thickened. Each papilla of the skin has an independent supply of blood by a little loop of capillary blood-vessels at its base. Hence mere removal of the wart is followed by its renewal from the well-nourished base and remaining cells which have transmitted the tendency to excessive growth. Cases are often cited of warts communicated by the blood from other warts, but the best authorities deny them. Warts occur chiefly in children between the second and fourteenth year; their cause is uncertain. Their duration is indefinite; they sometimes disappear suddenly, probably by contraction of the vascular papillary base and casting off of the superabundant dry cells. When they are kept free from handling or irritation, the diet is corrected, and alteratives are given, they may slowly disappear. The common treatment is to snip them off and touch the base with nitric acid, glacial acetic acid, or lunar caustic.

Warville, BRISSOT, de: See BRISSOT DE WARVILLE.

Warwick, wor'ik, or Warwickshire: county in the center of England; bounded on the W. by Worcestershire, on the N. by Staffordshire and Leicestershire, and on the S. by Oxfordshire, watered by the Avon and the Tame in the N. Area, 885 sq. miles. The surface is elevated; in the northern part, which once was covered with the Forest of Arden, moor, heath, and forest alternate, and the soil is often heavy and cold; in the southern part the soil is very fertile. Agriculture and dairy-farming are in an advanced state. Coal, chalk, lime, and marl are found. The manufactures are extensive. Pop. (1891) 805,070.

Warwick: county-town of Warwickshire, England; on the Avon; 21 miles S. E. of Birmingham (see map of England, ref. 10-H). It contains several fine buildings, among which the most remarkable is the castle. The oldest, and also the highest, of the castle's towers (147 feet), is of uncertain date; the next highest (128 feet) dates from the latter part of the fourteenth century. Besides having great architectural interest, the castle contains large collections of paintings, arms, and other objects of artistic and archaeological value. By the fire of Dec. 3, 1871, the building and collections

(which are open to the public) suffered considerably; but by 1876 the damage had been repaired. There are some manufactures of art furniture and a trade in agricultural produce. Pop. of the parliamentary borough, returning one member (1891) 39,102.

Warwick: village; Orange co., N. Y.; on the Wawayanda creek, and the Lehigh and Hudson River Railway; 11 miles S. of Goshen, 29 miles S. W. of Newburg (for location, see map of New York, ref. 7-J). It is in an agricultural region, with granite quarries and iron mines 4 to 6 miles distant, and is near Greenwood, Wawayanda, Clark's, and Glenmere lakes. It has 6 churches, Warwick Institute, 5 hotels, 3 creameries, fabric-hose works, foundry, railway-shops, a national bank (capital \$100,000), a savings-bank, and 2 weekly newspapers. Warwick is 550 feet above tide-water, and is a health and summer resort. Pop. (1880) 1,043; (1890) 1,557; (1895) 1,775. EDITOR OF "ADVERTISER."

Warwick: town of Kent co., R. I.; settled in 1642 by twelve Englishmen, of whom SAMUEL GORTON (*q. v.*) was the leading spirit, and incorporated 1647. It is 5 miles S. of Providence, on the Providence and Pawtuxet rivers, and is crossed in one direction by the Stonington Railway (now the N. Y., N. H. and Hart.), and by the N. E. in another (see map of Rhode Island, ref. 8-N). It has no compactly settled quarter, and consists of about twenty-seven villages, many of which are connected by electric railway. The Pawtuxet furnishes power for many manufacturing establishments, chiefly cotton (some woolen) and printed goods. The town has a national bank (capital \$100,000) and a savings-bank, and there are churches and schools in every village. In some villages there are free public libraries under the patronage of the State. Pop. (1890) 17,761; (1895) 21,170.

Warwick, GUY, Earl of; a legendary Saxon hero who figures largely in early English metrical romances as a champion against the Danes, being especially noted for his victory over the giant Colbrand. The romance of Sir Guy is mentioned in Chaucer's *Canterbury Tales* and alluded to in Shakspeare's *King John* and *Henry VIII.* He is usually assigned to the period of King Athelstan. In his *Specimens of Early English Metrical Romances*, Ellis suggests that the legendary Guy is identical with Egil, an Icelandic warrior in Athelstan's army, who contributed much to his victory over the Danes at Brunanburg; and Dugdale even goes so far as to fix the date of his combat with Colbrand in the year 926. But Guy of Warwick is unknown to English history, and equally so to English legend, until he emerges as the hero of Anglo-Norman poems of the twelfth century. Two English translations of these were made at the beginning of the fourteenth century, and a third about fifty years later. *The Booke of the most victorious Prince Guy of Warwick*, a metrical romance of the earlier half of the fourteenth century, was printed before 1567, and a prose French romance on the same subject, printed in 1525, was edited by J. Zupitza for the Early English Text Society 1875-76. Revised by H. A. BEERS.

Warwick, HENRY DE BEAUCHAMP, Duke of, and King of the Isle of Wight; son of Richard; b. at Hanley Castle, Warwickshire, England, Mar. 22, 1424; succeeded to the earldom on the death of his father 1439; distinguished himself in the defense of Normandy 1442-44; was created Duke of Warwick, to rank next the Duke of Norfolk and before the Duke of Buckingham—a provision which led to a controversy with the latter nobleman, which was settled by act of Parliament to the effect that the claimants should take precedence in alternate years; and received from Henry VI., who had been his companion in childhood, many honors, the most extraordinary being that he was crowned by that monarch as vassal King of the Isle of Wight early in 1445, which, however, did not mean much more than an empty ceremony. He survived his advancement but a few months, dying without issue June 11, 1445.

Warwick, RICHARD DE BEAUCHAMP, Twelfth Earl of; b. at Salwarpe, Worcestershire, Jan. 28, 1381; son of Thomas, who was condemned as a traitor in the reign of Richard II., but not executed; was made a Knight of the Bath at the coronation of Henry IV. (1399); succeeded to the earldom 1401; fought against Owen Glendower 1401-02, and against the Percies 1403, taking part in the famous battle of Shrewsbury; made a pilgrimage to the Holy Sepulcher 1408; visited several European courts, where he distinguished himself at tournaments; was lord high steward at the coronation of Henry V. (1413), and in the same year commissioner to

negotiate peace with France; headed an embassy to the Council of Constance 1414; was an energetic opponent of the Lollards or followers of Wycliffe; became in 1415 Captain of Calais, where he entertained the Emperor Sigismund with such grace as to receive from him authority to bear the title "father of courtesy"; aided in the siege and capture of Caen 1417; was ambassador to the Duke of Burgundy 1418; was created about that period Earl of Aumerle (otherwise Albemarle); attended Henry V. on his deathbed (1422); was regent of France 1425-28; directed for nine years the education of the young king, Henry VI., gaining the title "the good earl," and was again regent or lieutenant-general of France and Normandy from 1437 to his death at Rouen, Apr. 30, 1439. He was buried and has a magnificent tomb in the Church of St. Mary, Warwick. He was possessed of immense landed estates, was father of Anne, the wife of Richard Neville, subsequently Earl of Warwick, and was author of some courtly verses preserved in MSS. in the British Museum.

Warwick, RICHARD NEVILLE, Earl of, known as "the king-maker"; soldier and statesman; b. in England between 1420 and 1430; was related to both the Lancastrian and the Yorkist houses, being first cousin to Edward IV. and second cousin to Henry VI.; became the most wealthy and powerful nobleman of the kingdom; fought along with his father in the War of the Roses, which grew out of the claims of the Duke of York to the throne; bore a leading part in the first battle, that of St. Albans, 1455, which he decided in favor of the Yorkists by a daring charge into the town; was rewarded with the important post of captain of Calais and was afterward reconciled with Henry VI., but having been accused of misconduct, attacking a fleet of Lubeck merchantmen, he retired to Calais in anger. On the renewal of the civil war in 1459 he joined the Yorkist forces, and on the failure of their attempt returned to Calais, whence after negotiating with the Duke of York he fitted out an expedition, landed in Kent (June, 1460), and entered London without a battle. He defeated the queen's army near Northampton in July, capturing the imbecile king, Henry VI., after which the Duke of York laid formal claim and was recognized as heir to the throne. At the disastrous battle of Wakefield, however, in December, the pretender was killed, and the Earl of Salisbury (Warwick's father) and twelve other Yorkist nobles were captured and beheaded at Pontefract. Warwick suffered another defeat at the second battle of St. Albans Feb., 1461, but, having raised another army and joined the young Duke of York, marched upon London, where the duke was proclaimed king Mar. 4 under the title of Edward IV. Warwick next defeated the Lancastrians at the desperate battle of Towton, near the city of York, Mar., 1461, and was active in suppressing the attempt of the Lancastrians to regain their power in 1463. He captured the deposed king, Henry VI., and lodged him in the Tower (1465). He was rewarded with vast estates and the most important offices in the kingdom. He had now a revenue from his offices alone of 80,000 crowns a year, and displayed a regal magnificence, keeping open house wherever he went and maintaining many thousands of servants or dependents. He was employed on missions to France, Burgundy, and Brittany, and took such deep offense at the king's marriage with Elizabeth Woodville (1464), while he was engaged in negotiating for him the hand of a French princess, that he began to be disaffected; gave his daughter in marriage to Edward's brother, George, Duke of Clarence, without the royal permission, 1468, and, taking advantage of an insurrection against certain taxes in Yorkshire, placed himself, with Clarence, at the head of the rebellion; defeated the royal forces at Edgecote 1469, capturing the king and putting to death the queen's father and brother; had a brief reconciliation with the king; was again in arms against him in the following year (1470); was forced to flee to France; made at Amboise a treaty with Queen Margaret for the restoration of Henry VI., the marriage of Prince Edward of Lancaster to his daughter Anna (August), and the recognition of his son-in-law Clarence as heir-presumptive to the latter. By this double marriage the crown seemed now assured to the descendants of Warwick, who, aided by Louis XI., landed with a body of exiles at Plymouth and Dartmouth Sept. 13, 1470, successfully marched upon London, restored Henry VI., and was reinstated in all his offices, with the addition of that of lord high admiral. The Lancastrian restoration, however, had lasted barely six months before Edward IV., who had escaped to Holland, obtained the aid of Charles the Bold,

Duke of Burgundy; landed at Ravenspur, near Hull, with 2,000 men, English, Dutch, and Flemings, and Warwick, along with his brother Montague (then Earl of Northumberland), betrayed by his son-in-law Clarence, was defeated and killed at the battle of Barnet, Apr. 14, 1471. They were buried at Bisham Abbey, Berkshire. F. M. COLBY.

Warwick, ROBERT RICH, Earl of: a descendant of Lord Chancellor Rich; b. in England about 1590; succeeded to the earldom 1618; became a prominent leader of the Puritan party; took an active part in promoting the colonization of New England, especially of Rhode Island; was an intimate friend and protector of Thomas Hooker, the celebrated founder of Connecticut, and of other Puritan clergymen, whom he protected during the ecclesiastical persecutions of the reign of Charles I.; adhered to the cause of Parliament during the great rebellion; became lieutenant of the fleet under the Earl of Northumberland 1642, and was a prominent supporter of Cromwell as Protector, and was appointed to bear the sword of state in the latter's presence 1657. D. in 1658.

Wasatch or Wahsatch Mountains: See UTAH and ROCKY MOUNTAINS.

Wase'ca: city (founded in 1869); capital of Waseca co., Minn.; on the Chi. and N. W. and the Minn. and St. L. railroads; 15 miles W. of Owatonna, 26 miles E. by S. of Mankato (for location, see map of Minnesota, ref. 11-E). It is in an agricultural and dairying region; is on Clear Lake, where are located the extensive grounds and buildings of the Minnesota Chautauqua; and has 11 churches, graded public school, Roman Catholic academy, a State bank with capital of \$25,000, flour-mills, and 2 weekly newspapers. Pop. (1880) 1,708; (1890) 2,482; (1895) 2,198.

EDITOR OF "RADICAL."

Washburn: town (settled in 1829, incorporated in 1861); Aroostook co., Me.; on the Big Machias river; 52 miles N. by W. of Houlton, the county-seat (for location, see map of Maine, ref. 3-F). It contains the villages of Washburn and East Washburn, three churches, high school, and public library. Pop. (1880) 809; (1890) 1,097.

Washburn: city (founded in 1883); capital of Bayfield co., Wis.; on Lake Superior, and the Chi., St. P., Minn. and Omaha Railway; 60 miles E. of Duluth, 198 miles N. E. of Minneapolis (for location, see map of Wisconsin, ref. 1-C). It has 11 churches, high school (building cost \$40,000), 3 grammar schools, court-house (cost \$50,000), a State bank with capital of \$16,000, and 2 weekly newspapers, and is principally engaged in lumbering, brownstone-quarrying, and shipping coal, grain, and general merchandise. It is the site of the oldest settlement in Wisconsin, a Jesuit mission having been established here in 1665. Pop. (1890) 3,039; (1895) 5,178.

EDITOR OF "ITEMIZER."

Washburn, CADWALLADER GOLDEN, LL. D.: soldier; brother of Charles A. Washburn; b. at Livermore, Me., Apr. 22, 1818; studied law and settled at Mineral Point, Wis., in 1841, where he had a large practice as counsel for the early settlers in securing their homes. In 1854 he was elected to Congress, and by re-elections served till Mar. 3, 1861, declining another election. At the breaking out of the civil war he raised the Second Wisconsin Cavalry, of which he was made colonel, in Oct., 1861; was commissioned brigadier-general by President Lincoln in July, 1862, and was engaged in the Arkansas campaign during that year; was commissioned major-general of volunteers in Nov., 1862; was engaged in the siege of Vicksburg, and at its close was ordered to the department of the Gulf in command of the Thirteenth Corps; was ordered to Texas in Nov., 1863, with a portion of the Thirteenth Corps, and captured Fort Esperanza, a strong casemated fortification at Pass Cavallo, guarding the entrance to Matagorda Bay; in Apr., 1864, relieved Gen. Stephen A. Hurlbut in command at Memphis of the district of West Tennessee; resigned May 25, 1865. In 1867 he was again elected to Congress and re-elected in 1869; in Nov., 1871, was elected Governor of Wisconsin, but failed of re-election in 1873. He resided at Madison, Wis., and was largely engaged in the manufacture of lumber at La Crosse, Wis., and of flour at Minneapolis, Minn. The Washburn Observatory of the University of Wisconsin was founded by him. D. at Eureka Springs, Ark., May 14, 1882.

Revised by JAMES MERCUR.

Washburn, CHARLES ANES: editor and author; brother of C. C. Washburn; b. at Livermore, Me., Mar. 16, 1822. He graduated at Bowdoin College 1840, and soon after went

to California, where he became editor and eventually proprietor of the *Atta California*, a journal published in San Francisco. This was the first Californian paper to advocate the principles of the Republican party, and the growth and the strength of the party on the Pacific slope were largely due to Mr. Washburn's influence. From 1858 to 1861 he was editor and proprietor of the *San Francisco Daily Times*, and in 1860 he was chosen presidential elector-at-large. In 1861 President Lincoln appointed him minister to Paraguay, and he resided in that country in 1861-65, and again in 1866-68. During the latter period the most exciting episodes of the Paraguayan war with Brazil, the Argentine Republic, and Uruguay were enacted, and Minister Washburn was almost the only intelligent observer of the interior condition of Paraguay while the struggle was going on. The tyranny of Lopez culminated in the imprisonment and death of nearly all the better class of Paraguayans and foreign residents, who were accused of complicity in an imaginary conspiracy. Mr. Washburn, after vainly protesting against these acts, was himself accused, and escaped with his family only by the timely arrival of the U. S. steamer Wasp. After his return to the U. S. he published *The History of Paraguay* (2 vols., 1871). Mr. Washburn also wrote *Philip Thaxter* (New York, 1861); *Gomery of Montgomery* (1865), and other novels. D. in New York, Jan. 26, 1889. HERBERT H. SMITH.

Washburn, EDWARD ABIEL, D. D.: clergyman; b. at Boston, Mass., Apr. 16, 1819; graduated at Harvard 1838; studied theology at Andover and New Haven; became a Congregational minister in 1842, but left the denomination to enter the Protestant Episcopal Church, and was ordained priest 1845; was rector of St. Paul's church, Newburyport, Mass., 1844-51; traveled in Asia, Egypt, and Europe 1851-53; was rector of St. John's, Hartford, Conn., 1853-62, and at the same time Professor of Church Polity in the Berkeley Divinity School, Middletown; was rector of St. Mark's, Philadelphia, 1862-65, when he succeeded Bishop Coxe as rector of Calvary church, New York, which charge he held till his death. Dr. Washburn was a member of the New Testament company of revisers, and a leader among the Broad Church clergy of the Episcopal Church. Besides numerous sermons and review articles, he published *Relation of the Episcopal Church to the other Christian Bodies* (1874); *The Social Law of God* (New York, 1874; 6th ed. 1884); *Epochs of Church History* (posthumously ed. by Dr. Tiffany, 1883); *Voices from a Busy Life* (poems, 1883). D. in New York, Feb. 2, 1881.

Washburn, EMORY, LL. D.: jurist; b. at Leicester, Mass., Feb. 14, 1800; entered Williams College at the age of thirteen; graduated in 1817; after a three years' course of study at the Harvard Law School was admitted to the bar, and at the age of twenty-one commenced practice at Charlemont, Mass.; afterward removed to his native town of Leicester, and in 1828 settled in Worcester. In 1825 and 1826 he represented Leicester in the Massachusetts General Court, and Worcester in 1838. In 1841 and 1842 was a member of the State Senate for Worcester County. He was also nominated for Congress at a time when his party, the Whigs, had several thousand majority, but declined the nomination; in 1844 was appointed a judge of the court of common pleas, which office he resigned in 1847. During his absence in Europe in 1852 he was nominated and elected Governor of Massachusetts, and was re-elected the ensuing year. He removed to Cambridge in 1856, having been appointed Professor of Law in the Harvard Law School, which position he held for twenty years, resigning Sept. 1, 1876; then took up the general practice of law; served in the State Legislature, and held other positions of public and private trust. His *Lectures on the Study and Practice of the Law*, his *Treatise on the American Law of Easements and Servitudes*, and the more elaborate work in three volumes, *Treatise on the American Law of Real Property*, all of which have passed through several editions, are the highest standard authorities in both the law schools and the courts throughout the U. S. He also published a *Judicial History of Massachusetts*, a *History of Leicester*, and a *Manual of Criminal Law* (1878), besides pamphlets, essays, etc. D. at Cambridge, Mass., Mar. 17, 1877.

Revised by F. STURGES ALLEN.

Washburn, WILLIAM BARRETT, LL. D.: U. S. Senator; b. at Winchendon, Mass., Jan. 31, 1820; graduated at Yale College 1844; engaged in manufacturing at Greenfield, Mass., and made it his residence; was also engaged in banking, and in 1859 was chosen president of the Bank of Greenfield; was elected to the Massachusetts State Senate 1850, and a

member of the House of Representatives 1854. He was nominated as the Republican candidate for Congress for his district in 1862, and had the unusual, if not unprecedented, honor of being elected by a unanimous vote; was re-elected biennially till 1872, when he resigned to be inaugurated Governor of Massachusetts; was twice re-elected Governor, and was U. S. Senator 1874-75 to fill the vacancy occasioned by the death of Charles Sumner. He was one of the trustees of Yale College and of the Massachusetts Agricultural College; also a trustee of Smith College, Northampton, Mass. D. at Springfield, Mass., Oct. 5, 1887.

Washburne, ELIHU BENJAMIN: statesman; b. at Livermore, Me., Sept. 23, 1816; brother of Charles A. Washburn (added an "e" to the family name); early learned the printer's trade, and studied at the academy at Kent's Hill, Readfield, Me.; afterward studied law in Hallowell and Boston and at Harvard law school; in 1840 settled in Galena, Ill., where he began the practice of law with Charles S. Hempstead; in 1852 was elected to Congress, and continued to serve till Mar., 1869. At the time of his retirement he was by consecutive elections the oldest member, or, in congressional parlance, the "father of the House." On the accession of Gen. Grant to the presidency he was appointed Secretary of State, but soon resigned that office to accept that of minister plenipotentiary to France. He was serving in this capacity at the outbreak of the war between France and Prussia, and was the only foreign minister to remain at his post during the siege of Paris and the Commune, giving shelter and protection as far as possible to all foreigners. His firmness in protecting those unfortunate Germans who were unable to leave Paris won the admiration of all foreign governments. At the close of the war the German emperor conferred upon him the Order of the Red Eagle and sent him his portrait and autograph. On his return to the U. S. he settled in Chicago, Ill., and in 1880 his name was brought forward as a candidate for the presidency, but he declined to have it presented to the convention. He was the author of *Recollections of a Minister to France* (2 vols., New York, 1887). D. in Chicago, Oct. 22, 1887.

Washing of Feet: in supposed accordance with the Lord's example and mandate (John xiii. 5-14), a practice which was common in early Christianity, and continued so during the Middle Ages. At the present day it is observed by many of the minor Protestant sects in America, as Seventh-day Adventists, the Original Free-will Baptists, United Baptists, Baptist Church of Christ, Primitive Baptists, Old Two-seed-in-the-Spirit Predestinarian Baptists, River Brethren, United Zion's Children, the Church of God, the Dunkards, and Mennonites. It is observed in Europe by the Mennonites and other similarly primitive organizations. It was a practice of the early United Brethren in Christ. In the Roman Catholic Church the pope himself and the bishops and priests of certain dioceses wash the feet of twelve pilgrims once a year on Maundy Thursday, after the celebration of a solemn mass. It is a court ceremony, participated in by the emperor in the burg at Vienna and in the Kremlin at Moscow. It was formerly observed among the Jesuits.

SAMUEL MACAULEY JACKSON.

Washington: one of the U. S. of North America (Western group); the twenty-ninth in order of admission into the

Union; popularly known as the Evergreen State; capital, Olympia.

Location and Area.—It lies between lat. 45° 32' and 49° N. and lon. 117° and 124° 48' W., and is bounded on the N. and N. W. by British Columbia, on the E. by Idaho, on the S. by Oregon, and on the W. by the Pacific Ocean. The southern boundary line for about three-fourths of its

southern part (about 30 miles) of the boundary between Washington and Idaho is formed by the Snake river. The extreme width of the State from N. to S. is about 240 miles; extreme length E. to W., 360 miles; area, according to the annual report of the U. S. General Land Office, 1892, 69,994 sq. miles (44,796,160 acres).

Physical Features.—The Cascade Mountain range, extending through the State from N. to S., divides it into two parts known as Eastern Washington and Western Washington. Eastern Washington includes an area sometimes called Central Washington, lying between the Columbia river and the Cascade Mountains, and including the Yakima and Kittitas valleys, which were formerly considered sterile sage-brush plains, but are now being rapidly transformed into most fertile valleys by irrigation. Water for this purpose is taken largely from the Yakima river, a tributary of the Columbia. These two rivers, with the Snake, Spokane, Methow, and Okanogan rivers, include the most important watercourses of Eastern Washington. They afford untold possibilities of water-power, as there are many falls and rapids. The falls at Spokane are estimated at 35,000 horse-power, and are used by manufacturers. The largest lake in the Northwest is Lake Chelan, in Okanogan co., Eastern Washington, 70 miles long and about 3 miles wide. Besides the two valleys mentioned there are the fertile valley of Walla Walla, the Palouse valley (a large area of rolling land, especially adapted to cereals), the Colville valley (in Stevens County), the Okanogan valley (now used for grazing), and the large plateau known as the Big Bend Country, because it lies in the loop or large bend of the Columbia river. There are several smaller areas, such as the fertile Klickitat valley, and small fruit plats along the river courses. Western Washington is entirely different in its general features. Its area is a little over one-half as great, and its slope to tidewater is abrupt when compared with the long stretch of rolling plains and valleys of Eastern Washington. The most important part of Western Washington is known as the Puget Sound Basin. Its great body of water, now known generally as Puget Sound, embraces, with its bays and inlets, an area of about 2,000 sq. miles, including what is acknowledged to be one of the finest series of harbors on the globe. The rest of the coast is abrupt and barren of harbors, excepting Gray's and Willapa harbors. The important rivers of the Puget Sound Basin are the Skagit, Snohomish, Puyallup, Nisqually, White, and Dwamish—all of which drain productive and fertile valleys bearing the names of the rivers. Other important rivers of Western Washington are the Chehalis, flowing into Gray's harbor; the Willapa, flowing into Willapa harbor; and the Cowlitz, flowing southward into the Columbia river. A branch of the Snohomish forms the picturesque Snoqualmie Falls, about 20 miles E. of Seattle. The most important lake in Western Washington is Lake Washington, about 15 miles long and 3 miles wide. Lake Union lies between this lake and Puget Sound, and Seattle extends to the shores of both lakes. Lake Whatcom lies back of New Whatcom, in Whatcom County. Along the west coast of the State is a range of irregular mountains called the Olympics, or Coast Range, which embraces a stretch of practically unexplored lands between Puget Sound and the Pacific Ocean. One important feature of Western Washington is the islands of Puget Sound. Two whole counties—Island and San Juan—are composed entirely of islands. They are important for agricultural purposes, and supply the bulk of the lime used in the State. The possession of most of these islands was a matter of dispute with Great Britain for many years, and was not adjusted until 1873. The names of the most important islands are Whidby, San Juan, Orcas, Lopez, Camano, Fidalgo, Guemes, Lummi, and Waldron. The following table shows the altitudes of important points in the State:

Locality.	Elevation, feet.	Locality.	Elevation, feet.
Mt. Rainier	14,411	Colfax	1,941
Mt. Baker	10,827	Colville	1,917
Mt. St. Helens	9,750	Spokane	1,910
Mt. Adams	9,570	Ellensburg	1,518
Natchess Pass	4,900	Dayton	1,360
Stampede Pass (summit)	3,980	Fort Spokane	1,300
Snoqualmie Pass	3,110	Sprague	1,200
Great Plain of Columbia river	1,000 to 3,000	Walla Walla	1,000
N. P. R. R. Stampede tunnel	2,885	North Yakima	900
Chehalas Lake	2,388	Palouse Junction	858
Kachess Lake	2,158	Palouse	940

Fauna.—The native animals found in Washington include the elk, deer, caribon, mountain goat, mountain sheep (big-

Seal of Washington.

length follows the lower course of the Columbia river, the eastern part of it following the parallel of 46; and the

horn), bear, cougar, wildcat, wolf, coyote, raccoon, otter, beaver, wolverine, martin, skunk, muskrat, sewellel, fisher, and small rabbits and squirrels. There are no poisonous reptiles or insects, except the rattlesnakes that are found in a few places in Eastern Washington. The birds of the State are innumerable. The principal game birds are ducks of various kinds, geese, swans, prairie chickens, grouse, pheasants, quails, and pigeons. Fossil remains of many extinct animals and fishes are found, notably the *Elephas primigenius*. The streams and lakes, and the various bodies of salt water, abound in many varieties of fish and shellfish. The principal fishes of commerce are the salmon and halibut. Native oysters, though of very small variety, are largely exported to Pacific coast markets.

Soil and Productions.—The two natural divisions of the State are not more different in climate and topography than in the general characteristics of the soil and productions. The prevailing soil in Eastern Washington is a volcanic ash. It is light, and, when properly watered, is wonderfully productive. In Western Washington the soil mostly cultivated is that of the river bottoms and reclaimed tide-marshes, where it is a rich alluvial loam. The first settlers found in Eastern Washington the bunch-grass plains, unexcelled anywhere for natural grazing-ground, and in Western Washington the unparalleled forests of cone-bearing trees. The reclaimed tide marshes of the Puget Sound Basin have proved wonderfully productive. In a report on the tide-marsh lands in the U. S. in 1885, the U. S. Agricultural Department made the following statement: "Reclamation has nowhere been so popular and uniformly successful as with the pioneers on Puget Sound." And, further: "Perhaps no other farm-lands in the country have for a series of years yielded so large returns on the invested capital as the diked lands of Puget Sound." The State, especially the western portion, was very heavily clothed with native vegetation. The forests are famous for the size and number of trees. A large percentage of these belong to the family of conifers, and the deciduous or hardwood varieties are few and of little value. About nine-tenths of the Puget Sound forests consist of the fir timber of commerce (*Pseudotsuga taxifolia*). The other trees are cedar, spruce, hemlock, larch, pine, maple, alder, cottonwood, dogwood, madrona, bearberry, crabapple, yew, and a few scattering oaks. Smaller vegetation grows in luxuriant tangles in the low lands of Western Washington, and in some places is practically impenetrable. The soil in such localities, when cleared, is the richest. In Eastern Washington there are some forests of pine, fir, and cedar, greatly prized by the settlers of that part of the State, but the timber is much inferior to that of the Puget Sound forests. The drier plains of Eastern Washington were originally covered with sage-brush and bunch-grass.

The principal agricultural crops of Eastern Washington are wheat, barley, hay, hops, and oats; and of Western Washington, oats, potatoes, hops, and hay. There are also grown vegetables of all kinds, flax, rye, Indian corn, and in a few places in Central Washington some peanuts are raised. Hops thrive well; there was an unusually heavy yield in 1890, when 42,476 bales were harvested. Yields are reported of from 600 to 3,000 lb. of hops to the acre. In fruits, the State excels in prunes, apples, pears, cherries, and the small berries. The acreage is increasing rapidly and the surplus product is shipped to markets in the Eastern States. Irrigation is revolutionizing agriculture in the central part of the State, where sage-brush plains are being transformed into productive farms. In 1890 there were reported 48,000 acres of irrigated land under cultivation. This has been largely increased and millions of dollars are being invested in irrigating-works. The principal crops produced in the sections reclaimed by means of irrigation are fruits, alfalfa, hops, and vegetables. The Yakima valley, in the center of the irrigated lands, exports, among other things, many carloads of watermelons.

The following summary, which is compiled from the census reports of 1880 and 1890, shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms.....	6,529	18,056	176.6
Total acreage of farms.....	1,403,421	4,179,190	196.5
Total value of farms, including buildings and fences.....	\$13,844,221	\$83,461,660	502.9

* Increase.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	5,295	110,136 bush.	\$75,994
Wheat.....	548,700	9,108,420 "	3,552,284
Oats.....	87,612	3,197,838 "	991,330
Rye.....	2,322	33,437 "	18,725
Barley.....	47,336	1,505,223 "	510,471
Potatoes.....	15,422	1,927,750 "	539,770
Hay.....	372,956	764,560 tons.	5,642,553
	1,079,643	\$11,331,027

On Jan. 1, 1895, the farm animals comprised 200,057 horses, value \$6,457,895; 1,392 mules, value \$56,616; 113,962 milch cows, value \$2,835,375; 428,708 oxen and other cattle, value \$6,887,672; 748,857 sheep, value \$1,304,360; and 211,870 swine, value \$1,189,268—total head, 1,704,846; total value, \$18,731,186.

Minerals.—The value of the total mineral product in 1889 was \$2,998,355. The greatest product of the mines thus far has been coal, but gold, silver, lead, iron, copper, zinc, antimony, nickel, bismuth, and other metals are found in paying quantities. Granite, sandstone, lime, marble, and valuable clays are also found. Many of the mining districts abounding in precious metals are as yet only prospected and are awaiting railroads to mature development. Two large smelters are in operation, one in Tacoma, the other in Everett. Only bituminous coal is now mined. There are twelve mines in operation, located in King, Pierce, Kittitas, Thurston, Skagit, and Whatcom Counties. King County produced in 1893 577,731 short tons; Kittitas, 253,467; Pierce, 408,074; Skagit, 2,905; Thurston, none, though it had an output of 22,119 tons the previous year; and Whatcom, 22,700. The total production was 1,264,877 short tons, valued at \$2,920,876, the largest annual production on record up to that year. Of the precious metals the products were: Gold, 10,744 fine oz., value \$222,100; silver, 152,700 fine oz., coin value \$197,430—total value, \$419,530. In 1889 the product of limestone for building purposes and lime-making was \$231,287, and of sandstone \$75,936. Eight limestone and five sandstone quarries were in operation. There are productive mineral springs at the Cascades, in Skamania County; Medical Lake, in Spokane County; and North Yakima, Yakima County. Valuable deposits of iron ore are known to exist in the State, but mining operations are in their infancy.

Climate.—The director of the Washington weather service for the U. S. Government says: "For equability and mildness of climate, absence of either very hot or very cold waves, and freedom from destructive tornadoes or cyclones, Washington stands foremost among the favored States of the American Union." The following table shows the mean temperature and mean rainfall in Eastern and Western Washington by months, the averages being deduced from observations extending from two to forty years:

MONTHS.	WESTERN WASHINGTON.		EASTERN WASHINGTON.	
	Mean temperature.	Mean rainfall.	Mean temperature.	Mean rainfall.
January.....	37.3	7.82	26.3	2.17
February.....	40.2	6.45	31.4	2.08
March.....	44.3	5.80	42.6	1.20
April.....	49.7	3.21	51.0	1.33
May.....	54.7	2.77	59.4	1.25
June.....	60.1	1.94	66.0	0.88
July.....	62.7	0.96	71.6	0.56
August.....	62.5	1.13	70.6	0.27
September.....	58.2	3.31	60.6	0.69
October.....	51.2	4.54	49.6	1.92
November.....	44.7	6.94	38.6	1.58
December.....	39.9	7.65	32.2	2.58
Average temperature for year....	50.4	49.7
Total rainfall for year.....	52.52	16.51

The mean annual rainfall over the western half of Clallam, Jefferson, Chehalis, and Pacific Counties ranges from 79 to 107 inches. This region is the immediate Pacific coast portion of the State, and comprises about 6 per cent. of the entire area of the State. This immense rainfall occurs during the three winter months, and during the rest of the year the rainfall is not excessive. The Government records are doing much to dispel the erroneous idea that Washington has an excessively rainy climate.

Divisions.—For administrative purposes Washington is divided into thirty-four counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1880.	Pop. 1890.	COUNTY-TOWNS.	Pop. 1890.

* Reference for location, see map of Washington. † Estimated.

Principal Cities and Towns, with Population for 1890.—Seattle, 42,837; Tacoma, 36,006; Spokane, 19,922; Walla Walla, 4,709; Olympia, 4,698; Port Townsend, 4,558; Fair Haven, 4,076; Whatcom (now New Whatcom), 4,059; Vancouver, 3,545; Ellensburg, 2,768; and Centralia, 2,026.

Population and Races.—In 1860, 11,594; 1870, 23,955; 1880, 75,116; 1890, 349,390 (native, 259,385; foreign, 90,005; males, 217,562; females, 131,828; white, 340,513; colored, 8,877, comprising 1,602 persons of African descent, 3,260 Chinese, 360 Japanese, and 3,655 civilized Indians). There are (1894) in the State 18 Indian reservations with an aggregate area of 7,094,950 acres. Much of the land has been allotted to the Indians in severalty.

Industries and Business Interests.—The principal article manufactured in Eastern Washington is flour, large mills being located at Spokane, Walla Walla, Dayton, Waitsburg, Cheney, and other cities. The chief articles manufactured in Western Washington are lumber, iron, brick, and tile. The census of 1890 showed that 1,543 manufacturing establishments reported. These had a combined capital of \$34,369,735, including an investment of \$8,766,916 in machinery, tools, and implements. There were 20,366 persons employed, to whom \$12,638,614 was paid in wages. Materials used cost \$19,917,057, and the output was valued at \$41,768,022. SEATTLE and TACOMA (qq. v.) were the principal manufacturing cities reporting. Since then the city of Everett has come into existence and has important manufacturing in operation. In 1892 there were in operation in the State 227 sawmills, 246 shingle-mills (of which 127 were erected during the year), and 73 sash and door factories. The aggregate annual capacity of the sawmills is 2,970,000,000 feet, and of the shingle-mills 3,723,000,000. The capital invested in these plants is about \$30,000,000; total number of employes about 12,000, who receive over \$7,000,000 wages yearly. The total output for the year 1892 was 1,164,425,880 feet of lumber, 436,716,000 lath, and 1,883,868,750 shingles. The standing timber of the State is estimated as follows:

DIVISION.	Acres in timber.	Timber standing, feet.	Value.
Eastern Washington.....	11,616,730	106,978,041,000	\$80,436,521
Western Washington.....	11,971,792	303,355,294,000	189,134,808
Totals.....	23,588,512	410,333,335,000	\$269,561,329

Statistics of salmon canned and packed on the Columbia river have been preserved since 1866. The total to 1893 is 9,323,550 cases. In 1866 the pack was 4,000 cases, and in

1892 465,000 cases. The greatest pack for any single year was in 1883, 629,000 cases. During 1892 2,081 tons of sturgeon were exported. In the Puget Sound district the value of the fish catch of 1892 was \$138,700. There are 335 acres of oyster-beds in the State, from which 560 sacks of oysters are taken weekly. In 1892 the value of the output of the fisheries was \$1,176,862, and of oysters and clams \$132,840.

Commerce.—In the year ending June 30, 1894, the foreign trade in the Puget Sound customs district was as follows: Exports of gold and silver \$59,320, of merchandise \$4,942,040; imports of merchandise \$1,230,399—total foreign trade \$6,231,759. The entrances were, sailing-vessels 122, tonnage 94,900; steam-vessels 1,144, tonnage 694,465; and clearances, sailing-vessels 209, tonnage 193,755; steam vessels 1,168, tonnage 701,898.

Finance.—The constitution limits the State's indebtedness to \$400,000. Interest on State and county warrants is limited by law to 8 per cent. a year. State warrants usually mature in two years, and they sell readily for from 1 to 2 per cent. premium. The tax levy for State purposes is a trifle over 2½ cents on \$100. The assessed valuation of real and personal property as equalized by the State officers for 1894 was, real, \$183,683,372; personal, \$28,747,139—total, \$212,430,511; in 1892, however, it was \$319,016,341. The debt on Apr. 1, 1895, was, bonded, \$300,000; floating, \$931,369.

Banking.—In 1895 there were 56 national banks with combined capital of \$5,995,500; 38 State banks with capital of \$1,855,100; 19 investment and loan companies, 17 of which reported authorized capital of \$2,925,000; 3 trust companies with capital of \$800,000; 14 incorporated banks; and 16 private banks.

Post-offices and Periodicals.—In Jan., 1895, there were 822 post-offices, of which 32 were presidential (3 first-class, 4 second-class, 25 third-class) and 790 fourth-class. Of the total, 209 were money-order offices and 17 were limited money-order offices. There were 225 newspapers and periodicals, viz., 18 daily, 3 tri-weekly, 181 weekly, 22 monthly, and 1 quarterly.

Means of Communication.—The first steam railway built W. of the Rocky Mountains was in Skamania co., Washington. It was a short portage railway around the falls or cascades in the Columbia river, at the town of Cascade. From that beginning very little was done until 1885, when the first transcontinental railway entered Washington. Four great railways have since come into operation, and have their main lines or important branches in the State. The total mileage in 1893 was 2,619, of which 1,244 miles belonged to the Northern Pacific and its branches, and 487, the next largest number, to the Great Northern and branches. The great area of navigable waters has resulted in building up important water transportation enterprises. The U. S. Government has commenced (1895) a canal between Puget Sound and Lake Washington, for the benefit of the naval station at Port Orchard. Considerable steamboat business is done on the Columbia and Snake rivers, but the great bulk of water transportation is on Puget Sound, Gray's harbor, and Willapa harbor.

Churches.—The whole State constitutes two missionary jurisdictions of the Protestant Episcopal Church named Washington and Spokane, and a diocese of the Roman Catholic Church, named Nesqually. The census of 1890 reported 882 church organizations, 532 edifices, valued at \$2,408,625, 58,798 communicants, and the following statistics of the principal bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic.....	86	86	20,848	\$156,050
Methodist Episcopal.....	200	195	11,592	652,425
Disciples of Christ.....	86	88	5,816	93,400
Presbyterian in the U. S. of A.....	85	92	3,770	343,175
Congregational.....	104	103	3,154	316,230
Protestant Episcopal.....	23	23	1,698	212,800

Schools.—Every section of land numbered 16 or 36 is set aside for the maintenance of public schools. The aggregate is 2,484,480 acres, and none of it can be sold for less than \$10 an acre, while much of it will bring several times that price. The proceeds from the sale of these lands constitute an irreducible fund, having a minimum value of \$2,844,800, only the interest on which can be used. In 1894 there were 1,741 public-school districts, 1,654 school buildings, 3,088 teachers, 112,300 pupils, and school property, ex-

clusive of school lands, valued at \$4,872,710. The payment of teachers' salaries aggregated \$881,048. Besides the public schools there are over fifty colleges, endowed academies, and private and denominational schools. The colleges include the University of Washington (see WASHINGTON, UNIVERSITY OF); Colfax College (Baptist), at Colfax; Whitworth College, at Sumner; Whituan College (Congregational), at Walla Walla; and St. James's College (Roman Catholic), at Vancouver. There are State normal schools at Ellensburg and Cheney, and an agricultural college and school of science at Pullman.

Charitable, Reformatory, and Penal Institutions.—The State institutions comprise a Soldiers' Home at Orting, Reform School at Chehalis, hospitals for the insane at Steilacoom and Medical Lake, a School for Defective Youth at Vancouver, and a penitentiary at Walla Walla. There are numerous private and denominational hospitals, orphanages, homes, and other institutions, and a small penitentiary on McNeil's island, belonging to the U. S. Government.

Political Organization.—The constitution provides that the State officers shall be elected for four years at the same elections at which the vote is taken for President of the U. S. Much of the multifarious work of the State government devolves upon boards of trustees or commissioners. Each State institution has a separate board of trustees. There are boards to handle the State lands, to look after the State printing, to equalize the taxes, to appraise the tide lands, to regulate the practice of medicine, pharmacy, and dentistry, and to perform various other duties. These officers, except a few who are *ex-officio* members of certain boards, are all appointed by the Governor. An elector must be a male citizen of the U. S., and must reside in the State one year, in the county six months, and in his voting precinct thirty days before being entitled to vote at any election. For a brief period in territorial days the suffrage was extended to women, but it was withdrawn before statehood, though women are still allowed to vote at school elections. In the State Legislature there are thirty-four senators and seventy-eight representatives. Half the senators and all the representatives are elected biennially, making the senatorial term four years.

