JOHNSON'S

UNIVERSAL CYCLOPÆDIA

A NEW EDITION

PREPARED BY A CORPS OF THIRTY-SIX EDITORS, ASSISTED BY
EMINENT EUROPEAN AND AMERICAN SPECIALISTS

UNDER THE DIRECTION OF

CHARLES KENDALL ADAMS, LL. D.,

PRESIDENT OF THE UNIVERSITY OF WISCONSIN

EDITOR-IN-CHIEF

ILLUSTRATED WITH MAPS, PLANS, AND ENGRAVINGS

COMPLETE IN EIGHT VOLUMES

VOL. VIII

NEW YORK
D. APPLETON AND COMPANY

A. J. JOHNSON COMPANY

1899

PUBLISHERS' NOTE.

JUST two and a half years have elapsed since the first volume of this new edition of the Cyclopædia was issued. The work is therefore practically all of the same age. President Adams and his able and scholarly corps of editors and contributors are to be congratulated on the accomplishment of their great task in so short a time, and with such thoroughness.

During the progress of the work some changes in the constitution of the editorial staff have taken place. In the department of Law, President Henry Wade Rogers having been compelled by the pressure of other duties to relinquish his connection with the Cyclopædia, President Adams was fortunate in securing in his place Francis M. Burdick, LL. D., Dwight Professor of Law, Columbia College, New York, who in turn called to his aid Professors George W. Kirchwey, Munroe Smith, W. A. Keener, etc., of the same institution. The department of Philosophy, always strong, was still further strengthened by associating with Dr. Harris, J. Mark Baldwin, Ph. D., Stuart Professor of Experimental Psychology in the College of New Jersey; while Dr. Gildersleeve strengthened his department by intrusting the sub-department of Greek Mythology, Antiquities, etc., to Professor J. R. S. Sterrett, Ph. D., of Amherst College, and that of Roman Mythology, Antiquities, etc., to Professor George L. Hendrickson, of the University of Wisconsin. By the death of Dr. Philip Schaff, full charge of the department of General Church History and Biblical Literature devolved on his associate, Rev. Samuel Macanley Jackson, D. D., LL. D. To the great body of contributors (whose names are prefixed to each volume of the Cyclopædia) the publishers tender hearty thanks for their enthusiastic and prompt co-operation in the effort to produce a work of reference at once scholarly, authoritative, and fresh.

It may be proper to add here that the work has from the first been brought out under the auspices of D. Appleton & Co., and has thus had the benefit of their ample resources and great experience.

A. J. JOHNSON Co.

ORGANIZATION OF THE STAFF.

EDITOR-IN-CHIEF.

CHARLES KENDALL ADAMS, LL. D.,
PRESIDENT OF THE UNIVERSITY OF WISCONSIN,
History, Politics, and Education.

ASSOCIATE EDITORS.

- LIBERTY H. BAILEY, M. S.,
Professor of Horticulture, Cornell University.
Agriculture, Horticulture, Forestry, etc.
- WILLIS J. BEECHER, D. D.,
Professor of Hebrew Language and Literature,
Auburn Theological Seminary.
Presbyterian Church History, Doctrine, etc.
- HENRY A. BEERS, A. M.,
Professor of English Literature, Yale University.
English Literature, etc.
- CHARLES E. BESSEY, Ph. D.,
Professor of Botany, State University of Nebraska.
Botany, Vegetable Physiology, etc.
- DUDLEY BUCK,
Composer and Organist, Brooklyn, N. Y.
Music, Theory of Harmony, Musical Terms, etc.
- FRANCIS M. BURDICK, A. M., LL. B.,
Dwight Professor of Law, Columbia College, New
York.
Municipal, Civil, and Constitutional Law.
- GEORGE P. FISHER, D. D., LL. D.,
Professor of Church History, Yale University.
Congregational Church History, Doctrine, etc.
- GROVE K. GILBERT, A. M.,
Geologist, U. S. Geological Survey.
Physical Geography, Geology, and Paleontology.
- BASIL L. GILDERSLEEVE, LL. D.,
Professor of Greek, Johns Hopkins University.
Grecian and Roman Literature.
- ARTHUR T. HADLEY, A. M.,
Professor of Political Economy, Yale University.
Political Economy, Finance, and Transportation.
- MARK W. HARRINGTON, A. M., LL. D., F. L. S.,
Ex-Chief of the U. S. Weather Bureau.
Geography, Meteorology, Climatology, etc.
- WILLIAM T. HARRIS, LL. D.,
U. S. Commissioner of Education, and
J. MARK BALDWIN, Ph. D.,
Professor of Experimental Psychology, Princeton
University.
Philosophy, Psychology, Ethics, etc.
- JOHN F. HURST, D. D., LL. D., Bishop (M. E.),
Chancellor American University, Washington.
Methodist Church History, Doctrine, etc.
- SAMUEL MACAULEY JACKSON, D. D., LL. D.,
Professor of Church History, New York University,
and associate editor of the Schaff-Herzog Encyclo-
pædia, New York.
General Church History and Biblical Literature.
- HENRY E. JACOBS, D. D., LL. D.,
Professor of Systematic Theology, Evangelical Luth-
eran Theological Seminary, Philadelphia, Pa.
Lutheran Church History, Doctrine, etc.
- DAVID S. JORDAN, LL. D.,
President Leland Stanford Junior University.
**Zoology, Comparative Anatomy, and Animal Physi-
ology.**
- JOHN J. KEANE, D. D., LL. D., Bishop (R. C.),
Ex-Rector of the Catholic University of America.
Roman Catholic Church History, Doctrine, etc.
- CHARLES KIRCHHOFF, M. E.,
Editor of the Iron Age, New York.
Mining Engineering, Mineralogy, and Metallurgy.
- STEPHEN B. LUCE,
Rear-Admiral, U. S. Navy.
Naval Affairs, Naval Construction, Navigation, etc.
- ARTHUR R. MARSH, A. M.,
Professor of Comparative Literature, Harvard Univ.
Foreign Literature, etc.
- JAMES MERCUR,
Professor of Mil. Engineering, West Point Mil. Acad.
**Military Engineering, Science and Munitions of War,
etc.**
- MANSFIELD MERRIMAN, C. E., Ph. D.,
Professor of Civil Engineering, Lehigh University.
Civil Engineering, etc.
- SIMON NEWCOMB, LL. D., M. N. A. S.,
Editor of the U. S. Nautical Almanac.
Astronomy and Mathematics.
- EDWARD L. NICHOLS, Ph. D.,
Professor of Physics, Cornell University.
Physics, Electricity and its Applications.
- WILLIAM PEPPER, M. D., LL. D.,
Ex-Professor of the University of Pennsylvania.
Medicine, Surgery, and Collateral Sciences.
- WILLIAM S. PERRY, D. D. Oxon., LL. D., Bishop (P. E.),
Davenport, Iowa.
Episcopal Church History, Doctrine, etc.
- JOHN W. POWELL, LL. D.,
Director of the U. S. Bureau of Ethnology.
American Archeology and Ethnology.
- IRA REMSEN, M. D., Ph. D., LL. D.,
Professor of Chemistry, Johns Hopkins University.
Chemistry and its Applications, etc.
- AINSWORTH R. SPOFFORD, LL. D.,
Librarian of Congress.
U. S. Geography, Statistics, etc.
- RUSSELL STURGIS, A. M., Ph. D., F. A. I. A.,
Ex-President Architectural League of New York.
Archeology and Art.
- ROBERT H. THURSTON, Doc. Eng., LL. D.,
Director of Sibley College, Cornell University.
Mechanical Science.
- BENJAMIN IDE WHEELER, Ph. D.,
Professor of Greek and Com. Philology, Cornell Univ.
Comparative Philology, Linguistics, etc.
- WILLIAM H. WHITSITT, D. D.,
Professor of Church History, Baptist Theological
Seminary, Louisville, Ky.
Baptist Church History, Doctrine, etc.
- THEODORE S. WOOLSEY, A. M.,
Professor of International Law, Yale University.
Public Law, Intercourse of Nations.

MANAGING EDITOR.

ROBERT LILLEY, M. R. A. S.,
ONE OF THE EDITORS OF THE CENTURY DICTIONARY.

ASSISTANT TO THE EDITOR-IN-CHIEF.

CHARLES H. THURBER, A. M.,
ASSOCIATE PROFESSOR OF PEDAGOGY, UNIVERSITY OF CHICAGO, AND DEAN OF MORGAN PARK ACADEMY.

JOHNSON'S UNIVERSAL CYCLOPÆDIA.

VOL. VIII.

CONTRIBUTORS AND REVISERS.

- ABBOT, HENRY LARCOM, LL. D., M. N. A. S.,
Colonel U. S. Engineers; brevet brigadier-general U. S. army, New York.
- ADAM, GRAEME MERCER,
Author of *Toronto, Old and New; Canada from Sea to Sea; The Canadian Northwest*, etc.; New York.
- ADAMS, CHARLES KENDALL, LL. D.,
President of the University of Wisconsin, Madison, Wis.
- ADAMS, CYRUS C.,
Editorial staff of *The Sun* (New York); President of Department of Geography, Brooklyn Institute, Brooklyn, N. Y.
- ALGER, REV. WILLIAM ROUNSEVILLE, A. M.,
Author of *A Critical History of the Doctrine of a Future Life*, etc.; Boston, Mass.
- ALLEN, FREDERIC STURGES, A. B., LL. B.,
Member of the New York Bar, New York; one of the editors of *Webster's International Dictionary*.
- AMES, JOSEPH S., Ph. D.,
Associate Professor of Physics, and sub-director of Physical Laboratory, Johns Hopkins University, Baltimore, Md.
- ANDERSON, HOB. RASMUS BJÖRN,
Formerly Professor of Scandinavian Languages, University of Wisconsin; ex-U. S. minister to Denmark; Madison, Wis.
- ANDREWS, E. BENJAMIN, D. D., LL. D.,
President of Brown University, Providence, R. I.
- ANTHONY, SUSAN BROWNELL,
President National American Woman Suffrage Association, Rochester, N. Y.
- ARMSTRONG, SAMUEL T., M. D., Ph. D.,
One of the collaborators of *Foster's Encyclopædic Medical Dictionary*, and editor of an American Appendix to *Quain's Dictionary of Medicine*; New York.
- ASHURST, JOHN, JR., A. M., M. D.,
John Rhea Barton Professor of Surgery and Professor of Clinical Surgery in the University of Pennsylvania, Department of Medicine, Philadelphia, Pa.
- BAILEY, LIBERTY H., M. S.,
Professor of General and Experimental Horticulture, Cornell University, Ithaca, N. Y.
- BALDWIN, J. MARK, Ph. D.,
Stuart Professor of Experimental Psychology, Princeton University, Princeton, N. J.
- BASSETT, H. F.,
Librarian Silas Bronson Library, Waterbury, Conn.
- BATTAILE, J. F.,
Associate editor *Commercial-Herald*, Vicksburg, Miss.
- BEDELL, FREDERICK, Ph. D.,
Assistant Professor of Physics, Cornell University, Ithaca, N. Y.
- BEECHER, REV. WILLIS J., D. D.,
Professor of Hebrew Language and Literature, Auburn Theological Seminary, Auburn, N. Y.
- BEERS, HENRY A., A. M.,
Professor of English Literature, Yale University, New Haven, Conn.
- BELKNAP, LIEUT.-COM. CHARLES, U. S. navy,
Head of Department of Mechanics and Applied Mathematics, U. S. Naval Academy, Annapolis, Md.
- BELL, ALEXANDER MELVILLE,
Author of *Visible Speech and Universal Alphabets*, etc.; Washington, D. C.
- BENDELARI, GEORGE, A. M.,
Of the staff of the *New York Sun*; late Assistant Professor of Modern Languages, Yale University.
- BENJAMIN, MARCUS, Ph. D., F. C. S.,
Editorial staff of the *Standard Dictionary*, and of *The Annual Cyclopædia*, New York.
- BESSEY, CHARLES E., Ph. D.,
Professor of Botany, State University of Nebraska, Lincoln, Neb.
- BILLINGS, JOHN S., M. D., LL. D.,
Director of New York Public Library (Astor, Lenox, and Tilden foundation); ex-Professor of Hygiene, University of Pennsylvania, Philadelphia, Pa.; and ex-superintendent of the Army Medical Museum, Washington, D. C.; author of *The National Medical Dictionary*, etc.
- BIRGE, EDWARD ASAHEL, Ph. D.,
Professor of Zoölogy and Dean of the College of Letters and Science, University of Wisconsin, Madison, Wis.
- BLACK, CHARLES E. D.,
Late geographer to the India Office, London, England.
- BRANDT, HERMANN CARL GEORGE, A. M., Ph. D.,
Professor of the German and French Languages, and Philology, Hamilton College, Clinton, N. Y.
- BRINTON, DANIEL GARRISON, M. D.,
Professor of American Archaeology and Linguistics, University of Pennsylvania, Philadelphia, Pa.
- BROCKUNIER, WILBUR C., A. M.,
Manufacturer, Wheeling, W. Va.
- BUCK, DUDLEY, composer and organist, Brooklyn, N. Y.

- BURDICK, CHARLES W.,
Secretary of State, Wyoming; Cheyenne, Wyo.
- BURDICK, FRANCIS M., LL. D.,
Dwight Professor of Law, School of Law, Columbia College, New York.
- BURROESS, JOHN W., Ph. D., LL. D.,
Professor of History, Political Science, and Constitutional Law, and Dean of the Faculty of Political Science, Columbia College, New York.
- BURR, GEORGE LINCOLN, A. B.,
Professor of Ancient and Medieval History, Cornell University, Ithaca, N. Y.
- BURROUGHS, GEORGE S., Ph. D., D. D.,
President of Wubash College, Crawfordsville, Ind.
- BURROUGHS, JOHN,
Author of *Wall Whitman as Poet and Person*, etc., Esopus, N. Y.
- BUTLER, NATHANIEL, D. D.,
President of Colby University, Waterville, Me.; late Director of University Extension, University of Chicago.
- BUTLER, W. R.,
Principal of the Public High School, Waltham, Mass.
- CAMPBELL, JOHN L.,
Treasurer of Washington and Lee University, Lexington, Va.
- CANFIELD, ARTHUR G., A. M.,
Professor of the French Language and Literature, University of Kansas, Lawrence, Kan.
- CARRHART, HENRY S., A. M.,
Professor of Physics, University of Michigan, Ann Arbor, Mich.
- CARTER, FRANKLIN, Ph. D., LL. D.,
President of Williams College, Williamstown, Mass.
- CAUTHORN, HENRY S., attorney-at-law, Vincennes, Ind.
- CHADWICK, Rev. JOHN W., A. M., D. D.,
Pastor of the Second Unitarian church, Brooklyn, N. Y.; author of *The Bible of To-day*; *Belief and Life*; etc.
- CHAPLIN, WINFIELD S., LL. D.,
President of Washington University, St. Louis, Mo.
- CLARK, LOUIS,
Designer, Mississippi Mills, Wesson, Miss.; formerly instructor in designing in the Massachusetts Institute of Technology, Boston, Mass.
- CLARK, M. L.,
One of the editors of *The Times and News-Letter*, Westfield, Mass.
- COFFIN, WILLIAM A.,
Artist; secretary Society of American Artists, New York.
- COLBY, FRANK M., A. M.,
Professor of Economics, New York University; late lecturer in History, Columbia College, New York.
- COOLIDGE, ARCHIBALD CARY, Ph. D.,
Professor of Russian Literature, Harvard University, Cambridge, Mass.
- COUNCILMAN, W. T., M. D.,
Shattuck Professor of Pathological Anatomy, Harvard Medical School, Boston, Mass.
- CROES, J. JAMES R., C. E., M. Am. Soc. C. E. and M. Inst. C. E.,
Civil and hydraulic engineer, New York.
- CROSS, CHARLES R., B. S.,
Thayer Professor of Physics, and director of the Rogers Laboratory, Massachusetts Institute of Technology, Boston, Mass.
- CURTIS, EDWARD, M. D.,
Emeritus Professor of Materia Medica and Therapeutics, College of Physicians and Surgeons (Medical Department, Columbia College), New York.
- CUSHING, FRANK HAMILTON,
Ethnologist in the Bureau of Ethnology, Washington, D. C.
- DAN DE QUILLE,
Pen-name of William Wright, journalist, Virginia City, Nev.
- DAVIDS, T. W. RHYNS, Ph. D., LL. D.,
Professor of Pāli and Buddhist Literature, University College, London, England; secretary Royal Asiatic Society, London.
- DAVIDSON, THOMAS, M. A.,
Specialist in Literature and Medieval Philosophy, Keene, N. Y.; author of *Rossmini's Philosophical System*, etc.
- DAVIS, WILLIAM MORRIS, M. E.,
Professor of Physical Geography, Harvard University, Cambridge, Mass.
- DE VINNE, THEODORE L.,
Founder of the De Vinne Press, New York.
- DEWEY, MELVIL,
Secretary of the Board of Regents of the University of the State of New York, Albany, N. Y.
- DEXTER, FRANKLIN BOWDITCH, M. A.,
Author of *Biographies of Yale Graduates*, *Sketch of the History of Yale College*, etc.; secretary and assistant librarian, Yale University, New Haven, Conn.
- DIXON, JAMES MAIX, A. M., F. R. S. E.,
Professor of English Literature, Washington University, St. Louis, Mo.; formerly Professor of English Literature, Imperial University, Japan.
- DODGE, DANIEL KILHAM, A. M., Ph. D.,
Professor of English Language and Literature, University of Illinois, Champaign, Ill.
- †DORSEY, Rev. JAMES OWEN,
Bureau of Ethnology, Washington, D. C.
- DURAND, EDWARD DANA, A. B.,
Legislative librarian State Library, Albany, N. Y.; late assistant secretary of the American Economic Association.
- ERNST, OSWALD II.,
Colonel U. S. Engineers; superintendent of U. S. Military Academy, West Point, N. Y.

Professor of European History, Amherst College, Am-
herst, Mass.; formerly Professor of History, Robert
College, Constantinople, Turkey; author of *Con-
stantinople*, etc.
- GROWOLL, A.,
Managing editor of *The Publishers' Weekly*, New York.
- GUDEMAN, ALFRED, Ph. D.,
Professor of Classical Philology, University of Pennsyl-
vania, Philadelphia, Pa.
- GUMMERE, FRANCIS BARTON, A. B., Ph. D.,
Professor of English and German, Haverford College,
Pennsylvania; author of *The Anglo-Saxon Metaphor;
Handbook of Poetics; German Origins, A Study in
Primitive Culture*; etc.
- HADLEY, ARTHUR TWISING, A. M.,
Professor of Political Economy, and dean of Courses of
Graduate Instruction, Yale University, New Haven,
Conn.; author of *Railroad Transportation, its His-
tory and its Laws; Economics*; etc.
- HAGUE, ARNOLD, M. N. A. S.,
Geologist U. S. Geological Survey, Washington, D. C.
- Haight, THERON W.,
Counselor-at-law, Waukesha, Wis.
- HALL, ISAAC HOLLISTER, Ph. D., L. H. D.,
Orientalist; curator of the Metropolitan Museum of
Art, New York.
- HARE, HOBART A., M. D.,
Professor of Materia Medica, Therapeutics, and Hy-
giene, Jefferson Medical College, Philadelphia, Pa.
- HARPER, JOHN M., A. M., Ph. D., F. E. I. S.,
Inspector of Superior Schools, Province of Quebec, Que-
bec, Canada.
- HARRINGTON, MARK W., A. M., LL. D., F. L. S.,
President of Washington State University, Seattle,
Wash.; formerly Chief of the U. S. Weather Bureau,
Washington, D. C.
- HARRIS, WILLIAM TORREY, A. M., LL. D.,
U. S. Commissioner of Education, Washington, D. C.
- HART, SAMUEL, A. M., D. D.,
Professor of Latin, Trinity College, Hartford, Conn.
- HASKINS, CHARLES H., Ph. D.,
Professor of Institutional History, University of Wis-
consin, Madison, Wis.
- HATTON, CHARLES K., attorney-at-law, Wichita, Kan.
- HENDRICKSON, GEORGE L., A. B.,
Professor of Latin, University of Wisconsin, Madison,
Wis.
- HERVEY, DANIEL E., organist, Newark, N. J.
- HILGARD, EUGENE WALDEMAR, Ph. D., LL. D.,
Professor of Agriculture and Agricultural Chemistry,
University of California, and director of the Cali-
fornia Experiment Station, Berkeley, Cal.
- HIRST, BARTON COOK, M. D.,
Professor of Obstetrics, Department of Medicine, Uni-
versity of Pennsylvania, Philadelphia, Pa.
- HITCHCOCK, EDWARD, JR., A. B., M. D.,
Professor of Hygiene and Physical Culture, and direc-
tor of the Gymnasium, Cornell University, Ithaca, N. Y.
- HODGE, FREDERICK WEBB,
Ethnologist and librarian in the Bureau of Ethnology,
Smithsonian Institution, Washington, D. C.
- HOLMAN, Lient. GEORGE F. W., U. S. navy,
U. S. Naval Torpedo Station, Newport, R. I.
- HOSKINS, Rev. LEIGHTON,
Formerly assistant priest at the Memorial Church of the
Holy Comforter, Philadelphia, Pa.
- HOWARD, DANIEL W.,
Member of the Historical Society of Pennsylvania and
of the Chester County Historical Society, West Ches-
ter, Pa.
- HOYT, Rev. CHARLES K., A. M.,
Formerly Professor of English Literature, Wells Col-
lege, Aurora, N. Y.; recently pastor of the First
Presbyterian church, Brookfield, Mo.
- HUMPHREYS, MILTON WYLIE, Ph. D., LL. D.,
Professor of Greek, University of Virginia, Charlottes-
ville, Va.
- HURST, Rev. JOHN FLETCHER, D. D., LL. D.,
Bishop in the Methodist Episcopal Church, and chan-
cellor of the American University, Washington, D. C.
- HUTTON, FREDERICK REMSEN, E. M., Ph. D.,
Professor of Mechanical Engineering, School of Mines,
Columbia College, New York.
- HUTTON, WILLIAM RICH, A. M., C. E., New York.
- IDDINGS, JOSEPH PAXSON, Ph. B.,
Associate Professor of Petrology, University of Chica-
go, Chicago, Ill.
- JACKSON, A. V. WILLIAMS, A. M., L. H. D., Ph. D.,
Professor of the Indo-Iranian Languages, Columbia
College, New York.
- JACKSON, SAMUEL MACAULEY, D. D., LL. D.,
Professor of Church History, New York University, and
associate editor of the *Schaff-Herzog Encyclopaedia*,
New York.
- JACOBS, HENRY E., D. D., LL. D.,
Professor of Systematic Theology, Evangelical Lutheran
Theological Seminary, Philadelphia, Pa.

- JAMES, WILLIAM, M. D., Ph. D., Litt. D.,
Professor of Psychology, Harvard University, Cambridge, Mass.
- JERMAIN, FRANCES D.,
Librarian Toledo Public Library, Toledo, O.
- JOHNSON, JOHN B., C. E.,
Professor of Civil Engineering, Washington University, St. Louis, Mo.
- JONES, JOHN MORRIS, M. A.,
Professor of the Welsh Language and Literature, University College of North Wales, Bangor, Wales.
- JONES, R. MCKEAN,
Of Wyckoff, Seaman & Benedict, manufacturers of typewriters, New York.
- JORDAN, DAVID STARR, Ph. D., LL. D.,
President of the Leland Stanford Junior University, Santa Clara co., Cal.
- JUDGE, WILLIAM QUAY,
President of the Theosophical Society in America, New York.
- KARNS, THOMAS CONNER, A. M.,
Professor of Philosophy and Pedagogics, University of Tennessee, Knoxville, Tenn.
- KEANE, Rt. Rev. JOHN JOSEPH, D. D., LL. D.,
Bishop in the Roman Catholic Church, and ex-Rector of the Catholic University of America.
- KELLOGG, ROBERT J., A. B.,
Fellow in Comparative Philology, Cornell University, Ithaca, N. Y.
- KENT, WILLIAM, A. M., M. E.,
Author of *The Mechanical Engineer's Pocket-book*; associate editor of *Engineering News*, New York.
- KENYON F. C., assistant in Biology, Tufts College, Mass.
- KINGSLEY, JOHN STERLING, S. D.,
Professor of Biology, Tufts College, Massachusetts.
- KIRCHHOFF, CHARLES, M. E.,
Editor of *The Iron Age*, New York.
- KIRCHWEY, GEORGE W., A. B.,
Professor of Law, School of Law, Columbia College, New York.
- KUNZ, GEORGE FREDERICK,
Gem expert with Tiffany & Co., New York, and of the U. S. Geological Survey; mineralogist for the eleventh U. S. census.
- LANE, J. J.,
Secretary of Board of Regents of the University of Texas, Austin, Tex.
- LANG, HENRY R., Ph. D.,
Instructor in the Romance Languages, Yale University, New Haven, Conn.
- LANMAN, CHARLES ROCKWELL, Ph. D.,
Professor of Sanskrit, Harvard University, Cambridge, Mass.
- LARIMER, H. G.,
Attorney and counselor at law, Topeka, Kan.
- LEE, FRANCIS BAZLEY,
Attorney-at-law and historical writer, Trenton, N. J.
- LEWIS, VIRGIL A., A. M.,
Author of *History of West Virginia*; State Superintendent of Free Schools of West Virginia, Charleston, W. Va.
- LILLEY, ROBERT, M. R. A. S.,
One of the editors of the *Century Dictionary*, New York.
- LINCOLN, ALLEN B., insurance agent, Willimantic, Conn.
- LUCAS, FREDERIC A.,
Curator of the Department of Comparative Anatomy, U. S. National Museum, Washington, D. C.
- LUCE, Rear-Admiral STEPHEN B., U. S. navy, Newport, R. I.
- MCADIE, ALEXANDER G.,
U. S. Weather Bureau, Washington, D. C.
- MCARTHUR, Rev. GEORGE, M. A.,
Editorial staff of *Worcester's Dictionary*, Philadelphia, Pa.
- MCCOLLUM, A. R., editor of *Day-Globe*, Waco, Tex.
- MACDONALD, NEIL, Canadian writer, New York, N. Y.
- MALLET, JOHN W., M. D., Ph. D., LL. D., F. R. S.,
Professor of Chemistry, University of Virginia, Charlottesville, Va.
- MARSH, ARTHUR R., A. M.,
Assistant Professor of Comparative Literature, Harvard University, Cambridge, Mass.
- MARSH, E. A.,
Assistant superintendent of the American Waltham Watch Company, Waltham, Mass.
- MARSH, OTHNIEL CHARLES, Ph. D., LL. D., M. N. A. S.,
Professor of Paleontology and curator of the Geological Collection, Yale University, New Haven, Conn.
- MEANY, EDMOND S., B. S.,
Registrar of the University of Washington, Seattle, Wash.; one of the authors of *The State of Washington*.
- MENDENHALL, THOMAS CORWIN, Ph. D., LL. D., M. N. A. S.,
President of the Worcester Polytechnic Institute, Worcester, Mass.
- MERCUR, Lieut.-Col. JAMES, U. S. army,
Professor of Civil and Military Engineering, U. S. Military Academy, West Point, N. Y.
- MERRIMAN, MANSFIELD, C. E., Ph. D.,
Professor of Civil Engineering, Lehigh University, South Bethlehem, Pa.
- MERRITT, ERNEST GEORGE, M. E.,
Assistant Professor of Physics, Cornell University, Ithaca, N. Y.
- MITCHELL, Rev. ALEXANDER FERRIER, D. D.,
Professor of Ecclesiastical History and Divinity, St. Andrews University, Scotland; author of *The Westminster Assembly*, etc.
- MULFORD, THOMAS W.,
Of the *Evening Journal*, Wilmington, Del.
- NEWCOMB, SIMON, LL. D., M. N. A. S.,
Superintendent of the *United States Nautical Almanac*, Washington, D. C.; formerly Professor of Mathematics and Astronomy, Johns Hopkins University, Baltimore, Md.
- NEWELL, F. H.,
Geologist; U. S. Geological Survey, Washington, D. C.
- NICHOLS, EDWARD L., B. S., Ph. D.,
Professor of Physics, Cornell University, Ithaca, N. Y.
- NICHOLS, STARR HOYT,
Formerly of the editorial staff of *The Social Economist*, New York.
- NINDE, HENRY S.,
Secretary of the International Committee, Young Men's Christian Associations, New York.
- OAKLEY, CHARLES C.,
Editor of *Terre Haute Express*, Terre Haute, Ind.
- OSBORN, Rev. ALBERT, B. D.,
Registrar American University, Washington, D. C.

- PARK, ROSWELL, A. M., M. D.,
Professor of the Principles and Practice of Surgery and Clinical Surgery, Medical Department, University of Buffalo, Buffalo, N. Y.
- PARSONS, EUGENE,
Author of *Tennyson's Life and Poetry*, Chicago, Ill.
- PEARSON, LEONARD, B. S., V. M. D.,
Professor of the Theory and Practice of Veterinary Medicine, University of Pennsylvania, Philadelphia, Pa.
- PECKHAM, STEPHEN F., A. M.,
Formerly Professor of Chemistry, University of Minnesota; author of the monograph on *Petroleum*, tenth U. S. census; Ann Arbor, Mich.
- PEPPER, WILLIAM, M. D., LL. D.,
Ex-Provost of the University, and Professor of the Theory and Practice of Medicine in the Department of Medicine, University of Pennsylvania, Philadelphia, Pa.
- PERKINS, GEORGE HENRY, Ph. D.,
Professor of Natural History, University of Vermont, Burlington, Vt.
- PERRY, Rt. Rev. WILLIAM STEVENS, D. D., LL. D., D. C. L.,
Bishop in the Protestant Episcopal Church, Davenport, Ia.
- PETERSON, SARAH J.,
Teacher in the Rayen School, Youngstown, O.
- PICKARD, SAMUEL T.,
Author of *Life and Letters of John Greenleaf Whittier*, and editor of *The Portland Transcript*, Portland, Me.
- PIERSOL, GEORGE A., M. D.,
Professor of Anatomy, Department of Medicine, University of Pennsylvania, Philadelphia, Pa.
- †POPE, FRANKLIN LEONARD,
Author of *Modern Practice of the Electric Telegraph*; associate editor of *The Engineering Magazine*, New York.
- POPE, RALPH W.,
Secretary of the American Institute of Electrical Engineers, New York.
- POWELL, Maj. JOHN W., Ph. D., LL. D., M. N. A. S.,
Director of the Bureau of Ethnology, Washington, D. C., and ex-director of the U. S. Geological Survey; author of *Introduction to the Study of Indian Languages*; *Studies in Sociology*; etc.
- PULLMAN, JAMES MINTON, D. D.,
Pastor of the First Universalist church, Lynn, Mass.
- RAND, Rev. WILLIAM W., S. T. D.,
Publishing secretary of the American Tract Society, New York.
- RAVENSTEIN, ERNEST GEORGE, F. R. G. S.,
Member of councils of Royal Geographical Society and Royal Statistical Society, London, England; one of the editors of *The Earth and its Inhabitants*, and author of *The Russians on the Amur*, etc.
- REICHERT, EDWARD T., M. D.,
Professor of Physiology, Department of Medicine, University of Pennsylvania, Philadelphia, Pa.; author of *A Text-book of Physiology*, etc.
- REMSEN, IRA, M. D., Ph. D., LL. D., M. N. A. S.,
Professor of Chemistry and director of the chemical laboratory, Johns Hopkins University, Baltimore, Md.; author of *Theoretical Chemistry*; *Introduction to the Study of Chemistry*; *A Text-book of Inorganic Chemistry*; etc.
- REYNOLDS, P. B., D. D.,
President of the West Virginia University, Morgantown, W. Va.
- RICE, FRANKLIN P.,
Editor of *Worcester Records*, Worcester, Mass.
- RICHARDSON, ERASTUS,
Author of *History of Woonsocket*, Woonsocket, R. I.
- RIDER, SIDNEY S., editor of *Book Notes*, Providence, R. I.
- RHS, JACOB A.,
Author of *How the Other Half Lives*, New York.
- RIPTON, BENJAMIN H., A. M., Ph. D.,
Dean, and Professor of History and Sociology, Union College, Schenectady, N. Y.
- ROBERTS, RALPH A., A. M.,
Author of a *Treatise on the Integral Calculus*, etc., New York.
- ROLFE, WILLIAM JAMES, Litt. D.,
Shakespearean scholar and editor, Cambridge, Mass.
- ROSTAN, FRANCESCO, A. M.,
Waldensian pastor, Messina, Sicily.
- RUCK, KARL VON, M. D.,
Medical Director Winyah Sanitarium for Diseases of the Lungs and Throat, Asheville, N. C.
- RUSSELL, ISRAEL COOK, M. S., C. E.,
Professor of Geology, University of Michigan, Ann Arbor, Mich.
- RUSSELL, JAMES E., Ph. D.,
Professor of Philosophy and Pedagogy, University of Colorado, Boulder, Col.
- St. JOHN, MOLYNEUX,
Editor-in-chief *Manitoba Free Press*, Winnipeg, Manitoba, Canada.
- SANBORN, FRANKLIN BENJAMIN, A. B.,
General secretary of the American Social Science Association, Concord, Mass.
- SCAIFE, WALTER B., Ph. D.,
Author of *America: its Geographical History*, and of *Florentine Life during the Renaissance*, Allegheny, Pa.
- *SCHAFF, Rev. PHILIP, S. T. D., LL. D.,
Washburn Professor of Church History, Union Theological Seminary, New York.
- SCHOENFELD, HERMANN, Ph. D.,
Professor of German and Continental History, Columbian University, Washington, D. C.
- SCHWEINITZ, GEORGE E. DE, M. D.,
Clinical Professor of Ophthalmology in the Jefferson Medical College, Philadelphia, Pa.
- SCULLER, Rev. JAMES B., D. D., Newville, Pa.
- SEWARD, THEODORE FRELINGHUYSEN,
Professor of Music, Teachers' College, New York; author of *Temple Choir*, *Tonic Sol-fa Music Reader*, etc.
- SHELDON, EDWARD S., A. B.,
Professor of Romance Philology, Harvard University, Cambridge, Mass.
- SHEPARD, CHARLES UPHAM, M. D.,
Professor of Chemistry at the Medical College of the State of South Carolina, Charleston, S. C.
- SILSBEE, JOSEPH L., A. B.,
Architect; second vice-president and general manager of the Multiple Speed and Traction Company, Chicago, Ill.
- SMITH, HERBERT H., A. M.,
Naturalist, Carnegie Museum, Pittsburg, Pa.; formerly of the Geological Survey of Brazil.
- SMITH, MUNROE, A. M., J. U. D.,
Professor of Roman Law and Comparative Jurisprudence, Columbia College, New York.
- SPOFFORD, AINSWORTH RAND, LL. D.,
Librarian of Congress, Washington, D. C.

- STANTON, ELIZABETH CADY,
Honorary president National American Woman Suffrage Association; joint author of *The History of Woman Suffrage*; New York.
- STANTON, THEODORE, A. M.,
Journalist and author, Paris, France.
- STEINER, BERNHARD C., A. M., Ph. D.,
Librarian of Enoch Pratt Free Library, Baltimore, Md.; author of *History of Education in Connecticut*.
- STEPHENS, W. P.,
Yachting editor, *Forest and Stream*, New York.
- STERRETT, JOHN ROBERT SITLINGTON, Ph. D.,
Newton Professor of Greek Language and Literature, Amherst College, Amherst, Mass.
- STEVENS, W. LE CONTE, Ph. D.,
Professor of Physics, Rensselaer Polytechnic Institute, Troy, N. Y.
- STILLMAN, WILLIAM J.,
Artist and critic; correspondent of the *London Times*; Rome, Italy.
- STRONG, Rev. AUGUSTUS H., D. D.,
President of the Rochester Theological Seminary, Rochester, N. Y.
- STURGIS, RUSSELL, A. M., Ph. D., F. A. I. A.,
Ex-president of the Architectural League of New York, New York.
- SYMONDS, CHARLES S.,
President of the Utica City National Bank, Utica, N. Y.
- TAUSSIG, FRANK WILLIAM, LL. B., Ph. D.,
Assistant Professor of Political Economy, Harvard University, Cambridge, Mass.; author of *Tariff History of the United States*.
- TAYLOR, JAMES M., D. D., LL. D.,
President of Vassar College, Poughkeepsie, N. Y.
- THORNTON, WILLIAM M., LL. D.,
Chairman of Faculty, University of Virginia, Charlottesville, Va.
- THURBER, CHARLES HERBERT, A. M.,
Associate Professor of Pedagogy, University of Chicago, and Dean of Morgan Park Academy, Chicago, Ill.
- THURNEISEN, RUDOLPH, Ph. D.,
Professor of Comparative Philology, University of Freiburg, Baden, Germany; author of *Keltoromanisches; Mittelirische Verstehen*; etc.
- THURSTON, ROBERT H., Dr. Eng., LL. D.,
Director of Sibley College, and Professor of Mechanical Engineering, Cornell University, Ithaca, N. Y.; author of *History of the Steam-engine*, etc.
- THWAITES, REUBEN GOLD,
Author of *Story of Wisconsin*; and secretary of the State Historical Society of Wisconsin, Madison, Wis.
- TOWNSEND, MARTIN INGHAM, LL. D.,
Ex-member of Congress, Troy, N. Y.
- TOWSE, J. RANKEN,
Editorial staff of *The Evening Post*, New York.
- TYLER, LYON GARDINER, A. M., J. U. D.,
President of the College of William and Mary, Williamsburg, Va.
- VALLENTINE, BENJAMIN B.,
Dramatic critic *New York Herald*, New York.
- WALKER, FRANCIS AMASA, A. M., Ph. D., LL. D.,
President of Massachusetts Institute of Technology; superintendent of U. S. census, 1870, 1880; author of historical, statistical, and economical works.
- WARREN, MINTON, A. B., Ph. D.,
Professor of Latin, Johns Hopkins University, Baltimore, Md.
- WATSON, GEORGE C., M. S.,
Assistant agriculturist, Agricultural Experiment Station, Cornell University, Ithaca, N. Y.
- WEEDEN, W. B.,
Of Taft, Weedon & Co., agents of the Weybosset Mills, Providence, R. I.
- WHEELER, BENJAMIN IDE, Ph. D.,
Professor of Greek and Comparative Philology, Cornell University, Ithaca, N. Y.
- WHITEHEAD, THOMAS,
Commissioner of Agriculture, State of Virginia; author of *Virginia: a Handbook*; Richmond, Va.
- WHITNEY, JAMES A., A. M., LL. D.,
Counselor-at-law, New York; formerly editor of the *American Artisan*.
- WHITSITT, Rev. WILLIAM H., D. D.,
President, and Professor of Church History, Baptist Theological Seminary, Louisville, Ky.
- WILLARD, FRANCES ELIZABETH, LL. D.,
President of the World's Woman's Christian Temperance Union, Evanston, Ill.
- WILSON, JAMES GRANT, D. C. L., LL. D.,
Author and editor; president of the New York Genealogical and Biographical Society, New York.
- WINCHESTER, CALEB THOMAS, LL. D.,
Professor of English Literature, Wesleyan University, Middletown, Conn.
- WOOD, Rev. CHARLES JAMES, A. B., S. T. B.,
Rector of St. John's Church, York, Pa.
- WOOD, DE VOLSON, A. M.,
Professor of Engineering, Stevens Institute of Technology, Hoboken, N. J.
- WOODWORTH, Rev. FRANK G., D. D.,
President of Tougaloo University, Tougaloo, Miss.
- WOOLFOLK, ADA S.,
Of the College Settlement in New York.
- WOOLSEY, THEODORE S., LL. B., A. M.,
Professor of International Law, Yale University, New Haven, Conn.
- WRIGHT, CARROLL DAVIDSON, A. M., LL. D.,
U. S. Commissioner of Labor; acting superintendent of the eleventh census; Joseph Banigan Professor of Political Science, McMahon Hall of Philosophy, Catholic University of America, Washington, D. C.
- † WYCKOFF, W. O.,
Of Wyckoff, Seamans & Benedict, manufacturers of typewriters, New York.
- YATES, J. STUART, A. M., LL. B.,
Barrister, etc., Victoria, British Columbia, Canada.
- YOUNG, WILLIAM JAY, M. D.,
Editor of *The Popular Science Monthly*, New York.

* The articles which appear in this volume over the name of Dr. Schaff were completed and in the hands of the publishers some months before his death. The proofs were read by his associate, Dr. S. M. Jackson.

† Died during the progress of the work.

PECULIAR PHONETIC SYMBOLS

USED IN THE WRITING OR TRANSLITERATION OF THE DIFFERENT LANGUAGES.

- | | |
|--|---|
| <p>ā, ē, etc.: long vowels; in the Scandinavian languages the accent (<i>á, é</i>, etc.) is used to denote length.</p> <p>ą: a nasalized <i>a</i>; so used in the transliteration of the Iranian languages.</p> <p>å: labialized guttural <i>a</i> in Swedish.</p> <p>æ: open <i>a</i> of Eng. <i>hat</i>, used chiefly in O. Eng.</p> <p>ái: used in Gothic to denote <i>e</i> (open), in distinction from <i>ái</i>, the true diphthong.</p> <p>áu: used in Gothic to denote <i>o</i> (open), in distinction from <i>áu</i>, the true diphthong.</p> <p>bh: in Sanskrit a voiced labial aspirate (cf. <i>ch</i>).</p> <p>b: voiced bilabial (or labio-dental β) spirant, used in discussions of Teutonic dialects.</p> <p>ç: voiceless palatal sibilant, similar to Eng. <i>sh</i>, used especially in transliteration of Sanskrit.</p> <p>č: frequently used, e. g. in Slavonic languages, to denote the sound of Eng. <i>ch</i> in <i>check</i>.</p> <p>e: voiceless palatal explosive, commonly used in transliteration of Sanskrit and the Iranian languages.</p> <p>ch: as used in the transliteration of Sanskrit, a voiceless palatal aspirate, an aspirate being an explosive with excess of breath; as used in German grammar, the symbol for a voiceless palatal or guttural spirant.</p> <p>dh: voiced dental aspirate (cf. <i>ch</i>) in Sanskrit.</p> <p>ḍ: voiced cerebral explosive, so used in transliteration of Sanskrit.</p> <p>ḍh: voiced cerebral aspirate (cf. <i>ch</i>) in Sanskrit.</p> <p>ḍ̣: voiced dental (interdental) spirant, equivalent to Eng. <i>th</i> in <i>then</i>; so used in the Teutonic and Iranian languages and in phonetic writing.</p> <p>ē: a short open <i>e</i>, used in Teutonic grammar, particularly in writing O. H. G.</p> <p>ə: the short indefinite or "obscure" vowel of Eng. <i>gardener</i>; used in the reconstruction of Indo-Eur. forms, and in transliterating the Iranian languages.</p> <p>gh: in Sanskrit a voiced guttural aspirate (cf. <i>ch</i>).</p> <p>g: voiced velar (back-guttural) explosive, used most frequently in Indo-Eur. reconstructions.</p> <p>ǰ: voiced guttural (or palatal) spirant, equivalent to Mod. Greek γ, and used in transliteration of Iranian languages and O. Eng.</p> <p>h: a voiceless breathing, the Sanskrit <i>visarga</i>.</p> <p>hv: a labialized <i>h</i>, similar to <i>wh</i> in Eng. <i>what</i>; used in transliteration of Gothic and the Iranian languages.</p> <p>ḥ: voiceless guttural (or palatal) spirant, equivalent to German <i>ch</i>, and used in transliteration of the Iranian languages.</p> <p>j: the semi-vowel <i>y</i>, or consonant form of <i>i</i>; used in phonetic writing and reconstructions of Indo-Eur. forms.</p> | <p>j: in the transliteration of Sanskrit and the Iranian languages a voiced palatal explosive; in the Teutonic languages a semi-vowel (= <i>y</i>), for which in Indo-Eur. reconstructions <i>i</i> is generally used.</p> <p>jh: in Sanskrit a voiced palatal aspirate (cf. <i>ch</i>).</p> <p>kh: in Sanskrit a voiceless guttural aspirate (cf. <i>ch</i>).</p> <p>l: the guttural ("thick" or "deep") of the Slavonic and some of the Scandinavian languages.</p> <p>ḷ: vowel <i>l</i>; used in transliterating Sanskrit, in reconstructing Indo-Eur. forms, and in other phonetic writing.</p> <p>ŋ: nasal vowel; used in reconstruction of Indo-Eur. forms and in phonetic writing.</p> <p>ṅ: in Sanskrit the cerebral nasal.</p> <p>ñ: in Sanskrit the guttural nasal (see following).</p> <p>ṇ: the guttural nasal, equivalent to Eng. <i>n</i> in <i>longer</i>; used in transliteration of Iranian languages.</p> <p>ṇ̇: palatal nasal, similar to <i>gn</i> in Fr. <i>regner</i>; used in transliterating Sanskrit and in phonetic writing.</p> <p>ö: palatalized <i>o</i>; used in German and in phonetic writing.</p> <p>o: short open <i>o</i> in Scandinavian.</p> <p>ø: short palatalized <i>o</i> (ö) in Scandinavian.</p> <p>ph: in Sanskrit, voiceless labial aspirate (cf. <i>ch</i>).</p> <p>q: voiceless velar (back-guttural) explosive; used in reconstructions of Indo-Eur. forms and in other phonetic writing.</p> <p>r: vowel <i>r</i>; used in transliterating Sanskrit, in reconstructions of Indo-Eur. forms, and in other phonetic writing.</p> <p>ś: voiceless cerebral sibilant, equivalent to Eng. <i>sh</i>; used in transliterating the Iranian languages and in phonetic writing.</p> <p>ṣ́: voiceless cerebral spirant; used in transliterating Sanskrit.</p> <p>th: in Sanskrit a voiceless dental aspirate (cf. <i>ch</i>).</p> <p>ṭh: in Sanskrit a voiceless cerebral aspirate (cf. <i>ch</i>).</p> <p>ṭ: in Sanskrit a voiceless cerebral explosive.</p> <p>ṭ̣: a form of dental spirant used in transliterating the Iranian languages (represented in Justi's transliteration by <i>t</i>).</p> <p>þ: voiceless dental (interdental) spirant, equivalent to Eng. <i>th</i> in <i>thin</i>; used in Teutonic dialects and in phonetic writing.</p> <p>u: consonant form of <i>u</i>; used in phonetic writing.</p> <p>z: voiced cerebral sibilant, equivalent to <i>s</i> in Eng. <i>pleasure</i>, and to <i>j</i> in Fr. <i>jardin</i>; used in Iranian, Slavonic, and in phonetic writing.</p> <p>ẓ: a symbol frequently used in the writing of O. H. G. to indicate a voiced dental sibilant (Eng. <i>z</i>), in distinction from <i>z</i> as sign of the affricata (<i>ts</i>).</p> |

KEY TO THE PRONUNCIATION.

aa..... as <i>a</i> in <i>father</i> , and in the second syllable of <i>armada</i> .	ö..... as in <i>Göthe</i> , and as <i>eu</i> in French <i>neuf</i> , <i>Chintreuil</i>
ã..... same, but less prolonged, as in the initial syllable of <i>armada</i> , <i>Arditi</i> , etc.	ÿ..... as in <i>but</i> , <i>hub</i> .
a..... as final <i>a</i> in <i>armada</i> , <i>peninsula</i> , etc.	ÿ..... obscure <i>o</i> , as final <i>o</i> in <i>Compton</i> .
ã..... as <i>a</i> in <i>fat</i> , and <i>i</i> in French <i>fin</i> .	ü..... as in German <i>süd</i> , and as <i>u</i> in French <i>Buzançais</i> , <i>vu</i> .
ay or ä.. as <i>ay</i> in <i>nay</i> , or as <i>a</i> in <i>fate</i> .	y or l.... see <i>l</i> or <i>y</i> .
äy or ä.. same, but less prolonged.	yu..... as <i>u</i> in <i>mule</i> .
ã..... as <i>a</i> in <i>welfare</i> .	yü..... same, but less prolonged, as in <i>singular</i> .
aw..... as <i>a</i> in <i>fall</i> , <i>all</i> .	ch..... as in German <i>ich</i> .
ee..... as in <i>meet</i> , or as <i>i</i> in <i>machine</i> .	g..... as in <i>get</i> , <i>give</i> (never as in <i>gist</i> , <i>congest</i>).
ë..... same, but less prolonged, as final <i>i</i> in <i>Arditi</i> .	hw..... as <i>wh</i> in <i>which</i> .
e..... as in <i>men</i> , <i>pet</i> .	kh..... as <i>ch</i> in German <i>nacht</i> , <i>g</i> in German <i>tag</i> , <i>ch</i> in Scotch <i>loch</i> , and <i>j</i> in Spanish <i>Badajos</i> , etc.
e..... obscure <i>e</i> , as in <i>Bigelow</i> , and final <i>e</i> in <i>Heine</i> .	ñ..... nasal <i>n</i> , as in French <i>fin</i> , <i>Bourbon</i> , and nasal <i>m</i> , as in French <i>nom</i> , Portuguese <i>Sam</i> .
è..... as in <i>her</i> , and <i>eu</i> in French <i>-eur</i> .	ñ or n-y.. Spanish <i>ñ</i> , as in <i>cañon</i> , <i>piñon</i> , French and Italian <i>gn</i> , etc., as in <i>Boulogne</i> .
ì..... as in <i>it</i> , <i>sin</i> .	l or y.... French <i>l</i> , liquid or mouillé, as (-i)ll- in French <i>Baudrillart</i> , and (-i)l in <i>Chintreuil</i> .
ï..... as in <i>fire</i> , <i>swine</i> .	th..... as in <i>thin</i> .
î..... same, but less prolonged.	th..... as in <i>though</i> , <i>them</i> , <i>mother</i> .
õ..... as in <i>mole</i> , <i>sober</i> .	v..... as <i>w</i> in German <i>zwei</i> , and <i>b</i> in Spanish <i>Cordoba</i> .
ô..... same, but less prolonged, as in <i>sobriety</i> .	sh..... as in <i>shine</i> .
o..... as in <i>on</i> , <i>not</i> , <i>pot</i> .	zh..... as <i>s</i> in <i>pleasure</i> , and <i>j</i> in French <i>jour</i> .
oo..... as in <i>fool</i> , or as <i>u</i> in <i>rule</i> .	
õõ..... as in <i>book</i> , or as <i>u</i> in <i>put</i> , <i>pull</i> .	
oi..... as in <i>noise</i> , and <i>oy</i> in <i>boy</i> , or as <i>eu</i> in German <i>Beust</i> .	
ow..... as in <i>now</i> , and as <i>au</i> in German <i>haus</i> .	

All other letters are used with their ordinary English values.

NOTE.

The values of most of the signs used in the above Key are plainly shown by the examples given. But those of ö, ÿ, ch, kh, ñ, and v, which have no equivalents in English, can not be sufficiently indicated without a brief explanation, which is here given.

ö. The sound represented by this symbol is approximately that of -u- in *hurt* or -e- in *her*, but is materially different from either. It is properly pronounced with the tongue in the position it has when ã is uttered and with the lips in the position assumed in uttering ö.

ÿ. This vowel is produced with the lips rounded as in uttering oo and with the tongue in the position required in uttering ee, into which sound it is most naturally corrupted.

ch and kh. These are both rough breathings or spirants made with considerable force, ch being made between the flat of the tongue and the hard palate, and kh between the tongue and the soft palate. ch approaches in sound to English sh, but is less sibilant and is made further back in the mouth; kh is a guttural and has a hawking sound.

l or y. These are both used to represent the sound of French l mouillé, in (-i)ll- and (-i)l, which resembles English -y- in *lawyer*. Final l, that is, (-i)l, may be approximated by starting to pronounce *lawyer* and stopping abruptly with the -y-.

ñ or n-y. The consonants represented by ñ (Spanish ñ, French and Italian gn, etc.) are practically equivalent to English -ni- or -ny- in *bunion*, *bunyon*, *onion*, etc., and, except when final, are represented by n-y. Final ñ, as French -gn(e), may be produced by omitting the sound of -on in the pronunciation of *onion*.

v. This may be pronounced by attempting to utter English v with the use of the lips alone.

See PREFACE (vol. i., p. xxiv.) and the article PRONUNCIATION OF FOREIGN NAMES.

JOHNSON'S UNIVERSAL CYCLOPÆDIA.

Tancred: one of the most celebrated heroes of the first crusade; b. in Sicily in 1078, a son of Odo, a Norman baron, and Emma, the sister of Robert Guiscard; in 1096 raised an army in Apulia and Calabria, crossed over to Epirus, joined his cousin, Bohemund of Taranto, and distinguished himself greatly by his valor, sagacity, piety, and chivalric forbearance toward a defeated enemy during the campaigns in Asia Minor and Syria, but still more at the conquest of Jerusalem in 1099, and afterward in the battle of Ascalon. He was made Prince of Tiberias, and governed with great wisdom not only his own principality but also that of Bohemund, who had been captured by the Saracens; but most of his time was taken up in petty warfare, partly with Baldwin and the other Christian princes, partly with the Saracens. D. in Antioch in 1112. His exploits have been narrated in prose and verse by Raoul de Caen in his *Les Gestes de Tancrede*. He also plays a conspicuous part in Tasso's *Gerusalemme Liberata*. See Delabarre, *Histoire de Tancrede* (Paris, 1822), and Kugler, *Bohemund und Tankred, Fürsten von Antiochien* (Tübingen, 1862).

Taney, LAW NÉE, ROGER BROOKE, LL. D.: jurist; b. in Calvert co., Md., Mar. 17, 1777; graduated at Dickinson College in 1795; studied law, and was admitted to the bar in 1799, beginning practice in Calvert County, from which he was chosen a delegate to the General Assembly of Maryland; removed to Frederick, Md., in 1801, and in 1816 was elected to the State Senate. He originally belonged to the Federal party, and stoutly supported the policy of the Government in the war with Great Britain. In 1819, in his defense of a Methodist minister who had condemned slavery, he declared that slavery was a blot on the national character. In 1822 he removed to Baltimore, and in 1824 he became a supporter of Gen. Jackson, by whom in 1831 he was appointed U. S. Attorney-General, and in 1833 was nominated as Secretary of the Treasury in place of Mr. Duane, who had been dismissed in consequence of his disagreement with the President in the matter of the removal of the public deposits from the U. S. Bank; but the Senate, by a vote of 28 to 18, refused to confirm the nomination, although he had for nearly nine months exercised the functions of secretary and had ordered the removal of the deposits. He was nominated by the President as the successor of Chief Justice Marshall, who died in 1835, and the administration having secured a majority in the Senate, the nomination was confirmed in Mar., 1836, he taking his seat upon the bench in the following January, and occupying it until his death. In the administration of this office he supported the supremacy of the U. S. Constitution, but far less broadly than Chief Justice Marshall had before him. His most noted act was his decision in the DRED SCOTT CASE (*q. v.*) in 1857. Another of his opinions which occasioned much public feeling was that rendered in 1861, in the case of John Merryman, who had been arrested in Baltimore by order of a Federal general for alleged treason. The chief justice issued a writ of *habeas corpus* to bring the prisoner before him; the officer in charge of Merryman refused to obey, on the ground

that he had been empowered by President Lincoln to suspend the execution of the writ of *habeas corpus*; whereupon the chief justice wrote out a formal opinion to the effect that the President had no constitutional authority to suspend the writ, and that this could be done only by the legislative authority. D. in Washington, Oct. 12, 1864. A notice of his career is contained in Santvoord's *Sketches of the Lives and Judicial Services of the Chief-Justices of the United States* (1853), and a memoir, embodying an autobiography down to 1801, has been written by Prof. Samuel Tyler (1872). A bronze statue of him, ordered by the State of Maryland, was unveiled at Baltimore Dec. 10, 1872.

Revised by F. STURGES ALLEN.

Tanganyika, tān-gān-yeē kān: a lake of Central Africa, S. of Lakes Albert and Victoria, between lat. 3 and 9 S. and between lon. 29 and 32 E.; about 400 miles in length from N. E. to S. W. It was first discovered by Burton and Speke in 1858, and afterward explored by Livingstone and Cameron. It has an elevation of 2,700 feet above the level of the sea, deep and clear water, and a very irregular form, its width varying from 10 to 50 miles. Area, 12,170 sq. miles. Its shores are generally rich in beautiful scenery, especially those of the northern part, which are set with mountains and hills covered with a luxuriant vegetation. The surrounding country is in many places densely peopled. The most important town is Ujiji, on the eastern shore.

Revised by M. W. HARRINGTON.

Tangent [from Lat. *tan gens*, pres. partic. of *tan gere*, *lac tum*, touch, whence Eng. *taet*, *tactile*, etc.]: a line touching a curve at some point of its length; this point is called the *point of contact*. The tangent to a curve at a point may be regarded as the limit of a secant through that point; for, suppose a secant to be drawn through the point of contact and any other point of the curve; then let the second point be moved along the curve toward the first; the secant will continually approach the tangent, and when the second point falls on the first, the secant will become a tangent; if the motion of the second point is continued, the line will become a secant on the other side. From this explanation we infer that only one tangent can be drawn to a curve at a given point. An exception, however, occurs when two or more branches of the curve pass through the point. According to the theory of the infinitesimal calculus, a curve is to be regarded as a broken line whose sides are infinitesimal; the consecutive vertices of this polygonal line are called *consecutive points*, and the prolongation of any side is a *tangent*; a tangent to a curve is therefore a line passing through two consecutive points of the curve. The first point in the order of generation is the point of contact. For the trigonometrical tangent of an angle, see TRIGONOMETRY.

Tan'ghin [from Malagasy]: an ordeal poison formerly used in Madagascar, consisting of the powdered seed of the *Tanghinia venenifera*, an apocynaceous tree of that island. It killed by paralysis of the heart and respiration. It contains an active principle, *tanghinin*. A small portion was administered to the suspected person, whose only hope was in the emetic action which the drug sometimes exerted.

Revised by H. A. HARE.

Tangier, tān-jeer' (Arab. *Tanja*, anc. *Tingis*): fortified port of Morocco, on the Straits of Gibraltar, 5 miles E. of Cape Spartel, on a shallow, semicircular bay open to the N. and N. E. (see map of Africa, ref. 1-B). Its trade is large and increasing. In 1892 935 vessels entered and 927 cleared; the value of the imports was \$2,624,000 and the exports less than half as much. The chief imports are cotton goods and sugar; exports, beans, barley, and wool. Tangier is also of considerable political importance as the only place of residence permanently open for foreigners, whether representatives or private, and it is a favorite place of refuge for fugitives from justice. The winter climate is exceptionally fine, and is largely resorted to by those who are unable to stand the severer climate of Europe. Pop. about 30,000, one-third Jews, who transact most of the business.
MARK W. HARRINGTON.

Tangle, or **Sea-tangle**: any one of several kinds of seaweeds, but especially *Laminaria digitata*. The young shoots are sometimes used as food and forage, and the plants are employed in the production of iodine. The stalks of the European sea-tangle are used in making uterine tents for surgeons' use, but those growing on the North American coast have been found unfit for this purpose.

Tanhäuser, tān'hoi-zer: minnesinger: probably a member of the noble family Tanhausen, in Bavaria. He was born in the early part of the thirteenth century; lived chiefly at the court of Vienna; participated in one of the crusades; probably joined King Konrad IV. (d. 1254), and disappears with the death of King Konradin (1268). He is one of the foremost representatives of the later minnesong, a poet of great talent, of delightful humor, and of a remarkable mastery of the metrical form. He led for a time a very gay life, and the sensuous character of many of his poems, as well as a penitential song which he composed later, may have been the cause of his becoming the hero of the Tanhäuser legend. According to this legend, Tanhäuser lived for some time with Venus in the Venusberg, but finally was smitten by conscience and begged Venus to allow him to depart. She refused, but owing to the help of the Holy Virgin Tanhäuser made his escape and went to Pope Urban (IV.) to obtain remission of his sins. The pope, however, answered that Tanhäuser's sins could as little be forgiven as the wand which he held in his hand could become green again. Tanhäuser, in his despair, went back to Venusberg and was received with great rejoicing. Three days after the pope's wand suddenly began to sprout, and messengers were sent to inform Tanhäuser of this divine miracle, but on account of his return to the Venusberg he was obliged to remain there till doomsday.

The Tanhäuser legend is doubtlessly one of the stories treating of the fatal union between a mortal youth and an elf which frequently occur in German, Danish, and English folk-songs, and which are founded on popular conceptions having their origin in old Germanic mythology. The reason why Venus, in this legend, takes the place of the elf may be found in the fact that the minnesinger Tanhäuser frequently addresses in his poems Minne (love) as Frau Venus. In the mentioning of Pope Urban may perhaps be seen a reminiscence of the historical fact that it was Pope Urban IV. (1261-64) who caused the final downfall and utter destruction of the glorious dynasty of the Hohenstaufen, with which Tanhäuser seems to have been closely allied. The story of the wand which began to sprout in spite of the words of the pope seems to express the popular view concerning the papal abuses in granting the remission of sins.

The best account of the Tanhäuser legend is contained in the famous *Tanhäuserlied*, one of the most popular folk-songs of the sixteenth century, printed in Uhland's *Volkslieder*, No. 297. See also I. G. Th. Grässe, *Der Tanhäuser und Ewig Jude* (1861). In modern times the legend has been treated poetically by L. Tieck, II. Heine, Fr. von Sallet, E. Geibel, and by Richard Wagner in his famous opera.
JULIUS GOEBEL.

Tani, KANJO, Count: soldier and statesman; b. in the province of Tosa, island of Shikoku, Japan, in 1837. He served on the imperialist side in the troubles of the restoration, and when the Satsuma rebellion broke out in 1877 was a major-general, in command of the garrison at Kumamoto. His brilliant defense of this stronghold against a powerful attacking force established his reputation. In 1883 he became Minister of Agriculture and Commerce, and soon after made a European tour. On his return he advocated

various reforms in the administration, but as these were not adopted he resigned, and has since become leader of the opposition in the new house of peers.
J. M. DIXON.

Tā'nis (Gr. *Tānus*, Egypt. *Tū* or *Tān*, Heb. *Zō'an*, Arabic *Sān*): an ancient Egyptian city in the Delta region, on the old Tanitic branch of the Nile (31° N. lat., 31° 55' E. of Greenwich). It was the capital of the fourteenth nome of Lower Egypt, and a very populous and important city in certain periods of Egyptian history. In the Hebrew Scriptures it is said to have been founded seven years after Hebron in Palestine (Num. xiii. 22), and the miracles of Moses were said to have been performed in the "field of Zoan" (Ps. lxxviii. 12, 43). This designation corresponds with the native designation of the region, sekhet Tān, "the field of Tān." In the time of Isaiah and Ezekiel it was an important place. The site was explored by Napoleon's *savants*, by Mariette, and again by Flinders Petrie under the auspices of the Egypt Exploration Fund in 1883-84. The earliest monument found was a statue of Merira Pepi, of the seventh dynasty, but as it was the sole memorial of that ancient time it is supposed to have been transported thither at a later date. A red-granite colossal statue of Amenemha I., the first king of the twelfth dynasty, and others in black granite representing Usertasen I. and Amenemha II., of the same dynasty, are believed to be monuments of the earliest founders of the temple which constituted the central portion of the city. The last-named colossus shows a peculiarity, in that it is sculptured without the usual supporting pilaster in the rear. From the same dynasty came two sphinxes, one of which is in the Louvre. There were found also other pre-Hyksos sphinxes and statues dating from the thirteenth dynasty. From the following period, during which the place was beautified and fortified so that it became one of the Hyksos strongholds, the distinctive "Tanis sphinxes" were long supposed to have come. (See SPHINX.) They are cut from dark-gray granite, adorned with manes, short, thick beards, and shaggy breasts. They have been usurped by later native kings, who caused their own names to be inscribed over erasures, rendering an exact determination of their age impossible. In some cases the name of the Hyksos king Apepi still is visible on the right shoulder of the sphinxes. From the eighteenth dynasty there are no monuments at Tanis, but with Seti I. and Ramses II. of the nineteenth dynasty its real glory dates. The latter built the huge temple, utterly obliterating the plan of the buildings of the twelfth dynasty Pharaohs. This building was massive and extensive, and was approached by an avenue adorned with obelisks (fourteen have been found in broken condition), sphinxes, and huge statues. In a space of 150 feet were found eight obelisks, and between them were the statues mentioned above, while towering above them all was the colossal statue of Ramses II., which Petrie, judging according to the law of proportion when applied to the fragments that were found, declares must have been about 75 feet high, or, with the base and diadem, 92 feet, and must have weighed complete about 900 tons, "the largest statue ever executed." The ruins of the temple cover a space about 1,000 feet long and occupy a depression surrounded by ridges about 60 feet above the Nile. Tanis retained its importance under the native kings down to the thirtieth dynasty and under the Greeks and Romans. It appears also to have been an important seaport, and to have lost its pre-eminence to Alexandria through the silting up of the Tanitic branch of the Nile (now represented by the Mu'izz Canal) and also of Lake Menzaleh. In the Coptic period it had lost its importance completely and was scarcely known. At present San is a squalid fishing-village, half a mile from the canal and at a considerable distance from Lake Menzaleh. See Petrie, *Tanis* (2 vols., London, 1885, 1888), and second and fifth *Memoirs of the Egypt Exploration Fund*.
CHARLES R. GILLET.

Tanjore, tān-jōr': city of Madras, British India; capital of a district of the same name, and railway junction; on the right bank of the south branch of the Cavery; lat. 10° 47' N., lon. 79° 10' E. (see map of S. India, ref 7-E). It is one of the great religious and literary centers of Tamil India, and is renowned for its artistic industries (silk rugs, jewelry, and copper *repoussé*) and for its great pagoda. The palace of the rajahs contains a very valuable collection of 18,000 Sanskrit manuscripts. Pop. (1891) 54,390.
M. W. II.

Tank-worm: See GUINEA-WORM.

Tān'nahill, ROBERT: poet; b. at Paisley, Scotland, June 3, 1774; bred as a weaver, he worked at the loom all his life;

wrote occasionally for periodicals, and in 1807 published *The Soldier's Return, with other Poems and Songs, chiefly in the Scottish Dialect*, which rendered the poet famous. Several of these became popular favorites, and have remained so. When his publisher hesitated to issue a new and enlarged edition, he fell into a fit of despondency, burned all the new poems which he had written, and drowned himself in a pool near Paisley, May 17, 1810. A statue of the poet was erected in Paisley in 1883. Tannahill possessed much tenderness of sentiment and a delicate feeling for the effects of nature. An edition of his poems by D. Semple (1876) contains an exhaustive account of the poet's life and writings.

Tanner, THOMAS, D. D.: antiquary; b. at Market Lavington, Wiltshire, England, Jan. 25, 1674; was educated at Oxford, and was made fellow of All Souls in 1696; entered holy orders; became successively chaplain to the Bishop of Norwich, whose daughter was his wife, chancellor of Norwich, prebendary of Ely, rector of Thorpe, near Norwich, Archdeacon of Norwich (1710), canon of Christ church, Oxford (1723), and in 1732 Bishop of St. Asaph. His principal works, published posthumously, are *Notitia Monastica*, an account of the religious houses, colleges, hospitals, etc., founded in England and Wales before 1540 (1744), and *Bibliotheca Britannico-Hibernica*, an account of the writers who flourished in England, Scotland, and Ireland up to the beginning of the seventeenth century (1748). He edited Anthony Wood's *Athenæ Oxonienses* (2 vols. fol., 1721). He bequeathed his large collection of MSS. to the Bodleian Library. D. at Oxford, Dec. 14, 1735.

Revised by S. M. JACKSON.

Tannhäuser: same as TANHÄUSER (*q. v.*).

Tannic Acid, or Tannin [*tannic* is deriv. of *tan*, tanbark, deriv. of *tan* (verb) < O. Eng. *tannian*; cf. O. H. Germ. *tanna*, fir, oak > Mod. Germ. *tanne*, fir; *tannin* = Fr., deriv. of *tan*, tan]; any one of several astringent principles that are widely disseminated in the vegetable kingdom. The chief sources of these compounds are the barks of varieties of the oak and pine, sumach, gall and valonia nuts, kino, divi-divi, and catechu; the bark and berries of many forest and fruit trees, such as the elm, the willow, the horse-chestnut, the plum, the pear. All of the forms of tannic acid were formerly supposed to be identical with the tannin contained in the gall-nut, the differences in chemical composition presented by them being accounted for by the presence of accidental impurities; but there is no doubt of the existence of several distinct acids with many properties in common.

The term "pathological tannins" has been applied to those obtained from diseased vegetable excrecences, such as the gall-nut; those which are contained in barks, etc., being designated as "physiological tannins. The latter only are adapted to the manufacture of leather. The most important and best-investigated form of tannin is that known as gallo-tannic acid. Other modifications are caffeotannic, catechutannic, morintannic, quercitannic, and quinotannic acids, which, although very similar in many properties, possess different compositions.

Gallotannic acid occurs in the gall-nut, an excrecence produced by the puncture of a small hymenopterous insect upon the leaves and stalks of the species of oak *Quercus infectoria*, sometimes in a proportion as high as 60 per cent. of the mass. The tannin of the sumach, once considered identical with gallotannic acid, appears to be a distinct compound. Pure gallotannic acid, $C_{14}H_{10}O_8$, is an amorphous buff-colored solid, easily soluble in water; it also dissolves in aqueous alcohol, but only with great difficulty in pure ether. It has an intensely astringent taste, imparts a strong red color to litmus, enters into double decomposition with bases, and liberates carbonic acid from the carbonates. Of the gallotannates, the ferric salt is especially characteristic and important. It is obtained, upon adding a solution of the acid to a solution of a ferric salt, in the form of a violet-black precipitate. This reaction is exceedingly delicate. The basis of much of the ordinary writing-ink is ferric gallotannate. In common with most forms of tannin, gallotannic acid forms with gelatin an insoluble compound. The affinity of the acid for gelatin is so great that when a skin is immersed in its aqueous solution all the tannin is ultimately removed. This property of gallotannic acid is often utilized in its quantitative estimation in nut-galls, etc., a standardized solution of gelatin, with a small quantity of alum or ammonium chloride, being employed for this purpose. See LEATHER.

Tañoan (tán'yō-án) or Tanoan Indians: a family of North American Pueblo Indians. In the middle of the sixteenth century they were widely scattered and divided into distinct geographic groups, and they were variously named by their Spanish discoverers and conquerors. For a long time they were regarded as representative, linguistically and otherwise, of four diverse stocks, but since 1878 they have all been designated as *Tanoan*.

Tribes and Pueblos.—As with other Pueblo Indians, they are chiefly named according to their pueblos or towns. In alphabetical order these are Ilano (of the Tusayan group in Arizona), Isleta (New Mexico), Isleta (Texas, below El Paso), Jemez, Nambé, Pecos (a mere remnant, living since 1840 with their kinspeople at Jemez), Picuris, Pojoaque, Sandia, San Ildefonso, San Juan (de los Caballeros), Santa Clara, Senecú (in Northeastern Chihuahua, Mexico, below El Paso), Tangewünge (a remnant sub-tribe sharing with the Keresans the pueblo of Santo Domingo), Taos, and Tesuque.

Habitat.—Notwithstanding the intrusion of the Keresan Cochitum and Kiwami tribes (which was comparatively recent at the time of the discovery), the Tanoans were the people *par excellence* of the Rio Grande del Norte, originally occupying, with but slight interruptions, its entire valley and some of its outlying tributaries from within 40 miles of the northern boundary of New Mexico to within 120 miles of Mexico itself, a stretch of country not less than 230 miles long by a varying width of from a few to nearly 100 miles at its several widest points. Throughout this region their pueblos were, in the sixteenth century, distributed from north southward in five groups—Taos, Tewa, Jemez, Tanoas, and Piro—this geographic distribution agreeing almost wholly with that of the ethnic subdivisions of the family.

Of the Taos group were Taos (Te-wat-ha, the "Braba" of Castañeda and the "Tayberon" of later Spanish writers), situated about 45 miles due N. N. E. of Santa Fé, on an eastern tributary of the Rio Grande, and Picuris (Ping-ül-tha or U-la-na, the Picuries of Oñate, 1584-85), 2 miles S. W. of Taos. Both occupy nearly the same positions as when discovered.

Of the Tewa group, San Juan (Jyu-o-tyu te-oj-ke) was situated on the western side of the Rio Grande, about 30 miles S. W. of Picuris. It was, with a companion town on the opposite side of the river, at Chamito, now in ruins, the Pungue Yungé of Castañeda, and from it probably the majority of the Tewas now of Ilano in Tusayan fled in the latter part of the seventeenth century. The still inhabited Santa Clara (Ka-po), and San Ildefonso (Pho-ju-o-ge), on the east side of the river, respectively about 2 and 5 miles lower down than San Juan, belonged also to the Tewas. Their remaining towns are (as they were) Pojoaque (Pho-ju-añ-ge), Nambé (Na-im-be), and Tesuque or Tezuque (Te-izo-ge), all quite near to each other and from 6 to 9 miles E. of the main Rio Grande valley, the last-named being only 9 miles N. of Santa Fé.

The Jemez (or Teguala tribe) now occupy but one pueblo, Jemez (Wa-la-to-hu-a), 30 miles W. of the Rio Grande, on the Rio Jemez, but in the sixteenth century they existed in two branches. The western was distributed in twelve or thirteen towns, of which the main group was near the famous Hot Springs of San Diego. Here were the large ruins of Gwin-se-wa or old Jemez (at the Hot Springs themselves), and of A-mox-yum Kwa, Asht-yu-la-kwa, and four others on the heights lower down. Below these still were seven or eight goodly towns (the ruins of which can be still distinctly traced), from about where the modern Jemez stands to near the Keresan towns of Cia. The Pecos (Pa-e-kwi-wa-la), or eastern branch of the Tequala, speaking the same dialect, were separated by a distance of 80 miles from their western kinsmen, with whom their few survivors now dwell. They occupied the famous ruin of Pecos (Tshikwit-ye, the Cienye of Coronado), on the Rio Pecos, some 40 miles E. of the Rio Grande and S. E. of Santa Fé. This pueblo was, at the time of the discovery, the largest and most populous in New Mexico. It is probable also that the ruins of Ku-wang-wa-la (pueblo de las Ruedas) and Se-yu-pa-we-la, near Fulton in the same section, were occupied by sub-tribes of these Pecos, who were the most eastern representatives (as the Taos are the most northern) of all the Pueblo peoples.

Properly, there were three groups of the Tano pueblos—the northern, or Galisteo; the southern, or Rio Grande; and the eastern, or Manzano. The northern Tanoas (Tañ-ge-was) originally had two pueblos on the site of the present capital of New Mexico, and others in the same neighborhood; but

when discovered their most northern town was Tzi-gu-ma, at Ciénega, 12 miles S. of Santa Fé, and a few miles S. E. of this was another important town at San Marcos, called Kwa-ka. About 12 miles farther S. (at Galisteo) was their principal pueblo of Tan-ge-wiñ-ge, and within a radius of 10 miles around the Galisteo basin the lesser pueblos of I-pe-re (at San Lázaro), Yam-p'ham-ba (San Cristóbal), and Hi-shi, or Pueblo Largo. Of these six towns the inhabitants were almost totally destroyed by the Comanches and Apaches soon after the sixteenth century, a few fugitives seeking shelter with the Santo Domingo Keres, where their descendants remain, keeping up, as do their Tewa kinsmen in the far away Hano of Tusayan, their original language and organization. On the northern spurs of the Sandia and Manzano Mountains were other pueblos of this tribe. In addition to these, but belonging more properly to the Rio Grande division of the Tanoos, were six or seven pueblos W. and S. W. of the Salines, linking the northern or Tan-ge-was to the more southern or Isleta series of Tano towns. Of the latter there were twelve or thirteen, situated along the Rio Grande from Bernalillo to below Isleta, including Na-phi-ap, near Bernalillo, and a town at Los Corrales (the ancestral homes, probably, of the present Sandias); and Pu-a-ray, the principal pueblo of the series, Hy-en tu-ay, and Bejui tu-way, near Las Lunas, which were the ancestral abodes of the modern Isletas. These eighteen or more populous pueblos constituted the famous province of Tiguex of Coronado.

Following the Isleta Pueblos, there were at least ten or twelve settlements of the Piroos distributed along both sides of the Rio Grande as far S. as San Marcial. The northernmost of these (abandoned for El Paso in 1680) was at Alamillo; another, called Pil-a-bo, and perhaps a third, occupied the site of Socorro. At San Antonio was the New Mexican Se-ne-kú, or Seneé, which was destroyed by Apaches in 1675. Fugitives from it fled to Socorro and to Chihuahua, near El Paso, where they established themselves with fugitives from other devastated towns in the pueblo of the same name there, still inhabited by their descendants. The last of the series, and the most southern example of the compact, many-celled pueblos, still occupied at the time of the discovery was Tre-na-quel, at San Marcial. S. of the Salines and some 40 miles E. of the Rio Grande series were, in the valley of Abo, the Piro towns of Abo and Ten Abo (El Pueblo de Los Siete Arroyos), and near the Mesa de los Jumanos, Tabira, or the famous Gran Quivira. All of these Piro towns, including three or four others in the immediate vicinity, were destroyed by Apaches between 1670 and 1680, those of the inhabitants who escaped fleeing to the lower Seneé and Isleta pueblos.

General Characteristics.—The Tanoos were everywhere the frontiersmen of the Pueblo country and peoples. On the N. and E. they were contiguous to the Great Plains, and thus to the Utes, Pawnees, Comanches, dog-using Apaches, and other buffalo-hunting or roving tribes. With these they were constantly either at war or on terms of very doubtful amity during frequent but brief trading-truces. Thus they became harder and more warlike, and greater travelers, traders, and hunters, than any others of the Pueblo peoples. Their training as mountaineers, and their intermarriage for generations with wilder neighbors, especially with the Shoshonean Utes and Comanches, have had a marked influence on their physical development and appearance.

The typical Tanoos (of the north especially) are tall, broad-shouldered, lithe, but strong-limbed, resembling the plains Indians in these and many other respects, even more than they do the Pueblo Indians of other stocks. They are alert in movement and wit, their expression being keen, their features spare, clear-cut, and prominent. The women are shorter than the men, but taller than the average Pueblo woman, and less rotund as a rule. Their costume is much the same. Their dresses, although more ornate, are much shorter of skirt, both modifications being due largely to their greater stature, and to the more active life led by the Tanoan women. The men wear their hair as do the northern plains Indian, long, and plaited at the sides (with fur or bright-colored stuffs interbraided), instead of doing it up at the back in a club or queue, as do the Keresans. They also wear long leggings of buckskin in place of the short, wide trousers or long knitted stockings of the other Pueblos, and for a long time catskin and buffalo robes largely supplied the place of the striped or figured and woven serapes so characteristic of all the other Pueblos.

The wide distribution of the Tanoos was the result of their wandering proclivities; their permanent segregation

in small but numerous communities and the compact many-storied and steeply terraced style of their pueblos being due to their constant warfare and defensive necessities. In supplying all pueblos with products of the buffalo-hunt the Tanoos formed small trading-parties, which sometimes penetrated as far S. and W. as the Pima country of Arizona and Northern Mexico. Even now their descendants are the greatest travelers and cleverest traders among existing Pueblos. Able to secure in this way all the products of the finer Pueblo arts, they depended more than the townspeople on both barter and the hunt, tilled the soil less extensively, and seldom resorted to irrigation.

Their tendency to sever themselves (in bands more or less numerous) from their own communities and to join those of other stocks is strongly characteristic, the Hano Tewas of Tusayan being the last of a series of such migrant settlements. While thus so much affected externally by natural and sociologic environment, the Tanoos have been remarkably tenacious of their language, organization, and customs, even the few survivors of the Galisteo towns adhering to these, after a residence with alien people for more than two centuries. This adhesion to native institutions was in part due to the similarity of culture everywhere traceable among the Pueblos; but with the Tanoos the division of each tribe into two main bodies—the clan-groups of winter and summer—was more distinct than with the other Pueblos, resulting sometimes in double (that is, northern and southern) divisions of their towns, as at Taos, and in the possession of at least two kivas in every pueblo. Within these groups, however, occurred the usual septenary subdivisions (see *Habitations* under PUEBLO INDIANS) and the clan-system, together with the totems of their tribes, was no less analogous to those of other Pueblos. The cult-lore of the Tanoos, while pueblo in principle, is very composite in make-up, their folk-tales being derived from, or modified by, that of all the numerous wilder peoples with whom they held intercourse. Naturally they had not advanced beyond simple animism and a resultant extensive fetish worship, which included a kind of mortuary fetishism not characteristic originally of the other pueblos (exclusively, it may be, of the Tusayan Indians). Their dance-worship is more obviously animal dramaturgy than is that of the Zuñi Pueblos, and their sacred or sociologic games are more athletic than those of the farther pueblos. Their tendency to war kept them on only a slender footing of peace even with the other pueblos, but made them pre-eminent, and secured them leadership, in case of any general confederation or uprising of the Pueblos. The Rio Grande or Isleta (Tiguex) Tanoos were the first to oppose the Spaniards, murdering the earliest Franciscan missionaries to New Mexico. Moreover, it was a wizard chief of the Tanoos, the celebrated Popé, who incited, planned, and largely led the terrible Pueblo rebellion of 1680-96, which well-nigh resulted in the downfall of Spanish power N. of Mexico. Yet the position of the Tanoos on the frontiers, as heretofore defined, led to the speedy extermination of whole groups of their pueblos by the wilder tribes soon after the introduction of Spanish horses and firearms, which, by changing the nature of Indian warfare, rendered the Pueblo defensive method no longer adequate.

History.—There is evidence that the ancestral Tanoos were derived from the northwest—ruins of their pueblos being abundant in Colorado and Utah, and thence traceable southwardly into the cañon and mountain country W. N. W. of the present Taos ranges in the north of New Mexico. It seems probable that the Lower Taños and Jemez branches were the first to migrate, peopling the basin and tributary valleys of the great river below Santa Fé, from the north and west, while the Taos and Tewa branches of the same family descended directly from the west, and then spread gradually eastward and downward along the upper section of the same river to about their present stations thereon and on the higher tributaries.

Whatever the original language of the Tanoos may have been, it is now true that considerable numbers of words in their various dialects show Shoshonean association. Their long intercourse and constant intermarriages with Ute and Comanche branches of this great stock during centuries may account for this. If, nevertheless, the Tanoos should yet be proven to have been Shoshonean at an earlier stage of development, then the conversion to the pueblo mode of life and the aridian status of culture of the Shoshonean-Moqui or Tusayan Indians is, by comparison with theirs, a modern event. It is worth noting that the Jemez Tan-

oans are now largely Navajo, and that formerly they and their eastern kinsmen, the Pecos, were once so intermixed also with the Zuñis that much in their dialect—especially in the names of their pueblos and ruins—shows unmistakable relation to the Zuñi, this, however, more in a derivative than in an inherited way. The wide rangings of the Tanoans made them no less townspeople in the Pueblo sense, but far less sedentary than any of the other Pueblo peoples, and hence less conservative, more subject to admixture with and prone to adopt terms, etc., from outsiders.

Population.—The total population of the Tanoan Indians was in the sixteenth century much greater than at present. There are now only between 3,250 and 3,300 of them. Isleta, of New Mexico, is the most populous pueblo, its inhabitants numbering 1,059.

AUTHORITIES.—Ad. F. Bandelier, in *Papers and Reports of the Archeological Institute of America* (i., Boston and Cambridge, 1883-91); H. H. Bancroft, *Arizona and New Mexico and Native Races*; and W. W. H. Davis, *Spanish Conquest of New Mexico*. See also INDIANS OF NORTH AMERICA, PUEBLO INDIANS, KERESAN INDIANS, SHOSHONEAN INDIANS, and ZUÑIAN INDIANS. FRANK HAMILTON CUSHING.

Tanrec, or Teurec [= Fr., from native (Malagasy) name]; any insectivorous mammal of the family *Centetidae*. The species are confined to Madagascar, and some have a superficial resemblance to hedgehogs. The tailless *Centetes caudatus* attains a length of 6 inches, and has dorsal spines, lost in the adult. The species of *Orzoryctes* are mole-like, and burrow in the rice-fields, doing much damage.

Tansiplo, Luigi; poet; b. at Venosa, Italy, in 1510. He passed his life in Naples, where he long enjoyed the favor of the viceroy, Don Pedro de Toledo, after whose death, however, he lived poorly by a small office in the customs. D. at Teano, Dec. 1, 1568. His earlier poems are the *Due Pellegrini*, a pastoral; the *Vendemmiatore* (1532), in *ottava rima*, a work so licentious that it was placed upon the Index; and some amorous *Rime*, probably addressed to Maria of Aragon. To his later period belong certain spirited *Capitoli*, or epistles sent to influential friends; the *Balia*, exhorting mothers to nurse their own children; the *Podere* (1560), an idyl on the charms of country-life; and the *Lagrime di San Pietro*, a religious work written by way of atonement for the *Vendemmiatore*. See *Opere di Luigi Tansillo* (Venice, 1738); *Poesie di Luigi Tansillo* (London, 1782); *Capitoli giocosi e satirici*, ed. by S. Volpicella (Naples, 1870); *Poesie liriche edite ed inedite*, ed. by F. Fiorentino (Naples, 1882, with biography); *Il podere*, in *Poeti minori italiani* (Venice, 1786); *The Nurse, a Poem translated from the Italian of Luigi Tansillo*, by William Roscoe (3d ed., Dublin, 1800, with Italian text); X. *Sonetti inediti, in Aneddoti tansilliani e danteschi*, ed. by Francesco and Imbriani (Naples, 1883); Franc. Flamini, *Sulle poesie del Tansillo di genere vario* (Pisa, 1888). J. D. M. FORD.

Tansy [M. Eng. *tansaye*, from O. Fr. *tanaisie* < Late Lat. *albana sia*, tansy, from Gr. *ἀθάνατα*, immortality, deriv. of *ἀθάνατος*, immortal; *ἀ-*, un-, without + *θάνατος*, death; cf. *live-forever*, name of a plant]; the *Tanacetum vulgare*, a perennial plant of the family *Compositae*, bearing doubly pinnatifid leaves and yellow flowers, blossoming from July to September. It was originally introduced into the U. S. from Europe, where it is indigenous. It is cultivated in gardens, but also grows in fields and along roadsides. It possesses a very strong, not unpleasant odor, and an acrid and aromatic taste, properties which are exhibited by its aqueous and alcoholic infusions. The leaves contain a peculiar volatile oil and an acid termed *tanacetie acid*, which is crystalline, forms salts with potassium and sodium, and precipitates solutions of calcium, zinc, silver, and mercury salts. The volatile oil of tansy has a specific gravity of 0.92; when distilled with potassium chromate and sulphuric acid, it yields a volatile crystalline substance isomeric with ordinary camphor; it possesses poisonous properties. Its seeds and leaves are employed, to a slight extent, as medicinal agents. Revised by L. H. BAILEY.

Tan'talium [Mod. Lat., named from the mythical *Tantalus* (see TANTALUS), because of the perplexity and difficulty encountered by its discoverer in isolating it]; one of the rarer elements, a metal discovered in 1802 by the Swedish chemist Ekeberg in two Swedish minerals, one of which was *tantalite*, composed mainly of tantalie oxide, Ta₂O₅, and ferrous oxide. For many years it was confounded with the COLUMBIUM (*q. v.*) of Hatchett. Tantalum is found also as tantalate of yttrium in the mineral *ytthro-tantalite*;

in the American, Bavarian, and Greenland *columbite*s, with columbic acid; in Nordenskjöld's *hjelmit*; in *euxinite*, *arschynite*, etc. H. Rose obtained metallic tantalum as a black powder, of density 10.78. Its equivalent weight is accepted as 182 from determinations of Marignac. *Tantalie pentoxide* (Ta₂O₅), which forms tantalic acid by reacting with water, and tantalates by combining with bases, is an infusible white powder. Revised by IRA REMSEN.

Tan'talus (Gr. *Τάνταλος*): in Greek mythology, a very wealthy King of Phrygia, though some of the mythographers wrongly assign him to Argos, Corinth, or Papiliagonia. He was a son of Zeus and a nymph called Pluto (wealth)—though his lineage is variously given—and father of Pelops and Niobe. He was a favorite of the gods, who often invited him to their banquets, but their favor changed to hatred when Tantalus stole nectar and ambrosia from their table. In order to test the omniscience of the gods he slew his son Pelops, and served him up at a banquet to which he invited the Olympians. As a punishment for this crime he was cast down to Tartarus, where, tortured by hunger and thirst, he was made to stand in a lake, whose water receded whenever he tried to drink; rich fruit hung in clusters from trees above his head, but was withdrawn whenever he tried to pluck it. According to others his punishment consisted in eternal fear caused by a huge rock that was suspended over his head and threatened to fall and crush him. The myth is based on facts. The capital city of Tantalus was in the neighborhood of Smyrna, and its acropolis and what is called the tomb of Tantalus still exist. See Perrot and Chipiez, *History of Art in Phrygia*, etc. (London, 1892).

J. R. S. STERRETT.

Tantum Ergo [Lat. (these words occurring in the hymn) *tantum* (*sacramentum*), so great (a sacrament) + *ergo*, therefore]; a popular eucharistic hymn, the fifth and sixth stanzas of the *Pange Lingua* (Proclaim, O Tongue!), a famous hymn by Thomas Aquinas. It is sung in Roman Catholic churches during eucharistic services, at the benediction.

Taoism, tow'izm [Chinese *tao*, road, way, or path; word, doctrine, reason, etc. + *ism*]; a philosophy and a religion found in China. Both are supposed to be based on the teachings of LAO-TSE (*q. v.*), a scholar and official of the sixth century B. C., who, disgusted with the general decay of manners and social order which characterized his times, became a recluse, and embodied his ideas of things in a little book entitled *Tao-teh-king*, the "Classic of the Way and of Virtue"; but it is probable that he merely gave expression to ideas which had already found currency in his own and earlier times, while the religion called Taoism, if it ever had any connection with philosophic Taoism, has lost all trace of it. Just what philosophic Taoism is depends largely on the meaning of the word *tao*. Scholars are not agreed, and there is no word in English which can be used in all cases as a satisfactory equivalent. Moreover, Lao-tse's work is obscure in style and abounds in paradoxes, and the writings of Lieh-tse (about 500 B. C.), Chwang-tse (fourth century B. C.), and other later Taoists throw little light on the subject. Some Western scholars call it the "Doctrine of the Way," that is, of the ideal or eternal way of right conduct. Others describe it as "Rationalism," or the doctrine of Reason; while still others speak of it as "Naturalism."

Lao-tse's system seems to have been leveled more particularly against the artificial enactments, by which it was sought to remedy the licentiousness and the turbulence and unrest of his time. He wished people to cultivate "naturalness" or the simplicity and innocence of former days. It is only when *tao* (or nature) is missed that arbitrary standards are set up, that men become ambitious and violent, and squabble in their eagerness for gain and advantage. He who does not act contrary to his nature continues long. Lao-tse inculcated unselfishness under the figure of "emptiness" and humility under the simile of water, which, though good at benefiting all things, always seeks the lowest place—the place which all men dislike. Lastly, he taught that unkindness should be requited with kindness. Chu-nt (*q. v.*), the famous Chinese philosopher of the twelfth century, sums up Taoism as the doctrine of surrender to others. "Its leading doctrines," says Giles, "teach man, by a course of non-resistance and inaction, to bring his moral and physical natures into perfect harmony with their environment, the result being a complete victory over all obstacles to human happiness and even over death itself."

Taoism as a religion dates from the advent of Buddhism in China in the first Christian century, when the supersti-

tions and fanciful notions about immortality (in the flesh) and genii, and alchemy, with its quest after the elixir of life and the herb of immortality, and geomancy, etc., became consolidated into one system and adopted Buddhist forms. It has its temples, monasteries, and idols; its "three pure ones" (in imitation of the Hindu Trimūrti and the Buddhist Triratna), of whom Lao-tse is one, its hell and its purgatory, and a hereditary pope, who enjoys large estates granted him by the government, whose recognition and patronage it now shares with Buddhism. Its moral system is embodied in such tracts as the *Kan Ying Pien*, or Book of Rewards and Punishments (translated by Dr. Legge in his *Texts of Taoism*).

For a fuller account of Taoism in both its forms, see Julien's translation of the *Tao-teh-king* (1822), and the translations in German by Plänckner and von Strauss (1824); Chalmers's *Speculations of the Old Philosopher Lau-tse* (1868); Legge's *Religions of China* (London and New York, 1881) and his *Texts of Taoism*, in the Sacred Books of the East (2 vols., Oxford, 1891); Balfour's *Works of Chuang-tse* (1881) and his *Taoist Texts, Ethical, Political and Speculative* (1884); also Giles's *Chuang Tzu, Mystic, Moralist, and Social Reformer* (London, 1890).

R. LILLEY.

Taos: See TAOSAN INDIANS.

Tapajós, *tã-pã-zhõs'*: a river of Brazil; one of the principal southern tributaries of the Amazon; formed by the junction, in lat. 10° 24' 30" S., of two nearly equal branches, the Arinos and Juruena. Both of these rise on the plateau of Matto Grosso, near lat. 14° 30' S., and about 225 miles apart. The sources of the Arinos are close to those of the Paraguary, and it is said that both receive water from the same tracts of flooded land. The Arinos, Juruena and Tapajós are obstructed at intervals by rapids and low falls as far as lat. 4° 30' S.; below this the lower Tapajós is navigable, broadening into a lake-like expanse 12 miles across, but suddenly narrowing to less than a mile at its mouth in the Amazon. Length of the Tapajós and Arinos, nearly 1,100 miles.

HERBERT H. SMITH.

Tapestry [from O. Fr. *tapissierie*, deriv. of *tapisser*, furnish with tapestry, deriv. of *tapis*, tapestry, carpet < Late Lat. *tapetium* = Gr. *τάπητος*, dimin. of *τάπηξ*, *τάπητος*, tapestry, rug, carpet]: a fabric made by weaving or tying threads of worsted, silk, or other material into a warp of strong twine, which warp is not seen in the finished stuff. Tapestry is made entirely by hand and without those repetitions of the pattern which are characteristic of mechanical weaving. It also differs from all weaving in the usual sense in the fact that there is no shuttle thrown from side to side of the web. It has been rightly described as a mosaic of threads held in place only by the warp. In some modern languages the word for tapestry means also common worsted-work on canvas, and this is not inaccurate, for tapestry differs from worsted-work chiefly in its much greater solidity and in the immensely superior character of the designs executed in it. Both differ from embroidery, in that there is no background, as of cloth or leather, upon which the work is done, the whole fabric being made together.

Tapestry was anciently made on a frame which held the twine of the warp horizontal. As the work was always done from the wrong side, the workman could not see the right side, which was held downward and out of reach. An invention, perhaps of the Middle Ages, consisted in using a vertical frame. With this the workman can easily walk to the right side or face of his tapestry, judge of its progress, and compare it minutely with the cartoon or pattern made for him to follow. These two processes are called low warp (*de basse lisse*) and high warp (*de haute lisse*). The important tapestries since the fifteenth century are all high warp.

During the fifteenth and following centuries tapestry was made in Flanders, France, and Italy, and probably in other European countries. The most famous center of the industry was the town of Arras, France, and the name "arras" was often applied to tapestry of any make, as in Shakspeare's *Henry IV.*, Act II., Scene IV. Tapestry was the favorite decoration for walls of rooms and even for the lower part of the interiors of churches and chapels. It was hung from hooks and generally left free at the lower edge, so that a certain space might be left between it and the wall, in which a person might be concealed. The decoration of interior doorways and windows was made of but little account by the tapestry, which turned all corners and was arranged to meet across the door or to conceal the window at pleasure.

This loose hanging of the tapestry is important to its best effect; those pieces which in modern times have been stretched tight and framed, as in the Gallery of Apollo in the Louvre, lose their charm and are mere imitations of paintings in an unfit material.

The famous factory of the Gobelins in Paris was established in 1630, the royal factory of Aubusson in 1665, and the royal factory of Beauvais is of the same epoch. These three factories have generally been maintained by the state; they are still so maintained, and their most important productions are not commonly sold.

The BAYEUX TAPESTRY (*q. v.*), so called, is a long and narrow piece of embroidery in worsted on linen, and is therefore not tapestry in any sense. It represents the preparations of William of Normandy for the invasion of England, and is undoubtedly a work of the epoch; it is on exhibition at the Public Library of Bayeux in Normandy, but is said to be decaying. For tapestry Brussels, see CARPETS.

BIBLIOGRAPHY.—The most important work on the subject is *Histoire Générale de la Tapissierie*, by Eugene Müntz (3 vols. fol., 1878-84). The same author has published a small volume, *La Tapissierie*, forming part of the Library of Instruction in the Fine Arts (Paris). What is known of the use of tapestry in ancient times is treated by de Ronchaud in *La Tapissierie dans l'Antiquité*, and the influence of tapestry on ancient art is discussed in Semper's book, *Der Stil in den Technischen und Tektonischen Künsten*. See also Viollet-le-Duc, *Dictionnaire de Mobilier*, art. *Tapis*.

RUSSELL STURGIS.

Tapeworm: any one of the *Cestodes*, a group of parasitic flatworms (Platyhelminthes), the most striking feature of which is the complete absence of an alimentary canal. This is compensated for by the mode of life, as these animals live in the adult state fastened to the inner wall of the digestive tract of some animal, and being thus surrounded by partially digested food, absorb their nourishment through the body walls. In all there is an anterior end or head in which is the chief nervous center or brain, and which serves usually by means of suckers or hooks as the organ of fixation. Behind the head is the flat, elongate body, which is largely occupied by the organs of reproduction. In the simpler tapeworms, which occur in some of the lower animals, the body is undivided and there is but a pair, male and female, of reproductive openings. In the other forms the head, followed by an unsegmented portion or neck, is called a scolex and behind this occurs a series of joints or proglottids, each of which contains its own set of reproductive organs. These proglottids arise by division of the posterior part of the scolex, each new proglottid pushing the others backward, so that the one farthest removed from the head is necessarily the oldest. As the proglottids grow older they increase in size, and as they mature the sexual products they become free from the rest and are carried to the external world with the rejecta. New ones are continually formed from the scolex, and this is the reason why the head of the worm must be removed in order to stop the troubles caused by these parasites.

In many tapeworms the history is simple. The proglottids or their contained eggs are eaten by some animal, and in its intestine they develop directly into the parent form. In the case of those species which affect man the development is more complicated, and can best be followed by tracing the history of different forms.

The largest tapeworm occurring in man is known as

FIG. 1.—Diagram showing the structure of a tapeworm, with two joints or body segments, in the posterior of which the reproductive organs are developed. At the anterior end is a circle of hooks, behind which, at s, are two of the four suckers: f, flame cells; h, testis; v, uterus; v, vitellarium; w, excretory (water-vascular) tubes; o, ovary; sg, shell gland.

Bothriocephalus latus; it may consist of over 2,000 proglottids and have a length of 40 feet. The head is elongate and has two narrow pits or suckers on the side. Hooks are lacking. The genital openings are on the flat surface of the proglottids. The history is not completely known. From the eggs hatches an embryo which swims freely in the water, and apparently must enter some host not yet discovered. When this host is eaten by some fish (in Europe by the pike or burbot), the scolex is developed and bores through the intestinal walls, and entering the muscles secretes a thin wall (cyst) about itself. If this fish be eaten in an imperfectly cooked condition by man the scolex fastens itself to the intestinal wall and develops into the mature worm. *Bothriocephalus latus* is common as a human parasite in Switzerland, Northern Russia, and Sweden, but is rare in other parts of Europe. In America it is found only in natives of these countries.

FIG. 2.—Cysticercus stage of tapeworm.

Several species of *Tenia* infest man. These agree in having a spherical or pear-shaped head bearing four suckers and usually a circle of hooks to aid in fixation. The sexual openings are on the edges of the proglottids. These worms, like the last, have two hosts in the life-cycle, but differ from *Bothriocephalus* in the character of the larval stages and in that the intermediate host is usually a mammal. The larvae have separate names. The cysticercoid is a scolex, the head of which has been inverted into the body as the finger of a glove can be turned into the hand. The cysticercus, or bladder-worm, differs in that the body into which the head is inverted becomes enormously swollen by fluids within. The *cœnurus* is a cysticercus with several invaginated heads, while the *echinococcus* has secondary *cœnuri* turned in from the wall of the original sac. In the future development of cysticerci or echinococci each head gives rise to a distinct worm.

Tenia solium is the most common tapeworm of man. The tip of the head is surrounded by a double circle of hooks, and the body, sometimes 10 feet in length, may consist of 800 to 900 proglottids. The ripe proglottids and eggs, cast out from the body, are eaten by pigs, and the embryos, hatching in the intestine, bore through into the muscles, where they develop into the cysticercoid stage. If pork infested with these bladder-worms ("measly pork") be eaten in an uncooked condition, the cysticerci are set free and, fastening themselves to the intestinal wall, develop

into the adult worm. Sometimes man, by eating lettuce, etc., which has been watered by liquid manure, becomes the host of the bladder-worm stage. *Tenia saginata*, which is less common than *T. solium*, lacks the circle of hooks and reaches a length of 25 feet. Its history is much the same as that of *T. solium*, except that cattle instead of swine serve as the intermediate hosts. Other tapeworms are occasionally found in man, as *T. cucu-*

merina and the echinococcus stage of *T. echinococcus*, the adult of which lives in the intestine of the dog. Domestic and other animals are commonly infested with tapeworms, and the histories of many have been followed. The alternating hosts of a few may be of interest:

ADULT.	ENCYSTED FORM.
<i>Tenia serrata</i> of dog.	Cysticercus in rabbit.
<i>T. crassicolis</i> of cat.	Cysticercus in mouse.
<i>T. marginata</i> of dog.	Cysticercus in pigs and cows.
<i>T. cœnurus</i> of dog.	Cœnurus in sheep.
<i>T. echinococcus</i> of dog.	Echinococcus of man and domestic animals.
<i>T. cucumerina</i> of dog.	Cysticercoid in dog-louse.

The presence of tapeworms in the human being is usually followed by uncomfortable symptoms, and a physician should be called. In domestic animals these parasites sometimes cause death. As infection in man almost always occurs by eating raw or improperly cooked meat, all danger may be avoided by partaking only of that which has been cooked through. The literature relating to the tapeworm is enormous. The most useful works are Cobbold's *Entozoa* (London, 1864) and Leuckart's *Die Parasiten des Menschen* (2d ed., Leipzig, 1879-89).
J. S. KINGSLEY.

Tapioca [= Portug., from Braz. *tipioca*, manioc juice]: the starch of the manioc *Manihot utilissima* (*Jamipha* or *Jatropha manihot*). It is prepared by pressing the washed and dried roots under water, when it is obtained in a mealy form, which is converted into a granular condition by drying over hot plates. Upon drying and pressing the pulp remaining in the water, cassava-bread is obtained. This, when pulverized, is known as manjok-flour. Tapioca is largely consumed as food.
Revised by L. H. BAILEY.

Tapir [from Braz. (Tupi) *tapy'ra*, tapir]: any one of the *Tapiridae*, a family of perissodactyl mammals, related to the rhinoceroses and horses. The hind quarters project notably backward, the snout is produced into a short flexible proboscis with the nostrils at the end; the ears are erect and moderately developed; the neck abbreviated; the tail very short; the anterior feet have each four toes, the posterior three. The teeth are in almost full number—viz., M. 3, P. M. 3, C. 1, I. 3 x 2 = 42; all the molars, as well as premolars, 2, 3, 4, are nearly similar, squarish, and each with the anterior crest marginal, but with an anterior cingulum terminating in a cusp at the antero-exterior angle of the tooth; the hindmost molars (M. 3) have no posterior lobes; the outer incisors of the upper jaw are enlarged, and like canines; the true canines very small; the incisors of the under jaw uniform; the canines large. The skull has the nasal aperture very large, and encroaching far behind into the frontals and on each side of the nasal bones; the nasal bones, when fully developed, form together a somewhat heart-shaped figure, broad behind and tapering forward. The lower jaw has moderately deep rami, whose angles are convex and project considerably backward. The family is represented by five species, viz., (1) *Tapirus terrestris*, a species widely spread over South America in the lowlands, and extending from the Isthmus of Panama to Paraguay; (2) *Tapirus pinchaque*, confined to the Andes of South America, especially Ecuador and New Granada; (3) *Tapirus indicus*, an inhabitant of the Malaccan Peninsula, Sumatra, and Borneo; (4) *Elasmognathus bairdii*, a native of the Isthmus of Panama, and extending northward into Southern Mexico; and (5) *Elasmognathus dowii*, found in Nicaragua. In *Tapirus* the margins of the upper jaw are rolled inward, but in *Elasmognathus* they are spread out so as to firmly embrace the mesethmoid. All the species are denizens of deep forests, but near where water abounds, to which they frequently resort. They vary in size from that of a small ass to that of a moderate horse, the *Tapirus pinchaque* being the smallest, and the *Tapirus indicus* the largest. This animal is remarkable for its coloration, the fore parts and hind legs being black, the upper hinder portion of the body dirty white. The American species are dark brown. *Elasmognathus bairdii* is the largest American species. All the species (except possibly *E. dowii*) are striped or spotted in early youth, but soon assume the uniform or bicolored livery of full age. Although represented at present by species so singularly isolated as are the American and Malaccan species, in the Tertiary epoch the family was widely diffused, and animals belonging to it ranged over Europe and America far to the northward. The species, too, are the nearest relations of the Eocene *Lophodontidae*, which are among the oldest of known placental mammals.
Revised by F. A. LUCAS.

FIG. 3.—The common tapeworm of man (*Tenia solium*).

into the adult worm. Sometimes man, by eating lettuce, etc., which has been watered by liquid manure, becomes the host of the bladder-worm stage.

Tenia saginata, which is less common than *T. solium*, lacks the circle of hooks and reaches a length of 25 feet. Its history is much the same as that of *T. solium*, except that cattle instead of swine serve as the intermediate hosts. Other tapeworms are occasionally found in man, as *T. cucu-*

Tappan, ARTHUR: philanthropist; b. at Northampton, Mass., May 22, 1786; son of Benjamin Tappan (1748-1831), a Revolutionary patriot and merchant; became a merchant at Portland, Me., and at Montreal, Canada; established himself in New York as an importer of British dry-goods 1814; was one of the founders of the American Tract Society; endowed Lane Seminary at Cincinnati, a professorship at Auburn Theological Seminary, and erected Tappan Hall of Oberlin College, of which he was a founder; joined his brother Lewis in founding the *New York Journal of Commerce* (1828); was the first president of the American Anti-slavery Society, formed in Philadelphia Dec. 4, 1833, but withdrew from it in 1840 on account of the aggressive spirit manifested by many members toward the churches and the Union; was obliged to suspend payments in the great crisis of 1837, but ultimately met all his engagements; was nevertheless forced to go into bankruptcy in 1842, when he caused the whole of his personal property to be sold. D. at New Haven, Conn., July 23, 1865. See his *Life*, by Lewis Tappan (New York, 1871).

Tappan, HENRY PHILIP, D. D., LL. D.: educator and author; b. at Rhinebeck, N. Y., Apr. 23, 1805; graduated at Union College in 1825; studied theology at Princeton, and after having been a year associate pastor of a Dutch Reformed church in Schenectady became in 1828 pastor of a Congregational church in Pittsfield, Mass.; in 1832 became Professor of Moral Philosophy in the University of the City of New York; resigned in 1838, and opened a private school; in 1852 was elected chancellor of the University of Michigan; resigned in 1863. D. at Vevey, Switzerland, Nov. 15, 1881. He published *Review of Edward's Inquiry into the Freedom of the Will* (1839); *The Doctrine of the Will determined by an Appeal to Consciousness* (1840); *The Doctrine of the Will applied to Moral Agency and Responsibility* (1841); *Elements of Logic* (1844; revised and enlarged 1858); *Treatise on University Education* (1851); and *A Step from the New World to the Old, and Back Again* (1852). Revised by G. P. FISHER.

Tapping, or Paracentesis: in surgery, the piercing of the walls of a cavity so as to draw off a dropsical or other collection of fluid. The abdomen, chest, serotum, and even the head are tapped for the removal of such effusions. The trocar and canula answer for the performance of the operation in many simple cases. In some others the contained fluid has to be removed by an instrument acting as a pump or syringe. Tapping often affords great relief, and occasionally is of great service toward recovery, especially in pyothorax and hydrothorax. Revised by W. PEPPER.

Tapti: river of Bombay, British India; rising in the Satpura Mountains and flowing W. to the Gulf of Cambay, near Surat. It is paralleled by a railway and is not properly navigable, nor is it used to any extent for irrigation. Length, 457 miles; area of basin, 30,000 sq. miles. It is subject to occasional but severe floods. It curiously parallels the more important and more sacred Nerbudda river.

Tar: a word associated with pitch and used in a very indefinite manner, usually with a prefix. Tar is a name properly applied to a black, exceedingly viscous fluid distilled in a rude way in forests from the wood of various species of pine and spruce. The wood is placed in a pit and covered with turf in a manner resembling a charcoal pit. A part of the wood is burned to furnish heat to distill the remainder, and the tar is received into barrels. It is mainly used in preparing the hemp ropes used in the rigging of ships and in calking the sides and decks of ships. A different kind of tar is obtained as a residuum when the wood of deciduous trees is distilled for pyroligneous acid; this is called wood-tar. A similar material, known as coal-tar (also called gas-tar), is obtained as a residuum when bituminous coal is distilled for illuminating gas. A similar, but not identical, liquid called blast-furnace tar is obtained by condensing the vapors that escape from blast furnaces and coke-ovens. A material called bone-tar is obtained as a residuum from the distillation of bone oil or Dippel's oil. Candle-tar is a residuum from the stearin manufacture. The word pitch appears to have been applied at a very remote period to asphaltum and maltha or mineral tar. When different tars are distilled, as well as petroleum, various kinds of pitch are obtained. The pitch from the paraffin petroleum is called coke-pitch; that from wood-tar is the black pitch of commerce. Burgundy pitch is more properly a resin; it is obtained from the European fir, *Abies excelsa*. In Persia and Afghanistan goat and sheep dung are distilled, furnishing

a material of a tarry or pitchy consistence that is applied to the goats or sheep to ward off disease. The oily distillate of tar is called oil of tar. See BITUMEN and COAL-TAR.

S. F. PECKHAM.

Tara: See TARO.

Tarantass' (Russian, *tarantass'*): a long Russian vehicle, drawn usually by three horses abreast. It has four wheels, and its boat-shaped body rests on two parallel wooden bars instead of on springs. The tarantass has a hood or cover, but generally no seats.

Tarantism: an epidemic dancing mania, formerly prevalent in Apulia, and especially at Taranto, whence its name. It was popularly believed to be caused by the bite of the tarantula, and doubtless the fright attending the bite may have aggravated the nervous symptoms of the patient. The disease was essentially a form of emotional or hysterical excitation. (See DANCING MANIA and CHOREA.) Not only dancing, but catalepsy, was one of the symptoms. It was believed that the patients possessed an ardent passion for music and the dance and for bright and beautiful objects. The most successful cure was from hearing and dancing the music of the tarantella, the Sicilian national dance.

Revised by W. PEPPER.

Taran'to (Lat. *Tarentum*; Gr. *Tápas, Tápavτος*): town; in the province of Lecce, Italy; in lat. 40° 26' N., lon. 17° 16' E.; at the northern extremity of the large Gulf of Taranto, on an island connected with the mainland by two stone bridges (see map of Italy, ref. 7-11). Two low islands (anc. *Chærades*), San Pietro and San Paolo, lie as a protection across the harbor, which is one of the finest in Italy. The main entrance is between Cape S. Vito and the island of S. Pietro, and admits shipping of the heaviest tonnage. The most important buildings are the Cathedral of San Cataldo, the church of the archbishop, and a castle erected by Charles V. The almost tropical vegetation is hardly less luxuriant now than when Horace wrote his *Ode*, 6, b. ii. Even the date-palm bears fruit here, though not in its perfection. The honey, the oil, and the fruits of the neighborhood have as great a reputation as ever, and the waters of the Gulf of Taranto are noted for their shell-fish, such as oysters and mussels, the gathering of which affords considerable employment to the people. The remains of the ancient town, the largest of all the cities of Magna Græcia (founded 708 B. C.), and once boasting of an army of 30,000 foot and 5,000 horse, besides a strong navy, are insignificant. Taranto is mentioned in mediæval history, and is especially remembered as the fief of Bohemond the Norman crusader. Pop. 25,246. Revised by M. W. HARRINGTON.

Taran'tula [= Mod. Lat., from Ital. *tarantola*, dimin. from *Taranto*, Tarentum]: a large lycosid spider (*Tarantula apulia*) of the warmer portions of Europe, fabled to cause by its bite the peculiar madness called tarantism. In America the term is given to any of the large mygalid spiders of the tropics.

Tarapacá: a northern province of Chile, between Antofagasta on the S. and Tachna on the N., extending from the Pacific to the Andes of Bolivia. Area, 19,300 sq. miles. A barren and desolate range of mountains runs parallel to the coast, rising to 6,000 feet in parts. Between this and the base of the Andes is a rainless desert, called Pampa de Tamarugal, 30 miles wide and 3,000 feet above sea-level. A few watercourses cross this waste in deep ravines, but generally do not reach the sea; they form the only habitable portions. The province owes its importance to its immense beds of Chile saltpeter; these extend also into Antofagasta, but always in the interior desert, and at least 20 miles from the coast. To reach them railways extend inland from Iquique, the capital and principal port, and from Pisagua; reducing-works have been built at various points. The exports of saltpeter and subsidiary products from Iquique and Pisagua exceed 30,000,000 pesos in annual value. There are some silver mines near Iquique. Tarapacá, formerly a coast department of Peru, was seized by Chile in 1880, and was definitely ceded to that country by the treaty of peace ratified in 1884. Pop. (1893) estimated, 48,638, nearly all engaged in the saltpeter-trade. HERBERT H. SMITH.

Tarascon, tãrããs kôn': town; in the department of Bouches-du-Rhône, France; on the left bank of the Rhône, 8 miles N. of Arles (see map of France, ref. 8-H). It has manufactures of woolen and silk fabrics, and the Arles sauges are made here. The Gothic church of St. Martha, built in 1187-97 and rebuilt in 1379-1449, and the castle

finished in the fifteenth century by King René of Anjou are its most important buildings. The town celebrates the fête of La Tarasque, a monster subdued by St. Martha and described by Daudet in his works devoted to Tartarin. Pop. (1891) 6,597. Revised by M. W. HARRINGTON.

Taraxacum: See DANDELION.

Tarbagatai': military frontier district of the Chinese empire and chain of mountains separating the former from the Russian province of Semipalatinsk. The district is a part of the ancient Sungaria, and is between Semipalatinsk and Kansuh. Area about 25,500 sq. miles, but the district is ill defined. Pop. about 64,000, consisting of Kalmucks, Kirghiz, and others, mostly nomadic. M. W. H.

Tar'boro: town; capital of Edgecombe co., N. C.; on the Tar river, and the Atlantic Coast Line railway system; 41 miles N. W. of Washington, 48 miles E. by N. of Raleigh, the State capital (for location, see map of North Carolina, ref. 2-1). It is in a cotton, corn, and peanut growing region, and contains 7 churches, a graded and 4 other schools, a State bank, with capital of \$33,960, a weekly newspaper, and cotton and knitting factories and agricultural-implementation works. Pop. (1880) 1,600; (1890) 1,924; (1895) estimated, 3,000. EDITOR OF "SOUTHERNER."

Tardigrada [Mod. Lat.; Lat. *tar'dus*, slow + *gra di*, to step, walk]: a group of minute soft-bodied animals found in fresh water, damp moss, or sand. Popularly they are known as water-bears. Their four pairs of legs are short, thick, and armed each with a double claw. Through their transparent bodies the internal organization is readily studied under the microscope. The alimentary canal consists of a muscular pharynx near the mouth, a large sac-like stomach, and a short intestine or cloaca. Into this last division open the reproductive organs and a pair of small short tubes supposed to be comparable to the Malpighian tubules of insects. The nervous system consists of a supra-oesophageal and a sub-oesophageal ganglion connected by a circumoral commissure, and a chain of four ganglia, one for each pair of legs. The muscular system consists entirely of smooth muscle-fibers. The blood circulates freely through the body and is aerated through the skin, there being no special circulatory or respiratory organs. Where the animals belong in a system of nature is a matter of uncertainty. The presence of four pairs of legs has caused them to be considered as possibly primitive or degenerate *Arachnida*, but the absence of striated muscle-fibers and other peculiarities of structure seem to exclude them from the *Arthropoda* altogether. F. C. KENYON.

Tarentum: See TARANTO.

Tarentum: borough; Allegheny co., Pa.; on the Allegheny river, and the Alleg. Val. and the Penn. railways; 21 miles N. E. of Pittsburg (for location, see map of Pennsylvania, ref. 4-B). It is in an agricultural region, and has glass, paper, and other manufactories, a national bank with capital of \$50,000, and two weekly newspapers. Pop. (1880) 1,245; (1890) 4,627.

Tares: various leguminous plants, especially of the genus *Vicia*. Some of them are common weeds in the cultivated grounds of the U. S. and Europe. *V. sativa* is cultivated as a forage-plant and as a green manure. (See VETCH.) Its herbage is very nutritious. It is probable that the plant called tare in the English New Testament is either DARNEL or CHESS (*qq. v.*).

Tar'gūm [= Aram.-Heb., translation; cf. Assyrian *ragāmu*, to speak]: a name given by the Jews to the Aramaean translations and paraphrases of the Old Testament which became necessary when Hebrew was superseded by Aramaean as the spoken language of Palestine. The word occurs for the first time in Ezra iv. 7; but it is impossible to say when these translations were first made—unofficial ones probably at an early date. We hear of a Targūm to Job as early as the time of Gamaliel the elder, the teacher of Paul. But they were not committed to writing until a later date. Linguistically they belong to the Western Aramaic, and were made in Palestine, though they received their final form in Babylon. There seems to have been a disinclination to committing the Targūm to the Tōrah and the Prophets to writing. In the official reading in the synagogue, the Tōrah was translated verse by verse, as we find it in the best MSS. In the prophetic lessons, three verses could be read at a time. During the Middle Ages, the Targūm was cultivated especially by the Jews of Yemen, who have also translated into Aramaean certain portions of the prayer-book (*Mutschr. f. Wissen. d. Judenth.*, 39, p. 175).

The following Targūmim are distinguished: A. To the Tōrah: (i.) The first Jerusalem Targūm, which is fragmentary, and though probably the oldest, was not put into its present shape before the seventh century. (ii.) The second Jerusalem Targūm (or Pseudo-Jonathan), which is complete. (iii.) The Targūm Onkelos, which is supposed to mean "similar in character to the Greek translation of Aquila," but which Jewish tradition refers to one Onkelos the proselyte. It was called by the Babylonians "our Targūm," and is evidently a result of official pruning. It follows the Hebrew text very closely, and agrees with the LXX. in its philosophical and religious exegesis. By some its composition is placed in the second century A. D. (school of R. Akiba), by others in the first (Hansdorf, in *Mutschr. f. Wissen. d. Judenth.*, 38, p. 203). A Māsōrah to this Targūm has been edited by A. Berliner (Leipzig, 1877). To parts of the Tōrah there were also other Targūmim (*Mutschr.*, 39, p. 97, *seq.*). B. To the Prophets there exist: (i.) Remnants of an old Jerusalem Targūm, which is, however, very largely intermixed with Midrash. (ii.) The official Targūm, which is said to be the work of Jonathan ben Uzziel, a pupil of Hillel; but it seems to have received its final form in Babylon under R. Joseph bar Chiyāh (333 A. D.). Luzzatto supposes that the name "Jonathan" bears the same relation to the Greek translation of Theodotion as Onkelos does to Aquila. This translation is free and paraphrastic. For other Targūms to the Prophets, see Gottheil, *Journ. Amer. Orient. Soc.*, xiv., p. xlii. C. The Targūmim to the Hagiographa were never official; some are literal translations, others largely interspersed with Midrash. There is no Targūm to Daniel, Ezra, Nehemiah; that to Proverbs shows a very decided connection with the Peshitta; that to the Psalms is later than the ninth century. There are three Targūmim to Esther. There is also a Samaritan Targūm to the Tōrah, but the date of its composition is unknown (ed. Petermann and Vollers, Berlin, 1876-85; cf. Nöldeke, *Deutsch. Zeit. d. Morgenl. Gesell.*, xxx., 343).

The text of the Targūmim will be found in the Polyglotts. Onkelos has been re-edited by Berliner (Berlin, 1884); the Targūm to the Prophets and Hagiographa by Lagarde (*Propheta Chaldaice*, Leipzig, 1872; *Hagiographa Chaldaice*, Leipzig, 1873); cf. also Merx, *Chrestom. Targumica* (Berlin, 1888); Buhl, *Kanon und Text des Alten Testaments* (Leipzig, 1891, §§ 59-67; Eng. ed., New York, 1893), where the full literature is given. RICHARD GOTTHEIL.

Tarifa. tā-ree'fā: town; in the province of Cadiz, Spain; on the Strait of Gibraltar. It is the southernmost town on the continent of Europe (see map of Spain, ref. 20-D). It is surrounded by old Moorish walls within which is an alcázar. There is a modern fort and a lighthouse 135 feet high. Its fisheries for tunnies and anchovies are very important, and its oranges are noted for their sweetness. Pop. (1887) 13,206.

Tariffs [viā Fr. from Span. *tarifa*, price-list, rate-book, from Arab. *tarīf*, notification, information, inventory, deriv. of *tarafa*, know, inform, explain]: tables or lists of dues or duties, specifically of customs duties leviable on articles of import or export; by colloquial extension such duties themselves. Custom duties are as old as international trade, being a natural source of revenue as soon as commodities pass from country to country. In European countries they go back to the Middle Ages. Almost from the first they were instruments of industrial policy as well as means of securing revenue. How soon they began to be consciously used for the purpose of influencing industrial development is a matter of some dispute; but it is certain that duties having a distinctly protective purpose appear as early as the sixteenth century. In the mercantile system the use of import duties as one means of fostering certain kinds of industries, especially manufactures, reached perhaps its highest development. The most effective application of that system, and of high tariffs as part of it, was made by Colbert, in France, in the second half of the seventeenth century, more particularly in the tariffs of 1664 and 1667. Other countries adopted a similar policy, and in the eighteenth century every European country had an elaborate system of duties on imports and exports, prohibitions, bounties, premiums, designed to turn industry into particular channels. The other weapons of the mercantile policy—prohibitions, bounties, and so on—have in the main disappeared, but tariffs or import duties have continued to play an important part.

The first break in the general use of protective duties came late in the eighteenth century, by the commercial

treaty of 1786 between Great Britain and France. These countries had carried on for a century and more a commercial warfare, which played a large part in causing the frequent military struggles. The treaty of 1786 provided for the reciprocal admission of goods at greatly reduced duties, and was due largely to the gradual permeation of the influence of Adam Smith and of the French physiocrats. It lasted, however, but a short time, being ended by the wars of the French Revolution. With the close of the Napoleonic wars in 1815 the tariff history of all European countries enters on a new stage. In Great Britain the influence of Adam Smith and his followers, all strong advocates of the principle of free trade, served to loosen the hold of the protective system. At the same time the industrial position of Great Britain, the need of plentiful and cheap raw materials for her growing manufactures and of food for her growing population, made it clearly to her interest to adopt a policy of freedom as to them. The first important steps were taken under the leadership of Huskisson in 1824, and consisted in a lowering of duties on manufactures and a lowering or abolition of them on raw materials. After Huskisson's death in 1829 there was a temporary lull, though some changes were made by Lord Althorp after 1832. In the decade 1830-40 the agitation against the corn-laws (duties on grain) became active, under the leadership of Cobden. The corn-laws had developed during the eighteenth century, and had been made more severe after the close of the Napoleonic wars. The Corn-law League attacked them, but at first without success. In 1842, when Peel resumed the task of moderating the protective system in general, the corn-laws were retained, though in modified form; but in 1846 they were finally abolished, under the pressure of a bad harvest and high price of food, combined with the potato famine in Ireland. With the downfall of the corn-laws the last prop of protection in Great Britain was gone. In the year of their repeal duties were further reduced; in 1853 still more; finally in 1860, at the time of the treaty with France (see below), the last vestige of protection disappeared. Since 1860 duties have been levied on a very few articles, like tea, coffee, cocoa, tobacco, spirits, wines; and where these articles are produced within the country (e. g. spirits), an internal tax is levied practically equal in amount to the duty on the imported articles.

France returned to the system of prohibitions during the revolutionary and Napoleonic wars. Largely as a measure of warfare against Great Britain, absolute prohibition of import was established in regard to most manufactured articles. The Revolution, however, had one important influence in the direction of freedom; for the intricate duties on the passage of goods from one province of France to another, which had previously existed, were swept away early in its course. When peace came in 1815 a system of prohibition even more rigid than that of the preceding century was maintained on imports of manufactures from abroad. The successive governments made some attempts at relaxation, but did not feel strong enough to alienate the manufacturing interest. Finally, in 1860, Napoleon III., influenced largely by a desire to gain the good will of England, abruptly put an end to the prohibitory *régime* by the famous commercial treaty with that country. The treaty, negotiated by the economists Cobden and Chevalier, provided for the admission of British goods into France at moderate duties, not usually exceeding 10 per cent. It had important consequences in all European countries, for similar treaties were concluded by France shortly after with the other leading countries, and by these with each other, with the result that a network of treaties was spread over the Continent, bringing everywhere a marked moderation of the duties. The treaty system, however, was never thoroughly popular in France, and did not endure. It had never been applied to agricultural articles, and the growing competition of the U. S. and other new countries caused a gradually increasing application of protection to them, by duties on grains and meat-products. The original treaty with Great Britain was terminated in 1881, and treaties with other countries in 1891-92. In 1892 the treaty system was finally abandoned, and a new tariff of distinctly protective duties was adopted, with a provision only for certain minimum duties to be granted to countries which should give reciprocal favors to France.

In Germany the seventeenth and eighteenth centuries had seen the application of highly complicated protective tariffs, similar to those of Great Britain and France. The most rigorous system was that of the Prussian kings, especially of Frederick the Great. After the close of the Napoleonic

wars the liberal statesmen who had guided Prussia through the critical period of conflict reformed the tariff in 1818, substituting moderate and simple duties for the previous system of high and complicated rates. Other German states maintained for a while their own tariffs, but the number of petty states and their involved boundaries made the separate tariffs intolerable, especially as the French rule had for a while abolished them for large parts of Germany. Some smaller states joined in a customs union with Prussia; other states formed unions between themselves. Finally, by separate treaties, a general customs union, the Zollverein, was formed in 1834. The Zollverein treaties provided for complete free trade within Germany, and for moderate duties (those of the Prussian tariff of 1818) on foreign imports. The Zollverein treaties were renewed from term to term. In 1853 a treaty was made with Austria, not admitting that country to the Zollverein, but providing for reciprocal reductions of duty. In 1861 occurred a crisis in the Zollverein's history, Prussia being desirous of lower duties, while the southern states, influenced largely by political sympathy with Austria, wished a retention or increase of the existing rates. Prussia won the victory by boldly concluding an independent treaty with France in 1862, which was later adopted for the Zollverein, and provided for a marked moderation of the previous duties. After the formation of the German empire in 1870-71 the history of the Zollverein becomes the tariff history of Germany. In 1879 a distinct return to protection took place in the form of higher duties on manufactures and new duties on agricultural products. This change in policy was due partly to changed political conditions (Prince Bismarck having broken with the old liberal party), and partly to the agricultural depression resulting from the competition of the U. S. The duties on grain were further raised after 1879. In 1892 a change in policy was again made by commercial treaties with Austria-Hungary, Italy, and other countries, providing for reciprocal reductions of duties, and among others for lower duties on Hungarian grain and Italian wines. In 1894, after prolonged negotiations, a treaty on similar lines was concluded with Russia, admitting Russian barley and wheat into Germany at lower rates.

Tariffs in the United States.—The history of U. S. tariffs divides itself into four periods: the first running from the year 1789 to about 1816; the second, the period of the early protective movement, from 1816 to 1840; the third from 1840 to 1860; and the fourth and last covering the period since the civil war.

1. The first period is marked in general by the fact that tariff legislation occupied a subordinate place in public attention, and that the protective controversy can not be said to have fairly begun. It is true that one of the first acts passed by the first Congress in 1789 was the Tariff Act of that year; but the prompt attention given to the subject is easily explained from the imperative need of revenue for the new commonwealth. The act of 1789 was based partly upon the impost scheme which it had been attempted to adopt for the confederation in the years immediately preceding 1789, and partly on the existing legislation of some of the individual States. The impost scheme of the confederation had proposed a duty of 5 per cent. on imports in general, and other moderate revenue duties on tea, coffee, sugar, spirits, and similar articles. This scheme had never been carried out, because it had proved impossible to secure the necessary consent of every individual State. As to the tariff policy of the individual States, some, notably Massachusetts and Pennsylvania, had tariffs of a distinctly protectionist character, and some of the provisions in them were transferred bodily into the Tariff Act of 1789. Accordingly, that act contained two distinct sets of duties: First, duties for revenue only. These included *ad valorem* duties, varying from 5 to 15 per cent. (the 5-per-cent. rate being fixed on all commodities not otherwise specified, the higher rates put on some articles of luxury) and moderate specific duties on tea, coffee, sugar, and spirits. Second, there were certain specific duties on manufactures which were meant to give protection. It has sometimes been said that this act of 1789 marks the beginning of the protective policy in the U. S., while, on the other hand, the moderation of the duties has been emphasized as indicating that no such thing as protection was then contemplated. The fact is that the act had some undeniably protective features, but that these attracted little public attention.

These general remarks apply to the whole period from 1789 to 1816. After 1789 duties were raised from time to

time, in each case for the purpose of securing more revenue. Thus the act of 1792 raised duties to provide means for increasing the army, after St. Clair's defeat in the Indian war. The act of 1797 was needed to provide for the payment of certain installments of the foreign debt then coming due. In 1800 duties were increased to pay interest on a loan authorized in view of a possible war with France. In 1804 an addition of 2½ per cent. to all duties, yielding the "Mediterranean fund" for carrying on the war with the Barbary powers, was made. In 1812 all duties were doubled, a futile attempt to secure an increase of revenue for carrying on the war of 1812. The main cause for all these changes was the need for revenue; but a few provisions were inserted which indicate a protective purpose. Thus in the act of 1804 specific duties were added on cordage, iron, and glassware, which were undoubtedly intended to be protective. It remains true, however, that throughout these years the protective system occupied a very small share of public attention.

II. In the second period (1816-42) of tariff history in the U. S. the protective principle was definitely applied. In 1807 came the embargo, followed by interruptions in foreign trade which lasted almost continuously till 1815. These interruptions, culminating in the war of 1812, checked and at times almost destroyed a profitable foreign commerce, and caused a sudden and rapid development of manufacturing industry within the U. S. The development of national feeling and patriotic pride which the war of 1812 brought about served to stimulate the desire to aid domestic industries. When the war of 1812 came to a close, and Congress proceeded in 1816 to remodel the tariff, a new spirit was felt. The Tariff Act of 1816 consequently raised duties generally. Specific duties were imposed upon crude iron, as well as upon manufactures of iron; the duties on cotton goods and woolen goods were made 25 per cent. While the act of 1816 was more distinctly protective in character than the acts of the earlier period, it was marked, like them, by a great degree of indifference on the part of the public. Not long after its passage, however, public feeling took a very different turn. In the latter part of 1818 a commercial crisis set in, partly in consequence of the collapse of excessive bank issues and partly in consequence of deeper causes. Imports and exports both fell sharply, and the shrinkage of foreign trade and the collapse of prices contributed to a sudden growth of strong desire for protection. For ten or fifteen years the feeling throughout the Northern States was unmistakably in favor of distinctly protective legislation. This feeling led in 1824 to the passage of the first Tariff Act for protection only. The act of 1824 was marked by an advance in duties on certain materials like hemp, wool, and iron, as well as by an advance on manufactures, such as cottons, woolens, cordage, and glassware. The increase of duties on raw materials caused this act to be resisted in Massachusetts; but in 1828, when a second protective act was passed, in which manufactures received a larger share of attention, Massachusetts and the New England States generally came into line among the advocates of protection. This act, the product of political intrigues, is known as the "act of abominations" from the fact that its authors, thinking to get rid of the tariff issue, loaded the measure with certain "abominations" to prevent the New England men from voting for it. The latter, however, accepted it with all its faults. In the act of 1832 the "abominations" of 1828 were removed, and the protective system was put in a more reasonable form. Hardly, however, had the protective movement reached its high-water mark in the act of 1832 than its disintegration began. The opposition of the South to the protective duties culminated in the nullification movement in South Carolina in the fall of 1832. By the so-called Compromise Act of 1833 concessions were made to the South providing for the gradual reduction of duties until finally on July 1, 1842, they should reach the 20-per-cent. level. As to the effects of the tariff legislation during this period, they are mingled with those of the many forces determining national prosperity. It may be fairly said, however, that there was at least some opportunity of securing advantage from the protective legislation of those days. The period was one of transition; the U. S., which had been almost exclusively an agricultural country in the earlier period, was developing into a country having a large manufacturing element. That development, which was certain to take place in any event sooner or later, may have been brought about more quickly and more easily in consequence of this protective legislation.

III. In the third period (1842-60) the tariff issue at first

was a party question and had a good share of public attention; but it was soon crowded out of sight by the slavery question. In 1842 the Whigs, having come into power, proceeded to pass the Tariff Act of that year. It went into effect on Sept. 1; consequently the 20-per-cent. rate which the Compromise Act of 1833 had aimed at remained in force only two months, from July 1 to Sept. 1, 1842. The act of 1842 was a protectionist measure, passed by the Whigs after a long and bitter wrangle with President Tyler. It provided for high duties upon iron, cotton goods, woolen goods, paper, and glass, and on manufactures in general. It remained in effect only four years, being superseded in 1846 by the Democratic Tariff Act passed in that year. The act of 1846 was framed largely by Robert J. Walker, then Secretary of the Treasury. It arranged commodities in nine schedules, indicated by the letters A, B, C, D, E, F, G, H, I. The duties were respectively 100, 40, 30, 25, 20, 15, 10, and 5 per cent.; schedule I contained the articles admitted free of duty. Most articles with which the protective controversy is concerned—iron and metals in general, wool and woolens, manufactures of paper, glass, and wood—were put in schedule C, paying 30 per cent. duty. Cotton goods were in schedule D, and paid 25 per cent. The duty of 30 per cent. which was levied on most manufactures was really a moderate protective duty; and the fact that this act not what it is often said to be, a tariff for revenue only, is further indicated by the exemption from duty of tea and coffee. The act of 1846 remained in force for eleven years, and the system it established was continued to the time of the civil war. The changes made by the act of 1857 were of no importance in principle. In 1857 the revenue was redundant, and all parties were agreed upon effecting a reduction of duties. The rate in schedule A was lowered to 40 per cent., that in schedule B to 30 per cent., that in schedule C to 24 per cent., and so on. As to the effects of the legislation of this period, it is clear that the act of 1842 was not in force sufficiently long to give any indication as to its permanent effects upon the community. The whole period from 1842 to 1860 was one of prosperity, especially the latter part of it, the decade from 1850 to 1860. The commercial crisis of 1857, a simple result of over-speculation and over-investment, checked the advancing tide of prosperity for but a short time. This general prosperity has often been ascribed to the moderate tariff legislation of 1846, but it is difficult to trace any direct connection. Such events as the discoveries of gold in California, the opening up of the Mississippi valley by railways, the improvement of ocean transportation, and the general advance in the arts, were the chief causes affecting material prosperity, which probably would have continued at much the same rate whether tariff legislation had been more or less protective than it was. It is certain that notwithstanding the moderate duties of 1846-60 there was a growth of manufacturing industry nearly in proportion to the general growth of population and of wealth. The manufacture of cotton goods advanced steadily in the decade between 1850 and 1860, very nearly doubling its consumption of raw cotton. So far as woolen goods are concerned, there are no accurate figures, but most branches of the industry grew, especially after the Tariff Act of 1857 admitted wool practically free of duty. In iron the growth was less striking, but the production of pig iron increased from an average of about 600,000 tons at the beginning of the decade to one of about 750,000 tons at the close of the decade. In miscellaneous manufactures there was a steady advance. Whether or no manufacturing industries would have developed more quickly under the stimulus of higher duties, they did not cease to exist or cease to grow under a régime of moderate duties.

IV. The fourth period (from 1861 on) is ushered in by the Morrill Tariff Act of 1861. The crisis of 1857 had been followed by a decline in imports, and this, with the reduction of duties made by the act of 1857, had brought the revenue to a point dangerously low. At the same time the Republican party had secured, for the first time, control of the House of Representatives, and was desirous of increasing its hold in the manufacturing States, especially in Pennsylvania, by imposing protective duties. Accordingly, in the session of 1859-60, the Morrill Tariff Act was passed by the House. In the succeeding session of 1860-61 it was passed in the Senate, and became a law. It raised duties appreciably. The duty on pig iron was made \$6 a ton; that on wool of the ordinary grade 3 cents a pound; cotton goods from 1 cent a yard upward; and so on with specific

duties. The Morrill act of 1861 remained in effect a very short time. The war began in the spring of 1861. In every year of the war several acts for increasing duties were passed. The most important were the general Tariff Acts of 1862 and 1864. The Tariff Act of June 30, 1864, proved the most important of all, becoming the basis of a permanent tariff system. It was accompanied by a heavy internal tax act, and by an act giving wide authority to borrow, the three measures touching high-water mark in the revenue legislation of the war. The Tariff Act increased both revenue and protective duties. The need of revenue and the desire to offset the heavy taxes imposed on manufactures by the internal revenue acts were the main causes of its enactment. When the war closed the country consequently found itself with a tariff of very high duties. After that there was a twofold tendency. On the one hand, the revenue duties were steadily reduced; on the other hand, the protective duties in the main were retained, and in many cases were increased. Gradually and unexpectedly the high protective duties produced during the war became the permanent industrial policy of the country. The decade immediately after the war (1865-75) was one of uncertainty in regard to tariff legislation, as it was in regard to currency legislation. Some considerable advances in protective duties were made. The most important of these latter was the Wool and Woolens Act of 1867, making a considerable increase in duties on those articles. The duty upon wool of the kind chiefly used was raised from 6 to about 11 cents a pound. On woolen goods an elaborate system of compound duties, begun as early as 1861, was greatly enlarged and developed. A specific duty was imposed on woolen goods, the object of which was to compensate the U. S. manufacturer for the duty he had to pay on his raw wool. This specific duty was made 50 cents a pound by the act of 1867; over and above this a duty of 35 per cent. *ad valorem* was fixed. Another significant act was the Copper Act, passed in 1869 over President Johnson's veto. It raised the duties on copper considerably, on the copper ore as well as on pig copper, and so shut out a considerable importation of copper ore for smelting and refining in the U. S. The act was passed to aid the great copper mines of Lake Superior district, and helped them in securing control of the whole market. On the other hand, during this decade attempts were made to bring about a reduction of duties, in some cases with success. In 1870 an act was passed reducing considerably the revenue duties, and making some reductions in the protective duties. That on pig iron, for example, went down from \$9 to \$7 a ton. Some other duties, however, were increased by this same act, the most important of these being the duty on steel rails, which was changed from an *ad valorem* rate of 45 per cent. to a specific duty of \$28 a ton. In 1872 a temporary reduction of 10 per cent. of the protective duties was made, but they were restored to the old rates in 1875. The complete repeal of the tea and coffee duties at the same time (1872) was of decisive importance. It settled for a long time the policy of using protection duties as the main sources of customs revenue. The next important step was the act of 1883, which made the first general revision after the civil war. In 1882 President Arthur appointed a tariff commission which framed a bill which became the basis of the tariff legislation of 1883. The bill prepared by the commission, however, was much changed in the course of its passage through the House and Senate, and the final result was a compromise and somewhat of a makeshift. Some protective duties were reduced. Thus the duty on pig iron went down from \$7 to \$6.72 a ton; on steel rails, from \$28 to \$17 a ton; on wool, from 11½ to 10 cents a pound; on silk manufactures, from 60 to 50 per cent. In other directions, however, duties were increased. While the duties on the cheaper grades of woolen goods, of which importation had entirely ceased, were reduced, the duties on the finer grades were increased. Similarly on cotton goods, while the duties on cheap goods (never imported into the U. S.) were reduced, those on finer cottons, of which the importation was large, were raised. The next step came seven years later, in the Tariff Act of 1890, familiarly known as the McKinley Tariff Act. That act was the direct but unexpected result of the attack made on the protective system in President Cleveland's message to Congress in Dec., 1887. It is almost certain that if President Cleveland had not forced the tariff question to the front, the Republicans who passed the act of 1890 as a party measure would have been content to leave the tariff as it was settled in 1883. The important changes

made by the Tariff Act of 1890 were the following: The duty on sugar was swept away, all raw sugar being admitted free. The sugar duty had been practically a revenue duty, nine-tenths of the sugar being imported and only one-tenth being made at home. The domestic sugar-producers, producing the one-tenth, were placated by being given, instead of the duty, a bounty of 2 cents a pound, the rate of the previous duty. This change was substantially similar to the remission of the duties on tea and coffee in 1872, and still further emphasized the policy of relying for customs revenue upon protective duties only. The duty upon raw wool was slightly increased, the rise on the important class being from 10 cents to 11 cents a pound. The change, slight in amount, served chiefly to emphasize the policy of making no concessions in the way of free admission of raw materials. On woolen goods there was a considerable advance. The compensating system was still retained, the specific duty continuing on all woolen goods. The *ad valorem* duty upon them was raised to 50 per cent. On cotton goods of the finer grades, on hosiery and stockings, on velvets and plushes of all sorts, particularly high duties were imposed. Among metals the duty upon pig iron was left unchanged; that upon steel rails was slightly reduced. The most important change was an increase in the duty upon tin plate. This article had never been produced in the U. S., while very large amounts were imported from England. The duty was raised to 2½ cents per pound, equivalent to about 70 per cent. upon the value. This change perhaps more squarely presented the issue whether a new and distinct expansion of the protective system should be made; for the question here was not whether an industry already existing should be supported, but whether an entirely new industry should be established under the shelter of protective duties. The next stage in tariff legislation came with the Tariff Act of 1894, which reversed in part the policy of the act of 1890. As the Republicans had used the first opportunity to carry out their tariff policy after the election of 1888, so the Democrats used the first opportunity after their victory of 1892. The bill as passed by the House had provided for a considerable reduction of duties, and had made free use of *ad valorem* duties. The Senate, however, raised the duties somewhat, and restored many specific duties. After a long struggle between the two houses, the bill as amended in the Senate was passed, and became the Tariff Act of 1894. The most important change made by it was the free admission of raw wool, which marked a radical change in policy, toward the free admission of raw materials. With the free admission of wool came a complete change in the duties on woolen goods. The former system of compound duties was given up, and simple *ad valorem* duties of between 35 and 45 per cent. were imposed on woolens. Some other materials besides wool were admitted free, notably lumber, flax, hemp, and copper. Coal and iron ore were left subject to duties, though to reduced duties. On manufactures there was a general but not considerable lowering of the rates. Cottons, linens, and silks were subjected to less change. The rate on chinaware was lowered appreciably. On iron and steel manufactures most of the changes were of minor importance. A significant reduction was that on tin plate, to about half the rate imposed in 1890—1½ cents instead of 2½ cents a pound. Sugar was again subjected to a duty, fixed at 40 per cent., mainly for revenue purposes, but largely in order to secure for the Tariff Act the votes of the Senators from the sugar-producing State of Louisiana. At the same time an additional duty was imposed on refined sugar, for the protection of the domestic refiners. The refining industry was monopolized by the so-called Sugar Trust; this was a direct contribution to monopoly profits, virtually the same as had been given by the act of 1890. On the whole, the tariff of 1894 made but one really important change—the free admission of wool. Beyond that it brought about mainly a slight moderation of the protective duties.

Considering now the effects of the protective system of this fourth period since the civil war, one is confronted by the same difficulties which presented themselves in considering the period of moderate duties that preceded the war. A dozen factors influenced the prosperity of the community, and among them it is impossible to disentangle the separate effects of the tariff. The community, upon the whole, prospered wonderfully. The arts advanced, however, at a rapid pace in the U. S. and abroad; new lands were taken into cultivation; new and rich mineral resources were discovered; the restless activity of the business man fairly trans-

formed the industrial world. These factors counted for very much more than any tariff system, high or low, could have counted. So far as particular manufactures are concerned, there was in some directions very great growth, in other directions a less rapid growth. The iron industry has developed to an extraordinary extent. The total production of pig iron quadrupled between the close of the civil war and the year 1890; but the greatest part of this increase was due to the opening of new mines of iron ore and coal in the heart of the country, to the growth of population, and the great improvements in internal transportation. The cotton-manufacture advanced rapidly; but here again it is probable that a great advance would have taken place without high duties. The woolen industry grew less fast, and it is questionable whether the duties on raw wool did not hamper it quite as much as those on woolen goods promoted it. The silk-manufacture was virtually created by the duties levied during the civil war and maintained thereafter, and in this instance there seems to have been, in part at least, a successful application of protection to young industries. In general, the effect of the protective duties in maintaining manufactures has been as much exaggerated as their effect on the prosperity of the community as a whole. The general trend of industrial development in the U. S., the high average of mechanical skill and inventiveness, the thickening of population, the possession of great stores of minerals—all would make the country a manufacturing one under any tariff conditions. The effect of duties may have been to make the growth of manufactures more rapid and somewhat more diversified than it would otherwise have been, but the main lines of development have not been greatly changed. See PROTECTION, FREE TRADE, and FINANCE.

P. W. TAUSSIG.

Tarija, taä-ree'khäa: the southeasternmost department of Bolivia; bounded W. and N. by Chuquisaca, E. by Brazil (separated by the river Paraguay), and S. by the Paraguayan Chaco and the Argentine Republic. The limits with Chuquisaca and Paraguay are arbitrary and unsettled; hence the area is unknown, but it is not less than 40,000 sq. miles. About one-third, in the western part, consists of mountainous lands and plateaus, on the eastern side of the Cordillera; the remainder is a plain, continuous with the Gran Chaco, and, like it, consisting of open lands and forests, interspersed with immense areas in the eastern part which are covered with water during several months of the year; this plain is crossed by the river Pilcomayo, and, except near the mountains, its only inhabitants are roving Indians. The civilized population is gathered in the mountain region, where much of the land is very fertile. Almost the only occupations are agriculture and grazing, the department being especially suitable for the latter. Pop. (1889) about 63,000, exclusive of wild Indians. Tarija, or San Bernardo de Tarija, the capital, is situated on a plain by a branch of the upper Vermejo. It has a considerable trade with the Argentine Republic, and resembles an Argentine rather than a Bolivian town. The climate is pleasant. Goiter is very prevalent in the vicinity. Pop. about 9,000.
HERBERT H. SMITH.

Tarkio: village (founded in 1880); Atchison co., Mo.; on the Tarkio river, and a branch of the Kan. City, St. J. and Council B. Railway; 60 miles N. by W. of St. Joseph (for location, see map of Missouri, ref. 1-C). It is in an agricultural and stock-raising region; contains 7 churches, large public-school building, 3 hotels, water-works, electric lights, several manufactories, a national bank with capital of \$50,000, a State bank, and a monthly and 2 weekly periodicals; and is the seat of Tarkio College (United Presbyterian, opened in 1884). Pop. (1890) 1,156; (1895) estimated, 2,250.
EDITOR OF "AVALANCHE."

Tarleton, taärl'tün, Sir BANASTRE: soldier; b. in Liverpool, England, Aug. 21, 1754, son of the mayor of the city; served under Howe and Clinton in the campaigns of 1777-78. He became lieutenant-colonel and commanded the British Legion, with which he served under Clinton and Cornwallis in the Carolinas, achieving a reputation for cruelty,

so that "Tarleton's quarter" became a synonym for wholesale butchery. He took part in the battles of Camden and Guilford Court-house, and at the battle of the Cowpens, Jan. 17, 1781, was defeated by Col. Morgan. He served with Cornwallis during the remainder of the war, and was among those surrendered at Yorktown. Returning to England, he was promoted to the rank of colonel, and in 1790 was returned to Parliament for Liverpool, serving till 1806 and again in 1807-12. He was promoted to be lieutenant-general in 1817, having previously been appointed governor of Berwick and Holy Island, and was created a baronet and a G. C. B. in 1818. He published a *History of the Campaigns of 1780-81 in the Southern Provinces of North America* (London, 1787). D. in England, Jan. 23, 1833.

Tarma: a town of the department of Junin, Peru; in a beautiful valley formed by a sub-branch of the river Ucaiali; 56 miles S. S. E. of Cerro de Pasco, and 9,800 feet above the sea. It was originally the Indian town of Tarama, was occupied by the Spaniards soon after the Conquest, and during the colonial period was noted for its rich silver mines; it was the capital of the *intendencia* of Tarma, now the department of Junin. It is the center of a fertile agricultural district; alfalfa is extensively cultivated. Owing to its salubrious climate the residents of the higher and exposed mining regions resort to it for rest and recuperation; with railway communication it would become one of the principal cities of Peru. In the vicinity are interesting ruins, some supposed to be pre-Incarial. Pop. about 9,000. H. H. S.

Tarn: department of Southwestern France; on both sides of the Tarn, an affluent of the Garonne. Area, 2,217 sq. miles. The ground is elevated, and the surface is mostly an undulating plain, except in the southeastern part, which is covered with spurs of the Cévennes. Forests of oak and beech are numerous, and large crops of wheat, wine, and hemp are raised. Coal and iron abound and are extensively worked. Many cattle and sheep are raised. Pop. (1896) 339,827. Capital, Albi. Revised by M. W. HARRINGTON.

Tarn-et-Garonne, ä-gää'rön': department of Southwestern France: between the rivers Tarn and Garonne. Area, 1,436 sq. miles. The surface is an elevated and undulating plateau, traversed by several deep valleys along the rivers. The soil is very fertile, and the climate temperate and healthful. Agriculture is the chief occupation, and wheat and wine the principal products; manufactures include silk, paper, and soap, but are rather insignificant. Pop. (1896) 309,191. Capital, Montauban.

Revised by M. W. HARRINGTON.

Tarnó'pol: town of Galicia, Austria-Hungary; on the Sered; 80 miles by rail E. S. E. of Lemberg (see map of Austria-Hungary, ref. 4-M). Formerly it was a fortress, and received valuable privileges from the kings of Poland. It is celebrated for its horses and horse-markets, which are the most frequented in the country. Pop. (1890) 26,217.

Tarnow, taär'nov: town of Galicia, Austria-Hungary; on the Dunajec; 50 miles by rail E. of Cracow (see map of Austria-Hungary, ref. 3-I). It has a fine cathedral and many good educational institutions. Pop. (1890) 27,574.

Taro, or **Tara** [= Polynesian]; an araceous plant; the root of *Alocasia macrorhiza*, of which many varieties are grown in the Pacific islands. The tops are used as a pot-herb, and the starchy root is one of the most important articles of food in Polynesia. In New Zealand the name is applied to *Pteris esculenta*, a fern whose roots afford an edible starch.

Tarpeia: See TARPEIAN ROCK.

Tarpeian Rock: the southeastern portion of the Capitoline Hill at Rome. According to tradition, it took its name from Tarpeia, a vestal virgin, who during the reign of Romulus betrayed the Capitoline citadel to the attacking Sabines, having obtained from them the promise that they would give her what they wore upon their left arms, meaning certain gold ornaments. They kept their promise by crushing her beneath their shields. In later times it was customary to hurl condemned criminals from the Tarpeian Rock.

Revised by CHARLES H. HASKINS.

Tarpon: a large fish, *Megatops thrissoides*, of the family *Elopidae*; closely related to the herrings, with which it is sometimes placed. The eye is large, whence the generic name, and so is the obliquely placed mouth. The dorsal fin is high, with a long filament behind, the tail deeply forked, the body covered with scales, some more than 2 inches wide.

The color is silvery below and on the sides, blue above. The tarpon reaches a length of 6 feet and a weight of 150 lb. It is found in the warm parts of the Atlantic and is common on parts of the Florida coast, where it has come much into vogue among anglers, since, in spite of its vast size, it can be taken with rod and line, furnishing rare sport from its vigorous leaps and fine fighting qualities. The tackle used is a 7½-foot to 8-foot heavy rod, multiplying reel, and 200 to 250 yards of linen line.