History.—The geographical nomenclature of Washington throws light upon the history of its discovery. Along the seacoast are found names that perpetuate the memory of the earliest Spanish voyages to the Pacific Northwest, such as the Strait of Juan de Fuca and San Juan Islands. The greater number of names, as Vancouver Island, Puget Sound, Mt. Rainier, etc., commemorate the more complete work of the English navigator, George Vancouver. Gray's harbor and Columbia river are named after Capt. Robert Gray, and his vessel, the *Columbia*; he discovered both in 1792 while on the first voyage of exploration in the Pacific Northwest by and for Americans. These discoveries gave the U. S. a claim to at least a large part of the territory now embraced in the State of Washington, but title was not made perfect until 1803, when the Government purchased from Napoleon I. the Louisiana territory, which cleared away the last controversy except trifling differences with Great Britain as to boundaries between the U. S. and British America. The famous Lewis and Clarke overland expedition made valuable discoveries in 1803-05. The Hudson Bay Company long operated in this region, and remains of their forts and buildings still exist. The American Fur Company, John Jacob Astor's Pacific Fur Company, and other enterprises sought this field in the early part of the nineteenth century. Washington was a part of the Territory of Oregon until 1853, when a part was set off and organized as Washington Territory. Two years later white settlers experienced much trouble with Indians in different parts of the Territory. Washington was admitted into the Union as a State Nov. 11, 1889.

AUTHORITIES.—There are as yet but few books giving the history of Washington. Hubert Howe Bancroft includes one in his extensive series of the Pacific Coast histories. Others are Hawthorne's *History of Washington, the Evergreen State* (2 vols., New York, 1893); Evans's *History of Pacific Northwest, Oregon and Washington* (2 vols., Portland); Evans and Meany's *Washington, the Evergreen State* (1876); Barton's *Legislative Manual of Washington* (Olympia, biennial).

EDMOND S. MEANY.

Washington: town (incorporated in 1779); Litchfield co., Conn.; on the Shepaug river, and the She., Litch. and N. Railroad; 40 miles N. of Bridgeport, 90 miles N. E. of New York (for location, see map of Connecticut, ref. 9-D). It was set off from the towns of Woodbury, Litchfield, Kent, and New Milford; contains the villages of Washington, Washington Depot, Romford, New Preston, Marbledale, and Woodville; is principally engaged in agriculture; and is a summer resort. Pop. (1880) 1,590; (1890) 1,633.

Washington: city; capital of the U. S. of America and seat of the Federal Government since 1800; coextensive with the District of Columbia; on the east bank of Potomac river, 106 miles above its mouth, and 105 miles in a straight line W. of the Atlantic Ocean; in lat. 38° 53' 39" N. and lon. 77° 2' 48" W. of Greenwich (for location, see map of Maryland, ref. 3-E). The District of Columbia is bounded N., N. W., E., and S. E. by Maryland, and W. and S. W. by the Potomac river, which separates it from Virginia. Area, 64 sq. miles.

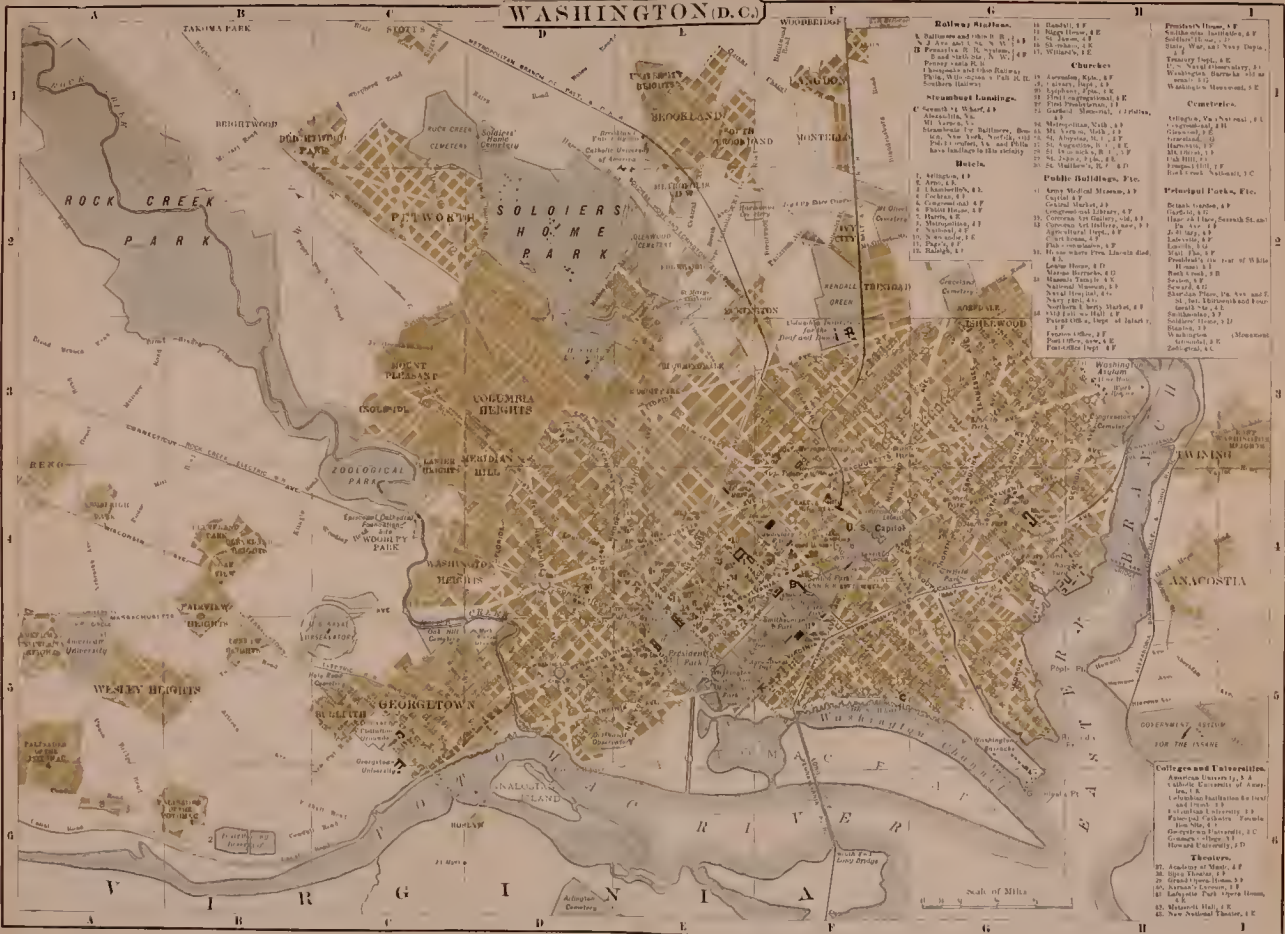

Washington is almost alone among the capitals of great nations of modern times in the fact of its creation for the sole purpose of a seat of government, apart from any questions of commercial greatness or population. While London, Paris, Berlin, St. Petersburg, Vienna, and Madrid are the commercial capitals and the most populous cities of the nations they represent, Washington never was the leading city of the U. S., or the great metropolis of a commercial and manufacturing population. Although located at the head of tidewater navigation, and possessing some natural advantages in the water-power of the Potomac, the city has no natural harbor. In trade and manufactures it is overshadowed by the neighboring commercial cities of Baltimore and Philadelphia, distant only 40 and 136 miles respectively, while New York is but 226 miles distant by railway. As a residence city, however, the capital has unsurpassed advantages.

Washington is connected with the Virginia shore by three bridges across the Potomac. The Long bridge, which has a track for railway running S. and a carriage-way for vehicles and pedestrians, is laid on piers. The Aqueduct bridge at Georgetown is now used only for travel to Arlington, Fort Myer, and the Virginia interior. The Chain bridge at Little Falls, 4 miles above, has given place to an iron truss bridge, erected in 1874. Across the Eastern Branch, or Anacostia, runs the Navy-yard bridge, an iron structure erected in 1875, and affording communication with the suburb of Anacostia, and another iron bridge connects Pennsylvania Avenue, E. with Twining City. Benning's bridge, of wood, lies about a mile above the navy-yard.

Streets and Avenues.—The streets are laid out of the width of 160 feet down to 70 feet. The length of the streets and avenues is 264 miles, and they are wider than those of any other great city. There are twenty-one avenues bearing the names of States of the Union. Pennsylvania Avenue is a celebrated thoroughfare 160 feet in width, paved with smooth concrete, constituting a splendid and attractive driveway. Massachusetts Avenue, of like width, is over 4½ miles long. East Capitol Street, 160 feet wide, extending from the east front of the Capitol to Lincoln Park, has become one of the most attractive streets. K Street, 148 feet wide, extending from Rock creek, the Georgetown boundary, to the Anacostia, is one of the finest thoroughfares of the city. Sixteenth Street, 160 feet wide, runs from Lafayette Square, opposite to the President's house, due N. to the boundary, whence it is extended into the country. In 1871 an extensive system of sewerage and of street pavements was instituted, the Washington Canal was filled up, and about 260 miles of streets and avenues paved, mostly with smooth asphalt or concrete. Many streets were completely regraded, while in the streets and avenues about 75,000 shade trees have been planted, giving the capital the aspect of a forest city.

The city proper measures 4½ miles by about 2½ miles, and its circumference is 14 miles, there being a water front on

the Potomac of 4 miles, and on the Anacostia, or Eastern Branch of the Potomac, of $3\frac{1}{2}$ miles. The area amounts to 6,111 acres, of which the Government reservations comprise 495 acres, while the avenues and streets embrace 2,554 acres, leaving only 3,152 acres to the squares on which private residences are built, which greatly conduces to the public health by the large open spaces and abundant ventilation in every quarter. There are 301 parks or reservations in all, varying from a few hundred square feet to 82 acres. The principal are Washington Park (Monument Grounds), President's Park (in rear of the White House), Smithsonian Park, Judiciary Park, Garfield Park, and Lincoln Park.

The site of the city of Washington is admirably adapted by nature for the building up of an attractive and imposing city. Situated in part on the tongue of land lying at the confluence of two broad rivers, from which the ground rises in natural and not abrupt ridges into the expanded plateau of Capitol Hill, about 100 feet above the Potomac, the surface of the city presents a gentle undulation which gives variety and constant transition of prospect, without producing any obstructions to travel. The city proper is surrounded on the E., N., and W. by an amphitheater of well-wooded hills, embracing in some cases the ancient forest-growth of tall timber, which was but partially cut off or burned on the Maryland side (as on the Virginia) during the ravages of civil war. Viewed from the vantage-ground of the Capitol dome, or from the Washington Monument, the environs of Washington present a landscape of rare beauty and varied effect. The near view includes the mass of the city, thickly covered with dwellings, stores, and shops, intersected by the two great arteries of Pennsylvania Avenue, running to the Treasury, and Maryland Avenue, running westward to the Potomac. At frequent intervals through the perspective of roofs rise the tall spires of churches and the massive white marble and granite edifices of the various Government buildings. Turning westward, the bright broad current of the Potomac—nearly a mile wide opposite the Capitol—sweeps southward, while there comes in on the left,

The latter little city, with its houses, churches, and shipping lying along the harbor, 7 miles below Washington, is clearly visible, and the river is dotted with the sails of river-craft and with steamers plying up and down. To the N. W., over the roofs of the Executive Mansion and the buildings of the State, War, and Navy Departments, rise the lofty and picturesque heights of Georgetown, attaining, just outside the borders of the District of Columbia, a height of some 400 feet above the level of the sea. To the N. are seen the buildings of Howard University, crowning Seventh Street hill, and beyond, the tower of the Soldiers' Home, a free refuge for the disabled soldiers of the army, comprising a beautiful park of 500 acres in extent. It was this comprehensive view which drew from Baron von Humboldt the remark, as he stood on the western crest of Capitol Hill and surveyed the scene, "I have not seen a more charming panorama in all my travels."

The Capitol, the most conspicuous object in Washington, is constructed in the purely Classic style, with a center and two projecting wings of great extent, and is ornamented on the east front with sixty-eight Corinthian columns. The length of the Capitol is 751 ft. 4 in.; breadth, 121 to 324 feet, covering $3\frac{1}{2}$ acres. From the central building springs a lofty iron dome 135½ feet in diameter, and containing 8,009,200 lb. of cast and wrought iron. The apex of the dome is surmounted by a lantern 15 feet in diameter and 50 feet high, crowned by a bronze statue of Liberty, the height of which is 19½ feet. The total height from the base of the Capitol to the crest of the statue is 285½ feet. The advantageous position, great architectural mass, and harmonious and imposing effect of the Capitol from most points of view have secured for it the almost unanimous praise of the best judges of all countries as the most impressive modern edifice in the world. The material of the central building is Virginia freestone; that of the wings is white marble from Massachusetts; while the fluted marble columns are from Maryland. The total expenditure upon the Capitol for erection, extension, and repairs has been a little over \$15,000,000.

Executive Mansion (White House).

joining its broad stream at Greenleaf's Point (on which the Government arsenal is situated), the deep current of the Anacostia. To the S., on the heights beyond the Eastern Branch, is seen the long mass of the Government insane asylum building. On the Virginia shore rises a long forest-clad range of hills, amid which may be discerned Arlington Heights, with its pillared edifice erected by George Washington Parke Custis, now occupied by the Government, and the National Cemetery or city of the dead, where 15,000 Union soldiers are interred, while the spire of Fairfax Seminary, 6 miles distant, rises above the horizon in the direction of Alexandria.

The first Capitol was erected on the same site, the corner-stone laid by George Washington Sept. 18, 1793. Before its completion the building was destroyed by the British in 1814. The present central structure dates from 1818 (completed 1827), and the extension or wings from 1851. The corner-stone of the Capitol extension was laid July 4, 1851, and the Hall of Representatives, in the south wing, was first occupied in 1857, and the Senate Chamber in the north wing in 1859. The work was continuously prosecuted during the civil war, until the statue of Liberty crowned the summit on Dec. 12, 1863.

The rotunda is the central attraction of the Capitol, and

is 96 feet in diameter by 180 feet in height to the canopy of the dome above, on the concave interior of which is a mammoth fresco by Brunetti representing allegorical and historical subjects. The eight panels surrounding the rotunda are adorned by historical paintings, four of which are by Trumbull, representing the Declaration of Independence, the surrender of Burgoyne at Saratoga, the surrender of Cornwallis at Yorktown, and Washington resigning his commission as commander-in-chief in 1783. The best embodiment of the sculptor's art in the external decorations of the Capitol is the group by Thomas Crawford on the east front of the Senate wing. This represents the progress of civilization in the U. S. The great bronze doors by Randolph Rogers which adorn the east front entrance of the Capitol represent in sculptured *alto-rilievo* events in the discovery of America and the life of Columbus, while the similar doors in bronze, the main entrance to the Senate wing, designed by Thomas Crawford, represent Revolutionary battles and prominent civic events in the history of the country. The Senate Chamber, in the north wing, is 113 by 81 feet, with seats for 88 Senators, the galleries furnishing room for 1,000 spectators. Staircases of white and colored marble run from the basement to the Senate galleries. The long apartment in the rear of the Senate Chamber known as the Marble Room is constructed wholly of marble, the ceiling resting upon four Corinthian columns of Italian marble, while the walls are of variegated Tennessee marble highly polished. Adjoining the Marble Room is the President's Room. The south wing of the Capitol is occupied by the House of Representatives and its offices. This is the largest legislative chamber in the world, 139 feet by 93 feet. The galleries accommodate about 1,500 persons, while the floor affords ample space for 360 members, each provided with a writing-desk. The Library of Congress occupies the west projection of the central building, and contains over 700,000 volumes. The law department of the library is in the basement of the Capitol. It has 90,000 volumes, included in the above. The Supreme Court-room and offices occupy the old Senate Chamber, in the central building, and rooms adjacent. The old hall of the House of Representatives is in the form of a semicircle, surrounded by columns of variegated marble. This hall was devoted in 1864 to the purposes of a national memorial hall, each State to contribute statues of two of its most distinguished citizens. The States which have already furnished statues are the six New England States, New York, New Jersey, Pennsylvania, Ohio, Michigan, and Illinois. In this hall, too, is the fine piece of sculpture by Franzoni representing the Muse of History on the winged ear of Time, with a clock recording the hours.

The Capitol contains, besides these, the historical paintings in the rotunda, and the frescoes, a considerable number of works of art of various merit. At the head of the grand staircase W. of the House is Leutze's large painting representing an emigrant train crossing the Rocky Mountains. A corresponding panel E. of the House holds Carpenter's picture of the signing of the emancipation proclamation. Powell's picture of Perry's victory on Lake Erie is at the head of the eastern staircase in the Senate wing. Two paintings of scenery on the Colorado and Yellowstone by Thomas Moran are in the corridor to the E. of the Senate gallery. Statues of Franklin and Jefferson by Hiram Powers, and of Hancock, Hamilton, and Baker, by Horatio Stone, are among the decorations of the Capitol. Marble busts of all the Vice-Presidents are to be placed in the Senate chamber. The Electoral Commission, a group of historical portraits by Mrs. Fassett, is also exhibited.

The *New Congressional Library* building occupies a square of about 10 acres just E. of the Capitol. It is built of white New Hampshire granite, three stories high, in the Italian Renaissance style, the four-corner pavilions and central front being moderately projected, with forty ornate pillars and capitals. The dimensions are 470 by 340 feet, the building covering $3\frac{1}{2}$ acres. The central feature of the interior is the reading-room, an octagonal or nearly circular hall 100 feet in diameter, its walls decorated with numerous beautiful arches of richly carved marbles, harmonious in tone and color. The book repositories opening out from the reading-room are filled with iron cases or stacks, accommodating 2,000,000 volumes, the ultimate capacity of the whole library building being 4,500,000. There are four great inner courts lined with white enameled brick, and the number of windows exceeds 2,000, rendering this the best-lighted library in the world. Copyright record-rooms, con-

gressional reading-rooms, a lecture-hall, an extensive map-room, and an art gallery of large dimensions, are other features of the building. Numerous statues of men eminent in literature and science and emblematic mural decorations in oil painting and fresco are in the interior.

The *Treasury Department*, at Fifteenth Street and Pennsylvania Avenue, is an imposing granite edifice in Ionic style, 468 feet by 264, and cost \$6,000,000.

The great building of the *State, War, and Navy Departments* is a massive pile of granite architecture in Italian Renaissance style, 567 by 471 feet, and with 4 façades, looking to the E., W., N., and S. respectively. The total cost of the building was about \$10,000,000.

The *Department of the Interior*, best known as the Patent-office building, occupies the entire square between F and G Streets, from Seventh to Ninth. This building is of severely simple though massive proportions, the architecture being pure Doric, modeled after the Parthenon, 453 by 331 feet, with an elevation of 75 feet. In it are located, besides the Patent-office, which occupies the larger portion of its 191 rooms, the Indian office and the office of the Public Lands, together with the offices of the Secretary of the Interior. Cost, \$2,700,000.

The *Post-office Department* is immediately opposite the Patent-office. It is of Maryland marble, 300 feet long by 204 wide, in pure Corinthian architecture. Cost, \$1,700,000.

The *Department of Agriculture* occupies a large brick building with brownstone trimmings, in Renaissance style, 170 by 61 feet, adjoining the Smithsonian Institution.

The *U. S. Naval Observatory* is on Georgetown Heights, its white marble buildings being in the purely Classic style. The great equatorial telescope, with an object glass of 26 inches, cost \$47,000.

The *Army Medical Museum* building, at the corner of Seventh and B Streets, S. W., contains the hospital records of the U. S. army in over 10,000 MS. volumes, and a vast assemblage of curious and instructive specimens representing the effects upon the human body of wounds, morbid conditions, surgical operations, etc. The library of the surgeon-general's office, here deposited, about 100,000 volumes, is by far the most complete medical collection ever gathered.

The *Washington Navy-yard*, established in 1804, occupies 27 acres on the Anacostia river at foot of Eighth Street, about a mile S. E. of the Capitol. This yard, now disused for the construction of naval vessels, is an important dépôt for the manufacture of ordnance.

The *President's house*—known also as the Executive Mansion, and popularly called the White House—is on Pennsylvania Avenue, occupying a reservation of about 20 acres, midway between the Treasury and the Departments of State, War, and Navy. It is a plain edifice of freestone painted white, 170 by 86 feet, with a colonnade of eight Ionic columns in front and a semicircular portico in the rear. The grounds are adorned with fountains, flowers, and shrubbery, and form a pleasing retreat in the midst of buildings devoted to commercial and public business. The building is adorned by excellent portraits of the ex-Presidents of the U. S. The largest apartment, known as the East Room, is 80 by 40 feet in dimensions, and 22 feet high. The adjoining Blue Room, an apartment finished in blue and gold, is devoted to receptions, diplomatic and social. The Green Room and Red Room (so called from their furnishings) are each 30 by 20 feet. The rooms of the second floor are occupied by the executive office and the President's secretaries, together with apartments for the presidential family. The first President's house, begun in 1792, was occupied by President Adams in 1800, and was burned by the British army in 1814. The present edifice was constructed 1818-29.

The *Fine Arts*.—Henry K. Brown's fine bronze equestrian statue of Gen. Winfield Scott, erected in 1874, occupies the circle at the intersection of Massachusetts and Rhode Island Avenues on Sixteenth Street. Ball's bronze statue, in Lincoln Park, emblematic of Emancipation, represents Abraham Lincoln freeing a slave in chains. Greenough's marble statue of Washington, classical in style and colossal in size, is immediately before the east front of the Capitol. Many other bronze statues, of various merit, of military and naval heroes, are located in the public reservations. The finest, as a work of art, is the statue of La Fayette in Lafayette Square, opposite the White House. The only public institution devoted exclusively to the fine arts is the Corean Gallery of Art, on Pennsylvania Avenue and Seventeenth

The Capitol, Washington, D. C.

New Congressional Library, Washington, D. C.

Street, opened with a collection of paintings, statuary, bronzes, and casts from the antique in 1873. It was founded by the liberality of William W. Corcoran, and is open to the public free during three days of the week. Its new stone building is to occupy a site on Seventeenth Street and New York Avenue, opposite the State Department.

The Washington National Monument (erected to commemorate the first President) was begun by an association incorporated by Congress. Its corner-stone was laid July 4, 1848. After an expenditure of \$230,000, raised by voluntary subscription, work was suspended. The monument was finished in 1885 under the direction of Col. Thomas L. Casey, U. S. Engineers, in accordance with an act of Congress passed in 1876. It is built of great blocks of crystal Maryland marble lined with blue gneiss, and rests on a foundation 104 feet square and 37 feet deep. The walls at the base are 15 feet thick; at the height of 152 feet, where the new work was begun, they are 12 feet thick; 10 feet higher they are reduced to 8 feet, and at the top to 1½ feet in thickness. The base of the shaft is 55 ft. 5½ in. square; the top of the

foot of Capitol Hill, is a fine collection of trees, shrubs, and flowers from many climes.

The Soldiers' Home, a national institution for invalid soldiers of the regular army, was established in 1851. The buildings are handsome and costly, and the grounds (523 acres), laid out in meadows, groves, and lakes, afford 7 miles of beautiful drives, serving as a free public park for the city of Washington.

Minor Government Buildings.—Among these are the Columbia Institution for the Deaf and Dumb, with its picturesque semi-Gothic buildings, occupying 100 acres in the northeast quarter of the city; the Pension-office, a large structure of brick erected in 1883 on Judiciary Square, at a cost of \$400,000; the Department of Justice, on Pennsylvania Avenue, opposite the Treasury; the Weather Bureau, corner of M and Twenty-fourth Streets, N. W.; the Government Printing-office, corner of North Capitol and H Streets, the most extensive printing establishment in America; the Bureau of Engraving and Printing, at Fourteenth and B Streets, S. W., where the national currency and bonds are printed; the Coast and Geodetic Survey, on New Jersey Avenue, near the Capitol; the U. S. Fish Commission building, corner of Sixth and B Streets, S. W.; and the Government Hospital for the Insane, a commodious structure, with several outlying buildings, on the crest of hills opposite Washington, with 419 acres. The Interstate Commerce Commission, Bureau of Education, Department of Labor, the Geological Survey, and the U. S. Civil Service Commission occupy rented buildings.

The clubs of Washington are numerous. The principal, in number of members, are the Cosmos Club, the Metropolitan, the Army and Navy, the University, and the Washington Club (a ladies' organization), all of which have separate club buildings.

Literary and scientific societies abound, many having large memberships. Among them are the Anthropological Society, the Philosophical Society, the National Geographic Society, the Biological, Chemical, Microscopical, and Woman's Anthropological Societies, the Columbia Historical Society, the Literary Society, the Unity Club, the Shakespeare Club, etc. Of the patriotic societies are the Sons of the American Revolution, Daughters of the American Revolution, Grand Army of the Republic, Association of the Oldest Inhabitants, etc.

Washington has become of late years the foremost city in the Union for conventions of all descriptions—political, religious, philanthropic, economic, medical, scientific, technical, industrial, educational, military, etc. Its ample space and accommodations for an influx of large additions to the resident population, joined to the universal desire to visit the nation's capital, readily account for the fact that the reunions of so many great organizations are held here. Convention Hall holds about 10,000 people, and numerous public halls, opera-houses, and theaters are drawn upon for lectures and public meetings. Nowhere in the country is there such an array of talent on the lecture platform as in Washington. Courses of scientific, literary, historical, musical, and art lectures are organized, many of which are free to the public.

The great value of the scientific establishments of the Government at Washington is recognized throughout the world. Most important among them are the NATIONAL MUSEUM and the SMITHSONIAN INSTITUTION (*qq. v.*). Indeed, the city of Washington, with its great national library, its museums of art and science, its bureau of patent inventions, and other Government exhibits, with the numerous public lectures of the winter season, affords opportunities for instruction unsurpassed elsewhere in the U. S.

Charitable institutions abound in Washington, and many of them have received continuous or occasional aid from the Treasury by act of Congress. The principal are Providence Hospital, a large edifice on Capitol Hill, accommodating 200 patients; Garfield Hospital, National Homœopathic Hospital, and Emergency Hospital; the Louise Home, a fine building on Massachusetts Avenue, erected and endowed by William W. Corcoran, in 1871, for indigent gentlewomen; the Columbia Hospital for Women; the Industrial Home School, the Reform School, the House of the Good Shepherd, the Washington Orphan Asylum, St. Joseph's, St. Ann's, and St. Vincent's orphan asylums, the Children's Hospital, the Freedmen's Hospital, and the Home for the Aged, under the care of the Little Sisters of the Poor.

The markets of Washington are profusely supplied with all the products of the soil and of the waters, meats of the

Washington Monument

shaft, at base of the pyramid, is 34 ft. 5½ in. square. The height of this monument is 555 ft. 5½ in., and it is the highest stone structure in the world. The weight of the whole structure, including foundation, is 81,117 tons of 2,240 lb.; cost, \$1,187,710. A polished cap made of aluminium, a metal that does not corrode by exposure to the elements, covers the highest point. Within the monument are an elevator and an iron stairway of 900 steps.

The Zoological Park lies along both banks of Rock creek, to the N. W. of the city, comprising 167 acres. The site is extremely picturesque, and the variety of animals and birds here exhibited render it a most attractive public resort.

The Rock Creek Park, an extensive tract purchased by Congress in 1890 for \$1,200,000 (one-half paid by the District of Columbia), comprises 1,606 acres, stretching along the winding stream for miles. Its wild natural beauty, grassy slopes, and wealth of forest-trees will render this park, when laid out in attractive drives and rambles, one of the most beautiful and extensive rural resorts in the neighborhood of any city.

The cemeteries of Washington are not numerous. Oak Hill Cemetery, on Georgetown Heights, is the most beautiful, and is thickly planted with noble forest-trees and shrubbery. The Congressional Cemetery, on the Anacostia river, a mile E. from the Capitol, embraces 30 acres. Glenwood, Rock Creek, and Mount Olivet are the other principal cemeteries.

The Botanical Garden, situated between Pennsylvania Avenue and Maryland Avenue, on the corner of Third Street,

best quality, and the finest game, at low rates. The two principal markets are the Central, erected in 1870, an ornate structure of brick on Pennsylvania Avenue between Seventh and Ninth Streets, and Northern Liberty Market, running from K to L Streets on Fifth, erected in 1874.

The water-supply of Washington is brought by a capacious aqueduct from the Great Falls of the Potomac, 16 miles above. It affords 80,000,000 gal. daily, and cost \$3,500,000. *The city police* numbers 433 men, at an aggregate cost of about \$481,000 a year. *The fire department* employs 140 men and 9 steam fire-engines, and costs about \$169,000 annually.

Newspapers.—Five daily newspapers, 30 weekly periodicals, and 28 monthlies, bi-monthlies, and quarterlies are issued.

Education.—The schools and universities are summarized under DISTRICT OF COLUMBIA (*q. v.*). The Catholic University of America (founded in 1887) has two extensive buildings of stone and 65 acres of grounds, about 2 miles N. of the city. The American University, to be erected under the auspices of the Methodist Episcopal Church, has a commanding site of 90 acres above Georgetown Heights, 2 miles N. W. of the city. The COLUMBIAN UNIVERSITY (*q. v.*) has widely extended its courses of classical, scientific, and professional study.

Churches.—Of these there are 217 in the District, the Methodists having 62 churches; Baptists, 63 churches; Presbyterians, 16 churches; Lutherans, 11 churches; Episcopalians, 18 churches; Roman Catholics, 17 churches; Congregationalists, 6; Independents, 5; Spiritualists, 3; Jews, 2; Christian Disciples, 2; members of the Reformed Church, 2; Friends, 2; and Adventists, Christian Scientists, Theosophists, Unitarians, Swedenborgians, Plymouth Brethren, Salvation Army, and Universalists, 1 each.

As the political capital of the U. S., Washington enjoys a distinction to which no other American city can lay claim. The vast and varied interests connected with the legislation for a people of 65,000,000, embracing (1895) forty-four States and six Territories, draw to Washington an annually increasing number of citizens. The number of officers and clerks in Government employ is nearly 6,500.

The members of the diplomatic corps, or foreign ministers resident, with their families, mingle freely with the residents, and many army and navy officers, retired or in active service, find Washington the most agreeable home in the country. Wealth and taste are seen in the numerous fine private residences erected in recent years, and the march of population is overflowing the limits of the city proper and taking possession of the attractive suburbs.

History.—There was a protracted conflict in Congress in 1789-90 over the claims of rival localities for the seat of government, and the present site was selected as a compromise, Philadelphia being made the capital for ten years, while after 1800 it was to be established on the Potomac. After the cession of a Federal district to the U. S. by Maryland and Virginia, the site of the city and the location of the public squares and buildings were selected by President Washington on the Maryland side of the Potomac, in accordance with the act of Congress of Mar. 30, 1791. At the time of this location the city was nearly in the geographical center between the northern and southern limits of the Union. Apr. 15, 1791, the corner-stone of the Federal territory was laid by three commissioners appointed by the President. It was called the "Federal City" by Washington and in the records of the time until Sept. 9, 1791, when the commissioners directed that the Federal district should be called the Territory of Columbia, and the Federal city the city of Washington. Major l'Enfant, a French engineer, prepared the topographical plan of Washington city under the direction of President Washington and Thomas Jefferson, Secretary of State. l'Enfant took as a basis for his design the topography of Versailles, the seat of the government of France, but with large modifications. On Aug 24, 1814, the city was captured by the British, who burned the Capitol and other public buildings. From 1802 to 1871 Washington was under municipal government, but in the latter year a territorial government was organized for the entire District of Columbia. In 1871 this in turn was abolished, and the government placed in the hands of three commissioners appointed by the President, while Congress assumed direct legislative control over all matters of finance and public improvements. During the civil war of 1861-65 Washington was the center of prodigious military operations. The city was fortified soon after the outbreak of hostilities

by a cordon of strong earthworks or forts, 68 in number, having an aggregate perimeter of about 14 miles, and it constituted a great dépôt for military supplies. The question of the removal of the seat of Government westward, or nearer to the present or prospective center of the U. S., is no longer agitated. The present capital, with its storied memories, founded by the first President, whose name it bears, is felt to be a worthy center of the political union of a great people, symbolized by the inscription engraved on the dome of the Capitol—"E pluribus unum."

Pop. (1800) 3,210; (1830) 30,261; (1860) 75,080; (1890) 230,392; (1894) 270,514.

For facts as to the climate, government, finances, education, manufactures, etc., of Washington, see DISTRICT OF COLUMBIA.

A. R. SPOFFORD.

Washington: village; capital of Wilkes co., Ga.; on the Georgia Railroad; 18 miles N. of Barnett, 75 miles N. W. of Augusta (for location, see map of Georgia, ref. 3-1). It is in a cotton and grain-growing region, and has a public school for males, a female seminary, St. Joseph's Academy (Roman Catholic), a State bank with capital of \$62,000, two weekly newspapers, and carriage, furniture, and other factories. Pop. (1880) 2,199; (1890) 2,631.

Washington: city; Tazewell co., Ill.; on the Atch., Top. and S. Fé, the Chi. and Alton, and the Tol., Peoria and West. railways; 12 miles E. of Peoria, 21 miles W. of El Paso (for location, see map of Illinois, ref. 5-D). It has a public high school, public library, two private banks, a weekly newspaper, carriage, wagon, and furniture factories, and grain elevators, and is a shipping-point for hogs and grain. Pop. (1880) 1,397; (1890) 1,301.

Washington: city; capital of Daviess co., Ind.; on the Balt. and Ohio S. W. and the Evansv. and Ind. railways; 20 miles E. of Vincennes (for location, see map of Indiana, ref. 10-C). It is an important shipping-point for canal and bituminous coal, flour, grain, cattle, horses, and hogs, with 9 large coal mines in operation in the vicinity; and has railway machine-shops, 2 national banks with combined capital of \$100,000, and a monthly, 2 daily, and 4 weekly periodicals. Pop. (1880) 4,323; (1890) 6,064; (1895) 9,634.

EDITOR OF "GAZETTE."

Washington: city (settled in 1839); capital of Washington co., Ia.; on the Burlington Route and the Chi., Rock Id. and Pac. railways; 51 miles N. W. of Burlington, 75 miles S. W. of Davenport (for location, see map of Iowa, ref. 6-J). It is in an agricultural region, and has 11 churches, high school, an academy that prepares pupils for the junior grade in Western colleges, 2 national banks with combined capital of \$200,000, 2 State banks with capital of \$75,000, a monthly and 3 weekly periodicals, and manufactories of carriages, machinery, pipe-organs, and cob pipes. Pop. (1880) 2,949; (1890) 3,235; (1895) State census, 3,671.

EDITOR OF "GAZETTE."

Washington: city; capital of Washington co., Kan.; on Mill creek, and the Burl. Route and the Mo. Pac. railways; 25 miles N. W. of Waterville, 22 miles W. by S. of Marysville (for location, see map of Kansas, ref. 4-G). It is in an agricultural and stock-raising region, contains a Friends' Academy, public high school, 2 national banks with capital of \$112,100, and 2 private banks, and has 2 weekly newspapers. Pop. (1880) 675; (1890) 1,613; (1895) 1,418.

Washington: town; St. Landry parish, La.; on the Bayou Courtableau, and the S. Pac. Co.'s Railroad; 6 miles N. of Opelousas, the county-seat, and 170 miles N. W. of New Orleans (for location, see map of Louisiana, ref. 10-D). It is at the head of navigation on the bayou, and has 3 churches for white people and 2 for colored, graded public school for white children, 3 private schools for colored, a State bank with capital of \$40,000, a weekly newspaper, 2 sawmills, cotton-mills, cotton twine and yarn factory, 2 brick-works, and a tile-factory. Much cotton, corn, rice, and sugar-cane are shipped from here. Pop. (1880) 1,194; (1890) 1,064; (1895) estimated, 1,800.

EDITOR OF "POST."

Washington: town (incorporated as Putnam in 1811, name changed in 1823); Knox co., Me.; 22 miles N. W. of Rockland, 24 miles E. by S. of Augusta (for location, see map of Maine, ref. 9-D). It contains the villages of Washington, West Washington, Globe, Razorville, and Stickney Corner, and has five churches, a high school, and manufactories of carriages, undertakers' supplies, lumber, barrels, casks, staves, headings, and cabinet work. Pop. (1880) 1,249; (1890) 1,230.

Washington: city; Franklin co., Mo.; on the Missouri river, and the Mo. Pac. Railway; 54 miles W. of St. Louis (for location, see map of Missouri, ref. 5-1). It has Lutheran, Methodist Episcopal, Presbyterian, and Roman Catholic churches, Lutheran high and graded schools, Roman Catholic convent (with young ladies' seminary), parochial school, a State bank with capital of \$50,000, and a daily and three weekly newspapers. There are manufactories of flour, lumber, leather, shoes, musical instruments, and cob pipes, and, near the city, an extensive bank of fire and potter's clay. The city is a shipping-point for wheat, corn, and packed beef and pork. Pop. (1880) 2,421; (1890) 2,725; (1895) estimated, 3,750.

EDITOR OF "FRANKLIN COUNTY OBSERVER."

Washington: borough; Warren co., N. J.; on the Morris Canal, and the Del., Lack, and West. Railroad; 13 miles N. E. of Easton, Pa., 60 miles W. of Newark (for location, see map of New Jersey, ref. 2-C). It is in an agricultural region on the south side of Scott Mountain, and has 6 churches, public schools with fourteen teachers, a national bank with capital of \$100,000, improved water-works, electric lights, silk-mill, 5 piano and organ factories, 3 hotels, and a bi-weekly, a monthly, and 2 weekly periodicals. Pop. (1880) 2,142; (1890) 2,834; (1895) 3,538.

EDITOR OF "STAR."

Washington: town; capital of Beaufort co., N. C.; on the Atlantic Coast Line Railway; 128 miles E. by S. of Raleigh, the State capital (for location, see map of North Carolina, ref. 3-J). It is at the head of Pamlico river, 80 miles from the ocean, and accessible to vessels drawing 8 feet of water, and has a large wholesale trade with the West Indies, and considerable fishing and trucking interests. There are barrel, sash, harness, and ice factories, lumber, planing, and grist mills, grain-elevator, a State bank with capital of \$50,000, an incorporated bank with capital of \$25,000, and a semi-monthly and two weekly periodicals. Pop. (1880) 2,462; (1890) 3,545.

EDITOR OF "GAZETTE."

Washington: city; capital of Fayette co., O.; on Paint creek, and the Balt. and O., the Cin. and Musk. Val., the Cin., Ham. and Dayton, and the Ohio S. railways; 35 miles S. E. of Springfield, 77 miles N. E. of Cincinnati (for location, see map of Ohio, ref. 6-F). It is in an agricultural region, and has a national bank with capital of \$50,000, 2 private banks, a daily and 4 weekly newspapers, planing and woolen mills, boot and shoe, wheel, ice, and soap factories, flour-mills, etc. Pop. (1880) 3,798; (1890) 5,742.

Washington: borough; capital of Washington co., Pa.; on Chartiers creek, and the Balt. and O., the Penn., the Pitts., Cin., Chi. and St. L., and the Waynes and Wash. railways; 31 miles S. W. of Pittsburg, 32 miles N. E. of Wheeling, W. Va. (for location, see map of Pennsylvania, ref. 5-A). It is in a bituminous coal and natural-gas region, and is the site of the WASHINGTON AND JEFFERSON COLLEGE (*q. v.*), the Lemoyne crematory, Washington Female Seminary, and Trinity Hall school; there are also a high school, a public library, 3 national banks with combined capital of \$350,000, 2 private banks a monthly, a quarterly, 2 semi-weekly, 2 weekly, and 3 daily periodicals, and manufactories of brass, malleable iron, tubes, pipes, carriages, and glass. Pop. (1880) 4,292; (1890) 7,063.

Washington: BUSHROD, LL. D.: jurist; nephew of George Washington; b. in Westmoreland co., Va., June 5, 1762; graduated at William and Mary College 1778; studied law with James Wilson at Philadelphia; began practice in his native county 1780; served as a private soldier at Yorktown 1781; was a member of the Virginia house of delegates 1787, of the Virginia convention to ratify the U. S. Constitution 1788; afterward practiced law at Alexandria and at Richmond; was appointed by President Adams an associate justice of the U. S. Supreme Court Dec. 20, 1798 (which office he held until his death); inherited from his uncle the Mt. Vernon estate 1799; was the first president of the American Colonization Society. He published *Reports of the Virginia Court of Appeals 1790-96* (2 vols., 1798-99) and *Reports of the U. S. Circuit Court, Third Circuit, 1803-27* (4 vols., 1826-29), the latter being edited by Richard Peters. D. in Philadelphia, Nov. 26, 1829.

Washington, GEORGE: soldier and statesman, and first President of the U. S. of America; b. in Washington parish, Westmoreland co., Va., Feb. 22 (*n. s.*), 1732, son of Augustine Washington by his second wife Mary Ball. The family was one of wealth and high rank in Virginia, the first mem-

ber, John Washington, having migrated from England in 1657. Augustine, by his first marriage, left a son Lawrence, whom he made his principal heir and the guardian of his son George. Lawrence, however, died while George was still young, and soon after, on the death of his young daughter, George inherited the whole estate.

Early Life.—Of the details of George Washington's early life very little is positively known. His early biographer, Weems, wove a web of anecdotes about his boyhood; but the stories which rest upon this authority are for the most part apocryphal. It is certain he was never the prig represented by Weems. When he was only about four years old he was placed in charge of one Hobby, a sexton of the parish, who taught him his letters and not long after sent him to a school kept by a Mr. Williams. Here he received an ordinary common-school education, with no instruction in any language, ancient or modern, except English. The mysteries of English orthography he never fully mastered; but in mathematics he was more successful. He matured early, was a tall, muscular boy, could outrun and outstride any of his fellows, and was universally recognized as a leader in athletic sports, as well as in social life. When he was eleven his father died, and his education was thenceforward in the hands of his mother. And no small task it was; for there were many acres, a considerable number of slaves, very little money, and five children. At fourteen there was serious talk of his going to sea on a tobacco-ship, but the plan was not approved by the mother and was abandoned. His aptitude for mathematics opened the way to one of the most immediately profitable pursuits then available to a young man, that of surveyor. Accordingly, he studied for two years more with Mr. Williams, and was so successful in his work that at sixteen he was ready to enter upon this new vocation. There is abundant evidence that he had remarkable soberness and strength of mind even at this early period. His manuscript papers of the time show the same painstaking care that characterized the work of all his later years. Still more important is the fact that he found and copied out from an English book 100 rules for behavior, which were singularly characteristic of his later methods. (See Sparks, *Writings of Washington*, ii., 412.) The great lesson of these rules in all the relations of life was self-control, a characteristic which even at that age Washington began to show in very marked degree. That he was regarded as a lad of unusual promise is evinced by the confidence shown by Lord Fairfax. This gentleman, who had come into possession of vast tracts of territory in different parts of the State, not only showed unusual interest in Washington, but intrusted to him the entire responsibility of surveying these lands. It was within a month after his sixteenth birthday that he set out with his surveying party to do this work. His notes and diary were kept with great fullness and painstaking care; and so admirably was his work performed that Fairfax secured his appointment as public surveyor, a position which gave authority to his surveys and secured him steady work. This manly and robust vocation occupied him for three years. He had now acquired his full stature of 6 ft. 2 in., his frame was broad and firmly knit, and he already had that reputation for remarkable physical strength which he carried through life. In 1751 he accompanied his invalid brother Lawrence to the West Indies, where he was prostrated with smallpox; but he returned in 1752 to enter upon more responsible duties on the death of his brother.

Early Military Experience.—George at nineteen had been appointed one of the adjutants-general of the colony, and under a Dutch soldier of fortune had studied the art of war, including tactics and the manual of arms. Affairs on the frontier grew so serious that in Oct., 1753, he was intrusted with the responsible leadership of a company of frontiersmen to ascertain the nature of the difficulties between the British, the French, and the Indians about the sources of the Ohio. His work was so admirably done that his praise was in every mouth, and he was the hero of the hour. The report indicated war, and Washington was at once appointed lieutenant-colonel of a Virginia regiment. In Apr., 1754, he set out with two companies for Mill's creek, where he arrived three weeks later, and found that the French in overwhelming numbers had swept down upon the British and captured the fort. This he regarded as a declaration of war, and pushed at once into the heart of the enemy's territory. Soon coming upon Jumonville and his party, who were out on a spying expedition in the hope of surprising the British, he brought on an action in which ten of the French were killed and twenty-seven

taken prisoners. Throughout the expedition one of the commander's most conspicuous characteristics was his personal courage. At one time he led 150 raw recruits into an open field where he knew he was surrounded by 1,000 French and Indians; and at all times he was ready to give battle at any odds with confidence and pleasure. It is impossible not to conclude, save in the light of results, that his conduct was rash in the extreme. Washington's friend, the celebrated Seneca chief Half-King, said that "the English acted like fools, and the French like cowards." It was doubtless the utter indifference of Washington and his troops to danger that created the apparent timidity of the French. Be that as it may, the expedition, though wild from the outset, showed that the commander was possessed of extraordinary personal courage, of perfect self-control, and of unhesitating self-reliance. He never asked or encouraged advice, he never lost his complete self-possession, and he wrote that he "loved to hear bullets whistle." At the end of the campaign he resigned his commission from indignation at a British order for assigning all provincials to subordinate rank in the presence of British officers.

But the flames of war were now bursting out in every direction. In Feb., 1755, Gen. Braddock arrived in Virginia at the head of two regiments, and, hearing of Washington's exploits and popularity, he offered him a place on his staff with the rank of colonel. The post was gladly accepted. Braddock was a veteran soldier and a rigid disciplinarian, but he was contemptuous of provincial methods and scorned to modify his plan of warfare. He not only refused to adopt the customary precautions against surprise, but declined to throw his men into the woods as advised by Washington. The well-known result was inevitable. When the army reached the valley, still known as Braddock, June 16, 1755, bullets and arrows began to be poured in by unseen enemies in the surrounding woods. The troops were thrown into the utmost confusion, and the death of Braddock threw upon Washington the responsibility of commanding the disorganized troops, of gathering up the remnants of the army, and of conducting the retreat. This was done with such bravery, discretion, and success as greatly to raise a reputation which had already become national. He threw himself headlong into the fight, and rode up and down the field, striving to rally the "dastards" as he characterized the regular troops. Though he dashed hither and thither, everywhere exposed to fire, and everywhere calling upon the troops to rally, all his efforts were in vain. Two horses were shot under him, and four bullets passed through his coat. In spite of all his efforts the troops broke in confusion, and it was with difficulty that they brought away the dying general.

Soon after his return to Mt. Vernon he was offered the command of all the Virginian troops on his own terms; but during the next three years his duty was confined to the protection of the frontier, which extended nearly 400 miles and was constantly subject to assault by a crafty and savage enemy. It was a trying experience, but one without brilliant results. When at length the policy of Pitt had conquered the French in Canada, Washington led the force which took formal possession of the upper waters of the Ohio and changed the old French fort Duquesne into the British fort Pitt. Immediately after this expedition he was married, Jan. 6, 1759, to Martha Dandridge, the widow of Daniel Parke Custis, a lady with youth, beauty, and a large fortune. Thus before he was twenty-seven he was the foremost soldier on the continent, was most widely and favorably known, and was one of the richest men in the country.

During the next sixteen years Washington's life was that of a successful and influential Virginia planter. He owned a large number of slaves, and he managed them with characteristic skill. He exacted obedience with a kind of military discipline, and to this fact has been attributed his remarkable success as a planter. It is said that he never bought or sold a slave, simply raising and keeping those that were born on his numerous estates. He gave to all his private affairs the most painstaking personal attention, as his MS. notes amply show. He was fond of every outdoor sport, and was a fierce rider after the hounds, of which he always kept an ample supply. He was universally known as a peace-loving man, but one possessed with a dangerous temper that would blaze out now and then against any form of injustice, oppression, or impertinence. But he was always ready to serve the State. A member of the House of Burgesses, he took a prominent part in all the differences that were soon to culminate in the Revolution.

Attitude toward the Causes of the Revolution.—His correspondence shows that in the Stamp Act he saw evidence of folly that would soon create an irreparable breach between the countries; and in the act of repeal he did not fail to see the dangerous reservation it contained. While not an agitator in any sense of the word, he was a careful observer, and his letters show that his judgment was seldom at fault in regard to the consequences of the various steps taken. In 1769 he wrote to George Mason: "That no man should scruple or hesitate a moment to use arms in defense of so valuable a blessing, is clearly my opinion. Yet arms, I would beg leave to add, should be the last resource, the *dernier ressort*." He was thus fully committed to the policy of war if war should be necessary to secure the cause of the colonies. His hopes of peace, moreover, gradually faded away. At the various meetings held in Virginia he was called to preside and gave tone to the declarations. His letters reveal the steady growth of his fighting spirit. The convention chose him as one of the six delegates of the State to the Continental Congress.

Washington took very little public part in the proceedings of Congress; but his letters show that he was active in the work of forming and ascertaining public opinion. Though seldom heard in public speech he gradually acquired the reputation of being the wisest man in the House. His letters assert that it was not the wish of any of the colonies to secure independence, but to a royalist friend in Massachusetts he wrote, "But this you may at the same time rely on, that none of them will ever submit to the loss of those valuable rights and privileges which are essential to the happiness of every free State"; and he added that in his opinion "more blood will be spilled on this occasion if the ministry are determined to push matters to extremity than history has ever yet furnished instances of in the annals of North America." His letters soon begin to contain expressions showing that he now regarded the violent separation of the colonies from the mother country as inevitable. In the second Continental Congress he appeared in his uniform of a Virginia colonel, and to a friend in England he wrote that "the peaceful plains of America are either to be drenched with blood or inhabited with slaves."

Commander-in-Chief.—In the spring of 1775 the events at Lexington and Concord occurred, and on June 15 Congress, on the motion of John Adams, adopted the army, and unanimously made Washington commander-in-chief. On the next day he accepted the position with great solemnity, declaring that as no pecuniary consideration would have induced him to undertake the work, he must decline all pay and emoluments, only relying upon Congress to defray his expenses. It is evident that he realized, as no other did, that with troops undisciplined, untrained, and unprepared for war, without money, without arms, without credit, and without allies, he was to face the best troops in Europe. On June 21 he set out to assume command of the army. At Newark, at New York, and at Watertown he was met by enthusiastic delegations who formally welcomed him, and on July 3 he assumed command of the first American army under the historic elm-tree at Cambridge.

The Boston Campaign.—It appeared at once that Washington had the faith and the sympathy of the army as well as of the people. But when he came to number the forces he found only 14,000 instead of the 20,000 accredited by public report. He wrote of the army as "a mixed multitude of people, under very little discipline, order, or government." But he rapidly brought order and regularity out of confusion. He carefully distributed and wisely posted the forces in strong intrenchments. He resorted to vigorous measures in order to restore discipline. In one of his letters he says: "I have made a pretty good slam amongst such kind of officers as the Mass. government abounds in, since I came into this camp, having broke one colonel and two captains for cowardly behavior in the action on Bunker Hill, and two captains for drawing more pay and provisions than they had men in their company. . . . Besides these, I have at this time, one colonel, one major, one captain, and two subalterns under arrest for trial." Besides these difficulties he showed that as yet there was no commissary department, there were no uniforms, no small-arms, no cannon, no resources to draw from, and no arrangements for ammunition. To teach Congress the necessity of providing for all these was no small part of his work. In August it was found that there were only nine rounds of ammunition to a man. Couriers were sent from village to village, and a vessel was dispatched to the Bermudas to seize

a supply of powder. Notwithstanding all these discouragements he gradually drew his lines about the landward side of the city, and in September proposed to his officers a general attack. They unanimously opposed the plan, and it was abandoned. In the following month he repeated the proposal, with the same result. In February, however, he could no longer be held back. In the night of Mar. 4 he moved a strong body of troops to Dorchester heights under cover of a brisk cannonade, and in the following morning was strongly intrenched. The British commander, Howe, saw at once that this movement had made his position untenable, and on Mar. 17 the British evacuated the city by taking refuge in their ships. Having thus gained complete possession of Boston, Washington moved with a large part of his army to New York, where he arrived on Apr. 13.

The New York Campaign.—Sir William Howe, after evacuating Boston and putting his forces in order at Halifax, sailed, as Washington had anticipated, for New York. It soon became evident that the British plan of campaign was to take possession of the Hudson, and, by so doing, cut off New England from the rest of the country. The failure of the expeditions of Montgomery and Arnold against Quebec had left the way open for an invasion from Canada by way of the St. John river and Lake Champlain. Accordingly, two expeditions were now planned. Gen. Sir Guy Carleton in the summer of 1776 ascended the St. John and advanced southward as far as Valcour island, where he met an American fleet under Benedict Arnold. In the engagement that ensued, Oct. 11, his fleet was so disabled that he turned about and went into winter quarters at Montreal. The other movement was far more formidable. Gen. Howe with a force of 25,000 men took a position on Staten Island, just S. of New York, and had the support of a powerful fleet in command of his brother, Lord Howe. Washington, in order to protect and command the city, had intrenched a force of 5,000 men under Gen. Putnam on Brooklyn Heights, and, in consequence of the sickness of Greene, had placed Sullivan with some 5,000 men to guard the approaches from the S. and E. On Aug. 27 Howe attacked Sullivan with an overwhelming force, and Sullivan, with about 1,000 of his troops, was taken prisoner. Howe, not venturing to attack Brooklyn Heights directly, determined to resort to a siege. Washington, perceiving the danger and observing the preparations for an attack front and rear, determined upon the bold hazard of withdrawing his army to New York. In the course of two or three days boats and scows from all quarters were brought together within sight and hearing of the enemy, and one dark foggy night he transported his whole force of 9,000 men with all their munitions.

By this movement, however, though the army was saved, the difficulties of the situation were scarcely diminished. The British army was more than twice as large as the American; the fleet had command of the bay and the river; the periods of enlistment were constantly expiring, and it seemed impossible to secure recruits enough to take the vacant places; Congress acted slowly, and had no adequate means of enforcing its measures; New York was full of British adherents; and an elaborate plot for a Tory uprising was soon discovered, with the purpose of assassinating the commander-in-chief, which was not fully subdued until the leader was publicly hanged.

The British soon secured a footing at Kip's Bay (about the eastern end of Thirty-fourth street), and threatened by advancing across the island to cut off Washington's retreat. A little later Howe landed at Throgg's Neck, 9 miles further up, and Washington, though repelling the enemy at every point, found it necessary gradually to withdraw northward. At White Plains Howe attempted to bring on a general action, but without success. Washington resisted every advance, but fought behind strong intrenchments, and, always retreating before a general assault could be made, kept the main force of his army untouched. But the advance was constantly, though slowly, northward, and Washington now found it necessary to retreat into New Jersey. The congressional committee on the war declared that Forts Washington and Lee must be held. The commander favored their abandonment, but unfortunately left the final decision in regard to Fort Washington to Gen. Greene, who determined upon resistance. The fort was taken by storm and nearly 3,000 troops were made prisoners. This great disaster had a depressing effect on all parts of the country. The enemy regarded the war as practically closed; and Washington, leaving the British in undisputed control of New York, retreated into the heart of New Jersey. When he reached

Princeton, with the enemy close on his heels, Dec. 2, he had only about 3,000 men.

The New Jersey Campaign.—The situation seemed desperate indeed. Gen. Charles Lee, an English adventurer, who had been placed second in command of the American army, persisted, contrary to orders, in remaining for a long time E. of the Hudson. Washington was thus deprived of his help, and when finally he crossed the river, his line of retreat was by a northerly route through Morristown, and he paid little attention to the orders of Washington summoning him and his forces to join the main army. Lee was soon taken prisoner, and the papers of Howe's private secretary, examined eighty years later, showed that he was a traitor to the American cause at the time of his capture. Howe issued an amnesty, and signs of wavering began to be seen in all parts of the country. Newport was in the hands of the enemy, Philadelphia was threatened, and the letters of appeal for men and money sent out by Washington in every direction brought few responses. But Washington himself, though his letters plainly reveal the gravity of the situation, never lost heart. The enemy, thinking him now within easy grasp, halted in the pursuit for a day or two; but on resuming the advance found that he had not only crossed the Delaware, but had cut off pursuit by destroying all the boats within 70 miles. Howe, leaving strong detachments at various points in the front, withdrew to New York in the confident belief that the American forces would melt away in the course of the winter. But no sooner was it known that Howe had gone than Washington determined to assume the offensive. Though he had in all his divisions only about 6,000 men, and the enemy had 25,000, he determined, in the dead of winter, to recross the Delaware and strike a blow at Trenton. To each of the divisions an exact part was assigned. Gates was to advance from Bristol; Ewing was to cross at Trenton; Griffin was to advance against Donop; and Putnam was to come up from Philadelphia. For one reason or another every one of them failed. But Washington himself, undaunted by the fact that the river was full of floating ice, threw his own division of 2,400 men across, and, after marching 9 miles in the face of a furious storm of snow and sleet, fell upon the city at daybreak. Sullivan sent word that the arms were wet, and that they could not fire. "Then tell the general to use the bayonet, for the town must be taken," was the reply. Washington, at the front of the line, swept down the Pennington road; Stark led up the van of Sullivan's force from the bank of the river; the enemy was thrown into immediate confusion, and Washington recrossed the river with 1,000 prisoners. The brilliancy and success of this action not only revived the drooping spirits of the Americans, but greatly alarmed the British. Gen. Cornwallis was at once sent out from New York with 7,000 men to administer fit punishment to such audacity. Stationing three regiments at Princeton, he advanced to meet Washington himself. The Americans posted themselves beyond the Assunpink river, and were drawn up in line of battle when at nightfall Cornwallis approached. Sure of the game, the British decided to delay the attack until morning. Washington, instantly perceiving the opportunity, decided to take advantage of the mistake. Lighting and leaving camp-fires all along the line, he began a circuitous march upon Princeton. At sunrise his force surprised the town. The British fought vigorously; but Washington led the charge in person, and the enemy was defeated with a loss of 500 killed, wounded, and prisoners. The enthusiasm aroused among the colonies by this brilliant movement was such that the British outposts were soon attacked in all directions, and the main force was obliged to withdraw to the immediate vicinity of New York. This winter's campaign may be said to have saved the Revolution.

In the spring of 1777 the British entered upon a still more elaborate design for obtaining possession of the entire line of the Hudson and Lake Champlain. The design of the British contemplated three distinct movements, all directed to the same end. Gen. Burgoyne was to ascend the St. John river from Montreal to take possession of Lake Champlain and the upper Hudson; Gen. St. Leger was to advance up the St. Lawrence into Lake Ontario, and by landing at Oswego arouse the Indians of Central New York for an attack from the W.; and Gen. Howe, by dividing his army into two parts, was to advance up the Hudson with one division, while with the other he was to move upon Philadelphia. This formidable plan was frustrated by the extraordinary skill and energy with which Washington

beset the forces of Howe. Posting himself near Brunswick with 9,000 men, he was ready to strike N. or S. as there might be need. On May 31 Howe moved out of New York with 100 sail. Before going far, however, re-enforcements arrived from Germany, and he decided to land and advance by way of New Jersey. Washington at once pursued and harassed him with such energy that he was obliged to evacuate New Jersey and return to New York and Staten Island. It was not until July 22 that he was ready once more to sail. Washington, learning that the fleet was now moving south, crossed the Delaware for the purpose of defending Philadelphia. Howe went as far S. as the Chesapeake. Washington had now gathered from various sources as many as 11,000 men with which to defend the city against 18,000. Marching through Philadelphia for the purpose of convincing the inhabitants that he had an army, he took up a strong position on the left bank of the Brandywine to contest the passage. Owing to an oversight of Sullivan the fords on the right were not protected, and Cornwallis, by a long detour, was able to attack him on the flank. He was disastrously defeated, Sept. 11; but the advantage was not followed up, and Washington withdrew his army in good order. Howe at once took possession of Philadelphia, placing the greater part of his force at Germantown, just N. of the city. Washington, after gathering together the fragments of his army, and finding them in good spirits, determined once more to bring on a battle. In the night of Oct. 3 he moved from the direction of Lancaster with about 8,000 men, and opened the attack at daybreak on the 4th at Germantown. All went prosperously for a while, but just at the moment of complete victory an unaccountable panic seized some of the new recruits and victory became defeat. The British were unable to follow up their advantage, and when the skies were cleared it was obvious that they were in no better condition than they had been when the campaign began. The fighting qualities of the Americans made a profound impression on the court of France. St. Leger's expedition had failed in August, and four days after the battle of Germantown Burgoyne with his army of nearly 7,000 surrendered at Saratoga. It was these events that brought the long-hesitating French to a recognition of the independence of the colonies. The former in the treaty bound themselves to send a fleet and supplies, and the latter bound themselves not to lay down arms till Great Britain should acknowledge their independence. Unfortunately, supplies did not arrive from France in time to prevent terrible suffering on the part of Washington's army during the winter of 1777-78 at Valley Forge. It was not until May 6 that the treaty was announced to the army.

The greatness of Washington never appeared at better advantage than in the period that followed. The difficulties that beset his position were manifold. During the whole of the war the terms of enlistment had been so short that the army at any given moment was made up largely of new and untried men; and as periods of enlistment were constantly expiring, it was often impossible to know how the ranks were to be refilled. But for Washington's constant foresight and his habit of sending letters of appeal in every direction, his army would have melted away, as did that of Gates after the defeat of Burgoyne. Another source of constant annoyance was the persistence of foreign adventurers. American agents in Europe in their zeal for the cause had given altogether unwarranted assurances of rank and promotion. If these assurances had been honored, the army would have been officered from top to bottom by foreigners. Washington had the foresight to perceive that such a course would take all spirit out of the cause and all heart out of the men, and therefore he resolutely refused to burden the army with foreign appointments. A far greater source of danger was in the army itself. There was a thoroughly organized plot to drive Washington from his position and place Gates in his stead. The argument of the cabal was simply that the army of the north had been successful; the army of Washington had fought on the defensive, and in its efforts to overwhelm the enemy had accomplished nothing. By putting Gates in his place, Howe, Cornwallis, and Clinton might be driven to the fate of Burgoyne. As it was known that Congress would not remove Washington, reliance was placed upon innuendoes and insult, in the hope that he would resign. The correspondence of the time shows that the "Conway cabal" reached out into every branch of the service. The calm and sometimes freezing dignity with which Washington refers to the matter in his letters affords a remarkable commentary on his

character. With all his high-spirited sensitiveness, it was evident that nothing but death or a prison, or the authority that had appointed him, could remove him.

In the spring of 1778 Sir Henry Clinton, who had succeeded Howe in command of the British army, showed a little more energy, though no more capacity, than his predecessor. He was so hard pressed that he found it necessary to evacuate Philadelphia and return to New York. Washington, determined to fight whenever there was the least chance either of defeating or harassing the enemy, fell upon him at Monmouth in one of the most hotly contested battles of the war. Gen. Charles Lee, whose traitorous correspondence was not at that time known, had been exchanged, and was sent forward by Washington in charge of a division to open the battle. Lee ordered a retreat almost as soon as the firing began; but Washington, coming up in a torrent of rage, ordered Lee to the rear, and with great difficulty succeeded in staying what threatened to be an overwhelming rout. Riding furiously from one regiment to another, he brought order out of confusion, and little by little restored the line. The enemy were pushed back until, when darkness came on, the Americans were in possession of the field. The next morning it was found that Clinton and his army had pushed on to New York. For his conduct on the field Lee was tried by court martial and dismissed from his command.

During the summer of 1778 Washington, with headquarters at West Point, held the Hudson firmly in his grasp. Clinton succeeded in taking possession of Verplanck's Point and Stony Point; but Wayne recaptured Stony Point, taking it by storm in one of the most brilliant exploits of the war. The British made various attempts in Connecticut and Rhode Island, but without important success. While these events were happening in the North, the British changed their plan of warfare by transferring the field of activity to the South. This movement was undertaken in the hope of drawing Washington from his strongholds on the Hudson, but the great commander saw that the separation of New England from the rest of the country would be far more disastrous to the cause than the loss of the Southern States. He therefore refused to move. Georgia and South Carolina, consequently, soon fell into British hands. Gen. Gates, who, in opposition to Washington's advice, had been given command in the South by Congress, was overwhelmingly defeated at Camden by Cornwallis.

These untoward events and the lack of any great aggressive movement on the part of Washington in the North, caused widespread discontent. Washington saw that everything depended upon the possibility of keeping up a large army and being ready to move whenever an opportunity should offer, but the difficulties in the way were almost infinite. Congress had no power to enforce levies upon the States, and few of the States were in condition to enforce levies themselves. The pay of the soldiers was far in arrears, and a mutinous spirit became widely prevalent. There was a revolt among the soldiers in Connecticut, which was quelled with great difficulty, and one in Pennsylvania, which was reduced to order only after two of the ringleaders had been hanged. The most serious cause of discontent was the state of the enrreny. When a bushel of corn cost \$150 and a suit of clothes more than \$2,000 it is not strange that the elements of discontent seemed about to get control of everything. It is hard to see how anything but the energy and the tact of Washington, as shown in the letters which he sent to all parts of the country, could have kept the cause from complete dissolution. Moreover, it was during this period that the treason of Arnold attempted to turn over West Point to the enemy.

To aggravate all these sources of embarrassment the assistance promised and undertaken by the French proved up to the end of 1780 to have been almost altogether worthless. D'Estaing had been just too late to cut off Lord Howe in the Delaware, and then too late to relieve Newport, and was obliged to go to Boston for repairs, without having struck a blow. The comments and complaints of Americans were so severe that the sensitive French admiral seemed on the point of sailing away in disgust. Washington saw that any serious alienation would be fraught with the greatest disaster. The infinite resources of his tact were never more severely tried. He not only rebuked the officers who had criticized the French, and in every possible way soothed public opinion, but he wrote to d'Estaing one of the most remarkable of all his letters. Deploping the differences that had arisen, and appealing to the loftiest considerations of honor, he wrote: "It is in the trying circumstances to

which your excellency has been exposed that the virtues of a great mind are displayed in their brightest luster, and that a general's character is better known than in the moment of victory. The adverse elements that robbed you of your prize can never deprive you of the glory due you." It was by such diplomacy that the French were held to their alliance until the final opportunity for joint action in 1781.

The Yorktown Campaign.—After the overwhelming defeat of Gates at Camden, Congress yielded to the advice of Washington and placed Greene at the head of the armies in the South. A succession of victories ensued. Morgan defeated Tarleton at the Cowpens Jan. 17, 1781; and, Mar. 15, Greene, after having led Cornwallis across North Carolina, dealt him so severe a blow at Guilford that the British withdrew into Virginia. This was what Washington had desired. He now began active movements about New York to prevent Clinton from sending reinforcements, at the same time putting himself in communication with de Grasse, who had just arrived at Newport in command of the French fleet. De Grasse then moved to the Chesapeake to prevent the co-operation of the British fleet with Cornwallis. Washington gradually concentrated his forces about New York, as though meditating an attack on Clinton. When he learned that de Grasse had reached the Chesapeake, he directed La Fayette, then in Virginia, to prevent Cornwallis at all hazards from moving south. Aug. 17 he wrote de Grasse, giving him all necessary information as to his own plans. Leaving Heath with a sufficient force to protect the Hudson, and keeping up an active movement at the front to persuade Clinton that an attack on New York was contemplated, he threw the major part of his army across the Hudson on Aug. 23 and 24, and at once began the march south. So skillfully was the maneuver carried forward that it was not till Sept. 2, when Washington had reached Philadelphia, that Clinton learned the nature of the movement. When the forces of Washington, after having united with those of de Rochambeau and La Fayette, closed in around Cornwallis, the British were confronted with a force of about 16,000 men, while escape was prevented by the French fleet in the rear. Cornwallis was soon obliged to abandon his outer works and withdraw into the town. A siege was at once begun. As soon as the batteries had effected a breach Washington ordered an assault. The forces were led by Alexander Hamilton and the redoubt was taken in ten minutes. Cornwallis soon saw that he must either surrender his army or submit to a useless slaughter. He chose to lay down his arms. On Oct. 19 he delivered over as prisoners of war his entire force of about 8,000 men.

Although the treaty of peace was not signed until Sept. 3, 1783, the surrender at Yorktown was virtually the end of the war. During the intervening period, however, Washington deemed it essential to security that the army should be kept up to its full strength, a result which, in view of the state of the currency and the universal arrears of pay, was accomplished with almost infinite difficulty. The dissatisfaction with the slowness of Congress was so general that a mutinous spirit seemed to be almost universal. The weakness of government was very keenly felt, and in May, 1782, the party of reform presented an address to Washington, recognizing him as the proper savior of society and hinting that it would be acceptable to the army if he would assume the headship of affairs. This unquestionably meant the assumption of a crown, and was so understood by Washington. In reply he said: "Be assured, sir, no occurrence in the course of the war has given me more painful sensations than your information of there being such ideas existing in the army as you have expressed, and which I must view with abhorrence and reprehend with severity. I am much at a loss to conceive what part of my conduct could have given encouragement to an address which seems to me big with the greatest mischiefs that can befall my country." Then, after assuring the writer of his great interest in the welfare of the army, he closed by saying: "Let me conjure you, then, if you have any regard for the country, concern for yourself or posterity, or respect for me, to banish these thoughts from your mind, and never communicate, as from yourself or any one else, a sentiment of the like nature." The severity of these utterances checked the movement at once, and it was never again revived; but the full significance of Washington's attitude can not be fully understood without remembering that the notion of kingly government was still familiar to everybody, and that as yet it contained very little that was repulsive.

On Nov. 25 the British army departed from New York and Washington marched in and took possession. On Dec. 4 he bade farewell to his officers, and at once took his departure for Annapolis, Md. Here, on the 23d, he surrendered his commission to Congress in a brief address of such dignity and solemnity that many of the members were moved to tears.

Under the Confederation.—During the critical period extending from 1783 to 1787 Washington, though living in private life, was a keen observer of public affairs. When it became obvious that the Government under the Articles of Confederation was too weak longer to continue, it was inevitable that the people should with united voice call for the sway and the stay of his strong hand. He was chosen to the constitutional convention, and when the delegates came together for their difficult task no one thought of any other for a presiding officer. This is not the place to describe the work of that remarkable body; but it should be said that its great achievements were very largely due to the steadiness with which Washington kept the interests of all parts of the country in view, and the tact with which he conducted the work of reconciling conflicting interests. It is difficult to see how any one can study the proceedings of that convention without perceiving that the outcome was as much the result of a spirit of mutual concession as of political wisdom. It is not too much to say that but for the pervasive influence of that spirit, chiefly engendered and encouraged by Washington, the delegates never would have agreed upon a constitution to be applied to all sections of the country. The Constitution was adopted by the convention Sept. 17, 1787, and, after it had been duly ratified by the several States, Washington was unanimously elected, and on Apr. 30, 1789, was inaugurated the first President of the U. S.

In the Presidency.—In the organization of the new Government Washington desired to accomplish the impossible task of uniting all conflicting political interests and ideas. His dominant purpose was to enlist the democratic notions of Jefferson as well as the federal sympathies of Hamilton and their followers into a hearty and strong support of the Government during the important period of its organization. To this end Jefferson and Hamilton were both called into the cabinet. Washington succeeded in keeping them from unseemly hostilities, but their fundamental ideas were so opposed to each other that complete political harmony was impossible. Washington himself was never publicly regarded as a strong partisan, but it is now easy to see from his letters that his feelings were strongly in sympathy with the general ideas of Hamilton. For the relief of the general financial distresses of the country Hamilton devised a comprehensive scheme consisting of three somewhat distinct parts: 1, the assumption and speedy payment by the Government of all the debts incurred under the Articles of Confederation; 2, the assumption of all the State debts incurred in the prosecution of the war; and 3, the provision of a discriminating tariff on imported goods for the purpose of raising the revenue necessary to accomplish these results. Washington heartily supported all of these measures, and they were adopted very largely through his influence. See UNITED STATES (*History*).

Another important question in regard to which the parties were sharply divided was the attitude of France toward the country during the French Revolution. When Citizen Genet, the French minister, ventured to presume upon the former relations of the governments as a justification for unwarrantable exactions, he was severely rebuked by Washington; but it soon became evident that he had the hearty sympathy of the Anti-Federalists. The subject was complicated by the fact that Great Britain was now at war with France and that the terms of the treaty which ended the Revolutionary war had not yet all been fulfilled. That treaty required the British to evacuate Detroit and the other Western posts without unnecessary delay, but as yet the posts had not been turned over to the U. S. Two important reasons had contributed to this delay. Owing partly to the poverty of the country and doubtless partly to the prevailing ill will left by the war, the British found the Americans slow in the liquidation of their old debts. When it was ascertained, moreover, that Genet was arousing public opinion and even recruiting privateers in the U. S. against the British, a vigorous course was called for. Jefferson was long opposed to definite action, but Washington insisted upon having a letter sent demanding his recall. Though Genet did not think it prudent to return to France, a successor soon arrived, and public opinion was somewhat allayed. The

Anti-Federalists, however, who were in more or less active sympathy with the Revolutionists in France, found in the incident abundant reason for opposition to the general methods of the Government.

A still further cause of irritation was the Jay treaty. Ever after the close of the war the conduct of the British Government had occasioned bitter complaints on the part of the President and people of the U. S. The search of American vessels for British seamen, the impressment of Americans into the British service, the closing of West Indian ports to American trade, the refusal to surrender the Western posts still held by the British, and, above all, the encouragement, if not even the active assistance, of Indians in their continuous warfare along the frontier, indicated unmistakably that unless a radical change could soon be brought about, war would be inevitable. Washington determined to send a special envoy to Great Britain to negotiate a new treaty. His first choice was Hamilton; but the opposition of the Anti-Federalists was so strong that this great leader thought it wise to decline. The President then selected the chief justice, John Jay, whose character and public service entitled him to most favorable consideration. Washington's instructions to Jay were most energetic and explicit. The treaty secured the greater part of the claims which the Americans set forth, though the right of search was still insisted upon by the British Government. When the terms of the treaty came to be known there was an outcry against it throughout the country which has seldom been equaled. Washington himself was not satisfied with the result; but he took the ground at once that it was far better than nothing, and was as good as could be had. Notwithstanding all the uproar throughout the country, the President and the Senate ratified the treaty, and history has amply justified their action.

As Washington's first term of office drew to a close it became apparent that his re-election was desired by both parties. He was the natural leader and supporter of the Federalists, and Jefferson probably saw that his own party was unformed and not in condition to carry on a successful contest. Washington, therefore, was unanimously re-elected, an evidence of public favor which gave him great satisfaction, and enabled him to keep his party together during the formative period of the Government. The most serious questions that arose, not only during his second term but also during the presidency of John Adams, were those relating to foreign affairs. The most intense feelings prevailed in regard to the progress and influence of the French Revolution. Jefferson and his followers looked on the Revolution with not a little favor, and were strenuously opposed to any action of the Government that was not of the most friendly nature. Washington, on the contrary, regarded the course of the Directory with abhorrence, and this feeling was shared by Hamilton and the Federalists generally. At one time Washington wrote to Hamilton: "The conduct of France toward this country is, according to my ideas of it, outrageous beyond conception, not to be warranted by her treaty with us, by the law of nations, by any principle of justice, or even by a regard to decent appearances."

In Retirement.—The treatment of Pinckney, Marshall, and Gerry, whom President Adams sent out as special envoys to negotiate a treaty, as revealed in the famous X, Y, Z letters, roused a storm of indignation throughout the country. A cry for war went up from every quarter. The whole country turned to Washington as the commander of the national forces. Adams persuaded him to accept the appointment of lieutenant-general, on condition that he should not be called into active service except in case of actual hostilities. Washington determined, however, to do his work with characteristic thoroughness, and make all necessary preparations for war. When it was decided to appoint three major-generals, the ranking officer of whom was to be inspector and virtual commander-in-chief, except in case of actual hostilities, Washington proposed the names of Hamilton, Pinckney, and Knox. The order was unquestionably in accordance with the organizing abilities of the several men, but Knox had been the ranking officer in the Revolutionary war, and had rendered distinguished service. This fact, coupled with the antipathy or jealousy of Adams for Hamilton, led Adams to reverse the order of the names suggested by Washington. Washington expressed to the President his earnest disapproval, and Adams promptly receded from his determination. But the incident became known, and was the beginning of that strife in the Federal party which speedily resulted in its overthrow. The

army was thoroughly organized, and the Alien and Sedition Acts were passed, but every movement seemed to intensify the bitterness of the Anti-Federalists and to widen the breach between the two branches of the Federalists themselves.

Before Adams's administration was far advanced it became evident that the Jay treaty, the funding of the national and State debts, the attitude of the Government toward France and Great Britain, and the reorganization of the army had together built up a mass of opposition which was likely to prove fatal at the next election. Earnest appeals were made to Washington to consent to become a candidate in order to save his party, but he declined, believing that in the coming contest over matters of principle the personality of the candidates would count for nothing. Though partisanship at this period often showed an intensity which happily in later years has seldom disfigured political life in the U. S., Washington was followed into his retirement at Mount Vernon with universal veneration and gratitude. His letters, even up to the very week of his death, show that, while he never presumed to interfere with the course of those upon whom official responsibility now rested, he never ceased to entertain a very active interest in all the political affairs of the country. He died on Dec. 14, 1799, in the sixty-eighth year of his age, in consequence of an acute inflammation of the throat caused by exposure while making the round of his estate in a severe storm.

General Estimate.—Washington, more perfectly than any other man in all history, is entitled to be known as the Father of his Country. Though at first he was not in favor of independence, he was among the earliest to perceive the necessity of it, and when once that necessity was recognized he never for a moment wavered from his determined purpose. He entered upon the war with a sedate consciousness of the magnitude of the undertaking; but in all his vast correspondence there is not a phrase to indicate that even in the darkest days of 1778 and 1779 he ever for a moment was in doubt of ultimate success. Nor was his a blind faith that can not see obstacles in their true light. He had an unhesitating belief that, if the colonies would continue to keep up an army he could, by choosing judiciously where to fight and when to retire, bring the war to a triumphant close. He fought invariably on his own terms. He was continually surprising the enemy, but he was never surprised himself. He was not always victorious, but even when repulsed and beaten he always brought off his force intact, and after a night's rest was ready to fight again. He was instantaneous in his ability to detect a mistake or an oversight in his enemy. The movements which led to the battles of Trenton and Princeton were recognized by Frederick the Great as among the most daring and brilliant of the century, and they have since been aptly compared with what Wellington regarded as the most brilliant of all Napoleon's exploits, the campaign after the battle of Leipzig. His keen foresight, his quick perceptions, his fertile ingenuity, and his impetuous courage were ever governed by an unflinching self-control and a consummate ability to detect and to trace the dividing-line between the practicable and the impossible, and it is difficult to study the campaigns in detail without arriving at the conviction that nothing but the smallness of the resources he had to deal with has prevented him from being universally recognized as one of the greatest of military commanders.

In the domain of statesmanship he was not less successful. He was one of the earliest to detect the fundamental defects in the Government established during the war; but he was wise enough to see the magnitude of the difficulties that stood in the way of bringing the North and the South, as well as the large and the small States, into harmonious agreement. When the weaknesses of the Confederation came to be universally recognized, the delegates to the convention, as well as the people at large, instinctively turned to him for guidance. Their reliance was not misplaced; for the Constitution, in all fundamental characteristics as it now stands, could hardly have been adopted but for his harmonizing and conciliating wisdom. During his office as President it was not only the unflinching strength and discretion of his foreign policy that, notwithstanding the violence of popular outcries, secured the rights of the country from Great Britain and France without war, but it was also his remarkable skill and firmness in the selection and support of heads of departments that brought the chaos of the Confederation little by little into the firm consistency of a united and strong Federal Government.

Finally, he was thoroughly American in the best sense of the term. Sober history can never adopt that line of America's greatest poet which characterizes Lincoln as the first great American. It was Washington that was the first to rise above the colonial spirit, and to reach the broad conception of a grand nationality. To Congress, which seemed inclined to commission every European adventurer that was recommended by Silas Deane, he wrote that the war must be fought and the victories won by Americans, if at all. In the same spirit he wrote to Patrick Henry in 1795: "My ardent desire is to keep the United States free from political connection with every other country, to see them independent of all, and under the influence of none. In a word," continued he, "I want an American character, that the powers of Europe may be convinced that we act for ourselves, and not for others." In his farewell address he adjured the country with great solemnity to avoid foreign entanglements and alliances; and in his will, after leaving a portion of his property for the founding of a national university at the capital, he used these words in explanation of his purpose: "It has always been a source of regret with me to see the youth of these United States sent to foreign countries for the purposes of education, often before their minds are formed or they have imbibed any adequate ideas of the happiness of their own; contracting too frequently not only habits of dissipation and extravagance, but principles unfriendly to republican government, and to the true and genuine liberties of mankind, which thereafter are rarely overcome. For these reasons it has been my ardent wish to see a plan devised on a liberal scale, which would have a tendency to spread systematic ideas through all parts of this rising empire, thereby to do away with local attachments and State prejudices, as far as the nature of things would or indeed ought to admit, from our national councils." From such expressions as these, scattered throughout his writings, it is evident that Washington was not only a great soldier and a great statesman, but a great American as well.

AUTHORITIES.—The most valuable of all sources of information is Ford's edition of the *Writings of Washington*. The old edition by Sparks was very injudiciously edited, and failed to contain many papers of importance that have since come to light. Of the many works on the life of Washington, those of Lodge and Laboulaye may be regarded as the most important. Those by Marshall and Irving, while valuable, were not written in the light of recent information. Of the general histories of the period, Fiske's *The American Revolution*, and the same author's *The Critical Period of American History, 1783-1789*, are the most modern and are written in the light of the most recent research. Baneroff's history for the period from 1765 to 1789 is a classic which still retains its importance. C. K. ADAMS.

Washington and Jefferson College: an institution of learning in Washington, Pa.; the result of the union of Washington College and Jefferson College, located respectively at Washington and Canonsburg, two villages 7 miles apart in Washington co., Pa. The former was chartered as a college in 1806, the latter in 1802. Throughout nearly their whole history efforts and plans for uniting them were proposed. With the cost of living increased by the civil war, their endowments, whose incomes furnished but a bare support before, became thereafter altogether inadequate. Under these circumstances the trustees of both institutions accepted the offer of Rev. Charles C. Beatty, D. D., LL. D., of Steubenville, O., of \$50,000 if they would unite, and in 1865 the enabling act passed the Legislature. By that union the preparatory department, scientific department, and the freshman class of the classical department were located at Washington, the sophomore, junior, and senior classes at Canonsburg. This arrangement proved undesirable, and application was made to the Legislature for leave to consolidate the whole institution at one place; this request was granted, and the trustees under that authority located the whole at Washington, Pa., in 1869. The first president was Rev. Jonathan Edwards, D. D., LL. D., who was succeeded in 1870 by Rev. George P. Hays, D. D., who, resigning in 1881, was succeeded by Rev. James D. Moffat, D. D. Buildings were erected in 1875 at a cost of about \$80,000, and a gymnasium in 1892 at a cost of \$40,000. The principal additions to the endowment have been \$40,000 by Dr. Francis J. Le Moyne, to found the chairs of agriculture and applied mathematics, and \$60,000 by Rev. C. C. Beatty, D. D., to endow the chairs of Greek and Latin. The productive funds

of the college amount to about \$270,000. In 1894 there were 14 professors and instructors, 270 students, and 12,000 volumes in the library. J. D. MOFFAT.

Washington and Lee University: an institution of learning at Lexington, Va. The settlers of the Great Valley of Virginia in 1749 established near the site of Greenville, Augusta co., a mathematical and classical school which was called Augusta Academy until the war of the Revolution. Its name was then changed to Liberty Hall Academy, and in 1780 the institution was removed to Lexington. Its charter was procured in 1782. It received from Gen. Washington, in 1796, 100 shares of stock in the James River Canal Company, which was commuted by the Legislature to an interest-bearing fund of \$50,000, and the name was changed to Washington College. It received in 1803 a fund of \$25,000 from the Society of the Cincinnati, and in 1826 a bequest of \$40,000 from John Robinson. Its endowment has been increased to \$625,000 by later gifts. On the death of Gen. Robert E. Lee in 1870 the name was changed to its present form. The course of study is divided into elective schools, including classic and literary studies, the applied sciences, engineering, and law. Scholarships are conferred upon students for the ministry, sons of clergymen, upon the students ranking first in several academies and high schools, and upon students ranking first in the several departments of the university. Several endowed scholarships and fellowships yield the holders from \$300 to \$500 each. Degrees are conferred only upon examination in the courses of the several schools. The government is in the hands of a board of trustees, and is more immediately conducted by the president and faculty. Instruction was suspended during the civil war, when the college suffered by the destruction of its scientific apparatus during the occupation of the town by the Union forces, but these losses have been more than counterbalanced by liberal contributions. The institution was reorganized in 1865 under the presidency of Gen. Robert E. Lee, who was succeeded in 1871 by his son, Gen. George Washington Custis Lee, LL. D. It has a library of about 30,000 volumes, and an average of 250 students and seven-teen instructors. JOHN L. CAMPBELL.

Washington University: an institution of learning at St. Louis, Mo.; incorporated in 1853. It consists of six higher departments—the undergraduate department, including the college (1859) and the polytechnic school (1870); the Henry Shaw school of botany (1886); the St. Louis law school (1867); the school of fine arts; the St. Louis medical college (1891); and the Missouri dental college (1892). The university has also three secondary schools—the Smith academy (1854); the manual-training school (1879); and Mary institute, for girls (1859). The number of students in all departments in 1894 was 1,710; the number of instructors was 155. The special reference libraries in the several departments include about 15,000 volumes. Fifty perpetual memberships in the Mercantile Library (75,000 vols.) are in the undergraduate department. The real estate of the university is valued at \$625,000, and its total endowment \$800,000. WINFIELD S. CHAPLIN.