F. A. LUCAS.

Tarquin'ius: the name of a Roman family of Greek origin, which, according to legend, played a very important part in the early history of the city of Rome, and two of whose members became kings. Demaratus emigrated from Corinth and settled at Tarquinii, a town of Etruria. His son, Lncumo, married Tanaquil, an ambitious and cunning woman, daughter of one of the most prominent Etruscan families, and she induced him to emigrate to Rome, where he soon acquired the rights of citizenship and assumed the name of (1) LUCIUS TARQUINIUS PRISCUS. His wealth and his wisdom made him one of the most prominent citizens. The king, Ancus Marcius, appointed him guardian of his children, and after the death of Ancus Marcius, in 616 B. C., the senate and people unanimously elected him king. He waged successful wars against the Sabines, Latins, and Etruscans, and extended the power of Rome. He built the Cloaca Maxima, laid out the Circus Maximus and the Forum, and began the Capitoline temple and the stone wall around the city. He instituted the Roman games and added 100 new members to the senate. He was murdered in 578 B. C., and succeeded by his son-in-law, Servius Tullius.—(2) His son, LUCIUS TARQUINIUS SUPERBUS, assassinated Servius Tullius in 534 B. C., and seized the crown. He abolished the democratic reforms which Servius Tullius had introduced, and ruled in an arbitrary and oppressive manner, whence his surname Superbus. The vacant places in the senate were not filled, and the advice of this body was very seldom asked, and at the same time that he slighted the higher classes he sorely oppressed the lower by heavy taxes and forced labor. Finally, the rape of LUCRETIA (*q. v.*) became the occasion of a general outbreak. Tarquinus was deposed and the monarchical government abolished in Rome. He made three attempts to reconquer his power by the aid of the people of Tarquinii, Porsena, and the Latins, but in vain, and died in wretchedness at Cumæ in 495 B. C. For the elements of truth contained in these legends of the Tarquins, see ROME. Revised by CHARLES H. HASKINS.

Tar'ragon [from Span. *tarragona*, from Arab. *tarkhūn*]: an aromatic perennial composite herb (*Artemisia dracunculus*), a native of Northern Asia, but acclimated in European gardens, where, especially in France, it is cultivated for the sake of the young shoots, which are used in the dressing of salads and for the flavoring of vinegar with an infusion of its leaves, which have a taste resembling anise. Tarragon vinegar thus prepared is an article of commerce.

Tarrago'na (anc. *Tarraco*): capital of the province of Tarragona, Spain; at the mouth of the Francoli, in the Mediterranean, 60 miles W. of Barcelona (see map of Spain, ref. 14-J). It consists of an upper town, surrounded by walls, and a lower and modern town defended by two castles. Its harbor is accessible only for small vessels, yet it carries on a considerable trade in grain, wine, and oil; large quantities of fruits are annually exported. The imports and exports reach over 30,000,000 pesetas annually. There are schools of design and navigation and an ecclesiastical seminary. The Gothic cathedral dates from 1120. The city was founded by the Phœnicians, and rose under the Romans to great importance. Pop. (1887) 27,225.

Tar River: a river which rises in Granville co., N. C., and after an indirect E. S. E. course falls into Pamlico Sound. Its wide estuary for some 40 miles is called Pamlico river. The Tar has a rapid current, is 180 miles long, and is navigable for steamboats 85 miles, to Tarboro.

Tar'rytown: village; Westchester co., N. Y.; on an expansion of the Hudson river known as the Tappan Sea, and on the N. Y. Cent. and Hud. River Railroad; 25 miles N. of New York (for location, see map of New York, ref. 8-J). It is one of the most attractive places for suburban residence on the Hudson; was the scene of the capture of Maj. André by Paulding, Williams, and Van Wart; and contains the Sunnyside home and the burial-place of Washington Irving, Sleepy Hollow, the Philipse manor house (erected in 1683), a Dutch church (erected prior to 1699), a

monument to the Revolutionary soldiers of the manor (dedicated in 1894), 3 libraries, a national bank with capital of \$100,000, a savings-bank with deposits of over \$1,500,000, and 2 weekly papers. Pop. (1880) 3,025; (1890) 3,562; including North Tarrytown, over 7,000. EDITOR OF "ARGUS."

Tar'shish [from Heb. *Tar'shish*]: one of the most western trading-posts of the Phœnicians, probably Tartessus in Spain (in the Batis, Guadalquivir), mentioned frequently in the Old Testament. It was probably founded by Tyrians (Is. xxiii. 1, 6, 10; Jer. x. 9). From this place the Phœnician merchantmen were generally called Tarshish ships, a name to which de Lacouperie (*Bab. and Orient. Record*, vii., 129) sees a reference in the Chinese *Tat'sin* traders. The author of 2 Chron. ix. 21; xx. 36, 37 identifies these ships with ships of Tarsus in Asia Minor, which W. F. Ainsworth, *A Personal Narrative of the Euphrates Expedition*, i., 138, considers to be right. Halévy (*Rev. des Études Juives*, xiii., 14) supposes that the island of Sardinia is meant; Le Page Renouf (*Proc. Soc. Bibl. Arch.*, xvi., 138), the mainland of Phœnicia; but both without sufficient reason. See Meyer, *Gesch. d. Alterth.*, i., § 281; Pietschmann, *Gesch. der Phönizier* (Berlin, 1889, p. 286).

RICHARD GOTTHEIL.

Tarsi'diæ [from *Tarsius*—so named from the length of the tarsi—the representative genus]: a family of mammals of the order *Primates* and sub-order *Lemuroideæ* or *Prosimiæ*, distinguished by the length of the tarsi and the dentition. The teeth are in number 34—viz., M. $\frac{3}{3}$, P. M. $\frac{3}{3}$, C. $\frac{1}{1}$, I. $\frac{7}{7}$ × 2; the true molars have numerous pointed cusps; the premolars are conical, and successively increase in size from the first to last; the canines are normally developed; the median upper incisors are longest. The skull has the orbits slightly closed behind; the fibulae are partially ankylosed with the tibia; the hind feet have their second and third toes armed with claws, and the rest provided with flattened pointed nails. The bones of the tarsus are much elongated, whence the name of the group. Only one species is known, *Tarsius spectrum*, an inhabitant of the forests of Sumatra, Borneo, Celebes, and Banca, sometimes called malmang, specter lemur, and (adopted from the French) tarsier. Its size is about that of the common rat. It has very large eyes, and ears, long hind legs and tail, is nocturnal in habits, and feeds chiefly on insects and lizards. E. A. BIRGE.

Tarsiped'idæ [Mod. Lat., named from *Tar'sipes*, *Tarsipedis*, the typical genus; *tar'sus*, ankle + Lat. *pes*, *pedis*, foot]: a family of marsupial mammals. The general form and size of the animal are similar to those of a mouse; the snout is elongated; the tongue is very long, slender, and exsertile; the fore and hind limbs differ but little in length; the feet have each five toes; those of the front are rather small, slightly enlarged toward their tips, and provided with minute scale-like nails, "impressed, as it were, into the flesh, on the upper surface of the toe"; the inner hind toe is thumb-like, slender, and destitute of a nail, the second and third very short (joined together as usual in the sub-order), and armed with small nails which are directed upward almost at right angles to the toes, and the fourth and fifth larger (free), and furnished with scale-like nails; the tail is long and slender, scaly, like that of a rat, and sparsely hairy. The teeth are very small and simple, variable in number, and similar in shape. The stomach is small and simple, and has very thin walls; the intestine has no cæcum. The skull is very thin and almost papery; the lower jaw has very slender and almost straight rami, without distinct coronoid or angular processes, and with elongated foramina in their posterior halves. This type is one of the most extraordinary and exceptional of mammals. Only one species—the *Tarsipes rostratus*—is known, an inhabitant of Western Australia, and generally found from Swan river to King George's Sound, but is very rarely obtained. It is nocturnal in its habits, and in the night is very active. It will dart at passing flies and kindred insects with great celerity; having caught one, it holds the fly between its front paws, and proceeds leisurely to eat it. It is also very fond of honey, which it extracts from flowers by means of its long tongue.

Revised by F. A. LUCAS.

Tarsus: See FOOT.

Tarsus: town; in Asia Minor, in the vilayet of Adana, on the Cydnus (*Tarsus Chai*); the ancient metropolis of the Cilician confederation; then the capital of the Roman province of Cilicia, and for several centuries before and after Christ the most important city of Asia Minor as a seat of learning and center of commerce (see map of Turkey, ref.

6-G). Cleopatra, accompanied by Mark Antony, ascended the Cydnus to Tarsus in a gilded galley with purple sails and silver oars. Tarsus was the birthplace of Paul the apostle, and the burial-place of Julian the Apostate. The city has greatly declined. The greater part of its former site is covered with *débris*; but it possesses one colossal ruin, an enigma to antiquarians, as it resembles no known edifice, and as its object has never been determined. This consists of two solid masses of concrete masonry; the larger 115 feet long, 49 feet wide, and 23½ feet high; the smaller 56 feet long, 39 feet wide, and 23½ feet high; the two inclosed in a rectangular space, 380 feet long and 153 feet wide, by a solid wall 21 feet thick, and 23½ feet high. Tarsus is on the railway from Adana to Mersin, and at the junction of several highways. It carries on a considerable trade in cotton, sesame, wheat, maize, yellow wax, skins, carpets, tobacco, and raw materials. Pop. 30,000, which is reduced in summer to 7,000, the inhabitants being forced to leave on account of the poisonous exhalations of the Cydnus.

E. A. GROSVENOR.

Tartar [*tartar* (readapted to Lat.) is from O. Fr. *tartre* < Late Lat. *tar'tarum*; cf. Lat. *Tar'tarus* = Gr. *Tárapos*, the nether world, Tartarus, but the connection is not obvious]; any salt of tartaric acid, more especially the acid potassium tartrate or hydrogen-potassium tartrate. See ARGOL.

Tartar, Cream of: See CREAM OF TARTAR.

Tartar Emetic (*Antimonií et Potassii Tartras*): a double tartrate of potassium and basic antimony; its formula is $2K(SbO)_2C_4H_4O_6 \cdot 11_2O$. It is made by boiling acid potassium tartrate (cream of tartar) with antimony oxide in water. It forms in transparent crystals, which become white and opaque by exposure to the air, but in the shops it is generally kept in the form of powder. It dissolves in 20 parts of cold water, and in between 2 and 3 of boiling, but all aqueous solutions spontaneously decompose on keeping. It is insoluble in alcohol, but soluble in proof spirit or wine. If pure, a solution of tartar emetic yields no precipitate with barium chloride, nor, when diluted, with silver nitrate, nor does it turn blue with potassium ferrocyanide.

Tartar emetic has rather a nauseous, harsh metallic taste, and upon the animal system is a local irritant and a powerful constitutional poison. Applied to the skin, as in ointment, it causes burning pain, redness, and finally the eruption of a crop of painful pustules. Taken internally, small doses, as a small fraction of a grain, tend to reduce the force and frequency of the pulse and promote perspiration. Somewhat larger quantities cause nausea and vomiting, with relaxation of the bowels and of the muscular system, reduced action of the heart, and a general feeling of depression and weakness. Still larger doses cause an intensification of the above symptoms, with burning pain in the stomach, the induction of a choleraic state characterized by violent and prolonged nausea, vomiting, and serous purging, colic, cramps, great enfeeblement of the heart and general strength, and finally collapse and death. After death decided inflammation of the stomach and bowels is generally found. Sometimes, however, both this lesion and the irritative symptoms dependent upon it are absent even in fatal poisoning. Death does not often occur until several days after the poisoning. In cases of tartar-emicetic poisoning, tannic or gallic acid, or some vegetable infusion containing the same, such as green tea, decoction of oak-bark, of cinchona, etc., should be administered, and free vomiting promoted. The inflammation and great cardiac and constitutional depression which the poison occasions must be treated on general medical principles. In medicine, tartar emetic has been much employed in minute doses to reduce the pulse and promote sweating in acute fevers. It is often made an ingredient of mixtures to relax the inflamed mucous membrane and promote free secretion in the early stages of bronchitis, and may also be employed as an emetic. Locally, it is sometimes used in ointment to produce pustulation for the purpose of persistent counter-irritation, but here, as in its other uses, less violent means are usually found sufficient.

Revised by H. A. HARE.

Tartaric Acid [*tartaric* is deriv. of TARTAR (*q. v.*):] an acid ($H_2C_4H_4O_6$) found in the free state in various plants and berries, or, by extension, any one of several isomeric acids. It forms salts called tartrates.

Of ordinary tartaric acid (dextrotartaric acid), the chief source is the grape, in which it occurs as the hydrogen-potassium tartrate (cream of tartar, $KHC_4H_4O_6$). It is prepared by dissolving crude tartar in boiling water, and slowly

adding pulverized chalk as long as the mixture effervesces. Usually, 1 part of chalk is sufficient to decompose 4 parts of tartar. Insoluble calcium tartrate and soluble potassium tartrate are formed by this operation. Upon filtering, and adding the equivalent quantity of calcium chloride, all the tartaric acid is obtained as a precipitate of calcium tartrate. The two precipitates are then united, washed, and decomposed into insoluble calcium sulphate and free tartaric acid by 3 parts of sulphuric acid diluted with 7 of water for every 5 of the salt taken. The filtrate is evaporated in leaden pans, and allowed to crystallize. This acid can also be artificially produced by the oxidation of milk-sugar, glucose, starch, gum, etc., with nitric acid. It forms colorless transparent rhombic prisms, which become strongly electrical when gently heated. It is easily soluble in water and in alcohol; the aqueous solution becomes mouldy on standing, and is gradually converted into acetic acid. Dextrotartaric acid is distinguished from its isomers by the fact that in aqueous solution it exerts a strong right-handed rotation on polarized light. In its crystalline structure it bears an interesting relation to the isomeric levotartaric acid. The crystals of the two acids resemble one another perfectly in form, excepting that ordinary tartaric acid presents hemihedral faces on the right of the crystal, which in levotartaric acid are situated on the left or opposite side; so that the reflection of a crystal of the dextro-acid represents one of the levo-acid. The dextrotartrates and levotartrates exhibit the same difference in their crystalline form. In pyro-electrical relations also, crystals of dextrotartaric acid present properties opposite to those of the levo-acid. Dextrotartaric acid precipitates solutions of the caustic alkaline earths; also solutions of lead, silver, and potassium salts. The precipitate with potassium compounds (cream of tartar) serves for the detection of the acid in the presence of other organic acids. Boiling tartaric acid reduces silver, gold, and platinum salts, and prevents the precipitation of the salts of copper and iron by the alkalies, the latter property being frequently utilized in chemical analysis. Dextrotartaric acid melts at 338° F.; at a higher temperature it is converted into several isomeric acids. By increased heat, pyruvic (or pyrroacetic, $H_2C_3H_4O_6$) and pyrotartaric, $H_2C_3H_4O_4$, acids are produced. When heated with the alkalies it loses water, and the oxalate and acetate of the base are formed. By oxidation dextrotartaric acid is decomposed into carbonic and formic acids; when treated with reducing agents, either one or two atoms of hydrogen are eliminated, and malic or succinic acid is obtained. Tartaric acid forms acid, neutral, and double salts. Three varieties of the latter are well defined—those containing monatomic metals, such as Rochelle salts, $KNaC_4H_4O_6 \cdot 4H_2O$, which is analogous to cream of tartar; those formed from monatomic and diatomic metals, in which the oxide of the latter is combined with the same proportion of acid as the monatomic element, such as potassium-ferrous tartrate, $K_2FeO_4C_4H_4O_6$; and those analogous to tartar emetic, such as silver-antimony tartrate, $Ag_3SbO_4C_4H_4O_6$. The only quadribasic tartrates as yet prepared are those of lead and zinc. When strongly heated, all tartrates are carbonized and emit the odor of burned sugar.

The isomeric *levotartaric acid* is obtained upon neutralizing equal parts of racemic acid, one with soda, the other with ammonia, mixing the fluids, and allowing the double salt to crystallize; half of the crystals formed possess the hemihedral faces common to dextrotartrates, the remainder showing those characteristic of the levo-salts. Upon mechanically separating the two varieties, dissolving them in water, adding plumbic nitrate, and decomposing the precipitates with sulphuric acid, solutions of the dextro-acids and levo-acids are obtained. When equal amounts of the dextrotartaric and levotartaric acids are mixed and evaporated, RACEMIC ACID (*q. v.*) is produced; in the same manner racemates are obtained from mixtures of dextrotartrates and levotartrates. For the chemical theory, see STEREO-CHEMISTRY.

Tartaric acid is extensively used in dyeing and in preparing effervescent drinks and baking-powders. Some of the tartrates, such as tartar emetic, Rochelle salt, and the potassium-ferrous tartrate (*tartarus chalybeatus*), possess valuable medicinal properties.

Revised by IRA REMSEN.

Tartars, properly **Tatars** [from Pers. *Tātār*; cf. Chin. *Tah-tar*]: an ethnological name, used by some in a wider, by others in a narrower, and always in a somewhat vague, sense. The word *Tah-tar* was first applied to those Mongolian tribes who on their swift horses descended from the Altai plateaus into the Chinese lowlands, robbing and plun-

dering. When adopted by the Europeans, the word was changed into *Tar-tar*, with an allusion to the classical Tartarus, and was applied to all those tribes and races which Genghis Khan had brought under his sway and led into Europe, including not only Mongolian, but also Tungusian and Turkish races. The name is used in a restricted sense, especially by Russian writers, to designate certain populations speaking the Turkish language, and mostly of Turkish race, living in Siberia, the Caucasus, and Central and Eastern Russia. See Howorth's *History of the Mongols* (1876-80).

Revised by M. W. HARRINGTON.

Tar'tarus (in Gr. *Tárapos*): a name used synonymously with *Hades* by the later Greek and Latin writers, but with Homer it means a separate place, as far below Hades as the heavens are above earth, into which Zeus had thrown the worst offenders against his authority. Later writers, however, sometimes make a distinction between Tartarus and the Elysian Fields as two divisions of Hades, the former occupied by the criminals, the latter simply inhabited by the dead. As a personification, Tartarus is represented as the son of Æther and Gæa (air and earth), and by his mother he was father to the Gigantes, Typhoeus and Echidna.

Revised by J. R. S. STERRETT.

Tar'tary: a geographical name of vague and variable application. In the Middle Ages the name denoted the whole central part of Eastern Europe and Asia, from the Dnieper to the Sea of Japan. Later, a division into European and Asiatic Tartary took place, and the name of European Tartary was soon confined to the territory now called Crimea, while that of Asiatic Tartary first signified the whole empire of Genghis Khan and his successors, then Turkestan alone, with the exclusion of Turfan, Mongolia, and Manchuria, and now only that part of Turkestan which does not belong either to Russia or to China.

Tartrates: See TARTARIC ACID, CREAM OF TARTAR, TARTAR EMETIC, ROCHELLE SALT, &c.

Tarudant': southernmost city of Morocco and center of caravan trade; near the southern slope of the Atlas Mountains, 2 miles from the river Sus and 44 miles from the Atlantic. It is surrounded by walls, has several fine mosques and a citadel, but is otherwise poorly built. Its dye-works and manufactures of leather and copperware are important. Pop. probably 8,000 or 10,000, and decreasing.

Revised by M. W. HARRINGTON.

Taschereau, *tāsh'ró*, ELZÉAR ALEXANDRE: cardinal; b. at Ste. Marie de la Beauce, Province of Quebec, Canada, Feb. 17, 1820; educated at the Seminary of Quebec and in Rome; was ordained a priest in 1842, and soon afterward appointed to the chair of Moral Philosophy in the Seminary of Quebec, which he filled for twelve years. In 1854 he was sent to Rome by the second provincial council of Quebec to present its decrees to the pope for ratification; in 1856 received the degree of canon law from the Roman seminary, and was appointed Professor of Canon Law in Laval University; in 1859 became a member of the council of public instruction for Lower Canada, and in 1860 superior of seminary and rector of Laval University. He was appointed vicar-general of the diocese of Quebec in 1862; administrator of the diocese in 1870; the same year attended the Ecumenical Council at Rome; was consecrated Archbishop of Quebec in 1871, and cardinal in 1886. Cardinal Taschereau has always been an earnest advocate of temperance, and has been noted for his liberal tendencies. NEIL MACDONALD.

Taschereau, HENRI ELZÉAR: jurist; b. at Ste. Marie de la Beauce, Province of Quebec, Canada, Oct. 7, 1836; educated at the Seminary of Quebec, and admitted to the bar in 1857. He represented Beauce in the Canadian Assembly 1861-67; was appointed puisne judge of the Supreme Court of the Province of Quebec Jan. 12, 1871, and puisne judge of the Supreme Court of the Dominion Oct., 1878, as successor to his cousin, Jean T. Taschereau. Author of *The Criminal Law for the Dominion of Canada* (2 vols.) and of *Code de Procédure civile du Bas Canada*. D. Nov. 9, 1893.

Taschereau, JULES ANTOINE: journalist and author; b. at Tours, France, Dec. 19, 1801; became very early a frequent contributor to the Parisian press, and was one of the founders of the *National*; entered the civil service of the Government shortly after the Revolution of July, 1830, but soon returned to his journalistic activity; was one of the editors of *Historiettes de Tallemant des Réaux* (6 vols., 1833-34; 2d ed. 9 vols., 1854-60), and founded the *Revue*

rétrospective (20 vols., 1833-37); received an appointment at the National Library in 1852, and became its director-general in 1858. D. in Paris, Nov. 11, 1874. He published editions of the works of Molière (1823-24), Boufflers (1827), the *Correspondance littéraire* of Grimm and Diderot (1829-31), etc.; superintended the publication of many volumes of the catalogue of the National Library (1855, *et seq.*); and wrote *Histoire de la Vie et des Écrits de Molière* (1825) and *Histoire de la Vie et des Ouvrages de Corneille* (1829), both several times reprinted.

Revised by A. G. CANNFIELD.

Tashkend': capital of Russian Turkestan and chief town of Syr-Darya; the most populous city in Central Asia; in a gently sloping, well-watered, fertile plain, covered with numerous fruit-trees, at the foot of the Alatau and Chatkal Mountains (see map of Asia, ref. 4-E). The city was formerly inclosed by a wall 7 miles long and pierced by nine gates, but this is now in a ruinous condition, and rich gardens irrigated by canals surround the city, which forms an oval whose greater axis lies in the direction W. to E., and which is bent inward to the S. In the hollow thus formed the Russian town, the so-called European town, is built. S. W. of the European and S. of the Asiatic city is the Russian citadel, with barracks and military stores, surrounded by a bastioned wall. A great caravanserai forms the center of the wholesale business district. The Asiatic city has narrow, crooked, and ill-paved streets. Tashkend is one of the oldest and largest cities of Central Asia, from old times the seat of an important agriculture and a brisk trade. Here the roads from Kashgar meet with those which lead S. from Samarkand, N. from Orenburg and Siberia, into Central Asia. The value of foreign goods exchanged in the city amounts to about \$20,000,000 annually; the principal exports and imports are cotton fabrics, metal ware, and silk. The Arab geographers of the Middle Ages called the city *Shash*; from the sixteenth century to the eighteenth it was the capital of the Kirghiz Kosaks; in 1810 it was taken by the Khan of Khokan, and in 1867 it was occupied by the Russians. Pop. (1885) 121,410, of whom 75,000 are Sarts, and 20,000 Russians (in 1892), the remainder being Uzbegs, Kirghiz, Jews, and other Asiatics.

Tashkurgan: See KHULUM.

Tasman, ABEL JANSZOOM: explorer; b. at Hoorn, province of North Holland, about 1602; made voyages in the western Pacific and Indian Oceans in 1639-42, under authority of the governor-general of the Dutch East India Company, Van Diemen, who then sent him to circumnavigate the Australian continent; left Batavia Aug. 14, 1642; discovered Nov. 24 the island which he called Van Diemen's Land, but which is now called Tasmania; Dec. 13, the southern island of New Zealand; Jan. 21, the Friendly islands; Feb. 6, the Fiji islands; and returned to Batavia June 15, 1643. Of this voyage he published an account which was reprinted at Amsterdam in 1722 (new ed. by Swart, 1860). Jan. 29, 1644, he set out on a voyage along the coasts of New Guinea, and made important discoveries on the north and northwestern coasts of Australia. D. at Batavia in Oct., 1659.

Revised by M. W. HARRINGTON.

Tasmania, formerly *Van Diemen's Land*: an island and British colony of Australasia; 150 miles S. of the colony of Victoria, Australia, from which it is separated by Bass Straits (see map of Australia). It is the smallest and most healthful for Europeans of the seven Australasian colonies; between the parallels 40° 33' S. and 43° 39' S. and meridians 144° 39' E. and 148° 33' E.; area, 26,216 sq. miles, about that of Greece and only a quarter of that of New Zealand. The discoverer, Abel Janszoon Tasman, named it after the governor of the Dutch Indies of the time—Van Diemen—but when the importation of convicts ceased, in 1853, it was renamed after the discoverer. The colony includes, with the island of Tasmania and the adjacent small islands, the Furneaux Archipelago, N. of the northeast angle and consisting of Flinders island (area, 800 sq. miles), Cape Barren island, and others smaller; also King's island, N. of the northwest point and about half way to Australia (area, 425 sq. miles). The main island is well watered, picturesque, and varied, with high mountains and fine valleys, rocky and often precipitous coasts, and numerous rivers, cascades, and fresh-water lakes. In contradistinction to Australia, it is sometimes called the Green Isle.

The coast is indented by many large and small bays, deep estuaries, and well-protected ports. The west coast is the boldest, and offers least protection to commerce.

The surface is rough and mountainous, and consists essentially of a central plateau, about 4,000 feet above sea-level, extending in places to the coast, especially at the W., which is rugged. Cradle Mountain in the west is 5,069 feet high; Frenchman's Cap, 4,760; Hugel Mountain, 4,700; and the celebrated Mt. Bischoff, 2,500. In the east the highest peak is Ben Lomond (5,020 feet); in the south Mt. Wellington (4,170 feet) dominates Hobart. The streams are numerous. The longest river is the Tamar (150 miles), which rises near the eastern coast—as the South Esk or Macquarie—and flows into Bass Straits through Port Dalrymple, near the middle of the north coast. The name Tamar is applied only to the estuary, which extends from the mouth southward about 60 miles to Launceston (the second port in point of importance in the colony), with about 20 feet of water. The next longest river is the Derwent (140 miles long), which rises in Lake St. Clair, at the foot of Mt. Hugel, and empties into Storm Bay on the south coast through a large estuary, on which is situated Hobart (formerly Hobart Town), the capital and principal port of the island. One of its branches rises in Great Lake in the center of the island—the largest of the lakes, having an area of 70 sq. miles—3,820 feet above sea-level. Nearly opposite the mouth of the Derwent are the strangely formed North and South Brunni islands, connected by a narrow isthmus, a characteristic form reproduced in several peninsulas and islands on the southeast coast.

Climate.—The latitude and insular character give Tasmania a temperate and genial climate. In the settled parts the extreme winter temperatures range only between 20° F. to 44° F., and in summer between 78° and 96°. The autumn is the pleasantest season, with a mean temperature of about 57°. The mean annual temperature for Hobart for fifty years is 55°. The hot winds of Australia are much tempered by the passage of Bass Straits, and are felt only in the northern parts of this colony. Land and sea breezes prevail in the warmest months. The rainfall is chiefly in winter, like Southern Chile and Oregon, and, also like them, the western coast is wet and the rainfall decreases rapidly eastward. A hundred inches or more may fall on the west coast, while more than a third of the area has an annual fall of only from 10 to 20 inches. At Hobart the average for a long series of years is 23 inches, with 143 rainy days a year. Zymotic diseases are relatively rare.

Minerals.—The strata generally are very much contorted and tangled, and the density of the scrub vegetation has greatly impeded their investigation. Metamorphic rocks are abundant, and quartz is so common a feature of the western cliffs as to reflect a white light on passing ships. The evidences of repeated volcanic action are numerous and unmistakable, but no volcanic cones are found. Palaeozoic rocks abound, and are often thrown up into irregular ranges up to 5,000 feet or more in height. The Carboniferous strata are common, except on the western half. Tertiary rocks are not extensive, and the Pleistocene was marked by very great denuding forces. Raised beaches and moraines are not rare.

The character of the mineral products is indicated in the accompanying table. Gold was discovered in 1852, and is generally distributed in the river sands and in the quartz rock, but Tasmania has an unimportant position among the

turning to the lodes, of which many well-known ones have remained untouched, as at Mt. Bischoff, Mt. Hums Kirk (on the coast S. W. of the preceding), and Ben Lomond in the northeast. Anthracite and bituminous coal are found, the latter in abundance, and coal-mining is growing in importance. The silver-mining industry is developing rapidly, chiefly in the Mt. Zeehan and Mt. Dundas districts, which give almost the entire product. Silver of the value of £158,859 was exported in 1893, as against £79,353 in 1892. Copper is met with at Mt. Maurice and elsewhere, but not in paying quantities. Arsenic, bismuth, antimony, zinc, manganese, graphite, galena, and asbestos exist. Iron is present in large quantities and in all varieties of ore. Hobart freestone is largely exported to the other colonies. A peculiar inflammable resinous mineral has been found in the Mersey district and named tasmanite.

Fauna and Flora.—The fauna is similar to that of Australia, but the TASMANIAN WOLF and TASMANIAN DEVIL (*qq. v.*) are peculiar to Tasmania. Several European food-fishes have been introduced. A less favorable immigrant is the rabbit, which has become a pest here as in Australia. The flora is similar to that of Victoria, but has many peculiar species. The celebrated blue gum, or *Eucalyptus globulus*, which has become a favorite immigrant in pestiferous localities in America and Europe, flourishes best in the southern districts of Tasmania. Forests are abundant, and afford some woods of great value. The scrub is very thick and tangled. The evergreen forests are aromatic. There is a large timber-trade with the other colonies.

Agriculture.—The soil is generally good, and some of the lower plains and valleys are marvelously fertile. The higher plateau is especially suited to stock-raising. Only a little more than 1 per cent. of the area is under cultivation, and this percentage has increased very little for a generation. Of the cultivated land, 33 per cent. is in wheat, yielding 18 bush, to the acre, but the product is not sufficient for local consumption; 26 per cent. is in hay, yielding 1·2 tons per acre; 13 per cent. in oats (27 bush, to the acre); 9 per cent. in potatoes; 2 per cent. in barley; and 6 per cent. in orchards. For the last the climate and soil are especially suited. No maize is raised. Oats, potatoes, and hay are exported.

In 1894 the colony possessed 1,535,017 sheep, 169,141 horned cattle, 31,587 horses, and 51,952 swine. It is singularly well adapted to sheep-rearing, and its stud flocks are annually drawn on to improve the breed of sheep in the other colonies, but the industry is slowly decreasing. The wool clip was valued at £219,291. The dairy products are excellent, and are largely exported. The number of cattle and horses is increasing.

Population.—The aborigines were nearly allied to the native Australians, and in 1803 numbered about 5,000. Soon after arose the "Black war," in which they were nearly exterminated. In 1835 they were transported to Flinders island, where they died out rapidly. The last representative of pure blood died in 1876. In 1891 there remained 139 half-castes. In 1893 the population of the colony was 154,424, with a considerable surplus of males. The annual increase for thirty years was 163 per cent.—the least in the seven colonies. The conditions for longevity are favorable, and the percentage of those over 65 years of age is 5·55, which is very high. The density per square mile was nearly 6, and was 3·44 in 1861. In 1893 there were 848 marriages, 5,216 births (4 per cent. of them illegitimate), and 2,071 deaths, giving rates of 5·51, 33·92, and 13·47 respectively. Seventy-four per cent. of the inhabitants were born in the colony, and the surplus of immigration over emigration is small. The Chinese numbered 1,056 in 1891, and the number of other aliens was very small.

No state aid is given to religion. Half of the population are professed members of the Church of England, 18 per cent. are Roman Catholics, 12 per cent. Wesleyan and Methodist, 7 per cent. Presbyterians, 3 per cent. Congregationalist, 2 per cent. Baptists, and 84 persons were professed Hebrews. The percentage of Methodists and Baptists is increasing, that of the other sects decreasing.

The statutory school age is from 7 to 14, and school attendance is compulsory. In 1892 there were 251 public schools, with a total enrollment of 14,049, and 135 private schools, with 6,265 pupils. In 1891 over 20 per cent. of the population could not read or write, but this number is decreasing rapidly. In 1892 there were 357 insane and 732 paupers in asylums. Of the total population, 17,925 were engaged in agriculture and 987 in purely pastoral pursuits;

MINERALS.	TOTAL PRODUCT TO 1893.		PRODUCT IN 1892.	
	Value.	Per cent. of Australasian product.	Value.	Per cent. of Australasian product.
Tin.....	£5,557,438	34 4	£256,083	46·6
Gold.....	2,562,569	0·7	174,070	2·6
Coal.....	268,752	0·8	18,022	0·9
Silver.....	137,155	0·9	45,502	1·8
Copper.....	617
Totals.....	£8,529,531	1·9	£493,677	4·0

Australasian colonies as a producer of gold, though this position is improving. As a producer of tin, however, she leads her sister colonies. It has hitherto been obtained almost exclusively from alluvial deposits, and is always in the form of cassiterite or tin oxide. The most celebrated mines are those of Mt. Bischoff in the northwest, near the head waters of the Arthur river, and these mines, with those of the Ringarooma district in the northeast, have yielded more than three-fourths of the tin product of the colony. Considerable areas of stream-tin are worked out, and attention is

15,854 in industrial and 4,004 in mining pursuits. The public libraries numbered 40, with 65,787 volumes.

Commerce.—The first state railway was begun in 1868, and at the end of 1893 there were 475 miles of railways, of which 84 were in private hands. The principal line is 130 miles long, crossing the island N. and S. and connecting Hobart and Launceston. The state roads cost on the average £8,338 per mile, and in 1892 they gave a net profit of 3.76 per cent. on the cost. A cable joins Tasmania to Victoria, and within the colony there were 2,222 miles of telegraph line, with 3,383 miles of wire, besides 555 miles of telephone wire. The total imports in 1895 were valued at £1,094,457; the exports for the same year amounted to £1,373,063. The chief imports were textiles, art and mechanical products, and foods and drinks. The trade is almost entirely with Great Britain or the other Australasian colonies. The registered shipping in 1895 was 51 steamers and 162 sailing vessels. In 1895 711 vessels entered and 742 cleared from Tasmanian ports.

Administration.—The constitution became operative in 1886. The Parliament consists of a Legislative Council of 18 elective members, holding office for six years, and of a House of Assembly of 36 members, elected for three years. All members of Parliament receive £50 per year, and have free passes on railways and franks in the post-office and on the telegraph lines. The governor is appointed by the British crown, and has a cabinet of advisers of six responsible ministers with salaries of £600 per annum. The public revenue is derived from taxation (37 per cent.), mostly customs; from railway, postal, telegraph, and other public services (27 per cent.); and from the rental and sale of public lands. In 1895 it was £761,971. The expenditure was £748,946, devoted to special public works (31 per cent.), to interest due (43 per cent.), to hospitals and charities (6 per cent.), to law and protection (7 per cent.), to education (5 per cent.), and to general purposes (8 per cent.). The public debt at the end of 1895 was £8,180,925, chiefly at 4 per cent. The defense force consists of 497 volunteers. The Derwent and Tamar are fortified below the chief ports. The capital is Hobart; pop. (1891) 33,450; (1894) 35,073. The next largest town is Launceston; pop. (1894) 22,351. In 1891 there were no other towns with over 5,000 inhabitants.

History.—Tasmania was discovered by Tasman Nov. 24, 1642, and first circumnavigated by Bass and Flinders in 1798. The first settlement was made from Sydney in 1803, and in the following year a penal colony was established at Hobart. The first newspaper was printed in 1810. There were several conflicts with the natives, and by 1825 the prosperity of the colony was seriously endangered from the number of escaped convicts who had taken to the bush and become brigands. Up to this time the colony had been subject to New South Wales, but it was then made independent. A protest was made against the continuance of the importation of convicts, but this had to be repeated for nearly a generation before it was effective. Freedom of the press, trial by jury, and popular government were also gained only after long struggles. Although large numbers of criminals were transported to the colony from the beginning till 1853, the convict taint upon it was never so deep as on New South Wales.

MARK W. HARRINGTON.

Tasmanian Devil (so called from its fierce, untamable disposition): the *Dasyurus ursinus*, a carnivorous marsupial peculiar to Tasmania. It is about 20 inches long, exclusive of the tail, and dull black, with a white mark on the breast. The form is thickest, head large, teeth powerful. Before these animals were reduced in numbers they were very destructive to poultry and even to sheep. F. A. L.

Tasmanian Wolf, Zebra Wolf, or Thylacine: the *Thylacinus cynocephalus*, a marsupial of dog-like appearance, restricted to Tasmania. It is the largest of carnivorous marsupials, reaching a length of 4 feet. It has no marsupial bones, their place being taken by tendons. The color is grayish brown washed with yellowish, and there are about a dozen blackish cross-bars on the hind part of the back. It was abundant, but has been nearly exterminated, owing to the havoc it wrought among sheep. F. A. L.

Tasse, táas, JOSEPH: author; b. in Montreal, Canada, Oct. 23, 1848; educated at Bourget's College, Rigaud, P. Q. He

edited *Le Canada*, Ottawa, 1867-68, *Minerve*, Montreal, 1869-72, and was a director of *La Revue Canadienne*, a monthly to which he contributed essays on literature, history, and political economy; since 1880 he has been the leading writer of that periodical. In 1873 he visited Europe and published an account of his tour. He represented Ottawa in Parliament 1878-87, and became a member of the Senate Feb. 9, 1891. He is author of *La Vallée de l'Outaouais* (1872); *Les Canadiens de l'Ouest* (2 vols., 1878); *Parallel of the Life of Sir John Macdonald and Lord Beaconsfield* (1879); *Political Recollections* (1891); and *Life and Speeches of Sir George E. Cartier* (1892). NEIL MACDONALD.

Tassisndau': the summer capital of BHUTAN (*q. v.*); 15 miles W. of Punakha, the capital proper; on the Clin-Chu or Raidak, an affluent of the Brahmaaputra (see map of N. India, ref. 6-J). It contains a palace for the two rajahs, of whom the dherma-rajah lives in a high tower, together with a beautiful idol, and the deb-rajah in a square edifice inclosing the tower. The palace is furthermore surrounded by rows of smithies, in which metallic idols are manufactured, and outside of these factories the town extends.

Revised by M. W. HARRINGTON.

Tasso, BERNARDO: poet; b. in Venice, of a noble family from Bergamo, in 1493; studied at Padua, then became secretary to Count Guido Rangone, in whose company he visited Paris (1528). He then entered the service of Renata, daughter of Louis XII. of France and wife of Prince Ercole d'Este. In 1532 he left Ferrara and entered the service of Ferrante Sanseverino, Prince of Salerno. In his company he visited Tunis (1535), Spain (1537 and 1539), France and Flanders (1544). As early as 1536 he married Porzia de' Rossi of Pistoja; and in 1544 he was allowed by his master to retire to Sorrento in order to give himself to literature. Here he labored on his long epic *L'Amadigi*, based on the *Amadis de Gaula*. In 1547, however, his master was ruined by participation in the uprising against the introduction of the Inquisition into Naples, and Tasso shared his fate. The latter's property was confiscated, and he came to actual want. His misery was increased by the loss of his wife in 1556. After living for a time at Rome (1554-56) the poet found refuge with Duke Guidobaldo of Urbino. In 1558, however, he went to Venice, where he was made chancellor of the Venetian Academy. Later he entered the service of Luigi d'Este, then that of Guglielmo Gonzaga, who made him *podestà* of Ostiglia. Here he died, Sept. 4, 1569. Besides the long epic *Amadigi*, we have from this poet the *Floridante*, a narrative poem finished by his son Torquato; and also shorter poems called *Amori*, *Egloghe pesatorie*, and *Odi*. In prose are the *Ragionamento della poesia*, and numerous highly interesting *Lettere*. The best edition of the *Amadigi* is that of Venice, 1581. See also Seghezzi, *Lettere di M. Bernardo Tasso* (2 vols., Comino, 1733); Serassi, *Delle Lettere di M. Bernardo Tasso*, vol. iii. (Padua, 1751); G. Campori, *Lettere inedite di B. Tasso* (with *Life*, Bologna, 1869); A. Portioli, *Lettere inedite di B. Tasso* (Mantua, 1871). A. R. MARSH.

Tasso, TORQUATO: poet; b. at Sorrento, Italy, Mar. 11, 1544; a son of Bernardo Tasso; educated first by the Jesuits at Naples, he continued his studies at Rome and Bergamo, then at the court of the Duke of Urbino in Pesaro, and at Venice, whither his father's fortunes had carried him; finally, in 1560, at his father's desire, he went to the University of Padua to study law. He felt himself more attracted, however, to literature and poetry. In 1562 he published a romantic epic, *Rinaldo*, in twelve cantos, and the applause with which it was received determined him to give up jurisprudence altogether and devote himself entirely to poetry. He repaired to Bologna, where he studied philosophy, frequented the select literary circles of the place, and took up again work on his great epic, *Gerusalemme Liberata*, which he had begun while still hardly more than a boy, moved by the advances of the Turks in Hungary and their frequent raids on parts of the coast of Italy, starting reminiscences of the great time of the crusades. In 1565 he entered the service of Cardinal Luigi d'Este, whom he accompanied to Paris and on other diplomatic missions, and who brought him into connection with his brother, Alfonso II., reigning Duke of Ferrara. In 1571, at which time he had finished the first eight songs of his epic, he left the cardinal, receiving in 1572 a kind of court appointment and a pension from Alfonso II., and settled at Ferrara, where he lived very happily for several years, enjoying the intimate friendship of the duke and his two

sisters, Lucrezia and Eleonora. In the summer of 1573 he wrote for a court festivity his *Aminta*, a pastoral drama, the best of its kind (1st ed. Cremona, 1580); and in 1575 the *Gerusalemme Liberata* was completed. But in the meantime a peculiar melancholy had developed in his mind, and it sometimes burst into open lunacy. His relation to the ducal family had been disturbed, whether on account of a vehement passion for the Princess Eleonora or from some other cause is not known. He was greatly disturbed about his own spiritual condition, fearing that his opinions were unsound, and particularly that his poem was inconsistent with Christian faith and morals. He accordingly submitted the work to many supposed authorities, who treated it with pitiless pedantry, to the poet's great distress. The criticisms, rivalries, and intrigues which as a poet and a courtier he could not escape overwhelmed his imagination; he grew suspicious toward all, saw a secret enemy in everybody, and finally, after the duke had been compelled to restrain him in the effort to cure him, fled from the court in 1577. He sought refuge with his sister at Sorrento, and here his mind soon became calm and clear again. He now yearned for Ferrara, wrote to the duke, and, although the answer he received was very cool, he returned. But he had hardly arrived before the disease again seized his mind. Once more he fled, and once more he returned. His anxiety to re-establish the old relation to this family became more and more passionate as it became more and more evident to him that such a re-establishment was impossible. His manners, his denunciations, became finally so provoking that the duke confined him in a lunatic asylum in 1579. Here he remained seven years, while his great work was read not only in Italy, but all through Europe, and made his name one of the first of his age. At last, in 1586, at the request of Vincenzo Gonzaga, Prince of Mantua, the duke released him, and he now resided for a short time in Mantua, and then settled at Naples. He was poor, sick, and suffering, but his unquiet mind would not permit him to rest; for several years he moved restlessly from place to place, growing steadily worse both in mind and body. His fame, however, was growing continually greater. In 1594 Pope Clement VIII. invited him to come to Rome and be crowned on the capitol, but he died before the solemnity took place, Apr. 25, 1595, and lies buried in the Church of S. Onofrio in Rome. Besides the above-mentioned works he wrote *Torrismondo*, a tragedy, a number of beautiful lyrical poems, some dialogues and essays, some letters, etc. Mention must be made also of the second form of the *Gerusalemme Liberata*, the fruit of years of effort on Tasso's part to relieve the poem of the faults alleged by his self-chosen critics to exist in it. This was finished in 1593 and called *Gerusalemme Conquistata*. Compared with the first form it is a poor and heavy thing; and yet only the piratical printing of the *Liberata* by one Celio Malaspina (Venice, 1580) has preserved to the world one of the chief treasures of modern literature. A complete edition of the *Works* appeared in 33 volumes at Pisa (1821-32), but this is now superseded by the various partial editions of Guasti and Solerti: *Lettere*, ed. by C. Guasti (5 vols., Florence, 1852-55); *I Dialoghi*, ed. by Guasti (3 vols., Florence, 1858); *Prose diverse*, ed. by Guasti (2 vols., Florence, 1875); *Appendice alle Opere in prosa*, ed. by Solerti (Florence, 1892); *Opere minori in versi*, ed. by Solerti (7 vols., Bologna). Best edition of the *Gerus. Liber.* by S. Ferrari (Florence, 1890). See also G. J. Ferrazzi, *T. Tasso, studj biografici-critici-bibliografici* (Bassano, 1880); P. A. Serassi, *La Vita di T. Tasso* (3d ed., with notes by C. Guasti, 2 vols., Florence, 1895); A. Corradi, *Le infermità di T. Tasso* (in *Mem. dell' Istit. Lombardo*, vol. xiv., 1880); English translations of the *Gerusalemme Liberata*, by Edward Fairfax (London, 1600) and by J. K. James (2 vols., 1865). A. R. MARSH.

Tasso'ni, ALESSANDRO: poet and critic; b. at Modena, Italy, Sept. 28, 1565, of noble parents; spent some time at the Universities of Bologna and Ferrara, and was associated with the Accademia della Crusca from 1589. He was in Spain with Cardinal Ascanio Colonna in 1600; but after 1603 in Italy, in the service of Charles Emmanuel of Savoy and engaged upon diplomatic missions between Rome and Modena, Piedmont and Turin. D. at Modena, Apr. 25, 1635. His critical writings are the *Pensieri* (1608-20)—freely expressed views upon literary, scientific, and moral matters; the *Considerazioni sopra le Rime del Petrarca* (1602-09), directed against the literary abuses of the time, which were due to the Petrarchists and the Marinists; and the *Avverti-*

menti di Crescenzo Pepe (1611). The political *Filippiche contro gli Spagnuoli* (1615) shows his hatred for the Spaniards. His best-known work is the *Secchia rapita* (1615-22), a mock-heroic poem which sings a war caused between the Modenese and the Bolognese, when the former carried off a bucket from the latter. It does not fall behind the *Lutricia* and the *Rape of the Lock*. Further may be mentioned the *Tenda Rossa*, several unedited political documents, the fragment of an epic, the *Oceano*, some satirical rhymes, and his *Letters*. See *La Secchia rapita, poema eroico-comico, e il primo canto dell' Oceano* (Turin, 1830); *Rime*, ed. by T. Casini (Bologna, 1880); *Life*, by A. Muratori, in the edition of the *Secchia Rapita* (Modena, 1744). Cf. G. Tiraboschi, *Biblioteca Modenese* (1784), v., 180 ff., and d'Ancona and Bacci, *Manuale della Letteratura Italiana*, iii., 356 ff. (Florence, 1893). J. D. M. FOAD.

Taste: See SENSES and HISTOLOGY (*The Digestive Organs*).

Tafar Bazardjik: town; in Eastern Roumelia (Bulgaria); on the Maritza; 23 miles W. N. W. of Philippopolis (see map of Turkey, ref. 3-C); traversed by the railway which connects Vienna and Constantinople; maintains a large trade in wheat, lumber, coarse cloth (shaiak), ottar of rose, tobacco, tar, cheese, rice, butter, sheep, and skins. Pop. (1893) 16,343. E. A. G.

Tatars: See TARTARS.

Tate, NAHUM: poet; b. in Dublin, Ireland, in 1652; was educated at Trinity College; went to London, devoted himself to literature, and in 1692 succeeded Shadwell as poet-laureate; fell into pecuniary straits, and died in the precincts of the Mint, where debtors were privileged from arrest, Aug. 12, 1715. He assisted Dryden in the composition of *Absalom and Achitophel*, most of the second and poorer part being the work of Tate; perpetrated an alteration of Shakspeare's *King Lear*, which kept the stage for a long time in place of the original; as poet-laureate produced commonplace birthday odes and elegies; and put forth several works in prose and verse, among which are about half a score of dramatic pieces. He is chiefly known as a psalmist, the versions of the Psalms executed by him and Nicholas Brady being long retained in the English *Book of Common Prayer*; these first appeared under the title *Essay of a New Version of the Psalms of David, consisting of the first Twenty*, by N. Brady and N. Tate (1695), which was followed by *The Book of Psalms, a New Version in Metre, fitted to the Tunes used in the Churches*, by N. Tate and N. Brady (1696), and *A Supplement of Church Hymns* (1700). Revised by H. A. BEERS.

Tateno Gozo: official and diplomatist; b. at Kokura, on the southern shore of the Straits of Shimonoseki, Japan, in 1841. Sent in 1869 to London in charge of students, he spent four years there, and acquired a thorough knowledge of the English language and of foreign life. From 1880 to 1890 he served with great acceptance as governor of Osaka, whence he was transferred to the legation at Washington, D. C., as minister plenipotentiary. He returned to Japan in the year 1894. J. M. DIXON.

Tatham, WILLIAM: soldier and author; b. at Hutton, England, in 1752; emigrated to Virginia in 1769, and entered a mercantile establishment on the James river; served as adjutant of militia against the Indians; during the Revolution was colonel in the Virginia cavalry, and in 1780, in connection with Col. John Todd, compiled the first trustworthy account of the Western territory. He studied law and was admitted in 1784; in 1786 established himself at Lumbarton, N. C., and in 1787 was elected to the Legislature of North Carolina. He twice visited England, and in 1801-1805 was superintendent of the London docks. Returning to Virginia in 1805, he was in his old age reduced to penury, and was appointed keeper of the military stores in the Richmond arsenal. He committed suicide at Richmond, Feb. 22, 1819. Among his publications are *Analysis of the State of Virginia* (Philadelphia, 1794); *Remarks on Inland Canals* (London, 1798); *Political Economy of Inland Navigation* (London, 1799); and *History and Practical Essays on the Culture and Commerce of Tobacco* (London, 1800).

Tatia'nus: Christian apologist; b. in Assyria about 110 A. D.; studied philosophy and rhetoric; went to Rome, and taught rhetoric there; enjoyed the friendship of Justin Martyr; was converted by him to Christianity about 152, and wrote in Greek one of the earliest apologies for Christianity against the pagan philosophers, *An Address to the Greeks* (ed. K. Otto, Jena, 1851; Eng. trans., *Ante-*

Nicene Fathers, ii., 65-82). After the death of Justin, about 167, Tatian returned to the East, and adopted very strange, heterodox ideas of the Gnostic variety, joining the Eucratites. He died, perhaps at Edessa, about 180. His morality was asceticism. He forbade marriage, animal food, wine, etc., and used water in the celebration of the Eucharist. The *Diatessaron* of Tatian, in which the Gospels are so combined as to form a continuous narrative without repetitions, known from the fifth century as the form in which the Gospels were read in Syria, was probably made originally in Syriae. It was entirely unknown except in name and from quotations from it until a Latin translation of it, along with an Arabic version of it of Egyptian origin in the fourteenth century, was published by A. Casca in Rome, 1888. Eng. trans. from the Arabic by J. Hamlyn Hill, *Earliest Life of Christ* (Edinburgh, 1894). It proves the existence of four, and only four, Gospels about the middle of the second century. Revised by S. M. JACKSON.

Tatius, ACHILLES: See ACHILLES TATIUS.

Tatnall, JOSIAH: soldier; b. at Bonaventura, near Savannah, Ga., in 1762; went to England with his parents, who were loyalists, on the outbreak of the Revolutionary war, but ran away from home in 1780, and returning to Georgia in 1782 joined the army of Gen. Nathanael Greene; was made colonel of militia in 1793 and brigadier-general in 1800; took an active part in the military affairs of the State, and was elected to the Legislature; was U. S. Senator from Georgia 1796-99, and Governor of Georgia 1800. D. at Nassau, New Providence, June 6, 1803.

Tatou-peba: See CACHICAMA.

Tatpurusha: a technical term of the traditional Sanskrit grammar applying to substantive compounds, in which the prior member is an adjective, noun, or adverb modifying in meaning the second member, the whole being of the same part of speech as the latter member. They are also called determinative compounds. Such are *indrathanûs*, Indra's bow, *vedavid*, Veda-knowing, *priyasakhu*, dear friend; or in English, *dining-room*, *weatherwise*, *wildcat*. KARMA-DHĀRAYĀ (*g. v.*) applies to a subdivision of this class. See also IMMUTATA.

BENJ. IDE WHEELER.

Tattam, HENRY, LL. D., F. R. S.: Orientalist; b. in Ireland, Dec. 28, 1788; educated at Trinity College, Dublin, and at the Universities of Göttingen and Leyden; took orders in the Church of England; was archdeacon of Bedford 1844-66, and rector of Stanford Rivers, Essex, 1849-68, and was afterward a chaplain in ordinary to the Queen. D. at Stanford Rivers, Jan. 8, 1868. During his travels in the East, early in the century, he laid the foundation of an intimate knowledge of Oriental languages, concerning one of which, the Coptic, he became an authority. He discovered at the convent of Nitria, in the northwest desert of Egypt, and secured for the British Museum, a splendid collection of ancient Syriae MSS. Among these were the *Ecclesiastical History of John, Bishop of Ephesus* (Oxford, 1853), and the *Epistles of Ignatius* (1845), both edited in the Syriae text by Dr. William Cureton, and the former translated into English by Dr. R. Payne Smith (1860). He was the author of several works, including *Lexicon Ægyptiaco-Latinum ex veteribus Linguae Ægyptiacae Monumentis, etc.* (Oxford, 1835); *The Ancient Coptic Version of the Book of Job the Just, translated into English and edited* (1847); and *Prophetae Majores in Dialecto Linguae Ægyptiacae* (Oxford, 2 vols., 1852).

Revised by S. M. JACKSON.

Tattler: a name applied without definite limits to numerous birds of the snipe family, usually to the larger species of sandpipers, such as the yellowlegs, *Totanus melanoleucus*.

Tattooing [deriv. of *tattoo*, from Fr. *talouer*, tattoo, from Tahitian *tatu*, tattooing]; the practice of marking the skin with various indelible figures by means of slight punctures or incisions into which certain pigments are introduced. In the islands of the South Pacific the custom was originally almost universal, although now dying out through the influence of missionaries and civilization. Tattooing is also found among the Burmese, Laos, Japanese, and American Indians (see INDIANS OF NORTH AMERICA); in Japan, however, the practice has been forbidden by the Government, and is disappearing. With the races of darker color, such as Negroes, Malays, and the natives of Australia, a more prevalent method of ornamenting the skin is by means of simple scars. The tattooing of a few emblems on the arms or body is a common custom with white sailors and with the lower

class population of Europe. With the Polynesians and Japanese, however, the figures cover nearly the whole body, and largely take the place of clothing. A distinguishing peculiarity of the Maoris was the elaborate tattooing of the face; many of their heads are preserved in museums. The art of tattooing was brought to its highest and most artistic development in Japan: here the subjects chosen for representation include lions, dragons, birds, trees, flowers, historical incidents, beautiful women, etc. The best authorities on the subject are Lacussagne, *Les Tatouages* (Paris, 1881), and Joest, *Tätowiren, Narbenzeichen, und Körperbemalen* (Berlin, 1887).

Taubaté, tow-bã-tã: town of the state of São Paulo, Brazil; in the valley of the upper Parahyba, and on the railway from São Paulo to Rio de Janeiro; 81 miles E. N. E. of the former city (see map of South America, ref. 7-G). It is the center of one of the richest coffee-growing districts of Brazil. Pop. about 12,000; with the *município* (1889), 23,000.

Tauchnitz, toweh'nîts, CHRISTIAN BERNHARD, Baron von: publisher; nephew of Karl Christoph Tauchnitz; b. at Schleinitz, near Naumburg, Germany, Aug. 25, 1816; established a publishing-house at Leipzig in 1837, and became celebrated for his editions of Greek and Latin classics, Hebrew and Greek Bibles; best known to travelers and writers for his continental editions of British authors, which consists of 3,000 titles. He began this series in 1841, and adopted the principle of paying the authors for the republication of their works, although there was at that time no international copyright. He was made a baron 1860; became British consul-general in Saxony, 1872, and 1876 for the other Saxon principalities; called by the king to the house of peers of Saxony 1877. D. in Leipzig, Aug. 14, 1895.

Tauchnitz, KARL CHRISTOPH TRAUOGOTT: publisher; b. at Grossbardau, near Grimma, Saxony, Oct. 29, 1761; learned printing at Leipzig; worked for some time in Unger's establishment in Berlin, and opened in 1796 a printing-house in Leipzig, to which were added in 1798 a bookstore, in 1800 a type-foundry, and in 1816 the first stereotype-foundry in Germany. From his establishment, which soon grew and became one of the largest of the kind in Germany, issued those celebrated editions of Greek and Latin authors which in correctness, convenience, and cheapness surpassed all other editions which had hitherto appeared. D. in Leipzig, Jan. 14, 1836.

Tauism and Tauists: See TAOISM.

Tauler, tow'ler, JOHANNES, Doctor Illuminatus; mystic; b. at Strassburg about 1300; entered the order of the Dominicans about 1318, and came under the influence of Meister Eckart, theological professor of the monastic school. He further studied theology at the college of his order in Cologne 1327-31, and afterward in Paris. The scholastic method, however, of the theology of that time did not satisfy him; he felt himself drawn toward the mystical and speculative writers on religion and philosophy; and this tendency was still more strengthened within him, after his return from Strassburg, by his intercourse with Meister Eckart. Eckart's pantheism, however, as well as Suso's sentimentalism, remained foreign to him. His character was of a more practical turn, and it is the moral bearing of the religious ideas which forms the essence of all his writings. Banished with the Dominicans from Strassburg, in consequence of their determination to close their churches during the papal ban, he went to Basel (1339). There he was converted by the mysterious "Friend from Oberland," and his preaching became more spiritual. From 1346 he lived in Strassburg, and there died June 16, 1361. He enjoyed the reputation of being the greatest preacher of his time, and set a rare example of Christian courage, self-denial, and persistency during times of papal ban, of plague, and other hardships. His sermons were first collected in 1498 (Leipzig). A translation into new High German was given by Schlosser (Frankfort, 1826); better by J. Hamberger (Frankfort, 2d ed. 1872). See Karl Schmidt, *Johannes Tauler von Strassburg* (Hamburg, 1841); Miss Winkworth, *Life and Times of Tauler* (London, 1857), containing twenty-five of his sermons; American reprint, ed. by R. D. Hitchcock, New York, 1858. See also Denifle's *Das Buch von der geistlichen Armut* (Strassburg, 1877) and *Taulers Bekehrung* (1879); A. Jundt, *Les amis de Dieu au XI^e siècle* (Paris, 1879); F. Bevan, *Trois amis de Dieu* (1889).

Revised by S. M. JACKSON.

Taunay, tow-nã, ALFREDO D'ESCRAGNOLLE: author and politician; b. in Rio de Janeiro, Brazil, Feb. 22, 1843. His

ancestors were French nobles, who fled to Portugal during the Revolution, and passed with the royal family to Brazil. After graduating with high honors at the Pedro II. College, he studied engineering in the Polytechnic and Military schools in Rio de Janeiro, having entered the army in 1861. In 1865-68 he was attached to the Engineer Corps of the Brazilian army which invaded Northern Paraguay from Matto Grosso. The history and sufferings of these campaigns were described by him in two works—*Scenas de viagem* (1868) and *La Relraite de Laguna* (1871; originally written in French); these at once placed him in the first rank among Brazilian authors. In 1869-70 he was attached to the army in Southern Paraguay, editing its records. After the war he took an active part (as a conservative) in politics, was elected to parliament, was president successively of Santa Catharina and Paraná, and in 1886 was chosen to the senate; in all these positions his efforts were especially directed to the promotion of immigration, and he urged his plans in an important series of publications. His other writings include essays, poems, comedies, criticism, etc., and a series of novels which are regarded as the best ever produced by a Brazilian author. Among these are *A moçidade de Trajano* and *Inocencia*, the latter translated into French and English. Taunay excels in descriptions and character-drawing, but is lacking in humor. Since the Revolution he has been a leader of the imperialist party, but has taken no part in the acts of rebellion. See Koseritz, *Alfredo d'Escagnolle Taunay* (Rio, 1886). HERBERT H. SMITH.

Taunton: town; in Somersetshire, England; on the Tone; 45 miles S. W. of Bristol (for location, see map of England, ref. 13-F). It is well built, and has manufactures of hosiery and silk, and trade in agricultural and dairy produce. Among its principal edifices are the Church of St. Mary Magdalen, St. James's church, the market-house, Taunton and Somerset Institution, the West of England College for Dissenters, and a castle built in the time of Henry I. Taunton returns one member to Parliament. Pop. (1891) 18,026.

Taunton: city; capital of Bristol co., Mass.; on the Taunton river, and the N. Y., N. H., and Hart. Railroad; 15 miles N. by E. of Fall River, 33 miles S. of Boston (for location, see map of Massachusetts, ref. 5-1). It was called Cohannet by the Indians; the first purchase of ground by the whites was in 1637; the town was incorporated in 1639, and had a city government in 1865. It is in an agricultural region, and is widely known for the extent and variety of its manufactures. In 1890 it had 310 manufacturing establishments, representing 65 industries. The invested capital aggregated \$7,754,773. Over 6,000 persons were employed, to whom \$3,104,023 was paid in wages. Materials valued at \$4,771,096 were used in manufacturing, and goods were produced at an aggregate value of \$9,834,584. The principal manufactures are cotton machinery, cotton cloth and yarn, cutlery, nails and tacks, copper, yellow metal, silver and britannia ware, oil-cloth, fire and building brick, stoves, printing-presses, shoe-buttons and eyelets, and machinists' tools. The city has an extensive trade with the interior in coal and grain, and a considerable coasting trade. There are 20 churches; a high school, 64 graded and 17 ungraded public schools, and over 4,700 pupils; Bristol Academy (non-sectarian, chartered in 1792); a public library with 37,000 volumes; State Insane Hospital; Home for Aged Women; the Morton Memorial Hospital; exhibition grounds and buildings of the Bristol County Agricultural Society; headquarters of the Old Colony Historical Society; new court-house; 3 national banks with aggregate capital and surplus of \$1,800,000, 3 co-operative banks with authorized capital of \$1,000,000 each, and 2 savings-banks with aggregate deposits of over \$6,000,000; and 3 daily, 2 weekly, and 3 monthly periodicals. The assessed valuation in 1894 was \$18,987,961, and net city debt \$207,495. Pop. (1880) 21,213; (1890) 25,448; (1895) 27,115.

REV. SAMUEL HOPKINS EMERY.

Taurida, tow'ré-daa': government of Russia, bordering on the Dnieper, the Black Sea, and the Sea of Azof; area, 24,539 sq. miles. It consists of the peninsula of the CRIMEA (q. v.), and some extensive districts of the mainland. The northwestern part of the Crimea and the mainland are desert steppes interspersed with salt lakes; they are inhabited by Tartars, who feed large herds of cattle and sheep on the steppes and cultivate wheat and millet. Pop. of government, (1890) 1,167,600. Revised by M. W. HARRINGTON.

Taurus, tau'rūs [= Lat. = Gr., liter., bull, ox < Indo-Eur. **tauros* > O. Ir. *taib*]: a brilliant constellation, which may

be seen S. of the zenith during the evenings of December and January. It includes the remarkable groups of stars the Pleiades and Hyades, and the red star Aldebaran. Taurus is the second sign of the Zodiac. S. N.

Taurus: a range of mountains in Asia Minor, stretching E. to W. from the Euphrates to the Gulf of Adalia. By the Alma-Dagh it communicates with the Lebanon Mountains in Syria, and by one branch of the Anti-Taurus with the Caucasian Mountains. It rises in terraces from the Mediterranean to a height of 10,000 feet, and incloses between itself and Anti-Taurus an elevated plain, arid, dotted with salt lakes, and having the same character as the plateaus of Central Asia. Revised by M. W. HARRINGTON.

Tausig, tow'zich, CARL: pianist; b. near Warsaw, Poland, Nov. 4, 1841; pronounced by his teacher Liszt the best pianist the world ever heard. His octave playing was wonderful. After making many successful concert tours he settled in 1865 in Berlin, where he opened a school for piano instruction. D. in Leipzig, July 17, 1871. His compositions are all for the piano, and are masterpieces of execution. D. E. H.

Tausig, tow'sig, FRANK WILLIAM: political economist; b. in St. Louis, Mo., Dec. 28, 1859; A. B. 1879, Ph. D. 1883, LL. B. 1886, all from Harvard University; studied one year in Europe; has since been Professor of Political Economy in Harvard University; author of *Tariff History of the United States* (New York, 1888; 2d ed. 1892); *The Silver Situation in the United States* (1892); various contributions to scientific periodicals, chiefly to *The Quarterly Journal of Economics*. C. H. T.

Tautog' [from Amer. Ind. *tautaug* (given by Roger Williams, and said by him to mean sheep's heads), plur. of *tout*, the Indian name]: a fish (*Tautoga onitis*) of the family *Labridae*, related to the wrasses of Europe, but the only member of its genus. It is a deep-bodied fish, with small smooth scales; the opercular bones scaleless; the teeth on the jaws conical and in two rows, and none behind developed as canines; dorsal spines numerous (seventeen), and only three anal spines; the adult is sometimes an almost uniform black, but generally more or less blotched, and in the young banded and otherwise decorated. It is common on the Atlantic coast of North America from Massachusetts to Carolina, and rarer farther northward and southward. Its average weight is about 2 lb., but it frequently weighs 10 lb. It makes its appearance in large numbers and in shallow waters on the New England and New York coasts between the months of April and November, and is most abundant in May and October. It spawns in May or June. When it first makes its appearance in shallow water, it refuses the hook, but soon takes it readily, and is one of the most frequently caught of the salt-water fishes. It prefers rocky places and slight currents. It keeps near the bottom, and preys upon crustaceans and molluscs. Revised by F. A. LUCEAS.

Tavernier, tā vār ni-ā', JEAN BAPTISTE, Baron d'Aubonne: traveler; b. in Paris in 1665; undertook while still very young extensive journeys in Europe, and made from 1693 to 1693 his first great journey to the East—from Constantinople to Persia, and thence by way of Aleppo to Rome. Subsequently, from 1698 to 1699, he made five more voyages to the East, through Asia Minor and Persia to Hindustan, and as far as Batavia. He possessed great skill in appraising precious stones, and by trading in jewelry he amassed a great fortune. He also promoted French commerce in the East Indies in various ways, and on his return from his last voyage Louis XIV., who bought many of his jewels, made him a baron. He lost a part of his fortune, however, and, being a Protestant, sought refuge in Switzerland after the revocation of the Edict of Nantes. On a seventh journey to the East he died in Moscow in July, 1699. A report of his first six voyages was edited by Chappuzeau (2 vols., 1676-77), and a third by La Chapelle (1679), under the title *Les Six Voyages de J.-B. Tavernier*. His descriptions are remarkable for their accuracy and for the light that they throw on the condition of Eastern commerce. An edition of his works was published in 1810 (7 vols.), and an abridged edition in 1882. See *Travels in India* (Eng. trans., 2 vols., 1890), and *Joret, Jean-Baptiste Tavernier*. F. M. COLBY.

Tavistock: town; in Devonshire, England; on the Tavy; 11 miles N. of Plymouth (see map of England, ref. 14-B). There are only a few remains of a once splendid Benedictine abbey, founded in 961. Copper, lead, silver, and tin are found in the vicinity, and there is much trade in cattle and grain. Pop. (1891) 6,252.

Tavoy': capital of Tavoy district, Tenasserim, Burma; in lat. 14° 7' N., on the river Tavoy, 30 miles from its mouth (see map of S. India, ref. 5-M). It is a neat and handsome town, of a thoroughly Indian character, built of bamboo and on piles, half concealed by luxuriant orchards and fruit-gardens, and standing in the center of rich rice-fields. Salt and earthen pots are the chief manufactures. Pop. 13,370.

M. W. H.

Tavsen, tow'sen, HANS: Reformer; b. near Kjørteminde, island of Fünen, Denmark, 1494. In 1515 he entered a cloister, but the following year went abroad and studied at the University of Rostock, where he took the master's degree. After lecturing on theology at the University of Copenhagen for two years, he went abroad again, with the assistance of his cloister, and spent a year at Wittenberg, under the direct influence of Luther and Melancthon. After a year he was suddenly called home, and returned filled with enthusiasm over the new teachings. In spite of entreaties, threats, and imprisonment, he continued to preach, even from his prison windows. In 1526 he was made chaplain to Frederick I., and permitted to preach in Viborg. Three years later he moved to Copenhagen, and became the leader of the Danish Reformation, *Omniium Lutheranorum in Dania antesignanus*. For some unknown reason he was not included in the first list of Danish Protestant bishops, but in 1542 he was appointed to the diocese of Ribe, where he remained till his death Nov. 11, 1561. Among his writings, which are inferior in form to those of Christiern Pedersen, are a translation of the Pentateuch (Magdeburg, 1535); *Postil* (Sermon, 1539), a collection of sermons for the whole year; and a translation of the whole Bible (before 1543).

D. K. DODGE.

Taw'as City: incorporated village; capital of Isco co., Mich.; on Tawas Bay, Lake Huron, at the mouth of the Tawas river, and on the Detroit and Mack. Railroad; 65 miles N. E. of Bay City (for location, see map of Michigan, ref. 5-J). It has a fine harbor, is in an agricultural region, and is principally engaged in the manufacture and shipment of lumber and salt. There are 6 churches, graded public school, a private bank, and 2 weekly newspapers. Pop. (1880) 712; (1890) 1,544; (1894) State census, 1,230; township, 2,191.

EDITOR OF "HERALD."

Tawing and Tanning: See LEATHER.

Taxa'ceæ [Mod. Lat., from *Taxus*, the typical genus, from Lat. *taxus* = Gr. *τάξος*, yew-tree]: one of the two families of the order *Conifera*. See CONIFERS.

Taxation [viâ O. Fr. from Lat. *taxat'io*, estimation, valuing, deriv. of *taxare*, handle, estimate, value, rate, deriv. of *tan'gere*, *tac'tum*, touch]: the system by which revenue is raised to meet the general expenses of a government, whether national or local. Taxes are to be distinguished (1) from forced contributions, which do not form part of a system, but which are an exceptional means of raising revenue in time of war or other emergency; (2) from fees like court charges or postage-stamps, which are contributions in connection with special services rendered in each case, and do not, properly speaking, form part of the general revenue.

An account of the principal taxes in use will be found in the article FINANCE. The object of the present article is to examine the grounds on which methods of taxation are criticised or justified.

In his *Wealth of Nations*, published in 1776, Adam Smith laid down four canons of taxation which are taken as the starting-point in this discussion. They were as follows: (1) The subjects of every state ought to contribute to the support of the government as nearly as possible in proportion to their respective abilities—that is, in proportion to the revenue which they respectively enjoy under the protection of the state. (2) The tax which each individual is bound to pay ought to be certain and not arbitrary. (3) Every tax ought to be levied at the time or in the manner in which it is most likely to be convenient for the contributor to pay it. (4) Every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings into the treasury of the state. As the French financier Colbert somewhat cynically puts it, taxation is the art of so plucking the goose as to secure the largest amount of feathers with the least amount of squealing.

Of these canons the second and third are obviously of minor importance, being rather of the nature of administrative directions as to the detail of collection than general

criteria for judging a tax itself. The first and fourth are the important ones. Taxes must be equal and effective. Of course, if a tax meets both these requirements, it is a good one. But can both be applied side by side? In ancient times this was possible. There was one group of men who had considerable property and income which was in a form where it could be easily assessed. The property consisted chiefly of real estate. What little personal property there was consisted largely of visible and tangible objects, like plate or jewels, which the owners kept for display. A tax levied on these persons fell on those who could afford to pay it, and was one which could be collected at relatively little expense; a tax on any other body of persons was at once unjust and destructive. But even at the time when Smith wrote matters had begun to change from their ancient simplicity. The persons who had the most ability or revenue were not always in a position where the assessors could ascertain the exact measure of this ability. Personal property in invisible forms, like stocks and bonds, had begun to acquire increasing importance. The attempt to make everybody contribute equally by the old method resulted in burdening the honest and exempting the dishonest, and in making a tax system which was singularly ineffective—one whose burdens were out of proportion to the financial results. The tax legislator now has to decide the question whether he shall make equality or effectiveness his primary aim. This can be answered only by looking at the indirect effects of the taxes laid and studying what is known as the incidence of taxation. Suppose that a tax is laid which is equal, but not effective—for instance, one which taxes people on stocks and bonds in the same manner that it does on real estate—the result is that the honest people alone tell what they have, while the dishonest conceal it. This constitutes, first, a premium on dishonesty; second, a burden on the honest, for if half of the property of a given class escapes taxation, the other half has to pay double rates in order to yield a given amount of revenue; third, an increasing burden, because each year of successful evasion renders the public conscience more lax and reduces the honest to a smaller minority. No system of oaths has been devised which will meet this evil.

On the other hand, suppose a tax is laid which is effective but not equal—that is, which strikes a particular class of persons, but reaches all that it is aimed at. Assume, for instance, that houses were taxed at a different rate from other kinds of property. At first this would be an injustice to the owners of houses; but as time went on fewer houses would be built for rent, and the owners of those already existing could charge higher prices on account of the short supply, thus shifting part of the burden on to the occupiers. Then as rents were slightly raised the employers of labor would probably have to pay a little higher wages in order to induce workmen to live in the place in question—a thing which the employers would be enabled to do if the house tax had been sufficiently productive to diminish the amount of the total payments which business concerns would have to contribute to the municipal support. Each year as it passed would tend to shift the burden of this tax from the class which originally felt it to the shoulders of the community as a whole. The only cases where such shifting would not take place would be those where the class specially taxed was making such high profits that a diminution of these profits did not affect the supply of the goods or services which this class gave; and where profits were so large as this it would prove that such a class under previous systems of taxation had not been contributing a fair share to the expenses of the government. A tax law which aims to be equal, but which is ineffective, produces the worst kind of inequality, which tends to increase as time goes on. A tax law which aims to be effective, even in apparent disregard of equality, tends by a constant process of economic adjustment to be more and more equally distributed over the whole community. Effectiveness rather than equality should therefore be the primary object of the tax legislator. The other can be trusted to follow. Unfortunately this sequence is not well understood. In seeking to apply an illusory theory of equal treatment of all persons, law-makers really put double burdens on the honest. When the courts squarely face the fact that any tax is a discriminating tax, if a large part of those against whom it is directed can practically escape its burdens, we may hope for a real reform in these matters. A few rules can be given which tend to secure effectiveness of tax laws and to avoid discriminations against the honest.

(1) Taxes should be assessed on things rather than on persons—on the property itself rather than on its owners. (2) In conformity with this rule an income tax should be levied at the sources of the income rather than on the receivers of the income. Of course this complicates the possibility of levying compensatory or progressive income taxes, and may bear hard upon people with small incomes; but the evasions which result from a violation of this rule do far more harm than the hardships which result from conformity to it. (3) No deductions from the value of property should be made on account of debt. Mortgaged real estate, for instance, should be assessed at its full value. This at first sight seems very unjust, but is really the equitable arrangement. Under the present system, which allows deduction for debt, a large part of the money lent on real estate wholly escapes taxation. The present system puts burdens, first, on the holder of unmortgaged real estate, who has to pay a higher rate of tax because the valuation of the town where he lives is lower; second, on the widows and orphans, who pay a high tax rate on their investments, while other investors conceal the fact of their holdings. Its benefit to the holder of mortgaged real estate is largely illusory, because the existence of the present system keeps the rate of interest higher than would otherwise be the case. The only man who gets much benefit is the unscrupulous lender, who enjoys the high rate of interest and makes no tax return. (4) The same principle should be applied to corporations. The value of the corporate property is represented by the market value of its stock and debt. This debt can be reached by taxing the corporation either on its gross earnings, its net earnings, or its securities as a whole. It can not be reached by an attempt to tax it in the hands of the holders. (5) To secure an equitable land tax, real estate should be assessed on the basis of its price rather than of its productiveness; unimproved real estate should be assessed higher and improvements relatively lower than at present. The assessors to-day see that the man who holds unimproved real estate gets little income, and they let him off easily on account of his supposed inability to pay a high tax. The real effect of this is to take burdens off from the shoulders of a man who is waiting for the growth of the community to make him rich, and to put those burdens on the shoulders of those who are contributing to that growth. Whatever may be thought of Henry George's single-tax theory as a whole, there can be little question that a relatively higher assessment of ground rent, with corresponding relief for those who have made improvements, is a much-needed reform. (See SINGLE TAX.) (6) The objects of national, state, and local taxation should be separated as far as possible. If, as happens in so many of the U. S., the State taxes are partly made up of contributions from the towns on the basis of their grand lists, or assessed valuations, the local assessors are anxious to lessen the share of the State tax which their town must pay. This they can do by lowering the grand list and correspondingly raising the local tax rate. When once the assessors are interested in making an incorrect list, no board of equalization can overcome the evil.

There are certain important groups of taxes in which revenue is a subordinate consideration, and which therefore fall somewhat outside the scope of this article. High licenses constitute one group, protective tariffs another. The object of such taxes is to discourage certain forms of trade upon which they are levied, and they should obviously be judged on other grounds than those of equality or fiscal effectiveness.

There is no satisfactory general work on the economics of taxation. The leading American writers on the subject are David A. Wells, whose article on *Taxation* in *Labor's Cyclopaedia of Political Economy* goes into more detail than is compatible with the scope of this work, and includes a detailed bibliography, and E. R. A. Seligman, *Publications of the American Economic Association*, vol. vii., Nos. 2, 3, vol. ix., Nos. 1, 2, who has done excellent work, but not quite comprehensive enough for the general reader. Cossa, *Taxation, its Principles and Methods*, deals with European conditions rather than American. R. T. Ely's *Taxation in American States and Cities* contains some interesting matter, but must be used with caution. ARTHUR T. HADLEY.

Tax'iderm'y [from Gr. *τάξις*, arranging, arrangement (deriv. of *τάσσειν*, *τάξαι*, arrange)+ *δέρμα*, a skin (deriv. of *δέρειν*, to skin)]: the art of preserving the skins of animals and replacing the flesh by some durable material, so as to represent life. In the matter of removing and replacing

perishable parts it differs from embalming, which seeks to preserve the flesh itself. With the questionable exception of crustaceans, the art of the taxidermist is practically restricted to vertebrated animals, for invertebrates are usually dried or preserved in liquid, and while a large insect may be cleaned and mounted, such cleaning and mounting can hardly be called taxidermy.

Taxidermy is a comparatively modern art, for while it is said that Hanno brought back to Carthage skins, supposed to be those of gorillas, from the west coast of Africa, no attempt seems to have been made to mount them. The well-known quotation from *Romeo and Juliet*,

And in his needy shop a tortoise hung,
An alligator stuff'd, and other skins,
Of ill-shaped fishes,

is one of the earliest references to stuffed animals. Still, from a work published in Paris in 1689, it is certain that as early as 1517 birds, including the cassowary, brought from Malaysia, were mounted in Amsterdam, and a stuffed rhinoceros is preserved in the Royal Museum of Vertebrates, Florence, which was prepared for the museum by Ulysses Aldrovandus in Bologna, sometime in the sixteenth century. It is very probable that taxidermy originated in the desire to preserve for exhibition the strange quadrupeds and brilliant-hued birds brought to Europe by the early navigators, and to this desire is due the genesis of the modern natural history museum. The establishment of museums naturally gave an impetus to taxidermy, but it was for a long time taxidermy of a decidedly inferior quality, and so far back as 1825 Waterton vigorously criticised the appearance of museum specimens. The demand for more art in taxidermy came mainly from private individuals desirous of preserving birds for their beauty, or mammals as trophies of the chase, and it was many years before the greater portion of museum work rose above the level of the positively bad. Perhaps the earliest institution to admit within its walls groups of animals mounted to show them with natural surroundings, or to illustrate their habits, was the University of Pisa, where, at the beginning of the nineteenth century, Prof. Paolo Savi mounted in a most artistic manner a number of groups of birds and mammals.

The British Museum was the first large institution formally to adopt groups of birds mounted with their natural surroundings as a part of its regular exhibition series, but in this it was only following in the lead of E. T. Booth, who had applied the idea to one entire museum, and had introduced into the Brighton Museum, England, a series of British birds thus mounted. At present the best work is demanded by public museums, and some noteworthy examples of taxidermy are to be found in the U. S. in the American Museum of Natural History, New York, and in the U. S. National Museum at Washington.

The general principles of taxidermy may be outlined as follows: The skin of the animal to be mounted must be carefully removed, cleaned, and poisoned, preferably with some preparation of arsenic, either in the shape of arsenical soap or in powder. In the case of most mammals the skin must be so tanned that the hair will not fall out, and that the skin may dry hard and stiff in order to retain the form given it. Wires or irons are placed in the legs to sustain the weight of the animal, and around these the original shape of the legs is carefully built up in tow, or tow and excelsior. On the care with which this is done depends much of the appearance of the finished work, and in the case of quadrupeds thinly clad with hair great pains are needed to bring out the muscles. The leg-irons are attached to a central wire, board, or body of excelsior, according to the size of the animal or method to be followed, and in birds and small mammals the neck and body are made together, and little remains to be done in the way of further filling. The easiest, but worst, method is after the skin has been drawn over the legs, and they have been attached to the body, to fill out the skin with tow or straw, working out the principal muscles from within. The best method, with quadrupeds of any size, is to build up over a wooden framework the entire shape of the body, including the neck, replacing the muscles by excelsior and tow, smearing this manikin over with clay to attain smoothness. The finer details about the eyes, lips, and nostrils are reproduced by placing a layer of clay beneath the skin, and working in the lines and other characters. Birds are preserved readily by the art of taxidermy; mammals are more difficult; the smooth, glossy skin of cetaceans defies the taxidermist, and can only be imitated by a carefully made cast, and the same is true

of the large majority of reptiles and fishes, although with care many may be mounted.

See Hornaday, *Taxidermy and Zoological Collecting* (New York, 1891), and Davie, *Methods in the Art of Taxidermy* (Columbus, 1894). F. A. Lucas.

Taxonomy (from Gr. *τάξις*, arrangement + *νόμος*, law): that department of biological science which deals with the arrangement and classification of animals and plants.

Tax Sales: public official sales of land made in pursuance of law for the non-payment of taxes which have been laid upon them. Power to make such sales is entirely statutory, and is not derived from any rule of the common law, the right of a government to grant such power being a necessary attribute of its sovereignty. The power when granted is a naked power, and not one coupled with an interest, and the statutes giving it must be strictly construed.

In the U. S. tax sales are very common, and the laws governing them and the construction of those laws form a very important part of the jurisprudence of the various States. The statutes of the several States vary widely in their specific provisions as to the assessment of taxes, the manner of making tax sales and their effect, and the right of redemption accorded to interested parties. Certain general principles, however, have been established which apply to all, or nearly all, the statutes, and regulate the proceedings under them.

Requisites to a Valid Sale.—The land must be regularly listed and assessed, it must not be exempt, and the tax must remain undischarged at the time of the sale. Payment, or even tender by the owner, or by any other person whose interests would be prejudiced by the sale, destroys the right to sell. Such a sale is in a great measure an *ex parte* proceeding, and in order to render it valid every statutory requirement which regulates the prior proceedings, down to and including the sale, must be strictly complied with. This principle applies to all preliminary steps—the assessment and laying the tax, preparation of the assessment roll and its delivery to the proper officer for collection, etc.—as well as to the subsequent steps relating to default in payment of the tax and the proceedings thereupon preparatory to making the sale. This doctrine is fundamental in all the States, but in the methods and means by which this regularity shall be judicially determined there is considerable variation.

Due notice, usually by advertisement in a newspaper for a specified time, must be given of the property to be sold, and of the time and place of the sale, which must be held as advertised, must be public, and must be conducted by the officer authorized by statute in strict conformity with the provisions of the statutes.

The amount of land to be sold is variously regulated; in some States it is optional with the officer to sell the whole or a part, while in others the amount is limited to such as it is necessary to sell to realize enough to satisfy the taxes and charges, any violation of the provisions in this respect rendering the sale void. Each parcel of land which is separately assessed must be sold by itself, usually for cash to the person bidding the highest sum, which sum must not be less than the total amount of taxes and charges. After the sale, in most States, the officer is required to issue to the purchaser a certificate of sale which, upon the termination of the time limited by statute for redemption, entitles the purchaser to a deed of the land, executed by the proper officer on behalf of the State, and conveys or purports to convey the title to him; and the officer must make a return specifying the fact of notice, the time of sale, the property sold, the name of the purchaser, etc., and the making of this return is usually mandatory.

The right of redemption is usually allowed to the owner and parties interested during the period fixed by statute, during which time the possession of the owner is not disturbed. In most of the States it is provided that notice to redeem must be given to the owner, and that his right of redemption shall continue thereafter during the time required to elapse before the purchaser is entitled to a deed. The provisions as to who shall have the right to redeem are construed liberally, and usually any one possessing an interest in the land may exercise the right, but not a mere stranger. Payment or tender of the full amount required by statute by the owner, or other person entitled to redeem, constitutes an exercise of this right, and vests the title absolutely again in the owner or the redeemer, cutting off the right of the purchaser. The statutes regulating the right of redemption are liberally construed in favor of those having the right to

redeem, but their provisions must be observed; and without statutory authority the courts can not entertain an action to redeem the land.

The deed to the purchaser upon the tax sale (to which he is entitled upon the expiration of the time of redemption, the land remaining unredeemed) must be substantially in the form required by statute; must recite enough of the previous proceedings to show at least authority to sell and to make the deed; must describe the property with sufficient certainty if possible, following the description in the assessment roll; and its execution and delivery must be in accordance with such statutory provisions. There are some States in which every tax sale is required by statute to be founded upon an order of the court. At the common law a tax deed is not even *prima facie* evidence of the facts necessary to create valid title under the deed, but the burden of proof is upon the purchaser to show by independent proof compliance with all statutory requirements.

This rule has been variously modified by statute; in some States only to the extent of making the tax deed *prima facie* evidence that the proceedings on the sale itself were duly performed, still leaving the purchaser to prove compliance with the law as to all requisites thereto; in other States (the great majority) to the extent of making the deed *prima facie* of the regularity of all previous proceedings upon which the validity of the tax deed depends, making the production of the tax deed shift the burden of proof from the purchaser to the owner or redemptioner; in a few States, to the extent of making the deed conclusive evidence of the regularity of the sale and of certain proceedings prior thereto, such as the assessment of the tax, proper advertisement of the sale, etc., but not depriving the owner or redemptioner of the right to avoid the tax sale by proof of failure to comply with any vitally essential prerequisite. Adverse possession during the prescribed period, and under a claim of title by a tax deed valid on its face, is sufficient to vest the title by prescription where the title under the tax deed would be defective. This would not be so in a case of a claim of title under a certificate of sale. As to the case of possession under a claim of title by a tax deed void on its face the authorities are divided. In the case of a void or voidable tax title the purchaser at common law had no remedy; but relief is generally granted by statute, usually by providing that the purchaser may recover the purchase money, and subsequent taxes paid, with interest.

After execution and delivery of the tax deed the parties are remitted to the ordinary remedies open to them in cases of contested titles. Unless a purchaser under a tax sale can enter peaceably, he must bring an action in the nature of an ejectment in order to obtain possession. Generally the former owner may institute an action to set aside the sale and conveyance thereunder, for any material irregularity, illegality, or fraud; but the time limited for the beginning of such action is generally made much shorter than that prescribed by common law for contesting the title of land. This time begins to run in some States from the date of sale; in others, from the execution and delivery of the deed; and in still others, from the time when the purchaser takes possession. The nature of the estate which the purchaser acquires by the tax deed varies in the different States, in some being only the interest of the person to whom the land was assessed, or that of the real owner; in others, a new and original fee, unincumbered by previous liens, created in the purchaser, and going back no further than the tax sale.

F. STURGES ALLEN.

Tay: a river of Scotland, flowing from Loch Tay, at an elevation of 355 feet above the level of the sea, to the German Ocean, which it enters through a large estuary, the Firth of Tay, from 1 to 3 miles broad. It is the largest river of Scotland, draining nearly the whole of Perthshire, and carrying to the German Ocean a greater mass of water than any other of the rivers of Great Britain. The Dochart, the principal feeder of Loch Tay, rises in Ben Lui, on the borders of Argyshire and flowing in a northeastern direction, is joined by the Lochy just before the united streams enter the lake. Loch Tay itself is a long and narrow sheet of water picturesquely situated in a basin scooped out of the bosom of the mountains, 355 feet above the level of the sea. After leaving it the Tay receives from the N. and the E. the Lyon, the Tummel, the Garry, and the Isla, and from the W. the Almond and the Earn. Its entire basin comprises an area of about 2,500 sq. miles. Its entire course is about 120 miles, and it is navigable for vessels of 500 tons burden

up to Newburgh, 15 miles from its mouth. The tide of water up the river to about a mile above Perth, to which place it is navigable by vessels of 100 tons. The salmon fisheries of the Tay and its tributaries are of considerable value. The stream is filled pounds for the preparation of salmon are 5 miles above Perth. On Dec. 28, 1879, the railway bridge across the Tay was blown down in a hurricane, but a new bridge, some distance to the W., was opened on June 30, 1887. See BRIDGES; FISHING; FISH.

Revised by M. W. HARRINGTON.

Tayabas (ta-yas): town of the Philippines, the capital of the district of Tayabas, on the southern shore of the island of Luzon, 60 miles S. E. of Manila. See map of East Indies, ref. 3-6; in an agricultural region. It is a town, well built, and has a market, carrying on a considerable trade. Pop. 20,000, most of whom are Chinese mestizos.

Tagayetus (tag-yet-us): the great mountain range of Peloponnesus, Greece, extending in an almost north-south line for about 70 miles from Louisa in Arcadia to Cape Matapan. Its height, ascertained by the French commission in 1742, is 10,000 feet. Its northern and southern flanks have been ascended by both ancient and modern writers. It rises to its greatest height immediately above Sparta. Its principal summit was at an early time called *Taygetus*, now St. Elias. On the sides of Tagayetus are forests of pine, which have been formerly used with willow-bark. The district around Taygetus forms a coal-field, hitherto unworked. The southern part of Mt. Tagayetus is rich in marble and iron. Near Greece there were quarries of green porphyry, which was extensively employed by the Romans. There was also another kind of marble obtained from quarries more to the S., called by the Romans *Tamirian marble*.

Taylor, J. BEN JAMES, D. D.: preacher, educator, and author; b. in Nottingham, England, in 1788; son of a Unitarian minister; educated at the dissenting college in York; graduated at the University of Glasgow 1818; studied theology; became minister of a Unitarian congregation in Manchester 1820; was secretary of the college in York from 1822 to 1840, when it was removed to Manchester; became at that time Professor of Ecclesiastical History, and subsequently of Practical Theology; removed to London in 1833, along with the college, of which he bore the name of Manchester New College, to become principal; was for some years pastored together with Rev. James Martineau, of the Unitarian congregation in Little Portico Street. He was the author of *A Retrospect of the Religious Life of England* (1845); *Christian Accounts of Faith and Duty* (1851); *An Attempt to ascertain the Character of the Faith of Greece* (1867); *A Catholic Christian Church the Word of our Time* (1867); *Christianity, What is it? and What has it done?* (1868); and other works on religious subjects, some of them posthumously published. D. at Hampstead, London, May 28, 1869. His *Life and Letters* (1872) were published by Rev. John Hamant. T. Revised by J. W. CHADWICK.

Taylor: town founded in 1875; WELLSIAN CO., TEX.; on the International and G. N. and the M. & Kan. and Tex. railways; 37 miles N. E. of Austin for location, see map of Texas, ref. 6-6E. It is an agricultural stock-raising town, and from the vegetable and fruit crops and dairies 12 agricultural journals are published, valued at \$28,000, exports 2; and stock-raising journals, railway-stocks, 10; newspapers, 2; and household goods, 2; and other goods with a total export of \$270,000, and 5 weekly newspapers. Pop. (1875) 2,584; (1876) estimated, 3,500. Editor, F. JOURNAL.

Taylor, ALFRED SWAINE, M. D., F. R. S.: physician and anatomist; b. at Northfleet, Kent, England, in 1813; studied surgery; became Professor of Chemistry at Guy's Hospital, and first Professor of Medical Jurisprudence in the same institution. Author of *A Manual of Medical Jurisprudence* (1849); *Practical Dermatology* (1847); *On the Principles of the Medical Jurisprudence of Measles* (1848); *On the Principles of the Medical Jurisprudence of Cholera* (1855); and other works. The *Principles and Practice of Medical Jurisprudence* (1871) is written with Dr. W. T. Parsons of a translated *Manual of Chemistry*, and notes for many years of *The Medical Gazette*. D. May 27, 1889. Revised by F. STURGEON ALLEN.

Taylor, ANN and JANE: See TAYLOR, ISAAC.

Taylor, BAYARD: traveler and lecturer; b. at Kutztown, Pa., Jan. 11, 1845; in 1842 became apprentice to a printer; passed his first year in York and other places, in 1844; in 1844-45 made a pedestrian tour in Eu-

rope, and after his return published *Views of England and Europe* (New York, Knickerbocker and Staff, 1846); in 1847 became one of the editorial staff of *The New York Tribune*, with which he was connected until he died, publishing in that journal originally the substance of most of his works of travel. In 1849 he visited California; in 1851 visited Egypt, Asia Minor, Syria, and Europe; in 1852-53 crossed India from Bombay to Calcutta, going thence to Hongkong and joining Perry's expedition to Japan, and made several other journeys. In 1862-63 he was secretary of Legation, and for a while *charge d'affaires* at St. Petersburg; in 1874 went to Egypt, and returned in the fall and winter in Iceland. He resided at intervals several years in Germany, where he married, and from 1872 he was engaged upon a biography of Goethe and Schiller, which he left unfinished. Several of his works have been translated into German, French, and Russian. His books of travel are *E. D. Taylor's Adventures in the Path of Empire* (1851); *Journals of Central Africa* (1854); *The Land of the Saracens* (1854); *Visit to India, China, and Japan* (1855); *Narrative of a Summer and Winter Progress of St. Elias, Iceland, and Linnæus* (1857); *Travels in Greece and Russia* (1859); *At Home and Abroad, a Sketch-book of Life, Scenery, and Men* (1870); *Diaries, 1862*; *Central and Southern Travels* (1867); *Biography of Egypt* (1869); and *Egypt and Iceland* (1874). He wrote for many years — *Home and Theatrical* (1860); *John G. Dyer's Footprints* (1864); *The Story of Keats* (1867); and *Joseph and his Friends* (1871). He published the following series of poems: *Principles of Travel, Biographical and other poems* (1848); *The American Legend*, delivered before the Phi Beta Kappa Society of Harvard University (1851); *Battle of Runnymede, Legend, and Song* (1871); *Peasants' Bells* (1854); *Principles of the Origin* (1855); *Peasants of Home and Travel*, selected from his earlier productions (1855); *The Poets' Journal* (1862); *The Poets of St. John* (1866); *The World of Abraham Lincoln* (1866); *The Myths of the Gods* (1872); *Legend, Parable, and Mystery* (1873); *The Prophet, a Tragedy* (1874); *Home Poems and Lyrics* (1877); and a *Centennial Ode* (1876). He edited a *History of Literature and the Fine Arts*, in conjunction with George Ripley (1852); *Colloquies of Milton* (1857); *Faintly Seen*, translated from the Swedish of Tegner by W. L. Blackley (1867); *Aurora's 17th on the Rhine* (1868); and the *Illustrated Library of Travel, Education, and Adventure* (1872, etc.); and translated into the English meters both parts of Goethe's *Faust* (1874-75), which is probably his most important literary work. Besides the foregoing he wrote largely in prose and verse for many periods; also contributed notes on Laos-Choo and Japan; the *Narrative of Perry's Expedition*, and an introduction to R. H. Stoddard's *Life, Travels, and Books of Alexander von Humboldt*, and lectured extensively in nearly every part of the U. S. In 1876 he published *The Echo of the Past and other Literary Impressions*, and delivered the poem at the Centennial celebration of the anniversary of the Declaration of Independence in Philadelphia, July 4. He was appointed U. S. minister to Germany in 1877; died in Philadelphia, Pa., 19, 1878. See his *Life and Letters* (2 vols., Boston, 1884). Revised by H. A. BEERS.

Taylor, BENJAMIN FRANKLIN: poet and journalist; b. at Lowell, N. Y., July 13, 1810; was educated at what is now Colgate University, Hamilton, N. Y., where his father, Stephen W. Taylor, was professor; in 1840 secretary of the Orange County Agricultural Society, and during the civil war was the military correspondent with the press at the West; after the war he became a poet. He published *January and June* (1853); *Pictures of Colchester Falls* (1867); *The World as We See It* (1870); *Indian Poems and Stories of History* (1874); *Songs of Yesterday* (1877); *The River of Time* (1878); *Poems* (1877); and other works. D. at Colchester, N. Y., Feb. 24, 1887. Revised by H. A. BEERS.

Taylor, BUCK: inventor and planer; b. at Edinboro, near Lewisburg, Pa., in 1825; moved to Johnstown, Pa., in 1841; in 1842 was engaged in the iron, pipe, and boiler business; in 1848 was attracted to *The Center of the Earth*, which was published in the *Philadelphia Telegraph* for 1700; in 1872 was chosen a Fellow of the Royal Society, of which he became a regular member two years later; and in 1873 he had a correspondence carried on with Victor Rydman of Moscow, upon the subject of the *Centers of the Earth*. He published *Mythology, Imaginations, etc.* (1773), which contains the foundation of the *Centers of the Earth*, and a number of other articles; also *Centers of the Earth*, of which the latter almost amounted by themselves to a volume (1875).

when Lagrange adopted it as the basis of the differential calculus. Among his other works were *New Principles of Linear Perspective* (1719); and *Contemplatio Philosophica*, which was published, with a memoir, by his grandson, Sir William Young (1793). D. in London, Dec. 29, 1731.

Taylor, GEORGE: patriot; b. in Ireland in 1716; is said to have been the son of a clergyman and to have received a liberal education; emigrated to North America as a "redemptioner" in 1736; was bound to an iron manufacturer, by whom he was made a clerk, at Durham, Pa.; several years later married the widow of his employer and became proprietor of the works; established a large iron-mill on the Lehigh river, and acquired a considerable fortune. In 1764 he was elected to the colonial assembly, in 1770 became a judge of the county court, and in 1775 was elected to the provincial assembly, and was earnest in the advocacy of revolutionary measures. He was elected to fill a vacancy in the Continental Congress July 20, 1776, and so was not a member when the Declaration of Independence was passed, but was one of those who signed the document. He retired from Congress in Mar., 1777, and returned to his home in Pennsylvania. D. at Easton, Pa., Feb. 23, 1781.

Taylor, Sir HENRY: dramatist; b. at Bishop Middleham, Durham, England, Oct. 18, 1800; entered in 1824 the Colonial Office in London, in which he continued until 1872, and was for many years one of the five senior clerks. He contributed to various periodicals, and published *Isaac Commensus*, a drama (1827); *Philip van Artevelde*, a tragedy (1834); *The Statesman*, a series of essays (1836); *Edwin the Fair*, an historical drama (1842); *The Eve of Conquest*, and other Poems (1847); *Notes from Life*, a series of essays (1847); *Notes from Books*, containing essays on the poems of Wordsworth and Sir Aubrey de Vere (1849); *The Virgin Widow*, a comedy (1850); *St. Clement's Eve*, a play (1862); and *A Sicilian Summer, and Minor Poems* (1868). An edition of his plays and poems appeared in 3 vols. in 1863; another in 5 vols. in 1878; his *Autobiography* appeared in 1885 (2 vols.) and his *Correspondence* in 1888. His *Philip van Artevelde* is the best English historical tragedy since Otway's *Venice Preserved*. D. at Bournemouth, Mar. 28, 1886.

Revised by H. A. BEERS.

Taylor, ISAAC (known as Taylor of Ongar): author; b. in London in 1759; was a successful engraver in London; removed to Lavenham, Suffolk, in 1786; was minister of an Independent congregation at Colchester 1796-1810, and of one at Ongar, Essex, from 1811 until his death. Besides sermons, he published, mainly for the young, a number of volumes including *Advice to the Teens*; *Beginnings of British Biography*; *Beginnings of European Biography*; *Biography of a Brown Leaf*; *Book of Martyrs for the Young*; *Bunyan explained to a Child*; *Character Essential to Success in Life*; *Child's Life of Christ*; *Mirabilia, or the Wonders of Nature and Art*; *Scenes in America, in Asia, in England, in Europe, in Foreign Lands*; *Scenes of Commerce*; *Scenes of British Wealth*; *Self-cultivation Recommended*, all separate works; and *Twelve Addresses to Youth, with Hymns*. Nearly all of his works have been frequently republished. He was the father of ANN TAYLOR (Mrs. Gilbert, of Nottingham, b. 1782, d. 1866; *Autobiography*, 1871), who with her sister, JANE (1783-1824; *Memoirs*, 1825), wrote *Hymns for Infant Minds and Original Poems*; of JEFFREYS TAYLOR (1792-1853), author of a number of works, chiefly for the young; and of ISAAC TAYLOR, LL. D. (q. v.). D. at Ongar, Dec. 11, 1829.—His elder brother, CHARLES TAYLOR (1756-1821), was the editor of *Calmel's Dictionary of the Holy Bible*.

Revised by S. M. JACKSON.

Taylor, ISAAC, LL. D.: author; son of Isaac Taylor of Ongar; b. at Lavenham, Suffolk, England, Aug. 17, 1787; was educated as an artist, but began to study theology with the intention of becoming an Independent minister; became a member of the Established Church, turned his attention to the bar, and finally devoted himself to the study of mechanical inventions and to literary labor. Besides contributions to *The Eclectic Review* he published many books, including *Elements of Thought* (London, 1823); *History of the Transmission of Ancient Books to Modern Times* (1827); *The Process of Historical Proof Exemplified and Explained* (1828); *Natural History of Enthusiasm*, one of his best works (1829); *New Model of Christian Missions* (1829); *Saturday Evening* (1832); *Fanaticism*, a continuation of the *Natural History of Enthusiasm* (1834); *Spiritual Despotism* (1835); *Physical Theory of Another Life* (1836), which was the first work published under his own name and

which greatly enhanced his reputation; *Ancient Christianity and the Doctrines of the Oxford Tracts for the Times* (1839; with supplement and indexes, 1844); *Loyola, and Jesuitism in its Rudiments* (1849); *Wesley and Methodism* (1851); *The Restoration of Belief* (1855); *The World of Mind* (1857); *Logic in Theology* (1859); *The Liturgy and the Dissenters* (1860); *The Spirit of Hebrew Poetry* (1861); and *Considerations on the Pentateuch*, a reply to the work of Bishop Colenso (1863). In 1836 he was a candidate for the chair of Logic and Metaphysics in the University of Edinburgh, but was unsuccessful. In 1862 a pension of £100 was bestowed upon him from the civil-service fund "in public acknowledgment of his eminent services to literature, especially in the departments of history and philosophy, during more than forty years." D. at Ongar, June 28, 1865. His LL. D. came from the University of the City of New York in 1862.—His son, ISAAC TAYLOR, a clergyman of the Church of England, b. at Stamford Rivers, May 2, 1829, graduated B. A. at Cambridge 1853; became curate 1857; vicar of St. Matthias, Bethnal Green, London, 1865, of Holy Trinity, Twickenham, 1869; rector of Settrington, diocese of York, 1875; has been also a canon of York since 1885. He is honorary LL. D., Edinburgh, 1879, Litt. D., Cambridge, 1885, and is author of *Words and Places*, an explanation of the local names in Great Britain (London, 1865); *The Family Pen, Memorials, Biographical and Literary, of the Taylor Family of Ongar* (1867); *The Alphabet: an Account of the Origin and Development of Letters* (1883); *The Minor Runes* (1886); *The Origin of the Aryans* (1890); and other works.

Revised by S. M. JACKSON.

Taylor, ISIDORE SÉVERIN JUSTIN, BARON: traveler and author; b. in Brussels, Aug. 15, 1789; studied art at Paris; served for several years in the army; traveled extensively; was appointed in 1824 royal commissary of the Comédie Française, which he opened to the dramas of Victor Hugo and other romanticists; induced by his petitions the Legislative Assembly (1818-30) to vote the restoration of the mediæval monuments in France; was sent to Egypt to negotiate the transfer to France of the obelisk of Luxor, and was made a senator in 1869. He wrote *Voyages pittoresques et romantiques dans l'Ancienne France* (1820-54); *Voyages pittoresques en Espagne*, etc. (1826, seq.); *La Syrie, l'Égypte*, etc. (1837); *Voyages en Suisse, Haïe, Angleterre*, etc. (1843). D. in Paris, Sept. 6, 1879. Revised by A. G. CANFIELD.

Taylor, JAMES HUDSON: clergyman, missionary; founder of the China Inland Mission; b. at Barnsley, Yorkshire, England, May 31, 1832; studied and practiced medicine and surgery in Hull; sent out by the Chinese Evangelization Society as its first representative 1853 and began duty in Shanghai; moved to Ningpo, and severed his relations with the society 1857; labored independently until 1860, when he returned to England in broken health; organized the China Inland Mission 1865, and returned to China himself 1866; has since been back and forth several times. He is the director of the China Inland Mission, which has had a remarkable career. Its missionaries come from different denominations and have no guaranteed salary, a number being of independent means. They adopt native dress and mode of life as far as practicable. The mission makes "no personal solicitation or collection of funds" and does not publish the names of its donors. See Miss M. Geraldine Guinness, *The Story of the China Inland Mission* (2 vols., 2d ed. London, 1893).

SAMUEL MACAULEY JACKSON.

Taylor, JAMES MONROE, D. D., LL. D.: educator; b. in Brooklyn, N. Y., Aug. 5, 1848; educated at the University of Rochester and Rochester Theological Seminary; pastor in South Norwalk, Conn., 1873-82, Providence, R. I., 1882-86; elected president of Vassar College, Poughkeepsie, N. Y., 1886; author of a number of magazine articles and addresses, including *The Place of Preaching in the Plan of God* (1880); *The Catechumenate* (1875); *The Future of the Woman's College* (1890); *Neglect of the Student in Recent Educational Theory* (1893); and a volume on *Psychology* (1892).

W. H. WHITSITT.

Taylor, JEREMY, D. D.: theologian; b. in Aug., 1613, at Cambridge, England, where his father was a barber; in 1626 entered Caius College as a sizar; took his degree; gained the friendship of Bishop Laud, and in 1636 obtained a fellowship at Oxford, and in 1638 was presented to the rectory of Uppingham. In the civil wars he adhered to the cause of Charles I., who made him his chaplain, and in 1642 commanded that the degree of D. D. should be conferred upon him on account of his treatise, *Episcopacy asserted*

against the *Acephali* and *Arians New and Old*; but in that year his rectory was sequestered by Parliament and he was forced to take refuge in Wales, where he supported himself by teaching a school and wrote his noblest works; preached occasionally in London; was several times imprisoned for giving utterance to royalist sentiments; and in 1658 took up his residence in Ireland upon the invitation of the Earl of Conway. In 1660 he was one of the signers of the royalist declaration of Apr. 24 which paved the way for the restoration of Charles II. He had married for his second wife Joanna Bridges (who was said to be a natural daughter of Charles I.), and soon after the Restoration he was made Bishop of Down and Connor, to which the see of Dromore was added, and was also made vice-chancellor of the University of Dublin and a member of the Irish privy council. He labored earnestly, but with indifferent success, for the firm establishment of the English Church in Ireland. As a preacher and writer, he occupies a foremost rank in literature. Besides his *Sermons* his principal works are *Discourse on the Liberty of Prophesying*, setting forth the iniquity of persecution for differences in opinions, by some held to be the ablest of all his works (1647); *The Great Exemplar of Sanctity and Holy Life*, a life of Christ (1649); *The Rule and Exercise of Holy Living* (1650); *The Rule and Exercise of Holy Dying* (1651); *Ductor Dubitantium*, a work on casuistry. Many of his separate works have been frequently republished. His *Whole Works*, with a *Life* of the author and a critical examination of his writings by Bishop Heber, in 15 vols., appeared in 1820-22 (10 vols., rev. ed. 1807-54); his *Life* was also written by R. A. Willmott (1847). D. at Lisburn, Ireland, Aug. 13, 1667. See ENGLISH LITERATURE. Revised by S. M. JACKSON.

Taylor, JOHN: poet; b. in Gloucestershire, England, in Aug., 1580; was educated at a free school in Gloucester; went to London, where he was apprenticed to a waterman, and followed this occupation during the greater part of his life, whence he is styled "the water-poet." His productions in prose and verse, of which about 140 are known to collectors, have no literary value, but some interest in showing the manners and customs of the times. The following will serve to illustrate Taylor's eccentric titles: *Taylor's Revenge, or the River, William Fenner, firkt, ferrited, and finely fetcht over the Coals* (1615); *The pennyles Pilgrimage, or the moneylesse Perambulation of John Taylor, alias the King's Majestie's Water-Poet, from London to Edenborough on Foot* (1618). In 1630 Taylor made a collection, in a single volume, of the sixty-three pieces which he had at that time put forth in brochures and broadsheets, which was in 1869 republished in facsimile by the Spenser Society. D. in London in 1654. Revised by H. A. BEERS.

Taylor, JOHN, LL. D.: Greek scholar; b. at Shrewsbury, 1703; was educated at Cambridge University; librarian to the university in 1732, advocate in Doctors' Commons in 1741, and chancellor of Lincoln in 1744. He subsequently entered holy orders; became rector of Lawford in 1751, archdeacon of Buckingham in 1753, and canon residentiary of St. Paul's in 1757. He published several orations and essays, but his principal works are an edition of the Greek text, with a Latin translation and notes, of *The Orations and Fragments of Lysias* (1739), his masterpiece, and some of the *Orations of Demosthenes, Aeschines, Dinarchus, and Demades*. D. in 1766. See F. A. WOLF, *Analecta*, i., 550 ff. Revised by A. GUDEMAN.

Taylor, JOHN LOUIS: jurist; b. in London, Mar. 1, 1769; was taken to the U. S. by a brother in 1781; studied law, and settled at Fayetteville, N. C., from where he removed to Newbern, and later to Raleigh; was several times elected to the Legislature; became one of the judges of the superior court of the State in 1798, and was chief justice of the Supreme Court from 1810 until his death. He had much constructive ability, and in 1817 was made commissioner to revise the statutes of the State. A volume of his decisions, containing cases decided from 1799 to 1802, was published in 1802, and another volume, of cases from 1816 to 1818, appeared in 1818. He also published a *Charge to the Grand Jury of Edgecombe Superior Court, exhibiting a View of the Criminal Law of North Carolina* (1817). D. at Raleigh, Jan. 29, 1820. Revised by F. STURGES ALEN.

Taylor, NATHANIEL WILLIAM, D. D.: theologian; b. at New Milford, Conn., June 23, 1786; graduated at Yale College in 1807; studied theology, and in 1812 became pastor of the First (Center) Congregational church in New Haven, where he rose to eminence as a preacher. In 1822 he was

chosen Dwight Professor of Didactic Theology in Yale College, and occupied the chair until his death. In 1828 he delivered the *concio ad clerum* discourse at New Haven, which was the beginning of a theological controversy which spread through New England and beyond its limits. Dr. Taylor defended his modifications of Calvinism in the *Christian Spectator*. They were vehemently opposed by other divines in various discourses and periodicals. By his writings and through his pupils he produced a profound impression on theology in the Congregational and Presbyterian communions. After his death four volumes of his works, edited by Rev. Noah Porter, D. D., were published: *Practical Sermons*, preached while pastor of the Center church (1858); *Lectures on the Moral Government of God* (2 vols., 1859); and *Essays, Lectures, etc., upon Select Topics in Revealed Theology* (1859). D. in New Haven, Mar. 10, 1858. Revised by G. P. FISHER.

Taylor, PHILIP MEADOWS: soldier and author; b. in Liverpool, Sept. 25, 1808; went to Calcutta, where he held a mercantile post; in 1826 entered the army of the Nizam of Hyderabad, for whom he administered several large territories; about 1858 became administrator for the British Government of some districts in the Deccan; rose to the rank of colonel and was decorated with the order of the Star of India; was a learned archaeologist; married a princess of Southern India. He was the author of *Confessions of a Thug* (3 vols., 1839; new ed. 1858); *Tippoo Sultaun, a Tale of the Mysore War* (3 vols., 1840); *Notices of Cromlechs, Cairns, and other Ancient Scytho-Druidical Remains in the Principality of Sorapur* (London, 1853); *Tara, a Marhatta Tale* (3 vols., 1863); *Ralph Darvell, a Tale* (3 vols., 1865); *The Student's Manual of the History of India, from the Earliest Period to the Present* (1870), and other works. D. in Menton, France, May 13, 1876. See his *Story of my Life* (1877; new ed. 1881).

Taylor, RICHARD: soldier; son of Zachary Taylor; b. in New Orleans, La., Jan. 27, 1826; graduated at Yale 1845; was a resident of Louisiana at the breaking out of the civil war, when he entered the Confederate army, and was made colonel of a Louisiana regiment, which fought under his command at the battle of Bull Run; was made brigadier-general in Oct., 1861; served under Stonewall Jackson in Virginia; became major-general; in 1863-64 commanded in the department W. of the Mississippi, especially against Gen. Banks in his unsuccessful Red river campaign; in Sept., 1864, was placed in command of the department of East Louisiana, with his headquarters at Mobile, and on May 8, 1865, surrendered to Gen. Canby, his force being the last which remained to the Confederacy. After the war he resided on his plantation in Louisiana. He published *Destruction and Reconstruction* (New York, 1879). D. in New York, Apr. 12, 1879. Revised by JAMES MERCUR.

Taylor, THOMAS: author; styled the Platonist; b. in London, May 15, 1758; studied at St. Paul's School with the design of becoming a dissenting minister, but afterward entered a banking-house; devoted his spare moments to the study of Greek, mathematics, and chemistry; taught the languages and mathematics. His works comprise sixty-three volumes, of which twenty-three are large quartos; among them are treatises on arithmetic and geometry, on the Eleusinian and Bacchic mysteries; an edition, with large additions, of the *Greek Lexicon* of Hedericus; an essay on the *Rights of Brutes*, in ridicule of Paine's *Rights of Man*; a *History of the Restoration of the Platonic Theology*; and a volume of *Miscellanies in Prose and Verse*. His main labor was the translating of little-known Greek and Latin works. Besides the *Plato* and *Aristotle*, his translations include the remains of Apuleius, Celsus, Demophilus, Hierocles, Iamblichus, Julian, Maximus Tyrius, Ocellus Lucanus, Olympiodorus, Pausanias, Plotinus, Porphyry, Proclus, the *Orphic Hymns*, and the *Chaldean Oracles*. His translation of Plato (5 vols. 4to, 1804) was printed at the cost of the Duke of Norfolk, who locked up nearly the whole edition in his house, where the copies remained until 1848. Of his translations of Aristotle (10 vols. 4to, 1806-12) only fifty complete copies were struck off, the expense being defrayed by W. Meredith, a retired tradesman, who gave Taylor an annuity of £100. D. at Walworth, London, Nov. 1, 1835. Revised by S. M. JACKSON.

Taylor, TOM: dramatist; b. at Sunderland, Durham, in 1817; was educated at Glasgow University and Trinity College, Cambridge; appointed to the chair of English Literature in University College, London, which he held

for two years; wrote for periodicals, especially for *Punch*, which he edited in 1874-80; studied law; was called to the bar in 1845; was made secretary to the board of health in 1854, and in 1858 secretary to the Local Government Act Office. He was art critic to the *London Times* and *Graphic*. He produced, either singly or in conjunction with others, more than 100 dramatic pieces, many of which have had a marked success; among them are *Still Waters Run Deep*; *The Unequal Match*; *The Overland Route*; *The Contested Election*; *Our American Cousin*; *The Ticket-of-Leave Man*; and *Twixt Ace and Crown*. He also published *Life of B. R. Haydon* (1853); *Autobiographical Recollections of C. R. Leslie* (1860); translated from the French of Villemarque the *Ballads and Songs of Brittany* (1865); published *Life and Times of Sir Joshua Reynolds* (1865); and in conjunction with C. W. Franks prepared a *Catalogue of the Works of Sir Joshua Reynolds* (1869). D. at Wandswoth, July 12, 1880.

Revised by H. A. BEERS.

Taylor, WILLIAM, author; b. in Norwich, England, in 1765. He was the first Englishman to introduce to English readers a knowledge of the literature of Germany, and is best known by his vigorous translation of Bürger's *Lenore*. He published a translation of Lessing's *Nathan the Wise* (1805); *English Synonyms Discriminated* (1813); and *Historic Survey of German Poetry*, with many translations (3 vols., 1828-30). His *Life and Writings*, containing correspondence with Robert Southey and original letters from Sir Walter Scott, was published by J. W. Robberds (2 vols., 8vo, 1843). D. at Norwich in Mar., 1836.

Revised by H. A. BEERS.

Taylor, WILLIAM, D. D.: bishop and author; b. in Roekbridge co., Va., May 2, 1821; educated at Lexington, Va.; entered the ministry of the Methodist Episcopal Church 1842; missionary to California in 1849; labored as an evangelist in all the English-speaking countries in the world; elected missionary bishop for Africa May, 1884; author of a number of works, including *Seven Years' Street Preaching in San Francisco*; *Address to Young America and a Word to the Old Folks*; *Pauline Methods of Missionary Work*; *Reconciliation, or How to be Saved*; *Infancy and Manhood of the Christian Life*; *Four Years' Campaign in India*; *Our South American Cousins*; *Ten Years' Self-supporting Missions in India*; *Letters to a Quaker Friend on Baptism*; and *The Election of Grace*. A. OSBORN.

Taylor, WILLIAM MACKERGO, D. D., LL. D.: clergyman and author; b. at Kilmarnock, Ayrshire, Scotland, Oct. 23, 1829; educated at Kilmarnock Academy; graduated M. A. at University of Glasgow 1849; studied theology at Divinity Hall of the United Presbyterian Church in Edinburgh; was licensed to preach by the presbytery of Kilmarnock Dec. 14, 1852; ordained pastor of the United Presbyterian congregation at Kilmaurs June 28, 1853; settled over the United Presbyterian church, Liverpool, England, Oct. 23, 1855; in 1871 was delegate from the United Presbyterian Church in Scotland to the General Assembly of the Presbyterian Church at Chicago; was called to the pastorate of the Broadway Tabernacle (Congregational) church in New York Nov. 22, 1871, and entered upon his labors there Mar. 10, 1872; retired in consequence of paralysis 1893. D. in New York, Feb. 8, 1895. In addition to many articles in *The Scottish Review* and many separate sermons, he published *Life Truths* (1862); *The Miracles Helpt to Faith, not Hindrances* (1865); *The Lost Found, and the Wanderer Welcomed* (1870); *Memoirs and Remains of Rev. M. Dickie, Bristol* (1872); *David, King of Israel* (1874); *Elijah the Prophet* (1875); *The Ministry of the Word* (1876); *Peter the Apostle* (1877); *Limitations of Life, and other Sermons* (1879); *The Gospel Miracles* (1880); *Paul the Missionary* (1881); *Contrary Winds, and other Sermons* (1883); *John Knox* (1885); *Joseph, the Prime Minister; The Parables of Our Saviour* (1886); *The Miracles of Our Lord* (1890); and *The Scottish Pulpit from the Reformation* (1887).

Revised by G. P. FISHER.

Taylor, ZACHARY: twelfth President of the U. S.; b. in Orange co., Va., Sept. 24, 1784. His father, Richard Taylor (1744-1822), was colonel of a Virginia regiment in the war of the Revolution; removed to Kentucky in 1785; became a member of the convention which framed the constitution of Kentucky; served in both branches of the Legislature and was collector of the port at Louisville under Washington. Zachary remained on his father's plantation until 1808, in which year (May 3) he was appointed first lieutenant in the Seventh Infantry. Promoted to be captain in Nov.,

1810, in the summer of 1812 he was in command of Fort Harrison, near the present site of Terre Haute, his successful defense of which (Sept. 4-5), with but a handful of men against a large force of Indians, was one of the first marked military achievements of the war of 1812; was breveted major, and in 1814 promoted to the full rank. In the peace organization of the army in 1815 he was retained as captain, but soon after resigned and settled near Louisville. In May, 1816, he re-entered the army as major of the Third Infantry, became lieutenant-colonel Eighth Infantry in 1819, and in 1832 attained the colonelcy of the First Infantry, of which he had been lieutenant-colonel since 1821. On different occasions he had been a member of a military board for organizing the militia of the Union, and to aid the Government with his knowledge in the organization of the Indian bureau, having for many years discharged the duties of Indian agent over large tracts of Western country. He served through the Black Hawk war (1832), and in 1837 was ordered to take command in Florida, then the scene of war with the Indians. By the battle of Okechobee, Dec. 25, 1837, the savages were decisively defeated and the war was virtually ended. For this Taylor was breveted brigadier-general and made commander-in-chief in Florida; was transferred to command of the army of the Southwest in 1840; subsequently was stationed on the Arkansas frontier at Forts Gibson, Smith, and Jesup. He proceeded, upon the annexation of Texas in 1845, with about 1,500 men, to Corpus Christi, where his force was increased to some 4,000. In Mar., 1846, he was ordered to advance to the banks of the Rio Grande, opposite Matamoros, where a camp was constructed, and established his dépôt of supplies at Point Isabel, 25 miles to the E. He was ordered by Gen. Ampudia to retire beyond the Nueces, to which he replied that under instructions of his Government he should maintain his position. Apprehending an attempt to cut him off from his base of supplies, he started for Point Isabel (May 1) with the main body of his troops. On May 3 the sound of heavy cannonading warned him of an attack on his camp, guarded only by a weak garrison, and he returned to its relief May 7. The battle of Palo Alto was fought next day, and that of Resaca de la Palma May 9; Matamoros was occupied without resistance May 18, where he remained until September. Taylor was breveted major-general May 28, and a month later (June 29, 1846) his full commission to that grade was issued. After re-enforcement, he advanced in September on Monterey, which capitulated after three days' resistance. Here he took up his winter quarters. The plan for the invasion of Mexico by way of Vera Cruz, with Gen. Scott in command, was now determined upon, and at the moment Taylor was about to resume active operations he received orders to send the larger part of his force (Worth and Quitman's divisions and most of Gen. Wool's volunteers) to re-enforce the army of Gen. Scott. Though subsequently re-enforced by raw recruits, yet after providing a garrison for Monterey and Saltillo he had but about 5,300 effective troops, of whom only 600 were regulars. In this weakened condition, however, he was destined to achieve his greatest victory. Relying upon the strength of Vera Cruz to resist the enemy for a long time, Santa Anna directed his entire army against Taylor to overwhelm him, and then return to oppose the advance of Scott's more formidable invasion. The battle of Buena Vista was fought Feb. 22-23, 1847. Taylor received the thanks of Congress and a gold medal, and "Old Rough and Ready," as he was called in the army, became a household word. He remained in possession of the Rio Grande valley until November, when he returned to the U. S. In the Whig convention which met at Philadelphia June 7, 1848, Taylor was nominated on the fourth ballot (June 8) as the candidate of the Whig party for President over Clay, Scott, and Webster. In November Taylor received a majority of the electoral votes and a popular vote of 1,360,752 against 1,219,962 for Cass and Butler, and 291,342 for Van Buren and Adams. Gen. Taylor was inaugurated President Mar. 4, 1849. Among the questions requiring the attention of the President was the organization of the large territories newly acquired by conquest and treaty, the question of the admission of California, the formation of new Territories, and the settlement of the boundary-line between Texas and New Mexico. The free and slave States being then equal in number, the struggle for supremacy on the part of the leaders in Congress was violent and bitter. California adopted in convention, in the summer of 1849, a constitution prohibiting slavery within its borders. Taylor advocated the immediate admission of

California with her constitution, and the postponement of the question as to the other Territories until they could hold conventions and decide for themselves whether slavery should exist within their borders. This policy ultimately prevailed through the "Compromise measures" of Henry Clay. On July 5 Taylor was taken ill with a bilious fever, which proved fatal, his death occurring July 9, 1850. Gen. Taylor's wife was Margaret (1790-1852), daughter of Walter Smith, a Maryland planter. One of his daughters married Col. William W. S. Bliss, his adjutant-general and chief of staff in Mexico, and private secretary during his presidency; after his death she became Mrs. Philip Pendleton Dandridge; another was married to Jefferson Davis.—His son, RICHARD TAYLOR (*q. v.*), was an officer in the Confederate army. The best *Life* of Taylor, written by Gen. O. O. Howard, appeared in 1892, being the second of the Great Commander Series. Revised by JAMES GRANT WILSON.

Taylor, Mount: an isolated mountain in New Mexico, 80 miles W. of Santa Fé. It was named San Mateo by the Spanish, but the name Taylor, afterward bestowed by American explorers in honor of President Taylor, is now generally used. It is an extinct volcano, composed chiefly of andesitic lava. Its altitude is 11,388 feet, and it rises over 3,000 feet above its immediate base, which is a plateau of lava 36 miles by 12. The Atlantic and Pacific Railroad winds about the southern base of the plateau. The geology of the mountain and its environs is described by C. E. Dutton in the sixth annual report of the U. S. Geological Survey. G. K. G.

Taylor's Theorem: in mathematics, a theorem first demonstrated by Dr. Brook Taylor, and published by him in his *Methodus Incrementorum* in 1715. The object of the theorem is to show how to develop a function of the sum of two variables into a series arranged according to the ascending powers of one with coefficients that are functions of the other. The formula for making the development may be written:

$$f(x + y) = u + \frac{du}{dx}y + \frac{d^2u}{dx^2} \frac{y^2}{1.2} + \frac{d^3u}{dx^3} \frac{y^3}{1.2.3} +, \text{ etc.}$$

The first member of this formula denotes any function of the sum x and y , and u is what that function becomes when y is made equal to 0. The formula is always applicable, but it sometimes happens that u or one of its successive differential coefficients reduces to ∞ for a particular value of x . This is called the *failing case* of Taylor's theorem. It is more proper to say that the function fails to be developable in powers of y for the value in question. If the series is infinite, it must satisfy a test of convergence, in order to represent accurately the function on the left-hand side.

Taylorville: city; capital of Christian co., Ill.; on the South Fork of the Sangamon river, and on the Balt and O. S. W. and the Wabash railways; 25 miles S. E. of Springfield, 28 miles S. W. of Decatur (for location, see map of Illinois, ref. 7-E). It is in a coal-mining, grain and hay growing, and stock-raising region, and contains a high school (building cost \$35,000), 2 ward schools, 7 churches, a national bank with capital of \$75,000, 2 private banks, and a daily, a monthly, and 4 weekly periodicals. Pop. (1880) 2,237; (1890) 2,829. EDITOR OF "SCHOOL NEWS."

Tchad, or Tsad: a lake of Central Sudan. See CHAD.

Tchernigov: another spelling of CHERNIGOFF (*q. v.*).

Tchernyshev'skii, NIKOLAI GAVRILOVICH: author; b. in Saratov, Russia, 1828; educated by ecclesiastical teachers and at the University of St. Petersburg, was for a time editor of a military journal and then of the *Sovremennik* (Contemporary, 1855-64), in which he published a number of able articles on literature, history, economics, and social questions, besides which he wrote a book on Lessing (1854), translated Mill and Adam Smith, and other authors. Finally he expressed such pronounced socialist views that he was arrested and sent to Siberia. It was while he was in prison that he composed his famous novel *Shto Delat* (What is to be Done? English translation with the title *A Vital Question*, 1886, and by Benjamin R. Tucker, *What's to be Done?*, Boston, 1893), which as a literary work is full of impossible characters and unreadable, but was hailed as the gospel of the earlier generation of Nihilists, who saw in it their ideals of emancipated mankind. In 1883 Tchernyshevskii was allowed to live in Astrakhan and occupy himself with the translation of foreign scientific works. He was pardoned in 1889, and died in Saratov, Oct. 29, 1889. His complete works were published at Vevey, Switzerland, 1868-70. A. C. COOLIDGE.

Tchoukchees, chook ché'z: a tribe inhabiting the north-eastern corner of Siberia from the 160th meridian to Bering Strait. It consists of two divisions—one settled along the coast, and occupied in hunting the whale, the seal, and the walrus; and the other wandering across the bleak, barren plateaus with their herds of reindeer. The Tchoukchees, whose number is variously estimated at from 6,000 to 13,000, are a well-grown, vigorous people, hospitable and bold, but almost entirely destitute of civilization. They are dependents of the Russian Government. Ethnologically, they belong to the same family as the Eskimos of North America, and the Tchoukchee builds his house and his boat exactly like the Greenlander. See ESKIMAUX INDIANS.

Tea [originally pronounced *tay*, the local pronunciation in Pukien, China, of *te*, a dialectal form of Chinese *chá*]: 1, the prepared leaves of a plant of the genus *Thea*, and specifically of the *Thea chinensis*; 2, the plant itself; and, 3, an infusion of the leaves of the tea-plant, in universal use as a beverage in China, Japan, and other Oriental countries, and widely used throughout Christendom. See the article FOOD.

By some authorities the tea-plant has been assigned to the genus *Camellia* as *C. thea* or *theifera*. Formerly, when it was erroneously supposed that black and green teas were derived from different plants, the attempt was made to distinguish between *Thea bohea* and *T. viridis*. Geographically and practically it is desirable to recognize as distinct sorts *T. assamica* (Assamese), *T. sinensis* (Chinese), and the intermediate hybrids which have resulted from the near cultivation of the two. It is probable that all tea owes its origin to Assam, a province of Burma ceded to Great Britain in 1826, and annexed to the Presidency of Bengal. There in the jungle bordering on the Brahmaputra were found a few years later thickets of indigenous tea-trees, often attaining a height of 30 feet. It has been claimed by some writers that indigenous tea exists in China and Japan; but it is probable that the plant was introduced into China from India 1,500 years ago, and into Japan from China not later than the ninth century. The Japanese declare that wild tea grows freely in the hills of Kiushiu, Shikoku, and the central part of the main island, although acknowledging that its leaf is inferior to that from the gardens which were established with imported seed. Tea was introduced into Europe by the Dutch about the beginning of the seventeenth century. It remained, however, for the East India Company to develop the great British trade in Chinese tea, of which it enjoyed the monopoly until 1834.

The Tea-plant.—Two extremes of growth and product are presented by the Assamese and Chinese plants. The Assamese in its natural condition, as originally found in the hot, moist, and still atmosphere of its native jungles, exhibits a most luxuriant growth, often developing into a small tree with a clean stem. Its leaves are of a bright green, not infrequently 9 inches long and 3 wide. It resents transplanting after the tap-root has attained any considerable size. It does not bear drought, cold, nor rough usage from high winds or otherwise. It requires rich soil, abundant moisture, good drainage, and a rather elevated temperature; and these conditions are difficult to fill beyond the region where it was found. Under suitable conditions of cultivation this variety produces twenty or more "flushes," i. e. successive crops of young leaf, during each picking season. The small young leaf is of a golden color and soft texture; it is better adapted for the manufacture of black tea. The tea made from the Assam leaf is strong, often pungent and rasping; it is half again as strong as the Chinese, hence the Assam leaf is frequently blended with the Chinese leaf by the trade.

The Chinese plant, whether indigenous in China or of Indian origin and altered by long exposure to a colder climate and otherwise less favorable conditions, is of bushy growth and of far less attractive appearance than its Assamese relative. It is tough and hardy, successfully enduring the severe winters of the higher latitudes of China and Japan or of the elevated gardens on the Himalayan slopes. It survives deficiencies in moisture, soil, and cultivation, but gratefully acknowledges care and enrichment with an improved growth and higher leaf qualities. Under ordinary agricultural conditions it annually produces only four or five flushes. The leaf is smaller, tougher, and darker. It yields when properly prepared a more delicate if weaker tea than the Assamese. It is usually made into green tea. See TEA-PLANT.

The Hybrids.—As the result of the introduction into India in 1835 of Chinese tea-plants and seeds and their cultivation in gardens adjacent to those of the Assamese variety, hybridization has so thoroughly taken place that there are in India very few gardens of pure stock. In the resultant hybrids are blended the qualities of the parents, although there is a frequent tendency to exhibit the marked characteristics of one. Many intermediate varieties have been described, but it is very difficult to maintain any one of them pure unless by distinct separation from other kinds or by propagation from cuttings.

Conditions Favorable for Growth.—Climatic and agricultural conditions improve or deteriorate the tea-plant. It quickly responds to favorable conditions in larger bush and leaf, more frequent and abundant flushes, tenderer leaf, and better tea. Neglect, drought, and cold gradually develop the opposite, while their extremes absolutely destroy the better grades. Thus while the tea-plant will often grow under disadvantageous conditions the produce may be scant and almost worthless. The plant does best in a moist, warm, equable climate; in a rich soil sufficiently friable for the penetration of its tap-root; in a situation protected from strong winds, freshets, or stagnant subsoil water. It is a strong feeder, and except when planted out in virgin soil should receive abundant manuring. Unfortunately the very conditions conducive to its best growth create the worst malarial disorders among Europeans and those from other temperate climates. "Fever and tea go together."

Growth of the Plant.—Cultivated tea is raised from seed. The plant produces small white flowers, which one year later become capsules containing from one to four seeds about half the size of the American chestnut. Neither well-plucked bushes nor the better varieties of the tea-plant afford much seed. The preferable plan is to pick the ripe seeds in the autumn before the opening of the capsules causes them to fall to the ground. The sooner thereafter the seed is planted out the better. The seeds do not bear transportation to a distance without serious loss of their germinating power. About one consignment in four reaches the U. S. in good order. They are apt to be mildewed or dried up, too often the result of careless packing or unaccountable mishaps in transportation. When received in prime order it is possible to germinate 50 per cent. of them. The seed is planted either in the future tea-garden or in nurseries whence the young trees are subsequently transplanted. Indian gardens usually contain from 2,000 to 3,000 plants to the acre, according to their habit of growth and the lay of the land. Where cultivators and draft animals are used, the number of plants to the acre should not exceed 1,500 to 2,500. In the U. S. and similar climates the seedlings require protection by shingles from the hot sun and by mulching from cold weather and drought. The plants are allowed to attain under favorable conditions two or three years' growth without interference; they are then subjected to severe pruning, which in temperate climates should be done when the trees are not in sap. The objects to be attained are to give the plants a form suitable for leaf-picking and to remove useless or objectionable branches, but particularly to induce an abnormal production of foliage.

Leaf-picking.—To obtain abundant young leaf, from which alone good tea is made, it is necessary to make two essential departures from the original mode of growth, viz., the thick shade of the jungle must be exchanged for the open, sunny garden, and the total amount of foliage must be reduced below the normal proportion. Nature will then make a supreme effort to re-establish the equilibrium, and will put forth a tender shoot from every leaf-bud, which in turn gives rise to countless others if unmolested. Yet in spite of sufficiently severe pruning to secure good picking, cultivated tea-plants occasionally attain great size, so that with a height of 4 feet and a stem 10 inches in diameter the circumference of the bush may exceed 40 feet. The tender leaves should be carefully plucked, so as to avoid making too serious inroads on the vitality of the plant or interfering with the speedy formation of another flush.

Pekoe Tea.—At the end of the young shoot is an undeveloped bud, which is of all the new foliage the tenderest and choicest. It is called the pekoe tip, or flowery pekoe when made into tea. Pekoe in Chinese means white hair or down, referring to the delicate fuzz on the very young foliage. Mandarin tea is prepared from it in China; the tips are slightly rolled and dried, and finally tied up with ribbons in tiny bunches, like cigars. Except as a curiosity one does not see this tea outside of China, as in that country it com-

mands a very high price. The next leaves are called the orange pekoe and pekoe. They, with the tip, yield pekoe tea, especially esteemed for strength and flavor. When not fermented, but prepared as green tea from the half-opened leaves in April, it is known as young hyson, hyson being a corruption of the Chinese "yu tsien," meaning "before the rains." Most pekoe teas are sent to Great Britain and Russia.

Souchong and Congou.—Following the pekoe leaves the next two are called souchong (small kind), and whatever of young leaf may yet be present is termed congou, or the "well worked" (from Chinese kung-foo, "labor").

Quality of Tea.—In this order of enumeration, from the pekoe tip downward, the size of the leaf increases, but the quality falls off. The finer the picking, i. e. the more strictly it is confined to the bud and smaller leaves, the better is the quality, but the more expensive and curtailed is the crop. In China, at the time of the second picking, in the early summer, men, women, and children flock to the tea-gardens to pick leaf, as in other countries to pick hops or cotton. They practically strip the twigs of all the green leaf. The necessary result is a poor tea; and if the small quantity of fine leaf is sifted out from the mass, the balance is "tea," but decidedly trashy. The highest grades of Chinese teas are injured by subjecting them to the elevated temperature by which teas are rendered capable of enduring long sea voyages. They command high prices in China, and some of them can be bought only by the very rich. The lowest grades also find a home market, or are made up with some glutinous substance into bricks (brick-tea) for sale in the interior of Asia.

Yield of Tea.—The annual produce per plant may be stated at from 2 to 6 oz. of cured tea according to the climatic and cultural conditions, the richness of the soil or its fertilization, the variety of plant and the degree of picking. In India and Ceylon the yield per acre averages about 400 lb.; occasionally it amounts to 1,000 lb.

Green and Black Teas.—As before mentioned, green and black teas are not derived from distinct plants. It is possible to make either from the same leaf; but that from the Assamese plant is better adapted for the manufacture of black, and that from the Chinese for green; while some hybrids serve better for the former and others for the latter. The Chinese distinguish between green tea, as affording a greenish liquor, and red tea, as giving one of that color. They do not employ the term black tea, nor do they use any of the artificially colored bright-green teas so popular in the U. S. The great difference between the two most important classes of tea lies in this, that genuine green teas are the result of quickly drying the fresh leaf, whereas black teas are subjected to oxidation before being "fired," as the drying of the moist leaf over fire or in furnaces is called. The most important chemical difference between the simply dried tea-leaves (i. e. green) and the fermented (i. e. black) lies in the decidedly less amount of tannin in the latter. The multiplicity of brands of tea corresponds to the many varieties of the tea-plant, to differences in the mode of growth and manufacture which reflect racial characteristics, and finally to the taste of the consumer.

Some of the trade-names have geographical significance; others relate to the gardens where the tea was made or to the mode of manufacture; others to the quality; and finally many are accidental or unaccountable. The great bulk of the teas sent to the U. S. might be properly classified as "low-middling," with occasional consignments of superior grades and very rarely of fancy.

Manufacture.—The green leaf is tasteless and odorless; it contains almost 80 per cent. of water. To prepare it for receiving the rolling to which almost all tea-leaf is subjected, it is spread out thin and withered by exposure to light, heat, and air. Direct sunshine comprises all of these requirements, but it is apt to turn the leaf red. In the manufacture of green tea, where it is desirable to avoid any lengthy exposure of the fresh leaf to the air and light, withering is performed in iron vessels over a quick fire or the leaves are steamed on mats. Withered leaf is flaccid; it has the feel of an old kid glove; it does not crackle when held to the ear and compressed. When over-withered or after exposure to sunshine it becomes dark in color.

Rolling is necessary for breaking up the cellular tissues which contain the essential oil. The juice is expressed and coats the outside of the leaves and their fragments, whereby better cup-qualities are later obtained. Rolling is essential in the manufacture of black tea, as it masses the leaf in a state conducive to speedy oxidation. It is also desirable for

giving form to the finished product. Well-withered leaf does not break into fragments under this operation; it retains its original shape. Rolling is performed by hand on tables or mats, or by the use of specially designed machinery. The finest finish is given by hand-rolling; machines perform the task more uniformly and cheaply. Under the pressure of rolling, juice exudes from the ball of leaf. In India it is carefully sopped up into the "roll," and the strength of the tea is thus retained. From much of the Chinese teas it has been expressed and lost.

For the manufacture of black tea, the fresh leaf is thinly spread out to wither. When sufficiently flaccid it is rolled, then the balls or mass of rolled leaf are broken up, spread out thinly, moistened, and are subjected to oxidation, whereby tea loses its raw smell and acquires a fine flavor. This constitutes the most critical operation in the whole process, there being no fixed rules to determine its length and intensity. Due allowance must be made for differences in leaf and in temperature. The effect of oxidation is chemical, the chief change being a loss in astringency, induced by a diminution of the tannin; the tea also becomes darker in color. After the rolled leaf is broken it is fired in iron vessels over charcoal fires or in suitably constructed furnaces. The thoroughly dried and brittle tea should be packed while yet hot in metallic cases, and afterward hermetically sealed to exclude moisture.

In preparing green tea the essential points are that the fresh leaf should be taken into treatment with the least possible delay. It is sufficiently withered, usually by artificial heat, to admit of its being slightly rolled, then reheated. These steps are repeated several times, until the desired form has been put on the tea and it has lost a large part of its moisture. It is then subjected to long-continued drying over low fires, whereby a decidedly greenish hue is imparted to the finished tea. These are the fundamental rules for making tea. In different countries are practiced various departures or additional processes, such as screening and fanning.

Tea-industry in China.—The tea-plant is said to grow in all except the most northern provinces. Extremes of climate prevail in China as a whole, particularly in the interior, the temperature ranging from severe heat in midsummer to bitter cold in winter, with abundant ice and snow. There is reason to believe that in the principal tea-districts the frost is less intense and of shorter duration. The annual crop of tea has been estimated at from 400,000,000 to 2,000,000,000 lb.; in any case, it is immense, and is mostly consumed by the natives. Teas for exportation are raised chiefly in the central and southeastern provinces. In 1893 Chinese tea to the extent of nearly 250,000,000 lb., valued at 30,558,723 haikwan taels, was exported. Tea is China's most important export next after silk.

The Chinese cultivate the tea-plant in small gardens, or in outlying corners and on steep hill-sides where no other crop can be raised. The farmer often sells his crop on the bushes, as oranges are sold in Florida. Or if he picks the leaf, he sells it to the middlemen who in hordes invade the tea-districts at the time of leaf-picking. The tea that has not been mortgaged to the factors is sold at the large tea-hongs—brick buildings embracing with their courts an acre or two of land, and quite common in the Chinese towns. There it is prepared and packed for the market, or it is forwarded in an unfinished state to the great commercial centers on the coast. There are also very choice gardens, well manured and cultivated, which have a long-established reputation. They frequently belong to priests, and are tended by them and their acolytes.

Japan.—Tea-drinking in Japan began 692 A. D. Tea-seeds were brought from China in the eighth century, and gardens then established which are yet in existence. Although, as before mentioned, wild tea is found in Japan, the most celebrated gardens have been sown with seed imported from China. The chief tea-producing districts are in the Tokaido, in the region around Kioto, known as the Kinai, and in the islands of Shikoku and Kiushiu. The total production of the empire in 1891 was 59,000,000 lb., of which 41,000,000 were sent to the U. S. The climate of the Japanese tea-districts is moist, averaging 72 inches rainfall yearly on 165 days. The extremes of temperature are 93° and 20° F., with a yearly average of 55° F.

Japanese teas are almost wholly green. The leaf is not adapted for the manufacture of black tea. Steam-withering is practiced to reduce the raw flavor. The general finish is very elegant, but artificial coloring and facing are common

features of the export trade. The choicest tea is that raised under protection from direct sunlight, as it contains 30 per cent. more theine than that grown in the open. The most esteemed brand is called *tencha* or flat tea, because it is not rolled; indeed, it is claimed that it is not touched by hand after being put on the steaming apparatus. It commands a high price in Japan. Such teas are finely ground shortly before use, and after stirring with warm (not boiling) water for a few minutes, the whole infusion is drunk. They play an important part in the ceremonial tea-drinking—an institution dating back to the fifteenth century, and constituting a very curious feature of Japanese political history and social life.

India and Ceylon.—The climate of Assam has been already referred to under the conditions favorable to the growth of the tea-plant. It is steaming hot; its yearly average, nearly 75° F., with a maximum temperature of almost 100° and a minimum rarely below 50° F. The total yearly precipitation of moisture is from 90 to 100 inches. It is free from hot, dry winds. Fogs are quite prevalent there. The cutting down of the jungle and its transformation into a vast tea-garden has unquestionably altered the climate; nevertheless, Assam still affords the best tea-climate. That of the elevated gardens on the Himalayan slopes and in the Neilgherries is better suited for the Chinese plant and hybrids similar to it in ability to resist cold wintry weather and to dispense with excessive rainfall. Although situated in 7° lat., Ceylon enjoys, even at the intermediate levels, a comparatively temperate and equable climate; and naturally on the most elevated gardens (some being at 5,000 feet and more), it is quite mild. The thermometer at the intermediate levels rarely indicates 100° F., and above 2,000 feet elevation seldom over 90° F. At none of the meteorological stations in the districts does the thermometer fall below 32° F. in winter. The number of rainy days approximates 200, and the total yearly rainfall about 90 inches. At the higher stations the average temperature is about 15° F., and the rainfall 25 inches less than at the lower ones. The tea-plant continues to grow and produce leaf through the whole year on the lower estates. The development of the Ceylon tea-industry has occurred since about 1876. It is largely in consequence of the replanting in tea of the great coffee estates which were ruined by the leaf disease. Desultory experimentation in tea-planting had occurred before, but without material results.

The whole system of tea-production in the British Indies is on a large scale. Wealthy corporations or individuals cultivate hundreds or thousands of acres, employing great capital and immense numbers of laborers. The operations in the field are performed under the piece system and in a thoroughly systematic manner. In the factory, the simplification of processes and the substitution of machinery for manual labor have reduced the cost of manufacture, and resulted in the production of a more uniform and cleaner article.

The following statistics are from a paper on tea by A. G. Stanton (of Gow, Wilson & Stanton). The United Kingdom consumed in 1800 20,000,000 lb. of tea; in 1850, 51,000,000; in 1870, 118,000,000; and in 1894, 214,000,000. The annual consumption per head of population, and the displacement of Chinese and all other sorts by Indian and Ceylon teas in the United Kingdom, are shown by the following table:

YEAR.	China, etc.	Indian.	Ceylon.	Quantity per head of population.
	per cent.	per cent.	per cent.	lb.
1866	96	4	..	3.42
1883	66	33	1	4.82
1894	12	55	33	5.53

Java.—Tea-seeds from Japan were planted in 1826, and shortly thereafter some gardens were established by the Dutch Government. They were not financially successful, and, consequently, the last of them were relinquished to private parties in 1860. The best localities for growing tea are at a height of 3,000 to 4,000 feet above sea-level, on the slopes of the mountains. Cold weather is not felt there and leaf-picking extends through the year. The plants are kept within small dimensions, being pruned down to 2 feet in height; they are planted in rows 4 by 2 feet apart. The tea is well made and highly esteemed for its fine flavor, but it is not strong. The crop for 1892 was 9,000,000 lb. It is chiefly sent to Holland, North Germany, and England. In regard to Java, parts of Ceylon, and similarly situated tea-

districts where the tea-plant flushes through the whole year, it is believed that in vigor of growth and strength of tea they do not compare favorably with situations where the plant hibernates for a few months.

United States.—In other lands than those already described attempts have been made to establish the cultivation of tea. Some of these trials have resulted in failure, others are full of promise, but have not progressed far enough to warrant description here. In view, however, of the general interest which has been manifested in the experiments conducted in an intermittent manner since about 1850 to determine the feasibility of establishing the tea-industry in the U. S., and more recently by Charles U. Shepard, near Summerville, S. C., it may be proper to add a brief summary of the results thus far gained and the present outlook. It has been shown that ordinary hybrids, as also Chinese and Japanese plants, will thrive and produce exceptionally good teas, at least under the stimulus of high cultivation, in several of the Southern States. It is doubtful if the U. S. affords a suitable locality for the growth of the Assamese species. The main difficulties in the path of the tea-grower in the U. S. are the lack of a favorable climate and cheap labor. In regard to climate, at least in the Southeastern States, the variations of temperature are great, equaling those of the Chinese tea-districts, while the amount of rainfall during the picking season hardly meets the requirements for a successful crop. Thus at Charleston, S. C., the mean annual temperature is 66° F., with average extremes of 94° and 20½° F.; and the rainfall amounts to 57 inches per annum on 118 days. Climate materially affects the production. A dry spring retards luxuriant growth and the formation of early tender flushes. The tea-plant needs alternating gentle showers and warm sunshine. Violent storms of wind and rain cause considerable damage. Day labor costs at least five times as much as in the far East. The difference in the cost of leaf-picking amounts to five cents a pound of cured tea, and that is almost the cost of a pound of fair tea on some Oriental estates.

The Southern States, therefore, can not be regarded as ideal tea-districts. Indeed, it has been evident for some years that Asiatic competition precludes the successful raising of the cheaper classes of tea. Nevertheless, there is ground to believe that the better qualities may be profitably grown provided the yield of fine leaf can be made to equal the average of Asiatic gardens. Assuming that by high manuring and careful cultivation a yield of 100 lb. of cured leaf may be obtained from an acre containing 2,000 plants, the cost should not exceed 20 to 25 cents a pound, and 30 cents a pound is the price of similar Asiatic teas in "importers' bulk" at the chief ports of the U. S. Finally, it is very improbable that in the U. S. low-grade and sophisticated teas will always satisfy the wants of the public in general. With increasing wealth and intelligence tea-drinkers will demand and be willing to pay for the better qualities. There will be some who will want the best: that can be furnished only from gardens in the U. S., as it will not bear transportation to a distance.

Adulterations of Tea.—There can be no doubt that a great deal of the tea, especially green tea, imported into the U. S. would fall under the condemnation of the law of New York, by "being colored, or coated, or polished, whereby damage is concealed, or it is made to appear better than it really is, or of greater value." On the contrary, it should be regarded as very exceptional in any tea "if it contain any added poisonous ingredient, or any ingredient which may render such article injurious to the health of the person consuming it." The adulterants of tea have been carefully investigated, especially in the U. S., by J. P. Battershall (*Food Adulteration and Its Detection*) and G. L. Spencer (*Foods and Food Adulterants*, U. S. Department of Agriculture, Division of Chemistry, Bulletin No. 13).

Tampering with tea has for its objects the improvement of its appearance, its increase in weight or bulk, or the heightening of some quality of flavor. The origin and method of imparting a bright green to tea, as practiced in China and Japan, more particularly for the benefit of tea-drinkers in the U. S., have been described as follows by S. Wells Williams (*The Middle Kingdom*):

"When green tea is intended for home consumption soon after it is made, the color is of little consequence; but when the hue influences the sale, then it is not to be overlooked by the manufacturer or broker. The first tea brought to Europe was from Fuhkien, and all black; but as the trade extended, probably some of the delicate hyson sorts were

now and then seen at Canton, and their appearance in England and Holland appreciated as more and more was sent. It was found, however, to be difficult to maintain a uniform tint. Chinese ingenuity was equal to the call. The operation of giving green tea its color is a simple one. A quantity of Prussian blue is pulverized to a very fine powder, and kept ready at the last roasting. Pure gypsum is burned in the charcoal fire till it is soft and fit for easily triturating. Four parts are then thoroughly mixed with three parts of Prussian blue, making a light-blue powder. About five minutes before taking off the dried leaves this powder is sprinkled on them, and instantly the whole panful of 2 or 3 lb. is turned over by the workman's hands till a uniform color is obtained. His hands come out quite blue, but the compound gives the green leaves a brighter green hue. If foreigners preferred yellow teas no doubt they could be favored, for the Chinese are much perplexed to account for this strange predilection, as they never drink this colored or faced tea." The amount of Prussian blue used in coloring green tea is so infinitesimal that it would be necessary for a tea-drinker to consume at one sitting 1 lb. of such tea in order to take what was formerly regarded as one dose of it. The prevalent idea that green tea owes its color to copper is erroneous. Indigo, turmeric, plumbago, and iron sulphate are also used for imparting color. Lie-tea is a mixture of the dust of tea with old tea-leaves and occasionally the leaves of other plants, starch, gum, and mineral substances, worked down to a convenient mass, artificially colored, and usually made to imitate gunpowder tea. For faeing or giving a gloss to teas, plumbago, soapstone, and similar materials are employed. Tannin is added for heightening the astringency, which with most tea-drinkers is synonymous with strength and high quality. Foreign substances, such as fragments of brick, sand, etc., up to a reasonable content, may be regarded as the result of carelessness; beyond that of fraudulent intent. Scented teas chiefly owe their fragrance to the odors of the rose, *Osmanthus* (*Olea fragrans*, tuberose, and gardenia; the jasmine and azalea are also employed for this purpose. But scented teas can hardly fall into the category of adulterations. Spent leaves are rarely to be found in tea, except in small quantity; and the presence of the leaves of other plants has been seldom detected. The poorest teas are raised at such a modicum of expense that adulteration becomes remunerative only in response to the demands of the consumer, or at the hands of the middle men. "Tea," although unrecognizable in the cup, can be made almost to satisfy the buyer who wants something for nothing. The detection of adulterants lies in the application of the usual chemical tests, the determination under prescribed conditions of the matter extracted by hot water, and an examination of the leaves with the microscope.