Washington University of: a State institution located at Seattle, Washington; the culmination of the State's system of public schools. In 1854 Congress granted two townships of land to the Territory of Washington for the establishment of a university. The school was opened in the town of Seattle in 1862, and in 1895 was transferred to a fine and picturesque campus of 350 acres between Lakes Union and Washington, 2 or 3 miles from the earlier site. In its new location it has been provided with buildings suitable for the accommodation of 800 students. In 1893 the State gave the university an endowment of 100,000 acres of land. The fees are very low. In 1894-95 the university had 18 instructors, 425 pupils, a small library, a good museum, and 20 departments of instruction. It has a school of pharmacy and a mining-school, and schools of law and medicine are contemplated. M. W. II.

Washita River (frequently spelled **Ouachita**): a stream which rises by its Brushy Fork in Polk co., Ark., and flows first E. and then S., crossing the Louisiana State line, and finally discharges its waters into Red river. That part of Washita river between Tensas and Red rivers is sometimes called Black river. It is navigable by steamboats throughout the year to Camden, Ark., and for two-thirds of the year to Arkadelphia, Ark. It is 600 miles long, and flows through a rich corn and cotton region. Its navigation is extensive and important.—Another WASHITA, called also

the FALSE WASHITA, traverses the Indian Territory between the South Fork of the Canadian and Red rivers, and falls into the latter stream at Washita Bend, above Preston, Tex. See RED RIVER.

Revised by I. C. RUSSELL.

Washo'an Indians: a linguistic family of North American Indians represented by a single small tribe, the Washo, in Western Nevada. The name Washo is a corruption of *Wol-osh'u*, signifying red man or Indian. When first known to the whites the Washo occupied the Truckee river as far down as the meadows, though the possession of the latter was in dispute, the Paviotso, a Shoshonean tribe, also claiming them. They also held Carson river down to the first large cañon below Carson City, and occupied the borders of Lake Tahoe, as well as Sierra, and other valleys northward to the first range south of Honey Lake, California, the mountains being resorted to only in summer. Of late years they have been confined to the country from Reno, on the Central Pacific Railroad, to a short distance south of Carson City. They have adopted a parasitic mode of life, being almost entirely dependent upon the towns and ranches. Their language seems to be quite distinct from any other known, though a few resemblances to California dialects, especially the Miwok, have been found. In physique and general appearance they resemble the California Indians rather than the Shoshonean tribes to the eastward of their habitat. There are some evidences that they once were established in the valleys farther to the east than those they occupied when found by the whites. In 1859 the Washo were said to number about 600. The present population is about 200. See U. S. Indian Affairs Reports for 1859, 1861, 1866, 1869, 1870; also INDIANS OF NORTH AMERICA. J. W. POWELL.

Wasp [N. Eng. *wasp* < O. Eng. *wæsp*, *wæps*; O. II. Germ. *wesfa* > Mod. Germ. *wespe*; cf. Lith. *wapsa*, gadfly; Lat. *vespa*, wasp, and Fr. *guêpe*, from M. H. Germ. *wespe*]: any one of a large number of hymenopterous insects (see ENTOMOLOGY) which are all essentially similar in the possession of a sting of no mean capacity at the end of the abdomen of the female. They have strong biting jaws, and the abdomen is either joined to the thorax by its whole breadth or by a slender pedicel. They may be separated from all other

Common wasp (*Vespa vulgaris*).

stinging Hymenoptera (*Aculeata*) by the absence of a kink or "knot" in the pedicel of the abdomen (which occurs in the ants), and by the cylindrical first joint of the hind foot or tarsus (which in the bees is expanded into a "basket" for carrying pollen). There are two well-marked groups of wasps, each containing many species: (1) The digger wasps, in which the wings are not folded when at rest, and (2) the true wasps, in which they are folded. In the first, of which there are several families, the female usually constructs nests for the young by excavating holes in the earth or in wood, and in them she lays her eggs. The diggers are all solitary in habit—i. e. each female works by herself in the nest-making. In the nest she stores up food in the shape of insects, which she paralyzes, but does not kill, with her sting. On these the larva feeds until ready to go through its transformations. Each species has its peculiar habits in this respect, some storing the nests with spiders,

Nest of paper-making wasp.

others with beetles, others still with caterpillars. Comparatively little is known of the habits of the American species in these respects. To the digger wasps also belong the mud-daubers, which make nests of clay in barns, garrets, etc. Among the true wasps are some with all the habits of the

diggers, boring in wood or earth, or making mud nests, each female working alone in this respect; while others are social in habits, and in the colonies of these forms we find, as in the ants and bees, males, females, and workers, the males alone being stingless. Most of the work is done by the workers, who build the nests either attached to the eaves of buildings or to trees, or concealed in the ground. The best known of the true wasps are the "yellow-jackets" or hornets, which construct the well-known large paper nests. The paper is obtained by tearing up weathered wood and mixing it with saliva, the whole forming a veritable wood-pulp paper. The cells are arranged in combs much as in the case of the honey-bee. No food is stored up, however, and the adults feed the growing young on masticated insects which they have captured. Males and workers die in the autumn, while the females pass through the winter to form new colonies in the spring.

LITERATURE.—For species, etc., see papers by Paekard (*Proc. Entomol. Soc.* (vol. vi., Philadelphia, 1866); Cresson, (*Transact. Entom. Soc.*, Philadelphia, 1882-83, 1887); Saussou, 1853-75. For habits, see Lubbock's *Ants, Bees, and Wasps* (New York, 1882). J. S. KINGSLEY.

Waste: any injury to real property committed by a tenant for life or for years to the prejudice of the reversioner or remainderman. This injury was punishable at common law by *Writ of Waste*, instituted "by him that had the immediate estate of inheritance," or it could, in a proper case, be restrained by an action in Chancery. At the present time the proceeding in Chancery, extended so as to cover an award of damages already sustained by the owner of the inheritance, has generally completely superseded the common-law remedy, the technical action of waste having been abolished in England and most of the U. S. In some of the States a statutory action at law has been substituted for the old writ of waste (see, e. g., the *New York Code of Civil Procedure*, §§ 1651-1659), without, however, derogating from the jurisdiction of the equity tribunals.

The doctrine of waste was a necessary corollary of the common-law doctrine of estates in land. (See the articles ESTATE and PROPERTY.) It will be remembered that there was at common law no such thing as an absolute ownership of lands by any subject, but only an estate, or interest, for a definite or indefinite period of time. So far as the term owner was applicable to any holder, or tenant, of lands, it belonged to a tenant for life as well as to a tenant in fee simple, and so long as the present owner (the particular tenant) was in possession, the future owner (reversioner or remainderman) was a stranger to the land, and could maintain no action at law or in equity with reference to it. He was, therefore, in theory at least, wholly without protection against the wasteful use of the tenement by the particular tenant. Just as a tenant in fee simple may devastate his property, leaving it to descend in a wasted and ruinous condition to his heir, so might a tenant for life or for years, upon the expiration of his estate, transmit the land to his successor denuded of everything that rendered it a valuable acquisition.

It was to remedy this anomalous consequence of the common-law theory of property in land that the doctrine of waste was devised. It was in its origin apparently a creation of the courts of common law, as a limitation on certain classes of life estates, which were themselves created by that law. As the estates known by the description of guardianship in chivalry, tenancy by the courtesy, and tenancy in dower, arose without the act or consent of the preceding owner of the fee, it was deemed just that the law which created them should also protect the heir against the abuse or destruction of the inheritance by such intervening tenant. The doctrine of waste as thus employed was by the Statute of Marlborough (52 Henry III., A. D. 1267) extended to tenants for years. This statute was followed in 6 Edw. I. (1278) by the Statute of Gloucester, which gave a writ of waste against any tenant for life or for years, fixed the damages at "thrice so much as the waste shall be taxed at," and punished the wasting tenant by forfeiture of his estate. Starting from this legislation the doctrine of waste was elaborated by the courts into a body of minute and, sometimes, technical rules. Waste was of two kinds—voluntary and permissive. Voluntary waste was such as was caused by the active misconduct of the tenant; permissive, such as resulted from his passive negligence. Cutting down timber trees, tearing down or altering buildings, opening new mines and quarries, and the like, are examples of the for-

mer; while merely suffering buildings and fences to become dilapidated or out of repair, or orchards to become decayed, or fields to become overrun with weeds and briars from lack of proper cultivation, are illustrations of the latter. But it was at common law as unequivocal an act of waste to build a new house or to alter and improve an old one, as to destroy a portion of the inheritance. To redeem waste land, or to convert woodland or meadow into arable land, or *vice versa*, were equally wasteful acts. The destruction of buildings by accidental fire or by the act of an incendiary was waste, but if a house "fall down by tempest, or be burned by lightning, or prostrated by enemies [i. e. the public enemy], or the like, without a default of the tenant, or was ruinous at his coming in and fall down," it is no waste.

The law of waste remains at the present time substantially as above set forth, although it has in its more technical applications been considerably modified, both in England and in the U. S. Thus it is generally provided by statute that a tenant for years shall not be compelled to suffer the consequences of a destruction of the premises by fire for which he was in no wise to blame, and in the U. S. a tenant may generally make such changes in the use and character of farming land as are deemed to be a proper and husbandlike treatment of the land in question, or, if the waste alleged is an unauthorized improvement of the premises, he may justify by showing that he has thereby actually and materially benefited the inheritance. The jurisdiction of the common-law tribunals has from a very early period been supplemented by equity in restraining and punishing acts of vandalism by a tenant which did not come within the technical description of waste. Of this character was the destruction of shade and ornamental trees, which were not timber trees, and the excessive and wasteful use of his privileges by a tenant who held his lands "without impeachment of waste." The term timber was ordinarily confined to the three varieties of trees usually employed for building purposes—namely, oak, ash, and elm—although in some parts of England, where proper timber was scarce, beeches and sometimes other trees were included under that designation.

It is to the doctrine of permissive waste as thus developed at common law that we owe the familiar rule of law which throws upon the tenant the burden of making all ordinary repairs to the premises occupied by him. Strictly speaking, the tenant can not be called upon to make repairs, nor is he liable in damages for his failure to do so. But as the deterioration or destruction of the premises subjects him to the harsh consequences of an action for waste, and as his only defense to such an action is to show that he has repaired the waste, he chooses the lesser hardship in keeping the premises in repair. The liability for waste, which was at common law confined to tenants for life and for years, has in recent years been extended by statute or judicial legislation to cover the acts of mortgagors and mortgagees in possession, of tenants in common, and of the vendor and vendee, respectively, under a contract for the sale of land. It is a confusion of the subject to refer the similar liability of a tenant at will (known as his liability for voluntary waste), as well as that of a tenant at sufferance, and of persons unlawfully in possession of lands, to the law of waste, instead of trespass, where they belong. Devastation by trustees, executors, and judgment debtors, as well as by owners of the fee whose estates are subject to executory limitations (see TENURE), while not coming within the description of waste, will yet be enjoined as such by the courts of equity.

See LANDLORD AND TENANT. Consult also the *Commentaries* of Blackstone and Kent; McAdam on *Landlord and Tenant*; Taylor on *Landlord and Tenant*; Williams on *Real Property*; and the *American and English Encyclopedia of Law*, title Waste. GEORGE W. KIRCHWEY.

Watch [deriv. of *watch*, hour of the night, period of time occupied by soldiers, etc., on duty < O. Eng. *wacce*, watching, watch, deriv. of *wacan*, wake]; a timepiece designed to be worn or carried on the person, as distinguished from a clock, which is a stationary timepiece. (See CLOCKS.) While to some extent the principles of the mechanism of clocks and watches are identical, yet there are radical differences in construction. It is evident that the employment of weights and pendulums is applicable only to stationary timepieces; but the equivalent of the weight has been found in the coiled spring, and the vibrating balance-wheel has been found to answer the purpose of the vibrating pendulum, when supplemented by the action of the hair-spring,

which, like the force of gravity in the case of the pendulum, is constantly striving to bring the moving balance to a state of rest.

Description of a Watch.—A complete watch is made up of two parts—the case and the movement. The latter consists principally of a train of gear-wheels and pinions, mounted between two metallic plates, commonly of brass or nickel alloy, in which the arbors of the wheels and pinions are journaled or pivoted. For symmetry of form and convenience in construction, as well as in practical use, this train of gearing is arranged as compactly as possible, and

FIG. 1.—Arrangement of time-train of a $\frac{3}{4}$ -plate, open-face, pendant-setting watch.

somewhat circular in form. (See Fig. 1.) Except for these reasons, however, the several members of the train could be located in a straight line, as shown in Fig. 2. At the right-hand extremity of this train is a large box-like wheel, containing the coiled mainspring (a ribbon of carefully tempered steel, from about 12 to 24 inches long), which serves as a medium for storing the physical energy or force exerted by the individual who winds the watch. In the ordinary form of construction the inner end of this spring is attached to the barrel arbor, while the outer end is connected to the barrel itself; the spring is wound up by turning the barrel arbor, and is prevented from immediately unwinding by a ratchet on the arbor, the teeth of which are engaged by a pawl or click attached to some stationary portion of the watch. In its efforts to relieve itself from the stress caused by the winding process, the action of the spring is to turn the inclosing barrel, the gear-teeth of which mesh into the center pinion, the next member of the train. In modern watches, as ordinarily constructed, this second member is located

FIG. 2.—Watch time-train arranged in a straight line: From right to left in order, the members are (1) the barrel; (2) center wheel and pinion; (3) third wheel and pinion; (4) fourth wheel and pinion; and (5) escape-wheel and pinion.

in the center of the circular watch-plates, and upon its axis is fixed the minute-hand. Fixed to the staff or arbor of the center pinion is a wheel, technically known as the center wheel, which meshes into the third member of the train, called the third pinion. To this pinion is also affixed a wheel called the third wheel, which in like manner meshes into and gives motion to a fourth pinion and wheel. The fourth member of the train revolves at sixty times the speed of the center wheel and carries the second-hand. This increase of speed is obtained by the interposition of the third wheel and pinion, which also secures another desirable end—viz., that of making the direction of the two members identical.

Although the minute-hand is mounted upon the axis of the second member of the train, it is not fixed directly to the staff, but upon the upper end of the cannon-pinion, so called from its having a long body, or hub, slightly suggestive of a cannon; and whereas the pinions in the time-train proper are integral with the staves or arbors, which are solid and pivoted at their ends, the cannon-pinion has an axial hole running its entire length, corresponding in size with the diameter of the projecting end of the center staff, upon which it is placed, being held by a sufficient frictional contact to carry the pinion and hand, and still allow of movement upon the staff, for the purpose of setting the hands. On key-winding watches of "full plate" model, the upper end of this cannon-pinion is made square, and of the same size as the square end of the mainspring or barrel arbor, so that the same key may be used for both setting the hands and winding the mainspring. In modern watches, commonly known as stem-winding watches, the hand-setting is performed by mechanism which may be thrown in gear with the stem at will, the same operation throwing the winding mechanism out of gear.

It remains to consider the provision for the mounting and movement of the hour-hand. The teeth of the cannon-

pinion are made to engage with the teeth of a little wheel which fits loosely upon a stationary stud projecting from the lower or pillar plate of the watch. The proportion in the number of teeth of this wheel and the cannon-pinion is ordinarily three to one.

FIG. 3.

Rigidly affixed to this wheel is a pinion, commonly called the minute-pinion, the wheel being designated as the minute-wheel. Upon the body or hub of the cannon-pinion is loosely fitted a wheel also having a projecting hub, upon the upper end of which is placed the hour-hand. The teeth of this wheel are made to engage the teeth of the minute-pinion before mentioned, their relative proportion being that of four to one, so that through the interposition of the minute wheel and pinion it will require twelve revolutions of the cannon-pinion, carrying the minute-hand, to produce one revolution of the hour-wheel, which carries the hour-hand.

The Escapement.—With only the time-train properly mounted, if the mainspring should be wound up, the effect would be to turn the mainspring barrel or wheel in which it is inclosed, which in turn would move the second wheel of the train, and it the third, and so on, each with increasing velocity, so that within perhaps a minute or two the various hands would have traversed their individual circuits as many times as would be required for a complete day. It is evident that no attachment in the nature of a brake which should serve to reduce the speed of the wheel would be practicable, for two reasons—first, it would be impossible to maintain a uniform degree of friction, and, second, because of the constantly diminishing force of the uncoiling spring.

The device employed to secure a correct and uniform speed is called an ESCAPEMENT (*q. v.*). The form which is now most commonly used, and which is probably, on the whole, the most satisfactory, is known as the *detached-lever escapement*. To the fourth or last pinion of the time-train is attached a wheel meshing into a small pinion known as the escape-pinion, to which is made fast the escape-wheel, in form entirely unlike any of the wheels of the time-train. (See Fig. 4, 5, or 6.) This wheel has fifteen teeth, and of each tooth one side is straight, but not radial, so that these teeth form a series of hooks. It will also be observed that the tops of these teeth are also straight, but not tangential, forming a series of inclines. Pivoted at one side of this wheel is the pallet, a peculiar anchor-like piece, the arms or ends of which are turned inward, but at differing angles. The extremities of these arms (also called pallets) are usually formed of some kind of precious stones, such as garnet, ruby, or sapphire, and are so placed that one or the other of them always slightly projects between some of the teeth of the escape-wheel so as to lock the escape-wheel and prevent its turning, which, of course, makes impossible the

movement of the time-train. If, however, the pallet should be rocked back and forth, causing the two extremities to alternate in locking the escape-wheel, one tooth of the latter would be allowed to escape at each oscillation, and therefore with the fifteenth oscillation the escape-wheel would complete one revolution. Evidently if this vibratory motion of the pallet could be continued at a correct and exactly uniform rate, the entire mechanism could be made to operate as desired and the progress of time be accurately indicated. This result is accomplished by means of a balance-wheel, hair-spring, etc.

In Fig. 3 is shown a balance-wheel mounted upon an arbor or staff upon which is also placed a hair-spring. This spring is on the upper side of the balance, while below the balance is fixed a small disk, technically known as the roller, from the lower side of which, near the periphery, projects a small pin formed from a precious stone and called the roller-pin. The pivots of the balance-staff are made exceedingly small and delicately finished, and are journaled in jewels of ruby and sapphire because of their special hardness, and, unlike the pivots of the time-train proper, are provided with end-stones to receive the end thrust which in the other pivots is received by the shoulders of the staffs. The object of this form of mounting is to reduce the running friction of the pivots to the smallest possible amount, and also to make it constant and uniform. The necessity for this extreme delicacy arises from the fact that the initial force given by the mainspring is small, and that only about $\frac{1}{100000}$ of it can be exerted at each oscillation of the balance.

From the pallet there extends back an arm, the extreme end of which has a semicircular hollow curve like the top of a crutch, in the center of which is a narrow slit. The balance-wheel is mounted in relation to this fork and the pallet and escape-wheel, so that their arbors are in a straight line, and so adjusted that when in position of rest the roller-pin above mentioned rests in the little slit in the hollow of the fork, with one of the arms of the pallet resting on the inclined top of one of the teeth of the escape-wheel (Fig. 4). The slight turning of the escape-wheel (in clockwise revolution), however, on account of the transmitted force of the mainspring, causes the pallet to swing to one side, on account of the inclined top of the tooth, and the lever swinging also carries with it the roller-pin, so causing the balance-wheel to turn, thereby creating a stress in the hair-

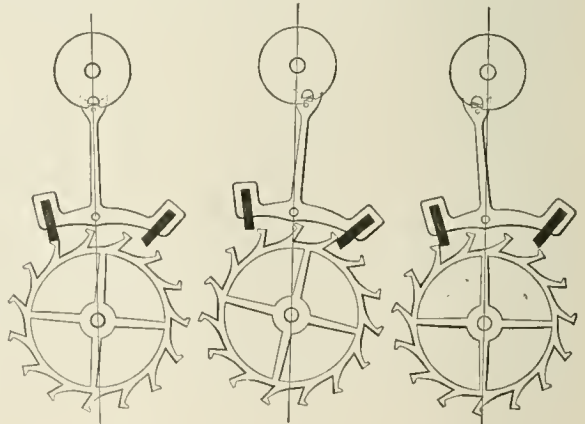

FIG. 4.

FIG. 5.

FIG. 6.

spring. The motion of the pallet in this direction substantially ceases as soon as the tooth of the escape-wheel leaves it, but its movement is sufficient to swing the other arm of the pallet directly in front of another tooth of the wheel, and so further movement of the wheel is arrested (Fig. 5). Now the hair-spring asserts itself, and begins to turn the balance back to the point of rest. In so doing the roller-pin is again made to enter the fork, and with sufficient force to swing the lever and pallet in the opposite direction, thereby unlocking the tooth of the escape-wheel, which at once begins to turn, and, as before, the inclined top of the tooth gives an impulse to the swinging pallet (Fig. 6). Each movement of the pallet and fork gives a slightly increased arc of motion to the balance until the proper equilibrium is reached.

It is evident that the strength of the hair-spring and the

weight of the balance must be properly related. This adjustment is exceedingly delicate. In most modern watches the train is arranged so as to require 18,000 vibrations of the balance-wheel per hour, and a loss of only a single vibration each hour would be a loss of a trifle over 33 seconds per week. The balance of the ordinary gentleman's watch travels about 18 miles each twenty-four hours.

The detached-lever escapement was the invention of Thomas Mudge about 1765, although several modifications in form of construction have been made. The form shown in Figs. 4, 5, and 6 shows the impulse action divided between the pallets and the escape-wheel teeth. A favorite form of the wheel with English watchmakers has slender pointed teeth, and the impulse angles are entirely on the pallets. The Germans, on the other hand, make an escapement in which the pallets are simply round pins, and the impulse plane is entirely on the wheel-teeth. In the description of the action of the detached lever no mention was made of one important function of the roller—viz., its use as a safety device.

FIG. 7.—Original cylinder escapement.

For greater safety double rollers are now used on the better grades of Waltham watches.

Although the detached-lever escapement is the simplest and most reliable form, others are in use. The *chronometer escapement*, invented by Pierre Le Roy in 1765, and improved by Earnshaw and Arnold about 1780, is used in ship or box chronometers, and by reason of its peculiar design is well adapted for timepieces which are not subjected to sudden and extreme changes of position. It is, however, sometimes applied to pocket watches of high grade. In the ordinary detached lever we have seen that each tooth of the escape-wheel acts first as a detent, and then to give an impulse to the balance, through the intermediate agency of the pallet and fork and roller-pin, and also that this action takes place at each excursion of the balance. In the chronometer escapement one of the teeth is held by a fixed spring detent, which is lifted by a little arm or dog attached to the balance arbor or staff. At the instant of the lifting of the detent and release of the escape-wheel tooth another tooth of the wheel imparts impulse to the balance through a second and longer arm or dog. This action takes place during the movement of the balance in one direction only. On the return movement of the balance the longer arm or dog passes between the teeth of the wheel, while the shorter arm is allowed to repress the detent by slightly deflecting a delicate spring, which rests upon a rigid seating, so as to resist pressure in the opposite direction. This form of escapement admits of some variety in arrangement and construction of the several parts.

The *duplex escapement* (patented about 1782 by Thomas Tyrer) possesses several features of similarity to the foregoing. It comprises an escape-wheel furnished with two sets of teeth in different planes, one set serving to impart the impulse to the balance direct, while the other set act as detents, to arrest the movement of the time-train during the movement of the balance in one direction, and also during most of its return movement.

A fourth form of escapement (invented by Booth and patented in 1695) is known as the *cylinder escapement*, by reason of the construction of the balance arbor, which is much larger in its body portion than in other forms (Fig. 7). This middle portion is cylindrical in form, one side of it being cut away so that when turned to a certain position one of the peculiarly formed escape-wheel teeth which was resting on the periphery of the cylinder is allowed to escape and move in until it strikes the inner side of the cylinder on the opposite side (in its passage in, the tooth, by means of its inclined top, gives an impulse to the cylinder). The peculiar form of the tooth permits the cylinder partly to encircle it, and on the return movement of the cylinder the tooth passes out, and by means of its inclined top, or face, gives an impulse to the cylinder and balance in a direction opposite to its entering impulse. This form of escapement possesses the merit of compactness, and is therefore used by European makers, especially in small watches, but its nature and plan of operation preclude a high degree of accuracy.

Devices to Lessen Friction.—The facts and conditions which have been described make it evident that the very

small amount of power available must be economized, so that the least possible portion of it shall be absorbed in friction. To insure this economy it is needful to have special regard to the construction and care of those portions of the mechanism where friction will be developed, viz., those parts which have a movable contact with each other; these points being the teeth of the wheels and pinions, the various pivots, and the parts of the escapement which slide one upon another. In forming the teeth of the wheels and pinions it is the practice to employ the epicycloidal curve, so that a rolling instead of a sliding contact may be obtained, and great pains are taken to produce a smooth and glossy surface on the pinion-teeth. The attempt is also made to proportion the teeth of the wheels to those of the pinions with which they act, so that no contact shall occur before the line of centers, the object being to avoid side thrust or pressure against the staff pivots.

A further provision for reducing friction in the train, and at the same time for insuring greater durability, consists in the employment of jewels as bearings in which the various pivots revolve. The advantages gained result from the fact that it is possible to produce a smoother surface in a precious stone than can be made in brass or nickel. There is also secured a greater durability, by reason of the fact that particles of dust inevitably find their way into a watch, and, reaching the bearings, become imbedded in a softer metal, remaining to wear or cut away the moving pivots. This alone makes it necessary that watches should be carefully cleaned at intervals not too prolonged.

Adjustment.—Watch movements of the higher grades are subjected to three kinds of adjustment, viz., adjustment to isochronism—to make both long and short arcs of vibration of the balance take place in identically equal intervals of time; adjustment to position—to put the movement in such condition that its time rate shall be constant in whatever position it may be placed, or however often its position may be changed; and adjustment to varying temperature. For the adjustment to position the movement is tested in six positions, viz., dial up, dial down, and 12 up, down, right, and left. The most important adjustment, however, is that for varying temperature. This consists in certain simple manipulations of the balance to put it in such condition that it will automatically compensate for the otherwise disturbing effects of thermal changes. Besides the lengthening of the spring and the enlargement of the balance, in accordance with the law of expansion of metals under the influence of heat, a much greater disturbance is caused by the loss of elasticity in the spring due to the increase of heat. It has been estimated that the loss per day from a change from 32 to 92° F. would be 6 minutes 33 seconds. To neutralize or overcome this difficulty, the best movements are provided with what are called compensation or expansion balances—i. e. balances whose rims are composed of two metals in laminated form—the outer lamina being of an alloy of much higher expansibility than the inner, and so constructed that the thermic changes, which would otherwise greatly modify the speed, are made to provide a means of correction.

Compensating balances are ordinarily formed of steel, to which is carefully fused an encircling band of brass. The ratio of expansion of these two metals is indicated in Fig. 8. At normal temperature the two strips are of equal length, but when heated they will expand in about the ratio indicated by the dotted lines. If these two strips

FIG. 8.

FIG. 9.

FIG. 10.

were firmly united and then heated, the greater expansion of the brass would force the compound bar to assume a curved form (Fig. 9), but a reduction to its normal temperature would allow it to recover its original form, and a greater degree of cold would cause it to curve in an opposite

direction (Fig. 10). A bimetallic balance is shown in Fig. 11, in which the rim, severed at opposite points, is somewhat deflected by the influence of heat; it will be observed that the result is to reduce the effective diameter instead of enlarging it, thereby lessening the inertia of the balance, so that less force in the hair-spring is needed to move it as required. To compensate properly, it is essential that this reduction shall be exactly equivalent to the sum of all the heat losses. Such losses are not determinable without careful and continued tests. As a means of providing for varying conditions, the balance rims when completed are provided with a series of radial holes, in some of which are fitted small screws with relatively large heads. When put

FIG. 11.

together and tested with an increase of, say, 25° in temperature, the watch might be found to lose six or seven seconds, which would indicate that for such conditions the balance was too large. The remedy is a change in the location of some of the adjusting screws in the balance rim; such, for instance, as the removal of the two screws from position No. 4 to position No. 11, as indicated by the

dotted lines. Such a procedure so disposes a portion of the weight that the action of heat serves to carry it nearer to the axis than before, thereby making a greater difference in its effective size. If, in the test, the rate had proved to be a gaining one, it would have indicated that for such conditions the balance was too small, and the movement of the adjusting screws would need to be in the opposite direction. *History.*—The earliest timepieces resembling watches rather than clocks were not designed to be carried on the person, but rather as table ornaments. The resulting practice of elaborately ornamenting the cases, as well as some portion of the movements, was continued for many years, and was applied to portable or pocket watches also. In the collection of rare and curious old watches which has been gathered by Evan Roberts, of England, some of which appeared in the American Waltham Watch Company's exhibit at the Columbian Exposition in 1893, there are some fine specimens of artistic work of that character. Carl Marfels, of Germany, also has a fine collection of similar character. Early watches had but a single hand.

The production of portable time-keepers dates from about A. D. 1500, although it is claimed that Peter Hele, of Nuremberg, made them as early as 1477, and that they were known as Nuremberg animated eggs. The invention of the coiled mainspring is credited to Hele. The verge escapement had been long employed in clocks, and when actuated by a constant power derived from a weight would doubtless give a fairly constant rate, but when that escapement was incorporated as a part of the mechanism of a watch driven by a coiled spring, whose tension was constantly diminished as the spring uncoiled, a uniform rate was impossible without especial devices to derive a uniform stress from the varying force of the coiled spring. The first known contrivance of this description was a sort of brake, so arranged that as the spring uncoiled less and less resistance would be applied. This device was known as a "stack freed"; it was unsatisfactory, and was succeeded by the greatly superior one of the fusee, said to have been the invention of Jacob Zech, of Prague, about 1525. It consisted of a sort of conical pulley having formed on its periphery a spiral groove. On the arbor of the fusee was fixed the main wheel, and the mainspring barrel served as a drum, around which was coiled a number of turns of a cord of catgut, one end of which was attached to the large part of the fusee and the other end to the barrel, so that the mainspring barrel was turned and the spring coiled up by turning the fusee. When uncoiling, the spring would first pull from the small part of the fusee, and as the pull of the spring grew weaker, it was compensated by a gradually increased leverage, as the uncoiling cord pulled from the larger part of the fusee. The use of

chains in place of catgut was introduced in 1664 by Gruet, a Swiss. English watchmakers continued to employ the fusee until the last part of the nineteenth century. Enamel dials were introduced about 1630. Hooke invented the balance spring about 1658.

It has seemed to be the policy of each European watchmaker to make a watch of a model peculiar to himself. This plan renders repairing difficult and expensive, and about 1849 suggested to the mind of Aaron L. Dennison, of Boston, Mass., the idea of manufacturing watches by machinery, and of making large numbers of each part of the movement so uniform in dimensions that they would be interchangeable. In 1850, in company with Mr. Edward Howard, he began the erection of a factory for the manufacture of watches on this plan, which is universally known as the American system. This building was located in what is now Boston Highlands, but within about three years a new factory was built at Waltham, on the Charles river, about 10 miles W. of Boston, and the business moved to that place. A few watches were produced, patterned after the English models, but the public was then distrustful of the ability of Yankees to make watches, so that the demand was limited. The original capital of \$20,000 soon disappeared, as did as much more as could be secured, and in 1856 the company made an assignment, the property was put up at auction, and purchased by Royal E. Robbins, of New York, who invested his entire capital in the bankrupt enterprise. By hard work night and day, and by the help of his partners, Henry A. Robbins and Daniel F. Appleton, the business was kept afloat till 1861, when the outbreak of the civil war caused a demand for American watches, which at once assured the success of the enterprise, and since then the growth of the business has been steady. Since 1885 the company has been known as the American Waltham Watch Company. The aggregate number of watch movements produced is (1895) over 7,000,000.

Of the watch-making enterprises undertaken in the U. S. since 1860, not one has escaped financial difficulties, a few were repeatedly reorganized, and of those a few still live, but about twenty became bankrupt and disappeared; of those which have succeeded, the Elgin National Watch Company has been the most prosperous, and its total product approaches that of the Waltham company. Other prominent watch-making companies are the Dueber Hampden Watch Company, of Canton, O., the Waterbury Watch Company, and the New York Standard Watch Company.

Watchung Mountains, known also as the ORANGE MOUNTAINS: elevations consisting of a triple range of hills rising to the W. of Plainfield, Orange, and Paterson, N. J. They are about 40 miles long, trend N. and S., and curve abruptly westward at each end. Each of the three divisions of the range is composed of a thin sheet of trap-rock (diabase), which was poured out as a lava flow during the Newark period, and subsequently covered with sand and mud, now changed to sandstone and shale. At a later date the entire series was tilted westward at an angle of from 10 to 15 degrees, and greatly eroded. The trap-rock now stands in relief, and forms hills 300 to 400 feet high, owing to the more rapid erosion of the softer sedimentary beds inclosing it. The Watchung Mountains are similar to the Palisades along the Hudson, but the rock composing them was poured out as surface flows, as already stated, while the Palisades sheet was forced in between sedimentary beds, and, so far as known, did not reach the surface. I. C. R.

Water [O. Eng. *water*; O. H. Germ. *wazzar* (> Mod. Germ. *wasser*); Ice. *vatn*; Goth. *watō*; cf. O. Bulg. *voda*; Gr. *ὕδωρ*; Sanskr. *udān*; cf. Sanskr. *ud-*, to wet, Lat. *undā*, water, wave, and Eng. *wet*]; a tasteless, inodorous, and transparent fluid, a compound of hydrogen and oxygen, and represented by the chemical formula H₂O. The importance of its functions in the mineral, vegetable, and animal kingdoms, its peculiar properties, and the numberless uses made of it, consciously and unconsciously, by man make it worthy of the most attentive study.

Occurrence in Nature.—Water in the state of vapor is always present in the atmosphere. On the one hand, this vapor is continually condensing to liquid water, which makes its appearance as cloud, fog, or mist, as rain, snow, or hail, falling upon the earth's surface, or deposits directly on cold solid surfaces as dew or frost. On the other hand, new supplies of vapor are continually entering the atmosphere by evaporation from surfaces of liquid water, as that of the ocean, from moist earth, and from the bodies of plants and animals.

In the liquid state a vastly larger quantity of water is found, covering something like eight-elevenths of the earth's surface with ocean, while less extensive bodies of this substance present themselves as seas, lakes, rivers, and springs. Moreover, liquid water occurs to no small extent diffused through soils and porous rocks, and forms a large part of the bodies of plants and animals.

As a solid—ice—we find great masses permanently covering the coldest parts of the surface of the globe, in the polar regions, and about the summits of the higher mountains, and temporarily extending to lower levels and more temperate regions during the colder portions of the year. Much of the ice found in largest masses represents highly compressed and consolidated snow; the slowly moving solid streams of this which descend valleys are known as glaciers, and the detached masses from the lower ends of these which reach the sea and float away, along with large masses of floating ice which has formed on the surface of the sea itself, are spoken of as icebergs and ice-floes; these when they reach warmer regions melt and return to the liquid form.

In much smaller quantity water is also encountered as a chemical constituent of minerals, such as gypsum, which sometimes form rock-masses.

A rough calculation of the quantity of water known to exist on the earth's surface in the three states of vapor, liquid, and solid is as follows:

	Millions of metric tons (of 1,000 kilog.).
Total weight of water in the gaseous state existing in the atmosphere at any one time (on the basis of the average tension of aqueous vapor of the Challenger observations), about.....	115,000,000
Total weight of liquid water on the surface of the earth, about.....	1,255,737,000,000
Total weight of solid water (ice) on the earth's surface (probably a low estimate, especially as regards the extent of the south polar ice cap), about.....	6,373,000,000
	1,262,225,000,000

If this be stated, as respects distribution in the three physical states, in the form of parts per million, we have—

In the state of vapor.....	91
In the state of liquid.....	994,860
In the state of solid.....	5,049
	1,000,000

The estimate of aqueous vapor in the atmosphere is doubtless too high, being based on vapor-tension observations made at sea; possibly one-half or two-thirds might be taken to be nearer the truth. If but 30 inches of annual rainfall be assumed as the average for the earth's whole surface, this will represent an annual distillation (and condensation as rain or snow) of about 387,000,000 millions of metric tons of water. See RAIN, SNOW, HAIL, ICE and GLACIERS.

Important Natural Functions of Water.—The mobility of the particles of this, the only liquid substance occurring in nature in large quantity, renders it the vehicle for the application of mechanical energy on the grandest scale in modifying the earth's surface, cutting away and removing the solid material of the higher portions of the land, and sweeping such material down to lower levels or into the ocean, of which the coasts are altered by water-currents; while the expansion of water in freezing disintegrates rocks and soils, and ice itself plays its part as an abrasive and shares in the transport of solid matter from place to place. (See GROTTOY). The mechanical effect of the expansion of water in freezing is observable also in the disruption of the tissues of living plants, and the pulpy condition of animal flesh which has been frozen, leading to speedy putrefaction.

Water is peculiarly fitted by some of its special physical properties to serve also as the vehicle for the distribution of heat. As aqueous vapor in the atmosphere, as liquid water

in the ocean and in lakes, and as changing its state by freezing or melting, evaporating or condensing, its influence is of the highest importance in maintaining in general, and, under special conditions of season and weather, of modifying the distribution of heat on the earth's surface, and determining the climate of its various parts. (See METEOROLOGY). A like part is played by the same substance in our own bodies, conveying heat from the seats of its development to the parts where it is dissipated, dissipating it by evaporation from the skin and lungs, and maintaining the needful equilibrium of temperature.

The relations of water as a solvent of great and varied power both for solids and gases give it still further the character of the restless agent of change in nature. The permanent gases of the atmosphere are brought down in solution to do their work upon the mineral crust of the globe, and to perform a part of their duty in the maintenance of plant and animal life, while the rocks and soils of the land are leached by the water continually distilled over them as rain, part of the matter brought into solution serving for plant nutrition, and most of the remainder being borne to the ocean, on which it confers its saline character.

As a chemical agent water is found changing feldspar and other minerals into clay, forming or modifying particular metallic ores, taking part in the chemical processes of vegetable and animal nutrition, and aiding in the changes of putrefaction and decay by which the material of organized structures is restored to the mineral forms from whence it came.

Industrial Applications.—Beside the indispensable use of water for drinking, it is applied by man indirectly to endless purposes of utility and convenience. As a vehicle for mechanical energy in the work of the water-wheel, in hydraulic mining, in the mechanical separation of ores, as the means of making available in the steam-engine the potential energy of fuel, as the basis for transportation on the largest scale by ocean, lake, river, and canal, as the vehicle of heat distributed by hot water or steam, as a solvent in metallurgy and the manufacture of chemicals, in brewing, distilling, dyeing, tanning, soap-making, in connection with pottery and the use of mortar and cement, and in a thousand other directions man's work would stop were he deprived of this material. See WATER-POWER, HYDRAULICS, HYDROSTATICS, HYDRAULIC ENGINES, STEAM-ENGINE, WATER-WHEELS, etc.

Process of completely Purifying Natural Water.—Water is never found pure in nature: it always contains in solution varying quantities of foreign solids and gases. If we desire to examine its properties in the pure state, either these foreign substances, of which the particular character will be noticed further on, must be separated, or water itself must be artificially produced by chemical combination of its elements. The former method is generally used. Clear rain or spring water has added to it a small quantity of permanganate and hydroxide of potassium, is allowed to stand for twenty-four hours, and is then slowly distilled from a vessel of block tin or tinned copper, in the upper part of which are perforated diaphragms to arrest any drops of liquid carried up, the steam being condensed in a tube of tin cooled from the outside. To separate traces of ammonia the condensed water is redistilled after having added to it a minute quantity of acid sulphate of sodium, and the vapor is now condensed in a tube of platinum. Finally, to expel dissolved air, the doubly distilled product is boiled down to two-thirds of its volume in a platinum vessel and allowed to cool in the vacuum produced by an air-pump.

Physical Properties of Water in a Pure State.—As seen at common temperature, water is a readily mobile liquid, transparent and colorless when in small quantity, but in mass appearing blue by transmitted light, without smell or taste. Its density at 4° C. (in England at 60 or 62° F.) is assumed = 1, and is made the common standard of comparison for the densities of other liquids and of solids. The mass of 1 cubic decimeter of water at 4° C. and under normal pressure (760 mm.) = 1 kilog. One cubic inch of water at 62° F. and normal pressure (30 in.) = 252.286 grains. Water yields but little to compression; each additional atmosphere of pressure reduces its volume by .0000462 at about 18° C. It presents greater cohesion between its particles than any other liquid, and rises to a greater height in capillary tubes.

In the solid state water is also colorless, or in mass blue, and occurs crystallized in forms of the rhombohedral system, snow often forming six-sided stars produced by slender hexagonal prisms. If solid water (ice) at a temperature well

below its melting-point be heated, it expands like other solids, gaining in volume by about $\cdot 000077$ for 1° C., until it melts. The melting-point under normal pressure (760 mm.) is made the zero of the centigrade scale of the thermometer (32° on the Fahrenheit scale), but it is lowered by increase of pressure, at the rate of $\cdot 0075^{\circ}$ C. for each additional atmosphere; on this effect of pressure depends the regelation of ice, two pieces at the melting-point uniting when pressed together and the pressure afterward relieved, or a large mass, as a glacier, changing its form under varying pressure. Clear water when at rest may be cooled several degrees below the normal melting-point without freezing, but agitation quickly causes the formation of some ice, and the temperature goes up to 0° C. The so-called latent heat of fusion of water is greater than that of any other substance; the heat required to melt 1 part of ice at 0° to water at 0° suffices to raise the temperature of $79\cdot 25$ parts of the water by 1° . Unlike most substances, ice in melting contracts, so that 1,000 parts by volume of ice produce but 917 parts of water; hence ice floats upon water, and vessels or pipes completely filled with water are burst when the water freezes.

If water at 0° be heated, contrary to the general rule, it contracts until the temperature of 4° C. (or, more exactly, $3\cdot 982^{\circ}$) is reached, but at that point begins to expand with increase of temperature, like most liquids, so that 4° C. is spoken of as the temperature of the maximum density of water. The existence of this point of maximum density involves a number of important consequences in the economy of nature. 1,000·122 volumes of water at 0° become 1,000 at 4° and 1,000·118 at 8° . Above 4° expansion continues at an increasing rate with increase of temperature: 1,000 volumes at 4° C. become 1,000·847 at 15° , 1,001·731 at 20° , 1,004·25 at 30° , 1,007·70 at 40° , 1,011·97 at 50° , and 1,043·23 at 100° . The specific heat of water (i. e. the quantity of heat required to raise the temperature of 1 part of water by 1°) is greater than that of any other known single liquid, and increases as the temperature rises. Its value between 0° and 1° C. is taken as the unit of comparison for specific heat. The specific heat of ice is much less than that of liquid water—namely, about $\cdot 504$, and that of steam is still less, $\cdot 369$ under constant volume, or $\cdot 4805$ under constant pressure.

Water evaporates at all temperatures, even when it exists as ice or snow, and into empty space or space occupied by air or other gases. The tension of the vapor formed increases as the temperature rises: at -20° C. it is equal to $\cdot 9$ mm. of mercury in the barometer, at 0° = $4\cdot 6$ mm., at $+20^{\circ}$ = $17\cdot 4$ mm., at 50° = 92 mm., at 100° = 760 mm. (this 760 mm. representing normal pressure; under it the temperature at which water boils is counted as 100° on the centigrade scale of the thermometer), at 150° = $3,581\cdot 2$ mm., at 200° = $11,689$ mm. The boiling-point of water with freely exposed surface being taken at 100° C. (or 212° F.) under normal pressure, is lower as the pressure is reduced and higher as the pressure is increased; it is practically affected by some other circumstances, as by the nature of the surface of the vessel in which it is heated. The critical temperature for water (at which it becomes a vapor under any pressure) is 370° C., the critical pressure being 196 atmospheres. The latent heat of vaporization of water is greater than that of any other substance; the heat required to convert 1 part of liquid water at 100° into steam of 100° suffices to raise the temperature of 534 parts of water at 0° by 1° ; this amount of heat becomes greater if the water be evaporated at lower and less if at higher temperature. In changing to colorless, invisible vapor, water increases greatly in volume; 1 volume of liquid water at 100° produces under normal pressure 1,632 volumes of steam. The density of steam is nearly 9 as compared with hydrogen, or $\cdot 625$ as compared with air.

Liquid water is a bad conductor of heat and electricity as compared with such substances as the metals. Heat sufficient to raise $\cdot 154$ milligrammes of water from 0° to 1° C. passes per second through a layer of water 1 mm. thick and 1 sq. mm. area with a difference of temperature of 1° between the two surfaces. The electrical resistance of 1 mm. of water equals that of 40,000,000 km. of copper wire of same area. The index of refraction of light is for water of common temperature about 1·331. The absorption spectrum of water vapor is chiefly characterized by five groups of absorption bands in the red and yellow.

Chemical Nature of Water.—From the earliest times water seems to have been generally looked upon as one of

the simplest or most elementary substances. Only in the second half of the eighteenth century was its true nature discovered, at about the same time that clear ideas began to be formed of the existence of chemical elements in the sense in which the word is now understood—that is, of substances which can not be decomposed or separated into dissimilar constituents. In 1781 Cavendish, experimenting on the changes undergone by common air in which substances are burned, showed that “inflammable air” (*hydrogen*), which was already known and had been distinguished by him as a peculiar gas in 1766, when added to “dephlogisticated air” (*oxygen*) formed an explosive mixture, which, fired by an electric spark, left as residue a “condensed liquor,” which was pure water. (See CHEMISTRY.) In 1783 Watt, without making new experiments of his own, expressed the opinion that water is a compound of the two gases which we now call hydrogen and oxygen, and in the same and the following year Lavoisier and Meusnier prepared hydrogen from water by passing it as steam over heated iron, determined the quantity of hydrogen obtained, and the gain in weight of the iron by combining with the oxygen. The chief methods used since have been the formation of water by exploding together hydrogen and oxygen (repetition, in more refined form, of Cavendish’s experiment), the decomposition of water by an electric current (producing from it hydrogen and oxygen as gases), and the formation of water by passing hydrogen over heated oxide of copper (weighing the water formed and finding the quantity of oxygen contained in it from the loss of weight of the metallic oxide).

Water is composed pretty nearly of 1 part of hydrogen united to 8 of oxygen by weight, and will yield 2 parts of gaseous hydrogen and 1 part of gaseous oxygen by volume, but there is still some question (of no small importance to the scientific chemist) as to the precise proportions. If Prof. Morley’s last determination of the volumes of hydrogen and oxygen combining to form water—namely, 2·0002 : 1—be adopted, along with Lord Rayleigh’s last determination of the density of oxygen—namely, 15·882—the composition of water by weight will be—

Hydrogen.....	2 atoms,	2·00 or 11·186
Oxygen.....	1 atom,	15·88 or 88·814
		17·88 100·000

The molecular weight of water in the gaseous state is 17·88, but for the liquid state the value may not improbably be double this, or even a higher multiple.

Physical Relations of Water to other Substances.—Solid substances which are not visibly “wetted” by water often retain it in a mechanically adherent state, as so-called hygroscopic moisture, so that while dry to the touch they give off, on being gently heated, vapor which condenses to liquid water on cooling; this is specially noticeable in the case of porous substances, such as charcoal, seemingly dry earth, etc.

Water acts as a solvent for a remarkably large number of solid and gaseous materials, and also dissolves or mixes with very many other liquids. No substance is so useful in bringing to the liquid condition of a solution an immense variety of other materials without changing their chemical nature. In a large proportion of the most familiar liquids, such as blood, milk, wine, beer, vinegar, liquid ammonia, etc., water is really the chief substance present. The mobility of the particles of a dissolved solid and the condensation into smaller space of a dissolved gas, which loses its elasticity, not only admit of such substances being easily carried from place to place with the solvent water, as in the flow of blood through arteries and veins, but also greatly increase the readiness with which such substances enter into chemical changes between themselves or with outside materials. Aqueous vapor is by some solids taken up from the air in such quantity that a solution of the solid gradually forms, as in the case of common potash, which, when exposed to the air, runs down to a lye; such substances are said to deliquesce. See SOLUTION.

When substances dissolve in water there is generally change of volume, most commonly contraction when the substances in question are solids or liquids, expansion when they are gases. Changes of temperature are also observed in connection with solution, the physical result of dissolving a solid being lowering of temperature (most notable when the water is taken in the form of ice or snow, and itself becomes liquefied, as in the common mixture of ice and salt used to freeze ice-cream), while the solution of a gas, such as ammonia, produces rise of temperature. Fre-

quently there is evidence in the amount of heat given out or absorbed that chemical action is also going on, and it is often not easy to separate clearly its effects from those of simple solution.

The presence of foreign substances in solution in water tends to lower the temperature at which the water freezes, so that sea-water, containing chiefly common salt, may be exposed to a temperature below 0° C. without any ice forming in it. When so far cooled that ice does form, this ice, if separated and melted, yields nearly pure fresh water, though it has been recently shown that it always retains a little salt in solid form, either entangled in or perhaps united to a portion of the water. The presence of foreign solids in solution tends, on the other hand, to raise the boiling-point of water, so that the latter may be heated much above 100° C. under normal pressure without boiling. Thus a saturated solution of saltpeter may be made the means of applying a temperature above 115°.

Chemical Relations of Water to other Substances.—Water is so commonly employed to dissolve other materials, and hence as the vehicle by means of which they are brought to act upon each other, that the chemical action of the water itself, the formation of new portions of water by chemical interaction of other materials, or the disappearance of water the elements of which have formed new associations, may easily be overlooked, and in fact many of the errors of early chemistry are traceable to neglect of such facts.

Chemical Compounds formed by Water.—What are called *hydrates* are substances formed by the combination of water with some other materials, in definite proportions by weight and under conditions which suggest that the water itself retains its original chemical constitution. Thus if chlorine gas be passed into water but little above the freezing-point a solid compound of chlorine and water separates out in pale-yellow crystals; this contains 27.7 per cent. of chlorine. In like manner, at -20° C. a crystallized compound of 46 parts of alcohol and 216 of water is produced. In many cases saline solutions on being cooled become concentrated to a certain point by the freezing out of ice, and then the remaining solution (containing a definite amount of the dissolved saline substance) solidifies throughout to a crystallized mass; such masses are spoken of as *cryohydrates*. In the case of common salt, 180 parts of water and 58.5 parts of salt solidify to a cryohydrate at about -23° C.

A large number of substances commonly seen in crystals permanent at common temperatures, such as alum, copperas, Rochelle salt, etc., contain definite amounts of water, known as water of crystallization, the presence of which is essential to the crystallized form and often to other properties of the substance, such as its color. There are, however, many crystallized substances which contain no water, and in those which do contain it the amount present varies; thus calcium sulphate crystallizes with 2 molecules of water, copper sulphate with 5 molecules, common iron sulphate with 7, sodium sulphate with 10. The same substance may assume different crystal forms by combining with different, but in each case definite, amounts of water; thus sodium sulphate forms crystals containing 10 molecules of water, or 7, or none at all. "Isomorphous" salts contain the same proportion of water in the crystals. Water of crystallization is generally removed with ease by moderate heating, as in the preparation of plaster-of-Paris or stucco from gypsum; when the calcined plaster is mixed with liquid water the setting or hardening which soon afterward takes place is the result of recrystallization with the resumption of the original proportion of water. In heating crystallized salts it appears that definite fractions of the water present are retained with different degrees of tenacity. Some crystallized salts give off in fairly dry air more or less of their water of crystallization in the form of aqueous vapor, crumbling down in doing so, and are said to effloresce; common sal-soda, or crystallized sodium carbonate, used in washing, is an example of this.

Chemical Changes involving the Production of Water.—It has been already mentioned that when hydrogen gas burns in an atmosphere of oxygen or in common air, which is diluted oxygen, the product of the combustion is water. In the burning in the air of many common forms of fuel, such as wood, bituminous coal, kerosene, illuminating gas, etc., of which hydrogen is a constituent, water is formed in large quantity, though it may be overlooked in consequence of its not immediately condensing, but going up the chimney

or otherwise mingling with the atmosphere as aqueous vapor. When hydrogen is passed over any one of many heated metallic oxides, as the oxide of iron or of copper, water is formed and volatilized, while the metal is reduced to the free state. Many hydroxides of the metals are decomposed by heat, forming water and the corresponding metallic oxides; the temperature required for this decomposition varies, cupric hydroxide undergoing partial decomposition at the boiling-point of water, while slaked lime (calcium hydroxide) is resolved into water and lime only at a bright-red heat. When an acid acts upon a metallic hydroxide or oxide, water is formed and a metallic salt simultaneously produced, and in like manner alcohols, which are hydroxides of organic radicles, react with acids to produce water and "esters," or salts of these radicles. In numerous other processes affecting organic substances, such as the production of aldehyde from alcohol, aniline from nitrobenzene, etc., water is formed by the union of hydrogen and oxygen derived from the materials used. In the complex changes which occur on strongly heating organic matter in closed vessels, in so-called destructive distillation, as in making charcoal, coke, etc., water generally presents itself among the products, often in large amount. From the lungs and skin of living animals water is freely given off, most of it simply evaporated, having been taken into the body as pre-existing water, but some of it formed by the oxidation within the body of substances containing hydrogen and derived from the food consumed. In the slow decay of the bodies of both plants and animals after death large quantities of water are formed and evolved.

Chemical Changes involving the Decomposition of Water.—When metallic oxides of well-marked acid or basic character are brought into contact with water the latter often ceases to exist as such, and loses its characteristic properties, but its elements, hydrogen and oxygen, take their places as constituents of new substances, to which the names acids and bases respectively are properly given. Thus sulphur trioxide by its interaction with water forms sulphuric acid, and freshly burned lime, or calcium oxide, forms, in the ordinary slaking of lime with water, calcium hydroxide. In such actions heat is often given off to a remarkable extent; wooden buildings or ships may be set on fire and gunpowder ignited by the slaking of lime in large quantity. Chlorine decomposes water gradually at common temperature, especially in daylight, combining with the hydrogen and setting free oxygen, and this oxygen at the moment of its liberation appears to be the chief effective agent in the common processes of bleaching and disinfecting by chlorine, moisture being always present. Many of the metals, on the other hand, decompose water, uniting with the oxygen and setting free hydrogen; sodium does so at ordinary temperature, magnesium at the boiling-point of water, iron at a red heat. At a red heat carbon decomposes water, liberating most of the hydrogen, but combining with a little of it to form marsh-gas, while carbon monoxide or carbon dioxide, or both of these, are produced. On these interactions depends the manufacture of the so-called water-gas, now very largely used for heating, and, after further special treatment, for illuminating purposes. Phosphorus pentachloride reacting with water forms phosphoric and hydrochloric acids, and in like manner acetyl chloride and water yield acetic and hydrochloric acids. By distillation with superheated steam fats are resolved, taking up the elements of the water, on the one hand, into fatty acids used in the manufacture of candles, and on the other into glycerol (glycerin), useful as the source of the most energetic of modern explosives and in a number of other directions.

Chemical Decomposition of Water by Physical Means.—When heated to a sufficiently high temperature water undergoes "dissociation"—that is to say, separates into its component elements, hydrogen and oxygen; these, however, recombining if they remain mixed with each other when the temperature gradually falls. Thus fused or white-hot platinum dropped into cold water causes a few bubbles of gas to escape, which are found to consist of oxygen and hydrogen in the proportions yielded by water, or, much better, by passing steam through a tube of porous earthenware, surrounded by one of glazed porcelain, and raised to something like a white heat, an indifferent gas being made to surround both surfaces of the porous tube, hydrogen may be collected from the outer side of the latter, having when liberated passed through the porous material more rapidly than oxygen, while oxygen may be withdrawn from the interior of the porous tube.

Although water itself in the purest condition in which it can be obtained is scarcely at all decomposed by the passage through it of an electric current, if a little sulphuric acid, sodium sulphate, or any one of a number of more easily decomposable substances be added, such added material may be separated into products which by their several actions upon water set free from it its constituent elements, reproducing at the same time the added material itself, to serve over and over again in the same way, so that by this "secondary electrolysis" water is practically resolved with ease into its constituents, the oxygen making its appearance at the positive, and the hydrogen at the negative pole.

In the production of 1 part of liquid water of atmospheric temperature by burning together hydrogen and oxygen gases, heat is evolved to the extent of about 3,830 units, i. e. heat enough to raise the temperature of 3,830 similar parts of water by 1° C.

Natural Waters.—All natural waters, such as must be depended upon for the practical use of man, contain foreign substances, of kinds and in amounts varying with the circumstances under which the water has been collected or to which it has previously been exposed. Some are originally gaseous, a few liquid, and both of them occur in the state of solution; many are originally solid, and of these some are dissolved and others simply suspended in the water. Of solid matters in suspension, some are mineral in character, others are derived from the vegetable and animal kingdoms, and in the latter case may be destitute of or may present organized structure, and if organized may be dead or living. In relation to the indispensable and extensive application of water to practical purposes it is important to consider the character, as respects these foreign substances, of natural waters under the conditions which surround them as they occur in large quantity.

Water as Precipitated from the Atmosphere—Rain, Snow, Hail.—When water condenses in the atmosphere from the state of vapor to that of liquid, it dissolves, in falling through the air, the gases of which the latter consists, and such soluble solid matter as may be present in a finely divided condition and in suspension, and it mechanically washes down with it insoluble suspended particles of dust. The proportion in which these substances are found in rain-water varies greatly with local conditions; it is generally much less after long-continued rain than in rainfalls following dry weather, and less in winter than in summer. The principal gases found in rain-water are nitrogen, oxygen, and carbon dioxide (often called carbonic acid), the second, and still more the third, of these occurring in larger relative proportion than in the air,* on account of greater solubility in water. On the average they are present in rain-water to about the following extent:

Nitrogen (and argon).....	13,080	parts in a million by volume.
Oxygen.....	6,370	" " " "
Carbon dioxide.....	1,280	" " " "

Ammonia is found as carbonate, nitrate, or nitrite to the extent of from .05 to 1.55 parts—on the average about .49 part per million by weight; occasionally a good deal more than this has been observed. Nitric and nitrous acids, chiefly as ammonium salts of these acids, are often present; in England from 0 to .44 part—on the average about .07 part per million by weight—has been found; larger amounts have been occasionally recorded. In cities burning large quantities of coal very appreciable quantities of sulphurous and sulphuric acids, derived from the sulphur of the coal, are washed down by rain; thus in the rain-water of English and Scotch cities, the equivalent of from 20.5 to 70.2 parts per million of sulphuric acid has been found, much of it in the free state. In the neighborhood of the sea sodium chloride (common salt) appears in rain-water: one analysis of a sample collected at the Land's End, Cornwall, gave chlorine equivalent to 359.2 parts of salt per million. Sodium sulphate and calcium salts have also been detected. Soot is common in the rain-water of cities. Mineral dust from the soil (and in cities coal-ashes) is always accompanied by more or less organic matter, sometimes by the pollen of plants, often by microbes, including, it may be, some of disease-producing character, and their spores. The average total amount of solid impurities in rain-water is some-

* The newly discovered minor constituent of the atmosphere, argon, is more soluble in water than nitrogen, and has been found to occur in the dissolved gases of rain-water in larger proportion than in the air.

thing like 30 or 40 parts per million. As collected from the roofs of houses it is liable to include grosser impurities, derived from the decay of wooden shingles, the *excreta* of birds, cats, etc.

Surface Drainage Water.—Rain-water which runs off upon the surface of the earth, without sinking into the soil or underlying rocks, begins at once to take up such soluble matter as it comes in contact with, but naturally becomes charged with soluble matter to a less extent than if it had percolated downward to any great depth. Its character depends much upon the local nature of the rocks and soils, especially whether these are, on the whole, siliceous or calcareous, upon the land being bare or clothed with vegetation, and upon the distance which the sample taken has flowed from the seat of rainfall. In such waters the total solid matters in solution average about 50 to 80 parts in a million for siliceous and 140 to 230 for calcareous districts, with somewhat larger figures if the land be under cultivation. The chief substances present are carbonates, sulphates, and chlorides of calcium, magnesium, sodium, and potassium, with silicic acid or acid silicates, and smaller amounts of iron, manganese, and other materials. The organic matter present is chiefly of vegetable origin; it varies much in amount, and is liable to be much increased at times, as during the fall of leaves in autumn.

Spring-water.—Much of the water falling as rain sinks into the earth, and percolates through porous masses of soil, sand, gravel, and rock until it encounters some impervious stratum by which it is retained, and above which it accumulates, until it finds exit at some lower level upon the surface, and makes its appearance as a spring. Spring-water, having come more intimately into contact with the mineral material of the earth's crust, naturally contains a larger proportion of dissolved mineral solids than surface-water—about 60 to 250 parts in a million for siliceous, and 300 to 660 for calcareous regions. The amount of organic matter is generally quite small, nitrates are generally present in appreciable quantity, giving evidence of the oxidation of organic nitrogen, and dissolved oxygen is absent, or present only to very small extent.

Water of Mineral or Medicinally Useful Springs.—When either the ordinary mineral constituents of spring-water present themselves in unusually large quantity, often giving strongly marked taste, or substances not commonly present are met with, such as iodides, bromides, arsenic, sulphuretted hydrogen, etc., the term mineral spring is applied, and the waters from such springs, as well as those distinguished mainly by high temperature ("thermal" waters), are largely used in the treatment of disease. See MINERAL WATERS.

River-water.—The water of streams and rivers is a mixture of surface and spring water, and represents more and more, as smaller watercourses unite into larger ones, the average product of the leaching of the earth on and beneath its surface. The total solids present range generally from about 125 to 350 parts in a million, with some examples considerably outside these limits. The amount of mineral matter in suspension varies greatly as a river is swollen by floods or falls in the dry season of the year, and also with the distance from the mountain sources of the water. Among the gases, carbon dioxide occurs dissolved to a much larger extent than in rain-water. Along the course of rivers the water is subject to pollution by organic matter from decaying vegetation, from the excreta during life of the lower animals and man, from the decaying bodies of animals after death, and from the introduction of sewage and of factory refuse in inhabited districts. On the other hand, a certain amount of "self-purification" takes place by filtration of surface-water over herbage, by the removal of substances taken up by growing plants or by the nutrition of fish and other aquatic animals, by the dilution of polluted water with that from purer sources, by subsidence of suspended solid matters, by absorption of oxygen from the atmosphere and oxidation thereby of organic matter, and to a large extent by the action of bacteria and other extremely minute organisms.

Water of Lakes.—In the case of lakes from which there is large outflow the water generally resembles that of rivers, and water of very great purity is often obtainable from mountain lakes supplied from limited areas of uncultivated land with underlying siliceous rocks. Such lakes serve the purpose of subsidence reservoirs, and, as in the case of the Lake of Geneva, water which comes in turbid leaves the lake clear. But lakes which discharge little or no liquid water, while subject to constant evaporation, present water often highly charged with saline matter and quite unfit for drink-

ing. In such water sodium chloride is usually most abundant, but the sulphate, carbonate, and borate of sodium are also met with in some cases.

Sea-water.—Such water, condensed upon the surface of the land, as escapes evaporation on its way down to the ocean carries to the latter the suspended and dissolved materials it bears along, and forms deposits of silt and mud, while gradually accumulating in solution the soluble saline matter, part of which comes to be afterward removed, especially the calcium salts, by precipitation and by the agency of coral-building organisms. The total amount of saline matter in ocean water varies between about 33,010 and 37,370 parts in a million. Sodium chloride largely predominates, but chlorides, sulphates, and carbonates, and in smaller proportion bromides, iodides, fluorides, and borates of sodium, magnesium, calcium, and potassium are also present, and silver, as well as probably many other elements, occurs in minute traces. Phosphates occur in remarkably minute quantity. Of the gases, carbon dioxide is but sparingly present, usually in less proportion than corresponds to bicarbonates of the basic constituents. For the chemical composition of sea-water, see OCEAN (*Composition of Ocean Water*).

Well-water.—Of wells, the artificial outlets provided for obtaining underground water, three kinds require notice. Common shaft wells, dug to very moderate depths—say, 10 to 100 feet—often pass altogether through porous strata, and situated, as they commonly are, as a matter of convenience, close by human dwellings, are peculiarly liable to suffer contamination of their water by kitchen slops, leakage from urinals and sewers, and the leaching of solid garbage thrown out on the surface of the ground. No other source of drinking-water entails so much danger to health as this, and the danger is enhanced by the two facts that filtration through a considerable amount of pervious earth frequently renders such water clear, sparkling, cool, and attractive to eye and taste, though it may, in fact, be seriously polluted by disease-germs, and that such water may in reality be wholesome and be used for years without any harm resulting, while the occurrence of a single case of typhoid fever in the adjoining dwelling may all at once render it in the highest degree dangerous by the introduction of disease-producing organisms without any warning change in the apparent character of the water. "Driven" wells, established by forcing down a moderate length of iron pipe, perforated at the lower end, and penetrating by a sharp, conical steel point, involve the same danger of surface pollution of the water unless an impervious stratum be passed through to tap a porous bed beneath; in this case the risk is somewhat lessened. So-called artesian wells, bored to great depths—often many hundred, and in some cases several thousand feet—frequently yield good, wholesome water, though sometimes too highly charged with saline materials to be fit for drinking. They are far less exposed to the danger of surface pollution than ordinary shafts or dug wells. The temperature of the water is sometimes quite high, rendering it unfit for immediate drinking, but valuable for washing purposes. See ARTESIAN WELLS.

Relations of Water to Use by Man.—These require to be carefully considered, particularly when the complex conditions present themselves under which the densely crowded populations of large cities live and have to be supplied. In these cases quantity as well as quality of the supply must be taken into account, and the cost of resorting to particular sources for the water needed can not be overlooked. The practical question generally presents itself in this form: From what source or sources can water of the best available quality be obtained in sufficient quantity for the present needs of the population to be supplied, and with reasonable allowance for increased demand in the reasonably near future, at the least cost, and, at any rate, within the limitation of maximum cost feasible?

Quantity of Water-supply.—Rain-water collected from clean roofs and stored in proper tanks or cisterns, water from a number of driven or deep-bored wells, may occasionally be obtainable in sufficient quantity, but for an adequate supply recourse must in general be had to rivers, mountain-lakes, or the water of numerous springs and small streams collected in a reservoir of sufficient storage capacity. In the case of rivers the average flow, and in that of lakes the out-flow, must be carefully gauged at various seasons, representing the average of differing years. In the case of a tract of springs and streams, the area of "catchment" must be measured, and the average annual amount of rainfall ascertained, with allowance for evaporation. The loss by evapora-

tion depends much upon whether rain is light and frequent, or heavy and concentrated at particular seasons; also upon the character of the surface—whether bare, or clothed with vegetation—upon the degree of porosity of the surface material, upon the general slopes of the surface and of the stream-beds being abrupt or gradual, and upon the rainfall occurring chiefly in the colder or warmer seasons of the year. In the selection of a catchment area an eye should be had to suitable sites for the construction of dams, to form storage-reservoirs from which water may be as far as possible drawn off by gravity, avoiding the expense of pumping machinery. In estimating the storage capacity of such reservoirs, aside from the advantage of having them large with a view to allowing satisfactory clearance of the water to take place by subsidence, provision should be made for holding a sufficient body of water to tide over the longest drought that can reasonably be expected; such drought in temperate climates may perhaps be estimated as extending to not less than 70 nor more than 300 days. For the amount of water consumed in cities, etc., see WATER-WORKS.

Quality of Water-supply.—The most important aspect in which the quality of water for human use has to be considered is, of course, its wholesomeness as a beverage. In general, it may be said that good drinking-water should be cool and clear—i. e. free from visible suspended particles—without any disagreeable smell or taste, and not capable of acquiring such by standing for a day or two in a clean and well-closed vessel; should contain enough of the gases derived from the atmosphere to give a slight fresh taste distinguishable from the "flatness" of recently distilled or boiled water, and should not contain solid matter in solution to the extent of more than about 300 parts in a million. In the mineral portion of this solid matter no distinctly injurious substance should occur, such as a compound of any one of the poisonous metals. As little as possible of the solid contents should consist of organic matter—usually not to exceed 15 or 20 parts in a million—and it is particularly desirable that decomposing nitrogenous organic matter (usually, though not necessarily, of animal origin), or the substances derived from it which give evidence of its having been present, shall be found, if at all, only in mere traces. Above all, good drinking-water should be free from disease-producing bacteria or other injurious micro-organisms. It is generally considered desirable that drinking-water shall not be "hard"—i. e. shall not contain sodium and magnesium salts in considerable quantity; but the evidence that hard water is necessarily unwholesome does not seem to be conclusive. All these statements must, however, be taken with various limitations, and not too rigidly. Thus some good waters contain notably more solid matter in solution than has been mentioned, and some peaty mountain waters contain much more organic matter, but of non-nitrogenous vegetable character. Many organisms are revealed by the microscope in perfectly unobjectionable water which look alarming, but represent merely harmless rhizopods, crustaceans, etc. Occasionally in water-reservoirs large accumulations form of *confervia*; minute sponges, etc., which, dying and decomposing, produce for a time disagreeable taste and smell without seriously affecting the health of those using the water. Even the far more minute bacterial and other organisms which play so important a part in fermentation and putrefactive decay, and among which are to be found the unquestionable carriers or causes of formidable disease, are by no means all of this dangerous character, the majority being harmless.

Water to be used for cooking, especially for cooking leguminous vegetables, as a general rule, should not be decidedly hard, but the presence of a moderate amount of calcium carbonate—say 70 or 75 parts in a million—is said to be advantageous in making tea or coffee, as reducing the proportion of tannin dissolved, and so rendering the beverage less astringent.

For domestic washing purposes the greatest importance attaches to the softness of the water, since the calcium and magnesium salts of hard water "curdle" or precipitate in insoluble form the fatty acids of soap, greatly increasing the necessary consumption of the latter, and producing a disagreeable sticky deposit on the surface of the skin or of clothing. From this point of view a distinction must be drawn between the states of combination in which calcium and magnesium occur in natural waters. A part, sometimes the principal part, consists of the carbonate, which is itself practically insoluble in water, but is dissolved in considerable quantity in the presence of carbonic acid (carbon

dioxide gas in solution), forming what is sometimes called the bicarbonate. The hardness due to this cause is removed by continued boiling, the solvent carbon dioxide gas being driven off and the calcium or magnesium carbonate precipitated—hence the term “temporary hardness” is applied to that due to the carbonates. But calcium and magnesium also occur as sulphate and chloride, and these salts being of themselves soluble in water, are not precipitated by boiling, and the hardness due to their presence is spoken of as “permanent hardness.” Water to be used in washing without being heated requires the “total hardness” to be considered, while for that used hot and having been boiled the “permanent hardness” alone requires attention.

For producing steam in the boilers of steam-engines or of heating apparatus the absence as far as possible of calcium and magnesium salts is extremely desirable. During the boiling of the water carbon dioxide is expelled and the carbonates are thrown down, and as the water is removed by evaporation calcium sulphate also deposits in solid form, both these changes giving rise to incrustations or “scale” on the inner surface of the boiler, objectionable in more than one way. The deposited solid material conducts heat badly, and hence serious waste of fuel is caused, the outside of the boiler becomes overheated, the metal is burned away, and the boiler becomes weakened, while it is probable that at least some dangerous boiler explosions are caused by the scale cracking and permitting sudden access of water to the overheated metal. Most boiler deposits from fresh water consist mainly of calcium (and magnesium) carbonate, those from sea-water mainly of calcium sulphate, those from brackish water—as in the case of steamships supplying their boilers at the mouths of rivers—of a mixture of both. The incrustation of marine boilers is now much diminished by condensing and using over again a large part of the water. Calcium and magnesium chlorides, if present in large quantity, tend to produce corrosion of the iron of the inner surface of a boiler, and this corrosion is particularly noticeable in the case of waters containing dissolved oxygen and carbon dioxide in large proportion.

For many special industrial purposes the character of the water used is highly important. Thus, for brewing, freedom from decomposing organic matter is always essential and soft water is generally desirable, but it is said that certain kinds of pale ale require the use of water containing not less than 300 or 400 parts of calcium sulphate per million. For bleaching and dyeing it is important that the water used shall be quite free from iron and manganese, shall not be acid, and in most cases shall not be hard, but in dyeing with certain colors the presence of a small amount of lime is desirable. For tanning, freedom from decomposable organic matter, softness, and the absence of an excess of chlorides are the chief requisites. For sugar-refining the occurrence of alkaline salts, especially nitrates, in unusual amount is objectionable. For paper-making water should be soft, and especially free from iron even in minute quantity.

For many purposes the quality of water is practically unimportant, as, for instance, for washing off vehicles, the fronts of houses, and the surfaces of sidewalks and streets in cities, for watering roads to keep down dust, for extinguishing fires, and the like. Owing to the great and ever-increasing difficulty of securing for large cities a sufficient supply of water of good quality, it has been suggested, and to a very limited extent the suggestion has been acted upon, that two separate supplies be provided—the one of water as pure as possible, to be used only for those purposes for which purity is important, the other of water of inferior character for all other purposes only. Such an arrangement carries with it some very great advantages, but is not free from practical difficulty. The expense of duplicate systems of distributing pipes and the risk of mistakes being made by careless people as between the two supplies have to be considered.

Examination and Inspection of Water for Human Use, especially from a Sanitary Point of View.—In judging of the quality of water chemical examination is chiefly resorted to, but this is beginning to be supplemented by biological study, and sanitary inspection of the sources of possible contamination of a water-supply is also highly important. The greatest care should of course be taken in collecting, preserving, and transporting samples of water to be examined so that the results of examination may really represent the water in its original condition. Only perfectly clean glass bottles with glass stoppers should be used to contain such samples.

Chemical Examination of Natural Waters.—This chiefly involves attention to the following points, to which space permits only brief reference. For numerous details and precautions requiring to be observed, special treatises on this branch of analytical chemistry must be consulted. The condition of the water as to clearness or turbidity is noted, and if deemed necessary suspended solid matter is filtered off and its quantity determined by weighing. The color of the water is noted as seen in a tube of 2 feet in length. A nearly pure greenish-blue color is presented by the purest water, while those of less purity are often distinctly yellowish green, yellow, or brown. Any smell or taste is observed, and also acid or alkaline reaction to test-paper, repeating the last-named observation with a portion of the water which has been boiled to expel carbon dioxide. The total amount of solid substances in solution is found by evaporating gradually to dryness a certain quantity of the water and weighing the residue after it has been dried at about 100° or 110° C. The dissolved gases can be expelled by prolonged boiling in a specially constructed apparatus avoiding mixture with air, their total volume measured, the carbon dioxide removed by caustic potash, the oxygen by the further addition of pyrogallol, and the volume of each of these ascertained by measuring the residue. The unabsorbed portion is usually nitrogen. The “total hardness” is determined by adding to a known quantity of the water in a stoppered bottle a dilute solution of soap of known strength, the addition being gradually made in small portions from a measuring vessel, and the bottle shaken after each addition. As long as the water still contains calcium and magnesium salts the soap added is curdled or precipitated, and the froth formed on shaking speedily disappears; but as soon as the calcium and magnesium salts have been all removed from solution and a small excess of soap has been added the froth becomes more permanent. When it remains visible for, say, five minutes, the quantity of soap solution which has been used is noted, and becomes the measure of the hardness of the water. This is often expressed in “degrees” of hardness, each degree being understood to mean the presence of calcium and magnesium salts equivalent in soap-curdling effect to 1 grain of calcium carbonate in each imperial gallon of water. A second experiment made in the same way upon a sample of water which has been thoroughly boiled gives the “permanent hardness,” and the latter subtracted from the former result gives the “temporary hardness.” Salts of the poisonous metals may be sought for by the appropriate tests for each, using large quantities of water, since such impurities, most of them likely to occur only under special conditions, such as those of mining districts, the neighborhood of special factories, etc., are usually met with in extremely minute amount only. Such metals most claiming attention are lead, zinc, copper, arsenic, barium, and chromium. In examining water for technical purposes, iron, which is not poisonous, may need to be looked for; its quantity may be determined by the colorimetric use of potassium ferrocyanide.

By far the most important question is that of the amount and nature of the organic matter present. It must be remembered that the term organic matter is a vague one, that under it are included endlessly numerous substances, consisting essentially of the same elements—carbon, hydrogen, oxygen, and nitrogen—united in different proportions, that for very many of these substances no distinctive tests are available, and that many of them are absolutely harmless when swallowed, while others are in a very high degree injurious to health; furthermore, that chemistry affords us no means of distinguishing unorganized, dead, and biologically inert organic matter from that which constitutes the material of organized and living structures, capable of indefinite self-multiplication when surrounded by suitable conditions. Modern investigation has shown the immense importance attaching to the minuter forms of living organisms in connection with fermentation and putrefaction, and with the propagation of disease. Chemical examination of water in regard to organic matter can never enable us to decide absolutely as to a given water being wholesome or unwholesome, but it may render valuable service by indicating whether such water is to be regarded as suspicious, and if so in what degree, suggesting caution in its use, and a search for possible sources of contamination, as also by drawing attention to changes of a suspicious character occurring in water which has formerly been used with safety. By evaporating to dryness a known quantity of water, at a gentle heat and with special precautions to exclude dust,

decomposed mineral carbonates, etc., and burning the residue completely in a small glass tube with cupric oxide, the carbon may be determined as carbon dioxide and the nitrogen as elementary nitrogen gas, and from the quantities of carbon and nitrogen, and the proportion borne by the former to the latter, an approximate idea may be formed of the amount of organic matter from which these elements have been derived, as also of its general character, since animal material is generally, though not always necessarily, more highly nitrogenous than that of vegetable origin, and on the whole more is to be feared from animal than from vegetable contamination. Other processes look to an estimation of the carbon or nitrogen separately. Thus by treating the water under examination, either at common temperature or boiling hot, with an acidified solution of permanganate of potassium of known strength, the latter loses its deep-purple color as long as it gives off oxygen to oxidize the organic matter present, and hence a determination of the quantity of the permanganate thus decolorized becomes a measure of the quantity of oxygen it has furnished, and this indirectly, though only by rough approximation, indicates the presence of more or less organic matter oxidized—the indication bearing much more on the carbon than on the nitrogen. Distillation of water to which a little sodium carbonate has been added drives off any ammonia present, this ammonia having usually been, in part at least, derived from the nitrogen of decaying organic matter; its quantity, even when very minute, can be easily determined by the application of the Nessler test solution. If water which has already been thus treated have added to it a strong solution of potassium permanganate, and the distillation be continued, a further portion of ammonia is obtained, to be determined as before; this second portion may be assumed to come from the more or less extensive decomposition in the retort of nitrogenous organic matter still in the water, and as substances allied to albumen form a very large proportion of such matter in the bodies of plants and much more in those of animals, the name albuminoid ammonia is often given to that obtained in the process under notice, that obtained in the first distillation being referred to as "free ammonia"; the predominance of free ammonia indicating a more, that of albuminoid ammonia a less, advanced stage of decay of nitrogenous organic matter. In the decay of such matter under special conditions, including the presence of a special ferment organism—a *micrococcus*—nitrates and nitrites are often produced, and a very high degree of importance deserves to be attached to the presence of these salts in unusual quantity, though a small amount of nitrates may be found in the best waters, being partly of atmospheric origin. Nitrites may be determined colorimetrically by the use of solutions of sulphanilic acid and a salt of naphthylamine; nitrates and nitrites together by applying the same solutions after conversion of nitrates into nitrites by reduction with zinc dust; or the nitrogen of both classes of salts may be evolved as nitrogen dioxide by shaking up with strong sulphuric acid over mercury and the evolved gas measured. More weight should generally be given to the presence of an unusual amount of nitrites than of nitrates, the former being in general more significant of decay still going on; ordinarily the formation of nitrites seems to precede that of nitrates, though under certain conditions the latter may revert to the former. Nitrites are specially significant in the water of shallow wells and of rivers; but little importance attaches to them in the case of natural springs and deep-bored wells when not exposed to surface pollution. The greater abundance of chlorides in most animal than in most vegetable material makes the quantitative determination of chlorine in water an indication of considerable value; it is easily effected by means of a solution of silver nitrate of known strength, which precipitates insoluble silver chloride. The pollution of shallow wells by the drainage into them of urine may often thus be detected, as urine contains chloride of sodium in very notable amount. It is to be remarked that such substances as ammonia, nitrates, nitrites, and chlorides are in themselves entirely harmless, certainly in any such quantities as ever present themselves in drinking-water, and therefore that their determination in water analysis is only important as indirectly throwing light upon the question of present or past contamination of the water by decaying organic matter. It is also to be noticed that sometimes the presence of these substances may be accounted for in other and unobjectionable ways; thus chlorides are to be looked for in unusual quantity in the neighborhood of the ocean, or may find their way into wells from the throwing out of spent freezing mixtures

of ice and salt used in making ice-cream; ammonia might be accounted for by the neighborhood of gas-works, or nitrates by that of a gunpowder-mill, etc.

Biological Examination of Natural Waters.—Much labor has already been expended, with the aid of the microscope and of the refined "culture methods" of modern biologists, upon the study of the relations to potable water of the swarming hordes of microbes or minute living organisms which are always more or less present in it. Great difficulties, however, are encountered, and much yet remains to be done. The determination of the number of microbes in a given small volume of the water examined—often extending to tens or hundreds of thousands in a single cubic centimeter—requires the immediate study of a sample after its collection, owing to the enormous rapidity with which these organisms multiply, and the value of the result is greatly diminished by the fact that the larger proportion of species of such organisms are harmless, and their presence without sanitary significance. These determinations are valuable, however, as means of testing the efficiency of different methods for the purification of water. In a few cases particular diseases have, with more or less probability, been traced to particular pathogenic organisms in drinking-water, or the chemical products which they form, and in such cases, as of epidemic cholera or typhoid fever, a bacteriological search for the specific cause of the mischief acquires, of course, very great interest. Experiments have also been made with a view to ascertain the greater or less fitness of a particular water to sustain or to cause the disappearance of particular microbial organisms intentionally introduced by the experimenter.

Sanitary Inspection of Sources of Water-supply.—Apart from or side by side with laboratory examination, and guided in part by the indications its results afford, there should always be made a careful inspection of the sources of a water-supply, and of the channels by which it reaches the consumers, taking note of all dangerous contamination, actual or possible. The necessity for this becomes greater as population is more dense and the conditions of life more complicated. Particular attention should be given to any drainage reaching the water from kitchen-sinks, garbage and manure piles, stables and cow-pens, privies and water-closets (above all, during epidemics of disease affecting the digestive organs), leaky sewers, or sewers discharging into streams, heavily manured land in cultivation, cemeteries, slaughter-houses, tanneries, flax and hemp steeping-grounds, and factories producing large quantities of easily decomposable organic refuse, such as paper-mills (especially those working up wood-pulp), starch and glue factories, etc. In such an inspection questions of difference of level have to be considered, as bearing upon the direction taken by drainage; thus the top of a well may lie so high as to be safe from contamination from a given source, and yet the bottom of the shaft may be dangerously polluted from such source by underground filtration. In tracing possible underground channels of communication use has been advantageously made of soluble substances thrown into water at one point and admitting of easy detection at another. Thus a very small quantity of the substance known as uranine will communicate to a large body of water its peculiar fluorescent green color, which will be easily recognized if the water emerge elsewhere. Lithium chloride, readily detectable by the spectroscope, has also been proposed for this purpose. In the celebrated case of the Lausen (Switzerland) epidemic of typhoid fever in 1872, the use of a large quantity of common salt established the fact of a subterranean channel connecting two points about a mile apart and lying on opposite sides of a mountain.

Artificial Purification of Water for Human Use.—The purification of water by distillation as practiced in chemical laboratories is too tedious and expensive to be generally available on a large scale, but is occasionally resorted to under special conditions. Thus on board seagoing steamships fresh water is obtained by condensing the steam from the boilers, and a portion of it, rendered palatable by aëration, is supplied for drinking and washing purposes to the crew and passengers. Artificial ice-factories use distilled water to be frozen; it is often employed for the preparation of "soda-water" and other effervescent beverages, and in some cities distilled and aërated water is sold in limited quantities to those who are specially cautious as to the purity of the water they drink. Partial purification is brought about by freezing, so that the ice formed in Arctic regions from sea-water when melted yields water practically fresh and fit

to drink. But in water polluted by decaying organic matter the purification is not sufficiently complete for safety, and microbes retain their vitality after exposure to temperatures much below the freezing-point. The most important methods in use upon a large scale aim chiefly at clarifying the water from suspended solid particles—mineral silt, finely divided organic matter, and living organisms—either by subsidence, filtration, or precipitation; at “softening” the water by removal of calcium and magnesium salts; at destruction of organic matter by oxidation; or at “sterilizing” the water by destroying the vitality of living bacterial or other organisms. These results may be attained separately or, to some extent, together.

Purification by Subsidence.—This has already been referred to in connection with the natural clearing of river-water in the larger and more slowly moving portions of large rivers, and in the expanded basins of fresh-water lakes, as also in the larger storage-reservoirs provided by engineering work for the water-supply of cities. Such reservoirs are necessary adjuncts of the arrangements for precipitation, to be mentioned presently.