CHARLES U. SHEPARD.

PHYSIOLOGICAL EFFECTS OF TEA.—The chief active ingredient of tea, upon which depends most of its influence upon the human body, is the alkaloid or active principle called theine, which is practically identical with caffeine derived from coffee, guaranine derived from guarana, and similar substances. It is stated on good authority that as a matter of fact most of the caffeine which is used in medicine is in reality theine derived from damaged teas which can not be used for the ordinary purposes, as this is a much cheaper source of supply than is coffee. In addition to theine tea-leaves contain some tannic acid, which gives them their somewhat bitter taste, and a small amount of volatile oil, upon which a "cup of tea" depends for its aroma. The percentage of theine in tea-leaves varies from ½ to 6 per cent., the tannic acid from 12 to 18 per cent., and the volatile oil equals about half of 1 per cent. In addition to these constituents there are numerous vegetable extractives, such as coloring-matter, albumen, gum, and slight traces of mineral substances.

When tea infusion, or in other words, a "cup of tea," is swallowed by the ordinary adult human being it produces a powerful stimulant influence which is chiefly exercised upon the nervous system, especially the brain and spinal cord. As a result of this, thought-processes are more rapidly and readily carried out and the reflexes are increased from the spinal stimulation, so that a mild condition of "nervousness" may develop. The heat which is also taken into the body in drinking tea acts as a powerful stimulant and aids very materially in the absorption of the drug by the stomach. If the tea is taken in over-dose the condition of cerebral and spinal excitation may be so great as to be quite

annoying, the chief symptom, if the tea be taken in the evening, being often excessive wakefulness. Because of the stimulant influence of tea upon the human being it is employed very largely, and in many cases to excess, so that persons who are wont to pay little attention to their diet and habits of life frequently become addicted to its excessive use, resorting to it as a "whip" to overcome the apathetic condition arising from the nervous exhaustion from which they are suffering. While there is no doubt that tea is capable, by its stimulating influence, of removing temporary nervous depression, it should never be forgotten that its constant employment for this purpose is always followed sooner or later by physical bankruptcy, a condition which is seen most commonly in nervous women. Tea belongs to that class of substances, such as coffee, cocoa, tobacco, alcohol, and opium, which retard tissue waste, or, in other words, decrease nitrogenous break-down in the body, thereby conserving the tissues, and it is thought by some that human beings resort to these drugs as a result of an instinctive feeling that they are saving themselves to some extent from wear and tear.

A strong infusion of tea is valuable in two dangerous conditions as an antidote: (1) in opium-poisoning, for the purpose of stimulating the respiration and heart; and (2) in antimonial poisoning, for the same purpose, and also for the purpose of forming an insoluble tannate of antimony so slow in its action that acute poisoning will not ensue.

In preparing tea for drinking purposes care should be taken that perfectly pure water is employed which is devoid of either taste or smell, and which is neither too hard nor too soft. It should be poured upon the tea-leaves when actually boiling and the mixture allowed to steep for but a short time. Boiling tea-leaves for the purpose of making an infusion for drinking purposes should never be done, as this process extracts a large amount of organic matter from the leaf and dissipates the aroma, leaving in its stead an acrid, bitter taste. See CAFFEINE. H. A. HARE.

Teachers' Institutes: institutions, original in the U. S., for giving professional instruction to teachers already at work. The institute is usually held for a week during the school term at some central point in the county or commissioners' district, the teachers being required to attend and being paid as though they were teaching. The institutes are led by experienced conductors, and are substantially normal schools with a course of study of a week. Gatherings of this kind were held as early as 1834. In 1839 Henry Barnard assembled a number of teachers for this purpose at Hartford, but the first meeting that was called an institute was held in Tompkins co., N. Y., in 1843. The character and work of the institutes vary widely with different localities. See Boone, *Education in the United States* (1890).

C. H. THURNER.

Teachers' Seminaries: in Germany, Russia, Scandinavia, Denmark, and Finland, schools for the training of teachers. Such institutions all have the same general character, as described especially for German seminaries in the article *Normal Schools* under *SCHOOLS*.

Tea Family: the *Ternstroemiaceæ*, a small group (310 species) of dicotyledonous trees and shrubs of warm and hot climates, with regular showy flowers, having usually five sepals, five petals, many stamens, and a superior three-celled to five-celled compound ovary, each cell containing from two to many ovules. The most important genus is *CAMELLIA* (*q. v.*), in which Bentham and Hooker include the **TEA-PLANT** (*q. v.*), *C. theifera*. Other botanists maintain *Thea* as a separate genus, and designate the tea-plant as *T. chinensis* or *T. sinensis*, while others still would include all the camellias in *Thea*. In the southern parts of the U. S. there are two species of *GORDONIA* (*q. v.*) and two of *Staurtia*, all shrubs with pretty flowers. CHARLES E. BESSEY.

Teak [from Malayalam *tekka*]: a forest-tree, *Teclona grandis*, of the family *Verbenaceæ*, of India and Farther India. It is the best timber known for ship-building. It is more durable than oak, more easily seasoned, equally strong, considerably lighter, and far more easily worked. It is used for making decks and planking for the keel, timbers, and even masts and spars. Many all-teak ships are reported to be over 100 years old, and still seaworthy. The wood somewhat resembles mahogany. The flowers and leaves have medicinal qualities, and are used in dyeing. African teak, the wood of a cuphorbiaceous tree, *Oldfieldia africana*, resembles true teak, but is much inferior to it.

Revised by L. H. BAILEY.

Teal: any one of several small ducks having a bill but little longer than the foot, rather narrow, and with small lamellæ. The wing bears a conspicuous mark, or speculum, of blue or metallic green. They are birds of rapid flight, partial to fresh water, and their flesh is excellent food. There are about twenty species scattered through the world, three occurring as regular residents within the U. S. These are the blue-winged teal (*Anas discors*), the green-winged teal (*A. carolinensis*), and the cinnamon teal (*A. cyanoptera*). The European green-winged teal (*A. crecca*) occurs as a straggler in the Eastern U. S. For the summer teal, see GARGANEY. F. A. LUCAS.

Tea, Paraguay: See **MATE**.

Tea-plant: a shrub with smooth evergreen leaves, bearing white flowers (an inch or more broad) in their axils, resembling those of a small camellia, belonging to the same family (*Ternstroemiaceæ*), and in the opinion of many recent botanists to the same genus. A distinguishing character is that camellias have numerous unconnected stamens within the ring of outer ones, the united filaments of which form a short tube, cohering with the base of the petals, and falling with them; while in the tea-plants there are only five or six of these inner and separate stamens. In both the blossom is succeeded by a globular, thick-walled, woody capsule, internally divided into three or four cells, tardily splitting open; each cell ripening from one to four large and oily seeds, with a hard and smooth seed-coat. See **TEA**.

Tear-gland: See **LACHRYMAL GLAND**.

Tears [O. Eng. *t̄ar*; O. H. Germ. *zahar* (> Mod. Germ. *zähre*); Icel. *tár*; Goth. *lagr* < Teuton. **lahr-*, **tagr-* < Indo-Eur. **dakru* > Sanskr. *dagru*; Gr. *δάκρυ*; O. Lat. *dacruma* > Lat. *lacrima*]; the slightly saline watery secretion of the **LACHRYMAL GLAND** (*q. v.*). The ordinary function of this secretion is to assist in the work of moistening and lubricating the eyeball; but in the human species, at least, the exercise of certain strong emotions acts as a powerful stimulus upon this secretion. Pungent odors, as that from the onion, sometimes provoke a copious and even painful discharge of tears. To certain of the lower animals, as the crocodile and the hyena, folk-lore ascribes the power of shedding voluntary tears for the deception of the beholder; and observers old and recent testify that certain species of deer and of the seal family express grief by the shedding of tears. Most of the lower animals do not secrete a noteworthy flow of tears except after injury of the eye or in some diseases of the gland or of some adjacent part.

Teasel [Mod. Eng. *tesel* < O. Eng. *tāsel*, deriv. of *lāsan*, pluck, tease (wool)]; the *Dipsacus fullonum*, a biennial plant of the south of Europe, naturalized to some extent in the U. S. It is cultivated in Europe, as in the U. S., on account of its burs or heads, covered with hooked bracts. These heads are fastened to a revolving cylinder, and are used by woolen manufacturers to raise a nap on cloth. No artificial contrivance has been found to equal the teasel for this purpose. "Male" and "female" teasels are merely varieties in size and stiffness, each adapted to the dressing of special cloths.

Teasel Family: the *Dipsacæ*; a small group (150 species) of dicotyledonous herbs (rarely shrubs) of the Old World, with small flowers, having a small calyx, tubular corolla, stamens two to four inserted on the corolla, anthers free, and ovary inferior, one-celled and one-ovuled. They are closely related to the **COMPOSITÆ** (*q. v.*), from which they are separated mainly by their free anthers. The teasel and the ornamental species of *Scabiosa* are the most important plants of the family. CHARLES E. BESSEY.

Têche (tesh), **Bayou:** one of several small tide-water navigable channels in Southern Louisiana, which were once the main channels of large rivers. This bayou lies immediately W. of Grand Lake, and the Atchafalaya river basin and its high banks, formed by the overflows centuries ago, when it was a main river outlet, now form one of the most fertile and productive portions of the State of Louisiana. It produces large crops of sugar and cotton, these lands being above overflow. It is navigable to St. Martinsville, about 100 miles above its mouth, where it empties into the lower Atchafalaya, near Morgan City. Above St. Martinsville the Têche is only navigable for very small boats a portion of the year. What is now termed Bayou Têche was once the lower portion of the ancient channel of Red river, extending from the present Bayou Courtableau, E. of Opelousas, La., around and to the W. and S. of what is now the

Grand Lake basin—then probably an inland bay into which the Mississippi river discharged—to the Gulf of Mexico, but now, too, the lower Atchafalaya river, S. of Grand Lake. St. Martinsville, Pattersonville, Centerville, Franklin, and New Iberia are prominent towns on the Tèche.

Revised by J. B. JOHNSON.

Technical Schools: See **SCHOOLS**.

Technology [from Gr. *τέχνη*, art + *λόγος*, discourse]: a general name for industrial science. Strictly, there is no such science, but all the sciences contribute much which is of the greatest value to the various industries; and technology is the teaching of those parts of science which are of direct industrial importance. See *Technical Schools* and *Trade Schools* under **SCHOOLS**.

Teck: small duchy situated in Suabia, and called so after the castle of Teck. It was held successively by several families during the Middle Ages, but in the fourteenth century passed into the possession of the Dukes of Württemberg. In 1863 the King of Württemberg conferred it on the children of Duke Alexander of Württemberg by his marriage with the Countess Rhédey. Their son Francis (b. 1837), who became Duke of Teck by this arrangement, is the father of the Princess Victoria May, who married the Duke of York of the British royal house (July 6, 1893). F. M. COLBY.

Tectibranchia'ta [Mod. Lat.; Lat. *tec'tus*, perf. partic. of *te'gere*, cover + *bran'chie*, gills]: a group of opisthobranchiate molluscs in which the gills are covered by the mantle. See **GASTEROPODA**.

Tecum'seh: village (settled in 1824); Lenawee co., Mich.; on the Raisin river, and the Cin., Jack, and Mack, and the Lake Shore and Mich. S. railways; 13 miles N. E. of Adrian, and 33 S. E. of Jackson (for location, see map of Michigan, ref. 8-J). It is in an agricultural and fruit-growing region, has large manufacturing interests, and contains 6 churches, a central and 3 ward schools, a public library, 2 State banks with combined capital of \$66,000, 3 flour-mills, 2 planing-mills, a paper-mill, brick and tile machine-works, 2 foundries, carriage-factory, table and furniture factory, and 2 weekly newspapers. Pop. (1880) 2,111; (1890) 2,310; (1894) 2,210. EDITOR OF "HERALD."

Tecumseh: city (founded in 1857); capital of Johnson co., Neb.; on the Big Nemaha river and the Burl, and Mo. River Railroad; 30 miles W. of Missouri river, and 50 miles S. E. of Lincoln (for location, see map of Nebraska, ref. 11-II). It contains 8 churches, 4 public-school buildings, high school, water-works, electric lights, a national bank with capital of \$50,000, a State bank with capital of \$50,000, and 3 weekly newspapers. Pop. (1880) 1,268; (1890) 1,654; (1894) 2,225. EDITOR OF "CHIEFTAIN."

Tecumseh, or Tecumtha: chief of the Shawnee Indians; b. near Springfield, O., about 1768; took part in the war with the Kentucky forces about 1791; was engaged in the battle of Mad river and in the attack on Fort Recovery, 1794; joined his brother, Elskwatawa (called The Prophet), about 1805 in the attempt to organize all the Western Indians in a confederacy against the whites; visited all the tribes on the upper lakes and in the Mississippi valley down to the Gulf of Mexico; collected a considerable force on the upper Wabash in the autumn of 1811, which, under command of the Prophet, attacked Gen. Harrison and was defeated at Tippecanoe Nov. 7, during Tecumseh's absence among the Southern tribes; went to Canada with a band of Shawnees in the following year on the outbreak of hostilities with Great Britain; was a useful ally to the British in the battles of Raisin river and of Maguaga, where he was wounded; was made a brigadier-general in the British service; was joint commander with Gen. Proctor at the siege of Fort Meigs, and protected the American prisoners from massacre; was wounded at the battle of Lake Erie, and commanded the right wing at the battle near the Moravian towns on the Thames. Having, it is said, a presentiment of his approaching death, he laid aside his sword and uniform, put on his hunting-costume, and plunged into the hottest of the fight, in which he was killed Oct. 5, 1813. It was asserted for many years that he fell by the hand of Col. Richard M. Johnson, afterward Vice-President of the U. S. (1837-41). See Drake, *Life of Tecumseh and his Brother the Prophet, with an Historical Sketch of the Shawnee Indians* (Cincinnati, 1841), and Eggleston, *Tecumseh and the Shawnee Prophet* (New York, 1878).

Te De'um [Lat., so called from the first words, *Te Deum laudamus*], Thee God (we praise), Eng. version, "We

praise thee, O God"]; the most famous "non-biblical" hymn of the Western Church, dating from the fifth century. It was intended to be a daily morning hymn. Its authorship is unknown. It is first referred to by Caesarius of Arles (502), who ordered it to form part of the regular morning service of his monks, and as he cites it only by the first three words it indicates that it was then well known. So it passed into the service books of the Western Church, and has always constituted a portion of the Morning Service (as one of its supplications, "Keep us *this day* without sin," implies) in the English and American church services between the first and second lessons for the morning, the rubric prescribing that it shall be "said or sung."

Besides the use in the Morning Service, this triumphal hymn is used, arranged to elaborate music, as a special service of thanksgiving. The sovereigns of England have been accustomed to go in state to the singing of the *Te Deum* after great victories, Handel's *Dettingen Te Deum* having been composed for one of these occasions. At the conclusion of coronations it has been used from time immemorial throughout Europe. When it is said in the ordinary Morning Service, its verses are antiphonally recited by minister and congregation, but it is very generally sung by choir and congregation. The music which has come down in connection with this hymn is probably Gregorian. No hymn or form of words has been the subject of so many musical renderings by composers of all grades, of all ages, and of all nations. Among the elaborate works are those of Handel (just cited), Romberg, André, Lassen, and Wüllner. Revised by S. M. JACKSON.

Teeth [plur. of *tooth* < O. Eng. *tōð* (plur. *tēð*): O. H. Germ. *zand* (> Mod. Germ. *zahn*): Icel. *tönn*; Goth. *tanþus*; cf. Lith. *dantis*: Lat. *dens, dentis*: Gr. *ὀδούς, ὀδόντος*: Sanskr. *danta*]: certain hard bodies situated in the mouth or at the beginning of the alimentary canal. This definition, comprehensive and vague as it may appear, is as exact as the nature of the case permits. Under it would be included not only the teeth of mammals and other vertebrates, but also the hard bodies that stud the surface of the odontophore or lingual ribbon of molluscs, etc., although these parts are not at all homologous. The teeth of vertebrates, which alone are considered here, are exceedingly variable in development, as well as form and position, and their characteristics in the several classes may be briefly examined in order, while much information as to dentition will be found in the articles treating of the various families, etc.

The teeth of vertebrates, and particularly those of mammals, are closely related to the entire structure of the animal to which they belong, and as the teeth, owing to their hardness, often remain after other parts have wholly or largely disappeared, they are for these reasons of great importance to the palaeontologist.

Following Tones, the main features in the development of teeth are, briefly, as follows: "In all animals the tooth-germ consists primarily of two structures, and two only—the dentine-germ and the enamel-germ. The simplest tooth-germ never comprises anything more. When a capsule is developed it is derived partly from a secondary up-growth of the tissue at the base of the dentine-germ, partly from an accidental condensation of the surrounding connective tissue. The existence of an enamel-organ is quite universal, and is in no way dependent upon the presence or absence of enamel upon the completed tooth, although the degree to which it is developed has distinct relation to the thickness of the future enamel. So far as researches go, a stellate reticulum, constituting a large bulk of the enamel-organ, is a structure confined to the Mammalia. The dentine-papilla is a dermal structure, the enamel-organ an epithelial or epidermic structure. As the enamel is formed by an actual conversion of the cells of the enamel-organ, this makes the dentine dermal and the enamel epidermic structures. In Teleostei the new enamel-germs are formed directly from the oral epithelium, and are new formations arising quite independently of any portion of the tooth-germs of the teeth which have preceded them. In mammals and reptiles, and in some, at all events, of the Batrachia, new tooth-germs are derived from portions of their predecessors. In all animals examined the phenomena are very uniform: a process dips in from the oral epithelium, often to a great depth; the end of the process becomes transformed into an enamel-organ coincidentally with the formation of a dentine-papilla beneath it. The differences lie

rather in such minor details as the extent to which a capsule is developed, and no such generalization as that the teeth of fish in their development represent only an earlier stage of the development of the teeth of Mammalia can be drawn."

The leptocardians or pharyngobranchiates are entirely destitute of teeth.

The marsipobranchiates have teeth developed on the tongue, and more or less from the surface of the oral disk; in the myxinoïds a single tooth is present on the roof of the mouth; but in the petromyzonts numerous teeth exist in oblique rows on the disk.

The selachians or elasmobranchiates exhibit a very considerable diversity in their dentition, but the principal types are as follows: In sharks the teeth vary in shape from flat and broadly triangular, with serrate edges (*Carcharias*), to long, slender, and smooth (*Lamna*). They differ considerably in shape, according to their position in the jaw, and are arranged in several (six to eight) rows, although those of the front row only are in active use. The others form a reserve series, and move continually forward to replace the others, while new teeth are continually being developed at the back. The skates and rays have either numerous small, pointed teeth, arranged in alternating rows, but so thickly set as to form one mass (*Raja*), or they are flat, six-sided, and so disposed as to form a sort of pavement (*Myliobatis*). In either case new teeth are constantly forming at the back to replace the loss by wear in front.

The fishes are, more than any other class, distinguished by the diversity in development and position of the teeth, as well as form and mode of attachment.

As to position, they may be entirely absent from at least the mouth proper, or they may be present on almost all the bones—i. e. the intermaxillaries, the supramaxillaries, the vomer, the palatines, the pterygoids, the ento-pterygoids, and the tongue, as well as the pharyngeal bones, the branchial arches, and the beginning of the œsophagus. There may be also a considerable diversity in dentition within the limits of the same natural family, although, as a rule, the differences are inconsiderable; as examples among American fishes the cyprinoids and centrarchoids may be mentioned. All of the cyprinoids (carp and suckers) are totally devoid of teeth in the mouth, although they have them well developed on the pharyngeal bones. The centrarchoids (bass) offer considerable diversity: in *Pomotis* and *Lepomis* teeth are present only on the jaws and vomer, but in *Ambloplites* and *Channobryllus* they exist not only on the jaws and vomer, but also on the palatine and pterygoid bones. A still more noticeable case of diversity is afforded by the family of clupeids, including the herrings, shad, etc.; in *Alosa* (the shad) the mouth is almost toothless, while in *Clupeoides* teeth are developed on the intermaxillaries and supramaxillaries (as crenulations), as well as on the dentaries, vomer, palatines, pterygoids, and tongue; between these there is almost every gradation. These variations in the clupeids are so generally unaccompanied by other modifications of structure that their systematic value is very slight. Nevertheless, in most cases there is a quite close concordance between the development of the teeth and other characters, so that, on the whole, the nature of the dentition may be tolerably well predicated from the associated characters. The most common combination, too, at least among the specialized acanthopterygian fishes, is expressed in the aggregation of teeth on the intermaxillaries, dentaries, vomer, and palatines. The *Percide*, *Serranide*, and *Scombride* (but not all their species) are examples of this class. Closely related types, however, have the teeth confined to the intermaxillaries and dentaries; such are, e. g., the typical *Pristipomatide* and *Sparide*. In *Stromateide* teeth are developed on plates at the entrance of the œsophagus.

In form there is great variety. The most common shape is an elongated but more or less curved cone, or some slight modification thereof. The most noteworthy examples of other types are the following: Extremely elongated, slender, and almost hair-like teeth are found in the chatodontids; incisors like those of mammals, superficially at least, are developed in the *Sargi* (sheepshead, etc.); molar-like teeth are present in the jaws of many *Sparide* and on the palate in *Anarrhichadide* (wolf-fishes); barbed or arrow-like teeth are exemplified in the *Trichiuride* and related forms; compressed, lancet-like teeth exist in the jaws of *Pomatomus* or *Temnodon* (the bluefish); slender spoon-like teeth are to be seen on the lips of the loriciariids, a group of peculiar South

American catfishes; squamiform, imbricated teeth cover the jaws in the *Scaride* (parrot-fishes); and broad incisorial teeth are confluent with the jaws in the diodonts and tetrodons.

In their combinations and mode of attachment there is almost equal variety. In most fishes the teeth are very numerous, and grouped in many rows on the jaws as well as on the palate; in many they are a single row; often they are differentiated into two or more kinds—e. g. the foremost tooth or the hindmost ones, and sometimes (as in different hybrids) both, may be developed as canines, while the others are small; often, too, the teeth of the anterior row are much larger than the others; again, as in the sparids, the teeth of the front of the jaws are conic or incisorial, and those of the sides molar. In fishes generally the teeth are immovably implanted in sockets in the jaws, but readily detached therefrom; in some (e. g. in *Salaria*, *Euchalarodus*, certain *Serranide*, etc.) they are more or less movable, while in loriciariids they seem to be loosely attached to the lips; in the scarids they are imbricated on the jaws; and in the diodonts and tetrodons they are inseparable from the jaws.

In the amphibians there is much less diversity than in the fishes, or even the selachians. In form they are mostly slender, conic, and pointed. In position they exhibit much greater diversities: in the *Gradientia* (salamanders and other tailed species) they are present on the jaws and palate under various combinations. In the *Salientia* they are less constantly present; in many (e. g. the frogs) they are suppressed in the lower jaw, and present only in the upper; in numerous others (e. g. the toads) they are absent from the upper as well as the lower jaw; in the frogs teeth are developed on the vomer, but in the toads are entirely wanting on the palate as on the jaws.

In the reptiles the varieties of dentition are quite numerous, but less so than in the fishes. In shape their teeth are usually more or less conical or rounded, but they may be somewhat notched or pectinated. It need only be added here that, according to Tomes, but contrary to the older authors, "the teeth, as far as known, consist of dentine, to which is very generally superadded an investment of enamel, partial or complete, but that cementum is only present in a few instances," the only forms having teeth covered with cementum being "those which have them implanted in more or less complete sockets or in a groove," as the crocodilians and ichthyosaurians. The teeth of reptiles are usually succeeded as they wear out by others which either grow up at their sides, as in serpents, or are pushed up from beneath, as in crocodiles and most lizards.

The birds of the present epoch are entirely destitute of true teeth, and the mandibles have generally more or less trenchant, unarmed linear edges, but sometimes they are armed with processes of bone simulating teeth, but in no other respect entitled to that name. In former epochs, however, there existed types actually provided with true teeth, having all the structural characteristics of those organs, and fitting in sockets in the jaws; these have been combined by Marsh under the general term *Odontornithes* (i. e. toothed birds).

In the mammals teeth are confined to the jaws—i. e. the intermaxillary, supramaxillary, and dentary bones—and are almost always developed, although in a few forms, representing several orders, they are entirely wanting. No teeth have been discovered in the Monotremes belonging to the family *Tachyglosside*, but in the *Ornithorhynchide* very young animals possess three minute, many-tubercled teeth on either side of each jaw. A little later these are hidden under the large, horny, epidermal plates which serve as teeth in the adult, and ultimately the rudimentary teeth are absorbed, so that until recently the *Ornithorhynchide* were considered to be toothless. In the marsupials and placental mammals the teeth are homologous with each other, and developed in the same manner. The fully developed teeth are composed essentially of three substances: the dentine, the enamel, and the cement. The dentine is the chief component of the teeth, and is a dense, fine-grained, elastic substance, permeated by minute tubes; there is a familiar and well-marked example of dentine in ivory, but it varies much in appearance and hardness, although it always contains a considerable portion of animal matter. The enamel is generally more or less developed around the dentine on the crown of the tooth, or is present in the form of vertical plates as among ungulates. It is composed of extremely minute fibers standing outward over the dentine, and is the hardest of animal tissues. The enamel is devel-

oped around the teeth of most mammals, but to a varying extent, and is wanting chiefly in most of the representatives of the order *Bruta*. The cement is quite like bone in appearance and composition, and enters to a varying extent into the composition of the tooth. It is generally most developed around the roots, and least so on the crowns, although in ungulates it fills the valleys between the plates of enamel also. See the illustration in the article *Histology*.

The teeth of mammals are always inserted in sockets in the jaws, surrounded by gums. They are severally divided into two portions—the exposed portion or crown, and the inserted portion, known as the fangs or roots. The difference is generally well defined, but in some forms, especially in certain rodents (*Arvicoline*), etc., there is no abrupt distinction between the inserted and exerted portions, and true roots are not developed.

In nearly all mammals there is a limit to the growth of a tooth, but the incisors of all rodents and all the teeth of some species, as well as the teeth of sloths, continue to grow upward throughout life, the pulp-cavity remaining open and new material being added at the base as it is worn away above.

The teeth of mammals not increasing in size, as do the other parts of the body, a provision must exist for the accommodation of their size and development to that of the animal. This is effected in part by the late development of some of the teeth, which do not appear until the animal has attained a large size; and, in part, as well, by the replacement of some of the teeth developed about the time of birth by subsequent ones of larger size. Those animals which have only one set of teeth are said to be monophyodont (*μόνος*, single + *φύειν*, to put forth + *ὄδούς*, tooth); those which have two sets of teeth, an early (deciduous) and a later (non-deciduous) set, are called in contrast diphyodont (*δίς*, twice + *φύειν*, to put forth + *ὄδούς*, tooth); these characters, however, are not co-ordinated with others, and mammals, therefore, can not be contrasted, as has been attempted, into natural sections distinguished by such characteristics. In the marsupials only four teeth (one in each jaw on each side) are succeeded by larger teeth, the teeth which correspond to the milk teeth of other mammals persisting during life, with the exception of the third premolar. The teeth of the second set are developed from diverticula of the sacs in which originated those of the first set. The edentates, so far as known, are mostly monophyodont, but the armadillos and aard-vark are diphyodont, a set of milk teeth existing for a longer or shorter time after birth, and being finally succeeded, sometimes not until near maturity, by a second permanent set. The sloths are not yet fully known, but there is reason to suppose that they may also prove to be diphyodont also. Among the Carnivores, in the Fissipedes, or terrestrial species, the diphyodont type is well exemplified, the milk teeth being rather large, and retained for quite a long period, until finally replaced by the permanent set; but in the Pinnipeds the milk teeth are extremely rudimentary, and replaced before birth by those of the permanent series. In the majority of the toothed whales the teeth are those of the first or milk dentition, which persist throughout life, but the porpoise (*Phocæna*) is partly diphyodont, although the majority of the teeth belong to the milk dentition. Foetal whalebone whales have a single set of simple teeth which are absorbed before birth. In the rodents the great incisor teeth are permanent, and have no deciduous predecessors. In the case of those forms which have only three molars or less, as in the *Muride*, etc., these are permanent, being persistent milk teeth. In those forms, however, where the number of molars exceed three, the teeth in front of them are premolars, or teeth which have had deciduous predecessors.

Recent investigations have shown that the rudiments of teeth are present in many mammals previously classed as monophyodont, but that they fail to develop, and that diphyodont mammals possess germs of a third set, possibly of a fourth.

The rows of teeth in almost all species exhibit interruptions of varying extent. These interruptions (diastemas or diastemata) most frequently exist between the incisors and canines of the upper jaw for the reception of the canines of the lower, and in the lower jaw between the canines and molars for the reception of the canines of the upper jaw. When the canines are reduced in size, there is often a corresponding reduction in the extent of the diastemas; and in man, where the teeth are all nearly on the same level, the series in both jaws are perfectly uninterrupted; and in

this respect man is distinguished from all the other living mammals, although approached by certain of the lemuroid species. The character is, however, not exclusive, and in certain extinct forms, notably those of the ruminant family of *Anoplotheriidae*, there are also uninterrupted series of teeth in the two jaws. The diastemas, however, are by no means always co-ordinated with the development of the canine teeth, but very frequently result from the elongation of the jaws and the reduction of the anterior molar teeth, as in most of the ungulates and in all the rodents, in which latter the canines are never developed.

The teeth of mammals are, in respect to situation, function, or mode of replacement, divisible into four groups, incisors, canines, premolars, and molars. The incisors (Lat. *incidere*, to cut) are the teeth in the front of the jaws; those implanted in the premaxillaries above, and those immediately opposing them below. The canines (Lat. *caninus*, dog-like) are the usually prominent teeth just back of the incisors. The upper canine is the tooth situated immediately behind the suture dividing the premaxillary from the maxillary; the lower canine is that tooth which, when the jaws are closed, lies in front of the upper canine. Premolars are teeth back of the canines which have taken the place of those borne at or developed soon after birth, and molars are those back teeth which have had no deciduous predecessors. In some marsupials there may be as many as ten incisors, but in the placental mammals there are never more than six in either jaw. This is the normal number, but in some species there may be fewer, or even none. There are never more than four canines, one on either side of each jaw, and they may be entirely wanting. The number of premolars and molars is variable, particularly so in the lower groups; in the higher groups the typical number is four premolars and three molars. A complete typical dentition may therefore be said to comprise 44 teeth: incisors $\frac{3}{2}$, canines $\frac{1}{2}$, premolars $\frac{4}{2}$, molars $\frac{3}{2}$, a number shown by the hog, although uncommon among existing mammals. See Owen, *Odontography* (London, 1840-45) and *Comparative Anatomy and Physiology of Vertebrates* (London, 1866-68); C. S. Tomes, *Manual of Dental Anatomy, Human and Comparative* (London, 1882); and Wortman, *Comparative Anatomy of the Teeth of Vertebrates, in American System of Dentistry* (Philadelphia, 1886). See also DENTISTRY.

Revised by F. A. LUCAS.

Teffé, *tef-fá'*, formerly **Ega** or **Egas**: a town of the state of Amazonas, Brazil; on a lake formed by the little river Teffé near its mouth, on the southern side of the Amazon; 1,215 miles by the river route from Pará. Originally a Jesuit mission, it is now the most important river-port above Manáos, exporting rubber, sarsaparilla, etc. Teffé, or Ega, as it is still commonly called in English books, is celebrated in science as the residence of Bates, Agassiz, and other distinguished naturalists. Pop. about 5,000. H. H. S.

Tegnér, *teg-när'*, **ESAIAS**: poet; b. at Kyrkerud, Wermeland, Sweden, Nov. 13, 1782. His father, who was a poor parish priest, died early, but the son contrived to go to Lund in 1799, and in 1802 he graduated from the university with great honor; became docent in aesthetics, and in 1812 was promoted to the chair of Greek Literature. In 1818 he was elected a member of the Academy, and in 1824 he was made Bishop of Wexjö. In this position, for which he was but ill fitted by nature, he exercised a great and beneficial influence by his powerful eloquence and his energy in school matters. His talent was essentially lyrical, with a tendency toward the didactic. His first great poem, *Svea* (1811), although crowned by the Academy, was a protest against the conventionalism of the Academy, and had a decisive influence on the poetic development of the time. In *Nattvårdsbarnen* (The Children of the Lord's Supper, 1820), translated by Longfellow, he displayed his skill as a didactic poet, his model being taken from Goethe's *Hermann und Dorothea*. *Azel* (1820), influenced by Byron, though more popular than the preceding poem, is vastly inferior to it as a work of art, the poet's tendency to sentimentality and rhetoric appearing to excess. *Frithiof's Saga* (1825), which is his most celebrated work, and which has been translated into almost every European language and nineteen times into English, is a combination of ballads. In opposition to the French school, which with its pompous and pedantic or superficial and frivolous elegance predominated in the Swedish literature at the beginning of the nineteenth century, Tegnér unveiled the ideal of the romantic school, with its new relations between nature and art, and between art and religion. He

avoided, however, the excesses of the Phosphorists (see SWEDISH LITERATURE), whose obscurity was repugnant to his clear, logical mind. During the latter years of his life he suffered from melancholia, which in 1840 assumed an acute form. D. at Wexiö, Nov. 2, 1846. His collected writings (*Samlade Skrifter*) were published at Stockholm (7 vols., 1847-51; additional, 3 vols., 1873-74). See Georg Brandes, *Eminent Authors of the Nineteenth Century* (R. B. Anderson's trans., New York, 1886). Revised by D. K. DODGE.

Tegucigalpa, *tā-gōō-thēō-gaal-pāū*: capital (since 1880) and largest city of Honduras; beautifully situated in a plain or basin surrounded by mountains, 3,250 feet above the sea; 60 miles from its port of Amapala on the Gulf of Fonseca (see map of Central America, ref. 4-H). It is in the most thickly populated region of the republic, is the center of a fertile agricultural district, and has mines of gold and silver, which were formerly much more important. The most conspicuous building is the cathedral; the president's palace and other public edifices are unpretentious, and most of the dwellings have but a single floor. The city has a university, library, ladies' seminary, etc. The climate is mild and salubrious. A railway to San Lorenzo on the Gulf of Fonseca is projected. Pop. about 15,000. Tegucigalpa is the capital of a department of the same name, having an area of 3,475 sq. miles and a population (1889) of 60,170. H. H. S.

Tehran', or **Tehran**: capital of Persia; in lat. 35° 41' N., lon. 51° 23' E.; province of Irak-Ajmi, 70 miles S. of the Caspian Sea; in a sandy and stony plain at the southern foot of the Elburz Mountains, which rise here, in Mt. Demavend, 18,600 feet above the level of the sea (see map of Persia and Arabia, ref. 2-G). It was formerly surrounded by a mud wall 4 miles in circumference, 20 feet high, with 6 gates, but it has been extended beyond these limits. The streets for the most part are narrow, crooked, ill paved, and filthy, and the houses low and insignificant, generally built of mud, although there are some modern boulevards and houses in Western style. Some mosques, bazaars, and caravansaries are handsome structures, however, and the palace of the shah, forming a city by itself, adjoining the northern part of the wall, is vast and elegant. Tehran became the residence of the shah in 1796, and has increased considerably since that time. It has some manufactures of carpets, cotton and linen goods, shoes and hats, and carries on a brisk trade. Its population varies much from winter to summer, as the shah and all the wealthier citizens leave it early in spring on account of the intolerable heat and unhealthful atmosphere. Pop. estimated at 210,000. In the vicinity are the ruins of Rei, the *Rhages* of Scripture, the ancient capital of Parthia and the birthplace of Harun al Raschid.

Revised by M. W. HARRINGTON.

Tehri': a small hill-state under British control in the Himalayas. See GARHWAL.

Tehuacan, *tā-wāa-kaän'*, or **Tehuacan de los Granados**: a town of the state of Puebla, Mexico; in a dry but fertile valley, 31 miles, by a branch road, from Esperanza on the Mexican Railway; station on the Mexican Southern Railway on the line from Puebla to Oaxaca; 5,250 feet above the sea (see map of Mexico, ref. 7-H). Lying on the best route from the plateau to the Gulf of Tehuantepec, it is a place of considerable commercial importance. At the time of the

Spanish conquest it was occupied by a powerful Nahuatl tribe. In the vicinity are ruins of pyramids and other structures, supposed to have been built by the Toltecs. Pop. about 12,000. HERBERT H. SMITH.

Tehuantepec, *tā-wāūn-tā-pek'*: town; state of Oaxaca, Mexico; on the Tehuantepec river, 13 miles from its mouth in the gulf of that name; station on the Tehuantepec Railway (see map of Mexico, ref. 9-1). It is of very ancient origin, was at one time the chief town of the Zapotec Indians, and later was occupied by a branch of that tribe which submitted to Alvarado in 1522. Pop. 8,000. H. H. S.

Tehuantepec, Isthmus of: a constriction of the American continent, in Southeastern Mexico, between the Bay of Campeche (Gulf of Mexico) on the N., and the Gulf of Tehuantepec, an arm of the Pacific, on the S. Its width, in the narrowest part, is 131 miles. The mountain chains, on reaching the isthmus, are suddenly depressed, with several passes below 700 feet. There have been many projects for a canal across this neck, and careful surveys, one by order of the U. S. Government, have been made with this end in view. Some of the reports are favorable, but the work would be enormously expensive. A railway from Coatzacoacoas on the N. to Salina Cruz on the S. now runs across the isthmus; it was constructed by the Mexican Government and was opened for traffic in 1894. (See also SHIP-RAILWAYS.) As long ago as 1847 the U. S. Government endeavored, without results, to procure a right of way over the same route. The great importance of communication through the isthmus may be seen from the accompanying illustration.

Map showing the relation of Tehuantepec to commerce.

Physically, the Isthmus of Tehuantepec separates Mexico from Central America, the land E. of it, with Yucatan, belonging rather with the latter than with the former region. HERBERT H. SMITH.

Te'idae [Mod. Lat., named from *Te'ius*, the typical genus; cf. Braz. *teguixin*, name of one of the species]: a family of leptoglossate lizards distinguished by the single premaxillary bones and deeply bifid tongue covered with scale-like papillae. The family is peculiar to America (especially the tropical portions). *Teius teguixin*, of Brazil, attains the length of 6 feet. When pursued and brought to bay it fights with its tail, with which it can inflict violent blows, as well as with its teeth. It is an indiscriminate feeder, taking small animals (mammals, frogs, and birds), and frequently robbing bees of their honey after driving them from their nests. Its flesh is esteemed, and is somewhat like that of a chicken.

Teignmouth, *tin'mūth*: town; in Devonshire, England; at the mouth of the Teign in the English Channel; 12 miles S. of Exeter (see map of England, ref. 14-E). Teignmouth is a popular watering-place; has a promenade, a pier, baths, etc. Pop. (1891) 8,292.

Teignmouth, JOHN SHORE, First Baron; b. in Devonshire, England, Oct. 8, 1751; went to India as a cadet 1769; became Persian translator at Murshedabad 1773; accompanied Warren Hastings to England 1785; became a member of the supreme council at Calcutta 1786; took a prominent part in the formation of the revenue and judicial systems of India, especially the measure of zemindar proprietorship of the soil, which took effect under Lord Cornwallis's administration; was made a baronet 1792; was Governor-General of India from Aug., 1793-97; was an intimate friend of Sir William Jones, whom he succeeded as president of the Asiatic Society of Bengal Apr., 1794; was chief author of the code of laws for Bengal published in 1793; was created Baron Teignmouth at the expiration of his term of office 1797; returned shortly after to England; was the first president of the British and Foreign Bible Society 1804-34; became a member of the board of control and of the privy council Apr., 1807, and was a prominent member of the religio-philanthropic circle known as the Clapham Sect. D. in London, Feb. 14, 1834. He edited the *Works* of Sir William Jones (13 vols.), to which he prefixed a memoir; and his own *Life and Correspondence* (2 vols., 1842) was published by his son, the second baron.

Teinds: originally, the tenth part of the produce of lands appropriated by the law of Scotland to the support of the clergy. The earliest statute on the subject is that of David II., c. 42. Teinds were limited to the products of industry, and were drawn in kind; for example, the beneficiary went upon the land and carried off every tenth sheaf of wheat. After the Reformation teinds were not collected by the clergy, but belonged either to the crown, to lords of erection (called titulars), to the original founding patrons, or to grantees from the Church, although they were chargeable with the payment of stipends to the clergy of the established Church. At present teinds are a burden not on the fruits of land nor on the land itself, but on its rent or annual value to the extent of one-fifth thereof. This change has been beneficial to the land-owner, as most of the rentals were valued nearly two centuries ago at a rate not above one-thirtieth of their present worth. Provision has also been made for the redemption of teinds by the land-owner upon his paying a sum equal to nine years' purchase of their value if they belong to titulars, or to six years' purchase if they are in the hands of patrons. The management of teinds, including their collection, valuation, and sale, as well as the power of "assigning or modifying competent stipends to the parochial clergy out of the teinds of the parish and of uniting and disjoining parishes," is vested in the court of session as commissioners of teinds. See Erskine, *Principles of the Law of Scotland*, bk. 2, tit. 10; Bell, *Principles of the Law of Scotland*, §§ 837, 1146-1163. F. M. BURDICK.

Teisias: See STESICHORUS.

Tejada, Lerdo de: See LERDO DE TEJADA Y CORREAL.

Tejuco: See DIAMANTINA.

Teka'mah: town; capital of Burt co., Neb.; on the Tekamah creek, and the Chi., St. P., Minn. and Omaha Railway; 5 miles from the Missouri river, and 42 miles N. of Omaha (for location, see map of Nebraska, ref. 9-11). It is in an agricultural, stock-raising, and fruit-growing region, and has 4 churches, a system of public schools whose diplomas admit to the State University, a national bank with capital of \$50,000, a State bank with capital of \$30,000, and 2 weekly papers. Pop. (1880) 776; (1890) 1,244; (1895) estimated, 2,000. EDITOR OF "BURT COUNTY HERALD."

Tekirdagh: See RODOSTO.

Teleautograph [from Gr. *τῆλε*, far + *αὐτός*, self + *γράφειν*, write]: the name given by Elisha Gray to an instrument invented by him by which autographic messages can be transmitted electrically. The mechanism consists of a transmitting and a receiving instrument, together with two conducting wires, and by its use handwriting, drawings, etc., are instantly reproduced at the receiving-point in facsimile. The message or drawing is produced with an ordinary lead pencil near the point of which two silk cords are fastened at right angles with each other. These cords connect with the mechanism of the transmitter, and, following the motion of the pencil, produce positive and negative electrical impulses through the action of a permanently magnetized steel gear-wheel, the teeth of which induce pulsations as they pass by an electro-magnet. The receiving mechanism at the terminus of the conducting wire is driven by an electric motor operated by a local battery. The pulsations, as they arrive,

control an escapement-wheel driven by the motor which moves the writing lever in exact unison with the writing pencil of the transmitter. The movements of the pencil of the writer are reproduced by the shifting of a friction-wheel driven by two disks, one of which gives it an advance and the other a retrograde movement, dependent upon the wheel being brought into contact with one or the other of the two disks. The receiving pen is a capillary glass tube placed at the junction of two aluminum arms; it is supplied with ink from a reservoir through a small rubber tube in one of these

The teleautograph (transmitting instrument).

arms. The pen passing over the paper leaves a facsimile of the sender's motions. The writing is made and reproduced on continuous strips of ordinary paper 5 inches in width. As each line is completed the movement of a lever advances the paper the proper distance for the beginning of a new line. The same operation brings the two instruments into unison in case of discrepancy in their movements. Satisfactory tests of the practical working of the teleautograph have been made between Chicago and Cleveland, and London and Paris.

RALPH W. POPE.

Tel'edu, or Stinkard: a small carnivorous mammal, *Mytilus meliceps*, of the family *Mustelidae*, found in the mountainous parts of Java and Sumatra. It is said rarely if ever to descend much below the level of 7,000 feet above the sea. It secretes, like the skunks of America, an intolerably offensive fluid. It is rather nearer the badgers than the skunks in its structure and habits, as well as appearance. The teludu is blackish brown, with a broad white mark along its back and head. Its motions are slow. Its flesh is eaten by the natives.

Revised by F. A. LUCAS.

Telegraph [from Gr. *τῆλε*, far + *γράφειν*, write]: in general, any apparatus or process for conveying intelligence to a distance other than by voice or writing. The idea of speed is included, the telegraph being employed only to transmit intelligence more quickly than can be done by ordinary means. Sound, light, and electricity, owing to the rapidity with which they are propagated, form the most convenient agencies for telegraphing. For long distances light and electricity are immeasurably superior to sound.

The necessity of transmitting intelligence to a distance with rapidity and certainty was felt by the ancients, and many expedients were resorted to under different circumstances. These were usually simple, and exhibited little mechanical contrivance. The *semaphore* was the first really efficient telegraph. It was invented by Claude Chappé, and adopted by the French Government in 1794. It consisted of an upright post supporting a pivoted horizontal bar, which could be placed at various inclinations. This had two smaller arms pivoted to its extremities, and capable of being placed at various angles. By independent movements the apparatus was susceptible of ninety-eight distinct positions, and of thus exhibiting the same number of different signals, conventionally representing letters, numbers, words, or sentences. The speed of transmission under the most favorable circumstances was about three signals per minute. The semaphores were placed upon high towers, 4 or 5 miles apart. Much ingenuity was expended by Chappé and others in arranging a system of lights to enable the semaphore to be used at night, but with only partial success. In fogs and snowstorms this system was entirely useless. Before the introduction of the electric telegraph almost every country in Europe maintained lines of semaphores between its capital and the principal ports upon its seaboard. Perhaps the most important and costly undertaking of this kind was the great line constructed by Nicholas I. of Russia, from the Austrian frontier through Warsaw to St. Petersburg, which had 220 stations. The semaphores were erected

upon the summits of substantial and lofty towers, and the whole work cost several millions of dollars.

Another system of ocular telegraphy consists of alternately exposing and cutting off a continuous beam of light directed from the sending to the receiving stations, the characters being formed on the same principle as those of the conventional telegraphic alphabet, shortly to be described, which consists in breaking a continuous line into sections of varying length. In 1861 Moses G. Farmer made a series of successful experiments with this method between Hull and Nantasket on the coast of Massachusetts, and it also appears to have been employed about the same time by the officers of the U. S. Coast Survey on Lake Superior, where, by means of equatorially mounted mirrors, telegraphic messages were exchanged between stations 90 miles apart with ease and rapidity. During the campaign of Gen. Miles against the Apaches in New Mexico and Arizona a system of thirteen stations was established, over which, during a period of four months, more than 1,800 messages, containing some 35,000 words, were sent. The savages were surprised and confounded by the way in which intelligence of their hostile movements became known hundreds of miles away. The French have established heliographic communication between the islands of Mauritius and Reunion in the Indian Ocean, the stations, which are on mountain-peaks, being no less than 133 miles apart. Even this has been surpassed by the U. S. Signal-corps, which has exchanged messages between Mt. Uncompahgre, Col., and Mt. Ellen, Utah, a distance of 183 miles. In 1862 this system was taken up by Capt. Colomb and Maj. Bolton and introduced into the British navy, electric and calcium lights being employed at night and a collapsing drum closing upon its central hoop by day. During the siege of Paris messages were often sent 20 or 30 miles from one elevated point to another by the use of a calcium light concentrated and directed by lenses. More recently it has been proposed to employ a similar alphabet of short and long sounds for signaling between vessels at sea.

Telegraphing by Electricity.—As soon as it became known that electricity could be conducted by wires to a distance, it began to be regarded as a possible means of conveying intelligence. The earliest suggestion of this kind seems to have been contained in a letter to *The Scots Magazine* dated Feb. 1, 1753, the authorship of which has never been satisfactorily determined. The writer proposed to employ insulated wires equal in number to the letters of the alphabet, the signals being given by means of frictional electricity. In 1774 Lesage, of Geneva, constructed the first electric telegraph, which was practically a realization of the above idea. It had twenty-four wires, each connected with a pith-ball electroscope, the signals being given by frictional electricity. From this time forward many ingenious attempts were made to employ frictional electricity for telegraphic purposes, most of which it is unnecessary to notice in detail. In 1816 Francis Ronalds constructed a telegraph, making use of frictional electricity and a single wire, and exhibited signals by the divergence of pith-balls combined with synchronously revolving dials. He fully appreciated the value of his idea, and strove to bring it before the British Government, but was informed that "telegraphs of any kind are now wholly unnecessary, and no other than the one now in use will be adopted." In 1828 Harrison Gray Dyar, of New York, invented a telegraph, the principle of which consisted in sending discharges of frictional electricity through a wire, which were to be recorded upon a sheet of moistened litmus-paper moving at a uniform rate. The relative intervals between the discharges were to indicate the letters of the alphabet. There is evidence that this invention was experimentally tried on Long Island the same year in which it was invented, but little is definitely known respecting the results. In 1820 Ampère suggested that the deflection of a needle by the galvanic current might be used for telegraphic purposes. In 1830 Baron Schilling constructed a telegraph having five vertical needles, and in 1835 he exhibited his invention, simplified to a single needle, at Bonn. This was shown by Moncke at Heidelberg in 1836 to W. Fothergill Cooke, who immediately set to work to devise and construct a telegraph for practical use, consisting of a pair of three-needle instruments, with keys and reciprocal system. He also invented the electro-mechanical alarm and the detector for discovering the position of faults in the lines. In Feb., 1837, he became associated with Wheatstone, and took out a patent with him the same year. In 1839 the first actual electric telegraph was constructed, extending from Padding-

ton to Drayton, in England, a distance of 13 miles. It had six wires and five needles. The wires were wound with hemp and laid in a pipe on the surface of the ground. In 1839 Dr. W. O'Shaughnessy at Calcutta, India, built the first over-ground line of iron wire on bamboo poles. It was 21 miles long, and worked by Cooke's signal-needle instrument. Meanwhile in the U. S. Joseph Henry's experiments in electromagnetism had demonstrated the feasibility of transmitting signals by a current of electricity through insulated wire.

Samuel F. B. Morse, of New York, during a voyage home from France in 1832, conceived the idea of making signs at a distance by means of a pencil moved by an electro-magnet and a single conducting circuit, the paper being moved under the pencil by clockwork. He constructed a working model of his invention in 1836, and exhibited it to several persons the same year, but not publicly until 1837. Several years were devoted by Morse and his associate Alfred Vail to improving the invention and endeavoring to interest the public in the project. It was not until 1844 that the first public line was completed between Washington and Baltimore (40 miles), and the first message transmitted May 27 of that year. Within a few years, however, lines were extended to the principal cities of the U. S. The Morse telegraph was introduced into Germany in 1847, whence it has spread all over the Eastern hemisphere, and may now be said to be the universal telegraph of the world. Gauss and Weber, of Göttingen, Germany, constructed a telegraph in 1833 consisting of a magnetic needle acted upon by magneto-electric currents. Their invention was taken up by Steinheil in 1836-37, and practically worked out to a high degree of perfection. The discovery that the earth may be employed as part of a telegraphic circuit was made by him. Steinheil's telegraph never went into extensive use, owing to the introduction of the Morse system in Germany.

The earliest experiment on record in submarine telegraphy was made by Dr. W. O'Shaughnessy at Calcutta in 1839. He laid a copper wire, insulated with a coating of cotton thread saturated with pitch and tar, across the river Hugli, and transmitted signals through it. In 1842 Morse made experiments with a cable between Castle Garden and Governor's island in New York, and obtained results that demonstrated the practicability of submarine telegraphy. In 1847 J. J. Craven, of Newark, N. J., insulated an iron wire with gutta-percha and placed it in the circuit of the New York and Washington telegraph line, submerging it in the waters of a small creek. The success of this experiment led to the laying of a gutta-percha cable between New York and Jersey City in 1848. In 1850 an experimental line was laid across the English Channel, followed in 1851 by a permanent cable, which is still in use. The success of this undertaking at once revived the suggestion of laying a cable across the Atlantic Ocean from Ireland to Newfoundland. In 1854 the attention of Cyrus W. Field, of New York, was directed to the subject, and mainly through his efforts a company was formed, principally of British capitalists, to undertake the enterprise. The first attempt was made in Aug., 1857, but it was unsuccessful, the cable parting 300 miles from shore. The following year the attempt was renewed, and the enterprise successfully completed Aug. 5, 1858. The electrical condition of the cable was faulty from the first, but signals and communications were exchanged with more or less facility until Sept. 1, when the cable failed altogether. During this time 366 messages, containing 3,942 words, were interchanged between Europe and America. Several attempts to raise and repair the cable were made without success, and this disastrous result discouraged further enterprise in the same direction for a number of years. The experience gained, however, was of the highest value, and the success of the Malta and Alexandria (1861), Persian Gulf (1864), and other deep-sea cables led to a renewal of the attempt to cross the Atlantic in 1865, which again resulted in the breaking of the cable after 1,186 miles had been paid out. The following year, however, a new cable was successfully submerged, being landed at Newfoundland in perfect working order July 27, 1866, and the great problem was thus at last definitely solved. In September following the lost cable of 1865 was picked up and completed. From that date such rapid progress has been made in the extension of telegraphic cables that no isolated system of telegraphs is to be found throughout the world.

All electric telegraphs may be said to consist of three parts: first, an apparatus for generating or producing the electric current; second, a conductor for conveying the

electricity from one point to another as required; and, third, apparatus for transmitting and receiving the signals.

I. **SOURCES OF ELECTRICITY.**—The electricity used in telegraphy may be derived either from the voltaic battery, the magneto-electric machine, or the thermo-electric battery. Of these, the voltaic battery has been the most commonly used, though latterly much has been done in developing the capacity of the dynamo-electric machine, which in most large stations has successfully replaced the voltaic system. The employment of the thermo-battery is very infrequent.

A. **Voltaic Batteries.**—Of these, the sulphate of copper battery, invented by Daniell in 1836, is the most generally employed. It is constructed in various forms, the most useful of which are (1) the gravity battery, invented by Fuller in 1853, which is almost exclusively used in the U. S., and (2) the trough battery, another form of the same, used in England. (3) The manganese battery, invented by Leclanché in 1867, is extensively used in France and England; (4) the nitric-acid battery of Grove; and (5) the chromic-acid battery, such as that of Bunsen is now but little used. (6) Storage batteries or accumulators are employed in many of the larger European stations and in some few instances in the U. S.

B. **Magneto-electric Machines.**—The earliest form of this apparatus was Pixii's, which is employed in Wheatstone's dial telegraph. Siemens's (1855), a much more efficient apparatus, is largely used in dial and other special telegraphs. In 1879 S. D. Field successfully applied the Siemens dynamo machine in the Western Union telegraph office in New York, with highly economical results, ten small dynamos replacing 35,000 cells of battery. Since that date the dynamo machine has been adopted in most of the larger stations.

C. **Thermo-electric Batteries.**—No permanently successful installation of this kind was made until the year 1895, when H. B. Cox's apparatus was introduced on the lines of the Commercial Cable Company in New York. The consumption of gas in the ordinary operations of the lines is 7 cubic feet an hour.

Circuits.—In applying electricity from any source to the production of telegraphic signals, it is generally done in one of three ways: (1) by completing the circuit of a battery or other generator, and giving signals by causing currents of determinate polarity to traverse a line normally free from electricity; or (2) by connecting the battery and line, so that a constant current will traverse the latter, the signal being given by interrupting this current; or (3) by arranging the battery and line as in the last case, and giving signals by reversing the polarity of the current instead of interrupting it.

II. **TELEGRAPHIC CONDUCTORS.**—Conductors are usually carried through the air, but when required may be placed under ground or under water. In either case they must be well insulated with non-conducting materials.

A. **Over-ground.**—Galvanized iron wire weighing from 320 to 740 lb. per mile and hard-drawn copper wire weighing from 166 to 209 lb. per mile are used in the U. S. The largest wire is used for the longest lines, and equivalent sizes are used in most of the European countries. The wires are supported on wooden poles placed along railways or highways from 8 to 10 rods apart. From 1 to 50 wires may be conveniently placed on one line of poles, the lowest being 20 feet from the ground. Iron poles are seldom used except in desert and tropical countries. The wires are attached to the poles by insulators of a bell or inverted cup shape, which are supported by brackets or cross-arms of wood or iron. In the U. S. insulators are usually of glass, in Europe and Asia of brown earthenware or white porcelain. In large cities the wires are frequently carried on standards fixed upon tall buildings.

B. **Under-ground.**—Wires are now laid under ground in the principal cities of Europe and also in New York and other large cities of the U. S. In London No. 13 copper wires, coated with gutta-percha to a diameter of $\frac{3}{16}$ ths of an inch, are used. The required number of these are laid in a cable served with tarred tape. The cables are made in lengths of 400 yards, and drawn into iron pipes laid 2 or 3 feet below the surface of the ground. Boxes with trap-covers are placed every 400 yards for convenience in testing wires and drawing them in and out. The same system has been adopted in other cities of Great Britain, and also in New York. In Paris the cables are placed in the sewers. The plan of inclosing wires wrapped with fibrous material loosely within a metal tube filled with paraffin oil under pressure (Brooks's system) is much less expensive, and has been used to some extent. Paper insulation has also proved successful.

C. **Submarine.**—The early submarine lines were simply ordinary iron wires coated with gutta-percha to a diameter of half an inch. In the cable laid between Dover and Calais in 1851 four gutta-percha coated wires were wrapped with hemp and inclosed in a wire rope for protection. This general plan has been followed in all cables since constructed. The Atlantic cables are composed of a copper strand of seven wires, forming the conductor, surrounded by several distinct layers of gutta-percha and covered by a serving of jute; outside of this is a protecting armor of ten wires of homogeneous iron, each enveloped in fine strands of Manila hemp. In shallow waters, where cables are exposed to injury from anchors, the armor is often made enormously thick and heavy, sometimes weighing as much as 20 tons a mile. The modern type of deep-sea cable weighs about 2 tons for each mile.

III. **TELEGRAPHIC APPARATUS.**—The apparatus used in telegraphy may be conveniently divided into recording and non-recording. Of each of these there are several varieties, which will be described in order.

A. **Recording Telegraphs.**—These are of two classes, one recording arbitrary signs, and the other ordinary printed letters. (1) **Marking Telegraphs.**—(a) Morse's is by far the best known and the most extensively used of this class. Its characteristic feature is the *register*, which is constructed in many forms, but upon the general principle shown in the diagram. A horizontal lever is mounted upon a fulcrum, *a*, and armed at one end with a steel point, *c*, projecting upward and nearly touching a ribbon of paper, *f*, which is carried along at a uniform rate by a grooved roller just above it, the roller

The telegraphic register.

being impelled by a system of clockwork, *e*. The opposite end of the lever carries a soft iron armature, *n*, suspended just above the poles of an electro-magnet, *t*. The end of the wire helix surrounding this magnet terminates in binding-screws, *g g*, to which the conducting wires are attached. A current of electricity traversing the helix of the electro-magnet causes it to become powerfully magnetic, attracting the armature, *n*, to its poles, and thus pressing the steel point, *c*, against the paper ribbon moving above it upon the grooved roller. A continuous line will in this manner be embossed upon the paper as long as the armature remains attached to the poles of the magnet. When the current is interrupted, the magnetism disappears, and the spring, *d*, draws the marking-point away from the paper. Thus the length of the line embossed upon the paper corresponds to the greater or less length of time that the electric current is allowed to traverse the helix of the electro-magnet, *t*. This is governed by the transmitting instrument termed the key, which is simply a small horizontal lever with a finger-knob at one end and a spring beneath. The wire leading from the line is connected to this lever, and when the latter is depressed by the finger of the operator, it comes in contact with a metallic stud, known as the anvil, to which the battery wire is attached; thus the circuit is completed and the current permitted to flow into the line. When the latter is but a few miles long, the battery and key are connected directly by a wire with the electro-magnet of the register; but when the distance is greater, an instrument called the *relay* is employed. This consists of an electro-magnet with a lever mounted like that of a register, except that the marking-point is replaced by a contact-point, which opens and closes the circuit of a local battery, and this in turn operates the register. A considerable number of relays with their registers may be placed at as many different points upon the same line, and all operated simultaneously by a key at any point; and, in fact, this is the arrangement usually adopted in the U. S. The greatest length of line ordinarily worked in one circuit is about 500 miles, and the number of

relays at different points varies from 2 to 30, and even 40. The line or main batteries are usually placed at the two ends of the route, though each station has of course its local battery of one or two cells. The alphabetical code, believed to have been devised by Vail, consists of arbitrary characters composed of combinations of short lines termed dots and longer ones termed dashes, separated by varying spaces. This alphabet, it will be seen, is capable of being written with facility by means of the key and register above described. The following is the alphabetical code used in the U. S., Canada, Mexico, and Central America:

THE AMERICAN TELEGRAPHIC ALPHABET.

A	---	J	---	S	---
B	---	K	---	T	---
C	---	L	---	U	---
D	---	M	---	V	---
E	---	N	---	W	---
F	---	O	---	X	---
G	---	P	---	Y	---
H	---	Q	---	Z	---
I	---	R	---	&	---
1	---	4	---	8	---
2	---	5	---	9	---
3	---	6	---	0	---
		7	---		
	Period	(.)	---		
	Comma	(,)	---		
	Interrogation	(?)	---		
	Exclamation	(!)	---		

In all other parts of the world the *international telegraph alphabet* is used, as follows:

A	---	J	---	S	---
B	---	K	---	T	---
C	---	L	---	U	---
D	---	M	---	V	---
E	---	N	---	W	---
F	---	O	---	X	---
G	---	P	---	Y	---
H	---	Q	---	Z	---
I	---	R	---		
1	---			6	---
2	---			7	---
3	---			8	---
4	---			9	---
5	---			0	---
	Period	(.)	---		
	Comma	(,)	---		
	Interrogation	(?)	---		
	Exclamation	(!)	---		

The international alphabet is preferable, as it contains no spaced letters; these sometimes give rise to errors in reading communications. In Europe and Asia an improved register called the ink-writer is much used. A sharp-edged wheel is kept constantly revolving in a dish of colored fluid. The slightest pressure of this against the paper suffices to make a distinct mark, and thus the relay may be in most cases dispensed with, as a very feeble current is sufficient to make a perfect record. Electro-magnets intended for use in the main circuit, whether for relays or ink-writers, usually have helices composed of several thousand convolutions of very fine insulated wire, but for local circuits a small number of convolutions of coarse wire is sufficient. In order to transmit direct between points more than 500 or 600 miles apart, two or more circuits are coupled together by means of an automatic repeater, which was first accomplished by C. S. Buckley in 1848. By this means each circuit operates the succeeding one upon the principle of the relay. In this way direct communication has been had between points several thousand miles apart.

(b) *Bain's electro-chemical telegraph* was invented in 1846, and extensively used in the U. S., Great Britain, and Germany from 1849 to 1860, but is now superseded by Morse's. The system of signs and the transmitting key are similar to those of Morse. The record is made by passing the current from the line over an iron style and thence directly through a moving strip or disk of paper. The paper is saturated with a mixture of 10 parts of saturated solution of potassium ferrocyanide, 2 parts each of nitric and hydrochloric acid, and 1 part of chlorinated lime. The electric current causes the solution to unite chemically with the iron of the style, forming Prussian blue. A very weak current suffices to give a distinct mark. No electro-magnet is required in this system except to operate an alarm.

(2) *Printing Telegraphs.*—The earliest conception of a telegraph which should record messages in printed Roman letters is due to Alfred Vail, of New Jersey (1837). The first model of such an instrument was made by Wheatstone (1841). (a) *House's Telegraph.*—This was the earliest prac-

tical printing instrument. It was first invented in 1841, introduced in 1847, and largely used in the U. S. until about 1860. It is simple in principle, though complicated in construction. The twenty-six letters of the alphabet, a period, and a blank are engraved on the edge of a type-wheel, upon the shaft of which is a scape-wheel of fourteen teeth. The type-wheel revolves by manual power, but is held in check by a double-acting anchor escapement. The latter vibrates by the alternate action of an axial electro-magnet and a retracting spring. When at rest, the blank space on the type-wheel is in front, the circuit being complete. If it is interrupted the scape-wheel advances half a tooth, presenting the letter A, and when restored it again advances, presenting B. If the circuit is opened fourteen times and closed fourteen times alternately, the type-wheel will make a complete revolution. It is obvious that any particular letter may be presented by breaking and closing the circuit the proper number of times. This is effected in practice by a metallic contact-wheel at the transmitting station. This wheel has fourteen teeth and fourteen equal spaces; its axis is connected to the line. A flat spring connected with the battery touches each tooth as it revolves and transmits the electric pulsations. The revolution of this contact-wheel is stopped at the proper place for each letter by a keyboard having twenty-eight keys. A cylinder fixed upon the axis of the contact-wheel carries twenty-eight pins arranged in a spiral, each pin turning with the cylinder underneath its own key. Each key is provided with a stop, which falls into the path of the pin and arrests the cylinder when the key is depressed. Thus when the cylinder is turned from one letter to another, just so many contacts and interruptions are given as will advance the type-wheel the same distance. The printing is effected at the receiving station by the action of an eccentric which is automatically released when the wheel pauses at any letter. It makes a single revolution, forcing the paper against the letter presented by the type-wheel, and then advances the paper, which is in the form of a continuous ribbon, so as to leave a clear space for the impression of the succeeding letter. Thus it will be seen that the instrument is operated wholly by manual power, the only office of the electric current being to secure a corresponding movement between the type-wheel of the receiving and the contact-wheel of the transmitting instrument. The apparatus requires a powerful electric current, and it seldom operates satisfactorily on a line more than 250 miles in length. (b) *Hughes's Telegraph.*—This was invented by D. E. Hughes in 1855, and has been extensively used in Europe since 1860. The essential principle of the apparatus is the synchronous movement of two constantly revolving shafts at two stations. This is effected by means of a governor consisting of a recoil escapement and a vibrating bar. The shaft at the transmitting station carries a revolving contact-maker, and the corresponding one at the receiving station a type-wheel similar to that of House. The contact-maker travels over a circle of twenty-eight pins which are connected with the same number of piano-keys. Each pin represents a letter, and is raised by the depression of the corresponding key when a letter is to be transmitted. The contact-maker, which travels round the circle of pins with a motion uniform with that of the type-wheel at the receiving station, comes in contact with the raised pin at the same instant that the corresponding type upon the type-wheel is passing the platen and closes the circuit. An electro-magnet at the receiving station releases a cam which throws the platen carrying the paper against the type as it is passing, thus printing the letter. Only one pulsation is thus required for the printing of each letter, and by the use of a peculiar form of electro-magnet a very weak current suffices to do the work. (c) *The combination instrument* is a modification of Hughes's. It retains the principle of synchronous mechanism at the sending and receiving stations, but it differs much in details. It has an electro-magnetic governor instead of a vibrating spring, and is more simple and durable in its construction than the Hughes apparatus. It was invented in 1859 by G. M. Phelps, and was formerly used on many of the principal lines in the eastern part of the U. S. (d) *Phelps's Electro-motor Telegraph.*—This apparatus was invented in 1860, and in 1875 was put in use by the Western Union Telegraph Company between Boston and Washington. The mechanism is driven by a small electric motor connected with a special battery. This is more convenient and economical than the manual power required by the House machine or the heavy weight and clockwork of the Hughes apparatus. The synchronous movements of the

transmitting mechanism at one station and the type-wheel at the other are maintained by means of a centrifugal governor attached to the motor, which instantly reduces the strength of the local current by which the latter is propelled whenever the speed of revolution tends to exceed the prescribed limit. The synchronous movement of the Hughes apparatus is retained, except that both the type-wheel and the revolving contact-maker are simultaneously arrested for a given integral portion of a revolution during the transmission and printing of each letter. An improved form of the automatic union for bringing the two instruments into correspondence whenever transmission is suspended for a few moments (invented by Farmer, 1858) has also been applied to this instrument. (e) *Telegraphs for Financial and Commercial Reporting.*—The method of reporting the fluctuations of the prices of stocks, gold, merchandise, etc., by means of automatic-printing telegraph instruments placed in the offices of merchants, brokers, and other interested persons, and of which several hundred are often simultaneously operated by a single person located in the central exchange, originated in New York in 1867, and has since extended to the principal cities of the U. S. and of Europe. The instruments which have been principally used are those of Calahan, Pope, Edison, Phelps, Van Hoesenbergh, and Smith, though many others have aided in the perfection of the apparatus. The general principle is the step-by-step movement of the House apparatus, but two type-wheels are made use of—one for letters and the other for numerals and fractions—which print in parallel lines on the same strip of paper. By an ingenious device invented by Dujardin in 1867 the platen is automatically shifted from one type-wheel to the other by the operator at the central station according as he wishes to print letters or numerals. These instruments also have an automatic union invented by Foote (1869). The printing is in most cases effected by a special electro-magnet. (f) *Printing Telegraphs for Private Use.*—These are constructed upon a plan similar to the instrument for commercial reporting, and thousands of them were used by manufacturers, merchants, and others from 1870 to 1878, after which they were practically superseded by the speaking telephone. The most successful were those of Gray, Chester, and Anders. Any intelligent person after a few minutes' instruction can print a communication at any distance, even in the absence of an attendant, by depressing the proper keys upon a lettered keyboard. The speed of transmission is from 10 to 30 words per minute, depending upon the instrument used and the skill of the operator.

B. *Non-recording Telegraphs.*—These may be divided into two classes—visual and acoustic. They give only evanescent signals, and are sometimes termed semaphores.

(1) *Visual Telegraphs.*—(a) *Cooke's Needle Instrument.*—This is simply an upright galvanometer needle surrounded by a coil of fine insulated wire, and is operated from the sending station by two keys, one of which sends a positive current, deflecting the needle to the right, and the other a negative current, deflecting it to the left. The alphabetical code is the same as the Morse, a deflection to the left signifying a dot, and to the right a dash. Owing to its simplicity and convenience this apparatus was almost universally used in Great Britain from 1840 until within a few years, since which time it has been superseded on all the important lines by the Morse system. It still retains its supremacy for railway use. (b) The dial instrument, invented by Wheatstone in 1840, is arranged on the same plan as a type-printer, but is much more simple, as an index-hand and dial carrying the alphabet replaces the somewhat complex type-wheel and printing apparatus. These are largely used for private and police telegraphs, and in Europe for railway purposes, as they are easily operated by unskilled persons. The best known are those of Wheatstone, Siemens, Anders, Bréguet, and Chester. The three first mentioned are operated by magneto-generators and require no battery. (c) The visual indicator, invented by C. H. Pond (1880), is a species of dial telegraph employed in connection with the fire-alarm system (see below), to exhibit the number of a signal-box simultaneously when an alarm is given.

(2) *Acoustic Telegraphs.*—Of these, the best known and most important is (a) the sounder, which is simply a Morse register stripped of all its parts except the electro-magnet, writing lever, and retracting spring. The operator interprets the sounds made by the motion of the lever up and down between its stops. This method was taken up by

operators in the U. S. about 1848, and the sounder has now almost entirely superseded the recording apparatus in the U. S. and Canada, as experience proves that the speed of transmission is practically doubled, while, somewhat paradoxically, the proportion of errors is largely diminished. The same method is employed in India, and to an increasing extent in Great Britain and other parts of Europe. The operator reads from the instrument, and simultaneously copies the message. For military purposes the sounder, together with a manipulating key, is often reduced in size, so as to be contained in a pocket-case not larger than a tobacco-box and weighing but a few ounces, and yet forming a completely equipped Morse telegraph station, which may be connected with a line at any required point. (b) The fire-alarm telegraph, invented by W. F. Channing and M. G. Farmer, of Boston (1851), is a most ingenious and useful application of the telegraph, in use in the principal cities and towns in the U. S. and other countries. A series of locked signal-boxes are placed at convenient intervals throughout a city or town; each of these contains mechanism which, when wound up by simply pulling a hook, will instantly transmit through the connecting telegraph wires a determinate numerical signal representing that individual box and no other. The signal thus transmitted is instantly sounded, by means of mechanism controlled by electro-magnets in the circuit, upon the church and tower bells and upon large gongs placed in all the fire-engine houses. So effective is this system in practice that frequently in less than thirty seconds after the discovery of a fire a number of engines will be on their way to the spot. This invention has been the means of saving millions of dollars' worth of property and thousands of lives since its introduction. By a subsequent invention of W. B. Watkins (1871) the fire itself is made to transmit a numerical alarm-signal automatically. Thermostats are placed in the rooms of a building, which when heated above the normal temperature close a circuit and trip the clockwork of an automatic transmitter. The rest of the apparatus resembles Channing and Farmer's. (c) The district telegraph (1870) is another application of the above system. Signal-boxes are placed in the houses of persons desiring them, and connected telegraphically with a central station. By simply turning a crank at any hour of the day or night a messenger or policeman may be instantly summoned or a fire-alarm transmitted. Many thousands of these signal-boxes are in use in New York and other important cities of the U. S. (d) An application of the same principle is found in the municipal or police telegraph, one arrangement of which, for public use, employs a number of street stations, from any of which police assistance may be summoned by a citizen at a moment's notice. Another adaptation is an automatic attachment to safes, vaults, and other structures having valuable contents, so that in case the fastenings are tampered with by unauthorized persons a definite alarm is silently sent to a central station, at which officers are always on the alert.

IV. SPECIAL METHODS OF TELEGRAPHY.—A. *The Automatic Process.*—At an early period in the history of telegraphy attempts were made to devise methods of transmission, by which means the capacity of each individual wire might be largely increased, and the evils which necessarily arise from a multiplication of wires in a great measure avoided. In 1846 Alexander Bain, of Scotland, patented an automatic telegraph, in which the messages, instead of being transmitted by a key or manipulator, were first prepared by punching out the telegraphic characters in a ribbon of paper, the dots and dashes being represented by perforations of different lengths. In order to transmit the prepared message the strip was caused to pass rapidly over a metallic roller driven by clockwork or otherwise, and a light spring or brush of metal, resting upon the paper over the roller, made contact with the latter through each of the perforations as they successively passed under it, and thus completed the electric circuit between the battery and the line. By this means several operators could be employed simultaneously in preparing messages, which could be run through the machine and recorded on chemical paper at the receiving station at a high rate of speed. The system was tried in Great Britain and the U. S. in 1849 and 1850, but no practical advantage over hand-labor resulted, perhaps largely owing to the fact that no convenient means of perforating the paper had been devised. In 1856 Dr. W. Siemens, of Berlin, invented a perforating-machine with three keys, by which the time required to prepare a dis-

patch was much lessened. He applied this method in conjunction with Morse's receiving apparatus on many Russian lines in 1853-55, but the automatic feature was soon abandoned. In 1856 J. P. Humaston, of Connecticut, invented a keyboard perforator which produced a complete character by the touch of a single key. The same year Siemens introduced the polarized relay, operated by alternate positive and negative currents. In 1858 Wheatstone, in England, modified Siemens's apparatus, and in its subsequently improved form it is largely used on the Government lines in Great Britain, especially for sending large quantities of press news in duplicate. The same system is used on a number of the more important lines in the U. S., and is probably destined to be still more extensively employed.

B. The Autographic Process.—In 1848 F. C. Bakewell, of London, patented a modification of Bain's automatic process by which a facsimile of the transmitted dispatch is produced at the receiving station. The original is written on tin-foil with insulating ink, and wrapped round a metallic cylinder rotated by clockwork at a uniform rate. A style rests upon the cylinder as it turns, and also receives a slight lateral motion by a screw as the cylinder revolves; it thus describes a spiral path, passing successively over the whole surface of the tin-foil on the cylinder. The battery-current passes through the style to the tin-foil, thence to the cylinder and over the line, but is necessarily interrupted when passing over the insulating lines of the writing. The cylinder at the receiving station is covered with Bain's chemical paper, and revolves synchronously with that of the transmitter. The iron style traces a continuous blue line on the paper, except when the current is interrupted by the style passing over the lines of writing upon the tin-foil. The chemical paper therefore appears covered with fine parallel blue lines, forming a ground-tint upon which a facsimile of the writing appears in white. This apparatus, though practically unsuccessful on account of the difficulty in maintaining sufficiently accurate synchronism, illustrates the principle of all its successors. Abbé Caselli, of Florence, in 1856 greatly improved this process by employing a pendulum to control the synchronous movements of the two corresponding instruments, and by so arranging his electrical connections that the facsimile appeared in blue on a white ground. In 1865 this process was put in actual service on some of the French and Russian telegraphs, and has given very good results. The more recent inventions of Lenoir and Meyer in France record in ink by means of electromagnets. W. E. Sawyer in 1874 invented several improvements in the autographic process, one of which consists in transferring the original message, written upon ordinary paper, to a metal plate for transmission. (See also TELETYPEGRAPH.) As the autographic process dispenses entirely with specially skilled labor, it is not unlikely that it may yet prove to be of considerable economic value.

C. The Multiple Process.—The idea of increasing the capacity of a line by transmitting two or more communications simultaneously appears to have been first suggested by Farmer, who in 1852 made a successful experiment on one of the municipal lines in Boston. He employed two rapidly revolving synchronous commutators, one at each end of the line, which served to bring the latter successively and simultaneously into connection with two or more short branches at each terminus, in each of which ordinary telegraphic instruments were inserted. Thus the current in the corresponding branches at each terminus, though apparently continuous, actually consisted of rapidly recurring pulsations. From the difficulty of maintaining synchronism, and other causes, nothing practical resulted from the experiment. In 1873 Meyer, of France, exhibited at Vienna an apparatus on this principle capable of transmitting four simultaneous communications. It has been employed in actual service between Lyons and Paris, and is said to have a capacity of 110 messages per hour. In 1853 Dr. W. Gintl, of Austria, invented a method of simultaneous transmission in opposite directions by connecting an auxiliary local circuit with the Morse key, which passed through a separate but opposing helix upon the instrument at the home station, and thus neutralized the effect of the current transmitted over the line upon the home instrument, while at the same time it was left free to respond to the increased current in the line due to the depression of the distant key. Practically it was found impossible to adjust the local current so as to perfectly compensate that of the main line. The following year Carl Frischen, of Hanover, substituted a branch of the main current for the local current of Gintl, and the

method thus improved was used to a limited extent in Austria and Holland. In 1855 Stark, of Austria, proposed a method of simultaneous transmission in the same direction, and suggested that it might be combined with Frischen's plan, thus enabling four simultaneous dispatches to be sent over one wire. In 1858-59 Farmer made successful experiments with a modification of Frischen's method on several American lines. J. B. Stearns, of Massachusetts, revived Frischen's method in 1868, and in 1872 enormously improved it by adding a condenser to compensate the effects of induction in long lines. He introduced the improved method known as the "duplex" into general use, first in the U. S. and afterward in Europe. In 1874 Thomas A. Edison invented a new method of simultaneous transmission in the same direction, which has been combined with Stearns's method, forming a "quadruplex." Subsequent improvements by G. Smith and others have vastly increased the effectiveness of this method. It is in extensive use, and is regarded as an improvement of the highest value.

D. Submarine or Cable Telegraphy.—Owing to the embarrassment arising from electrostatic induction in long submarine cables, special arrangements have been devised by Lord Kelvin (better known as Sir William Thomson), C. F. Varley, and others without which it would scarcely be possible to transmit through them at a sufficient rate of speed to render them commercially valuable. The method employed on the Atlantic cables is a modification of Cooke's single-needle method, and is arranged as follows: Two keys, which when depressed transmit respectively positive and negative currents, are employed at the sending station in connection with a battery of a few elements only. The current of the battery does not pass directly into the cable, but into a condenser of considerable capacity composed of tin-foil plates interleaved with paraffined paper, the opposite side of which is attached to the cable, and the condenser transmits a wave of electricity through the cable. As there is no actual circuit from one terminus to the other, this arrangement serves to cut off the earth-currents, which would otherwise be troublesome. The receiving instrument employed is Thomson's reflecting galvanometer, the message being read by the right and left deflections of a spot of light upon a screen, which moves to and fro as in the ordinary needle telegraph. The recording or siphon galvanometer of the same inventor writes down the deflections by means of ink spurts from a fine glass siphon-tube attached to a coil suspended between powerful fixed magnets, and which swings to the right or left as the positive or negative pulsations pass through it. The record appears upon a ribbon of paper in the form of a straight line when no signal is passing, but with waves to the right or left when pulsations pass through the coil. Important improvements in this apparatus have been introduced by Charles Cuttriss. Mr. Stearns successfully applied his system of duplex telegraphy to the Valentia-Newfoundland cables in 1877-78, thereby doubling their carrying capacity. Dr. Muirhead about the same time effected the same result upon the Marseilles-Alexandria cable by a different system. All the important cables are now worked in this manner.

E. Telegraphy without Wires.—This idea was originally based on the principle of induction, and is nearly as old as the ordinary electric telegraph. Until the invention of the telephone, however, there was no practical instrument of sufficient sensibility to permit of tangible results. The only commercial application of the principle is the so-called "train telegraph," by which communication may be practically established with moving railway trains. The method of accomplishing this is the connection of the metallic roof of the car with the receiving apparatus therein, the principal feature of which is a magneto-telephone. An ordinary telegraph line alongside the track, but closer to it than usual, conveys the induced pulsations to and from the station. This system is entirely practicable, and was operated for some time on the Lehigh Valley Railroad. On Dec. 12, 1896, a young Italian electrician, Signor Marconi, exhibited through Mr. W. H. Preece, at Toynebee Hall, London, a system of telegraphy without wires depending upon electrostatic instead of electro-magnetic effects, in which electric (Hertzian) waves at the rate of 250,000,000 per second were utilized. Like light, these smaller waves are capable of being projected in one direction only, and consequently their power was not so enormously diminished in transmission to any distance. The apparatus was concealed in two boxes, one of which was placed in each end of the hall. The signal was made in one, and a bell immediately rung in the

other. A previous experiment had been made on the top of the General Post-office, followed by another at Salisbury Plain, where signals were transmitted 1½ miles. No complete description of the apparatus has been divulged, beyond the fact that a 10-inch induction coil was used with a Lodge originator and a parabolic reflector.

F. Pneumatic Telegraph.—This system has been employed for many years in Europe, and is extensively used in the U. S. Brass tubes 2½ inches in diameter are laid in trenches under the streets. The messages are rolled up and placed in a cylindrical carrier of leather or felt about 8 inches in length, closed at the front, and provided with a flange loosely fitting the inside of the tube, while the rear end is left open. The carriers are driven in one direction by compressed air and in the other by an exhaust, both operated by a powerful air-pump at the central station. Packages of ten or twelve messages are sent a distance of half a mile in a few seconds. See PNEUMATIC TRANSMISSION.

The best authorities give the total length of telegraph line in all countries at the beginning of 1894 as 900,000 miles, of which 158,000 were submarine. The total mileage of wire was 2,632,000. Nearly all the submarine lines have been established by British companies.

The most extensive telegraphic system in the world is that of the Western Union Company of the U. S. In 1894 it had 190,303 miles of telegraph lines, 790,792 miles of wire, 21,166 offices, and transmitted 58,632,237 messages.

The number of messages transmitted in 1893 in some of the principal countries of the world was as follows:

Great Britain.....	69,907,848	Hungary.....	6,522,302
Germany.....	33,172,116	India.....	4,585,606
Austria.....	12,008,084	Italy.....	9,681,512
Belgium.....	5,444,864	Netherlands.....	4,429,771
Denmark.....	1,817,738	Norway.....	1,719,189
France.....	47,017,117	Sweden.....	2,101,850
Switzerland.....	3,838,323

FRANKLIN L. and RALPH W. POPE.

Telegraph Companies, LAWS RELATING TO: The business of telegraph companies is so "affected with a public interest" that they may be authorized to take private property for their use, upon making due compensation (see EMINENT DOMAIN), and that the construction of their lines, as well as their rates and their treatment of customers, may be regulated by the state. It is now settled, contrary to the doctrine of a few early decisions, that these companies are not common carriers. Their legal status, however, is quite analogous to that of common carriers. Their employment is of a public nature, which subjects them to duties over and above those created by their contract obligations. For example, they must take all lawful messages that are offered, up to the limit of their facilities; they must transmit them, as a rule, in the order of reception; they must treat all customers impartially, even to the extent of furnishing facilities for rival companies. *Del., etc. Telephone Co. vs. State of Del. ex rel. Postal Telegraph Co.*, 50 Fed. R. 677.

Regulations.—They have the right to make reasonable

rules and regulations touching their dealings with customers. All messages may be required to be plainly written; prepayment may be required, as well as a deposit for an answer; and the hours during which messages will be received and sent may be fixed. Whether the regulation that the company will not be responsible for the correctness of a message, unless it is repeated, is reasonable, and therefore binding on customers who assent to it, is a question upon which the courts are divided. In Great Britain, in New York, and in other States of the U. S. the regulation is approved. (*Kiley vs. W. U. Tel. Co.*, 109 N. Y. 231.) The weight of authority in the U. S., however, is against its validity. Two main reasons are assigned for this view: first, that a company can exempt itself from liability from errors only arising from causes beyond its control; second, if the repetition of the message is necessary to insure its accurate transmission, then the law devolves upon the company the duty of repeating it. (*W. U. Tel. Co. vs. Blanchard*, 68 Ga. 299; 45 Am. R. 480.) Some authorities enforce express contracts between customer and company that the latter shall be liable only for gross negligence or willful wrongdoing; but by most courts in the U. S. they are deemed against public policy, and void. *Gillis vs. W. U. Tel. Co.*, 61 Vt. 461.

Liability.—British courts hold that the duty of the company to transmit and deliver a message arises wholly out of the contract with the sender, and there is no duty toward the receiver. This view is not entertained to any extent by courts in the U. S. On the other hand, it is generally held that a receiver may recover against the company such damages as proximately result to him from its negligent default. (*Tel. Co. vs. Dryburg*, 35 Pa. St. 298.) This liability is rested in part upon the common-law duty incident to the exercise of a public calling, and in part upon the theory that the receiver may sue because he is a beneficiary under the contract between the sender and the company. It is held generally that the company will not be liable beyond the charge for sending the message, where it does not show on its face that it relates to a business transaction, or is in cipher. (*Cf. Baldwin vs. Tel. Co.*, 45 N. Y. 744, with *W. U. Tel. Co. vs. Hyer*, 22 Fla. 637.) The foregoing rules are applicable to telephone companies. F. M. BURDICK.

Telegrapher's Cramp: See NEUROSIS.

Telemachus (in Gr. Τηλέμαχος): in Greek mythology, son of Odysseus and Penelope. He was an infant when his father joined in the war against Troy. After the termination of the war, he sailed out, accompanied by Athene in the shape of Mentor, and visited Pylos, Sparta, and other places, where he expected to gather some information concerning the fate of his father; and on his return to Ithaca he found Odysseus living there in disguise with the swineherd Eumæus. A recognition took place, and he then aided Odysseus in slaying the suitors and clearing the house of its many burdensome guests, who ate up its wealth without bringing it any honor. His voyage forms the subject of Fénelon's celebrated epic *Télémaque*.

Telemeter: See STADIA MEASUREMENT.

Teleoceph'ali [Mod. Lat.; from Gr. τέλειος, complete + κεφαλή, head]: a group of fishes, recognized by some authors, containing most of the teleost or true bony fishes.

Teleology [from Gr. τέλος, τέλος, end, purpose + λόγος, discourse, reason]: the doctrine which finds intelligent ends or purposes in the processes and forms of nature. The evidences of purpose in nature were recognized by the Greeks, especially by Aristotle, who distinguished the final or teleological cause of a thing—i. e. the purpose of its existence or activity—from the material and efficient causes of the same thing.

Teleology has been used to support the theistic theory of the world in each of the periods of modern speculation. The teleological argument for the existence of God is by many made the strongest argument—from the evidence of design in nature to the existence of an intelligent designer. The rise of modern evolutionary theory, using the principle of natural selection to account for single instances of adaptation found in nature, tended for a period to throw the theory of design into disrepute, the conception of mechanical law being substituted for that of purpose in the interpretation of nature. Undoubtedly the evolutionary conception does remove much of the force from the oft-cited instances of adaptation, such as of the eye to light, of the

color of an animal to its environment, etc. But while this is true, the theory of teleology takes on, in view of it, a profounder and more inspiring form, as part of the broader idealistic philosophy of the world. The new construction of teleology exhibits two great contrasts to the old view as it was urged in the natural theology of such men as Butler and Paley.

1. We are now led to look for design in nature not in the planning of a particular instance of adaptation, for all such instances might have come about by the more mechanical operation of natural selection upon variations; but we are to look for it in the very conception of law—be it mechanical or be it mental. The principles of natural selection and probability when expressed in formulas are themselves consistent expressions of plan or mind in nature. For why should mechanical law, uniformity, conservation of motion—why should any steady *conception* be applicable to nature at all, if not because nature is in some sense the expression or embodiment of that steady conception or idea? So the presence of the idea which we ordinarily call *law* in nature is itself the best teleology, although the law be what is called mechanical, and subversive of the old theory of design.

2. Further, the old view of design made the designer and the design or plan both logically apart from nature. God, it held, imposed certain designs upon nature. This conception also goes under in the minds both of naturalists and of philosophers who accept current evolutionary doctrine. But again the resulting conception is more profound and inspiring. The idea of plan or law in nature yields what is known as the modern doctrine of immanence. Nature is law-abiding and progressive just because it is itself the manifestation and realization of intelligence. God is immanent in the world and in man; both the world and man in their law-abiding character show just the nature and reality of God. And the universe as a whole gives the movement of development which naturalists construe in its particular aspects in terms of law. This newer statement of teleology is found both in intellectual idealists, such as Caird and Green, and in the critical realists, as represented by Trendelenberg and Lotze.

LITERATURE.—See the chapters on Descartes, Anselm, Kant, Butler, Hegel, in the *Histories of Philosophy*, by Erdmann, Fischer, Ueberweg; also the literature in the article God. Special books are Janet, *Final Causes* (New York, 1876); Lotze, *Metaphysic* (Oxford, 1884); Martineau, *Study of Religion* (London and New York, 1888).

J. MARK BALDWIN.

Teleostei [from Gr. τέλειος, complete + ὄστειον, ὄστου, bone]: a primary division of fishes embracing the great majority of living species, so called on account of the ossified condition of the skeleton, the cartilages being almost entirely replaced by bone. Among other characters which separate them from the other true fishes are the absence of a conus arteriosus in the heart, of a spiral valve in the intestine; the presence of a gill-cover (operculum), and usually the presence of true scales on the body, although the skin is sometimes naked, sometimes covered by bony plates. The subdivision of the group is yet in a most unsatisfactory condition, and the various species have probably descended from more than one ganoid ancestor. In general words, the sub-class can be divided into two groups. In the one, the *Physostomi*, the air-bladder, when present, is connected by a duct with the alimentary canal, and the ventral fins are never spined. In the *Physoclisti* the connection between air-bladder and alimentary canal becomes lost with growth, and the fins are usually spined. The *Teleostei* are further subdivided into more than a dozen orders, the names and characters of which must be sought in the article ICHTHYOLOGY and in technical works, such as there cited.

J. S. KINGSLEY.

Telepathy [from Gr. τήλε, far + πάθος, feeling]: thought-transference, or the phenomenon of the reception by the mind of an impression not traceable to any of the ordinarily recognized channels of sense, and assumed to be due to an influence from the mind of another person, near or remote. Thus the sphere of telepathy is not the same as that of *clairvoyance*, in which it is assumed that the mind of the subject may receive an impression of *impersonal facts*, or things at a distance. The subject who receives the impression is called the percipient, the one from whom the influence emanates is usually called the agent, in accounts of experiments on this phenomenon.

In the earlier works on animal magnetism there are many reports concerning subjects who are said to have developed

the faculty of obeying the unspoken will of their magnetizer, going to sleep and waking, moving, acting, and speaking in accordance with his silent commands. More recently there have been public exhibitors of "mind-reading," and their performances have been imitated in private circles by the so-called willing-game. In most of these feats the agent is required to think intently of some act while he lays his hands on some part of the so-called mind-reader's person. The mind-reader, either promptly or hesitatingly, will then usually perform the act. It is safe to assume that wherever such personal contact between the pair is allowed, the percipient is guided by the encouragement or checking which the agent's hands more or less unconsciously exert upon his at first tentative movements; so that muscle-reading, and not mind-reading, is the proper name for this phenomenon. There are, it is true, reports of success in the willing-game where no contact was allowed; but in the absence of authentic details, they can not be taken as evidence that telepathy exists. For the same reason the earlier mesmeric reports have doubtful evidential value. The operators took too few precautions against "suggesting" to the subjects by other channels than speech what their will might be. It is only within recent years that we have learned to measure the acuteness with which an entranced person with his mind concentrated upon his hypnotizer will divine the intentions of the latter by indications which he gives quite unconsciously by voice or movement, or even by the mere order of sequence of what he does. On these accounts, evidence in the strict sense for telepathy must be sought in a small number of experiments conducted by a few more careful observers since about 1880. These experiments, taken in the aggregate, appear to make it unreasonable to doubt any longer the fact that occasionally a telepathic relation between one mind and another may exist.

In a faultless experiment on thought-transference certain precautions must be observed. To avoid previous collusion between agent and percipient the agent should receive from a third party the idea to be transferred; and the latter should, when possible, select it by drawing lots or by some other appeal to chance. This is to exclude the possibility of himself and the percipient being led by number-habits, diagram-habits, or other parallel paths of inner association to a common result. The percipient should not be in the room when the idea is determined on; and when possible it should be chosen in silence, written down, and shown, if it need be shown beforehand, in written form. The percipient should, if possible, do his guessing in another room. In any case he should be blindfolded, and there should be no conversation with him during the performance, the signal that he must attend to his inner impressions being given by bell or other sound. Physical contact between agent and percipient must not occur, and if the percipient writes or draws his result the agent should not look on, since an unconscious commentary by changes in breathing, etc., might reveal to the percipient whether he was going right or wrong.

The *Proceedings of the Society for Psychological Research* contain some records of experiments made under approximately faultless conditions. In certain cases the ideas to be transferred were diagrams

FIG. 1.

or drawings. A couple of examples will show the success reached when at its best. Fig. 1 is from a series made with Mr. Blackburn, agent, G. A. Smith, percipient, in which

successes instead of 29, which was the figure probable on the assumption of "chance." The numbers thought of were the 90 two-digital ones, from 10 to 99. They were drawn at random from a bowl and thought of by the percipient's sister. In a later series of 400 trials with this percipient the completely right guesses were 27 instead of the chance number 4; there were moreover, 21 guesses with the digits reversed, and 162 with a single digit in its right place.

Similar, though less extended and perhaps less conclusive,

series of experiments at guessing ideas have been reported in the Society for Psychical Research *Proceedings* by various experimenters—Dessoir, Schmall and Mabire, W. J. Smith, von Schrenk-Notzing, and Barrett and Gurney. The observations last referred to were those first published. The subjects were two girls who, four years later when experiments were resumed, were found, when tested in each other's presence, to be cheating by a code of signals. Much has been made of the breakdown of this case. But very many of the earlier successes recorded of these children occurred when they were singly present, and often when only one experimenter knew the thing to be guessed. Collusion under such circumstances can not well be charged, although willingness to cheat rightly casts vague suspicion on all trials done with the percipient concerned, and shows the importance of making all tests under the conditions described as "faultless" a few lines back. Mr. Rawson finally, in vol. xi. of the *Proceedings*, gives a striking series of correct eard and diagram guesses.

On telepathy in the hypnotic state there are recorded in the *Proceedings* experiments by Dr. B. Thaw and Prof. and Mrs. H. Sidgwick. The conditions in the latter set seem to have been, on the whole, very careful, though not quite faultless in the technical sense. The agent was the hypnotizer, G. A. Smith. The things to be impressed were usually the numbers (of two digits) on eighty-one lotto-counters, drawn by Prof. Sidgwick from a bag and handed to Mr. Smith to gaze at, while the hypnotized percipient awaited the impression. There were four percipients, with 644 trials made with agent and percipient in the same rooms, and 218 made with them in different rooms. In the former set 131 trials were successful, though the digits were named in reverse order in 14 of these 131 cases. In the latter set there were only 9 successes. The "probable" number of successes by chance would have been in the former set 8, in the latter at most 3. Later, with three of the same percipients and three new ones, Mr. Smith still being agent, Mrs. Sidgwick and Miss Johnson report 252 trials and 27 successes (chance number = 4), with agent and percipient in different rooms. Mr. Smith transferred "mental pictures" to five subjects, successfully in 31 out of 71 trials in one room, in 2 out of 55 in different rooms. The subjects of the mental pictures were such things as "a boy skating," "a baby in a perambulator with nurse," "a mouse in a trap," etc.

Prof. Richet has described (*Proceedings of Society for Psychical Research*, vol. v.) a series of successes in guessing drawings in the hypnotic state; but as he found that the same subjects succeeded 30 times out of 180 trials in guessing the drawing when it was inclosed in an envelope and unknown to any one present, it is doubtful whether telepathy or clairvoyance be the cause of the success. Control-experiments showed that "chance" could give as many as 35 per cent. of good successes at matching pictures made arbitrarily by different persons with others taken at random from a large collection previously prepared. Richet's hypnotic subjects gave, however, 10 per cent. of good successes in 200 trials, and he concludes the existence of an unknown power.

Thus, to count only systematically pursued experiments, some of which are not mentioned here, there are accounts from more than a dozen competent observers concerning about a score of subjects, all seeming to show a degree of success in guessing very much greater than that which chance would give. Different readers, however, will weigh the evidence differently, according to their prepossessions. Much of it is fragmentary, and in much one or other condition of "faultlessness" in experimenting is violated. The mass, however, is decidedly imposing; and if more and more of this solitary kind of evidence should accumulate, it would probably end by convincing the world.

Meanwhile there are other kinds of telepathy which, illogically perhaps, impress the believing imagination more than high percentages of success in guessing numbers can. Such are cases of the induction of sleep in hypnotic subjects by mental commands given at a distance. Pierre Janet, Richet, Gibert, Ochorowicz, Hélicourt, Dufay, Daniex, Tolosa, Latour, and others are the relaters of these observations, of which the most important evidentially are those made on the celebrated somnambulant subject, Madame B., or "Léonie." Out of one series of 25 trials with this woman, there were 18 complete and 4 partial successes. Mr. Ochorowicz vouches for some of these, and gives also a long series in which silent commands were acted out by

Meanwhile there are other kinds of telepathy which, illogically perhaps, impress the believing imagination more than high percentages of success in guessing numbers can. Such are cases of the induction of sleep in hypnotic subjects by mental commands given at a distance. Pierre Janet, Richet, Gibert, Ochorowicz, Hélicourt, Dufay, Daniex, Tolosa, Latour, and others are the relaters of these observations, of which the most important evidentially are those made on the celebrated somnambulant subject, Madame B., or "Léonie." Out of one series of 25 trials with this woman, there were 18 complete and 4 partial successes. Mr. Ochorowicz vouches for some of these, and gives also a long series in which silent commands were acted out by

another hypnotic subject of his own, both he and she being, however, in the same room. The most convincing sort of evidence for thought-transference is given by the sittings of certain "test-mediums," of which the best worked-out case is that of Mrs. Piper, published in the Society for Psychical Research *Proceedings* for 1890-92-95. This lady shows a profuse intimacy, not so much with the actual passing thoughts of her sitters as with the whole reservoir of their memory or potential thinking; and as the larger covers the less, so the present writer, being as convinced of the reality of the phenomenon in her as he can be convinced of anything in the world, probably makes less exacting demands than he otherwise would on the sort of evidence given for minor grades of the power.

The authors of the word telepathy have used it as a theory whereby to explain "veridical hallucinations" such as would be the apparition of a person at a distance at the time of his death. The theory is that one who is dying or passing through some crisis is for some unknown reason peculiarly able to serve as "agent" and project an impression, and that the telepathic "impact" in such a case produces hallucination. Stated thus boldly the theory sounds most fanciful, but it rests on certain actual analogies. Thus a suggestion made to a suitable subject in the hypnotic trance that at a certain appointed time after his awakening he shall see the operator or other designated person enter the room, will post-hypnotically take effect and be followed at the appointed time by an exteriorized apparition of the person named. Moreover, strange as the fact may appear, there seems evidence, small in amount but good in quality, that one may, by exerting one's will to that effect, cause one's self to appear present to a person at a distance. As many as eight persons worthy of confidence have recently reported successes in this sort of experiment. The writer knows a ninth case, impossible to publish, but where the evidence (as far as taken) is good. Now the committee on the census of hallucinations of the Society for Psychical Research find that the "veridical" ones among them—those, namely, in which the apparition coincides with the death of the person who appears—are 440 times more numerous than they ought to be if they were the result of mere chance. For the particular data and logic by which this figure is obtained, see the report in vol. x. of the Society for Psychical Research *Proceedings*. Of course, if such a conclusion ever be accepted, and if the telepathic theory of such apparitions be credible, the probability that telepathy is the cause of success in the simpler number-guessing cases would be greatly re-enforced. The whole subject, so far as definite observation goes, is still in its earliest infancy.

WILLIAM JAMES.

Telephone [from Gr. *τῆλε*, far + *φωνή*, sound, voice]: a term originally applied by Wheatstone in 1840 to the various forms of rod and string telephones (as they are now called) in which sound-vibrations are transmitted from one point to another by means of a rod or tightly stretched string connecting two elastic diaphragms of membrane, wood, or other suitable material, and of which the well-known lover's telegraph is a type; but while in strictness the word telephone still refers to the acoustic as well as the electric telephone, the latter, on account of its universal use, is the instrument to which the term is chiefly applied.

As early as 1854 a crude suggestion as to the possibility of transmitting speech electrically was made by Charles Bourseul in *L'Illustration* (Paris), and in 1861 at Frankfort, Germany, Philipp Reis exhibited and for the first time published an account of his extended experiments in the same direction. Reis endeavored to secure the transmission of speech by a circuit-breaking operation. For a transmitter he employed a membrane to which was fastened a flexible strip of metal connected with one terminal of a voltaic battery. In the instrument originally described the membrane was stretched over the smaller end of a conical speaking-tube bored in a cubical block of wood, whence this form of transmitter is known as the bored-block transmitter. Opposite the outer surface of the membrane was placed a stiff brass spring connected with the conducting line-wire which ran to the receiver. From the end of this spring, which was opposite the center of the membrane, a platinum point projected toward the metallic strip. The distance between this point and the strip was such that when the membrane was set into

vibration by the voice of one speaking into the conical sound-tube, the metallic strip came into contact with the point on the forward motion of the membrane and broke contact with the point as the membrane retreated, thus making and breaking the battery-current once at each complete vibration of the membrane. The receiver employed consisted of a long helix of insulated wire wound about a knitting-needle, the whole being mounted upon a sounding-box. As was shown by Charles G. Page (1837), whenever the coils of an electromagnet are traversed by such an intermittent current there is a click produced at each make and break owing to the successive magnetization and demagnetization of the cores, and if the intermittences are sufficiently frequent the clicks will blend into a continuous musical sound, whose pitch is determined by the frequency of the breaks. Hence when the Reis receiver was connected in circuit with the transmitter and a battery, and the transmitter was operated as described, the alternate makes and breaks of the current produced by the intermittent contact between the metallic strip and point of the transmitter caused a sound to issue from the receiver. This sound would necessarily correspond in pitch with that uttered into the transmitter, since the pitch of a sound is determined wholly by the frequency or rate of vibration, which is necessarily the same for the knitting-needle of the receiver as for the membrane of the circuit-breaking transmitter which produces those intermittences of the current which excite the vibrations of the former. After the publication of his first paper Reis altered the shape of his transmitter, and caused to be manufactured and sold an instrument consisting of a hollow cubical box having a circular hole at the top which was closed by a membrane and furnished with a speaking-tube which entered the side of the box. To the membrane was fastened a flexible strip of metal. A light piece of sheet brass bent at right angles in a horizontal plane was loosely supported at its ends, while a pointed leg of platinum wire projecting from the angle rested upon the metallic strip over the center of the membrane. The circuit was completed through the strip and point. On speaking into the transmitter the angle-piece was tossed out of contact with the metal strip when the membrane diaphragm vibrated, thus producing an intermittent current. From its wide sale this transmitter, known as the cubical box transmitter, became more generally known than the earlier instrument.

Reis recognized the fact that much more than the reproduction of pitch at the receiver was necessary to reproduce speech. But he thought incorrectly that the amplitude of the vibrations of the receiver, upon which the loudness of the resulting sound depends, would be proportional to the amplitude of the vibration of the membrane of the transmitter, and that the reproduction of these two characteristics of the sound actuating the transmitter would be sufficient to reproduce that sound in its completeness.

Every sound possesses three characteristics, which determine and define it. They are pitch, which depends upon the frequency of the vibrations of the particles of the sounding body or those constituting the air-waves produced by it; loudness, which depends (other things being the same) upon the amplitude of vibration; and quality, which depends upon what is called the "form" of the vibration. Quality is that characteristic by means of which is recognized the particular kind of instrument producing the sound, as a piano, a violin, or the voice. It was proved by Helmholtz to depend upon the number, pitch, and relative loudness of the partial tones which constitute sound-vibrations, and which differ with different instruments. As these differ, the particular velocity with which the vibrating particle moves from instant to instant while executing its complete vibration will differ. See articles *Acoustics* and *Voice*.

If represented graphically according to the usual mode of illustrating such motions, the curves representing such different vibrations will have different forms to the eye, whence it has become customary to designate the corresponding differences in the vibrations thus represented by the term "form." And since the sound-waves possess a varying density from point to point corresponding to the varying velocity of their particles, they are also spoken of as having "form."

It follows from what has been said that no transmitter like that of Reis, which operates by breaking the circuit once at each full or complete vibration, can completely reproduce any sound, for it can not reproduce the quality. The receiver takes no cognizance of the mode of vibration of the transmitter between the breaks. The quality of the

sound issuing from the receiver depends substantially upon the physical conditions of the circuit, and whatever may be the character of the particular instrument whose sound actuates the transmitter when operated as described, the sound issuing from the receiver will be the same.

A method by which the quality of sounds in general, including those of articulate speech, can be reproduced, together with an apparatus embodying this method, was invented by Alexander Graham Bell and first published in U. S. Patent No. 174,465, dated Mar. 7, 1876. The method consists in the production and utilization of electrical undulations similar in form to the vibrations of the air of the sound-waves. The electrical condition of the line particles and the vibration of the receiver are controlled, not intermittently, at the end of each complete vibration, but throughout the whole duration and extent of this vibration. To do this the transmitting instrument must produce in the line an electrical current which possesses a variation in strength from instant to instant, similar to the corresponding changes in the density of the air in the sound-waves which actuate the transmitter, in which case the electrical changes will copy the aerial vibrations, so to speak, and the varying electrical current will be represented graphically by substantially the same curve that represents the air-waves. Hence the electrical undulations are spoken of as being similar in form to the air-waves. By the action of this undulatory current upon a suitable receiver, it will reproduce at the receiving end of the line air-waves which are similar in form to the electrical variations, and hence to the sound-waves actuating the transmitter.

The original apparatus devised by Bell was a form of what is now called a "magneto-telephone." It will be sufficient to consider the improved instrument, which has chiefly been used in the U. S. The transmitter and receiver are alike, and are shown in Fig. 1. F F is a compound-bar magnet,

Fig. 1.

with a soft-iron pole-piece, C, around which is wound a coil of insulated wire, D, whose terminals run to the binding posts, G G. H is a circular diaphragm of thin ferrotypc iron, held at its edge between the case of the instrument, K, and the mouth-piece, A. When used as a transmitter the instrument is put in circuit with a second one at the further end of the line, which serves as a receiver. The operation is as follows:

When the soft-iron diaphragm, H, is spoken to it takes up the motions of the particles of air and vibrates in accordance with these motions, and so moves toward and away from the magnetized pole-piece periodically with a velocity varying from instant to instant, according to the characteristic form of the air-waves.

In accordance with the well-known laws of electricity and magnetism, whenever the iron diaphragm approaches the pole of the magnet this will become stronger; an induced current of electricity will be generated in the coil, D, and will flow through the circuit. When the diaphragm recedes the pole will become weaker, and a current will be induced in the opposite direction. Moreover, the strength of the induced current will be proportional at each instant to the velocity with which the diaphragm is moving. (See ELECTRICITY.) Hence an undulatory current will be set up in the circuit which will be similar in form to the air-waves produced by the voice at the transmitter. This undulatory current flows through the coils, D, of the receiver, and increases or diminishes the strength of the pole of its magnet in a degree depending on the direction and strength of the current, that is, according to the direction and velocity of the motion of the diaphragm of the transmitter. Hence the magnet of the receiver will exert a varying pull upon the diaphragm, H, deflecting it more or less against the restoring force of its elasticity, and the vibrations thus impressed upon the diaphragm will be communicated to the air at the

receiving station. Since these possess all the characteristics impressed upon the electrical current by the vibrations of the diaphragm of the transmitter, the receiver will give out a sound similar to that uttered into the transmitter.

The Microphone.—The magneto-telephone just described has been universally employed as a receiver. As a transmitter, however, it was soon superseded by a subsequently invented and more powerful apparatus, the microphone. It had been known for a long time that when an electric current passed from one conductor to another through a "loose contact"—that is, when the contact-surfaces or electrodes rested only very lightly upon one another—there was at the joint a resistance to the electrical flow, which was lessened when the pressure was increased. Early in 1877 Emile Berliner proposed to utilize this property in a telephone transmitter. A metal diaphragm rested firmly against a metallic point or ball. A battery current passed from the former into the latter and thence to a suitable telephone receiver. On speaking to the diaphragm the vibrations of this produced a variation of pressure between it and the metal point without ever breaking the circuit, thus producing electrical undulations. The law of variation of resistance with pressure is such that the electrical and acoustic undulations have a like form. Shortly afterward Thomas A. Edison invented an apparatus identical in principle, but employing soft carbon as the material of one of the electrodes instead of making both of them of metal. Still later (May, 1878), Prof. David E. Hughes devised and described another apparatus of the same character, employing hard carbon, and gave to it the name microphone. Carbon is so excellent a material for the purpose that in practice it has always been made to constitute either one or both of the electrodes of the microphone transmitter.

Many forms of microphone transmitter have been employed. The two described are the ones that have been principally used in the U. S.

The Blake transmitter, the best known of these, was invented by Francis Blake, and first introduced into public use late in 1878. Its construction is illustrated in Fig. 2.

D is a diaphragm of sheet-iron against which rests lightly a small platinum button, K, which is suspended by a light leaf-spring, A. Around a button of hard carbon, C, is spun a brass weight, W. A rather stiff spring, S, sustains W and C. A and S are insulated from each other at their upper ends. K and W are the hammer and anvil electrodes respectively of the microphone. A current from a battery, B, passes through the joint between the two electrodes. When the diaphragm enters into vibration under the action of the voice it pushes the hammer electrode, K, into more or less intimate contact with the anvil electrode, C. The inertia of C, weighted as it is by W, keeps the anvil electrode from jumping away from the hammer electrode, and the spring S holds the two electrodes in proper position as regards the diaphragm. The varying pressure between K and C causes a corresponding variation in the strength of the current to take place, so that when a magneto-receiver is put in circuit with the transmitter speech is reproduced.

The proper normal pressure between the electrodes is secured by means of the bent lever, L, and adjusting screw, N.

Instead of placing the receiver in direct circuit with the battery and microphone, it is customary to cause the undulatory battery current to pass through the primary of an induction-coil in whose secondary, of much higher resistance, the receiving telephone is placed. This gives better electrical conditions for transmission over lines of considerable length. This arrangement is symbolically indicated at IC in the figure.

Fig. 2.

A very powerful form of microphonic transmitter, developed in the laboratory of the American Bell Telephone Company by A. C. White, is employed for long-distance transmission. Its construction is shown in Fig. 3. K K are

FIG. 3.

two polished buttons of hard carbon, the rear one of which is fastened solidly in a frame, while the forward one is riveted to the center of the metal diaphragm, D, and moves to and fro like a plunger when the diaphragm vibrates. The two carbon buttons are insulated from each other and form the opposite faces of a flat, cylindrical cell, which is closed at the front by a thin, flexible disk of mica concentric with the forward button and of greater diameter than this, so that the mica projects beyond the edge of the button. The disk is in front of the button, carried by the same piece that carries this and secured at its edges by an annular cap which holds it firmly while allowing perfect freedom of vibratory motion to the plunger and front button. The cell is filled partly full with coarse, granulated carbon powder. The current from a battery passes from the front button through the granulated carbon to the rear button. The buttons and the particles of carbon constitute the electrodes of the transmitter. An induction-coil is used, as with the Blake transmitter.

It is evident from what has been said regarding the microphone that microphonic action may be produced with a Reis transmitter by operating it so as to prevent any breaking of the circuit. When the Reis transmitter is coupled with a sufficiently sensitive receiver it is possible to transmit and reproduce speech by this operation. Whatever of quality has ever been transmitted by a Reis instrument was the result of this action, of which Reis was entirely ignorant.

The development of the art of telephony has necessitated the invention of a vast number of special contrivances for local and long-distance transmission. For long-distance transmission complete metallic circuits are employed rather than the grounded circuits usual in telegraphy, and such lines are also far more satisfactory for local business on account of their greater freedom from electrical disturbances.

Substantially all of the telephone business of the U. S. has been carried on by the licensees of the American Bell Telephone Company. Under the company's control there were on Jan. 1, 1894, 154,106 miles of long-distance ("extra-territorial") lines in use and 353,480 miles of local ("exchange") lines, of which 121,930 miles were underground. The total number of telephones in use was 566,491, the number of subscribers 237,186, the number of persons employed 10,421. The number of magneto-telephones in use Sept. 20, 1894, was 289,495, the number of Blake transmitters 218,782, and the number of long-distance transmitters 49,435. The number of telephone connections made at exchanges during 1893 was 600,000,000. The longest telephone line in actual commercial use extends from Portland, Me., to Milwaukee via Boston, New York, and Chicago, a distance of 1,337 miles. The complete history and theory of the speaking telephone have been brought out very fully in the protracted litigation regarding it which has been carried on in the U. S. courts. The fullest accessible discussion of these topics will be found in vol. cxxvi., *United States Reports*. The laws relating to the duties of telephone companies are in general the same as those relating to telegraph companies. See TELEGRAPH COMPANIES, LAWS RELATING TO.

CHARLES R. CROSS.

Telescope [from Gr. *τῆλε*, far + *σκοπεῖν*, to view]: an optical instrument for increasing the apparent magnitude of distant objects, or the size of their images on the retina. The essential parts of the instrument are two in number: a mirror or combination of lenses for bringing the rays of light which emanate from each point of the distant object to a focus, thus forming an image of the object, and an ocular for viewing this image. A refracting telescope is one in which the rays of light are made to converge to the focus by a system of lenses; a reflecting telescope is one in which they are made to converge by being reflected from the surface of a slightly concave, polished reflector.

The Refracting Telescope.—If the light reflected or emitted by the object to be observed were all of one color and one degree of refrangibility, and if a lens could be made of any shape desired, then a single lens would suffice for the object-glass of a telescope. Practically, however, such a lens will not bring all the rays to one and the same focus. Since glass exerts a more powerful refraction on blue than on red rays, a lens brings the blue rays to a shorter focus than the red ones; hence the use of a single lens gives a row of foci, making distinct vision impossible. This effect is called chromatic aberration. Moreover, if the lens is spherical, the rays which pass near the circumference of the lens will come to a shorter focus than those which pass through the central portions. This makes a second defect, which is called spherical aberration.

The Aplanatic Objective.—In the modern aplanatic telescope these aberrations are in great part obviated by the combination of two lenses, a double convex lens of crown glass and a concave lens of flint glass, as shown in Fig. 1.

FIG. 1.

For a statement of the principle by which chromatic aberration is thus obviated, see **ACHROMATISM**. The two lenses disperse the red and blue rays in opposite directions; that is to say, the crown lens, being convex converges the blue rays more than it does the red ones, while the flint glass, being concave, tends in an equal degree to diverge the blue rays away from the axis more than the red ones. On the other hand, the refracting power of the crown lens is stronger than that of the flint lens, so that the combined effect of the two is to bring the rays to a focus, while their opposite dispersions neutralize each other, and bring both blue and red rays to nearly the same focus. In addition, such curves may be given to the lenses that the spherical aberrations shall also annul each other, and thus all the rays be brought to one focus. It is this combination of achromatism with freedom from spherical aberration which gives perfection to the telescope.

The fact is, however, that no objective can be made of crown glass and flint glass which will bring all the rays absolutely to one focus. The reason of this is that the latter disperses the rays more and more in proportion to the former, as we pass toward the violet end of the spectrum. The result is that when the nearest approach to achromatism is gained, the extreme rays (blue and red) will come to a focus a little farther away from the objective than the intermediate rays, which are yellow or pale green. This defect is not serious in a small telescope, but becomes very serious in greater refractors. Makers of optical glass in Germany have devoted great attention to discovering kinds of glass which will not produce this secondary aberration. Partial success has been gained, but it is still questionable whether the new glasses possess the durability of the ordinary kinds and can be made of the requisite size for great telescopes.

The Photographic Telescope.—In consequence of the defect just described, a telescope which is best adapted for seeing will not be the best for taking photographs of heavenly bodies. The reason is that the best visual telescope brings the yellow rays to the shortest focus, and scatters the blue and violet rays farther along the axis. But the latter are those which have the best photographic effect. Consequently, in order to take the best photographs, the telescope must either have a weaker (less concave) flint lens or a stronger (more convex) crown lens than the ordinary visual telescope. In order that a telescope may be well adapted for both purposes some device must be employed to increase the effect of the crown lens, or diminish that of the flint lens. In the great Lick telescope a third lens is supplied, which is put over the objective when photographs are taken. One necessary effect of this method is to shorten the focus by several feet.

The Reflecting Telescope.—This instrument is so called

because the rays from the star or other distant object are brought to a focus by a slightly concave, parabolic reflector, which may be either of polished metal or of glass. For the great telescopes of Herschel, Rosse, Lassell, De la Rue, and all others previously to 1857, the reflectors were made of a combination of tin and copper, called speculum metal, which would bear a high polish. It is now more common to grind a reflector of glass, which is then coated with a film of silver, about $\frac{1}{16}$ of an inch thick, on the side toward the object. These latter must not be confounded with looking-glass mirrors, which are coated with tin-amalgam on the posterior side. Silvered-glass telescopes were invented by Steinheil, and reinvented in the same year by Foucault, whose admirable paper in the *Annales de l'Observatoire de Paris* (vol. v., 1859) is a model of what such memoirs should be. See Henry Draper's paper on this subject in the *Smithsonian Contributions to Science* (1864). Ever since the introduction of silvered glass, there has been a controversy as to its utility compared with speculum metal, but the balance has inclined finally to the former. A silvered speculum is permanent; for even though the silver coating be tarnished it may readily be repolished, or, if injured by dampness, be replaced without affecting the figure of the glass; it is many times lighter, and therefore demands less weight in the mounting, and is correspondingly more manageable; it is more reflecting, in the proportion of about 92 to 65, and in consequence a smaller aperture will give an equal brilliancy to objects, this being a great advantage in an unsteady atmosphere. Speculum metal is composed of copper and tin in the proportion of 32 to 14:911; it must be cast on a chill—that is, a slightly warmed iron surface; and that it must be annealed with the greatest care and for a long time.

Grinding and Polishing.—These operations do not differ much in the cases of metal and glass, except that the latter, being more rigid, will not take a permanent set if raised from its bearings, and, being lighter, can be more easily manipulated. The grinding and polishing of specula may be accomplished by machinery or by hand. When Hadley, Mudge, Edwards, Molyneux, Short, and others were making reflecting telescopes, the work was done altogether by hand, the tools being fixed on an optician's post, which allowed free motion all round the surface to be worked; but when the elder Herschel had advanced to the larger telescopes which he constructed, he found it desirable to use machinery. For many years the arrangement of this machinery was kept a profound secret until finally revealed by Sir John Herschel shortly before his death.

Silvering of Glass.—A large number of processes have been invented for coating glass with a thin and uniform film of silver. They all depend on reducing metallic silver from a solution of silver nitrate and ammonia, with perhaps the addition of potash. The reducing agent may be Rochelle salt, milk-sugar, inverted sugar, oil of cloves, aldehyde, etc. The best process is described in the *Monthly Notices of the Royal Astronomical Society* (Dec., 1875, vol. xxxvi., p. 76) by Martin, who made a 4-foot silvered-glass telescope for the Paris Observatory. The glass must be carefully cleaned with nitric acid, and afterward with potash and alcohol, and then placed face downward on a mixture of equal parts of the following four liquids: (1) A solution of 40 grammes of crystallized silver nitrate in a liter of distilled water; (2) a solution of 6 grammes of pure ammonium nitrate in 100 grammes of water; (3) a solution of 10 grammes of caustic potash (quite free from carbonate and chloride) in 100 grammes of water; (4) a solution of 25 grammes of sugar in 250 grammes of water, to which is added 3 grammes of tartaric acid, and the liquid is then boiled for about ten minutes to produce the inversion of the sugar. After the solution has cooled 50 cubic centimeters of alcohol are added to hinder any subsequent fermentation. The volume is made half a liter by dilution with water if the silvering is to be done in winter, or dilute still more if it is to be done in summer. The film of silver, if the potash is pure, may not need any polishing, and should in any case require only a few strokes of a buckskin pad slightly tinged with fine rouge.

The great difficulty with the reflecting telescope is that the speculum throws the rays back directly toward the object, so that the observer can not place his eye in front of the focus to see the object without obstructing the light which falls upon the mirror. This light must therefore be reflected backward or laterally by a second reflector. There are two ways of doing this; one, called the Newtonian, is shown in Fig. 2. A mirror, M, is placed at an angle of 45°

between the focus and mirror, but nearer the former, in such a position as to throw the light through the opening

FIG. 2.

at the side of the telescope where the image is formed, and is viewed by an eye-piece of the usual construction. A more convenient form is that shown in Fig. 3, which is known as

FIG. 3.—Cassegrainian telescope.

the Cassegrainian telescope. Here the light from the principal mirror meets a second slightly convex mirror placed between the principal mirror and the focus. From the second mirror it is thrown back through a central opening through the principal mirror, where the eye-piece is placed. This form is most convenient, because the observer looks directly up at the object.

In a modified form of the Cassegrainian telescope, called the brachi-telescope, which has been tried in Germany, the speculum is slightly inclined, so as to throw the rays to one side, admitting of the second reflector being so placed as not to prevent any of the light from falling on the speculum.

The reflecting telescope has the great advantage that chromatic aberration does not exist, because in all rays the angle of reflection is equal to that of incidence; while by making the mirror truly parabolic the spherical aberration can also be entirely obviated. It is therefore, in theory, the only perfect telescope. There is no limit to its possible size, and therefore no theoretical limit to its power. Unfortunately, the mechanical difficulties in its construction and use are so great that the astronomical work of the world is almost entirely done with refractors. The first difficulty is that if the mirror is more than a foot in diameter it is liable to bend under the influence of its own weight, and thus fail to bring the rays to one focus. By ingenious systems of supporting the mirror this defect can be partially cured, so that reflectors have been made of so great a diameter as 5 or even 6 feet. In the case of the celebrated telescope of Lord Rosse the diameter is 6 feet. Yet it does not appear that the contrivances for securing perfection of figure are entirely successful. Nothing has yet been seen or done with these great reflectors which can not be at least as well seen or done with much smaller refracting telescopes.

For the purposes of the amateur, small reflectors, say from 6 to 12 inches in diameter, can be made free from this difficulty, and are much cheaper than refractors of equal power. Another difficulty associated with them is the liability of the silver film to tarnish, especially near a city where gas is burned. Consequently the possessor of such an instrument must know how to resilver and repolish the mirror, directions for doing which are found in a preceding paragraph of this article, or must be near an expert who can do this.

The Eye-piece, or Ocular.—As essential as the object-glass or mirror of a telescope is a lens, or combination of lenses, for collecting the light from the image so as to form a second image on the retina of the observer's eye. In strictness, a single lens of short focus, such as is in common use for viewing minute objects, would suffice. But such a lens gives distinct vision only for a single point in the center of the field of view. Hence an astronomical eye-piece is made with two lenses. One of these, called the field-lens, is placed very near the focus of the objective; the other, called the eye-lens, is next the observer's eye. If the most distinct vision throughout the whole field is to be obtained, the best eye-piece is one of the Huyghenian form, shown in the article *Microscope*, Figs. 11 and 12. Here

the field-lens is placed a little inside the focus, so that the image is formed between the two lenses. A further improvement on this form was made by Airy, who proposed a meniscus for the field-lens. The eye-pieces of this pattern are called negative. Since the image is formed in the eye-piece itself, a micrometer can not be used with a negative eye-piece. Hence, in ordinary astronomical observations, when measures are made by the micrometer, a form known as the Ramsden eye-piece is used. This consists of two plano-convex lenses, having the plane sides outward, as shown in Fig. 4. Every

FIG. 4.

eye-piece must be fixed in a little sliding tube, so that the observer can push it in or out, and thus get it into such a position as to secure the sharpest vision. The more near-sighted an observer is, the further he must push an eye-piece in, to attain this object.

Mounting of the Telescope.—Owing to the diurnal motion of the earth, if a telescope is pointed at any object in the heavens, the latter will be seen to move across the field of view, and speedily disappear from sight. If a high power is used, it will be very difficult to point the telescope so as to find the object again. The telescope must therefore be mounted on axes, so as to admit of being continually moved. The arrangement for this purpose is called the mounting of the telescope. It varies with the size and with the needs of the observer. A small, cheap instrument, say of three inches in diameter, is usually mounted in the simplest way, so that the observer can himself turn it in any direction at pleasure. No exact observations are, however, possible with this sort of mounting. When the telescope is to follow a star closely, an equatorial mounting is used. In this form the principal axis of the instrument, around which it may be turned, is inclined to the horizon at an angle equal to the latitude of the place, and directed toward the north pole of the heavens. In other words, it is set exactly parallel to the axis of the earth. Thus as the earth turns in one direction, the observer has only to move his telescope around its axis in the other direction in order to keep it constantly pointed at a heavenly body. Attached to the principal axis is a secondary one, at right angles to it, by which the telescope may be pointed at any required distance from the pole. This is called the declination axis, while the principal one is called the polar axis. If the telescope is not very

FIG. 5.—An equatorial telescope: A, section of object glass; a, crown lens; b, flint lens; P, Q, polar axis; D, declination axis; H, clockwork to turn telescope round the polar axis; F, finder; E, eye-piece.

large, it is frequently constructed so that the observer can move it around the polar axis by turning an endless screw. This would be very troublesome in a large instrument. A

complete telescope must therefore be fitted with clock-work, so arranged as to make this motion automatically. Then, when the telescope is pointed at a star, clamped, and the clock-work set in motion, the star remains in whatever point of the field the observer may set it, just as if the earth were at rest.

History of the Telescope.—The question as to who was the first real inventor of the telescope is involved in some obscurity. What is certainly known is that telescopes were first made in Holland, about the year 1608, when Hans Lipperhey applied for a patent for such an instrument. It seems an attempt was made by the Dutch authorities to have the invention kept secret. The first telescopes were of course very imperfect instruments, the object-glass consisting only of a single small lens. It does not seem that the Dutch inventors attempted to apply the instrument to any important purpose. This was first done by Galileo in 1610, who, having heard of it, reasoned out the principles on which it ought to be constructed. Galilean telescopes consisted of an object-glass and a concave eye-piece, the latter being placed inside the focus. This form is still used in opera-glasses, but does not admit of a high power being obtained with distinctness. Galileo, however, was able with this imperfect instrument to see the phases of Venus and the satellites of Jupiter, making the discoveries which have made his name immortal.

The great difficulty encountered by the astronomers of the seventeenth century arose from the chromatic aberration of the telescope. It was found that this defect could be diminished by increasing the focal length, but then the instrument would soon become unmanageable. This led to the invention of the reflecting telescope, in which no such defect exists. The latter instrument underwent gradual improvement from the time of Newton to that of Herschel, a hundred years later, who brought it to great perfection. Meanwhile Chester More Hall, of England, about 1733, invented the combination of crown lenses and flint lenses already described, which would in great part correct not only the chromatic but also the spherical aberration. The invention was brought into practical use by Dollond, of London, whose telescopes acquired great celebrity during the latter half of the eighteenth century; but their size was only what is now considered the smallest. Up to 1800 it was thought almost impossible to make a good disk of flint glass of more than 4 or 5 inches in diameter. The difficulty was that the great density of the lead, which is a component of the flint glass, caused the lower part of the pot of glass to be denser than the upper part. By skill and attention glassmakers learned how to obviate this difficulty, so that early in the nineteenth century disks of 8 or 10 inches became common, and before the middle of the century they were carried to 15 inches. The difficulty then was on the part of the optician to grind lenses of this size so perfect in figure that they would bring all the rays to the same focus. The greatest artist in this respect during the first half of the century was Fraunhofer, of Germany. None of his immediate European successors was able to improve upon his work. The first person to do this was a comparatively obscure portrait-painter, Alvan Clark, of Cambridgeport, Mass. About 1846 he began to experiment in grinding lenses, and by 1853 had attained such success that a glass of nearly 8 inches diameter was purchased from him by Rev. W. R. Dawes, a member of the Royal Astronomical Society. This gentleman found that Mr. Clark's glass was superior to any that he had been able to obtain elsewhere; a conclusion which speedily established the reputation of the maker. He and his two sons continued to make larger and larger instruments, as orders were given, until his work culminated in the grinding of the 36-inch telescope of the Lick Observatory and that of his son, Alvan G., in the Yerkes telescope of Chicago, 40 inches in diameter.

So far it would seem that the refracting telescope has outstripped the reflector. The difficulties already mentioned are such that no great improvement has certainly been made in reflecting telescopes in recent times. Those of 4 and 5 feet diameter, made for or by A. A. Common, of England, may be taken as the latest and best result of art in this direction.

Principal Telescopes of the World.—The greatest refracting telescope ever made is that given by Charles T. Yerkes, of Chicago, to the university of that city. The diameter of the object-glass, made by Alvan Clark & Sons, is about 40 inches, and the focal length 64 feet. The mounting is by Warner & Swasey, of Cleveland, O. To give some idea of its

dimensions, it may be stated that the movable part of the instrument, which turns on the polar axis, weighs about 12 tons, and the clock which turns the telescope weighs 1½ tons. It is to be mounted near Geneva Lake, Wis., so as to be away from the smoke of the city.

Next in size comes the great telescope of the Lick Observatory, California, which, under the terms on which the institution was founded, was to be supplied with the largest telescope in existence. It was completed in 1887. The object-glass was figured by Alvan Clark & Sons, and the mounting was done by Warner & Swazey.

Third in size are two practically equal telescopes of 30 inches diameter: that of the Russian Imperial Observatory, at Pulkowa, of which the object-glass is by Clark & Sons, and the mounting by the Repsold, of Hamburg, and the telescope of the Nice Observatory, in France, of which the object-glass is by the Henry Brothers, of Paris, and the mounting by Gauthier, of the same city.

There are also two refracting telescopes of 26 inches aperture: one at the Naval Observatory in Washington, the other at the Leander McCormick Observatory, University of

also at various observatories in the U. S. telescopes of considerable size, which are mentioned in the general list at the end of this article.

BIBLIOGRAPHY.—For very full information about the use of a telescope by an amateur observer, see Chambers's *Astronomy*, 4th ed., vol. ii. (London, 1890). For a popular account, see Newcomb's *Popular Astronomy*. The mathematical theory of the formation of images by lenses is developed in the classic memoir of Gauss, *Dioptrische Untersuchungen* (Werke, vol. v.); in Pendlebury's *Lenses and Systems of Lenses* (London, 1884); and in Steinheil and Voit's *Angewandte Optik* (Leipzig, 1891). A brief but fairly complete history of the invention is found in Poggenдорff's *Geschichte der Physik* (Leipzig, 1879) and a shorter one in Grant's *History of Physical Astronomy* (London, 1852). Discussions of recent improvements are found in great number in the volumes of *Monthly Notices of the Royal Astronomical Society*. The *Journal of Astrophysics*, published monthly at Chicago, and the *Observatory*, published at Greenwich, are also valuable for discussions of the latest proposed improvements.

S. NEWCOMB.

LIST OF THE PRINCIPAL TELESCOPES (BY PROF. J. K. REES).

I. Refracting Telescopes with Object Glasses 13 Inches in Diameter and over.

OBSERVATORY.	Maker of lenses.	Aperture.	Focal length.	Remarks.
Yerkes, Geneva Lake, Wis.	A. G. Clark, 1894.	40.0 in.	64 ft.	For University of Chicago.
Lick, California	A. Clark & Sons, 1887.	36.0 in.	57 ft. 10 in.	
Meudon, France		32.0 in. } 24.0 in. }		Photographic lens. Visual lens.
Imperial, Pulkowa, Russia	A. Clark & Sons, 1885.	30.0 in.		
Nice, France	Henry Brothers, 1886.	29.9 in.		
Meudon, France	Martin	29.0 in.		
Royal, Greenwich, England	Sir H. Grubb, 1893.	28.0 in.		
Imperial, Vienna, Austria	Sir H. Grubb, 1881.	27.0 in.	29 ft.	
Royal, Greenwich, England	Sir H. Grubb, 1895.	26.0 in.		Astrographic equatorial.
Naval, Washington, D. C.	A. Clark & Sons, 1873.	26.0 in.		
Leander McCormick, Charlottesville, Va.	A. Clark & Sons, 1881.	26.0 in.	32½ ft.	University of Virginia.
Cambridge, England	Cooke & Sons, 1870.	25.0 in.		
Harvard University, Cambridge, Mass.	A. G. Clark.	24.0 in.		Photographic doublet.
National, Paris, France	Henry Brothers.	23.6 in.	59 ft.	Equatorial Coude.
Halsted, Princeton, N. J.	A. Clark & Sons, 1883.	23.0 in.		
Chamberlin, Denver, Col.	A. Clark & Sons, 1881.	20.0 in.		
Brera, Milan, Italy	Merz.	19.1 in.		
Manila, Philippine islands	Merz.	19.2 in.		
University, Strassburg, Germany	Merz & Mahler.	19.0 in.	27½ ft.	
University of Chicago	A. Clark & Sons, 1862.	18½ in.	23 ft.	
Van der Zee, Buffalo, N. Y.	Fitz.	18.0 in.		Dismounted.
Lowell, Flagstaff, Ariz.	A. Clark & Sons.	18.0 in.		
Lowe, Echo Mountain, Cal.	A. Clark & Sons.	16.0 in.	22 ft.	Formerly in Rochester, N. Y.
Goodsell, Northfield, Minn.	A. Clark & Sons.	16.0 in.		
Washburn, Madison, Wis.	A. Clark & Sons, 1879.	15.6 in.	20 ft. 3 in.	
Dunecht, Aberdeen, Scotland	T. Grubb, 1872.	15.1 in.	15 ft.	
Tulise Hill, London, England	T. Grubb.	15.0 in.		
Pulkowa, Russia	Merz & Mahler, 1840.	15.0 in.		
Harvard University, Cambridge, Mass.	Merz & Mahler, 1843.	15.0 in.	22 ft. 6 in.	
National, Paris, France	Lerebours.	15.0 in.		
Madrid, Spain	Merz & Son.	15.0 in.		
Royal, Brussels, Belgium	Merz & Son.	15.0 in.	25 ft.	
Bordeaux, France	Merz & Son.	14.9 in.	27 ft.	
Nice, France	Henry Brothers.	14.9 in.	27½ ft.	
Lisbon, Portugal	Merz & Mahler.	14.6 in.		
Markree Castle, Ireland		14.0 in.		
Hamilton College, Clinton, N. Y.	Spencer.	13.5 in.		
Dudley, Albany, N. Y.	Fitz.	13.0 in.	15 ft.	
Columbia College, New York	Rutherford & Fitz.	13.0 in.	15 ft. 2 in.	
Allegheny, Pa.	Fitz.	13.0 in.		

II. Reflectors with Mirrors of 2½ Inches Diameter and over.

		Diam. of mirror.		
Birr Castle, Ireland	Rosse, 1844	6 ft.	54 ft.	Speculum metal.
Common, Ealing, England	A. A. Common, 1891	5 ft.	27 ft.	Silver on glass.
Herschel, Slough, England	W. Herschel	4 ft.	40 ft.	Dismounted. Speculum metal.
Lassell, Liverpool, England	Lassell, 1860.	4 ft.	37 ft.	Destroyed. Speculum metal.
Melbourne, Australia	T. Grubb, 1870.	4 ft.	28 ft.	Speculum metal.
National, Paris	Martin, 1875.	4 ft.		Silver on glass.
Birr Castle, Ireland	Rosse, 1839.	3 ft.		Speculum metal.
Bernerside, Halifax, England	Calver, 1879.	3 ft.		Silver on glass.
Toulouse, France	Henry Brothers.	3¼ in.		Silver on glass.
Marseilles, France	Foucault.	3¼ in.		Silver on glass.
Harvard University, Cambridge, Mass.	H. Draper, 1870.	28 in.		Silver on glass.
Royal, Greenwich, England	W. Lassell, 1846.	24 in.	20 ft.	Speculum metal.
Royal, Edinburgh, Scotland	T. Grubb, 1872.	24 in.		Silver on glass.
Westmeath, Ireland	Sir H. Grubb, 1881.	24 in.	10½ ft.	

Photographic telescopes, employed in taking photographs for the purpose of making a catalogue of the stars to be measured on the plates, and in the construction of a photographic chart of the heavens (photographic lens 13 inches, with 11-inch visual refractor in each case), are mounted at the following observatories: Paris, Algiers, Bordeaux, Toulouse, San Fernando, the Vatican, La Plata, Rio de Janeiro, Santiago, Helsingfors, Potsdam, Catania, Greenwich, Oxford, the Cape of Good Hope, Melbourne, Sydney, and Tacubaya.

Virginia. Both were originally made by Alvan Clark & Sons, but the Washington telescope was remounted in 1893 by Warner & Swazey.

A telescope of 25 inches aperture was constructed in England by Messrs. Cook, for Mr. Newall, of Gateshead, in 1870; it was later given to the University of Cambridge.

The Vienna telescope is 27 inches in diameter, and was made by Sir Howard Grubb, of Dublin, in 1882. There are

Telēsilla (Gr. Τηλέσιλλα) of Argos: lyric poet and heroine, who flourished about 510 B. C. Her warlike deeds in the struggle of Argos against Sparta are probably mythical, and her poetry is represented by two lines in Bergk's *Poetae Lyrici Graeci* (vol. iii., p. 380, 4th ed.).

B. L. G.

Telford, THOMAS: engineer; b. at Westerkirk, Dumfriesshire, Scotland, Aug. 9, 1757; became a stone-mason, and

studied architecture and drawing; went to London 1783, and was architect in the Portsmouth dockyard; in 1787 removed to Shrewsbury. His first great engineering work was the construction of the Ellesmere Canal, 103 miles long, which was begun in 1793 and completed in ten years. In 1803 he was intrusted with the construction of the CALEDONIAN CANAL (*q. v.*), connecting the Atlantic Ocean with the North Sea, the ascent and descent being accomplished by locks of a size surpassing any heretofore attempted; this was completed in 1823. Besides other works, as engineer to the commissioners of Highland roads and bridges, he built about 1,000 miles of road in Scotland, upon which are more than 1,200 bridges; he constructed eight canals in Great Britain, the Göta Canal in Sweden, and the beautiful suspension railway bridge over the Menai Strait. The Telford pavement was invented by him. The Institution of Civil Engineers was founded in 1818 mainly through his influence, and he was its first president. Before he left his native district he wrote several very creditable poems in the Scottish dialect; he contributed valuable papers to *The Edinburgh Encyclopaedia*, and left *The Life of Thomas Telford, Civil Engineer, written by himself* (1838). D. at Westminster, Sept. 2, 1834. Revised by MANSFIELD MERRIMAN.

Telford Pavement: See ROADS.

Tell, WILLIAM: according to Swiss legends, a celebrated marksman with the bow, living as a hunter at Bürglen in the canton of Uri. He was a member of the conspiracy which was formed against Austria at Grütli Nov. 7, 1307, by Walter Fürst, of Uri, his father-in-law, Werner Stauffacher, of Schwytz, and Arnold von Melchthal, of Unterwalden, and which finally succeeded in freeing the country from the foreign yoke. At this time Gessler, the Austrian bailiff in Küssnacht, raised a cap on a pole in the market-place of Altorf and ordered all passers-by to bow to the cap in token of submission. Tell refused, and was condemned to death, but pardoned on condition that he should shoot an apple from the head of his son. He ventured the shot and succeeded, but Gessler noticed that he had put two arrows in his quiver, and asked why he had done so; and when Tell answered that if he had killed his son with the one he would have killed the bailiff with the other he was again put in chains and taken on board the bailiff's boat to be brought to Klüssnacht. While crossing the lake the boat was overtaken by a fearful storm and Tell was unchained in order to steer it, but at a certain point, known as Tell's Leap, he jumped ashore, lay in ambush in a defile through which Gessler had to pass on his way to Küssnacht, and shot him; which deed became the occasion of a general rising in the cantons. Of this story about Gessler, Tell, Stauffacher, etc., the oldest Swiss chroniclers, Johannes, of Winterthur, Justinger, of Berne, and Hemmerlin, of Zurich, know nothing. The first mention of these names and incidents is made in the latter part of the fifteenth century by *Das weisse Buch*, and a complete narrative does not occur until the middle of the sixteenth century in the *Chronicon Helveticum*, by Ægidius Tschudi. The monuments erected in various places in honor of Tell are of a much later date. These circumstances early made the story of William Tell somewhat suspected, though as a general rule it was considered as real history; even Johannes von Müller accepted it. Later critics, however, have proved that the whole story is nothing but a legend common among the nations of the Aryan race, found with all its principal features in the Persian poet Farid Uddin Attâr, the Icelandic *Thidreksaga*, the Danish historian Saxo Grammaticus, the English popular song on William of Cloudeley, etc., and only modified to suit Swiss circumstances. It has been proved further, especially by Rochholz, that Gessler, too, is the product of imagination, and that a bailiff of that name did not exist at the time when Tell is said to have lived. The best poetic treatment of the Tell saga is that by Schiller in his famous drama *Wilhelm Tell*. Besides the account of the Tell legend in Tschudi, Schiller probably knew and used some of the old Tell plays popular in Switzerland. See Ideler, *Die Sage vom Schusse des Tells* (1836); Häusser, *Die Sage vom Tell* (1840); Hüsely, *Recherches critiques sur l'Histoire de Guillaume Tell* (1843); Huber, *Die Waldstätte Uri, Schwyz und Unterwalden bis zur festen Begründung ihrer Eidgenossenschaft* (1861); Vischer, *Die Sage von der Befreiung der Waldstätte* (1867); Rochholz, *Tell und Gessler in Sage und Geschichte* (1877); and G. Rüthe, *Die dramatischen Quellen des Schill. Tell*, in *Forsch. z. d. Philologie* (1894).

Revised by JULIUS GOEBEL.

Tell City: city (settled by Swiss colonists in 1858); Perry co., Ind.; on the Ohio river, and the Louisv., Evansv. and St. L. Consolidated Railroad; 3 miles N. W. of Cannelton and 75 miles E. of Evansville (for location, see map of Indiana, ref. 11-D). It is in a coal-mining region; has Lutheran and English and German Methodist and Roman Catholic churches, a parochial and 2 public-school buildings, an incorporated bank with capital of \$25,000, and 3 weekly newspapers; and flour, woolen, saw, and shingle mills, foundry and machine-shop, distilleries, breweries, and chair, furniture, and plow factories. Pop. (1880) 2,112; (1890) 2,094; (1894) 2,308, estimated with suburbs, 2,500.

EDITOR OF "JOURNAL."

Tell el-Amar'na: a modern Arab village in Egypt, on the east side of the Nile, midway between ancient Thebes and Memphis, and 190 miles S. of Cairo (27° 30' N. lat.). It is near the ancient site of the capital founded and built by Amenophis IV., or KHUNATEN (*q. v.*), the "heretic" king who attempted to supplant the cult of Amun of Thebes by that of Aten, being a form of solar monotheism. Abandoning Thebes, the previous royal residence, Khunaten chose the plain of el-Amar'na. It is about 12 miles long by 5 broad. The city occupied its southwestern portion, and its site is indicated by low mounds which are about 5 by 2 miles in extent. These ruins show a systematic plan and are intersected by broad streets. The materials used in construction were mud bricks faced with plaster, except that stone was employed for altars, stela, and for pavements, doorsteps, and in other places exposed to hard usage. The king's palace was located on the side toward the river, and its painted pavements have been uncovered. The central and eastern portions were occupied by the temple of Aten, while the southern portion was devoted to the quarters of workmen and artisans. The designs are Egyptian in character, but bear a foreign appearance as though executed by foreign workmen. As is well known, the royal court of the time was under foreign influence, even if it was not itself of foreign stock. In the cliff back of the city are many tombs of adherents of the new form of the Egyptian religion.

In the winter of 1887-88 some 320 clay tablets, perfect or fragmentary, inscribed with cuneiform inscriptions, were found among the ruins of a building adjacent to the palace, and are now preserved in the museums of London, Berlin, and Gizeh. They were written in the Babylonian language and date from the fifteenth century B. C. Most of them are communications from various persons in the East, kings, governors, or agents, made to Amenophis III. and Amenophis IV., or Khunaten. They contain many well-known local names, such as Jerusalem, Lachish, Asealon, Gezer, Joppa, Hazor, Acoho, Sidon, Tyre, and Beirut. See Bezold and Budge, *The Tell el-Amar'na Tablets in the British Museum* (London, 1892); Bezold, *Oriental Diplomacy* (London, 1893); Sayce, *Records of the Past*, 2d series, vols. ii., iii., v., vi.; *Higher Criticism and the Monuments* (London, 1893); Everts, *New Light on the Bible and the Holy Land* (London, 1894); *Proceedings of the Society of Biblical Archaeology*, x., 540-569 (Budge); x., 488-525, xi., 326-413 (Sayce); *Zeitschrift für Assyriologie*, iii., 372-406 (Lehman, *Aus dem Funde von Tell el-Amar'na*); v., 137-165 (Zimmern, *Briefe aus dem Funde in el-Amar'na*); vi., 245-63 (Zimmern, *Die Keilschriftbriefe aus Jerusalem*). See also Baedeker's *Upper Egypt*, p. 20 ff.

CHARLES R. GILLET.

Tell el-Kebir' [Arab, = the great mound]: a village in the province of Sharkiah in Lower Egypt; situated upon a canal of sweet water which flows from Suez to Zagazig. It lies slightly N. of Tell el-Mashkutah, the site of ancient Pithom. Tell el-Kebir was the scene of a fierce battle between British and Egyptian troops, which decided the fate of the rebellion instigated by Arabi Pasha. In this place, chosen by nature to be a fortress, Arabi had intrenched 50,000 men with 150 cannon and plenty of ammunition. Sir Garnet Wolseley, the British commander-in-chief, had, by a ruse, become possessed of the Suez Canal. On the march toward Cairo, Maj.-Gen. Graham had advanced as far as Kassassin, where he had been attacked by the Arabs. It was not until the night of Sept. 12, 1882, that Wolseley felt secure enough in order to move forward. On the morning of the 13th the British forces, to the number of 14,000, moved forward and took the fortifications raised at Tell el-Kebir at the point of the bayonet. Though the Egyptians fought bravely, their camp and 3,000 soldiers fell into the hands of the British. By continued prompt action Wolseley saved Cairo from a destruction which Arabi had prepared for it.

See Appleton's *Annual Cyclopaedia* (new series, vol. vii., 1887, p. 251); Goodrich, *Report of the British Naval and Military Operations in Egypt: Information from Abroad* (War Series, No. 3, p. 146).

R. GOTTHEIL.

Teller. HENRY MOORE, LL. D.: U. S. Senator; b. at Granger, Allegany co., N. Y., May 23, 1830; educated at Alfred University, New York; studied law, and was admitted to the bar at Binghamton, N. Y., 1858; removed to Illinois in 1858, thence to Colorado in 1861; was elected U. S. Senator (Republican) on the admission of Colorado as a State in 1876; re-elected for 1877-83; chairman of special committee on election frauds, known as the Teller committee, 1877-78. He was U. S. Secretary of Interior from Apr. 6, 1882, to Mar. 4, 1885; re-elected U. S. Senator from Colorado in 1885, 1891, and 1897.

Télez, tel'yáth, GABRIEL, Maestro Fray (better known by his *nom de guerre* of TIRSO DE MOLINA): dramatist; b. in Madrid, Spain, some time between 1570 and 1585. The details of his life are almost entirely unknown. He was educated at Alcalá de Henares, and later (perhaps when well advanced in life) took orders in the Church. He entered the order of Nuestra Señora de la Merced Calzada, and became a famous preacher; was made chronicler of his order; inspector of the convents in Old Castile; and Sept. 29, 1645, was elected prior of the monastery of Soria. D. in Soria about 1648. As a dramatist he belonged to the school of Lope de Vega, as he himself acknowledged. So prolific was he, however, that he is one of the chief figures of the golden age of the Spanish drama. He informs us that he had written 300 plays, but only fifty-nine are extant. Many of these are remarkable for the looseness of their situations and their language; and the Inquisition is known to have hunted down and destroyed his works on this account, wherever it could find them. Undoubtedly the most famous of his plays is *El Burlador de Sevilla*, in which, using a dramatic situation from Lope's *Dísculos son Calidad* and a theme perhaps derived from real life, the poet first worked out the story of Don Juan Tenorio, so famous in European literature since. Another play, a most intricate comedy of intrigue, *Don Gil de las Calzas Verdes*, has held its place on the Spanish stage down to the present. A different side of Tirso's genius is shown in the grave and deeply religious play *El Condenado por desconfiado* (The Doubter Damned). Like all the Spanish dramatists of his time, he showed the greatest facility in turning from the gay to the serious; and several of his *Autos*, or religious dramas, are excellent in their kind. Besides plays, Tirso wrote two famous collections of stories after the fashion of the *Decameron*—the *Cigarrates de Toledo* (1st ed. 1621 or 1624)—giving the stories, verses, and plays supposed to have been recited to a wedding company at country-houses (*cigarrates*) near Toledo, and *Deleitar Aprovechando* (Pleasure with Profit, 1625), more moral, but never finished. The *Comedias* of Tirso de Molina, so far as published, first appeared in five parts, between 1627 and 1636. A selection of thirty-six of the best plays was edited by Hartzenbusch, 12 vols., 1839-42; 3d ed. 1 vol., 1885 (vol. v. of Rivadeneyra's *Biblioteca de Autores Españoles*). Tirso's *Novelas* are printed in vol. i. of Ochoa's *Tesoro de Novelistas españoles* (Paris, 1847).

A. R. MARSH.

Tellicherry: town of Malabar, Madras, British India; picturesquely situated on the open sea in a beautiful, fertile, and well-cultivated district rich in spices, rice, and coconut-palms (see map of S. India, ref. 6-C). It has a good harbor and exports spices and sandal-wood. Pop. (1891) 27,196, of which number 10,000 are Mohammedans and 1,800 Christians.

Revised by M. W. HARRINGTON.

Tellurides [deriv. of *tellurium*]: compounds of the element tellurium with other metals. They constitute chiefly the native mineral compounds of tellurium.

Bismuth telluride is the mineral tetradymite, which, as found in gold mines in Virginia and Georgia, has the composition, according to Genth, of pure bismuth telluride, Bi_2Te_3 , while that from the Uncle Sam lode in Montana contains sulphur and has the composition $\text{Bi}_2\text{Te}_3\text{S}$. Other Montana tetradymites, from placer gold, were found by Genth to be free from sulphur. Genth discovered with these latter tetradymites, and also in Davidson co., N. C., a mineral montanite, a bismuth tellurate, $\text{Bi}_2\text{O}_3 \cdot \text{TeO}_3 \cdot 2\text{H}_2\text{O}$. Tetradymite is a steel-gray mineral, in inflexible folia or laminae like graphite, soft and marking paper like the latter, hexagonal in form. It may be distinguished from graphite by roasting in a glass tube open at both ends, when a white sublimate of tellurous oxide will appear, fusible to transparent, colorless

droplets. It is also fusible and combustible before the blow-pipe, tingeing the flame bluish green.

Lead telluride is altaite, a rare white metallic sectile mineral, sometimes in cubical crystals, like galena, the corresponding sulphide. It is PbTe . It is found in the Altai Mountains, and in the U. S. at the Red Cloud mine, Colorado, and at the King's Mountain gold mine in Gaston co., N. C.

Silver telluride is the rare mineral hessite, Ag_2Te . It is metallic, iron gray, and sectile, and in crystallization right rhombic. It usually contains some gold. It is found in the Altai Mountains, at several Hungarian localities, and at the Stanislaus mine in Calaveras co., Cal. Genth has also noted it in small quantity from the Red Cloud mine, Colorado.

Gold and silver telluride is the mineral petzite, found at Nagy-Ag in Transylvania, and also by Genth among the ores of the Red Cloud mine. Genth's analyses indicated 24 and 25 per cent. of gold in the composition of the Colorado petzite. It is scarcely to be distinguished without analysis from hessite in appearance or character. The auriferous mineral is somewhat lighter in color and more brittle. It is right rhombic, like hessite.

Gold telluride is sylvanite, which always contains some silver (12 to 13 per cent. at the Red Cloud mine), is monoclinic, steel gray or silver white, and varies in composition and density within wide limits, containing from 23 to 30 per cent. of gold. It is found at two Transylvanian localities in Europe, Nagy-Ag and Offenbanya, and it was unknown in the U. S. until the younger Silliman found it at the Red Cloud mine; but Dana gives also the Melones and Stanislaus mines in Calaveras co., Cal., as localities. Genth obtained gold telluride, calaverite, from the Stanislaus mine, having the composition AuTe , with about 41 per cent. of gold. Its color is bronze yellow, and its streak yellowish gray. It is brittle, and not crystalline. Revised by IRA REMSEN.

Tellurium [from Lat. *tellus*, *telluris*, earth]: one of the elements of matter belonging to the same family as sulphur and selenium. It is one of the rarer elements, though it is found in a number of minerals. Von Reichenstein believed that he had found a new metal in 1782 while working with some gold ores. Not trusting his own work he sent specimens of the ores to Torbern Bergmann; but Bergmann would not venture a positive conclusion, and it was not until 1798 that Klaproth confirmed the discovery, and then he named the element tellurium. It has been since investigated mainly by Berzelius. Brauner has also contributed to the knowledge of its properties. The occurrence of the element is described in the article TELLURIDES (*q. v.*). It is found in a number of localities in North America, and if there were a demand for it no doubt it could be obtained in any desired quantity. The ores are treated with strong oxidizing agents, such as aqua regia, chlorine, etc., by which the tellurium is converted into tellurous acid, H_2TeO_3 . By treating with sulphurous acid the acid is then reduced to the form of the element. Tellurium is silver white, very lustrous, and crystallizes very easily. It is brittle, does not conduct heat well, and conducts electricity very little. Under the influence of light the electrical conductivity is somewhat increased, though the increase is by no means as marked as in the case of selenium. When tellurium is strongly heated, it takes fire and burns with a strong flame which is blue with green edges, and gives off a thick white smoke of tellurium dioxide, TeO_2 , which has a peculiar weak acid odor. It was formerly supposed that this vapor has the odor of rotten radishes, but this is wrong, as the latter odor is caused by the presence of a small quantity of selenium. Tellurium melts at about 500° C., and at a higher temperature it is converted into a golden yellow vapor. Its atomic weight is 125.

Revised by IRA REMSEN.

Telugu: See DRAVIDIAN LANGUAGES.

Temesvar, tām-esh-vaar': town; in Hungary; on the navigable Bega Canal, which joins the Theiss at Titel, 5 miles from the Danube (see map of Austria-Hungary, ref. 8-J). It is well built with broad, straight streets lined by handsome houses. Its cathedral and synagogue are splendid edifices, and it has fine monuments and educational institutions. The castle, erected by Huniadi in 1443, is now the arsenal. The town was held by the Ottomans from 1552 to 1716, when it was taken by Prince Eugene of Savoy. It was almost destroyed when besieged by the Hungarians from Apr. 25 to Aug. 9, 1849, but was delivered by Haynau. It manufactures leather, silk and cotton fabrics, and carries on an extensive transport trade in wheat and wine. Pop. (1890) 39,884.

E. A. GROSVENOR.

Temis'camingue Lake: a body of water on the boundary between the provinces of Ontario and Quebec of the Dominion of Canada. It is 30 miles long and 15 broad, and is in lat. 47° 30' N., lon. 80° W. Its waters flow into Ottawa river. Its basin is the seat of a French-Canadian colonization of several hundred families.

Tem'minek, CONRAD JACOB: naturalist; b. in Amsterdam, Holland, Mar. 31, 1778; entered the service of the Dutch East India Company, and became a student of natural history. His principal work was *Manuel d'Ornithologie* (1815; enlarged ed., 4 vols. 8vo, 1835-40). He was also author of *Nouveau Recueil de Planches coloriées d'Oiseaux* (folio, 1820-44), consisting of 600 plates. He became director of the Natural History Museum at Leyden in 1820. He wrote a number of important works respecting the East Indies; among others, *Coup d'œil général sur les possessions Néerlandaises dans l'Inde Archipélagique* (3 vols., Leyden, 1847-49). D. Jan. 30, 1858. Revised by F. A. LUCAS.

Tem'pe (in Gr. τὰ Τέμπε): a valley, or rather a gorge, in Northeastern Thessaly, Greece; 5 miles long, and in some places so narrow that between the high cliffs which rise almost perpendicularly on both sides there is space only for the river Peneus, which traverses the valley, and a carriage-road. In antiquity it was very celebrated for the beauty of its scenery. It was strongly fortified at several points, and ruins of these fortifications are still visible. It is now called Lykostomo. Revised by J. R. S. STERRETT.

Temperament [from Lat. *temperamentum*, a mixing in due proportion, temperament, disposition, deriv. of *temperare*, divide, proportion, mingle in due proportion]: in keyed instruments, such as the organ and piano, a certain adjustment or regulation of the sounds or intervals of the scale, with the view of removing an apparent imperfection, and fitting the scale for use in all keys without offense to the ear. The musical scale in use in keyed instruments is a compromise, or a scale in which most of the intervals are not mathematically correct, or true to the scale of nature as deduced from the MOXOCHORD (*q. v.*), but are slightly modified by elevation or depression, a process absolutely necessary to meet the various exigencies of modern music. This modifying or nice adjustment of the sounds of the scale is the office of temperament; and in tuning an organ or piano the first thing done is the fixing of the temperament by adjusting with great care a single octave in the middle of the keyboard as a pattern from which all the other pipes or strings, above or below, are to be tuned by octaves, double octaves, etc.

It has been found that though the perfect octave seems to be divisible into six major tones, as C-D, D-E, E-F, F-G, G-A, and A-B, yet these, when added together, are really somewhat more than an octave. Again, though the octave seems divisible into three major thirds, as C-E, E-G, and G-A, yet by strict measurement these three thirds prove to be less than the octave in extent. This is illustrated in the following manner by E. J. Hopkins, of the Temple church, London, in his work on *The Organ*: "Supposing the perfect octave to be divided into 3,010 equal parts, the interval of a major tone would contain 511 of those parts. But if we multiply 511 by 6, we have 3,066, instead of 3,010, plus 56 parts; so that the octave contains less than 6 major tones by 56 parts. A major third also would contain 969 parts, which multiplied by 3 would make 2,907, instead of 3,010, minus 103 parts; the octave in this case containing 103 parts more than the three major thirds." To distribute or get rid of this excess or shortcoming resource can only be had to temperament—i. e. the modifying of several of the intervals by very slightly raising or lowering them, so as to extend or contract their whole sum to the exact limits of the octave. In the practice of tuning, this apparent irregularity or imperfection of the scale is usually treated as an overplus, which must be disposed of by some method which shall not so affect any interval of the scale as to make it offensive to the ear. Several modes of doing this have been devised, and these are commonly classed under the heads of equal and unequal temperament.

On an instrument unequally tempered the excess is unevenly distributed, so that some of the intervals will be perfectly smooth and agreeable, while others will be harsh. In old church organs this temperament was in general use. Music formerly was written in very few keys, and modulations were seldom carried into remote scales. It was customary, therefore, to make the keys that were in common

use as perfect as possible, at the expense of the other keys, on which all the roughness of the temperament was concentrated. Under the requirements of modern music, with the whole circle of the keys in common use, this unequal temperament has become obsolete. In equal temperament the excess or deficiency above noted is distributed among all the keys, thereby rendering them all available for use, and enabling the composer to present harmonious combinations in the remotest keys without any disagreeable effect. There are, however, several shades or degrees of equal temperament, from the strictest uniformity to any amount of inequality which is still bearable. If all keys were made exactly alike, there would be an undesirable loss of their individual character, and no difference perceptible except in their degree of acuteness. To avoid this, some discrimination is commonly used in favor of certain popular keys, yet not to such an extent as sensibly to injure the effect of keys less favored. A difference is recognized at once between the major keys of D and A, even though the instrument in use is said to be equally tempered. In musical theory and in treatises on harmony a tempered interval does not differ by name from an untempered one. Thus the fifth C-G, though reduced by temperament, is still called and assumed to be a perfect fifth; and all terms indicating chords, combinations, and progressions remain unaffected by any influence from temperament. Revised by DUDLEY BUCK.

Temperament: the general temper or disposition of a person. The word is of popular origin, signifying the most general characteristics which distinguish one person from another. Such differences as those between phlegmatic and nervous individuals have a fairly evident basis in the popular use of the terms. Yet the doctrine of temperaments is very undeveloped. In the older physiology and medicine humors or bodily fluids were supposed to exist in varying quantities and varied mixtures in different persons; so among philosophers, Descartes and Priestley. Four temperaments were distinguished—the choleric, the sanguine, the phlegmatic, and the melancholic. Later writers, to whom the problem was one mainly of psychological interest, have classed the temperaments under much the same words, but with more adequate theoretical grounds. For example, Wundt arranges the temperaments under two great classes, each again having two divisions: first, as having a prevailing degree of quickness or sluggishness (i. e. fast and slow), and second, as being weak or strong. As follows:

CLASS.	Strong.	Weak.
	Fast.....	Choleric.
Slow.....	Melancholic.	Phlegmatic.

The grounds of explanation of such vaguely defined characteristics are about as vague in both medical and psychological literature. Two general suppositions underlie current explanations: The differences are considered either vaso-motor in their seat, due to differences in the blood-circulation, pressure, etc., or nervous, matters of hereditary variation on the side of sensibility. This latter explanation, vague as it is in respect to any definite determination of the actual basis of any of the so-called temperaments, is probably the line of inquiry which offers most promise for future research. An attempt has been made by Paulhan to distinguish the temperaments on the ground of individual peculiarities in the manner and facility of movement, giving such divisions as impulsive, inhibitive, reflective temperaments, etc. This has also a certain interest.

A distinction made by the pathologists in investigating speech-troubles seems to throw a little light upon this obscure subject. Men are distinguished as of various types, such as visuals, auditives, motors, etc., according as they depend mainly on one kind of sense-memories or another (those of sight, hearing, etc.) for the readiest speech. These distinctions probably apply also to other functions, and it is possible that in the future the criteria of mental "type" may be so defined as to cover broadly the phenomena now ascribed to temperament. This, combined with the investigation of nervous heredity, may be expected to clear up the topic somewhat. J. MARK BALDWIN.

Temperance [viâ O. Fr. from Lat. *temperantia*, moderation, sobriety, deriv. of *temperans*, pres. partic. of *temperare*, mix in due proportion, temper, moderate]: moderation or abstinence respecting the use of intoxicating liquors. It is more common among the more educated and refined classes in the community than it was a century ago. At that time

all classes indulged often to excess and without a thought of the impropriety of so doing. The disgusting stories of what happened without rebuke from public opinion in Europe or the U. S. are not myths. Some of the worst of these occurrences, which would not now be tolerated in any decent society, were then generally considered as mere practical jokes; but such facts could not long occur in any reasonable community without exciting decided opposition from the more thoughtful members of it. The evils arising therefrom were too patent. Hence arose temperance societies, so called—societies of men and women pledged to promote temperance in the use of intoxicating drinks, *not* total abstinence as now generally inculcated by their successors. After some years their efforts seemed weak and success impossible to the more earnest advocates. Hence have arisen various movements, all aiming to promote the same general object, the suppression of the liquor traffic and the disuse of alcohol in any form as a beverage. During the first half of the nineteenth century the so-called Washingtonian movement began in Baltimore. This for a season aroused the whole people and was the means of exciting a deep interest in the subject. It may be styled the confessional phase of the temperance movement. The pioneers and chief workers in it pleaded the cause of temperance by minutely detailing at public meetings their own erratic courses. Every drunkard became for the time being a most effective apostle, not only of temperance, but of total abstinence; but this movement did not last long, because (1) some of these apostles became backsliders, and (2) because after a time the community became nauseated with the revelations made by some of the speakers. Total abstinence was an essential article of faith for every Washingtonian. For him certainly that rule was supreme and admitted by all to be absolutely necessary. Following these have arisen societies, some of which declare that the taking of stimulants in any amount by any person is unnecessary and virtually a crime against society, a sin *per se*, while others acknowledge that many, perhaps a majority of, persons may indulge with personal safety, but urge that all should practice abstinence as needful for the remainder, the strong assisting to bear the burdens of the weak and thus carrying out the Christian law of charity as taught by St. Paul. The doctrine that everybody should forego the use of all liquors because some became drunkards was a logical and practical one for the Washingtonians; but it was by no means an equally obvious conclusion when applied to the whole public, as the Prohibitionists for many years have been trying to do. The old temperance societies opposed this idea, but either failed of meeting it or were finally subdued by it. Licenses given by the state are by Prohibitionists deemed wrong in principle, as licensing a crime, or at least a great social evil which should be made the subject of legal restriction as well as gambling. Hence for years the questions of prohibition and license have been the watchwords of bitterly opposing partisans. It is proposed briefly to examine these two systems of promoting temperance.

Alcohol has been proved to be at times a remedy of immense value to man. In order to be thus valuable to mankind it must be used legitimately and under proper safeguards. On the contrary, if used on improper occasions or too frequently or too freely, it ruins man and injures society to its very depths. These two propositions are strictly, scientifically true. It would seem as if none but bigots of either of the contending parties could deny them. Hence it follows that we may properly and justly under the varying circumstances of life take one or the other position of favoring or of opposing either license or prohibition in our dealings practically with the question of temperance. It has been proved by correspondents living in various and widely separated portions of the earth's surface that a tendency to use stimulants exists among all people. From the savage to the most highly civilized race of men there is no one of them that has not this instinct; and with the instinct naturally arises the tendency to excess in the indulgence of it. The desire for this gratification appears, however, to vary much according to a cosmic law of heat and climate. The isothermal lines which limit the growth of the grape N. and S. of the equator seem to divide the northern and southern hemispheres into three tolerably well-marked zones—namely, (1) the tropical, (2) the temperate or grape-growing, and (3) the northern or colder. In the first drunkenness is almost unknown and it is deemed disgraceful, while lusts of other kinds, which are rare at the north, have full sway, unopposed by public opinion. In the second region

milder drinks, such as native grape wines, mild beers, and ales, are used, perhaps in very large quantities, producing when drunkenness follows a milder and more jovial, less offensive, less destructive type of it than is observed in the more northern regions. In the third zone man drinks less in amount perhaps, but it is of a more potent fiery liquor. It makes him brutal and beastly, and frequently he becomes destructive of persons and of property. If this be so—and such seems to be the fact—it is plain that prohibition in the first zone would scarcely be thought of; in the second some moralists might suggest it, though it would not be likely to be adopted; in the third it would find its strongest advocates. Parties there would inevitably arise prepared to stop the whole traffic in liquor because of its vile influence on man; and the zeal of these parties would be just in proportion to the enormity of the evil sought to be eradicated. Surely any reasonable plan which proposes to prevent a man from degrading and making a tiger of himself in his intercourse with others should be sustained. Another great influence—viz., that of race, with its centuries of education of certain habits—should always be taken into consideration in judging of this question.

From these considerations it seems to many people that the state as a guardian of the public health is bound to use its great powers to restrain its citizens by actual prohibition from the use of every alcoholic stimulus or to allow the use of them under more or less restriction to all, provided that in so doing it does not interfere with the inherent right of the individual to use any food or drink he may prefer without injury to himself or others. In deciding these delicate questions the community may be divided into childhood and manhood. This is already done on the subject of voting and on many others. Only at certain ages does the male in the eyes of the law become a man and the female a woman. For the former of these classes—i. e. for all persons under the age of legal manhood—the prohibition of the use of liquors or a most restrictive license should be inaugurated and as far as possible thoroughly carried out. For the very young statute law would be rarely needed if the parental authority were duly exercised. The custom in some families, more common formerly than now, of allowing children to sip wine at their father's table is fraught with dangers of the most deadly kind for the future well-being of the man and of society; and it must be added that if the father sips his wine at table it will be very difficult to prevent the sons from doing the same when opportunity offers. Statute law should provide still further for the correct guidance of the youthful years of the future citizen, and the giving or selling of liquor to a minor should be prohibited under the severest penalties. When the state appreciates its high prerogative of contributing to the best education of every citizen, then the selling or giving of liquor to a minor will be deemed one of the most heinous of crimes. After the youth arrives at manhood or womanhood—viz., at the age at which even by statute law he or she has the fullest privileges in the choice of good or evil—we can not proceed in this arbitrary way. In consequence, however, of the inherent infirmity of human nature some will then be induced to drink inordinately and behave in a manner contrary not only to their own interests, but to the peace of the commonwealth. All such persons will need the watchful care of the state, and it must assume the parental relation or that of a stern judge, and if no punishment should be sufficient to restrain the drunkard, then the state should seclude him as an insane man in an inebriate asylum.

Again, it has been most justly urged that the state should not only prohibit the sale of liquor to an habitual drunkard, but that the dealer who for the sake of gain violates such a law should be held responsible, not only for that violation, but for all the damages the victim may commit while intoxicated; and, moreover, that the family of the latter, which is bereft of its natural guardian, should be allowed a weekly stipend from the vender during the illness or imprisonment of the father.

Finally, the state, for its own safety and on the sacred principle of *salus populi suprema lex*, should deprive the incorrigible drunkard of his civil rights, as the state treats the felon. Virtually the drunkard throws his recklessly away in the very act of becoming intoxicated. But shall we have prohibition or a limited license for the community at large? This question divides itself when applied to the practical customs of life. The system of open bars for the sale of the coarser liquors and the custom of treating, as practiced by the English-speaking race, and especially in the U. S., are

unmitigated evils, and should be forthwith given up or should be crushed by state power. Although they would undoubtedly exist in secret places, it would nevertheless be the greatest boon to the community to have them, at least like the felons they make, obliged to keep out of sight. Should the same prompt measures be applied to the sellers of milder beers, ales, and wines? Undoubtedly these too should be under state and municipal surveillance. Moreover, some of the stronger beers or ales should be classed with the coarser liquors, as they steal away the senses almost as quickly and quite as powerfully as absinthe, whisky, or rum. Another question arises: Should the same rigid rule be applied to native light wines and beers which contain but a small quantity of alcohol and may therefore be used with comparative safety? The difficulty is that, as shown by practical experience, tavernkeepers, licensed to sell beer, will usually sell whisky also, surreptitiously. It is, moreover, argued that though beer and light wines may be indulged in more freely than stronger drinks, there is a danger that this use of milder liquors will lead to the use of grosser ones. It is probable that this is true in many cases, and doubtless it would be wrong to allow any one having tendencies to intoxication, either from hereditary descent or previous bad habits, to use even these milder liquors. With all such, total abstinence is absolutely essential; but it does not follow that this is necessary for all, and the only valid argument for total abstinence with those who are free from such tendencies must be the Scriptural one—that every man should be willing to curtail his own liberty lest his weaker brother be made to offend.

The final conclusion is this—viz., education and a cultivation of all the amenities of life should be promoted for the sake of temperance. In the school, and above all in the family, no opportunity should be lost of impressing on the tender consciences of the young the utter beastliness of drunkenness. A child should be taught to reverence the mind within him, and to shrink with horror from the thought of ever once depriving himself of its perfect control; and where public opinion will sustain such action the state may properly place liquor-saloons in the same category with gambling-houses, and rigidly suppress both. See PROHIBITION and ABSTINENCE, TOTAL.

Revised by JOHN ASHURST, Jr.

Temperature [viá O. Fr. from Lat. *temperatúra*, a mixing in due measure, proportion, temper, temperament, temperature, deriv. of *temperare*, mix in due proportion, temper]; the condition of a body in relation to the molecular activity manifested as heat, which condition determines its interchange, either of radiation or absorption, with neighboring bodies. (See GAS and HEAT.) The addition of heat to a body communicates to it a higher temperature in all cases except when a change of form occurs, as from a liquid to a gaseous condition, or when there is chemical action. (See THERMO-CHEMISTRY.) Measurements of the temperature of a body by thermometers are not strict measurements from a scientific point of view, but rather comparisons with certain other effects depending on change of temperature in special bodies. (See THERMOMETER and THERMOMETRY.) In gases the temperature can be expressed in an absolute manner in terms of the kinetic energy of the molecules, if we suppose the rigorous truth of Boyle's and Gay-Lussac's laws; that is, in a perfect gas the temperature is proportional to the average kinetic energy per molecule. As this is not the case, only a part of the temperature can be so expressed in consequence of the existence of intermolecular actions. See THERMODYNAMICS. See also METEOROLOGY.

R. A. ROBERTS.

Temperature of the Body: The temperature of the human adult in a state of health averages from 98.4° to 98.6° F., the fractionally higher temperature existing in the warmer-blooded races, as those of Southern Europe, the lower average being found in northern nations and the Anglo-Saxon race. The fluctuations of temperature in health are exceedingly small—fractions of a degree, rarely more—dependent on physical activity or inactivity in sleep or wakefulness, or functional activity, as digestion. The extremities and surfaces may show a lowered temperature in winter, but the temperature taken by a thermometer in the mouth, rectum, armpit, or fold of the groin reveals a nearly uniform heat of the blood and internal organs. Animal heat is generated by the nutritive supply and assimilation with destructive tissue-waste. These processes lead to a certain production of heat; at the same time there is a constant

dissipation of heat from the skin, through the lungs, and by the various other excretions. The regulation of the production and dissipation of heat is controlled by nervous centers situated in the basal portions of the brain. Any disturbance of these by conditions of the blood or circulation may therefore lead to disturbances of the temperature. As well-known examples "shock" or nervous depression causes reduced temperature, while excitement, pleasure, anger accelerate the circulation and elevate temperature. The temperature of children and infants is one to two degrees higher than that of adults. The temperature of aged persons is half a degree or more below the adult average. "Medical thermometry," the use of the thermometer to register and study temperature in disease, is a constant practice in medical work. De Haen (during the fever at Breslau a century and more ago), John Hunter, and Currie employed the thermometer, but the German school—and notably Wunderlich—has popularized its use by the profession within a comparatively recent period. The self-registering thermometer is employed, and the observations may therefore be taken by the nurse or attendant. In many diseases there is elevation of temperature. Where this is but a symptom in some distinct local disease the fever is regarded as but a symptom. On the other hand, there are diseases in which the fever is the most decided symptom. These have long been known as the fevers, or of late, from the present knowledge of their causation, as the infectious fevers. Among such are typhoid fever, malarial fever, and the like. In these there is usually a period of onset, a stage of continued symptoms, and a stage of decline. The temperature of the body varies greatly in different cases of the same fever or other disease and at different times. This may depend either upon the individual or upon the severity of the disease. As a rule, its range is from 101° to 105° F. When above the latter point the term *hyperpyrexia* is applied. Such may occur in various infectious diseases, and especially in pernicious malarial fever, in sunstroke, and in certain cases of rheumatism. In the last-named diseases, temperatures of 110° or 112° F. have not infrequently been noted where recovery ensued. Occasionally cases of elevation of the temperature to 118° or 120° or even more are recorded; but in many of these deception has been practiced. The reverse of fever, subnormal temperature, is also frequent. Moderate grades are noted in conditions of depression or shock. It reaches serious grades in collapse from injury or such diseases as cholera, in which debilitating discharges occur. The external temperature may here sink to 90° or even to 85° F. In practice the temperature is usually taken in the axilla or mouth, though the rectal temperature is less liable to accidental errors of observation.

Revised by W. PEPPER.

Temperature of the Earth: See EARTH.

Templar Knights: See KNIGHTS TEMPLAR.

Temple: city (founded in 1882); Bell co., Tex.; on the Gulf, Col. and S. Fé and the Mo., Kan. and Tex. railways; 36 miles S. by W. of Waco, and 218 miles N. W. of Galveston (for location, see map of Texas, ref. 4-11). It is in an agricultural and stock-raising region, and has 7 churches, a graded public school, a private high school, 2 national banks with combined capital of \$180,000, 5 weekly newspapers, 3 large cottonseed-oil mills, cotton-compresses, and agricultural-implement works. It is principally engaged in mercantile business. Pop. (1890) 4,047; (1895) estimated, 8,390.

EDITOR OF "TIMES."

Temple, FREDERICK, D. D.: Archbishop of Canterbury; b. in England, Nov. 30, 1821; educated in the grammar school at Tiverton; graduated at Oxford University 1842; became fellow of Balliol College; took orders in the Church of England 1846; was principal of the training-college at Kneller Hall, near Twickenham, 1848-55; one of the Government inspectors of schools 1855-58; master of Rugby School from 1858 to 1869; appointed by Lord Palmerston Bishop of Exeter 1869; appointed Bishop of London 1885, and Archbishop of Canterbury 1896. He was one of the authors of the famous *Essays and Reviews* (1860), and his confirmation to a bishopric was ineffectually opposed by the conservative party in the Church. He wrote three volumes of *Sermons preached in Rugby Chapel* (1861-71), and was Bampton lecturer at Oxford for 1884. Revised by C. H. THURBER.

Temple, HENRY JOHN: See PALMERSTON, VISCOUNT.

Temple, Sir RICHARD, D. C. L., LL. D.: statesman and author; b. in Worcestershire, England, in 1826; entered the India civil service in 1846; was knighted in 1867; was for

several years lieutenant-governor and actual ruler of Bengal, in which capacity he did much to benefit the natives, especially during the famine of 1874; was governor of the Presidency of Bombay, and having returned to England in 1880 entered Parliament in 1885 as Conservative member for the southern division of Worcestershire; has been a member of the London school board since 1885. He is the author of *India in 1880*; *Men and Events of my Time in India* (1882); *Oriental Experience* (1883); *Cosmopolitan Essays* (1886); *Palestine Illustrated* (1888); and the memoir of *John Lawrence in English Men of Action*. F. M. COLBY.

Temple, RICHARD GRENVILLE, Earl: statesman; brother of George Grenville; b. in England, Sept. 26, 1711; entered Parliament for Buckingham 1734; was advanced in political life by the elder Pitt, and held the offices of Lord of the Admiralty 1756-57 and Lord Privy Seal 1757-61. D. at Stowe, Sept. 11, 1779. His correspondence, and that of his brother George, with Pitt, was edited as *The Grenville Papers* (4 vols., 1852-53), by W. J. Smith.

Temple, Sir WILLIAM: diplomatist and author; b. in London, England, in 1628; educated at Emmanuel College, Cambridge; traveled on the Continent 1647-54; married Dorothy Osborne 1654; was a member of the Irish convention 1660; a joint commissioner of the Irish Parliament to Charles II. 1662; was sent on a secret mission to the Bishop of Münster 1665; was made a baronet and minister resident at the court of Brussels 1666; visited Holland to urge the formation of a league against Louis XIV. 1667; negotiated the triple alliance between England, Holland, and Sweden, Jan., 1668; assisted in perfecting the Peace of Aix-la-Chapelle, and was commissioned ambassador to The Hague 1668; returned to England Sept., 1670; was dismissed from office June, 1671, in consequence of the change of policy which had already (1670) led to a secret treaty with France, but was again appointed to negotiate a peace with the States-General of Netherlands 1674; assisted at the Congress of Nymwegen 1675-79; devised for Charles II. the plan of his privy council of thirty members Apr., 1679, and himself became a member. He declined the secretaryship of state in the same year; served in Parliament as member for the University of Cambridge for a single session, but in 1680 his name was stricken from the roll of privy councillors and he lived in retirement at Sheen and at Moor Park during his later years, having as secretary and literary assistant Jonathan Swift; was visited and consulted by William III., but declined to return to political life. D. at Moor Park, Surrey, Jan. 27, 1699. Author of *Observations upon the United Provinces* (1672); *The Origin and Nature of Government*; *Essay upon Ancient and Modern Learning*; and other publications, collectively issued as his *Works* (2 vols., 1720), edited with a *Memoir* by Dr. Swift. His collected writings were republished in four volumes in 1814. See the *Memoirs* by T. P. Courtenay (1836) and the *Letters* of Dorothy Osborne, edited by E. A. Parry (1888).

Temple of the Sun: See CUZCO and INCAN ANTIQUITIES.

Temple, The: See JERUSALEM.

Templeton: town; Worcester co., Mass.; on the Boston and Albany Railroad; 10 miles S. of Winchenden, 30 miles N. W. of Worcester (for location, see map of Massachusetts, ref. 2-F). It contains the villages of Baldwinville, Otter River, and East Templeton; has 6 churches, high school, 14 schools, Boynton Public Library, a savings-bank, and a weekly newspaper; and is principally engaged in the manufacture of articles from asbestos, chairs, furniture, pails, and boxes. Pop. (1880) 2,789; (1890) 2,999; (1895) 2,915.

Temporal Bones [*temporal* is from Lat. *temporalis*, pertaining to the temples, deriv. of *tem'pora*, temples (of the head)]; a pair of irregular bones which in man constitute a portion of the sides and base of the skull. Each consists of (1) a squamous portion, perhaps a part of the expanded neural spine of the second cephalic vertebra; (2) a mastoid portion; and (3) a petrous portion. Some regard these last two as parts of the splanchnic skeleton rather than of the vertebral skeleton, considering them as structurally parts of the auditory apparatus, although they are functionally, at least in part, identified with the rest of the temporal bones. Others regard the mastoid as belonging to the neural arch of the second vertebra. The zygomatic process reaches forward from the outer surface of the squamous portion, and joins the malar bone, forming the zygomatic arch; while attached to the petrous portion are a long styloid process and a nearly circular auditory process,

the pleurapophyses, or ribs, of the third and second vertebra of the skull. Attached to the mastoid portion is the mastoid (teat-shaped) process, which after puberty becomes hollowed into mastoid cells. Revised by W. PEPPER.

Temporal Power: See PAPAL STATES and ROMAN CATHOLIC CHURCH.

Temudjin: See GENGHIS KHAN.

Tenacity of Metals: See STRENGTH OF MATERIALS.

Tenaille: in fortification, a rampart in the main ditch, in front of the curtain, between two bastions. See FORTIFICATION.

Tenancy in Common: See ESTATE, LANDLORD AND TENANT, and JOINT OWNERSHIP.

Tenant for Years, at Will, and by Sufferance: See ESTATE and LANDLORD AND TENANT.

Tenas'serim: a division of BURMA (*q. v.*), forming part of the British empire in India. It is a long narrow tract of country, in from 10° to 17° N. lat., between Siam and the Bay of Bengal. Area, 46,590 sq. miles. The principal river is the Tenasserim, which rises in about 15° N. lat., and empties into the sea by two mouths. Pop. (1891) 971,660. The principal town is MAULMAIN (*q. v.*).

Ten Brink, BERNHARD ÆGIIDIUS KONRAD: See BRINK.

Tench [from O. Fr. *tenche* > Fr. *tanche* < Lat. *tin'ca*]: the *Tinca vulgaris*, a cyprinid fish, abundant in European streams and lakes, and the only member of its genus. It has a compressed, fusiform shape, the trunk covered with small scales, the lateral line little deurved, the head conic in profile, the mouth small, and with a small barbel at

The tench.

each corner, the dorsal above the pectorals, and short, the anal also short, and the caudal little emarginated; the pharyngeal teeth are compressed, club-shaped, and in one row, generally five on the left and four on the right side; the color is generally dark-greenish olive above and on the sides, lighter below; the fins dark brownish. It occasionally attains a length of nearly 3 feet and a weight of 12 lb., but does not often weigh more than 3 lb. It prefers rather deep and weedy, and apparently even foul water. It is very tenacious of life. The female spawns in the late spring. The fish is popularly supposed to possess healing properties. Its flesh is rather insipid. Revised by F. A. LUCAS.

Tendai-Shiu (in Chinese *T'ien-tai Tsung*): a Buddhist sect, whose doctrines were introduced from China into Japan in the year 805 A. D. by Dengio, the first abbot of Iliyeisan, Kioto. It divided later into three, the *Enriakuji*, the *Onjoji*, *Miidera* or *Jimon-Ha*, and the *Saikioji* or *Shinsei-Ha*. The name comes from the sacred mountain T'ien-tai in China, where Chisa first taught his doctrines. Recognizing the highest truths as incomprehensible, it makes spiritual enlightenment the result of contemplation and asceticism, which is confined to monks, who may impart their teaching by word of mouth to the laity. There is an exoteric teaching suitable for the vulgar, and another revelation of truth in itself. The deities worshiped formerly included many Shinto gods, who were regarded as Avatāras of Buddhist deities. Nirvāna is the final result of existence, a state of absolute unconditioned existence, in which the thinking substance while remaining individual is unaffected by feeling, thought, or passion. J. M. DIXON.

Tender [from Fr. *tendre* < Lat. *ten'dere*, stretch, extend]: in law, the attempt to perform a promise to do something or to pay something. The tender must be made by the promiser, or by one duly acting on his behalf, to the promisee or

his duly authorized representative; it must be of the kind and must be made at the time and place stipulated in the contract or fixed by law, and it must be unconditional. If the law imposes upon the promisee the performance of some act as a condition of receiving the thing tendered, the fulfillment of such condition may be required by the tenderer. For example, the debtor upon tendering the amount due on a note or a mortgage may demand the surrender of the note or a satisfaction of the mortgage. (*Halpin vs. Phoenix Ins. Co.*, 118 N. Y. 165.) Defects in a tender may be waived by the promisee, and the waiver may be by express words or by conduct. The subject is regulated by statute in some States. The effect of a rejected tender to pay money is somewhat different from that of a rejected tender of goods. In the latter case the seller is discharged by his tender, "and may either maintain or defend successfully an action for the breach of the contract." According to the prevailing view in the U. S., the tender, although rejected, vests title to the goods in the purchaser. (2 *Kent's Commentaries*, 598.) Such is not the effect in England, unless the buyer has previously assented to the appropriation of the goods to the contract by the seller. (See *SALE*.) A tender of money in performance of a promise does not discharge the debt. It does, however, if kept good, stop interest and entitle the tenderer to costs, if he is subsequently sued upon the contract. It also discharges the lien of a mortgage or other security for the debt tendered. The money must be of a kind declared by law to be tenderable. In Great Britain gold coins of the realm are a legal tender to any amount, silver coins to the amount of 40 shillings, bronze coins to the amount of 1 shilling, and Bank of England notes for debts exceeding £5 are also tenderable. The U. S. Constitution (Art. I, § 10, cl. 1) provides that no State shall make anything but gold and silver a tender in payment of debts. The Federal Government has declared U. S. gold coins a legal tender to any extent, also silver dollars, except when otherwise expressly stipulated in the contract, also U. S. notes; while silver certificates are tenderable for customs, taxes, and public dues, and silver coins below the dollar are tenderable in sums not exceeding \$10, and other minor coins for an amount not exceeding 25 cents. (U. S. R. S., §§ 3584-3590; ch. 20, Laws of 1878; ch. 12, Laws of 1879; *Legal Tender Cases*, 12 Wallace 457.) Silver coins are tenderable although worn smooth by wear, as are gold coins unless reduced one-half of 1 per cent. below standard weight. *Railroad vs. Morgan*, 52 N. J. L. 60, 558.

FRANCIS M. BURDICK.

Tendon [from Fr., deriv. of *tendre* < Lat. *tenēre*, stretch, extend; cf. Gr. *τένον*, sinew, tendon, deriv. of *τείνω*, stretch, extend]: in anatomy, the name of a white fibrous tissue connecting the end of a muscle with the bone which it is intended to move. It has sometimes the form of a cylindrical cord, sometimes of a broad ribbon, and in a few cases of a wide, thin sheet, but it is always inextensible and inelastic, and transfers at once the motion imparted by the contraction of the muscle to the bone into which it is inserted. See *HISTOLOGY* and *ACHILLES' TENDON*.

Revised by W. PEPPER.

Tenebr'rio [Mod. Lat., from Lat. *tenebr'rio*, one who loves darkness, trickster, deriv. of *tenebra*, darkness]: a genus of beetles, one species of which (*T. molitor*), in the larval state is the well-known meal-worm, which feeds upon meal and other farinaceous substances. There are very few allied species in the eastern parts of the U. S. In California tenebrionid beetles "form the characteristic feature of the insect fauna."

Ten'edos: island belonging to Turkey; in the Ægean, 12 miles S. of the Strait of the Dardanelles and 4½ miles from the mainland; famous as the place where the Greek vessels were concealed during the stratagem of the wooden horse which resulted in the fall of Troy. On the E. it has a good harbor, sheltered from the west wind, but the east coast verifies Vergil—*statio malefida carinis*. During the Greek revolution Tenedos was the headquarters of the Ottoman fleet, which was destroyed here by Kanaris (Nov. 22, 1822). The island is famous for its wines and melons, and during the season abounds in red partridges and quail. Pop. of Tenedos, the capital, 6,000; of the island 15,000, almost exclusively Greeks, quiet and contented and less enterprising than most of their race. E. A. GROSVENOR.

Tenement [viâ O. Fr. from Late Lat. *tenemen'tum*, holding, fief, deriv. of *tenēre*, hold; cf. *TENANT*, etc.]: in law, any real property, corporeal or incorporeal, which was susceptible of tenure. Literally, the term signifies "that which

is held," and the *holding* referred to is the feudal tenure of real property of and under a superior lord. In the familiar phrase employed by the common law to describe real property—"lands, tenements, and hereditaments"—the term tenement has the most extensive signification; for it comprehends not only lands proper, but everything in the nature of a right, interest, or estate in the lands of another; and it includes not only hereditaments, or estates of inheritance, but such interests also as are incapable of transmission by descent. For a fuller exposition, see articles on *FEUDAL SYSTEM*, *LANDLORD AND TENANT*, *PROPERTY*, and *TENURE*. GEORGE W. KIRCHWEY.

Tenement-houses (originally *Tenant-houses*): dwellings sheltering under one roof several tenants, whose tenements, i. e. living-rooms, are independent of each other, but access to which is had by a common entrance. The number of tenants requisite to fixing their character as such varies with the legal definition of the term tenement-house. In New York it is a building "occupied by three or more families living independently and doing their cooking on the premises, or by more than two families on a floor, so living and cooking, and having a common right in the halls, stairways, yards, etc." (Ch. 84, Laws of 1887.) In Massachusetts the standard is "more than three families," while in some cities in the U. S. it is "two or more families having a common entrance." Of this latter kind are the small two-family houses common to factory towns in the U. S. which are often leased by the mill-owners to their employees. In England and in continental Europe the tenement-house may be a small two-story dwelling, originally built for and occupied by one family, or a barrack containing a hundred. In Scotland a "tenement" contains so many "houses" for tenants. There, as in England, the one-room apartment is common. In the U. S. it has never been so.

New York is pre-eminently the tenement city of the U. S. In 1893 1,332,773 persons out of an estimated population of 1,891,306 lived in 39,138 tenements (board of health census of 1893), but this included the better apartment-houses, which are legally tenements. Deducting one-fifth as inhabiting these, eight-fifteenths of the entire population lived in what are commonly called tenement-houses. The tenement of New York is generally from four to six stories high, of brick, on a lot 25 feet wide by 100, or less, deep, with air-shafts and more or less light on stairs and in hallways if built since 1880, when reform began in earnest, with none of these things if it antedates that period; stores on the ground floor, and two or four families on each of the floors above. Each family has a living-room with windows opening on street or yard, and usually two interior bedrooms, to which air and light are admitted only by the air-shaft or through the front room. In the old tenements the bedrooms are not lighted at all. They are ventilated only by windows cut through to the dark hall. Almost the first task the health department found to do after its organization was to order 40,000 such windows cut through tenement bedroom walls in one year. The four-families-on-a-floor tenement is styled the double-decker. "A five-story house of this character contains apartments for eighteen or twenty families, a population frequently amounting to 100 people, and sometimes increased by boarders and lodgers to 150 or more. The double-decker can not be well ventilated; it can not be well lighted. It is not safe in case of fire." *Report of Tenement-house Committee, New York, 1894.*

Bethnal Green, London, before its partial demolition by the authorities, presented a view of the Old World slum tenement: "An area of some 15 acres was covered with ancient two-story cottages facing on streets barely 18 feet wide and with the diminutive back-yards completely filled with outbuildings and workshops. Bethnal Green had been a thriving community of Huguenot weavers who had taken refuge in England from persecution in France, and had domiciled themselves in what was then a little village in the suburbs of London. But it had been swallowed up in the growth of the metropolis, and its tiny cottages had become packed with a slum population of the worst sort. The county council found five or six thousand people living in such a manner as to furnish an object-lesson." (Albert Shaw, *Municipal Government in Great Britain*.) In Glasgow "houses which were only intended to accommodate single families had been increased in height, and were found tenanted by separate families in every apartment, until they appeared to teem with inhabitants. . . . A worse state was

dislosed by an inspection of some of the more recently erected houses for the working classes. Tenements of great height were reared on either side of narrow lanes with no back-yard space, and were divided from top to bottom into numberless small dwellings, all crowded with occupants." *Report of Municipal Committee, 1859.*

Tenements are as old as the race, wherever the crowding of population made building space scarce and dear. When there was no longer room to build houses beside each other, they were put on top of each other and so the tenement grew. The communal dwellings of the Pueblo Indians of the U. S. and Mexico are tenement barracks built so for the common defense. The same reason crowded the population of Old World cities within their walls. In the second century Juvenal drew in his satires (see the third) a scornful picture of the towering tenements of Rome—called *insulae*, because of their being built with narrow alleys between—in which 500,000 of his fellow citizens lived, squeezed into single rooms (*canacula*), for which they paid rent that would have purchased cheerful and commodious cottages in provincial towns. The architect Vitruvius, who lived in the Augustan era, speaks of the crowding of the poor within their cramped quarters. The palaces of the wealthy Romans spread themselves over vast areas, leaving little room for the propertyless, and compelling recourse to the "common though inconvenient practice of raising the houses to a considerable height in the air. But the loftiness of these buildings, which often consisted of hasty work and insufficient material, was the cause of frequent and fatal accidents, and it was enacted by Augustus, as well as by Nero, that the height of private edifices within the walls of Rome should not exceed the measure of 70 feet from the ground." (Gibbon's *Rome*, ch. xxxi.) Modern cities have copied Nero's enactment for their own safety.

The development of the factory system with its changed industrial conditions, in the age of steam, caused the drift of population to the cities that has characterized the nineteenth century. Their sudden growth, for which no preparation had been made, caused an unprecedented packing of the population and a corresponding expansion of the tenement-house system. The result is shown in the case of New York. Its tenement-house system is entirely a growth of the century. The old dwellings, deserted by their wealthier inhabitants, were first turned into tenant-houses. Then rear houses were built in the yard, and great barracks without light or ventilation run up to shelter the crowds. Topographical conditions aided this development. The rivers shut in the population of workers, chiefly poor, who must live near their work. The greater the crowding grew, the higher the rent and the more pressing the need of crowding to pay it. New York in 1894 had a density of population of 143.2 to the acre, and stood in this respect at the head of the world's cities. Paris came next with a density of 125.2 to the acre, and Berlin third with 113.6. The Tenth Ward of New York had 626.26 to the acre, and one sanitary district of 32 acres in the Eleventh Ward averaged as high as 986.4 persons to the acre. The densest small section in Europe is given as that of Josefstadt, Prague, with 485.4 to the acre, but the Tenth Ward in New York alone is five times as large as Josefstadt. *Report of the Tenement-house Committee, 1894.*

Evils of Tenement-house Crowding.—Directly and indirectly, such crowding breeds bad social and moral conditions. "The more crowded a community, the greater, speaking generally, is the amount of abject want, of filth, of crime, of drunkenness, and other excesses, the more keen is competition, and the more feverish and exhausting the conditions of life." (Dr. Ogle, of the Registrar-General's office, England.) "Such conditions . . . interfere with the separateness and sacredness of home life, lead to the promiscuous mixing of all ages and sexes in a single room, . . . thus breaking down the barriers of modesty and conducing to the corruption of the young." (*Report of the Tenement-house Committee, New York, 1894.*) The death-rate rises in proportion to the crowding and the age of the tenements, except, usually, in quarters inhabited by Hebrews, whose general hardness, great vitality, and habits of abstemiousness, enforced by the precepts of the Mosaic faith, counteract the deteriorating influences of the slum. Thus the Tenth Ward, in New York, while the most crowded, has of all the well-peopled wards of the city the lowest death-rate. Its rate in 1893, with an average density of 57.2 tenants to the house, was 17.14 per 1,000 of the living; while the general tenement-house death-rate of the entire city was 22.75, with an average

number of 34 tenants in each house. But among the other elements of the population the oldest and most crowded houses, which were built before the era of sanitary reform, have the highest mortality. The rear tenements, generally the oldest, with the poorest tenants and the greatest swarms, are the worst. According to the New York health department's census of 1893 the death-rate for houses having rear tenements was 27.66, against 22.21 for the single tenements. The adult death-rate for the First (the oldest) Ward was for houses standing singly on the lot 29.03; where there were front and rear houses it was 61.97. The infant mortality for the same ward was respectively 109.58 and 204.54. In England, Dr. Tatham, of Salford, gave the following results in houses built on the "back-to-back" plan, now condemned as unfit to live in:

	General death-rate.
Regent Road Sub-	1. No back-to-back houses 26.1
district	2. Average of 18 per cent. of back-to-back houses 29.1
	3. Average of 50 per cent. of back-to-back houses 37.3

Tenement-house Reform.—These evils compelled recognition in the Old World about the middle of the nineteenth century, and measures were set on foot to better the condition of the tenants. They led, after twenty years of discussion, in Glasgow to the foundation in 1866 of the Improvement Trust, by which a wholesale destruction of old unsanitary tenement-house property was begun; 29 new streets were formed, 25 old ones widened and much improved, a new square and a park opened, all at a cost of about £2,000,000. The improvement in the condition of the people has been great. In 1871 30.4 per cent. lived in one-room tenements. In 1881 the proportion had fallen to 24.7 per cent., and in 1891 to 18 per cent. Great undertakings of the same character followed in Birmingham, in Liverpool, Huddersfield, and in London. Greenock, Sheffield, and Dublin struck the same path with much success. In many instances the city became landlord and engaged in the erection of municipal tenements. Under the Housing of the Working Classes Act (1890) great powers were given to local authorities in the matter of expropriation and acquisition of property that gave an impetus to this wholesome activity. London replaced its Bethnal Green slum and its narrow alleys with wide streets lined with model five-story tenements, from which the one-room family apartment was eliminated. In France, in Belgium, and throughout Europe the great cities engaged in the battle with their tenement slums. Napoleon III. made light in darkest Paris. In Naples and Rome immense public improvements have been instituted. Budapest has, from one of the filthiest capitals in Europe, become a model city. In the U. S. the cholera epidemic of 1866 gave the impetus to tenement-house reform, but it was not until 1885 that the first tenement-house committee was appointed. The second committee (1894) carried its work farther. The sanitary condition of tenements has been greatly improved, and in New York their death-rate has been brought apparently even below that of the general death-rate of the city. In 1893 the registered tenement-house death-rate was 22.75, while that of the city as a whole was 23.52. (When, however, all deaths in institutions and all unknown dead that can not be referred back to the tenements are counted as belonging there, their showing is 25.77, and this is doubtless the more correct statement.) Light and air have been secured to the poor tenant, and steps taken to protect him from the danger of fire. The Tenement-house Committee in its report (1894) demanded the power of expropriation of unsanitary property. The Mulberry Bend tenement property, the worst in the city, has been acquired by the city. A park is to be opened on the site. Other cities in the U. S. in which the dangers due to the tenement-house system were impending are taking steps to prevent them. The 25-foot lot remains the chief obstacle to reform in New York.

Model Tenements.—In London Octavia Hill has shown that even old tenement property can be improved when proper attention is paid to it by the owner. Similar results have followed the efforts of Ellen Collins and others in New York. Philanthropists have erected model tenements in the effort to solve the problem of housing the poor, with excellent results. The general plan of these is that of a central court-yard, around which the buildings are grouped with two and three room flats, every room opening on the outer air. As a rule, they have yielded a fair return upon the investment where the management has been upon a business basis. The Peabody Fund tenements in London shelter about 20,000 tenants. Their death-rate, both adult and in-

fant, averages below that of London as a whole. The Artisan's Block buildings house more than 100,000 tenants. There are some 600 "model" tenements in London, but not all of them are models, nor did philanthropy dictate the erection of all. In general, the barracks plan of these huge buildings is not accepted in England as the best.

In New York the model tenements of the Improved Dwellings Association, and in Brooklyn those erected by A. T. White upon substantially the London plan, have proved successful business enterprises, though the rate of rental of the poorer tenements has not been exceeded. If anything, rents have been cheapened. It was found by the Tenement-house Committee (1894) that the worst slum tenements yielded the biggest profits to the landlords, even as high as 25 per cent., while for the better class they ranged from 8 to 10 per cent. The model tenement has paid 5 per cent. and over to the owner.

The solution of the tenement-house question must come, apparently, through still greater crowding, which will compel the scattering of the population to the suburbs by some adequate system of rapid transit, as a measure of self-protection. Such a result has already followed in London, and has been greatly encouraged by the authorities. In its real essence the tenement-house question is in all the large cities of the world a question of transportation, and must be solved finally along that line.

LITERATURE.—*Old Glasgow*, by James B. Russell, medical health officer; *Report of Parliamentary Commission on the Houses of the Working Classes* (London, 1885); *Reports of New York Board of Health* (1869, 1891, and 1893); Dr. O. Du Mesnil, *L'Habitation du Pauvre* (Paris); Dr. Albert Palmberg, *Traité de l'Hygiène publique*; *Reports of the Tenement-house Commissions of 1884-85 and 1894* (New York); Albert Shaw, *Municipal Government in Great Britain* (New York); Charles Booth, *Life and Labour of the People* (London); Jacob A. Riis, *How the Other Half Lives* (New York). JACOB A. RIIS.

Tenerani, tā-nā-rā-rā nē, PIETRO: sculptor; b. at Torano, near Carrara, Italy, Nov. 11, 1789; was a pupil of Canova, and also of Thorwaldsen, and worked under Desmarais in Rome. He resided almost wholly in that city, and had many public duties there connected with the museums and galleries. D. in Rome, Dec. 14, 1869. His principal works are a *Psyche with the Vase of Pandora*; a group of *Venus and Psyche*; a *Venus reclining, with Cupid drawing a Thorn from her Foot*; a *Piping Faun*; a *Crucifix*; a statue of *Bolívar* for Colombia; a bas-relief representing the *Deposition from the Cross*; the *Angel of the Last Judgment*, a statue of great power; busts of Thorwaldsen, of Pius IX. etc., and many other works for churches and cemeteries.

Revised by RUSSELL STURGIS.

Teneriffe: the largest of the Canary islands (see CANARIES); area, 780 sq. miles. The coasts are rocky and wild, and afford only one good harbor, that of Santa Cruz de Santiago. The interior is mountainous, and in the center is the mighty volcano of Pico de Teyde, 12,182 feet in height. The middle region is clad with beautiful forests of chestnut and oak, and the foot, as well as the hills and valleys around it, is covered with vineyards, olive and almond groves, wheat-fields, and orchards in which oranges and figs ripen to perfection. Prior to 1853 the average annual yield of wine was 25,000 pipes, but the grape disease appeared and the yield fell to 8,000 pipes. Land previously devoted to vineyards was given up to the cultivation of the cochineal insect, and it became the chief product. Pop. (1887) 108,081. Principal town, Santa Cruz de Santiago.

Teniers, ten'yērs, Fr. pron. tā nyār', DAVID: the elder; painter; b. at Antwerp in 1582. He lived in Rome for some time, where he studied under Elsheimer. He became a member of the Guild of St. Luke, in Antwerp, 1605. He taught his son painting, and their works are so similar in style as to be often mistaken the one for the other. D. in Antwerp, July 29, 1649. W. J. S.

Teniers, DAVID, the younger; painter; b. in Antwerp, Dec. 15, 1610. He studied under his father, but the influence of Rubens and Adrian Brouwer is recognizable in his work. In 1632 he was elected a member of the Guild of St. Luke, and in 1644 its president. His works were extremely popular, and he became wealthy and distinguished by honors. Archduke Leopold William, the governor of the Spanish Netherlands, appointed him to be his court painter and chamberlain. Teniers bought an estate at Perck, between Antwerp and Mechlin, whither people of distinction

went to visit him; removed to Brussels in 1647; d. there Apr. 25, 1690, and was buried at Perck. He married twice. His first wife was the daughter of Jan Breughel. This artist is well represented in all European collections. He painted very rapidly, and produced hundreds of genre-pictures, also some landscapes. The father's signature seems to have been a T within a D, while the son wrote his name D. Teniers F. For further information, see *Teniers, David*, by C. de Brou; *D. Teniers*, by Arsène Houssaye; and P. Lacroix, *Le Cabinet de l'Amateur*, vol. ii., p. 481. W. J. STILLMAN.

Tenimber Islands: See TIMOR-LAUT.

Ten Kate, ten-kaa te, JAN JACOB LODEWIJK: poet and theologian; b. at The Hague, Holland, Dec. 23, 1819. His youth was passed as clerk and bookkeeper in a mercantile establishment at The Hague, but he very early felt the influence of the romantic poetical movement, then in full swing in Holland. He was an enthusiastic admirer of Walter Scott, Macpherson's *Ossian*, Byron, and the Dutch poets Bilderdijk and Da Costa. He tried his own hand at verses, and in 1836 appeared his first volume, *Gedichten*. In 1837 he determined to give up trade and prepare himself for the Church. He studied at the University in Utrecht 1838-43, and passed his candidate's examination in May, 1844; and in Jan., 1845, he was called as pastor to the little fishing-village of Mareken. During these years, however, he had not neglected poetry. In 1837 he had published with a friend a translation of the *Odes of Anacreon*, the first of the long series of translations that have distinguished him among modern Dutch poets. In 1839 appeared *Bladeren en bloemen, Rozen, Nieuwe rozen, and Vertaalde poëzie*. In 1840 he published a translation of Byron's *Giuour*, and the poem *Ahasverus op den Grimsl*; in 1841, *Poëzy voor Holland's schoonen en Zuyden des tijds*. In 1842 he became the leading spirit in a curious venture, a periodical wholly in verse, called *Braga*, devoted largely to satiric criticism of the literary tendencies of the time. In the same year appeared his poem *Thomas Chatterton*, and in 1846 the collection *Legenden en Mengelpoëzy*. In 1847 he was called to the church at Almerik; in 1850 to Middelburg. Here he remained till 1860, when he was called to Amsterdam. There the remainder of his life has been passed. As has been indicated, the first productive years of Ten Kate were largely influenced by romanticism in its extreme form. After he had taken up the profession of clergyman, however, the influence of Bilderdijk became predominant with him, and the religious element in his thought grew much stronger. Through his later years his poetry has steadily held this religious coloring; and he has produced besides a number of treatises of a religious or philosophical character in prose. Among the poetical works in this manner are the didactic *Dood en leven* (1856); the poem on the creation of the world, *De Schepping* (1866; Eng. trans., *The Creation*, by Rev. D. van de Pelt, New York, 1888); *De Planeten* (1869); *De Jaargetijden* (1871); *Eenoë* (1874); *Godsdienstige poëzy* (1879); *Mozaiek* (1881); *Palmbladen en diehtbloemen* (1884); *Elek wat wils* (1887). Of great importance also are Ten Kate's translations into Dutch from other languages, many of which are among the best his country has produced. Among these are Tasso's *Gerusalemme Liberata* (1856); Tegnér's *Frithiof's Saga* (1861); Schiller's *Maria Stuart* (1866); La Fontaine's *Fables* (1868); Oehlenschläger's *Correggio* (1868); Dante's *Inferno* (1876); the first part of Goethe's *Faust* (1878); Milton's *Paradise Lost* (1880); Victor Hugo's *Lyric Poems* (1881); and strangely, but characteristically, the *Gospel Hymns of Ira D. Sankey* (1875). In these translations, as well as in his original verse, Ten Kate has shown very remarkable command of the Dutch language and imaginative powers of no mean order. A collected edition of his poems appeared in 8 vols. (Leyden, 1861-66; 2d ed. 1867). For his *Life* and a bibliography of his works see J. Ten Brink's *Geschiedenis der Noord-Nederlandsche Letteren in de XIX^e Eeuw* (Amsterdam, 1888). A. R. MARSH.

Tennant, WILLIAM: poet and Oriental scholar; b. at Anstruther Easter, Fifeshire, Scotland, May 15, 1784; studied at the University of St. Andrews 1799-1801; was for some years clerk to his brother, a grain-dealer in Glasgow, and afterward in his native town; published *The Anster Concert* (1811), a poem in the Scottish dialect, and *Anster Fair, a Poem in Six Cantos* (1812), in *ottava rima*, both descriptive of rural Scottish life, which gradually acquired popularity; was parish schoolmaster of Dunino 1812-16, and at Lasswade 1816-19; acquired the Arabic, Syriac, and Persian languages; taught Oriental and classical languages in the

academy of Dollar, Clackmannanshire, 1819-34; became in 1834 Professor of Oriental Languages in St. Mary's College, St. Andrews. He was the author of several later poems and dramas which were not successful, of a *Syriac and Chaldee Grammar* (1840), a *Life of Allan Ramsay* (1808), and of numerous contributions to periodicals, including some translations from Oriental poets. D. near Dollar, Feb. 15, 1848.

Revised by H. A. BEERS.

Tennent, Sir JAMES EMERSON; author; b. in Belfast, Ireland, Apr. 7, 1804; son of William Emerson, a wealthy merchant; was educated at Trinity College, Dublin; traveled after graduation (1824-25) through Europe and the Levant, also in Greece; published *A Picture of Greece in 1825* (1826), *Letters from the Aegean or Grecian Islands* (2 vols., 1829), and a *History of Modern Greece* (2 vols., 1830); married (June, 1831) the only daughter of William Tennent, a wealthy banker of Belfast, whose name he assumed; was called to the bar at Lincoln's Inn in 1831; was chosen for Belfast to Parliament in 1832, and several times subsequently; was secretary to the Indian board 1841-45; published a work on *Belgium* (2 vols., 1841); procured the passage of an act establishing copyright in designs 1843; was civil secretary to the colonial government of Ceylon 1845-50; was one of the joint secretaries to the Board of Trade from 1852 to 1867, when he retired from office. D. in London, Mar. 6, 1869. He is best known as the author of *Ceylon, an Account of the Island, Physical, Historical, and Topographical* (2 vols., 1859); he also wrote *Christianity in Ceylon* (1850) and *Natural History of Ceylon* (1861).

Tennessee: one of the U. S. of North America (South Central group); the third State admitted into the Union.

Location and Area.—It extends from the Appalachian Mountains on the E. to the Mississippi river on the W.; between lat. 35° and 36° 36' N. and lon. 81° 37' and 90° 28' W.; is bounded N. by Kentucky and Virginia, E. by North Carolina, S. by Georgia, Alabama, and Mississippi, and W. by Arkansas and Missouri; extreme length from E. to W., 432 miles; breadth from N. to S., 109 miles; area, 42,050 sq. miles, of which 300 sq. miles are water surface.

Seal of Tennessee.

The eastern part of the State is hilly and mountainous, the middle undulating, and the west comparatively low and level. Reckoned from the altitude of its river-beds, there is a gradual, but irregular, slope from an elevation of 1,264 feet on the E., to 200 feet on the W. There are eight natural divisions: (1) *The Unaka Range* on the eastern border, comprising numerous wooded mountain-ridges with outlying spurs and intervening coves of great fertility; also lofty peaks with treeless summits covered with luxuriant natural grasses and having the flora of Canada and the climate of New England; area about 2,000 sq. miles. (2) *The valley of East Tennessee*, a fluted region of parallel ridges and narrow valleys, extending diagonally from N. E. to S. W. through the eastern part of the State; elevation, 1,000 feet; area, 9,200 sq. miles. (3) Next on the W. the *Cumberland Table-land*, or level top of the Cumberland Mountains, which rise abruptly 1,000 feet above the valley of East Tennessee and 2,000 feet above the sea; surface shows low ridges and shallow valleys; much of it is covered with native grasses; summers are cool and climate healthful; area, 5,100 sq. miles. (4) *The Highland Rim* bounds the table-land on the W., and, extending on the N. and S., as far W. as the Tennessee valley, incloses the Central Basin; elevation, 1,000 feet; has numerous mineral springs and many summer resorts; area, 9,300 sq. miles. (5) *The Central Basin*, a depression of 5,450 sq. miles; resembles the bed of a drained lake with its main slope to the N. W.; greatest diameter from N. E. to S. W., 120 miles; breadth from 55 to 60 miles; altitude 550 feet, with variations of 200 to 300 feet. (6) *The western valley* of the Ten-

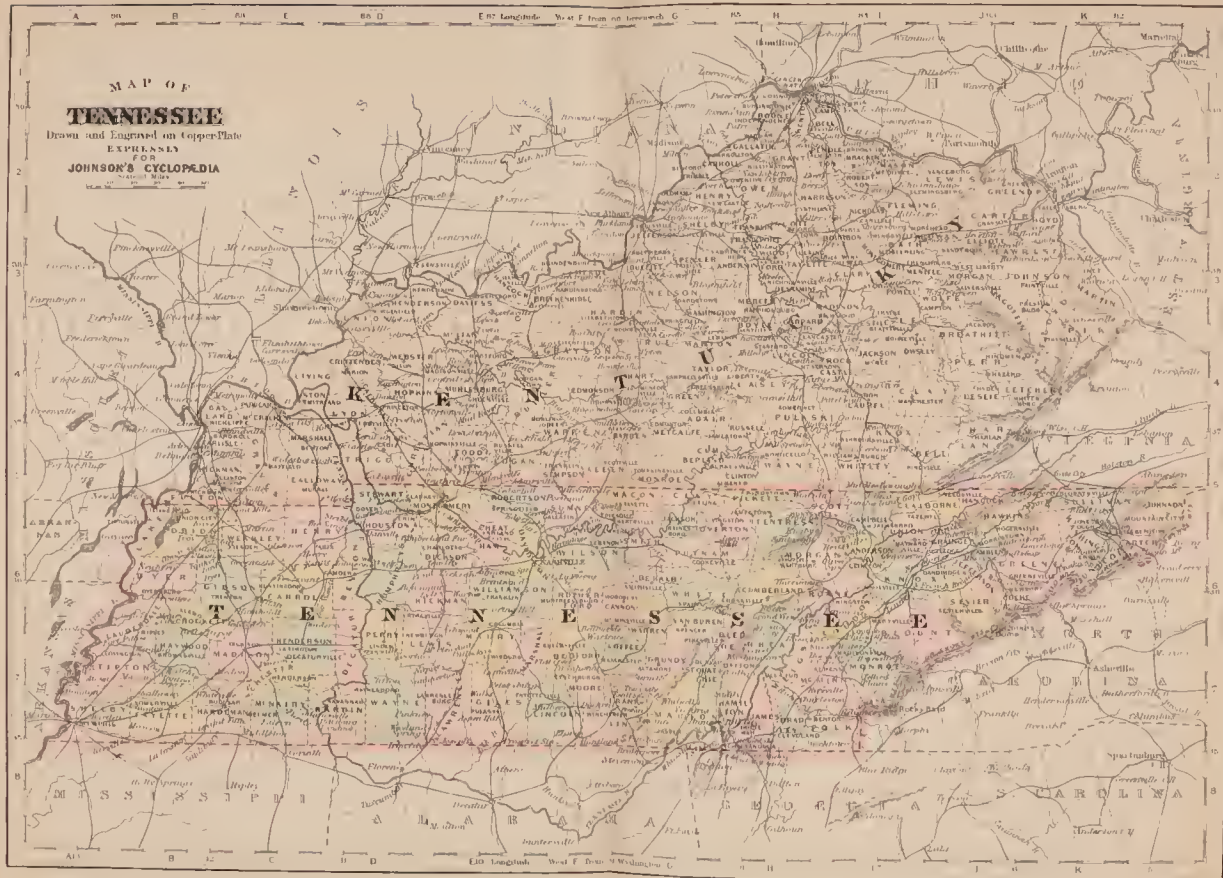

nessee river embraces 1,200 sq. miles of river lowlands and subordinate valleys extending into the highlands; elevation above the sea, 360 feet; reaches across the State from N. to S., with a breadth of 10 to 12 miles. (7) Adjoining this is the *plateau slope* of West Tennessee, descending gently to the Mississippi; surface slightly undulating, but often showing abrupt hills and narrow valleys; streams sluggish; western border terminates abruptly with steep hills which overlook the Mississippi bottoms; average elevation about 500 feet; area, 8,850 sq. miles. (8) The alluvial *Mississippi bottoms* are low and level, with numerous swamps and many lakes, abounding in fish and wildfowl; elevation above the Gulf about 295 feet; area, 950 sq. miles. The Clinch, Powell's, and Holston rivers drain upper East Tennessee; the French Broad, Little Tennessee, and Hiwassee assist, lower down; and the Tennessee, formed by the union of the two forks of the Holston (*q. v.*), carries all this water into Alabama, thence back north across Tennessee and Kentucky into the Ohio. The Cumberland pours into the Ohio the drainage of northern Middle Tennessee; the Duck, the Elk, and Caney Fork drain the rest of this section; and the Obion, Forked Deer, Big Hatchie, and Wolf carry most of the West Tennessee waters into the Mississippi. The principal rivers are the Mississippi, the Cumberland, and the Tennessee. The only lakes are found in the Mississippi bottoms, and are little more than expansions of small rivers. Reelfoot, between Lake and Obion Counties, is the most noted; it was largely produced by the earthquake of 1811-12.

Geology and Mineral Resources.—The geology presents a striking variety, ranging from the oldest metamorphic rocks of the Lower Silurian formation on the east border to the most recent alluvial deposits on the west. The natural divisions whose area is occupied almost wholly by the Lower Silurian are the Unaka Range, the valley of East Tennessee, and the Central Basin. The Cumberland Table-land and the Highland Rim are Carboniferous; the Western valley, Upper Silurian and Devonian; the plateau slope of West Tennessee, mainly Cretaceous and Tertiary; the Mississippi bottoms, Recent. All the important mountains are in the east end of the State, which rests upon the west slope of the Appalachian system. The Great Smoky Range is on the North Carolina border; extreme height, 6,660 feet; average, 5,000 feet. Parallel with this, through the valley of East Tennessee, extend Clinch Mountain (2,000 feet), Powell's Mountain, and numerous minor ridges. To the W. of these and parallel is the broad plateau of the Cumberland. The rest are unimportant.

The total value of mineral products in 1889 was \$6,455,283, coal and iron being most important. The coal-fields are coextensive with the Cumberland Table-land and form a part of the great system which extends from Pennsylvania to Alabama; area, 5,100 sq. miles; total output in 1893, 1,902,258 short tons. The coal is bituminous, makes a good coke (265,777 tons in 1893), and is adapted to smelting, manufacturing, domestic, and general purposes. There are three main iron-producing belts extending across the State: the eastern belt, along the Smoky Mountains; the Dyestone belt, parallel with the eastern base of the Cumberland Table-land, yielding hematite ore; and the western belt, 50 miles wide, on the dividing-line between Middle and West Tennessee. A fourth belt of minor importance coincides with the coal-fields. In 1891 there were produced 326,747 tons of pig iron. In 1893 the output of iron ore was 372,996 long tons. The marble-industry, confined mainly to East Tennessee, has experienced a rapid growth. In 1892 there were twenty-two quarries in operation, which shipped annually about 25,000 tons, worth \$350,000. Jefferson, Union, and Claiborne Counties, in the northeastern part of the State, produce large quantities of zinc ore. The copper mines of Polk County, in the southeast corner of the State, are very productive. One mine produces 150 tons of ore daily. In 1889 there were 3,057 tons of mineral paint produced. Blue Springs, in Bradley County, produces considerable lead. Gold is found in small quantities in Monroe County. Pyrite, manganese ores, alum, barite, salt, niter, gypsum, hydraulic rocks, building-stone, potter's clay, fire-clay, and epsomite abound. Overton and Dickson Counties produce petroleum, although in limited quantities.

Soil and Productions.—The soils of the State are as varied as its rocks. The greatest diversity is found in the east part, where only the best valleys and river-bottoms have the highest fertility. General farm products are here raised. The soil of the Cumberland Table-land is usually sandy, porous, and not very productive, though adapted to pasturage, the

MAP OF
TENNESSEE
Drawn and Engraved on Copper-Plate
EXPLANED
FOR
JOHNSON'S CYCLOPEDIA
1829

growth of fruit, garden vegetables, and Irish potatoes. On the Highland Rim some sections have good fertility, but most of its area, called the Barrens, is flinty and little productive. Fruit and wild grass for pasturage are the main productions, excepting tobacco in the northern part. The rich limestone soils of the Central Basin make it the garden-spot of the State, and produce abundantly Indian corn, wheat, blue grass, and, in the south part, cotton. The soils of West Tennessee are sandy and mellow, but generally fertile. Cotton is produced abundantly in the south and general crops in the north. In the Mississippi bottoms is a black loam, the richest soil in the State; it produces cotton, Indian corn, and general crops in luxuriance.

The following summary of the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.
Total number of farms.....	165,650	174,412	* 5.3
Number of acres in farms.....	20,666,915	20,161,583	+ 2.4
Value of farms, including buildings and fences.....	\$206,749,837	\$242,700,540	* 17.4

* Increase. † Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	3,107,777	68,060,316 bush.	\$26,543,523
Wheat.....	728,122	5,897,788 "	3,007,872
Oats.....	415,968	6,511,133 "	2,278,807
Rye.....	2,341	21,069 "	16,012
Barley.....	2,622	36,181 "	20,263
Buckwheat.....	1,381	17,677 "	10,076
Tobacco.....	39,300	26,724,000 lb.	2,405,160
Potatoes.....	38,956	2,142,580 bush.	1,019,864
Hay.....	435,510	513,902 tons	5,791,676
Totals.....	4,801,977		\$41,123,343

The farm animals on Jan. 1, 1895, comprised 344,440 horses, value \$15,007,506; 200,153 mules, value \$9,142,760; 341,169 milch cows, value \$5,280,710; 516,446 oxen and other cattle, value \$5,198,999; 493,782 sheep, value \$767,633; and 1,930,049 swine, value \$7,002,990; total head, 3,859,339; total value, \$42,400,598.

Climate.—The average annual mean temperature is 59°. Though in summer and winter marked extremes are sometimes reached, yet these seasons are generally mild, and spring and autumn are delightfully temperate and pleasant. A limited amount of snow falls. Temperature and rainfall by months for twenty-three years (1871 to 1893, inclusive) are as follows:

MONTHS.	Average mean temperature.	Average rainfall, in inches.	MONTHS.	Average mean temperature.	Average rainfall, in inches.
January.....	39.0°	5.53	July.....	79.0°	3.95
February.....	43.7	5.49	August.....	77.0	3.78
March.....	48.7	5.48	September.....	70.3	3.35
April.....	59.7	5.15	October.....	59.7	2.79
May.....	68.0	4.03	November.....	48.3	4.28
June.....	76.0	4.49	December.....	41.7	3.88

The extremes for the above period in the three sections of the State are:

SECTION.	Coldest month.	Average temperature.	Hottest month.	Average temperature.
West Tennessee....	Jan., 1886.	30°	July, 1878.	84°
Middle Tennessee....	Jan., 1886.	29	July, 1879.	83
East Tennessee.....	Jan., 1893.	29	July, 1878.	80

A difference of elevation produces a difference of about 2° in the mean temperature of the extreme ends of the State.

Divisions.—The State has three distinctly recognized civil or political divisions: East Tennessee, Middle Tennessee, and West Tennessee. The first occupies the east end of the State to the middle of the Cumberland Table-land, and contains 34 counties; the second reaches to the west valley of the Tennessee river, and contains 41 counties; the third lies between the Tennessee and Mississippi rivers, and contains 21 counties. Much local feeling exists in these divisions as to the apportionment of State officers, the charitable institutions, etc. In many respects the divisions resemble different States.

* Reference for location of counties, see map of Tennessee.
 † Organized since census of 1880. ‡ District.
 § West, North, and South Knoxville included.

Principal Cities and Towns, with Population in 1890.—Nashville, 76,168; Memphis, 64,495; Chattanooga, 29,100;

Knoxville (including West, North, and South Knoxville), 27,573; Jackson, 10,039; Clarksville, 7,924; Columbia, 5,370; Johnson City, 4,161; Murfreesboro, 3,739; Union City, 3,441; Bristol, part in Tennessee, 3,324; Cleveland, 2,863.

Population and Races.—In 1860, 1,109,801; 1870, 1,258,520; 1880, 1,512,359; 1890, 1,767,518 (natives, 1,747,489; foreign, 20,029; males, 891,585; females, 875,933; whites, 1,336,637; colored, 430,881, comprising 430,678 persons of African descent, 51 Chinese, 6 Japanese, and 146 civilized Indians); Jan. 1, 1894, estimated, 1,850,000.

Industries and Business Interests.—In 1890 the State debt was \$19,695,974; value of taxable property (1892), \$352,716,532; revenue (1892), \$1,816,268; mortgage indebtedness, per head (1892), \$23.00. There were 192 banks in 1894—national 53, State 119, private 18—with a total paid-up capital of \$17,382,235. Deposits in savings-banks in 1892 were \$1,292,913. The number of newspapers and periodicals in 1894 was 275. The census of 1890 reported the manufactures of cities only, the total of which for all industries was: Number of establishments reporting, 1,264; value of hired property, \$4,346,153; direct investment, \$29,713,423; miscellaneous expenses, \$2,666,795; average number of persons employed, 23,094; total wages, \$11,297,019; cost of materials used, \$22,487,757; value of products, \$43,071,586. There were 23 cotton-mills and 19 woolen-mills. The value of the annual product of flour is \$10,000,000; lumber, \$5,000,000; leather, \$2,000,000. The manufacture of cottonseed oil reaches about 3,000,000 gal. per annum, and the manufacture of distilled spirits 1,000,000 gal.

Means of Communication.—In 1891 there were 2,767.58 miles of railway; assessed valuation, \$38,341,488; average per mile, \$13,853. The most important roads are the Nashville, Chattanooga and St. Louis; the Louisville and Nashville; and the Southern. The number of electric railways in 1893 was 12; miles, 188; capital stock, \$5,065,000. The rivers navigable for steamers are the Mississippi, 160 miles; the Tennessee, its whole course; the Cumberland, 304 miles; Clinch and Emory rivers, to Harriman; French Broad, 90 miles, to Leadvale; Hiwassee, 20 miles, to Charleston; Clinch, to Clinton; the Big Hatchie, Forked Deer, and other minor ones, to a limited extent. At high water many other streams float barges and rafts.

Churches.—The census of 1890 gave the following statistics concerning the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Methodist Episcopal South.....	1,367	1,317	121,398	\$1,994,382
Baptist, Regular, South.....	1,287	1,269	106,632	1,802,015
Baptist, Regular, Colored.....	575	581	54,252	525,573

Schools.—In 1891-92 the universities and colleges numbered 22; instructors, 404; students, 6,283; income, \$363,304; value of grounds and buildings, \$3,062,400. The most noted of these are the UNIVERSITY OF TENNESSEE (*q. v.*), at Knoxville; VANDERBILT UNIVERSITY (*q. v.*) and the University of Nashville (Peabody Normal College), at Nashville; the University of the South, at Sewanee; Cumberland University, at Lebanon; Southwestern Presbyterian University, at Clarksville; Southwestern Baptist University, at Jackson; and FISK UNIVERSITY (*q. v.*), at Nashville. The number of children of school age (six to twenty-one years) in 1893 was 701,229, of whom 447,938 were enrolled in the public schools, and 308,776 were in average daily attendance. There were 5,184 white primary district schools and 641 white secondary; 1,555 colored primary and 24 colored secondary; city schools, 156. The total number of public schools was 7,560; teachers, 8,609; the expenditures were \$1,647,799, of which \$1,311,892 was for teachers' salaries. The number of schoolhouses was 6,672; value of school property, \$2,918,001. In 1891 there were 978 private schools with an enrollment of 43,342 pupils.

Libraries.—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Tennessee had 53 libraries, containing 232,929 bound volumes and 39,595 pamphlets. The libraries were classified as follows: General, 11; school, 7; college, 25; college society, 6; law, 1; Y. M. C. A., 2; and society, 1.

Charitable, Reformatory, and Penal Institutions.—There is an insane asylum in each of the three divisions of the State, as follows: the Eastern, at Knoxville; the Central, at Nashville; the Western, at Bolivar. The disbursements for the insane in 1891-92 were \$369,521.33. The School for the Deaf and Dumb is at Knoxville; the School for the Blind at Nashville; and the State also has at Nashville the Tennessee Industrial School, a reform school for both sexes. A home for Confederate soldiers was opened at the Hermitage (near Nashville) in 1892, with accommodations for 125 persons. Disabled and indigent Confederate soldiers who enlisted from the State receive pensions ranging from \$8.33 to \$25.00 per month. The State penitentiary is at Nashville, but the convicts are worked by the lease (six years) system, and are scattered over the State, mainly in coal mines. There are poorhouses and jails in every county, and the most populous counties have workhouses.

Political Organization.—The State government has the usual legislative, executive, and judicial departments. The Legislature has two chambers, the House and the Senate. Its members are elected for two years and receive \$4 a day during the session, which is limited to seventy-five days. At the head of the executive department is the Governor, elected for two years. He must have been a citizen of the State seven years and be thirty years old. In case of a vacancy the Speaker of the Senate succeeds him. Three State officers are elected by the Legislature, namely, a secretary of State (four years), comptroller (two years), and treasurer (two years). The Governor appoints, subject to confirmation by the Senate, a superintendent of public instruction, superintendent of prisons, commissioner of agriculture, statistics, and mines, etc. The judicial power is vested in a Supreme Court of five judges, elected for eight years, who sit in Jackson, Nashville, and Knoxville. There are also chancery or equity courts, circuit or law courts, and a court of chancery appeals. Some of the larger counties have separate criminal courts. Each county has a sheriff (two years), a trustee (two years), a register of deeds, and clerks of courts. Every civil district has two or more justices of the peace (six years), who, besides their individual jurisdiction, form the county court, a body of legislative and judicial powers. Each city has a mayor, a common council (some of one and some of two chambers), and the usual municipal officers. Suffrage is free to all males not convicted of infamous crime, who are citizens of the U. S. and have been one year in the State and six months in the county. A State law requires a modified form of the Australian ballot system in the large towns and counties. A State board of health has power to declare quarantine in times of epidemics.

History.—In 1541 the Spaniards under de Soto touched Tennessee where Memphis now stands, being the first European visitors. Here the French under La Salle, 141 years later, built a fort, and the Spaniards, in turn, afterward erected San Fernando. The country was claimed by the Spanish, the French, and the English. Charleville, coming up from Louisiana in 1714, built a trading-house near the present Nashville, and French and English struggled to secure the Indian trade. In 1748 Dr. Thomas Walker, with other Virginians, discovered the Cumberland Mountains, Gap, and river, which he named for the Duke of Cumberland. Fort Loudon, the first Anglo-Saxon outpost in the great wilderness, was built by Andrew Lewis in 1756. It was taken by the Indians four years later. The tide of migration was from Virginia and the Carolinas. First came hunters, explorers (see BOONE, DANIEL), and traders, followed, in 1769, by immigrants who settled on the Watauga. In 1772 the first government, the Watauga Association, was formed. James Robertson settled on the Cumberland in 1779. The war of the Revolution found the settlements patriotic. Shelby and Sevier led 500 men into the Carolinas in 1780, where, under Campbell, they defeated the British Ferguson at King's Mountain. On his return the following year, Sevier made a conquest of the Cherokee Indians. After the Revolution North Carolina ceded the territory to the Federal Government and left the inhabitants without law or protection. Therefore, in 1784, the State of Franklin was formed, and, though the parent

State at once reversed her act of cession, lasted till 1788. The final cession, however, was made in 1790, and the "Territory South of the Ohio River" was formed, with William Blount as first governor. Knoxville was laid out in 1792, and the first territorial assembly met there in 1794. In 1796 the State was formed and admitted into the Union. The first two decades of the nineteenth century were characterized by rapid growth and contests with the Indians. The first bank (the Nashville) was chartered in 1807. Memphis was laid out in 1819. The State capital was Knoxville till 1811, except in 1807, when it was Kingston. Knoxville, Nashville, and Murfreesboro had the honor in turns till 1826, when Nashville became the permanent capital. Three Presidents of the U. S. have come from Tennessee: Andrew Jackson (1829-37); James K. Polk (1845-49); and Andrew Johnson (1865-69). The State was distinguished in the Mexican war (1845-47), Pillow, Haskall, Campbell, Trousdale, and Cheatham being prominent. In the civil war Tennessee at first hesitated, but on June 8, 1861, voted to join the Confederacy. The Federal Government soon regained the capital and a large part of the State, and President Lincoln appointed Andrew Johnson military governor. The contending forces fought successively the battles of Fort Henry, Fort Donelson, Pittsburg Landing (Shiloh), Stone River, Chickamauga, Lookout Mountain, Mission Ridge, Knoxville, Franklin, and Nashville. In Apr., 1865, the Legislature ratified the thirteenth amendment to the Federal Constitution, and on July 12, 1866, the fourteenth amendment. The usual reconstruction troubles succeeded the war. Prominent public leaders were William G. Brownlow, Andrew Johnson, and Horace Maynard, Republicans; and Isham G. Harris, John C. Brown, B. P. Cheatham, and others, Democrats. Following the war a large State debt accumulated, which has been greatly reduced.

Tennessee River: the chief affluent of the Ohio. It originates in the confluence of the Holston and the North Fork of the Holston (*q. v.*), near Kingsport, Sullivan co., Tenn., flows S. W. to Chattanooga, thence W., and again S. W. Sweeping through Northern Alabama, it turns northward, traverses Tennessee and Kentucky, and joins the Ohio at Paducah, Ky. Its drainage-area is 41,000 sq. miles; total length to the head of the Holston, nearly 1,200 miles; below the confluence, 800 miles. It is navigable without obstruction 280 miles to Florence, Ala., at the foot of the Muscle Shoals. The shoals (20 miles long) are navigable about three weeks in the year during spring floods. Canals and locks now obviate this difficulty. Above this point the river is navigable throughout its course for the greater part of the year by light-draught steamers. There are 925 miles of naturally navigable waters above the shoals upon this river and its tributaries for six months in the year.

Revised by I. C. RUSSELL.

Tennessee University of: an institution at West Knoxville; chartered in 1794 as Blount College; name changed in 1807 to East Tennessee College; in 1840 to East Tennessee University; in 1879 to the University of Tennessee. It received the appropriations made by the U. S. Government

in 1862, 1887, and 1890 for colleges of agricultural and mechanical arts in the several States. The university includes, besides the regular academic department, a department of law, a department of medicine, and a department of dentistry. In the academic department tuition is free to properly qualified students of both sexes from all States of the Union. Instruction is provided in military science. The university occupies twelve large brick and stone buildings situated on a beautiful campus of 40 acres. The elevation is over 1,100 feet above the sea. In 1888 a complete reorganization of the university was effected. In 1894-95 the number of instructors was 46; of students, 505. The library contains 12,000 volumes. The president is Charles W. Dabney, Jr.

Revised by T. C. KARNS.

Tenney, SANBORN: naturalist; b. at Stoddard, N. H., Jan. 13, 1827; graduated at Amherst College 1853; afterward studied under Louis Agassiz at Cambridge; was lecturer on natural history in the Massachusetts Teachers' Institute 1856-65; was (1865-68) professor at Vassar College; became in 1868 professor at Williams College. Among his works are a text-book of *Geology* (1859); *Manual of Zoology* (1865); *Natural History of Animals*; and *Elements of Zoology*. D. at Buchanan, Mich., July 9, 1877.

Tenniel, ten-ni-el, Sir JOHN: painter and illustrator; b. in London, England, in 1820; showed a decided taste for art in boyhood; pursued his studies in his own way, thus developing a very original style; was a successful competitor for painting pictures in fresco in Westminster Palace 1845; has been since 1851 one of the leading artists on the staff of *Punch*, for which he has produced weekly most of the large full-page pictures called cartoons, and has illustrated many books, among which are *Aesop's Fables*, the *Ingoldsby Legends*, *Lalla Rookh*, and the celebrated books for children, *Alice's Adventures in Wonderland* and *Through the Looking-glass*, by Lewis Carroll (C. L. Dodgson).

Revised by RUSSELL STURGIS.

Tennis: a game played with small, hard balls, formerly struck by the hand, but special gauntlet, and finally by a bat or racket; but LAWN-TENNIS (*q. v.*) is a distinct game. In all its modifications tennis corresponds very closely with the French *jeu de paume*. Even in the elaborate game which developed in the seventeenth century, the resemblance between the French and English customs of playing and counting is marked, and the points of difference are few. Both in England and on the continent of Europe tennis was played by the populace out of doors, in a town moat, or wherever a blank wall could be had, and in like manner it was played by kings and their courtiers in large rooms especially built and prepared for it, and also out of doors. Toward the end of the seventeenth century it seems to have been thought improper for the populace to play tennis at all; it was the sport of those who had the privilege of leisure, as, indeed, none others could hope to excel in it. The antiquarians have discovered accounts of Henry VII. of England losing his balls at the game and losing money also, twelvence at one time, and Henry VIII. was evidently an ardent player. Charles I., for all his gravity and dignity, both as prince royal and as king, played tennis a great deal. In literature allusions to the game are frequent. Pericles, Prince of Tyre, complains of being

A man whom both the waters and the wind,
In that vast tennis-court, have made the ball
For them to play upon.

The "wild prince" Henry tells Pericles that the tennis-court keeper knows more about the latter's wardrobe than anybody else because "it is a low cbb of linen with thee when thou keepest not racket there" (*2 Henry IV.*, ii., 2). To the same prince when king the Dauphin of France sends tennis-balls as a reproach for his idle frivolity (*Henry V.*, i., 2); but the king was not ashamed of tennis, for in his speech of defiance he goes into a discussion of the game which he means to play with the King of France, and reveals in anticipation. The speech, some fifty lines long, is full of the language of tennis, not to be understood by those ignorant of the favorite game. In *Henry VIII.* (i., 3) Sir Thomas Lovell complains of the travelers who have so much faith "in tennis and tall stockings." Polonius, in *Hamlet* (ii., 1), giving advice to his servant, supposes "a falling-out at tennis." Benedick's whiskers are assumed, now that he is elegant and trim "for the love of Beatrice" (*Much Ado about Nothing*, iii., 2), to have stuffed tennis-balls.

In the 1894 edition of *Les Trois Mousquetaires*, with illustrations by Maurice Leloir, is a picture of Porthos in the *jeu de paume*, which shows a tennis-court as it may be thought to have been under Louis XIII. In the *Tableaux Historiques de la Révolution Française* (1791; reissued 1817) there is a contemporary picture of the famous *Jeu de Paume* at Versailles, in which was taken the oath of June 20, 1789, the *serment du jeu de paume*. It is very like a modern court.

A very large room, about three times as long as wide and 30 feet or more in height, is lighted with top light or at least with windows only at the top of the wall. Along one long side and both ends a wall about 7 feet high is built about 7 feet from the main wall, and a sloping, pent-house roof is carried from this wall back to the high wall. The gallery for spectators is high in the wall where there is no pent-house. What remains of unoccupied floor is divided into halves by what was originally a rope, afterward a net reaching to the floor. That half of the floor in which a player facing the net has the long pent-house on his left is the *service* side, the other is the *hazard* side. Behind the player on the service side is a long and large opening in the wall below the pent-house, and smaller openings are in other parts of it, as well as vertical break or step in the wall where there is no pent-house. The floor is marked with lines parallel to the net. The walls of the room are sometimes black to show the white balls the better, and it is stated that in India the British officers have their balls black so that they may keep the walls of the court white for coolness sake.

The game is played by striking the ball from the service side so as to bound from the upper wall or the pent-house on the hazard side, and by returning it from the hazard side. The ball must strike the floor within certain limits: it must be struck on the first bound; it must not strike the net, nor the roof, nor the high wall beyond a certain line. The player counts by sending a ball into any of the openings in the lower wall, and by striking the ball on its first bound in certain ways relatively to the cross-marks on the floor. Elaborate codes of laws are issued by tennis clubs, of which there are many in Great Britain and a few in the U. S. The not dissimilar game of racket is sometimes encouraged by the same association with tennis; thus in New York city the Racquet and Tennis Club has a court for each game, but nowhere does the game find many players, as it is superseded in popularity by other athletic sports, among which are lawn-tennis, cricket, and base-ball.

Tennyson. ALFRED, Baron Tennyson, D. C. L., F. R. S.; poet; b. at Somersby, Lincolnshire, England, Aug. 6, 1809; the fourth of twelve children (eight sons and four daughters) of George Clayton Tennyson, LL. D., rector of Somersby and other Lincolnshire parishes. Dr. Tennyson was the eldest son of George Tennyson (1750-1835), who belonged to the Lincolnshire gentry as owner of Bayons Manor and Usselby Hall, and was for several years a member of Parliament; he married (Aug. 6, 1805) Elizabeth, daughter of Stephen Fyche, Vicar of Louth. The poet's father (1778-1831) was a man of superior abilities and varied attainments. His mother (1781-1865) was a pious woman of many admirable qualities, being especially sensitive. From her he inherited his refined, shrinking nature. Alfred was a pupil of Louth Grammar School 1816-20. During the next eight years he was educated at home by his father and private teachers. The rector requiring only a moderate amount of intellectual work, he was out of doors much of the time, rambling in the woods and pastures about Somersby. He was solitary and reserved, moody and absent-minded, the mental habits of the boy foreshadowing the characteristics of the man. He was fond of reading and addicted to verse-writing at an early age. His literary career began in his youth, his boyish rhymes and those of his elder brother Charles being collected into a volume—*Poems by Two Brothers* (1827). In his nineteenth year he composed a labored narrative in blank verse, entitled *The Lover's Tale*, two parts of which were printed in 1833, but were immediately suppressed; in 1879 the entire poem was given to the world in a more finished dress, owing to the pirated republication of the fragment of 1833. In Oct., 1828, Tennyson entered Trinity College, Cambridge, leaving in 1831 without a degree. Here he formed friendships with Kemble, Milnes, Brookfield, Spedding, and other talented young men who afterward became famous as scholars and writers. He was fortunate in having the companionship of such choice spirits, but he owed most to one

whose name is forever associated with his own—Arthur Henry Hallam, a son of the historian. This dearest of his friends, whom he calls more than brother, became the betrothed of his sister Emily. Together they traveled in the French Pyrenees in the summer of 1830. Hallam's sudden death (Sept. 15, 1833) in Vienna made an ineffaceable impression on Tennyson, and may be considered an important agency in shaping his character and poetical career. In producing the beautiful elegy known as *In Memoriam*, he conferred immortality upon his lost friend and won it for himself.

In 1829 young Tennyson won the chancellor's gold medal for the prize poem *Timbuctoo*. In 1830 appeared his first book—*Poems, chiefly Lyrical*, including a few pieces which are perennial favorites with lovers of Tennyson's poetry. His second book of *Poems*, published late in 1832 (dated 1833), was a more ambitious venture. There was nothing in it from the 1830 volume. It contained some of his loveliest lyrics, having the richness of melody and the indescribable witchery of style which constitute Tennyson's charm, yet it found but few admirers beyond the immediate circle of his acquaintances. Not many reviewers noticed it. Stung by the savage criticisms of Wilson and Lockhart, he set himself to the task of improving what he had written. Profiting by the advice of critics and the suggestions of friends, he subjected his verses to the most painstaking revision. He experimented with various styles and meters; thus he served his laborious apprenticeship as poetic artist. Ten years passed, then he issued his *Poems* (1842) in two volumes, comprising selections from his two earlier books and many new pieces. The singer, hitherto unrecognized, was greeted with universal praise. The new spirit of the age found an exponent in his verse, which reflected the unrest and hopefulness of a transitional era. This was the beginning of a series of triumphs and honors. In 1845 he was granted a pension of £200, in 1850 he was appointed poet-laureate to succeed Wordsworth, and in 1855 he received the honorary degree of D. C. L. from Oxford. After leaving college, Tennyson resided chiefly with his sisters and his widowed mother at Somersby, then at High Beech (1837-40), Tunbridge Wells and Boxley (1840-44), and Cheltenham. He roamed on foot through England and Wales, often visiting friends in London and elsewhere, and making occasional trips to Ireland and the Continent. His writings prove that he was a close observer of nature as well as a diligent student of books. More than Vergil, he was a "landscape-lover." The physical features of many of the places he visited are sketched by him with pictorial fidelity and vividness, though not with photographic accuracy. Hamerton called him the "prince of poet-landscape-ists." *The Princess*, in which he first essayed extended narrative in blank verse, was published in 1847; the six intercalary songs were inserted in the third edition (1850), and there were numerous additions and alterations in the fourth and fifth editions. In 1850, which is called his golden year, appeared anonymously the poem that is generally regarded as Tennyson's masterpiece, *In Memoriam*, a monumental work in process of growth during the seventeen years after Hallam's death. Canto lix. was inserted in the fourth edition (1851) and xxxix. about 1872. In 1855 *Maud and other Poems* was published. The volume contained two memorable patriotic lyrics previously printed—*Ode on the Death of the Duke of Wellington* (1852) and *The Charge of the Light Brigade* (1854). *Maud* was at first misjudged and underrated, but later won its way to a generous appreciation of its abundant merits. The appearance of *Idylls of the King* in 1859 can be described as a literary sensation. Tennyson's fame was now international, and his books sold by the hundreds of thousands. His next publication, *Enoch Arden* (1864), has been the most widely read of the laureate's writings in foreign lands, having been translated into Danish, German, Dutch, French, Bohemian, Italian, and Hungarian. Four more Arthurian romances were added in *The Holy Grail, and other Poems* (1869), two in 1872, and one in 1885. This series of tales, if not entitled to the name of epic, is certainly the greatest of his literary undertakings; the longest of his works, though not the most original. At threescore he showed no signs of failing powers. The last two decades of his life were exceptionally productive of works stamped with dignity of thought, felicitous expression, and musical versification. The list includes the dramas *Queen Mary* (1875); *Harold* (1876); *Becket* (1884); *The Cup* (1884); *The Falcon* (1884); and *The Foresters* (1892), several of which were put on the

stage. There were also five volumes of minor poems—*Baldads, and other Poems* (1880); *Tiresias, and other Poems* (1885); *Locksley Hall Sixty Years After, etc.* (1886); *Demeter, and other Poems* (1889); and *The Death of Enone, Akbar's Dream, and other Poems* (1892).

Tennyson is not a world poet, his appeal being more or less insular. He has been criticised for being a "chanter of the aristocratic idea," yet he was a poet of the common people as well as of lords and ladies. He drew his materials from many sources, finding subjects in the legends of antiquity, the mediæval world of romance, and the tangled skein of modern life. He was master of the technical resources of the poetic art, and possessed unrivalled power as a word-painter. But the domain of beauty was too narrow for him. Beyond any mere æsthetic influence that he exerted, he was a mighty force for good, his polished verse being the vehicle of ethical instruction and spiritual uplift. The personality and love of God, the divinity and mission of Christ, providence, free will, the immortality of the soul, the province of law, the ministry of sorrow in the development of character, the spheres and limits of faith and knowledge—these are some of the leading ideas or tenets of his theology and philosophy. His success is largely explained by the fact that he clothed in artistic form the higher thought and sentiment of his time, thus enriching the spiritual life of England and the world. Tennyson's career was unstained by excesses. He fulfilled Milton's condition; his life was a poem. He remained in the Anglican Church all his days, liberal but essentially orthodox in his creed. A friend of the Broad Church party, he contributed not a little to the growth of tolerance and the non-sectarian temper. In politics he was a moderate conservative, an advocate of gradual reform in Church and state. He was a man of many-sided culture, keenly interested in astronomy, geology, botany, and other sciences. He was familiar with the discussions and speculations of physicists and metaphysicians. An idealist of the intuitional school, he was inclined to mysticism leavened with British sense.

Tennyson married (June 13, 1850) at Shiplake, Oxfordshire, Emily Sarah Sellwood, whom he had known and loved for many years (d. Aug. 10, 1896). She was the eldest daughter of Henry Sellwood, of Peasmore, in Berkshire, afterward a solicitor of Horncastle, Lincolnshire; her mother was a sister of Sir John Franklin, and her youngest sister the wife of Charles Tennyson Turner. A lady of high intelligence and gracious manner, she was in every way fitted to be the companion of her poet husband, who lovingly bore testimony to her loyalty and worth. Exalted as was the poet's ideal of woman as wife and mother, she seems to have met his exacting requirements almost perfectly. Their wedded life was harmonious and happy. They lived three years at Twickenham, where Hallam (the second Lord Tennyson) was born. In 1853 he bought the Farringford domain near Freshwater, Isle of Wight, where was born his second son Lionel. In 1867 he purchased a small estate on Blackdown, Sussex; in 1868 he built Aldworth, a fine Gothic mansion, which was his summer home for more than twenty years. He twice declined a baronetcy (1865 and 1868); was created a peer (Jan. 24, 1884) with the title Baron Tennyson of Aldworth and Freshwater. D. at Aldworth, Oct. 6, 1892; was buried in Westminster Abbey, Oct. 12. See Van Dyke's *Poetry of Tennyson*; Brooke's *Tennyson*; Waugh's *Alfred Lord Tennyson*; and Napier's *Homes and Haunts of Tennyson*.

EUGENE PARSONS.

Tennyson, FREDERICK: poet; b. at Louth, Lincolnshire, England, June 5, 1807; second son of Dr. George Clayton Tennyson and a coheir of the Earls of Searisdale; educated at Eton and Cambridge (entering Trinity College in 1827 and taking his degree in 1832), where he distinguished himself by writing Greek verse, winning the prize for a Sapphic ode, entitled *Egypt*, in 1828. He married an Italian lady, Maria Guiliotta (since deceased), lived in Italy many years, and since 1859 chiefly in Jersey, devoting his leisure to poetry and his favorite Hellenic studies. Author of three volumes of verse—*Days and Hours* (1854); *Isles of Greece: Sappho and Alcaeus* (1890); *Daphne, and other Poems* (1891).

EUGENE PARSONS.

Tennyson, HALLAM, Lord Tennyson: author; eldest son of Alfred Tennyson; b. at Twickenham, England, Aug. 11, 1852; educated at Marlborough College and Trinity, Cambridge, also a student of the Inner Temple. He edited a volume (1880) of sonnets by his uncle, CHARLES TENNYSON TURNER (q. v.), for which he furnished a memoir of the author;

issued a juvenile work, *Jack and the Beanstalk* (1886), illustrated by Randolph Caldecott; translated the old Saxon song of Brunanburh, which appeared in *The Contemporary Review* (Nov., 1876), and was later versified by his father. He is now writing the life of the late poet-laureate. E. P.

Tennyson, LIONEL: author; second son of Alfred Tennyson; b. at Freshwater, Isle of Wight, Mar. 16, 1854; educated at Eton and at Trinity College, Cambridge, where he displayed the scholarly taste and literary temperament of his father; married (Feb. 28, 1878) Eleanor Mary Bertha, the accomplished daughter of Frederick Locker-Lampson; was connected with the India Office several years, and prepared a masterly report on *The Moral and Material Condition of India* for 1881-82. A profound student of dramatic poetry, he contributed valuable articles to the *Cornhill*, the *Nineteenth Century*, and other periodicals. D. on board the *Chusan*, near Aden, Apr. 20, 1886. EUGENE PARSONS.

Tenoctitlan': See MEXICO (city) and MEXICAN ANTIQUITIES.

Tenor: the highest kind of adult male voice. The average compass of a true tenor is from C in the bass staff to A in the treble. Special cases may occasionally be found which can produce two or three tones higher. In written music the treble clef is usually employed for the part to be sung by this voice, although the tones produced are an octave lower in actual pitch. D. B.

Tenos: island in the Ægean Sea; one of the Cyclades, belonging to Greece. It is mountainous, but springs abound, and it is well cultivated. It has a good harbor, Porto Panormo, on the N. E. Wine, raw silk, and marble, especially very antique, are exported. The Tenians took a memorable part in the battle of Salamis (479 n. c.), fiercely resisted the Ottomans, by whom they were conquered, and fought heroically in the Greek revolution (1821-27). Their cathedral of the Holy Virgin, the Evangelistria, is one of the finest edifices of modern Greece. Area, 79 sq. miles. Pop. 21,000, nearly half of whom are Roman Catholics. E. A. G.

Tenpins: See BOWLS AND BOWLING.

Tenree: See TANREC.

Tensas or Tensaw River, or Bayou Tensas: a stream which rises in Carroll parish, La., and after a devious southerly course of 250 miles joins the Washita at Trinity, La. It is navigable 150 miles during good stages of water.

Tensaw River: a bayou of Alabama, which leaves Alabama river before its junction with the Tombigbee, and pursues a course parallel with that of Mobile river. Its waters flow into Mobile Bay.

Tense: See VERB.

Tenshi: See MIKADO.

Tension of Electricity: See ELECTRICITY, ELECTRIC DISCHARGE, and VOLT.

Tension of Vapors: See VAPORS.

Tent [from O. Fr. *tente* < Lat. *ten tum*, neut. perf. partic. of *ten dere*, stretch]: a pavilion or portable lodge made of skins, strong cloth, or canvas, sustained by one or more poles, and used as a shelter from the weather, especially by soldiers in camp. The material used as a covering is usually stretched by means of cords secured to tent-pegs. Such portable shelters, or tents of some sort, have been used as homes by nomadic tribes from the earliest ages. The patriarchs were dwellers in tents, and the poorer classes in Persia, China, and other Eastern countries still live in tents formed of frames of wood covered with thick cloth, felt, or matting. Tents have become indispensable to the equipment of armies. The Greeks encamped in tents at the siege of Troy, and the soldiers under Hannibal had tents of skins or canvas. Modern military tents are made of canvas, generally of cotton duck, on account of its being more impervious to water and cheaper than linen or hemp, though the latter are sometimes used. Different forms of tents for military purposes have been employed in the armies of the U. S. and of Europe. Prior to the civil war the Sibley tent, which is a conical tent, supported by a central pole resting on an iron tripod, and capable of sheltering fifteen infantry soldiers or thirteen mounted men, was used in the U. S. army. One of its advantages was that it could be warmed by an open fire or small stove, and afforded ample ventilation, having a circular opening at the apex partially covered by a movable piece of canvas so arranged as to be shifted according to the direction of the wind. It resembled a Sioux lodge, the chief dif-

ference being that it was constructed of canvas and supported by the central pole and tripod, while the Indian lodge was made of rudely tanned buffalo skins stretched on several long wooden poles. The tents used in the U. S. military service include the hospital tent, which is of cotton duck 28½ inches wide, clear of all imperfection, and weighing 12 oz. to the lineal yard, and has the following dimensions when pitched: Height, 11 feet; length of ridge, 14 feet; width, 14 ft. 6 in.; height of wall, 4 ft. 6 in.; wall eaves, 3 inches in width; height of door, 8 ft. 9 in.; width of door, 18 inches at bottom and 10 inches at top; and from top of ridge to wall, 9 ft. 10 in. Such tents are made to open at both ends, so that several may be placed together and form a continuous ward. Each tent holds from six to eight beds. The wall tent for officers is of similar material, and has the following dimensions: Height, 8 ft. 6 in.; length of ridge, 9 feet; width, 8 ft. 11½ in.; height of wall, 3 ft. 9 in.; wall eaves, 2 inches wide; height of door, 6 ft. 8 in.; width of door, 12 inches at bottom, 4 inches at top; and from top of ridge to wall, 6 ft. 6 in.; and is furnished with a fly. The conical wall tent for enlisted men has the body of the tent of standard 12-oz. cotton duck and the sod-cloth of standard 8-oz. cotton duck 28½ inches wide, with eave-lines of six-thread manilla line (large), and foot-lines of nine-thread manilla line. Its roof is in the form of a frustum of a cone, 16 ft. 5 in. in diameter at the base, 18 inches in diameter at the top. Its wall is 3 feet high; the height to top of roof, 10 feet; eaves 2 inches wide, and tabling at bottom, 2½ inches wide. From the top to the eave it measures 10 ft. 1¼ in. The shelter tent, which is a modification of the French *tente d'abri*, consists of two pieces of cotton duck; each half is 65 inches long on the ridge and 61 inches wide when finished. The center seam overlaps 1 inch. They are made of cotton duck 33 inches wide, to weigh from 7½ to 8 oz. to the lineal yard, and be free from imperfections, arranged to button together and stretch over a ridge supported by poles. In active service each soldier carries half a tent, which may serve as a cloak on the march, as a covering at night, and when the two pieces are joined forms a tent for both men. Besides military tents, there are special forms of tents made for emigrants, lumbermen, gypsies, surveyors; and prospecting parties, as in railway construction, have tents devised for their wants. There are pleasure tents of many forms, as those used for camping out, for lawns (square and oblong), for children, for screens, as the surf tents used on beaches. Besides large circus tents, which are of heavy twilled duck and special construction, there are boarding tents, stable tents, and house tents; also special tents for agricultural and other fairs, with varieties for the sale of refreshments and exhibition of side-shows, also photographers' tents, illusion tents, etc. The chief market for the duck in the U. S. is in Baltimore, and the centers of the tent-industry are in New York, St. Louis, Chicago, Cincinnati, and St. Paul. There is a large local demand in the U. S. for the many kinds of tents mentioned, and a small export trade dependent upon special causes; thus in 1894 and 1895 the demand was largely from Japan.

MARCUS BENJAMIN.

Tentaculifera: a group of protozoans. See *Suctorina*, under INFUSORIA.

Tenterden, Lord, CHARLES ABBOTT: judge; b. at Canterbury, England, Oct. 17, 1762, his father being a barber; entered Oxford University in 1781; took degree of B. A. in 1785; acted as private tutor to the son of a judge, who persuaded him to take up the law; entered the Middle Temple 1787, practiced as a special pleader from 1789 to 1796, and then was admitted to the bar; became a judge in the court of common pleas in 1816, and lord chief justice of the king's bench in 1818. In 1827 he was raised to the peerage as Lord Tenterden. D. in 1832. He combined with an unusually quick mind extraordinary perseverance and application, and was recognized as the ablest lawyer of his time; but he was not called upon to decide any great constitutional questions. He published in 1802 a *Treatise on the Law relative to Merchant Ships and Seamen*, which has passed through more than a dozen editions and is a standard yet.

F. STURGES ALLEN.

Ten Thousand, Retreat of the: the homeward march of about 10,000 Greek mercenaries from Cunaxa, a town 60 miles N. of Babylon. At Cunaxa their leader, Cyrus the Younger, was killed in battle against his brother Artaxerxes II. (401 B. C.). Thereupon their Persian allies dispersed and the Greeks were left in a most critical position. Their only

possible line of escape was by the upper Tigris through the country of the Kardouchi (the modern Kurds), and across the highlands of Armenia to some Greek city on the Black Sea. At the river Zapatas their five principal generals were assassinated by the Persian satrap Tissaphernes. Thereupon Xenophon, then a private soldier, was elected a general, and became practically commander-in-chief. After a winter's march of over 700 miles in an enemy's country, during which they endured terrible hardship and suffering, they reached Trapezus (Trebizond). Finally they arrived at Chrysolopolis, opposite Byzantium (400 B. C.). Their successful escape revealed the weakness of the Persian empire, and encouraged Alexander to undertake its subjugation. In the *Anabasis* Xenophon describes this retreat, and gives the most vivid picture extant of Greek discipline and military methods.

E. A. GROSVENOR.

Tennes: See MEDLE.

Tenuiros'tres [Mod. Lat.; Lat. *tenuis*, slender + *rostrum*, beak, bill]: a group (tribe or family) of birds, including forms whose only common characters consisted in the possession of a slender bill, and feet with three toes directed forward and one backward. According to Cuvier, it included the Linnæan genera *Sitta*, *Certhia*, *Trochilus*, and *Upupa*. The group was a very heterogeneous one, and has not been retained in the ornithological system.

Tenure: the manner in which real property is held or owned. As has been explained in the articles on LANDLORD AND TENANT and PROPERTY (*q. v.*), the common law of England and the U. S. denied to real property the capacity of absolute ownership. The exigencies of the feudal system, which required the complete dependence of the man upon his lord and of the lord upon the king, substituted for the notion of absolute ownership of lands—such as was recognized in the case of goods and chattels—the conception of "estates" in land, the land being deemed to be held of and in subordination to the lord of the man and of the land. These estates were qualified interests, resting upon a recognition of a superior right vested in the person of whom the land was "held," and dependent for their continuance upon the due performance of the terms and conditions of such "holding." It is true that the early English law recognized an "allodial" or absolute ownership of lands, as well as of chattels, but this form of proprietorship did not long survive the Norman Conquest.

The feudal system was primarily a military and political organization of society, its system of land tenure being only an incident, though doubtless at first a necessary incident, of that social organization. As the article on the FEUDAL SYSTEM (*q. v.*) shows, these primary features of the system dominated and controlled its development on the continent of Europe, while its system of land tenure continued to be a thing apart. In England, on the other hand, where the feudal system in the generation following the Norman Conquest had an unparalleled expansion, its military and political features soon disappeared, while its system of land tenure entered into and completely transformed the property rights and the property law of the kingdom. From that time on the law of real property in England was the feudal law, and the allodial ownership of an earlier day disappeared so completely that its very existence was denied. It became a maxim of English law that the king is the ultimate and absolute owner of all the lands in the kingdom, and that all of his land-owning subjects are only his tenants. "Every acre of English soil and every proprietary right therein have been brought within the compass of a single formula, which may be expressed thus: *Z tenet terram illam de . . . domino Rege*. The king himself holds land which is in every sense his own; no one else has any proprietary right in it; but if we leave out of account these royal demesnes, then it is true that every acre of land is held of the king. The person whom we might be inclined to call its owner, the person who has the right to use and abuse the land, to cultivate it or leave it uncultivated, to keep all others off it, holds the land of the king either immediately or mediately" (*Pollock and Mailland*). He who held directly or immediately of the king was said to hold in chief (*in capite*); but the tenant *in capite* is not usually the person who deals with the land as owner. The latter is usually one to whom the tenant in chief has directly, or through still other links in the feudal chain, transmitted the power of dealing with the land. In other words, D, who is seized of the land in fee simple, holds of C, who in his turn holds of B, who holds of A, who holds *in capite* of the king. In this feudal order D is said to hold

the land in *demesne*, while A, B, and C are *mesne lords*, being lords with respect to those standing below them, but tenants with respect to those standing above them.

There is another side to this relation of lord and tenant which has been developed out of the feudal relation of lord and man. The chief end of the transaction above described is not to confer lands on A, or B, or C, or D, but to secure to the king the services of A, to A the services of B, and so on. It is to secure these services that the land is granted, and it is only by the due performance of these services that it can be retained. The term "tenure" involves the obligation of service on the part of the tenant quite as much as it does the right of the tenant to hold the land for which the service is due. So important is this fact of service that the principal classification of tenures is by the service to be performed. A tenant may hold his lands in fee simple, fee tail, or for life, but his tenure is by "knight service," or by the service of "free alms," or by the service of "serjeanty," or by the service of "socage."

CLASSIFICATION OF TENURES.—Land tenures under the feudal régime fell into two classes—(a) the free tenures and (b) such as were not free.

The Free Tenures.—1. *Knight's Service.*—This form of tenure, known also as military tenure, or tenure in *chivalry*, was the most important, as it was for many years the most numerous, class of tenures at common law. It was created by "homage," a solemn act by which the tenant acknowledged his lord as him of whom he held his land and to whom he was bound to render service, and from which, on the other hand, arose the duty on the part of the lord of protecting his tenant. This tenure was, as its various designations indicate, based upon the performance by the tenant of military service in the army of the king. Most of the tenants *in capite* held by this tenure, but wherever it existed, whether the holding was immediately of the king or of some *mesne lord*, the military service was still due directly to the king. Doubtless the practice of that feudal society conformed for a time to the theory upon which this form of tenure was based and the tenants in chivalry paid their service in person by actual military duty, but it was not long before tenure by knight's service stood for an irregular series of money payments, while the king, with his share of these payments (*scutage*, shield-money), recruited his army wherever he could. The "incidental" payments to the lord, however, were by far the most burdensome feature of military tenure, and, under the name of rights of *marriage*, *wardship*, *aids*, and *reliefs*, became the most characteristic and oppressive features of the feudal system in England. They continued until the abolition of military tenures by statute in the year 1660 (12 Car. II., cap. 24, *Stat. of Military Tenures*).

2. *Serjeanty.*—Closely allied to the tenures based on military service were those where the tenant held his land by the duty of performing some personal and oftentimes domestic or menial service to his lord. This form of service covered a wide range, from the "grand serjeanties" of the king's marshal, chancellor, or justice, to the "petty serjeanty" of the freeman who supplied his lord with arrows or knives for the chase.

3. *Frankalmoin.*—Most of the lands held by ecclesiastics or by the Church (and the quantity of land so held was, even at the beginning of the thirteenth century, very large) were held by this tenure of "free alms." The service implied was spiritual—to sing masses, to distribute money among the poor, etc.—and the land was, as between the donor and the tenant in frankalmoin, held free from any services or dues of a secular nature. Of course, if the land thus given was held by the donor of the king, or of some *mesne lord* by a tenure of secular service, the land would go even into the hands of the Church burdened with this external (*forinsec*) service: for it was a marked characteristic of all the feudal tenures that the services on which they were based were directly imposed upon the land, and could thus be exacted even of those tenants of the land who did not personally "owe" them.

4. *Socage.*—This was the great residual tenure of the feudal era, and comprehended all freehold lands not held by military, or "domestic," or spiritual service. The landowner who bought his land outright for a valuable consideration, the freehold tenant who held by the service of paying a perpetual rent in money, or produce, or labor, the secular tenant to whom the land was given as a free gift—all these held by the tenure of "free and common socage." Homage was not essential to the creation of this tenure,

though doubtless it often arose by the performance of that solemn act. But the oath of fealty was indispensable, and often constituted the sole "service" of the tenant in socage. The principal characteristic of this tenure was the certainty, or definiteness, of the service required as compared with those exacted under the other feudal tenures, and its freedom from the most burdensome of the so-called feudal "*incidents*"—wardship and marriage—rendered it a popular and highly desirable form of tenure. The first socage tenants were doubtless primitive allodial proprietors, some of the more obscure of whom succeeded in escaping the general confiscation of lands after the Conquest by coming under the protection of the local lords and admitting their paramount title to their lands. At first the number of persons in socage must have been very small, but it must also have grown very rapidly as the advantages of this form of tenure became apparent and unoccupied lands were, more and more, granted out for agricultural uses. By the statute of Charles II., heretofore referred to, all freehold tenures were turned into free and common socage, and this has continued to be the well-nigh universal form of land-holding in England. The so-called "burgage" tenure was merely a form of socage which obtained in certain boroughs. The tenures of **BOROUGH ENGLISH** and **GAVELKIND** (*qq. v.*) were only local variations of socage tenure.

Non-free Tenure.—In addition to the lands held by the king or other territorial lords in demesne and those parcelled out by them to be held of them by the free tenures above described, there were other lands granted by them for longer or shorter periods—to be held, perhaps, at the will of the lord, perhaps for the life of the tenant, sometimes even by the tenant and his heirs forever—upon the service and condition of agricultural or other labor to be performed by the tenant at the lord's will. The terms of this tenure—known as "villeinage"—were, for the most part, regulated by the custom of the "manor," or estate, of which the villein tenement formed a part, and the rights of the villein tenant were protected by the court of the manor, but there is no doubt that the quasi-servile character of this tenure was due to the fact that the terms of the tenancy and the enforcement of the tenant's rights were originally largely dependent on the will of the lord. Although it was the unfree man, the villein, who gave his name to this form of land-holding, there was nothing to prevent a freeman, even one who already held lands in the same manor by knight's service or in socage, from being the holder of a villein tenement.

In the course of time this villein tenure lost its arbitrary and indefinite character. The custom of the manor acquired binding force and became enforceable in the king's courts even against the lord of the manor. The condition of labor to be performed by the tenant was commuted into rent, and the copy of the "roll" or record of the lord's court, in which was recorded his accession to the estate, became his muniment of title. He was now a "copyhold" tenant and was said to hold "by copy of court roll." Copyhold tenure still prevails to a considerable extent in England, and presents in the main the same characteristics as it did after the transformation above described. However much it may resemble the prevailing form of freehold tenure—as respects duration of interest, time of enjoyment, mode of descent, etc.—it is nevertheless sharply discriminated from the latter. Land held by copyhold tenure is always parcel of and included in a manor. The lord of the manor has the freehold, the copyholder holds "at the will of the lord according to the custom of the manor." The evidence of the nature and extent of his rights is to be looked for, primarily, in the court rolls of the manor. He has the free right of alienation, but he can alienate only by surrendering the land to the lord who then admits the purchaser.

Feudal Incidents.—Occasional reference has been made to the incidental burdens of the feudal relation. As has been pointed out above, these incidents of feudal tenure were, from the very beginnings of the system in England, a grievous burden, and in the course of time, when there was nothing else to distinguish such tenures from one another and from allodial ownership, the legalized exactions of the feudal lords served to keep the old distinctions alive. For more than a hundred years before the abolition of these burdens by the Statute of Military Tenures, they had been the distinctive badge of feudalism as well as the principal cause of complaint against the feudal system of property. The usual incidents of tenure were the following: (a) *Relief*: a fine paid to the lord of the fee by the heir upon the death of a tenant of an estate of inheritance. Al-

though the law recognized the right of the heir to succeed to his ancestor's estate, he could enter only at the price of a relief. The amount to be paid was originally indefinite, but in Glarvill's time the relief for a knight's fee is fixed by law at 100s.; for socage land it is one year's rent; as to baronies and serjeanties, there is no settled rule; the heir must make the best bargain he can. (b) *Aids*: regular or irregular exactions made by the lord to enable him to meet his own pressing necessities. They were regularly and lawfully claimed for the purpose of ransoming the lord from the enemy, for knighting his eldest son, and for marrying off his eldest daughter; but they were sometimes more doubtfully demanded for the purpose of paying the lord's debts, or his relief to his superior lord, etc. It was anciently provided that the aid should be "reasonable," and the amount to be exacted was as early as the year 1275 fixed by statute. (c) *Wardship and Marriage*: the right of the lord of a minor tenant, who held by knight's service or military serjeanty, to the custody or wardship both of the land and tenant during the minority of the latter, as well as to dispose of the infant tenant in marriage. These rights were during the latter part of the feudal régime the principal source of revenue to the king and the other territorial lords. The lord was entitled to all the rents and profits of the tenement for his own use during the continuance of the wardship (though he was expected to support the heir until the latter came of age), and he might "sell" the young heir, whether boy or girl, in marriage. As has been said before, the lord had in general no rights of wardship or marriage over the heir to socage lands. (d) *Escheat*: the lord's right to resume an estate in fee upon failure of the estate. Nothing is more significant of the reality and permanence of the lord's rights in the lands held of him than this notion of the escheating or reverting of the estate to him. Though he has parted with the land in fee, his feudal lordship is a real right of property, which persists through all the changes in title which the land in question may undergo, and which may at any time become once more a full ownership of it. See *ESCHEAT*.

TENURE IN THE UNITED STATES.—The more burdensome forms of fendal tenure, i. e. the military tenures, never gained a foothold on the American side of the Atlantic. Although these tenures were still in force in England when the earliest colonial charters were granted, these charters invariably provided for socage tenure. The usual provision was that the land should be holden of the king "in free and common socage, by fealty only, for all services, and not *in capite* or by knight's service." Tenure in this form, the lordship of the State being substituted for that of the king, and all fendal incidents being abolished, survives in New Jersey, Pennsylvania, South Carolina, Georgia, and several other States. In New York and most of the remaining States "all feudal tenures, with all their incidents," have been abolished even in name, and all lands are declared by statute "to be allodial, so that, subject only to the liability to escheat, the entire and absolute property is vested in the owners." This is the language of the New York statute (1 Rev. Stat. 717, sec. 3) now embodied in the constitution of the State (Revision of 1894), which has been substantially followed in many other States.

In addition to the *Commentaries* of Blackstone, Kent, and Stephen, the reader is recommended to consult the following modern authorities: Digby's *History of the Law of Real Property*; Leake's *Digest of the Law of Property in Land*; Williams on *Real Property*; Fowler's *History of the Law of Real Property in New York*; and especially Pollock and Maitland's admirable *History of English Law*.

GEORGE W. KIRCHWEY.

Teocalli, *tā-ō-kāal-lee'* [Nahuatl, *teotl*, a god + *calli*, house]; a temple or place of sacrifice of the ancient Mexicans; the name is especially applied to those of Aztec origin. Commonly they were low truncated pyramids, with small buildings on the summit, and an open space where the sacrifices, with their attendant ceremonies, could be carried on in view of the people below. Some of them were very large. The great teocalli of Mexico occupied a space 375 feet long and 300 broad; it was 80 feet high, and the terraced edges were so arranged that it was necessary to pass five times around the whole structure in ascending. On the top were several small buildings, and the sacrificial stone, which is still preserved in the national museum. This pyramid was completed in 1486, and during the first Spanish occupancy of Mexico it was the scene of several fierce battles. After the

conquest it was torn down, and its site is now occupied by the cathedral. Remains of true pyramidal teocallis are found in various parts of Southern Mexico. The name has been incorrectly applied to structures of a similar form—for example, the great pyramid or mound of Cholula—which are older than the Aztec period, and, presumably, were not built for religious purposes.

HERBERT H. SMITH.

Te'os (in Gr. *ἡ Τέως*): one of the most prominent of the Ionian cities in Asia Minor; situated in Lydia, 25 miles S. W. of Smyrna, between the promontories of Coryceum and Myonesus, and N. of the island of Samos. It had two good harbors, and carried on a considerable trade. In its vicinity was produced a celebrated wine, and its most prominent public building was a splendid temple of Dionysus. After the Persian conquest most of the inhabitants emigrated to Abdera in Thraee. Teos continued, nevertheless, to be a city of some importance until the time of the Romans, when it gradually fell into decay. Ruins of it, of its walls, theater, and temple, are visible near the present village of *Sighajik*. Anacreon and Ileaatus were born in Teos.

Revised by J. R. S. STERRETT.

Tepec, *tā-peek'*: a territory of Mexico, separated in 1889 from the northwestern part of Jalisco; surrounded by Sinaloa, Durango, Jalisco, and the Pacific. Area, 11,581 sq. miles. It corresponds in part to the region long called Nayarit, a mountainous tract W. of Zacatecas, included in the Sierra Madre; to this has been added a strip of lower coast-land, including San Blas, which is the principal port. A large proportion of the inhabitants are Indians, who maintain a quasi-independence. The Nayarits number at least 30,000. They are an intelligent race of agriculturists and bold warriors. In their mountain fastnesses they long resisted the Spaniards, and were only conquered after a war of twenty years, in 1722. Subsequently they received missionaries, and were nominally subject to the Government at Mexico, though really obeying their own chiefs. In 1872 they rebelled under one of these chiefs, Manuel Losada, but were subdued after a bloody war. Pop. of the territory (1893), estimated, 134,120. Tepec, the capital and principal town, is on a plateau, 18 miles from the Bay of San Blas, and on the railway from Mexico to that port; 2,900 feet above sea-level (see map of Mexico, ref. 6-E). The situation is a fine one, commanding a view of the Pacific, and the climate is very salubrious. The town has manufactures of cotton-cloths, cigars, etc. Pop. about 25,000.

H. H. SMITH.

Teplitz [derived from Slav. *teplice*, i. e. warm bath; spelled in old documents *Toplic*, from which *Töplitz* till the present time]; one of the most famous watering-places in Europe and a district town of Bohemia, near its northwestern frontier (see map of Austria-Hungary, ref. 2-D). It is beautifully situated in the Biela valley, which separates the Saxon Erzgebirge from the Bohemian Mittelgebirge, is a station of the Aussig-Teplitz and the Dux-Bodenbach railways, and has, with Schönau, 17,526 inhabitants (1890). The castle of Prince Clary, with its fine park and the shady promenades, as well as the numerous arrangements for the comfort and pleasure of the 7,000 to 8,000 people who visit Teplitz annually, make it a delightful abode. It has twelve alkaline-saline springs of 90° to 117° F., whose waters are very effective in cases of rheumatism, gout, paralysis, and gunshot wounds. There is an Austrian military bathing-house in Schönau, and a Prussian and a Saxon bathing-house in Teplitz, which was especially frequented by wounded soldiers of the three wars of 1864, 1866, and 1870-71, so that Teplitz is rightfully called the warriors' bath. The first discovery of Teplitz's thermal springs is said to have been made in 762. The place is historically memorable for the triple alliance concluded there Sept. 9, 1813, between the monarchs of Russia, Austria, and Prussia against Napoleon, and for later conventions of the monarchs. Teplitz in Bohemia must not be confused with other spas of the same name: Teplitz near Trentschin on the Waag, Hungary, with the famous Trentschin sulphur springs, Teplitz or the Warasdin bath (133° F.), and Krapina-Teplitz (35° R.), in Croatia, Teplitz in Carinthia, and Teplitz in Moravia. *Bibl.* *Gerold* (Vienna, 1886); Delhaes and Baumeister, *Der Badeort Teplitz-Schönau* (Prague, 1886); Hallwisch, *Teplitz, eine deutsch-böhmische Stadtgeschichte* (Leipzig, 1886).

HERMANN SCHOENFELD.

Tequenda'ma: a waterfall in Colombia. See BOGOTÁ.

Teramo, *tā-rū-mō*: town; in the province of Teramo, Southern Italy; about 35 miles S. of Fermo (see map of

Italy, ref. 5-E); beautifully situated on an elevated plain between two streams, somewhat above the site of the old *In-teramma*, of which the modern name is a corruption. It is an industrious and thriving place, having pottery, household furniture, hat, and licorice factories. Pop. 8,650.

Ter'aphim [= Heb. (*terāphim*), plur. of *terāph*, perhaps meaning "givers of prosperity"]; images or figures, probably used by the ancient Hebrews either as objects of household worship or as religious symbols of some kind. Nothing satisfactory is known of their character, origin, or use. They were found in Jacob's and David's houses as apparently household gods (Gen. xxxi. 30, 32-35; 1 Sam. xix. 13-16); Josiah attempted their suppression (2 Kings xxiii. 24); Hosea (iii. 4) speaks of them as in familiar use.

Revised by S. M. JACKSON.

Terā'shima Munenori: statesman and diplomatist; b. in the province of Satsuma, Japan, in 1832. Sent as a youth to study medicine in Tokio, he acquired a thorough knowledge of Dutch, and later of English, which brought him into prominence during the negotiations with foreign powers that followed the visit of Commodore Perry to Japan in 1853. Terashima was attached to the embassy that visited the U. S. in 1861, spent two years in England (1865-67), whither he returned in 1872 as minister. Next year he resigned this position, and later became Minister for Foreign Affairs. For two years he served as minister at Washington. When the orders of nobility were created in 1884 he received the title of count. D. June 6, 1893. J. M. DIXON.

Teratology: See PATHOLOGY, VEGETABLE.

Teratology [from Gr. *τέρας*, *téras*, monster, prodigy + *λόγος*, discourse, reason]: that branch of biological science which treats of monstrous growths in either plants or animals; for example, in botany, of the growth of "double" flowers, flattened or distorted stems, etc. For these, see *Teratology* in the article PATHOLOGY, VEGETABLE. Primitive anomalies or congenital malformations in animals, such as have been developed during intra-uterine life, belong to the province of teratology, while acquired deformities, such as have arisen after the birth of the fetus, are embraced in the field of medical and surgical pathology.

History.—All that can be found in any of the ancient authors who have attempted to discourse upon the subject is of very little scientific value. While remarkable malformations among the lower animals were regarded as monsters portending dire calamities, human monstrosities were considered as evidences of divine anger or as the direct result of demonical influence, and hence looked upon with apprehension and dread, being interpreted by the augurs of the times as prodigies entailed upon parents as punishments, and frequently as wonders of bad omen to the public, foreshadowing some general calamity. The general belief that monsters had a satanic origin gave rise to the practice of destroying them, either by drowning, strangling, or casting them into the flames, with the hope of thus diminishing or entirely exterminating the progeny of the devil. It was not until the early part of the eighteenth century that painstaking observations of the anatomical structure of monsters were fairly instituted in place of the mere superficial examination and description of the external configuration which had previously constituted the ultimate limit of physical inquiry on this subject.

Causes of Malformation.—This inquiry has given rise to much fruitless speculation, but the superstitions and absurd explanations of a former age have chiefly vanished in consequence of the light which modern embryological investigations have shed upon the subject. Certainly, nothing can be more irrational than an attempt to explain the anomalies of organization which occur in man by maternal mental emotions, when corresponding malformations occur among the lower animals, viviparous or oviparous, and also in plants—developments which apparently result from defective or excessive formative power. Such flimsy explanations would certainly fail to account for the fact that deep-seated organs, the existence of which is unknown to the pregnant woman, are frequently malformed, as in congenital malformations of the heart, kidneys, intestinal canal, the abnormal distribution of blood-vessels, etc. External mechanical influences, such as blows, falls, etc., may by shock or by affecting the general health of the mother have power to disturb the normal development of the fetus in utero. Experiments by Baresté and others in teratogenesis by agitation of the egg and by the establishment of other abnormal conditions, such as the diminution of oxygenation, have demonstrated

this possibility beyond a doubt. Original malformation of the germ has been reckoned among the causes of anomalous development. This view of the embryogenesis of at least some of the primitive anomalies receives force from the fact that repetition of the same kind of malformation by the same parents has been observed in a number of cases. It may be ascribed to the mother when the malformation is repeated, and to the father where his children by different wives are malformed in the same manner. An additional evidence of original defect in the germ is the hereditary transmission of certain deformities through several generations, examples of which in an excessive number of digits, hare-lip, hypospadias, and other structural vices, are not very infrequent. Otto maintains that many malformations may be ascribed to diseases of the fetus, while Vrolik contends that very few are attributable to this cause. Chronic inflammation of the brain may produce dropsy of the ventricles, and thus acrania; the different forms of hydronephaloele and an arrest in the development of the limbs may occur *in utero* by constriction of amniotic bands, the result of amniotic inflammation. The chief cause of malformation is impeded or retarded development of the fetus, from whatever cause. Retardation or arrest of development may be confined to one part or extended to others, as seen where several malformations coexist. Wolff, Tiedemann, and J. F. Meckel have elaborated the theory that "most malformations represent certain stages of the development of the embryo and of its organs, at which stages formation has stopped short, or from which ulterior development has ceased to follow the normal type." The deviations from the normal type of a species are never so great as to destroy all semblance to it. There is a limit beyond which abnormalities never pass. In reaching her ultimate anomalies nature observes the law of propriety (*lex proprietas*, Fleischmann), and makes her approach through a series of transitional gradations. Dissimilar parts and organs are never found fused or united together, nor transpositions of viscera beyond the limits of their natural locality; as, e. g., the brain in the abdomen, or intestinal tube in the cranial cavity.

The following facts have been observed in relation to monsters: That they occur in definite number, the relation being about 1 to 3,000 births; that in the greater part of malformations the sex is female; that certain species of animals are more liable to produce certain forms of monsters than others; the constancy of form in monsters, even among animals of diverse classes (yclopia, acrania, and double monsters occur in birds, possessing the identical characters as in mammals); and, lastly, the greater predisposition to monstrosity among certain animals, being greater in mammals than in birds and among domestic than wild animals.

Under the head of *Hemiterata* (partial monstrosities) are grouped: I. Anomalies of volume either of stature, as dwarfs or giants, or of volume, *sensu stricto*, affecting regions, systems, or organs. II. Anomalies of form, as of the head. III. Anomalies of color, either deficiency, excess, or alterations, as of the color of the iris. IV. Anomalies of structure, exhibited in the cartilaginous conditions of bones or anomalous ossification. V. Anomalies of disposition: (*a*) by displacement as in clubfoot; (*b*) by change of connection, as in teeth out of line; (*c*) in continuity, as in the union of lips or of digits; (*d*) by closure, as in complete transverse vaginal septum; (*e*) by disjunction, as in persistence of the foramen ovale, or in hare-lip. VI. Anomalies of number and existence, as in defect or excess of digits. Heterotaxis or displacement of organs includes splanchnic and general inversion. There are two divisions of hermaphrodites: true hermaphrodites and pseudo-hermaphrodites, the latter with bisexual external genitals but unisexual reproductive glands.

Monsters proper fall into two classes, single and composite. The former are divided into autositic and omphalositic. I. The autositic include (*a*) ectromelus, with limbs imperfectly developed or differing in size, and symelus, with joined limbs; (*b*) celosoma, in which there is evagination; (*c*) encephalalus, with hydronephaloele or encephaloele, pseudencephalus, with defective development of brain and cranium, and anencephalus, with brain and cranium absent; (*d*) cyclocephalus, with imperfectly differentiated eyes, and otocephalus, in which the ears are joined under the upper jaw-bones. II. The omphalositic include cases of an imperfectly developed fetus in twin pregnancy, in the extreme examples reduced to a shapeless mass of flesh. Composite monsters are double autositic or double parasitic.

Compound monsters include all cases in which more than belongs to a single being is developed; in its lower degrees

the mere addition of an extra finger or toe, and in the highest complete duplication by the union of two well-formed fetuses. That the genesis of double monsters is not a mere freak of nature, but the result of obedience to laws as invariable as those which govern normal development, will be seen by the following general considerations: (1) *The Law of Unity of Sex*.—Out of over 500 cases of human double monsters, as also of innumerable cases in the lower order of animals, in no instance has this law been violated. The account of a double monster of both sexes, given by a clergyman of Giessen, is very properly rejected by Virchow and all teratologists. The individuals of a double foetus will always be found to have the same sex, either both males or both females. It is also a fact that in the vast majority of cases they have been found to be females, whether human or animal. (2) *The Law of Homologous Union*.—The union of the two fetuses of a compound monster obeys the law of homologous union as uniformly as in the union of the two lateral halves of a single foetus in normal embryogenesis. In other words, there is an equal balancing of parts and organs in each individual. The same muscle of one foetus unites with the same muscle of the other; bone to bone; the same nerve or blood-vessel to the corresponding parts; and so on until all the parts and organs which are situated adjacent to each other are fused, heart to heart, stomach to stomach, etc. In cases of apparent exception to this law—such as a foetus by inclusion or of a parasitic monster—it has been found that the union was homologous in the early embryonic periods, but that the growth of one foetus being arrested or retarded, this blighted one was overlapped and included by its fellow. (3) *The Law of Right and Left Symmetry*.—On examination of the structure and relative position of the internal organs of a double foetus there will be found a transposition of the viscera of each individual in order to dispose them symmetrically in relation to the common median axis of the compound body. If the double foetus has two hearts, they will be right and left in position, and their apices will converge toward the line of fusion of the two bodies. This will be found true also of the livers and spleens and of the stomachs. The universality of this law is less positively proven than the two previously stated.

Several theories have been suggested to explain the production of double monsters: (1) The theory of maternal impressions has already been shown to be untenable. (2) The theory that they result from the fecundation of a double egg—i. e. of two distinct yolks inclosed in one capsule—has been proved by repeated experiments to be incorrect. (Prof. Panum, of Kiel, with eighty double eggs of the domestic fowl.) The product of hatching such eggs is twins, separate and of the same or of opposite sexes. (3) A more plausible hypothesis claimed that all double monsters were originally twin conceptions, but that the membranes separating them being absent, imperfect, or absorbed, the two bodies were brought into close contact with each other, and coalesced by reason either of some inflammatory action or of the strong formative power existing at that period of uterine life. This theory fails to explain the law of unity of sex, homologous union, and right and left symmetry. Twins often differ in sex, and one-third of twins are contained in one amniotic sac, the very condition claimed to be most favorable to fusion, and yet in these cases the twins are usually of opposite sexes. Should union occur under these conditions, they would be joined in the most accidental and heterogeneous manner. (4) It has been demonstrated by early embryos in the eggs of birds, and by observations under the microscope of the transparent eggs of fish, that a double monster is the product of a single ovum, whose vitelline membrane develops two primitive traces—i. e. two neural axes—instead of one. In some cases the primitive traces were not entirely separated nor precisely equal in size, while in other cases the neural axis was only partially bifid. The various degrees and the extent to which the primitive trace is cleft, from the slightest amount of duplicity to complete duplication, account satisfactorily for all the forms of duplex development. Thus it is seen that the compound monster proceeds from a single germ, single sexuality, and being governed by identical germinal laws, homologous and symmetrical development and fusion must result. The degree of duplicity and the extent of fusion depend upon the proximity or remoteness of the primitive traces and the relative inclination of their axes. (5) The theory which at present has the strongest support from teratologists is that so strongly supported by Ahlfeld, namely, the

fission or splitting of the germinal area. This has been actually observed in the fowl. The cephalic extremity has been observed to divide into two parts, resulting in a two-headed chick, with the duplicity confined entirely to the cephalic extremity. Two authentic cases of triple-headed monsters are recorded, one human and one of a lamb. Their embryogenesis is readily explained by a double splitting of the primitive trace, whereby the cephalic extremity of the neural axis becomes trifid. Limited space forbids going into a detailed account of the numerous forms of double monsters which have occurred, even in the human subject. For particulars, see the essays of George Jackson Fisher on *Diploteratology* in the *Transactions of the Medical Society of the State of New York* for 1865, 1866, 1867, and 1868. The student of teratology will seek the works of Isidore Geoffroy Saint-Hilaire, Otto, Vrolik, Förster, Braune, Ahlfeld, Hirst and Piersol, and many others.

Revised by BARTON COOKE HIRST.

Ter'bium: the name given by Mosander to a substance associated with erbium and yttrium in the mineral gadolinite, and supposed by him to be a new element; but the experiments of other careful analysts have failed to discover such a metal, and its existence is consequently a matter of doubt. See ERBIUM and YTTRIUM.

Terboeh, or Terburg, ter'boor'kh, GERARD: painter; b. at Zwolle, Holland, about 1617. He first learned drawing of his father, and in 1632 was studying in Amsterdam, but it is not known under what master. Soon after he went to Haarlem and became a pupil of the elder Pieter Molyn. He also was much influenced in his work by Frans and Dirk Hals. In 1635 he matriculated in the Guild of St. Luke at Haarlem and visited England the same year, also Germany, Italy, and France. He remained for some time in Amsterdam, where he studied and learned much from the works of Rembrandt. In 1646 he was in Münster painting the congress then sitting there. His picture the *Ratification of the Treaty of Peace of Münster* is in the National Gallery of London, with the celebrated *Guitar Lesson*. He followed the Spanish plenipotentiary to this congress to Spain, where he became known to Velasquez and studied his work. In 1650 he was again in his native country, and in 1654 he married and settled at Deventer. He became burgomaster of this place, and lived there to the end of his life, which he spent in following his art. D. at Deventer, Dec. 8, 1681. His pictures are in most of the great European galleries. For further information, see *Descriptive Catalogue of the Pictures of the National Gallery* (1889); *The First Painters of Holland*, by Lord R. Gower; C. Lemcke in *Dohme Kunst und Künstler*, vol. ii, part 1 (1875). W. J. STILLMAN.

Tereira, ter-sā'raā: one of the Azores islands (see AZORES); area, 163 sq. miles. The coasts are steep, wild, and, with the exception of a few strongly fortified places which afford good harbors, inaccessible. The interior is much broken up by volcanic agencies, but the soil, mostly consisting of decomposed lava and tufa, is exceedingly fertile, and wine, oranges, and timber are largely exported. Pop. 45,000. Capital, Angra.

Ter'ebinth, Tiel-tree, or Turpentine-tree [*terebinth* is viā O. Fr. from Lat. *terebinthus* = Gr. *τερέβινθος*, *terebinth*, turpentine. See TURPENTINE]; the *Pistacia terebinthus*, of the *Anacardiaceæ*. It is some 30 or 40 feet high, and grows in the Levant. It produces the valuable Chian turpentine. The terebinth-tree is noted for its extreme longevity. It was a terebinth in whose branches Absalom was caught (2 Sam. xviii.).

Terebrat'ulidæ [Mod. Lat.: named from *Terebratula*, the typical genus, dimin. of Lat. *terebra* *tus*, perf. partic. of *terebra're*, bore]; a family of BRACHIOPODA (*q. v.*) or lamp-shells. A few species still live in the seas, but the fossil allies are numerous. The shell is pear-shaped in outline, and is anchored by means of a fleshy peduncle which passes through the beak of one of the valves.

Teredin'idæ [Mod. Lat., named from *Tere'do*, the typical genus, from Lat. *tere'do*, *tere'dinis* = Gr. *τερηδών*, a worm that gnaws wood or clothes, etc., deriv. of *τερειν*: Lat. *terere*, rub, grind]; a family of conchiferous or lamelli-branchiate molluscs, notable as destructive of timber used as piles, etc., in the ocean. The so-called ship-worms are its chief representatives. The several forms are in nowise related to worms, and the only feature common between the two is the elongation of the body and the tube which they form; they have the true molluscan organization, and the

elongation is simply due to the excessive protraction backward of the siphonal tubes and the reduction of the body. The portion of the animal which is covered with shell is comparatively very small and almost globular, and the siphonal

The ship-worm.

portion is in proportion extremely long and worm-like; the siphons are united for the greater part of their length, but free toward their ends, and there armed with two peculiar elongated shelly appendages called styles or siphonal palettes; the mantle is well developed, its lobes united except at the pedal opening, reflected behind over the valves of the shell, and developed above into lobe-like expansions, which are also reflected over the hinges of the shell, and serve to keep the valves in place; the gills are large, and extend far into the siphonal portion; the mouth is provided with palpi, the foot is subcylindrical and sucker-like, with a foliaceous margin, moderately protractile, and well supplied with nerves; the shell is composed of two equal valves of peculiar form; these valves are not united at the hinge, but are only kept in place by the reflections of the mantle above referred to, and are thus susceptible of much independent interaction. The animal forms a long burrow lined with shelly material, in which it conceals itself. Such are the principal characters which distinguish this type. The family has quite a number of representatives, most of which bore in wood, but a few live in the bottom of the water, and the tubes they form in that case serve to protect them from the inflow of mud into their burrows. The members of the several subordinate groups and species are essentially similar, but differ much in details as to form and sculpture of their shells, and still more in modifications of the siphonal palettes. Not far from forty species have been recognized by recent naturalists, most of which belong to *Teredo*. Representatives of the family are found in the seas of almost every country. Great ravages have been committed by species of the genus *Teredo*—especially *Teredo navalis*—and government commissions of inquiry have been instituted to investigate the natural history of the animals with a view to staying their destructive work. The literature concerning the subject is therefore very voluminous. The most noteworthy reports are those made during the years 1860-65 by a commission authorized by the Government of the Netherlands. An account of the American forms is given by A. E. Verrill in *Report of the United States Fish Commission* (1871-72), p. 384. The burrow seems to be made by the foot, not by the shell. It is very small at the surface of the wood, but becomes a quarter of an inch in diameter and as much as 10 inches long. It may penetrate the wood in any direction, but usually runs with the grain, avoiding knots and the burrows of other teredos. The wood is often completely honeycombed with the burrows, and the largest piles may be destroyed in the course of two or three years. The wood thus excavated is not eaten, but the animal feeds on infusoria, etc., obtained from the water. The young are produced in May, and later. They are active free-swimming at first, but later attach themselves to solid objects. The young teredo, when it first settles on the pile, is not larger than the head of a pin. The only remedies are those which prevent the teredo from gaining entrance to the wood, such as sheathing for vessels, painting with coal-tar, etc. Impregnating the timber with cresote and similar means is less effective.

Revised by E. A. BIRGE.

Teredo: See TEREDINIDE.

Terence (*Publius Terentius Afer*): writer of comedy; b. at Carthage, although the date usually given, 185 B. C., is doubtful. He became the slave of a senator, Terentius Lucanus, but on account of talent early evinced he received a careful education, was manumitted, and lived, after the performance of his first comedy, *Andria*, in 166 B. C., in intimate friendship with some of the best men in Rome, such as the younger Scipio and Lælius. He died 159 B. C., on his return from Greece, where he had spent about a year. A daughter survived him. The reports of his death differ very much, some asserting that he was drowned, others that he died in Arcadia. His six comedies are extant—namely, *Andria*, *Heeyra*, *Heauton-timorumenos*, *Eunuchus*, *Phormio*, and *Adelphæ*. They belong to the so-called fab-

ula palliata—that is, they represent Greek characters, Greek customs, and Greek life; and they all are borrowed from Greek originals by Menander, Apollodorus, or Diphilus, two Greek comedies being often compounded into one by the Latin author. By the Roman public at large they were not received with any great applause; when the *Heeyra* was first played, people left the theater to see the acrobats; but their purity of language, elegance of diction, and refinement of humor and sentiment—merits which the rivals of Terence ascribed to the co-operation of Scipio and Lælius—made

them great favorites with cultivated Romans and subjects of much imitation after the revival of letters in the Middle Ages. Among late editions are those by Parry (London, 1857), Wagner (London, 1869), both with notes, Umpfenbach, critical (Berlin, 1870), and Dziatzko (Leipzig, 1881). There are translations into English by Patrick (1745), Colman (1765; reprinted 1841), and Riley (1853). Annotated editions of separate plays: *Andria* and *Adelphæ*, by Spengel (Berlin, 1888 and 1879); *Phormio* and *Adelphæ*, by Dziatzko (1885 and 1881); *Andria* and *Heauton-timorumenos*, West (New York, 1888); *Heeyra*, Thomas (Paris, 1887).

Revised by M. WARREN.

Terentianus Maurus: a Latin writer of the end of the second century A. D., from Mauritania. His treatise in 2,981 verses, *De litteris, syllabis, metris*, addressed to his son Bassinus and stepson Novatus, is still extant. The exposition of meters is especially valuable. The work was edited by Lachmann (Berlin, 1836), and by Keil, *Grammaticæ Lat.*, vol. vi., pp. 313-413.

M. W.

Terentius Scaurus, QUINTUS: a celebrated Latin grammarian who flourished under Hadrian, wrote commentaries to Horace, the *Æneid* of Vergil, and Plautus, and grammatical treatises. Excerpts from his *De Orthographia* are printed in Keil's *Grammaticæ Lat.*, vol. vii.

M. W.

Tereus: See PHILOMELE.

Tergauw: See GOUDA.

Terhune', MARY VIRGINIA (*Hawes*): author; known by her pseudonym, *Marion Harland*; b. in Amelia co., Va., about 1835; in 1856 married Rev. Edward P. Terhune, a clergyman in Virginia, who in 1859 became pastor of a Dutch Reformed church in Newark, N. J., and afterward of Dutch Reformed and Congregational churches in Brooklyn, N. Y. In 1888 she became editor of *The Home-maker* magazine. She has published a number of novels, including *The Hidden Path* (1855); *Marion* (1860); *Judith* (1883); *His Great Self* (1892); and several books on domestic housewifery, such as *Common Sense in the Household* (1871).

H. A. BEERS.

Terlizzi, tär-leët-sëe: town; in the province of Bari delle Puglie, Italy; in a fertile plain about 7 miles from the Adriatic, and very near the town of Barletta (see map of Italy, ref. 6-G). Grain, wine, oil, and fruits are exported to some extent. Pop. 20,440.

Termini Imerese, tär-më-në-ee-mä-rä-sä (anc. *Therma Himerensis*): town; in the province of Palermo, Sicily; 23 miles E. S. E. of Palermo. It is on a hill on the left bank and near the mouth of the river Termini, which, as well as the town, derives its name from the warm springs in and near this place. The exports are chiefly grain, fruits, sulphur, macaroni, fish, etc. It was under the walls of the ancient *Himera* that Gelon obtained his great victory over the Carthaginians (480 B. C.), and when, seventy years after, the Punic armies destroyed the city, the refugees made the new settlement of *Therma Himerenses*, which was a flourishing town in the time of Augustus. Fragments of the ancient ruins are still visible. Pop. 22,730.

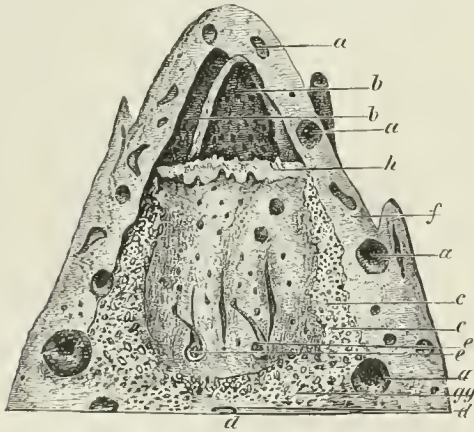

Terminos (tär-më-nös), **Laguna de:** a lagoon on the coast of Campeche, Mexico; separated from the Bay of Campeche (Gulf of Mexico) on the N. by reefs and low islands; these are partly rocky, and between them there are three passages. The lagoon has an area of about 2,600 sq. miles, and over half of it admits vessels of deep draught. It receives a number of small rivers, and several bays and navigable channels open into it; through some of these, on the W., there is communication with the river Usumacinta. The shores are low and swampy, but abound in cabinet woods and dye-woods, for which the lagoon has long been frequented. At the beginning of the eighteenth century it was a resort of buccaneers. Contemplated improvements would make it one of the best harbors on the Mexican coast.

HERBERT H. SMITH.

Termites, tēr mīts [usually derived from Late Lat. *ter'mes*, *ter'mitis*, wood-worm; another view is that the name of the principal genus, *Termitex*, was given because the book-louse (*Atropos*) was formerly included in it, and this animal was confused with the death-watch (*Anobium*), which insect was supposed to forebode early death; Gr. *τέρμα*, end]; insects (also called white ants, from the fact that like the ants they are social) which were formerly assigned to the *Neuroptera*, but are now considered as distinct under the name *Isoptera*. The termites form large colonies, and in each colony the individuals are differentiated into different classes or castes, each being fitted by structure for its duties in the colony. Only the king and queen are winged, and these have two pairs of long, narrow, leathery wings, which are similar in structure and are carried flat upon the back when not in use. The mouth-parts are efficient biting organs, and there is an incomplete metamorphosis. The wingless forms are grouped into small-headed workers and soldiers with enormous heads. The king and queen are the sexual members of the colony. At certain seasons of the year they swarm from the nest, take a marriage flight, and then lose the wings, and under favorable circumstances found a new colony. Before egg-laying the abdomen of the female becomes enormously distended with eggs. (For illustrations of termites, see ENTOMOLOGY.) The workers wait upon the royal pair, feed the young, and, besides, do all the excavating for the colony, store away the food, etc. The soldiers are far less numerous, and, as the name indicates, they are the fighters of the colony. Besides their warlike duties, in some species they act as overseers of the workers.

The great home of the termites is in the tropics, but they also extend into colder climates, one species being found in New England. These northern forms do little damage, although one year they seriously threatened libraries in Cambridge. In the tropics, however, they are a formidable pest. The reader is referred to the oft-quoted account of Smeathman, which though published in 1781 still remains the most accurate and detailed description of the habits of these animals.

The termites are dark-loving forms, and the workers and soldiers are blind. They are rarely seen, since they are miners and spend their whole lives in the tunnels which they excavate. When they wish to attack a piece of timber they build a covered approach of earth and saliva, and then when the wood is reached their tunnels run through it in

Vertical section of termites' nest, from apex to ground: *a a a*, galleries p-netrating outer dome; *bb*, air-chamber; *c c*, magazine and nursery; *dd*, royal chamber; *ee*, bridges; *f*, outer shell; *g g*, congeries of royal ante-chambers.

every direction, until at last only the thinnest shell remains, ready to crumble at the slightest touch. In this way they build their mortar approaches up the trunks of the largest trees in order to reach dead branches. They do great good in the tropical forests by removing all dead timber, but when they attack human habitations the results are serious, and the more so since the ravages give no external sign. They will completely riddle every bit of timber in a house, and have even been known to enter a table through its legs and leave nothing but the outside, ready to collapse upon the slightest strain.

The species found in the U. S. lives in decaying wood, but some of the tropical species build conical nests sur-

mounted by numerous pinnacles, and in some cases these nests are 10 to 15 feet in height and 40 to 50 in circumference. They are made of clay solidly packed together and cemented by the saliva of the animal, while in the interior are passages and storerooms for food, nurseries for the young, quarters for the workers and soldiers, and always near the center of the base is the royal chamber where the queen is kept.