Purification by Filtration.—The porous materials used for the construction of filters vary, partly with the scale on which they are to be applied and partly with the special conditions of application. For small domestic filters fine siliceous sand, porous sandstone of natural or artificial origin, asbestos, siliceous infusorial earth, vegetable or animal charcoal, and spongy iron are among the most extensively adopted substances. Sponge, paper, and other organic materials are to be deprecated as furnishing the basis for decay in the filter itself. The most effectual clarification is brought about by the use of the Chamberland-Pasteur filters of unglazed porcelain or other fine earthenware; these at first entirely remove even bacteria, but their action is slow, and soon becomes much slower, and after a time bacterial organisms make their way, seemingly by *growth*, through the fine pores, though the filter can be re-sterilized by heat. Domestic filters are variously constructed; in some the water, in moderate quantity, passes through merely by its own weight; in others pressure, as, for example, the “head” of water in a system of city pipes, is used to force it through. It should never be forgotten that all filters require careful, periodical cleaning, often aided by a reversal of the current of water through them, and that the filtering material must after a time be renewed. If these precautions be neglected, filtration may become a source of increase rather than diminution of pollution.

On the larger scale sand is the material chiefly used, natural sand-beds being sometimes utilized. Brick tanks are constructed, often of an acre or more in area and several feet in depth. Broken stone is placed at the bottom of these, over drains for drawing off the water, and upon this layers of coarse gravel, fine gravel, and, on top, 3 or 4 feet of fine siliceous sand. The water is allowed to stand to the depth of 1 to 4 feet over the sand. The rate of filtration should be slow, generally not more than $2\frac{1}{2}$ or 3 gal. an hour for each square foot of area. The efficiency of these filters, especially in the removal of microbes, is at first much increased by the formation of a slimy deposit on the upper surface of the sand, but later on the filter becomes so clogged that the rate of filtration is too slow for practical purposes. Hence periodical cleaning becomes necessary. The foul upper part of the sand is removed, water is introduced from below to effect an upward washing of the lower layers, and when the sand layer becomes too thin fresh sand is supplied on top. Spongy metallic iron has been used in some filters, but soon becomes clogged by oxidation, and is with difficulty kept in efficient condition. In cold weather large filtering-tanks may give trouble from freezing; under such circumstances covered tanks or more rapid filtration under increased pressure may be resorted to.

Purification by Precipitation.—Various saline substances, when added to turbid water, cause a more rapid deposition in the form of sediment of whatever suspended particles may be present. Even the common salt in sea-water acts in this way. Alum is thus employed, being added generally at the rate of from 2 to 5 grains, sometimes not more than half a grain, to the gallon. As the aluminium hydroxide, thrown down by carbonates in the water, has much to do with rapid sedimentation, it appears still better to add simultaneously alum and sodium aluminate. It is extremely desirable that no more be used than is absolutely necessary, so that no aluminium compounds remain in the clarified water. Iron chloride (ferric chloride) in very small quantity may be ap-

plied to the same purpose. The Anderson process has been successfully employed at Antwerp; it consists in passing the water slowly through revolving cylinders partly filled with iron borings. Ferrous carbonate in small quantity is formed and dissolved, and this by subsequent exposure to the oxygen of the air forms ferric hydroxide, which deposits in a flocculent state, carrying down with it the suspended matter of the water and materially reducing the amount of organic matter and of microbes. The application of any precipitating material requires, of course, to be followed by subsidence or filtration for the removal of the sediment formed.

Purification by Removal of Calcium and Magnesium Salts.—In 1841 it was first proposed by Dr. Thomas Clark, of Aberdeen, to get rid of the “temporary hardness” of water, due to calcium and magnesium carbonates held in solution by carbonic acid, by adding lime-water or milk of lime in quantity just sufficient to combine with the carbonic acid to form calcium carbonate; this, being insoluble in water, precipitates, and at the same time the original calcium and magnesium carbonates of the water treated, deprived of the solvent carbonic acid, precipitate also, the united precipitate being afterward removed by subsidence or filtration. The softening of hard water by this process is particularly valuable when it is afterward to be employed for certain industrial purposes. If to the lime-water there be added a carefully regulated quantity of sodium hydroxide, or if sodium carbonate and hydroxide be used together, “permanent” as well as “temporary” hardness may be removed. This may be made valuable in the purification of water to be used for raising steam, to avoid boiler incrustation. For the same purpose barium chloride is sometimes applied to the precipitation of calcium and magnesium sulphates when these salts are present in the water. For preventing steam-boiler incrustation a multitude of substances have been tried and are more or less used, which aim not at preventing the deposition of calcium and magnesium salts in the boiler, but at causing the deposit to form as a loose powder, easily removable, instead of producing a hard and adherent scale. Among such substances may be mentioned trisodium phosphate, paraffin oil, molasses, catechu, logwood sawdust, and tanbark. Many of those offered for sale are of very doubtful efficacy, and may even be considered positively mischievous.

Purification by Oxidation of Organic Matter.—Among solid oxidizing agents the most available for the removal of organic matter from water are the manganates and permanganates. Sodium manganate is now manufactured at a very moderate price for the disinfection of city sewage, and pure crystallized potassium permanganate may be employed under special circumstances, as in the exploration of specially unhealthy tropical countries, to diminish the risk of drinking-water contaminated by organic matter. The quantity required is small, and the right amount may be recognized by the pink color of the salt in solution ceasing to disappear when a minute excess has been added. The mixture used by the British troops in the Ashantee campaign of 1873-74 consisted of 1 part of calcium permanganate, 10 parts of aluminium sulphate, and 30 parts of fine clay, the last two being added to promote sedimentation.

The attempt has been made at several places, and with considerable success, to imitate artificially the natural action on organic matter of atmospheric oxygen in the so-called self-purification of rivers. Either air is sent through pipes in the storage-reservoirs, with numerous minute apertures for the gradual escape through the water of air in bubbles, or air is pumped into the distributing-pipes, becoming in them intimately mixed with the water under pressure greater than that of the atmosphere, so that when the water is drawn off for use it often appears for a short time milky, in consequence of effervescent escape of the surplus air in a very finely divided condition. Excellent results are reported as obtained with sewage, or water largely polluted by organic matter, by rapid filtration through gravel and sand, aided by the passage of a current of air.

Purification by Boiling, to Destroy Vitality of Microbes.—Great practical value attaches to the simple process of heating water intended for drinking, so as to bring it to active ebullition for a quarter of an hour or twenty minutes, allowing it to cool, and removing the “flatness” of taste by aëration, which may be brought about by passage through a porous filter (not to be also used for unboiled water). All, or all but the merest traces, of living organisms are destroyed by the boiling, and water originally suspicious or dangerous may be safely used for drinking. Of course, exposure to

microbe-laden air or dust might lead to the boiled water becoming again contaminated, so that it should not be kept too long on hand, and should be preserved in closed vessels. The method is chiefly applicable in a domestic way to small quantities of water, but arrangements have been devised by which larger quantities may be treated for the supply of barracks, hospitals, etc. It has been suggested that the dense population of China, living under conditions in many respects highly insanitary, may very probably owe its exemption from much disease that might be expected to prevail, to the general use of boiled water in the form of weak tea.

Influence upon Water of the Materials used for its Storage and Conveyance.—Some considerations in regard to the materials of tanks, cisterns, and pipes used for storing and distributing water, and their effects upon the character of the water, may suitably close this article. Masonry cisterns should be built with the best hydraulic cement, so as not to give up any considerable quantity of lime to the water. Wooden cisterns and casks used for the storage of water are with advantage charred on the inside to the depth of something like a quarter of an inch. Boiler-plate iron serves well for the construction of water-tanks, as for use on board ships, and cast iron is the chief material used for the main lines of distributing-pipes, while smaller wrought-iron pipes are in part employed in the interior of buildings. The passage of water charged with atmospheric oxygen and carbonic acid through iron pipes is apt to lead to solution of enough of the metal, as ferrous carbonate, to cause tea made with the water to be blackened, clothes washed with it to be stained yellow, and sometimes a perceptible chalybeate taste to be produced. Dipping the pipes, previously heated to black redness, into well-boiled coal-tar tends greatly to protect them, and the black, asphalt-like coating formed does not give a bituminous taste if the process is properly carried out.

An extremely convenient material, but one which more frequently than any other has been found to affect the wholesomeness of water, is lead, often used as sheet-lead to line wooden tanks, and still more commonly as lead pipe in distributing water in houses. Waters differ greatly as to the extent of their action upon lead, and the conditions of action have not been defined with entire clearness. In general, very soft water containing much dissolved oxygen, that containing organic acids or peaty matter, and that which is brought intermittently into contact with the metal, attacks it most; hard water, especially that containing sulphates in large proportion, is much less active. The continued use for drinking of water which has taken up lead into solution, to the extent of but $\frac{1}{100}$ th or even as little as $\frac{1}{1000}$ th of a grain to the gallon, may give rise to the exceedingly serious symptoms of chronic lead-poisoning. It has been found advantageous to add to water found to attack lead notably a very small quantity of calcium or sodium carbonate, and it has been proposed to protect in some degree the surface of the metal by running through the pipes, when new, a strong solution of sodium sulphide, thus forming a film of insoluble lead sulphide, which may afterward change by oxidation to the likewise insoluble lead sulphate. Water which has stood for some time in the service-pipes is naturally most dangerous; hence when lead pipes are used at all for the conveyance of drinking-water, care should always be taken to allow the water to run to waste for a time on opening a stopcock before collecting the portion to be used. Block-tin pipes are quite harmless and by far the best substitute for those of lead, but are expensive. An ingenious process has been invented for making lead pipe lined with tin, but it is not easy in making connections to insure the protection of the whole surface of the interior by tin. Zinc is also attacked and dissolved by many natural waters, especially when they come in contact with iron superficially coated with zinc (so-called "galvanized iron"). Copper, either alone or as brass (an alloy of copper and zinc), is acted upon, though in general slowly, the action being much promoted by the presence also of air. Soluble compounds of both zinc and copper must be counted among the deleterious impurities of drinking-water.

Various other materials—such as stoneware, glass, glass-lined iron, "enameled" iron, gutta-percha, and paper soaked with asphalt—have been, to a limited extent and under special conditions, used for the storage or conveyance of water, but can not be considered generally available for such use.

AUTHORITIES.—Among the works which may be consulted with advantage in reference to some of the aspects in which

water has been considered in this article are the following: Tyndall, *The Forms of Water* (London, 1872); Dove, *Der Kreislauf des Wassers auf der Oberfläche der Erde* (Berlin, 1873); Dittmar, *Report on the Composition of Ocean Water* (1884, reports II, M. S. Challenger expedition); Reports of English Rivers Pollution Commission (London); especially the Sixth Report; Report of Royal Commission on Water Supply (London, 1869); Reports of State Board of Health of Massachusetts on Water Supplies (1887-90); Nichols, *Water Supply considered mainly from a Chemical and Sanitary Standpoint* (3d ed.); Bolton and Frankland, *Collection, Storage, Purification, and Examination of Water* (Chatham lectures, London, 1886); Fischer, *Das Wasser, seine Verwendung, Reinigung u. Beurtheilung* (2d ed. Brunswick, 1891); Guichard, *L'Eau dans l'Industrie* (Paris, 1894); Guinochet, *Les Eaux d'alimentation; épuration, filtration, stérilisation* (Paris, 1894); Frankland, *Water Analysis for Sanitary Purposes* (London, 1890); Wanklyn, *Water Analysis* (5th ed. London, 1879); Mallet, *Report on Chemical Methods for the Determination of Organic Matter in Potable Water* (Annual Report of U. S. National Board of Health, Washington, 1882); Leffmann and Beam, *Examination of Water for Sanitary and Technical Purposes* (2d ed. Philadelphia, 1891); Miquel, *Manuel d'Analyse bactériologique des Eaux* (Paris, 1891); Frankland and Ward, *First Report to the Water Research Committee of the Royal Society on the Present State of our Knowledge concerning the Bacteriology of Water* (London, 1892); Panning, *Practical Treatise on Water Supply Engineering* (New York); and Thorpe, *Dictionary of Applied Chemistry* (London, vol. iii., article Water). J. W. MALLET.

Water-bear: See TARDIGRADA.

Water-beetle: any representative of two families of beetles which live in fresh water—the DYTISIDÆ (*q. v.*) and Gyrinidæ. These two families, although distinct, agree in these respects: the beetles belonging to them have the body oval and depressed, the first ventral segments visible only at the sides, the legs of the second and third pairs flattened and fitted for swimming.

The Gyrinidæ are beetles "of an oval form, somewhat attenuated at their end, usually of a brilliant bluish-black color above, with the punctures reflecting a golden tint"; the prothorax has the prosternum short and carinated, and the episterna and epimera are distinct; the abdomen has seven segments; the eyes are completely divided by the margin of the head; the antennæ are inserted under the sides of the front, behind the base of the mandibles, and are short and thick, the "anterior legs very long, and received in oblique grooves of the pro- and mesosternal segments; tibiae slender, with one terminal spur"; the middle and posterior legs are short, broad, and much compressed. The beetles of this family associate in groups, and are more generally known by their peculiar habits. In the proper season and place they abound, and move rapidly in whirl-like motion on the surface of the water, and, if disturbed, suddenly dive to the bottom. This habit of gyrating has obtained for them the name of whirligigs. See Leconte's *Classification of the Coleoptera of North America*. E. A. BIRGE.

Water-boatmen: hemipterous insects of the family Notonectidæ. These have a boat-like supinate form, the rostrum is free, the antennæ concealed beneath the eyes and four-jointed, and the posterior pair of legs have the coxæ very slightly movable in a longitudinal direction and longitudinally grooved, and the other joints are elongated and provided with a ciliated fringe, which enables them to swim rapidly through the water. Representatives of the family occur very generally in pools, etc. They are good divers, and also fly readily. They often collect around electric lights in such numbers as to be called electric-light bugs. Their eggs are laid in spring, and are attached mostly to the stems and leaves of aquatic plants. The young are comparatively broad and flattened. Revised by E. A. BIRGE.

Waterboro: town (incorporated in 1787, settled in 1789); York co., Me.; on the Portland and Rochester Railroad; 4 miles N. of Alfred, 28 miles S. W. of Portland (for location, see map of Maine, ref. 11-A). It contains the villages of Waterboro, Waterboro Center, North Waterboro, East Waterboro, South Waterboro, and Ossipee Mills, 2 churches, 3 hotels, manufactories of lumber, and an apiary for breeding Italian bees and queens. Pop. (1880) 1,482; (1890) 1,357.

Waterbury: city; New Haven co., Conn.; on the Naugatuck river, and the N. Y., N. H. and Hart., and the N. Y.

and New Eng. railways; 21 miles N. by W. of New Haven, 33 miles S. W. of Hartford (for location, see map of Connecticut, ref. 10-F). It owes its origin as a manufacturing center to the Naugatuck river and several smaller streams that unite here, but these now provide a very small fraction of the power required by its manufactories. The business of making metal buttons was begun here nearly 100 years ago, and for a long time the making of brass and German silver and of articles made therefrom was, in the U. S., confined to this city. The census of 1890 showed that 219 manufacturing establishments reported. These had an aggregate capital of \$17,692,921, employed 10,354 persons, to whom \$5,608,654 was paid in wages, used materials that cost \$8,715,921, and had an output valued at \$17,712,829. Of the total capital, about \$10,000,000 was invested directly in the manufacture of brass and German silver, and of goods made therefrom. Waterbury is called the Brass City, and its buttons, plated ware, clocks, and watches are known all over the world.

The city has two reservoir water-supply systems, which have cost nearly \$1,000,000, by one of which water is brought from the hills in the southeast part of Litchfield County, 11 miles distant; also electric lights, electric street-railway, public park, board of trade, 4 national banks with combined capital of \$1,000,000, 3 savings-banks, a private bank, and 3 daily and 6 weekly newspapers. There are 23 churches, viz., Roman Catholic, 6; Methodist Episcopal, 5; Baptist, 3; Congregational, 3; Protestant Episcopal, 3; Lutheran, 2; and Second Advent, 1; and 3 chapels. The graded public schools number 16, employ nearly 150 teachers, and cost for maintenance over \$130,000 a year. There are nearly 10,000 children of school age, and public-school property is valued at \$468,500. A new high-school building was nearing completion in 1895, at an estimated cost, with site, of \$130,000. Other educational institutions are St. Margaret's Diocesan School (Protestant Episcopal, chartered in 1875), Academy of Notre Dame, a large parochial school, and several private schools. The Silas Bronson Public Library, established on a bequest of \$200,000 by the man whose name it bears, was opened to the public in 1870, and contains 51,000 volumes, for which a handsome building was completed in 1895. The city also contains a Masonic Temple, an Odd Fellows' Hall, a soldiers' monument, a costly drinking-fountain in the park, an armory, and an opera-house. Pop. (1880) 17,806; (1890) 33,202. H. F. BASSETT.

Waterbury: town; Washington co., Vt.; on the Waterbury river, and the Cent. Vt. Railroad; 12 miles N. W. of Montpelier (for location, see map of Vermont, ref. 4-B). It contains the villages of Waterbury and Waterbury Center; has a Congregational, a Roman Catholic, two Free-will Baptist, and two Methodist Episcopal churches, a national bank with capital of \$100,000, a graded school, the Green Mountain Seminary, and two hotels; and is principally engaged in the manufacture of boots and shoes, carriages and sleighs, leather, lumber, chimney-tops, and brick. Pop. (1880) 2,297; (1890) 2,232.

Water Cavy: See CAPYBARA.

Water-clock: See CLEPSYDRA.

Water-closet: a stool in which excremental matter is diluted with water and discharged into the soil pipe of a house. It consists of an earthenware basin to which water is brought by a pipe from a small tank, and is provided with a trap at the base. This trap keeps the gases of the soil-pipe from entering the house, and a vent-pipe should be attached to it on the lower side to prevent the water in it from being discharged by siphonage. The earliest form of water-closet which was extensively used was the pan closet. In this the matter was received in a metal pan which was tipped by means of a handle attached to a lever into a lower basin connecting with the soil-pipe. It was a very objectionable form owing to the difficulty of cleaning the lower basin, and has now gone out of use. The wash-out closet receives the matter in an earthenware basin, from which it is washed out into the trap by water entering around the upper rim of the upper basin. The hopper closet is the most approved modern form, the matter falling directly into the water which fills the trap; there being really but one compartment to the basin, it is more easily kept in good order than the wash-out closet. There are numerous kinds of both wash-out and hopper closets which vary in the special details. Automatic devices for discharging a water-closet are used to some extent. These are operated by the weight of the person upon a movable platform or movable seat to

which is attached the mechanism necessary to discharge the tank. These devices are liable to get out of order and for a private house are not to be recommended. See Gerhardt's *Sanitary Plumbing and Waring's House Drainage*. See also PLUMBING and SEWERAGE. MANSFIELD MERRIMAN.

Water-color Painting: painting by means of color dissolved in water, some glutinous vehicle being combined with the color to fix it upon the surface to be painted. Fresco-painting is water-color and so is calcimining, such as is done upon ordinary walls and ceilings. The term is used especially for painting upon paper with colors prepared in advance by being carefully ground and mixed with gum. The colors are sold in hard cakes, in pans, and collapsible tubes. In the early stages of this art the solid cakes did not lend themselves to facile manipulation. The admixture of honey and glycerin with the colors, by keeping them soft, better meets the requirement of the artist for swift work, as in sketching. It has been held by some that opaque color such as has been got by mixing white with the paints is illegitimate, and is like a process of oil-painting. These critics hold that the lights in water-color should be got by the white paper showing through the work, which is to be kept as translucent as the pigments allow. The skill required by water-color artists is not inferior to that required by a painter in oil, but is in some respects different; thus there are some water-color artists who are not masters of oil-painting, and the reverse is also true. In fact, the artist in water-color requires greater swiftness and certainty of touch, and mistakes in drawing can not be corrected or covered over, as on canvas; the lines and the processes stand revealed. The ease with which the painter in water-color throws off sketches and produces startling effects with a few masses of light and shade, or a few bold gradations of tone, deludes many into the belief that this is a light and trifling branch of art. The method, in fact, is remarkably well suited to sketching, owing to the lightness of the materials and the rapidity with which the paper dries; the luminousness of the paper likewise greatly assists the immediate, superficial effect. But finished painting in water-color demands skill of a very high order; great works come only from masters, and no master has exhausted or even severely taxed the resources of the method. Its permanency seems to be unquestionable, though perhaps it is too early to pronounce a decided opinion on this point. Water-color paintings—not tinted drawings, which are very different things—have been known to retain their freshness and brilliancy for the space of ninety years, giving then no indications of weakness. The darkening of the paper on long exposure to the air may be partly avoided by protecting the surface with glass. The colors in other respects may be trusted to hold their own with even more certainty than is the case with canvas painting. The liability of paper to be torn renders the water-color painting less durable than the work on canvas, but this disadvantage reflects no disparagement on the method of applying color. True gems of art receive the greater care from being committed to fragile materials. And this care will be bestowed the more readily as it is a peculiar property of the paper on which water-color pictures are painted to retain and give back light, as may be observed by the luminousness of water-colors at dusk, when oiled canvas rapidly darkens. Societies of artists in water-color hold now a distinguished place among the schools of painting. The Belgian association, under the patronage of the king, is by some ranked first. In Great Britain there are two—the Royal Society of Painters in Water-colors, which was instituted in 1804 as the Society of Painters in Water-colors, but was not chartered till 1882, and the Royal Institute of Painters in Water-colors, which was founded in 1831. The French have paid less attention to water-color than the British, though individual artists owe their fame to it—Vibert and Detaille, for example—and there is a Parisian Society of Water-color Painters. Artists of the Spanish school find it admirably adapted to produce the gorgeous effects they aim at. In New York the American Society of Painters in Water-colors was formed in 1867, and is already an established institution. Revised by RUSSELL STURGIS.

Watercourses: in law, streams of water which flow usually and between defined banks. They need not flow in a constant current or regularly throughout the year in order to have the character of watercourses, but must nevertheless be something more than mere torrents whereby the accumulation of surface water is carried off, perhaps always through the same channels or beds, but which soon become

exhausted and remain dry until the next supply from the rain or melting snow. So the watercourse is, on the other hand, to be distinguished from a mere percolation of water through underground strata of the earth or the drainage of surface water, however constant these may be, without being collected into a distinct current running between ascertained banks. A stream may have the character of a watercourse though it flow, throughout its course, in underground channels. The only point of difficulty in such a case is the ascertainment of the facts by which its character as a watercourse, as above defined, is determined.

It is only to such defined and regular watercourses, surface or subterranean, that the law of RIVERS and of RIPARIAN RIGHTS (*qq. v.*) has any application. Percolating waters, surface waters not collected in defined channels, and occasional or intermittent torrents are not subject to property rights, nor will any action lie for detaining or diverting such waters.

G. W. KIRCHWEY.

Water-cress: See CRESSES.

Water-cure: See HYDROPATHY.

Water-dog: See MUD-PUPPY.

Water-feather: See FEATHERFOIL.

Water-ferns: See FERNWORTS (*Hydropteridae*).

Water-flea: a name sometimes given to certain of the ENTOMOSTRACA (*q. v.*) and especially to the *Daphnidae*.

Waterford: county of Ireland, province of Munster; bordering S. on the Atlantic. Area, 721 sq. miles. The surface is mountainous, several ranges from 2,000 to 3,000 feet high traversing it. The Suir and the Blackwater are the chief rivers. Pasturage and dairy-farming are the principal occupations. Coal, iron, lead, copper, and marble are found. Marble quarries are worked with success. Pop. (1891), 98,351.

Waterford: capital of the county of Waterford, Ireland; at the head of the tidal estuary of the Suir; 97 miles S. S. W. by rail of Dublin (see map of Ireland, ref. 12-11). It has a good harbor, with ship-building docks and a fine quay, to which vessels of 2,000 tons burden can ascend and unload. It contains fine streets; has good educational and benevolent institutions; manufactures flour, ale, and spirits, and carries on a considerable trade with England, exporting large quantities of agricultural produce. Pop. of the parliamentary borough, returning one member (1891), 27,623.

Waterford: town; Saratoga co., N. Y.; at the junction of the Hudson and Mohawk rivers, and on the Champlain Canal and the Del. and Hud. Railroad; 2 miles N. E. of Cohoes, 10½ miles N. of Albany (for location, see map of New York, ref. 4-J). It has abundant water-power, paper, flour, and knitting mills, boiler-works, foundries, soap and candle works, steam fire-engine shops, machine-shops, and other manufactures, library of School District No. 1, Union Free School, a private bank, and a weekly newspaper. Pop. (1880) 4,328; (1890) 5,286.

Water-gas: the mixture of hydrogen, carbon monoxide, and carbon dioxide gases which is produced by the contact of water or steam with carbon at the temperature of incandescence, or higher. It has been considered preferable, in practice, to heat the steam itself to as high a temperature as practicable, before contact with the carbon, by passing it through some superheating apparatus. The general result of this is to produce a mixed gas containing more carbon monoxide and less carbon dioxide, the latter gas being not only a useless but a detrimental constituent, as involving the consumption of lime (or other adequate purifying agent) in its removal from the gaseous mixture. It would appear that no temperature, however high, altogether prevents the formation of carbon dioxide; but the process has been conducted with such success as to involve the formation of but little, if any, more carbon dioxide than occurs in ordinary illuminating gas from gas-coal. If no carbon dioxide were formed, the reaction (supposing the carbon pure) should be as follows:

and the resulting gas would consist of equal volumes of hydrogen and carbon monoxide. More than one circumstance conduces, however, to prevent the volume of carbon monoxide from being equal to that of the hydrogen. One is the formation of carbon dioxide. Another is the presence of more or less iron pyrites in the carbon (which in America is always anthracite coal), the iron of which decomposes some steam without forming the equivalent of carbon

monoxide. Another is the fact that no natural form of carbon (anthracite included) is free from hydrogen.

It must also be added that marsh-gas is probably a constant component of water-gas made from anthracite coal. The consequence of this is that water-gas, after purification to separate its carbon dioxide impurities, has been found to contain a proportion of carbon monoxide as small as 36 per cent., with about 56½ per cent. of hydrogen and 3½ of marsh-gas; the remainder, about 4 per cent., being nitrogen, which is derived from several sources.

Most of the experiments that have been made involving the preparation of water-gas—of which the most prominent in the U. S. have been by the different modifications known as the Gwynne-Harris, the Tessie-du-Motay, and the Lowe systems—have had as their object to produce a cheaper substitute for ordinary coal-gas for illuminating purposes; and the product is therefore usually combined with other gases made from gas-coal, petroleum, and the like. Its practical qualities and behavior under various conditions, and its peculiarities when handled in the way in which other gases are handled, on a large scale, are similar to those of other illuminating gases. It is produced in great volume and with great rapidity from comparatively compact apparatus, whose first cost is much less (per capacity of production) than that for ordinary coal-gas; and water-gas has therefore largely superseded coal-gas for heating and illuminating purposes.

Water-glass, also called **Soluble Glass:** a class of compounds of silica with alkalis which contain a sufficient proportion of the latter to confer solubility in water. The first formation of a definite compound of this kind has the composition $\text{K}_2\text{O} \cdot 4\text{SiO}_2$, and should contain very nearly 72 per cent. of its weight of silica. Fuchs's soluble glass is not deliquescent, and is insoluble in cold water; solutions made with boiling water, when strong and pure, are sirupy in consistence, transparent and colorless, and of specific gravity 1.25 or higher. The material is insoluble in alcohol, and the latter decomposes it when in aqueous solution, precipitating a silicate which contains twice the amount of silica corresponding to the above chemical formula. One of the most important adaptations of soluble-glass solutions is in the making of cement compositions and artificial stone. When brought into contact with lime or calcium carbonate or sulphate, insoluble, hard, glassy calcium silicates are formed, and this fact has been extensively applied, not only in hardening the surfaces of artificial-stone compositions, but in compounding the whole mass thereof. Other applications of water-glass are as a detergent, as a dressing for textile fabrics, for reducing the explosiveness of gun-cotton, for some surgical applications, as a cement for broken glass and porcelain, and even as a substitute for common glue. See GLASS.

Water-hen: another name for the MOOR-HEN (*q. v.*).

Water-hog, or **Water-cavy:** See CAPYBARA and HYDROCHERIDE.

Waterland, DANIEL, D. D.: divine and controversialist; b. at Wasely, Lincolnshire, England, Feb. 14, 1683; studied at Magdalene College, Cambridge; became a fellow (1704) and master (1713) of that college; took orders in the Church of England; was appointed chaplain to George I. 1714; delivered the Lady Moyer lectures at St. Paul's, London, 1720; became rector of Ellingham 1713, and of the united parishes of St. Austin and St. Faith, London, 1720; chancellor of York 1723; canon of Windsor 1727; vicar of Twickenham and Archdeacon of Middlesex 1730; was highly distinguished as a Trinitarian controversialist. D. in London, Dec. 23, 1740. He has been called the last of the great patristic scholars of England. Among his writings were controversial treatises on the *Divinity of Christ*, against Drs. Daniel Whitby and Samuel Clarke (1718-24), in vindication of the authority of Scripture, against Middleton and Tindal, and on the doctrines of the Eucharist and baptismal regeneration, against the laxer divines of the Anglican body; and a critical essay on the Athanasian Creed, which he traces to Hilary of Arles. A complete edition of his *Works*, with a *Memoir*, was published by Bishop W. Van Mildert (11 vols., Oxford, 1823-28; 3d ed. 6 vols., 1856).

Water-lily Family: the *Nymphaeaceae*; a small group (thirty-five species) of herbaceous, aquatic, choripetalous dicotyledons, natives of all temperate and warm climates. The sepals are three to five, petals three to many, stamens

six to many, and ovaries three to many, free, or united into a compound pistil. The stems are creeping and submersed and the leaves mostly peltate, long-petioled, and floating. Fourteen species are North American. The white water-lily (*Castalia odorata*, Fig. 1) is common in the Eastern U. S. A

FIG. 1.—White water-lily (*Castalia odorata*), one-half natural size.

near relative (*C. tuberosa*) occurs more abundantly in the Mississippi valley. The lotus, water-chinquapin, or yellow nelumbo (*Nelumbo lutea*, Fig. 2), occurs in the waters of the

FIG. 2.—Lotus or water-chinquapin, one-fifth natural size.

Mississippi valley. It is curious on account of its large top-shaped receptacle, in the cavities of whose upper surface the

pistils are imbedded (Fig. 2, at the left). The common yellow water-lily, or spatter-dock (*Nymphaea advena*), has

smaller, yellow flowers with fewer petals. It is widely distributed in the U. S. The Victoria lily (*Victoria regia*, Fig. 3), the largest of all, occurs in the waters of the Amazon region of South America. Its peltate leaves are 6 to 10 feet in diameter, with an upturned margin 2 inches in height. Its flowers are from 10 to 15 inches in diameter, pinkish and fragrant. The starchy seeds are eaten by the natives. It is now grown in the parks and public gardens of many cities of the U. S., and flowers in the open air as far north as Washington.

CHARLES E. BESSEY.

Waterloo: a suburb of Berlin, the county-seat of Waterloo County, Ontario, Canada (see map of Ontario, ref. 4-C). It has a large trade, good water-power, and thriving manufactures. Pop. (1881) 2,066; (1891) 2,941—nearly all Germans.

Waterloo: a thriving town, the *chef-lieu* of Shefford County, Quebec, Canada; near the center of the Eastern Townships, and having railway connection with Montreal by the Central Vermont Railway (see map of Quebec, ref. 6-C). The Canadian Pacific Railway has a branch running through the town. The trade of the place consists in the export of farm produce and such manufactured goods as leather, furniture, carriages, and woolen stuffs. Pop. (1881) 1,617; (1891) 1,733.

J. M. HARPER.

Waterloo: city (founded in 1818); capital of Monroe co., Ill.; on the Mobile and Ohio Railroad; 22 miles S. of St. Louis, Mo. (for location, see map of Illinois, ref. 9-C). It is in a wheat and corn growing region; has a quarry of fine building-stone known as Waterloo marble, public-school building, St. Joseph's Academy (Roman Catholic), a State bank with capital of \$25,000, a private bank, and 2 weekly newspapers; and contains 2 flour-mills, 2 soda-water factories, marble-works, large brewery and bottling-works, and ice-factory. Pop. (1880) 1,802; (1890) 1,860; (1895) estimated, 2,300.

EDITOR OF "REPUBLICAN."

Waterloo: town (founded in 1857, incorporated in 1864); De Kalb co., Ind.; on the Cedar creek, and the Lake Shore and Mich. S. Railway; 28 miles N. of Fort Wayne, 79 miles W. of Toledo (for location, see map of Indiana, ref. 2-G). It is in an agricultural region, is an important shipping-point for general produce, and has a graded high school, 7 churches, 2 private banks, and a weekly newspaper. Pop. (1880) 1,376; (1890) 1,473; (1895) estimated, 1,800.

EDITOR OF "PRESS."

Waterloo: city; capital of Black Hawk co., Ia.; on the Cedar river, and the Burl., Ced. Rap. and N., the Chi. Gt. W., and the Ill. Cent. railways; 93 miles W. of Dubuque, 297 miles W. of Chicago (for location, see map of Iowa, ref. 4-1). It is in an agricultural region; derives excellent power from the river for manufacturing; has gas and electric-light plants, water-works, street-railway, 2 private banks, and 2 daily, 5 weekly, and 4 monthly periodicals; and contains several flour-mills, foundries, carriage-factories, agricultural-implement works, railway machine-shop, well-drilling machinery-works, gasoline-engine factories, and sash, door, and blind factories. Pop. (1880) 5,630; (1890) 6,674; (1895) 8,490.

EDITOR OF "COURIER."

Waterloo: village; one of the capitals of Seneca co., N. Y.; in the towns of Waterloo and Fayette, on both sides of the Seneca river and the Cayuga and Seneca Canal, and on the N. Y. Cent. and Hud. River Railroad; 17 miles W. of Auburn, 58 miles E. of Rochester (for location, see map of New York, ref. 5-F). It contains several large woolen, flour, and saw mills, wheel, wagon, and piano factories, union public school with library, a national bank with capital of \$100,000, and a State bank with capital of \$25,000; and has two weekly newspapers. Pop. (1880) 3,893; (1890) 4,350.

EDITOR OF "OBSERVER."

Waterloo, Battle of: one of the most important military engagements in all history, fought June 18, 1815, between the allied forces of Great Britain, the Netherlands, and Prussia on the one hand, and France on the other. The battle was the culmination of the campaign resulting from the escape of Napoleon I. from his exile at Elba.

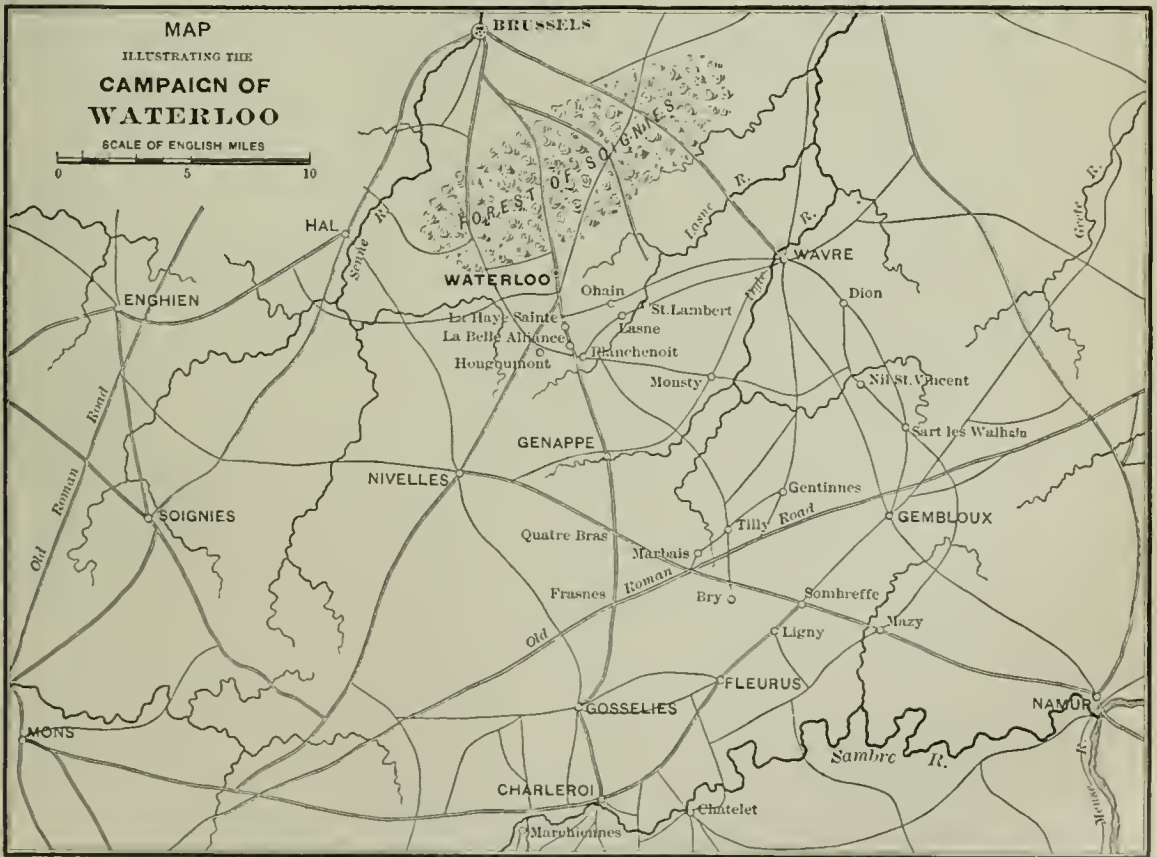

The Hundred Days.—Napoleon, on his return from Elba, reached Paris on Mar. 20, 1815. The great powers, whose representatives were then in session at Vienna, at once agreed to unite for his final overthrow, and the forces of Great Britain, together with those of the Netherlands and Brunswick, were placed in command of the Duke of Wellington, the Prussians were united under Field-Marshal Blücher, and the forces of Austria and Russia were to be commanded by

Prince Schwarzenberg. Napoleon decided to strike his blow before the enemy was ready to receive him, but wished to postpone the movement as long as possible in order to gather his forces. He judged that 800,000 men would be necessary to defend his recovered empire, and as early as June 1 there were 560,000 men on the rolls. Charras has shown, however, that at that date there were really only 198,000 troops in condition for active service.

Plan of Campaign.—Napoleon kept himself fully informed through private sources of the movements of his enemies. Though by guarding the frontier with the utmost strictness he endeavored to keep his own plans a secret from the enemy, it afterward appeared that he had not been completely successful. The Prussians under Blücher, with headquarters at Namur, were the first to be ready for action. Of this Napoleon was fully aware, and accordingly he decided to strike a decisive blow before Wellington could come to the support of his ally. The line occupied by the two armies of Wellington and Blücher on the 10th of June may be roughly described as extending about 150 miles from Ostend, on the channel, through Brussels, to Liège, in the eastern part of Belgium. The headquarters of Wellington were at Brussels. Napoleon very naturally attached not a little importance to the fact that Wellington's army depended upon the channel ports for its supplies, while the supplies of the Prussians must come from the Rhine; for either army in case of defeat would naturally, Napoleon thought, fall back toward its base, and thus the two forces would be driven farther apart. Napoleon's plan of operations seemed to be invited by the fact that a great turnpike which furnished admirable facilities for the movement of an army extended from Brussels almost due S. to the French frontier. Wellington's army was entirely W. of this road, while Blücher's was entirely E. of it. But Wellington believed that the em-

venient for immediate concentration either at the western or at the eastern end of the line. Wellington has often been criticised for this extension of his forces, but it would seem that a sufficient answer to this criticism is found in the fact that when the attack came he was able to concentrate his troops in time to frustrate the advance at Quatre Bras, upon which so much depended.

The Number and Position of the Forces.—At the beginning of the campaign the Prussian force under the command of Blücher consisted of four corps: the first, under Ziethen, of 32,692 men, stationed at Charleroi; the second, under Pirch, of 32,704 men, at Namur; the third, under Thielmann, of 24,456, at Ciney; the fourth, under Bülow, of 31,102, at Liège; constituting a total, including 3,120 wagners, of 124,074 men. This force consisted mainly of veterans, even the youngest of them having seen hard service in 1813 and 1814. Blücher's corps commanders were all experienced officers, though Bülow was the only one of them who had ever before had an independent command. Wellington's force was a motley collection made up from different nationalities and speaking different languages. The number of the British troops was 31,253; of the king's German legion, 6,387; of Hanoverians, 15,935; of Dutch-Belgians, 29,214; of Brunswickers, 6,808; of the Nassau contingent, 2,880; of engineers, etc., 1,240; making a total of 93,717, of whom 69,829 were infantry, 14,482 cavalry, and 8,166 artillery. The force was grouped into two corps, the first, of 25,233, commanded by the Prince of Orange; the second, of 24,033, by Lord Hill; while the reserve, of 20,563, and the cavalry and artillery were under the more immediate direction of the duke himself. The commanders of this motley army, and even the subordinate officers, were men of large military experience, though the army as a whole was declared by the duke to be the poorest he had ever led.

peror would strike the blow at the N. W. for the purpose of cutting off the British and Dutch from their line of supplies. Ever afterward, as his *Memorandum* of 1842 shows, Wellington believed that Napoleon might have attacked at that point with greater chance of success. It was this belief which led the British commander, even up to the hour when the French crossed the frontier, to keep his forces distributed at points

Until the blow was struck Wellington deemed it necessary to guard the approaches by Lille and Ath, and by Mons and Hal, and consequently his first corps was stationed about Mons, Enghien, and Nivelles, while his second was distributed at points as far W. as the Scheldt. The reserve was held in the vicinity of Brussels. The French army was organized in five corps, besides the reserve. The first corps,

d'Erlon's, had 19,939 men; the second, Reille's, 24,361; the third, Vandamme's, 19,160; the fourth, Gérard's, 15,995; and the sixth, Lobau's, 10,465. Besides these, the Guard contained 20,884, and the reserve 13,784, making a total fighting force of 124,588 men. Of these, 89,415 were infantry, 23,595 cavalry, and 11,578 artillery, with 344 guns.