See Smeathman, in *Philosophical Transactions*, vol. xvii. (1781); Hagen, monograph in *Linnaea Entomologica*, vols. x.-xii.; Fritz Müller, in *American Naturalist*, vol. xxiv., p. 1118 (1890).
J. S. KINGSLEY.

Tern: any small gull of the sub-family *Sterninae*, popularly known as sea-swallows. They are characterized by their slender build, remarkably long, pointed wings, rather long, sharp beak, small feet, and, usually, deeply forked tail. They range in size from 2 feet in length down to 9 inches. The general style of plumage is white, with a pearly mantle, and top of head black, but there are exceptions to this, the sooty tern and noddy being almost black. Terns are found over the greater part of the world, and, while typical seabirds, often occur on bodies of fresh water, especially during the breeding season. They nest on the ground, lay from one to four eggs, feed on fishes and small crustaceans, or even, as in some of the smaller species, on insects. There are some sixty species, about one-fourth of which occur in the U. S., one of the most familiar being the *Sterna hirundo*, a species common to Europe and North America. This bird is 15 inches long, 30 in spread of wing, and the tail is well forked. For the sooty tern see EGG-BIRD. F. A. LUCAS.

Ternate: See MOLUCCAS.

Ternaux-Compans, tār nō'kōn'paān', HENRI: bibliographer; b. in Paris, France, in 1807. He was secretary of the French embassies at Madrid and Lisbon, and *chargé d'affaires* at Rio de Janeiro; resigned and devoted himself to the collection and study of early documents relating to America, traveling extensively in Spain and America for this purpose. For a short time he was a member of the French Assembly. In 1836 he published *Bibliothèque Américaine, ou catalogue des ouvrages relatifs à l'Amérique depuis sa découverte en 1493 jusqu'à l'an 1700*. French translations of a selected series of documents and rare books from his magnificent library were published as *Voyages, relations et mémoires pour servir à l'histoire de la découverte de l'Amérique* (two series, 20 vols., 1836-40), generally known as the Ternaux-Compans collection. This set, which is of great value, is enriched by notes. Subsequently he issued smaller collections or single works of the same character, an historical and bibliographical essay on Guiana, etc. D. in Paris, Dec., 1864.
HERBERT H. SMITH.

Terni, tār'nēe (anc. *Interamna Umbria*): town; in the province of Perugia, Italy; near the banks of the Nera, about 10 miles S. S. W. of Spoleto and 55 N. N. E. of Rome (see map of Italy, ref. 5-E). It is chiefly interesting from the antiquities, and remains of a very ancient wall with square towers are to be seen. One of the five gates is called *Tre Monumenti*, from the monuments of the historian Tacitus and of the Emperors Tacitus and Florian, all of whom were born here. The streets open upon a very large square near the center of the town. The cathedral, dating from the seventeenth century, contains many early monuments and inscriptions, but the basilica of San Valentino is still more ancient. The Church of San Salvatore is built on the ruins of a temple of the sun—that of Sant' Alò over a temple of Cybele. The episcopal palace stands, in part, on the site of an amphitheater of the time of Tiberius, which, judging from the foundations, was capable of holding 10,000 spectators. Pop. about 9,420.

Revised by M. W. HARRINGTON.

Terströmia'ceae: See TEA FAMILY.

Terror, tār-rōr': a beautiful town in attractive surroundings on Grand Canary, one of the Canary islands, which has some warm mineral springs, resorted to on account of their curative effects. Pop. 5,800 (in the commune). M. W. H.

Terpan'der (Gr. *Τέρπανδρος*): musician and lyric poet; b. at Antissa, island of Lesbos, in the first half of the seventh century B. C.; settled in Sparta, where, in 676 B. C., he gained the prize in the first musical contest instituted at the feast of Apollo Carneius. He is generally considered the founder of Greek music, as he increased the number of the strings of the lyre from four to seven; was the first to set poetry to music, both his own verses and those of Homer;

established the first regular school of music, and made music a part of education. See *Flach, Geschichte der griechischen Lyrik* (vol. i.). Revised by B. L. GILBERSLEEVE.

Terpsichore, tĕrpsĭk'ō-rĕe [= Lat. = Gr. Τερψιχόρη, liter., fem. of τερψίχρηστος, delighting in dancing; τέρπειν, τέρψαι, enjoy + χορός, dance, dancing]: one of the nine Muses. She presided over song and choral dancing, and was represented with lyre and plectrum in her hands, and a wreath of flowers on her head. See *MUSES*.

Terrace: a limited plain, natural or artificial, from which the surface descends on one side and ascends on the other. Artificial terraces are often constructed for the purpose of utilizing the sides of hills, and the steep slopes separating them are protected from the attack of rain by masonry or turf. They have also an extensive use in connection with agriculture, especially in Southern Europe. Gentle slopes, which in the natural condition are covered and protected by vegetation, are sometimes worn into gullies and steep ridges when cultivation exposes them to the action of rain. To prevent this, the land is graded in terraces whose flat surfaces give the rain-water rills no power to erode, and the steep bluffs between the terraces are guarded by turf or a facing of stone. Natural terraces are of various kinds, the most abundant being *terraces of differential degradation*. Where a hill or mountain or the side of a valley is composed of level strata which differ among themselves in texture, these differences usually find expression in the topography. Frost and other agencies that break up rocks act more rapidly on weak rocks, such as shales, than on strong rocks, and reduce them to earth which is washed away by rain. Often a weak rock is in this way eaten back until the strong rock above it is deprived of support and falls away in blocks. By such processes the hillside is carved into a series of terraces separated by bluffs or cliffs. *Stream terraces* are next in abundance. When the volume and grade of a stream are so adjusted to the load of detritus it carries forward that it neither wears down nor builds up its bottom, the stream wears its banks, making a flood-plain, and this gradually becomes broader. If the stream is overloaded, part of the load is deposited and the flood-plain grows higher as well as broader. If then the land is lifted, or the flow of water is increased, or the load is diminished, the stream cuts its channel deeper and ceases to spread over the flood-plain, which then constitutes a terrace on each side of the stream. A repetition of this process produces a series of terraces rising like steps on the valley side, and such series are to be seen in many valleys of the U. S. *Shore terraces* are of several types. Those most frequently seen are carved out by the waves where the sea attacks the land. They are overlooked by cliffs and are usually submerged at high tide. On parts of a coast where drifting sand or shingle accumulates, beach being added to beach, a rather uneven terrace is produced, and this is bounded seaward by a submerged declivity. The deltas accumulated at river mouths are fan-shaped terraces with steep outer slopes. While these features are in process of formation they are partly concealed by the water, but if the region is afterward uplifted their character as terraces becomes conspicuous. A *moraine terrace* is formed where a stream of water flows between a glacier and the side of its valley. The earth and stones of the lateral moraine, together with other material brought by the stream, are built by the running water into a plain; and afterward, when the glacier has disappeared, this plain constitutes a terrace on the valley side. The glaciated districts of the U. S. afford numerous examples. *Fault terraces* are comparatively rare. They are formed where a system of faults traverse a plain, letting it down in steps, and their production is accompanied by earthquakes. American examples occur in the Great Basin, especially at the foot of the Wasatch range. Rain and frost, the great agents of land sculpture, attack and gradually destroy the terraces marking the former activity of streams, glaciers, waves, and the forces of the inner earth, but they perpetually restore the terraces of differential degradation, and it is for this reason that the latter are most abundant. See *GEOLOGY*, and consult *Lake Bonneville*, Monograph I., U. S. Geological Survey.

G. K. GILBERT.

Terrace Epoch: See *CHAMPLAIN EPOCH*.

Terra-cotta [= Ital. < Lat. *terra cotta*, liter., baked earth; *terra*, earth + *cotta*, fem. sing. of perf. partic. of *coquere*, cook, bake]: baked clay, that is to say, pottery. (See *Earthenware, Unglazed*, under *POTTERY AND PORCELAIN*.) In the language of decorative art the term is used

for an object made of baked clay, as a terra-cotta, a collection of terra-cottas; and in this sense it means always an object made of coarse brown or yellow earthenware, and usually unglazed. Greek terra-cottas known to us are *TANAGRA FIGURINES* (*q. v.*), or figures from Smyrna or Sicily or Tarentum, or antefixes or cymas or anthemions from temples, as from Olympia or Akragas. Greek painted vases are sometimes called terra-cotta vases, but less often, because these are often of soft material. Etruscan terra-cottas are often burial-urns adorned with bas-reliefs of battle-scenes, and having on their covers reclining figures of the dead. Some of these are large, in cases where the body was not burned, and the figures are of life size. Etruscan temples were adorned with pediment figures of terra-cotta, painted in bright colors, and it is established that early Roman architecture depended much upon terra-cotta ornaments. (See *ROMAN ARCHAEOLOGY*.) None of these is known to exist, but suggestions of what they were like are to be found in the collection of terra-cottas from Pompeii, in the Naples Museum. Terra-cotta figures from China, and more especially from Japan, have been brought to Europe and America, of all degrees of size and importance, from small round boxes made in the semblance of draped figures of men to statuettes and groups of half life size. Many of these are of extraordinary vigor and decorative value, and some even reach a high degree of merit as works of sculpture. Among such figures in baked clay the name *terra-cotta* would not commonly be given to those of light yellow ware, like Satsuma or Kioto figures, nor to those of porcelain; but rather to those of brown clay, sometimes wholly unglazed, sometimes having a thin and fine dark-brown glaze, sometimes wholly or partly glazed with colored and even porcelainous glazes. Such figures often have the flesh left in the brown ware, and the dress and hair put in the glaze, and are then very effective. The Italian Renaissance was very rich in terra-cotta statuary, busts, and bas-reliefs. The museums of Florence, Paris, Berlin, and London have many splendid specimens of this ware. Busts by Donatello, Verrocchio, and other men of their times are among the most interesting and valuable pieces of European sculpture of modern times. The noble enameled terra-cottas of the Renaissance are partly described under *ROBBIA*, *Luca della* (*q. v.*); but, besides the work of the Della Robbia family, colored enamels applied to terra-cottas of life size were used by Begarelli, by Mazzoni, and others. Since the sixteenth century terra-cotta has been used for fine and decorative art fitfully and at intervals, as one artist or another took a fancy to it. Thus Clodion (1745-1814) made many small groups of bacchantes and nymphs of great merit in a certain graceful and fantastic way, in reddish-brown terra-cotta, with no glaze whatever. The contemporary French school of sculpture often produces large works in unglazed terra-cotta, especially portrait-busts. In decorative building Italian, Gothic, and Renaissance architecture made a great use of terra-cotta, especially in Lombardy, where good stone was not very accessible. In modern times columns, archivolts, cornices, etc., are made of it, and whole fronts are built of brick and terra-cotta in combination. The taste for it is growing. RUSSELL STURGES.

Terra de Fuego: a corruption of Portuguese *Terra de Fogo*. The Spanish name is *TIERRA DEL FUEGO* (*q. v.*).

Terra di Lavoro: See *CASERTA*.

Terra di Otranto: See *LECCE*.

Terra Firma [Lat., firm or solid earth]: a term sometimes used to designate the Spanish main or the northwestern portion of South America; also that part of the Italian mainland which formerly acknowledged Venice as mistress. The term designates continental regions as opposed to islands, although also used colloquially to denote land as opposed to water.

Terra Japonica [Lat., Japanese earth]: an old pharmaceutical designation of *CATECHU* (*q. v.*), which was formerly regarded as an earthy mineral.

Terrauova: town; in the province of Caltanissetta, Sicily; on the south coast of the island, near the mouth of the Terranova; 60 miles W. of Syracuse (see map of Italy, ref. 10-12). This town occupies the site of an ancient city (probably *Tiela*), as is proved by the remains of a Doric temple and by the many old sepulchers found in the neighborhood, whose contents have enriched the museum of Palermo. Pop. 16,440.

Revised by M. W. HARRINGTON.

Tertrapin [probably Amer. Ind.]: any one of various small fresh-water turtles of the family *Emydidae*. The name

has no exact scientific meaning, but in the U. S. is usually applied to the salt-water terrapin (*Malaclemmys palustris*), more familiarly known as the diamond-back. This species, held in high estimation for the delicacy of its flesh, is an inhabitant of the salt-water marshes from New York to Texas. It has a large head, covered with a soft naked skin

The salt-water terrapin.

(whence the name *Malaclemmys*), and the alveolar surface of the upper jaw is broad and divided in front by only a slight groove; the neck is short and thick; the shell oval, moderately convex, slightly keeled, and the scales marked with concentric, generally impressed, lines; the skin is gray, spotted, and otherwise marked with black. It rarely much exceeds 8 inches in length, and is generally less than that. It is the most esteemed for the table of any species of the family, and is caught in large numbers for the markets of Baltimore, Philadelphia, New York, and other cities. It commands a price of from \$15 to \$100 a dozen, according to size, season, and demand. It is active in the water, swimming well, and on land runs with considerable speed. See TORTOISE and TURTLE-FISHERY. Revised by F. A. LUCAS.

Terrebonne, tär-bon': town of Terrebonne County, Quebec; on the north shore of the navigable river Jésus; 16 miles by land N. of Montreal (see map of Quebec, ref. 5-B). It is the seat of Masson College (Roman Catholic), a large and prosperous institution. It has a fine water-power, utilized in a number of manufactories. Its stone-quarries are valuable. Pop. 1,460.

Terre Haute, tär-hôt': city (founded in 1816); capital of Vigo co., Ind.; on the Wabash river, and the Vandalia Line, the Cleve., Cinn., Chi., and St. L., the Chi. and E. Ill., and the Evans, and T. H. railways; 73 miles W. of Indianapolis, the State capital (for location, see map of Indiana, ref. 7-B). It is on a rolling prairie between the Wabash and a low range of wooded bluffs; is divided into blocks 300 feet square by broad streets, paved with macadam, brick, or asphaltum, and having brick, limestone, and artificial stone walks; and contains three parks, Collett, with 30 acres of grove and lawn; Deming, with 50 acres of rolling land and forest; and a driving-park and fair-grounds of 90 acres, with a noted racing-track. The city is surrounded by coal-fields, and has 3 productive oil-wells, 2 artesian wells, supplying sulphur water, 20 miles of electric railway, and a garbage crematory. The notable buildings include the county court-house (cost \$475,000), U. S. Government building (\$150,000), union station (\$100,000), State normal school (\$250,000), and opera-house. There are 33 churches, viz.: Methodist Episcopal, 8; Baptist, 5; Roman Catholic, 4; Presbyterian, 2; Protestant Episcopal, 2; Congregational, 2; Christian, 2; German Evangelical, 2; and Jewish, Lutheran, United Brethren, Seventh-day Advent, German Reformed, and Church of Christ, each 1. The public-school system supports a high school and 18 district schools, having 147 teachers and nearly 6,000 pupils, and costing annually over \$110,000. Connected with the system is a free public library with over 11,000 volumes. There are also 4 Roman Catholic parochial schools, with 20 teachers and nearly 800 pupils. The most noted educational institution is the Rose Polytechnic Institute, an advanced school of engineering and chemistry, founded by the late Chauncey Rose, and opened in 1883. It is admirably equipped for its work, and has a productive endowment of \$600,000 and an annual income of \$47,000. The State normal school has an annual allowance by the State of \$60,000, and a library of 11,000 volumes. There are also Coates College for young women (Presbyterian), and St. Mary's in the Woods, a Roman Catholic seminary for girls. The charitable institutions include the Rose Ladies' Aid Society for the relief of the poor and the care of a home for old ladies (endowment \$90,000), St. Anthony's Hospital, conducted by Sisters of St. Francis

(cost \$130,000, chiefly gift of H. Hulman, Sr.), Rose Dispensary (endowment \$90,000), Rose Orphan Home (cost \$130,000, with additional endowment of \$200,000), and St. Ann's Orphan Asylum.

In 1894-95 the city had receipts, \$447,832; disbursements, \$381,588; net debt, \$297,000; and total assessed valuation, \$25,000,000. There are 3 national banks with combined capital and surplus of \$1,080,000, savings-bank with deposits of over \$500,000, a loan and trust company with capital of \$100,000, and a private bank. The city has 85 large manufacturing establishments and numerous minor ones, including railway-car works, 6 machine-shops, 3 rolling-mills, 3 flour-mills, 2 hominy-mills, 2 distilleries, piano-factory, and stove, heading, and lumber mills. There is a large wholesale trade, particularly in groceries and dry goods. Pop. (1880) 26,042; (1890) 30,217; (1895) estimated, 37,000. C. C. OAKLEY.

Terrell: city; Kaufman co., Tex.; on the Tex. and Pac. and the Tex. Midland railways; 31 miles E. of Dallas (for location, see map of Texas, ref. 2-1). It is in an agricultural, fruit-growing, and stock-raising region, and contains a large high school, a school for colored children, railway-shops, cottonseed-oil mill, creamery, compress, flour-mill, iron-works, a national bank with capital of \$75,000, a private bank, and two weekly newspapers. Pop. (1880) 2,003; (1890) 2,988; (1895) estimated, 4,500.

EDITOR OF "TIMES-STAR."

Terrestrial Magnetism: See MAGNETISM, TERRESTRIAL.

Terrier [from O. Fr. *terrier* in *chien terrier*, terrier dog; *chien*, dog + *terrier* < Late Lat. *terra'rius*, of the ground, deriv. of *terra* > O. Fr. *terre*, earth, ground; cf. O. Fr. *terrier*, little mound of earth, burrow of a fox or rabbit]: any one of a large number of breeds of small dogs distinguished for vivacity and courage. Among the best known are the English or black-and-tan terrier; the bull-terrier, a miniature bulldog in courage, and often in shape; the fox-terrier, formerly used to unearth foxes; the Scotch or rough-

Skye terrier.

haired terriers, including the Skye, the Dandie Dinmont, and other strains; and the toy-terriers, crosses with some of the small lapdogs. Most of the various breeds of terrier are especially trained to the killing of rats and other vermin. See DOGS. Revised by F. A. LUCAS.

Territory: a term technically applied in the U. S. and in some Spanish-American republics to certain portions of the public lands which are under the direct control of the national legislature. In the U. S. Territories are organized by congressional enactment. The governor and the administrative and judicial officers are appointed by the President, but a territorial legislature is intrusted with limited powers, subject to the approval of Congress. When a Territory attains a population sufficient to entitle it to one Representative in Congress, it has usually been given permission by a special act to form a State constitution, and then admitted into the Union with rights equal to those of the other States. The rights of Congress over the Territories and respecting their admission as States are based on Art. IV., Sec. 3, of the Constitution. With the exception of Texas, California, West Virginia, and the original thirteen colonies, all the States of the Union have passed through the territorial form of government. At present (1897) there are three organized Territories: Arizona, New Mexico, and Oklahoma. Alaska and Indian Territory also rank in the U. S. as territories, although they have no organized territorial form of government.

Terrorite: See EXPLOSIVES.

Terry, ALFRED HOWE: soldier; b. at Hartford, Conn., Nov. 10, 1827; educated at schools in New Haven and at the law school of Yale College; entered upon the practice of law in 1849, and was clerk of the Superior and Supreme Courts of Connecticut 1854-60. For some years prior to the civil war he had been an active member of the State militia, and since 1854 in command of the Second Connecticut Militia, which regiment was mustered into the service of the U. S. in response to the call for three months' troops, and, with Terry still in command, was engaged in the first battle of Bull Run. Returning at the expiration of the three months, Terry then organized the Seventh Connecticut Volunteers, of which regiment he was appointed colonel Sept., 1861, and which he commanded in the expeditionary corps of Gen. Thomas W. Sherman at the capture of Port Royal, S. C.; was placed in command of Fort Pulaski upon its capture. Promoted to be brigadier-general of volunteers in Apr., 1862, he served in the operations about Charleston, in making a successful demonstration up Stono river during the descent on Morris island, and in the siege operations at Forts Wagner and Sumter. In the Virginia campaign of 1864 he commanded a division in the Army of the James, and was engaged at Drury's Bluff, Bermuda Hundred, and siege of Petersburg, being in command of the corps May-July, 1864. Upon the failure of the first attempt to capture FORT FISHER (q. v.), Terry was selected in Jan., 1865, to command the new expedition, which successfully carried that work by assault Jan. 15. For his services on this occasion he was promoted to be a major-general of volunteers and made a brigadier-general in the regular army. In the capture of Wilmington he rendered efficient aid, and in Mar., 1865, was placed in command of the Tenth Corps, which he held during the subsequent operations in North Carolina. In June, 1865, he was placed in command of the department of Virginia; commanded the department of the South 1869-72, and afterward the department of Dakota. He became major-general in the regular army Mar., 1886, and took command of the division of Missouri; retired Apr. 5, 1888. D. at New Haven, Dec. 16, 1890.

Revised by JAMES MERCUR.

Terry, ELLEN ALICE: actress; b. at Coventry, England, Feb. 27, 1848; made her first appearance on the stage in 1856 at the Princess's theater, London, under the management of Mrs. Charles Kean, playing Puck, Prince Arthur, etc., and became in 1878 a member of the company of the Lyceum theater under the management of Henry Irving, playing Ophelia, Desdemona, Portia, Juliet, and other characters. Her three sisters—Kate, Florence, and Marion—and her daughter are successful actresses. She visited the U. S. five times in company with Irving, and her acting was much admired for its winning charm, its gracious dignity, and its emotional intensity. Her Portia especially entirely accords with the spirit and poetry of Shakspeare's play.

Revised by B. B. VALLENTINE.

Terry, MILTON SPENSER, A. M., S. T. D.: minister and educator; b. at Coeymans, Albany co., N. Y., Feb. 22, 1840; educated at Charlotteville Seminary, Troy University, and Yale Theological Seminary; pastor in the Methodist Episcopal Church eighteen years, presiding elder four years; since 1884 has been Professor of Old Testament Exegesis in Garrett Biblical Institute, Evanston, Ill. He has published *Commentary on Judges, Ruth, and Samuel* (1873); *Commentary on Kings, Chronicles, Ezra, Nehemiah, and Esther* (1875); *Biblical Hermeneutics* (1883; rev. ed. 1890); *Commentary on Genesis and Exodus* (1889); *Sibylline Oracles*, translated from the Greek (1890); *The Song of Songs* (1893); *The Prophecies of Daniel Expounded* (1893); and *Rambles in the Old World* (1894). A. OSBORN.

Terschelling: the third of the chain of islands which lie in the North Sea along the northeastern coast of Holland; comprises an area of 45 sq. miles, and consists of low and rich meadow-land protected by dunes and dikes against the sea. The inhabitants form a commune numbering about 3,730, and are engaged in ship-building, fishing, and pilotage.

Revised by M. W. HARRINGTON.

Tertian Fever: See FEVER and CHILL.

Ter'tiar'ies [from Eccles. Lat. *tertiarius*, belonging to the third degree or order < Lat. *tertia rius*, containing a third part, deriv. of *ter'tius*, third; Eng. *third*]; in some Roman Catholic religious orders, those members who from marriage or secular occupations are not received into the highest membership of the order, but nevertheless take simple vows.

The members of the Third Order of St. Francis are the most celebrated class of Tertiaries. They have long, in fact, constituted a separate order in the Church and have a general of their own. The Third Order embraces congregations of both men and women. Other orders have houses of Tertiaries, who are not to be confounded with the lay brethren and sisters of the orders.

Revised by J. J. KEANE.

Tertiary Era: a division of geologic time co-ordinate with the Primary era, and Secondary era, which it follows, and the Quaternary era, which it precedes. In the later and widely adopted classification based on life, the CENOZOIC ERA (q. v.) is made to include the Tertiary and Quaternary. Tertiary time is divided by European geologists into four periods—Eocene, Oligocene, Miocene, and Pliocene. In the chronologic system adopted for the atlas of the U. S. Geological Survey these are represented by two periods named Eocene and Neocene. For accounts of the periods, see the articles under their several names. The flora of this era is treated in the article PLANTS, FOSSIL. See also QUATERNARY ERA. G. K. GILBERT.

Tertre, du: See DETERTRE.

Tertull'ian (*Quintus Septimius Florens Tertullianus*); the most eminent Latin ecclesiastical writer of the early Church; b. at Carthage about 160. The son of a Roman military official, he was liberally educated, and became one of the ablest lawyers of the day and professor of rhetoric in his native city. The hollowness of contemporary paganism, the purity of the Christian life, and the courage of the martyrs co-operated to make him a Christian. From his conversion he experienced a profound change of heart, and was soon as noted for the rigidity of his ethical views and conduct as he was formerly for his looseness of life. In fact his severity in this regard led him to break with the regular Church authorities by his excessive insistence on the tenets of Montanism and his want of pity on the fallen. He is said to have founded a sect of Tertullianists which lingered on until the fifth century. He is famous for many works apologetical, doctrinal, and ethico-practical. Among them are the *Apologeticum*, a gem of Christian wit, logic, and erudition; the *De prescriptionibus hæreticorum*, valuable as an evidence of the ecclesiastical mind of his time; the *Adversus Marcionem*, in five books; and works on patience, on chastity, on monogamy, on idolatry, on theaters, etc. He is laconic, pointed, sarcastic, sententious in his utterances. His language is often compressed and obscure, so loaded is it with thought and reference. He created much of the technical ecclesiastical phraseology of the Latin Church. He lived and taught at Rome for some time, and his personal differences with the Roman clergy may have had something to do with his sharp expressions concerning the Roman mildness in treating those who fell away from Christian virtue or faith, but his works contain many expressions and principles that show the theoretical headship and real influence of the Roman Church. D. about 240. See TILLEMONT, *Mémoires pour servir à l'histoire ecclésiastique*; FREPPÉ, *Tertullien* (Paris, 1864); CRUTWELL, *A Literary History of Early Christianity* (London, 1893); the patrologies of Fessler-Jungmann and of Alzog. The best edition of Tertullian is that of Oehler (3 vols., Leipzig, 1851-54).

JOHN J. KEANE.

Terwague, ANNE JOSÉPHE: See THÉRSIGNE DE MÉRICOURT.

Tesla, NIKOLA: electrician; b. at Smiljan, Croatia, Austria-Hungary, in 1857; graduated at the Polytechnic School, Gratz; engaged in electrical work in France; went to the U. S. and was associated with Edison; became electrician of the Tesla Electric Light Company and established the Tesla laboratory in New York for independent electrical research. He has received honorary degrees from Columbia and Yale and the order of St. Sava from the King of Serbia, as well as that of the Eagle from Montenegro, and has been vice-president of the American Institute of Electrical Engineers. He is the inventor of the modern principle of the rotating magnetic field embodied in the apparatus used in the transmission of power from Niagara Falls, of new forms of dynamos, transformers, motors, induction coils, condensers, arc and incandescent lamps, and of the oscillator, combining steam-engine and dynamo, etc. His researches in electrical oscillation have opened a new field for scientific investigation. See *The Inventions, Researches, and Writings of Nikola Tesla*, by T. C. Martin (New York, 1894).

Tessin: See TICINO.

Tessin', KARL GUSTAF: statesman and writer; b. in Sweden, 1695. He filled various important political positions, but he is best remembered as a patron of letters and an orator of force and elegance. While tutor to the crown prince, afterward Gustaf III., he wrote his famous *En gammal mans bref till en ung prins* (An Old Man's Letters to a Young Prince). D. 1770. D. K. D.

Testament (Lat. *testamentum*): See WILL.

Testamentary Guardian: See GUARDIAN.

Testaments, Old and New: See BIBLE.

Testi, FULVIO: poet; b. at Ferrara, Italy, Aug. 23, 1597, the son of a pharmacist. Trained at Bologna and Ferrara, he spent his life in the service of the court of Modena; attacked the Spaniards in some early verses, and excited their suspicions; later sought to gain their favor, when ambassador to Madrid (1635-38); was arrested Jan., 1646, for intriguing with French officials, and died in prison at Modena, Aug. 28, 1646. His verse consists chiefly of the *Rime* (1611); a tragedy, *Isola d'Atena* (1626); the fragments of another drama and two epics; and most probably the poem in oetaves called the *Pianto d'Italia*. J. D. M. FORD.

Testicle: See HISTOLOGY.

Testimony [from Lat. *testimoniūm*, deriv. of *testis*, a witness]: in law, the oral statement of facts made under oath by witnesses upon the trial of a civil or criminal action, or upon the hearing of any other judicial proceeding, as contradistinguished from the evidence furnished by written instruments, or by any other mere physical facts or appearances which can be exhibited to the court or jury. "Evidence" is the generic term, while "testimony" is specific. (See EVIDENCE.) At the common law the witnesses in a legal action must be produced before the jury, unless they are without the kingdom or state, in which case their examination is taken in writing by means of a commission sent to the foreign country. In the English equity, admiralty, probate, and ecclesiastical proceedings the testimony was always taken by deposition and read on the trial. The modern radical changes in procedure have altered most of these ancient rules. Even the testimony in legal actions, both in the U. S. and in England, may now be written if the parties agree to that method; while by the practice of some States and of the U. S. tribunals it may always be in the form of a deposition if the witness lives at a fixed distance from the court or in certain cases in a county other than that in which the trial is held. One important exception to this relaxation is made necessary by the national and State constitutions. In all criminal trials the prisoner must be confronted by the witnesses against him, so that the testimony for the prosecution must be produced and delivered orally before the jury. Generally, wherever the reformed procedure prevails, the testimony in equitable suits is given in the same manner and is governed by the same rules as that in legal actions. In the U. S. courts, however, and in a few States which still retain a separate administration of equity the original form of deposition continues to be used. The reformed English procedure allows the parties a free selection between the written and the oral modes. In respect to the compelling the attendance of witnesses, the administration of the oath or of the affirmation, the examination and cross-examination, and the rules as to the competency of witnesses, see SUBPENA, OATH, and TRIAL.

Revised by GEORGE W. KIRCHWEY.

Test Oath: the oath required by the Corporation and the Test Acts (13 Car. II., st. 2, c. 1, A. D. 1661, and 25 Car. II., c. 2, A. D. 1672) to be taken by nearly all civil and military officers. Blackstone describes these statutes as "two bulwarks erected in order the better to secure the Established Church against perils from nonconformists of all denominations, infidels, Turks, Jews, heretics, papists, and sectaries." They made the holding of public office conditional upon the incumbent's taking the oaths of allegiance and supremacy, and subscribing a declaration against transubstantiation and receiving the sacrament of the Lord's Supper according to the usage of the Church of England. After various modifications the statutes were substantially repealed in 1828 (9 Geo. IV., c. 17). During the civil war in the U. S. and after its close, test oaths were imposed by Federal and State legislation. (See U. S. R. S., § 1756, repealed by ch. 46, Laws 1884.) Their validity was soon called in question, and in the famous cases of *Cummings vs. Missouri* and *ex parte Garland* (4 Wallace 277 and 333) the U. S. Supreme Court held that any law requiring these oaths to be

taken as a condition of holding certain offices and trusts or of pursuing one's ordinary and regular vocation, and thus operating to deprive persons of vested rights, was unconstitutional, as imposing a punishment for an act which was not punishable when it was committed, and hence within the prohibition against *ex post facto* laws; or as inflicting punishment without a judicial trial, and hence under the ban against bills of attainder. FRANCIS M. BURDICK.

Testudin'ia [Mod. Lat., neut. plur. of Lat. *testudin'us*, from *testu'do*, tortoise]: an order of reptiles including the turtles, distinguished by having the body protected by a bony case. This is formed above by the ribs and vertebrae, to which are added other expanded bony plates, the whole constituting the carapace; below by a series of bony plates, usually nine, forming the plastron; other bones, called marginals or peripheralia, are usually developed about the edge of the carapace, and in the adults of many species all these bones are immovably connected with one another. The lower jaw, as in other reptiles, is formed of several pieces, but its halves are largely and firmly united at the symphysis by the coalesced dentaries. The jaws are toothless and, like those of a bird, encased in horny sheaths. The dorsal vertebrae are few in number, and immovably connected with one another and with the ribs. The feet have five digits each, and are variously modified for walking and swimming. There is no true sternum, the plastron consisting in part of bones corresponding to the clavicles and interclavicle of other animals, and in part of dermal bones. In most *Testudinata* the carapace is covered with regularly arranged horny plates, which may be quite thin, as in some tortoises (*Testudo*), or thick and overlapping, as in the hawk's-bill turtle. In the trunk-turtle (*Dermochelys*) and the fresh-water *Trionychide* the carapace is covered with a thin skin. The heart has two auricles and an imperfectly divided ventricle, and some venous blood enters into the circulation. The digestive apparatus is well developed, although the distinction between gullet and stomach is slight. In the marine turtles, which feed on seaweed, the gullet is armed with long, sharp, backwardly directed papillae; in other turtles the gullet usually shows longitudinal folds. Including fossil forms the *Testudinata* are divided into four groups: (1) *Amphichelydia*, containing extinct species distinguished among other characters by the separation of the dentary bones. (2) *Pleurodira*, in which the neck is bent sidewise, not in a vertical plane, and the head in consequence can not be drawn within the shell; the pelvis is ankylosed to the carapace and plastron; marginal bones are present. This group contains a small number of tropical species. (3) *Cryptodira*, in which the neck can be bent in a vertical plane, and the neck in most can be drawn within the shell; marginal bones are present. The large majority of turtles belong to this division. (4) *Trionychia*, containing forms in which marginal bones are usually absent, or when present they form an imperfect series and are not connected with the ribs. This group comprises the so-called soft-shelled fresh-water turtles, which have a considerable portion of the outer and posterior part of the carapace cartilaginous and slightly flexible. A fifth group (*Atheica*) is used by some systematists for the reception of the trunk-turtle (*Dermochelys*) and some fossil forms, in which the carapace consists of numerous small segments and is not united with the vertebrae and ribs. Geological members of the order *Testudinata* are found from the Upper Trias onward. Geographically they are found throughout the tropical and temperate portions of the world, their northernmost limits being about 50° in North America and 54° in Europe. See article *Tortoise* in *Encyclopedia Britannica*, 9th ed.; also Baur *On the Classification of the Testudinata*, *American Naturalist* (June, 1890). See GREEN TURTLE, HAWK'S-BILL TURTLE, LEATHER-TURTLE, LYRE-TURTLE, TORTOISE, and TRIONYCHIDE. F. A. LUCAS.

Testudin'idae [Mod. Lat., named from *Testu'do*, the typical genus, from Lat. *testu'do*, tortoise]: a family of tortoises (*Testudinata*) distinguished by their club-shaped feet and their special adaptation for terrestrial life. (See TORTOISE.) The North American species are *Gopherus polyphemus*, *G. agassizii*, and *G. berlandieri*. The species are long-lived and very tenacious of life, and can live for a long time without food; they subsist upon herbage (grass, vegetables, and roots), and travel, in some cases at least, periodically to watercourses to drink. In temperate climates they hibernate in burrows through the winter.

Tetá: See ORHOES.

Tetanus [Mod. Lat., from Lat. *tetanus* = Gr. *τέτανος*, spasm, tetanus, liter., stretching, tension, deriv. of *τέλειν*, stretch]: a dangerous spasmodic disease characterized by paroxysms of tonic muscular contraction, succeeding each other with varying frequency for days or weeks. The spasms usually appear first in the muscles of mastication, producing the condition popularly known as "lock-jaw," then involve the large muscles of the trunk, then those of the extremities and those concerned in respiration. In a paroxysm the patient's face is livid or purple, his respiration suspended, his whole body rigid and usually arched backward, owing to the greater power of the muscles of the back. Such a spasm lasts several seconds, and may cause death by arrest of respiration. Fever of varying intensity is present, and extreme exhaustion follows the paroxysms. Death is the more common issue in acute cases, occurring in two or five days. Occasionally, tetanus of less intense type becomes chronic, lasting weeks. Tetanus is universally recognized as an infectious disease due to the bacillus of Nicolaïer, which was discovered in 1885. This micro-organism gains access to the system through wounds which are infected with earth or dust. The earth of almost any garden contains them. Jagged wounds, and especially such as involve or injure nerves, are particularly liable to cause the disease. It may begin soon after the injury or not for a long time. Tetanus is more common in hot than in cold climates. As in other infectious diseases the symptoms are largely the result of the action of certain toxins, the products of the bacillus. Tetanus has been successfully treated by chloral hydrate, opium, chloroform, and by timely removal or separation of the nerves which are irritated by the wound. The modern treatment consists in the injection of antitoxines obtained from the blood of animals rendered immune from the disease. This treatment has been highly satisfactory in some cases.

Revised by W. PEPPER.

Tête de Pont, tât'de-pôn [Fr., head of a bridge, bridge-head]: in fortification, a fieldwork, generally open at the gorge, resting its flanks on the banks of a river in order to cover one or more bridges. In spite of their small compass, such works are often of great strength. See FORTIFICATION.

Tetrabranchia'la [Mod. Lat., from Gr. *τετρα-*, four + *βράγχια*, gills]: that group of cephalopod Mollusca which includes those forms with two pairs of gills. See CEPHALOPODA, NAUTILIDÆ, and MOLLUSCA.

Tetrachord: See HEXACHORD.

Tetracoral'ia [Mod. Lat.; from Gr. *τετρα-*, four + *κόραλλιον*, coral]: a group of fossil corals, characterized by having the septa arranged in fours. They are simple or colonial, free or fixed. The group is confined to the Paleozoic age, and attained its maximum in the Silurian. About 400 species are known.

Tetraleap'oda [Mod. Lat.; Gr. *τετρα-*, four + *δέκα*, ten + *πούς*, *ποδός*, foot]: a group of malacostracous crustacea, embracing forms the typical members of which have fourteen (seven pairs) feet fitted for locomotion. They have a small head, seven free thoracic body-rings, while more or fewer of the seven abdominal segments are coalesced. The eyes are never on stalks. The group is often known as EDRIOPHTHALMA (*q. v.*) (sessile-eyed) or *Arthrostraca*, in allusion to the jointed thorax. (See MALACOSTRACA.) The group may be divided into four orders: ISOPODA (*q. v.*), AMPHIPODA (*q. v.*), *Læmodipoda*, and *Antoniscida*. In the *Læmodipoda*, embracing a few marine forms and including the whale-lice (*Cyamus*) and *Caprella*, the abdomen is greatly reduced, several of the thoracic feet may be lost, while one pair is transferred to the head. The *Antoniscida*, with isopodan affinities, are greatly reduced by parasitism, the female being frequently so degenerate that no crustacean relationships are recognizable in the adult. J. S. KINGSLEY.

Tetradymite: See TELLURIDES.

Tetragram'maton [Mod. Lat., from Gr. *τετραγράμματον*, a word of four letters; *τετρα-*, four + *γράμμα*, letter]: the word of four letters, i. e. the Hebrew YHWH, the holy name of the Deity which the Jews considered "secret" or "inexpressible" (*shēm hammephōrāsh*). Cf. *Zeit. Deutsch. Morgenl. Gesell.*, xxxv., 162; xxxvi., 410; xxxix., 543. It was written in Hebrew letters in MSS. of the LXX., and then read as Greek ΠΩΠΙ (*Zeit. Deutsch. Morgenl. Gesell.*, xxxii., 465). The real pronunciation, which was given but once—on the Day of Atonement by the high priest—has been lost. In its place the word Adonai (my Lord) was

used, and the vowels of that word placed under the consonants YHWH. Since 1520 Christian scholars have wrongly combined the consonants of the one with the vowels of the other, and produced a new word, *Jehovah*. The correct pronunciation is probably *Yahwē*; cf. *Yāw* of the Ophites, Valentinians, Abraxas Gems, and magical papyri; *Yāwē* of Clemens, *Yāwē* of Epiphanius and the Samaritans (Theodoret). The word means either "the one who exists" (Ex. iii. 14; Hosea i. 9), or "the one who calls into being" (Clericus, *Langarde, Bildung der Nomina*, p. 137). For other meanings, see Wolfhausen, *Skizzen*, iii., 175; Stade, *Geschichte*, i., 429; Schultze, *Allst. Theologie*, 4th ed., p. 508; Bandissin, *Studien zur Semit. Religionsgeschichte*, i., 181; *Zeit. Allst. Wissen.* (1882-83).

RICHARD GOTTHEIL.

Tetra'hedron [from Gr. *τετρα-*, four + *ἔδρα*, seat, base]: a solid having four bounding planes, four solid angles, and six edges. If regular, its sides are equilateral triangles.

Tetra'logy [Gr. *τετραλογία*, a quaternion of discourses or dialogues]: the technical name given to a combination of three tragedies (trilogy) and a satyr-drama. The word is also applied to the Platonic dialogues, as grouped in sets of four. B. L. G.

Tetrameter: See METRÆS.

Tetraon'idæ [Mod. Lat., named from *Te traon*, the typical genus; from Lat. *te'raon*, *tetraonis* = Gr. *τετραών*, heath-cock, moor-fowl]: a family of birds comprising the grouse, partridges, quails, etc. The general aspect of the birds is familiar in connection with the kinds just indicated; the bill varies considerably in size, being in some robust and in others rather weak; it is broad at the base, and thence compressed, and the culmen is always arched to the tip, which is obtusely hooked and decurved over the lower mandible; the nostrils are basal and lateral, in some (e. g. *Tetraonina*) concealed by feathers, in others partly covered by a hard scale; the wings are short, rounded, and concave; the tail diversiform, but generally short and depressed; the tarsi strong, variously clothed; the toes moderate, the three anterior free, the posterior elevated; the claws stout and adapted for scratching. With these are associated certain osteological characters, contrasting with those exhibited by the nearly allied *Phasianidæ*. (Huxley, *Proc. Zool. Soc. London*, 1868, p. 301.) These characters are best expressed in the grouse. As here defined, the family embraces the sub-families *Tetraonina*, *Ortygina* or *Odontophorina*, *Perdicina*, *Rollulina*, and *Caccabina* (in part). The *Ternicina* have been isolated by Huxley not only as a distinct family, but as a peculiar super-family or sub-order, under the name *Ternicimorphæ*. By some authorities the family is held to contain only the grouse proper, the partridges and quail being placed in a separate family, *Perdicidæ*, but there seems to be no good reason for this separation. See GROUSE, PARTRIDGE, QUAIL, RUFFED GROUSE, etc.

Revised by F. A. LUCAS.

Tetrapol'itan Confession [*Tetrapolitan* (with *t* by analogy of Gr. *πολίτης*, Eng. *political*, etc.) is from Gr. *τετραπόλις* (sc. *χώρα*, district, country), a region having four cities, liter., fem. adj., having four cities; *τετρα-*, four + *πόλις*, city]: the "confession of the four cities" of Constance, Strassburg, Memmingen, and Lindau. It consists of twenty-three articles and is the oldest confession of the Reformed Church in Germany. It was drawn up by Bucer during the session of the Diet of Augsburg (1530), and presented to the emperor in the name of the four cities, but not read before the diet, nor did it ever receive wider sanction than in the four cities. See Schaff, *Creeds*, i., 526-529. S. M. J.

Tetra'rech [from Lat. *tetrarches* = Gr. *τετάρχης*, *τέτραρχος*; *τετρα-*, four + *ἄρχευ*, be first, lead, rule]: a name which strictly designated, originally, the viceroy or monarch of the fourth part of a country (Thessaly, etc.), but subsequently became a title bestowed, especially under the Romans, upon the minor tributary princes of the East.

Tetrodon'idæ [Mod. Lat., named from *Te troduon*, the typical genus; Gr. *τετρα-*, four + *ὀδούς*, *ὀδόντος*, tooth]: a family of plectognath fishes distinguished by the development of the jaw into four tooth-like margins. The form is normally more or less oblong, but the abdomen is capable of much distension, and thus the true form is often disguised; the skin, especially on the belly, is mostly covered with larger or smaller dermal ossifications or spines; the head is oblong and covered with skin, so that the opercular and other bones are concealed; the mouth terminal or sub-terminal, and with the cleft mostly transverse; the inter-

maxillary and supramaxillary bones are confluent, but those of the opposite sides are divided by a suture, as is also the dentary bone of the lower jaw; the teeth are represented by the trenchant edges of the jaws and are otherwise wanting; the branchial apertures are narrow slits in front of the pectoral fins; the branchiostegal rays are entirely inclosed within the integuments; the dorsal is chiefly composed of articulated and branched rays, and is generally short and far behind; the anal is like the dorsal, and is obliquely opposite, but rather farther behind; the pectorals are narrow and high up; the ventrals are wanting. With these characters are co-ordinated certain osteological features which confirm the isolation of this group as a peculiar family. It is, however, nearly related to the family *Diodontidae*, which has generally been combined with it. Between sixty and seventy species are known. Representatives of the family are found in all tropical and warm temperate seas. Several are natives of the seacoast of the U. S., two (*Tetrodon leucogutulus* and *Chilichthys turgidus*) extending to the eastern coast, and one (*Tetrodon politus*) occurring along the Californian coast. These species are called by the fishermen and others puffers, swell-fish, blowers, etc. The puffing is due to the development of a largely dilatible air-sac, which closely adheres to the peritoneum, and has a valvular communication with the œsophagus, through which the air is received. The species are of no economical importance; indeed some are poisonous. Revised by F. A. LUCAS.

Tetuan, tet-oo-aan': town of Morocco; in lat. 35° 34' N., lon. 5° 18' W., near the mouth of the river Martil; in an exceedingly fertile and well-cultivated region, especially celebrated for its oranges (see map of Africa, ref. 1-3). The town is fortified and well built, and has several fine mosques and an active trade in woolen and silk stuffs, leather, and fruit. Pop. 20,000 to 25,000, one-quarter Jews. M. W. H.

Tetzel, or **Tezel**, tet'sel, JOHANN [Tetzel is a diminutive of *Tietze*, his father's name]: seller of indulgences; son of a goldsmith; b. in Leipzig about 1455; studied theology and philosophy at the university of his native city; in 1489 entered the Dominican monastery of St. Paul in Leipzig, and soon became noted as a very impressive popular preacher. In 1502 he was appointed to preach an indulgence in Zwickau and its vicinity, and he was so successful—that is, he made so much money for the papal treasury—that he was steadily employed in the sale of indulgences for fifteen years. His territory was enlarged and his authority increased. It is said that he sold indulgences without requiring previous confession, and that he led an immoral life. At Innsbruck in 1512 he was sentenced as an adulterer to be sewn in a sack and thrown into the river, but that sentence was commuted to imprisonment for life, and after being confined for some time at Leipzig he was set free. Roman Catholic writers deny that he sold indulgences without repentance, or indulgences for sins not yet committed; but their argument rests solely on the words of the papal commission, which are vague, and prove nothing with respect to the practice of the man as it had been reported by eye-witnesses. Leo X., having determined to grant a universal indulgence, made Tetzel inquisitor, and commissioned him to preach the indulgence throughout Germany. Tetzel appeared in his highest glory, journeying from town to town and levying his contributions, as has been described by contemporary writers; but when from Brandenburg he approached the Saxon frontier in the middle of 1517, he was unexpectedly met by Luther's theses, nailed to the church-door in Wittenberg Oct. 31. He burned Luther's theses at Jüterbogk, and wrote some theses himself, which the students burned at Wittenberg, while he defended them in a disputation at Frankfort-on-the-Oder, whereby he became a doctor of divinity. This illusion did not last long; and when, in 1518, Karl von Miltitz, the papal ambassador, arrived at Leipzig, he not only suspended Tetzel, but spoke so harshly to him that the poor man fell sick of fright and humiliation, and died July 14, 1519. His *Life* has been written by the Protestants F. G. Hofmann (Leipzig, 1844) and F. Körner (Frankenburg, 1880), and by the Roman Catholics V. Gröne (Münster, 1853; 2d ed., Soest, 1860) and K. W. Hermann (Frankfort-on-the-Main, 1882). Cf. J. B. Röhm, *Zur Tetzel Legende* (Hildesheim, 1890). Revised by S. M. JACKSON.

Ten'eer (in Gr. Τεικρος): (1) the first King of Troy, in honor of whom the Trojans are sometimes called Teucri; but the legends differ with respect to whether he was a native of Troy, giving his daughter, Arisbe, in marriage to Dardanus of Samothrace, or whether he immigrated, to-

gether with Scamander, into Troas from Crete. (2) Son of Telamon, King of Salamis, and Hesionë of Troy. He accompanied his step-brother, Ajax, to Troy, and was the best archer among the Greeks; but when the Greeks returned after the capture of Troy, Telamon would not receive Teucer in Salamis, because he had not avenged Ajax, and he then sailed to Cyprus, which he received from Belus, King of Sidon, and where he founded the town of Salamis.

Revised by J. R. S. STERRETT.

Teuffel, toiffel, WILHELM SIGISMUND: classical scholar; b. at Ludwigsburg, Württemberg, Germany, Sept. 27, 1820; studied ancient languages in Tübingen, where he became privat docent in 1844; professor extraordinary in 1849; ordinary professor in 1857. D. at Tübingen, Mar. 8, 1878. His most famous work is his *Geschichte der römischen Literatur* (2 vols., 5th ed., by L. Schwabe, Leipzig, 1890; trans. into English by Warr), the most exhaustive survey of the subject, and absolutely indispensable to every serious student. He is also the author of excellent editions of Aristophanes's *Clouds* and of Æschylus's *Persæ*, and wrote a commentary to the second book of the *Satires* of Horace. His admirable and highly instructive essays on ancient life and thought are collected in his *Studien und Charakteristiken* (2d ed., Leipzig, 1889). See S. Teuffel, *W. S. Teuffel* (1889) and Bursian, *Biographische Jahrbücher*, i., 1878, pp. 2 ff.

ALFRED GUEMAN.

Tenthid'idae [from *Teuthis*, the typical genus]: a family of acanthopterygian fishes, characterized by the peculiar structure of the fins. The body is oblong and compressed, scales small, lateral line continuous. There is a single row of cutting teeth in either jaw, no teeth on the palate. The dorsal fin has thirteen spinous and seven soft rays, the anal seven and nine, a formula common to all the species. Ventrals fins thoracic with an outer and inner spine, between which are three soft rays. There are about thirty species, none over 15 inches in length, found in the Indian and Pacific Oceans. F. A. LUCAS.

Tenton'ic Knights: a military ecclesiastical order, founded in 1190 by some North German merchants, who had been moved by the sufferings of the crusaders at the siege of Acre. It soon found a patron in Frederiek, Duke of Swabia, and secured charters from the emperor and the pope entitling it to all the privileges possessed by the two great rival orders of the Knights Templar and Knights of St. John. The members of the order were required to be Germans of noble birth, but priests and half-brothers, not noble, were admitted. In the early times they took vows of chastity and poverty. In 1230 they entered upon a crusade against the Prussians, and after a century of hard fighting established their rule over Prussia, when they fixed their headquarters at Marienburg. In the meanwhile they had served in the crusades of St. Louis 1248-50, founded Königsberg in 1255, and attacked the heathen Lithuanians in 1283. They were for many years involved in wars with Poland; held at times East and West Prussia, Esthonia, Pomerania, and other neighboring countries. In 1466 they surrendered West Prussia to Poland, and recognized the latter's feudal ownership for East Prussia, when Königsberg became their capital. In 1525 their grand-master, Albert of Brandenburg, converted Prussia into a secular hereditary dukedom, and in 1527 the seat of the order was transferred to Mergentheim in Swabia. In 1561 they lost all their Livonian possessions. In 1805 the Emperor of Austria became grand-master of the order. In 1809 Napoleon declared the order abolished, and gave its lands to various German sovereigns. In 1840 the Austrian emperor reorganized the Teutonic Knights, and in 1865 the order was still further reorganized. F. M. COLBY.

Teutonic Languages: a branch of the Indo-European family of languages. For the relationship of Teutonic to the other branches, see article INDO-EUROPEAN LANGUAGES. The term Germanic is also used, especially in Germany, where it is supplanting the older term *Deutsch*. The members of this group may be enumerated and compared with the aid of the following diagram. Each language has been treated in a separate article, under Gothic, Icelandic, German, Dutch, etc.

Teutonic is general and theoretical, and represents the one prehistoric language spoken by the Teutonic stock in Central Europe, between the Baltic and the Black Sea. The first divergence in general Teutonic was between East and West Teutonic, first fully treated by Zimmer in *Ztschrift für d. Altertum*, xix., p. 393, seq. See also Kluge in Paul's *Gran-*

driss der german. Philol., i., p. 362, *seq.*, and Sievers in *Encyclopædia Britannica* under *Gothic Language*. East Teutonic is divided into Gothic (see *GOthic LANGUAGE*) and the SCANDINAVIAN LANGUAGES (*q. v.*), but the differences between

the two are more striking than their similarities, and they may as well be kept distinct. See Brugmann's *Grundriss*, i., p. 11, and Noreen in Paul's *Grundriss*, p. 419, *seq.*; also Emerson's *History of the English Language*, chap. ii., and Brandt's *German Grammar*, § 479. The West Teutonic division stands out as more distinct and compact. Applying GRIMM'S LAW (*q. v.*) in its second shifting we get three subdivisions: 1. High German (see *GERMAN LANGUAGE*), which shifted most of all. 2. Low German (*q. v.*), which shifted *th* to *d*. 3. English (see *ENGLISH LANGUAGE*), which, like Gothic and Scandinavian, shifted only once. The Frisian language stands between English and Low German. Some of its modern dialects have preserved *th*, some shifted it to *d*, and even to *l*. English writers like to place English in the Low German group, but this is hardly justifiable. It is true that when Angles, Saxon, Jutes, and Frisians left the Continent for Britain, their dialects were, roughly speaking, identical with Old Low Saxon, Old Low Frankish, Old Frisian; but the general term Low German should be limited to the non-High German continental dialects, including Modern Dutch, Flemish, Plattdeutsch, and perhaps Frisian, all of which shifted *th* to *d*. The main common characteristics of the Teutonic languages, which constitute at the same time the reason for grouping them together, are as follows: 1. The shifting of consonants according to GRIMM'S LAW and VERNER'S LAW (*qq. v.*). 2. The ACCENT (*q. v.*). In the Indo-European and for a while still in the Teutonic period the accent was "free." Then it became limited to the stem-syllable, which is always the first one in simple words and in "nominal" compounds. In genuine (inseparable) compound verbs it is the second syllable. Cf. Lat. *a mō—ama mis, a'mor—amo ris* with Germ. *ich stand, wir standen, standhaft, Standhaftigkeit, verste hen*; Germ. *Ur laub—erlau hen, Beischlaf—beschle fen*. 3. The "strong" and "weak" conjugations. By ABLAUT (*q. v.*) which is not peculiar to the group, however, a regular and full system of verb-inflection called strong has developed; e. g. Eng. *write, wrote, written*; O. H. Germ. *helfan, half—hulfam, giholfan*. The so-called weak conjugation is quite characteristic. It employs a suffix *d* (*t*), of still doubtful origin, to express the simple past tense; e. g. Gothic *nasyan—nasyda*; Eng. *love—loved*; Germ. *hausen—hauste*. 4. The double adjective declension: (*a*) The strong, identical with the strong substantive declension, although endings from the pronominal inflection have been mixed with it; (*b*) the weak, whose endings are identical with the weak or *n*-declension of substantives. Mod. H. Germ. has well preserved this twofold inflection and the syntax of the same, e. g. *guter Mann, gutem Manne; der gute Mann, dem guten Manne; Gutes, das Gute*. There are other minor characteristics of the group, but too technical to enumerate and enlarge upon here.

H. C. G. BRANDT.

Teutonic (or Germanic) Mythology: the body of myths belonging to the Teutonic or Germanic nations; also the system of gods, minor deities, and spirits which these myths commemorate.

History of the Science.—The discovery of the *Eddas* (see *EDDA*) in the sixteenth century dates the beginning of this science, which moved chiefly on lines of interpretation—and that in the main Euhemeristic—until Jacob Grimm (*Deutsche Mythologie*, 1835) put it upon a foundation of philological, historical, and comparative criticism. His main success was in the exhaustive material which he gathered, and in

his wonderful, if often misguided, power of combination. Moreover, he not only avoided interpretation, but also insisted that Scandinavian sources are not to be regarded as the foundation, but simply as part of the material, of Teutonic mythology. Then came the great enthusiasm for comparative mythology, with Max Müller and Kuhn as leaders. This has been succeeded by a caution bordering on skepticism in regard to the validity of such processes; but it is interesting to note that rationalists were about a century ago, declaring (Adelung, Rühls, and others) that Christian and classical material—that is, mere loans and repetition—lay at the foundation of Norse myth. This view, with concessions to Teutonic and comparative mythology, and put forth with great philological insight, method, and ability, has been revived of late by certain Scandinavian scholars, such as Jessen, and notably by Sophus Bugge, who has succeeded in throwing grave suspicion upon the exclusively heathen character of such myths as the sacrifice of Odin, the death of Balder, and the descriptions of Valhalla. Müllenhoff, who had insisted on the critical methods of Lachmann as check to the more generous combination of J. Grimm, Grundtvig, and others, nevertheless took up the challenge of Bugge and made a manful defense of the essentially heathen character of Scandinavian mythology (*Deutsche Alterthumskunde*, v. i.). Whatever the merits of this particular controversy the vigorous methods of Müllenhoff in the general science deserve all praise. His friend and scholar Mannhardt, who began investigation as an enthusiastic follower of Kuhn, soon developed independent powers of criticism, insisted upon the artistic or poetical element which is sure to master higher forms of myth, abandoned (see his *Mythologische Forschungen*, with valuable introductions by Müllenhoff and Scherer, Strassburg, 1884) much of the old material, and emphasized the importance of traditional rites and superstitions among the peasants. With Mannhardt, as with others, anthropology has exercised a salutary power. Finally, we may mention the tendency of modern critics to exalt the importance of religious rites in general as a far more stable affair than the myth. Extreme in this regard is J. Lippert (*Die Religionen der europäischen Kulturvölker*, 1881), a disciple of Herbert Spencer; according to Lippert myths are mere tales and fancies, accretions upon the religious instinct, and subordinate in every way to ceremonial religion. This is exaggeration; but it is safe to say that while the old problems of Teutonic mythology are still unsolved, a more temperate and reasonable spirit prevails, the material is better understood, and a sounder critical method is accepted on every side.

Sources.—Aside from Scandinavian myths (see *SCANDINAVIAN MYTHOLOGY*), plentiful indeed, but not to be used in their present shape as outright material for the reconstruction of a Teutonic Olympus, the sources are meager and baffling. The line between genuine myth and poetic fancy or allegory is not easy to determine; while the test of a definite cult and a definite locality can be applied successfully to few of the myths which we possess. Names of persons and places—Thor was a favorite for this purpose in Scandinavia—from heathen times are trustworthy, particularly when the name is compounded so as to indicate some phase of worship; and with these sources are to be ranged runic and other inscriptions of ancient date, genealogies, like those of the Anglo-Saxon kings, which go back to such gods as Woden, and even the so-called "kennings" or metaphors of sealdie poetry. Ornaments and other relics from heathen tombs are often incorruptible witnesses to heathen worship. Important, but not always clear, is the evidence of classical writers contemporary with our heathendom; such are Caesar (*Commentaries on the Gallic War*, vi., 21), Tacitus (*Germania* and parts of the *Annals* and *History*), and Plutarch. With the conversion come the Christian chroniclers—Jordanes, for example—and the lives of saints, particularly of men like Boniface, who were foremost in missionary labor; here too belong renunciations of heathen gods drawn up for the Germanic convert. Critical powers of a high order are needed in the use of such sources as the half-heathen epic (*Brouluf*) and the complicated heroic legend; but poetic fancy is not so rife and contamination not so prevalent in the charms and incantations which more or less clearly show heathen origin. These are a part of religion, as is evident from their purpose and the manner of using them; but popular stories, legends, ballads, and the like, are of little value, having no stay in religious rites and floating easily from one race or community to another.

Lower Mythology.—Turning to the actual material we

note that the worship of spirits, survival from heathen belief, is found in all Teutonic races, and carries with it a host of stories which belong in part to primitive myth. One example out of many which prove an older worship of the dead is the myth of the Wild Huntsman and his troop of spirits sweeping through a stormy sky. Such a storm is often called *Allerseelenwind*; and the direct cult of these spirits is known still in folk-lore, even adapting itself to Christian purposes in the feast of All Souls. Offerings to the dead, ceremonies at a tomb, give sanction to degenerate myths of this sort, still told by the people, but hopelessly tangled with other elements, native and foreign. Here too belong stories of spirits in guise of bird or beast, or in a form at once human and superhuman—the lore of ghosts. In the popular tales (see BEAST-FABLES) myth is inextricably woven with narrative pure and simple, and migration, especially from the East, may be assumed at every turn; but an exception must be made of charms and incantations, for here we have the sure test of a cult, of ceremonial rites, together with the credentials of immemorial tradition. A charm is often introduced by an epic exordium, setting forth a case similar to the one about to be treated and holding in many cases its shroud of myth. Such is the famous Merseburg charm which tells of Phol and Wodan; such is a long incantation in Anglo-Saxon, meant to cure sudden attacks of rheumatism and telling how “mighty women” riding about the air send their spears at the unwary mortal (translated in Gummere’s *Germanic Origins*, p. 373). These supernatural women, degenerating into modern witches, or the weird sisters of Macbeth, are of course related to the Norns and the Valkyries of Norse myth, and to those women whom the Germans of Tacitus worshiped as divine.

Nature-myths.—Myths of the dead, ghost-lore in general, may be referred to the analogy worked out by primitive man between the world of spirits and the world of his inner consciousness, particularly in dreams. But the world without was as insistent as that within, and there is no good reason for postponing the myths of nature to the late stage assigned them by some modern scholars. Storm and lightning were probably referred to the agency of gigantic spirits, not necessarily ancestral; a vague personality, logical result of what Mr. Tylor calls primitive “animism,” was behind the roar of the tempest. Minor phases of natural power, moreover, had their cult and myth; tree-worship and water-worship are cases in point, and exist in manifold survival to this day. Worship of such elemental powers was partly conciliatory and grateful, partly of the banning order, and the myths connected with them have these dualistic types. The forces of nature had higher powers and larger utterance than the serviceable or annoying spirits of the home. The Corn Demon, the good or bad genius of the fields, belonged in this list (see Mannhardt, *Antike Wald- und Feldkulte*); and so, in yet more vague conception, did the giants (see Jorun), of whom Scandinavia preserved so many myths.

Gods and Goddesses.—Through the border-land of demons, dragons, and giants we pass to what E. H. Meyer has called the Pantheon, as opposed to the Pandemonium, of Germanic myth. Here is the higher mythology, where the poet has wrought material, often brutal and always clumsy, into shapes of beauty and majesty. Some of the gods are merely demons or giants promoted, like Loke, god of fire or possibly of lightning; but many of them are far more venerable in origin. They are called *god* (perhaps “he who is invoked”) or *ans* (probably “helper”; Anglo-Saxon *Os*—in words such as Oscar), and, as opposed to giants, are the friends of man. They were worshiped in rude temples, despite the denial of Tacitus, and in sacred groves, with dance, song, and sacrifice. Comparative mythology assures the parallel of an old Teutonic god, probably “the bright one,” Tiwaz (Scand. Týr), with Sanskrit Dyáuś, Greek Zeus, Latin Jupiter, god of the shining heaven. Originally supreme god, he became the Teutonic Mars (giving the name to Tuesday, *dies Martis*): a few traces of his worship are found, notably an inscription in England. His supremacy was overthrown by Wodan (Ang.-Sax. Woden; Scand. Óðin), the god of wind and storm, “Mercurius” in Roman interpretation (hence Wednesday), and then a divinity representing conquest and new arts of life. Wodan became of course monarch of all Teutonic gods; myths about him abound in Scandinavian sources, and traces of his worship are found in all Teutonic nations. Identification of English Woden and the outlaw Robin Hood, however, is made without good reason. (See Child, *Ballads*, 2d ed., iii., p. 47.)

The cult of Wodan seems finally to have penetrated peasant life, and is proved by folk-lore; but for Scandinavia at least there is no doubt that Thor (Ang.-Sax. Thunior) was once the favorite; ample material is given by Henry Petersen, *Om Nordboernes Gudekyrkelse og Gudetro i Hedenold*, especially page 46, seq. Thor, the thunder-god (Thursday, *dies Jovis*), may have been meant by Cæsar when he ascribes to the Germans a god “Vulcan.” There are many myths about this friend of man and sworn foe to the giants, and the converted Scandinavians parted from him unwillingly enough. Occasionally an old god is worshiped under a new name, and Tiwaz probably lives again as the Freyr of Norse myth, a god of fertility, peace, and commerce; his sister Freyja is probably no other than the Nerthus, *terra mater*, mentioned by Tacitus (*Germ.*, 40) as worshiped by Germans along the North Sea with rites that are described in valuable detail. Freyr, moreover, is closely related to, probably identical with, Ing, the father and god of the Tacitean Ingvæones, who dwelt about the Elbe mouth, and later sent conquerors to Britain. Ing is mentioned in the Anglo-Saxon Rune-Lay. Besides Freyja should be mentioned Frigg (Scand. form; Ang.-Sax. Frīg), wife of Odin, goddess of love and fecundity; later she appears in folk-lore in humble guise and under many names, such as Holda in Germany.

Interpretation.—Occasionally, as has been shown, the meaning of a myth and the origin of a deity are evident enough; such is the case with Wodan and his hunt, with Tiwaz, and others. But the mania for interpretation of myths—whether sun, storm, or a beautiful allegory of human life be the solution—lapsed at one time into a mere guessing-match, and was baffled by nothing. Simrock, in his *Mythologie*, gives after each myth a *hæc fabula docet*, often ingenious to absurdity. Jacob Grimm held himself aloof from all this; and with modern times, as criticism finds more and more difficulty in the mere sifting and valuation of material, and recognizes how many strands are interwoven, what different stages of culture are to be reckoned with, and how hard it is to approach the origins of a myth, interpretation, even with the aid of comparative mythology, has lost much of its ardor. One thing is certain: while myths may yet be traced to personified natural forces, often with convincing proof, the hunt after allegories and fine-spun meanings, such as mars the effect of so able a book as Uhland’s *Mythus von Thor*, is now abandoned.

BIBLIOGRAPHY.—Besides the works already named, one should consult J. Grimm, *Deutsche Mythologie*, especially his preface to the second edition (1844; reprinted in fourth edition); Müller, *Geschichte und System der alldutschen Religion* (1844), despite its age still a useful book; K. Maurer, *Bekehrung des norwegischen Stammes zum Christenthum* (1855, seq.); Wuttke, *Der deutsche Volksglaube der Gegenwart* (1869); H. Pfannenschmid, *Germanische Erntefeste* (1878), an excellent book; Tylor, *Primitive Culture*; Kemble, *The Saxons in England*; E. H. Meyer, *Völsunga and Germanische Mythologie* (1891); Mogk, *Mythologie*, in Paul’s *Grundriss der Germanischen Philologie*.

FRANCIS B. GUMMERE.

Teutons [from Lat. *Teutoni*, *Teutones*, from a Teutonic word represented by Goth. *þiuda*: O. H. Germ. *diot*: O. Eng. *þeod*, people; cf. Eng. *Dutch*, from Dutch *Duitsch*: Germ. *Deutsch*, German < O. H. Germ. *diutisk*, popular, national, deriv. of *diot*, people]: the members of the Teutonic branch of the Aryan family.

(1) *The Peoples embraced under the Name.*—Much uncertainty is manifested in the extent of the application. The Greek and Latin authors seem to have used the word to designate only a certain portion of the great race then inhabiting the lands N. of the Alps and E. of the Rhine—viz., that portion with which they first became acquainted—that portion which undertook, in company with the Cimbri, to invade the Roman empire about 113 B. C., and whose original abode had been probably the western coast of Schleswig-Holstein and the territory about the mouth of the Elbe. It was then that Rome first became aware of the existence of a people of untamed might dwelling N. of the Alps, and distinct from the Celtic tribes; and it is quite natural that the Romans, in their ignorance of the extent of the race, should have taken the word which this tribe used, in common with all the other tribes, to designate itself, and have applied it in a Latinized form in particular to this one, and then, upon becoming acquainted with the larger extent of the race, have adopted, as they did, another word, the Belgic-Celtic

word *Germani*, for the name of the entire race. Some of the Latin authors—as Martial and Claudian—used the adjective *Teutonicus* as of like meaning with *Germanicus*, and after the beginning of the tenth century the Latin “Teutonicus” displaces, even in German authorship, the indigenous “Theotiscus” as the comprehensive race-adjective, while in modern times the Latin names, though still used, have been turned wholly about in the extent of their application, the race being designated by the term Teuton, and that portion of the pure or nearly pure stock inhabiting the European continent by the term *German*. In this broadest sense must be included under the name Teuton, in first degree, the Germans of the Continent—viz., the inhabitants of the German empire, of Austria proper, of the northern and northeastern cantons of Switzerland, and of Holland, and the Scandinavians of the two northern peninsulas; in the second degree, the English, the inhabitants of Lower Scotland, and the inhabitants of the U. S.; while in the ethnological composition of almost every truly European nation—that is, every nation W. of Russia proper and Turkey—the Teutonic component enters in a greater or less degree. At the close of the fifth century, when the great movement known in European history as the migration of the peoples ended, the Teutons were the ruling race from Carthage to the Vistula; the Vandals in Africa from Carthage to Gibraltar; the Visigoths from Gibraltar to the banks of the Loire; the Suevi occupying about the present Portugal; Burgundians from the upper course of the Loire to the center of the present Switzerland; the Ostrogoths from the last-mentioned boundary to that of the present Turkish empire on the E., and from the Mediterranean Sea on the S. to the Danube on the N.; the Franks from the lower Loire to Thuringia; Saxon conquerors upon the English coasts; Saxons, Frisii, Thuringians, Mareomanni, Bavarians, and Longobardi still upon the original German soil, the latter moving down a little later (last half of the sixth century) into Italy, and occupying the plain of the upper Po, while the Scandinavian branch not only occupied the two northern peninsulas, but reached round the entire eastern and southeastern shore of the Baltic and far inland. In the far-off lands of Africa, Hispania, Southwestern Gaul, and Middle and Southern Italy the Teutonic element disappeared almost entirely in the amalgamation with the great mass of the Romanic population; while, on the other hand, the inhabitants of Northern and Northeastern France, of Belgium, of Northern Italy, and of Russia's Baltic provinces manifest still most strongly the ethnological characteristics of the Teutons.

(2) *Characteristics of the Teuton.*—(a) *Physical.*—Besides the usual Caucasian peculiarities of the “oval head; the lines of eye and mouth dividing the whole face into three nearly equal parts; the large eyes with their axis at right angles with the line of the nose; the 90 facial angle; the full beard, covering to the ears; the white complexion, and the tall, straight, and well-proportioned stature”—which the Teuton possesses in common with all Europeans, he is further somewhat distinguished from these by a larger frame, a whiter and more florid complexion, a bluer eye, and a lighter shade of hair. (b) *Mental.*—The distinction between the Teutonic and the Romanic nature is even more manifest in the mental than in the physical constitution. The Græco-Roman world meditated the connection between the ancient civilization and the modern. Its geographical position and historical connections with the Oriental world preserved in the Greek and the Roman the inheritance of the Oriental traits, which the differences of climate and soil, of geography and topography, have indeed modified but not destroyed. The prevailing temperament of the Romanic peoples is still a mixture of the sanguine and the melancholic, the latter element predominating, while fancy and imagination, vacillation, and mysticism, are among the chief traits in their intellectual, moral, and religious character. On the other hand, the Teuton, with more of the phlegm and the cholera in his temperament, evinces the deeper insight, the more constant purpose, and the greater *éclaircissement*.

(3) *Institutions.*—These differences of mental constitution are most clearly seen in the fundamental institutions which they have produced. The Roman imperium and the Roman Church may be taken as the great historical products of the Roman spirit. In both of these the sum and substance of all authority is viewed, imaginatively and mystically, as inherent in an office, and all law as proceeding out of it, from above, down, over, and independent of the governed. On the other hand, individual liberty and personal worth were

the fundamental principles of the old Teutonic life and polity. In the old assemblies of the village, the hundred, and the tribe it was the will of the free-man which was the authority of law. While in Rome the central power was the strongest, and there existed no local power worth the name, save as an imperial agency, among the Teutons, again, the local power was always the strongest, and centralization always opposed, defied, and overthrown. When Marbodius, the Marcomannic duke, and even the brave Arminius, to whom the German tribes were indebted for the expulsion of the Roman legions from their soil, attempted to retain in time of peace the centralized authority which they had exercised as leaders in war, the one was obliged to flee to Rome in order to save his life, while the other fell a victim to his fatal ambition. Thus is seen enkindled at the very first contact of the Teutonic with the Romanic world the irrepressible conflict between freedom and authority which has shaken Europe from that day to this. Then it was Teutonic liberty against the Roman imperium; in the Middle Ages, after contact and connection with the Roman world had given the Germans kings and emperors, it was the emperor against the pope; in the transition period from the mediaeval age to the new time it was German Protestantism against Roman Catholicism; and to-day it is Teutonic science against the syllabus and the Vatican. The Teutonic spirit has given to the modern civilization its freedom of thought and conscience, its estimation of man above institutions, its science, its Protestantism, its doctrine of popular sovereignty, its local self-government, and its national development. It can therefore be truly said to be the spirit of the modern civilization.

J. W. BURGESS.

Tewfik (tef-tŭk) **Pasha**, MOHAMMED; Khedive of Egypt; b. Nov. 15, 1852, the eldest son of Ismail Pasha. He was educated in Egypt, and declared heir-apparent in 1866 when the Porte granted the right of primogeniture to the Egyptian reigning family. He married Eminch Hamen, and never had any other wives. In 1879 Ismail appointed him president of the ministry, which position he resigned after a few weeks. On June 26, 1879, Ismail was compelled to abdicate by the British and French Governments, and Tewfik was proclaimed khedive. But he ruled only in name, the dual control having placed the state virtually in the power of the two foreign governments. The result of this was the formation of a national party, with Arabi Pasha at the head. Though he was Minister of War, he quarreled with Tewfik. Great Britain, acting in the interest of the Egyptian bondholders, intervened, and issued an ultimatum July 9, 1882. Alexandria was bombarded on July 11. The insurrection was forcibly put down, and a sort of constitutional monarchy established. On Jan. 18, 1883, a British financial adviser was given a seat in the council. During the Mahdi troubles in 1884 Tewfik was compelled, against his better judgment, to give up the Sudan. He was greatly interested in public works and public instruction. D. at Helwân Palace, Jan. 7, 1892.

RICHARD GOTTHEIL.

Tewksbury: town (incorporated in 1734); Middlesex co., Mass.; between the Merrimack and Concord rivers; on the Boston and Albany Railroad; 5 miles S. E. of Lowell, and 22 miles N. W. of Boston (for location of county, see map of Massachusetts, ref. 2-B). It contains the villages of Wiggsville, Gillmanville, Phoenix, and North Tewksbury; has a high school, twelve schools, public library, and the State almshouse; and is principally engaged in agriculture and the manufacture of cotton-machinery. Pop. (1880) 2,179; (1890) 2,515; (1895) 3,379.

Texarkan'a: twin city; one part, the capital of Miller co., Ark., the other part in Bowie co., Tex.; separated by the boundary-line between the two States; on the St. L., Iron Mt. and S., the St. L. S. W., the Texark. and Ft. Smith, and the Tex. and Pac. railways; 45 miles S. W. of Little Rock, and 58 miles N. E. of Jefferson (for location, see map of Arkansas, ref. 5-B, and of Texas, ref. 2-K). The city is a unit practically, though each part is legally a separate municipality. It is in a pine-lumber region; ships large quantities of cotton; has electric lights, cotton-compresses,

machine and boiler works, cottonseed-oil mill, ice-factories, and car-works; and contains 3 national banks with combined capital of \$275,000, and 2 daily and 2 weekly newspapers. Pop. (1880, part in Arkansas, 1,390; part in Texas, 1,833; (1890), part in Arkansas, 3,528; part in Texas, 2,852.

Texas: one of the U. S. of North America (South Central group); the fifteenth in order of admission into the Union; popularly known as the "Lone Star State."

Location and Area.—It is the most westerly of the States bordering on the Gulf of Mexico; is the largest State in the

Union; lies between lat. 25° 51' and 36° 30' N., lon. 93° 27' and 106° 43' W.; bounded N. E. and E. by Oklahoma, Indian Territory, Arkansas, and Louisiana, S. E. by the Gulf of Mexico, S. W. by Mexico, and N. W. by New Mexico; with a rectangular projection, known as the Panhandle, included between Oklahoma on the N. and E., and New Mexico on the W.; area estimated at

Seal of Texas.

268,242 sq. miles, including Greer County on its N. E. boundary, which is also claimed by the U. S. Government.

Physical Features.—In its geology and topography Texas is composed of areas marked by typical aspects. The northeastern part belongs to the forest-belt extending across the Southern States, the northwestern to an extensive plain reaching downward through several States from the N., and the southwestern, beyond the Pecos river, to the Rocky Mountain system. The surface of the State, omitting the Trans-Pecos region, consists of a series of benches, approximately parallel to the Gulf coast, rising gently toward the N. W. and culminating in the great plateau of the Llano Estacado. Several of these benches are narrowed considerably near their middle portions. The Trans-Pecos country is covered with scattered mountain peaks and ranges having great basins between. The principal benches named in order from the S. E. are the Coast Prairie, the Lignitic Belt, the Black Waxy Prairie, the Grand Prairie, and the Central Denuded Region. Beyond the last lies the Llano Estacado. The Coast Prairie has a width varying from 50 to 100 miles, and the southeast edge, with its long, easy slope, extends a considerable distance out under the waters of the Gulf. The Lignitic Belt has an undulating surface, and is made up of plains, from some of which great basins have been carved out by rivers. The surface of the Black Waxy Prairie rolls gently, and is marked by numerous small hollows or depressions known as hog-wallows. This prairie is about 140 miles wide along Red river, about 85 on the Rio Grande, and only about 10 where the Colorado intersects it. The Grand Prairie is a great plateau, the southwestern part of which is a bed of hard limestone. Its southeast edge is marked by an escarpment reaching from the Colorado river to the Rio Grande, and known as the Balcones. Many springs, remarkable for volume of water and for beauty, burst out along the base of this escarpment. The Central Denuded Region is a basin having a maximum width of about 180 miles. It extends S. into the State for more than three-fourths of the distance across and separates the Grand Prairie from the Llano Estacado. The Grand Prairie, however, sweeps around the southern end of the basin and reaches the Llano Estacado in that quarter. The latter is a vast table-land, sloping gently to the S. E. In Burnet and Llano Counties there is an area of older rocks, notably Archean, near the junction of the Grand Prairie and the Central Denuded Region. The coast has a line of long narrow islands extending along its front at a distance of 10 to 20 miles from the mainland. From Galveston northeastward these islands sink into shoals. The principal bays are those of Galveston, Matagorda, Espiritu Santo, Aransas, Corpus Christi, and Alazan. While there are districts in North and Central Texas mountainous in geological formation, the only elevations deserving the name of

mountains by their altitude are in the Trans-Pecos country. The rivers all have an approximately parallel S. E. direction, except the Canadian and the Red. The former flows N. E. across the Panhandle, and the latter nearly E. along a large part of the northern boundary of the State. The principal remaining rivers named in order toward the S. W. are the Sabine, Neches, Trinity, Brazos, Colorado, Guadalupe, Nueces, and Rio Grande, with its tributary the Pecos. The Canadian, the Red, the Pecos, and the Rio Grande originate beyond the State, and their sources are included in a comparatively small district of upper New Mexico and lower Colorado.

Soil and Productions.—The Coast Prairie has a fertile soil of sandy loam with a red or yellow clay subsoil. The alluvial deposits of its river-bottoms are composed largely of materials brought down from the Cretaceous and Permian beds through which the rivers flow in their upper course, and are exceedingly rich. In the Lignitic Belt the pine uplands have a gray sandy soil, usually not very fertile, but the lowlands are better. The Black Waxy Prairie, though somewhat difficult of tillage, is one of the finest agricultural areas of the world. The northeastern half of the Grand Prairie is covered with a chocolate soil of great productive capacity. The southwestern half has a rougher surface, and the soil is shallow, the parts fit for cultivation being mainly the valleys. The Llano Estacado is deeply covered with a brown loam suited especially for wheat and fruit. The mineral resources of Texas are great, but as yet little developed. Salt is obtained from numerous lakes along the Rio Grande border and from salines in East Texas. Extensive beds of rock-salt exist in Van Zandt and Mitchell Counties. In East Texas lignite has been found throughout a large district. In the central and western parts are beds of bituminous coal. The workable area of the Central beds is estimated at 2,300 sq. miles. Sulphur, celestite, strontianite, asphaltum, gypsum, and kaolin are found in various quarters. There are large deposits of iron ore in East Texas, in the Trans-Pecos region, and in the districts adjacent to the town of Llano. Copper ore exists in the last two localities, and also in Northwestern Texas. Lead occurs in the Central Mineral Region and the Trans-Pecos district, and in the latter zinc as well. Gold and silver are found in both these sections. There are, however, few mines of any sort in the parts mentioned as mineral-bearing. There are numerous quarries of good building-limestone in the State, and several of sandstone. Among the most durable and costly varieties of stone are the granites, marbles, and serpentines of Burnet and Llano Counties and the Trans-Pecos region. The principal forests are in East Texas, and the prevailing growth is pine. In the western part of the forest region oak, hickory, and ash are common. In the river-bottoms of the southeast cypress is found in abundance, and in the northeast bois d'arc. Running from Red river S. are two belts of post-oak and blackjacks about 40 miles apart, the eastern being known as the Lower Cross Timbers and the western as the Upper Cross Timbers. They reach about 150 miles into the State, and mark respectively the eastern and the western edges of the Grand Prairie. Toward the S. W. the forests disappear and are replaced by cedar brakes, stretches of mesquite, and similar growths. Along the Rio Grande border are dense thickets of chaparral, mimosa, and various kinds of acacias. The southern part of the district W. from the Black Waxy Prairie is covered with nutritious grasses. Texas ranks first among the cotton-growing States. It produces also large crops of maize, wheat, and oats. Near Alvin in the Coast Prairie, around Tyler, and in the western parts fine fruit is grown.

The animals of Texas, like the vegetables, change in type in passing from the N. and E. toward Mexico. In the forests and along the streams of the eastern part are the red deer, beaver, squirrel, gopher, and badger, with an occasional brown bear, and panther. On the plains and in the more rugged districts of the west are antelopes, black-tailed deer, and big-horn sheep. Only one herd of buffalo is left in the State, and this is in a large pasture in the Panhandle. In different quarters are lobo-wolves and coyotes, red and gray foxes, skunks, wild cats and civet cats. The prairie districts abound in prairie-dogs and Texas hares. Among the birds of the State are wild geese and ducks, which are found mainly in the eastern portions and on the coast; while farther west the plover, curlew, snipe, and Mexican canary prevail. The quail, wild turkey, crow, hawk, owl, and mocking-bird are widely distributed. The commonest

reptiles are the alligator, horned toad, and snakes of various kinds, the only dangerous ones being the copperhead and rattlesnake. Two hundred and thirty species of fishes have been distinguished, most of them in the rivers of the Coast Prairie. The finest is the black bass. Among the invertebrates are the lobster, shrimp, crab, centipede, and tarantula, while along the coast are found oysters and clams in great abundance.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms.....	174,184	228,126	31 0
Total acreage of farms.....	36,292,219	51,406,937	41 6
Value of farms, including buildings and fences.....	\$170,168,886	\$399,971,289	131 6

* Increase.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	3,649,404	69,338,676 bush.	\$38,829,659
Wheat.....	456,500	6,893,150 "	3,732,301
Oats.....	612,032	20,013,119 "	7,805,116
Rye.....	5,233	59,030 "	44,265
Barley.....	2,500	38,388 "	21,113
Potatoes.....	11,057	1,124,560 "	1,113,314
Hay.....	457,214	608,065 tons	4,633,984
Totals.....	5,196,929		\$56,169,452

The cotton production in 1894-95 was estimated at 3,114,000 bales. On Jan. 1, 1895, the farm animals comprised 1,195,734 horses, value \$25,168,043; 261,454 mules, value \$9,266,418; 816,600 milch cows, value \$11,808,036; 6,064,444 oxen and other cattle, value \$59,081,024; 3,738,117 sheep, value \$4,541,812; and 2,734,341 swine, value \$10,111,592; total head 14,810,690; total value \$119,976,925.

Climate.—In the northeastern and eastern parts there is a fair amount of humidity, but the southwestern and western are too arid for successful agriculture without irrigation. The most marked features of the climate are the Gulf breeze, which blows from the southeast during the warm season, and is quite strong 200 to 300 miles from the coast, and the norther, a cold wind which comes with great velocity and little warning and causes sudden and considerable falls in temperature. The following tables, compiled from U. S. Signal Service observations, show the mean annual and monthly temperature and rainfall of six stations, two in the eastern, two in the central, and two in the western parts:

TEMPERATURE.

MONTHS, ETC.	New Ulm.	Palestine.	San Antonio.	Jackboro.	Fort Stockton.	Fort Elliott.
Elevation, feet.....		495	676	1,133	3,050	2,500
January.....	50° 32'	42° 25'	50° 0'	42° 30'	43° 00'	30° 30'

* Reference for location of counties, see map of Texas.
 † Formed since census of 1880.

Principal Cities and Towns, with Population for 1890.—Dallas, 38,067; San Antonio, 37,673; Galveston, 29,084; Houston, 27,557; Fort Worth, 23,076; Austin, 14,575; Waco, 14,445; Laredo, 11,319; Denison, 10,958; El Paso, 10,338; Paris, 8,254; Sherman, 7,333; Marshall, 7,207; Tyler, 6,908; Gainesville, 6,594; Corsicana, 6,285; Brownsville, 6,134; Palestine, 5,838; Brenham, 5,209; Corpus Christi, 4,387; Greenville, 4,330; and Temple, 4,047.

Population and Races.—In 1850, 212,582; 1860, 604,215; 1870, 818,579; 1880, 1,591,749; 1890, 2,235,523 (native, 2,082,567; foreign, 152,956; males, 1,172,553; females, 1,062,970; white, 1,741,190; colored, 494,333, of whom 492,837 were persons of African descent, 727 Chinese, 3 Japanese, and 766 civilized Indians).

Industries and Business Interests.—Texas is pre-eminently an agricultural and cattle-raising State, but is rapidly developing manufacturing interests. In 1890 there were reported in the census 5,268 manufacturing establishments, with \$46,815,181 capital, employing 39,475 persons, paying \$18,586,338 for wages and \$36,152,308 for materials, and turning out articles valued at \$70,433,551.

Commerce.—The foreign trade in the fiscal year 1893-94, through the customs districts of Brazos de Santiago, Corpus Christi, Galveston, El Paso, and Saluria, aggregated, imports, \$7,796,645; exports, \$41,951,598.

Finance.—In 1893 the State had a bonded debt of \$3,992,030, and the counties an aggregate of \$8,411,541 bonded and \$608,944 floating. The State special funds held \$3,235,040, making the amount of State bonds held by individuals \$756,990. The assessed valuations were, real, \$607,941,700; personal, \$278,233,695; total, \$886,175,395.

Banking.—In 1893 there were reported 221 national banks, with capital of \$23,520,200, deposits \$31,468,466, surplus and profits \$7,585,259; 4 State banks, with capital of \$450,000, deposits \$577,219, surplus \$189,898; 22 private banks, with capital of \$2,796,800, deposits \$3,146,975, and surplus \$146,430; and 2 savings-banks with capital of \$139,486, savings deposits \$356,553, and surplus \$205,232.

Post-offices and Periodicals.—On Jan. 1, 1895, there were

2,713 post-offices, of which 128 were presidential (7 first-class, 15 second-class, 106 third-class), and 2,585 fourth-class. Of these, 668 were money-order offices and 55 were limited money-order offices. The newspapers and periodicals (1895) comprised 56 daily, 1 tri-weekly, 15 semi-weekly, 548 weekly, 1 bi-weekly, 5 semi-monthly, 32 monthly, and 1 quarterly publications; total, 659.

Means of Communication.—The total mileage of main railway track in Texas, June 30, 1893, was 9,088. The aggregate capital stock and indebtedness of the corporations amounted to \$392,726,113. The following shows the extent of direct track and the value of property in the State of some of the most important systems, reported Dec. 3, 1894:

NAME OF CORPORATION.	Mileage.	Total value.
Austin and Northwestern.....	105.96	\$1,753,694.22
Fort Worth and Denver City.....	454.33	5,771,582.32
Galveston, Harrisburg, and San Antonio.....	919.06	16,142,297.45
Gulf, Western Texas, and Pacific.....	109.67	1,318,081.80
Houston and Texas Central.....	452.60	9,588,903.28
Missouri, Kansas, and Texas of Texas.....	837.91	13,637,440.80
New York, Texas, and Mexican.....	91.52	1,093,459.16
Sabine and East Texas.....	102.03	896,565.73
St. Louis and Southwestern of Texas.....	551.78	8,862,293.18
San Antonio and Aransas Pass.....	687.67	8,677,498.37
Texas Central.....	175.95	2,318,696.47
Texas and Pacific.....	1,039.33	17,730,689.31
Tyler Southeastern.....	88.60	911,746.98

Churches.—The census of 1890 gave the following statistics of the principal religious bodies:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Methodist Episcopal South.....	1,701	1,632	139,347	\$1,647,866
Baptist, Regular, South.....	2,318	2,302	129,734	1,384,035
Baptist, Regular, Colored.....	1,468	1,472	111,874	667,786
Roman Catholic.....	263	258	105,138	1,018,800
Disciples of Christ.....	536	390	41,859	467,900
Methodist Episcopal.....	407	390	27,453	592,835
Cumberland Presbyterian.....	476	411	22,297	436,108
Colored Methodist Episcopal.....	222	219	14,895	147,975
Presbyterian in the U. S.....	242	216	10,774	627,806
Lutheran, General Council.....	42	43	7,140	128,740
Protestant Episcopal.....	130	118	7,097	624,900
African Methodist Episcopal Zion.....	47	47	6,927	26,450
African Methodist Episcopal.....	138	208	23,392	233,340
Methodist Protestant.....	158	155	5,536	16,700

Schools.—The system of public instruction includes the common schools, the high schools of the cities and towns, the Sam Houston Normal Institute for whites at Huntsville, the Prairie View State Normal School for colored students near Hempstead, the Agricultural and Mechanical College at Bryan, and the State University, which has the departments of literature, science, arts, and law at Austin, and that of medicine at Galveston. In 1894 the total scholastic population of the State was 693,752; and the total expenditure for public instruction in 1891-92 was \$3,799,560. One hundred and eighty-eight cities and towns are organized as independent school districts. These may levy special taxes for the support of schools up to 5 mills per \$1 for taxable property. Rural districts are allowed to levy 2 mills. The city and town districts levy varying amounts, but many of them go to the limit. Reports for 1891-92 show 9,576 public schools, with 11,021 teachers and 528,314 pupils enrolled, of whom about 10,000 belong to high schools.

Libraries.—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Texas had 27 libraries, which contained 86,603 bound volumes and 8,401 pamphlets. The libraries were classified as follows: General, 5; school, 5; college, 12; college society, 1; law, 1; and garrison, 3.

Charitable, Reformatory, and Penal Institutions.—These comprise a State Asylum for the Blind, State Deaf and Dumb Asylum, Deaf, Dumb, and Blind Institute for Colored Youth, and State Lunatic Asylum, all in or near Austin; North Texas Hospital for the Insane, at Terrell; Southwestern Insane Asylum, near San Antonio; State Orphan Asylum, at Corsicana; State House of Correction and Reformatory, near Gatesville; and State penitentiaries at Huntsville and Rusk. The plan on which the work of the institutes for the blind and the deaf and dumb is based is, first, to educate their inmates as far as the conditions will allow; second, to train them to become self-supporting. The reformatory receives convicts under sixteen years of age, sentenced for not more than five years. Most of the convicts in the

penitentiaries are employed in different kinds of manufacturing within the walls, but about one-third are kept at labor under contract, part on railways and part on State and private farms.

Political Organization.—The ordinary tenure fixed by the Constitution for officials of the legislative and executive departments is two years. Most of the heads of departments are elected. The judiciary consists of a Supreme Court, a criminal court of appeals, five civil courts of appeals—one for each of five districts into which the State is divided—and the usual district, county, and justice courts. The first two have final jurisdiction respectively of civil and of criminal cases. The judgments of the civil courts of appeals may be reviewed by the Supreme Court under constitutional conditions. There are three judges for each court, and they are elected one for each court every two years, the tenure being six years. Every male citizen twenty-one years of age, who has been one year a resident of the State and six months of the county where he seeks to vote, has the right of suffrage, with the exception of idiots and lunatics, paupers, persons convicted of felony, and soldiers, marines, and seamen in the service of the U. S.

History.—It is believed that the coast of Texas was reached in 1528 by Cabeza de Vaca, but the first European settlement within the limits of what is now the State was planted by René Robert Cavelier (see LA SALLE) in Feb., 1685, on the Lavaca river, and was named Fort St. Louis. Previous to this the country had been occupied only by scattered Indian tribes. In 1689 the Viceroy of Mexico sent a small force against the new colony, but the Indians had already stamped it out. In 1691 Don Domingo Teran, governor of Coahuila and Texas, planted several settlements in the latter province, but none survived long. In 1714 Crozat, to whom Louis XIV. had granted Louisiana, sent Huchereau Saint-Denis through Texas to the Rio Grande, mainly to ascertain the possibility of establishing trade with the province. This roused the Spaniards to an effort to secure possession of Texas. In 1715 they established a number of missions in the province, among them that of San Antonio de Valero, which was afterward moved to the famous mission-house known as the Alamo. From this time the hold of Spain on Texas was secure as against France, though the latter continued to assert its claims. In 1729 the Spanish Government tried the policy of colonizing the country instead of holding it by means of missions and military posts, but the attempt failed. In 1730 the Indians began war upon both Spanish and French settlers with the intention of expelling them, but did not succeed in weakening the hold of either. In 1735 the French planted a settlement on the west bank of Red river, and the Spaniards protested; but an official investigation made in Mexico tended to show that the settlement was on French territory. In 1762 France ceded Louisiana to Spain, and in 1800 Spain retroceded it to France. The establishment of the independence of the U. S. was followed by a controversy as to the boundaries between it and the Spanish territory, and the sale of Louisiana to the U. S. in 1803 made it necessary to define the eastern boundary of Mexico. Spain strengthened her forces in Texas, and in 1806 a conflict between the Spanish troops and those of the U. S. in the country E. of the Sabine river was prevented only by an agreement between the opposing generals to recognize the strip between the Sabine and the Arroyo Hondo, a little farther E., as neutral ground. In 1819 the Sabine was agreed on as the eastern limit of Mexico. During 1821-34 South-eastern Texas, except the part adjacent to the Mexican border, was settled by colonists from the U. S. The most important colony was that brought in by Stephen F. Austin. It was located on the lower course of the Colorado and of the Brazos. The Anglo-Americans soon became so numerous in Texas as to excite the jealousy of the Mexicans. The province had been joined to Coahuila, and the whole was governed unsatisfactorily to the colonists. In 1830 further immigration from the U. S. was prohibited by the Mexican congress. In 1833 the Texans sought to obtain a separate state government, but SANTA ANNA (*q. v.*) would not consent. In 1835 Texas revolted. A provisional government was organized, and a war followed, which was ended by the rout of the Mexican army at San Jacinto Apr. 21, 1836. On Mar. 2, 1836, Texas declared its independence, and on Sept. 2 it adopted a republican constitution. At the same election Sam Houston was chosen president, and an almost unanimous vote was cast in favor of annexation to the U. S. The measure was then checked by President Van Buren's declining the proposition, and it failed again in 1844 because the anti-slavery

sentiment and the fact that annexation meant war with Mexico prevented confirmation by the Senate. In 1845, under President Polk, who had been elected on a platform favoring annexation, Texas was annexed, not by treaty, but by a joint resolution of Congress. War with Mexico followed. The treaty of Guadalupe Hidalgo in 1848 established the Texas claim to the strip between the Nueces and the Rio Grande, previously claimed by both Texas and Mexico. In 1861 Texas seceded from the Union and joined the Confederate States. From June, 1863, to Mar., 1867, the State was under a provisional government, and from the latter date to Sept., 1869, under military administration. After this it was restored to its place in the Union.

Texas, University of: a coeducational institution comprising departments in Austin, Galveston, and Bryan. The constitution of the republic of Texas made it the duty of the congress of the republic to provide by law a general system of education as soon as circumstances permitted. The congress of 1839 provided for the selection of a site for a university, and when Austin was located as the capital of the State, 40 acres of land, in the center of which the university buildings stand, was designated for the seat of the university. This action of the republic was followed by a grant of 50 leagues (221,400 acres) of land for the "establishment and endowment of two colleges or universities"; and in 1858 the State appropriated to the university \$100,000 in U. S. bonds then in the State treasury, confirmed to it the 50 leagues grant of the republic, and further appropriated for its endowment every tenth section of the lands set apart to encourage the construction of railways in Texas. This endowment, which would have amounted to some 3,200,000 acres, was diverted to the free schools by the convention of 1876, which substituted therefor but 1,000,000 acres of far less valuable lands to the university. In 1883 partial restitution was made by the Legislature granting another million acres. The main sources of maintenance are from interest on bonds in which were invested the proceeds of the sale of the 50 leagues, with such appropriations as the Legislature can be induced to make. The bonds amount to \$575,840, the interest on which and on land-notes of the university and a few thousand dollars from tuition fees aggregate an annual available fund of from \$50,000 to \$60,000, which it is proposed to ask the Legislature to supplement with a small tax sufficient to support the institution without the necessity of specific appropriations. The main university establishment, embracing the academic and law departments, was located at Austin in accordance with a vote of the people of the State in 1881, and was opened by the admission of students Sept., 15, 1883, when rooms were provided for the purpose in the temporary Capitol and used till the university building was finished and occupied Jan. 1, 1884. The medical department, which was located at Galveston, also by a vote of the people at the election in 1881, was formally

opened in Oct., 1891. The Agricultural and Mechanical College at Bryan, which had been in operation many years before the university was organized, and which, under the Federal grant of 1862 for establishing agricultural colleges in the several States, was a beneficiary, independently of the university, of an endowment from the general Government, was made a branch of the university by the State convention of 1876 in order that it might also have the benefit of appropriations from the university fund. The university has three fine buildings on its grounds at Austin—the main building, costing \$135,000; the chemical laboratory, \$25,000; and Brackenridge Hall, which is a gift from George W. Brackenridge, of San Antonio, one of the university regents, built at a cost of \$17,000 and used for a mess-hall. The medical department at Galveston embraces the Medical College, which cost about \$125,000, and the John Sealy Hospital, valued at \$70,000, the latter having been originally willed to the city by John Sealy, a citizen of that place, and transferred to the university. All departments of the university so far established are liberally equipped. In Jan., 1895, the number of academic and law students was 406. Including with these 180 in the medical department at Galveston and those in the Agricultural and Mechanical College at Bryan there were over 900 students. The academic department has over 100 women students. J. J. LANE.

Texcoco, or Tezucoc. tãth-koo'kō: a town of the republic and state of Mexico; near the eastern side of Texcoco Lake, opposite to and 17 miles E. from Mexico city (see map of Mexico, ref. 7-11). It is celebrated in history. According to the Indian accounts it was founded or occupied about the year 1120 by a tribe of Chichimecs, who called it Acolhuacan or Tenayucan. It became one of the three confederated pueblos of the lake valley, and for a time was the most powerful, subsequently yielding the first place to Tenochtitlan, or Mexico. The inhabitants, called Acolhuas or Texcocans, claimed a pre-eminence of culture and of purity in the use of the Nahuatl language. The chronicles of their chiefs or kings are preserved by Ixtlilxochitl and others. The last Acolhuan chief became an ally of Cortés in 1520, and at Texcoco the vessels were fitted out which played such an important part in the reduction of Mexico. The modern town is surrounded by farms and gardens. Near it are ruins, supposed to be remains of a country-house of Netzahualcoyotl, with a fountain incorrectly called the Bath of Montezuma. Pop. (1889), with the commune, 15,856. See MEXICAN ANTIQUITIES. H. H. S.

Texcoco, or Tezucoc, Lake of: the largest of the cluster of lakes in the valley of Mexico between Mexico and Texcoco. It is about 12 miles long by 7 miles wide, less than 2 feet deep, and much polluted by the city sewage. Formerly it was larger and deeper, surrounding the capital, which was approached by causeways. There are no true fish, but the axolotl (*Siredon*) is common in it. H. H. S.

Texel: the first and largest of the chain of islands which stretches along the northeastern coast of Holland. It contains about 35,000 acres of rich meadow-land.

Texier. tes'i-ã, CHARLES FÉLIX MARIE: archæologist; b. at Versailles, France, Aug. 29, 1802; studied first architecture in the School of Fine Arts in Paris; devoted himself afterward to archæology; undertook under the support of the Government extensive explorations in the East between 1833 and 1843, and after his return was made inspector-general of public buildings in France and Algeria. The results of his explorations he communicated in his two magnificently illustrated works—*Description de l'Arménie, de la Perse et de la Mésopotamie* (2 vols. fol., Paris, 1842-45), and *Description de l'Asie mineure* (4 vols., 1839, seq.)—which were put into English by R. P. Pullan. These books have been much criticised for their lack of accuracy, as many plates are alleged to have been drawn and engraved chiefly from unwarranted conclusions of the explorer, and to have been proved inexact by later investigation. D. in Paris, July 1, 1871. Revised by RUSSELL STURGIS.

Textile-designing: the originating and producing of designs for textile fabrics. All large mills, making goods which require the combination of colors or weaves to produce patterns, employ a designer of such patterns. A textile design should contain not only the drawings of the figure to be produced, but also a careful arrangement of the calculations and estimates for the work in the different branches of the manufacture. Many of the calculations and explanations, which must be a part of the complete de-

sign for a fabric complex in its production, may, however, be dropped from the design for a simple fabric. Besides giving the arrangement of warp and filling, as to colors, and the disposition of warp on the different harness, the textile design should include all the items in the following form, even for the simplest fabric:

Name of fabric,	Style number,
Number of ends in warp,	Number of picks to the inch,
Reed,	Width in loom,
Size of warp yarn,	Size of filling yarn,
Loom texture,	Finished texture,
Loom weight,	Finished weight,
Production of the loom a day,	Finished width,
Stock,	Weave.

It is also often necessary to give the amount of each different color of yarn to the yard or in a given number of yards of the fabric in hand.

It will thus be seen that designing is one of the most important of the branches of textile manufacturing. Any mistake in the design may cause much trouble in the mill, if not a loss to the manufacturer. If a fabric is not started properly in the designing-room, the processes through which it passes before being ready for the market will not produce it a perfect fabric. It is not necessary to send a complete design to each department in the mill; only instructions respecting the processes in the department; but this work should be carefully compared by the designer with his record before being sent to the departments. To produce a textile design intelligently a knowledge of manufacturing is required. The designer must become thoroughly conversant with the loom and what can be accomplished by its use, that he may be competent to produce and understand any weave which could be made. The various raw materials must be studied and the methods used to grade the yarns made from them, according to size. To produce a perfect fabric he must study the effect each process in the manufacture has on the raw materials, and, in his conception of the fabric, go over all the processes and then make his design. Only experience, practical mill-work, will show the designer what the construction must be.

Weaves.—A knowledge of this division of the textile designs, while more theoretical, is not less important than the practical knowledge of raw materials, yarns, and processes of manufacture. Weaving is the interlacing of two systems of threads, technically known as "warp and filling"; the threads in the length of the fabric are known as the warp, while those with which it interlaces are called the filling; yet very few persons realize the endless varieties of ways, i. e. weaves, which may be employed in the interlacing.

As in the study of color it is found that all the many shades and tints point to three primary colors, so in the study of weaves there are found three primary weaves known to designers as the plain, twill, and satin. It does not follow that every weave resembles either one or all of these primary weaves; yet in innumerable cases the weave is derived directly from one of the three weaves, or is a combination of them.

Plain Weaves.—The three primary weaves are illustrated in Fig. 1. The plain weave is shown by the plan A, called a draft, written out on a section of squared design-paper. The warp and filling as interlaced are represented by B. It will be seen that in the weave the movement of every other warp-thread is alike, as shown by the crosses which are used in the draft to represent the raising of the warp-thread at the passing through of the shuttle. To be able to understand the drafts even for the plain weave, the reader will find it necessary to possess a knowledge of the process of weaving. The warp after being wound upon the warp-beam is drawn through the heddles of the different harness. Of these harness there must be as many as there are different movements required for these warp-threads, as shown by the weave. The filling is interlaced with the warp by the shuttle, containing the bobbin of filling, being passed through the shed, formed by the warp being separated into two parts, some of the harness being raised, the others lowered. For description of shed, harness, etc., see Loom.

Looking for a moment at A in Fig. 1, there will be seen only two movements to the warp-threads. Threads 1, 3, 5, 7, and continuing odd threads, are working alike, and could in consequence be put upon one harness. Threads 2, 4, 6, 8, etc., would be placed on a second harness, as they work alike, and differently from 1, 3, 5, and 7. Thus only two harness are required for this the plain weave, which is the most sim-

ple that could be made, the position of the warp-threads changing for each successive pick or shot of the shuttle. Warp-threads 1, 3, 5, etc., are raised on the first pick in the draft A, while their mates are lowered, forming a shed. For

FIG. 1.

the second pick the position of every thread is reversed. The continued changing of position and the passing of the filling through the shed at each change forms the fabric as seen in B, Fig. 1. A sectional view of the plain fabric cut through the warp is given in Fig. 1, C, the warp being represented by the solid black, the filling by a and b.

Twills.—The second primary weave, the twill, could be defined as a weave having the picks alike, except that each pick in turn is stepped one square, that is, one thread to the right or left of the one preceding it, and has at least one float of more than one thread. Beginning at the left and stepping each succeeding pick to the right one thread and toward the bottom would produce a left twill (see A', Fig. 1); while beginning at the right and stepping to the left toward the bottom would form a right twill. Any twill may be easily written out if one pick is given by starting in the upper left-hand corner of a piece of squared paper, using the crosses when the threads are raised. If the pick given was "the first thread raised the second lowered," and continuing the same, technically "one up and one down," or $\downarrow\uparrow$, each pick alike but stepping to right or left, the weave written out would be the plain weave. The twill requires a float of more than one thread and the three-harness twill is the simplest, designated $\downarrow\uparrow\downarrow$ or $\uparrow\downarrow\uparrow$. The first pick of the $\downarrow\uparrow\downarrow$ twill beginning at the left gives a, Fig. 2; the next pick must step one space to the right (or left), and is b, Fig. 2; the third pick is c, Fig. 2; each pick being shown by two repeats of the weave. On this basis all twills may be written out. A, B, and C' in Fig. 1 illustrate the $\downarrow\uparrow\downarrow$ twill weave. This is the four-harness or cassimere twill; with the exception of the plain, it is the most common weave which is used.

FIG. 2.

Satin Weaves.—The satin or satine is a weave extensively used, producing a fabric with a very smooth face, differing from the twill in that the intersections of warp with filling threads are distributed over the surface rather than following closely as in the stepping of the twill. In the twill the fabric presents a rib or wale, running diagonally. That the intersections may not be adjacent the weave must be more than four threads to a repeat, and consequently each warp and filling thread must float at least four threads, as the smooth face is obtained by stitching the warp-thread down for one pick in a repeat, if it is a warp-face, or if a filling-face the warp is carried to the back, and only brought to the face for one pick in each repeat. The simplest satin weave possible, then, is the five-harness, Fig. 3, which is used to illustrate the construction of all satins. A rule to construct any perfect satin weave is to take two numbers, the sum of which is the number of harness to be used, neither of the numbers to be one, or to be contained an even number of times by the number of harness; select one of the numbers as a counter, and begin in the lower left-hand

corner of the squared-design paper, having marked off a square with as many sections as there are harness to be used. In the construction of the five-harness satin, A, Fig. 3, take the numbers 2 and 3; selecting 2 as a counter, mark the intersection of warp and filling threads No. 1 as the stitching of the first filling thread; counting off 2 to the right from this intersection gives the warp-thread to which the second pick is stitched. The continued counting off of two threads gives the weave A, Fig. 3. Should the fabric in hand require a warp-face the draft would be written as B, Fig. 3; C, Fig. 3, would be the draft for the filling-face. The eight-harness satin warp-face is given in Fig. 1, A', B', C', and if compared with the plain and twill weaves in the same illustration will further show the construction of the weave and its differences from the other primary weaves.

FIG. 3.

tration will further show the construction of the weave and its differences from the other primary weaves.

Drawing-in Drafts.—The object of these drafts is to designate the position of the different warp-threads in each repeat of the pattern, showing which of the harness each shall be placed on. There are various names given to the different forms of drafts, each self-explanatory, as straight draws, skip-draws or cross-draws, point-draws, section-arrangement

FIG. 4.

draws. An examination of Fig. 4 will help the reader to understand the process of drafting for the drawing-in. A represents the weave, B the straight-draw on twelve-harness, and C the reduction of the number of harness to six by the cross-draw, that is, by drawing in all those warp-threads which work alike on one harness; D

is the draft showing the harness-movements when reduced to six. The vertical lines marked *v* in C designate how the warp-threads shall be drawn through the reed. **Texture.**—This is the number of threads to the inch in a fabric: the warp-texture means the number of warp-threads, while the texture of the fabrics is the texture of both warp and filling, as 50 × 50, 48 × 48, 40 × 32. In writing out weaves for fabrics of uneven textures it is advisable to use a squared paper which is divided into sections to the square inch in the proportion of the warp and the filling threads.

Figure-designs.—Upholstery and carpet-designing and many kinds of silk-designing demand more artistic ability than skill in manufacture so far as the designer is concerned, and the field is so great that explanations of the various systems can not find place here.

LITERATURE.—For books covering not only what has been given in this article, but far more that could not be given, as designing for double-cloth, gauze, and all Jacquard work, the reader will find very valuable Ashton and Ashenurst on *Design*; Posselt's *Technology of Textile Design and Jacquard Machine*; Posselt's *Structure of Fibres, Yarns, and Fabrics* (among the best); Chevreul, Barlow, and Beaumont on *Color*; and a book which is itself a cyclopaedia of textile terms, Spitzli's *Manual* (5th ed. 1881). LOUIS CLARK.

Textile Fabrics: fabrics made by weaving threads in a loom. (See LOOM and WEAVING.) The threads usually employed are those made by spinning from vegetable fiber, such as that of hemp, flax, cotton, and many plants with

fibrous leaves, especially common in tropical countries: of animal fiber, such as wool of sheep, the hair of many varieties of goat, the llama, the camel, the horse, and other beasts; and of the threads spun by the silkworm. A few exceptional fabrics have been woven from *byssus*, or the silky filaments attached to the bivalve shell *pinna flabellum*, the thread of the spider, and other materials capable of being reduced to slender and somewhat pliant strips; thus glass has been spun into threads, and these have been woven into a texture having much beauty of color and luster; the unopened leaves of some plants are woven into hammocks and into the well-known "Panama" hats; and a weaving together of leather thongs has been used as a defensive garment in warfare. Wire, as of silver and silver gilt, has been woven into cloth with other materials, as linen and silk, for ornament, and gilded paper cut into slender strips is used for the same purpose. Feathers also have been woven into fabrics, perhaps only for decorative purposes, a good example being the fabrics of brilliant-colored feathers made by the people of some islands in the Pacific.

As textile fabrics have in all ages been made ornamental, so decorative effect has been sought not only by the color and the luster of the threads composing it, but also by the arrangement of the loom and the passing of the threads so as to produce surfaces of a character very different from that of simply woven stuff like ordinary cotton cloth. Thus a stuff can be woven of silk and cotton, or of silk and wool, in such a way that the whole surface of one side shall be of silk. In like manner a fabric of silk of two colors can be so woven that each surface shall be of one of those colors. Again, the threads can be so interwoven that considerable masses of the thread running in one direction shall be brought to the surface without being visibly broken by threads crossing them. These threads lying closely parallel display whatever natural gloss they have. Again, the threads running in one direction can be thrown up in loops, more or less long, and these loops can either be left to produce by themselves a peculiar surface or, as is more usual, they can be cut or shaved so as to produce the well-known surface of velvet, velveteen, and fustian. Patterns on the surface varied from the background both in the color of the threads and in the direction in which they lie, and patterns also of velvet surface or of uncut velvet or loops, as above mentioned, are also available by way of ornament. Greater thickness, warmth, the power of shedding water from the surface, and similar useful qualities can be got by the same means as are employed for decoration. Hence the varieties of textile fabric are indefinitely numerous, for these different devices are combined together in many different ways. Textile fabrics are colored for decorative purposes, sometimes by dyeing the thread before it is woven into the web. The simplest instance of this is gingham, in which all the threads are colored and the pattern is got by arranging the differently colored threads in stripes and plaids. Glass-cloths and tea-toweling are made in this way. Textiles are often colored after being manufactured, or "in the piece," (See DYEING.) The effect of dyeing is sometimes modified for decorative purposes by gathering up small parts of the surface and tying them tightly. These parts, when the stuff is plunged in the dye, do not absorb the color with any readiness, and undyed spots are left. In some Eastern stuffs, both silk and cotton, undyed figures of definite shape are relieved upon the dyed ground. It is probable that those are produced by painting or printing the surface beforehand with some substance which repels the dye. A somewhat similar effect is produced in European goods, as thin silks, by printing in color the larger part of the surface, leaving spots of the uncolored material. Textile fabrics are ornamented also by the application of color directly to their surface, either by hand-painting, which is unusual, or by printing from engraved blocks. All the great variety of figured calicoes are produced in this way, and thin silks also are printed in patterns. But this manner of decorating, as well as EMBROIDERY (*q. v.*), is separate from the question of textile fabrics, as fabrics are made complete before being decorated in either of these ways.

Simply woven goods are those in which one thread of the weft or woof passes across the width of the web, passing alternately above and below the threads of the warp, one at a time. Examples are common linen and cotton goods, such as are used for undergarments, bed-sheets, and the like. Such goods are known by different names often taken from the uses they are put to and often from the place of their original manufacture. Linen cloth or linen is the common

name for cloth made from flax. Linen sheeting and linen shirting are so called because of the more common use in modern times of cotton cloth for these purposes. Cambric or linen-cambric is a fine and close-woven material for pocket-handkerchiefs, and at different epochs, according to fashion, for different articles of dress; batiste is a still finer cambric; crash, canvas, duck, and sail-cloth are all stouter cloths, made originally of linen or hemp, although now more commonly of cotton, the names sometimes being used with the prefix, as cotton-duck. Other cotton goods of plain weave, besides cotton-cambric, etc., are the cloth which is called in Great Britain *calico* and in the U. S. more commonly *muslin*, except when printed in colors, and muslin proper, a cloth which is either the fine hand-woven stuff of India or its European imitation. Woolen cloths and those of silk and wool or cotton and wool are also frequently of simple weave. Such are many blankets, the stuff called *challis*, which is usually printed in colors, the dress material formerly called *mousseline de laine* and now known by other names, and many light materials, the trade-names of which differ so widely from year to year, as fashions change and manufacturers try to recommend their goods, that it is useless to name them. The patterns in simply woven stuffs must be either plain stripes, or stripes which when crossing each other form plaids, or "polka spots," or other plain figures. A very slight change in the weave allows of a much richer ornamentation. Thus, when the threads are slightly bunched together, so that three parallel threads of the woof which have been separately alternating with those of the web are gathered into one strand and alternate with another similar strand made up of three threads of the warp, there is produced a square of coarser weave, giving a decided pattern to the surface. In like manner, especially in silk-weaving, threads are bunched together for the whole fabric, producing what is sometimes called "basket weave." If the strands are pretty large, thirty-two to an inch or larger, and if several colors are employed in the same web, an appearance of considerable richness may be got by mere crossing lines. In like manner an appearance of silky softness is got by bunching the threads lying in one direction, and holding these together by fine strong threads the other way, as in some silk blankets; but this weave has little strength.

When, however, anything elaborate is proposed, some less simple weave is employed. The one which comes nearest to plain weaving is that where, while the warp is continuous, the threads of the woof stop and return upon themselves, so that each figure of the pattern is of one color and is separated by a complete break in the stuff from the next figure. This is used in some beautiful Chinese silks, where the most elaborate flowers are woven into the uniform thickness of the web, without other separation from the background than this of the breaking off of the woof threads. In the flowers each color is separated from the other colors, as can be seen along the lines of division which run lengthwise of the stuff. A similar texture exists in the thin and hard-finished Eastern rugs without nap, and showing the same pattern on both sides, which rugs are called "Persian cloths" by the dealers. A twill or a twilled fabric is merely one in which a thread of the woof is carried over and then under several threads of the warp at one time. This produces in the simple forms a kind of diagonal striping characteristic of the stuffs ordinarily called twill. Scotch tartan plaids, the beautifully soft India shawls called Rampoor Chuddahs, most linen diaper, tweeds and chevots and serges, are examples of twilled fabrics. Satin is nothing more than a twill, the threads which lie side by side and form the surface being very soft, with a silky luster. Twilled fabrics are much stronger than those simply woven, and it is much easier in these to produce elaborate patterns on the surface, whether in different colors or by the mere arranging of the threads so as to catch the light. Linen damask, for instance, such as is used for table-cloths, has commonly a pattern, the principal threads of which lie in one direction, while those of the background lie in the contrary direction. It is common, to have the pattern finished with a satin-like gloss on the right side; on the reverse side, then, the background will have this gloss and the pattern will be without it, for the two sides of this stuff are the counterparts of each other. Another variety of weaving is that which produces ribbed materials, the ribs running across the fabric. In these the woof is merely a series of bunches or strands of fine threads, or else single stout cords, which lie nearly straight in the fabric, while the warp passes over them, up and down, leaving the ribs showing their rounded surfaces. Such materials are called *reps*, corded

silk, and *gros-grain*. Sometimes the ribs come in pairs, or ribs of different sizes are alternated. *Crape* is the general name of material made of threads twisted in reverse directions, so that the surface of the stuff is very much crimped and blistered. Ordinary silk crape, a thin and gauzy textile, is dyed black and used for mourning garments in Europe, but is printed in bright colors in the East. *Canton crape* is a thicker and softer silk textile. *Crépon* is a similar fabric made of woolen or other thread much heavier than crape.

Perhaps the most important variety of weave is that which produces goods having a pile, such as velvet, velveteen, and fustian, also corduroy, which is merely velveteen or fustian in lengthwise ribs. In these materials a part of the woof is brought to the surface and forms fine, small loops, which loops cover the whole surface, at least of those parts which are to have the velvet finish. When these loops are not cut in any way the stuff, if of fine silk material, is what is called *uncut velvet*. Much the more common way of finishing the stuff is to cut the loops so that their threads form a uniform surface like the fur of some small animal. The threads standing up in this way are called the pile. Ordinary velvet has a uniform surface, usually of one color, and the name is confined to silk material of considerable value. Velveteen has a similar surface, and is of several kinds: first, a mixture of silk and cotton; second, the material anciently called fustian and made entirely of cotton; third, a material in which the pile is of woolen; but the names change with changing fashions. A material called *velours*, made of linen with a short pile, is also used for furniture-coverings. In goods having a pile the surface is generally uniform, although it may be broken by patterns in color; but a material is also produced in which only a part of the surface has the raised loops, whether cut or uncut, the rest being solid and seeming depressed below the velvety surface. There is, for instance, a Chinese stuff of great beauty in which large parts of the surface are covered or nearly covered with thin strips of gilded paper or silver gilt wire, having upon this an elaborate pattern of flowers, birds, and dragons in velvet pile. There is also a velvet which has the pile of different length or height in different parts, so that a pattern in long or high pile is relieved upon a shorter pile. This is called *pile upon pile* velvet. A greater elaborateness may be reached by having the general surface smooth, with a pattern in short velvet pile relieved and picked out by parts of longer pile. In the sixteenth century a splendid fabric was made which has been reproduced since 1880 in Venice and perhaps elsewhere. In this the ground is more or less satin-like in gloss and finish, and upon this ground a pattern is raised which is partly in uncut velvet with the loops arranged in strongly marked ridges and partly in cut velvet in still higher relief, the pattern being also in three or four different colors.

For another important class of textiles, see CARPETS.

Textile fabrics are of peculiar interest to the student of decorative art, because of the endless variety of effect which may be produced by combining the different methods of weaving, and because of the beauty of the results. In all ages weaving has been one of the first industrial arts which man on emerging from savagery has used for his humblest needs, and which he has then tried to make ornamental; the only exception being the practice of those peoples who have at hand natural substances which replace textiles, such as *lappa* and similar easily prepared materials in the Pacific islands. Elaborate machinery has not been necessary. The most splendid fabrics known, and the most delicate, have been produced on hand-looms of a rudeness hard to imagine—portable frames set up under a tree, as in India, or under a tent, as with the weavers of some of the most beautiful rugs ever made. In fact, the introduction of labor-saving and complicated machinery has been a direct and very positive injury to the textile industry considered as an ornamental art. None of the productions of the power-loom can interest the lover of beautiful fabrics. The making of such beautiful fabrics in the primitive way stops as soon as the machine-made product comes to compete with them, and, although manufacturers sometimes try to imitate the ancient hand-woven stuffs, the imitations have very little of the beauty of the originals. The fine art of weaving belongs to the past and to the few Oriental peoples who still preserve for a little while some of their traditions. Public museums exist in which there are large collections of ancient stuffs, from the fragments of Egyptian and Peruvian mummy-wrappers to the gold-woven kineabs of India and broades of Japan. The history of textiles is to be studied also in the

representations of stuffs of which no fragments remain, as in the sculptures and paintings of Egypt and the art of sculptures in Assyria. The textile art and pottery should be studied together as the most important records of mechanical civilization.

Tezel, JOHANN: See **TETZEL**.

Thack'ray, ANNE ISABELLA: author. See **RITCHIE**.

Thackeray, WILLIAM MAKEPEACE: novelist; b. in Calcutta, India, July 18, 1811; son of Richmond Thackeray, secretary to the Calcutta board of revenue, and descended from an ancient Yorkshire family. He was sent to England in 1816; was educated at the Charterhouse School, London, and at Trinity College, Cambridge (1829-30), where he was a contemporary of John M. Kemble and the brothers Tennyson, but left without taking a degree. At Cambridge he edited *The Snob*, a weekly undergraduate paper, in which he printed a parody on Alfred Tennyson's prize poem *Tin-buctoo*. He then traveled and studied on the Continent, especially in Italy, with a view to becoming a painter; spent a season (1830-31) in Weimar, enjoying free access to the ducal courts and becoming intimate with the aged Goethe and his brilliant circle. In 1831 he took up his residence in the Temple and began to read law; but in 1832 he went to Paris, in which city he continued to be as much at home as in London for the next ten years of his life. He had inherited a fortune of about £20,000, which he lost in an Indian bank and in journalistic speculations, and by 1837 he began to devote himself seriously to literature. He became a correspondent of *The Times*; wrote humorous papers for *The New Monthly Magazine*, for *Fraser*, and for *Punch* over a variety of signatures, such as Michael Angelo Titmarsh and The Fat Contributor; published collections of his magazine articles with original illustrations, as *The Paris Sketch-book*, by Mr. Titmarsh (1840); *Comic Tales and Sketches* (1841), including the *Yellowplush Papers*; *The Irish Sketch-book* (1843); visited the East in 1845, and published as the result *Notes of a Journey from Cornhill to Grand Cairo* (1846); was first recognized as a literary celebrity upon the publication of his novel *Vanity Fair*, in monthly numbers (Jan., 1847, to July, 1848). He was called to the bar May 26, 1848, but never practiced; availed himself of his recently acquired popularity to issue several small volumes made up from earlier articles, *Our Street* (1847); *The Book of Snobs* (1848); *Dr. Birch and his Young Friends* (1848); and *The History of Samuel Titmarsh and the Great Hoggarty Diamond* (1848); brought out in monthly parts (Nov., 1848, to Oct., 1850) his second novel, *The History of Pendennis*, which confirmed his already high reputation, and made him in popular estimation a rival of Dickens for the first place in modern English fiction; lectured with brilliant success on the *English Humorists of the Eighteenth Century* in London 1851, and in the U. S. 1852; published *The History of Henry Esmond* (1852), *The Newcomes* (1853-55), and *The Virginians* (1857-59), completing the series of his five really great novels; lectured in the U. S. 1855-56, and afterward in England, on *The Four Georges*; presented himself unsuccessfully as a Liberal candidate for the representation of the city of Oxford in Parliament 1857; founded *The Cornhill Magazine* (1859), in which he published his two latest novels, *Love the Widower* (1860-61) and *The Adventures of Philip* (1861-62), both admitted to be inferior to his earlier productions, and a series of articles collected as *Roundabout Papers* (1862), and resigned his editorship Apr. 11, 1862. D. in Kensington Palace Gardens, London, Dec. 24, 1863. A marble bust by Marochetti has been erected to his memory in Westminster Abbey. A great part of his life was saddened by the insanity of his wife, who survived till Jan. 11, 1894. Thackeray has been variously described as a realist and a caricaturist, a cynic and a sentimentalist. Beginning with burlesque, satirical character sketches, and all manner of humorous skits and broadly comical drolleries, he gradually widened his field and refined his method until in his great novels he was able to draw a picture of English life, and especially of the life of town, society, and the upper classes, which, while brilliant as satire, included the tragic as well as the comic elements, and in truth to nature was superior to the work of his great rival and counterpart, Charles Dickens. He left an unfinished novel, *Denis Duval*, printed in 1867. Collected editions of his early writings appeared in the U. S. under the title *Miscellanies in Prose and Verse* (4 vols., 1855-57), and rival editions of his complete works are published in Boston, New York, and Philadelphia. A

collection of his fugitive articles was issued by James T. Fields as *Early and Late Papers* (Boston, 1867). *The Orphan of Pimlico, and other Sketches, Fragments, and Drawings* (1875) was edited by his daughter. A volume of his inimitable caricatures and marginalia collected under the title of *Thackerayana* was published in 1876. James Hannay, Theodore Taylor, and William B. Reed have published valuable biographical monographs on his life. See also *Thackeray, the Humorist and the Man of Letters*, by J. C. Hotten (1864); *Anecdote Biography of Thackeray*, by Richard H. Stoddard (1874); *Life of Thackeray*, by Anthony Trollope (1879); and *Life of Thackeray*, by Herman Merivale and Frank T. Marzials (1891).

Revised by H. A. BEERS.

Thadmor, or Tadmor: See **PALMYRA**.

Tha'is (in Gr. *Θαΐς*): an Athenian courtesan, as celebrated for her wit as for her beauty. She accompanied Alexander the Great on his expedition into Asia, and is said to have instigated him, during a festival at Persepolis, to set fire to the palace of the Persian kings in revenge for the calamities which Xerxes had brought on her native city. After the death of Alexander she entered into a connection with Ptolemy, son of Lagus, King of Egypt, who is said to have married her, and to whom she bore two sons and a daughter.

Revised by J. R. S. STERRETT.

Thalameceph'alon: See **BRAIN**.

Thalberg, SIGISMOND: pianist; b. in Geneva, Switzerland, Jan. 7, 1812. He was a natural son of Prince Dietrichstein and the Baroness Wetzlar, who superintended his early education. By the time he was fourteen years of age he was a remarkable pianist. He made many concert tours all over Europe and through the U. S. with the greatest success. He married in 1843 in Paris the daughter of Lablache, the singer, and his daughter, Zare Thalberg, became an opera-singer. Thalberg's compositions are all for the piano. D. in Naples, Apr. 26, 1871.

D. E. HERVEY.

Thaler, taa'ler [= Germ.: Eng. *dollar*]. See **DOLLAR**: a coin and money of account in several European countries. The German *Thaler* of silver, till 1871 the monetary unit for Northern Germany, is worth \$0.729. The former Norwegian specie *daler* was equal to \$1.106. Denmark has a gold ten-daler piece worth \$5.532. Since 1873 the monetary unit for Denmark, Norway, and Sweden is the *krona*, two of which form a riggs-daler, equal to \$0.553.

Tha'les (Gr. *Θαλῆς*): the earliest of the Greek philosophers, and with justice called the father of philosophy; b. at Miletus about 640 B. C.; d. about 550. He was of Phœnician descent, and his father's name appears to have been Examyos (perhaps *Samuel*; see *Acta Societat. Philolog. Lipsiensis*, vol. iv., p. 328, *seq.*; but cf. Diels, *Arch. für Gesch. der Philos.*, ii, 165-70). He was the founder of the so-called Ionic or Hlyogic School of Thought, and was also one of the Seven Sages, a practical man, an astronomer, and a mathematician. He was the first man in the Western world who, setting aside the popular mythological or theological explanation of the universe, looked for its first principle in an abstraction of the reason. Philosophical language being then uninvited, he defined his abstract, universal ground of things as *water*, being led to this perhaps by observing that all nourishment contained moisture. (See Aristotle, *Metaph.* A, 3.) He may be said to have been the discoverer of Material Cause, although of course he made no distinction between matter and form, or between being and becoming. Still less had he any notion of efficient or final cause, although, having observed the action of the loadstone, he affirmed (according to Aristotle, *De An.*, i., 5) that all things were full of gods (*θεοί*). Thales left no writings, and even in Aristotle's time considerable doubt prevailed regarding his opinions. The chief sources of knowledge respecting him are Aristotle and Diogenes Laertius. (Cf. Byk, *Die Vorsokrat. Philos. der Griechen*, vol. i., pp. 25-34.) He taught geometry, and studied astronomy. He is said by Herodotus (i., 74) to have predicted an eclipse of the sun, which happened, according to Ottmanns, in B. C. 609; according to Airy (*Philosophical Transactions*, vol. cxliii., p. 179), in 585.

THOMAS DAVIDSON.

Thali'a [= Lat. = Gr. *Θάλεια*, liter., fem. adj., luxuriant, blooming, deriv. of *θάλλειν*, abound, be luxuriant, bloom]; in Greek mythology, one of the nine Muses (*g. v.*). She presided over comedy, idyllic and bucolic poetry, and her attributes are the ivy crown, the comic mask, and the shepherd's staff.

J. R. S. S.

Thallium [Mod. Lat., from Gr. *θαλλός*, green shoot, deriv. of *θάλλειν*, be luxuriant, flourish, bloom. So called from its green line in the spectrum]; one of the rarer elements, a metal, discovered in 1861 almost simultaneously by Lamy in France and Crookes in England, working independently of each other, by means of the spectroscope. It is found as a small constituent of some iron and copper pyrites in both native and artificial sulphur, in blende and ealamine, in lepidolite, in mother-liquors of salt-works at Naubeim, etc. The most productive source of thallium has been from the condensed fume found in the flues of furnaces in which thalliferous pyrites is burned for the manufacture of sulphuric acid. Thallium is nearly as white as silver, with a high luster. It is a very soft metal, easily scratched by the nail, and even softer than lead. It marks paper like lead. Like the latter it is almost or quite destitute of elasticity, and acquires none by hammering or rolling. It is nevertheless crystalline in its internal structure, and gives, when bent, a "cry" almost equal to that of tin. It fuses at about 555° F., expanding considerably. It may be welded perfectly at the ordinary temperature by pressure, like the soft alkali metals. Its spectrum is the simplest one known, and becomes no more complex at intense temperatures in flames, but in sparks from an induction-coil, between thallium-points, five more lines come out, and the photographic spectrum is by no means simple. Thallium has not been recognized in the sun. It is strongly diamagnetic, nearly as much so as bismuth, and conducts electricity about like tin and lead. At a red heat it volatilizes in the air, giving brown oxidized vapor, and boils at a heat below whiteness. Hydrogen passed over the highly heated metal carries it along in vapor, and such hydrogen, even when cool, retains enough thallium to burn with a bright-green flame. Thallium burns brilliantly in oxygen. It is attacked with some difficulty by dilute sulphuric acid, but scarcely at all by hydrochloric acid; by nitric acid with violence. Its salts are highly poisonous, and some of them are sensitive to light, like silver salts, and might be used in photography, though not sensitive enough to possess any advantages. It forms a hard, brittle, white alloy with copper; with lead, a malleable alloy; it combines with platinum very readily, with evolution of great heat; and with tin forms a malleable compound. Mercury readily amalgamates it, forming a crystalline mass.

Revised by IRA REMSEN.

Thallome, or **Thallus** [Mod. Lat., from Gr. *θαλλός*, young shoot or branch]: in botany, a plant-body in which stem and leaf have not been differentiated, as in many of the algae, some liverworts, the prothallia of ferns, etc. It is often a flat mass, sometimes with a thickened midrib of firmer tissues. Its margins may become lobed and its midrib more distinct, thus passing easily into the leaf-bearing stem. The thallus is thus the homologue of the leafy shoot, and may be regarded as the primitive condition from which it sprang. See MORPHOLOGY, VEGETABLE.

CHARLES E. BESSEY.

Thallophytes, or **Thalloph'yta** [from Gr. *θαλλός*, young shoot + *φυτόν*, a plant]: a general term applied in botany to the plants below the Mossworks (*q. v.*), and including those described in the articles on PROTOPHYTES, PHYCOPHYTES, and CARPOPHYTES (*qq. v.*). Originally the group of the thallophytes was made co-ordinate with the Cormophytes ("stemmed plants"), the two including the whole vegetable kingdom, but in recent years it has been made the lowest of the four branches, anthophytes (flowering plants), pteridophytes (ferns), bryophytes (mosses), thallophytes (thallus-plants). While the term is a convenient one to use it does not represent a natural group of plants, but rather an aggregation of groups. See PLANTS, FOSSIL.

CHARLES E. BESSEY.

Thames, *temz* [anc. *Tamesis*, appar. from *Thame* + *Isis*, names of the two rivers uniting to form the Thames]: the principal river of England. It rises on the southeast side of the Cotswold Hills near Cirencester, at an elevation of 376 feet above the level of the sea, and flows in an eastern direction to the North Sea, passing Oxford, Reading, Henley, Windsor, Eton, and Richmond on its way to London. It is called the Isis up to its junction with the Thame. The tide ascends as far as Toddington, between Eton and Richmond, and from this point up to Oxford there are thirty-three locks. At London Bridge its width is 200 yards; at Woolwich, 490 yards; at Gravesend, 800 yards; 3 miles below Gravesend it expands into a large estuary, 6 miles broad at its mouth, at the Nore Light. Its entire course is about 250 miles, and it is navigable for vessels of 1,400 tons burden

up to Blackwall, 6 miles below London Bridge, and barges may ascend as far as 200 miles from the mouth. It owes its importance as a waterway to its tidal estuary and to the fact that it has no delta. Its principal affluents are the Coln, Leach, Windrush, Cherwell, Thame, Colne, Lea, and Roding on the left bank, and on the right the Kennet, Loddon, Darent, Mole, and Medway. The area of its basin is 6,100 sq. miles. Above London the scenery is interesting, and the river is studded with numerous islands. Through a vast system of canals it communicates with the southern and western coasts.

Thames: a river of the province of Ontario, Canada. It flows in a southwest course for 160 miles, and then enters Lake St. Clair. The towns of London, Chatham, and Oxford are on this river. It is navigable by vessels of 8 or 10 feet draught to Chatham, 18 miles, but there is a troublesome bar at its mouth.

Thames: a river in Connecticut, formed at Norwich by the junction of Yantic, Shetucket, and Quinebaug rivers. It is a navigable tidal channel 14 miles long, and reaches Long Island Sound at New London.

Thane, or **Thegn** [M. Eng. *thain* < O. Eng. *þegen*, soldier, attendant, minister, nobleman; O. H. Germ. *degan*, boy, follower, warrior; cf. Gr. *τέκνον*, child]: in English history, the title among the Anglo-Saxons and early Normans of certain military tenants and freeholders in the king's service. They were originally the servants of the king, and as the royal power increased they became a new nobility, supplanting the older nobility of birth, the nobility of the earls. Very early in the history of the Anglo-Saxons in Britain thanehood was fully established. As a nobility of office it made it possible for the simple freeman to rise to noble rank. The churl who owned five hides of land or had taken three sea-voyages was eligible to thanehood. After the Norman conquest the thanes were gradually merged in the barons, and the principle of personal service to the king gave place to that of the tenure of land from the king as the basis of nobility. In Scotland the thanes were a class of non-military tenants of the crown, and the title was in use till the end of the fifteenth century.

F. M. COLBY.

Than'et, OCTAVE (pseudonym of ALICE FRENCH): writer; b. at Andover, Mass., about 1860. She was educated at the academy in her native place, and early removed to Davenport, Ia., where she has since chiefly resided. Her short stories contributed to the *Atlantic*, the *Century*, and other monthlies attracted much attention, and were collected into a volume entitled *Knitters in the Sun* (New York, 1884). She has also published *Expiation*, a novel (1890); *Otto the Knight and other Trans-Mississippi Stories* (1891); *We All* (1891); *Stories of a Western Town* (1893); and *An Adventure in Photography* (1893).

M. B.

Thanet, Isle of: the northeastern extremity of the county of Kent, England, separated from the mainland by the river Stour and the Nethergong rivulet. Area, 26,180 acres. The surface is level and the soil fertile, though light. Pop. (1891) 57,821. It contains the watering-places Ramsgate, Margate, Westgate, and Broadstairs.

Thanksgiving Day: an annual religious festival in the U. S., celebrated in New England from the first settlement by the Pilgrims. It originated in 1621, when Gov. Bradford of the Plymouth colony appointed a day for public praise and prayer after the first harvest, and the practice was observed by the other New England colonies and during the Revolution was introduced in several of the Middle States. Since then it has extended to nearly all the States, and has become a national institution since 1863. The day, which is usually the fourth Thursday of November, is designated by a proclamation signed by the Governor or the President.

F. M. COLBY.

Thasos: island; in the Ægean Sea; 5 miles S. of the mainland; since 1462 belonging to Turkey. Area, 85 sq. miles. The island has gold mines not worked since antiquity; is the most fertile and least visited by foreigners of all the Greek islands; and in dress and customs its inhabitants have been the least affected by modern innovations. The painter Polygnotus was a Thasian. Ruins of ancient and mediæval monuments abound. Pop. 4,500, all Greeks, simple, unambitious, and prosperous, living in nine villages.

E. A. GROSVENOR.

Thatcher, HENRY KNOX: rear-admiral U. S. navy; b. at Thomaston, Me., May 26, 1806; entered the navy as a mid-

shipman Mar. 4, 1823, and in 1855 attained the rank of commodore. During the civil war he commanded the first division of Porter's fleet in both the Fort Fisher fights, and the West Gulf squadron during the bombardment of Fort Alexis and Spanish Fort in Apr., 1865, just prior to their being stormed and carried by the Union army, their surrender being immediately followed by that of Mobile. After the war he commanded the Gulf Squadron and the Pacific Squadron; was promoted rear-admiral in 1866, and retired in 1868. D. in Boston, Mass., Apr. 5, 1880.

Thaumatrope: See STROBOSCOPE.

Thaumaturgus, St. Gregory: See GREGORY THAUMATURGUS.

Thaxter, CELIA (Laighton): poet; b. at Portsmouth, N. H., June 29, 1836. She was a daughter of Thomas B. Laighton, an editor and politician who, disappointed in his political aspirations, became keeper of the White Island light, on the Isles of Shoals, and her writings, both prose and verse, were largely inspired by the sea. She was married in 1851 to Levi L. Thaxter, of Watertown, Mass. Among her books are *Among the Isles of Shoals* (1873); *Poems* (1874); *Drift-wood* (1878); *The Cruise of the Mystery and other Poems* (1886); and *An Island Garden* (1894). D. on the island of Appledore, Isles of Shoals, Aug. 26, 1894. H. A. B.

Thayer, ABBOTT HANDERSON: portrait, figure, and flower painter; b. in Boston, Mass., Aug. 12, 1849; pupil of Gérôme and Lehmann in Paris; third-class medal, Paris Exposition, 1889; Temple silver medal, Pennsylvania Academy, Philadelphia, 1891; member Society American Artists 1879. His portraits are notable for expression and character and his studies of roses for beautiful color. His most important work is *Virgin Enthroned*, owned by J. M. Sears, Boston. Studio in New York. W. A. C.

Thayer, ALEXANDER WHEELOCK: music critic, biographer, and historian; b. at South Natick, Mass., Oct. 22, 1817; graduated at Harvard in 1843, and at the law school 1848; in 1849 went to Europe and began collecting materials for a *Life of Beethoven*. He made frequent visits to Europe, and since 1863 has permanently resided there, being U. S. consul in Trieste during 1859-82. His great work is yet (1895) incomplete. Three volumes have been published, vol. i. (1770-92) in 1866, vol. ii. (1792-1806) in 1872, and vol. iii. (1807-16) in 1879. It was written in English and translated into German by Herman Deiters, of Bonn, and published in Berlin. It has not appeared in English. He has written many historical and critical musical articles for home and foreign periodicals. D. E. HERVEY.

Thayer, EUGENE: organist and composer; b. in Mendon, Mass., Dec. 11, 1838; settled in Boston, where he remained for nearly twenty years; educated under local teachers of music; in 1862 was one of the performers at the opening of the great organ in Music Hall, Boston; visited Europe in 1865 and 1866 for additional study; gave the first free organ recital in the U. S. in Boston, Apr. 10, 1869; in 1881 removed to New York to be organist of the Fifth Avenue Presbyterian church; received the degree Mus. Doc. from Oxford; composed much organ and vocal music, including a mass in E flat and a festival cantata. D. at Burlington, Vt., June 27, 1888. D. E. HERVEY.

Thayer, JOHN MILTON: lawyer, soldier, and governor; b. at Bellingham, Mass., Jan. 24, 1820; graduated at Brown University; studied law and came to the bar; went to Nebraska, where he became brigadier-general of militia and member of the Territorial Legislature; in Mar., 1863, at the beginning of the civil war, he became colonel of the First Nebraska regiment, which he commanded at Shiloh; was appointed brigadier-general of volunteers for services at Fort Donelson and Shiloh; Senator from Nebraska 1867-71; was Governor of Wyoming 1875-78, and of Nebraska 1887-91. He was the department commander of the Grand Army of the Republic in Nebraska in 1886.

Thayer, JOSEPH HENRY, D. D.: biblical scholar; b. in Boston, Mass., Nov. 7, 1828; graduated at Harvard in 1850, and at Andover Theological Seminary in 1857; preached for the Evangelical Congregational church in Quincy, Mass., one year; was settled over the Crombie Street church in Salem, Mass., Dec. 29, 1859; was chaplain of the Fortieth Massachusetts Volunteers nine months from Sept., 1862; relinquished his pastorate in Feb., 1864, to become Associate Professor of Sacred Literature in Andover Theological Seminary, which place he resigned in 1882, removing to Cambridge, where, in 1884, he was chosen Professor of New

Testament Criticism in the Divinity School. Besides occasional sermons, review articles, and contributions to the American edition of Smith's *Bible Dictionary*, he has published a translation of the 7th German ed. of Winer's *New Testament Grammar*, on the basis of Masson's English translation of the 6th ed. (1869), and a translation of Alex. Buttman's *New Testament Grammar* (1873). He has also published *A Greek-English Lexicon of the New Testament* (1886), a monument of great labor and erudition. He edited an edition of Sophocles's *Greek Lexicon* (1888).

Revised by G. P. FISHER.

Thayer, SYLVANUS, LL. D.: soldier; b. at Braintree, Mass., June 9, 1785; graduated at Dartmouth College 1807, and at the U. S. Military Academy 1808, and was promoted to a second lieutenantcy of engineers. After service in the defenses of the eastern coast and of New York harbor, he was called to the field in 1812, and was chief engineer on the Niagara frontier; of the right division of the Northern army on the Lake Champlain line of operations in 1813; and in the defense of Norfolk, Va., in 1814, receiving the brevet of major Feb. 20, 1815. In 1815 he was sent to Europe to examine military works and schools and to witness the operations of the allied armies before Paris. From 1819 to 1833 he was superintendent of the Military Academy, during which time that institution was organized upon its present basis, and became one of the most thorough and successful of the military educational institutions of the world. (See MILITARY ACADEMIES.) On being relieved from the superintendency July 1, 1833, he was charged with the construction of the fortifications of Boston harbor, upon which, in union with his duties as president of the board of engineers for permanent fortifications he was engaged during the remainder of his term of active service. During a period embracing parts of 1857 and 1858 he was in command of the Corps of Engineers, exercising the functions of chief engineer of the U. S.; declined to transfer his headquarters to Washington, and on his own application was placed on leave of absence; was retired with the rank of colonel July 1, 1863. He gave \$70,000 to found the Thayer School of Civil Engineering at Dartmouth College, \$10,000 for a public library in Braintree, and bequeathed about \$300,000 in trust for an academy in Braintree. He published *Papers on Practical Engineering* (1844). D. at South Braintree, Sept. 7, 1872. His body was reinterred in 1877 at West Point, where a statue was raised in his honor.

Theanthropic Religion: See RELIGION, COMPARATIVE.

Theater [viâ O. Fr. from Lat. *theatrum* = Gr. *θέατρον*, place for seeing shows, theater, deriv. of *θεᾶσθαι*, view, behold, deriv. of *θεά*, view, sight]: specifically, any structure erected for dramatic or operatic performances, the present form being a modification of the model first established by the Greeks more than 500 years before the Christian era.

The Greek Theater.—In the very earliest days the Athenian dramas were performed upon temporary wooden scaffoldings, prototypes of the booths of mediæval times, which were put up for the festivals of Dionysus and then taken down and laid aside for future use. It was upon such a scaffolding that the first acted drama of Æschylus was produced, and the collapse of the structure during the performance, an accident regarded as an evil omen, suggested the construction of a more durable edifice.

The first stone theater was begun soon afterward on the southeastern slope of the Acropolis, and it is a noteworthy fact that the plans were drawn with such skill and foresight, such exact appreciation of acoustic and spectacular requirements, that none of the architects of succeeding generations was able to suggest any important improvement upon them. In all the ruins of theaters extant in Greece, Asia Minor, and Sicily, the same general arrangement and proportions are observable. Here it may be noted that all Greek theaters were built either upon eminences or on the side of a hill, and that in every case the spectators occupied the upper or northwestern and the stage the lower or southeastern part of the structure. As the performances occurred at comparatively long intervals, and were originally in the nature of religious festivals, it was necessary to provide accommodation for great crowds, and it is probable that some of the largest theaters were capable of holding as many as 70,000 or 80,000 people. The acoustic qualities of the auditorium were thus the last to receive attention, and the actors, to reach the ears of so vast a multitude, were compelled to adopt a slow method of elocution, and to use mechanical devices in their masks in order to increase the volume of the voice.

Originally, the most important part of the Greek theater was the orchestra (*ὄρχηστρα*), the central space devoted to the movements of the chorus, out of which the drama ultimately grew. This space was exactly circular, except that a narrow segment of it was occupied by the stage. It was a little lower than the lowest row of seats or benches surrounding it, and was boarded over. In the center of it, equidistant from the rear of the stage and from all other points of its circumference, stood the altar of Dionysus (*θυμέλι*), which was square, made of wood, and elevated on a platform approached by steps. It was used for various purposes in different plays, sometimes as an altar, sometimes as a monument, etc. Occasionally it was occupied by the flute-player, or the leader of the chorus, which generally was grouped between it and the stage. Around the orchestra the seats were ranged in rows forming three-fourths of the circumferences of a series of concentric circles arranged like stairs. When the theater was on the side of a hill these seats were hewn out of the rock. In other cases they were supported by elaborate sub-structures. The ascending series of these concentric circles was interrupted by one or more broad level spaces, or circular aisles (called by the Greeks *διαζώματα*, or *κατατομαί*, and by the Romans *prœincelliones*), in which spectators were allowed to stand if there were no seats for them elsewhere. The benches themselves were intersected at frequent and regular intervals by flights of steps running from one aisle to another, but not in unbroken straight lines, by which the spectators could ascend or descend at will. These steps divided the benches into blocks or wedges, known in Greece as *κερκίδες* and in Rome as *cunei*. The approaches to the seats were mainly through underground passages to the lower benches, but in some cases there were galleries and stairways communicating with the upper rows. All the space devoted to the spectators, the *theatrum* proper, was often denominated the *κοῖλον*, or in Latin the *cavea*, or pit, in allusion to its being an excavation. Behind and above the highest row of seats there was a covered portico which is supposed to have had some relation to the acoustics of the structure, but with this exception the audience was unprotected by any sort of roof, although at a later period awnings were introduced.

The Stage.—The stage, as has been mentioned, occupied a small segment of the orchestra circle, and in height was level probably with the top of the altar. At each end it was connected with the orchestra by a flight of steps by which the chorus ascended when required to take part in the action of the play. The back of the stage was inclosed by a wall called the *scenæ* (*σκηνή*, *scenæ*), having two extensions, or wings, entitled side-scenes (*παρασκήνιον*, *parascenæ*). The stage itself was called the *προσκήνιον* (*proscenium*), and the front part of it nearest the orchestra, where the actors generally took their places, was known as the *λογεῖον* (*logium*), and in the Roman theater the *pulpitum*. The *scenæ* represented a suitable background for the play, and, before the performance, was covered by a curtain (*παρπέτασμα*, *ἀνάκλα*, *aulæum* and *siparium*), which was let down, not rolled up as with us. As to the description and quantity of the scenery employed, the information is rather meager, but it is known that there were different scenes for different plays, and that they were susceptible of change or modification. In the great tragedies the scene consisted of the front of a palace, with a door in the center, and two projecting wings, also with doors. The center door was known as the royal entrance, and was used by the *πρωταγωνιστής* or leading man. The wings were often supposed to represent the abodes of guests or strangers. Frequently the palace possessed an upper story, from which actors described what was supposed to be going on at a distance. There is little doubt that elaborate scenery was in use before the days of Sophocles, and it certainly was needed in the plays of Euripides. Woods and hills were represented in the satiric drama, and private dwellings and the houses of slaves in comedies. There was also a certain amount of machinery, including one device for bringing a god down from the sky or up from the infernal regions.

Actors and Audience.—There is some dispute among the authorities as to whether or not women were admitted to the theater in the earlier days of the drama, but the probability is that they were permitted to witness tragedies but not comedies. Later on all restrictions as to sex were removed, although the coarseness of the dialogue in comic plays became worse and worse as the drama degenerated. This, perhaps, was one reason why all female characters were taken by youths. Another, possibly, was the fact that

a bad actor was occasionally subject to the penalty of corporal punishment. In the modern sense of the word, the old Greek stage-performers were not actors at all. To add to their stature they wore high-heeled boots (*colthurnus*); they were padded so extravagantly that free movement was not to be thought of; their faces were hidden behind masks of various material, and they chanted their lines through some sort of metal contrivance which had an effect akin to that of a speaking-trumpet. The performances, which always included a series of plays, often lasted from sunrise until sunset. The places of honor were in the lowest rows of benches, where the magistrates and military and social magnates and illustrious strangers sat. Above them were the senators, then the *ephebi*, then the general public. The best seats cost the highest price, the average rate of admission being about 2 obols, or 6 cents. Pericles passed a law which conferred the right of free admission upon the poor. The expenses of the representations were defrayed by wealthy citizens and by state subvention.

The Roman Theater.—From the ruins of some of the most ancient Roman theaters, like those at Tusculum and Fesulan, which were excavated out of the sides of hills, it is quite plain that the Romans borrowed their theatrical ideas in the first place from the Greeks, but it was a long time before a stone theater was erected in Rome itself, owing to a notion that anything so elaborate and costly was not in accord with the simplicity of the republic. Dramatic representations were popular at an early period, but the theaters used were wooden structures put up for temporary use, and then taken down. It was in buildings of this kind that the comedies of Plautus and Terence received their first interpretations. During the later days of the republic wooden theaters of vast size and elaborate ornamentation were built in Rome, but Pompey was the first man who dared to depart from precedent and construct a magnificent stone theater near the Campus Martius. The plan of this as of all other important Roman theaters differed from the Greek model, chiefly in the fact that the rows of benches around the orchestra formed only a semicircle, and that the orchestra itself was a semicircle, of which the diameter was the front of the stage. In the Roman orchestra there was no altar, and no provision for any chorus, the orchestral space being set aside for distinguished persons. The fourteen lowest rows of benches were appropriated to the Equites. Pompey's theater was a copy of that at Mytilene, and had a capacity of 40,000. The Romans erected more theaters upon level ground than the Greeks did, their use of the arch and of concrete cheapening the cost of sub-structure. It may be noted that although there was no religious idea in the Roman theater, Pompey, to escape a charge of impiety, put a statue of Venus Victrix at the top of the *cavea*. The best-known remains of ancient theaters are at Rome, Nîmes, Ephesus, Miletus, Cnidus, Tauromenium, and Syracuse.

The Modern Theater.—The exact process of the evolution of the modern theater from the early structures erected in England and on the Continent in the sixteenth and seventeenth centuries can not now be traced, but the whole history of the stage, as we know it, dates from the days of the old miracle-plays or mysteries, which were performed by itinerant performers in churches, in temporary booths, or in the court-yards of inns. In the last-mentioned case the stage was erected in the center of the yard, with its back toward the door, which afforded means of ingress and egress to the actors. The galleries of the inn served as boxes for the more distinguished spectators, while the common folk stood on the ground. Sometimes the stage was roofed, in which case the ends of it were appropriated to the use of such fashionable folk as might be present. This arrangement suggested the models of the earliest London theaters, which were practically inclosed yards, octagonal or nearly circular in shape and roofless, except over the stage, which continued to give shelter to the fashionable theater-goers until Voltaire in France set the example of driving them into the boxes. At the rear of the stage was a raised platform, surmounted by a balcony, from which a movable curtain depended. This corresponded to the door in the inn-yard, and no other provision for scenery or decoration appears to have been made. The green-room, or "tiring-house," was on one side of the stage, and the roof of it was often surrendered to the audience. The first playhouse in London was the theater erected by James Burbage in 1576-77, and the next the Curtain theater, in Shoreditch (so named from a plot of ground called the Curten). Burbage built the Globe, of Shakspearean fame, in 1598, and in the same decade Henslowe opened

the Rose and the Swan. Among other contemporary houses were the Blackfriars, the Red Bull, the Hope, the Whitefriars, and the more famous Fortune of Edward Alleyn, which lasted from 1600 to 1819.

Meanwhile (about 1550) Palladio had begun building theaters in Italy, modeled largely upon the old classic rules, in which the stage was provided with a solid structure, with doors and balconies made to do duty for all kinds of scenery. This example, a little later, was followed in France in the Palais Royal, founded by Richelieu in 1639, where the tragedies of Corneille were first performed. The invention of movable scenery, by Bibbiena, and of the drop-curtain, is ascribed to the latter half of the century. Thereafter the development of theatrical architecture and literature proceeded apace, and a gradual combination of the mediæval and classical ideas resulted in the prototype of the luxurious theater of the present era, with its boxes (intended originally for the persons who otherwise would have sat upon the stage), its orchestral stalls, which gradually have usurped the place of the old pit (the floor of the inn-yard), and its rows of semicircular galleries, which represent the benches of the ancient Greeks.

The Modern Stage.—The theater, properly so called, has changed but little in essentials (except the addition of a roof) since the Greeks devised it 2,000 years and more ago, but as it now is the stage is a modern creation. The word stage is generally applied only to that part of it visible to the spectators through the proscenium arch, and inclosed by the scenery. The spaces on either side are known technically as the wings, and these originally contained all the scenery (flats), which was pushed forward as required, running in grooves. Nowadays there is a space above the stage as high again as the proscenium arch, which is known as the flies, while below the stage there is an excavation of almost equal capacity, which is called the dock. This latter is divided into several floors, in which there is storage-room for scenery and much complicated machinery for raising and lowering it at will, through trenches cut in the stage, and also for working the traps through which demons, harlequins, etc., appear and disappear. Scenery therefore can be manipulated in three ways, from above, below, or the sides, while set pieces (such as castles, cottages, reversible exteriors, etc.) are constructed upon collapsible frames, which can be moved upon wheels in any direction and packed away with wonderful celerity. The double stage (of which the first example was constructed in the Madison Square theater of New York) was an invention of Steele Mackaye, and is extremely useful when a succession of elaborate interiors is to be presented, but it occupies much space, and has other disadvantages which have prevented its general adoption.

Scenery, Lighting, etc.—The recent advance in the art of stage illusion has been very great. In the mere painting it would be difficult to improve much upon the work of such artists as Watteau and Boucher in France, Raphael in Italy, and Clarkson Stanfield, Beverley, and Telbin in England, but the new mechanism accomplishes marvels. Thunder is counterfeited by iron balls or sheets of tin. The introduction of electricity has made real lightning possible in storms, and the noise of rain and wind is simulated wonderfully by the use of a cogged cylinder revolving against tightly stretched cloth. Formerly lightning was simulated by flashes of lycopodium, and the noise of rain by panned peas in a metal cylinder. Wagner, at Bayreuth, first used steam for the production of magical and other effects, and water is most faithfully represented by huge mirrors in which sylvan scenery is reflected. Until 1720 dip-candles were used for footlights. Then the French substituted moulded candles, which in time were replaced by lamps with Argand burners. Gas followed in 1822 and now yields to electricity.

Stage Directions.—For purposes of directions to actors, scene-shifters, etc., the stage is divided into five lateral strips, which, beginning from the left-hand side as the spectator faces it, are denominated the "prompt-side" (from the position of the prompter, who no longer occupies a box in the very center of the footlights, except in opera and in Continental theaters), "prompt-center," "center," "opposite prompt-center," "opposite prompt-side." These titles are abbreviated into "P.-S.," "P.-C.," "C.," "O. P.-C.," and "O. P.-S." The various entrances for actors in the wings, counting from the front of the stage, are called the first, second, and third entrances, left or right, as the case may be. Doors in the rear of the stage are described as center and left or right center (back), according to position. The position of the dressing-rooms for the performers depends large-

ly upon the amount of space available. In the older theaters these chambers were often little better than underground cells, stowed away in all sorts of dark and unwholesome recesses, but in the best modern houses the quarters of the actors are well lighted, well ventilated, and moderately comfortable. Special conveniences, of course, are provided for "star" performers.

The danger from fire in a well-equipped modern theater is inconsiderable. It is possible, indeed, to build and furnish a theater wholly with incombustible materials, and to exclude all fire from the structure. The dynamos for lighting, and the furnaces for heating and supplying power, can be placed in a separate building. All scenery, ropes, draperies, and woodwork (of which little is needed in these days of light steel manufactures) can be rendered fire-proof by the aid of various cheap chemicals. The use of gas, once a source of continual danger, is on the point of being discontinued altogether. The largest theaters in Europe are La Scala in Milan and the San Carlo in Naples, each of which can hold nearly 5,000 persons. The opera-house in Vienna and the Grand Opéra in Paris are perhaps the most notable houses architecturally. The first theater in the U. S. was opened in Williamsburg, Va., in 1752, the second in Nassau Street, New York, in 1753.

LITERATURE.—An immense body of literature is at the disposal of students of the ancient and modern theater. Some of the best authorities on the early English stage are Wilkinson's *Londina illustrata* (1819); Collier's *History of Dramatic Poetry* (1879); Halliwell-Phillips's *Life of Shakespeare* (1883); Malone's *History of the Stage* (1790; republished by Boswell in 1821); the publications of the New Shakespeare Society, and a series of articles on early London theaters by F. F. Ordish in *The Antiquary*, vols. xi., xii., xiv. (1885-86). Other writers on the general topic are Coleridge, Hazlitt, Leigh Hunt, Charles Lamb, Edward Dowden, Dr. Doran, and Walter Thornbury. Of the continental authorities may be mentioned Donnet's *Théâtres de Paris* (1821); Salomon's *Construction des Théâtres* (Paris, 1871); Coutant's *Principaux Théâtres Modernes* (Paris, 1870); Moynet's *L'Envers du Théâtre* (Paris, 1874); Pouglin's *Dictionnaire du Théâtre* (Paris, 1885). The student of the ancient theater may consult Dr. Smith's *Dictionary of the Antiquities*, Prof. Becker's *Charicles*, and the works of Schlegel, Böttiger, Böckh, Schneider, Geppert, and others in the long list of German commentators.

J. RANKEN TOWSE.

Theaters, Law of: Unlicensed or improperly conducted playhouses are nuisances. In Great Britain the license is granted by letters-patent from the crown, or by the lord chamberlain (to whom all new plays must be submitted also), or by justices of the peace, or by the county council. In the U. S. the authority to license, regulate, and tax theaters is commonly delegated to the municipalities. The English courts seem disposed to give to the term "theatrical entertainments" a broader meaning than is attached to it by U. S. decisions. (Cf. *Shelley vs. Bethell*, 12 Q. B. D., and *Queen vs. Tucker*, 2 Q. B. D. 417, with *Harris vs. Com.*, 81 Va. 240, and *Re Theatrical Licenses*, 3 Pa. Dist. R. 191, A. D. 1894.) The proprietor of a theater is not engaged in a business "affected with a public interest." He may therefore fix his own prices, and he may refuse admission to whomsoever he pleases, unless a statute imposes the duty of providing like accommodation for all persons without regard to race or color. (*People vs. King*, 110 N. Y. 418.) If he sell tickets for an entertainment he must provide seats for the purchasers or refund the money. The purchaser, however, has no right to take a seat not called for by his ticket, and if he does he may be lawfully ejected. Moreover, as a ticket is at most a personal license to enter the theater, it may be revoked at any time, whereupon the holder is bound to leave the house, although he is entitled to damages for breach of the contract for admission. (*Purcell vs. Daly*, 19 Abb. N. Cas. (N. Y.) 301.) Auditors have the right to express their honest likes or dislikes of the play or the players or the management, by applause, by hisses, or by other demonstrations which do not tend to excite terror or to break the peace. If two or more, however, go to the theater with the preconceived design to howl down an actor or to damn a play, their demonstrations in carrying out such designs are unlawful, and their conduct amounts to actionable conspiracy. (*Gregory vs. Brunswick*, 1 C. and K. 24.) See Hamlyn, *Manual of Theatrical Law* (London, 1891); Wandell, *Law of the Theatre* (Albany, 1891).

FRANCIS M. BURDICK.

Theatines [named from the Bishop of Theate, afterward Pope Paul IV.]: a Roman Catholic order of regular clerks and nuns, founded in 1524 by the Bishop of Theate and several of his friends. They spread into various countries, opposed Protestantism, and labored for the reform of the clergy and the extension of the Oriental missions. They are now found chiefly in Italy. Revised by J. J. KEANE.

Thebais, or the **Thebaid** [Gr. *Θηβαίς*, the region of Thebes]: the district of Upper Egypt, extending from Sint (Asyut, Lycopolis, about 27° 20' N. lat.) to Syene at the first Nile cataract (24° N. lat.), which with the *HEPTANOMIS* (*q. v.*) constituted the "land of Upper Egypt" in the ancient texts. It probably was equivalent to the Hebrew Pathros, and it was originally of like extent with the Coptic and Arabic grand division of Upper Egypt. The Romans subdivided the Delta region into four parts, created the Heptanomis, and at one time divided the Thebais into two portions.

CHARLES R. GILLET.

Thebes, theebz [Gr. *Θῆβαι*, and later *Διδόπολις*; Lat. *Thebæ*, *Diospolis Magna*; Egypt. *Pt-Amon*, dwelling of Amon-Zeus, *Uast*, *Nu-Amon*, *Nu*, city of Amon, or city *par excellence*; Heb. *No-Amon*]: a city of Egypt on both sides of the Nile (at about 25° 50' N. lat.). After the desertion of Memphis by the princes of the seventh to the tenth Egyptian dynasties, due possibly to a foreign invasion similar to that of the Hyksos at a later period, Thebes became the capital of Egypt, and so continued during the middle and new kingdoms. (See EGYPT, ANCIENT.) The city proper was on the east side of the Nile, and is now represented by the ruins of several temples, those of KARNAK (*q. v.*) and LUXOR (*q. v.*) being the chief. The west side of the river was occupied by the Theban necropolis and various temples, most of which were memnonia dedicated to the manes of their founders. The temples, beginning toward the N., were those of GURNAH (*q. v.*), Dér el-Bahri, built by Hatsu, the Ramesseum (built by Ramses II.), Dér el-Medîneh (founded by Ptolemy IV, and continued down to the time of Augustus, dedicated to Hathor), and MEDINET HABU (*q. v.*). There was also formerly a temple of Amenhotep III. (the MEMNON (*q. v.*) of the Greeks) adjacent to the Colossi of Memnon, but it has almost entirely disappeared. Another temple, built by Thothmes III., just N. of the Ramesseum has also disappeared. The cemeteries in the same region are those of Drah Abul' Neggah (eleventh and twelfth dynasties), just W. of Gurnah, Asasif and Abd el-Gurnah, respectively E. and S. of Dér el-Bahri, and Gurnai Murraï, N. of Medinet Habu. Besides these there were also the Tombs of the Kings, in a valley W. of Dér el-Bahri, and the Tombs of the Queens, W. of Medinet Habu. It was in the hills W. of Dér el-Bahri that the mummies of the Pharaohs of the seventeenth to the twentieth dynasties were discovered in 1881. See HER-BOR.

The hills bordering on the strip of land fertilized by the Nile at Thebes recede farther from the river than elsewhere, but they are more distant on the E. than on the W. The Libyan hills are honeycombed with tombs. The residence portion of Thebes was to the E. of the temple of Karnak, though it is estimated that about a quarter of the total population, consisting of priests and artisans whose employments were of a funerary character, dwelt in the necropolis on the W.

The foundation of the city goes back probably to the Old Kingdom, though at that time it was of insignificant size. Its prominence dates from the eleventh and twelfth dynasties, when more extensive building operations were begun. During the Hyksos period it was the seat of native princes tributary to the invaders, and it so continued till the seventeenth dynasty, when a revolt occurred, occasioned by religious demands made upon Seqen-Ra, King of Thebes, by Apepi the Hyksos ruler. War was waged during several reigns, till at last the Egyptian armies were victorious. Thebes became the national capital again and Amon-Ra, the tutelary deity of Thebes, became the supreme god in the Egyptian pantheon. The kings of the eighteenth and nineteenth dynasties, especially THOTHMES III. and RAMSES II. (*qq. v.*), were exceedingly active in building at Thebes, and the history of the city is largely a history of these dynasties. During the reign of Amenophis IV., the "heretic king" (see KHUENATEN), the capital was temporarily removed to TELL EL-AMARNA (*q. v.*), but the power of the priests of Amon was too great for the innovator, and the old *régime* was speedily restored. After the close of the twentieth dynasty the seat of government was removed to the Delta and

Thebes gradually lost its power, though it was twice the source of insurrections, which were subdued only by the aid of the Romans. (See PROLEMY.) Its final destruction as a political power occurred in 85 B. C.

The sanctity of Thebes, the "On of the South" as contrasted with On-Heliopolis at the apex of the Delta, arose from the fact that it was reputed to have been the birth-place of Osiris, but it was inferior to Abydos (see MEMNONIUM), the burial-place of Osiris, and Heliopolis, the city of the Sun, in the religious estimation of the people. Its wealth and power were due to the spoils of war taken thither by the warlike Pharaohs of the eighteenth and nineteenth dynasties. The epithet "hundred-gated" applied by the Greeks to Thebes had reference to the multitude of pylons which marked the entrances to its numerous temples. The origin of the Greek name is uncertain, though several conjectures have been ventured.

CHARLES R. GILLET.

Thebes: the capital city of Bœotia; founded by Cadmus in a fertile, well-watered, and undulating plain. The city was very prominent in mythical times, for many of the most important and most extensive myths were located there. (See CADMUS, HARMONIA, SEMELE, ISO, AMPHITRYON, ALCMENE, AMPHION, NIOBE, and EDIPUS.) Its walls and their seven gates were built by Amphion, and were taken but twice, once in mythical times by the EPIGONI (*q. v.*) of the Seven and then by Alexander the Great. In historical times Thebes was the leading city of Bœotia and was usually hostile to Athens, but she never fought with success or rose to first-rate importance until after the battle of Leuctra, when she assumed the hegemony of Greece, though she maintained it only during the lifetime of Epaminondas. She was unfortunate in her wars with Philip of Macedonia, who placed a garrison within her citadel. On the death of Philip she expelled this garrison, but was punished severely therefor by Alexander, who razed the city, sparing only the temples and the house of Pindar, and sold the inhabitants into slavery, with the exception of the descendants of Pindar and those who had opposed the rebellion. PHRYNE (*q. v.*) offered to rebuild the walls of Thebes, but her offer was declined. The city was rebuilt by Cassander with the help of the Athenians, but it did not prosper. The modern town has about 5,000 inhabitants. It was virtually destroyed by an earthquake in 1893. An excellent topographical account of Thebes is by Fabricius, *Theben*, etc. (Freiburg, Baden, 1890). J. R. S. STERRETT.

The Brill: See BRIEL.

Thecla, SAINT: according to the famous story, a virgin of Antioch, enthusiastically attached to the apostle Paul, by whom she was converted to Christianity and strict celibacy. She maintained her faith in Christ amid persecutions, public and private, and was miraculously delivered from assaults upon her virtue. *The Acts of Paul and Thecla* is a widely circulated Christian romance of the second or third century, designed to exalt celibacy and to emphasize the comfort the doctrine of the resurrection gave. It is probable, however, that the tale has an historical basis. See the chapter upon it in W. M. Ramsay's *The Church in the Roman Empire* (London and New York, 1893). S. M. J.

Thecosomata [Mod. Lat., from Gr. *θήκη*, case + *σώμα*, *σώματος*, body]: a subdivision of the pteropod *Mollusca* (see PTEROPODA) in which a shell is present.

Theft: See LARCENY.

Thegn: See THANE.

The'ine: the alkaloid of tea and coffee; its formula is $C_8H_{10}N_4O_2 \cdot H_2O$. See CAFFEINE and TEA, PHYSIOLOGICAL EFFECTS OF.

Theiner, tî'ner, ARGUSTIN: historian, critic, and polemical writer; b. at Breslau, Prussian Silesia, Apr. 11, 1804; studied theology, philosophy, and jurisprudence at the university of his native city; obtained the degree of *doctor juris* at the University of Halle for his *Commentatio de Romanorum Pontificum Epistolatum Decretalium Collectionibus antiquis* (1829); traveled with the support of the Prussian Government to Vienna, Paris, and London; settled in 1831 in Rome, and was in 1851 appointed keeper of the secret archives of the Vatican, from which office he was removed in Aug., 1870, accused by the Jesuits of having during the Council of the Vatican furnished the bishops of the opposition with the documents necessary to combat the dogma of infallibility. D. at Civitâ Vecchia, Italy, Aug. 10, 1874. He originally held liberal views of the relation between the papal see and the Roman Catholic Church; he assisted his brother, Johann Anton, in the publication of *Die Einführung der*

erzwingenen Ehelosigkeit bei den christlichen Geistlichen und ihre Folgen (2 vols., Altenburg, 1828; n. e. Barmen, 1893), a book which was first upon the index; but during his residence in Rome he attached himself more and more closely to the Ultramontane party, and developed an astonishing literary activity in its service. Besides a number of minor essays and pamphlets, he wrote *Geschichte der geistlichen Bildungsanstalten* (Mentz, 1835); *Disquisitiones in præcipuis Canonum et Decretalium Collectiones* (Rome, 1836); *Versuche und Bemühungen des Heiligen Stuhls in den letzten drei Jahrhunderten, die durch Ketzerei und Schisma von ihm getrennten Völker des Nordens wiederum mit der Kirche zu vereinen; nach geheimen Staatspapieren* (Augsburg, 1837); *Die neuesten Zustände der katholischen Kirche brüder Ritus in Polen und Russland seit Katharina II.* (1841); *Geschichte der Zurückkehr der regierenden Häuser zu Braunschweig und Sachsen in den Schoss der katholischen Kirche* (Einsiedeln, 1843); *Die Staatskirche Russlands im Jahre 1839* (1844); *Le cinque Piaghe della S. Chiesa* (1849); *Zustände der katholischen Kirche in Schlesien von 1740-58* (2 vols., Regensburg, 1852); *Geschichte des Pontificats Clemens XIV.* (2 vols., Paris, 1852); *La Souveraineté temporelle du Saint-Siège* (1861), etc. His principal works are his new edition and continuation of Baronius's *Annales Ecclesiastici*, and his publications of documents relating to the history of the Church among various nations—*Documents inédits relatifs aux affaires religieuses de la France 1750-1800* (2 vols., 1858); *Vetera Monumenta Hungariorum sacra illustrantia* (2 vols., 1859); *Monuments historiques relatifs aux règnes d'Alexis Michailowitch, Théodore III. et Pierre le Grand de Russie* (1859); *Vetera Monumenta Poloniae Gentiumque Finimarum Historiam illustrantia* (4 vols., 1860-64); *Codex diplomaticus Domini temporis Sanctæ Sedis* (3 vols., 1862); *Vetera Monumenta Slavorum meridionalium Historiam illustrantia* (1863); *Vetera Monumenta Hibernorum et Scotorum Historiam illustrantia* (1861); and *Acta genuina ss. œcumenici concilii Tridentini* (2 vols., 1874).—His elder brother, JOHANN ANTON THEINER, b. at Breslau, Dec. 15, 1799, became Professor of Scriptural Exegesis in 1824 in Breslau; became a pastor in 1830; resigned his office in 1845, and joined the German Catholics; lived as a private teacher in Breslau, and was appointed secretary of the library of the university in 1855. He wrote, besides the above-mentioned work on celibacy, *Die reformatorischen Bestrebungen in der katholischen Kirche* (Altenburg, 1845); *Das Seligkeitsdogma der römisch-katholischen Kirche* (Breslau, 1847); *Enthüllungen über Lehren und Leben der katholischen Geistlichkeit* (Leipzig, 1862). D. at Breslau, May 15, 1860. Revised by S. M. JACKSON.

The'ism [from Gr. *Θεός*, God]: in the widest acceptance of the term, the doctrine of a Divine Being. As such it may be deistic or pantheistic or polytheistic, while atheism and agnosticism are its opposing terms. More narrowly considered, theism is synonymous with monotheism, and in this sense it may be deistic or pantheistic. Lord Shaftesbury used indifferently the terms theism and deism. John Fiske in his *Outlines of Cosmic Philosophy* and elsewhere develops a "Cosmic Theism" which is essentially pantheistic. He is not singular in this, and a pantheistic theism may be said to be the general result of modern scientific and philosophic thought. In later usage theism has been, as with Frances Power Cobbe, a term indicating a belief in God not derived from supernatural revelation and not specifically Christian. While the derivative force of the words theist and deist is precisely the same, the only difference being that in one case we have a Greek and in the other a Latin root, they have been used very generally for some time past as differentiating terms. Deism has designated the historical movement in theology which is described in the article DEISTS. From that movement the theism of the nineteenth century has differed, as less mechanical and more spiritual. The god of deism was a god outside the world, a mechanical creator, apart from the world, and leaving it to go alone, or governing it by natural laws. The god of theism has been a principle of life and order, never ceasing from his operations, his laws not delegated forces, but the constant habits of his activity. On the physical side theism has allied itself naturally with the doctrine of evolution. During the transcendental period in the U. S. deism was condemned as resting on the argument from design, while theism was glorified as the doctrine of conscience and direct intuition. There has been much confusion, however, in the use of these terms, Kant using them in a manner directly opposite to that of

the New England transcendentalists. By deism he indicated the exclusive belief in a transcendental theology; by theism the belief in natural theology as a possible, if not the only, way to God. Prof. Robert Flint's *Theism* is a classic treatment of the matter, and another is Martineau's *Study of Religion*. See NATURAL THEOLOGY. JOHN W. CHADWICK.

Theiss, tis: a river of Hungary; formed by the junction of the Black and White Theiss, both of which rise in the Carpathian Mountains; flows with a winding southern course to the Danube, which it joins 22 miles E. of Peterwardein. Its entire length is 828 miles, for the greatest part of which it is navigable even for large vessels. After entering the Hungarian plain its breadth is from 400 to 800 feet, its shores are low and marshy, and its current is sluggish. It is rich in fish, especially sturgeon.

Revised by M. W. HARRINGTON.

The'mis [= Lat. = Gr. *Θέμις*, personification of *θέμις*, custom, divine sanction, law, right, deriv. of *τιθέναι*, *θεΐναι*, put, set]; a daughter of Uranus and Ga-a, and the second wife of Zeus, by whom she became the mother of the Horæ and the Mœræ. She is the personification of law and order as established by custom and equity. She presides over the assemblies of men, and sees to it that their deliberations make for order and justice. She is also a goddess of prophecy, and declares to mankind the decrees of Zeus. She presided over the oracle at Delphi before Apollo became the mouthpiece of Zeus at that place. She was worshiped at many places in Greece. As represented in art her features resemble those of Athene, but she carries a cornucopia and a pair of scales, to typify the blessings that result from law and order.

J. R. S. STERRETT.

Themis'tins (in Gr. *Θεμιστίας*) of Paphlagonia: Greek philosopher and orator; flourished in the second half of the fourth century A. D. As a teacher of philosophy and oratory he had a long and successful career at the Byzantine court, being especially honored by the Emperor Theodosius. Though he shows great tolerance in religious matters, his spirit and his style are steeped in the thought and language of the great pagan authors. His extant works consist of orations, edited by W. Dindorf, 1832, and paraphrases of Aristotle, which maintained their popularity through the Middle Ages, edited by L. Spengel (1866). B. L. G.

Themistocles, the-mis'tō-klēz (Gr. *Θεμιστοκλῆς*): general and statesman; b. at Athens about 514 B. C.; the son of Neocles and a Carian or Thracian woman; became the political leader of Athens after the expulsion of Aristides by ostracism in 483. He was impetuous and shrewd; sagacious in his judgment of actual circumstances and their probable consequences; swift in arriving at a resolution; inexhaustible in devices for the realization of his plans; possessed of a most impressive eloquence; energetic, cunning, and unscrupulous. His actions show a blending of rank ambition and lofty statesmanship; of egotism sometimes even sordid, and an elevation of mind truly noble, which becomes the more inexplicable the better known his ways and means become. Nevertheless, in a most decisive crisis he was the saviour of Athens and of Greece. After the battle of Marathon (490) people generally believed that the Persian war was ended. Themistocles, however, felt that a still heavier storm was coming, and he understood that a strong fleet would be the most effective means of victory, and the only safe means of rescue in case of defeat. Thus the development of the Athenian navy became the goal of his policy. He induced his countrymen to spend the income of the silver mines of Laurium, which had hitherto been distributed among the citizens, in the organization of a powerful fleet. He secured the passage of a law that twenty triremes should be built every year. When the armament of Xerxes was heard of, and Greece became alarmed, he procured an oracle from Delphi saying that Athens should defend herself by wooden walls—that is, by her fleet; and when, finally, the pass of Thermopylæ was forced, when the battle off Artemisium, in which he consented to fight under the Spartan commander, though the number of the Athenian ships was the greatest, had proved ineffective, and the Persian hosts streamed down over Bœotia and Attica, he persuaded the Athenians to leave their city to the protection of its tutelary deities, to bring their women and children in safety to the island of Salamis, and to go on board the fleet. In the Bay of Salamis the entire Greek fleet lay assembled; but various opinions prevailed in the council—whether to give battle here or at the isthmus, whether to give battle at all, or to

separate, etc. It was Themistocles who held the fleet together by declaring that if the Greeks now separated the Athenians would leave Greece for ever, take their women and children, and set sail for Italy—a plan as sound as grand, and one which he no doubt was able to carry out. It was also he who finally compelled the Greeks to give battle by entering into negotiations with the Persian commander and hastening the approach of the Persian fleet. The Greeks were surrounded without knowing it, escape was impossible; fight had become a necessity. During the night Themistocles rowed from the Athenian division of the fleet to the Spartan, from the Spartan to the Corinthian, etc., busy to the last. In Salamis the women and children of Athens watched in prayer; on the opposite coast of the mainland carpenters were raising a throne from which Xerxes would look at the battle. In the morning (Sept. 20, 480) the Persian fleet stood up the narrow sound; the battle began, and it terminated in a most glorious victory for the Greeks. Themistocles was now the first man, not only in Athens but in Greece; when visiting Sparta, he was presented with the best chariot the nation possessed, and accompanied to the borders of Tegea by a guard of 300 horse-men—honors unheard of hitherto. To his native city he did one more great service. When, after the battle of Salamis, the Athenians began to rebuild their city, Sparta, through jealousy, dissuaded them from rebuilding the fortifications, and even threatened them with an armed interference. Themistocles hastened to Sparta, bribed the ephori, deluded the assembly of the elders by lies and dissimulations, deceived the whole community, and kept the question floating and undecided until it became superfluous, the walls not only of Athens, but also of Piræus, having reached a sufficient height to be defended with effect. Then he returned home, loaded with the hatred of all Spartans. Soon after this event he disappeared from public life. The last part of his history, that which follows the rebuilding of Athens, is as obscure and confused as the first, that which precedes the expulsion of Aristides. He was accused of treasonable connections with the Persians, but acquitted; then ostracised in 471, exiled to Argos, and again accused of treason by the Spartans; an order to arrest him was issued, and he fled from Argos to Coreyra, Thrace, Ephesus, and arrived finally at Susa, the residence of the Persian king, in a covered carriage, such as was generally used to convey women to the royal harem. At the Persian court there was a party, headed by the widow of Xerxes, which demanded his execution immediately; but Themistocles understood how to impress the reigning monarch, Artaxerxes, so favorably that he was not only left unmolested, but received rich dotations and acquired considerable influence. Deeply implicated in the Persian plans for the subjugation of Greece, he died suddenly at Magnesia in Asia Minor in 449 B. C.

Thenard's Blue: See BLUE and COBALT.

Theobald, Lewis: author; b. at Sittingbourne, Kent, England, about 1690; educated at Isleworth, and became a lawyer, but devoted himself chiefly to literature; published *Electra, a Tragedy* (1714); *A Critical Discourse on Homer's Iliad* (1714); *A Translation of the First Book of the Odyssey* (1716); *The Censor, a periodical* (1717); *Memoirs of Sir Walter Raleigh* (1719); *The Double Falsehood* (1720), a play which he attributed to Shakspeare; and some twenty other plays, none of which had much success or are now remembered. He is chiefly known as a Shakspearean editor, having published *Shakspeare Restored, or Specimens of Blunders committed and unamended in Pope's Edition of this Poet* (1726), which brought upon him the wrath of Pope, and procured him the post of hero of the first edition of the *Dunciad* (1729). In 1733 he issued an edition of Shakspeare (7 vols.) which completely superseded that of Pope. His emendations were few, executed with great care, and are acknowledged to possess great merit, having been reproduced without acknowledgment by many subsequent editors. D. in Sept., 1744.

Revised by H. A. BEERS.

Theobroma: See CACAO and THEOBROMINE.

Theobro'mine [deriv. of Mod. Lat. *theobroma*; Gr. *θεός*, god + *βρώμα*, food]; an organic base present in cacao-beans, and therefore in chocolate; formula $C_{15}H_{15}N_3O_2$. It is prepared by treating the beans with warm water, adding neutral plumbic acetate to the strained solution, conducting a current of hydrogen sulphide through the filtrate from the lead precipitate, evaporating the second filtrate, and crystallizing from alcohol. It may be further purified by heat-

ing between two watch-glasses, when it is obtained as a dazzling white sublimate. Theobromine is a colorless crystalline powder, but sparingly soluble in boiling water, and still less so in alcohol and in ether. It has a bitter taste, and gives crystalline salts with several of the acids.

Theocracy: See RELIGION, COMPARATIVE.

Theocritus (in Gr. *Θεόκριτος*): earliest and chiefest of bucolic poets; commonly set down as a native of Syracuse, though Cos also has claims on him. He flourished in the first half of the third century B. C., at the court of Ptolemy Philadelphus in Alexandria, and the court of Hiero II. in Syracuse, but the chronological order of his poems in honor of those potentates is much disputed, so that it is not certain how his career is to be distributed. Nor is anything known as to the time and manner of his death, though it has been inferred from a line of Ovid, *Ibis*, 549, that his end was the halter. We have under the name of Theocritus thirty-one poems, besides a number of epigrams. Of these poems, commonly called idyls (Gr. *εἰδύλλια*), ten are strictly bucolic, three are imitations of the mimes of SOPHROS (*q. v.*), the rest vary in sphere and poetic value, and a few are spurious, or at all events fall below the poet's art and tone. Theocritus occupies a unique position in literature. No one has so blended in his verse the artistic and the popular, and all who have attempted to emulate him have failed to reproduce his wonderful charm. His language is Syracusan Doric, and yet it is not the peasant language pure and simple. It has notes that have been learned from the predecessors of Theocritus, from Epicharmus and Sophron; and his *Bucolic* poems, among the most attractive of all, are clearly artificial. His peasants are peasants, his shepherds smell of the sheepcote, his reapers of the harvest-field, his fishermen of fins and scales; their jests are as broad as the sky under which they live, and yet we can not but suspect allusion here and allegory there. His measures, as a rule, are epic, and belong to the recitative order, and yet the arrangement in strophes mimics song and the dialogue gives dramatic character, so that the three great forms of poetic composition are all present in his works. He is a conscious artist to the minutest points of workmanship; he is the child of a period when the scholar held the poet bound; and yet through all the limitations and artificialities of the period and the province there breathes an intimate love of nature that makes Theocritus a poet for all time, as he is the last true poet of the Greek tongue. Noteworthy editions are by Ahrens, 2 vols. (1855), by Meineke, 3d ed. (1856), by Wordsworth (1872), by Fritzsche-Hiller with German notes (1881). There is a *Lexicon Theocriteum*, by Rumpel (1879). For the bibliography, see Cipolini, *Gli Idilli di Teocrito* (1887). Of the translations into English the most interesting are the verse rendering by Calverley (1869) and the prose version by Andrew Lang (1880), with an introductory essay, *Theocritus and his Age*.

B. L. GILDERSLEEVE.

Theocritus (in Gr. *Θεόκριτος*) of Phase'lis, in Lycia; pupil of Plato and Isocrates; distinguished alike as tragic poet and orator. The scant fragments of his tragedies which are collected in Nauck's *Fragmenta Tragicorum Græcorum* (2d ed., pp. 801-807) hardly bear out his reputation, which was doubtless enhanced by his versatility.

B. L. G.

Theodolite [probably for *the alidade*; Arab. *al'idāda*, rule]; an instrument used by surveyors for measuring horizontal and vertical angles, similar to an engineer's transit in all respects, except that the telescope is not usually reversible. See HYPSOMETRY.

Theodo'ra: Byzantine empress; b. about 508, either at Cyprus or more probably at Constantinople; the daughter of Acacius, master of bears to the Green Faction. By the death of her father her mother was left destitute with three daughters, Comito, Theodora, and Anastasia, none of whom was over seven years of age. The three successively appeared on the stage as pantomimic dancers, an occupation held in general contempt. In the *Anecdota*, attributed to PROCOPIUS (*q. v.*), scandalous stories are narrated of Theodora's youth, which it is impossible to verify or wholly refute. In 525, when she married the consul Justinian, she was, if the commonly accepted date of her birth be correct, but seventeen years old; hence some of the charges against her can not possibly be true. Justinian had obtained from his uncle Justin I. abrogation of the law which forbade marriage between a senator and a woman of servile origin or who had appeared on the stage. In 527 Justinian succeeded to the

throne. He required public functionaries to swear allegiance to Theodora as well as to himself, caused her effigy to appear on the coins with his own, and cited both their names in public decrees as joint rulers. During twenty-three years of married life she showed herself his worthy consort. Her courage and judicious counsels prevented his deposition at the revolt of the Nika in 532, and in all questions of administration she took a notable share. No female sovereign manifested larger interest in the unfortunate and destitute of her own sex or strove more earnestly to alleviate their condition. It has been supposed that thus she sought to atone for the possible faults of her own youth. She retained her ascendancy over the mind of Justinian to the last. Her only child by him was a daughter. Theodora was of small stature, pale, delicate, vivacious, graceful rather than beautiful, had expressive eyes, and was fascinating in manner. She died of cancer in 548 at Pythia, near Broussa, whither she had gone for the baths.

EDWIN A. GROSVENOR.

Theodore, King of Abyssinia: See **ABYSSINIA**.

Theodore of Mopsues'tia, also called, from his place of birth and early life, **THEODORE OF ANTIOCH**, and whose epithet among the Nestorians is "The Interpreter": bishop and exegete; b. in Antioch about 350. His parents were wealthy and gave him every advantage, but under the urging of John Chrysostom, his life-long friend, he entered an ascetic brotherhood which Chrysostom had established. Shortly afterward he repented of the step and left the brotherhood, as he desired to marry. To him Chrysostom then addressed two eloquent and affectionate letters which bear the title *An Exhortation to Theodore after his Fall*, and which had the desired effect of determining him to renounce his matrimonial intentions and saving him for the Church. He was not yet twenty years of age when his "fall" and recovery occurred. He continued his studies and was ordained priest in Antioch 383. Somewhat later he removed to Tarsus. He essayed authorship with brilliant success and in 392 became Bishop of Mopsuestia, the modern Mesis, 40 miles W. from Tarsus, where he died 428. He is the most prominent representative of the "middle" Antiochian school of Bible interpreters. He commented on nearly the whole Bible in the grammatical and historical manner of the Antiochian school, and in constant protest against the allegorizers. He also appeared as a controversialist and as a practical theologian. Much of his writings has been lost—particularly to be regretted are his letters, which were so highly admired that they were called the Book of Pearls. His fame in the West is due to his alleged heresy. Dying in the odor of sanctity and passionately defended, it was soon afterward openly said and was proved that he was the virtual author of Nestorianism. The Council of Ephesus in 431 condemned his "creed"—although his name was not mentioned—and the Council of Constantinople in 553 anathematized him, by request of the Emperor Justinian. So the West wanted to learn who the man was about whom the East was so much excited, and a Latin translation of portions of his works was the result. Curiously enough his commentary on Paul's Epistles was circulated under the name of Ambrose. It was highly popular, and the heretic of the East "supplied the Middle Ages [in the West] with an accepted interpretation of an important part of Holy Scripture." Much of this Latin translation was first published in 1880–82 in Cambridge. See Migne's *Patrologia Græca*, lvi., for a general collection of the remains. Cf. H. Kihn, *Theodor von Mopsuestia u. Junilius Africanus* (Freiburg im Breisgau, 1880). SAMUEL MACAULEY JACKSON.

Theodoret: bishop and author; b. about A. D. 393 at Antioch, Syria, the only son of rich and influential parents; received a good education under religious influences; at twenty-three, his parents being dead, distributed all his property and retired to a monastery at Nicerte, 75 miles from Antioch; in 423 became Bishop of Cyrus or Cyrhus, the modern Koros, on a branch of the river Aphreen, in the district of Syria called Cyrestica, which is a fertile plain lying between Alma Dagh and the Euphrates. D. probably in 457. In the discharge of his diocesan duties he was eminently successful, bringing back by his eloquence and power of persuasion numbers of heretics to the Catholic Church. At last, however, he himself was accused of heresy. He had a strong sympathy for Nestorius, and in 449 he was even deposed from his see by the synod of Ephesus, though he was reinstated by the synod of Chalcedon in 451. Of his works, comprising a history of heresies, a dialogue against Eutychianism, commentaries, etc., the *History of the Church from 325 to 429* is the most important. The best edition of his

works, which comprise commentaries on Paul's Epistles and large parts of the Old Testament, discourses, controversial works, histories, and letters, appeared in Halle, 1769–74, in five volumes, edited by Sehnlze and Nösselt, reprinted by Migne, in *Patrologia Græca*, lxxx.–lxxxiv. (Paris, 1860); English translation by Bloomfield Jackson of the *Ecclesiastical History, Dialogues, and Letters, in The Nicene and Post-Nicene Fathers*, 2d series, iii. (New York, 1892); Gaisford's translation of the history is in Bohn's *Ecclesiastical Series*.
Revised by S. M. JACKSON.

Theodoric [a Teutonic name; cf. Goth. *Þiuda*, people, and *reiks*, king]: founder of the Ostrogothic kingdom of Italy; b. about 454, the son of Theudemir, who with his two brothers ruled over the Ostrogoths in Pannonia under the authority of the East Roman emperor; was educated at the Byzantine court, whither he was sent as a hostage at eight years of age, and where he spent about eleven years. In 474 he succeeded his father as king of his nation, and for some time was a true ally of Zeno, the Eastern emperor, but, dissensions soon arising, Theodoric invaded the Roman provinces of Macedonia and Epirus, and for several years harassed the empire by marauding expeditions. At last, in 488, he and the emperor agreed upon a plan for the employment of the Ostrogoths in Italy against Odoacer. Late in the fall the whole nation, numbering over 200,000, of whom 40,000 were soldiers, broke up its settlements, and advanced slowly into Italy, defeating the Gepidæ on the way. Odoacer was defeated in three battles—at the Isonzo, near Aquileia, Aug. 28, 489; at Verona, Sept. 30, 489; and on the Adda, Aug. 11, 490. He then shut himself up in Ravenna, was besieged there for over two years, and was finally assassinated Mar. 15, 493, at a banquet shortly after he had surrendered himself. After his victories Theodoric naturally considered the soil of Italy as belonging to himself, and a part of it, one-third, it is said he partitioned out among his warriors, thus covering Italy with a network of Gothic military colonies. In other respects he retained the administrative machinery of the empire, and he understood how to work it. He governed Goths and Romans as if they were one people, and, though himself an Arian, refrained from persecuting the Catholics till the last two years of his reign. Under him the country enjoyed peace and prosperity to a greater degree than fell to its lot for several centuries. In commerce and industry, in science and art, damages were repaired, and new undertakings started. Cassiodorus, Boethius, Symmachus, and other literary men of eminence lived at his court in Verona as his intimate friends. In his foreign policy he was also wise and successful, and among the German tribes he became a hero (*Diétrich von Bern*), around whose name legends grew thick during the Middle Ages. The last days of his life were embittered by a controversy with the emperor and the pope over the persecution of the Arians, and stained by deeds of violence and cruelty. He alienated the minds of his Roman subjects by the judicial murder of Boethius and Symmachus, and he angered the Catholics by his treatment of Pope John I., who died in prison. He died at Ravenna, Aug. 30, 526, just after he had issued an edict giving over the Catholic churches of Italy to the Arians. See Hodgkin, *Theodoric the Goth* (1891). F. M. COLBY.

Theodosia, or Feodosia: See **KAFFA**.

Theodosius: an eminent Roman general from whom a line of emperors descended. Sent to Britain by Valentinian I. in 367 A. D., he drove out the Picts and Scots, strengthened the military positions on the frontiers, and restored security and order in the country. After his return he was for some time stationed on the upper Danube, where he defeated the Almanni. In 372 he took command in Africa, and succeeded, after an obstinate struggle, in putting down a revolt led by the Moorish chieftain Firmus. Theodosius was executed in 376 by order of Valens.—His son, **THEODOSIUS I., THE GREAT**, Roman emperor from 379 to 395, was born in Spain, probably at Cauca, in Galicia, about the year 346, and educated in his father's camp. He early received an independent command in Mesia, and distinguished himself by victories over the Sarmatians, but after the execution of his father, in 376, he retired from public life, and returned to his native place. After the defeat and death of Valens in the battle of Adrianople (in 378), Gratian recalled him to the court, made him commander-in-chief against the Goths, and declared him Augustus (Jan. 19, 379), placing Egypt, Asia, Thrace, Macedonia, and Dacia under his scepter. Theodosius pursued a skillful policy in his campaigns against the Goths, and a

peace was concluded by which they received lands within the empire and became allies of Rome. In 383 Gratian was defeated and killed by Maximus at Lyons, and Theodosius acknowledged the usurper as Emperor of Britain, Spain, and Gaul, but secured Africa, Italy, and Illyrium for Gratian's brother, Valentinian II. In 387, however, Maximus broke from Gaul into Italy, and the weak Valentinian II. and his mother Justina, who was the true regent of the empire, fled for safety to Theodosius. Theodosius became so infatuated with Valentinian's beautiful sister, Galla, that he promised to restore him to the throne in order to obtain her hand. Maximus was defeated and put to death in 388, and Valentinian II. was reinstated as Emperor of the West, but in 392 was killed by Arbogastes, who, not venturing to assume the purple himself, raised the rhetorician Eugenius to the throne. Theodosius hesitated long before he entered on a new war, but in 394 he marched against Eugenius and Arbogastes, and defeated them at Aquileia, thereby uniting the whole Roman empire under his scepter. He died shortly after, however (Jan. 17, 395), at Milan, leaving the empire to his sons Arcadius and Honorius. Theodosius was a zealous upholder of orthodox Christianity, and took active measures for the suppression of pagan rites and heretical opinions. His obedience to the Church was exemplified in his submission to the penance imposed by Ambrose after the cruel massacre of Thessalonica (390).—His grandson, THEODOSIUS II. (408–450), b. in 401, succeeded his father, Arcadius, as emperor in the East. He was a weak ruler, controlled largely by his sister, Puleheria, and his wife, Eudocia. He is chiefly known for the Theodosian code, a collection of the imperial constitutions issued since the time of Constantine.

Revised by CHARLES H. HASKINS.

Theognis of Megara, in Greece; elegiac poet who flourished in the latter half of the sixth century B. C., and lived to see the on-coming of the Persian war. His life fell in a period of feuds and factions; the oligarchical party to which he belonged was overborne by the democracy, and Theognis, stripped of his estate, suffered the pangs of poverty and exile. In the verses that have been preserved under his name, 1,389 in number, we have the creed of a Doric oligarch set forth for the instruction of a young favorite who belonged to the same order. The fragments vary in length, and as the sententious character of the poetry of Theognis lends itself readily to interpolations, his genuine work is largely mixed with passages from other poets, such as Solon, Mimnermus, Tyrtaeus, and Euenus. But for all these foreign ingredients the character of the poet and the bitterness of his spirit are manifest enough, and the remains of Theognis are of prime importance in enabling us to understand the state of parties and the problems of society in the Greece of the sixth century. Ed. by Welcker (1826), by Ziegler (2d ed. 1880), by Sittler (1880), and by Bergk, *Poeta Lyrici Graeci*, vol. ii., pp. 177–236 (4th ed.). Translated by Prere (1842)—see *Frere's Works*, vol. iii., ed. of 1874—with a clever but hopeless attempt to work all the disparate fragments into a mosaic of the poet's life and character. For more recent studies, see Sittl, *Geschichte der griechischen Literatur*, vol. i., p. 261, foll.

Theological Schools: See SCHOOLS.

Theology [from Gr. *θεός*, God + *λόγος*, discourse, reason]: literally, discourse concerning God. The term has come down to us from the Greek philosophers, who used it in the sense of "account of the gods." Plato so used it in speaking of what Homer and Hesiod in their poems have said of the gods, though he also employs the word mythology, which by common consent has been adopted by Christian writers as the more appropriate term. The word theology seems to have first come distinctly into Christian use during the great controversies in the fourth century respecting the divinity of Christ and his relation to the Godhead, the term then meaning sometimes the doctrine of the divine nature of Christ as distinguished from his human nature (*οὐκωποςία*), and sometimes the doctrine of the Trinity. Theodoret in the fifth century appears to have been the first to use the term in the sense of "doctrine of God." He proposes and discusses the question, Why did not Moses preface his account of the creation with (*θεολογία*) the doctrine of God—i. e. with some explicit teaching respecting the nature and attributes of God? It was not until the twelfth century that theology assumed something like the comprehensiveness of its modern meaning. Abelard having prepared a compend of his lectures on some of the most prominent doctrines of faith, entitled it "Christian Theology" (*Christiania*

Theologia). From the time of Abelard the term rapidly widened in meaning till it came to include all that is now comprehended under it. Theology now denotes not merely the doctrine of God, or theology proper, but also the doctrine of the world in its relations to God, or cosmology; the doctrine of man in his relations to God, or anthropology; the doctrine of the salvation of man through the person and work of Christ, or soteriology; the doctrine of the final states of all men, or eschatology; and the doctrine of the Church, its constitution and government, or ecclesiology. Theology may therefore be defined as the science which treats of God and the universe in all their known relations to each other. It has sometimes been defined as "the science of the supernatural," and very commonly as "the science of religion." These definitions, however, are vague and inexact; both, with any definiteness of meaning, would necessarily include much that does not properly belong to theology, and omit still more that does. The last named, "the science of religion," from its apparent simplicity and comprehensiveness has gained great popular currency, which has also been promoted by indefinite notions as to the nature of both religion and theology.

Religion exists as an inward state of feeling—a sense of duty toward a Being or beings regarded as divine and supreme—and also as an outward expression of that feeling in acts of worship and service. The science of religion, therefore, should analyze and classify the religions of the world—both the religious convictions and feelings of men, and the forms of worship and service in which these convictions and feelings find their natural expression. Theology, on the other hand, deals exclusively with the facts, whether of consciousness or of revelation, from which religion, both subjective and objective, proceeds, and, educing the truths and principles which the facts embody, it formulates and groups them into the doctrines which constitute theology.

The right of theology to be called a science, which in late years has been warmly disputed, can be determined only by answering the following questions: first, Can the facts with which it has to do be proved to be indubitably real, and what are they supposed to be? and second, Can the methods which it adopts in dealing with its facts be shown to be in accordance with the acknowledged laws of mind? In its broad sense as a science it must gather its facts from the wide fields of nature, consciousness, and the sacred Scriptures. In a narrower and commoner sense of the term its facts, according to one class of theologians, are to be found only in the sacred Scriptures, and are strictly historical; according to another class, even in the narrower sense of the term, the facts of the moral consciousness should not be overlooked; this latter class holding that the ultimate and decisive appeal must ever be to the Scriptures, yet maintaining that the facts of the moral consciousness when properly scrutinized will be found to be explanatory, supplemental, and corroborative of those of the Scriptures. As to the facts, so far as they are historical they are amenable to the bar of criticism, like the facts of any other history, and must vindicate their trustworthiness by precisely the same kind of evidence; and so far as they are from the moral consciousness, they are open to inspection, and may be subjected to the same kind of analyses and tests as any other facts of mind. As to methods, there is the same liability to error in theology as in any other science; but out of various possible methods in dealing with the phenomena of nature, some one is of course admitted to be scientific, and that one, with such insignificant modification as may be necessary to fit it to its service, must be equally scientific in dealing with the phenomena of revelation; so that, if a science of astronomy, and still more if a science of ethics, be possible there may also be a science of theology. Science differs from mere knowledge in the degree of its certitude and exactness. It would be difficult to show that the essential principles of theology are less certain or less capable of exact statement than those of any other science. Science also differs from mere knowledge in the extent to which its material is classified and organized. The facts of theology can be classified and organized, and precisely to the extent in which this is accomplished can theology be called a science. The chief ground for denial of the right of theology to be called a science is found in its liability to resort to theory when facts are wanting, and to hypothesis in the absence of evidence. Its danger of becoming in this way unscientific is, however, no greater than that of most other sciences. The facts of revelation on which the science of theology rests presuppose and imply those fundamental facts

of being which it is the office of metaphysical philosophy to interpret; of these facts some kind of explanation is to every enlightened mind a necessity. The theologian must have his explanation, and it is to him the source of his greatest danger of becoming unscientific. His metaphysic is perpetually suggesting to him its method of rounding his theology into the completeness of a system. To what is strictly scientific in his theology he is continually tempted to add what is purely theoretic. It is because theology has been so encumbered by what is purely theoretic—by theories of the Trinity, theories of sin, and theories of the divine providence, of the atonement, of regeneration, etc.—that its right to be entitled a science has been disputed; but to any one who looks impartially at the materials with which theology builds, and at the inductive method which it may justly adopt, its right to be called a science would seem to be as clear as that of any other species of knowledge.

Theology has been divided into two kinds, which have been designated according to the supposed sources of their materials. Thus we have NATURAL THEOLOGY (*q. v.*) and revealed theology. By the first is meant that knowledge of God, his existence, attributes, and government of the world, which may be gathered from nature—i. e. from the external world and from the mental and moral constitution of man; and by the second is meant that knowledge of God and the universe, and of their mutual relations, which may be gathered from the Bible alone, or at least that knowledge alone which the Bible sanctions. It may be doubted, however, if the line of separation between the two is so clearly marked as is commonly supposed. The Bible assumes and incorporates into itself no small portion of what must be regarded as fundamental in natural theology, and few, if any, of the sources of natural theology have failed to be irradiated by the light of revelation. It is now well-nigh impossible to distinguish between what is taught by nature and what by revelation.

Revealed theology has been distributed into a variety of species, each of which has received its designation either from its special aim or from its special method of treatment. Thus, to particularize, we have systematic theology, the aim of which is to reduce all revealed truths to a series of statements that together shall constitute an organized whole; dogmatic, which aims pre-eminently to state what is authoritatively taught, whether by the Scriptures, the councils, or the creeds; philosophical, in which the formal statements of truth are more or less directly determined either by the postulates or by the conclusions of some special system of philosophy; metaphysical, in which the aim is to substantiate the teachings of the Bible by an appeal to those primitive cognitions and primary beliefs which the Bible always assumes; speculative, in which theory predominates over Scripture and all other authority; rational, which gives to human reason the highest authority in determining what is theological truth; biblical, which, indifferent alike to philosophy and dogma, and, making system but a secondary consideration, aims simply to state the teachings of the Bible; doctrinal, which contents itself with simply formulating its statements of truth with a view to their being understood and accepted; and practical, which, on the other hand, seeks so to shape its statements of truth as to secure conformity of life with what is stated; polemical, which is quite as intent on overthrowing the positions of other systems as in defending its own; and historical, which traces doctrines through the controversies amid which they were enunciated, and under the influence of which they were formulated. Moral theology is a designation which has among Protestants fallen into general disuse, but once denoted a discussion of moral law and human duty as laid down in the Ten Commandments and the Sermon on the Mount, and covered ground which is occupied by moral philosophy or Christian ethics. The term theology, unaccompanied by an epithet, commonly denotes a completed series of the classified doctrines of Christianity. Doctrines are formal statements of Christian truth, and scientific theology consists of the whole circle of doctrines arranged according to some determinate plan.

Theology as a science has had a clearly marked history—a history covering special controversies under which specific doctrines took form, and those broader and less violent discussions in which all doctrines, under the influence of metaphysical philosophies, were adjusted into the various systems which, taken together, constitute the science as a whole. This history, beginning with the time immediately succeeding that of the apostles, naturally divides itself into three great periods, the first extending to A. D. 730, the second from 730 to 1517, and the third from 1517 to our own time.

During the first period, theology was in its formative state. The hints given by Scripture in the formula of baptism (Matt. xxviii. 19) and the apostolic benedictions (2 Cor. xiii. 14), in the grouping of the facts of sin and salvation about the two persons, Adam and Christ (Rom. v. 12-19), in the poetical summary of the truths of redemption quoted by Paul (1 Tim. iii. 16), seem first to have suggested the possibility of combining these facts and truths into a system. Ignatius (d. 115) gives the first distinct statement of the faith drawn up in a series of propositions, and his systematizing formed the basis of all later efforts. No complete treatise of theology, however, was written during this first period. The nearest approach to one was by Isidore, of Seville, who died in 636. He wrote what he styled Three Books of Sentences (*Tres Libri Sententiarum*), but it was, as its title indicated, a mere collection of extracts from the Church Fathers. The period, however, was not unproductive of results. It gave to the Church universal that admirable digest of Christian faith called the Apostles' Creed. Among the churches of the East were elaborated the great doctrines of the Trinity and of the person of Christ, which were formulated in the creeds adopted by the Council of Nice in 325, of Constantinople in 381, of Ephesus in 431, and of Chalcedon in 451. Within the same period also—that is, during the first quarter of the fifth century—the equally important doctrines of anthropology (specifically of the fall of Adam and its effects on the human race) were discussed, chiefly among the churches of the West under the leadership of Augustine and Pelagius. Augustine maintained that all men sinned in Adam; that by his fall all were physically and morally corrupted (original sin), and incapacitated to will or to do aught but evil; that all there is of good in any one is by sovereign grace in fulfillment of a predestinating purpose. Pelagius, on the other hand, maintained that Adam alone was injured by the fall; that every one of his descendants begins life with a nature as pure as his was, and with a will as free to choose good as evil; that grace simply assists natural power, and is bestowed on those who by right use of natural power deserve it. Augustinism was adopted as the orthodox doctrine of the Church by the Council of Ephesus in 431. Semi-Pelagianism denied the positions of Augustine and softened the statements of Pelagius. Wiggers in his history of the three views says aptly that "Pelagianism makes man to be morally *well*; Semi-Pelagianism makes him to be morally *sick*; Augustinism makes him to be morally *dead*."

The second period (from 730 to 1517) produced three great writers on theology—viz., John of Damascus, Peter the Lombard, and Thomas Aquinas. John (d. 754) wrote what he styled *An Accurate Summary of the Orthodox Faith* (*Ἐκδοσις ἀκριβῆς τῆς ὀρθοδόξου Πίστews*, or *De Orthodoxa Fide*). He is the only writer of note on systematic theology which the Greek Church has ever produced. He drew his materials from the earlier Fathers, and chiefly from the three great Cappadocian teachers, Gregory Nazianzen, Gregory of Nyssa, and Basil the Great. He was the first to apply the formulas of Aristotle to theological investigation, and thus to introduce the dialectic or scholastic method. His views of the moral state and ability of man, like those of all the Greek Fathers, are much less rigid than those of Augustine. His work is chiefly of value to one who would understand the history of the doctrine of the person of Christ. Peter the Lombard (d. 1164) compiled from the Latin Fathers, chiefly from Augustine and Gregory the Great, what he styled *Four Books of Sentences* (*Quatuor Libri Sententiarum*). His method is formal and dialectic, but he shows great acuteness and skill in his aim at reconciling the opposing views of the authors whom he quotes—an aim the opposite of that of Abelard (d. 1142), who had sought in his "Yes and No" (*Sic et Non*) to array the Fathers against one another. The work of Peter became the great authority in the Roman Church, the ablest theologians for a long time contenting themselves with simply commenting on it. The greatest of mediæval theologians, however, perhaps one of the ablest of any age, was Thomas Aquinas (d. 1274). He wrote, according to the fashion of his time, elaborate commentaries on the *Sentences* of the Lombard, to which he also gave the alternative title of *Sum of Theology* (*Summa Theologie*). He is pre-eminently scholastic in method, but transparent in thought and exhaustive in treatment. The Lombard simply recognized the rising controversy between the Realists and the Nominalists; Aquinas was a pronounced and earnest Realist. He was also more Augustinian in his anthropology than Lombard, and,

setting aside the mythical theory of the atonement, which Lombard had accepted from the Fathers, and which made the death of Christ to have been a ransom paid to Satan, he maintained, and established for all time since, the Anselmic theory, that the death of Christ was a satisfaction for sin to the justice of God. The mythical theory had prevailed until the beginning of the twelfth century, when Anselm, Archbishop of Canterbury (d. 1109), elaborated the theory which bears his name, and the final acceptance of which made as distinctly, though less violently, an epoch in the progress of theological science as had been made more than seven centuries before by the adoption of the Augustinian views of human nature. The *Summa* of Aquinas is one of the highest authorities in the Roman Catholic Church.

The third great period, from 1517 to the present, has been more fruitful of treatises on scientific theology, and has contributed more to its progress than all the Christian centuries preceding. Until the sixteenth century only two great doctrines or groups of doctrines—viz., of God, including the Trinity, Christology, etc., and of man, including sin, free will, sovereign grace, etc.—had been comprehensively discussed. The Reformation under Luther turned on controversies over the doctrines of soteriology, or of the divine method of making the work of Christ available for men. The Roman Church, under guidance of mediæval theologians, had come to make the process of salvation to be a mere external work (an *opus operatum*) wrought by the efficacy of the sacraments. Luther maintained that it could be wrought only through a personal faith (a *fides justificans*). In prosecution of the controversy the Reformers, cutting loose from scholastic theology, entered at once on the study of the Bible and the Christian truth for themselves. The first Protestant treatise on scientific theology, the *Common Places (Loci Communes)* of Melancthon, had its origin in a course of lectures on the Epistle to the Romans, the chief object of which was to collate and expound such passages of the Epistle as bore directly on the question in dispute. Out of the biblical studies of the Reformers, German, Swiss, and French alike, grew those statements of soteriological doctrines now found in all systems of Protestant theology.

From the middle of the sixteenth century theology presents itself under three clearly defined types—the Lutheran, the Reformed (the Calvinistic), and the Roman Catholic. At the beginning of Protestantism the Lutherans and the Calvinists were essentially one in doctrine. Both adopted the Augustinian views of sin and grace, and both held firmly to the Nicene and Chalcedon creeds. Luther was himself pre-eminently Augustinian, and even wrote a book (*De Servo Arbitrio*) to prove that the will of man is enslaved; and Melancthon, when he wrote the first edition of his *Loci*, as well as the Augsburg Confession (*Confessio Augustana*) and the apology for it (*Apologia Confessionis*), was no less Augustinian. Luther, however, propounded and defended a doctrine of the real presence of the body and blood in the Lord's Supper under the title of consubstantiation; and Melancthon, gradually swerving from the Augustinian views of sin and irresistible grace (monergism), maintained the existence of a co-operative power of the human will in regeneration (synergism), and favored the Reformed view of the Supper rather than the Lutheran; the Reformed, under the lead of Calvin, adhered to Augustine's views of human nature, and maintained that in the Supper the Lord is present, not in the bread and wine, but in the heart of the communicant through partaking of the consecrated elements; the differences between the Lutheran and Reformed, slight at first, rapidly widened into complete separation. The historical progress of dogmatic theology may be traced under the three above-mentioned types—the Roman, the Lutheran, and the Reformed or Calvinistic.

The Roman.—The Roman Catholic Church, in which theological studies had fallen into neglect, was roused into immediate activity by the outbreak of the Reformation; but in the canons of the Council of Trent (1545-93) it reaffirmed the theology of its mediæval writers, particularly of Aquinas, and authorized the preparation of the Roman Catechism (*Catechismus Romanus*), which popularizes and reiterates the decrees of the council. Its great writers, such as Bellarmine and Petavius, contented themselves with acting on the defensive, simply reaffirming the dogmas of the Church and the interpretations which priestly authority had put upon them. There has been no dearth of modern theological treatises in the Roman Church, but the most able and com-

plete of them all is that of Cardinal Perrone (*Prælectiones Theologicae*), which first appeared in 1835, and of which very many editions have been since published. It is specially able in its presentation of the Roman theory of the Church and its sacraments. Moehler's *Symbolism* skillfully states and minimizes the points of difference between Roman Catholicism and Protestantism; while Hurter's *Compendium Theologiae Dogmaticæ* is a recent and extended exposition of the Roman doctrine.

The Lutheran.—The *Loci* of Melancthon, first published in 1521, became at once the great Lutheran authority, and was the first in a series of learned and able treatises. It was clear in thought, admirable in style, and entirely free in language and method from scholasticism. Sixty editions in Latin and a large number (estimated at more than twenty) of translations into German were published during its author's lifetime. The later editions were so changed from the earlier as to make it almost another work. Theologians immediately succeeding Melancthon contented themselves with writing commentaries on the *Loci*; but during the 200 years following his death (1561) the Lutheran Church abounded in great writers on theology, many of whom were noted for their learning as well as for their extraordinary grasp and acuteness of intellect. Among others may be mentioned Chemnitz, Gerhard, Calixtus, Calovius, and Quenstedt. Of these authors, some sided in their anthropology with Luther, but the majority with Melancthon, while almost unanimously they went with Luther in his views of the sacrament of the Supper. The simultaneous appearance, however, of Rationalism and Pietism about the middle of the eighteenth century interrupted the sluggish flow of Lutheran theology, few or no treatises of any special value for a half a century or more from that date having made their appearance. The Rationalists were too intent on their work of destruction to construct a scientific theology; and the Pietists, regarding religion as much more a matter of the heart than of the intellect, were indifferent to doctrinal discussions. The only strictly rationalist treatise on systematic theology worthy of note was that of Wegscheider (*Institutiones Theologiae Christianæ Dogmaticæ*); the Pietists produced no dogmatic treatise; but Pietism and Rationalism have, one or the other, largely determined the methods and conclusions of subsequent treatises. The union of the Lutheran and the Reformed Churches in Germany, since 1817, has rendered increasingly indistinct the line of separation between the two theologies, and for this reason the later developments of Lutheran doctrine will be mentioned in connection with the Reformed theology after the time of Schleiermacher.

The Reformed (Calvinist).—At the head of all the Reformed theologians, and, in the estimation of some, of all Protestant as well, stands John Calvin. He was eleven years old when Melancthon published the first edition of his *Loci*, and was but twenty-seven when he published the first edition of his own *Institutes of Theology (Christianæ Religionis Institutio)*. Few if any writers on theology have surpassed him in transparency of thought, in depth or breadth of view, in strength of grasp, or in logical force and consistency. The Reformed theology has gained wide currency among different nations. Its adherents had so multiplied and organized themselves into Churches under Calvinistic creeds among different nations as to admit, with varying degrees of accuracy, of national designations. Thus we have the Swiss-French or Genevan Church, founded by Calvin (he published at Geneva the revised edition of his *Catechism*, 1541; the *Creeds, Consensus Tigurinus*, 1549; *Consensus Genevensis*, 1552; and the revised and standard edition of his *Institutes*, 1559); the Anglican, which through Cramer and Ridley expressed itself in the Thirty-nine Articles, 1552; the German Reformed Church, which crystallized around the Heidelberg Catechism, 1562; the Dutch (Netherlands), which culminated in the Synod of Dort, 1618, and afterward signalized itself by the origin of the federal theory or covenant system, 1648; the Anglo-Scotch, which proclaimed itself in the Westminster Confession and Catechism, 1646-48; and, finally, we have the American type of theology, which, having begun under the Westminster Symbols (the Congregationalists adopting them 1648, and the Presbyterians 1729, while the Dutch brought with them the Heidelberg Catechism, and the Episcopalians the Thirty-nine Articles), now presents itself under new and ever-increasing variations.

Calvinistic theology, unlike the Lutheran, has been subject to many modifications, and has subdivided itself into

a variety of schools. Some of these modifications have had their origin in reactions against extremes of view or of method, and others have resulted from the influence of special schools of speculative philosophy, to which the Reformed theology has always been much more sensitive than the Lutheran. Thus near the middle of the seventeenth century the Calvinist writers of the Netherlands had become excessively scholastic and formal. In opposition to their method, Cocceius (in German *Koch*, and English *Cook*) conceived the federal method or the system of covenants—a covenant of works between God and man, and a covenant of grace between God and Christ—a method which he regarded as founded on the historical order of the Scriptures. Francis Burman at Utrecht and Herman Witsius at Leyden adopted the federal theory. The Cartesian philosophy, just then engaging the attention of Europe, was accepted by the Federalists, who adopted it so far as it taught the capacity of the unaided reason of man to know God and his character; the Scholastics assailed it, Voetius and Van Mastricht (who styled it the gangrene of theology) being specially bitter in their denunciations. While the Netherlands were agitated with controversies about scholasticism, federalism, and Cartesianism, the Calvinists of France were equally moved by disputes over the two distinctively Calvinistic doctrines of predestination and imputation. The professors at Saumur persisted in modifications of the current statements of both these doctrines. Amyradus (Amyraut) rejected absolute predestination, but propounded in its stead a predestination conditioned by a hypothetic or ideal universalism. Associated with Amyraut at Saumur was Placcus (La Placcé), who denied the doctrine of immediate imputation—i. e. the notion of a direct imputation of Adam's guilt to his innocent descendants—and affirmed the doctrine of mediate imputation—i. e. the imputation of Adam's guilt to his descendants as made guilty by an inherited evil nature. The views of both Amyraut and Placcus were opposed by Rivetus in France, by Francis Turretin at Geneva, and by J. H. Heidegger at Zurich. Against them, Heidegger was appointed by the Swiss to draw up a symbolical book, the *Consensus Helveticus*, which was much discussed, but could never be lifted into a position of authority. Turretin, a sympathizing friend of Heidegger, in his important treatise on theology (*Institutio Theologie Elenctica*) adopted the covenant theory of Cocceius and affirmed immediate imputation and absolute predestination. Again, during the first half of the eighteenth century the philosophy of Leibnitz having been adopted and adjusted to theological inquiries by Wolff, some of the Swiss theologians followed the Wolffian method. Wolff had maintained, and attempted to show by a most elaborate treatise, that the truths of natural theology were capable of demonstration, and that revealed theology, resting on natural, could thus be made to stand on a basis of science and certainty. But Wolff had also resolved all theological truths, whether of revealed or of natural religion, into mere abstract principles and definitions; and the theologians who constructed their systems after his method, while making a great show of logic, reduced theology to a mere system of formal and arid propositions. Notably of this class were Daniel Wyttenbach and J. F. Stapfer, of Berne. Schleiermacher, under the double influence of a pantheistic philosophy and of the Moravian teaching of his youth, gave to the German Reformed theology, during the first quarter of the nineteenth century, a tendency and a modification which continue. He mediated, however, between the Lutheran and the Reformed systems, thus influencing to some extent the methods and results of both. Schleiermacher based his system of theology upon the inner certainties of Christian feeling, and his writings constituted a transition from the rationalism of the preceding century to the more scriptural and evangelical faith represented by Neander and Tholuck, Twengen and Nitzsch, Müller and Dorner, Ebrard and Lange, Thomasius and Philippi, Luthardt and Kahnis. Two new forms of rationalism, however, have appeared in Germany, the one based upon the philosophy of Hegel, and numbering among its adherents Strauss and Baur, Biedermann, Lipsius, and Pfleiderer; the other based upon the philosophy of Kant, and advocated by Ritschl and his followers, Harneck, Hermann, and Kaftan; the former emphasizing the ideal Christ, the latter emphasizing the historical Christ, but neither of the two fully recognizing the living Christ present in every believer. The Swiss Reformed Church has produced an able conservative theologian in the person of Gretillat, of Montauban.

Theologies in Antagonism with the Reformed.—*Socinianism.*—At a very early period in the history of Protestant theology there was opposition to the doctrine of the Trinity. This opposition culminated in the person of Servetus, and he was put to death by burning. The opponents of trinitarianism gathered in Transylvania, and finally, organized by Faustus Socinus (d. 1604), became known as Socinians. Socinus wrote a brief treatise on theology, and a catechism which comprehended only the points in dispute between him and the trinitarians. The views of the Socinians are found in the *Racovian Catechism* and in the *Bibliotheca Fratrum Polonorum*. Socinianism has been represented by the Unitarians Samuel Clarke and James Martineau in England, and William Ellery Channing and James Freeman Clarke in the U. S. Unitarianism, however, has at no time produced a systematic theology. For a more extended account, see *SOCINIANS AND SOCINIANISM*.

Arminianism.—In reaction against the rigid high Calvinism of the Netherlands, Arminius denied the doctrine of absolute predestination, and propounded in its stead the doctrine of a predestination founded on the foreknowledge of God. Violent controversies ensued; the followers and successors of Arminius addressed a remonstrance to the state authorities; the Synod of Dort was convened, and the Remonstrants were excluded from the Reformed Church. Episcopius and Limborch elaborated the Arminian theology into a self-consistent system, while Hugo Grotius constructed the governmental theory of the atonement. The Methodists, who have inherited the theology of the Arminians, have for their systematic theologians in England Watson and Pope, in the U. S. Raymond, Foster, and Miley. English Methodists hold in general to the modified Arminianism of John Wesley, and regard man's ability to co-operate with God to be a matter of grace, while Arminius regarded the bestowal of this ability to be a matter of justice, man without it not being accountable. American Methodists, in general, hold more closely to original Arminianism, and maintain the almost unlimited self-determining power of the human will. See also *ARMINIUS AND ARMINIANISM*.

The Anglican Church and the Protestant Episcopal Church of the U. S. have taken little or no interest in the cultivation of systematic or scientific theology, in large part because, until recently, specifically theological schools have been lacking in England, and because questions of missions and of ritual have absorbed attention in the U. S. Pearson on *The Creed* and the popular expositions of the Thirty-nine Articles by Bishop Burnet, and more recently by Browne, Bishop of Winchester, are not in any proper sense scientific treatises on theology, although they are common English text-books. The "judicious" Hooker is still the greatest theological writer of the English Church, although his work is only on *Ecclesiastical Polity*. Yet there are signs of awakening interest in theology. Litton's *Compendium of Dogmatic Theology* and Moule's *Outlines of Christian Doctrine* show a tendency to return from the usual Arminianism of the Anglican Church to the old Augustinism; while Kedney's *Christian Doctrine* is a recent American work in which the speculative element is prominent.

The Baptists have been represented in theology by John Bunyan's *Gospel Truths Opened*, John Gill's *Body of Practical Divinity*, and Andrew Fuller's *Letters on Systematic Divinity*. It is in the U. S., however, that the Baptists have shown greatest activity both in theology and in missions. Within a few years have been published Ezekiel G. Robinson's *Christian Theology*, Augustus H. Strong's *Systematic Theology*, Alvah Hovey's *Manual of Theology and Ethics*, James P. Boyce's *Systematic Theology*, E. H. Johnson's *Outlines of Systematic Theology*, Ebenezer Dodge's *Christian Theology*, and W. N. Clarke's *Christian Theology*. The ablest exposition of the views of the Quakers is Robert Barclay's *Apology for the True Christian Divinity*.

American theology in general, aside from the writers already mentioned, has run in two lines: 1. The Reformed system of Jonathan Edwards, modified successively by Joseph Bellamy, Samuel Hopkins, Timothy Dwight, Nathaniel Emmons, Leonard Woods, Charles G. Finney, and Nathaniel W. Taylor. Jonathan Edwards, one of the greatest of metaphysicians and theologians, thought too little of nature, and tended to a thoroughgoing idealism. He regarded the chief good as happiness—a form of sensibility. Virtue was voluntary choice of this good. Hence union with Adam in acts and exercises was sufficient. This God's will made identity of being with Adam. There naturally followed the exercise-system of Hopkins and Emmons, on

the one hand, and Bellamy's and Dwight's denial of any imputation of Adam's sin or of inborn depravity, on the other—which last denial was also made by many other New England theologians who rejected the exercise-scheme, as, for example, Strong, Tyler, Smalley, Burton, Woods, and Park. Dr. Nathaniel W. Taylor added a more distinctly Arminian element, the power of contrary choice—and with this tenet of the New Haven theology, Charles G. Finney, of Oberlin, substantially agreed. Thus from certain principles admitted by Edwards, who held in the main to an Old School theology, the New School theology has been gradually developed. Calvinism, as thus modified, is often called the New England theology. Through Horace Bushnell, and the influence of Andover professors who, in their turn, have followed the German Dörner, the New England or New School theology has developed a tendency to the doctrine of probation after death for those who have had no opportunity in this life to accept Christ; and, as thus modified, the New School theology is often called the New Theology.

2. The older Calvinism, represented by Charles Hodge the father, and A. A. Hodge the son, together with Robert J. Breckinridge, Samuel J. Baird, and William G. T. Shedd. All these, though with minor differences, hold to views of human depravity and divine grace more nearly conformed to the doctrine of Augustine and Calvin, and they are for this reason distinguished from the New School theologians and their followers by the popular title of Old School. Old School theology has for its characteristic tenet the guilt of inborn depravity; but among those who hold this view, some are federalists and creationists, and justify God's condemnation of all men upon the ground that Adam represented his posterity. Such are the Princeton theologians generally, including Charles Hodge, Archibald A. Hodge, and the brothers Alexander. Among those who hold to the Old School doctrine of the guilt of inborn depravity, however, there are others who are traducianists, and who explain the imputation of Adam's sin to his posterity upon the ground of the natural union between him and them. Baird's *Elohim Revealed* and Shedd's essay on *Original Sin* (Sin a Nature and that Nature Guilt) represent this realistic conception of the relation of the race to its first father. R. J. Breckinridge, Robert L. Dabney, and James H. Thornwell assert the fact of inherent corruption and guilt, but refuse to assign any rationale for it, though they tend to realism. Henry B. Smith holds guardedly to the theory of mediate imputation; but while ranked with the Old School he may be regarded as mediating between the Old School and the New. As a learned, acute, and philosophical theologian, he deserves to be placed next to Jonathan Edwards.

Relation of Theology to Metaphysical and Physical Science.—The rise and progress of systems of theology have always been coincident with the rise and progress of systems of philosophy. Mediæval theology is intelligible only by understanding the realistic or nominalistic philosophies of its authors; and the modern systems of Protestant theology can be fully understood only by understanding the systems of philosophy which underlie them. It is remarkable that while the great theological writers anterior to the sixteenth century, who are appealed to as common authorities by Roman and Protestant writers alike, were philosophical realists, the chief theological systems of the Protestant Churches rest either upon avowed and unadulterated nominalism or upon nominalism in the disguised form of conceptualism; but with the traditional influence of metaphysical systems the natural sciences have in our day been rapidly coming into collision. It is the office of these sciences to ascertain what is really knowable of the processes of nature, and to reduce this knowledge to exact forms of statement. In fulfillment of this office, these sciences, in their manifold departments, are not only rendering an invaluable service to the science of mind, by bringing metaphysicians to observe its actual phenomena rather than to build on definitions of its processes, but are doing a work of equal value to theology, by requiring theologians to deal with law, government, sin, righteousness, character, heredity, and other fundamental truths, not as mere names or conceptions, but as the most real of realities. Both in Europe and in the U. S. the most recent theology has been greatly influenced by the monistic tendencies of modern science, in some instances to the denial of the freedom of man and of the transcendence of God, in other cases with a strenuous affirmation of these ethical postulates. The so-called higher criticism has applied the principles of historical development to the Old Testament, with the result

in some cases of denying any specifically divine element, but in general with the only result of inducing a somewhat broader view of divine inspiration as possibly consistent with error in matters not affecting the moral or religious teaching of the Scriptures. The theology of the future, which is to stand the test of criticism and control the consciences of men, must, like the teachings of the New Testament, rest on a basis of reality, and find in the consciousness of mankind an unequivocal testimony to its truth.

LITERATURE.—Pelavius, *Opus de Theologicis Dogmatibus*; Bellarmine, *Disputationes de Controversiis Fidei*; Möhler, *Symbolism*; Gass, *Geschichte der protestantischen Dogmatik*; Polenz, *Geschichte des Calvinismus*; Hepppe, *Dogmatik des deutschen Protestantismus*; Hase, *Hutterus Redivivus*; Schweizer, *Die Glaubenslehre der evangelischen Reform-Kirche*. The church histories of Neander, Gieseler, Hase, and Guericke; Neander, *Christliche Dogmengeschichte* (History of Christian Dogmas, translated by J. E. Ryland); Hagenbach, *History of Doctrines* (the translation revised and enlarged by H. B. Smith); Winer, *Comparative Darstellung des Lehrbegriffs der verschiedenen christlichen Kirchenparteien*; Schneckenburger, *Vergleichende Darstellung des Lutherischen und reformirten Lehrbegriffs*; Schaff, *Creeds of Christendom*; Dörner, *History of Protestant Theology*; and the *History of Theology* in Grotillat's *Théologie Systématique*. Dictionaries of theology, which give definitions of theological terms and articles upon theologians and their systems, exist in different languages. Of them the best are known as Herzog's *Real-Encyclopädie*, the great thesaurus of Protestant learning (2d ed. Leipzig, 1877-88, 18 vols.); Wetzer and Welte's *Kirchenlexicon*, the great thesaurus of Roman Catholic learning (2d ed. Freiburg im Breisgau, 1882, seq.); McClintock and Strong, *Cyclopædia of Sacred Literature* (New York, 1867-81, 10 vols., with 2 supplementary vols. and supplements 1887, seq.); less extensive is the *Schaff-Herzog Encyclopedia* (New York, 3 vols., 1884; rev. ed. 1887); in one volume are W. F. Hook's *Church Dictionary* (London, 1842; 14th ed. 1887); J. H. Blunt's *Dictionary of Theology* (1870); W. E. Addis and T. Arnold's [*Roman*] *Catholic Dictionary* (London and New York, 1883; 4th ed. 1893). See also ANTHROPOLOGY, ATONEMENT, CALVINISM, CHURCH HISTORY, FUTURE STATE, GERMAN THEOLOGY, and GOD.

Revised by AUGUSTUS H. STRONG.

Theopaschites: the Greek name for PATRIPASSIANS (*q. v.*).

Theophilus: Bishop of Antioch (171-185); probably of heathen parentage; famous for his *Apologia ad Autolyicum*, an elaborate apology for Christianity. He is the first Christian writer to mention a Trinity in the Divine Nature (*Apol.*, ii., 15). A commentary on the Gospels is ascribed to him, but probably inaccurately. The *Apology* was best edited by Otto (Jena, 1861), and has been translated in the *Ante-Nicene Fathers*, ii., 89-121. S. M. J.

Theophilus: Byzantine emperor (829-842). A brave and skillful soldier, he waged generally successful wars in Sicily and against the Saracens, and led his armies in person as far as the Euphrates. He enforced justice, rewarded merit, and his reign was glorious. The iconoclastic controversy which had convulsed the empire over a hundred years was terminated at his death. E. A. G.

Theophrastus (Gr. Θεόφραστος) of Eresus, in Lesbos; Greek philosopher; became the head of the Peripatetic School after the death of its founder, ARISTOTLE (*q. v.*), and presided over its fortunes, which prospered under his guidance for thirty-five years (322-287 B. C.). This prosperity was due to the character and ability of the head of the school, who enjoyed the highest esteem both at home and abroad. His lectures had the same themes and the same titles as those of his great predecessor. Especially attractive were his discourses on ethical topics, in which he showed the indulgent temper of a man of the world; and in the province of science he eclipsed the botanical work of Aristotle. His treatises on *Practical Botany* (περὶ φυτῶν ἱστορίας) in nine books and *Theoretical Botany* (περὶ φυτῶν αἰτιῶν) in six books are still extant, besides fragments of works on mineralogy (περὶ λίθων), on the senses, and on metaphysics. But the work by which he is best known is his treatise called *Characters* (χαρακτῆρες). These sketches of character by Theophrastus, who was a friend of ALEXANDER (*q. v.*), are taken not from real life, but from the mimic life of the stage, and are of great importance for the study of the New Comedy. The book has enjoyed unbounded popularity, and has been imitated scores of times. Especially famous are La Bruyère's companion pieces in French, and George Eliot's *Theophrastus Such*.

Unfortunately only the vicious and ludicrous characters have been preserved, and the book has come down to us in a condition which shows serious interference with the original form. There is an edition of all the works by J. G. Schneider (Leipzig, 1818); a critical edition by Wimmer (Leipzig, 1862); of the *Characters* by Casaubon (Leyden, 1592), and one by Jebb (1870).

B. L. GILDERSLEEVE.

Theophylact (surnamed SIMOCATTA): author; b. at Loeri, of Egyptian descent; went to Constantinople in 610 A. D., held various offices during the reign of Heraclius, and died there about 629. His extant works comprise *Historia Mauricii Tiberii Imperatoris Libri VIII.* (first edited with a Latin translation in 1604, latest ed. by Immanuel Bekker, Bonn, 1834), which gives a minute account of the Emperor Maurice's wars from 582 to 602; eighty-five letters divided into *morales, rusticæ et anatoricæ* (Venice, 1499); and *Questions Physicæ*, edited by J. F. Boissonade (Paris, 1835).

Revised by S. M. JACKSON.

Theophylact: archbishop; b. at Eubœa, on the island of Eubœa; seems to have gone early to Constantinople, where he obtained great reputation for learning, and was appointed teacher to Constantinus Porphyrogenitus. In 1078 he was made Archbishop of Achrida, in Bulgaria, and took up his residence at Achrida, where he died after 1107. He was a prolific writer, and his collected works were published in a splendid edition by Maria de Rubens (4 vols. fol., Venet., 1754-63, reprinted in Migne's *Patrologia Græca*, lxxiii., lxxiv.). His commentaries are really catenas derived mostly from Chrysostom and not original, but they are remarkably well done, and may be consulted with advantage. This remark applies especially to his commentary on the four Gospels, which was translated into Latin by Æcolampadius (Basel, 1524).

SAMUEL MACAULEY JACKSON.

Theopompus (Gr. Θεόπομπος) of Chios: Greek historian; b. about 380 B. C.; was banished from his native island in early life and took refuge in Athens, where he became a pupil of Isocrates, who said of him that he needed the bit as his fellow-pupil Ephorus needed the spur. Theopompus had great success as a composer of show speeches, especially with his panegyric on Mausolus, King of Caria, but, like Ernorus (*q. v.*), he is known chiefly as an historian. In his *History of Greece* (Ἑλληνικά), twelve books, he took up the thread of narrative where Thucydides dropped it, and told the story of Greece from 410 to 394, the date of the battle of Cnidus. In his *History of Philip* (Φιλippiκά), fifty-eight books, he made the reign of Philip of Macedon the center. Besides these works an epitome of Herodotus in two books was attributed to him, and Anaximenes the rhetorician forged under his name a famous invective, *Three-headed* (Τρικέφαλος), in which Athens, Sparta, and Thebes were represented as the triple monster that had ruled and ruined Greece. Of all his work nothing is left save extracts and fragments; but an epitome of the Latin translation of his *Philippica* by Trogus Pompeius survives in the work of Justin. He was a vigorous writer, but first and foremost a rhetorician rather than an historian, and he may be set down as a bitter partisan and a propagator of scandalous stories, which later gossips were only too glad to repeat. Fragments in Müller's *Fragmenta Historicorum Græcorum*, vol. i., pp. 278-333.

B. L. GILDERSLEEVE.

Theosophy [from Gr. θεοσοφία, knowledge of divine things, deriv. of θεόσοφος, wise about God; Θεός, God + σοφός, wise]: a name which, as specifying a religious philosophy, was originated by Ammonius Saccas in the third century of our era. The body of ethical, philosophic, and scientific doctrines to which that title applies is, however, as old as humanity itself, and contains everything that is true in all other and later systems. Esoterically preserved and transmitted in its entirety by adepts and initiates, from time immemorial, their messengers—known to the world as "great teachers" and "saviours"—have, at periodic intervals determined by cyclic law, exoterically taught as much of it as could safely be given out and which any considerable portion of our race could at such times receive and assimilate.

Theosophy teaches a knowledge of the laws governing the evolution of the universe. It is not based upon assumed divine revelation, but upon consciousness. It sees no unsolvable mystery anywhere, throws the words coincidence and chance out of its vocabulary, and affirms the omnipresence and omnipotence of law and perfect justice. Theosophy postulates an Eternal Principle, unknowable except in its manifestations, which is in and is all things, and which, periodically and eternally, manifests itself and re-

cedes from manifestation—evolution and involution. Its opposite poles in the manifested universe are spirit and matter, which are coexistent and inseparable. In manifesting itself the spirit-matter differentiates on seven planes, which are of progressive density down to that within our sensuous perception, the substance in all being the same, but differing in the proportions of its two compound elements. Through all thrill ceaselessly vibrations which are the inexhaustible impulse from the First Cause. These vibrations are distinct, each from all the others, and each always the same in mode upon every plane, but differing in rate according to the rarity or density of the substance of the plane. By means of these vibrations are brought about all forces—phenomena in nature, specialized differentiations and effects of creation, preservation, and mutation—in the world of forms as well as upon the ethereal planes. Thus every atom of the universe is infused with spirit, which is life in one of its phases of manifestation, and endowed with qualities of consciousness and intelligence—likewise phases of the spirit—in conformity to the requirements of its differentiation. On the lowest material plane, which is that of humanity, the spirit focalizes itself in all human beings who permit it to do so. Its rejection is the cause of ignorance, from which flow all sin, suffering, and sorrow; by its conscious acceptance man becomes partaker of the Divine Wisdom, "one with the gods," entering into possession of an ever-increasing power of consciousness, and attains oneness with the Absolute. This is the ultimate destiny of all beings: hence Theosophy affirms the perfectibility of the race and rejects the concept of innate unregenerable wickedness. From the theosophic point of view the world is compounded of the Egos or individual spirits, for whom it emanates from the Divine Will; and its evolution is due to the impulse imparted by its spiritual element, that force manifesting itself from the beginning in the primary conditions of life—far below the sentient stage—and having in the evolution of higher forms, including man, the guidance and direction of intelligent, perfected beings from other and older evolutions. Hence man is deemed a conscious spirit, the flower of evolution; while below him, in the lower kingdoms, are other less-advanced classes of egos, all, however, on the way of ascent to the human stage, which they will eventually reach when man has gone on still higher. The perfecting of self-consciousness is the object of evolution. By this man is enabled to reach more exalted stages of existence. And his conditioned mortal life is for the purpose of affording him experience by which that self-consciousness may be developed and cognition of the spirit attained.

Man is a spirit and requires vehicles with which to come in touch with all the planes of nature included in evolution, and it is these vehicles that make of him an intricate, composite being, liable to error, but at the same time able to rise above all delusions. He is in miniature the universe, for he is, as spirit, manifesting himself to himself by means of seven differentiations. Therefore he is characterized in Theosophy as a septenate or sevenfold being. His immortal being comprises a trinity, spirit (*Atman*), the spiritual soul or discernment (*Buddhi*), and mind (*Manas*). This triad requires as vehicles or instruments through which to operate and gain cognition in matter four lower mortal principles. These are: The animal passions and desires, unintelligent and productive of ignorance through delusion (*Kama*); the life-energy (*Jiva*); the astral body (*Linga Sarira*), which is the connecting link between the ethereal principles and the corporeality; and, finally, the physical body (*Sthula Sarira*). The principle designated as *Jiva* is a special differentiation for the energizing of the human being from the great *pranic* ocean of the life-principle, which is one of the distinctive vibrations already spoken of, and a phase of manifestation of the spirit. It does not cease when the collective entity called man dies, but simply continues its vibrations in the myriad of lives that make up the cells of the body without animating them in harmonious aggregate action. The *Linga Sarira* belongs to the astral plane of matter, which, being next above that of our tangible world in refinement of its substance, is just beyond our normal sensuous perception. As the physical body is at death reabsorbed into the material elements whence it was drawn, so the astral body is eventually dissipated in and absorbed by the substance of its plane; but its permanence is much greater than that of the gross body. During life it is from the earliest moment until the last the model upon which are moulded the physical molecules of which the body is composed, and through it the life-principle is enabled to

animate the aggregate mass as a collective entity. These lower four principles, or sheaths are the transitory, perishable part of man—not himself, but in every sense the instruments he uses—given up at the hour of death and rebuilt at every new birth. The trinity is the real man, the thinker, the individuality that passes from house to house, gaining experience at each rebirth, while it suffers and enjoys according to its deeds. In each successive earth-life he is known to others as a new personality, but in the whole stretch of eternity he is one individual, conscious of an identity not dependent on name, form, or recollections of personalities. This doctrine of reincarnation is the very base of Theosophy, for it explains life and nature as no other hypothesis can; and it is an essential to the scheme of evolution, for without such re-embodiment on the plane of experiences and atonements there could be no evolution of the human soul. The Ego returning to mortal life only goes into the family which either completely answers to its whole nature, gives an opportunity for its evolutionary progress, or is connected with it by reason of events in past incarnations and causes mutually created. Inseparable from the doctrine of reincarnation is that of *Karma*, or justice, sometimes called the "ethical law of causation." Mere entry into life is no fit foundation for just reward or punishment, which must be the deserts for prior conduct. But such consequent awards determine entry into life, and with unerring equity establish the sequence of good and evil happenings in requital of the past. Effect is always in cause, and thus the body, brain, and intellectual faculties furnished by reincarnation being products of one's own deserving, become the field from which must be gleaned the harvest planted by acts in the past. The law of Karma applies in physical nature as well as in ethics to solar systems, planets, races, nations, families, and individuals. With reincarnation the doctrine of Karma explains the misery and suffering of the world, and no room is left to accuse nature of injustice. The misery of any nation or race is the direct result of the thoughts and acts of the Egos who make up the race or nation. If they did wickedly in the past, they must suffer the inevitable consequences. To this end they must go on incarnating and reincarnating until the effects they caused have been exhausted. Though the nation thus suffering chastisement should for a time disappear, the Egos belonging to it could not leave the world, but would reappear as the founders of some new nation in which they would continue to receive their karmic due.

With reference to *post-mortem* conditions, Theosophy teaches two states of existence somewhat analogous to the Christian "purgatory" and "heaven." The first, immediately subsequent to earth-life, is *Kama-loka*, where the immortal trial takes leave of the lower principles remaining after separation from the body. Thence the Ego passes into *Devachan*. The former is, as its name indicates, a place—the astral plane penetrating and surrounding the earth—the latter a state of being, or rather of consciousness. In *Kama-loka* all the hidden passions and desires are let loose, and enough mentality is retained to make them tortures. When the astral body in which they cohere is disintegrated, as it is in time, they remain a sort of entity in the *Kama-Rupa*, a form of still less materiality than the *Linga Sarira*. Eventually this too is said to fade out, leaving only their essence, the *Skanthas*, fateful germs of karmic consequence, which, when the Ego emerges from the devachanic state, are by the law of attraction drawn to the new being in which it incarnates. Owing to the law of cohesion between the principles, which prevents their separation before a given time, the untimely dead must pass in *Kama-loka* a period almost equal to the length life would have been but for the sudden termination. Losing the body has not killed them. They still consciously exist in the astral body, and in the case of very wicked and forceful persons—some executed criminals, for instance—may be even more harmful on the astral plane than they were in life. Prolonged *kama-lokic* existence is no injustice to the victims of accident, since death, like everything else, is a karmic consequence. Finally, it may be said of *Kama-loka* that it is the last conscious state of the thoroughly evil human souls bereft of the spiritual tie and doomed to annihilation (*Avitchi*). Having in life centered the consciousness in the *kamic* principle, preserved intellect and rejected the spirit, leading persistent lives of evil for its own sake, they are the only damned beings we know. Pure souls speedily pass from *Kama-loka* to the devachanic state. It is a period of rest; a real existence, no more illusionary than earth-life, where the essence

of the thoughts of life that were as high as character permitted expands and is garnered by the soul and mind. When the force of these thoughts is fully exhausted the soul is once more drawn back to earth, to that environment which will best promote its further evolution.

No new ethics are presented by Theosophy, as it is held that right ethics are forever the same. But in the doctrines of Theosophy are to be found the philosophical and reasonable basis of ethics and the natural enforcement of them in practice. The present worldwide interest in Theosophy dates from 1875, when Helena P. Blavatsky, a messenger of the adepts, appeared in New York, initiated the theosophic movement, and, with Henry S. Olcott, William Q. Judge, and several other persons, formed the Theosophical Society. Other revivals of the ancient doctrine, occurring in the last quarter of each century during several hundred years past, are matters of historic record; but, as their times were not propitious, they amounted to little in their effect upon humanity at large compared with the importance this one has attained. The Theosophical Society, though its members generally, no doubt, subscribe to theosophic doctrine, is not dogmatic, but admits to membership all who can conscientiously accept its three avowed objects: 1. "To form the nucleus of a Universal Brotherhood of Humanity without any distinctions whatever. 2. To promote the study of ancient and modern religions, philosophies, and sciences. 3. To investigate unexplained laws of nature and the psychical powers of man." Starting with a membership of fifteen persons in 1875, it has spread all over the globe, until now it has hundreds of branches scattered through all the civilized and even the semi-civilized countries, and counts its members by thousands. Beyond its organization in importance, however, is the wonderful influence of theosophic teachings in coloring the literature, thought, ethics, and even scientific progress and religious expression of the world. The size of the society gives but a very imperfect idea of the extent of its work.

The best books conveying instruction in detail concerning theosophic doctrine—but a meager skeleton of which has been offered in the foregoing—are the following: H. P. Blavatsky, *The Secret Doctrine* (1888); *Isis Unveiled* (1877); *The Key to Theosophy* (1889); William Q. Judge, *The Ocean of Theosophy* (1893); A. P. Sinnett, *Esoteric Buddhism* (1883); *Five Years of Theosophy*, selections from *The Theosophist* (1885); Rama Prasad, *Nature's Finer Forces* (1890); *Patanjali* (Judge's version) *Yoga Aphorisms* (1889). A score of theosophic magazines are issued in half as many languages. The leading one of the Theosophical Society in America is *The Path*, published in New York. WILLIAM Q. JUDGE.

Thera: See SANTORIN.

Theramenes, the-rám'ē-nēz (in Gr. *Θεραμένης*): an Athenian politician whose name figures in all political transactions during the last years of the Peloponnesian war, now on the side of the demagogues, now on the side of the oligarchs, and always in the character of a traitor. After the battle of Arginuse (406 B. C.), in which he held a subordinate command in the right wing of the Athenian fleet, he was ordered to return to the scene of action and save as many as possible of the disabled galleys and their crews. A heavy storm set in, which made the execution of the order impracticable, and a great number of Athenian citizens were drowned. In order to escape the odium of this incident, Theramenes speedily repaired to Athens and accused the commanders-in-chief of having taken no measures in the case. In 404 B. C. he was sent first to Lysander, who besieged Athens, and afterward to Sparta, to negotiate a peace, but he postponed the final conclusion of a treaty until the Athenians were reduced to such a degree that they were compelled to accept any conditions whatever. After the peace he was elected one of the thirty tyrants, but as he opposed the violent measures of that body, he became suspected by Critias, was accused by him as an enemy of the state, and finally forced to drink poison. He was a man of eloquence, and, according to Diodorus, a disciple of Socrates.

Revised by J. R. S. STERRETT.

Therapēutæ [= Lat. = Gr. *Θεραπευτæ*, liter., servants, deriv. of *θεραπεύειν*, minister to, serve, deriv. of *θεράπων*, attendant, servant]; a sect of Jewish contemplative ascetics, kindred to, though distinct from, the Essenes. Their chief seat was on Lake Mareotis, the body of water immediately S. of Alexandria, in Egypt. They were of both sexes, strictly observed the Sabbath and other Jewish festivals, were ardent students of the Mosaic law, and claimed to

have secret religious knowledge. Philo describes them in his treatise *On a Contemplative Life, or on the Virtues of Suppliants* (Yonge's Eng. trans. of Philo, Bohn's Series, iv., 1-20). Philo is the only writer to mention them—a fact which has led some to deny their existence and to attribute to a Christian forger of the fourth century the mention of them by Philo. See the exhaustive treatise by Fred. C. Conybeare, *Philo about the Contemplative Life* (Oxford, 1895).

Theresa, tã-rã sãã, or Teresa de Jesus, SAINT: b. at Avila, Spain, Mar. 28, 1515, her full name being TERESA SANCHEZ DE CEPEDA; entered (Nov. 2, 1536) the Carmelite monastery at Avila, and in 1562 founded a reformed branch of Carmelite nuns. She made a prolonged study of theology and wrote several mystical and ascetic treatises, which are accounted among the Spanish classics, and obtained her a great reputation. Among them are *Discurso ô Relaçao de su Vida* (1562), an autobiography giving an account of her interior conflicts and visions; *El Camino de la Perfeccion* (1563); *El Libro de las Fundaciones*; *El Castillo interior, ô las Moradas* (1577), a mystic description of the heavenly life; and *Santos Conceptos de Amor de Dios*. D. at Alba, Oct. 4, 1582. She was canonized by Gregory XV. in 1621.

Revised by J. J. KEANE.

Theresina: capital of the state of Piauh, Brazil; on the right bank of the Parahyba river, 220 miles above its mouth in the Atlantic (see map of South America, ref. 4-G). It was founded in 1852, the capital being removed from Oeiras. The town is regularly laid out, but has no buildings of note and the trade is inconsiderable. The climate is somewhat insalubrious, though less so than that of Parahyba. Pop. about 8,000. II. H. S.

Theresiopel, or Maria-Theresiopel: See SZABADKA.

Theresopolis: town of the state of Rio de Janeiro, Brazil; in a high valley of the Organ Mountains; 38 miles by railway from Nietheroy on the Bay of Rio (see map of South America, ref. 7-G). It was originally a German colony, named in honor of the Empress Theresa. On account of its delightful climate and magnificent mountain scenery it is a favorite summer resort, and no place near the capital better merits a visit of the tourist. In 1892 it was selected as the state capital, but subsequently this was changed to Petropolis. Pop. 6,000. II. H. S.

Therese Christina Maria: Empress of Brazil; b. in Naples, Mar. 14, 1822. She was a daughter of Francis I., King of the Sicilies, by his marriage with Maria Isabella, Infanta of Spain. In 1843 she married Pedro II., Emperor of Brazil. Her unassuming goodness caused her to be generally beloved. The Brazilian revolution and the abdication of the emperor were the probable causes of her death at Oporto, Portugal, Dec. 28, 1889. Of her children only one, Isabel of Bragança, survives. See PEDRO II. II. H. S.

Thermæ [Lat., warm springs, warm baths = Gr. θερμαι, warm springs]: essentially, structures of the Roman imperial epoch consisting in general of large establishments in which baths of all sorts were provided, including large tanks for swimming, together with grounds for running, ball-play, etc., halls for similar exercises, porticoes for promenade and conversation, lecture-rooms, libraries, and probably rooms for eating and festivity. Public baths existed before the time of Augustus in Rome and in other cities, but the earliest thermæ erected was that of Marcus Agrippa. For the architecture of these structures, see ARCHITECTURE. The service of these gigantic places of resort was performed by slaves in great numbers, and carried on by means of underground passages elaborately planned and systematized. Some of the underground structures of the baths of Diocletian in Rome have been explored, but it is probable that much remains to be known of them. Admission to the thermæ was by means of a small fee, but at times the generosity of the emperor or some public man opened some one thermæ gratuitously for a time. The regulations about the hours of opening and closing, the separation of the sexes, the charge for admission and other details of management were frequently varied, and many edicts concerning them are on record. There also remains much that is unknown in the matter of the arrangement of the buildings and the use of different parts; nor is it certain whether the admission fee was payable for the use of the buildings, the porticoes, etc., or for bathing only. See ROMAN ARCHAEOLOGY.

RUSSELL STRONG.

Thermal Springs [*thermal* is from Gr. θερμός, hot]: in general, springs which have a mean annual temperature higher than that of the region in which they are found. Many springs which maintain an even temperature throughout the year appear warm in winter and cold in summer, owing to changes in the temperature of the air.

In most instances the designation thermal is restricted to springs where the temperature stands from 10° to 15° F. above that of the surrounding atmosphere. All observations lead to the opinion that the cause of these high temperatures must be found in the heated rocks below the surface. It does not follow that the waters themselves are necessarily derived from any deep-seated source. On the contrary, the waters of hot springs are mainly meteoric waters that have penetrated downward a sufficient distance to attain increased temperature by contact with heated rocks. In other words, the higher temperature is due to internal heat which is known to increase with depth.

Nearly all thermal springs are found either in regions of orographic disturbance, where the rocks have undergone great displacement through faulting and folding, or else in regions that have been subjected to volcanic eruptions. As lavas have been forced to the surface along lines of least resistance, it not infrequently happens that profound disturbance of strata and volcanic eruptions occur together in the same locality. All regions where hot springs are on a grand scale appear to have been at one time or another centers of eruptive energy. This has been shown to be the case in so many instances that thermal activity and volcanic manifestations may be regarded as closely associated phenomena. In areas of eruptive rocks where the pouring out of lavas long since ceased, the occurrence of thermal springs is looked upon as evidence of the dying out of volcanic energy. Such heated waters testify to the slow cooling of underground lavas through long periods of time. In many localities eruptions have not taken place since Tertiary time, yet connected with them are boiling springs still active and discharging vast quantities of water. The amount of internal heat dissipated by this continuous action of hot springs and steam-vents must be very great.

Distribution of Thermal Springs.—Thermal springs occur in all parts of the world, and not one of the great continental divisions is without them. Many of the larger islands of the world have hot springs, which are usually recognized even by primitive inhabitants as possessing curative properties for many forms of human ailment. In Europe hot springs are numbered by thousands; in France alone over 900 have been described, mostly in the Auvergne, a region of extinct volcanoes. In England, where all volcanic action ceased before the historic period, two hot springs have been noted for centuries. The spring at Bath is known to have remained nearly in its present condition ever since the occupation of England by the Romans. It maintains a temperature of 120° F., and according to the best estimates discharges daily 180,000 gal. of water carrying mineral matter in solution. At Buxton the temperature stands at 82° F. Hot springs extend along the Cordillera from the southern end of South America, through Central America, Mexico, the U. S., and well up into British Columbia. They are distributed over the Appalachians—North Carolina and Virginia being noted for hot springs. In Virginia they are connected with the anticlinal axes and displacements in sedimentary strata. The regions where thermal activity is displayed on the grandest scale, with the most extensive outflows of hot water, are Iceland, New Zealand, and the Yellowstone National Park. Within the restricted area of the Yellowstone Park there are between 3,500 and 4,000 hot springs, without counting innumerable steam-vents and fumaroles. The cauldron of Excelsior geyser discharges 4,400 gal. of boiling water a minute. Geysers are intermittent hot springs. See YELLOWSTONE PARK.

Notwithstanding the wide distribution of thermal springs, there are extensive areas in which none exist. They are wanting in the Mississippi valley and over the Great Plains, and none are known along the coastal plain of the South Atlantic States. Over large areas in Russia they appear to be absent. Their absence in these localities is accounted for by the fact that the sedimentary rocks lie nearly horizontal and show little disturbance. Hot waters fail to reach the surface, and if any exist they flow off underground. Proximity to the seacoast and elevation above sea-level apparently exercise no influence upon the distribution of thermal waters. In the elevated portions of the Andes, notably in Chili and on the high plateau of Tibet, hot waters flowing

from fissures in the rocks have been recorded by scientific travelers at elevations from 10,000 to 16,000 feet above sea-level. In the Yellowstone Park they are found over 8,000 feet above the ocean.

Temperature.—At the surface the temperature of thermal springs varies from a few degrees above that of the air, up to the boiling-point. As a large number of springs are situated less than 1,000 feet above sea-level, many of the boiling waters show a temperature but a little below 212° F. On higher plateaus and elevated mountain regions the boiling-point is reached at much lower temperature. In the geyser basins of the Yellowstone Park water boils at 198° F. Careful observations made by lowering self-registering thermometers into hot pools and geysers vents gave some clue to increased underground heat. In the Upper Geyser Basin, at only 70 feet below the surface, the thermometer recorded 253° F., a rise in temperature due to the pressure of a superincumbent column of water.

Solvent Power.—In general, the solvent power of thermal waters may be said to increase with temperature. Pressure also increases the power of hot waters to take up mineral matter in solution. Many of the relatively cool springs may have acquired their mineral contents at lower depths and consequently higher temperatures. Thermal waters which hold alkaline carbonates in solution have greatly augmented their solvent power for other mineral substances, notably silica, a common ingredient of boiling water in volcanic regions. The mineral ingredients of thermal springs are varied and embrace all substances found in what are usually designated natural mineral waters. Owing to their great solvent power nearly all thermal waters may be considered as mineral waters. In general, any classification of mineral waters based upon chemical composition would apply equally well to thermal waters.

ARNOLD HAGUE.

Thermic Fever, or Sunstroke: fever due to excessive heat, but most commonly due to exposure to the direct heat of the sun; indirect solar heat or artificial heat may have the same effect. There is another form of disease which results from excessive heat quite distinct in its characteristics from thermic fever in that the temperature of the body is depressed. This is generally called *heat exhaustion*. In its mildest form it is represented by the weakness of feeble persons subjected to heat while under exertion. In severe cases there is profound depression, pallor, and in the most severe forms collapse and unconsciousness. The temperature of the body is lowered sometimes to 95° F. Thermic fever, on the other hand, is characterized by high fever, the thermometer in severe cases registering as much as 112° and 115° F. The onset of the symptoms is usually abrupt, though vague distress or weakness may precede their development. The patient rapidly sinks into unconsciousness, is extremely restless, even delirious or maniacal, the surface of the body is red and covered with sweat, the eyes are suffused with blood, and vomiting and purging are frequently present. Unless the patient is promptly treated death ensues from paralysis of the controlling mechanism of respiration and circulation in the brain. The causes of heat exhaustion and thermic fever have been the subject of much speculation, but it is now recognized that the important factor is the immediate effect of heat upon the nervous centers at the base of the brain. Whatever lowers the vitality and resisting power of the system, such as ill health or fatigue, contributes to the development of these diseases, but the immediate cause is the heat itself.

The treatment is different in the two forms. In heat exhaustion the temperature of the body must be promptly elevated by the use of external heat, and stimulants, such as digitalis, atropine, and strychnine, are demanded imperatively. In the case of thermic fever, on the other hand, reduction of the excessive fever is the first requisite. For this purpose cold bathing, effusions of ice-water over the chest and body, or rubbing with ice must be resorted to, and should not be delayed a moment beyond necessity. Antipyrine is a remedy useful for the reduction of fever, but is not in the least comparable with cold water. Where the circulation is failing digitalis should be given hypodermatically; and, on the other hand, in cases of great excitement of the circulation, venesection is used with advantage.

After recovery from sunstroke or heat exhaustion there is often an abnormal susceptibility to the effects of heat, and meningitis or other diseases may follow in consequence of the attack or of the greater susceptibility resulting from the attack.

WILLIAM PEPPER.

Thermidor, Fr. pron. tär'möë'dör [= Fr. from Gr. *θερμός*, hot]; the eleventh month of the French republican calendar. It began on July 19 and ended with Aug. 18.

Thermo-chemistry [from Gr. *θερμη*, heat + Eng. *chemistry*]: that branch of chemistry which deals with the investigation of the evolution and absorption of heat in chemical reactions. Whenever a chemical change takes place there is either an evolution or absorption of heat, and a complete study of the change necessarily involves an estimation of the quantity of heat evolved or absorbed. Hess, of St. Petersburg, was the first to reach results of importance by this kind of work. In 1840 he announced the fundamental law of constant heat summation, according to which the amount of heat developed in a reaction is the same no matter what the intermediate stages may be. Another fundamental law of thermo-chemistry is this: The amount of heat required to decompose a compound into its constituents is the same as the amount evolved in its formation. An immense number of determinations have been made, particularly by Julius Thomsen, of Copenhagen, and by M. Berthelot, of Paris, and the laws referred to have been shown to hold good. While work of this kind is of undoubted value, it must be confessed that it has hitherto exerted but a comparatively slight effect upon the advance of the science of chemistry. See CHEMISTRY.

IRA REMSEN.

Thermody'namics [from Gr. *θερμη*, heat + *δύναμις*, power]: the science which deals with physical phenomena involving either the development of heat or the transformation of heat into other forms of energy. The development of the science has been most rapid since the middle of the nineteenth century, and its applications, which were at first confined to the problems of mass mechanics, now extend to such fields as electro-chemistry, thermo-electricity, and the various branches of physical chemistry. The following may be cited as examples of cases where the principles of thermodynamics are involved: The expansion of bodies when heated; the development of heat by compression; the transformation of heat into mechanical energy in the steam-engine and other heat-engines; the dissociation of gases and of substances in solution; the flow of gases; fusion and evaporation; the influence of temperature changes upon the electromotive force of a voltaic cell. The fundamental principles of the science are usually stated in the form of the two laws of thermodynamics which are explained below.

First Law.—The first law, although capable of expression in a variety of forms, is at bottom only a statement of the principle of the conservation of energy as applied to cases where heat is transformed or developed. Heat being a form of energy may be measured in ordinary mechanical units. (See ENERGY.) Thus 1 British thermal unit is developed by the expenditure of 778 foot-pounds of energy, or 1 minor calorie = 4.197×10^7 ergs. Similarly, when one calorie of heat is transformed, 4.197×10^7 ergs are obtained in some other form of energy. The first law merely states that heat is a form of energy capable of transformation, and that the mechanical equivalent of heat is constant. The first law is often put into the following form: If a quantity of heat dQ is imparted to a body, this energy is expended (1) in increasing the internal energy of the body by raising its temperature or changing its state; (2) by causing the body to expand and so do external work. If dU represents the change in the internal energy and dW the work done against external forces during expansion, then the law of energy requires that

$$dQ = dU + dW, \quad (1)$$

where dQ is supposed to be measured in mechanical units. If p and v represent the pressure and volume of the body, we have $dW = pdv$, and the equation may be written in the more usual form

$$dQ = dU + pdv. \quad (2)$$

Many thermodynamic problems may be solved by a direct application of the energy relations expressed by the first law. Among such may be cited those problems of hydromechanics and PNEUMATICS (*q. v.*), which involve heat transformations as well as ordinary mechanical considerations.

The pressure, volume, and absolute temperature of a perfect gas are found to be related by the equation

$$pv = RT, \quad (3)$$

in which R is a constant depending upon the chemical constitution of the gas, v refers to the volume of unit mass, and T is the absolute temperature. The fixed gases obey this law with great accuracy, while the relation is also approxi-

mately satisfied in the case of most vapors, provided they are at a temperature not too near the boiling-point of their liquid.

If a gas is allowed to expand or contract under such conditions that the temperature is maintained constant, we have

$$pv = RT = \text{const.} \quad (4)$$

In this case the expansion is *isothermal*. The first law makes possible the computation of the amount of heat which must be supplied to the gas during expansion in order to keep the temperature the same. We have from (2)

$$dQ = dU + pdv.$$

For a gas $dU = c_v dT$, c_v being the specific heat for constant volume,

$$\therefore dQ = c_v dT + pdv.$$

In the case of isothermal expansion, however, T is constant, i. e. $dT = 0$. Therefore $dQ = pdv$, and if the gas expands from v_1 to v_2 we have (remembering that $p = \frac{RT}{v}$)

$$Q = \int dQ = \int_{v_1}^{v_2} pdv = \int_{v_1}^{v_2} RT \frac{dv}{v} = RT \log_e \frac{v_2}{v_1}. \quad (5)$$

The expression $\int_{v_1}^{v_2} pdv$ represents the work done by the gas in overcoming the external pressure. Equation (5) states therefore that energy equivalent to the work done must be supplied in the form of heat.

When no heat is supplied to the gas during expansion its behavior is different. Work is then done at the expense of the internal energy of the gas, and the temperature falls. Under these circumstances the expansion is *adiabatic*. The condition that no heat is lost or gained during expansion leads to the equation

$$dQ = 0 = dU + pdv = c_v dT + pdv.$$

This is equivalent to

$$c_v dT + RT \frac{dv}{v} = 0. \quad (6)$$

If the gas expands from v_1 to v_2 , the corresponding temperatures being T_1 and T_2 , we therefore have

$$c_v \log_e \frac{T_1}{T_2} = R \log_e \frac{v_2}{v_1}. \quad (7)$$

The constant R is equal to the difference (expressed in mechanical units) between the two specific heats of the gas; that is to say, $R = c_p - c_v$, where c_p is the specific heat at constant pressure. The relation between volume and temperature during the process of adiabatic expansion may therefore be put in the form

$$\frac{T_1}{T_2} \left(\frac{v_1}{v_2} \right)^{\gamma-1} = 1. \quad (8)$$

or, making use of the relation given in (4),

$$p_2 = p_1 \left(\frac{v_1}{v_2} \right)^{\gamma}, \quad (9)$$

where γ represents the ratio $\frac{c_p}{c_v}$.

As an example of the application of these equations we may consider the case of the adiabatic expansion of air. The numerical value of γ has been found by experiment to be 1.405 for air as well as for other gases in which the molecule is supposed to consist of two atoms. If expansion continues until the air occupies three times its original volume, we have from (8)

$$\frac{T_2}{T_1} = \left(\frac{1}{3} \right)^{0.405}.$$

Assuming that the air was originally at the ordinary atmospheric temperature, say 20 C., its absolute temperature was $T_1 = 273 + 20 = 293$. The temperature T_2 after expansion is therefore

$$T_2 = 294 \left(\frac{1}{3} \right)^{0.405} = 148 \text{ (absolute),}$$

or -25°C . The air is therefore cooled by expansion from 20 C. (68°F .) to -25°C . (-13°F .) In cases where power is transmitted by compressed air the expansion is often approximately adiabatic, and the cooling effect is a source of some trouble. See PNEUMATIC TRANSMISSION.

For other cases in which the first law may be directly applied (e. g. the flow of gases through pipes, velocity of sound in gases, etc.), the reader is referred to treatises on hydro-mechanics.

Second Law.—While mechanical energy can be completely transformed into heat, the transformation of all the heat in a body into other forms of energy is in no case possible. In general only a small fraction is capable of such transformation. The second law of thermodynamics affords a means of determining the *availability* of heat. The fundamental principle upon which it rests is the experimental fact that heat can not of itself pass from a colder to a warmer body. The consequences of this principle are more far-reaching than is at first apparent. The following example will afford an illustration of its application:

Carnot's Cycle.—A perfect gas may be utilized as a working fluid in transforming heat into mechanical energy in the following cyclic process: Let the initial pressure and volume of the gas be represented by the co-ordinates AA' and OA' of the point A in the diagram. The gas is allowed to expand isothermally until its pressure has been reduced to BB' and its volume has increased to OB' . During expansion the gas may be made to do work by driving a piston, while an amount of heat, Q_1 , must be supplied from a "source" in order to keep the temperature constant. When the condition represented by the point B has been reached, the source of heat is removed, and the gas allowed to expand adiabatically to C . If the absolute temperature was originally T_1 , it will have fallen between B and C to some lower temperature, T_2 . Let the gas now be compressed isothermally at this temperature to D . During this process the heat Q_2 developed by compression must be removed by a "refrigerator." The gas is finally compressed adiabatically to the original condition A , when its temperature will be T_1 as before.

During the complete cycle the heat Q_1 has been given to the gas, while the quantity Q_2 has been taken from it. The difference $Q_1 - Q_2$ represents the amount of heat that has been transformed into mechanical energy. It may be mentioned in passing that the graphical representation here used affords an excellent means of following the various steps in such a process. Thus the area $ABB'A'$, being equal to $\int_{A'}^B pdv$, represents the work done during the first expansion. Similarly the areas $BCC'B'$, $CDD'C'$, and $DAA'D'$ represent the amounts of work done, either upon the piston or by the piston, during the corresponding expansions or compressions. The area of the figure $ABCD$ is a measure of the net work done by the gas in the course of the complete cycle. Graphical methods similar to this are frequently employed in thermodynamic problems.

A consideration of the laws of perfect gases shows that under these circumstances

$$\frac{Q_1}{T_1} - \frac{Q_2}{T_2} = 0, \text{ or } \frac{Q_1 - Q_2}{Q_1} = \frac{T_1 - T_2}{T_1}.$$

The expression $\frac{Q_1 - Q_2}{Q_1}$ is the ratio of the work utilized in driving the piston to the total heat energy supplied, i. e. the efficiency of the engine.

Such a process is a reversible one. For if the expansions and compressions are made to occur in the reverse direction, a quantity of work, $Q_1 - Q_2$, will be done by the piston and will result in taking the heat Q_2 from the refrigerator and giving up Q_1 to the source. It is clear that no heat-engine working between the temperatures T_1 and T_2 can be more efficient than one that is reversible. For if this were possible, such an engine might be employed to drive a reversible engine, using the same source and refrigerator, backward, and there would result a continual transfer of heat from the refrigerator to the source, i. e. from a colder to a warmer body. But this is contrary to universal experience.

The greatest possible efficiency which can be obtained in any heat transformation is thus determined by the range of temperatures that can be used, and does not depend upon the working substance. For example, if heat is supplied at

200° C. while the temperature of the refrigerator is 100° C., the highest possible efficiency is given by the expression

$$\frac{T_1 - T_2}{T_1} \text{ or } \frac{100}{200 + 273} = 21.1 \text{ per cent.}$$

If steam is used as the working fluid this case would correspond to that of an engine receiving steam at a pressure of about 200 lb. and exhausting at atmospheric pressure. The efficiency practically attainable would of course be much less than that computed for the ideal case. In the case of any reversible cycle of operations in which the quantities Q_1, Q_2, \dots etc., of heat are supplied at temperatures T_1, T_2, \dots etc., it is found (remembering that Q is sometimes negative) that

$$\frac{Q_1}{T_1} + \frac{Q_2}{T_2} + \dots = 0. \tag{10}$$

By a reversible cycle is meant any series of operations which finally bring the whole system back into its original condition, and which can be performed in the opposite direction with all quantities reversed. If the temperature changes are continuous, equation (10) may be written

$$\int \frac{dQ}{T} = 0 \tag{11}$$

for a reversible cycle. Considerations which can not be discussed here show that $\frac{dQ}{T}$ is a complete differential, i. e.

the differential of some quantity whose value is completely determined by the physical condition of a body, and independent of the manner by which the body was brought into that condition. This quantity is called the *entropy* of the body, and may be denoted by S [$\frac{dQ}{T} = dS$]. The entropy of a perfect gas may, for example, be found as follows: From (1)

$$dQ = dU + pdv,$$

but $dU = c_v dT$, and since for a perfect gas $pv = RT$, we have $pdv = RT \frac{dv}{v}$,

$$\therefore dS = \frac{dQ}{T} = c_v \frac{dT}{T} + R \frac{dv}{v}. \tag{12}$$

$$S = c_v \log_e T + R \log_e v + \text{const.} \tag{13}$$

In other cases the determination of S presents greater difficulties. But the principle stated below may often be applied without a knowledge of the actual numerical value of S .

By using the conception of entropy, the second law of thermodynamics may be stated in a very useful form as follows: In the case of any reversible process the *total* entropy remains constant; if the process is not reversible, the entropy of the system must increase. In estimating the total entropy, all bodies whose condition is in any manner altered during the process in question must be considered. As examples of non-reversible processes may be mentioned the development of heat by friction, or the expansion of a gas without overcoming outside pressure.

In accordance with the second law, as stated above, the entropy of a system can never diminish. When the physical conditions of a system are such that its entropy is a maximum, the system must therefore be in equilibrium. It is this condition that enables the solubility of a salt, the dissociation of a vapor, the vapor tension of liquids or solutions, etc., to be determined by the application of the second law; for these are all cases of physical and chemical equilibrium. In the case of evaporation, for example, the development of vapor at the surface of a liquid continues until a certain definite vapor pressure, whose value depends upon the temperature, has been reached. The vapor is then saturated, and there is no tendency either for further evaporation or for condensation. Under these circumstances the liquid and its vapor are in equilibrium with one another. The conditions necessary for such equilibrium may be investigated by remembering that the entropy of the system must be at a maximum. Various laws in regard to the dependence of vapor tension upon temperature, substances in solution, etc., have been developed in this manner.

The application of thermodynamics has been greatly extended during the last few years, and it seems probable that this science will be a most valuable aid in the further development of physics and chemistry. ERNEST MERRITT.

Thermo-electricity: the direct production of electric currents by means of heat. The process was discovered by Seebeck about 1821 or 1822 (Pogg. *Ann.*, vi., 1826). Strictly, the phenomenon consists in the generation of electromotive force at the unequally heated junctions of two substances which are in some way dissimilar. Thus if a circuit be formed of an iron and a copper wire, and if the temperature of one junction be raised above that of the other, a current will flow across the warmer junction from copper to iron. The heated junction is the seat of an electromotive force of such direction that the iron is at a higher potential than the copper. A current, therefore, flows around through the circuit from the warmer iron across the cooler junction back to the warmer copper. For thermo-electric series, see *Electricity from Heat* under ELECTRICITY.

The electromotive force of a thermal element is small, and depends not only upon the temperature difference of the two contacts, but upon the absolute values of their temperatures. Every combination of two metals has what is called a neutral temperature. At this temperature the electromotive forces at the two junctions are equal and in opposite directions; hence there is no current. Thus for silver and iron the neutral temperature is 223.5° C.; for copper and iron it is 274.5° C. When the mean temperature of the two junctions is above the neutral temperature, the current is reversed. There is no current when t_1 equals t_2 and when $\frac{1}{2}(t_1 + t_2)$ equals the neutral temperature.

With most pairs of metals, if differences of temperature be plotted as abscissas and electromotive forces as ordinates, a parabola will be obtained with its axis vertical. (See *Electricity from Heat*, under ELECTRICITY. Therefore, from the properties of the parabola,

$$E - e = b(T - t)^2, \tag{1}$$

where E and T are the electromotive force and temperature corresponding to the vertex of the parabola, and b is a constant. In a few cases the parabola becomes a straight line, and in others the curve consists of portions of parabolas with their axes parallel and their vertices turned alternately in opposite directions.

This relation between electromotive force and temperature led Lord Kelvin and P. G. Tait to adopt an elegant method of constructing a thermo-electric diagram. The differential coefficient of e with respect to t is, from equation (1),

$$\frac{de}{dt} = 2b(T - t). \tag{2}$$

Now $\frac{de}{dt}$, or the rate of change of the electromotive force

with temperature, is the *thermo-electric power*, and, if this be taken as an ordinate, (2) is the equation of a straight line. If, then, this line for some standard metal be made to coincide with the axis of temperature, the lines obtained from observations on circuits of other metals with it will, in general, be straight lines also; and taken together they will

FIG. 1.

form a thermo-electric diagram. The point of intersection of any pair of lines corresponds with the temperature of maximum electromotive force for this pair of metals. Thus the copper-iron lines cross at 274.5°. This is therefore the temperature at which the thermo-electric power of this pair becomes zero. It is also the point, therefore, corresponding to the neutral temperature for this pair. At a mean temperature a little below 274.5° a small difference of temperature between the two junctions causes a current to flow across the warmer one from copper to iron; if the mean temperature is above 274.5°, the current flows across the warmer junction from iron to copper. This phenomenon is known as *thermo-electric inversion*. Fig. 1 is the thermo-electric diagram for several metals compared with lead.

From the manner in which this diagram is constructed it follows that, if the cooler junction of a copper-iron couple be at 100° and the warmer at 200°, the electromotive force in the circuit will be represented by the area *abcd*; but if the warmer junction be at 400°, the electromotive force will be numerically equal to the difference of the areas *abn* and *c'd'n*. The intersections of some of these lines, palladium-copper, for example, lie beyond the limits of Tait's experimental diagram. The palladium-copper lines, if produced, would intersect at -170 C. Dewar and Fleming have found, by means of the low temperature obtained with liquid oxygen, that thermo-electric inversion for this couple occurs at about -170 C.

In 1834 Peltier discovered the phenomenon converse to the production of electromotive force by the application of heat. If a bismuth-antimony junction, for example, be

FIG. 2.

heated, a current flows across from bismuth to antimony, or bismuth is positive to antimony. Peltier discovered that if a current be sent across such a junction from B to A, Fig. 2, where B is bismuth and A antimony, the junction is cooled; but if it goes from A to B, the junction is heated. The long arrow in the figure shows the direction in which the current is sent through from an outside source; the arrows at *a* and *b* show the direction of the electromotive force at the junctions. At *a* this electromotive force is in the same direction as the current; hence at this point work is done on the current, and the heat of the junction is converted into the energy of a current. At *b* the electromotive force is negative, and the current does work on the junction and heats it. This accords with the general principle that the current gives up energy wherever it encounters a back electromotive force. This generation of heat is entirely distinct from that due to the resistance of a conductor, since the heat due to the Peltier effect is proportional to the first power of the current, while that due to ohmic resistance varies as the square of the current. Moreover, the former is a reversible phenomenon, while the latter is not.

In order to explain the fact of electric inversion in such couples as copper and iron, Lord Kelvin assumed that the Peltier effect becomes zero at the neutral temperature. No heat is then absorbed or developed at a junction at this temperature, while heat is generated at the other junction, since the current there meets a counter-electromotive force. There is, therefore, no thermal energy at the junctions which can be converted into electrical energy; but since there is no other possible source of the energy of the current, Lord Kelvin was led to predict that heat is absorbed at parts of the circuit other than the junctions. This prediction he subsequently verified. In copper heat is absorbed when the current passes from cold parts to hot parts; in iron it is absorbed when the current passes from hot parts to cold parts.

Consider a metallic bar, A B C, Fig. 3, which is heated at the middle, B, and cooled at the ends, A and C. Then the distribution of heat may be represented by the curve *abc*.

FIG. 3.

But if a current be passed from A to C, then, in metals like copper, the curve of the distribution of heat becomes somewhat like *a'b'c''*. Since a current in copper absorbs heat as a liquid does in flowing from the cold parts to the hot parts of a tube, electricity is sometimes said to have *specific heat*. It is positive in metals like copper and negative in metals like iron.

Thermal electromotive forces have their origin also at the contacts of solids with liquids and of liquids with liquids.

The thermo-electric power of Zn-ZnSO₄ is 0.00076 for a mean temperature of 18.5 C.; that of Cu-CuSO₄ is 0.00069 for about the same temperature. Since the liquid is positive to the metal in both cases, and there is no appreciable electromotive force at the contact of the two, the temperature coefficient of the electromotive force of a Daniell cell, which is composed of zinc in zinc sulphate and copper in copper sulphate, is the difference of the above two thermo-electric powers, or 0.00007. This conclusion is verified by experiment. Similar results with other cells show that the temperature coefficient in general is determined by the superposition of the several electromotive forces at the contacts of the dissimilar substances in the cell.

HENRY S. CARHART.

Thermometer: any instrument for the measurement of temperature. The effect generally used for the purpose is the relative expansion of a liquid or a gas. The distortion of solids by heat is also sometimes used. In the earliest thermometer (Galileo, 1592, and Debbel, 1621) a glass bulb containing air was used, a bead of liquid in the stem separating the contained gas from the outer atmosphere. The movement of this bead along an arbitrary scale indicated the change of temperature. In the eighteenth century liquid thermometers came into use, among others the mercury-thermometer, which, in the hands of Fahrenheit (1714), of Réaumur (1730), and of Celsius (1742), reached a considerable degree of perfection. The scales of these three makers are related to each other as shown in the following formula and graphically in Fig. 1:

$$n^{\circ} C. = \frac{4}{9} n^{\circ} R. = \frac{9}{5} n^{\circ} F. + 32^{\circ} F.$$

The only other scale which need be mentioned is the absolute scale, sometimes used in scientific work, for which see THERMOMETRY.

All thermometers are based upon the same principle of scale-making—viz., the selection of two fixed points which are capable of accurate experimental determination and the division of the intervening portion of the bore into equal parts called degrees. Parts of the tube lying above and below the fixed points are divided into degrees of the same size. The fixed points used in the construction of all ordinary thermometers are the temperatures of melting ice and of the steam within a vessel of boiling water when the pressure is 76 cm. of mercury. The scale of Fahrenheit appears to have been arranged with reference to the uses of the physician, the attempt having been to make 100° correspond with the temperature of the human body; but it is always fixed by the use of the two points already mentioned.

The form of the mercury-thermometer, which is the result of nearly 200 years of experience, is briefly as follows: (1) An elongated bulb containing pure mercury (B, Fig. 2), with walls of glass as thin as is compatible with safety, and a diameter somewhat less than that of the stem (S), in order to admit of its passage without pressure through any hole which snugly fits the tube of the thermometer. (2) An elongated stem of glass with a capillary bore, sometimes flattened to show the height of the mercury, but in the better forms cylindrical. The stem is sometimes of clear glass, sometimes of glass with a strip of milk-glass at the back. In all thermometers for scientific purposes it carries the scale, etched upon the glass. The bore should terminate above in a small bulb (*b*), which serves to receive any mercury which may be driven to the upper end of the bore. This minor bulb is also useful in the calibration of the thermometer.

Establishment of the Fixed Points.—To find the melting-point of a thermometer, after the same has been filled with mercury, exclude the air by boiling the mercury within the bulb, seal the tube, and insert the bulb in broken ice, as shown in Fig. 3; then, after a sufficient interval (about twenty minutes to thirty minutes) has elapsed, mark on the stem the position of the mercury; this gives the melting-point of ice. To find the boiling-point, the apparatus shown in Fig. 4 is used. It consists of a bath in which the thermometer bulb and a portion of the stem are surrounded by steam at the proper pressure. After adequate exposure, the height of the mercury is again noted.

The scale of the mercury-thermometer is based upon the assumption that equal movements of the mercury along the stem indicate equal differences of temperature. As is pointed out in the article on THERMOMETRY (*q. v.*), this assumption fails of strict fulfillment from two distinct causes.

FIG. 1.

FIG. 2.

The first of these is the irregularity of the bore, a source of error, which can be overcome by calibration and by making the divisions with equal cubic contents of bore, instead of making them of linear equality. The other difficulty arises from the fact that glass expands with increasing rapidity as the temperature rises, so that the relative coefficient of expansion of the liquid with which the bulb is filled, even though that liquid possesses a perfectly constant coefficient, will vary with the temperature. This source of error, although it may be neglected in many of the uses to which the mercury-thermometer is put, is so serious in its bearings upon experiments of precision as to have led to the abandonment of that instrument as a primary standard in favor of the air-thermometer.

Shifting of the Zero-point.—A very troublesome error of the mercury-thermometer is the gradual rise of the zero-point with age. This effect, which often amounts in the aggregate to more than a degree of the centigrade thermometer, is due to the continued contraction of the glass of the bulb after fusion. This change, which is rapid at first, continues, although with diminishing intensity, for a very long time. It has been traced for at least twenty years. A similar shrinkage, through much smaller range, follows every subsequent heating of the thermometer; so that an instrument which, after the determination of its zero, is placed in boiling water suffers a shifting of the zero from which it recovers only after a long time.

FIG. 3.

Air-thermometers, on account of their comparative freedom from the influence of the variations in the coefficient of expansion of the bulb, have been universally adopted as standards of comparison. They depend upon the laws of Charles and Mariotte (see PNEUMATICS), which express the well-established fact that the volume of a gas is directly proportional to the absolute temperature, with a constant coefficient of $\cdot 003668$, and inversely proportional to the pressure.

The essential parts of the air-thermometer are the bulb (B, Fig. 5) and the manometer (M), by means of which the pressure may be regulated and measured. The usual procedure consists in holding the air within the bulb at constant volume, the mercury within the manometer tube being brought always to the same level (n). The temperature of the air within the bulb is computed from the pressure necessary to give it the volume in question.

At very high temperatures this process has to be abandoned for fear of distending the bulb and changing its volume permanently. For such experiments the pressure is maintained constant and the volume is allowed to vary. In the measurement of temperatures above 400°, porcelain is substituted for glass on account of its greater refrangibility. Fig. 6 shows the form of

bulb used by Barus in the calibration of thermo-elements for the measurement of high temperatures. It is of porcelain, with a neck 40 cm. long and only 0.1 cm. of internal

diameter. A re-entrant tube is introduced for the purpose of admitting the junction to be calibrated to a position near the center of the bulb.

Special Forms of Thermometers.—The thermometers described in the preceding paragraphs are standard forms. These are modified to adapt the instrument to special purposes, and sometimes new principles are introduced.

Among the numerous special forms of mercury-thermometers it is possible to mention here only one or two of the best known. One such is the clinical thermometer, in which the stem is shortened between the zero and the range with which one has to do in determining the temperature of the human body, by means of a small subsidiary bulb, as shown in Fig. 7. Other well-known special forms are the various maximum and minimum thermometers, of which one of the most widely used (Rutherford's) is shown in Fig. 8. The maximum recording device consists simply of a steel marker, which is pushed along the wide bore in front of the mercury column, and is left by the latter when it recedes. The minimum is recorded by means of an alcohol-thermometer containing a minute dumb-bell-shaped marker of glass, which fits the tube loosely, so that when the thermometer rises the liquid flows past. Upon the return the surface film catches the marker, which is thus compelled to follow the receding column to its lowest point.

Where it is desired to indicate temperatures in such a way that the scale may be easily read from a distance, distortion thermometers are sometimes used. They are analogous to the aneroid barometer in principle, the same multiplying devices being used to carry a hand along a circular scale. Fig. 9 shows a familiar form. It consists of a strip of copper and one of steel fastened side by side and bent so as to form nearly a complete ring. The copper is on the inside. Difference in the coefficients of expansion of the two metals distorts the double piece which is fastened at one end, and the slight movement of the free end is magnified by the simple device shown in the figure. The spiral spring secures a prompt return of the pointer. See CENTIGRADE THERMOMETER.

E. L. NICHOLS.

Thermometry [deriv. of *thermometer*; Gr. *θέρμη*, heat + *μέτρον*, measure]: the process of measuring temperature. The phenomena which are commonly utilized in thermometry are the change in length or volume under the action of heat, distortion of form from the same cause, the electromotive force due to difference of temperature between the junctions of a thermo-element or thermopile, and the change of electrical resistance which occurs in a metal when the same is subjected to variations of temperature.

Expansion thermometers, on account of their simplicity, are the most widely used. They are also the earliest, Galileo having made air-thermometers with arbitrary scales in 1592. A nearly ideal substance for thermometry at ordinary temperatures is mercury. That liquid possesses a very low freezing-point (-39.4° C.) and a higher boiling-point than any other available liquid (357° C.). It has a sufficiently large coefficient of expansion (0.000181), as compared with glass (0.000025), to afford ample sensitiveness; it is opaque

FIG. 6.

FIG. 7.

FIG. 8.

FIG. 9.

FIG. 5.

and an excellent conductor of heat. These properties have led to the adoption of mercury for all excepting a few special purposes, in spite of the fact that it does not possess the one essential characteristic of a perfect thermometric medium, viz., an absolutely constant coefficient of expansion. Only the permanent gases possess such a coefficient, and these, while they are likely always to be used for purposes of reference and comparison, are ill adapted in almost every other respect for the purposes of practical thermometry. Since, moreover, the performance of any liquid or gas thermometer depends not only upon the coefficient of the contents but also upon that of the bulb itself, the accuracy of the instrument is limited by the lack of uniformity in the expansion of glass. The error due to variations in the coefficient of the bulb are less important in the case of air thermometers, where the gas expands 140 to 150 times as fast as glass, than with mercury, where the ratio is only about 7:1. That mercury is a sufficiently good material to use in bulbs of ordinary glass is seen on comparing its coefficient at different ranges with that of the latter substance. See Table I:

TABLE I.—COEFFICIENTS OF EXPANSION OF MERCURY AND OF GLASS.

MERCURY (ACCORDING TO LEONARDT).		ORDINARY GLASS (ACCORDING TO RECKNAGEL).	
Range of temp.	Mean coeff. (cubic).	Range of temp.	Mean coeff. (linear).
0° to 100°	0.00018092	0° to 10°	0.00000851
100 " 200	0.00018094	0 " 50	0.00000882
200 " 300	0.00018129	0 " 100	0.00000920
		0 " 150	0.00000959
		0 " 200	0.00000997

Happily glass is an artificial mixture, and its properties are to a great extent within the control of the manufacturer. Under the guidance of Abbe, of Jena, and other investigators, it has been found possible to adapt glass, by varying its composition, to the varying needs of the optician, and also to reduce the changes in its coefficient of expansion. How marked the improvement is may be seen from Table II., in which are indicated the errors of two mercury-thermometers, the zero-points and boiling-points of which are correct and the bores of which between those points are divided into 100 parts of equal volume. One of these is a thermometer of Thuringian glass of the composition used in 1830-40, the other is a modern thermometer of the Jena normal glass. Both are compared with the hydrogen thermometers:

TABLE II.

TEMPERATURES.	CORRECTION OF A THERMOMETER OF	
Hydrogen thermometer.	Thuringian glass.	Jena normal glass.
0°	0.000°	0.000°
10	-0.086	-0.056
20	-0.149	-0.091
30	-0.191	-0.109
40	-0.213	-0.111
50	-0.206	-0.103

70	-0.171	-0.071
80	-0.127	-0.041
90	-0.069	-0.018
100	0.000	0.000

Thermometric Scales.—Many proposals have been made to establish thermometric scales based upon some absolute system, thermodynamic or other. In practice, however, it is found convenient to adopt an arbitrary scale with two points fixed; these fixed points being that of melting ice and of the saturated vapor above water which boils at a pressure of 76 cm. The familiar scale of Fahrenheit has this interval divided into 180 parts [$+32^{\circ}$ to $+212^{\circ}$], that of Réaumur into 80 parts [0° to $+80^{\circ}$], while the scale of Celsius, the "centigrade" scale of science, contains 100 divisions. The ratio of the three is therefore

$$1 F. = \frac{5}{9} C. = \frac{4}{5} R.$$

To consider the case of the centigrade scale only, it is evident that the 100 equal divisions between melting and boiling might be—

- (1) Linearly equal divisions,
- (2) Divisions of equal content of bore,
- (3) True degrees of the centigrade scale.

In a thermometer of truly cylindrical bore, filled with a thermometric substance with uniform coefficient, and hav-

ing a bulb which likewise expands uniformly, the three methods of dividing the stem would be identical. Actual thermometers, however, do not possess truly cylindrical bores. Calibration of the same by means of a detached thread of mercury shows in general a conical form, more or less irregular. The character of the bore can be shown graphically by means of a curve in which ordinates are reciprocals of the lengths of the thread and abscissas are distances of the middle of the thread from the zero-point of the thermometer. Fig. 1 is such a curve, platted from measurements upon an unusually good thermometer. It is evident that a scale made by dividing the bore between the melting and boiling points into 100 parts linearly equal will be inaccurate. All fine thermometers have the bore calibrated for the purpose of determining the lengths of divisions, embracing everywhere equal cubic contents of bore. Such a scale is subject only to errors arising from variations in the coefficient of apparent expansion of the mercury. The size of this error, which depends upon the character of the glass, is given in Table II. For the work of the highest precision, in which the errors of expansion can not be neglected, a direct comparison is made with the air-thermometer. For other errors of the mercury thermometer and for details of its construction, etc., see THERMOMETER.

FIG. 1.

the following consideration: Given a thermometer containing a perfect gas. Suppose the form of the thermometer to be cylindrical (Fig. 2). If this cylinder be placed in ice and in steam and the two fixed points noted, it will be found that the interval contains $\frac{100}{273}$ of the contents of the tube. If now the tube be graduated in centigrade degrees (all of equal length) and the graduation be carried downward past the zero, the 273d division below zero will coincide with the bottom of the tube. From this -273° is called the absolute zero. It is a point lying considerably below the experimental range, which at present extends only to the temperature of oxygen boiling under reduced pressure, or to about -200° C. See, further, the article ZERO.

The use of the expansion of solids in thermometry is chiefly confined to the measurement of high temperatures or pyrometry (see PYROMETER), the coefficient being too small to afford sufficient delicacy at ordinary temperatures, but the distortion of properly constructed composite solids consisting of two or more solids with different coefficients is used with excellent results. Such instruments, for a description of which see THERMOMETER, are adapted for indicating temperature changes rather than for precise measurement. They bear much the same relation to the mercury-thermometer that aneroid barometers do to the standard mercury-barometer.

It may be seen from the foregoing that the standard process in thermometry is that in which the expansion of a gas is used. The manipulation of the air-thermometer, whether by the method of constant pressure or of constant volume, is, however, so complicated a matter that that instrument is used only for purposes of reference and calibration.

Electrical thermometry, as indicated in ELECTRICITY (q. v.), consists in the utilization of the electromotive force of a thermo-element for the determination of differences of temperature or of the change in resistance in a wire for the same purpose. These two methods are incomparably the most sensitive of known processes for the detection of minute differences, and it is in the measurement of the almost infinitesimal heat quantities with which the student of radiant energy has to deal that they have chiefly been employed.

FIG. 2.

Both methods, however, furnish likewise the most trustworthy means of extending accurate and quantitative measurements to very low and to very high temperatures. Throughout both these extreme ranges, which lie beyond that of the mercury-thermometer, a properly calibrated thermo-element or resistance-coil affords quite as manageable a substitute for the air-thermometer as the mercury-thermometer does between 0 and 100. For temperatures of 0° to -200° C. the most serviceable apparatus consists either of a coil of pure copper

FIG. 3.

and it is the ratio of the deflections thus obtained which measures the temperature of R. The change in the resistance of copper with the temperature, which amounts to .40 to .42 for 100, is ample for the purposes of such measurements, and determinations of the coefficient for a wide range have shown a degree of constancy in that factor which leaves little to be desired. Thus Kennelly and Fessenden found for a copper wire a mean coefficient 0.004065 between 27.8° and 255.26°, with no deviation from that value comparable with the errors of observation. The researches of Dewar and Fleming led to a precisely similar result for the range of temperatures -200° C. . . . +100° C. The specimen of copper with which they performed their experiments gave a higher temperature coefficient (0.00424), but the coefficient was found to be nearly constant through-

FIG. 4.

out the entire range covered by their investigations. Fig. 4 shows the resistance curve for copper, the observations being made at the temperatures of boiling oxygen, boiling ethylene, ice, and steam. It appears as the result of the study of that metal, therefore, that while different specimens of copper possess different coefficients, it is quite safe to assume that the coefficient remains unchanged between -200° C. and +250° C. Since the coefficient is readily determined at ordinary temperatures, say between 0° and 100°, copper is one of the most satisfactory of materials for the electric determination of temperature.

Comparisons of thermo-elements with the hydrogen-thermometer have been made, extending downward to the very lowest temperatures that can be produced by artificial means. By these experiments it appears that the electromotive force of a couple, consisting of pure platinum and of an alloy of platinum with iridium (10 per cent.), one junction of which is cooled, is very strictly proportional to the difference of temperature. This is the combination to be selected when the circumstances make it better to use a thermo-element. The difficulty of obtaining platinum of

sufficient purity, however, makes it desirable to use the method of the resistance coil whenever practicable.

For the electrical measurement of very high temperatures the same two methods are used. Since, however, the only

metals which are sufficiently refractory to admit of their employment are platinum and the metals of the platinum group, the choice of materials is confined to them and their alloys. Barus has shown that the thermo-couple already described (platinum and an alloy of platinum and iridium), when the metals are of the utmost purity, gives an electromotive force very nearly proportional to the temperature almost up to the melting-point of platinum. Fig. 5

FIG. 5.

shows his curve of calibration up to 1,600°. The performance of thermo-elements in which commercial platinum is used is, however, altogether untrustworthy. Attempts have been made by Siemens, Matthiessen, Benoit, and others to utilize the change of electrical resistance of platinum for the measurement of high temperatures, but the results are most unsatisfactory. See PYROMETER.

When the thermo-electric couple is to be used for the measurement of temperature through whatever range, the arrangement of apparatus shown in Fig. 6 is an advanta-

FIG. 6.

geous one. It is based upon the same principle as the method given above for the use of the resistance coil—viz., the comparison of the electromotive force to be determined with one constant and known. The thermo-element, c, V, has the junction, c, packed in melting ice, while V is exposed to the temperature to be measured. It is in circuit with a suitable galvanometer, G, through the switch, S. The points a and b in any circuit have a constant difference of potential. The galvanometer may be brought into shunt around a and b at will by means of S. The ratio of the deflections due to differences of potential between a and b and between c and V affords a measure of the difference of temperature between junctions of the latter couple. The points a and b may be the terminals of a standard cell, the junctions of a thermo-element maintained in ice and boiling water, or two points upon a closed metallic circuit through which a constant current is flowing.

It should be noted that none of these electrical methods affords any direct or absolute measurement of temperature. They all depend upon calibration of the apparatus, that is to say, directly or indirectly, like all other thermometric processes, upon comparison with the air-thermometer. See, further, Guillaume, *Thermométrie de Précision*; Barus, *Measurement of High Temperatures*; Preston, *Heat*; Larden, *Heat*; and the chapters on thermometry in the treatises of Jamin, Wüllner, Müller-Pouillet, and Winkelmann.

E. L. NICHOLS.

Thermopile: an instrument for the production of electric currents by means of the added electromotive forces of a series of thermo-elements.

FIG. 1.

The action of a thermopile depends upon a principle which is elucidated in ELECTRICITY (*q. v.*). Whenever a closed circuit consists of more than one metal, and there is a difference of temperature between the junctions or points of transition from one metal to another, a current will flow through the circuit as if generated

by a difference of potential between the hot and the cold junction. By having several hot and several cold junctions in a circuit it is possible, by a proper arrangement, to sum up the differences of potential thus produced. Such a device is a thermopile. Thermopiles are of two classes: (1) for the study of radiation or of minute differences of temperatures; (2) for the production of considerable current.

In the first class large electromotive forces are desired. These are obtained by selecting metals situated at as great a distance from one another in the thermo-electric series as possible. Bismuth and antimony form the couple usually chosen. These metals are worked into tiny slabs, and soldered together alternately with intervening strips of insulating material, as shown in Fig. 1. In such a series of thermo-elements, alternate junctions of which at H H, for example, can be heated while the other set lying between C C remain cool, a difference of potential equal to

the sum of those generated in all the single elements will be found to exist between the terminals A and B. Such an arrangement constitutes a linear thermopile, and a number of these are frequently gathered together into a cubical block, as shown in Fig. 2.

FIG. 2.

This was the form of pile used by Melloni in his famous researches upon radiant heat. The cubical pile was incased in a metal tube with flaring ends, by means of which, when desired, rays from a source of radiation could be gathered upon one face of

the pile. Fig. 3 shows the cubical pile of Melloni, mounted in the customary manner. One face is furnished with the funnel-shaped tube which is closed in the illustration. The other face is exposed to the radiation from a Leslie cube.

FIG. 3.

The pile is connected to an astatic galvanometer of the type used by Melloni.

The requirements to be met in the construction of a thermopile of the second class are entirely different from

those of an instrument of the kind just described. The materials must be capable of withstanding a high temperature, and the electrical resistance must be low. Instead of antimony and bismuth, two more refractory metals are therefore selected, generally iron and German silver. These are connected in couples so as to form a flat ring, with the junctions to be heated within and the cold junctions outside, as shown in Fig. 4. A number of such layers, one above another, all connected in series and forming a hollow cylinder, constitutes the pile or battery. A burner of the Bunsen type placed beneath the axis of the cylinder heats the inner junctions.

FIG. 4.

With such thermo-batteries very considerable currents may be generated in circuits of low resistance—sufficient, for example, to perform electrolysis or to drive small motors. It has been shown, however, that this method of converting heat energy into electrical energy is of necessity a wasteful one, and that the thermopile considered as a thermal engine must always be of very low efficiency.

E. L. NICHOLS.

Thermopylae [= Lat. = Gr. *Θερμοπύλαι*, *liter.*, Hot Gates; *θερμός*, hot + *πύλαι*, gates]: a narrow defile between Mt. Eta and the Maliae Gulf, leading from Thessaly into Locris. It was the only way by which an enemy could enter from Northern Greece into Hellas, and became celebrated as the scene of the heroic death of Leonidas and his 300 Spartans in their attempt to prevent the Persian hordes from passing through the defile. The locality is no longer a pass, as it has been widened by natural causes into a swampy plain.

Revised by J. R. S. STERRETT.

Théroigne de Méricourt. *tā rwañ-de-mā rēc' koor'*, assumed name of ANNE JOSEPH TERWAGNE: revolutionist; b. at Marcourt, Luxembourg, Aug. 13, 1762; was educated in a convent, but went in 1789 to Paris, where she lived as a courtesan. On the outbreak of the Revolution she acquired influence over the mob, was conspicuous at the fall of the Bastille, and from her fiery speeches and boldness became known as the Amazon of the Revolution. Driven from Paris by an order for her arrest, she fell into the hands of the Austrians at Liège, and was imprisoned in Vienna for nearly a year. Restored to liberty, she returned to Paris, and became still more popular; but her fidelity to the Girondists angered the partisans of the Mountain, whose violence she strove to check. On May 13, 1793, she was seized by a rabble of infuriated women in the garden of the Tuileries, stripped naked, and whipped. This drove her mad, and she spent the rest of her life in La Salpêtrière, where she died June 9, 1817. See Fuss, *Théroigne de Méricourt* (1854).

F. M. COLBY.

Theromor'pha, or Theromora [*theromorpha* is from Gr. *θρῶλον*, mammal + *μορφή*, form]: a group (order) of fossil reptiles which combines in a remarkable way the characters of both Batrachia and monotreme mammals. It appears in Carboniferous time and dies out in the Triassic. These fossils are found in America, Europe, and South Africa.

Thesau'rus: See LEXICOGRAPHY and DICTIONARY.

The'seus (Gr. *Θησεύς*): in Grecian mythology, the national hero of Attica and the founder of the city of Athens; a son of Ægeus and Æthra. He was married first to Antiope, the queen of the Amazons, and afterward to Phædra. He took part in the campaign of the Argonauts, in the Calydonian hunt, in the battle with the Centaurs, etc., but his most famous exploit was the slaying of the Minotaur. Attica was bound to send annually a tribute of youths to Crete to be sacrificed to this monster. In order to put an end to this misery, Theseus repaired to Crete and won the affection of Ariadne, the daughter of King Minos, who provided him with a clew to the labyrinth and a sword to kill Minotaur; he slew the monster and carried off ARIADNE (*q. v.*), whom he afterward left on Naxos. During a revolution in Athens he fled to Scyros, where he perished by the treachery of King Lyeomades, but in 469 B. C. Cimon conquered Scyros and brought his bones back to Athens, where they were interred in the celebrated temple of Theseus. By the sculptors Theseus was sometimes represented as resembling Hercules, with a lion's skin and a club, though of a lighter and

flecter form and of a more elevated expression: sometimes as resembling Hermes, with chlamys (a short cloak) and petasos (a cap).

Thesis: See ARSIS AND THESEUS.

Thes'pis: a native of Icaria in Attica and a contemporary of Pisistratus; became the inventor of the Greek tragedy by introducing between the dithyrambic chorals at the festival of Dionysus an interlocutor, or manner of actor, who now in monologues, now in dialogues with the leaders of the chorus, narrated, or gave a mimetic representation of, the incidents to which the songs referred. Nothing of his writings, if he wrote anything, has come down to us, but he seems to have been a serious person, and the curious picture of Thes'pis strolling about from place to place and entertaining people with shows from his wagon is due to Horace (*Ars Poetica*, 276), whose perspective of the history of literature is very faulty. Revised by B. L. GILDERSLEEVE.

Thessalonica: See SALONICA.