Napoleon decided to concentrate his army on the French frontier a few miles S. of Charleroi, and to this end the first and second corps were sent to Solre, about 8 miles S. W. of Charleroi, the third to Philippeville, and the fourth and sixth, with the reserve, to Beaumont. These positions offered good roads to the point of crossing the Sambre at and near Charleroi, about 8 miles away. Though the Prussian army had pushed its line S. of Charleroi, the concentration of the French at the three points named was so quietly and successfully accomplished that on the evening of June 14 Napoleon believed his movements had been unobserved. But in this he was in error, for as early as the evening of the 13th Ziethen had reported to Blücher the gathering of two great camps at Solre and Beaumont, and had received orders in return to send heavy baggage back to Gembloux. On the evening of the 14th Blücher received further reports, whereupon he ordered Ziethen to fall back and hold Fleurus, a village 7 miles N. of Charleroi. At Wellington's headquarters it was also understood that the enemy was approaching. Mülling, then with the duke, says that "on the 13th and 14th it was positively known that the enemy was concentrating in the neighborhood of Maubenge." On the evening of the 14th, Napoleon himself, who had just arrived from Paris and established headquarters at Beaumont, sent to all the regiments one of those stirring addresses he was accustomed to issue to his troops on the eve of a great battle. His orders were that all should be ready to move at 3 A. M. on the 15th.

Ligny and Quatre Bras.—Various causes delayed the movements of the French. Napoleon had supposed that his whole force would be across the Sambre at noon, but in fact when night came on a little less than 100,000 were N. of the river. A glance at the map will show that two great roads extend northward from Charleroi, the one running almost due N. through Quatre Bras and Waterloo to Brussels, the other running in a northeasterly direction through Fleurus and Sombreffe to Gembloux. These two roads are crossed at Sombreffe and Quatre Bras by the great turnpike leading from Namur to Nivelles and forming the most important line of connection between the allied armies. At a meeting of Wellington and Blücher as early as May 3 it was agreed that if Napoleon should cross at Charleroi, the utmost endeavors should be put forth to prevent his taking possession of either Sombreffe or Quatre Bras. Napoleon, on the other hand, was equally aware of the importance of securing one or both of these points. He met with a stubborn resistance, especially from the Prussians under Ziethen, who was slowly driven back contesting every point on the way. Ziethen held Fleurus at dark, but the most of his forces were already encamped on the slopes about Bry and Ligny. It was while Napoleon was near Fleurus that he was joined by Marshal Ney, who, in response to the emperor's call at the last moment, had just reached the army. Napoleon assigned his old marshal to the command of the left column, intrusting to him the great work of opening the road through Quatre Bras to Brussels. Ney, not having been with the army, was quite unacquainted with its organization, and the orders that had been given the corps commanders. He gathered the threads into his hands, however, as best he could, and in the course of the afternoon pushed forward through Gosseries to Frasnes, and finally to the vicinity of Quatre Bras. Here he met with a stubborn resistance by a brigade of Wellington's troops. It was now eight o'clock and nearly dark, and the French had been on the march for seventeen hours. Leaving his troops as he had brought them up, Ney returned to Charleroi, where he remained until two o'clock in the morning of the 16th with Napoleon.

Meanwhile the forces were gathering in the north for the contests of the morrow. Ziethen at daybreak of the 15th had sent a message to Blücher that his posts had been driven in, and Blücher at once issued orders to the corps of Pirch, Thielmann, and Bülow. Pirch reached Ligny at five, and Thielmann at eight on the morning of the 16th. The march of Bülow, however, was less fortunate. Stationed at Liège, he had received his orders at a later hour, and as the dispatch had not told him that the conflict had already begun, did not press forward with unusual haste. The consequence was that it was not till noon of the 16th

that he reached Hannut, 25 miles from Ligny, although if his orders had been more explicit he might have arrived at Ligny in time to have saved the battle.

Wellington received the first news of Napoleon's advance at about three o'clock in the afternoon of the 15th at Brussels. He hesitated, however, to issue orders until he should receive further information, alleging as a reason that the French design was not yet sufficiently revealed. It is evident he feared the attack at Charleroi was designed merely to conceal a more formidable advance by way of Mons. It was therefore not until he had received further news in the evening assuring him directly from Mons that the enemy had turned his entire force against Charleroi that he issued two orders—the first to be in readiness, and the second to move the whole army to the left.

The delays that occurred on the part of the French on the morning of the 16th can be accounted for only by the supposition that Napoleon was entirely ignorant of the condition and situation of his enemies, and that his conjectures in regard to their movements and purposes were grossly erroneous. At six o'clock Grouchy reported to Napoleon that the Prussian army was deploying before Fleurus, where the corps of Ziethen had already been joined by that of Pirch. It was not until eight o'clock, after Thielmann's corps, having marched 15 or 18 miles from Namur, had joined the other Prussians, that Napoleon issued the orders for the day. He then formed the army into two wings, giving the right to Grouchy, the left to Ney, and keeping the reserves under his own more immediate supervision. The orders that he gave to Grouchy and Ney show that he had no adequate conception of what was before him. As if there were hardly more than a skirmish line of Prussians to be brushed aside, he ordered Grouchy "to march on Sombreffe and take up a position there." He was then "to send an advance guard to Gembloux and reconnoitre all the roads, especially that to Namur, establishing also communication with Marshal Ney." To Ney he writes in equally explicit terms. He says he will himself be at Fleurus before noon; that he will clear the road to Gembloux before three; that he will there decide what future course to pursue. His intention was to march on Brussels, and Ney was directed to be ready to start for Brussels in the evening.

Ney received the order between ten and eleven, but did not succeed in bringing up the scattered forces from the rear so as to begin the advance from Frasnes until between one and two. Wellington arrived on the field from Brussels at about eleven. The emperor was not ready to attack until two; but before ordering an advance he sent a note to Ney directing him to drive off vigorously what was before him, and then to wheel and assist in the annihilation of the Prussians. But although at first Ney made good progress and seemed for a time likely to secure the Namur road at Quatre Bras, the arrival of Picton at about three made all further advance impossible. At six Ney received a further dispatch from the emperor saying that the Prussians were hotly contesting their attacks, and calling upon him "to maneuver immediately in such a manner as to envelop the right of the enemy and fall upon his rear." Thereupon Ney called up all his reserves for another desperate attack. But Wellington's force had now been increased to over 30,000 men, and, feeling himself now superior to the enemy, the duke took the offensive and drove back the exhausted troops of Ney to Frasnes. Here the corps of d'Erlon, which by a misunderstanding had marched over to assist Napoleon and then turned back, came up just in time to prevent further pursuit by the allies.

This defeat of Ney at Quatre Bras compelled Napoleon to finish the battle of Ligny without his assistance. The desperate fight had continued about three hours, chiefly on the Prussian left, where Vandamme had attacked again and again without important results. At about half-past six, when the Prussians had become entangled in the indecisive results all along the line, the emperor ordered the Guard to charge upon the enemy's center. The furious onsets of the French pierced the Prussian line and threw it immediately into confusion. The French captured twenty-one guns, but darkness prevented pursuit. Blücher, who had fallen from his horse and been disabled, at this point turned over the command to Gneisenau, his chief of staff. In the course of the night Gneisenau decided upon a general retreat northward upon Wavre, and gave orders to start at daylight. By this movement Napoleon was completely deceived. Never thinking that the Prussians would abandon their source of supply at Namur, he assumed that they had retreated in that

direction. On the morning of the 17th he wrote Ney: "The Prussian army has been put to rout; Gen. Pajol is pursuing it on the road to Namur and Liège." It was the error of this supposition that made victory impossible on the following day.

Waterloo.—Napoleon, apparently quite satisfied with what had been accomplished on the 16th, did not leave his tent at Fleurus until late on the morning of the 17th. The Prussian troops, having started at about three o'clock, had already been more than four hours on the march. Ziethen and Pirch made their way due northward by narrow roads through Tilly and Gentinnes, while Thielmann, who had the reserves and a large part of the artillery and heavy wagons, took the better though longer road, through Gembloux. Bülow, who had learned of his mistake in delaying at Hannut on the morning of the 16th and had hurried along the old Roman road toward Ligny, only to find himself too late, received orders early on the 17th to turn from Gembloux to Wavre. At nightfall Ziethen and Pirch had their corps safe on the north side of the Dyle at Wavre, Thielmann was on the south side, and Bülow was at Dion, 2 miles to the southeast. Gneisenau in the course of the night sent word to Wellington of his line of retreat, but the messenger did not reach the headquarters of the duke at Quatre Bras until seven in the morning of the 17th. Wellington, on receiving assurance from Blücher that he would join him, began to fall back, and at night the 30,000 who had fought at Quatre Bras, united with about 42,000 others, slept upon the field which on the following day was to be made one of the most famous battle-fields of the world.

Early in the morning of the 17th Ney sent to Napoleon for instructions. In answer to this inquiry the emperor sent a letter containing the most explicit directions. Ney was ordered to concentrate all his forces near Quatre Bras and await further orders. He added: "To-day is required for completing this operation, filling up ammunition, and gathering stragglers and detachments." From this it was made evident to Ney that no general engagement was intended unless the allies should assume the offensive. The emperor after sending this letter reviewed the several divisions at Bry and Ligny, and even took the time to address the Prussian prisoners at some length. At noon, hearing that Wellington was still at Quatre Bras, he directed Soult to send another letter to Ney in which he said: "The emperor has just placed in position before Marbais a corps of infantry and the Imperial Guard. His Majesty desires me to tell you it is his intention that you should attack the enemy at Quatre Bras and drive them from their position, and that the corps at Marbais should second your operations. His Majesty is going to Marbais and waits impatiently for your report." It was just after sending this letter that he called Grouchy to his side and intrusted to him a force of 33,000 men and orally directed him to pursue Blücher, "complete his defeat," and communicate constantly with the emperor by the Namur road. Grouchy expressed himself freely as to the difficulty of finding and defeating the Prussians, who had about eight hours the start. But the emperor insisted upon the marshal's doing his duty. At Marbais, however, Napoleon received information which shook his confidence that Blücher had gone to Namur, and sent, through the hand of Gen. Bertrand, positive instructions for Grouchy's guidance. He was to march on Gembloux and throw out exploring parties "to ascertain whether the Prussians were separating from the British or bent on uniting with them to save Brussels and try the fate of another battle." This letter, written about three o'clock, probably reached Grouchy not earlier than four, at the very time when a full half of the Prussian army was north of the Dyle at Wavre. After two o'clock it rained in torrents, and it was 10 p. m. when the rear of Grouchy's column bivouacked at Gembloux. It is worthy of note, moreover, that it was not until he reached this point that Grouchy was able to state positively that even a part of the Prussians had gone to Wavre. The reports indicated, however, that Blücher himself with one column had retired to Liège, and that one column had gone to Namur. At 2 a. m. he satisfied himself that the whole army had gone to Wavre; and accordingly, at that hour, he wrote to Napoleon that he should move in that direction early in the morning to prevent Blücher from uniting with Wellington for the protection of Brussels.

When Napoleon, leaving Marbais at about two o'clock, reached Quatre Bras, he found that Wellington's force had left before noon, and that Ney's army was still resting about the crossing of the Namur and the Charleroi roads. Napo-

leon's re-enforcements raised the army to 71,947 men and 240 guns. The French marched toward Waterloo and bivouacked in parallel lines only a few thousand yards from the enemy. Both armies were drenched during the night, as the downpour of rain did not cease until three or four hours after sunrise; but the French, nearly destitute of firewood, suffered more severely than the British.

Both the allies and the French were put under arms at an early hour. The French lines were drawn up in full view of the allies, and were purposely so disposed as to make the largest possible impression. The emperor went from division to division cheering the men and showing the utmost confidence in the issue of the day. Wellington was equally active. He gave his final directions to the various commanders, and then dispatched messengers to Blücher. Three contingencies were provided for: If Napoleon should attack the British right, the Prussians were to approach by way of Ohain for the purpose of meeting the two armies; if he should assault the center or the left, they were to advance by St.-Lambert and Lasne, and take the French on the right flank; if he should advance to St.-Lambert, Blücher was to meet him in front, while Wellington would attack vigorously in the rear. At half-past eleven the French began a cannonade and apparently were making preparations for an assault upon the center, but on account of the difficulty of moving the guns Napoleon decided to delay the forward movement until one o'clock. Before the advance began the head of Bülow's column had been a full hour in sight on the heights of St.-Lambert. Wellington knew that these were Prussians, but Napoleon could not be sure whether they were Prussians or Frenchmen.

But where was Grouchy? Leaving Gembloux at about the same hour that Blücher left Wavre, the head of his column under Vandamme had reached Nil St. Vincent, and Grouchy himself had reached Sart-les-Walhain, when, at half-past eleven, the roar of artillery in the west announced that the battle had begun. Napoleon had ordered Grouchy to find Blücher and follow him. The question now arose whether he should carry out his orders strictly or, on hearing the cannonade, wheel to the left, and by crossing the Dyle near Mousty attempt either to arrest the Prussians or to push on with all possible speed to Planchenoit. The question was discussed by Grouchy and his officers, some of whom warmly urged the latter movement. But the head of the column was 14 miles from Planchenoit, they would have for most of the way only a single narrow road, the mud was so deep that all movements must be exceedingly slow, the general of artillery protested that it would be impossible to reach the battle-field in time to be of assistance that day, and Grouchy decided to continue his march on Wavre. Whether he was right in this decision has been a matter of almost endless controversy among military critics. The head of Grouchy's column after the utmost endeavors did not reach Wavre until after two o'clock. Over a much worse road it could hardly have reached Mousty before half-past two or three. But at three the last of Bülow's column was passing St.-Lambert, and Pirch was approaching. St.-Lambert, moreover, is more than 5 miles nearer the battle-field than Mousty. From all this, it appears that it would have been impossible for Grouchy to interfere with the advance of Bülow, and probably impossible to arrest Pirch. But even if he had succeeded in reaching the second of the Prussian columns, Pirch and Thielmann, with their superior numbers, would at least have kept him back, and Bülow and Ziethen would have been left to pursue their way undisturbed. In view of these facts, it is not easy to see how Grouchy could in any way have influenced the result of the battle.

The first advance ordered by Napoleon at Waterloo was on the Château Hougomont, at the left of the line, for the purpose of diverting attention from the more formidable attacks soon to be made on the right and the center. But the walls had been pierced with portholes by order of Wellington, and every assault was successfully repulsed. The attacking force was increased until it numbered about 12,000 men, and so persistently and wastefully was the effort kept up that very few of this force took any part in the assault on the main line of the allies.

Napoleon's plan was to make the main attack upon the center, for the purpose of taking possession of the high ground where the Wavre turnpike enters that from Charleroi. To prepare the way for the charge an enormous battery of seventy-eight pieces planted in front of the French lines had continued for an hour and a half to fire at a range

of less than a third of a mile into the allies lying across the pike at the junction of the Wavre road. The attack was to be made in four columns, so arranged that they were from twenty-four to twenty-seven ranks deep. This unusual arrangement proved to be unwieldy, and when the assault came tended only to confusion. The charge was led by d'Erlon, and at first swept everything before it. The Dutch-Belgian brigade fell back in confusion. The French reached the crest of the ridge, when Piéton's division received them with so hot a fire, and then charged them with so much vigor that they were arrested and staggered. While they were trying to disengage their ranks Ponsonby's brigade of heavy cavalry charged them furiously, and, riding down between the columns, cut down the infantry right and left with such fury that the French, leaving two eagles and fifteen guns in the hands of the British, were obliged to withdraw in confusion. It was at this moment that Napoleon saw the Prussians approaching in such mass as to require his immediate attention. He decided to send the Sixth Corps to hold Blücher in check beyond Planchenoit. This necessity weakened his attacking line by about 16,000 men, making his available force now some 6,000 less than Wellington's.

The next movement was a reckless assault upon the farmhouse at La Haye Sainte, the walls of which were defended with the same vigor that had characterized the defense of Hougomont. After vast numbers of officers and men had been sacrificed, the place was taken just before four o'clock. Napoleon now thought it necessary to give his own attention to the Prussians, who were striking at his flank and rear $1\frac{1}{2}$ miles away. Meanwhile it had been decided to make the next great assault on the west of the Brussels pike. It was therefore determined to make the advance with cavalry. From four o'clock until six, Ney hurled the magnificent divisions of Milhaud, Lefèvre-Desnoyettes, Kellermann, and Guyot in four successive assaults upon the British squares, but could not break through the lines.

While these events were going on Napoleon himself was occupied in defending his flank and rear against Bülow at Planchenoit. The Prussians drove back the Sixth Corps and took possession of the village; but the emperor, believing that his flank should be defended at all hazards, called in strong re-enforcements from the Old, the Middle, and the Young Guard, the very *élite* of the army. With the help of these he retook the town, and then, thinking the line was safe, returned to witness the results of Ney's charge. It was now seven o'clock, and Pirch was only 2 miles in the rear of Bülow. Ney, having no control over the Guard, had exhausted his resources, and an hour of hull gave Wellington time to reform his line.

The emperor now had before him the hard task of bringing his force into order for a final attempt to break the enemy's center. There were but eight battalions remaining that could be used against the allies. These, with such artillery as could be manœvered for their support, were drawn up just at the left of the Brussel's pike, and, after being addressed and appealed to by Napoleon, were given into the command of Ney. They were to advance by column diagonally across the field so as to attack the British center. As they advanced at quickstep, shouting *Vive l'Empereur*, all firing ceased. The heavy infantry, who were to receive them, lay flat upon the ground until the column was within 50 or 60 paces; Maitland's brigade, presenting a front of 450 men, were then ordered to stand up. The French suddenly halted. As they seemed to hesitate, Maitland's famous brigade sprang forward with the bayonet. The charge was supported by the allies with a vigorous fire on the flanks, and the French were forced back to their own lines with great slaughter.

It was at this time that the head of Ziethen's column reached the ground. Coming from Ohain, he approached the field opposite the space which divided the contending armies. The division of Steinmetz at once wheeled into position and began a furious attack upon the French, spreading terror and confusion throughout the right wing of the army. At this juncture the duke, seeing that the battle was won, ordered an advance along the whole line. The French gave way at every point. The emperor did what he could, but the troops were everywhere too much exhausted to make any determined resistance. Only one line of retreat was open. The army was crowded into a confused mass, and the Prussian cavalry took up the pursuit with such terrific vigor that at Genappe the French abandoned 100 cannon, and from that point made no attempt to preserve even the semblance of order. The

army broke into confusion, and the flying troops, throwing away every incumbrance, made their way as best they could toward Paris. Napoleon himself left the field in the center of a square "with a somber, but calm countenance, his far-seeing glance probing futurity, and seeing that more than a battle had been lost on that day." Before sunrise he reached Charleroi, on the 21st he arrived at Paris, and on the 22d he presented his abdication.

The number of casualties to the French it is impossible to determine. Charras, who studied the matter, estimates the killed, wounded, and missing at between 31,000 and 32,000. The allied armies lost in killed, wounded, and missing, a total of 22,428. The losses of the British, Scott says, "threw half Britain into mourning."

AUTHORITIES.—The accounts of the campaign and battle written before a critical examination had been made of the dispatches were all very untrustworthy. Even the celebrated description of Thiers has been shown to abound in errors of the most fundamental and important nature. Alison's account, written from the British point of view, has also been entirely superseded. The two accounts of the campaign and battle given by Napoleon himself while at St. Helena, though important, are shown by the dispatches to abound in errors and misrepresentations. In some important points also they contradict each other. The most important modern works, written after a study not only of the original dispatches, but also of the memoirs of the officers who took part, are the following: Charras, *Histoire de la Campagne de 1815*; Chesney, *Waterloo Lectures* (London, 1868; 3d ed. 1874); Clausewitz, *Der Feldzug von 1815 in Frankreich*; Gardner, *Quatre Bras, Ligny, and Waterloo*; Hooper, *Waterloo, the Downfall of the First Napoleon*; Kennedy, *Notes on the Battle of Waterloo*; Mülling, *A Sketch of the Battle of Waterloo*; Ollech, *Geschichte des Feldzuges von 1815*; Quinet, *Histoire de la Campagne de 1815*; Siborne, *History of the War in France and Belgium in 1815*; and Ropes, *The Campaign of Waterloo* (New York, 1893). Those of Ropes, Gardner, and Chesney are the most valuable authorities in English. The fullest bibliography and the best maps are in Ropes. Gardner abounds in admirable notes, and has an interesting Appendix of "Waterloo Poetry." The highest value of Chesney perhaps is his merciless and irrefutable exposure of the mendacity of Napoleon, and the consequent worthlessness of such descriptions as those of Thiers and others that are founded on the emperor's representations.

C. K. ADAMS.

Watermelon: the fruit of the *Citrullus vulgaris*, a trailing annual vine of the family *Cucurbitaceæ*, a native of Asia and Africa, extensively found wild on the plains of the latter continent, where some varieties or specimens of its fruit are bitter and poisonous. Watermelons are largely grown in the U. S. for their cooling, watery pulp. In warm climates sugar has been profitably made from watermelons. About sixty different varieties are offered by seedsmen. A variety with hard, inedible flesh, the rind of which is used for preserves, is popularly known as citron.

Revised by L. II. BAILEY.

Water-meter: an automatic device for measuring and registering the flow of water.

One of the most difficult problems in municipal engineering is to prevent wanton waste of the water supplied to the inhabitants at public cost. (For statistics illustrating the fact that great waste is prevalent, see **WATER-WORKS**.) The only mode of restraining such waste appears to lie in a system of charges based upon the quantity of water actually drawn by each consumer. Such a system of charges presupposes accurate means of determining the quantity of water drawn. The device made use of must be capable of registering the smallest as well as the largest quantity deliverable; it must work under all pressures from a few feet up to 200 or more; it must work for long periods without attention; it must not leak; it must be capable of standing idle or even of remaining dry without losing its efficiency; it must offer but slight resistance to the flow of the water; and, finally, since it must be applied in great numbers, it must be furnished at a moderate cost.

A leading type of modern water-meter is the disk meter. Figs. 1 and 2 show the principle on which the meter acts; 1 is a section on the line A B through the chamber of the meter, and 2 shows the meter in plan. The top and bottom of the chamber are formed by two conical surfaces, whose vertices meet at the center and whose axes coincide. They are joined by the vertical partition *cd* extending from the cen-

ter to the circumference. The circular wall of the chamber, uniting the outside edges of the cones, is a spherical surface. A slight enlargement of the chamber at *g* receives the admission-pipe *k* and the discharge-pipe *l*. A round ball is fitted in the center of the chamber, the cones and the partition being cut away to receive it. It fits watertight and is susceptible of a slight rotary movement. Through the center of the ball passes the disk *a b*, and at right angles to the disk is the spindle *p*. The disk exactly fits the interior of the spherical zone of the chamber. In the position shown the disk touches the upper conical surface in a line extending from *e* to the ball, and the lower one in a line extending from the ball to *f*, Fig. 2.

FIG. 1.

As shown in the figure, the portion of the chamber below the disk is divided into two parts, viz., the first, which is in communication with the supply-pipe, extends from the partition *c d* to the line *f*; the second, which is in communication with the discharge-pipe *l*, extends from *f* to the partition. The upper part of the chamber is also divided into two parts, viz., the first, which, in communication with the supply-pipe *k*, extends from the partition to *e*; the second, communicating with the discharge *l*, extends from *e* to the partition. It should have been noted before that the disk by means of a radial slot "straddles" the partition.

FIG. 2.

From this description it will be apparent that the admission of water through the pipe *k* will cause the disk to take an oscillating or "wabbling" motion. The line of contact *e f* will travel round and round the chamber. The point of the spindle *p* will move in a circle, and at every rotation one-half the contents of the chamber will be discharged. In practice the point of the spindle turns a crank and gives motion to a train of wheel-work, by means of which the amount of the discharge is indicated on a dial-plate.

The combination shown in Figs. 3 to 5 is the crown meter, a type adopted by the city of Boston. Fig. 3 is a plan of the case showing the ports and passages in the bottom. Fig.

FIG. 3.

4 represents the case with piston. Fig. 5 is a section on the line *a b*: *B* is the piston which rests on the bottom plate and is covered by the top plate, both fitting so closely that the piston revolves water-tight between them. The piston, as will be seen, is susceptible of a slight revolving motion, rolling around the case so that its center describes a small circle shown in dotted line at the center of the case. The pro-

jections *j* on the piston make water-tight contact with the projections *i* on the case. In the position shown the chamber is divided into two compartments on the line *a b*. The piston is provided with the central cavities *o* above and *q* below, and the annular grooves *f* above and *g* below; *g* communicates with *o* by the internal passages *m m*, and *q* communicates with *f* by the passages *n*. The two compartments into which the chamber is divided on the line *a b* may be called the high-pressure and the low-pressure compartments. The rotation of the piston is effected by such an arrangement of ports and passages as keeps the high-pressure compartment in communication with the inlet *a* and the low-pressure in communication with the outlet *b*. The lower plate has the ports *c*, *c*₂, *c*₃, etc., communicating by means of the curved passages with the spaces *h*₁, *h*₂, *h*₃, etc. The upper plate is an exact duplicate of the lower, but being reversed in position, it brings the upper port *c*₄ in communication with *h*₃ instead of *h*₄, etc. The space *g* stands in constant communication with the influx, and, as the piston rotates, successively opens and closes the ports *c*₁, *c*₂, *c*₃, etc. Likewise the space *o* is in constant communication with the efflux, and successively opens and closes the upper ports. When the lower port *c*₂ is opened to the influx through the space *q* the opposite lower port *c*₃ is opened to the efflux through the groove *g* and passage *m*. When the upper port *c*₂ is in communication with the efflux through the space *o*, the opposite upper port *c*₃ is opened to the influx through the groove *f* and passage *n*. As *j*₄ passes out of contact with *i*₃, *j*₃ comes into contact with *i*₄, and the line of division between high and low pressure is *i*₄ *i*₃. This line of division travels round and round the chamber. The spindle *r* moves the train of wheel-work which registers the quantity of water.

FIG. 4.

jections *j* on the piston make water-tight contact with the projections *i* on the case. In the position shown the chamber is divided into two compartments on the line *a b*. The piston is provided with the central cavities *o* above and *q* below, and the annular grooves *f* above and *g* below; *g* communicates with *o* by the internal passages *m m*, and *q* communicates with *f* by the passages *n*. The two compartments into which the chamber is divided on the line *a b* may be called the high-pressure and the low-pressure compartments. The rotation of the piston is effected by such an arrangement of ports and passages as keeps the high-pressure compartment in communication with the inlet *a* and the low-pressure in communication with the outlet *b*. The lower plate has the ports *c*, *c*₂, *c*₃, etc., communicating by means of the curved passages with the spaces *h*₁, *h*₂, *h*₃, etc. The upper plate is an exact duplicate of the lower, but being reversed in position, it brings the upper port *c*₄ in communication with *h*₃ instead of *h*₄, etc. The space *g* stands in constant communication with the influx, and, as the piston rotates, successively opens and closes the ports *c*₁, *c*₂, *c*₃, etc. Likewise the space *o* is in constant communication with the efflux, and successively opens and closes the upper ports. When the lower port *c*₂ is opened to the influx through the space *q* the opposite lower port *c*₃ is opened to the efflux through the groove *g* and passage *m*. When the upper port *c*₂ is in communication with the efflux through the space *o*, the opposite upper port *c*₃ is opened to the influx through the groove *f* and passage *n*. As *j*₄ passes out of contact with *i*₃, *j*₃ comes into contact with *i*₄, and the line of division between high and low pressure is *i*₄ *i*₃. This line of division travels round and round the chamber. The spindle *r* moves the train of wheel-work which registers the quantity of water.

FIG. 5.

One of the oldest forms of meter which has attained any success is the piston meter, in which the water is admitted alternately to opposite sides of a reciprocating piston. In the early forms two pistons were used which mutually worked each other's valves. Latterly a successful meter has been made with a single piston.

Another type of water-meter adopts the principle of the rotary pump. See PUMP and BLOWING-MACHINES.

Reference must be made to the Venturi meter, a type developed by Clemens Herschel. This is more especially applicable to large quantities of water. As indicated at Fig. 6, it consists simply of a contracted section in the line of

FIG. 6.

pipe conveying the water. A small pipe, *a*, is inserted at the point where the contraction commences, and another, *b*, at the smallest section of the pipe. The height to which water rises in *a* and *b* indicates the pressure at these points respectively; or when, as more commonly happens, the pressure is too great to be observed in that manner, it can be shown by pressure-gauges.

In moving through the diminishing section of the pipe from *a* to *b* the velocity of the water is greatly increased and its pressure is correspondingly diminished. The difference of pressure between *a* and *b*, coupled with the dimensions of the pipe, is a correct indication of the quantity of water flowing. In moving through the expanding pipe the velocity of the water diminishes, and its momentum is expended in restoring the pressure. The pressure is the same at *c* as at *a*, except the slight loss due to friction.

The action of this meter, whereby it furnishes an indication of the quantity of water passing the pipe, is exceedingly simple. Its freedom from liability to derangement of every kind is also manifest. As regards the registering of its indications, however, it is under a great disadvantage. Every other form of meter imparts a movement to something whereby its indications may be registered through a train of wheel-work. The movement for registering the indications of this meter must be obtained from an independent source actuated like the works of a clock. It is claimed that this difficulty has been overcome and a satisfactory registering mechanism perfected.

J. P. FRIZELL.

Water-mole: any one of the ORNITHORHYNCHIDÆ (*q. v.*). See also DUCKBILL.

Water-moulds: the *Saprolegniaceæ*: a family of aquatic, saprophytic or parasitic plants, related to the Downy Mildews and belonging to the order *Siphonocæ* of the class *Chlorophyceæ*. They consist of non-septated, branching filaments which grow in and on the tissues of the host, eventually producing terminal, elongated zoösporangia, from which emerge myriads of biciliated zoöspores. The latter are the active agents of dispersion, and after a period of activity they become covered with a wall and are quiescent for a time; in some cases there is a second period of activity, followed by a second period of rest; eventually they germinate and give rise to new plants.

The sexual organs consist of globular or ellipsoid oogones and slender antherids, which are developed upon the main branches of the plant. It is now generally believed that the antherids are impotent, and that the oogones develop without an actual fertilization; at least it is certain that this is so in many cases. After a period of rest the oogone germinates by sending out a vegetative filament, which finally develops into a plant similar to that upon which it was produced.

Water-moulds "are found more or less commonly in all

fresh waters, but prefer such as are pure and clear. They occur most abundantly and develop most luxuriantly in such waters as contain and favor the growth of the pure-water algae" (*Humphrey*). In such situations they live upon dead woody or herbaceous parts of plants, or the bodies of dead insects, crustacea, fishes, etc. They may attack the eggs of animals, as of fishes, and in certain cases they attack living animals, as the young fishes in fish-hatcheries, and more rarely the large fishes in streams. The salmon in certain rivers in England and Scotland suffered greatly from the attack of a species known as *Saprolegnia ferax*.

All told, there are about sixty known species of water-moulds, belonging to eight or ten genera, of which the most important are *Saprolegnia*, *Achlya*, *Dictyuchus*, and *Leptomitul*.

LITERATURE.—Berlese and de Toni, in *Saccardo's Sylloge Fungorum*, vol. vii. (1888); Fischer, in *Rabenhorst's Kryptogamenflora von Deutschland, Oesterreich und der Schweiz*. (1892); *Humphrey's Saprolegniaceæ of the United States, with Notes on other Species* (1892); Schröter, in *Engler and Prantl's Natürliche Pflanzenfamilien* (1893).

CHARLES E. BESSEY.

Water-oats: See RICE, INDIAN.

Water-ouzel: a kind of bird also called dipper. See DIPPERS.

Water-plantain Family: the *Alismaceæ*; a small group (sixty-five species) of mostly aquatic monocotyledons, with hermaphrodite or diclinous flowers; stamens mostly six; pistils six or more, free and superior; ovules one to many; seeds without endosperm. The members of this family may well be regarded as representing the primitive mo-

A, flower of *Alisma plantago*; B, vertical section of flower.

nocotyledonous structure approaching that of the Crow-foot (*q. v.*) in the dicotyledons. Probably in these two families there is the nearest relationship between monocotyledons and dicotyledons. From fifteen to twenty species occur in North America. *Alisma plantago*, the water-plantain, is very common in shallow ponds and ditches. The numerous species of arrowheads, of the genus *Sagittaria*, are well known from the arrow-like shape of their large leaves.

CHARLES E. BESSEY.

Water-plants: See AQUATIC PLANTS.

Water-pores: openings in the epidermis of higher plants structurally identical with the breathing-pores (see STOMATE), but serving as exits for excreted water-drops and not as air-passages. Their guard cells are not movable, hence the pores remain open. They occur at the ends of fibrovascular bundles, usually at the margins of leaves. In the fuchsia they occur upon the summits of the teeth, into each of which a reduced bundle penetrates. The water exuded by these pores in many cases contains calcium carbonate, which is deposited as evaporation takes place. A full account of these structures is given in de Bary's *Comparative Anatomy of the Vegetative Organs of Phanerogams and Ferns* (English edition, 1884).

CHARLES E. BESSEY.

Water-power: power derived from water falling through a certain height whereby its energy is converted by means of hydraulic motors into useful work.

Water-privileges, as they are commonly called, exist on nearly all streams of any considerable magnitude, and in settled countries, where they have become developed or utilized by the construction of dams or otherwise, they are regarded as a kind of property having special value, depending on the quantity of water available and the height of fall. The quantity of water which flows yearly through a stream at a given point depends on the drainage area of the stream above that point and the yearly rainfall over this area. Inasmuch as the rainfall is seldom the same in any two years, and is never distributed through the year in the same proportions in any two years, the quantity of flow of all streams varies not only in different days, weeks, and

months of the same year, but also varies greatly in different years. It will be found generally that the total amount which flows away from a watershed is 50 to 70 per cent. of the rainfall for the year, while the minimum daily flow for a month is many times less than the average, and the maximum many times greater. On account of these variations of flow a storage reservoir is necessary, for water-powers, and a certain proportion between the capacity of such a reservoir and the number of square miles in the watershed is necessary if the full average daily flow for the year is to be secured. This proportion is seldom realized, on account of the expense attending the establishment of reservoirs; and the consequence is that a vast majority of the improved water-powers of the world are subject to great fluctuations of supply. In wet seasons a large quantity of water runs to waste over the dams, and in dry seasons the supply is deficient, often requiring the stopping of mill machinery.

The quantity of power which any privilege can furnish depends not only on the quantity of water, but also directly on the available fall. When the available head and the quantity of water which flows are determined, the total theoretical energy of the water for a given time is found by multiplying the number of pounds of water that flows during this time by the number of feet of fall. This will give the energy expended in foot-pounds. If the time be one minute, and the number thus obtained be divided by 33,000, the theoretical horse-power of the waterfall will be given. Since no motor can realize a perfect efficiency, however, the actual horse-power is less than the theoretical. If we suppose the motor to utilize 75 per cent. of the available energy, the horse-power will be found by dividing the product of the height and weight of water which flows in one minute (in feet and pounds) by 41,000. It is very difficult, however, to estimate the horse-power of a water-privilege with exactness, as it must vary with the varying flow of water; nothing, in fact, being fixed but the fall.

The motors employed in connection with water-powers are known as water-wheels and water-engines; the latter being used, however, only to a limited extent for small powers. Water-wheels are classed as overshot wheels, breast wheels, undershot wheels, and turbines, the latter forming a distinct class of modern development which has superseded to a great extent the other classes. See **TURBINE** and **WATER-WHEELS**.

The great water-powers of Holyoke, Lowell, Lawrence, Birmingham, and Minneapolis, in the U. S., may be referred to as illustrative on a grand scale of the value of improved water-powers, while the mills scattered throughout nearly every populous district of civilized communities furnish examples on smaller scales. Yet a great many unoccupied and unimproved sites for valuable water-powers still remain. It has been estimated that the rivers of the U. S. can furnish about 200,000,000 horse-power, while the amount utilized is only about 1,500,000 horse-power. The possibilities for the future are hence very great, and when coal becomes high in price water-power is sure to take the place of steam. In addition an enormous amount of available power is wasted twice every day by the energy expended in the fall of the tides, and only the expense of deriving power from this source prevents its utilization.

Water-power is often sold by the "mill-power," which in any particular case is defined by a certain quantity of water under a given head. At Holyoke a mill-power is 38 cubic feet a second under 20 feet head, or 86 theoretic horse-powers. At Minneapolis it is 30 cubic feet a second under 22 feet head, or 75 theoretic horse-power. At Holyoke the cost of one mill-power for sixteen hours a day is \$300 a year.

The possibility of transforming power into electric energy by means of dynamos and of transmitting it to considerable distances has given a marked impetus to the development of water-power. Many cities are lighted and many lines of electric railway are operated by power thus transmitted through distances of from 5 to 20 miles, while in one or two special cases the distance is over 100 miles. The utilization of the power of Niagara Falls is an example.

The mean discharge of the Niagara river above the falls, as determined in 1892 by the U. S. Corps of Engineers, is 230,000 cubic feet a second. A vertical descent of 160 feet occurs at the falls. The theoretic power of the falls is then about 4,000,000 horse-power, nearly equal to all the power, both water and steam, used in the U. S. The possibility of utilizing a portion of this has long been discussed, and a number of mills on the U. S. side below the falls have been

erected to which water is led by canals from points above. In 1892 the construction of a very large power-plant was begun by the Cataract Construction Company on the U. S. side of the river about 1½ miles above the city of NIAGARA FALLS (*q. v.*). The water is led from the river by means of a canal 1,260 feet long to the wheel-pits, passes down through steel penstocks 7½ feet in diameter to turbines, which are placed 136 feet below the head-water level. After leaving the turbines the water falls to the bottom of the wheel-pit and is carried by a tunnel, over 7,000 feet long, to the river below the American fall. The wheel-pits are designed for ten turbines, which in total can furnish 50,000 horse-power, converted into electrical energy by means of dynamos. The work was partly completed and the first power delivered in 1895. See **TURBINE** and **TUNNELS AND TUNNELING**.

Surveys and plans of other companies on both sides of the Niagara river have been undertaken with the intention of erecting other large power-plants. As all of these can scarcely utilize more than 5 per cent. of the total available power, the quantity of water passing over the falls can not be materially diminished. The cost of water-power, when produced under favorable conditions, varies from one-eighth to one-fourth of that of steam-power. See **HYDRAULICS** and **WATER-WHEEL**.
MANSFIELD MERRIMAN.

Water-proofing: the art of rendering textile fabrics, paper, and other substances impervious to water. This result is usually obtained either by applying an insoluble coating upon the surface, or by causing the formation of a compound that exerts a repellent action toward water in the pores of the article, often by means of double decomposition. One of the most important branches of this art is the application of India-rubber in the preparation of mackintoshes and other water-proof wearing apparel. (See **INDIA-RUBBER**.) Woolen and other goods may be rendered water-proof by first saturating them with a solution of soap, then with a solution of alum, or by successive immersions in solutions of gelatin and galls (tannic acid), whereby the same compound that is formed in the tanning of leather is produced. Paper is rendered impervious to grease and water by immersing it, when unsized, in a solution of shellac in borax. The product obtained in this manner somewhat resembles parchment paper. The Japanese and Chinese are said to prepare water-proof paper for the manufacture of umbrellas, water-buckets, rain-coats, etc., by treating it separately with solutions of potassium dichromate and glue, the gelatin being thus rendered insoluble. Revised by IRA REMSEN.

Water-ram: See **HYDRAULIC RAM**.

Water-rat, or Beaver-rat: the *Hydromys chrysogaster* of Tasmania; an animal resembling the muskrat in many particulars, and deriving its scientific name from the golden-yellow color of its belly; the back is of a dark rich brown. It is an expert swimmer, frequents both salt and fresh water, is nocturnal in habits, and when eating supports itself upon the hind legs and tail.

Water-rice: See **RICE, INDIAN**.

Watershed [*water* + *shed*, a parting < O. Eng. *scēadan*; Germ. *scheiden*, part, separate]: a geographical term of somewhat ambiguous meaning, as it has been used in different senses by various writers. Some apply the term to the slopes of the land from which water is shed to a river, thus making every valley consist of two watersheds which unite along the stream-line. Others, with the support of etymology and better usage, mean by it the line of water-parting that separates the slopes on the two sides of a height of land. In the U. S. the word divide has come into general use; this lends itself better to derivative terms, such as "subdivides," the name for the numerous subordinate water-partings between the minor streams of a river system; "undivided" areas, meaning the plain surfaces which are not yet dissected by streams, and from which the rainfall is disposed of more by penetration into the soil or by evaporation than by runoff. These are by no means rare. It is a serious error to suppose that watersheds are necessarily well defined. They may be very indefinite, being areas rather than lines, as between the branches of the Missouri and the Saskatchewan on the undivided plains of the Rocky Mountains. Whenever one side of a divide is eroded more rapidly than the other, the watershed will be shifted toward the side of slower wasting. (For such "migration of divides," see **RIVERS**.) In some cases divides are altered by movements of the land. The former discharge of Lake Huron and Georgian Bay across the province of Ontario to the lake of that name has

been changed by a general uplift of the land to the N. E.; thus a divide now crosses the former path of the lake outlet. (See NIAGARA.) The former presence of a great ice-sheet over Canada and some of the Northern U. S. greatly interfered with the discharge of rivers in accordance with land watersheds; thus many of the great lakes were for a time drained by southward overflows when the ice stood in the way of their present northeastward discharge. The former channels of these temporary overflows are easily traceable at several points; for example, along the path of the canal now in construction by which Lake Michigan is again to be in part drained southward; and between the head waters of the Maumee and Wabash in Northern Ohio, where Lake Erie once ran over to the Mississippi system. It occasionally happens that a lake has two or more outlets, several such lakes being known in Canada. The line of the watershed between the outflowing streams is then practically interrupted on the lake surface.

W. M. DAVIS.

Water-spaniel: any one of several breeds of the spaniel, distinguished by fondness for swimming. They have rather long, curled hair, which has an oily feel and turns water very well. They are largely used by sportsmen for the purpose of fetching out of the water the game which they have shot, or of swimming to the opposite bank of a river or to an island and starting therefrom the various birds that love such moist localities. The Irish water-spaniel, one of the best-known breeds, is a dark brown, frequently with a white spot on the breast.

F. A. L.

Waterspout: a secondary storm closely allied in formation to the tornado, hail-storm, thunder-squall, and white squall. Under certain conditions the broad, thin "sinks" of revolving air called cyclones develop in the southern and southeastern octant, small secondary depressions which are called, according to their formation, intensity, and appearance, tornadoes, hail-storms, thunder-storms, and waterspouts. Two prime conditions must exist for the occurrence of these vorticular storms; first, a condition of unstable equilibrium of the air; and, second, a gyratory motion. The axis of such storms is not necessarily vertical, and hence in a waterspout the dark spout portion may writhe and twist in a manner similar to the funnel-shaped cloud of the tornado. The whirling is counter-clockwise. The beginning of a waterspout is generally a pendent cloud on the under surface of a large cloud-layer. The tapering whirl apparently descends and the sea-water immediately below appears to rise and meet it. What really occurs, however, is cloud condensation, and but little sea-water is carried aloft. Ships have sailed into waterspouts in process of formation with the barometer remaining unaffected until the spout itself was almost reached. At the center of the spout the diminution of pressure is marked, and objects there experience not only strong in-flowing, whirling, and out-throwing forces, but also the explosive force due to a rapid expansion of confined air. Waterspouts are most frequently seen in tropical seas, but are by no means rare in higher latitudes. As many as twenty spouts have been seen within an hour, from five to seven at the same time. It is generally believed that the firing of a cannon or any violent concussion of the air will dissipate waterspouts, but cannon have been discharged directly at spouts without such results, and there is no known reason for such a result. ALEXANDER MCADIE.