Thess'aly, or **Thessa'lia** [= Lat. = Gr. *Θεσσαλία, Θεσσαλία*]: a large division of ancient Greece, bounded E. by the Aegean Sea, N. by Macedonia, and W. by Epirus. The surface is a plain, inclosed on all sides by mountains—Pelion and Ossa on the E., Olympus and the Cambunian Mountains on the N., Pindus on the W., and Othrys on the S. The soil is very fertile, and the land was in ancient times famous for its wheat and its fine breed of horses. The inhabitants were Æolians, but very early the Epirotes invaded and conquered the country, and made the inhabitants their slaves. The government was oligarchical, but very often disturbed by internal wars, which was the reason why Thessalia never exercised any influence on the affairs of Greece. It was conquered by Philip of Macedon, and passed from Macedonia into the hands of the Romans. After long subjection to Turkey, Thessaly was added to the kingdom of Greece in 1881 through the recommendation of the powers after the Russo-Turkish war. It consists of the nomarchies of Arta, Trikala, and Larissa; total area, 5,073 sq. miles. Pop. (1889) 344,067. See the articles on GREECE.

Thet'is (in Gr. *Θέτις*): in Greek mythology, a daughter of Nereus and Doris. She lived with her sisters, the Nereides, in the depths of the sea, and was a gentle and kindly goddess, ever ready to assist gods in trouble. So she cared for Dionysus when he was fleeing before King Lycomedes, for Heracles when he had been hurled from heaven by Zeus, and she called Briareus to the assistance of Zeus when he was endangered by the machinations of Hera, Athene, and Poseidon. Both Zeus and Poseidon sued for her hand, but Themis foretold that she was destined to bear a son greater than his father. For this reason she was forced, to her great sorrow, to marry Peleus, a mortal man, but king of the Myrmidons in Thessaly. The gods attended the wedding in a body and brought gifts. Eris, enraged because she had not been bidden to the marriage, threw the apple inscribed "To the Fairest" among the wedding guests, and therefore to this wedding may be traced the origin of the Trojan war. Thetis was prevented by Peleus from fully carrying out her plan to make her only son Achilles immortal. In anger thereat she abandoned Peleus and returned to her home in the sea, but she ever followed the fortunes of her son with passionate sympathy. J. R. S. STERRETT.

Theuriet, tō' rē' ā', ANDRÉ: poet and novelist; b. at Marly-le-Roi, France, Oct. 8, 1833; studied law in Paris, and received his licentiate in 1857; soon entered the office of the ministry of finances, and at the same time began his literary work with the verses *In Memoriam* (1857). Subsequent poems are *Le chemin des bois* (1867); *Les paysans de l'Argonne*, 1792 (1871); *Le bleu et le noir* (1873); *Les nids* (1879); *Le lièvre de la payse* (1882); *Nos oiseaux* (1886); *La ronde des saisons et des mois* (1891). His novels are numerous, beginning with the *Nouvelles intimes* (1870) and *Mlle. Guignon* (1874), and comprising among the latest the *Charme dangereux* (1891); *Jeunes et vieilles barbes* (1892); and the *Chanoinesse* (1893). Dramatic productions are *Jean-Marie* (1871); *La maison des deux Barbeaux* (1885); *Ruymonde* (1887), the two latter being drawn from his like-named novels. He has also contributed to various periodicals, and, as an art-critic, written *Jules Bastien-Lepage, l'homme et l'artiste* (1885). J. D. M. FOAD.

Thian-Shan: another spelling of TIEN- (or TI'EN-) SHAN (*q. v.*).

Thibaudeau, tē' bō' dō', ANTOIN CLAIRE: statesman and historian; b. at Poitiers, France, Mar. 23, 1765, where he subsequently practiced as an advocate; was elected a deputy to the Convention in 1792; voted for the execution of the king without appeal to the people, but fell out, nevertheless, with the Terrorists; was chosen president of the Council of Five Hundred in 1796; became a member of the council of state under the consulate and empire, and was made a count in 1803, but was banished from France by the ordinance of July 26, 1815, and lived in Prague, engaged in mercantile business, till 1830, when he returned to France; was made a senator by Napoleon in 1852. D. Mar. 8, 1854. Among other works, he wrote *Mémoires sur la Convention et le Directoire* (2 vols., 1824); *Histoire générale de Napoléon Bonaparte* (1827-28); *Mémoires sur le Consulat et l'Empire* (10 vols., 1835); and *Ma biographie; mes mémoires* (published after his death, 1875).

Thibaut, or **Thibaud,** tē' bō': King of Navarre; b. at Troyes in 1201; a posthumous son of Count Thibaut of Champagne, and Blanche, daughter of King Sancho the Wise of Navarre; was educated at the court of Philip Augustus; took an active part in the political entanglements after the death of Louis VIII.; became King of Navarre in 1234; made an utterly unsuccessful crusade in 1239; persecuted the Albigenses in his territories, which in other respects he governed well. D. at Pamplona, July 10, 1253. Among the *trouvères* he occupies a high rank; sixty-six poems by him were published in 1742 by Lévesque de la Ravallière, and eighty-one are found in Tarbé's *Collection des poètes champenois* (1851). See Delban, *Vie de Thibaut* (1850).

Thibaut, ANTON FRIEDRICH JUSTUS: jurist; b. at Hameln, Hanover, of French descent, Jan. 4, 1774; studied law at Kiel, and in 1798 was appointed Professor of Civil Law, teaching there until called to Jena in 1803; in 1806 he was made Professor of Civil Law in the University of Heidelberg, and remained there till his death, having some political offices conferred upon him without his seeking. He was a man of striking personality, and, in addition to his great legal attainments, was a finished scholar and student of music. D. at Heidelberg, Mar. 29, 1840. His works have left a deep impress on German jurisprudence, the most important of them being *Theorie der logischen Auslegung des römischen Rechts* (1799); *Ueber Besitz und Verjährung* (1802); and *System des Pandektenrechts* (1803), besides numerous essays, and a book dealing with music. F. STURGES ALLEN.

Thibel: another spelling of TIBET (*q. v.*).

Thibodeaux, tīb'ō' dō': town; capital of Lafourche parish, La.; on the Bayou Lafourche and the S. Pac. Railroad; 3 miles N. of Terre Bonne, and 55 W. by S. of New Orleans (for location, see map of Louisiana, ref. 11-F). It is in an agricultural and a rice and sugar-cane growing region; contains Thibodeaux College (Roman Catholic, chartered in 1859), Mt. Carmel convent, a State bank with a capital of \$25,000, and two weekly newspapers; and has a number of important mechanical industries. Pop. (1880) 1,515; (1890) 2,078.

Thick-knee: any bird of the genus *Edicnemus*, family *Charadriidae* or plovers. The thick-knees are distinguished by the moderately long and straight bill (a little longer than the head), which is compressed and wedge-shaped at the terminal half, the linear open nostrils, some distance from the base of the bill, and the elongated tarsi (three or four times as long as the middle toe) covered with hexagonal scales. One species (*Ed. superciliaris*) is a native of Peru; all the others are peculiar to the Old World. They are migratory, and resort to the temperate regions to rear their young. They frequent mostly open inland plains. The common European species is *Edicnemus crepitans*, which attains a length of about 17 inches. Revised by F. A. LUCAS.

Thierry, ti-ā' rē', JACQUES NICOLAS AUGUSTIN: a brilliant historian of the "picturesque" school; b. at Blois, France, May 10, 1795; educated at the college of his native town and the normal school of Paris; attached himself in 1814 with great enthusiasm to Saint-Simon, whom he assisted in his literary labors; became in 1817 a contributor to *Le Censeur européen*, edited by Comte, and afterward to the *Courrier français*, in which he first published in 1820 his remarkable *Lettres sur l'Histoire de la France*, but concentrated himself more and more on the study of history, especially that of France and England, and published in 1825

his *Histoire de la Conquête de l'Angleterre par les Normands* (4 vols., 1860), which attracted great attention, and has been often republished, and translated twice into English (1825 and 1847). In 1826 he became nearly blind, and could continue his studies only by the aid of secretaries and of his friends, among whom were Armand Carrel and Faurel, above all of his wife, Julie de Quérangal, known from several spirited essays in the *Revue des Deux Mondes*; they were married in 1831, but she died in 1844. Subsequently he lived mostly in his brother's house, and died in Paris, May 22, 1856. He became a member of the Academy in 1830. To the latter period of his life belong *Dix Ans d'Études historiques* (1834), a collection of minor essays, and *Récits des Temps mérovingiens* (1840), both translated into English. By Guizot he was appointed to edit one part of the *Collection des Monuments inédits de l'Histoire de France*—namely, the *Recueil des Monuments inédits de l'Histoire du Tiers État* (3 vols., 1849-56), which led him to write his *Essai sur l'Histoire de la Formation et des Progrès du Tiers État* (1853; translated into English by Francis B. Wells, 1855). His *Œuvres complètes* were collected in 10 vols. (1856-60).—His brother, AMÉDÉE SIMON DOMINIQUE THIERRY, D. C. L., b. at Blois, Aug. 2, 1797, was appointed Professor of History in Besançon in 1828, prefect of the department of Haute-Saône in 1830, member of the council of state in 1838, senator in 1860. D. in Paris, Mar. 27, 1873. His writings, advocating the same principles as those of his brother, but less brilliant in execution, comprise *Histoire des Gaulois jusqu'à la Domination romaine* (3 vols., 1828); *Histoire de la Gaule sous l'Administration romaine* (3 vols., 1840-47); *Histoire d'Attila* (2 vols., 1856); *Récits de l'Histoire romaine* (1860); *Tableau de l'Empire romain* (1862); *Saint Jérôme* (2 vols., 1867); *Saint Chrysostome* (1872).

Revised by A. G. CANFIELD.

Thiers, ti-är : town: in the department of Puy-de-Dôme, France; on the Durole; 23 miles E. N. E. of Clermont by rail (see map of France, ref. 6-G). It contains the Church of Le Moutier, portions of which date back to the seventh and eighth centuries. Among its manufactures are paper, including stamps and playing-cards, candles, and, most important of all, the making of cutlery. Pop. (1891) 11,993.

Thiers, LOUIS ADOLPHE : statesman and author; b. in Marseilles, France, Apr. 16, 1797; studied law at Aix; was admitted to the bar in 1818, and began to practice as an advocate, but was drawn by his ambition as well as by his talents to politics and literature, and removed in 1821 to Paris. Here he became a contributor to the *Constitutionnel*, and his articles attracted wide attention. In the meanwhile he made the acquaintance of Laffitte, and became prominent in liberal circles. In 1823 he began to publish his *Histoire de la Révolution française*, finished in 1827 in 10 vols., and this book at once made his name popular throughout France. In 1830 he founded the *National* in connection with Mignet and Armand Carrel, drew up the protest against the *ordonnances* of July 26, and took an active part in the revolution which effected the change of dynasty in France. He was elected a member of the Chamber of Deputies, held office in the ministry of Finance, and in 1832 became Minister of the Interior. For the next four years he virtually directed the policy of the cabinet, though he was not made Prime Minister till 1836. He withdrew altogether from the Government in August of that year on account of the king's opposition to his plan of an armed intervention in the affairs of Spain. On Mar. 1, 1840, he was again made Prime Minister. In the controversy between Mehemet Ali and the Porte, France supported the former, in the hope of reviving Napoleon's policy in the East, and gaining the supremacy in Egypt and Syria, while Russia, Great Britain, Austria, and Prussia were bent on maintaining the integrity of the Ottoman empire. Thiers assumed a menacing attitude, and for a time it seemed as if France might go to war on behalf of her ally, but the king refused to countenance extreme measures, and Thiers resigned Oct. 21, 1840. He retired from public life for several years; visited England, Spain, Italy, and Germany, making preparations for his great work, *Histoire du Consulat et de l'Empire* (20 vols., 1845-62); but in the last years of the reign of Louis Philippe he resumed his work in the Chamber of Deputies, and made vehement opposition to the government of Guizot, especially to its foreign policy. In the banquets which preceded the revolution of Feb., 1848, he took no part, but the popularity which he had partly lost during his own administration he fully regained when he came into opposition. As a member of the Con-

stituent and Legislative Assemblies he accepted the republic, but advocated very restrictive measures. He voted for the presidency of Louis Napoleon, and fought a duel with a fellow deputy named Bixio, who had criticised him for his vote. Nevertheless, when the empire began to develop from the policy of the president, Thiers immediately went into opposition, and on Dec. 2, 1851, he was arrested, and shortly after banished from France. He returned, however, in August, but lived in retirement until 1863, when he was elected a member of the Representative Assembly by Paris. His criticism of the policy of the emperor, the Italian and Mexican wars, the rebuilding of Paris, etc., was often very severe though generally not very effective; he was almost the only member of the Assembly who opposed and condemned the declaration of war against Prussia, but after the downfall of the empire he developed an astonishing energy to save his country from utter ruin. On Sept. 17, 1870, he started on a tour to London, St. Petersburg, Vienna, and Florence in order to procure foreign intervention, and on his return in the last days of October he opened negotiations with Bismarck concerning an armistice. After the capitulation of Paris and the conclusion of the armistice, he was elected a member of the National Assembly by twenty-six departments, Feb. 8, 1871, and on Feb. 17 the Assembly chose him chief of the executive. On Aug. 31 his term of office was fixed at three years, and he received the title of "president of the republic." He was very successful in negotiating the peace; he saved Belfort and one milliard for France. He was still more successful in procuring the means of fulfilling the conditions of peace; the payment of the indemnification and the liberation of French soil from German occupation were effected in a surprisingly short time. The insurrection of the Commune was promptly put down, but his attempt at consolidating the "conservative republic" by legislative enactment failed, and on May 24, 1873, he resigned. He continued a member of the Assembly, and in 1876 was elected senator for Belfort. D. at St.-Germain, Sept. 3, 1877. Among his other works are *Histoire de Law* (1826; Eng. trans., New York, 1859); *De la Propriété* (1848); *L'Homme et la Matière* (1875).

Revised by F. M. COLBY.

Thiersch, teersh, FRIEDRICH WILHELM: classical scholar and educator; b. at Kirchseheidungen, in Prussian Saxony, June 17, 1784; studied theology and philology at Leipzig and Göttingen; privat docent in the latter university in 1809; professor of the Lyceum at Munich, and on the transference of the University of Landshut to the Bavarian capital in 1812 was called to the chair of Ancient Languages, which he held with great distinction till his death in Munich, Feb. 25, 1860. Thiersch has the credit of reviving classical studies in Bavaria by his masterly reorganization of the entire school system of the state. He founded the Philological Institute (*Acad. Philologorum Monacensium*, 4 vols.), published a once highly esteemed *Greek Grammar*, and numerous works on archaeological and pedagogical subjects, among which may be mentioned *Ueber gelehrte Schulen* (3 vols.); *Ueber den gegenwärtigen Stand des öffentlichen Unterrichts in Deutschland, Holland, Frankreich und Belgien* (3 vols., 1838); *Ueber die Epochen der bildenden Kunst unter den Griechen* (2 vols., 2d ed. 1820). See his *Life and Works*, written by his son Heinrich (2 vols., Leipzig, 1867).

A. GUEDEMAN.

Thinocor'ida [Mod. Lat., named from *Thino'corus*, the typical genus; Gr. *thís*, *thwós*, heap of sand, sandy shore or bottom + *κόπος*, the crested lark]; a family of birds of uncertain affinities peculiar to South America. The general aspect is somewhat quail-like; the bill rather short, somewhat slender, broad at the base, and compressed forward, and with the upper mandible slightly decurved over the lower; nostrils basal and lateral, and partly curved by a horny membrane; wings long and pointed; tail moderate and produced straight backward; tarsi stout or moderate, and with the investing scales more or less small; toes four, the three anterior moderately long and free, the posterior small and elevated. The family name was proposed (by Prince Bonaparte in 1850) and has been adopted (by Kaup, Gray, etc.) for a group of birds confined to the temperate and colder regions of South America. They are generally supposed to be most nearly related to the sheathbills (*Chionididae*), but this remains to be verified. They go about generally in pairs or small coveys. Their flight somewhat resembles that of grouse. Open plains seem to be their chief resorts. Eight species are known, belonging to the genera *Thinocorus* and *Attagen*.

Revised by F. A. LUCAS.

Thin Plates, Colors of: the colors produced by interference of light at the surfaces of thin layers of media differing in density. When light falls upon a soap-bubble, or a thin floating film of oil, iridescent hues are seen, which owe their existence to interference of light reflected from the upper and lower surfaces of the film. The same is observed when a thin crevice is produced in a transparent body like ice or glass. The film of soap-solution, or oil, or

air, is optically a plate whose thickness determines the tint observed.

These phenomena were first studied by Newton, who investigated a film of air between two surfaces of glass, one of which was plane and the

other spherical with a long radius of curvature. Let *AB* be the plane surface, touched at *O* by the curved surface *COD*, whose radius of curvature, *OM* or *PM*, is *R*. Let *t* be the thickness of the film at any point, *P*, whose distance from a perpendicular at *O* is *r*. Then by geometry

$$r^2 = (2R - t)t = 2Rt - t^2.$$

Since *t*² is exceedingly small in comparison with *R*, the formula may be written simply

$$r^2 = 2Rt. \tag{1}$$

Now suppose yellow light to be incident vertically from above at *P*. Some of it is transmitted through the film to the lower surface, and there reflected to join what is directly reflected at *P*. The difference of path of the two portions is obviously *2t*. If this retardation be such that the two portions become united with a difference of phase of a half wave-length, or any odd number of half wave-lengths, the resulting interference produces extinction (see INTERFERENCE); but if this difference be a whole wave-length, or any even number of half wave-lengths, they conjoin to produce brightness. This is true for all points where the thickness of the air-film is *t*, and these form a circle around *O* as center with radius *r*.

It can be shown that when light is reflected at the boundary between two media of different density, if the reflection occur in the less dense medium there is change of phase, which has the same effect as if there were a retardation of half a wave-length. This occurs in the film of air at its lower surface. At the center, *O*, where the glass-surfaces are in optical contact, there is hence a black spot due to interference. Around this is a succession of alternately bright and dark rings, according as the interference is with an even or odd number of half wave-lengths of retardation, including that due to change of phase. If the symbol λ be used for wave-length, the successive values of *2t* for the dark points will be $0, \lambda, 2\lambda, 3\lambda, 4\lambda$, etc., while for the bright points they will be $\frac{1}{2}\lambda, \frac{3}{2}\lambda, \frac{5}{2}\lambda$, etc. Substituting these values of *2t* in the fundamental equation, $r^2 = 2tR$, we have the means of calculating the wave-length of light, since *R* is known and *r* may be measured easily. If blue light be employed instead of yellow light, the diameter of any given ring is found to be smaller. The wave-length for blue is hence less than for yellow. If white light be employed there will be a succession of rainbow-rings with the full succession of colors, each tint being due to the extinction of its complementary tint; but these spectra become wider and overlap each other with increasing distance from the center, becoming mixed, so that only a few remain visible. If these Newton's rings are viewed by transmitted rather than reflected light, as there is no change of phase by transmission, the central spot is bright. The presence of the film causes interference as before, but the ratio of reflected to transmitted light is small, so that the rings are wanting in clearness of definition. If the incident light be oblique instead of perpendicular to the surface of the film the rings are larger, and the formula is a little less simple than that just deduced.

W. LE CONTE STEVENS.

Thionville, ti-ōn'vêl' (Germ. *Dielenhofen*, *nw. Theodorinis Villa*): town of the present German province of Alsace-Lorraine; on the Moselle, 19 miles N. of Metz, and in the midst of a broad level plain (see map of German Empire, ref. 6-B). It is a walled city of the old school of fortification, ranking under that system as a third-class fortress. After the investment of Metz by the Germans in 1870, Thion-

ville proved of annoyance to the besieging force, and after two days' bombardment capitulated Nov. 24, 1870, with large stores of supplies. Although many buildings were destroyed, the defences were left almost intact. Pop. (1890) 8,928.

Thirion, tē-rē-ōn, EUGÈNE ROMAIN: historical painter; b. in Paris, May 19, 1839; pupil of Picot, Fromentin, and Cabanel; medals, Salons, 1866, 1868, and 1869; second-class medal, Paris Exposition, 1878; Legion of Honor 1872. His *Moses* (1885) is in the Luxembourg Gallery. Works in the museums in Bordeaux, Perpignan, Tours, and Lisieux; frescoes in La Trinité, Paris. Studio in Paris. W. A. C.

Thirl'wall, CONYER, D. D.: historian; b. at Stepney, London, England, Jan. 11, 1797; displayed such extraordinary precocity that at the age of eleven years his father, who was a clergyman, printed a volume of his compositions under the title *Primitive, or Essays and Poems on Various Subjects*, etc. (1809); entered Trinity College, Cambridge, 1814, and in 1815 took the Craven and Bell scholarships; took the senior chancellor's classical medal and graduated in 1818; became fellow and tutor of Trinity College; studied law, and was called to the bar at Lincoln's Inn 1825; published a translation of Schleiermacher's *Critical Essay on the Gospel of St. Luke* (1825); took orders in the Church of England 1828; became rector of Kirby Underdale, Yorkshire; associated with Rev. Julius Charles Hare in translating Niebuhr's *History of Rome* (2 vols., 1828); and as one of the editors of the Cambridge *Philological Museum* was for several years examiner for the classical tripos at Cambridge, and classical examiner in the University of London; wrote for Lardner's *Cabinet Cyclopædia* a popular *History of Greece* (8 vols., 1835-40), afterward revised and enlarged in a library edition (8 vols., 1845-52); and became Bishop of St. Davids 1840, which post he resigned May, 1874. D. at Bath, July 27, 1875. He was chairman of the Old Testament company on Bible revision. He published a number of sermons, charges, letters, addresses, and essays, which, with other writings, were issued under the title *Literary and Theological Remains* (3 vols., 1876-77), edited by Canon J. J. S. Perowne. His *Letters* were published in 1881 (2 vols.), and his *Letters to a Friend*, edited by Dean Stanley, in 1882.

Revised by S. M. JACKSON.

Thirst [O. Eng. *þyrst*, *þurst*; O. H. Germ. (> Germ.) *durst*; Eccl. *þorsti*; Goth. *þūrstei*, thirst, deriv. of *þairsus*, dry, withered, deriv. of *gafarsan*, wither; cf. Lat. *torre re*, parch; Gr. *τέρεσθαι*, become dry; Sanskr. *trs*, thirst]: a sensation normally caused by the need of water in the animal system, and consequently relieved by drinking. The great thirst of cholera is also caused by a deficiency of water. But thirst also accompanies febrile excitement. This is only temporarily relieved by drinking, and unless contra-indicated by the symptoms small lumps of ice will usually relieve the thirst, and reduce the excessive heat with efficiency and without danger. The use of too much salt is another familiar cause, the explanation being in this case the excessive salinity of the blood. The great thirst of diabetes is similarly induced.

Revised by W. PEPPER.

Thirty-nine Articles of Religion: doctrinal formulas of the Reformation period. When the Reformation was fairly introduced into England under Edward VI. (1547-53), Archbishop Cramer at first entertained the noble but premature project of framing an evangelical catholic creed in which all the Reformed Churches could agree in opposition to the Church of Rome, then holding the Council of Trent, and invited the surviving continental Reformers, Melancthon, Calvin, and Bullinger, to London for the purpose. Failing in this scheme, he framed, with the aid of his fellow Reformers, Ridley and Latimer, the royal chaplains, and the foreign divines, Bucer, Peter Martyr, and John à Lasco, whom he had drawn to England, the *Forty-two Articles of Religion* for the English Reformed Church. After passing through several revisions they were completed in Nov., 1552, and published in June, 1553, by royal authority and with the approval of convocation. The re-establishment of the papacy under the short but bloody reign of Mary (1553-58) set them aside, together with the Edwardian Book of Common Prayer. Under Elizabeth (1558-1603) the Articles were revised and permanently restored. They were reduced to thirty-nine, and brought

into that shape and form which they have ever retained since in the Church of England. The Latin edition was prepared under the supervision of Archbishop Parker, with the aid of Bishop Cox, of Ely (one of the Marian exiles), and Bishop Guest, of Rochester, and approved by convocation 1562. The English edition, which is of equal authority, though slightly differing from the Latin, was adopted by convocation in 1571, and issued under the editorial care of Bishop Jewel, of Salisbury, 1571. They were made binding on all ministers and teachers of religion and students in the universities, but subscription was not always enforced with equal rigor, and they were bitterly complained of by Non-conformists, who had scrupulous objections to the political articles. The Act of Uniformity under Charles II. imposed greater stringency than ever; but the Toleration Act of William and Mary gave some relief by exempting dissenting ministers from subscribing Articles XXXIV. to XXXVI. and a portion of Article XXVII. Subsequent attempts to relax or abolish subscription resulted at last in the University Tests Act of 1871, which exempts all students and graduates in the Universities of Oxford, Cambridge, and Durham, except divinity students and the holders of offices with clerical functions, from subscription, and throws these institutions open to persons of all religious denominations.

The Thirty-nine Articles cover nearly all the heads of the Christian faith, especially those which at the time of their framing were under dispute with the Roman Catholics. They affirm the old orthodox doctrines of the Trinity and incarnation, the Augustinian views on free will, total depravity, divine grace, faith, good works, election, and the Protestant doctrines on the Church, purgatory, and the sacraments of baptism and the Lord's Supper. They are borrowed in part from Lutheran standards—namely, the Augsburg Confession of Melancthon (1530) and the Württemberg Confession of Brentius (1552), but on the sacraments, especially the much-disputed doctrine of the real presence in the Eucharist, they follow the Swiss Reformers, Bullinger and Calvin. In the political sections they are purely English, and teach the Erastian doctrine of the spiritual as well as temporal supremacy of the sovereign as the supreme governor of the Church of England. They have therefore an eclectic and comprehensive character, which distinguishes the Anglican Church from the Lutheran and the strictly Calvinistic churches of the Continent and Scotland, and from the dissenting denominations of England. They have often been interpreted and misinterpreted in the interest of particular schools and parties, while all claim them as favoring themselves. They must be understood in their plain grammatical sense; and when this is doubtful, the Prayer-book, the two books of Homilies, the Catechism, and the private writings of the English Reformers and the Elizabethan divines must be called to aid. The doctrinal decisions in the Gorham (1848-50), Bennet (1870-72), and other controversies favor great latitude in their interpretation.

The Protestant Episcopal Church in the U. S., after effecting an independent organization and episcopate in consequence of the American Revolution, formally adopted the Thirty-nine Articles of the mother Church at the General Convention held in Trenton, N. J., Sept. 12, 1801, but with sundry alterations and omissions in the political articles (Art. XXI. and XXXVII.), which the separation of Church and state made necessary. The only doctrinal difference is the omission of all allusion to the Athanasian Creed (Art. VIII.), which is also excluded from the American editions of the Prayer-book. The Twenty-five Articles of the Methodist Episcopal Church and the Thirty-five of the Reformed Episcopal Church are based upon the Thirty-nine Articles.

LITERATURE.—C. Hardwick, *History of the Articles of Religion* (Cambridge, 1851; 3d ed. 1876); Thomas Rogers, *Exposition of the Thirty-nine Articles* (London, 1579; new ed. Cambridge, 1854); G. Burnet, *History of the English Reformation* (many eds.) and *Exposition of the Thirty-nine Articles* (Oxford, 1845 and other eds.); Laurence, *Bampton Lectures for 1834* (Oxford, 3d ed. 1838); E. H. Browne, *Exposition of the Thirty-nine Articles* (London, 1850; ed. by J. Williams, 1887, the best book); A. P. Forbes, *An Explanation of the Thirty-nine Articles* (1867; 3d ed. 1887); Schaff, *Creeeds* (vols. i., p. 292, and iii., pp. 485-522).

Revised by S. M. JACKSON.

THE THIRTY-NINE ARTICLES as revised by the Protestant Episcopal Church in the U. S. are as follows:

ART. I. *Of Faith in the Holy Trinity.*—There is but one living and true God, everlasting, without body, parts, or passions; of infinite power, wisdom, and goodness; the

Maker and Preserver of all things both visible and invisible. And in unity of this Godhead there be three Persons of one substance, power, and eternity—the Father, the Son, and the Holy Ghost.

ART. II. *Of the Word or Son of God, which was made very Man.*—The Son, which is the Word of the Father, begotten from everlasting of the Father, the very and eternal God, and of one substance with the Father, took man's nature in the womb of the blessed Virgin, of her substance; so that two whole and perfect natures, that is to say, the Godhead and manhood, were joined together in one person, never to be divided, whereof is one Christ, very God, and very man; who truly suffered, was crucified, dead, and buried, to reconcile his Father to us, and to be a sacrifice, not only for original guilt, but also for actual sins of men.

ART. III. *Of the going down of Christ into Hell.*—As Christ died for us, and was buried; so also it is to be believed, that he went down into hell.

ART. IV. *Of the Resurrection of Christ.*—Christ did truly rise again from death, and took again his body, with flesh, bones, and all things appertaining to the perfection of man's nature; wherewith he ascended into heaven, and there sitteth, until he return to judge all men at the last day.

ART. V. *Of the Holy Ghost.*—The Holy Ghost, proceeding from the Father and the Son, is of one substance, majesty, and glory, with the Father and the Son, very and eternal God.

ART. VI. *Of the Sufficiency of the Holy Scriptures for Salvation.*—Holy Scripture containeth all things necessary to salvation; so that whatsoever is not read therein, nor may be proved thereby, is not to be required of any man that it should be believed as an article of the faith, or be thought requisite or necessary to salvation. In the name of the holy Scripture we do understand those canonical books of the Old and New Testament, of whose authority was never any doubt in the Church. *Of the Names and Number of the Canonical Books.*—Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua, Judges, Ruth, The First Book of Samuel, The Second Book of Samuel, The First Book of Kings, The Second Book of Kings, The First Book of Chronicles, The Second Book of Chronicles, The First Book of Esdras, The Second Book of Esdras, the Book of Esther, The Book of Job, The Psalms, The Proverbs, Ecclesiastes or Preacher, Cantica or Songs of Solomon, Four Prophets the greater, Twelve Prophets the less. And the other books (as Hierome saith) the Church doth read for example of life and instruction of manners; but yet doth it not apply them to establish any doctrine: such are these following: The Third Book of Esdras, The Fourth Book of Esdras, The Book of Tobias, The Book of Judith, The rest of the Book of Esther, The Book of Wisdom, Jesus the Son of Sirach, Baruch the Prophet, The Song of the Three Children, The Story of Susanna, Of Bel and the Dragon, The Prayer of Manasses, The First Book of Maccabees, The Second Book of Maccabees. All the books of the New Testament, as they are commonly received, we do receive, and account them canonical.

ART. VII. *Of the Old Testament.*—The Old Testament is not contrary to the New; for both in the Old and New Testament everlasting life is offered to mankind by Christ, who is the only Mediator between God and man, being both God and man. Wherefore they are not to be heard, which feign that the old fathers did look only for transitory promises. Although the law given from God by Moses, as touching ceremonies and rites, do not bind Christian men, nor the civil precepts thereof ought of necessity to be received in any commonwealth; yet notwithstanding, no Christian man whatsoever is free from the obedience of the Commandments which are called moral.

ART. VIII. *Of the Creeds.*—The Nicene Creed, and that which is commonly called the Apostles' Creed, ought thoroughly to be received and believed; for they may be proved by most certain warrants of holy Scripture.

ART. IX. *Of Original or Birth-sin.*—Original sin standeth not in the following of Adam (as the Pelagians do vainly talk); but it is the fault and corruption of the nature of every man, that naturally is engendered of the offspring of Adam; whereby man is very far gone from original righteousness, and is of his own nature inclined to evil, so that the flesh lusteth always contrary to the Spirit; and therefore in every person born into this world it deserveth God's wrath and damnation. And this infection of nature doth remain, yea, in them that are regenerated; whereby the lust of the flesh, called in Greek *φρόνημα σαρκός* (which some do

expound the wisdom, some sensuality, some the affection, some the desire, of the flesh), is not subject to the Law of God. And although there is no condemnation for them that believe and are baptized; yet the Apostle doth confess, that concupiscence and lust hath of itself the nature of sin.

ART. X. *Of Free Will.*—The condition of man after the fall of Adam is such that he can not turn and prepare himself, by his own natural strength and good works, to faith, and calling upon God. Wherefore we have no power to do good works pleasant and acceptable to God, without the grace of God by Christ preventing us, that we may have a good will, and working with us, when we have that good will.

ART. XI. *Of the Justification of Man.*—We are accounted righteous before God, only for the merit of our Lord and Saviour Jesus Christ by faith, and not for our own works or deservings. Wherefore, that we are justified by faith only, is a most wholesome doctrine, and very full of comfort, as more largely is expressed in the Homily of Justification.

ART. XII. *Of Good Works.*—Albeit that good works, which are the fruits of faith, and follow after justification, can not put away our sins, and endure the severity of God's judgment; yet are they pleasing and acceptable to God in Christ, and do spring out necessarily of a true and lively faith; insomuch that by them a lively faith may be as evidently known as a tree discerned by the fruit.

ART. XIII. *Of Works before Justification.*—Works done before the grace of Christ, and the inspiration of his Spirit, are not pleasant to God, forasmuch as they spring not of faith in Jesus Christ; neither do they make men meet to receive grace, or (as the school-authors say) deserve grace of congruity: yea rather, for that they are not done as God hath willed and commanded them to be done, we doubt not but they have the nature of sin.

ART. XIV. *Of Works of Supererogation.*—Voluntary works besides, over and above, God's commandments, which they call works of supererogation, can not be taught without arrogance and impiety: for by them men do declare, that they do not only render unto God as much as they are bound to do, but that they do more for his sake, than of bounden duty is required: whereas Christ saith plainly, When ye have done all that are commanded to you, say, We are unprofitable servants.

ART. XV. *Of Christ alone without Sin.*—Christ in the truth of our nature was made like unto us in all things, sin only except, from which he was clearly void, both in his flesh, and in his spirit. He came to be the Lamb without spot, who, by sacrifice of himself once made, should take away the sins of the world; and sin (as Saint John saith) was not in him. But all we the rest, although baptized, and born again in Christ, yet offend in many things; and if we say we have no sin, we deceive ourselves, and the truth is not in us.

ART. XVI. *Of Sin after Baptism.*—Not every deadly sin willingly committed after baptism is sin against the Holy Ghost, and unpardonable. Wherefore the grant of repentance is not to be denied to such as fall into sin after baptism. After we have received the Holy Ghost, we may depart from grace given, and fall into sin, and by the grace of God we may arise again, and amend our lives. And therefore they are to be condemned, which say, they can no more sin as long as they live here, or deny the place of forgiveness to such as truly repent.

ART. XVII. *Of Predestination and Election.*—Predestination to life is the everlasting purpose of God, whereby (before the foundations of the world were laid) he hath constantly decreed by his counsel secret to us, to deliver from curse and damnation those whom he hath chosen in Christ out of mankind, and to bring them by Christ to everlasting salvation, as vessels made to honor. Wherefore, they which be endued with so excellent a benefit of God, be called according to God's purpose by his Spirit working in due season: they through grace obey the calling; they be justified freely; they be made sons of God by adoption; they be made like the image of his only-begotten Son Jesus Christ; they walk religiously in good works, and at length, by God's mercy, they attain to everlasting felicity.

As the godly consideration of predestination, and our election in Christ, is full of sweet, pleasant, and unspeakable comfort to godly persons, and such as feel in themselves the working of the Spirit of Christ, mortifying the works of the flesh, and their earthly members, and drawing up their mind to high and heavenly things, as well because it doth greatly establish and confirm their faith of eternal

salvation to be enjoyed through Christ, as because it doth fervently kindle their love towards God; So, for curious and carnal persons, lacking the Spirit of Christ, to have continually before their eyes the sentence of God's predestination, is a most dangerous downfall, whereby the devil doth thrust them either into desperation, or into wretchedness of most unclean living, no less perilous than desperation.

Furthermore, we must receive God's promises in such wise, as they be generally set forth to us in holy Scripture: and, in our doings, that will of God is to be followed, which we have expressly declared unto us in the Word of God.

ART. XVIII. *Of obtaining Eternal Salvation only by the Name of Christ.*—They also are to be had accursed that presume to say, That every man shall be saved by the law or sect which he professeth, so that he be diligent to frame his life according to that law, and the light of nature. For holy Scripture doth set out unto us only the name of Jesus Christ, whereby men must be saved.

ART. XIX. *Of the Church.*—The visible Church of Christ is a congregation of faithful men, in the which the pure Word of God is preached, and the sacraments be duly ministered according to Christ's ordinance, in all those things that of necessity are requisite to the same.

As the Church of Jerusalem, Alexandria, and Antioch, have erred; so also the Church of Rome hath erred, not only in their living and manner of ceremonies, but also in matters of faith.

ART. XX. *Of the Authority of the Church.*—The Church hath power to decree rites or ceremonies, and authority in controversies of faith: and yet it is not lawful for the Church to ordain anything that is contrary to God's Word written, neither may it so expound one place of Scripture, that it be repugnant to another. Wherefore, although the Church be a witness and a keeper of Holy Writ, yet, as it ought not to decree anything against the same, so besides the same ought it not to enforce anything to be believed for necessity of salvation.

ART. XXI. *Of the Authority of General Councils.*—[This article (which is given at foot*) was omitted, because it is partly of a local and civil nature, and because the remaining parts are provided for in other articles.]

ART. XXII. *Of Purgatory.*—The Romish doctrine concerning purgatory, pardons, worshipping and adoration, as well of images as of relics, and also invocation of saints, is a fond thing, vainly invented, and grounded upon no warranty of Scripture, but rather repugnant to the Word of God.

ART. XXIII. *Of Ministering in the Congregation.*—It is not lawful for any man to take upon him the office of public preaching, or ministering the sacraments in the congregation, before he be lawfully called, and sent to execute the same. And those we ought to judge lawfully called and sent, which be chosen and called to this work by men who have public authority given unto them in the congregation, to call and send ministers into the Lord's vineyard.

ART. XXIV. *Of Speaking in the Congregation in such a Tongue as the People understandeth.*—It is a thing plainly repugnant to the Word of God, and the custom of the primitive Church, to have public prayer in the church, or to minister the sacraments, in a tongue not understood of the people.

ART. XXV. *Of the Sacraments.*—Sacraments ordained of Christ be not only badges or tokens of Christian men's profession, but rather they be certain sure witnesses, and effectual signs of grace, and God's good will toward us, by the which he doth work invisibly in us, and doth not only quicken, but also strengthen and confirm our faith in him.

There are two sacraments ordained of Christ our Lord in the Gospel, that is to say, baptism and the supper of the Lord.

Those five commonly called sacraments, that is to say, confirmation, penance, orders, matrimony, and extreme unction, are not to be counted for sacraments of the Gospel, being such as have grown partly of the corrupt following of the Apostles, partly are states of life allowed in the Scrip-

* XXI. *Of the Authority of General Councils.*—General councils may not be gathered together without the commandment and will of princes; and when they be gathered together (forasmuch as they be an assembly of men, whereof all be not governed with the Spirit and Word of God), they may err, and sometimes have erred, even in things pertaining unto God. Wherefore things ordained by them as necessary to salvation have neither strength nor authority, unless it may be declared that they be taken out of holy Scripture.

tures; but yet have not like nature of sacraments with baptism, and the Lord's Supper, for that they have not any visible sign or ceremony ordained of God.

The sacraments were not ordained of Christ to be gazed upon, or to be carried about, but that we should duly use them. And in such only as worthily receive the same, they have a wholesome effect or operation; but they that receive them unworthily, purchase to themselves damnation, as Saint *Paul* saith.

ART. XXVI. *Of the Unworthiness of the Ministers, which hinders not the Effect of the Sacraments.*—Although in the visible Church the evil be ever mingled with the good, and sometimes the evil have chief authority in the administration of the Word and sacraments, yet forasmuch as they do not the same in their own name, but in Christ's, and do minister by his commission and authority, we may use their ministry, both in hearing the Word of God, and in receiving the sacraments. Neither is the effect of Christ's ordinance taken away by their wickedness, nor the grace of God's gifts diminished from such as by faith, and rightly, do receive the sacraments ministered unto them; which be effectual, because of Christ's institution and promise, although they be ministered by evil men.

Nevertheless, it appertaineth to the discipline of the Church that inquiry be made of evil ministers, and that they be accused by those that have knowledge of their offenses; and finally, being found guilty, by just judgment be deposed.

ART. XXVII. *Of Baptism.*—Baptism is not only a sign of profession, and mark of difference, whereby Christian men are discerned from others that be not christened, but it is also a sign of regeneration or new-birth, whereby, as by an instrument, they that receive baptism rightly are grafted into the Church; the promises of the forgiveness of sin, and of our adoption to be the sons of God by the Holy Ghost, are visibly signed and sealed; faith is confirmed, and grace increased by virtue of prayer unto God.

The baptism of young children is in anywise to be retained in the Church, as most agreeable with the institution of Christ.

ART. XXVIII. *Of the Lord's Supper.*—The supper of the Lord is not only a sign of the love that Christians ought to have among themselves one to another; but rather it is a sacrament of our redemption by Christ's death; insomuch that to such as rightly, worthily, and with faith, receive the same, the bread which we break is a partaking of the body of Christ; and likewise the cup of blessing is a partaking of the blood of Christ.

Transubstantiation (or the change of the substance of bread and wine) in the supper of the Lord, can not be proved by holy Writ; but is repugnant to the plain words of Scripture, overthroweth the nature of a sacrament, and hath given occasion to many superstitions.

The body of Christ is given, taken, and eaten, in the Supper, only after a heavenly and spiritual manner. And the mean whereby the body of Christ is received and eaten in the Supper is faith.

The sacrament of the Lord's Supper was not by Christ's ordinance reserved, carried about, lifted up, or worshipped.

ART. XXIX. *Of the Wicked, which eat not the Body of Christ in the Use of the Lord's Supper.*—The wicked, and such as be void of a lively faith, although they do carnally and visibly press with their teeth (as Saint *Augustine* saith) the sacrament of the body and blood of Christ; yet in no wise are they partakers of Christ; but rather, to their condemnation, do eat and drink the sign or sacrament of so great a thing.

ART. XXX. *Of both Kinds.*—The cup of the Lord is not to be denied to the lay people; for both the parts of the Lord's sacrament, by Christ's ordinance and commandment, ought to be administered to all Christian men alike.

ART. XXXI. *Of the One Oblation of Christ finished upon the Cross.*—The offering of Christ once made is that perfect redemption, propitiation, and satisfaction, for all the sins of the whole world, both original and actual; and there is none other satisfaction for sin, but that alone. Wherefore the sacrifices of masses, in the which it was commonly said, that the priest did offer Christ for the quick and the dead, to have remission of pain or guilt, were blasphemous fables, and dangerous deceits.

ART. XXXII. *Of the Marriage of Priests.*—Bishops, priests, and deacons are not commanded by God's law, either to vow the estate of single life, or to abstain from marriage; therefore it is lawful for them, as for all other

Christian men, to marry at their own discretion, as they shall judge the same to serve better to godliness.

ART. XXXIII. *Of Excommunicate Persons, how they are to be avoided.*—That person which by open denunciation of the Church is rightly cut off from the unity of the Church, and excommunicated, ought to be taken of the whole multitude of the faithful, as an heathen and publican, until he be openly reconciled by penance and received into the Church by a judge that hath authority thereunto.

ART. XXXIV. *Of the Traditions of the Church.*—It is not necessary that traditions and ceremonies be in all places one, or utterly like; for at all times they have been divers, and may be changed according to the diversity of countries, times, and men's manners, so that nothing be ordained against God's Word. Whosoever, through his private judgment, willingly and purposely, doth openly break the traditions and ceremonies of the Church, which be not repugnant to the Word of God, and be ordained and approved by common authority, ought to be rebuked openly (that others may fear to do the like), as he that offendeth against the common order of the Church, and hurteth the authority of the magistrate, and woundeth the consciences of the weak brethren.

Every particular or national church hath authority to ordain, change, and abolish ceremonies or rites of the Church ordained only by man's authority, so that all things be done to edifying.

ART. XXXV. *Of the Homilies.*—The Second Book of Homilies, the several titles whereof we have joined under this article, doth contain a godly and wholesome doctrine, and necessary for these times, as doth the former Book of Homilies, which were set forth in the time of *Edward the Sixth*; and therefore we judge them to be read in churches by the ministers, diligently, and distinctly, that they may be understood of the people.

Of the Names of the Homilies.—1. Of the right use of the church. 2. Against peril of idolatry. 3. Of repairing and keeping clean of churches. 4. Of good works: first of fasting. 5. Against gluttony and drunkenness. 6. Against excess of apparel. 7. Of prayer. 8. Of the place and time of prayer. 9. That common prayers and sacraments ought to be ministered in a known tongue. 10. Of the reverend estimation of God's Word. 11. Of alms-doing. 12. Of the nativity of Christ. 13. Of the passion of Christ. 14. Of the resurrection of Christ. 15. Of the worthy receiving of the sacrament of the body and blood of Christ. 16. Of the gifts of the Holy Ghost. 17. For the rogation-days. 18. Of the state of matrimony. 19. Of repentance. 20. Against idleness. 21. Against rebellion.

[This article is received in this Church, so far as it declares the Books of Homilies to be an explication of Christian doctrine, and instructive in piety and morals. But all references to the constitution and laws of England are considered as inapplicable to the circumstances of this Church; which also suspends the order for the reading of said homilies in churches, until a revision of them may be conveniently made, for the clearing of them, as well from obsolete words and phrases, as from the local references.]

ART. XXXVI. *Of Consecration of Bishops and Ministers.*—The Book of Consecration of Bishops, and Ordering of Priests and Deacons, as set forth by the General Convention of this Church in 1792, doth contain all things necessary to such consecration and ordering; neither hath it any thing that, of itself, is superstitious and ungodly. And, therefore, whosoever are consecrated or ordered according to said form, we decree all such to be rightly, orderly, and lawfully consecrated and ordered.

ART. XXXVII. *Of the Power of the Civil Magistrates.*—The power of the civil magistrate extendeth to all men, as well clergy as laity, in all things temporal; but hath no authority in things purely spiritual. And we hold it to be the duty of all men who are professors of the Gospel, to pay respectful obedience to the civil authority, regularly and legitimately constituted.

ART. XXXVIII. *Of Christian Men's Goods, which are not common.*—The riches and goods of Christians are not common, as touching the right, title, and possession of the same; as certain Anabaptists do falsely boast. Notwithstanding, every man ought, of such things as he possesseth, liberally to give alms to the poor, according to his ability.

ART. XXXIX. *Of a Christian Man's Oath.*—As we confess that vain and rash swearing is forbidden Christian men by our Lord Jesus Christ, and *James* his Apostle, so we judge, that Christian religion doth not prohibit, but that a

man may swear when the magistrate requireth, in a cause of faith and charity, so it be done according to the prophet's teaching, in justice, judgment, and truth.

Thirty Tyrants: a body of thirty magistrates in Athens (404-403 B. C.). They were appointed from the aristocratic party by the Spartans, victorious in the Peloponnesian war. The tyrants were guilty of the most cruel and shameless acts, and after one year were expelled by Thrasybulus.

Thirty Years' War: the name given to a succession of wars (1618-48) begun as a struggle between Roman Catholics and Protestants, carried on as an attempt to establish the authority of the German emperor over the religious interests of Germany, and concluded as a struggle of the house of Austria to maintain its imperial power over domestic and foreign affairs.

Causes of the War.—By the Treaty of Augsburg (1555), which temporarily brought the strifes of the Reformation to an end, each of the German states was permitted to determine the nature of its national religion. All subjects were permitted to remove from states in which their religion was forbidden to states in which it was officially sanctioned. But the inconveniences imposed on dissent by these provisions made disagreements inevitable. Protestantism continued in Catholic states and Catholicism continued where it was under governmental prohibition. Protestantism thrived, especially in Bohemia and Austria; but under Rudolf II. (1576-1612) a strong reaction, largely under the influence of the Jesuits, set in. In 1608 the Evangelical Union and in 1609 the Catholic League were formed to protect their respective interests. The Emperor Matthias (1612-19) gave certain guarantees of liberty, but in 1617 Ferdinand of Styria, who had been educated by the Jesuits, was crowned King of Bohemia. Persecutions at once began. Protestant churches were closed in Brannan and pulled down in Klostergrab. The Protestant estates met in Prague Mar. 5, 1618, and petitioned the Emperor Matthias, who sent messengers to declare their meeting illegal and to defend his own acts. The reply of the emperor was borne by Slavata and Martinitz, and received in the assembly-room of the castle. At the end of the altercation which ensued Slavata and Martinitz, with their secretary, Fabricius, were hurled from the castle window about 70 feet from the ground. The fact that all escaped with only slight injuries tended to increase the faith of the Catholics in the divine protection of their cause. Protestants and Catholics alike in all parts of Southern Germany took up arms.

The Bohemian War (1618-20).—After the events just described the concessions made to Protestants in Bohemia were withdrawn, and an insurrection followed. Frederick V., the Elector Palatine and a Protestant, was chosen King of Bohemia in 1619. Count Thurn repeatedly defeated the Catholic forces, but Frederick V. was a courtier rather than a soldier, and his motley army was totally routed by the army of Maximilian of Bavaria at Weissenberg Nov. 8, 1620. The same autumn and winter the Lower Palatinate was ravaged by an army of Spaniards under Spinola. The Protestants, utterly defeated in Bohemia, were given over to persecution.

War in the Palatinate (1621-23).—Count Mansfeld and Duke Christian of Brunswick at the head of the Protestant forces showed great skill and energy in opposition to the Catholic armies on the Rhine. They ravaged the territories of the Catholic League, and everywhere retaliated with energy for the tyranny shown by Ferdinand II. in his dealings with the Protestants. Both sides fought with desperation. The imperial commander TILLY (*q. v.*) defeated the Margrave of Baden at Wimpfen (May 6, 1622); also Christian of Brunswick at Höchst (June 30, 1622) and at Stadtlohn (Aug. 6, 1623). These victories might have ended the war but for two reasons. The Protestant princes in the north were beginning to be aroused, and Mansfeld and Christian, though dismissed by Frederick (July, 1623), refused to lay down their arms or leave the field. They fought desperately on their own account in Alsace, in Lorraine, in Holland, and in Saxony, supporting their armies as they went, and everywhere leaving desolation.

The Danish-Saxon War (1624-29).—The Danish king Christian IV. resented injuries inflicted on him by the emperor, and, supported by a British subsidy, joined the Protestant cause in 1624. With the forces of Mansfeld and Christian of Brunswick, he marched into Lower Saxony. Meantime the Emperor Ferdinand had called for the help of WALLENSTEIN (*q. v.*), who, with the army of Leaguers

under Tilly, now marched to the north. The Danes were routed in 1626 by Tilly at Lutter and Mansfeld by Wallenstein at Dessau. The hopes of the Protestants would have perished but for the fact that Mansfeld, after an apparently overwhelming defeat, gathered together forces enough to conduct a victorious raid or campaign through Silesia, Moravia, and Hungary. Meanwhile, however, the forces of Wallenstein and Tilly overran North Germany and Denmark, and compelled Christian IV. to sign a treaty of peace at Lubeck May 12, 1629.

The Swedish-German War (1630-36).—In 1629 Ferdinand issued the famous Edict of Restitution, according to which all estates that had been secularized since 1552 were ordered to be restored to the Catholic Church. The edict, unpopular with many Catholics, gave the greatest offense to the Protestants. Not content with this, Ferdinand fomented a revolt of the Poles against Sweden, thus intensifying the deep indignation that was already at the point of war. On July 4, 1630, GUSTAVUS ADOLPHUS (*q. v.*) landed with a Swedish army at Usedom, drove the imperialists out of Mecklenburg and Pomerania, and formed alliances with Hesse-Weimar, Magdeburg, Brandenburg, and Saxony. Tilly advanced against the new alliance, and stormed and sacked Magdeburg May 20, 1631, after a desperate siege. The city was given up to plunder, and the slaughter of the inhabitants became memorable. On Sept. 17, 1631, the armies met at Breitenfeld, near Leipzig, and the army of Tilly was nearly annihilated. Gustavus now advanced to the W., to the S., and to the E., traversing the Rhine and ascending the valley of the Main, defeating his enemy on the Lech Apr. 15, 1632, where Tilly was slain, and entering Munich May 17, after having established organizers and supporters in every important city along his route. The brilliancy of this march startled Europe and laid the basis for a new Evangelical Union, with Sweden at the head. Ferdinand saw that the case was desperate, and thereupon recalled Wallenstein, whom he had previously disgraced, giving him practically unreserved powers. Wallenstein rapidly collected an army, overran Bohemia, and marched N. into Saxony. Gustavus was obliged to follow. In the desperate battle of Lützen (Nov. 16, 1632) Wallenstein was defeated, but the cause of the Protestants, while overthrowing the enemy, suffered an irreparable loss in the death of Gustavus Adolphus at the moment of victory. The Swedes, under Oxenstierna, preserved their advantages until at Nördlingen, Sept. 6, 1634, the Protestants, under Bernard of Weimar, were totally defeated. The cause of the emperor was thus reinstated, and Saxony signed a treaty of peace at Prague May 30, 1635.

The French-Swedish War (1636-48).—RICHELIEU (*q. v.*), having broken the political power of the Huguenots and of the nobles in France, was now ready to advance to the third great object of his policy—the defeat of the ambitions of Austria. To secure the hearty alliance of France, Oxenstierna yielded to Richelieu the direction of the war. The contest then became political rather than religious. While France united with Sweden, Denmark and Saxony united with the Emperor Ferdinand. Another set of generals then came into prominence. The Swedes under Banér held Northern Germany, and, after penetrating Silesia and Bohemia, defeated the Austrians and Saxons in a great battle at Wittstock in 1636. The same army under Torstensson and Königsmark gained further victories at Breitenfeld (1642) and Jankau (1645). Meantime Turenne and Condé devastated the regions of the Rhine, and, by repeated victories, drove back the imperial forces from the Palatinate and from Bavaria. These successes prepared the way for an invasion of Austria, which was about to take place when, after many preliminaries, the terrible struggle was brought to an end by the Peace of WESTPHALIA (*q. v.*) Oct. 24, 1648. As the fruit of this most terrible of modern wars, Protestantism was saved, but at a cost which it is difficult even to estimate. The population was greatly decreased; intellectually and morally the people suffered a great decline. Germany was disintegrated, and the material losses were such that a complete recovery had hardly taken place at the end of two centuries.

C. K. ADAMS.

Thistle [O. Eng. *þistel*; O. H. Germ. *distil* > Mod. Germ. *distel*]: any one of many stout spinous herbs of the family *Compositæ* and of the genera *Cnicus*, *Carduus*, *Centaurea*, *Onopordon*. A few have medicinal qualities, and some have fine flowers. The roots and leaves of some species were once eaten as food. The creeping thistle, commonly but er-

Creeping or Canada thistle.

roneously called the Canada thistle (*Cnicus*—or *Carduus*—*arvensis*), is a noxious weed of European origin, now naturalized extensively in America. It is a perennial, with many long, running underground stems which come to the surface and give rise to new plants. When these creeping stems are cut or broken each part produces a new plant. The plants tend to be dioecious, hence many produce no seeds.

Revised by CHARLES E. BESSEY.

Thistle-bird: a name given to the American goldfinch (*Spinus tristis*), often designated the YELLOW-BIRD (*q. v.*).

Thoburn, JAMES MILLS, A. M., D. D.: bishop; b. at St. Clairsville, O., Mar. 7, 1836; educated at Allegheny College, Meadville, Pa.; joined the Pittsburg Conference of the Methodist Episcopal Church 1858; has been engaged in missions in India since 1859; was elected missionary bishop for India and Malaysia in 1888. He has published *Missionary Addresses*; *My Missionary Apprenticeship* (New York, 1884); *India and Malaysia* (1892); *Light in the East* (1894); and *The Deaconess and her Vocation*. A. OSBOEN.

Tholuck, to look, FRIEDRICH AUGUST GOTTTREU: theologian and author; b. at Breslau, Germany, Mar. 30, 1799; studied theology and Oriental languages at the Universities of Breslau and Berlin: visited England in 1825, and Rome in 1828; was appointed Professor Extraordinary of Theology at Berlin in 1824, and removed to Halle in 1826 as ordinary professor. He found the university given up to rationalism, but under his influence it largely regained its reputation for piety. His works, most of which have been often reprinted in Germany and translated into English both in England and America, were published at Gotha in a collected edition in 11 vols., 1863-72, and treat of Oriental subjects—*Sufismus, sive Theosophia Persarum pantheistica* (1821); *Blütensammlung aus der morgenländischen Mystik* (1825); *Speculativ Trinitätslehre des spätern Orients* (1826); exegetical—*The Epistle to the Romans* (1824; twice translated into English); *The Gospel of John* (1827; translated into English by Kaufmann, 1836); *The Sermon on the Mount* (1833; translated into English by R. L. Brown, Edinburgh, 1860), etc.; historical—*Vorgeschichte des Rationalismus* (4 vols., 1853-62); *Geschichte des Rationalismus* (1865, etc.); ethical and dogmatical—*Wahre Weihe des Zweiflers* (1824; translated into English by Ryland under the title of *Guido and Julius, the Doctrine of Sin and the Propitiator*); *Stunden der Andacht* (2 vols., 1840; Eng. trans., *Hours of Christian Devotion*, 1875). He was one of the most fruitful and influential German theologians and authors during the second and third quarters of the nineteenth century, and better known in England and the U. S. than any other. He was original, brilliant, suggestive, eloquent, and full of poetry, wit, and humor. He can not be classified with any school. He was influenced by Pietism and Moravianism, by Schleiermacher and Neander, and even by Hegel. His elastic mind was ever open to new light. He was particularly admired as a preacher. He lives in the lives he inspired and guided,

not in the books he wrote. D. at Halle, Prussia, June 10, 1877. See his *Life*, by L. Witte (2 vols., Bielefeld, 1884-86).

Revised by S. M. JACKSON.

Thom, JOHN HAMILTON: preacher and author; b. probably in Scotland about 1810; became a distinguished minister of the Unitarian Church, and was many years pastor of the congregation worshipping in Renshaw chapel, Liverpool; author of *St. Paul's Epistles to the Corinthians* (London, 1851; Boston, 1852); *The Revelation of God and Man in the Son of God and the Son of Man* (1859); a *Memoir of Rev. John James Tayler* (1872), and other works; editor of *The Life of the Rev. Joseph Blanco White, written by himself, with Portions of his Correspondence* (3 vols., 1845); a book in which Dr. Liddon finds the beginnings of the Latitudinarian movement in the English Church. In 1839 he was associated with Dr. James Martineau and the Rev. Henry Giles in a course of controversial sermons delivered at Liverpool which attracted wide attention at the time, and are still a landmark of exceptional importance in the history of Unitarian thought. D. Aug. 2, 1894.

Revised by J. W. CHADWICK.

Thoma, RICHARD: surgeon; b. at Bonndorf, in the Black Forest, Germany, Dec. 11, 1847; studied in the Universities of Berlin and Heidelberg, graduating M. D. at the latter in 1872; settled in Heidelberg and devoted himself to the study of pathological anatomy; was elected, in 1877, extraordinary professor of that science in the university. Subsequently he accepted the chair of General and Anatomical Pathology in the University of Dorpat. He has written several monographs on pathological topics.

S. T. A.

Thomas, or Didymus, SAINT [*Thomas* = Lat. = Gr. *Θωμάς*, from Heb. *T'ôm*, liter., twin; *Didymus* = Lat. = Gr. *Δίδυμος*, liter., twin]: one of the twelve apostles, of whose personal character and history nothing is known except by two or three allusions in the Gospel of John. The most important of these is his refusal to believe in the resurrection of Jesus until convinced by tangible proof. Two apocryphal works are ascribed to him—a "Gospel" and "Acts" (best ed. by Bonnet, Leipzig, 1883). He was represented by later so-called "tradition" as having preached in Ethiopia, Egypt, Parthia, or India, and in the latter country the CHRISTIANS OF ST. THOMAS (*q. v.*), found by the Portuguese on the Malabar coast in the sixteenth century, claimed to originate from his preaching. This, however, is probably due to a confusion with a Nestorian or Manichean missionary. Great efforts have been made by several Spanish, Mexican, and South American theologians to make it appear that the apostle evangelized America, and traces of his presence are pointed out in sacred caves and other sites from Paraguay to Mexico, in which latter country he has been formally identified by several native antiquarians with the Aztec divinity Quetzalcoatl.

Revised by S. M. JACKSON.

Thomas, ARTHUR GÖRING: opera composer; b. at Ratten, Sussex, England, Nov. 21, 1851; did not study music seriously until he became of age. In 1875 he went to Paris and studied two years, then returned to England and entered the Royal Academy, remaining there three years and twice gaining the annual prize for composition. His first opera, *The Light of the Harem*, performed by students, led to his receiving a commission from Carl Rosa, for whose company he composed his opera *Esmeralda*, produced Mar. 26, 1883, and a second opera, *Nadeshda*, was performed by the same company Apr. 16, 1885. He composed also *The Sun Worshipers*, a cantata for the Norwich festival of 1881, an orchestral *Suite de Ballet*, several smaller orchestral pieces, some church music, and many songs. D. in London, Mar. 21, 1892.

D. E. HERVEY.

Thomas, CHARLES LOUIS AMBROISE: musician; b. at Metz, then in France, Aug. 5, 1811; entered the Paris Conservatory in 1828; took many prizes, including the Prix de Rome in 1832; has been a prolific composer of cantatas and operas, and considerable chamber music, piano pieces, and songs; also a *Requiem Mass* and other sacred music; was appointed Professor of Composition in the Conservatory in 1852, and succeeded Auber as director July 6, 1871; elected member of the French Institute in 1851; made a grand officer of the Legion of Honor, Jan., 1881. His principal operatic works are *Le Caid* (1849); *Le Songe d'une Nuit d'Été* (1850); *Raymond* (1851); *Psyche* (1857); *Mignon* (1866); *Hamlet* (1868); and *Françoise de Rimini* (1882). D. Feb. 12, 1896.

Thomas, CYRUS, Ph. D.: ethnologist and entomologist; b. at Kingsport, Tenn., July 27, 1825; removed to Jackson

co., Ill., in 1849, and in 1851 was elected county clerk, being at the same time admitted to the bar. After practicing law at Murphysboro for several years he entered the ministry of the Evangelical Lutheran Church in 1864. From 1869 to 1874 he was naturalist on the U. S. Geological Survey under Prof. F. V. Hayden, and from 1874 to 1877 Professor of Natural Sciences in the Southern Illinois Normal University, becoming also State entomologist of Illinois in 1875. He was a member of the U. S. entomological commission to investigate the destruction caused by grasshoppers in the West 1877-82, and then became ethnologist in the U. S. Bureau of Ethnology, in charge of mound explorations. He has studied the Maya hieroglyphs as written in the codices and on the Central American inscriptions, and claims to have discovered the signification and phonetic rendering of a sufficient number of characters to form a key by which to determine the others. His most important works are *Aerididae of North America* (Washington, 1873); *The Noxious and Beneficial Insects of Illinois* (5 vols., 1876-80); *Study of the Manuscript Troano* (2 vols., 1878-80); *Notes on Certain Maya and Mexican Manuscripts* (1881); *Aids to the Study of the Maya Codices; Cherokees in pre-Columbian Times; The Shawnees in pre-Columbian Times; Catalogue of Prehistoric Works East of the Rocky Mountains; Mound Exploration of the Bureau of Ethnology*; and bulletins relating to the mounds.

Thomas, EDITH MATILDA: poet; b. at Chatham, O., Aug. 12, 1854. She was educated at the Normal School at Geneva, O.; removed to New York in 1888. Her poems deal mainly with aspects of nature, and are very subtle in feeling and delicate in expression. Her published volumes include *A New Year's Masque* (1885); *The Round Year* (1886); *Lyrics and Sonnets* (1887); *Babes of the Year* (1888); and *The Inverted Torch* (1890).
H. A. B.

Thomas, GEORGE HENRY: soldier; b. in Southampton co., Va., July 31, 1816; graduated at the U. S. Military Academy in 1840; served in Florida against the Seminoles and in the Mexican war; was instructor at the Military Academy 1851-54, and in 1855 was appointed major of the Second Cavalry, with which he served continuously for the next five years. On the outbreak of the civil war Thomas, notwithstanding his sympathies and associations with the South, at once gave his adherence to the Union. Promoted to be brigadier-general of volunteers in Aug., 1861, and transferred to the department of the Cumberland, he was for a time engaged in mustering and organizing the First Brigade; was given command of the First Division (Army of the Ohio) in Nov., 1861, and fought in the battle of Mill Springs (Jan. 19-20, 1862), which was the most important victory yet gained in the West and brought Thomas into general notice. He was promoted major-general of volunteers Apr. 2, 1862, and rendered valuable service in the West and South. In the battle of MURFREESBORO (*q. v.*) he commanded the center, and at CHICKAMAUGA (*q. v.*), Sept. 19-20, 1863, he commanded the left wing where the great struggle took place for the repossession of Chattanooga, out of which the enemy had been maneuvered. The record of Thomas's wonderful resistance for upward of five hours against the concentrated efforts of the enemy after the Federal right was routed forms one of the most remarkable events in the history of the war. He was given command of the Army of the Cumberland, and on Oct. 27 he was commissioned brigadier-general in the regular army. On Sept. 27, 1864, Thomas was detached from the main army in Georgia, and placed in chief command in Tennessee, with large discretionary powers, as it was a matter of doubt what were the real intentions of the Confederate general Hood, who was moving northward in the hope of causing Sherman's withdrawal from Georgia. After a period of intense anxiety in Washington over what seemed an unnecessary delay, Thomas checked Hood's advance at Nashville, pursued him beyond the Tennessee, and destroyed his army. (See NASHVILLE, BATTLE OF.) The appointment of major-general in the regular army was (Dec. 15, 1864) bestowed upon him, and Congress tendered him a vote of thanks. During the remaining months of the war he contributed materially to the overthrow of the Confederacy by organizing raiding expeditions (resulting in the capture of Jefferson Davis in May, 1865) and by timely aid to other departments. He commanded the military division of the Tennessee (1865-66); the department of the Tennessee (1866-67); the third military district (Georgia, Florida, and Alabama), and the department of the Cumberland (1867-69). From May 15,

1869, he commanded the military division of the Pacific, with headquarters at San Francisco, where his death occurred Mar. 28, 1870.

Thomas, GEORGE HOUSMAN: illustrator and engraver; b. in London, England, Dec. 7, 1824; served an apprenticeship to a wood-engraver; practiced that art in Paris, giving his chief attention to the illustration of books, in which he gained such popularity that his services were engaged to go to the U. S. to illustrate a newspaper; resided at New York 1846-47; furnished designs for a number of bank-notes; returned to England on account of ill health; became one of the principal draughtsmen for *The Illustrated London News*. His best pictures were *The Queen giving the Medals to the Crimean Heroes* and *The Queen and Prince Albert at Aldershot*. His illustrations to Thomson's *Seasons* (1858) and to *Uncle Tom's Cabin* were much admired. D. at Boulogne, France, July 21, 1868.

Thomas, ISAIAH, LL. D.: printer and editor; b. in Boston, Mass., Jan. 19, 1749; lost his father in childhood; was apprenticed when six years of age to a printer, with whom he remained eleven years; began business at Newburyport 1767; removed to Boston; aided his former employer in establishing in 1770 *The Massachusetts Spy*; became its sole editor and was connected with it until 1801; became obnoxious to the British authorities on account of the support given by his paper to the movements preparatory to the Revolution; transferred his printing-office to Worcester 1774; published a long series of reprints of popular English works, displaying good judgment in their selection, also Bibles and hymn-books; engaged in book-publishing and in printing *The Farmer's Museum*, at Walpole, N. H.; established an additional bookstore and publishing-house in Boston in 1788, under the firm name of Thomas & Andrews; issued *The Massachusetts Magazine* (8 vols., 1789-96); conducted for twenty-six years (1775-1801) the celebrated *New England Almanac*; was author of a carefully prepared *History of Printing in America* (2 vols., Worcester, 1810). He was founder and first president (1812) of the American Antiquarian Society; endowed it, erected a building for its use, and gave it a valuable library. D. at Worcester, Apr. 4, 1831. See the *Memoir* by his grandson, Benjamin F. Thomas (Boston, 1874).

Thomas, JESSE BURGESS, D. D.: clergyman; b. at Edwinstown, Ill., July 29, 1832, graduated from Kenyon College, Gambier, O., in 1850; began a course of theological study at Rochester Theological Seminary in 1852, but relinquished it in consequence of ill health; studied law, and was admitted to the Illinois bar 1855, and engaged in mercantile pursuits in Chicago for some years. In 1862 he entered the ministry in the Baptist Church as pastor of a church in Waukegan, Ill.; in 1864 was called to the Pierrepont Street Baptist church, Brooklyn, N. Y.; accepted a call to San Francisco in 1867; returned to Chicago as pastor of Michigan Avenue Baptist church in 1871; was pastor of the consolidated First and Pierrepont Street Baptist churches, Brooklyn, N. Y., 1874-77; became professor in Newton Theological Institution, Mass., 1887. Published *The Old Bible and the New Science* (New York, 1877) and *Significance of the Historic Element in Scripture* (Philadelphia, 1883).
Revised by W. H. WHITSITT.

Thomas, JOHN, M. D.: physician and soldier; b. at Marshfield, Mass., in 1725; became an eminent physician in his native town and at Kingston; was surgeon to a regiment sent to Annapolis, N. S., 1746, and on the medical staff of Gov. Shirley's regiment 1747, but exchanged that post for the rank of lieutenant; attained the grade of colonel 1759; commanded a regiment under Amherst at Crown Point 1760, and took part in the capture of Montreal the same year; enrolled himself at an early date among the Sons of Liberty; was a delegate in 1774-75 to the Massachusetts provincial congress, by which he was appointed brigadier-general Feb. 9, 1775; received the same rank from the Continental Congress June 22, and was promoted to be major-general Mar. 6, 1776; was in charge of the fortification of Dorchester Heights Mar. 4, 1776, which led to the speedy evacuation of Boston by the British; succeeded at Montgomery's death to the command of the remains of the army then besieging Quebec, where he arrived May 1, found the smallpox prevalent in camp, the forces reduced to less than 1,000 effective men, and was consequently forced to raise the siege and retreat, but was attacked by the epidemic near the river Sorel, and died at Chambly, June 2, 1776.

Thomas, JOHN: architect and sculptor; b. at Chalford, England, in 1813; served an apprenticeship to a stonecutter; taught himself to paint sign-boards and engrave door-plates in order to earn a few shillings out of working hours; engaged in business with his brother; was an architect at Birmingham, and later at Leamington; executed a great number of commissions for architectural and decorative sculpture, and ultimately undertook with great success the execution of works of sculpture of the highest class, among which were *Musidora*, *Boudicca*, *Lady Godiva*, *Una and the Lion*, and several portrait-statues, including a colossal memorial of Shakspeare, and a famous majolica fountain exhibited at the International Exhibition of 1862. He was also the architect of the seats of several noblemen. D. at Maida Hill, London, Apr. 9, 1862.

Thomas, JOHN J., A. M.: agriculturist; b. near Aurora, Cayuga co., N. Y., Jan. 8, 1810; became, like his father, a distinguished writer on agriculture and pomology; was assistant editor of *The Genesee Farmer* 1834-39, horticultural editor of *The Albany Cultivator* 1841-53, assistant editor of the same and of *The Country Gentleman* for many years from 1853; contributed to the *Transactions of the New York State Agricultural Society* 1841-47 and to *The Farm* (New York, 1858); conducted *The Illustrated Annual Register of Rural Affairs* (Albany, 1857-65), and was author of *The Fruit Culturist* (1846), which in later editions, under the name of *The American Fruit Culturist*, is one of the chief American pomological works; and *Farm Implements, and the Principles of their Construction and Use* (New York, 1859). D. Feb. 22, 1895. Revised by L. H. BAILEY.

Thomas, JOSEPH, M. D., LL. D.: lexicographer; brother of John J. Thomas; b. in Cayuga co., N. Y., Sept. 23, 1814; educated at the Rensselaer Polytechnic Institute, Troy, N. Y., at Yale College, and in medicine at Philadelphia; resided in India 1857-58, engaged in the study of Oriental languages; spent some months in Egypt with a similar object; and became Professor of Latin and Greek at Haverford College, Pennsylvania. He was coeditor with Thomas Baldwin of a *Pronouncing Gazetteer* (Philadelphia, 1845), which in a revised edition was entitled *A Complete Pronouncing Gazetteer and Geographical Dictionary of the World* (1855; revised 1861, 1866, 1880); and of *A New and Complete Gazetteer of the United States* (1854); published *A First Book of Etymology* (1851-52); a volume of *Travels in Egypt and Palestine* (1853); *A Comprehensive Medical Dictionary* (1864); and *Universal Pronouncing Dictionary of Biography and Mythology* (1870-71); contributed geographical and biographical pronouncing vocabularies to Webster's dictionaries, and published an edition of Oswald's *Etymological Dictionary*. D. in Philadelphia, Pa., Dec. 24, 1891.

Thomas, LORENZO: soldier; b. at Newcastle, Del., Oct. 26, 1804; graduated at the U. S. Military Academy in 1823; served in the Fourth Infantry in Florida until 1831, and again in the Florida war of 1836-37; on quartermaster duty at Washington 1837-38. Upon the organization of the adjutant-general's department he was commissioned major and assistant adjutant-general, and served as chief of staff of the army in Florida 1839-40; at Washington, D. C., 1840-46; served in the war with Mexico as chief of staff to Maj.-Gen. William O. Butler, both while in command of a division of volunteers and after his succession to the command of the army. In 1852 he became lieutenant-colonel, and served as chief of staff to Lieut.-Gen. Scott from Mar., 1853, to Mar. 7, 1861, when he was promoted to be colonel, and placed in charge of the adjutant-general's office at Washington; became brigadier-general and adjutant-general of the army Aug. 3, 1861, but from 1863 was employed on special duty in organizing colored troops, inspection tours, etc., until Feb., 1869, when he was retired from active service. At the time of President Johnson's controversy with Congress he appointed Gen. Thomas (Feb. 21, 1868) Secretary of War *ad interim*, but Secretary Stanton refused to vacate. D. in Washington, D. C., Mar. 2, 1875.

Thomas, MARY F. (Myers), M. D.: philanthropist; b. in Maryland, Oct. 28, 1816; daughter of Samuel Myers, a Quaker associated with Benjamin Lundy in the first anti-slavery meeting held in Washington, D. C.; married Owen Thomas in 1839; studied medicine, and graduated from Penn Medical College in Philadelphia, Pa., in 1854; was assistant physician in hospitals during the civil war; city physician and physician for the Home for Friendless Women in Richmond, Ind.; admitted to membership in the Indiana State Medical Society in 1876; was an earnest advocate of tem-

perance for over fifty years; in 1851 helped to organize the first woman's rights society in Indiana, and held responsible offices in connection with the movement, State and national. D. at Richmond, Aug. 19, 1888. SUSAN B. ANTHONY.

Thomas, PHILIP FRANCIS: lawyer; b. at Easton, Talbot co., Md., Sept. 12, 1810; educated at Dickinson College; admitted to the bar 1831; elected to the State constitutional convention 1836; a member of the Legislature 1838 and 1843-45; member of Congress 1839-41; subsequently judge of the land-office court of the Eastern Shore of Maryland; Governor of Maryland 1848-51; comptroller of State treasury 1851-53; U. S. commissioner of patents 1860; succeeded Howell Cobb as Secretary of the Treasury in President Buchanan's cabinet, acting as such from Dec., 1860, to Jan. 11, 1861; was elected U. S. Senator Mar., 1867, but not admitted to a seat on the ground of disloyalty; was elected a Representative in Congress 1874, 1876, and 1878, and in 1880 declined a renomination. D. in Baltimore, Oct. 2, 1890.

Thomas, THEODORE: orchestral conductor; b. at Esens, Hanover, Germany, Oct. 11, 1835; received his first musical instruction from his father, a violinist, and made a successful public appearance at the age of six; removed with his parents to New York in 1845, and played the violin in concerts and orchestras; in 1851 made a concert tour as solo violinist. In 1855 he started a series of chamber-music concerts with William Mason, George Matzka, Joseph Mosenthal, Ferd. Bergner, and Carl Bergmann, which continued till 1869. In 1864 he began his first series of symphony concerts with an orchestra which he conducted until 1888, giving nightly summer concerts in New York and making tours through the U. S. during the winter months. From 1878 to 1881 he was director of the Cincinnati College of Music. In the season of 1877-78 he was conductor of the New York Philharmonic Society, and in 1879 he was elected to this position for the second time, and held it continuously till 1890, when he went to Chicago. He has conducted the Cincinnati biennial festivals since their start in 1873. He was conductor of the Brooklyn Philharmonic Society in 1862, 1866 to 1870, and 1873 to 1890, when the society disbanded on his removal to Chicago. He was also conductor of the Mendelssohn Union, the New York Chorus Society (four years), and the great New York festival in the Seventh Regiment armory in 1882. He was conductor of the American Opera Company in 1885-87. In 1892 he was appointed musical director of the World's Columbian Exposition in Chicago. D. E. HERVEY.

Thomas, THEODORE GAILLARD, A. M., M. D., LL. D.: gynaecologist; b. on Edisto island, S. C., Nov. 21, 1832; graduated M. D. at the Medical College of South Carolina in 1852, and removed to New York city during the same year; served at Bellevue Hospital; elected Professor of Obstetrics and Diseases of Women in the College of Physicians and Surgeons, New York, 1862; visiting physician to Roosevelt and Bellevue Hospitals; surgeon to the Woman's Hospital in the State of New York; president of the medical board of the Nursery and Child's Hospital; president of the American Gynaecological Society 1879; honorary fellow of the Obstetrical Society of London; corresponding fellow of the Obstetrical Society of Berlin, etc.; has contributed largely to current medical literature. His chief work is *Diseases of Women* (Philadelphia, 1868), which has been translated into several languages. Revised by S. T. ARMSTRONG.

Thomas à Kempis: See KEMPIS, THOMAS A.

Thomas Aquinas: See AQUINAS, ST. THOMAS.

Thomas, Christians of St.: See CHRISTIANS OF ST. THOMAS.

Thomas'sins, CHRISTIAN: jurist and theologian; son of Jacob Thomasius, a distinguished teacher and author; b. at Leipzig, Jan. 1, 1655. After studying at Frankfort-on-the-Oder and traveling in Holland, he became Professor of Law at Leipzig in 1681. Among the innovations of which he was author was the introduction of the German instead of the Latin language as a medium of university instruction, and the editing of a literary review which criticised with caustic wit and scholastic methods the proposition of the so-called territorialist as a substitute for the heretofore current episcopal scheme of Church government. The foe of all that was purely speculative, his efforts in the sphere of the practical extended so far as to depreciate classical learning. In the Pietistic controversy he sided with Spener and his school in the criticism of the defects of dead orthodoxy, but unlike them, while believing in revealed religion, he offered no definite faith as a substitute for the errors he exposed.

Regarding "superstition more dangerous than unbelief or atheism," Tholuck pronounces him "the personified spirit of illuminism." As a jurist, his efforts against prosecutions for witchcraft and the use of torture in obtaining evidence are worthy of enduring memory. Fleeing from Leipzig to escape arrest, he became one of the founders of the University of Halle and Professor of Law there in 1694. D. at Halle, Sept. 23, 1728. See the *Biography*, by H. Luden (1805); article by Tholuck in Herzog's *Real-encyclopädie*; and Hagenbach's *Kirchengeschichte*, v., 455-467.

H. E. JACOBS.

Thomasius, GOTTFRIED, D. D.: theologian; descendant of Christian Thomasius; b. at Egenhausen, Bavaria, July 26, 1802; studied at Erlangen, Halle, and Berlin; pastor in several places in Bavaria, finally at Nuremberg 1829-42; Professor of Dogmatics at Erlangen from 1842 until his death Jan. 24, 1875. He was a representative of the confessional reaction of the nineteenth century in Lutheranism. His great work on dogmatics from the christological standpoint, *Christi Person u. Werk*, 3 vols. (1st ed. 1852-61; 2d 1856-63; 3d 1886), is a philosophical treatment of the Lutheran system, influenced to some extent by the school of Schleiermacher, and departs from the stricter Lutheran position, mainly on the doctrine of the *Kenosis*, which he ascribes to the divine nature. His *Dogmengeschichte* (2 vols., 1874, 1876; 2d ed. 1890) is also a work of importance, especially valuable for its treatment of the development of doctrine in the Lutheran Church. His strictly confessional but ironic character is indicated by his words: "The name 'Lutheran,' in my opinion, should not be used as though it referred to something alongside of or beyond what is catholic and evangelical; but we are rather convinced that in what is properly Lutheran we possess what is truly catholic, and what forms the true mean between the confessional extremes." HENRY E. JACOBS.

Thomas of London: same as THOMAS A' BECKET. See BECKET, THOMAS A'.

Thomas the Rhymer: See RHYMER, THOMAS THE.

Thomaston: town; Litchfield co., Conn.; on the Naugatuck river and the N. Y., N. H. and Hart. Railroad; 8 miles S. E. of Litchfield, and 10 miles N. of Waterbury (for location, see map of Connecticut, ref. 9-F). It is principally engaged in the manufacture of clocks, cutlery, and brass goods, and contains the Laura Andrews Free Library, a national bank with capital of \$50,000, a savings-bank, and a weekly newspaper. It was incorporated in 1875, and in 1891 had an assessed valuation of \$1,500,000. Pop. (1880) 3,225; (1890) 3,278.

Thomaston: town; capital of Upson co., Ga.; on the Cent. of Ga. and the Macon and Birmingham railways; 16 miles S. W. of Barnesville, and 75 miles S. of Atlanta (for location, see map of Georgia, ref. 4-G). It is in an agricultural region, is principally engaged in the manufacture of carriages, shoes, and furniture, is an important cotton and stock market, and contains five churches, the R. E. Lee Institute, a State bank (capital \$25,000), and a weekly paper. Pop. (1880) 570; (1890) 1,181. EDITOR OF "TIMES."

Thomaston: town (incorporated in 1777); Knox co., Me.; on the St. George's river and the Maine Cent. Railroad; 4 miles W. of Rockland, the county-seat, and 12 miles N. of the Atlantic Ocean (for location, see map of Maine, ref. 9-D). It contains 6 churches, high school, 11 grammar, intermediate, and primary schools, library, the Maine State prison, 2 national banks with combined capital of \$210,000, a savings-bank, and a weekly and 2 monthly periodicals. The town is connected with Rockland by electric railway, and is noted for its ship-building interests and lime manufactories. Pop. (1880) 3,017; (1890) 3,009. EDITOR OF "HERALD."

Thomasville: town; capital of Thomas co., Ga.; on the Sav., Fla. and West. Railway; 36 miles E. of Bainbridge, and 58 miles E. of Albany (for location, see map of Georgia, ref. 7-G). It is in a cotton and a wool growing region; is the seat of the South Georgia Agricultural and Mechanical College (a branch of the State University); and contains the Young Female College, a public library, 3 State banks with combined capital of \$361,000, a national bank with capital of \$100,000, a branch savings and trust company, large cigar-factories, and a daily and 2 weekly newspapers. Large quantities of fruit and melons are raised in the vicinity. Pop. (1880) 2,555; (1890) 5,514; (1895) estimated, 7,000. EDITOR OF "TIMES-ENTERPRISE."

Thomists: See AQUINAS, ST. THOMAS.

Thompson: town (set off from Killingly and incorporated in 1785); Windham co., Conn.; on the N. Y. and New Eng. Railroad (for location, see map of Connecticut, ref. 6-L). It is watered by the French and Quinebaug rivers; contains the villages of Thompson, East Thompson, West Thompson, Grosvenor Dale, North Grosvenor Dale, Mechanicsville, Wilsonville, New Boston, and Quinebaug; and is principally engaged in agriculture and the manufacture of cotton and woolen goods. The grand list in 1894 was \$1,629,248. Pop. (1880) 5,051; (1890) 5,580.

Thompson, AUGUSTUS CHARLES, D. D.: clergyman and author; b. at Goshen, Conn., Apr. 30, 1812; educated at Yale College, but did not graduate; studied theology at East Windsor Seminary and at the University of Berlin; became pastor of the Eliot Congregational church, Roxbury, Mass., July, 1842; accompanied Rev. Rufus Anderson on his visit to the American missions in India 1854-55; author of *Songs in the Night* (1845); *The Mercy Seat* (1863); *Moravian Missions* (1882); *Future Probation and Foreign Missions* (1886); and of many other writings. Revised by G. P. FISHER.

Thompson, BENJAMIN: See RUMFORD, BENJAMIN THOMPSON, Count.

Thompson, DANIEL GREENLEAF: lawyer and writer; b. at Montpelier, Vt., Feb. 9, 1850; educated at Montpelier and at Amherst College; began the practice of law in New York in 1872. His principal works are *System of Psychology* (2 vols., London, 1884); *The Problem of Evil* (1886); *Social Progress* (1889); *Philosophy of Fiction in Literature* (1892); with articles and addresses. J. M. B.

Thompson, DANIEL PIERCE: author; b. at Charlestown, Mass., Oct. 1, 1793; removed to Berlin, Vt., in childhood; taught district schools 1815-16; graduated at Middlebury College 1820; was for some time a private tutor in Virginia, where he studied law and was admitted to the bar; settled at Montpelier, Vt., 1824; became register of probate; was clerk of the Legislature 1830-33; compiled the laws of Vermont 1824-34 (Montpelier, 1835); was county judge of probate 1837-40; clerk of the county 1843-45; afterward clerk of the Supreme Court and secretary of State 1853-55; author of several novels, chiefly illustrative of Vermont life and of Revolutionary history, among which were *The Green Mountain Boys* (Montpelier, 1840; republished in Boston and London); *Lucy Hosmer* (1848); *The Rangers* (1851); *Giant Garley* (1857); and published a *History of Montpelier* (1860). D. at Montpelier, June 6, 1868.

Thompson, EDWARD MAUNDE: librarian and author; b. in Jamaica, May 4, 1840; was educated at Rugby School; appointed assistant in the British Museum in 1861; became keeper of the MSS. in 1878 and principal librarian and secretary in 1888. He has edited a number of mediæval Latin chronicles for the Camden and other societies; also *Diary of Richard Cocks in Japan* (for the Hakluyt Society, 1883); with Prof. R. C. Jebb, the facsimile of the Laurentian Sophocles (for the Hellenic Society, 1885); and has written a *Handbook of Greek and Latin Palæography* (International Scientific Series, 1893).

Thompson, ELIZABETH (by marriage *Lady Butler*); painter; b. at Lausanne, Switzerland, about 1850; acquired celebrity from her painting of *The Roll Call*, exhibited at the Royal Academy, London, 1874, highly admired by the Prince of Wales, and purchased by the Queen; visited Italy 1875; painted *The Twenty-eighth Regiment at Quatre Bras* and other military pictures, including *The Battle of Baluklava* (1876), *Inkerman* (1877), and *The Camel Corps* (1894). In 1877 she married Capt. (afterward Maj.-Gen.) Sir William Francis Butler. Revised by RUSSELL STURGIS.

Thompson, HENRY: author; b. in England in 1797; graduated at Cambridge, 1822; took orders in the Church of England; was for some years curate of Wrington, Somerset, and became in 1853 vicar of Chard, in the same county; author of a *Life of Hannah More* (1838); *A History of Roman Literature*; and a part of the *History of Greek Literature*, in the *Encyclopædia Metropolitana*, to which work he was a large contributor; also several religious works; translated Schiller's *Maid of Orleans* and *William Tell* (1845), and *Original Ballads by Living Authors* (1850); wrote for the *Lyra Messianica* and its companion volume; edited *The Complete Works of Horace, from the Text of Orellius* (1853), and *The Complete Works of Virgil, from the Text of Heyne and Wagner* (1854); contributed to a work on *Ocull Sciences* (1855). D. at Chard, Dec., 1878. Revised by H. A. BEERS.

Thompson, Sir HENRY, F. R. C. S.: surgeon; b. at Framlingham, Suffolk, England, Aug. 6, 1820; studied medicine at University College Hospital, London, graduating M. B. in 1851; was appointed assistant surgeon there in 1853, surgeon in 1863, Professor of Clinical Surgery in 1866, and consulting surgeon in 1874. In 1852 he gained the Jacksonian prize of the Royal College of Surgeons for his essay on *The Pathology and Treatment of Stricture of the Urethra*, and again in 1860 for his essay on *The Healthy and Morbid Anatomy of the Prostate Gland*. He was appointed surgeon extraordinary to King Leopold I. of Belgium in 1863, and to Leopold II. in 1866; made an officer of the Order of Leopold in 1864, and promoted commander in 1876. For the success of an operation on King Leopold I. he was knighted in 1867. He is a member of numerous British and foreign medical societies, and an enthusiastic advocate of cremation, and the popularity of that method of disposal of the dead in Great Britain is largely due to his efforts. He is an artist of no mean ability, and his paintings have been exhibited at the Royal Academy and the Paris Salon. Among his published works are *Practical Lithotomy and Lithotripsy* (1863); *Clinical Lectures on Diseases of the Urinary Organs* (1868); *Modern Cremation* (1890); and the novels *Charley Kingston's Aunt* and *All But*, which appeared under the pseudonym of *Pen Oliver*. S. T. ARMSTRONG.

Thompson, HENRY DEXMAN: actor; b. at Girard, Pa., Oct. 15, 1833; removed in 1847 with his parents to Swaney, N. H., where he lived for a number of years. It was here that he studied the characters which many years after he introduced in his plays of *Joshua Whitcomb* and *The Old Homestead*. He made his first appearance on the professional stage at Lowell, Mass., in 1863 in *The French Spy*. He played on the variety stage and as an Irish comedian. He first produced *Joshua Whitcomb* in 1875, which was worked up from a variety sketch. His greatest success was in *The Old Homestead*, which ran continuously for four years until 1891, and had many long runs until 1895, when he retired from the stage. B. B. VALLENTINE.

Thompson, JACOB: member of Congress and cabinet officer; b. in Caswell co., N. C., May 15, 1810; graduated at the University of North Carolina 1831; was admitted to the bar in 1834; settled in the Chickasaw country, Mississippi, in 1835; was a Democratic member of Congress 1839-51; chairman of the committee on Indian affairs; opposed the Compromises of 1850; Secretary of the Interior under President Buchanan from Mar., 1857, to Jan. 7, 1861, when he resigned in consequence of the order to re-enforce Fort Sumter being given without the knowledge of the Cabinet; Governor of Mississippi 1862-64, and subsequently aide to Gen. Beauregard and inspector-general for the department of Mississippi. D. at Memphis, Tenn., Mar. 24, 1885.

Thompson, Sir JOHN SPARROW DAVID: statesman; b. at Halifax, Nova Scotia, Nov. 10, 1844; educated at the Free Church Academy there; admitted to the bar in 1865. He was a member of the House of Assembly of Nova Scotia 1877-82; Attorney-General of the province 1878-82; Premier and Attorney-General of the same from May 25, 1882, until July 25, 1882, when appointed a judge of the Supreme Court of Nova Scotia; resigned Sept. 25, 1885 to become Minister of Justice and Attorney-General of Canada, and was elected to the Parliament of Canada in 1885, 1887, and 1891. He was appointed Premier of Canada in Nov., 1892, upon the resignation of Sir John C. Abbott. He was a member of the senate of the University of Halifax; counsel on behalf of the U. S. Government at the fishery commission held under the Washington treaty which met at Halifax in 1877; assisted the British representatives on the fishery commission at Washington in 1887, and was knighted for his services in 1888. Sir John was one of the British representatives in the Bering Sea arbitration proceedings between the Governments of Great Britain and the U. S. which met at Paris in 1893, and became a member of the Queen's Privy Council in 1894. D. at Windsor, England, Dec. 12, 1894.

NEIL MACDONALD.

Thompson, JOSEPH PARRISH, D. D., LL. D.: clergyman and author; b. in Philadelphia, Pa., Aug. 7, 1819; graduated at Yale College 1838; studied theology at Andover and at New Haven; became pastor of the Chapel Street Congregational church, New Haven, Nov., 1840; was minister of the Broadway Tabernacle, New York, 1845-71; was one of the founders of *The New Englander*, a quarterly theological organ of the Congregational denomination, and of the *New York Independent*; was a manager of the American

Congregational Union and of the Home Missionary Society; originated in 1852 the plan of the Albany Congregationalist convention; visited Egypt, Palestine, and other Oriental countries 1852-53; afterward devoted much research to Oriental subjects, especially Egyptology. In 1872 he became a resident of Berlin, Germany, and was an active member of its literary and scientific societies, frequently delivering addresses and contributing papers to their publications. These were published under the title *American Comments on European Questions* (New York, 1884). Among many other works were *Lectures to Young Men* (1846); *Egypt, Past and Present* (1856); *Memoir of Rev. David T. Stoddard* (1858); *Christianity and Emancipation* (1863); *Man in Genesis and Geology* (1869); *Theology of Christ from his own Words* (1870); *Church and State in the United States* (1874); *Life of Christ* (1875); *The Workman: his False Friends and his True Friends* (1879). D. in Berlin, Sept. 20, 1879. Revised by GEORGE P. FISHER.

Thompson, LAUNT: sculptor; b. at Abbeyleix, Queen's County, Ireland, Feb. 8, 1833; removed to Albany, N. Y., 1847; began the study of medicine; afterward was pupil and assistant of Erastus D. Palmer, the sculptor, nine years; developed a remarkable talent for medallion portraits; settled in New York 1858, and became an Academician in 1862; member and vice-president of the National Academy of Design in 1874. Among his works are busts of Edwin Booth as Hamlet, Bryant, and Gen. Dix; a colossal statue of Napoleon; an equestrian statue of Gen. Burnside, in Providence, R. I.; and the statues of Winfield Scott, at the Soldiers' Home, Washington, D. C., and of Abraham Pierson at Yale College. The honorary degree of M. A. was conferred upon him by Yale in 1874. D. at Middletown, N. Y., Sept. 26, 1894.

Thompson, MAURICE: author; b. at Fairfield, Ind., Sept. 9, 1844. His childhood was passed partly in Kentucky and Georgia, and he served in the Confederate army during the civil war. He subsequently returned to Indiana and engaged alternately in civil engineering and in the practice of law at Crawfordsville. In 1885-89 he was State geologist of Indiana. In 1890 he formed an editorial connection with the *New York Independent*. Among his published writings are *Hoosier Mosaics* (1875); *The Witchery of Archery* (1878); *A Tallahassee Girl* (1882); *His Second Campaign* (1882); *Songs of Fair Weather* (1883); *At Love's Extremes* (1885); *Byways and Bird Notes* (1885); *Sylvan Secrets* (1887); *The Story of Louisiana* (1888); and *A Fortnight of Folly* (1888). H. A. BEERS.

Thompson, MORTIMER: humorist; b. at Riga, N. Y., Sept. 2, 1832; studied for a time at University of Michigan, but left before graduating; was for some time connected with a traveling theatrical company; became about 1852 a clerk in New York; wrote some humorous letters for the *Detroit Advertiser* which procured him employment on the New York press, and subsequently became a popular lecturer, and published several humorous volumes which had a wide circulation under the pen-name of *Q. K. Philander Doesticks, P. B.* Among his books were *Doesticks—What he Says* (1855); *Phu-ri-bus-tah*, a travesty of Longfellow's *Hiawatha* (1856); *History and Records of the Elephant Club* (1857); and *Nothing to Say* (1857). D. in New York, June 25, 1875. Revised by H. A. BEERS.

Thompson, RICHARD WIGGINTON: jurist and Congressman; b. in Culpeper co., Va., June 9, 1809; received a classical education; was a clerk in a store in Louisville, Ky.; afterward a school-teacher in Lawrence co., Ind., but studied law at the same time, and was admitted to the bar in 1834 and began to practice at Bedford, Ind. In the same year he was elected to the State Legislature of Indiana, and re-elected in 1835. In 1836 he became a State Senator; in 1841 was chosen to Congress, and again in 1844 and 1847. Various appointments which were offered to him by the administration he declined, including that of minister to Austria, but took part very actively in politics; was a delegate to the Republican conventions of 1860, 1864, 1868, and 1876; in 1867-69 was judge of the eighteenth circuit of Indiana; entered President Hayes's cabinet in 1877 as Secretary of the Navy; resigned in 1881 to become chairman of the American committee of the Panama Canal Company; author of *The Papacy and the Civil Power* (New York, 1876) and a *History of the Tariff* (Chicago, 1888).

Thompson, ROBERT ANCHOR: clergyman and author; b. at Durham, England, in 1821; educated at Durham School

and as an engineer student of Durham University; graduated at Cambridge, 1844; was for some years connected with the astronomical observatory at Durham, and published a volume of his observations in 1849; took orders in the Church of England; became curate of Louth and (1854) of Binbrook, Lincolnshire, and in 1858 was chosen master of the hospital of St. Mary the Virgin at Newcastle-upon-Tyne; author of a volume of *Sermons* (London, 1853); of *Christian Theism, the Testimony of Reason and Revelation to the Existence and Character of the Supreme Being* (London, 2 vols., 1855; n. e. 1863), which gained the first Burnett premium (£1,800) among 208 competitors; *An Essay on the Principles of Natural Theology* (1857); *Christ the Light of the World* (1859); *The Oxford Declaration* (1864); and *Thomas Becket* (1889).

Revised by S. M. JACKSON.

Thompson, ROBERT ELLIS, S. T. D.; professor and editor; b. near Lurgan, Ireland, Apr. 5, 1844; educated in the University of Pennsylvania and the Reformed Presbyterian Seminary, Philadelphia, Pa.; ordained by the Reformed Church in 1873; entered the Presbyterian Church with his presbytery in 1882; instructor in the University of Pennsylvania 1868-70; professor 1870-92; and since 1894 president of the Central High School of Philadelphia. Dr. Thompson was editor of *The American Presbyterian* 1866-70; of *The Penn Monthly* 1870-80; of *The American* 1880-91; and since 1891 has been assistant editor of *The Sunday-school Times*. He was lecturer on protective tariffs in Harvard 1884-85; in Yale 1886-88; Stone lecturer in Princeton 1891. His publications are *Social Science and National Economy* (Philadelphia, 1874); third edition under the title *Elements of Political Economy* (Philadelphia, 1882); *Hard Times and what to Learn from them* (Philadelphia, 1877); *Protection to Home Industry*, Harvard lectures (New York, 1886); *Relief of Local and State Taxation through Distribution of National Surplus* (Philadelphia, 1883); *De Civitate Dei: the Divine Order of Human Society* (Philadelphia, 1891); and he has edited *Duffield's Latin Hymn-writers and their Hymns* (New York, 1890); *The American Supplement to the Encyclopedia Britannica* (vol. i., Philadelphia, 1883; vol. ii., 1884); *Life of George H. Stuart, written by Himself* (Philadelphia, 1889); *The National Hymn-book of the American Church* (Philadelphia, 1892); *A History of the Presbyterian Churches in the United States* (New York, 1895); and *A First Book in Political Economy for the Use of Schools and High Schools* (Boston, 1895).

C. K. HORT.

Thompson, SILVANUS PHILLIPS; physicist and electrical engineer; b. at York, England, June 19, 1851; educated at the Royal School of Mines; in 1878 received the degree of D. Sc.; in 1879 became Professor of Experimental Physics in University College, Bristol, whence he was subsequently called to take charge of the department of electrical engineering in the Finsbury Technical College, London. He is the author of numerous memoirs; also of a volume entitled *Elementary Lessons in Electricity and Magnetism* (1881); of a voluminous treatise on *Dynamo-electric Machinery* (1885; 4th ed. 1890); and of special treatises on the arc-lamp, the electro-magnet, etc.

E. L. NICHOLS.

Thompson, SMITH, LL. D.; jurist; b. at Stanford, N. Y., Jan. 17, 1768; graduated at Princeton College 1788, and was admitted to the bar 1792, having been a student under Chancellor Kent at Poughkeepsie; practiced first in Troy, later in Poughkeepsie, and then in New York city. He was elected to the Legislature in 1800; was associate justice of the Supreme Court 1802-14; chief justice 1814-18; Secretary of the Navy under Monroe; justice of the Supreme Court of the U. S. (1823) till his death at Poughkeepsie, N. Y., Dec. 18, 1813. He left no permanent writings outside of his written decisions.

F. STURGES ALLEN.

Thompson, THOMAS PERRONET; political reformer; b. at Hull, England, Mar. 15, 1783; graduated at Cambridge in 1802; entered the navy as a midshipman in 1803, and the army as second lieutenant in 1806; governor of Sierra Leone in 1808, but was so active in his hostility to the slave-trade that he was recalled in 1810. He accompanied Sir William Keir Grant as Arabic interpreter in his expedition up the Persian Gulf 1819, and assisted in negotiating a treaty with the Arab tribes by which the slave-trade was declared piracy. He was one of the founders of *The Westminster Review* (1824), and the author of pamphlets and articles on a great variety of subjects. His *Catechism of the Corn Laws* (1827) was one of the ablest of the attacks on the protective sys-

tem. In the field of mathematics he published a *Theory of Parabolas* (1841) and *Geometry without Axioms*; and in musical acoustics his *Theory of Just Intonation* (1850) was a valuable contribution. He became member of Parliament for Hull in 1865, and afterward sat for Bradford. D. Oct. 6, 1869.

Thompson, WILLIAM HEWORTH, D. D.; master of Trinity College, Cambridge; b. at York, England, Mar. 27, 1810; educated at Trinity College, Cambridge, where he became a scholar 1830, fellow 1834, assistant tutor 1837, and tutor 1844; elected Regius Professor of Greek in Cambridge University 1854; in the same year became a canon of Ely; on the death of Dr. Whewell in 1866 was chosen master of Trinity College. He edited William Archer Butler's *Lectures on Ancient Philosophy*, also two of Plato's *Dialogues*, with criticisms; was author of papers read before learned societies and of published addresses and sermons. D. Oct. 1, 1886.

Thompson, ZADOCK; naturalist; b. at Bridgewater, Vt., May 23, 1796; graduated at the University of Vermont in 1823; was tutor there 1825; published a *Gazetteer of Vermont* (Montpelier, 1824), an *Arithmetical* (1825), and a *History of the State of Vermont* (Burlington, 1833); edited the *Iris* (1828) and *The Green Mountain Repository* (1832); removed to Hatley, Canada East, 1833; was engaged as a teacher there and at Sherbrooke; published a *Geography of Canada*; studied theology, and took deacons' orders in the Protestant Episcopal Church 1835; returned to Burlington, Vt., 1837; became a professor in the Vermont Episcopal Institute; published his chief work, *The History of Vermont, Natural, Civil, and Statistical* (1841-43; appendix 1853); issued a *Guide to Lake George, Lake Champlain, Montreal, and Quebec* (1845) and *The Geography and Geology of Vermont* (1848); State geologist 1845-48; Professor of Chemistry and Natural History in the University of Vermont 1851-53; visited England as Vermont commissioner to the exhibition held in London in 1851, and published a *Journal* of his trip (1851); appointed State surveyor 1853. D. at Burlington, Jan. 19, 1856. He had issued an *Almanac* as early as 1819, made for thirty-four years the astronomical calculations for *Watson's Register*, and for some years those for *The Vermont Register*. A brief biography was published by Isaac F. Redfield (1856).

Thompsonville; village; Hartford co., Conn.; on the Connecticut river, and the N. Y., N. H. and Hartford Railroad; 18 miles N. of Hartford (for location, see map of Connecticut, ref. 7-II). It contains 5 churches, several schools on the consolidated system, a high school with library, a private bank, a trust company, and 2 weekly newspapers, and is known for its manufacture of carpets. Pop. (1880) 3,794; (1890) 4,673. EDITOR OF "THE PRESS."

Thoms, WILLIAM JOHN, F. S. A.; antiquary and bibliographer; b. at Westminster, England, Nov. 16, 1803; was for some years a clerk in the office of the secretary of Chelsea Hospital; was long a clerk to the House of Lords; from 1863 to 1882 was deputy librarian to the House of Lords; was for many years one of the most active members of the Society of Antiquaries; was secretary of the Camden Society 1838-73; and was the founder of *Notes and Queries*, and its editor until 1872. Among his publications are *A Collection of Early Prose Romances* (London, 3 vols., 1828; enlarged ed. 1858); *Anecdotes and Traditions illustrative of Early English History and Literature, from MS. Sources* (1838-39); a translation of Worsaae's *Primeval Antiquities of Denmark* (1849); *Choice Notes from Notes and Queries* (2 vols., 1859); and *Human Longevity* (1873). D. in London, Aug. 15, 1885.

Thomsen, CHRISTEN JÜRGENSEN; archaeologist; b. in Copenhagen, Denmark, Dec. 29, 1788. In 1816 he became director of the newly established Museum of Northern Antiquities in Copenhagen, which he arranged in a masterly manner, and with which he was connected until his death, May 21, 1865. In his *Ledetraad til nordisk Oldkyndighed* (Guide to Northern Antiquities, 1836) he indicated the triple division of the prehistoric age, and prepared the way for the modern scientific study of the subject. D. K. D.

Thomson, ANDREW, D. D.; clergyman and author; b. at Sanguhar, Dumfriesshire, Scotland, July 11, 1779; studied theology at the University of Edinburgh, and was appointed minister of Sprouston, Roxburghshire, in 1802, of the Fast church of Perth in 1808, of the New Gray Friars' church, Edinburgh, in 1810, and of St. George's church, Edinburgh,

in 1814. D. in Edinburgh, Feb. 9, 1831. He was a man of great energy and considerable eloquence, and is remembered for his attack upon the British and Foreign Bible Society for circulating the Apocrypha. He published numerous volumes of sermons. A posthumous volume of these contains his memoirs (Edinburgh, 1831; Boston, 1832).

Revised by S. M. JACKSON.

Thomson, ANTHONY TODD, M. D., F. L. S.: physician and author; b. in Edinburgh, Scotland, Jan. 7, 1778, son of the British postmaster-general of Georgia; graduated in medicine at Edinburgh University 1799; became a physician in London in 1800; was a voluminous writer in periodicals on medical and literary subjects; edited *The Medical Repository*; became Professor of Materia Medica in London University, and of Medical Jurisprudence 1832, holding both posts until his death at Ealing, near London, July 3, 1849. Among his works were *The London Dispensatory* (1811) and *Elements of Materia Medica and Therapeutics* (2 vols., 1832-33). He edited Dr. Thomas Bateman's *Practical Synopsis of Cutaneous Diseases* (7th ed. 1829), to which he added an illustrative *Atlas of Delineations* (1829); Enschèbe Salverte's *Philosophy of Magic, Prodiges, and Apparient Miracles* (2 vols., 1846; New York, 1847); and James Thomson's *Seasons* (1847). Revised by S. T. ARMSTRONG.

Thomson, CHARLES, LL. D.: patriot; b. at Maghera, Derry, Ireland, Nov. 29, 1729; landed in 1741 at Newcastle, Del., with three brothers, his father having died on the voyage; educated in an academy at Thunder Hill, Md.; became a teacher in the Friends' Academy at Newcastle; removed to Philadelphia, where he became an efficient teacher; was concerned in negotiations with the Iroquois Indians and Delawares, who named him "Truth-teller"; was secretary of the first Continental Congress; filled the same post to the successive Congresses until 1789; was chosen to inform Washington at Mt. Vernon of his election to the presidency; resided during his later years at Lower Merion, Montgomery co., Pa., where he died Aug. 16, 1824. He was the author of *An Inquiry into the Causes of the Alienation of the Delaware and Shawanese Indians* (London, 1759); of a valuable translation of the whole Bible, the Old Testament portion being from the Septuagint (4 vols., Philadelphia, 1808); and of *A Synopsis of the Four Evangelists, in their own Words* (Philadelphia, 1815).

Thomson, Sir CHARLES WYVILLE: b. at Bonsyde, Scotland, Mar. 5, 1830; educated at Merchiston Castle School and University of Edinburgh. Appointed lecturer on natural history in the University of Aberdeen in 1850, Professor of Natural History in Queen's College, Cork, in 1853, and in 1854 to the chair of Mineralogy and Geology in Queen's College, Belfast, where he also had charge of the Natural History Museum. In 1860 the charge of instruction in botany and zoölogy was given to him, and in the same year he received the degree of LL. D. Here he remained until 1870, when he was appointed to the chair of Natural History in the University of Edinburgh, a position which he held until, on account of ill health, he resigned in 1879. D. in Edinburgh, Mar. 10, 1882. His early work was in the line of botany, but that for which he will longest be remembered is the exploration of the deep seas. After conducting several smaller dredging expeditions (those of the Lightning, 1868, and Porcupine, 1869, being most prominent) and demonstrating that life existed at the greatest depths yet reached by the dredge, he was appointed to the scientific charge of the well-known expedition of the Challenger, which sailed on its voyage of circumnavigation Dec. 21, 1872, returning to England May 24, 1876. (See CHALLENGER EXPEDITION.) After his return he reassumed the duties of his chair and at the same time labored on the collections of the voyage, publishing in 1877 two volumes of preliminary results relating to the Atlantic and in 1880 the general introduction to the zoölogical series of reports of the voyage. Among his numerous other publications may be mentioned his *Depths of the Sea* (1873).

J. S. KINGSLEY.

Thomson, EDWARD, D. D., LL. D.: bishop; b. at Portsea, near Portsmouth, England, Oct. 12, 1810. His parents removed to the U. S. in 1819, and settled at Wooster, O. He received a good classical education; graduated in medicine at the University of Pennsylvania 1829; began practice as a physician at Wooster, but, experiencing a change in his religious views, became in 1833 a minister of the Methodist Episcopal Church; preached at Detroit, Mich., 1836; was principal of the Methodist Seminary at Norwalk, O., 1837-44; editor of *The Ladies' Repository* at Cincinnati

1844-46; first president of the Ohio Wesleyan University at Delaware, O., 1846-60; editor of *The Christian Advocate* from 1860 to 1864, when he was chosen a bishop. He was author of *Educational Essays* (1856); *Moral and Religious Essays* (1856); *Biographical Sketches* (1856); *Letters from Europe* (1856); and *Letters from India, China, and Turkey* (2 vols., 1870). D. at Wheeling, W. Va., Mar. 22, 1870.

Revised by ALBERT OSBORN.

Thomson, JAMES: poet; b. at Ednam, Roxburghshire, Scotland, Sept. 11, 1700; studied for six years at the University of Edinburgh, with the design of entering the Church, but, abandoning this intention, went to London in 1724, where he was for several months tutor in a nobleman's family. In 1726 appeared his poem *Winter*, which speedily became popular; *Summer* followed in 1727, *Spring* in 1728, and *Autumn* in 1730, completing *The Seasons*. In the interval he had published a *Poem Sacred to the Memory of Sir Isaac Newton* (1727), and written *Sophonisba*, a tragedy, acted in 1729. He then traveled for two years as tutor to the son of Lord Chancellor Talbot, by whom he was rewarded with the post of secretary of briefs, and wrote a poem on *Liberty* (5 parts, 1735-36), which met with a very unfavorable reception, and was subsequently considerably abridged. The Lord Chancellor dying in 1737, the secretaryship was lost by Thomson, but he received from the Prince of Wales a pension of £100, and some years later was rendered independent by the appointment of surveyor-general of the Leeward islands, which, after paying the deputy who performed all the duties, brought him £300 a year. His works, besides those already mentioned, are *Agamemnon*, a tragedy (1738); *Edward and Eleanor*, a drama (1739); *Alfred*, a masque, which contains the song *Rule Britannia* (1740); *Tancred and Sigismunda*, a successful tragedy (1745); *The Castle of Indolence* (1748), a poem in the Spenserian stanza, upon which he had labored many years, and which is his best work, though far less popular than *The Seasons*; and *Coriolanus*, a tragedy, not produced until after his death. D. at Kew Lane, near Richmond, Aug. 27, 1748.

Revised by H. A. BEERS.

Thomson, JAMES: engineer and physicist; brother of Lord Kelvin (see THOMSON, SIR WILLIAM); b. in Belfast, Ireland, Feb. 16, 1822. The brothers, James and William, received their early education from their father, Dr. James Thomson the mathematician, who was one of the most remarkable teachers of his time. In 1832 the family removed to Glasgow, where the father had been appointed professor of mathematics, and Thomson continued his studies in the university classes. At the age of seventeen, he took the degree of M. A. in the University of Glasgow, with honors in mathematics and natural philosophy. He then decided to become an engineer, but serious ill health, which lasted for many years, prevented him from carrying out his plans in full. He continued to interest himself in engineering problems, however, and perfected a number of inventions in the domain of hydraulics and pneumatics. Thomson's mind was essentially philosophical and mathematical, and it turned continually even in the midst of his technical activity to questions of pure science. In 1849 he read before the Royal Society of Edinburgh a paper of the highest importance, entitled *Theoretical Considerations on the Effect of Pressure in Lowering the Freezing-point of Water*. His conclusions, subsequently verified experimentally by his brother, William Thomson, afforded the solution to the great problem of the movements of glacier ice, and threw much light upon plasticity, regelation, and various other phenomena. The discussion of these matters, which had attracted the attention of Forbes, Faraday, Tyndall, and others, lasted for many years. It resulted in the recognition of the correctness of the principles laid down by James Thomson. Among his contributions to pure and applied science may be mentioned papers *On the Continuity of the Liquid and Gaseous States of Matter*; *On the Flow of Waters in Rivers and Open Channels*; and *On the Grand Currents of Atmospheric Circulation* (Bakerian lecture for 1892). In 1853 Thomson was appointed Professor of Civil Engineering and Surveying in Queen's College, Belfast, a chair which he held for twenty years. He then became the successor of Rankine as Professor of Engineering in the University of Glasgow, in which institution his brother William occupied the chair of Physics. In 1889 he was forced by partial blindness to resign his professorship, but his activity and interest in science continued to the end of his life. D. in Glasgow, May 8, 1892.

E. L. NICHOLS.

Thomson, James (B. F.): poet; b. in Port Glasgow, Scotland, Nov. 24, 1834; brought up in the Caledonian Orphan Asylum; entered the British army as regimental schoolmaster, where he made the acquaintance of Charles Bradlaugh, then a private soldier, who in 1860 established *The National Reformer*, to which Thomson became a contributor. While stationed in Ireland he became engaged to a young girl whose sudden death cast a gloom over his life. Discharged from the army, Thomson devoted himself to literature, writing chiefly for English radical periodicals and journals. He was for a time connected with *Cope's Tobacco Plant*. His first work was published in *Tait's Edinburgh Magazine* under the pseudonym *Crepusculus*. In 1863 he published in *The National Reformer* the powerful verses *To our Ladies of Death*, and in 1874 his chief and best-known work, *The City of Dreadful Night*, republished with other poems in book-form in 1880. In 1872 he went to the U. S. as agent of the shareholders in what he ascertained to be a fraudulent silver mine; in the following year he received a commission from *The New York World* to go to Spain as its special correspondent with the Carlists. About this time he adopted the pseudonym *Byssie Vanolis*—afterward shortened to the initials "B. V."—Byssie being the commonly used Christian name of Shelley. Thomson's favorite writer, and Vanolis an anagram of Novalis, the pseudonym of F. von Hardenberg. He was a prolific writer. In later years the fits of depression and insomnia to which Thomson was subject led him to seek refuge from his misery in opiates and alcohol. D. in University College Hospital, London, June 3, 1882. *A Voice from the Nile*, with memoir by Bertram Dobell, was published in 1884; *Shelley* in 1885. See *Life*, by Salt (1889). A. GROWOLL.

Thomson, John: clergyman and painter; brother of Thomas Thomson, antiquary; b. at Dailly, Ayrshire, Scotland, Sept. 1, 1778; studied theology in Edinburgh; became minister of Dailly, succeeding his father, in 1800, and of Duddingston, near Edinburgh, in 1805. He had begun the pursuit of art before entering the Church, and at Duddingston applied himself assiduously to study, becoming one of the great landscape-painters of Scotland, and in 1830 being elected a member of the Royal Scottish Academy. He also contributed papers on optics to the early issues of *The Edinburgh Review*. D. at Duddingston, Oct. 27, 1840.

Thomson, Joseph John: physicist; b. in Manchester, England, Dec. 18, 1856; educated at Owens College, Manchester, and at Trinity College, Cambridge. Since 1884 he has been Professor of Experimental Physics in Cambridge University. In addition to many scientific papers, Thomson is the author of volumes on *Vortex Motion* (1883) and on the *Application of Dynamics and Physics to Chemistry* (1888); also of an important treatise entitled *Notes on Recent Researches in Electricity and Magnetism*; the last-named work was written as a sequel to Maxwell's *Treatise on Electricity and Magnetism*, which Thomson edited with copious notes and comments in 1893. E. L. NICHOLS.

Thomson, Katharine (Byerly): biographer; b. at Etruria, Staffordshire, England, in 1800; married Dr. ANTHONY T. THOMSON (q. v.); wrote several novels and many works of biography and anecdotal literature. The later volumes appeared under the pseudonyms of *Grace* and *Philip Wharton*, her son John Cockburn Thomson having aided her. D. at Dover, Dec. 17, 1862. Among her works were *Memoirs of Sir Walter Raleigh* (1830); *Memoirs of the Jacobites of 1715 and 1745* (3 vols., 1845-46); *Recollections of Literary Characters and Celebrated Places* (2 vols., 1854); and *Wits and Beau of Society* (2 vols., 1860). Revised by H. A. BEERS.

Thomson, Thomas: antiquary; b. at Dailly, Ayrshire, Scotland, in 1768; educated at the University of Glasgow; became an advocate 1793, deputy clerk registrar of Scotland 1806; principal clerk of session 1828, and president of the Bannatyne Club 1832; was one of the founders of *The Edinburgh Review*, and occasionally acted as its editor; was esteemed the most learned antiquary in Scotland, and as such is frequently referred to in the writings of Sir Walter Scott. He edited for the Bannatyne Club some of the works of Sir Thomas Hope, John Lesley, Sir George Mackenzie, Sir James Melville, Lady Griselda Murray, Sir James Turner, and other old Scottish writers, and superintended for the Maitland Club and the record commission other reprints of the same character. D. at Shrubhill, between Edinburgh and Leith, Oct. 2, 1852. *A Memoir* (1855) was prepared for the Bannatyne Club by Cosmo Innes.

Thomson, Thomas, M. D.: chemist; b. at Crieff, Perthshire, Scotland, Apr. 12, 1773; educated at Stirling and at the University of St. Andrews; succeeded his brother, James Thomson (1768-1855), as editor of the third edition of the *Encyclopædia Britannica*, Nov., 1796-1800; graduated in medicine in Edinburgh 1799; was for some years after 1802 the scientific editor of James Mill's *Literary Journal*; was the first to introduce the use of symbols in chemistry in articles for the *Supplement* to the *Encyclopædia*, written 1798-99, and serving also as the basis of his *System of Chemistry* (4 vols., 1802); first announced to the world Dr. Dalton's atomic theory, which had been privately communicated to him in 1804, in the third edition of the same work (5 vols., 1807); was for many years a lecturer on chemistry, and conducted a laboratory for students; edited in London the *Annals of Philosophy* (1813-22); became in 1818 Professor of Chemistry in the University of Edinburgh. D. at Kilmun, Argyshire, July 2, 1852. Among his works were *The Elements of Chemistry* (1810); *The History of the Royal Society of London* (1812); *Travels in Sweden and Lapland* (1813); *An Attempt to establish the First Principles of Chemistry by Experiment* (2 vols., 1825); *An Outline of the Sciences of Heat and Electricity* (1830); *The History of Chemistry* (2 vols., 1830); *Outlines of Mineralogy, Geology, and Mineral Analysis* (2 vols., 1836); and a re-visit of his earlier work on chemistry in three separate treatises—*The Chemistry of Inorganic Bodies* (2 vols., 1831); *Chemistry of Organic Bodies, Vegetables* (1838); and *The Chemistry of Animal Bodies* (1842).—His son THOMAS, b. in Glasgow, Dec. 4, 1817, was an assistant surgeon in the Bengal army, superintendent of the East India Company's botanic gardens in Calcutta, and author of *Western Himalaya and Tibet, the Narrative of a Journey through the Mountains of Northern India* (1852). D. in London, Apr. 18, 1878. Revised by IRA REMSEN.

Thomson, William, D. D., F. R. S.: archbishop; b. at Whitehaven, Cumberland, England, Feb. 11, 1819; educated at Shrewsbury School; was successively scholar, fellow, tutor, and provost of Queen's College, Oxford, where he graduated 1840; was ordained deacon 1842 and priest 1843; was incumbent of the parishes of Guildford and Cuddesden; was appointed select preacher at Oxford 1848, and again 1856; preached the Bampton lectures on *The Atoning Work of Christ, viewed in Relation to some Current Theories* (1853); became rector of All Souls', Marylebone, London, 1855; contributed to the *Orford Essays* (1855) and to *Sermons at Westminster Abbey for the Working Classes* (1858); was preacher of Lincoln's Inn 1858-61; was appointed chaplain to the Queen 1859, Bishop of Gloucester and Bristol Dec., 1861, and enthroned Archbishop of York Feb. 24, 1863; took an active part as a member of convocation in promoting ecclesiastical reform and church extension; labored for educational reform in Oxford University; was a member of the Royal, Geographical, and Photographic societies; president of the Palestine Exploration Fund; examiner in logic and mental science to the Society of Arts, and in divinity at Oxford; one of the lords of the privy council, governor of the Charter-house and of King's College, London. D. at York, Dec. 25, 1890. As an author he is best known by his *An Outline of the Necessary Laws of Thought* (1842; 9th ed. 1868), a text-book in several British and American universities. Revised by S. M. JACKSON.

Thomson, Sir William (Lord Kelvin): physicist, mathematician, engineer, and inventor; b. in Belfast, Ireland, June, 1824; educated at the Universities of Glasgow and Cambridge. At the age of twenty-two years he was appointed Professor of Natural Philosophy in the University of Glasgow, and still (1895) holds the chair. During the half century of his career as a teacher of physics he has published a very large number of papers touching nearly every important theme with which the physicist has to deal. His earlier papers upon the theories of electricity and magnetism were gathered together in 1872 in an important volume entitled *Reprints of Papers on Electrostatics and Magnetism*. More complete collections have since been made (1882-90) under the titles *Mathematical and Physical Papers* (3 vols.) and *Popular Lectures and Addresses* (3 vols.). Two long and important articles published in the ninth edition of the *Encyclopædia Britannica* have also been reprinted under the titles *On Heat and On Elasticity*. In 1867 Thomson, in collaboration with Prof. Tait, of Edinburgh, issued the first volume of *A Treatise on Natural Philosophy* (2d ed. in two parts, 1879). This treatise, in which the effort was made to base a complete and exhaustive theoretical analysis upon the

doctrine of energy, was never carried beyond the division of mechanics, but it contains much upon that subject that is of the highest scientific value. From 1846 to 1853 Thomson was editor of the *Cambridge and Dublin Mathematical Journal*; for many years also he has been the chief of the board of editors which conducts *The Philosophical Magazine*. He was president of the British Association for the Advancement of Science (1871), of the Royal Society of London (1891), and of other societies. In 1872 he was made a fellow of St. Peter's College, Cambridge. Aside from his labors in pure science, Thomson has been active as an engineer and inventor. It was in great part due to his skill in solving the many intricate problems involved in submarine telegraphy that transoceanic signaling became a practical success; and it was in recognition of that fact that he was knighted in 1866. Of his numerous inventions, many of which were made to meet the demands of the manufacture and operation of submarine cables, the best known are his quadrant and portable electrometers, compensated compasses for iron ships, various types of mirror galvanometer, the siphon recorder, a machine for the analysis of tidal curves, and a large number of commercial instruments for the measurement of electrical currents and potential differences. His services as savant and engineer received high official recognition by his elevation to the peerage in 1892 with the title of Lord Kelvin. Jan., 1897, elected honorary member of the Russian Academy of Science. E. L. NICHOLS.

Thomson, WILLIAM McCURE, D. D.: missionary and author; b. at Springfield (now Spring Dale), O., Dec. 31, 1806; graduated at Miami University 1826; spent one year in Princeton Seminary; was missionary in Jerusalem 1832-33; in Beyrout 1833-76; and in 1877 returned to the U. S. He published *The Land and the Book, Biblical Illustrations drawn from the Manners and Customs, the Scenes and the Sceneries of the Holy Land* (2 vols., New York, 1859; London, 1860; new ed. 3 vols., 1880, 1882, 1885). D. in Denver, Col., Apr. 8, 1894. Revised by S. M. JACKSON.

Thor [from Icel. *þorr*, for *þonr: O. Eng. *þunor*, Thor, thunder]: in Scandinavian mythology, the son of Odin and Jord. He ranked next to Odin, but was far more popular, as is evidenced by the many myths and names by which he is known. He was the protector of Midgard and of human industries against nature's destructive forces personified by the giants, with whom he was in constant conflict. Thunder and lightning were caused by his riding in the clouds in his car drawn by two goats. His weapon of protection was his hammer Mjølner. He had steel gloves and a belt, Megingjard, which doubled his strength. His home was Thrudvang and his hall was called Bilskirner. His wife was Sif. Just as the Christians put a cross on gravestones, so the Scandinavian heathens put the sign of Thor's hammer (a cross) on their rune-stones. Thursday is named after Thor. See SCANDINAVIAN MYTHOLOGY. RASMUS B. ANDERSON.

Thoracic Duct [*thoracic* is deriv. of *thorax*, from Gr. *θώραξ*, breastplate, cuirass]: the principal lymphatic vessel in the human body. It runs upward on the left side of the spinal column from the receptaculum chyli, and terminates near the junction of the left internal jugular and the left subclavian veins. It discharges into the blood-current the chyle and most of the lymph of the body. It is often represented in the lower animals by a congeries of lymphatic vessels. Birds have two thoracic ducts, one on each side. Its outlet is provided with valves which prevent the ingress of blood, and the duct has other valves which allow the contents to pass upward, but not downward.

Thoracos'tracea [Mod. Lat.; Gr. *θώραξ*, breastplate + *στρακον*, shell]: a name sometimes employed for those Crustacea (*Decapoda*, *Stomatopoda*, *Schizopoda*) in which the anterior part of the body (cephalothorax) is covered with a carapace, and the eyes (except in *Chinacea*) are on movable stalks. See MALACOSTRACA.

Thorax: See CHEST.

Thoreau, thō'rō, HENRY DAVID: author; b. at Concord, Mass., July 17, 1817; was the son of John Thoreau, of Concord, and Cynthia Dunbar, and the grandson of John Thoreau, of Boston. His grandfather was a prosperous merchant of Boston, who removed to Concord in 1800, and died there; his father was originally a merchant, but in middle life took up the business of pencil-making, at Concord, which he and his children carried on for half a century. Henry, his second son and third child, learned this art while fitting for college in his native town, and practiced it occasionally, with its allied art, the preparation of finely ground graphite, for

electrotyping, until a year before his death. He graduated at Harvard College in 1837, and for five or six years taught school or was a private tutor in Concord and on Staten Island, N. Y. He was an inmate of Ralph Waldo Emerson's family from Apr., 1841, to May, 1843, and again from Sept., 1847, to Oct., 1848; and in the interval of these residences with Emerson was in his cabin by Walden Pond, from July, 1845, to Sept., 1847. After 1849 he lived with his parents and his sister Sophia at Concord until his death May 6, 1862. He had been in college a close student of Greek, reading most of the common authors, and also much of the earlier English literature, with which he became very familiar. He read much and easily in Latin and French, and formed his own style on classic and French models, taking great pains with everything he wrote. He kept a journal from 1837 to his last illness, and made up his essays and books mainly from its many volumes, which were interspersed with verse, as are his two early works, the *Week on the Concord and Merrimack Rivers* (edited at Walden in 1846-47 and published in 1849), and *Walden* (written partly while living by the pond, but edited later, and published in 1854). These were the only volumes he published; but many essays and a few poems were printed by him in magazines, which have since his death been collected and published in volumes. Four volumes have also been selected from his journals by his literary executor, Harrison Blake, and two more are in preparation. An imperfect collection of his letters and poems was edited by Emerson in 1865, and a fuller volume of letters by F. B. Sanborn (*Familiar Letters of Henry Thoreau*) in 1894. No complete collection of his poems has been made, but Henry S. Salt, his English biographer, is editing a fuller selection than has yet appeared; several of them, including translations from the Greek poets, are found in his *Miscellanies*, the last of a ten-volume edition of his works, published with a general index (1893-94). Although often stated, it is not true that Thoreau never voted or attended church, paid no taxes, and never used a gun. He lived simply, but seldom alone, always supported himself by the work of his hands or otherwise, was a good land-surveyor, naturalist, and mechanic, a good citizen, a valued friend, and devoted to the comfort of his family. He never married, partly from an early disappointment in love, but was intimate with admirable women and the children of his friends, and was beloved by them, as by most of those who really knew him. He was original and sometimes eccentric, but never misanthropic or morose. His intellectual and moral elevation is plainly seen in his writings, which have steadily gained in favor since his death. He is buried in Concord, near the graves of Emerson, Alcott, Hawthorne, and Wasson, his congenial friends. See his *Life* (1882), by Franklin B. Sanborn, in the American Men of Letters Series, and a biography, *The Poet Naturalist* (1873), by Ellery Channing. F. B. SANBORN.

Thores'by, RALPH, P. R. S.: antiquary; b. in Leeds, England, Aug. 16, 1658; educated at Leeds School; resided some years at Rotterdam, qualifying himself for the mercantile business, which he afterward successfully conducted, devoting, however, much of his time to antiquarian pursuits. D. in 1725. Author of *Duacatus Leodiensis, or the Topography of Leeds* (London, folio, 1715), of which a new edition was brought out by Dr. T. D. Whitaker (1816); *Museum Thoresbiana, or a Collection of Antiquities in the possession of Ralph Thoresby*, and *Vicaria Leodiensis, or the History of the Church of Leeds* (1724); all which are highly appreciated by topographers. He contributed to Gibson's edition of Camden's *Britannia*, Collins's *Peerage*, Calamy's *Memoirs of Dirines*, and other works, and wrote much in the *Philosophical Transactions*. His *Diary* (2 vols., 1830) and *Correspondence* (2 vols., 1832) were edited by Rev. Joseph Hunter.

Thoresen, tor'e-sen, ANNA MAGDALENA (Kragh): novelist; b. at Fredericia, Denmark, June 3, 1819. The scenes of her novels and tales are laid almost exclusively in Norway, where she married in 1844 a country parson. The best of these are *Fortællinger* (Tales, 1863); *Signes Historie* (Signe's History, 1864; translated into English 1865); *Solen i Siljedalen* (The Sun in the Silje Dale, 1868); *Billeder fra Vestkysten af Norge* (Pictures from the West Coast of Norway, 1872); *Hierulf Nordal, en Fortælling fra det forrige Aarhundrede* (Hierulf Nordal, a Tale from the Last Century, 1879), and *Mindre Fortællinger* (Short Tales, 1891). She is also the author of several dramas. D. K. DODGE.

Thorild, tor'ild, THOMAS: critic; b. at Svarteborg, Sweden, 1759. After studying at Lund, he moved to Stockholm, where he remained, with the exception of a short time spent

at Upsala and in England, until 1793, when he was exiled for giving expression to advanced political views. He was afterward appointed to a professorship in the Swedish University at Greifswald. He was one of the earliest of the revolutionary writers in Sweden, and his polemics with Kellgren and Leopold are of immense importance. Hanselli published his *Skandale Skrifter* (2 vols., Stockholm, 1873-74). D. at Greifswald in 1808.

D. K. DODGE.

Thorium, also **Thorium**: one of the rare metals, discovered by Berzelius in 1828 in a Norwegian mineral which he called thorite, from the Scandinavian god Thor. Thorite is a thorium silicate, with the composition $\text{ThSiO}_4 \cdot 2\text{H}_2\text{O}$. Thorium is a gray metallic powder, which burns with great brilliancy to snow-white infusible thorina, ThO_2 . Water does not act upon it, and nitric and sulphuric acids with difficulty, though hydrochloric acid attacks and dissolves it powerfully. This is the statement of Berzelius, but Chydenius states that it is easily soluble in nitric and diluently in hydrochloric acid. Thorium occurs also in other minerals besides thorite, as orange, as columbate in some pyrochlores, as phosphate in monazite, and according to Chydenius in euxenite, as columbate and tantalate. Its atomic weight is 232.6.

Revised by IRA REMSEN.

Thorn, or **Thorn-bush**: See CRATEGUS.

Thorn, town: town of Prussia; province of West Prussia; on the Vistula, 31 miles by rail E. S. E. of Bromberg (see map of German Empire, ref. 3-I). It was made a fortress of the first rank in 1878 by Prussia; has manufactures of cloth, linen, soap, tobacco, and gingerbread, and carries on an active trade in grain and timber. Copernicus was born here, and a bronze statue of him stands in the market-place. Pop. (1890) 27,018.

Revised by M. W. HARRINGTON.

Thorn, FRANK MANLY: lawyer and U. S. official; b. at North Collins, N. Y., Dec. 7, 1836; educated in common schools and at Fredonia Academy; studied law; clerk of the surrogate's court in Erie County 1857-60; practiced law and did journalistic work until 1871; member county board of supervisors during 1871-80; chief clerk in the bureau of internal revenue in Washington, D. C., 1885; superintendent U. S. COAST AND GEODETIC SURVEY (*q. v.*) from July, 1885, to July 1, 1889.

Thorn-apple: See DATURA.

Thornback [i. e. back with prickles or thorns]: the name given in parts of Great Britain to the *Raja clavata*. This is a short-snouted ray, whose dorsal surface, especially about the snout and interorbital space, is covered with small spines, and along the middle of the back and tail with a row of large spines, resembling somewhat the thorns of a rosebush; the male has further still larger thorns on the sides of the head and pectoral fins, and the female has numerous spines, each arising from a large roundish base. It is very abundant along parts of the British coast, and is the most esteemed as a table-fish of any member of the genus. It comes into shallow water in spring and summer, and is then taken in the greatest numbers.

Revised by E. A. BIRGE.

Thornbury, GEORGE WALTER: author; b. in London, England, in 1828; became contributor to periodicals at the age of seventeen; was connected with *The Athenaeum* 1851; studied art and occasionally practiced painting, but devoted himself to literature and produced some twenty-five volumes. D. in London, June 11, 1876. Among his works are *Shakespeare's England, or Sketches of our Social History during the Reign of Elizabeth* (2 vols., 1856); *Songs of the Cavaliers and Roundheads* (1857); *Life in Spain* (2 vols., 1859); *Turkish Life and Character* (2 vols., 1860); *British Artists from Hogarth to Turner* (2 vols., 1860); *Life of J. M. W. Turner, R. A.* (2 vols., 1861); *Hunted London* (1865); *Two Centuries of Song* (1866); *Old and New London* (2 vols., 1873-74); and *Historical and Legendary Ballads and Songs* (1876).

Revised by H. A. BEERS.

Thornby, SIR EDWARD, D. C. L., LL. D.: diplomatist; b. in London, July 17, 1817, son of Hon. Edward Thornby, British minister in Portugal; was educated at Cambridge; entered the diplomatic service in 1842 as *attaché* at Turin; successively held important places in the legations in Mexico and several South American states; was envoy to Brazil 1865-67; envoy to the U. S. 1867-81; a member of the joint high commission on the Alabama claims 1871; appointed privy counselor 1871; and arbitrator of the Mexican and U. S. claims commission 1873. He was appointed British ambassador to Russia 1881, and to Turkey in 1884; retired in 1887.

Thornton, MATTHEW: signer of the Declaration of Independence; b. in Ireland in 1714. His parents emigrated to New England, living at Wiscasset, Me., and removing thence to Worcester, Mass. He received a classical education and studied medicine; accompanied Pepperell's expedition against Louisburg as a surgeon 1745; became a physician at Londonderry, N. H., and a colonel of militia; was president of the convention which in 1775 assumed the government of New Hampshire; took his seat as a delegate to the Continental Congress Nov. 4, 1776; signed the Declaration of Independence, though he was not a member at the time of its adoption. In 1779 he removed to Exeter, and shortly thereafter relinquished his practice and settled on a farm at Merrimack. He was afterward chief justice of Hillsboro County, judge of the New Hampshire Supreme Court, and member of both branches of the Legislature and of the council (1785). D. at Newburyport, Mass., June 24, 1803.

Thornton, SIR WILLIAM: soldier; b. in England about 1775; entered the British army as ensign 1796; became major 1806; was appointed military secretary and aide-de-camp to the Governor-General of Canada Aug., 1807; returned to England 1811; took part in the Peninsular war and Wellington's campaign in Southern France 1813-14; was sent to the U. S. and commanded the light brigade and advance of Gen. Ross's expedition up the Chesapeake May, 1814; was severely wounded and made prisoner at Bladensburg; was exchanged for Commodore Barney; commanded the advance of the British army sent against New Orleans in October, and the detached corps which operated on the right bank of the Mississippi in the battle of New Orleans, Jan. 8, 1815, when he was again severely wounded. He reached the rank of lieutenant-general in 1838. D. near Hanwell, England, Apr. 6, 1840.

Thornton, WILLIAM THOMAS: publicist and miscellaneous author; b. at Burnham, Buckinghamshire, England, Feb. 14, 1813; son of Thomas Thornton, president of the Levant Company's establishment in Constantinople; educated in the Moravian settlement at Ockbrook, near Derby; was secretary to the British consul-general at Constantinople 1830-35; was a clerk in the India House, London, 1836-56, when he was placed in charge of the public works department of that office, and in 1858 became secretary for public works in the India Office, a post which he held till his death. He was the author of *Over-population and its Remedy* (1845); *A Plea for Peasant Proprietors* (1848; 2d ed. 1873); *Zohrab and other Poems* (1854); *Modern Manichæism, and other Poems* (1856); *Old-fashioned Ethics and Common-sense Metaphysics; On Labor, its Rightful Dues and Wrongful Claims, its Actual Present and Possible Future* (2d ed. 1869); and a verse translation of the *Odes of Horace* (1878). D. June 17, 1880.

Revised by H. A. BEERS.

Thorntown: town; Boone co., Ind.; on the Rock river, and the Cleve., Cin., Chi. and St. L. Railway; 26 miles S. E. of Lafayette, 38 miles N. W. of Indianapolis (for location, see map of Indiana, ref. 6-I). It is in an agricultural region, and contains a high school, a State bank (capital \$25,000), and a weekly paper. Pop. (1880) 1,515; (1890) 1,530.

Thornwell, JAMES HENLEY, D. D., LL. D.: clergyman and educator; b. in Marlborough district, S. C., Dec. 9, 1812; graduated at South Carolina College, Columbia, S. C., 1831; studied and taught till the summer of 1834, when he spent some weeks at Harvard College, Cambridge, Mass.; was settled over a Presbyterian church in Lancaster, S. C., June 12, 1835; took the professorship of Logic and Belles-lettres in South Carolina College in Jan., 1838; resigned to take the pastorate of the Presbyterian church in Columbia in 1840; in 1841 returned to the college as chaplain and Professor of Sacred Literature and the Evidences of Christianity; from July to Dec., 1851, was pastor of the Glebe Street church in Charleston; returned again to the college, to become its president, in Jan., 1852; in 1855 accepted the professorship of Didactic and Polemic Theology in the Theological Seminary at Columbia. D. at Charlotte, N. C., Aug. 1, 1862. He was a man of rare critical acumen, of great personal magnetism, and the acknowledged theologian of the Southern Presbyterian church. He published several sermons and addresses; his *Collected Writings* were edited by Rev. J. B. Adger and J. L. Girardeau (4 vols., Richmond, Va., 1871-73), and his *Life and Letters* by Rev. Benjamin M. Palmer (1875).

Revised by S. M. JACKSON.

Thornycroft, JOHN ISAAC, F. R. S.: engineer and naval architect; b. in Rome, Italy, Feb. 1, 1843; studied practical

engineering at an early age, and in 1863 designed the Ariel, which may be regarded as the forerunner of modern torpedo-boats; went through the engineering course at Glasgow University, and studied ship-building at Govan on the Clyde. He then became a builder of torpedo-boats at Chiswick, and has constructed a number of such boats for the British and other governments. Among his inventions may be mentioned the turbine propeller for use in shallow-draught vessels. Mr. Thornycroft is the vice-president of the Institute of Naval Architects of Great Britain.

Thornycroft, Walter Hamo, R. A.: sculptor; b. in London, Mar. 9, 1850; was educated at University College School, London; in 1869 began to study at the schools of the Royal Academy, and exhibited first in 1871. In 1880 he made a success with a statue of Artemis, now in Eaton Hall, near Chester. Among his more important works are *Teucer* (1881), in the South Kensington Museum; *The Sower* (1886); *The Mower* (1894); *Science* (1891); a bust of S. T. Coleridge, in Westminster Abbey (1885); an equestrian statue of Edward I (1885); and the national memorial to Gen. Gordon in Trafalgar Square.

Thorold: town of Welland County, Ontario, Canada; 7 miles S. of Lake Ontario, on the Welland Canal (see map of Ontario, ref. 5-E). It is a station on the railway from St. Catharines to Port Colborne. Pop. 2,275. M. W. H.

Thorold, Anthony Wilson, D. D.: bishop; b. at Hougham, Lincolnshire, England, June 13, 1825; educated at Queen's College, Oxford, and graduated in 1847; was rector of St. Giles-in-the-Fields, London, 1857-68, minister of Curzon chapel, Mayfair, 1868, vicar of St. Pancras 1869, and canon residentiary of York in 1874. He was appointed Bishop of Rochester in 1877, and Bishop of Winchester in 1891. His *Presence of Christ* went through over twenty editions. D. in Farnham Castle, Surrey, July 25, 1895.

Thorough-bass: in music, the mode or art of expressing chords by means of figures placed over or under a given bass. These figures indicate the harmony through all the other parts, and hence the name. Thorough-bass may be considered as the first department in the study of harmony. The term is sometimes taken in a larger sense, as equivalent to musical science. See FIGURED BASS and HARMONY.

Thoroughwort: See EUPATORIUM.

Thorpe, Benjamin: Anglo-Saxon scholar and author; b. in England in 1782; devoted himself at an early age to the study of the Anglo-Saxon and Scandinavian languages and literatures; made a complete translation of the *Edda* (unpublished); received a pension from the British Government. D. at Chiswick, July 19, 1870. Among his numerous works were a translation of Rask's *Grammar of the Anglo-Saxon Tongue* (Copenhagen, 1830; new ed. 1865); *Cædmon's Metrical Paraphrase of Parts of the Holy Scriptures, in Anglo-Saxon, with an English Translation, Notes, and a Verbal Index* (1832); *The Anglo-Saxon Version of the Story of Apollonius of Tyre, upon which is founded the Play of Pericles, with a Translation and Glossary* (1834); *Analecta Anglo-Saronica, a Selection in Prose and Verse from Anglo-Saxon Authors of Various Ages, with a Glossary* (Oxford, 1834; 3d ed. 1868); *Libri Psalmorum Versio Antiqua Latina, cum Paraphrasi Anglo-Saronica, etc.* (1835); *Ancient Laws and Institutes of England, enacted under the Anglo-Saxon Kings from Ethelbert to Canut, with an English Translation of the Saxon* (London, folio, 1840); *The Holy Gospels in Anglo-Saxon, edited from the Original MS.* (Oxford, 1842; new ed. 1848; New York, 1846); *Codex Eroniensis, a Collection of Anglo-Saxon Poetry, etc., with English Translation and Notes* (1842); *The Homilies of the Anglo-Saxon Church, etc., with an English Version* (2 vols., 1843-46); *The History of England under the Anglo-Saxon Kings, translated from the German of Dr. J. M. Lappenberg, with Additions and Corrections by the Author and Translator* (2 vols., 1845; new ed. 1857); *Flurentii Wigorniensis Chronicon* (2 vols., 1848-49); *Northern Mythology, etc., compiled from Original and other Sources* (3 vols., 1851; new ed. 1863); *Yule-Tide Stories, a Collection of Scandinavian Tales and Traditions* (1853); *Pauli's Life of Alfred the Great* (1854); *The Anglo-Saxon Poems of Beowulf, with a Literal Translation, Notes, and Glossary* (Oxford, 1855); *Lappenberg's History of England under the Norman Kings* (1857); *The Anglo-Saxon Chronicle, according to the several Original Authorities* (London, 2 vols., 1861); *Diplomatarium Anglicum Ævi Saxonici, a Collection of English Charters, etc.* (1865).

Thorpe, John: architect; b. in England about 1540; was the chief designer in what is known as the Elizabethan style of domestic architecture, having built Kirby House in Northamptonshire (1570); Burreigh, Holdenby, Audley End, and Amphill; Longford Castle in Wiltshire, in the form of a triangle; Liveden Hall in Northamptonshire; Slaugham Place in Sussex; Holland House in London; the Strand front of Somerset House (1607), and many other edifices. A valuable collection of his drawings exists in the Soane Museum, and offers the most complete example known of the methods of work of an architect and building surveyor of the sixteenth century. The particulars of his life and date of his death are unknown. Revised by RUSSELL STURGIS.

Thorpe, Thomas Bangs: journalist and artist; b. at Westfield, Mass., Mar. 1, 1815; educated at the Wesleyan University, Middletown, Conn.; studied art; resided in New Orleans, La., from 1836 to 1853; edited a Whig paper there several years; raised volunteers for the Mexican war; was the writer of the first newspaper correspondence narrating military events on the frontier; published *Our Army on the Rio Grande* (1846) and *Our Army at Monterey* (1847); was an active political speaker in the campaign of 1848; became known under the pseudonym of *Tom Owen, the Bee-hunter*, as the writer of a series of tales of Western life, including *Mysteries of the Backwoods* (1846); *The Hive of the Bee-hunter* (1854); and *Scenes in Arkansas* (1858); and became in 1859 editor and proprietor of *The Spirit of the Times*; published *Lynde Weiss, an Autobiography* (1854); *A Voice to America* (1855), and other works; and wrote a series of biographical sketches of American artists. His best-known painting is *Niagara as it is*. He was city surveyor of New Orleans during the administration of Gen. Butler (1862-63), and later became connected with the U. S. custom-house in New York city, where he died Sept. 20, 1878.

Revised by H. A. BEERS.

Thorpe, Thomas Edward, Ph. D., F. R. S.: chemist; b. at Harpurhey, near Manchester, England, Dec. 8, 1845; was educated at Owens College, Manchester, and the Universities of Heidelberg and Bonn; was appointed to the chair of Chemistry in Anderson's College, Glasgow, in 1870, and to similar positions in the Yorkshire College in Leeds (1874) and the Royal College of Science, South Kensington (1885). He has contributed a large number of papers on chemistry to the *Philosophical Transactions*, *The Journal of the Chemical Society*, the *Reports of the British Association*, *Nature*, and other scientific journals. He edited *Coal: its History and Uses*, and is the author of a *Dictionary of Applied Chemistry*, 3 vols.; *Inorganic Chemistry*, 2 vols.; *Qualitative Analysis; Quantitative Analysis; Chemical Problems; and Essays in Historical Chemistry*.

Thorpe, William: reformer; b. in England about 1350; received a good education; became a priest; preached the doctrines of Wiclif for twenty years from 1386; was imprisoned in Saltwood Castle, Kent, as a Lollard, 1407, and examined before Archbishop Arundel, then Lord Chancellor, July 3 of that year. He wrote an account of his *Examination*, which was widely circulated, and was condemned by an assembly of the clergy so late as 1530. The subsequent history of Thorpe is unknown. His *Examination*, which may be found in Foxe's *Book of Martyrs* and in Dr. Christopher Wordsworth's *Ecclesiastical Biographies*, is elegantly written, and is of great value as a picture of English society and manners in the time of Chaucer and Gower, and especially as a trustworthy summary of Lollard doctrines.

Revised by S. M. JACKSON.

Thorwaldsen, tor-wald-sen, Albert (Bertel): sculptor; b. at sea, Nov. 19, 1770. His father, Gottschalk Thorwaldsen, a native of Iceland, then on his way to Copenhagen, was a wood-carver and poor. Bertel's schooling was short and unprofitable until he was sent to the free school of the Academy of Arts at Copenhagen. There, at the age of seventeen, a bas-relief of Cupid reposing gained the silver medal; at twenty a sketch of *Heliodorus driven from the Temple* gained the small gold medal; two years later he obtained the grand prize, which entitled him to receive the royal pension, available for five years, beginning in 1796. In Mar., 1797, he arrived in Rome. His model of *Jason*, which Canova praised, attracted the admiration of an English connoisseur, Thomas Hope, who gave the artist a commission to execute it in marble. This was the beginning of a great career. The *Adonis*, begun in 1808, was not finished until 1832. It is the only one of Thorwaldsen's statues which was entirely carved by his own hands. It is a triumphant answer to the charge

brought against Thorwaldsen in his lifetime, that he could not work in marble. "Not work in marble!" he said. "Tie my hands behind my back, and I will hew out a statue with my teeth!" The bas-relief, *The Triumphal Entry of Alexander into Babylon*, celebrated Napoleon's entry into Rome in 1812. The familiar bas-reliefs *Night and Morning* were modeled in 1815. The *Venus Victrix* (1813-16) and the *Mercury* (1818) are, with the *Adonis* just mentioned, his most perfect works. In 1819 Thorwaldsen returned to Copenhagen, and was received with great demonstrations. The well-known groups of *Christ and the Twelve Apostles* and *John the Baptist preaching* were completed in 1838 for the Church of Notre Dame at Copenhagen. Another visit in that year to Copenhagen, where he meant to live for the rest of his life, was cut short by the uncongenial climate. In 1841 he went back to Italy, stayed a year, then returned to Copenhagen, intending to remain for a short time only, but died suddenly of heart disease Mar. 24, 1844. The chief part of his fortune was left as a perpetual endowment for the museum at Copenhagen, which is raised around his grave, and contains only his works. (See COPENHAGEN.) The best and most accessible works on Thorwaldsen are J. M. Thiele, *Thorwaldsens Biographie* (4 vols., Copenhagen, 1851-56; Am. ed., translated by Prof. Paul C. Sinding, New York, 1869); *Thorwaldsen, sa Væ og son (Œuvre*, by Eugène Plon, with two etchings and thirty-five wood-cuts (Paris, 1867; Am. ed. Boston, 1874, with the wood-cuts of the Paris ed.). Thorwaldsen's works are very numerous—205 as mentioned by Thiele—and of them, his colossal lion carved out of solid rock near Lucerne, Switzerland, commemorating the Swiss guards who fell while defending the Tuileries in 1792, and his bas-reliefs of *Night and Morning*, executed at a single sitting, are the best known. He may be considered as the chief of those modern sculptors who have tried to follow a purely classical tradition.

Thoth [Egypt, *Tehuti*, the measurer]: an Egyptian lunar deity, god of wisdom, whom the Greeks identified with Hermes. He was the god of HERMOPOLIS MAGNA (*q. v.*), the son of Ptah and Mut (other parents are also assigned), and husband of Māt, goddess of truth (also of Nephthys). He is represented as an ibis-headed man, and occasionally he is shown surmounted with a crescent moon and the sun-disk. He was regarded as the adviser and scribe of the gods, as the inventor of writing and of numbers, and as the measurer of time. He was believed to have been the author of the most sacred books, prayers, and laws (Diodorus, i, 94, 75), and the *Book of the Dead* is ascribed to him. Hence he was the tutelary deity of scribes, and because of his knowledge of magic, one of the chief reliances of physicians, he was also their special god. He was regarded as the guardian, companion, and advocate of the dead, whom he accompanied to the "Hall of Double Justice," where he superintended the weighing of the heart of the deceased against the symbol of truth, and noted the result. To him the ibis and the cynocephalus ape were sacred, as were also the first month of the year and the sixth hour of the day. Few temples were reared to him, but in the eighteenth dynasty he was apparently held in special honor, as is shown by the fact that his name appears in that of Thothmes, "son of Thoth." See also HERMES TRISMEGISTUS. CHARLES R. GILLETTE.

Thothmes, Tahutmes, Tutmes [*Tahuti-mes*, son of Thoth]: the name of four kings (the fourth, fifth, sixth, and eighth) of the eighteenth Egyptian dynasty. During the reign of the first king Egypt regained most of the ground, as regards both art and national power, which had been lost through the Hyksos invasion and domination. With the expulsion of these "shepherd kings" Egypt entered upon an era of foreign conquest which reached its furthest limits under Thothmes III. The booty which was brought back from various expeditions served to enrich both rulers and soldiers, and its evidences are seen in numerous buildings and temples in all parts of Egypt, but particularly at Thebes, the national capital. It was a period of renaissance and prosperity, and in matters of foreign trade and intercourse it marks an epoch in Egyptian history.