Water-supply: See WATER.

Water-tiger: See DYTISCIDÆ.

Watertown: town (incorporated in 1630); Middlesex co., Mass.; on the Charles river, and the Fitchburg Railroad; 8 miles W. of Boston (for location, see map of Massachusetts, ref. 2-H). It contains the villages of Watertown, Mt. Auburn, and Bemis; has seven churches, high school, seven district schools, public library, electric railway to Boston, the noted Mt. Auburn Cemetery, an important U. S. arsenal where a large amount of modern ordnance-work is being done, a national bank with capital of \$100,000, a savings-bank, and a weekly newspaper; and is principally engaged in ordnance-work and the manufacture of woolen goods, starch, needles, stockings, cardigan jackets, paper bags, etc. In 1894 it had an assessed valuation of \$8,251,400. Pop. (1880) 5,426; (1890) 7,073; (1895) 7,788.

EDITOR OF "ENTERPRISE."

Watertown: city (settled in 1800, incorporated as a city in 1869); capital of Jefferson co., N. Y.; on the Black river, 8 miles above its mouth in Black River Bay, Lake Ontario, and on the Rome, Watertown and Ogdens. Railroad; 71

miles N. of Syracuse, 90 miles N. W. of Utica (see map of New York, ref. 2-G). It is within an hour's ride of the Thousand Islands and but 12 miles from historic Sacket Harbor. The business portion centers around a beautiful public square containing two small parks and a handsome fountain; the manufacturing establishments extend along the river for 3 miles; the residence portion spreads from both banks of the river and out from the business center in every direction. Small triangular parks with fountains are scattered throughout the city. Electric street-railways extend from the city to neighboring villages. Among the notable buildings are the post-office, State armory, opera-house, Jefferson County Savings-bank, Henry Keep Home for the Aged, the county buildings, and several fine church edifices. There are 20 church societies: Methodist Episcopal, Presbyterian, Protestant Episcopal and Roman Catholic, 3 each; and Universalist, Baptist, Congregational, Disciples, Free Methodist, African Methodist Episcopal Zion, Spiritualist, and Jewish, 1 each. The public schools number 9, with graded system, high school, and night-school. The enrollment is 3,000, number of teachers 80, annual cost \$47,000. Other educational institutions are a private day-school for girls, kindergarten, business college, Convent of the Immaculate Heart, St. Joseph's parochial and apostolic schools, and St. Joachim Academy and kindergarten. The city has a bureau of charities and active societies for the prevention of cruelty to children and animals, city hospital, orphans' home, county jail, and 2 daily, 2 semi-weekly, and 4 weekly newspapers. The annual city receipts are \$150,918; expenditures, \$109,430; debt, \$103,000; and property valuation, \$8,549,230. There are 5 national banks with combined capital of \$571,240, and 2 savings-banks with aggregate deposits of \$2,150,000. The principal business interests are allied with agriculture and manufacturing. There are 4 carriage and wagon works, 10 paper-mills, 4 roller flour-mills, 3 machine-works and foundries, planing-mills, air and vacuum brake-works, marble-finishing works, corn-canning factories, steam-engine works, and manufactories of furniture, electrical machinery, paper-mill machinery, printing-presses, thermometers, underwear, and tools and locks, brass goods, spirit-levels, lamps, tinware and peddlers' supplies, boats, agricultural implements, etc. Manufacturing is promoted by water-power derived from the rapids and falls of Black river within the city boundaries. The city owns its own water-works, which cost \$300,000. Pop. (1880) 7,883; (1890) 14,725; (1895) estimated, 20,000.

CHARLES E. COLE, "WATERTOWN DAILY TIMES."

Watertown: city (founded in 1881); capital of Codington co., S. D.; on the Big Sioux river, and the Burl., Ced. Rap. and N., the Chi. and N. W., the Gt. North., and the Minn. and St. L. railways; 70 miles N. E. of Huron, 93 miles W. of Benson (for location, see map of South Dakota, ref. 5-G). It is in a wheat-growing and stock-raising region, 3 miles from Lake Kampeska, the most beautiful lake in the State, and has 8 churches, graded public schools, 3 national banks with combined capital of \$150,000, and 3 weekly newspapers. Pop. (1890) 2,672; (1895) 2,709.

EDITOR OF "JOURNAL."

Watertown: city (settled in 1836); Dodge and Jefferson cos., Wis.; on the Rock river, and the Chi. and N. W. Railway; 39 miles E. by N. of Madison, 44 miles W. by N. of Milwaukee (for location, see map of Wisconsin, ref. 7-E). It is bisected by the river, which furnishes valuable water-power for manufacturing; is surrounded by a thickly settled and highly cultivated agricultural region; contains the Northwestern University (Lutheran), College of Our Lady of the Sacred Heart (Roman Catholic), public high and graded schools, a national bank with capital of \$50,000, and 2 State banks with combined capital of \$125,000; and has 4 weekly newspapers. It is an important cheese and barley market. Pop. (1880) 7,883; (1890) 8,755; (1895) 9,922.

EDITOR OF "GAZETTE."

Water Valley: city; Yalobusha co., Miss.; on the Ill. Cent. Railroad; 17 miles S. of Oxford, 28 miles N. N. E. of Granada (for location, see map of Mississippi, ref. 5-G). It is in an agricultural and dairying region, with extensive forests of valuable timber in the vicinity, and has 11 churches, public schools for white and colored children, 2 State banks with combined capital of \$49,125, cotton and broom factories, large railway, machine, and car shops, and a monthly and 4 weekly periodicals. Pop. (1880) 2,220; (1890) 2,832; (1895) estimated, 5,200.

EDITOR OF "NORTH MISSISSIPPI HERALD."

Waterville: city; Kennebec co., Me.; on the Kennebec river, and the Maine Cent. Railroad; 18 miles N. by E. of Augusta, 80 miles N. E. of Portland (for location, see map of Maine, ref. 9-C). It was settled about 1650, was formerly a part of Winslow, was incorporated as a town in 1802, had West Waterville set off from it in 1873, and was chartered as a city in 1888. It derives excellent power for manufacturing from Ticonic and other falls, and has 2 cotton-mills running 90,000 spindles, 2 iron-foundries, 2 tanneries, railway construction and repair shops, saw and grist mills, 2 brick-yards, slate-quarries, and shovel-handle factory. The city is the site of COLBY UNIVERSITY (*q. v.*), and of Coburn Classical Institute, and has 8 churches, a high school, convent, parochial school, 3 national banks with combined capital of \$400,000, a trust and deposit company with capital of \$100,000, a savings-bank, 2 building and loan associations, and 3 weekly, a semi-monthly, and 2 monthly periodicals. Pop. (1880) 4,672; (1890) 7,107; (1895) estimated, 8,500.

EDITORS OF "MAIL."

Waterville: village (named in 1807, incorporated in 1870); Oneida co., N. Y.; on the Del., Lack. and West. Railroad; 22 miles S. W. of Utica, the county-seat (for location, see map of New York, ref. 4-H). It is in a hop-growing region, and has 6 churches, graded union school with library, a national bank with capital of \$150,000, a private bank, 2 steam grist-mills, shoe, paint, and wood-working factories, race-track and agricultural fair-grounds, Y. M. C. A., Granger, and Masonic halls, a crematory, and a semi-weekly newspaper. Pop. (1880) 1,184; (1890) 2,024; (1895) 1,875.

Water-wheels: wheels for utilizing the energy of a waterfall, the water entering the wheel only upon a portion of the circumference. Water-wheels are usually vertical, turning upon horizontal axes.

When the water enters around the entire circumference the wheel is called a turbine; these are usually horizontal, revolving on vertical axes. Turbine wheels are more extensively used than all other kinds of hydraulic motors; they are described in the article TURBINE.

The overshot wheel is an old form especially adapted to high falls. The water from the reservoir is led through a feeding canal to the upper part of the wheel, where it falls into buckets. The action of the water is then almost entirely that of weight, and the work performed is closely

FIG. 1.—Overshot wheel.

equal to the weight of water multiplied by its fall in the wheel. The overshot wheel revolves slowly, but its efficiency is high, from 80 to 90 per cent. of the theoretic work being utilized. On account of its large size and the liability to become clogged with ice in the winter time it has been mostly superseded by turbines. One of the largest overshot wheels is that at Laxey, on the Isle of Man; it is 72½ feet in diameter, and develops about 150 horse-power.

The breast wheel is similar to the overshot wheel in general appearance, but it receives the water near the middle of its height instead of near the top. The water acts mainly by weight, but also to a certain degree by impulse, at the point of entrance. Its efficiency is from 70 to 80 per cent. of the theoretic work.

Undershot wheels in great variety have been constructed. Those with plane radial vanes are used in running streams, and are of low efficiency. The form devised by Poncelet has a curved sill and guide by which the water is directed tangentially against the vanes, and its efficiency is from 60 to 70 per cent. In these wheels the water acts almost entirely by its impulse, and the advantageous velocity of revolution is one-half that of the velocity of the entering water.

Vertical impulse wheels, which are driven by a stream of water issuing from a nozzle under high pressure, have been developed since 1880, and are highly advantageous on account of their small size and consequent portability. The water is brought to the wheel through a pipe or hose, and

delivered tangentially against a series of small buckets on the circumference. The velocity of revolution is rapid. A

FIG. 2.—Poncelet's undershot wheel.

Pelton wheel at the Sutro tunnel, in Nevada, 36 inches in diameter, is driven under a head of 2,100 feet, and makes 1,150 revolutions a minute, a stream of water from a nozzle ¾ inch in diameter furnishing nearly 100 horse-power. With buckets properly curved, so that the water is turned back contrary to its original direction, this form of wheel has been found to have an efficiency of 83 per cent.

The principles of the design of water-wheels may be summarized by saying that the water should enter the wheel without shock and leave without velocity. When the vanes are so designed that the water enters upon them tangentially, shock, together with the consequent losses in eddies and foams, is avoided. When the water leaves the wheel without velocity all its available energy has been expended. It is not possible to realize either of these conditions fully, and in addition frictional resistances consume from 5 to 10 per cent. of the total work, so that efficiencies of over 90 per cent. are rarely obtained.

FIG. 3.—The Pelton impulse water-wheel.

A water-wheel is tested by means of a friction-brake or dynamometer attached to a pulley on its axis. All the work of the wheel is then expended in producing friction, and this is balanced by weights acting at the end of a lever. From the load thus balanced, the length of the lever, and the number of revolutions of the wheel per minute, the actual work of the wheel is computed, while the theoretic work is found by finding the weight of water expended per minute and its effective head. Thus both the power and the efficiency of the wheel are ascertained, and by running it at different speeds the velocity which gives the maximum efficiency is also determined.

See Weisbach's *Hydraulics and Hydraulic Motors* (New York, 1877); Björling's *Water or Hydraulic Motors* (London, 1894); and also the works mentioned in the article TURBINE.

MANSFIELD MERRIMAN.

Waterwitch: See GREBE.

Water-works: constructions and appliances for the collection, preservation, and distribution of water for the supply of communities. For the supply of large communities access to streams of a size sufficient to furnish the required quantity at all times can not usually be had; and when possible the stream is ordinarily exposed to contamination, which makes its use objectionable. The most suitable sources of supply are small streams in sparsely inhabited districts. The flow of such streams is enormously variable, being sometimes as much in an hour as at other times in a month. They can furnish no constant supply

of any magnitude without the aid of storage-reservoirs. The most that is ordinarily attempted is to utilize a quantity equal to the flow of the driest year. Experience has shown that to accomplish this the reservoirs must be capable of containing about four months' supply. That is, if the minimum yield for a sufficiently long series of years is 14.68 inches of water, which is equivalent to about 700,000 gal. a day to the square mile, the reservoirs should be sufficient to deliver 700,000 gal. a day for each square mile of drainage-ground during a period of about four months. This is a reservoir capacity of 85,000,000 gal. per square mile of drainage-ground. In some European systems of water-works an attempt is made to economize the flow of the three driest known consecutive years. For this purpose the reservoir capacity must be equal to about six months' supply. The average rainfall of the three driest consecutive years of a long series is usually represented very closely by the general average rainfall diminished by one-sixth. Where, for instance, the average rainfall of a series of years, thirty or more, is 48 inches, the average of the three driest consecutive years will be about 40 inches. Assuming 20 inches collectible, this would be about 952,000 gal. daily per square mile. The reservoirs must be sufficient to contain six months' supply at this rate—viz., about 174,000,000 gal. per square mile of drainage-ground. To economize the total yield of the drainage-ground there would be required a reservoir capacity equal to the average flow of from nine to eighteen months—that is, in the case just supposed, from 260,000,000 to 520,000,000 gal. per square mile of drainage-ground. The gallon spoken of here, unless otherwise stated, is the U. S. standard gallon, 231 cubic inches, being 58.373 troy grains at the maximum density. A cubic foot contains 7.48 gal. The imperial gallon contains 10 lb. of water at a temperature of 62° F., so that a cubic foot contains very nearly 6½ imperial gallons.

Considerable quantities of water are often obtained by pumping from deep wells. This term is used in distinction from shallow wells, which in all countries are the chief source of water-supply for isolated dwellings. The geological formations composing the earth's crust are always saturated to within a few yards of the surface with water. The quantity of water contained by different materials varies greatly. Sand, gravel, and chalk contain from 2 to 2½ gal. a cubic foot; magnesian limestone, about 2 gal.; building-sandstone, about three-fourths of a gallon; granite, one-fifth of a gallon. A square mile of sandstone formation 500 yards deep contains water sufficient for nine months' supply of New York city. But such a region, once exhausted of water and depending on rainfall for its replenishment, would require more than 200 years to fill up again. Water drawn from such formations by deep wells forms the supply of many European towns, though this mode of obtaining water is but little practiced in America. The city of Liverpool, England, with a total supply of 20,000,000 imperial gal. a day, derives 6,250,000 from wells in the new red sandstone underlying the region. The wells are from 100 to 250 feet deep, and are supplemented by bore-holes reaching 200 to 500 feet deeper. There are four such wells in use, furnishing from 830,000 to 2,900,000 imperial gal. a day each. The city completed in 1891 a system of water-works on a stupendous scale, consisting of a reservoir on the head-waters of the Severn, in Wales, to hold 10,000,000,000 or 12,000,000,000 imperial gal., and an aqueduct 68 miles in length to the service reservoirs of the city, at a cost for the entire system of \$10,000,000. Birkenhead, near Liverpool, containing 99,184 people in 1891, derives its entire supply from wells and borings in the sandstone. The Kent Company, one of the companies supplying London, pumps daily about 8,000,000 imperial gal. from wells reaching the chalk formation; the New River Company has the capacity to draw about 9,000,000 gal. a day from the same source. The excessive pumping in London has resulted in a progressive lowering of the level to which water will rise in deep wells, amounting to more than 100 feet since the beginning of the nineteenth century. Among places of minor importance in England, probably not less than one-half draw their supply of water from deep wells. Deep wells have not been much used in the U. S., except for special purposes, as obtaining a supply of pure water for paper-mills, breweries, etc. Some towns in Texas obtain domestic supplies from this source. Galveston, on the Gulf coast, has a system of this kind. Many towns have adopted systems of driven wells, consisting of pipes carrying strainers, driven into beds of gravel or sand, and have thus obtained limited supplies of very pure water.

Consumption.—The purposes to which the water-supply of towns is applied may be embraced under three general heads: 1, domestic supply; 2, trade supply; 3, watering. The first includes the manifold uses and waste of water in dwellings; the second, its use in various manufacturing establishments, as bleacheries, dye-works, laundries, sugar-refineries, breweries, distilleries, the working of elevators and supply of steam-boilers, and in some cases for mechanical power; the third includes watering streets and grounds, extinguishing fires, flushing sewers, etc. In London the domestic supply amounts to about 82 per cent. of the total, which is probably about the average for commercial cities. In manufacturing towns not using water-power the second item is more important, amounting sometimes to one-third or more of the total. The third item is not more than 5 per cent. on an average, being next to nothing in the winter, and sometimes reaching as high as 20 per cent. in hot weather and in suburban districts.

The following table of water-works data for twenty cities in the U. S. is obtained from the *Engineering News's Manual of Water-works* for 1890-91:

CITIES.	Population supplied.	No. of taps.	No. of meters.	No. of hydrants.	Daily consumption, gal.

Cambridge.....	1873	41	54
Lynn.....

In 1894 the daily rate of consumption per inhabitant in Washington, D. C., was 187 gal.

The table on the next page is from *Waterworks Engineering*, by Turner and Brightmore (London, 1893).

The most striking feature of these tables is the difference in consumption between cities in Europe and those in the U. S., the highest consumption of the latter being about equal to the lowest of the former. This is due in some degree to the general wasteful habits of Americans, but more especially to the fact that in European towns consumers of water are usually under some control and restraint in its use. In the U. S. such restraint is rarely exercised, and reckless and wanton wastefulness prevails. The evil is constantly growing, and the above figures for Buffalo, Chi-

WATER-SUPPLY OF CERTAIN TOWNS IN GREAT BRITAIN.

ago, Washington, etc., show that it is impossible to assign any limits to the consumption under such a system. The simplest mode of restraining waste is by means of an intermittent supply, each consumer having a reservoir fitted with a self-closing cock. Water is turned on once a day long enough to fill all reservoirs, and then shut off. This method has been, and still is, much practiced in English towns. It is chiefly objectionable as regards fires. With constant supply the best means of restraining waste hitherto adopted consists in a system of inspection to detect defective fittings, pipes, and appliances and enforce remedies. In the city of Norwich, England, the consumption was reduced from 40 to 15 gal. by such means. A very complete system of this kind has been in force for a number of years in Liverpool, and to this is due the low consumption there. The city has been divided into a number of districts, in each of which the aggregate consumption is measured by meters. The nightly indications of these meters show which districts are most in need of inspection. No premises are entered unless waste is observed. Inspections to detect waste are made at night after all legitimate consumption has ceased. The inspector applies his wrench or key to the street stop-cock controlling the service-pipe which supplies the premises, and nearly closes the cock. Then, applying his ear to the key, the passage of a very minute quantity of water can be detected. If waste is observed, the house is entered in the daytime, the fittings carefully inspected, and defects pointed out, which the owner is required to remedy. Previous to the adoption of these measures the city had been on intermittent service. At one time in 1865 water was furnished for only three hours a day. Constant service was restored for a short time in 1873 as an experiment. It appeared that its maintenance would require a daily supply of 33½ imperial gal. a head. The results of these inspections were surprising. In a large district the consumption was reduced to 12 imperial gal. a head. In a district containing 2,134 persons it was reduced to 6 or 7. In 1875 the constant service had been restored to nearly the entire town, with a consumption much less than had formerly been required with intermittent service. It is conceded that only the most stringent legal provisions, and the most ample authority on the part of officers for their enforcement, can avail to restrain the wasteful tendencies of consumers.

A department of inspection and waste was organized about 1883 by the city of Boston on the same general plan as for Liverpool, so far as the nature of the appliances in use would permit, Boston not being furnished with sidewalk stop-cocks. The official report for 1884 claimed a reduction of the daily consumption from 91 to 70 gal. a head. Later these good results seem to have disappeared. The daily consumption rose in 1893 to over 100 gal. a head.

These results show that a material diminution of waste may be effected by simply pressing the matter upon the attention of consumers. Nevertheless, the only remedy that will go to the root of the evil is a system of charges based upon the quantity of water actually drawn by each consumer. The difficulty in the way of this result has hitherto been the want of a reliable water-meter at a reasonable cost. (See WATER-METER.) Mechanical skill may be said to have fairly supplied this want, and the question is now presented to the taxpayers in great cities whether, instead of spending great sums of money to provide additional supplies of water, it may not be judicious to undertake the task of enforcing a proper use of the supply already at hand.

Constructions.—The multifarious applications of water in a city require a considerable pressure in the distributing-pipes. This is secured in two ways: (1) by adopting a natural source of water at a sufficient elevation; (2) by pumping. The most obvious classification of the systems of water-supply is that of gravitation systems and pumping systems. The configuration of the ground is rarely such as to furnish a source sufficiently elevated and sufficiently near, capable of supplying the requisite quantity at all seasons of the year. The principal elements of a gravitation system are—(1) the drainage-grounds; (2) the storage reservoirs; (3) the conduit; (4) the distributing or service reservoirs; (5) the distributing-pipes. The pumping system commonly lacks the feature of storage reservoirs, and has in addition the pumping establishment and force main, and ordinarily arrangements for filtering or otherwise purifying the water. There are, however, pumping systems with storage reservoirs, of which Brooklyn, N. Y., is an example, and there are gravitation systems in which the water is subjected to filtration, as in the case of Dublin, Ireland.

The conduit or aqueduct conveys the water from the source to the distributing reservoir in or near the city. In extensive works it is ordinarily of masonry, not being intended to sustain any pressure. It is built to a nearly level grade, having only sufficient inclination to give motion to the water. Intervening ridges are cut down or pierced by tunnels. Valleys are crossed by embankments of earth or earth and masonry combined, or by rows of arches. In crossing deep valleys or rivers the masonry of the aqueduct is sometimes interrupted, and the water flows in iron pipes, which descend into the valley and rise and re-enter the aqueduct on the opposite side. In the ancient aqueducts, where, from the limited knowledge of iron-working, such expedients could not be adopted, these crossings required ranges of arches supported by piers of enormous height, constituting the most remarkable monuments of ancient civilization. (See AQUEDUCTS.) Small conduits are often made of earthenware pipe. The best earthenware pipes, and particularly the celebrated Scotch pipes, are made from very pure clay mined at great depths, the clays found near the surface of the ground not being found so suitable. The pieces are moulded by hydraulic pressure, and are covered with a vitreous glazing which renders them impermeable to water. These pipes are made in lengths of 2 or 3 feet. The smaller sizes are put together with sockets. Each piece has an enlargement at one end into which the next piece enters, and the joint is made tight by hydraulic cement. The larger sizes are put together with sleeves, which are narrow rings encircling the pipe at each joint, the space between the inside of the sleeve and the outside of the pipe being filled with hydraulic cement. The thickness of earthenware pipes should be about one-twelfth of the diameter. Such pipes have been made as large as 48 inches in diameter. Conduits have been made of wood, but such are not to be recommended. For the first year or two they impart a disagreeable taste to the water, and if not entirely filled with water at all times they decay rapidly. The portions of a conduit subjected to pressure are sometimes made of wrought iron lined with brickwork or cement. The use of wrought-iron pipes without any protection other than a coating of tar or mineral paint originated in California, and has latterly been coming into favor in other parts of the U. S. It may be safely adopted in the case of waters which do not act with energy upon iron. The East Jersey Water Company has laid down a steel-ribbed pipe, 48 inches in diameter and 21 miles long, to convey the waters of the Pequannock river to supply municipalities in the vicinity of New York city.

A long and large aqueduct should be provided with gates and discharge-sluires at intervals of a few miles, in order that any section may be emptied for repairs without wasting the entire contents of the aqueduct. The inside of a conduit should be cleaned once or twice a year. This is done with brooms after drawing down the water.

A pumping system usually has a conduit, not essentially different in construction from that required in a gravitation supply, though it ordinarily forms a much less important feature of the system. Its purpose is to convey the water from the source to the pump-well, which can usually be located so as not to require a great length of conduit. In water-works for cities located on the shores of the Great Lakes, and drawing their supply therefrom, the conduit forms a very important feature. The water can not be taken from any point near the shore, as it is liable to be contaminated

by sewage and turbid on account of the action of waves. To procure water free from the latter source of impurity, the conduit must extend a long distance into the lake, as it is only in water of considerable depth that the waves cease to act upon the bottom. A solid structure built into the lake would require the strength and solidity of a breakwater, and even in that case would not be sufficiently permanent and free from settlement to serve as the foundation of an aqueduct. The method adopted at Chicago and other lake cities has been to extend a tunnel under the bottom of the lake to the desired point. The first tunnel built in the U. S. for the supply of water was the one at Chicago, made in 1864-67, under the direction of E. S. Chesbrough, the engineer for the city, who may be regarded as the originator of this method of procuring a supply of water from lakes. This tunnel is about 2 miles long and 5 feet in diameter. A second tunnel, 7 feet in diameter, was built parallel to it in 1872-74. A third, 10 feet in diameter and extending 4 miles into the lake, was brought into use in 1892. Cleveland built a tunnel of this kind over a mile long and 5 feet in inside diameter in 1869-74. See TUNNELS AND TUNNELING.

Distributing or Service Reservoirs.—The supply of water is liable to too many contingencies to be intrusted to a pipe or conduit reaching from the source of supply to the point of consumption. It is always considered judicious, where the topographical conformation admits of it, to provide a reservoir at an elevation corresponding to the pressure required in the distributing-pipes. An elevation of from 100 to 150 feet is usually sufficient for all purposes of domestic supply, and a greater height than 150 feet is not desirable, unless all fittings are made to conform to the increased pressure, as the leakage is increased, and the velocity with which the water moves in the service-pipes often causes them to burst when outlets are suddenly closed. Where fire-engines are to be dispensed with a greater elevation is necessary, as will be noticed further on. Many towns situated on undulating ground have more than one reservoir—a low one for the lower districts, and a high one for the higher. The town of Brighton, England, has four "zones of distribution," with a reservoir for each, the highest being 480 feet above the level of the sea.

In localities where land is not too expensive, reservoirs are usually built entirely of earth. The most suitable site for the construction of a reservoir is an eminence composed of gravel containing such a proportion of clay as to admit of being consolidated by pressure. This is called "binding gravel." The embankments forming the sides of the reservoir are formed of this material very carefully compacted by heavy rollers and by the wheels of vehicles. Such embankments ought to have a slope of 2 base to 1 perpendicular, so that an embankment 25 feet high, assuming it to be 15 feet wide on the top, should be 115 feet wide at the bottom. They are further secured from filtration by a central core or an inner lining of puddle, which is an artificially prepared mixture of clay and gravel in such proportions as to be impermeable to water without being liable to crack when dry. Ledges and abandoned stone quarries have sometimes been chosen as sites for reservoirs, with usually very unsatisfactory results. The rock should always be covered with a thick layer of puddle. The inner slopes of the embankments are usually paved with heavy stone resting on a layer of pebbles or broken stone. This is necessary on account of the waves to which all bodies of water are liable, which would otherwise injure the banks and render the water turbid. Reservoirs in thickly settled parts of towns are generally built of masonry, and are sometimes covered to prevent contamination of the water by dust and smoke. All reservoirs in London within 5 miles of St. Paul's are required by law to be covered, unless the water is subjected to filtration after leaving the reservoir. In open reservoirs the water should not be less than 20 feet deep when full, as vegetation is active at a depth much less than this when exposed to the sun. Modern practice, in fact, calls for much greater depths. Impurities sometimes affect the surface, while the water remains good at the bottom, and *vice versa*, for which reason engineers are accustomed to construct reservoirs so that the water can be drawn from the bottom or otherwise at pleasure. They should also be so arranged that the water will have a circulation through the whole extent of the reservoir, the outlet being at the opposite side from the inlet.

In a pumping system the pipe leading from the pumps to the reservoir is called the force-main. It is usually made a little stronger than other pipes sustaining the same pressure, under the impression that it is liable to greater shocks from

the pulsations due to the action of the pumps, though, in reality, the pulsations to which the force-main is liable are probably less violent than is the case with any other part of the system of pipes, especially where, as is the universal practice, it is in free communication with an air-chamber.

Where, from lack of a suitable eminence or from economical considerations, no reservoir is constructed and the water passes from the pump directly into the distributing-pipes, a stand-pipe is often employed to prevent the pulsations due to the action of the pumps from extending to all parts of the distributing system. A stand-pipe is simply a vertical pipe communicating with the force-main, and rising to a height greater than that corresponding to the pressure in the distributing-pipes. It sometimes consists of two pipes communicating with one another at their summits. In this case the pump acts under a constant pressure, the water being all raised to the same height and flowing from one pipe to the other at their summits. In the case of a single pipe the water oscillates according to the varying consumption and the speed of the pumps. A great many small towns have recently adopted stand-pipes which serve, to some extent, the purpose of reservoirs—viz., circular tanks of plate iron 20 feet or more in diameter. These have reservoir capacity sufficient for any sudden emergency, and greatly diminish the difficulty of regulating the speed of the pumps, allowing the latter to stop for longer or shorter periods without interrupting the supply.

The *Holly system* of water-works has neither reservoir nor stand-pipe. The pumps work directly into the distributing-pipes, and when the pumps stop the supply ceases. An automatic device controls the speed of the pumping machinery according to the pressure in the mains. It is claimed that this system maintains a pressure sufficient for domestic purposes at all times, and on the occurrence of a fire the pressure can in a few minutes be raised to a point which will enable the latter to be controlled by streams from the hydrants without the use of fire-engines. In fact, many towns, upon the adoption of this system, have disposed of their movable engines and rely altogether upon hydrants for controlling fires. A fire-alarm, to give notice at the pump-house of the occurrence of a fire, is a part of the system. It is claimed for the Holly system, as an advantage over reservoirs sufficiently elevated to deal with fires, that it works under the high pressure only so long as the fire lasts, while for ordinary purposes it works under a very moderate pressure. This would certainly be a substantial advantage if the pumps worked with the same relative economy in the one case as in the other. This system recommends itself by its low first cost as compared with a reservoir system, but the necessity of keeping the machinery in readiness for fires at all hours of the day and night, with the requisite number of men in attendance, makes the pumping much more expensive than in the reservoir system.

Purification of Water.—For various methods of purifying the water-supply, see WATER.

The *distributing system* embraces the network of pipes through which the water is conveyed from the reservoir or other central point to all parts of the town. The pipes lying in the common streets and thoroughfares are called mains; those leading from the latter to the premises of consumers are called service-pipes. Distributing mains of wood, lead, stone, earthenware, and asphaltum have been used at various times. The water of London was once distributed in wooden and lead pipes. The water from Jamaica Pond was distributed in Boston in wooden pipes before the introduction of the supply from Lake Cochituate. Wooden pipes, formed of the trunks of straight trees, are still employed for conveying water under slight pressure, as in the supply of farm-buildings. Pipes formed of natural stone, artificially hollowed out, were laid down in considerable quantity in London, and also in Manchester, England, in the early part of the nineteenth century. The result in each case was a disastrous failure. A pipe of sheet iron, coated internally and externally with hydraulic cement, has been extensively used in the U. S. The cement, while it remains intact, very effectually preserves the iron from rusting. These pipes are joined together by means of sleeves of the same material, the void spaces being filled with cement. The cement used in these joints gives such a degree of rigidity to the line of pipes that any settlement of the ground causes cracks. The separation of the cement from the iron at any point is followed by a rapid corrosion of the pipe. This kind of pipe has, in many cases, given satisfaction, though it has frequently failed in connection

with the Holly system of pumping, and is at present little used, on account of the great reduction in the price of cast iron, which, notwithstanding its grave defects, is by far the most reliable and satisfactory material. The most serious defect of cast-iron pipe is the facility with which the metal is acted on by water. The inner surface becomes covered with tubercles or protuberances, sometimes of such size as to diminish the effective diameter of the pipe by as much as $\frac{1}{2}$, or even 2 inches. In small pipes this action sometimes goes to the extent of closing them entirely. A 3-inch pipe is often so choked that one can not see through it from end to end. Wrought iron is attacked more energetically than cast. The gray variety of cast iron is more readily oxidized than the white. A large proportion of carbon or graphite in the iron accelerates the action. The development of tubercles proceeds most rapidly in the softest and purest waters, the Boston pipes being more rapidly fouled than those of Philadelphia or New York. No method of preventing this action has been discovered, but it may be delayed for many years by a process commonly ascribed to Dr. R. Angus Smith, of Manchester, England. This consists in immersing the pipe in a bath of coal-tar, both the pipe and tar being heated to a temperature of from 300 to 500° F. The pipe remains in the tar some thirty minutes, and on being removed and allowed to cool a very fine coating is formed on the surface of the pipe. This resists the action of the water for a long time, but the tubercles usually appear in the course of ten or twelve years, sometimes much sooner. Pipe thus prepared imparts a slightly tarry taste to the water at first, but it disappears in a year or two. Cast-iron pipes are also liable to another kind of deterioration in certain soils, arising from the action of matters contained in the soil upon the exterior of the pipe. The iron undergoes a remarkable change, being reduced to a substance resembling graphite. The mud of salt-water marshes has this action upon iron in a remarkable degree. Long lines of pipe laid in this material in Boston have been entirely destroyed in the course of fifteen or twenty years. In some places a crowbar, or even a knife, could be thrust through the pipe, and it could be cut with a knife. The pitch coating is thought to be a protection against this kind of decay, but for greater security the pipe should be imbedded in and covered with unobjectionable material. Cast-iron pipes are made in lengths of from 9 to 12 feet. For the purpose of joining them together, one end of each pipe has an enlargement called the bell; the unenlarged end is called the spigot. The inside diameter of the bell is some three-fourths of an inch greater than the outside diameter of the spigot. The spigot of each pipe enters the bell of the preceding pipe to the depth of 3 or 4 inches, and the void space is filled with lead.

Pipes are usually cast in vertical moulds with the bell downward. A more uniform thickness is thus secured than by casting them horizontally. Pieces of peculiar form, called branches, are required where two lines of pipe communicate with one another. Curved pieces are required for changes of direction in a line of pipe, though straight lengths of pipe may be laid to a curve of 400 feet radius. Pipes usually communicate at all street-crossings. This intercommunication gives a great number of routes by which the water may approach any point in case of fire. Hydrants are inserted at intervals of some 200 feet in the more compact parts of towns, 300 or 400 feet in the more sparsely peopled districts. Valves or stop-gates are introduced, so as to divide the whole system into a great number of small sections, any one of which can be isolated from the rest for the purpose of repairs without interrupting the supply to other districts. Rivers and other bodies of water are crossed by pipes provided with a sort of ball-and-socket joint, by means of which the pipe adapts itself to the inequalities of the bottom. Lines of pipe which cross summits of ground are provided at such points with air-cocks, to allow the air inclosed at the summit to escape. Air lodges at such points when the pipe is filled after having been emptied for any cause. Air is also, under some circumstances, disengaged from the water itself, and accumulates at the summits of pipes.

The depth to which pipes are covered varies with the climate. In different parts of England from 2 to 3 feet is considered to afford sufficient protection from frost. In St. Paul, Minn., 7 and $7\frac{1}{2}$ feet are found sufficient. In the adjacent city of Minneapolis, which has a very loose gravelly soil, the pipes are laid 8 feet deep, and give great trouble from freezing. In Montreal the authorities are content with

a depth of 6 feet, though much trouble is experienced from frost. In Quebec the pipes are laid 8 and 10 feet deep.

Service-pipes are generally from $\frac{1}{4}$ to $1\frac{1}{2}$ inches in diameter. They are most commonly composed of lead, or of wrought iron prepared in various ways to resist corrosion. From a mechanical point of view lead pipe has peculiar fitness for this use. It is procurable in any desired length, easily attached to mains and fittings, easily divided and bent to suit the various situations. These advantages have led to its employment for service-pipes more than any other material, notwithstanding the fact that it is liable to impart poisonous qualities to the water. (See WATER.) A service-pipe of wrought iron, lined internally with hydraulic cement, has been much used, and appears to be eminently well fitted for the purpose. The most important precaution to be observed in the introduction of service-pipes is to secure protection from frost. The pipe usually passes from the main directly into the cellar. In houses having open areas, it is hardly possible to secure sufficient depth. The pipe is usually provided with a cock just inside the cellar wall, by which the water can be shut off and discharged from the portion within the cellar, as city cellars are rarely frost-proof. Freezing usually takes place at or near the cellar wall. For this reason the pipe is often so made that it can be separated at this point and thawed out by injecting hot water through a long small pipe. A service-pipe should, by preference, enter at the sunny side of a house, as the ground freezes less deeply there. See also AQUEDUCTS, PLUMBING, and SEWERAGE.

Cost of Pumping.—The unit of cost of pumping water is the cost of pumping 1,000,000 gal. 1 foot high. The performance of a steam pumping-engine, or what is called its "duty," is the weight of water that it can raise to a height of 1 foot with 100 lb. of coal. Many recent engines have shown an experimental duty of 100,000,000 lb. It is doubtless practicable to work permanently with a duty of 75,000,000, which is equivalent to raising 9,000,000 gal. of water to a height of 1 foot, or, what is the same thing, 1,000,000 to a height of 9 feet. At this rate, with coal at 25 cents per 100 lb., the cost of coal to raise 1,000,000 gal. 1 foot high would be a little less than 3 cents. The other items of cost are the expense of attendance, oil, waste, kindling-wood, etc.

Where the engine works to one-third, one-fifth, or one-tenth its full capacity, the cost of attendance and repairs cuts a large figure in the cost of each million gallons pumped. In a cheap and poorly constructed engine, the cost of repairs often is very great. The most economical results are obtained with a first-class engine working to its full capacity. Suppose such an engine pumps 5,000,000 gal. a day to a height of 200 feet. The total cost for attendance and incidentals would not exceed \$10 a day, being 1 cent a million gallons raised 1 foot. Adding 1 cent for ordinary repairs, the total cost of raising 1,000,000 gal. 1 foot is 5 cents. It is very seldom that this degree of economy is attained. Six cents is a first-class result, and 10 is probably not above the average, where interest and depreciation are considered. In pumping by water-power 2 cents is about the average cost.

J. P. FRIZELL.

Watkin, Sir EDWARD WILLIAM, M. P.: b. in Manchester, England, about 1815; was trained to the mercantile business by his father, with whom he became a partner; became one of the directors of the Manchester Athenaeum in 1839, organized its celebrated literary *soirées* in Free Trade Hall, and in 1843 led in the inauguration of the Saturday half-holiday; became director and manager of several important railways, especially the Intercolonial of Canada; visited the U. S. and Canada on railway business 1851 and 1861; was for some time president of the Grand Trunk Railway of Canada; was influential in securing the confederation of British North America, for which he was knighted 1868; and has been prominent in Parliament as a supporter of reforms in financial legislation. He promoted and accomplished the extension of the Manchester, Sheffield, and Lincolnshire lines, giving a new entrance into London. In 1890 he laid out a site at Wembley Park, near London, where he proposed to build a tower that would surpass the Eiffel Tower. The first story was built, but the work was suspended in 1894 for want of funds. He is an ardent supporter of the project of tunneling under the English channel, and has accomplished a considerable amount of work in that direction, but has been unable to obtain sanction for its completion from the Government.

Watkins: village; capital of Schuylcr co., N. Y.; on Seneca Lake, and the North Cent. and the Fall Brook rail-

ways; 22 miles N. of Elmira (for location, see map of New York, ref. 5-P). It is in an agricultural and grape-growing region; is chiefly noted for its famous Glen (see WATKINS GLEN); and has several mineral springs, the Glen Springs Sanitarium, one of the largest salt-making plants in the State, an academy, 2 public libraries, 2 private banks, 3 weekly newspapers, several iron-foundries, carriage-factories, and flour and saw mills. Pop. (1880) 2,716; (1890) not reported; (1895) estimated, 3,000. EDITOR OF "EXPRESS."

Watkins Glen: a picturesque ravine in western central New York, near the head of Seneca Lake. Its beautiful scenery attracts thousands of visitors annually. The lake region of Western New York is underlain by a great body of shale belonging to the Devonian system. During the Pleistocene period the face of the country was much modified through erosion by glacial ice, and some of the north-south valleys were converted into deep troughs with smooth, steep sides. After the melting of the ice a new drainage system was established, and many small streams flowing down the sides of the troughs carved out deep, narrow ravines, sharply contrasted in character with the troughs. They are barely wide enough to hold the streams which flow through them in time of flood; their walls are precipitous, and they contain many cataracts. Of these Watkins Glen is the most celebrated. G. K. G.

Watling's Island: a small island of the Bahamas, E. S. E. of Cat island, and a little outside of the line formed by most of the group; crossed by lat. 23° 56' N. and lon. 74° 28' W. It is fertile, but has few inhabitants. In the center there is a lagoon. Most prominent authorities are now agreed that this was Guanahani, the first American island seen by Columbus and called by him San Salvador. When the explorer's track is traced back from Cuba, the position of Watling's agrees better with that sought than does Cat island or any other, and a lagoon as mentioned in the narrative is found only here. Among those who have accepted Watling's island as the probable landfall are Muñoz, Capt. Beecher, Peschel, Richard H. Major, Lieut. J. B. Murdoch, and Markham. In 1891 an expedition led by Walter Wellman, in the interests of the Chicago *Herald*, visited the waters of the West Indies in order to determine exactly where the first landfall made by Columbus was. After carefully following in his track as laid down in Las Casas's abridgment of Columbus's *Journal* or log-book, Wellman decided in favor of Watling's island, and there placed a tablet with this inscription: "On this spot Christopher Columbus first set foot upon the soil of the New World. Elected by the Chicago *Herald*, June 15, 1891." H. H. S.

Watse'ka: city; capital of Iroquois co., Ill.; on the Iroquois river, and the Tol., Peoria and West, and the Chi. and E. Ill. railways; 75 miles S. of Chicago, 100 miles E. of Peoria (for location, see map of Illinois, ref. 4-G). It is in an agricultural region, and has 6 churches, 3 public-school buildings, a national bank with capital of \$50,000, a private bank, 3 weekly papers, 3 tile-factories, 2 grist and flour-mills, knitting-mill, and planing-mill. Pop. (1880) 1,507; (1890) 2,017; (1895) 3,135. EDITOR OF "REPUBLICAN."

Watson, HEWETT COTTRELL, F. L. S.: botanist; b. at Firbeck, England, in May, 1804; son of a magistrate; educated at the University of Edinburgh; author of *Outlines of the Geographical Distribution of British Plants* (1832; new ed. 1835); *The New Botanist's Guide to the Localities of the Rarer Plants of Great Britain* (2 vols., 1835-37); *The London Catalogue of British Plants* (6th ed. 1867); *Cybele Britannica, or British Plants and their Geographical Relations* (4 vols., 1847-60), and of a *Supplement* (1863) and a *Compendium* (1870) of the same work. D. at Thames Ditton, July 27, 1881. Revised by CHARLES E. BESSEY.