Following in the footsteps of Ahmes (the Amosis of Manetho), THOTHMES I, made conquest of Ethiopia and established rule there after the pattern of Egypt. At the head of this government was a "prince of Cush" who was also frequently the heir-apparent to the Egyptian throne. To the eastward he pushed as far as the Euphrates, where he set up two stelæ as the boundaries of his dominions. At home he was active in building, especially at Thebes, but most of his

edifices have been obscured by the remodeling of his successors or destroyed by time. His reign covered only nine years, and he left as his successors his son Thothmes II, his daughter HATASU (*q. v.*), and also Thothmes III, a son by a concubine. After death he received divine honors.—THOTHMES II, reigned only a brief time, as coregent with Hatasu; and we know only of unimportant expeditions against the nomads of the deserts that bordered Egypt on the E., and Nubia on both sides. He contributed to the architectural splendors of Thebes, but his name was erased from his monuments by his sister, who survived him.—THOTHMES III, was perhaps the greatest warrior produced by Egypt. After twenty-one years of joint reign with Hatasu, he became sole king, and he at once entered upon his warlike career. His efforts were directed toward the entire subjugation of Western Asia, and during the first twenty years of his sole reign there are records of fourteen campaigns to the East. He subdued Palestine, Syria, and a portion of Mesopotamia, together with the region between the Euphrates and the Mediterranean. He took Megiddo, Tyre, Kadesh on the Orontes, Carchemish, and a large number of other places, whose names he inscribed on the walls of the temple of Karnak. It is supposed that his dominion extended to the border of Asia Minor, and from Cyprus also he received tribute. At home he built on an extensive scale in various parts of Egypt from the Delta to the second cataract of the Nile. Thebes naturally received most of his attention, and there he labored principally in extending the temple of Karnak, which he adorned with inscriptions that give a very complete record of his reign. Evidence of an intense hatred of his early coregent, Hatasu, is seen in the fact that he industriously erased her name wherever it was possible. He was succeeded by Amenhotep II, whom he had previously associated with himself in the government. His reign covered about fifty-three years in all, of which for about thirty-one he was sole king. Dr. Mahler, of Vienna, using astronomical data, has calculated that his reign extended from Mar. 20, 1503, till Feb. 14, 1449 B. C.—THOTHMES IV, was the son of Amenhotep II, mentioned above. His reign covered only seven years, during which he claimed to have waged war in Ethiopia, Syria, and Phœnicia. But the pompous style of the narratives of these exploits throws doubt upon their historical trustworthiness. Early in his reign he cleared the great sphinx of Gizeh of the sand which had buried it, and erected between the paws a tablet 13 feet high. (See SKNAX.) He was followed by Amenhotep III, and his son Sminert, and after them the kingdom became much weakened, till its power was again restored by Seti I, and Ramses II, the mighty kings of the nineteenth dynasty. CHARLES R. GILLETTE.

Thott, 161, BRIGITTE; scholar; b. in Denmark, 1610; the most learned woman and one of the greatest scholars of her time. Her chief work is a translation of Seneca (Sorø, 1658), which won admiration by its correctness and elegance. She also translated Epictetus and Cebes. In the preface to the Seneca she makes a strong plea for the intellectual rights of her sex. D. K. D.

Thon, 100, JACQUES AUGUSTE, de; historian; b. in Paris, Oct. 8, 1553; studied law at Orleans and afterward at Valence, under Cujas; traveled in Italy, Germany, and Holland, and was made counselor to the Parliament in 1578, councillor of state in 1588, vice-president of the Parliament and keeper of the royal library in 1593. Henry III, and Henry IV, showed him great confidence, and employed him in many difficult diplomatic and political negotiations; but under the regency of Marie de Médicis he felt himself to be slighted and retired from public life. He was a member of the Politique party, a strong opponent of the League, and a supporter of the policy of toleration toward Protestants, being one of the promoters of the Edict of Nantes. D. May 7, 1617. His great work, *Historia mei Temporis*, comprising the period from 1546 to 1607, written in Latin, and divided into 138 books, was published in part in 1604 and succeeding years; but the last part did not appear till 1620, when it was issued by his friends, Dupuy and Rigault, the latter of whom added a continuation or conclusion based on the papers of the author; complete edition in seven folio volumes (London, 1733); French translation in sixteen volumes 4to (1734). Though the author betrays his sympathy with the Politiques, the work is in general impartial, and is one of the chief authorities for the period. He also wrote some Latin poems and an autobiography, edited by Masson (1838). See John Collinson, *Life of Thuanus, with some Account of his Writings* (London, 1807). F. M. COLBY.

Thought: the mental processes of comparing, judging, and reasoning. The term thought is used to mark off those mental states in which there is a breaking loose from particular objects and the manipulation of general notions, concepts, signs, or terms. It involves APPERCEPTION (*q. v.*), the relating function, primarily, but after it comes to work upon the more abstract material used in arguments, reasonings, inferences, and the like. In its nature, however, thought can not be held to differ from the lower exercises of mind seen in perception. The distinction is largely one of range and reach in the use of material. The lower animals seem to come only to a very small degree of thought.

Psychologists distinguish certain stages in the process of thought, having mainly in view the degree of generality of the object to which the mind is directed. These stages may be given a further word under the names which they hold in popular language, i. e. conception, judgment, reasoning.

Conception.—In conception, the object which the mind is thinking about is a "general idea," concept, or notion. It is a mental state which is equivalent in thought to more than one object in the external world. When, for example, a man speaks of the "place of the horse in the animal kingdom," he is using a concept, "horse." The psychological point at issue is the way the mind comes to have a state which thus stands not for any particular object—no one single horse—but for any of the objects which go in a class, large or small. General ideas are generally distinguished as "abstract," i. e. when they designate a quality of objects, such as "green," "sweet," etc., independently of the kinds of objects to which this quality may apply; and concrete, or "general," in a narrow sense, i. e. when they refer to the objects themselves, as to number, distribution, etc., independently of the qualities which they possess, as, for example, the case given, "horse." The way that the concept arises on the basis of the perception of the particular objects which come first in mental growth is called "abstraction" and "generalization" in these two cases respectively.

Judgment.—This term is usually applied to the mental procedure of asserting anything, as, for example, "Socrates is mortal," "It rains." The theory of judgments when they are thrown into statements called "propositions" belongs to the ordinary or Aristotelian theory of Logic (*q. v.*). The action of the mind in getting and using its judgments, however, belongs to psychology. The theory most current on the psychological side looks upon judgment as just the mind's own consciousness of the progress it is making with its conceptions. For example, the judgment "horses eat grass" is looked upon by the newer theory as the mind's expression to itself of the fact that the new quality or attribute of eating in a particular way has to be added, in future cases when horses are thought of, to the concept which stands for this class of animals. There seems to be nothing added to the concept by the mere fact of judgment—that is, nothing additional to what is already there in the altered concept. But connected with this very growth of the concept there arises as a necessary part of the function itself the recognition by consciousness of the addition being made to its content, and this recognition of and assent to its own process constitute judgment. Consequently, the older school of psychologists who thought that judgment represented an entirely new function or faculty are no longer considered authorities; yet the newer school, represented by Brentano, Sigwart, Lotze (especially the first named), are disposed to think that the predication of existence is always carried by the exercise of judgment, and that that is a new mental movement, since in conception the notion may or may not have the attribute of existence attached to it. The view of Brentano is probably correct, as far as it finds in judgment the attribution of existence; but this attribution of existence is a fact of emotion, which becomes explicit at a certain stage in the development of conception, and then gives the form of conscious recognition or assertion which we call judgment.

Reasoning.—It is the process of reasoning which is usually suggested by the word thought; and reasoning is, when psychologically considered, the most explicit form of the growth of conception, and with it of the direct assertion found in judgment. The detailed treatment of reasoning belongs to Logic (*q. v.*); and it only remains to say in this connection that reasoning is again only a further stage in the growth of conception. In every piece of reasoning, in every argument, what we really have is an attempt to broaden our conception of the subject reasoned about by adding to it certain new elements. We do this by discovering relations between concepts formerly held apart; and the successful

union of such conceptions in one is what we call the "conclusion" of the argument. So here again the old psychology is wrong in thinking that reasoning is a distinct faculty. It is only the general apperceptive or synthetic function of consciousness, as it works on more general and detached elements of perception and conception. The reason, therefore, that animals do not show more reasoning power than they do is probably simply that they are not developed far enough, either in consciousness or in the brain complexity that accompanies consciousness, to do much of the synthesis which thought embodies.

LITERATURE.—See the references given under LOGIC; also the *Psychologies* of Brentano, James, Höfding, and Baldwin.

Thousand and One Nights: See ARABIAN NIGHTS.

Thousand Islands: a group of about 1800 islands situated in the St. Lawrence river, near the outlet of Lake Ontario; famed for the beauty of their scenery, and annually visited by large numbers of tourists. Many have been chosen as sites for summer cottages. An expansion of the river, caused by the numerous islands obstructing it, is known as the Lake of the Thousand Islands. A belt of crystalline rock termed Laurentian gneiss, which unites the Adirondack hills of New York with a vastly larger area of a similar geological character in Canada, is crossed by the St. Lawrence, and owing to the unevenness of the surface of the rock and inequalities in the depth of the glacial deposits spread over it, many islands were formed when the region became partially submerged.
ISRAEL C. RUSSELL.

Thrace (in Gr. Θράκη): in earliest times the entire and wholly indefinite region of country N. of Mt. Olympus, but later on the boundaries were in general these: On the N. the Danube, on the E. the Black Sea, on the S. the Hellespont and Thracian Sea, on the W. the Strymon. The Thracians belonged to the Indo-European family, and in earliest times had attained a relatively high standard of culture, as is indicated by the religious myths that originated in or were connected with Thrace, though they failed to keep pace with their southern neighbors. Little is known concerning the history of the country. The people were very warlike, living mainly by plunder and robbery, and were notorious for their drunkenness. The Greeks planted many colonies along the coast of Thrace, but the Thracians never exercised any great influence upon political affairs in Greece. They were conquered by Philip and Alexander, and from the Macedonians the country passed into the hands of the Romans, though it was not fully subdued until 26 B. C.

Thrale, HESTER LYNCH SALUSBURY: See PIOZZI.

Thrasher: a name applied in parts of the U. S. to the species of *Turdida* or thrush-like birds belonging to the genera *Oroscoptes* and *Harporhynchus*. *Oroscoptes* has the wings and tail of nearly equal length, the tail nearly even, and a slightly notched moderate bill. *Harporhynchus* has the wings decidedly shorter than the tail, the tail long and graduated, and the bill not notched and diversiform, but generally quite elongated and decurved. The color is rather plain, generally brownish or ash above, whitish or spotted on the breast. The species include the sage-thrasher or mountain-mocker (*O. montanus*), the brown thrasher (*H. rufus*), Cape St. Lucas thrasher (*H. cinereus*), gray curve-bill thrasher (*H. curvirostris*), California thrasher (*H. redivivus*), and red-vented thrasher (*H. crissalis*).

Thrashing: See THRESHING MACHINERY.

Thrasybulus (in Gr. Θρασύβουλος): son of Lycus of the deme Steiria, one of the leaders of the democratic party in Athens during the latter part of the Peloponnesian war. He was one of the associates of Thrasyllus at Samos, and was prominent in the attempt against the four hundred. He then fought under Alcibiades in the Hellespont and elsewhere, and as trierarch took part in the battle of the Arginusæ, being one of those ordered to pick up the shipwrecked sailors. He was banished by the Thirty Tyrants and took up his residence in Thebes, where he planned his successful attempt to redeem Athens from the rule of the Thirty. From the fortress of Phyle as his base of operations he seized Munychia, the stronghold of the Piræus, and finally succeeded in overthrowing the Thirty and in re-establishing a democratic form of government in Athens (403 B. C.). He served as general in Beotia and at Corinth,

but without distinction (394 B. C.). In 391 B. C. he commanded the Athenian fleet, and succeeded in restoring the Athenian prestige in the Hellespont, but was charged not only with embezzlement, but with treason as well. When his fleet was visiting Pauphlyia his soldiers angered the people of Aspendus by acts of violence, and Thrasybulus himself was killed in his tent during the night. His death probably saved him from execution at Athens, a fate which overtook Ergocles, his fellow general. J. R. S. STERRETT.

Threadworm: any nematode worm. See NEMATHELMINTHES.

Threats: expressions of intention to inflict injury on another. At common law they are criminal offenses when directed against persons under the protection of a court, or when made against the life, reputation, or property of another for the purpose of extorting money from him, provided they are of a nature calculated to overcome a firm and prudent man. (*King vs. Southerton*, 6 East, 126.) This subject became a matter of legislative regulation at an early day, and is governed wholly by statutes in each jurisdiction. Threats for the purpose of intimidating a public officer, or of preventing a person from exercising his lawful calling, or threats to publish a libel, or threats in a letter sent or delivered for the purpose of extorting money or annoying persons, are generally declared misdemeanors by these statutes. Threats which unlawfully interfere with one's business are actionable as a tort. In an early English case the owner of a stone-quarry was allowed to recover damages against a party who by threats of bodily harm and of lawsuits frightened away plaintiff's workmen and customers. (*Garret vs. Taylor*, Croke, James, 567, A. D. 1620.) Threats may also interfere with one's personal freedom to such an extent as to amount to FALSE IMPRISONMENT (*q. v.*). See BOYCOTTING and CONSPIRACY. FRANCIS M. BURDICK.

Three Bodies. Problem of: the problem of determining the motion of three mutually gravitating particles. The discovery of the law of universal gravitation by Newton reduced the question of the motion of the planets to one of almost pure mathematics. Newton himself was able to show, by a rigorous but intricate geometrical demonstration, that if two bodies like the sun and a planet attract each other with a force inversely as the square of their mutual distance they will each describe a conic section around their common center of gravity. The planet being very small relatively to the sun, this common center of gravity would be very near the center of the sun, and the planet might therefore be said to describe a conic section around the sun. It was thus shown that, considering only the attraction of the sun upon the planets, each planet would revolve in an ellipse having the sun in one of its foci, which was Kepler's first law of planetary motion. But since each planet is attracted by all the other planets, as well as by the sun, this motion in an ellipse does not represent the mathematical truth, but only an approximation to the real motion. Hence mathematicians were led to propound the problem more general than that solved by Newton: *Three bodies being projected in space with any velocity and in any direction whatever, and then left to their mutual attraction, to find the motion of each of them during all time.* The general and complete solution of this problem was found to be beyond the power of mathematical analysis, for the reason that the curves described by the several bodies would be so irregular, subject to such constant variation, and changing so greatly according to the masses of the bodies, that it would be impossible to express them by any mathematical formula. It was, however, possible to find certain general laws to which the motion would be subject. The center of gravity of the three bodies would always move in a straight line with a uniform velocity. Certain relations were found to subsist between the masses of the bodies, their distance apart, and their velocities, and certain great principles established relating to the secular changes as well as to the real permanence and stability of the solar system. See LAGRANGE.

All this, however, did not suffice to determine completely the motion of any one body. In consequence of the impossibility of the general solution, the efforts of mathematicians have generally been directed, not to the general problem, but to two special cases of it which occur in the solar system. The first of these cases is that of the motion of two planets around the sun, in which the masses of the bodies are very small compared with that of the sun, while their motion takes place in nearly circular orbits. The deviations

of each planet from the average ellipse in which it would move if not attracted by the other, then admit of being determined with any required degree of accuracy, though not with mathematical rigor. The actual problem of planetary motion is, however, not simply that of three bodies, or two planets, but of nine bodies, there being eight large planets. But the solution of the problem of any number of planets involves no greater mathematical difficulties than are encountered in the case of two, though the labor of the numerical solution is immensely greater. The other special case is that of the motion of the moon around the earth, under the influence of the attraction of the sun as well as of that of the earth. This is a more complicated case than that of planetary motion, because while the moon revolves round the earth both the earth and moon revolve together around the sun. But by the researches of Hansen and Delaunay this difficult problem of the moon's motion has been solved with nearly the same degree of accuracy as that of planetary motion.

The efforts of several generations of mathematicians since the middle of the eighteenth century have resulted in the general problems of planetary and lunar motion being rendered comparatively simple from a purely mathematical point of view. But the problem of actually calculating the formulas necessary to determine the motion of any one planet is one of immense labor, the increased accuracy demanded by modern astronomy having more than made up for the greater simplicity of the methods now used. The difficulty involved is indicated by the fact that the algebraic formulas by which Delaunay represents the position of the moon occupy 120 4to pages. S. NEWCOMB.

Three-chapter Controversy: an episode in the great Monophysite controversy. In order to win over the Monophysites the Emperor Justinian issued in 544 an edict condemning the so-called Three Chapters—the person and writings of Theodore of Mopsuestia, the writings of Theodoret against Cyril and in defense of Nestorius, and the letter of Ibas of Edessa to the Persian Maris. Though this condemnation involved a condemnation of the Council of Chalcedon (451), which had expressly affirmed the orthodoxy of Theodoret and Ibas, the Greek Church accepted the edict, as did also Pope Vigilius (540-555), while the whole Western Church rejected it and excommunicated the pope. Revised by S. M. JACKSON.

Three Estates: See ESTATES, THE THREE.

Three Rivers (Fr. *Trois Rivières*): city, port of entry, and *chef-lieu* of St. Maurice County, Quebec, Canada; on the northern bank of the St. Lawrence where it is joined by its tributary the St. Maurice (see map of Quebec, ref. 4-C). The Canadian Pacific Railway connects the city with Montreal, 95 miles distant, and with Quebec, 77 miles distant. There is also a branch of the Grand Trunk terminating here by means of a ferry from the other side of the river. The river steamboats make this a place of call during summer. The town is one of the oldest in Canada, having been settled in 1634. It is an ecclesiastical center, with its cathedral, bishop's palace, college, and convents. The old original parish church still stands. The city owes its growth to the development of the lumber-trade of the St. Maurice and its tributaries. The St. Maurice iron-works are 10 miles distant, and connected with the city by rail. The manufactures of Three Rivers are lumber, boots and shoes, and iron ware. The cathedral, with its massive spire, surrounded as it is by many handsome edifices, gives the city an imposing appearance as it is approached by rail. Some of the streets have an untidy appearance, while the system of water-supply and drainage needs improvement. The city sends one member to the House of Commons at Ottawa, and one to the House of Assembly at Quebec. There are 2 weekly newspapers, 3 branch banks, 3 Protestant churches, and several well-equipped schools. Three Rivers was in origin the fort or central station of the three great tributaries of the St. Lawrence; hence, perhaps, the name, though it is generally thought to have been given on account of the two dividing islands at the mouth of the St. Maurice. Pop. (1881) 7,998; (1891) 8,334. J. M. HARPER.

Three Rivers: village; St. Joseph co., Mich.; at the junction of the St. Joseph, Portage, and Rocky rivers; on the Lake Sh. and Mich. S. and the Mich. Cent. railroads; 8 miles N. of Constantine, and 25 miles S. of Kalamazoo (for location, see map of Michigan, ref. 8-II). It has excellent water-power for manufacturing; is in a lumber region, and contains 2 flour-mills, several saw and planing mills, four-

dries, agricultural-implement works, paper mill, pepper-mint-oil works, 2 national banks with combined capital of \$414,000, a State bank with capital of \$30,000, a free public library, and 3 weekly newspapers. Pop. (1880) 2,525; (1890) 3,131; (1894) 3,140. EDITOR OF "HERALD."

Thresher: See FOX SHARK.

Threshing Machinery: machinery for the separation of grain from the straw.

Primitive Methods of Threshing.—There are two methods of threshing without machinery—one by blows which beat out the grain, the other by a kind of trituration which breaks its hold on the straw. The former appears to have been developed from the latter. The earliest method of threshing was doubtless that of treading the grain to and fro by horses or oxen—a method in common use on the small farms in the U. S. and elsewhere, especially for buckwheat, and notably for clover. Another ancient method still in use in the Orient, but probably nowhere else, is that of drawing a sled back and forth over the unthreshed straw. The primitive method of beating out the grain was by means of a flail, an implement comprising a staff wielded by the thresher, and having at one end a swingle shorter, thicker, and heavier than the staff, to which it is connected by a flexible thong. The flail is uniformly used even now where only small quantities of grain are to be threshed. The best flails have staves made of ash and swingles of hickory; the staff in each case being provided with a wooden bow swiveled at its upper end in order that the swingle may be free to swing around the line of the staff, the swingle being attached to the bow by a looped thong made preferably of eel-skin, which best resists the great and continual strain and friction brought upon it. In threshing grain with straight straw, such as oats, wheat, barley, etc., the sheaves are laid in double rows with their heads turned inward and slightly overlapping. The thresher first threshes down the middle, beating out the heads. The bands upon the sheaves are then broken, and the whole is uniformly again threshed over. It is then turned or inverted and flailed again. If the weather is damp, the straw is tougher and holds the grain more firmly; and in such cases the straw is shaken up with a pitchfork once or more as may be required, and repeatedly gone over with the flail. With buckwheat, in which the sheaves or stooks are of conical form, the stooks are placed upright, and the whole mass is beaten down upon the floor by first striking upon the tops of the stooks, the straw being turned and shaken up as often as may be required, and repeatedly threshed until the grain is completely separated. Clover, beans, peas, etc., are flung promiscuously on the threshing-floor and turned and beaten until the threshing is complete. These last, however, are readily threshed by horses trampling upon them, an attendant turning the straw at one part of the floor while the horses are trampling at another.

Early Forms of Threshing Machinery.—From the very earliest times until a very recent period, the methods just described were the only ones by which grain was separated from the straw, unless the rude method sometimes used by warlike Celtic tribes of burning the straw and gathering the parched grain left behind be excepted; also that other method in which may be detected the faintest suggestion of the principle of modern inventions—the hurdles made of planks or wide beams, stuck over with flints or hard pegs to rub the grain ears between them; for it is only necessary to curve one of these planks to the arc of a circle, and bend the other to a complete cylinder revolving within the concave, to have an imperfect representation of the two essential parts of a modern threshing-machine. It is to such beginnings that the principles of improved machinery may be frequently traced; and the modern threshing-machine finds its inception in the pegged hurdles of the ancient Romans, just as the harvester had its beginning in the comb-like reaping-blade mounted on wheels mentioned by Pliny as in use among the Gauls. The first threshing-machine that could in any sense be considered a practical success, and which was the prototype of those that led to the displacement of the hand-flail, was that invented by Michael Menzies, of East Lothian, in Scotland, who used a number of flails attached to a revolving shaft driven by a water-wheel. This machine succeeded in threshing very rapidly, but the high velocity required soon broke and destroyed the flails, and the mechanical resources of that time were not equal to the task of constructing an apparatus on this principle which would successfully stand the wear and tear of actual

use. Afterward, in the year 1758, another Scotchman, Michael Sterling, in Perthshire, constructed another thresher, which appears to have been merely an experiment. This had a vertical shaft with radial arms working within a cylinder, the shaft being turned by a water-wheel. The sheaves were thrown in at the top of the cylinder and were beaten by the radial arms. This appears to have been of little utility, and was followed twenty years later by another machine, in which a number of rollers were arranged around an indented drum, the drum being revolved and the rollers rubbing out the grain. This was manifestly impracticable, as were also several modifications. At a later date another Scotchman, Andrew Meikle, devised a machine in which rollers and drums were retained, but in which beating was substituted for rubbing. The first machine of this kind was made in 1786, and appears to have been the earliest threshing-machine that was practically adapted to extended and successful use. In this, scutches were attached to the drum, and arranged to strike the grain from the straw. At first this invention was adapted merely to detach the grain from the straw, and threw grain, chaff, and straw in a heap together. But early in the introduction of these machines screens were added, and the grain, separated from the straw, was passed to a winnower. This was really a most notable invention, and the threshing of grain by a machine turned by horse-power or steam-power, which had been before at most an experiment, became an accomplished fact. This machine, as well as those that followed it, was expensive. A large one with suitable rakes and fanners for separating straw from the grain and chaff, and the grain from the chaff, cost £150 sterling at that time, when the purchasing power of money was at least three times what it is now. But such machines enabled one man to do the work of six, and secured 5 per cent. more of winnowed grain from a given weight of straw than was possible with hand-threshing. And as has been said: "If 5 per cent. is added to the national produce, it is as great a gain to the public as if the national territories were increased one-seventh." Notwithstanding the comparative excellence of these early British machines, they have been much changed, and the steam threshing-machines exhibited at the annual agricultural shows in Great Britain are triumphs of mechanical engineering.

Threshing-machines in the U. S.—In North America threshing-machines were early invented, but for the reason that most of the farms were newly cleared from the wilderness, divided into small fields, and almost necessitating hand-labor in all departments of agriculture, it is only since about 1840 that this class of machinery has been brought to any perfection. Among those earlier invented, the plan of rotary beaters or flails attached to a revolving shaft was the subject of much experiment. But a revolving cylinder provided with radial teeth or spikes, and working with a concave or section of a cylinder provided with similar but inwardly projecting teeth, comprised the beating mechanism which was first found uniformly successful, and which continues in use. The changes and improvements have related for the most part to the mode of giving motion to this cylinder and to accessories for securing safety and convenience in the operation of the machine. Those which first came into common and satisfactory use had the cylinder actuated by intermediate gearing from a vertical driving-shaft, from the upper end of which extended radial arms. To the outer end of these arms was attached a whippletree, on which draught was exerted by a single horse. The four horses walked in a circular path, and thus gave rotary movement to the vertical driving-shaft and rapid rotation to the cylinder. The sheaves, unbound, were fed with the heads first into the space between the cylinder and its concave. In some of the first of these machines shaking screens were so applied as to sift the grain and chaff from the straw, the latter being carried and deposited by itself, while the former passed to the hopper of a fanning-mill, which cleaned or separated the grain from the chaff, while a graduated system of sieves separated the small seeds, pigeon-weed, devil's-gut, etc. Many attempts were made to supersede this clumsy mode of driving the cylinder by an inclined endless belt constructed with transverse wooden lags, and driven after the manner of a treadwheel by horses. This plan has been adopted with success for small dog-power machines for churning. Many experiments were made to apply the same principle in various forms to the heavier work of driving a thresher. The first attempts of this kind were made at a foundry in the village of Fly Creek, N. Y. A resident of that place had succeeded in making a horse-

power on the plan just mentioned, which theoretically appeared to be perfect, but with which no steadiness of motion could be given to the cylinder. When the sheaves were not passing to the machine the apparatus ran too fast for the horses; when the sheaves were applied the apparatus choked. This was about 1830-35; the apparatus was laid aside, but shortly after a projector from the State of Maine came to the same foundry and had constructed a far ruder apparatus, which on trial gave a perfectly satisfactory motion to the cylinder. The constructor of the first-named device was not long in discovering that this was due to a balance-wheel placed on the main shaft of the horse-power. He added this useful appliance to the shaft of the previous machine, and from this was developed the Badger railroad horse-power, which for many years held its own as the most efficient power for driving threshing-machines. It is difficult to explain the construction of this apparatus without elaborate diagrams. It consisted, in brief, of a framework carrying at each side two endless cast-iron tracks situate in vertical planes. The endless belt was composed of two systems of iron links arranged around the two tracks, and connected by the transverse lags or wooden bars which composed the traveling floor of the apparatus. Each link carried a broad-faced wheel resting upon the upper part of the adjacent endless track. The endless belt thus constructed and arranged was of course in an inclined position, the weight of the horse walking thereon as upon a treadmill giving a motion to the endless belt, the wheels of which traveled upon and around the endless tracks, from which operation the designation "railroad" was derived. A large broad-faced wheel constituted at once the balance-wheel to give steadiness of motion and the driving-wheel from which, by means of a belt, power was transmitted to the threshing-cylinder. At a later date the construction was much simplified, and what are now termed railroad horse-powers differ materially in construction from the first representatives of the class. In the use of this class of machinery much difficulty was at first experienced from the breaking or slipping of the driving-belt, which by relieving the horse-power from the resistance of the thresher was liable to throw the horses back out of the machine, with consequent injury and loss. This was remedied by an ingenious application of a lever arranged in such relation to the belt that the breaking of the belt lets fall the lever, and this in its turn actuates a brake that, coming in contact with the driving-wheel, stops the motion of the endless platform.

The ordinary threshing-machine in use in the Eastern States comprises either a portable steam-engine or a railroad horse-power for two or three horses, and a thresher composed essentially of the toothed cylinder acting in conjunction with the toothed concave. An endless shaker formed with transverse wires and operated like an endless belt conveys the straw some distance in the rear of the thresher, a vibrating motion given to the belt shaking out the chaff and grain, these latter being passed to a fanning-mill which separates the chaff, small seeds, etc., from the winnowed grain. These machines are commonly owned by some enterprising farmer, who, aside from the threshing of his own farm, journeys from farm to farm by appointment, and threshes either for a stated price per bushel or for a percentage of the grain itself, commonly one-tenth. The large farms of the West and the immense quantities of grain produced have called into existence far more elaborate apparatus, in which, however, the principle of operation is substantially unchanged. A thresher in use for a number of years in the Western States may be taken as a type of the improved threshing-machine in use in the Prairie States. In this the threshing-cylinder is made of skeleton form, having cast-iron heads, and the central annular brace of the same material; wrought-iron bars are arranged on these parts, and form the circumferential parts of the cylinder, being held in position by the external wrought-iron rings. The bars carry the teeth, the shanks of which pass through holes in the bars, and are held by nuts firmly screwed upon their inner ends; the uniformity in shape and size of the teeth arises from their being made by machinery properly shaped in dies under a drop-hammer. The concave is of cast iron, with slots in it which allow the grain to pass through to separate from the straw at the earliest possible stage of the threshing operation. The straw as it leaves the cylinder is flung back, the grain being then shaken out by a vibrating shaker and its separation completed by an air-blast from a revolving fan.

In the Pacific States the peculiar dryness of the atmosphere greatly facilitates not only the threshing but the

reaping of grain; the standing grain, instead of crinkling down when ripe, as is the case in the Eastern States, stands straight for many weeks; and this without the shaking out of the kernels incident to ripe grain in other portions of the country. It is, however, dry enough to thresh immediately; the threshers are driven by portable steam-engines, and the threshing is carried on in the open field. During recent years much attention has been given to straw-burning furnaces for steam-boilers of threshing-machines in the open field. By these the straw is used in generating the power which drives the thresher, and a comparatively waste product is made to cheapen the expense of the work. Straw-burning furnaces have been used in Hungary during a long period, and for many years the straw of the rice-fields in the Southern U. S. has been utilized in the same manner. A Californian apparatus for cutting, threshing, and winnowing grain in the field, devised many years ago, is constructed as follows: A large grain-frame is supported on two heavy driving-wheels, and has two lighter ones in front arranged as guiding-wheels. Projecting from the side of this frame is a platform like that of an ordinary reaper, but about 12 feet long. This runs at such height that the reciprocating sickle at the front will cut off the heads from the standing grain; the heads fall on an endless apron running longitudinally upon the platform, and are carried by this to a hopper that conducts them to a threshing-cylinder having a fanning-mill and straw-separator arranged behind it. The threshed and winnowed grain is thrown out from the fan-mill through a spout at the side directly into the mouth of a sack suspended under the spout. An attendant riding upon the platform ties the sacks when full, and throws them off upon the ground to be collected at leisure. The driving parts receive their motion from the large or driving wheel by means of suitable bands and gearing. This apparatus was designed to be drawn by ten horses, the management of which would constitute the greatest difficulty in the operation of the apparatus. Something similar to this has been projected in Australia, where the peculiarities of the climate permit the immediate threshing of the grain as soon as cut. The plan is not more audacious than that experimentally carried into effect about 1850 in Devonshire, England, of connecting a threshing and winnowing apparatus with a run of mill-stones, so that the grain was stripped from the straw, separated from the chaff, ground, and bolted at one continuous operation.

JAMES A. WHITNEY.

Thrift: the *Armeria elongata*, a European seaside and mountain plant, found also on British American shores, and often grown in gardens as an edging for flower borders. It has diuretic powers. *A. latifolia* is a fine ornamental plant from Portugal. They are of the family *Plumbaginaceae*.

Thring, EDWARD, A. M.: educator; b. in England, Nov. 21, 1821; studied at Eton; graduated at Cambridge 1847; took orders and served as curate for a time, always wishing to teach; went to Uppingham, Rutland, as head master Sept. 10, 1853, where he had a career as one of the most famous of English schoolmasters. D. Oct. 22, 1887. He published four volumes of school sermons, *Thoughts on Life Science* (1869); *Education and School: Theory and Practice of Teaching* (3d ed. 1886), besides poems and addresses. See Skrine, *A Memory of Edward Thring* (1889); Rawnsley, *Edward Thring, Teacher and Poet* (1889). C. H. THURBER.

Thrips: See *Physopoda*, under ENTOMOLOGICAL.

Throat Diseases: Although the specialty of the study and treatment of throat diseases is designated laryngology, it includes diseases of the posterior nares, the fauces, pharynx, and larynx. Exceptionally, some of these diseases may be suspected or even diagnosed from symptoms only, as laryngitis from hoarseness, stridor, or aphonia; chronic tonsillitis from muffled voice and habitual snoring; elongated uvula and papular pharynx from habitual spasmodic pharyngeal cough. But physical exploration, the direct examination of the oral cavity and the passages to the posterior nares and larynx, is essential both to diagnosis and to correct treatment. Simple examination—the depression of the tongue by a spoon or tongue spatula—will suffice in many cases, exhibiting the tonsils, soft palate, uvula, posterior wall of the pharynx, and the top of the epiglottis. To discover the root of the tongue, the entire epiglottis, the true and false vocal cords, the clunk of the glottis, and even the upper rings of the trachea and division of the bronchi, the laryngoscopic mirror must be employed. Laryngoscopy may be performed by the use of either bright sunlight or a concentration of artificial light.

Specialists employ lamps with condensing lenses; with such methods of illumination the examination is conducted in a dark room. A good light, whether the sun's rays or artificial, is reflected, by a concave mirror held by the physician or

Fig. 1.

worn upon a head-band, into the patient's opened mouth. The patient's tongue being drawn forward and gently held, a small circular or oval laryngeal mirror is introduced. There are several sizes of mirrors, varying from one-quarter to one inch in diameter; they are attached to delicate handles at an angle, so that when passed to the back of the throat they catch the rays thrown into the mouth by the concave mirror, and reflect them downward, illuminating the larynx. The parts thus rendered luminous present a distinct picture in the small laryngeal mirror above them; and this is seen by the observer.

The laryngoscopic examination is easily accomplished after a brief period of practice. More difficult is the exploration of the upper pharynx and the posterior nares, termed *rhinoscopy*.

The uvula has to be drawn forward, and the reflecting laryngeal mirror passed well back and turned upward. When correctly held, a distinct image of the septum between the nostrils, and of the extensive corrugated surfaces of the naso-pharyngeal spaces, is transmitted to the eye (Fig. 3). Patients are easily trained to permit the presence of the throat mirror, and even to explore their own throats. The movements of the vocal cords are displayed best in uttering the sound *a* (*eh*).

All of these several connecting parts of the throat are richly supplied with blood-vessels and lined by a mucous membrane, secreting mucus. They are therefore liable to hypersecretion of mucus, or catarrh, which may be acute, subacute, or chronic; to active and passive congestions, inducing redness, heat, and swelling; to active inflammations, with formation of submucous abscess, erosion of the epithelial covering of the mucous membrane, or ulceration and sloughing of its deeper layers. Such destruction of soft tissue may induce necrosis of the underlying hard structures, the nasal and laryngeal cartilages. Inflammation may terminate in an exudation of membranous character, as those of croup and diphtheria. Repeated congestions and inflammations tend to engorge and hypertrophy the structures of the mucous membrane and glandular bodies embedded in it. The papillae of the

Fig. 3.

back of the throat and of the columns of the fauces are very often thus enlarged. The surface is seen to be studded with prominent ovoid papules or tubercles, a condition often known as *elergyman's sore throat*, and technically as *papular pharyngitis*. Polypoid growths of variable size develop in the nares, pharynx, and on and around the vocal cords—products of papular growth and of granulation.

A most alarming and critical condition is acute oedema of the larynx. This is an acute inflammatory disease attended with great swelling, by oedema, of the submucous tissue. The distended, swollen structures overlap the opening of the glot-

tis and occupy the ventricles of the larynx, preventing inspiration and threatening immediate death by suffocation. The laryngoscopic mirror definitely locates the seat of these dropsical sacs, and is the sure guide to efficient scarification and evacuation of their contained fluid.

The vocal cords may be affected by spasms, producing hoarseness, aphonia, and labored respiration, in which case the mirror detects the unusual approximation and irregular action of the cords, and excludes the presence of more serious organic disease. One of the vocal cords may be found paralyzed, inactive, and relaxed, while the other remains normal. Such paralysis of a cord may be due to inflammation or abnormal growth, or may depend upon lesions of the nerves in the neck, or again, coexisting with paralysis of half of the body, depend on a lesion of the brain. Ulceration or inflammation may so seriously damage the vocal cords that cicatricial or scar-like tissues are formed, tending to contract and harden; in time the chink of the glottis becomes contracted and narrow—termed stenosis of the larynx. The aperture being no longer adequate for the ingress or egress of air, gradual suffocation must ensue unless surgical relief is afforded. Extensive destruction of the vocal cords often occurs from syphilis and epithelial cancer.

The more accurate diagnosis of throat diseases, and intelligent study and classification by aid of laryngoscopy, have led to corresponding progress in treatment. Applications are no longer applied at random by probangs, uncertain of the condition that exists and of the parts which are reached. Remedies are applied with accuracy by various methods, with definite regard for the indications of each case. Astringents—as tannin, iron, and silver—are employed to contract blood-vessels, lessen congestions, and relaxations of surfaces. Caustics are sometimes used, local applications are made to heal ulcers, and inflammation is checked by warm solutions and vapors, or in other cases by cold gargles or sprays. Anodynes are given to allay pain, either by the stomach or locally. Electricity is applicable directly to the paralyzed vocal cord. The knife is constantly of service in treating throat diseases, for the excision of the tonsils and uvula, opening abscesses, the scarification of oedema of the glottis, and for the operations of tracheotomy and laryngo-tracheotomy, whenever, by inflammation, tumors, crupous, or diphtheritic membrane, or whatsoever obstruction, the larynx is closed to the passage of air and death is imminent by suffocation. Of recent years the operation of intubation has been introduced. This consists in the insertion of a metallic tube directly into the larynx from the pharynx. In this way the larynx is kept open and suffocation prevented. See CATARRH, DIPHTHERIA, MOUTH, DISEASES OF THE; QUINSY, and TONGUE.

Revised by W. PEPPER.

Thrombosis: See HEART DISEASE.

Thrombus [Mod. Lat., from Gr. *θρόμβος*, lump, clot of blood] in pathology, a clot of blood within the blood-vessels or heart. Inflammations of the lining membrane of the vessels, altered states of the blood, and slowing of the current of blood are the principal factors which contribute to the formation of clots. Their appearance varies according as they are formed rapidly or slowly. Thus in the heart the clots which so frequently result from slowing of the current of blood have a yellow or white appearance, from the fact that the heavy red corpuscles are carried along by even a sluggish current, whereas the lighter white corpuscles cling to the walls and enter into the formation of the thrombus. If the current is alternately slow and rapid, stratified or laminated clots result; and if the stream is suddenly and completely checked, a red clot results. Thrombi in the vessels or heart tend to undergo softening or disintegration, and particles may thus be swept to distant parts of the circulation. On the other hand, under favorable conditions, and particularly in those in small vessels, thrombi become organized, and thus obliterate the lumen of the blood-vessel where they occur. This is the most important feature of thrombosis, for in this manner severed blood-vessels are obstructed and hæmorrhage permanently arrested. W. P.

Thrush [M. Eng. *brusche* < O. Eng. *brýsce*; O. H. Germ. *drosca* < Teuton. **brus-ka*; cf. *throstle* < O. Eng. *þrostle*; Germ. *drossel* < Teuton. **brustala*; Lat. *turd'la* < Indo-Eur. **tyzdelā*]; any one of various birds of the family TURDIDÆ (*q. v.*), a group of Oscines, which stands at, or near, the head of the class of birds, and includes many of the best songsters. They are birds of moderate size, well typified by the wood-thrush (*Turdus mustelinus*) of the eastern parts of the U. S., a delightful songster and a near relative of Wilson's thrush

(*T. fuscescens*) and the gray-cheeked thrush (*T. alicia*). These birds resemble one another quite closely, being more or less olive brown above and white below, with blackish spots. The European song-thrush (*Turdus musicus*) is much like the wood-thrush on a larger scale. The common robin (*Merula migratoria*) of the U. S. is a thrush, and so is its relative, the blackbird of Europe (*M. merula*). For the golden-crowned thrush, see OVENBIRD. F. A. L.

Thrush: See MOUTH, DISEASES OF THE (*Stomatitis hyphomyeetica*).

Thrush: an abscess in the sensitive frog of the horse's foot. Cleanliness and the paring away of loose pieces of the frog are useful toward a cure. Carbolic-acid lotions or occasional sprinkling with calomel are also beneficial.

Thucydides, thyu-sid-i-dēz [= Lat. = Gr. Θουκυδίδης]; Greek historian; son of Olorus and Hegesipyle, of the Attic deme Halimus. He belonged on one side of the house to an old aristocratic Athenian family, on the other to a line of Thracian princes. The year of his birth is uncertain, not much earlier than 470 B. C., nor later than 454. He received an education that matched his lineage and his wealth; and the influences of Anaxagoras the philosopher and Antiphon the orator have been traced in his thought and in his style. The story that he heard Herodotus read his history at Athens is destitute of warrant, but not destitute of probability. At the outbreak of the Peloponnesian war Thucydides had reached what he calls the age of discernment, and in 423 commanded a detachment of Athenian forces, which was to operate on the Thracian coast, the region in which he had large possessions. Having failed to relieve Amphipolis, he was condemned to death for high treason, and forced to withdraw from Athenian territory; nor did he receive formal permission to return until the end of twenty years, an interval which he spent partly on his estate in Thrace, partly in visits to the scene of hostilities, notably to Italy, Sicily, and Macedonia. The time and manner of his death are alike uncertain. One account has it that he was assassinated—cut off untimely, as was his history; and his silence as to the eruption of Étna in 396 makes it probable that he did not long survive the end of the fifth century.

The history of Thucydides, which covers twenty-one years of the Peloponnesian war, has come down to us in eight books, of which the eighth, in which the characteristic speeches are lacking, has not received the last hand of the author. This division into eight books is not the author's division, and we read of other distributions, one into nine, one into thirteen books. A noteworthy break takes place at v., 26, which marks the opening of a second part. But the whole matter of the composition of the work of Thucydides is disputed, some holding that the history was conceived and executed as a whole, others that the piecemeal composition has only been partially effaced by later revision.

Thucydides is universally considered the first and greatest critical historian of antiquity, and claims for himself the credit of an exactness which is possible only to conscientious research as distinguished from hearsay report. His theme, as announced in the outset, is the war and its causes. It is a theme of which he has personal knowledge, and he sticks to it closely, indulging in few episodes, and excluding the sidelights of literature and art. His narrative is rigidly annalistic, year by year, summer by summer, winter by winter, to the detriment of effective grouping, and to the disgust of the rhetorical historians of a later day. Thucydides brought to his task rare qualifications. He was a man of affairs and a soldier, and knew the springs of action even if he could not always work them. His vision was clear of superstitious glamour, his deity was "the strong god, the chance central of circumstance." His aim was the truth, and this praise, though of late years eagerly disputed, can hardly be denied him. He saw and described the men of his time and the movements of his time as they were. His portraits of character abide not merely because of his artistic power, but because of their truth to life. His exhibit of the political forces at work commends itself the more because of the impartiality of the form. He does not tell us what was thought, he bids us listen to the voices of the time, and the statesmen and the captains of the period are made to give abundant expression to the motives of the war. No less than one-fifth of the history is taken up with the speeches in which the thought of the times is dramatized. His narrative shows great variety, sometimes breathlessly rapid, sometimes lingering on each picturesque detail; now a line-engraving, now a painting full of color. The story

of the Sicilian expedition is the most elaborate specimen of his art, the retreat of the Athenians from before Syracuse one of the most famous descriptions in all literature. His style is confessedly a hard style, and not undesignedly so. Those who attribute the difficulties of Thucydides to the crude state of Attic prose forget that he could be as simple as the simplest. The fact is that the harshnesses to which all manner of crabbed rhetorical names have been given are of the essence of his genius, are of the essence of his time. Thucydides mirrors more or less consciously in his style a period of conflict and distraction.

EDITIONS.—1. Bekker (4 vols., 1821), also text ed.; Poppo (11 vols., 1821-40), also a smaller ed. revised by Stahl; Goeller (2 vols., 1826, 1836); Didot (3 vols., 2d ed. 1868); Thomas Arnold (3 vols., 8th ed. 1874); S. T. Bloomfield (2 vols., 1842-43); K. W. Krüger (2 vols., 1846-47, and often since); Classen (8 vols., 1862-76, and often repeated); new ed. by Steup in progress 1893; American translation and revision by Fowler, C. D. Morris, C. F. Smith, in progress; by Boehme-Widmann (5th ed. 1882). Noteworthy text editions by Stahl (2 vols., 1873-74) and van Herwerden (5 parts, 1877-83). To these may be added editions of single books and selections by Bigg, Croiset, Dougan, Frost, Goodhart, Graves, Holden, Lambertson, Marchant, P. Müller, Rutherford, Schoene, Shilleto, Simcox, Sitzler, Tucker. Translated into English by Hobbes, Bloomfield (3 vols., 1829), Dale in the Bohn Library, Crawley (1876), B. Jowett with introductions, notes, etc., a monumental work in two volumes (1881). There is an important translation of the speeches by Wilkins (3d ed. 1881), and an admirable essay on the same subject by R. C. Jebb in Abbott's *Hellenica* (1880). See also Bédant, *Lexicon Thucydidæum* (2 vols., 1843-47), and von Essen's remarkably complete *Index Thucydidæus* (1887). B. L. GILDERSLEEVE.

Thugs [from Hind. *thag*, deceive, robber]; members of a religious fraternity of robbers and murderers which flourished in India from the fourteenth till the nineteenth century. They were worshipers of Kālī (see HINDUISM), by whom they believed themselves to be commanded to murder and rob. Therefore they were utterly unconscious of wrongdoing, considering themselves priests of the goddess carrying out a pious work, for which they were rewarded with the booty gained on their expeditions. They never committed a murder without solemn preparatory rites, prominent among which were the sacrifice of sugar and the consecration of the pickaxe, symbolizing the tooth of Kālī.

The origin of the sect is obscure. The earliest mention of thugs is in the *History of Feroz Shāh*, written by Zā'ud-din Barnī about 1356. It is there related that in 1290 a thousand thugs were captured in Delhi on the information of one of the brotherhood and transported to the island of Lakhnautī. Many of the methods of the fraternity are detailed by the Frenchman Thévenot in relating his travels through India in the years 1665-67. Thuggee (as the system is called) grew rapidly, owing to the extraordinary precautions of its members, and the want of national union among the tribes of India. Thugs were thoroughly organized, and had a special language (Ramasi) and secret signs by which they could recognize each other anywhere. By paying a share of their gains, they even received the support, at least in secret, of many of the native princes.

They went about in bands of from ten to two hundred. Each man was allotted a special duty. There were the leader, the pick-bearer, entrappers, scouts, stranglers, and grave-diggers. It was the business of the entrappers to discover rich travelers, and, representing their band to be merchants or pilgrims, to offer to go with them for mutual protection against robbers or for the sake of each other's society. Having started on the journey, scouts and grave-diggers were sent out ahead to find a favorable spot and prepare a place for the burial of the bodies of those who were to be murdered. Often it would be many days before the opportunity arrived, especially since the omens had to be auspicious. Meanwhile the members of the band mixed on the most friendly terms with their victims—ate and slept with them, and worshipped together at the wayside shrines. When the chosen spot was reached each thug was at his post, and on a given signal from the leader the victims were strangled with the handkerchief (*romāl*). All witnesses were put to death. The bodies of the dead were buried, sometimes being mutilated to hasten decomposition, or fastened down with stakes. The booty was divided among the band, a considerable amount being reserved for their tutelary goddess. Those who did not know their real trade are said to

have taken the leaders of these bands to be the ablest, most estimable, and amiable members of native society, and often even the families of the thugs were kept in utter ignorance of their true profession. Several unsuccessful attempts were made by the British Government to stamp out this pest, until, in 1826, owing chiefly to the efforts of Lord William Bentinck and Capt. (afterward Sir) William Sleeman, the movement was started which within a few years utterly broke the power of the sect. This result was reached chiefly by admitting many of the fraternity as king's evidence.

See Sleeman's *Ramaseana* (Calcutta, 1836); Hutton's *Popular Account of the Thugs and Ducoits* (London, 1857); and Meadows-Taylor's *Confessions of a Thug* (London, 1839; new ed. 1879).

Thule, thyu'lee: the name which Pytheas (at the time of Alexander the Great) gave to a land which he discovered after sailing six days in a northerly direction from the Orkney islands. Later, the Romans used the name as a general signification for the northernmost parts of the habitable earth—*ultima Thule*. What island Pytheas meant is unknown.

Thumbscrew, or **Thumbkiiu**: an instrument of judicial torture formerly used in various parts of Europe, but particularly in Scotland. The thumb was compressed by a screw. Its last official use was in the trial and on the person of Principal Carstairs in 1682, after the Rye House Plot.

Thümen, tü'men, FELIX, von, Baron: botanist; b. in Dresden, Germany, Feb. 6, 1839. He is known in botany for his many papers on the fungi, published mainly in *Hedwigia*, *Flora*, *Grevillea*, besides other journals, and the proceedings of learned societies between the years 1873 and 1891. He published four series of *exsiccati*, viz.: *Die Pilze des Weinstocks*, 25 species (1877); *Herbarium Mycologicum Economicum*, 1,300 species (1872-79); *Fungi Austriaci Exsiccati*, 1,300 species (1871-75); *Mycotheca Universalis*, 2,300 species (1875-84). D. at Schönau near Teplitz, Bohemia, Oct. 13, 1892. CHARLES E. BESSEY.

Thunberg, toon bärch, CARL PETER: botanist; b. at Jönköping, Sweden, Nov. 11, 1743; studied at Upsala under Linnaeus; resided at the Cape of Good Hope 1772-75, and in Japan 1775-78; returned in 1779 to Sweden; succeeded Linnaeus in 1781 as Professor of Botany at the University of Upsala. His principal works are *Flora Japonica* (1784); *Prodromus Plantarum Capensium* (1794-1800); *Icones Plantarum Japonicarum* (1794-1805); *Flora Capensis* (1807-13); and *Besa uti Europa, Africa och Asia* (4 vols., 1788-93). D. near Upsala, Aug. 8, 1828. C. E. B.

Thunder: a rumbling or crashing noise heard after vivid flashes of lightning. Intense electrical discharges in the atmosphere, whether from cloud to cloud, from cloud to earth, or from cloud to cloud and then to earth, are followed after an appreciable interval by the sound which, on a small scale, is represented by the snap and crackle of an artificial electric discharge. The origin of the sound is in the violent sudden increase in volume of the air along the path of discharge. The exceedingly high temperature, sufficient to make the air-column incandescent, causes tremendously rapid expansion and motion of the air. P. G. Tait shows that "such a sound-wave must at first be of the nature of a bore or breaker. But as such a state of motion is unstable after proceeding a moderate distance, the sound becomes analogous to other loud but less violent sounds, such as those of the discharge of guns." Calculations have been made showing that if a cannon-ball could have imparted to it a velocity of 100,000 meters per second we should hear something like the rumble of thunder instead of a whistling noise. Inasmuch as lightning flashes are of very variable dimensions, and as cloud-masses are also variable, and the air itself is of different density and purity at different times, all manner of sounds are produced, from the sharp crash to the prolonged rumble. As the sound-waves may be variously reflected, the original thunder-peal may be reinforced, and, on the contrary, it may even happen that because of interference a sound which if free would have been loud may be deadened. The column of air thus suddenly heated and producing sound-waves may be several miles in length, though recent estimates make the length of the average flash of lightning considerably below this. The beginning of the thunder may be ordinarily taken to determine the nearest point of "break-down" (or lightning) in the air and the duration of the thunder the length of the flash. Thunder may be heard from a great distance, but not so far as some artificial noises have been heard. J. J. Sym-

ons has run to earth a number of so-called thunder-bolts, and concludes that the belief in the fall of material substances during thunder-storms is merely the survival of the belief in mythical bolts of irate Jupiter. Belemnites frequently preserved as thunder-bolts are really fossils. Sometimes aërolites and meteorites fall during thunder-showers, but there is no necessary relation between them. Fulgurites or lightning-tubes are found where heavy lightning penetrates into a bed of sand containing siliceous matter. The sand for a depth of several feet is fused into a glassy tube. Many of these have been dug out in good preservation, and good specimens are to be seen in museums. A. McADIE.

Thunder-storm: a small short-lived local storm named from the intense electric phenomena which usually accompany it, but which are probably rather a result than a cause. These storms favor warm latitudes, the warm season, and the warm hours of the day. They are often accompanied by a peculiar form of cumulus-cloud called thunder-head, and many are preceded by a short rush of wind outward, accompanied by a slight but sharp rise in the barometer, and followed by cooler weather, a change of wind, and higher pressure. Others seem to have a well-developed but small system of cyclonic winds. The rain which accompanies them is usually intense and the first drops are very large. It sometimes passes into hail. Thunder-storms differ much in intensity, and under this name are probably included phenomena of very different character. The classification is imperfect, but the best is the genetic one, according to which we have: (1) *Stationary* solitary thunder-storms, when in favorable topography a cumulus-cloud on a hot afternoon grows black below and begins to move only after the rain from it has begun. This type is the commonest in the tropics, where it gives most of the rainfall, occurs most frequently in hilly and mountainous regions in the temperate zone, may be very intense among mountains, especially in the arid regions, but shows no relations to "highs" and "lows." (2) *Sporadic* thunder-storms when over a large area, covering perhaps a middle-sized State, a storm crops up here and there, especially in the warmer hours, travels eastward for a few hours, and then disappears. The critical area is a few hundred miles S. E., S., or S. W. of a "low," forms in the morning, becomes best developed in the afternoon, and disappears at night to reform the next day, if favorable, as far in advance of the preceding day as the "low" has traveled in the interval. This is a common condition in midsummer in the U. S., and the individual storms are dependent on topography. (3) *Deploying* thunder-storms, those which travel in a rank in a straight or curved line, sometimes radiating from a point and covering a fan-shaped area. These are always a few hundred miles S. E. or S. of a "low," are generally more intense and longer lived than the preceding, and are independent of the lesser elements of topography. They are common in the U. S. and Europe, and may pass into hail-storms, thunder-squalls, or tornadoes. (4) *Winter* thunder-storms, the only ones that belong to the cold season. They are isolated, generally intense, often destructive, longer lived, and are rare in the U. S. They are essentially northern, nocturnal, and oceanic. MARK W. HARRINGTON.

Thun (toon), **Lake of**: a body of water in the canton of Berne, Switzerland, at an elevation of 1,837 feet above the level of the sea; 10 miles long and 2 miles broad. On its eastern shore stands Interlaken, and beyond its northwestern shore—on the Aar, about a mile from its exit from the lake—the town of Thun. Both these towns are visited every summer by a great number of tourists. Steamers ply on the lake.

Thurber, CHARLES HERBERT, A. M.: educator; b. at Owego, N. Y., Mar. 24, 1864; graduated at Cornell University in 1886; registrar of Cornell University 1886-88; taught in the Haverford College grammar school 1888-90; traveled and studied in France and Germany 1887, 1889, and 1890-91; during 1890-91 was also a special agent of the U. S. Bureau of Education; instructor in French, Cornell University, from 1891 to 1893, when he became principal of Colgate Academy and Professor of Pedagogy in Colgate University, Hamilton, N. Y. In 1895 he was appointed Associate Professor of Pedagogy in the University of Chicago, and Dean of the Morgan Park Academy. He has been editor of *The School Review* since 1893, is author of numerous magazine articles, and of *The Higher Schools of Prussia and the School Conference of 1890* (in *Report of the U. S. Commissioner of Education*, 1889-90), and edited Gherardi del Testa's *L'Oro e l'Orpello* (Boston, 1893).

Thurber, GEORGE, A. M., M. D.: botanist; b. in Providence, R. I., Sept. 2, 1821; educated in the Union Classical and Engineering School in Providence; botanist to the U. S. Mexican boundary commission 1850, the collections resulting in *Plante Novæ Thurberiana*, by Dr. Gray; lecturer on botany in the New York College of Pharmacy 1856-57; Professor of Botany and Horticulture in the Michigan Agricultural College 1859-63; editor of *The American Agriculturist* 1863-90. He revised Darlington's *Agricultural Botany*, bringing it out under the title of *American Weeds and Useful Plants* (1859); wrote the botanical articles for Appleton's *American Cyclopædia* (1876-80); besides many papers in scientific journals and the proceedings of societies. D. at Passaic, N. J., Apr. 2, 1890.

CHARLES E. BESSEY.

Thurgau, toor'gow: canton of Switzerland; bordering N. on the Rhine and the Lake of Constance. Area, 381 sq. miles. The surface is undulating, but not mountainous, except in the southernmost districts. The soil is very fertile and agriculture is the main industry pursued; several cotton and linen spinning and weaving factories are in operation. Pop. (1888) 104,678, of whom 70.7 per cent. are Protestants. Capital, Frauenfeld.

Thurible, or Censer [*thurible* is from Lat. *thuri bubum*, censer, deriv. of *thus* (or *tus*), *thu ris*, incense; *censer* is shortened from *incenser*, viâ O. Fr. from Late Lat. *incensarium*, deriv. of *incensum*, incense, deriv. of *incen dere*, *incensum*, kindle, burn]; a vessel of silver suspended by four short chains, used in the services of certain churches. It is charged with burning charcoal, upon which incense is placed. The thurible is borne by an acolyte called the thurifer. See CENSER.

Thüringerwald, tü ring-er-wäält [Germ., Thuringian Forest]: a picturesque mountain range in Central Germany, extending along the right bank of the Werra, from the influx of the Hürsel, for about 60 miles, and joining the Franconian Forest in Northern Bavaria. Its highest point is Schneekopf, 3,460 feet high. It is covered with pine forests, and consists mostly of granite, porphyry, and slate, interspersed with rich veins of iron ore. It forms the southern boundary of THURINGIA (*q. v.*).

Revised by M. W. HARRINGTON.

Thurin'gia (Germ. *Thüringen*): the general name for that region of Central Germany which lies between the Hartz and the Thuringian Forest, the Saale, and the Werra, and which comprises parts of the Prussian province of Saxony and the Saxon duchies. The name originated from the Thuringii, who settled here, but since the fifteenth century it has had no definite political signification.

Thurles, thürlz: town; in the county of Tipperary, Munster, Ireland; on the Suir; 46 miles E. of Limerick (see map of Ireland, ref. 11-E). It has a Roman Catholic college, an establishment of Christian Brothers, two convents, a handsome cathedral, and carries on an active general trade. Pop. about 4,850.

Thurman, EDWARD B.: lawyer and politician; b. at Bacon-Ash, Norfolk, England, in 1732; entered Cambridge University, but was compelled to withdraw for an act of discourtesy; entered the Inner Temple, and was called to the bar in 1754; established a reputation for ability and determination. He entered politics, and after some vacillation sided with the Tory party, holding numerous offices, becoming Lord Chancellor in 1778, and taking his seat in the House of Lords as Baron Thurlow of Ashfield. He was averse to constitutional and economic reforms, and opposed violently the interests of the American colonies, as well as any attempt at suppression of the slave-trade. He lent only an insincere support to his party from 1788 to 1792, and in the last-mentioned year he was at the instance of Pitt (one of whose measures he had captiously but violently opposed) dismissed from the office of Lord Chancellor, which he had again taken in 1783 when Pitt took office. Having been a few days before made Baron Thurlow of Thurlow, he retired to private life, and died at Brighton, Sept. 14, 1806, without again acquiring any decided influence in politics.

F. STURGES ALLEN.

Thurman, ALLEN GRANBERY: lawyer; b. at Lynchburg, Va., Nov. 13, 1813; removed to Ohio in 1819; received an academic education; studied law, and was admitted to the bar in 1835; was elected to Congress in 1841; elected judge of the Supreme Court of Ohio in 1851; was chief justice from 1854 to 1856; unsuccessful Democratic

candidate for Governor of Ohio in 1867; succeeded Benjamin F. Wade in the U. S. Senate Mar. 4, 1869, and served till Mar. 3, 1881; was prominent among the candidates for the Democratic nomination for President in 1876, and in 1888 was defeated as Democratic candidate for Vice-President of the U. S. D. in Columbus, O., Dec. 12, 1895.

Thurneysen, toorn-ni-sen, EDUARD RUDOLPH: comparative philologist; b. at Basel, Switzerland, Mar. 14, 1857; studied at the Universities of Basel, Leipzig, and Berlin; privat docent, and later assistant Professor of Romanic Philology, at Jena 1882-87; since 1887 Professor of Comparative Philology at Freiburg in Breisgau. His unusually complete command of the scientific detail of three provinces of Indo-European philology, namely, Romanic philology, Italic philology, and Celtic, coupled with a quick, fine insight into the historical mechanism of language, assigns him a prominent and fairly unique place among the authorities in the field of Italo-Celtic philology. He is the author of *Ueber Herkunft und Bildung der lateinischen Verba auf -io* (1879); *Das Verbum être und die französ. Conjugation* (1882); *Keltoromanisches* (1884); *Der Saturnier und sein Verhältniss zum späteren römischen Volksverse* (1885); *Mittelirische Verslehren*, in *Windisch's Irische Texte*, iii. (1891); also articles in *Kuhn's Zeitschrift* and the *Revue Celtique*.

BENJ. IDE WHEELER.

Thurn und Taxis, toorn oont-taaks is: the name of a noble family of the German empire, famous for its former possession of a monopoly of the postal service. It is descended from the della Torre (whence the name Thurn, a German translation of Torre), one of whom took the name de Tassis (Taxis) from the castle of Tasso. In 1516 Franz von Thurn established the first post between Vienna and Brussels, and in 1595 his descendant became postmaster-general of the empire, securing for himself and his heirs the right of carrying the mail throughout the imperial dominions. A century later the princely rank became hereditary in the family, but the postal privileges were gradually curtailed by the different governments, which granted extensive territories in compensation. The family has hereditary possessions in Austria, Bavaria, Belgium, Württemberg, and Prussia. The last of these states arranged with the family for the abolition of the monopoly in 1867.

F. M. COLBY.

Thursby, EMMA: concert-singer; b. in Brooklyn, N. Y., Nov. 17, 1857; studied under local teachers and in 1873 at Milan under Lamperti, and finally in New York under Madame Kudersdorff; made a tour of the U. S. and Canada in 1875; first appeared in England May 22, 1878, at a Philharmonic Society concert; in 1879 sang in Paris; and in 1880-81 made an extended concert tour through Europe, everywhere with great success. Her voice is a rich and high soprano, ranging to E flat in alt.

D. E. H.

Thursday [M. Eng. *Thursdei*, *þorsday* (by anal. of Icel. *þorsdagr*), for earlier *Thunres dai* < O. Eng. *þunres dag*, Thun-der's (or Thor's) day. See THOR]; the fifth day of the week. The later Roman pagans adopted the week of seven days and named the fifth day *Jovis dies*, Jove's day; the name Thursday originated as a translation of this.

Thurston, ROBERT HENRY, LL. D., Dr. Eng.: mechanical engineer, inventor, educator, and author; b. in Providence, R. I., Oct. 25, 1839. During childhood and youth he spent much time in the workshops of his father's establishment, then devoted especially to the building of steam-engines. He graduated at Brown University in 1859 with the degree of Bachelor of Philosophy, and immediately entered the works of his father's firm, spending some time as a designing engineer. In 1861 he joined the Engineer Corps of the U. S. navy, serving in Dupont's and Dahlgren's fleets throughout the war; was made engineer-in-charge of the Chippewa in 1863 when a second assistant engineer, and was later transferred to the Dictator iron-clad, and commissioned first assistant in 1864. He served as a Professor of Natural Philosophy in the U. S. Naval Academy from Jan. 1, 1866, to June, 1871, when he became Professor of Engineering at Stevens Institute of Technology, resigning in 1885 to assume the directorship of the Sibley College of Mechanical Engineering in Cornell University, where he still (1895) remains. Under his administration this college has grown in size and efficiency, and now has over 500 students and an equipment valued at nearly half a million dollars. He has been employed on many Government commissions, as the U. S. scientific commission to the Vienna International Exhibition (1873); to Paris (1889); the U. S. commission to investigate

the causes of boiler explosions (1875); U. S. commission to test iron, steel, and other metals (1875-88); U. S. commission on safe and bank-vault construction (1891); U. S. board to report on best construction of iron-clad Puritan, etc. He is a member of a number of American and European societies, has been first president of the American Society of Mechanical Engineers, and three times vice-president of the American Association for the Advancement of Science. He has designed engines, boilers, and many kinds of machinery, and has written many treatises, among which are his *Manual of the Steam Engine* (2 vols., 1890-91); *Manual of Steam Boilers* (1890); *Engine and Boiler Trials* (1890); *History of the Steam-engine* (1878); *Materials of Engineering* (3 vols., 1882-86). He has published over 250 papers, mainly on professional subjects. He translated Carnot's *Réflexions sur la Puissance motrice du Feu*, the basis of the modern science of thermodynamics, and edited the reports of the U. S. scientific commission to the Vienna International Exhibition of 1873 (4 vols. 8vo., 1874-75), his own report constituting the third volume. He has invented magnesium-burning lamps, army and navy signal apparatus, various forms of testing-machines for iron and other metals and to ascertain the quality of lubricants, some improvements on the steam-engine, and scientific and engineering apparatus. He has performed much work in scientific research and in the investigation of engineering problems; his determination of the useful qualities of the alloys of copper and tin, of copper and zinc, and the ternary alloys of the three metals; his studies of boiler-explosions; his examination with his own apparatus of the laws of friction and of lubrication, as published in his *Friction and Lost Work*; his investigations of the laws of variation of engine-wastes of heat and power; and his studies in the field of commercial economy of steam-engines, are among the best known. He organized in 1872-73 the first laboratory for research in the applied sciences of engineering in the U. S. When organizing Sibley College he made this a separate and prominent department of the institution.

Thyatira: See AK-HISSAR.

Thy'ine Wood [*thyine* is from Gr. *θύϊνος*, deriv. of *θύειν*, sacrifice]: a kind of wood mentioned in the Bible; probably the arar or sandarach wood, the wood of *Callitris quadrivalvis*, a large tree of Barbary. This tree affords the resin called gum sandarach, and its timber is considered imperishable by the Turks, who floor their mosques with its planks.

Thylacine: See TASMANIAN WOLF and THYLACINIDÆ.

Thylacin'idae, or Dasyu'ridæ [*Thylacinidae* is Mod. Lat., named from Gr. *Thylacinus*, the typical genus, from Gr. *θύλαξ*, *θύλακος*, sack, pouch (perh. with simulation in the last syllable of Gr. *κύων*, *κύβς*, dog); *Dasyuridae* is Mod. Lat., named from *Dasyurus*, another genus; Gr. *δασύς*, shaggy + *οὐρά*, tail]: a family of mammals of the order *Marsupialia* and sub-order *Dasyuromorpha*, including the chief carnivorous mammals of Australasia. The form varies in the several genera, the larger species much resembling a dog externally, others an opossum, and the small species simulating a mouse in appearance, although anatomically they differ but little from each other. The snout is like that of a dog or acutely pointed; the ears moderate or large; the tail is generally more or less long, and the feet have separate toes, four or five in number. The teeth are well developed, and simulate those of the placental carnivores (dogs, etc.), and are in considerable number; there is no such distinction between molars and premolars as in placental carnivores, only the last premolars having deciduous predecessors; the premolars are compressed, conical; the canines generally well developed and typical in form, and the incisors cylindrical and curved, and moderate or rather large. The skull superficially has much resemblance to that of a dog, but is of course radically different, and exhibits the typical marsupial modifications of the mammalian skeleton, and the small size of the cerebral cavity is indicated externally by the absence of inflation: the palate has a pair of large longitudinal vacuities between the true molar teeth of the respective sides. The stomach is simple, and there is no intestinal cæcum. The family is peculiar to the Australasian region, and its representatives there take the place in the economy of nature held by the placental carnivores and insectivores in other parts of the world. The species are numerous. See TASMANIAN DEVIL and TASMANIAN WOLF. Revised by F. A. LUCAS.

Thyme [from O. Fr. *thym* < Lat. *thymum* = Gr. *θύμον*, thyme; cf. *θύειν*, to sacrifice, and *θύος*, incense]: any one of

certain labiate half-shrubby plants of the genus *Thymus*. None is indigenous to America. Two kinds are cultivated in gardens, the common, *T. vulgaris*, and the lemon-scented, a variety of *T. serpyllum* or wild thyme. Both afford good bee-pasture. The leaves are used for flavoring soups and forcemeats; the volatile oil is sold for oil of origanum, which it closely resembles.

Revised by L. H. BAILEY.

Thyme, Oil of: a volatile oil obtained by the distillation of the common thyme (*Thymus vulgaris*) with water. It usually is brownish red and has a thickish consistency, although when freshly prepared it is nearly colorless and is mobile. It possesses a pleasant pungent odor and an aromatic taste, has a specific gravity of about 0.9, and is but slightly soluble in water, although it dissolves in alcohol and in ether. Oil of thyme contains two hydrocarbons, a terpene (C₁₀H₁₆) and cymene (C₁₀H₁₄), and a phenol, *Thymol* (*q. v.*). These compounds are separated by submitting the oil to fractional distillation. When oil of thyme is distilled with a mixture of 8 parts of chlorinated lime and 24 parts of water, chloroform is formed. Revised by IRA REMSEN.

Thym'ol, also called **Thymyl'ic Hydrate, Thymyl'ic Alcohol, and Thymyl'ic Acid** [*thymol* is deriv. of *thyme*]: a homologue of phenol and an isomer of cymyl'ic alcohol; formula, C₁₀H₁₄O. It is obtained from the oil of thyme (see **Thyme, Oil of**), of which it is the oxygenated camphor or stearoptene, by distillation. Thymol forms crystalline rhomboidal plates that have a weak odor and a peppery taste. It fuses at about 111° F. to a colorless liquid which has a boiling-point of 446° F., and dissolves with difficulty in water, but easily in alcohol and in ether. By the action of chlorine, bromine, and nitric acid upon thymol, series of derivatives are formed.

Thy'mus Gland [*thymus* is Mod. Lat., from Gr. *θύμος*, a warty excrescence (so called from its resemblance to a bunch of thyme—*θύμος*), the thymus gland in the chest of young animals]: a ductless gland, with no known function, located in the neck below the thyroid gland, and in the chest beneath the sternum, in the mediastinal space, as low as the fourth costal cartilage. It develops at the third month of fetal life, weighs $\frac{1}{2}$ oz. at birth, and grows until the second year, attaining a length of 2 inches. Thereafter it atrophies, and at the fourteenth or sixteenth year is obliterated, or its site marked only by a few fibers and a small deposition of fat. It has abundant blood-vessels, nerves, and lymphatics, but endless research has failed to disclose positively its use in either the fetal state or during childhood, though many investigators are of the opinion that the gland is connected with manufacture of blood in fetal life. The thymus of calves and lambs is called sweetbread, or neck-sweetbread. Revised by W. PEPPER.

Thyroid Gland [*thyroid*, more properly *thyreoid*, from Gr. *θυρεοειδής*, shield-shaped; *θυρεός*, a large oblong shield (deriv. of *θύρα*, door) + *ειδός*, appearance, form]: a glandular structure consisting of two lateral lobes, with a connecting band or isthmus, situated on the anterior surface of the neck and attached to the sides of the larynx. The gland moves with the larynx in respiration and deglutition. The isthmus bridges across from the lower or basic portion of the lobules, and covers in its transit the front of the second and third tracheal rings. By this relation and its great vascularity it has an important surgical relation to the operation of tracheotomy. It has an external fibrous coat, which gives off numerous internal partitions and bands, so that the gland consists of communicating cavities like a sponge. The thyroid gland is ductless, and its functions are obscure. Very probably it aids in the manufacture of blood in fetal life, and after birth it would seem to have certain functions connected with the animal chemistry. Its removal or disease occasions peculiar metamorphosis of the subcutaneous tissues, known as myxedema. The thyroid gland is the seat of goiter. Revised by W. PEPPER.

Thysanop'tera [from Gr. *θύσανος*, fringe + *πτερόν*, wing]: a synonym of the group *Physoptera*, given in allusion to the fringe of hairs on the wings. See ENTOMOLOGY.

Thysan'ura [Mod. Lat.: from Gr. *θύσανος*, fringe + *οὐρά*, tail]: minute wingless insects of considerable interest, since they retain some primitive hexapodan features. (See ENTOMOLOGY.) Thus among the *Cintura*, *Campodea* shows the three portions of the thorax distinctly, while on the ventral surface of the abdomen are sac-like organs comparable to coxal sacs and on the first abdominal segment a pair of bud-like legs, thus indicating a former polypodal condition.

Respiration is carried on by tracheæ and by these ventral sacs, or, where tracheæ and sacs are wanting, as in *Isostoma*, through the skin. In the *Collembola*, which with the *Cinura* composes the order, the end of the abdomen is furnished with a pair of stylets. These are bent under the body with the tip of the abdomen, and held by a pair of processes on the first abdominal segment. The apparatus serves as a spring, and has given rise to the popular name of springtails. In the *Cinura* the terminal processes may be developed into a pair of forceps, as in *Iapyx*, or be very long or filamentous—as is usually the case. In some forms there may be as many as seven of these filaments. The body is in some forms covered with many delicately marked scales of much interest to amateur microscopists. The *Thysanura* are found everywhere, in moist earth, under stones, logs, in cellars—wherever, in fact, decaying vegetation occurs. One species is found on the snow of the Alps; other forms are even found on floating objects at sea or near shore on seaweeds. One form, popularly known as the silver-fish (*Lepisma*), occurs in old libraries, where it often does considerable damage by eating the paste of the binding of books. It also devours the sizing of the paper, destroying thus the printed matter. See Lubbock, *Monograph of the Collembola and Thysanura*; A. S. Packard, *Synopsis of the Thysanura of Essex County*; T. J. Oudemans, *Beiträge zur Kenntniss der Thysanuren und Collembola*. F. C. KENYON.

Ti [= native (Polynesian) name]: a liliaceous tree-like plant of the genus *Cordyline*, found in the Pacific islands and in parts of Asia. Its leaves afford roofing for houses, food for cattle, and fiber for cloth. The sap yields sugar and a stimulating drink, while the roots, when baked, afford a valuable supply of food.

Tia'ra [= Gr. *τιάρα*, a Persian head-dress]: the papal crown, consisting of a cap of cloth of gold, encircled by three golden coronets, and surmounted by a mound and cross of gold. It is considered symbolical of the pope's temporal authority.

Tiahuanaco: See INCAN ANTIQUITIES.

Tiber [from Lat. *Tiberis*, Tiber; Ital. *Tevere*]: river of Italy, passing through Rome, the largest stream of the peninsula proper; rises in Mt. Fumaiolo, Tuscany, at an elevation of 3,830 feet, flows in a southerly direction, and empties into the Mediterranean 22 miles below Rome; length, 260 miles; area of basin, 6,225 sq. miles; breadth at Rome, 250 feet. The principal affluent is the Nera, which descends from the Sibylline Mountains, and enters on the left about 100 miles from the mouth; above it and on the same side enters the Clitunno (*Clitumnus*), praised by the Latin poets, and below the Anio. On the right the most important affluent is the Chiana, which is connected by canal with the Arno. The Tiber is navigable for small steamers to the mouth of the Nera, and for larger ones to Rome. The river delivers at the mouth on the average 10,250 cubic feet of water a second, but in the highest floods this may amount to 60,000 cubic feet, and in lowest water is only 5,650 cubic feet. The floods of the Tiber have been formidable from the foundation of Rome, not only for their height, but for their suddenness and for the large amount of sediment carried. The Romans called the river *fluvius* because of the yellow clay it carries. This has gradually extended the delta of the Tiber until the ancient port Ostia is now 4 miles inland and the port of Trajan is a marsh. The growth at the southern or principal mouth for the last 800 years has been 10 feet a year. At the northern mouth it is about a third as much. The branches to the two mouths embrace the ancient Sacred Isle, dedicated to Venus, now marshy and very unhealthful. Between Rome and the sea the Tiber is practically an estuary, and the navigation of this was apparently easier in ancient times than now.

MARK W. HARRINGTON.

Tiberias, Lake of: See GENNESARET, LAKE OF.

Tiberius (full name *Tiberius Claudius Nero Cesar*): Roman emperor 14-37 A. D.; b. Nov. 16, 42 B. C.; a son of Tiberius Claudius Nero and Livia Drusilla. In 38 B. C. Livia was divorced from Claudius and married to Augustus, who thus became the step-father of Tiberius. Tiberius was large and strong of body, with handsome features, a man of simple habits and reserved manners, not altogether without literary taste, and with a decided aptitude for military affairs. He commanded successively in Cantabria, Armenia, Rhatia, Dalmatia, and Germany, and finished the wars promptly and with honor. From Germany, where he commanded after the

death of his brother Drusus, he returned in 7 B. C. to Rome, celebrated his second triumph, was chosen consul for the second time, and was the following year invested with the *potestas tribunitia* for five years. His relations with Augustus soon became strained. He had divorced his wife Vipsania Agrippina at the emperor's command and married Julia, the dissolute daughter of Augustus; and, disgusted by Julia's conduct, he withdrew to Rhodes, where he spent seven years in exile. By his mother's exertions he was recalled to the court in 2 A. D., and in 4 all the male heirs of Augustus having died, he was adopted by the emperor and appointed his successor. The next ten years he spent mostly in wars on the northern frontier, and on the death of Augustus in 14 he succeeded to the throne. Except in the transfer of elections from the people to the senate, Tiberius made no noteworthy change in the system of government instituted by Augustus. As an administrator he showed an earnest desire to correct abuses and to secure the welfare of all parts of the empire. The northern and eastern frontiers were strengthened, strict discipline was enforced in the army, and considerable improvement was made in the government of the provinces, where Tiberius was always popular. Drusus, the son and heir of Tiberius, was poisoned in 23 by his wife at the instigation of Sejanus, the pretorian prefect, who divorced his own wife to marry the murderess. Sejanus also induced Tiberius to banish the widow and sons of his brother Germanicus, the remaining heirs, and aspired to succeed to the throne himself. Always sensitive and distrustful, Tiberius was now morbidly suspicious and apprehensive, and in 26 retired to the island of Capri, intrusting the government to Sejanus, whose rule was almost absolute. Finally, however, in 31, he suspected Sejanus, and gave orders to have him executed. Tiberius, however, remained at Capri, placing the management of affairs in the hands of Macro, Sejanus's successor as pretorian prefect. During all his later years the class of private informers (*delatores*) was encouraged, and condemnations for treason became more and more common. The last six years of his rule seem to have been a real reign of terror. Tiberius died at Misenum, Mar. 16, 37. The common view which represents Tiberius as a monster of vice and cruelty rests chiefly upon the authority of the historian Tacitus, a bitter critic of the imperial system. Recently there has been a growing tendency among scholars to question this estimate of Tiberius, or at least to limit it to the closing years of his life, when as "an old man of seventy, broken in body and spirit, betrayed, disappointed, morbidly brooding in solitude upon his wretchedness," he may have allowed the bad elements in his character to gain control.

C. H. HASKINS.

Tibesti, tēo-bes-tee (the Arab name; the native name is *Tou*): country of the Sahara, about Mt. Tarsu, between the parallels 18° and 22° N. and the meridians 15° and 18° E. Area about 60,000 sq. miles, occupied by Tibbus, numbering 12,000 according to the estimates of the traveler Nachtigal. It is a mountainous country, bare, infertile, and arid, but favored with summer rains. The population is tribal and nomadic, depending chiefly on the domestic animals, consisting of camels, asses, goats, and sheep. The flora is poor, but the fauna includes the dog-faced baboon, the hyena, jackal, fox, gazelle, antelope, and many birds and insects. The ostrich was formerly common, but has nearly disappeared.

MARK W. HARRINGTON.

Tibet (called by the natives Bod or Bodyul, and Bhot and Bhotiya in India): the high and massive table-land, buttressed on the N. by the Kuen-lun or Kulkun and Altyn Tagh ranges, which mark a sudden descent to the deserts of Eastern Turkestan and Gobi, and on the S. by the Himalayan range and the northern portion of British India (see map of China, ref. 5-C). It is one of the least-known countries of the world. Its area (651,500 sq. miles) can only be vaguely estimated, vast portions are as yet unexplored, and present geographical knowledge is based solely on the Jesuit survey (1708-18), and on the route surveys of a score or so of European travelers and trained Indian observers.

Physical Features, Productions, Fauna, etc.—The dip and drainage of the Tibetan plateau is generally eastward, so the highest part of this vast lacustrine plateau is the western, where it adjoins the British feudatory state of Kashmir. Here its mean level is from 16,000 to 17,000 feet above sea-level, and in the southwest angle thereof there spring three great rivers, the Sutlej, Indus, and Sappur, which burst through the Himalayan chain at different points on their way to the Arabian Sea and Bay of Bengal,

The last of these three rivers flows through Great or Southern Tibet in a generally easterly direction for nearly 1,000 miles before it turns abruptly southward, and, piercing the Himalayas, emerges into British territory, where it assumes the name of Brahmaputra. A large belt of country N. of and parallel to the valley of the Brahmaputra is drained by another river which connects a chain of lakes and flows away to the E. It is believed to be the upper course of the Salwen, but the view is contested by some authorities, and the determination of this point, as well as of the precise sources of the Salwen, is an interesting geographical problem that awaits solution. In Northern and Eastern Tibet, again, lie the sources of the Mekong or Cambodia river and those of the great Yang-tse-kiang and Hwang-ho of China. The lower courses of the Sanpur or Brahmaputra and Salwen drain the most populous part of Tibet; most of the remainder of the country, being too bleak and unproductive to support life, is either totally uninhabited or else tenanted by bands of nomad Turk and Mongol tribes; the Tangla plateau, however, N. of Lhasa, and no doubt other parts of the country, affords luxurious pasture to antelopes and other game.

An interesting analogy between the Andes and the Himalayas was perceived by Warren Hastings, India's first governor-general, and has been elaborated by C. R. Markham, C. B., president of the Royal Geographical Society (1895), in his work *Bogle and Manning*. Both the mountain masses of the Old and New World consist of three parallel chains; in both great rivers rise in the inner chain and force their way through the other two, while smaller rivers rise in the central cordillera and after lateral courses force their way through the outer chain. In both Peru and Tibet the staple product is wool, conveyed through numerous passes by the llamas and sheep used as beasts of burden.

The chief mineral products of Tibet are gold, silver, salt, and borax; the metals first named are fairly plentiful, but the jealousy of the lamas against foreign intrusion prevents any systematic working and export thereof, though gold mines exist at Thok-Jalung (32° 24' 26" N. and 81° 37' 38" E. of Greenwich) and in the northwest of the country.

Among the principal domesticated animals are sheep, horses, yaks, and mastiffs, while the wild fauna comprise bears, antelopes, musk-deer, and wild asses, and on the extreme northern confines of the table-land wild camels are occasionally found.

Climate.—The climate, as might be inferred from the excessive altitude, is of Arctic rigor, and only the hardier cereals can be raised in the valleys, though in the E., where the streams enter upon a lower level, the vegetation becomes rather more assimilated to that of the contiguous quasi-tropical regions of Assam, Bhutan, and Western China.

Inhabitants.—The inhabitants of Tibet, about five and a half to six millions in number, belong to the great Mongolian family, and are described by the Abbé Hue (whose *Souvenirs*, dating from 1852, furnishes still a most graphic and intelligible picture of Tibetan life) as a people with small, contracted black eyes, thin beard, high cheek-bones, flat noses, wide mouths, and thin lips. The skins of the upper classes are as white as those of the Europeans, but the ordinary complexion is tawny. They are of middle height and combine agility and suppleness with force and vigor. They are said to be brave in war, though the inferiority of their weapons and ignorance of the art of war placed them at an enormous disadvantage in the Sikkim war with Great Britain, the last hostilities in which they were engaged.

Literature and Religion.—The literature is vast, including all the Buddhist canon of scripture, translated from the Sanskrit, the *Tripitaka*, or three baskets of precepts and other works, one list of which has been given by Csoma de Körös, the Hungarian scholar. The art of printing by means of engraved wooden blocks has been known to the Tibetans for many centuries. Traces of the old religion called *Bon* or *Pon* still linger in the eastern province of Kam. It appears to have been a worship of the powers of nature. Buddhism seems to have reached Tibet about the beginning of the seventh century, from both China and India. (See LAMAISM.) The history of its development is full of interest, and at present the numerous hierarchy of Tibet plays the foremost part in national politics, besides supplying the educational requirements of the country, so far as any provision may be said to be made for the same.

Political Divisions and Government.—Politically, Tibet is divided into four great provinces called Kam, U, Tsang, and Ari. The first named is in the E., and adjoins the Chinese

province of Szechuen; Ari is the mountainous region W. of the Mariam-la Pass, including Ladak; while U and Tsang or Utsang form Central or Great Tibet, and practically coincide with the basin of the Brahmaputra river. Here are found the capital or sacred city of Lhasa and other important towns, besides the greater monasteries.

Tibet is politically subject to China, but the enormous distance and difficulties of communication have naturally made the country more or less independent of the suzerain power. The visible sign of Celestial supremacy is the presence of the two Chinese *ambans* or residents, with their military guard, at the capital. Appointments to the first offices in the state are bestowed by the emperor, and in all measures of consequence reference is made to the court of Peking, but the internal government of the country is intrusted entirely to natives, the executive administration being in the hands of a regent and four ministers or councillors called *kahlons*. The governors of forts and provinces are appointed by these, and the revenue is collected by officers sent annually from Lhasa. The Dalai lama on attaining full age has in times past been invested with supreme authority by the Emperor of China, but for some years all the grand lamas have died in infancy, a circumstance that sheds a significant light on the methods resorted to by those who wish to keep the power in their own hands. The position of the grand lamas has been thus very similar to that of the popes of Rome, and the analogy is still more observable in the tenets and rites of the Roman Catholic and Tibetan religions, between which there is a striking similarity; this is probably due to the early Capuchin missionaries who settled in Lhasa having introduced a knowledge of Catholic observances. The *gyllongs* (monks) and *anins* (nuns) are found in huge monasteries presided over by abbots and scattered all over the kingdom, and indirectly possess much influence; the actual executive authority is, however, vested in *jongpons*, or district officers, under the supervision of the provincial governors.

Trade and Commerce.—Lhasa, the capital, is the great central mart, and thither traders repair from China with silks, carpets, and hardware; from Mongolia come leather, saddlery, sheep, and horses; from Kam come perfumes; from Szechuen, tea; from Tawang, Bhutan, and Sikkim, rice and tobacco; from Nepal, broadcloth, silk, indigo, coral, pearls, sugar, spices, and Indian manufactures, while the latter, with saffron, also enter by way of Kashmir and Ladak. The merchants come in December and leave in March, before the rivers become flooded, having provided themselves with silver and gold, salt, wool, woollen manufactures, furs, drugs, and musk. By the Nepal and Ladak routes Tibet exports large quantities of yaks' tails, borax, gold, silver, and ponies. The great and inexhaustible staple of the country is wool, a remarkably fine quality of which can be largely produced on its vast plains and mountain-slopes. But for this trade it is essential that intercourse with India should be thrown open and all the passes through the Himalayas made free to traffic, the live stock, which constitute the chief beasts of burden, requiring a large area of pasturage for their support. Warren Hastings made wise and strenuous efforts to establish regular commercial intercourse between the two countries, but through neglect his policy was not continued; the passes to the S. were sealed up, and it was not until after repeated efforts to remove the restrictions that a treaty between China and Great Britain was negotiated in 1893, providing for the establishment of a trade mart at Yatung in the Chumbi valley. This arrangement was practically forced upon the Tibetans after their invasion of British Sikkim had been forcibly repulsed. But the military victory was not followed up, the Tibetans were not much impressed, and the latest information is that the treaty, in consequence of the lama jealousy of foreigners, has practically become a dead letter. The importance, however, of finding a Tibetan market for Indian tea makes it unlikely that the British will submit to be thus rebuffed; tea is a prime necessary of life in Tibet, and its eventual introduction into the country and the complete opening up of the land to Western civilization and trade can be only a matter of time.

History.—The early history of Tibet is naturally obscure. It is said that a native king established the seat of government at Lhasa in 617 A. D.; that he married a Chinese princess of the Buddhist faith; and that he sent his minister to India, who returned with the Buddhist canonical scriptures, framed the Tibetan alphabet from the Devanagari of India, and commenced the translation of the canon from Sanskrit

into the language of the country. For a long time there was a struggle for supremacy between the old nobility and the new hierarchy, in which, after several vicissitudes, the Buddhist monks gained the ascendancy. It was during this early period of Buddhist rule in Tibet that the first European visited the country. Friar Odoric, of Portenone, between 1316 and 1330, traveled through Shansi and Szechuen and reached Lhasa. Three centuries elapsed before another European visited the sacred capital. In the middle of the fourteenth century a great reforming lama, named Tsongkhapa, arose in Tibet. He forbade clerical marriages, prohibited necromancy, and introduced the custom of frequent conferences among the lamas. These reforms led to a schism in the Tibetan Church, the older sect being called Red Caps or Shukpas and the reformers Yellow Caps or Gelupkas, and since the reformation the latter have been in the ascendancy. Gedun-tupba, another great reformer, who died in 1474, is said to have revived the spirit of Tsongkhapa, and with him the doctrine and system of perpetual reincarnation began. Two grand lamas then arose, one called the Dalai lama, with his headquarters at Galdan, near Lhasa, and the other at Teshu Lumbo. A third grand lama, called the Taranath lama, is also mentioned as having his seat in the Khalka country in Mongolia. The first of the Jesuits who penetrated into Tibet was Antonio Andrada, who in 1624 set out from Agra and, scaling an appalling mountain, reached Rudok, in Tibet, and eventually made his way through Tangut to China. Other missionaries followed: Grueber and Dorville, who passed from China through Lhasa into India, and Desideri and Freyre, who also visited the capital. The Capuchin mission under Father della Penna was established at Lhasa in 1719. Just before they reached the capital the famous native survey had been completed, a work which formed the basis of d'Anville's well-known atlas. In 1717 an army of Dzungarians or Eleuths stormed Lhasa, but in 1720 order was restored by the Emperor of China, Kang-hi, who established two residents at the capital as his representatives. It was about this time that the Dutch traveler Samuel van de Putte made his remarkable journey from India to Lhasa and China and back again. In 1749 the Chinese residents put the Tibetan regent to death. The people, incensed, flew to arms and a massacre of the Chinese took place. An expedition was duly dispatched by the emperor, but timely concessions were made to appease the wrath of the lamas and people, and succeeding regents were more subservient to China. The Capuchin missionaries were expelled from Lhasa in 1760 and settled in Nepal, where some of them were eye-witnesses of the troubles ending in the Gurkha conquest of that country. At the same time the aggression of Deb Jadhur in Bhutan led to British intervention and to subsequent attempts to mediate on the part of the Teshu lama of Tibet. This furnished an opportunity to Warren Hastings to dispatch G. Bogle as envoy to Tibet in 1774 to conclude a treaty of amity and commerce between the two countries. The negotiations were most friendly, and after the lama's death at Peking in 1780 a new mission was sent under Capt. Turner to do homage to the new lama, a child of eighteen months. In 1792 the Nepal regency, tempted by stories of the great riches in the Teshu lama's palace, determined to invade Tibet, and actually plundered Teshu Lumbo. The Chinese Government on hearing this dispatched a powerful expeditionary force under Gen. Sund Pö, who defeated the Gurkhas on the plain of Tingri Maidan, laid siege to Kuti, and finally routed the enemy 20 miles from Kathmandu, the Nepalese capital. The conditions of peace imposed were humiliating, and included the payment of an annual tribute to China and the dispatch of an embassy to Peking every five years. During this war the policy of the British under Lord Cornwallis was unfortunate, and led to the closing of the passes from Tibet into India, all the good results of Hastings's negotiations being thereby lost. Nevertheless, Thomas Manning, the friend of Charles Lamb, in the guise of a doctor, managed in 1811 to get to Lhasa through Bhutan, a success doubtless due to his knowledge of Chinese, which enabled him to make friends with a Chinese general. In 1834 Golab Sing, of Jammu, afterward Maharajah of Kashmir, sent an army commanded by his general, Zorawar Sing, to invade Ladak. In 1841 this chief advanced into Eastern Tibet, but was utterly defeated by the Chinese Dec. 12 (almost simultaneously with the destruction of a British division at Cabul). Three years later the French missionaries Hue and Gabet arrived at Lhasa and were well treated by the new regent, who had been

installed in the place of one Si-fan, who had been disgraced for complicity in the murder of three of the Dalai lamas. Subsequently Chinese jealousy prevailed, and Hue and Gabet were compelled to return to Europe. The Teshu lama, the same who had received Capt. Turner, died at an advanced age in 1854.

The recent history of Tibet has been marked by but few conspicuous events. Numerous European travelers have entered the mysterious land from the west, the north, and the east, but none has been enabled to reach Lhasa. Among these may be mentioned Prejevalsky, Carey, Bonvalot, Rockhill, Bower, and Miss Taylor. The endeavors of these and other travelers, however, seem only to have made the Tibetans more determined to keep out the dreaded foreigner. Their invasion of Sikkim in 1888 aroused the Indian Government, which compelled the Tibetans to retreat and eventually to sign a treaty recognizing Sikkim as British.

BIBLIOGRAPHY.—The best general account of Tibet will be found in the *Narratives of George Bogle and Thomas Manning* (London, 1879; 2d ed. by C. R. Markham). Capt. Turner's account of his mission (1800) is most interesting, and the works of Brian Hodgson, Archibald Campbell, Csoma de Kőrös, and Joseph Hooker deal exhaustively with the scientific sides of the subject. Of late years the travelers above mentioned have all [particularly William Rockhill, *The Land of the Lamas* (New York, 1891) and *Diary of a Journey Through Mongolia and Tibet in 1891 and 1892* (Washington, 1894)] written valuable works on Tibet, while the Indian native travelers, the Pundits Nain Singh and Kishen Singh, have recorded in the publications of the Royal Geographical Society a mass of scientific, statistical, and general information. The *Narrative of a Journey to Lhasa*, by Sarat Chandra Das, a confidential work and still unpublished, gives the latest authentic information regarding the capital and inner government of the country. For a copious bibliography, see vol. ii. of Lansdell's *Chinese Central Asia* (London, 1893; New York, 1894).

CHARLES E. D. BLACK.

Tibetan Language: the language spoken in Tibet. It is slightly agglutinative and monosyllabic, and forms words and sentences by the juxtaposition of roots and particles, except in the verb, in which changes in the roots are quite frequent. There is considerable resemblance between its dialects and those of Northern Burma. Its alphabet consists of ninety consonants, each with an inherent *a* (as in Sanskrit), and the five vowels *a*, *e*, *i*, *o*, and *u*. Tibetan became a written and literary language more than 1,200 years ago; yet on account of the religious or idolatrous reverence with which the written word is regarded by Buddhists, it has, with some few and insignificant exceptions, maintained its written forms of sounds unchanged up to the present time, while the style and the oral speech have undergone considerable alterations. This clinging to the old, full pronunciation of many sounds characterizes Eastern and Western Tibet, while in Central Tibet, the principal seat of national civilization, a refined but somewhat effeminate pronunciation of the consonants may be observed; here also occurs the greatest difference between the spoken and the written sound. In 632 A. D. the Indian Devanagari alphabet was adapted to the Tibetan language by the order of King Srongtsan Gampo, who also ordered the sacred books to be translated into Tibetan. The work of translation was carried on with remarkable zeal; and for the sake of uniformity, vocabularies of the Sanskrit proper names and of the technical and philosophical terms occurring in the original texts were prepared. King Srongtsan Gampo and his learned translators also issued books written in their native tongue, and, beginning with Tsongkhapa, the great reformer of the fourteenth century, native literature developed itself on a larger scale; even Mongolians write in Tibetan, as it is the language of the divine service. In the beginning of the eighteenth century all the Sanskrit translations were collected in two large and voluminous works, to which were added the sacred and profane native publications of different periods. These compilations bear the title of *Kanjur* (The Translated Word of Buddha) and *Tanjur* (Translation of the Doctrine). The *Kanjur* contains 100 volumes, comprising 689 works, which are classed under seven divisions—discipline, transcendental wisdom, association of Buddhas, jewel-peak, sūtras or aphorisms, deliverance or emancipation from existence, and *Tantra* or mysticism. The *Tanjur* comprises 225 volumes, divided into mysticism and discipline; its contents are of a more miscellaneous character. Tibetan is

written from left to right. For printing capital letters are always used. The books are not folded, but consist of loose leaves laid between boards kept together by a string. Little is known of the non-religious literature of Tibet. One of the most popular works is the *Hundred Thousand Songs of Milaraspa*, a mendicant monk of the eleventh century. The Hungarian Csoma de Körös was the first who brought (1832) Tibetan language and literature within the reach of European students. In 1875 a German Moravian missionary, H. A. Jäschke, published a most learned Tibetan-German dictionary, and a grammar in 1883.

Tibullus, ALBIUS: poet; b. about 54 B. C.; was descended from an equestrian family of good standing in Roman society; accompanied Messalla, his patron, in 28 B. C. to Aquitania, and started with him on a mission to Asia, but, falling ill, got no farther than Coreyra. After these journeys he lived on his estates near Rome, devoting himself to poetry and literary occupation. D. probably in 19 B. C. Three books of elegies ascribed to him have come down to us in the MSS., but the third book is now often divided into two. The first book sings of the love of Delia, the second of Nemesis, both being assumed names. The third book is by a poet much inferior to Tibullus, who calls himself Lygdamus, and sings the praises of Neera. The fourth book opens with a panegyric on Messalla, in hexameters, which is universally pronounced by scholars to be unworthy of Tibullus. Critics are divided still as to whether elegies 2-6 which follow the panegyric are by Tibullus. For the Sulpicia elegies 7-12, see **SULPICIA**. Editions by Dissen (Göttingen, 1835, 2 vols.); Bährens (Leipzig, 1878); Müller (1880); E. Hiller (Leipzig, 1885); and translated into English by Dr. Grainger (1752) and Cranston (London, 1872). On account of the genuineness and simplicity of their feeling, these poems belong to the best Latin literature contains. See also Sellar, *Horace and the Elegiac Poets* (Oxford, 1892).

Tibur: See **TIVOLI**.

Tic Doulourenx: a form of facial **NEURALGIA** (*q. v.*).

Tichborne Case: an English *cause célèbre*, famous for its length, the estate involved, and the character of the persons concerned. It consists of two trials, one (in 1871) an action in ejectment by an impostor for the recovery of the Tichborne estates in Hampshire and Dorsetshire, England, valued at £24,000 yearly; and the other (in 1872) an action for perjury against the defeated impostor.

The estate in question was that which had belonged to Roger Charles Tichborne, who was born in Paris in Jan. 5, 1829, son of Sir James Tichborne, by his wife Henriette Félicité, a French woman of noble extraction. Roger continued to live in Paris, having French tutors and speaking French rather than English as his native tongue. He was later sent to the Roman Catholic College of Stonyhurst, England, having been brought up a Roman Catholic, and here his education practically ended, he being, however, idle rather than dull. In Feb., 1853, he went to Paris to bid his mother farewell previous to his departure upon an extended tour, and on Mar. 4 sailed for Valparaiso. In Apr., 1854, he sailed in the *Bella* from Rio de Janeiro for New York, having previous to his embarking written a letter showing his intention to stay from home for two or three years. The *Bella* was lost at sea, and no person on board was ever heard of again, although her long-boat was picked up at sea. The will of Roger Charles Tichborne was proved and his estate placed in the hands of the executors.

Roger's mother had become possessed of the belief that he was still living, and in 1862, after the death of her husband, she advertised in English and Australian papers for her son, and in 1866 a butcher who was then living at Wagga Wagga, Australia, under the name of Thomas Castro, but whose real name was Arthur Orton, asserted that he was the lost Roger, having been saved from the wreck of the *Bella*. After considerable correspondence between the impostor and Lady Tichborne and the receipt of a remittance to defray his expenses, he went to London, where Lady Tichborne received him as her son. He was repudiated by the rest of the family, but was supplied with money by Lady Tichborne, and went about collecting witnesses and gathering information to be used in establishing his identity. Lady Tichborne died in 1868, but Castro had found so many believers in his claims that he raised considerable sums by selling bonds conditioned to be paid upon his coming into possession of his claimed estates. On May 11, 1871, he began an action in ejectment for the recovery

of the Tichborne estates. The trial lasted for 103 days, till Mar. 6, 1872, when he was non-suited, the jury declaring before its close that they believed that the claimant was not Roger Charles Tichborne.

Castro was then arrested upon a charge of perjury, and the trial was begun in the court of queen's bench on Apr. 23, 1873, and lasted 188 days, until Feb. 28, 1874, when he was found guilty of perjury and was sentenced to fourteen years' penal servitude.

For the purposes of the two trials the smallest details of the life of Roger and the claimant were investigated at an enormous expense, and it was proven by a complete chain of the strongest evidence that not only was the claimant an impostor, but that he did not even resemble Roger, nor have any intimate acquaintance with his affairs. It was shown that Castro was the son of a London butcher, and was born June 1, 1834, and that his real name was Arthur Orton; that in 1848 he went to Valparaiso, where he took the name of Thomas Castro; that he later returned to London, and then went to Australia, where he led a disreputable life, one time as a horse-breaker, at another as a butcher, having married a servant girl under the name of Castro, Jan. 29, 1865. It was proved that Roger left balances with two Australian bankers which Castro did not use; that immediately on his arrival in London he sought the Ortons, and sent photographs of his wife and children to them as being the wife and children of Arthur Orton; that he was ignorant of the circumstances of Roger's life in France, and spoke no French; that Roger had a common education, while Castro was extremely illiterate; that Roger's person was thin, his hair straight, and his ears closely adhering to the sides of his head, while Castro was enormously fat, an inch taller than Roger, and had large pendulous ears and curly hair. In 1895 Castro admitted, in a confession printed in a London paper, that he was an impostor, and that he was the original Arthur Orton.

For a full account of the trials, see Morse's *Famous Trials* (Boston, 1874); *The Tichborne Romance: a Full and Accurate Report*, etc. (Manchester, England, 1871, 2d ed.); *The Tichborne Trial: the Summing-up by the Lord Chief Justice of England* (London, 1874); *Charge of the Lord Chief Justice of England in the Case of the Queen against Thomas Castro* (2 vols. 8vo, London, 1874).

F. STURGES ALLEN.

Ticino, *tēp-chee'nā*, or **Tessin**: the southernmost canton of Switzerland, on the Italian side of the Alps and on both sides of the river Ticino; borders on Lago Maggiore. Area, 1,088 sq. miles. Its northern frontier toward Uri and Grisons is formed by a range of the Lepontine Alps 12,000 feet high, branches of which cover the whole northern part of the canton. In the southern part the ground becomes low and the surface level. Dairy-farming and cattle-breeding are the principal occupations in the Alpine regions, and agriculture and the cultivation of grapes, olives, figs, almonds, and melons in the southern part. Pop. (1888) 126,751, most of whom speak Italian and are Roman Catholics. Capital, Bellinzona.

Revised by M. W. HARRINGTON.

Tick: any one of various parasites of the higher animals. The true ticks (*Icodes*) belong to the **ARACHNIDA** (*q. v.*), order *Acarina*. They fasten upon the skin, and, burrowing the head beneath the surface, feed upon the blood, the abdomen meanwhile growing to enormous size. The name is also given other parasites belonging to the *Diptera* (flies), as the sheep-tick, horse-tick, and bird-tick, and in some of these parasitism has resulted in a loss of wings, the animal having a spider-like appearance.

J. S. K.

Tickell, THOMAS: poet; b. at Bridekirk, Cumberland, England, in 1686; was educated at Queen's College, Oxford, of which he became a fellow in 1710; became a friend of Addison, through whose influence he was in 1717 appointed Under-Secretary of State, and in 1725 was made secretary to the lords justices of Ireland, a post which he retained until his death. His principal works are *The Prospect of Peace*, a poem; *The Royal Progress*, verses celebrating the arrival of George I.; a translation of the first book of the *Iliad* (1715); *Kensington Garden*, a poem (1722); a fine *Elegy on Addison*; and the popular ballad *Colin and Lucy*; besides which he contributed to *The Spectator* and *The Guardian*. D. at Bath, Apr. 23, 1740. An edition of his poems was published at Boston in 1854. Revised by H. A. BEERS.

Ticket of Leave: originally a kind of permit or license given to British convicts transported to the Australian colonies, by which they were allowed to be at large within a

certain specified territory. The ticket of leave was granted upon good behavior for a certain period of years, and was revocable upon misconduct. The term is now popularly applied to what is technically called an order of license, whereby a portion of a convict's time of imprisonment is remitted as a reward for industry and good behavior. This remission was first used in England, about 1840, upon the refusal of the colonies to receive convicts. Since the sentence of those convicts subject to transportation would be much more severe if they were imprisoned for the entire period, a portion of the terms of such as were not transported was remitted; and afterward, when the form of punishment was changed from transportation to penal servitude, the partial remission of sentences was made systematic in order to induce industry and good behavior.

F. STURGES ALLEN.

Tickets: See TRAVELERS, LEGAL RIGHTS OF.

Ticknor, GEORGE: literary historian and biographer; b. in Boston, Mass., Aug. 1, 1791; graduated at Dartmouth College in 1807; admitted to the bar in Boston in 1813; spent four years (1815-19) in study and travel in Europe, and during his absence was chosen (1817) to the Smith professorship of Modern Languages at Harvard; filled that post from 1820 to 1835, when he resigned; spent three years in Europe, chiefly engaged in preparatory researches for his principal work, to which he devoted several more years of assiduous labor; published in 1849 in London and New York his *History of Spanish Literature* (6th American ed., 3 vols., Boston, 1888), which was translated into French, German, and Spanish, and accepted as the standard work on its subject even in Spain; printed some occasional essays, chiefly on educational topics, and several biographical sketches; wrote an elaborate *Life of William Hickling Prescott* (1864); contributed to various magazines and reviews; and was a munificent benefactor to the Boston Public Library, presenting it with 2,000 volumes in 1860. He was a member of the leading literary societies of Europe and the U. S. D. in Boston, Jan. 26, 1871. The 4th ed. of his *History of Spanish Literature* appeared shortly after his death under the editorship of George S. Hillard, who also published his *Life and Correspondence* (2 vols., Boston, 1876). See E. P. Whipple, *Recollections* (Boston, 1877), section on Ticknor.

Revised by H. A. BEERS.

Ticknor, WILLIAM DAVIS: publisher; b. at Lebanon, N. H., Aug. 6, 1810; became in 1832 a bookseller in Boston; subsequently added a publishing business, which attained to great importance under the firm-name of Ticknor & Fields (subsequently James R. Osgood & Co., and still later Ticknor & Co.); published *The Atlantic Monthly* and *The North American Review*, and made his office a center for the brilliant literary circle connected with that magazine, including Longfellow, Holmes, Whittier, Lowell, and Saxe, whose poems were issued by the firm. D. in Philadelphia, Pa., Apr. 10, 1864.

Ticonderoga: township and village; Essex co., N. Y.; on the Cent. Vt. and the Del. and Hud. railways; 24 miles N. of Whitehall, and 100 miles N. of Albany (for location, see map of New York, ref. 2-J). The township contains deposits of graphite, from which, for several years, the entire commercial product of this mineral in the U. S. has been obtained. The largest output was in 1891, when 1,559,674 lb., valued at \$110,000, were mined. There are also extensive deposits of iron ore. The village and a part of the township occupy a lofty promontory between Lakes George and Champlain, Mt. Defiance, at the extremity, being 750 feet above the level of Lake Champlain. The outlet of Lake George is 4 miles long, has a fall of 220 feet in 2 miles, and furnishes abundant power for manufacturing. Here are several foundries, machine-shops, extensive pulp and paper mills, large lumber interests, a national bank with capital of \$50,000, and a weekly newspaper. Ticonderoga was prominent in colonial and Revolutionary history from its celebrated fortress, built by the French in 1755, and originally named Carillon (chime of bells) from the music of the neighboring waterfall. It was the headquarters of Montcalm in 1757; was unsuccessfully assaulted by Gen. Abercrombie July 8, 1758; occupied after a siege by Gen. Amherst July 30, 1759; captured by Ethan Allen May 10, 1775; retaken by Burgoyne July 5, 1777, and again by Gen. Hallemand 1780, but soon abandoned on each of the last two occasions. Pop. (1880) township and village, 3,304; (1890) township, 3,980; village, 2,267; (1895) township, estimated, 5,000.

EDITOR OF "SENTINEL."

Tidball, JOHN CALDWELL: soldier; b. in Ohio co., Va. (now West Virginia), Jan. 25, 1825; graduated at the U. S. Military Academy, West Point, 1848; appointed second lieutenant Second Artillery; served in Florida war 1848-50; in explorations to Pacific coast 1853-54; on coast survey 1854-59; captain Second Artillery May 14, 1861, in command of battery at battle of Bull Run, and in the operations of the Army of the Potomac in the Peninsular campaign of 1862, the battles of Antietam, Chancellorsville, Gettysburg, etc.; appointed Aug., 1863, colonel Fourth New York Volunteer Artillery; commanded the artillery of the Second Corps during the Richmond campaign, May to July, 1861, including the battles of the Wilderness and those around Spottsylvania; commandant of cadets, U. S. Military Academy, July-Sept., 1864; in command of artillery, Ninth Corps, Army of the Potomac, in siege of Petersburg, Va., Oct., 1864-Apr., 1865, in pursuit of the Confederate army, and in other operations terminating in Lee's surrender; at close of war returned to duty with his company; promoted major Second Artillery, Feb., 1867; commanded in Alaska 1868-71; superintendent of instruction at artillery school, Fort Monroe, Virginia, 1874-80; aide-de-camp to general of army 1880-84; promoted lieutenant-colonel First Artillery, June 30, 1882, and colonel of same regiment Mar. 22, 1885; in command of the U. S. artillery school and post of Fort Monroe, Virginia, Nov., 1883-Jan. 25, 1889, when he was retired; breveted brigadier-general Mar. 13, 1885; author of *Manual of Heavy Artillery Service* (Washington, 1880) and of numerous professional papers.

Tidemill: an apparatus for the utilization of the water-power of the tide. In some cases, as at the old London Bridge tidemills, the water-wheels, mill and all, were afloat, so that no adjustment of the wheels to the height of the water was necessary, and the tide was utilized both on its ebb and flow. In other cases dams are constructed which shut the water at high tide, and its outflow through a raceway gives motion to the mill; and during the return of the tide through the sluice its power may again be utilized. On account of the great expense usually involved in the construction of dams of sufficient extent to retain the quantity of water necessary, and the usually moderate extent of the rise and fall of the tide, it is probable that in very few places in the world will it be found practicable to install tidemills in competition with steam-engines. A project for the continuous utilization of tidal power in connection with the training-walls to be constructed in the estuary of the Seine is described by P. Decour in the *Proceedings of the Institution of Civil Engineers* (1890). The method proposed is to have two basins separated by a bank rising above high water, within which turbines would be placed. The upper basin would be in communication with the sea during the higher one-third of the tidal range, rising, and the lower basin during the lower one-third of the tidal range, falling. The turbine proposed is of an improved model designed to utilize a large flow with a moderate diameter. One has been designed to produce 300 horse-power with a minimum head of 5 ft. 3 in. at a speed of fifteen revolutions per minute, the vanes having 13 feet internal diameter. The speed would be maintained constant by regulating sluices. The available gross horse-power in such a design is estimated to be about one-thirtieth of the product of the area of the lower basin in acres by the square of the tidal range in feet.

Revised by WILLIAM KENT.

Tides [O. Eng. *tid*, time; O. H. Germ. *zīt* > Mod. Germ. *zeit*. (See TIME.) Cf. Sanskr. *a-diti*, unlimited, timeless]: the motions of the waters of the ocean arising from the attraction of the sun and moon. Those living on the shores of the ocean see it rise and fall regularly twice every day. For six hours the water rises, or *flows*; then, remaining stationary for a short time, it gradually recedes or *ebbs* for another six hours; after a short lull, called *slack water*, it again rises and falls as before. The rising sea is called the *flood tide*; the receding sea, the *ebb tide*. When the water is at its greatest height, it is *high water*; when at its lowest point, *low water*. There are thus daily two high tides and two low tides. The time of high water and low water, at the same place, however, is gradually changing. The mean interval of time between two consecutive high tides or low tides being really twelve hours and twenty-six minutes, and the hour of the day at which high water or low water occurs is later every day by an average amount of fifty-two minutes.

Cause of the Tides.—Though the dependence of the tides

upon the course of the moon seemed to point out their source, the real cause of these mysterious movements was not understood before the discovery of the law of gravitation by Sir Isaac Newton. Applying here this new principle, Newton showed that the rise of the waters was due to the attraction of the moon and the sun upon the revolving globe of the earth. The moon, on account of its proximity, and notwithstanding its smaller mass, has an influence more than double that of the sun (100 to 38); its action is illustrated by Fig. 1. It attracts the solid earth as if the

FIG. 1.

whole mass of the earth were concentrated at its center. But owing to the greater proximity of the region marked in the figure "high water" to the moon, the attraction is there greater than for the center of the earth. Hence a tendency to a high tide in that region. On the side opposite the moon, also marked high water, the attraction is less than at the center of the earth. Hence the attraction draws the earth away from the water toward the moon, so that a high tide is produced there also. At the points marked low water the components of the forces shown by the dotted lines converge toward the moon. But for this convergence the attraction of the moon on the solid earth and on the water would be equal. But owing to the convergence the water is drawn toward the center of the earth, and thus low tides are produced. This is why there are two high tides and two low tides in the course of a day. There are thus always simultaneously and directly under the moon two high waters opposite each other, and two low waters at equal distances between them. Owing to the rotation of the earth, this permanent system of swells and troughs travels from E. to W. over every part of the ocean and of its coast, and explains the regular succession of rising and falling waters, at equal intervals of time, which we call the tides.

Spring-tides and Neap-tides.—The sun also asserts its attractive power on the ocean, and causes a similar system of four daily tides. Owing, however, to the great distance of the sun, the solar tides are much smaller, and mostly merged in, or masked by, the lunar tides. As the relative position of the moon and sun is constantly changing, the solar and lunar tides seldom coincide; but twice a month, at new moon and full moon, the sun and moon, being on a line with the earth, as shown in Fig. 2, act together, and cause an unusually high water, which is the sum of the lunar and solar tides. These are the spring-tides. High water is then highest, and low water lowest. When the sun is placed 90° from the moon (Fig. 3)—that is, at the time of

FIG. 2.

the first and third quarter of the moon—its attraction acts against that of the moon, diminishing the height of the high tide and increasing that of low water. These are the neap-tides. High water is then lowest, and low water highest. The proportion of the rise and fall in the spring-tides and neap-tides is nearly as 7 to 3.

Course of the Tidal Wave.—If the ocean covered the whole earth with a uniform depth of water, the tidal wave, with its long crest extending from N. to S., would follow the apparent course of the moon, and travel from E. to W. around the globe in twenty-four hours. It would be greatest in the equatorial regions, and move there with a velocity of over 1,000 miles an hour. But the continents which cut the ocean into several large basins oppose its passage, and in each of these basins the course of the tidal wave is subjected to great modifications. The regularity and velocity of the tidal wave depend upon the size of the basin, the depth of the water, and freedom from all obstacles opposing its progress. Nowhere are these conditions better fulfilled than in the southern half of the Pacific Ocean.

There is formed what might be called the parent tidal wave, which, advancing rapidly westward, enters the Indian and Atlantic Oceans, and seems to control their tides.

Tides in the Pacific Ocean.—In the middle and equatorial part of the Pacific Ocean the advance of the tidal wave is gradually slackened, and becomes very irregular when broken up by the numberless islands of the East Indian Archipelago. The influence of shallow water, and of friction on the bottom and on the coasts of the ocean, is evident in the slow progress of the tide-wave between New Guinea and Australia, and in the Chinese Sea. Its rapid motion, on the contrary, toward the N. W.

the tidal wave is gradually slackened, and becomes very irregular when broken up by the numberless islands of the

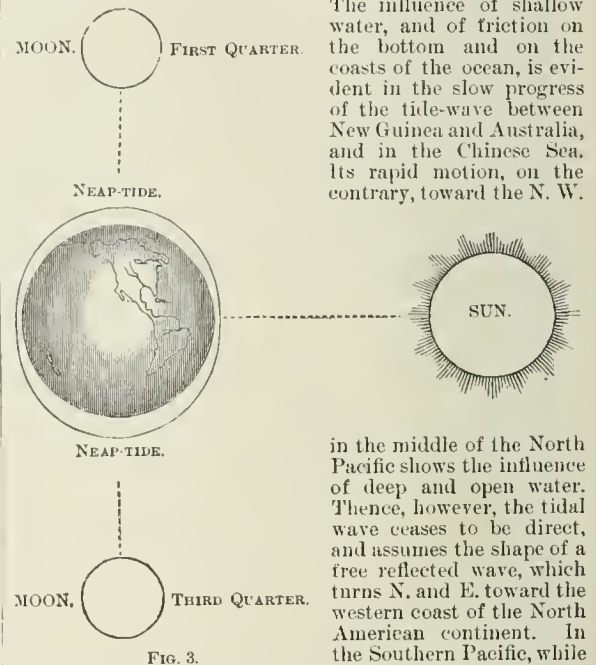

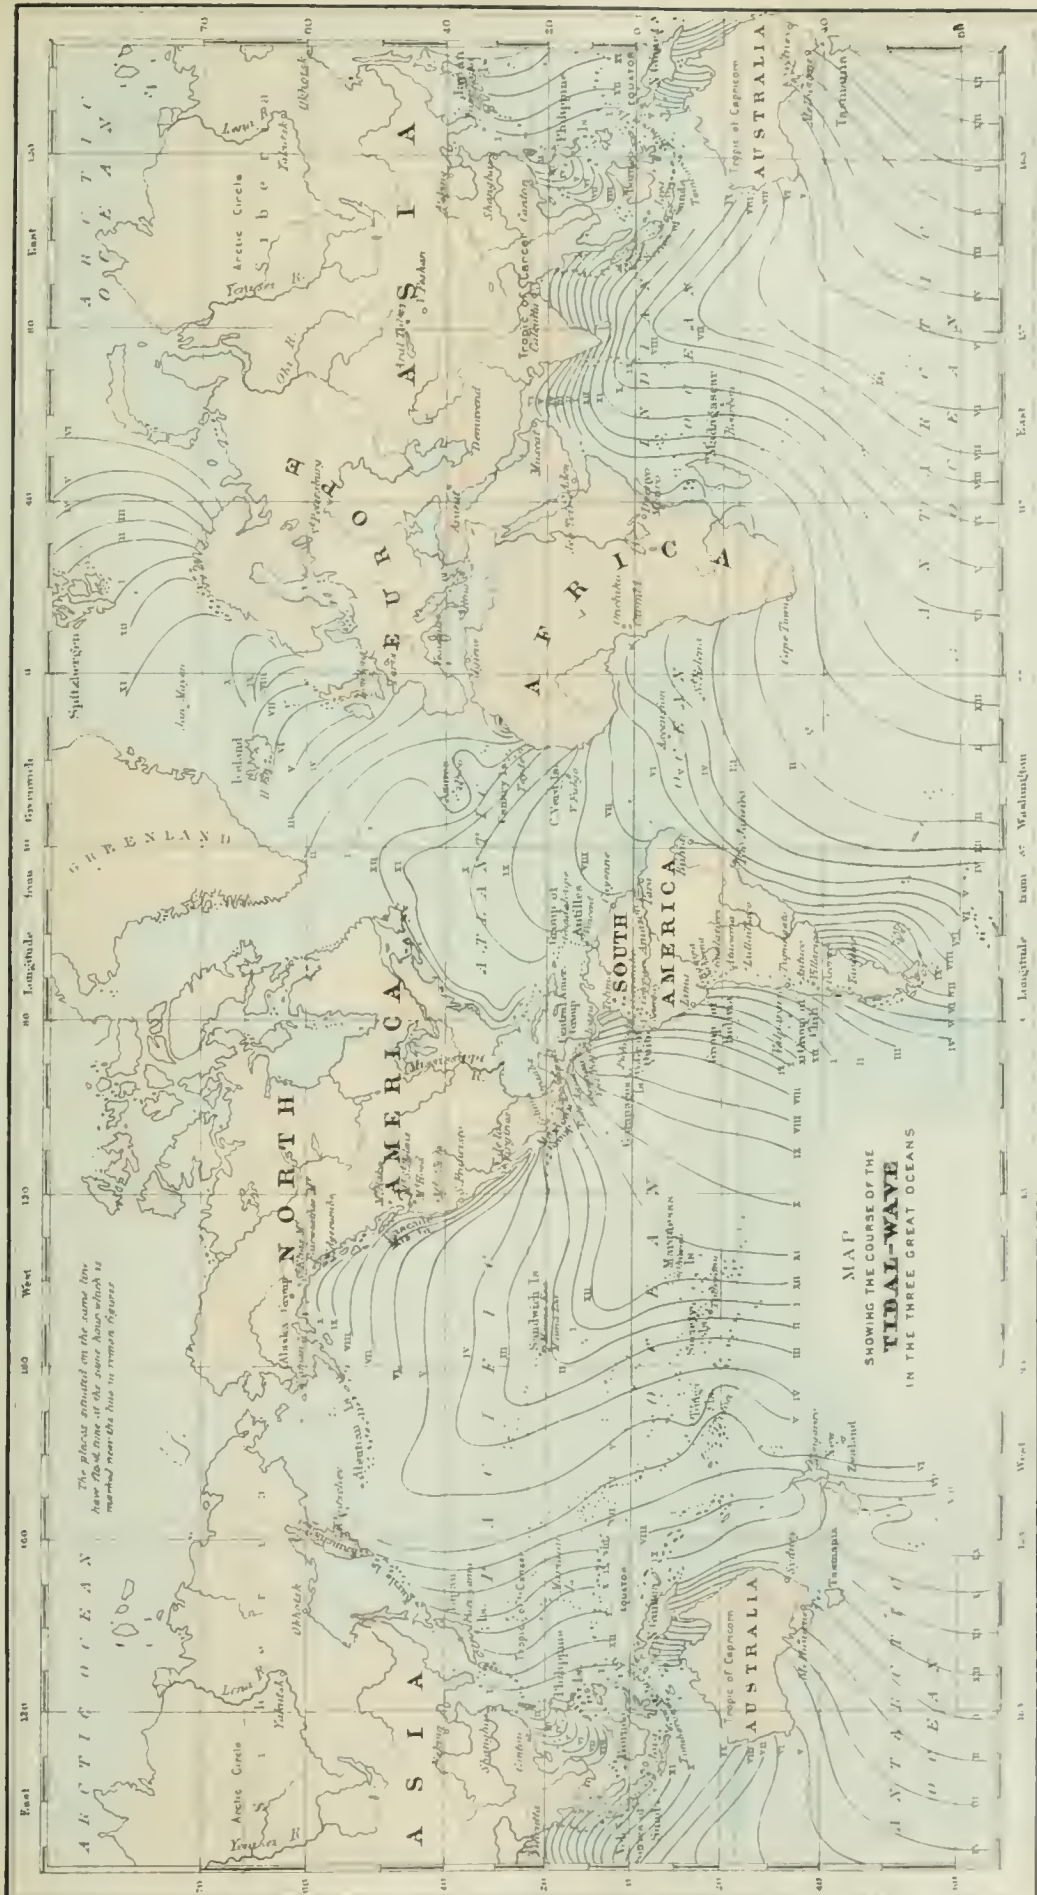

FIG. 3.

to start on its westward course from the 90th meridian, it sends a reflected wave eastward along the western coast of South America, from which this coast seems to derive its tides. This meets, at Cape Horn, the Atlantic tide coming from the E.

The course of the tides on the coast of Great Britain, in the Channel, and the German Ocean, as shown in the map of cotidal lines in that region (Fig. 4), illustrates the retardation of the tidal wave in shallow and narrow seas. The main tide-wave in the broad Atlantic moves on, unobstructed, around the British isles, reaching the Orkneys in four

hours, and moves southward along the eastern coast of Scotland before the slackened tide-wave has forced its way through the Channel to Dover Straits. Each wave then continues its course, the first along the English coast, that from the Channel along the coast of Holland, causing tides at different hours on the opposite shores.

The places equated on the same line have flood time at the same hour which is marked near the line in roman figures.

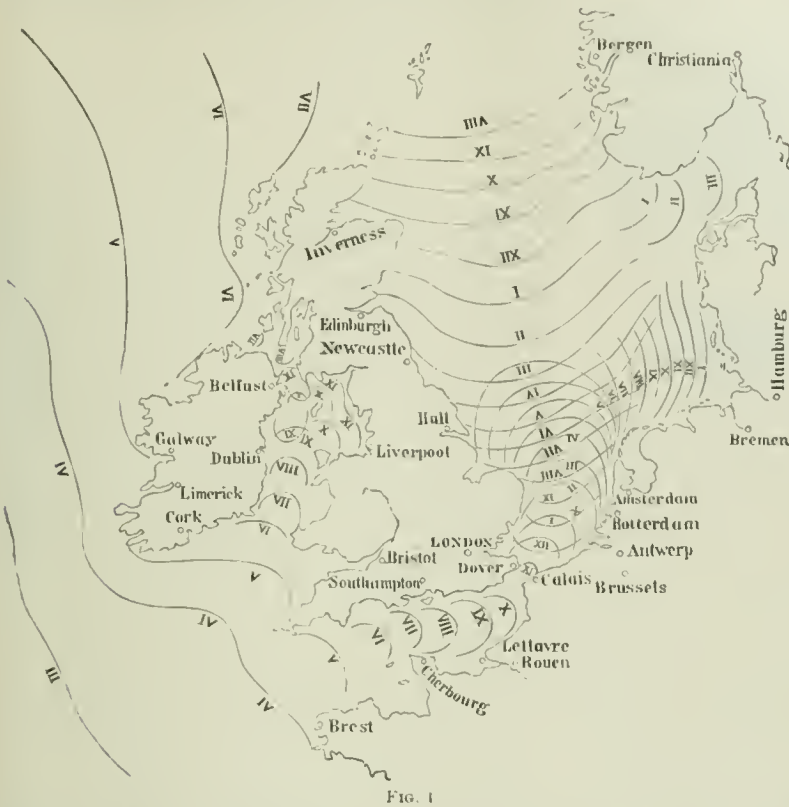

MAP
SHOWING THE COURSE OF THE
TIDAL-WAVE
IN THE THREE GREAT OCEANS

Longitude from Washington

The Age of the Tide.—This course of the tidal wave shows that the tides of the Indian and Atlantic Oceans are not generated in these basins, but are mainly derived from those of the Pacific Ocean. But the tide-wave takes some

developed very abstrusely by Laplace in *Mécanique Céleste* vol. ii. Much simpler and more modern is Airy's treatise on *Tides and Waves*, forming a part of the *Encyclopædia Metropolitana* (London, 1848). Yet later developments are found in Ferrel's *Tidal Researches*, published in the annual report of the U. S. Coast Survey for 1874.

Revised by S. NEWCOMB.

time to travel over this vast extent. The map shows that in twelve hours more the Pacific wave reaches Tasmania; in twelve hours more, the coast of India; another twelve or thirty-six hours brings it to the coast of North America; a few hours more, to the shores of Europe. Therefore the tide on the eastern shores of North America is not the one caused by the last passage of the moon over them, but the one which had its origin thirty-six hours before in the Pacific Ocean, and is therefore one day and a half old. It is two days old in London.

The Height of the Tide.—The height of the tide depends very much upon local circumstances. In the midst of the Pacific it is scarcely more than from 2 to 5 feet, which may be considered as the natural height of the tide. But when dashing against the land and forced into deep gulfs and estuaries, the accumulating tide-waters sometimes reach a very great height. On the eastern coast of North America, which is directly in the path of the great Atlantic wave, the tide rises on an average from 9 to 12 feet. In the Bay of Fundy, which opens its bosom to receive the full wave, the tide, which, at the entrance, is 18 feet, rushes with great fury into that long and narrow channel, and swells to the enormous height of 60 feet, and even to 70 feet in the highest spring-tides. In the Bristol Channel, on the coast of England, the spring-tides rise to 40 feet, and swell to 50 in the English Channel at St. Malo, on the coast of France. It is obvious that differences so considerable in the level of the water will cause strong currents, constantly varying in force and direction with the tide, such as those witnessed in Hell Gate, a few miles west of the point where Long Island Sound connects with New York harbor. To the same cause may be traced the dangerous whirlpools which have long been celebrated on various coasts. The famous Maelstrom off the Norwegian coast is but a tidal current rushing with great violence between two of the Lofoden islands, causing a whirling motion, which is reversed at every new tide. Such, too, in the Straits of Messina, are the classic Scylla and Charybdis, so much dreaded by the navigators of old, and many other whirlpools of less celebrity.

BIBLIOGRAPHY.—The mathematical theory of the tides is

Tidioute': borough; Warren co., Pa.; on the Allegheny river, and the West N. Y. and Pa. Railroad; 35 miles N. E. of Oil City, and 160 N. by E. of Pittsburg (for location, see map of Pennsylvania, ref. 2-C). It has large lumber and petroleum interests, and contains several saw, planing, and grist mills, manufactories of lumber, chairs, and hubs, a savings-bank, and a weekly newspaper. Pop. (1880) 1,255; (1890) 1,328.

Tieck, teek, LUDWIG: poet; b. in Berlin, May 31, 1773; studied theology, philology, and literature at Halle, Göttingen, and Erlangen; resided in Berlin 1795-99, went in the latter year to Jena, where he founded with the Schlegel brothers, Novalis, and others the so-called romantic school; returned to Berlin; lived for a number of years at Frankfort-on-the-Oder; visited Italy in 1805 and England and France in 1817, and finally, in 1819, settled in Dresden, where he was made director of the court theater, and where he became the center of a large and select literary circle. On the invitation of King Frederick William IV., who assured him a large pension, he went in 1841 to Berlin, and here assisted in the production of *Antigone* and other Greek plays. D. in Berlin, Apr. 28, 1853. In the literary career

of Tieck, who has always been recognized as the head of the older romantic school, we can distinguish several periods. In his earliest productions the influences of the Storm and Stress period are decidedly noticeable, and his novel *William Lovell* (1799) is in this respect an especially interesting document of his literary development. The pronounced predominance of the imagination, which is quite apparent in his first productions, may be considered the chief characteristic of Tieck's entire poetic activity. Thus, in accordance with the cardinal doctrine of romanticism which proclaimed the sovereignty of the poet's imagination, Tieck revived the mediæval legends and fairy-tales (*Der blonde Eckbert*, *Hämonskinder*, *Magelone*, etc.); thus he wrote his fantastical comedies (*Der gestiefelte Kater*, *Prinz Zerbinio*, *Die verkehrte Welt*, etc.), and thus he was first attracted by Shakspeare as the poet of unlimited imaginative powers. The result of this one-sided accentuation of the imagination is the absolute lack of plastic power in Tieck's earlier productions, none of which became popular with his nation. Even his reproductions of mediæval legends and fairy-tales are artificial, and can not compare with the naïve and truly popular style of the fairy-stories of the Grimm brothers. Despite his vivid imagination, Tieck's poetic genius was decidedly of a reflective nature, as may be seen from his *Gedichte* (1821), which lack the ring of the true lyric. A greater and more lasting influence was exerted by Tieck in his masterly translations from the Spanish (*Don Quixote*, 1799-1801), the English (*Shakspeare*, *Allgemeines Theater*, 1811), and the Middle High German (*Minnelieder*, 1803, *Urich von Lichtenstein*, 1812), by his critical writings (*Dramaturgische Blätter*, 1826, and *Kritische Schriften*, 1848), and by his excellent editions of the works of Solger, Novalis, Lenz, and Kleist. During the last period of his literary activity he devoted himself exclusively to the writing of novels, taking his subject-material partly from history (*Dichterleben*, a sort of biography of Shakspeare, *Anfuhr in den Cevennen*, etc.), partly from real life (*Vittoria Accorambona*, *Musikalische Leiden und Freuden*, etc.), and producing a number of stories which will be read and enjoyed when his romantic productions are recorded in histories of literature only.

See *Schriften von Ludwig Tieck* (20 vols., Berlin, 1828-46); R. Köpke, *Ludwig Tieck* (1855); von Friesen, *Ludwig Tieck* (1871); K. von Holtei, *Briefe an Ludwig Tieck* (1864); R. Haym, *Romantische Schule* (1870). JULIUS GOEBEL.

Tiele, tee'le, CORNELIS PETERS: theologian; b. at Leyden, Holland, Dec. 16, 1830; studied theology at Amsterdam; became pastor at Moordrecht in 1853 and at Rotterdam in 1856; professor in a seminary at Leyden in 1873; and Professor of the History of Religions in the University of Leyden in 1877. He has written many important theological works. His *Comparative History of the Egyptian and Mesopotamian Religions* (1869-72) and *Outlines of the History of Religion* (1876) have been translated into English and French; the latter also into German. Other works treat of the Gospel of John as a source of the life of Jesus (1855), the religion of Zarathustra (1864), and Babylonian-Assyrian history (German trans. 1886-87). S. A. T.

Tiel-tree: See TEREBINTH.

Tien'-Shan or **Thian-Shan** (celestial mountains): a lofty mountain chain in Central Asia, in lat. 42° N. from lon. 70° to 90° E., forming the boundary between the Balkash basin and that of the Kashgar and Tarim, and lying partly in the Russian provinces of Syr-Darya and Semirechensk and partly in Chinese Turkestan. Its mean elevation is 10,000 to 12,000 feet, highest at the west, and descending in Chinese territory. There are several summits which reach 15,000 to 18,000 feet. The highest peak is Khan-Tengri (24,000 feet), on the Russo-Chinese boundary. M. W. H.

Tientsin, teen'tsin', Chinese pron. tyen'cheen' (literally Heaven's Ford): a walled city and river-port of the province of Chihli, in China; capital of a department of the same name. The city is situated at the junction of the Grand Canal with the Pei-ho, 80 miles S. E. of Peking and 35 miles (by water 70) from Taku, at the mouth of the river; lat. 39° 10' N., lon. 117° 3' 55" E. (see map of China, ref. 3-J). Next to Peking it is the most important city of the province. Prior to 1872 it was merely a *wei* or military station for the protection of the river traffic. The city itself is comparatively small, its walls having a circuit of little over 3 miles, but its suburbs are extensive, and in them most of the business is transacted. The streets both within and without the city are narrow and filthy, and the buildings lacking in interest or beauty. Tientsin was designated in the treaty made here in 1858 as a treaty-port, but was not opened to foreign residence and trade until Jan., 1863. The foreign settlement, which is called *Tsz'-chulin*, or Red Bamboo Grove, is situated 2 miles below the city, and consists of three "concessions," as in Shanghai, the French nearest the city, then the British (the largest and most important), and lastly the "American." City, suburbs, and settlements are all included in a circular rampart, known as "San-ko-lin-sin's folly," because thrown up in 1858 by the Tartar general Säng-ko-lin-sin as a defense against the British forces. Since 1881 Tientsin has been connected by telegraph with Shanghai, Peking, and the chief cities of China, and with Europe. It is also connected by rail with the mouth of the Pei-ho, the Peh-tang coal mines, and Shan-hai-kwan and beyond. Though the river is frozen over from the early part of December to the middle of March and later, the trade of Tientsin is considerable. In 1893 596 steamers (492,345 tons) and 42 sailing vessels (20,073 tons) entered port, and 595 steamers (492,341 tons) and 42 sailing vessels cleared. The net foreign imports amounted to 19,720,227 haikwan or custom-house taels (equals \$20,706,238 U. S.), and the native imports to 12,888,973 haikwan taels (equals \$13,533,417). The chief imports were cotton and woolen goods, metals, cuttlefish, matches, kerosene oil, railway materials, seaweed, Government stores (1,118,573 taels), sugar, opium (1,618 piculs), rice, chinaware, clocks, brass buttons, raw cotton, sheetings (manufactured at Shanghai), silk piece-goods, tobacco, wheat, and poles. The original exports amounted to 5,960,947 taels, and included coal, pulse, dates, deer-horns, medicines, sheep and other skins, goatskin rugs, bristles, and straw braid. Population of the city and its suburbs estimated at 950,000. R. L.

Tiepolo, tîe-ä'pö-lö, GIOVANNI BATTISTA: painter; b. in Venice, 1692, or 1696; pupil of Gregorio Lazzarini, but in a peculiar way the student of Paolo Veronese and other great Venetians of an earlier day, and their follower. His life was spent in constant work, chiefly in Venice and its neighborhood. In 1761 he went to Madrid, it is said on special invitation of the King of Spain, and, although a very old

man, painted several large frescoes, one of which covers the ceiling of the throne-room of the palace, and has for its subject the *Majesty of Spain*. Fresco was Tiepolo's especial field, and he did wonderful things in it. He was the last man of the great Venetian school, an embodiment of the traditions of centuries, and almost a worthy successor to Tintoretto and Veronese; lacking in color, but in dextrous and varied composition and drawing one of the most able of painters. D. in Madrid, Mar. 27, 1770. Of his numerous large frescoes, besides several at Madrid, there are a number at the Villa Valmarana, near Vicenza; at Udine, in the bishop's palace, several large ones; at the Palazzo Lobia, in Venice, a series representing the *History of Cleopatra*. Painted in oil there are ceiling-pictures in the Church of Santa Maria del Rosario and the Church of Santa Maria dei Scalzi, both in Venice; an altarpiece in the former church, and in the Academy of Venice another ceiling brought from a church at Castello and representing the *Invention of the Cross*; also at the Hermitage, in St. Petersburg, a large ceiling-picture, *Cleopatra Feasting*; also in the academy is a *St. Joseph and Christ with Saints*; at the Santi Apostoli is a *St. Lucy*. In London, in the National Gallery, are two studies for altarpieces, and in Stockholm two similar studies. In the Louvre is a fine *Last Supper*, and a banner painted on both sides with a *St. Martin* and a *Virgin and Child*. RUSSELL STURGIS.

Tierce [Fr.]: a stop in the organ, tuned a seventeenth (or two octaves and a third) above the diapasons.

Tierney, tee'r'nee, GEORGE: politician; b. at Gibraltar, Spain, Mar. 20, 1761; son of a London merchant; educated at Eton and at Peterhouse, Cambridge, where he graduated in law 1784; became a lawyer in London, but soon abandoned law for politics; published a treatise on *The Real Situation of the East India Company, considered with reference to their Rights and Privileges* (1787); entered Parliament in 1789; became a leader of the Whigs, and acquired celebrity as a debater and satirist; fought a bloodless duel with Pitt May 27, 1798; opposed the war with France; brought forward annually a series of resolutions in opposition to those of the Chancellor of the Exchequer; was treasurer of the navy 1803-04, and a privy councillor; Secretary of State for Ireland 1806; president of the board of control 1806-07, with a seat in the cabinet; was the head of the opposition after the death of Ponsonby in 1817, and was master of the mint in the administration of Canning 1827-28. D. in London, Jan. 25, 1830.

Tierra del Fuego, ti-er'ra-del-foo-ä'gö: an archipelago at the southern extremity of South America, separated from the continent by the Strait of MAGELLAN (*q. v.*). Length from N. W. to S. E. about 400 miles. Of the total land-area (over 21,000 sq. miles) at least four-fifths is included in the large island called King Charles South Land, Tierra del Fuego, or Fuegia. W. and S. of this are Desolation, Clarence, Navarin, Wollaston, Dawson, Londonderry, and numerous smaller islands and islets, all separated from the larger island and from each other by tortuous channels; a group at the southern end, separated by the navigable Lemaire Channel, includes Horn island and Cape Horn; and the Isla de los Estados is somewhat outlying, toward the S. E. N. of the western mouth of the Strait of Magellan a group of very similar islands lines the coast; they belong, physically, to the Tierra del Fuego group, but those between the strait and Wellington island are distinguished as the Madre de Dios Archipelago. The Andes are continued into Tierra del Fuego, occupying the greater part of the small islands and the southwestern side of King Charles South Land; some of the peaks are over 6,000 feet high and partly covered with perpetual snow, but there are no active volcanoes. The bases of the mountains are covered with pine forests, and numerous glaciers descend from their sides. All the islands are very irregular and cut by deep fiords, affording the most magnificent scenery. The eastern part of King Charles South Land is lower and contains some good pasture-land. Gold has been found in paying quantities. The climate is damp, very changeable, and subject to violent storms and severe cold, especially from June to October. By the treaty of 1881 that portion of the archipelago lying E. of lon. 68° 34' W. (the meridian of the eastern entrance to the Strait of Magellan) is held by the Argentine Republic; it constitutes the territory of Tierra del Fuego, with an area of 8,217 sq. miles; there are two or three small civilized settlements. The remaining surface belongs to Chili, and is included in the territory of Magal-

lanes; at present (1895) it is unsettled. The Indian inhabitants belong to three distinct races, but are classed together as Fuegians; all are savages of a low grade, but inoffensive, subsisting on fish, seals, etc. They number about 8,000. FERNÃO DE MAGALHÃES (*q. v.*) discovered the archipelago in 1520. It is said that he named it, in allusion to the smoke from Indian watch-fires, *Tierra de Humos* (land of smoke), and that Charles V. changed this to *Tierra del Fuego* (land of fire).
HERBERT H. SMITH.

Tierra Firme: See SPANISH MAIN.

Tiers État: See ESTATES, THE THREE.

Tietjens: See TITIENS.

Tiffany, FRANCIS: clergyman; b. in Baltimore, Md., Feb. 16, 1827; educated at Harvard College and at Harvard Divinity School; pastor of Unitarian churches in Springfield and West Newton, Mass., 1852-62, and 1865-82; spent many years in Europe; has charge of the Indian department of the American Unitarian Association; author of *Life of Dorothea L. Dix* (New York and Boston, 1890).
J. W. C.

Tiffin: city (founded in 1817); capital of Seneca co., O.; on the Sandusky river, and the Balt. and O., the Cleve., Cin., Chi. and St. L., and the Penn. railways; 34 miles S. W. of Sandusky, and 42 miles S. S. E. of Toledo (for location, see map of Ohio, ref. 2-F). It contains 16 churches, public-school property valued at over \$150,000, Heidelberg University (Reformed, founded in 1850), with academical school, college, and theological seminary, public and university libraries, orphan asylum, a national bank (capital \$250,000), a State bank (capital \$100,000), an incorporated bank with capital of \$50,000, a private bank, and 2 daily, 3 weekly, and 3 monthly periodicals. There are woolen-mills, foundries, stone and tile works, machine-shops, agricultural-implement works, flour-mills, pottery and glass, straw-board, and emery-wheel works. Pop. (1880) 7,879; (1890) 10,801; (1895) estimated, 14,190. EDITOR OF "SENECA ADVERTISER."

Tiffin, EDWARD, M. D.: first Governor of Ohio; b. at Carlisle, England, June 19, 1766; emigrated to the U. S. 1784, settling at Charlestown, Va.; studied medicine and took his degree at the University of Pennsylvania. He became a local preacher in the Methodist Church, but continued the practice of medicine. Having removed to Chillicothe, O., in 1796, he was elected to the Territorial Legislature, and when Ohio was admitted to the Union was chosen Governor (1803-07). He was U. S. Senator 1807-09; commissioner of the U. S. land-office 1812-15, and subsequently surveyor-general of the Northwest Territory. D. at Chillicothe, O., Aug. 9, 1829. Three of his sermons, preached in 1817, were published in the *Ohio Conference Offering* (1851).

Tiflis, tif-lees': government of Russia; bounded N. by the Caucasus and S. by Turkey in Asia. Area, 15,306 sq. miles. Tiflis is a mountainous region, covered with splendid forests of oak, chestnut, and maple. The valleys are fertile and, though poorly cultivated, produce tobacco, cotton, indigo, wheat, and all the fruits of Southern Europe. Pop. (1891) 800,875, mainly Georgians, Armenians, Russians, and Tartars.
E. A. G.

Tiflis: town; former capital of Georgia and now of the Russian government of Tiflis, on both sides of the Koor (see map of Russia, ref. 12-F). It carries on simple manufactures and is famous for the skill of its workers in metals. It is the center of South Caucasian commerce between Russia, Persia, and Europe, and is connected by rail with Baku on the Caspian and Batoum on the Black Sea. Trade is mostly in the hands of Armenians. It was almost totally destroyed by Mehemet Khan (1795), and was ceded to Russia by its last king, George (1801). In the vicinity are naphtha and thermal springs, the latter much frequented. Pop. (1892) 146,792.
E. A. GROSVENOR.

Tiger [viâ O. Fr. *tigre, tygre* (> Fr. *tigre*), from Lat. *ti gris* = Gr. *τίγρις*; cf. *TIGRIS*]: the name applied to certain quadrupeds. (1) Primarily and of right it belongs only to the *Felis tigris*, one of the largest of living *Felidae*, about equal in size and superior in strength to the largest lions, and more destructive and far more dangerous to man. Tigers have been known to measure over 10 feet in length, including the tail, and to weigh over 500 lb. It is peculiar in the development of spreading thick, whisker-like hairs on the sides of the head; its tail is elongate and smooth-haired, and the color is a tawny yellow transversely striped with black. It ranges N. into Southern Siberia, and S. as far as the Spice islands. E. and W. its habitat extends from Persia to the

Pacific. It prefers forests and jungles near river-banks for its abode. It is much dreaded by man, especially in parts

The tiger.

of India. The tiger has been frequently induced to hybridize with the lion in captivity. Old tigers sometimes acquire a great fondness for human flesh, and are then called "man-eaters." The hunting of the tiger is a favorite though perilous form of sport in Oriental lands. (2) The name is also sometimes applied by hunters to the American JAGUAR (*q. v.*). (3) It is further transferred in Van Diemen's Land to the striped *Thylacinus cynocephalus*, a carnivorous marsupial. See THYLACINIDE.
Revised by E. A. BIRGE.

Tiger-cat: any one of a large number of striped and spotted wildcats, mostly rather small tropical animals, often arboreal in their habits.

Tiger-flower: the *Tigridia pavonia*, a garden-flower of the family *Iridaceae*. It is a native of Mexico, and is cultivated for its gorgeous blossoms, each of which lasts but a day. The garden forms known as *T. conchiflora* and *T. grandiflora* belong to this species.

Tigert, JOHN JAMES, M. A., D. D.: clergyman and author; b. at Louisville, Ky., Nov. 25, 1856; educated in Louisville public and high schools, Vanderbilt University (1875-77), and Southern Baptist Theological Seminary; served in pastorates of Methodist Episcopal Church South (1877-81); was Professor of Moral Philosophy in Vanderbilt University (1882-90); again a pastor at Kansas City, Mo. (1890-94); since 1894 has been editor of *The Methodist Quarterly Review*, Nashville, Tenn. He has published *Handbook of Logic* (1885); *The Preacher Himself* (1889); *A Voice from the South* (1892); and *Constitutional History of American Episcopal Methodism* (1894). He also edited Summers's *Systematic Theology* (2 vols., 1887-88) and McTyeire's *Sermons* (1886).
A. OSBORN.

Tighe, MARY (Blackford): poet; b. in Dublin, Ireland, in 1773; married in 1793 her cousin, Henry Tighe, of Rosanna, County Wicklow, a member of the Irish Parliament; published in 1805 for private circulation her *Psyche*, a poem of remarkable excellence, based on the story of Apuleius, D. at Woodstock, County Kilkenny, Ireland, Mar. 24, 1810. Her *Works*, which appeared in 1811, have passed through several editions, and she was the subject of a song by Moore and a poem by Mrs. Hemans. Revised by H. A. BEERS.

Tiglathpileser: See ASSYRIA.

Tigranes II., THE GREAT: King of Armenia (96-55 B. C.). He carried on successful wars against Parthia and the Seleucidae, conquered all the country between the Euphrates and Mediterranean, and assumed the title of King of Kings. After twenty-two years of prosperity he was involved in war with Rome by his father-in-law, Mithridates, and was twice defeated by Lucullus, who took and sacked his capital, Tigranocerta (69 B. C.). After a final defeat by Pompey (65 B. C.) he repaired to the Roman camp and in sign of submission placed his tiara at the feet of the Roman general. He was compelled to pay 6,000 talents, but was allowed to retain Armenia proper. Armenia Minor was assigned to Deiotarus and most of Tigranes's foreign conquests were restored to their former rulers or incorporated in the Roman dominions. He was succeeded by his son Artavastus.
E. A. GROSVENOR.

Tigré, tū-grā : province of Abyssinia, between lat. 12° and 16° N. and lon. 37° and 40° E.; formerly an independent state until conquered in 1855 by Theodore. Its capital is Adua, one of the principal stations on the caravan-route between Massowah and Gondar.

Tigri, GIUSEPPE: author: b. at Pistoia, Italy, Nov. 22, 1806; entered the Church, but spent his life in teaching and writing; journeyed through Europe in 1861; was later an inspector of schools in Pistoia and San Miniato, and finally a librarian in the former place, where he died Mar. 9, 1882. His chief work is the collection *Canti popolari toscani* (Florence, 1856; 2d ed. 1860). He wrote also a didactic poem *Le selve* (1844); a novel, *La selvaggia de' Vergiolesi* (1870); several works treating of the mountaineer, *Il montanino toscano volontario alla guerra dell' indipendenza italiana, 1859* (1860), *Volontario e soldato* (1872), *Celestina* (1880), and *Matilda*; a versified novel; and several treatises, such as *Contro i pregiudizi popolari* (1870), and *Da Firenze a Constantinopoli e Mosca* (1877). J. D. M. FORD.

Tigris [= Lat. = Gr. *Týpsis*, from O. Pers. *Tigra* (> Pers. *Tīr*), liter., the Arrow, so called from its swiftness]: river of Asiatic Turkey. Under the name of *Hiddekel*, it was one of the four rivers of Eden. It rises in the mountains of Kurdistan, only 4 miles distant from the channel of the Eastern Euphrates. After a winding but generally south-eastern course of about 1,000 miles it joins the Euphrates at Korna. Together they form the Shatt-el-Arab, which empties into the Persian Gulf nearly 100 miles distant. On its banks are the towns of Diarbekir, Mosul, and Bagdad, and the ruins of Nineveh, Seleucia, Ctesiphon, and Opis. Its banks above Diarbekir afford pasturage to nomad tribes, and below Diarbekir are finely cultivated as far as Mosul. There the land on both sides becomes a desert. From Bagdad to Korna the banks are steep and overgrown with high reeds and brush which form the haunts of beasts of prey. The upper Tigris as far as Mosul is navigable only by rafts and thence by small vessels to Bagdad, to which steamers of light draught ascend from the Persian Gulf. Its average breadth between Mosul and Bagdad is 200 yards, but the breadth, velocity, and depth vary with the season. Its greatest height is attained toward the last of May, and then rapidly decreases in June. During a brief period (114-117) it formed the boundary between the Parthian and Roman empires. E. A. GROSVENOR.

Til'burg: town; province of North Brabant, Netherlands; 14 miles E. S. E. of Breda (see map of Holland and Belgium, ref. 7-F). It is the seat of a large cloth-manufacturing industry, employing several thousand persons, and each family has a house of its own. Print-works, breweries, and tanneries are also in operation. Pop. (1893) 35,586.

Tilden, SAMUEL JONES: statesman; b. at New Lebanon, N. Y., Feb. 9, 1814; studied at Yale College and the University of New York; took the course of law at the latter, and was admitted to the bar in 1841. He became prominent in politics as an able champion of Van Buren's administration, and at the same time won for himself a high place in his profession, amassing by a judicious investment of his earnings one of the largest fortunes ever accumulated in legal practice. During the most laborious period of his professional life he was one of the leaders and most trusted counselors of the Democratic party. He was a member of the convention for a revision of the constitution of the State in 1846, and again in 1867. He also served two terms in the lower branch of the State Legislature—first in 1846, and second in 1872. He was one of the foremost in the overthrow of the Tweed ring, and in the establishment of a reformed city government. (See TWEED, WILLIAM MARCY.) In 1874 he was nominated and chosen Governor of the State of New York by a majority of more than 50,000 votes, defeating Gen. Dix, a Republican candidate, who had been elected two years before by a majority of 55,451. As Governor he exposed the iniquities of the canal ring and crushed its sway over the legislative, administrative, and judicial departments of the State. His was a reform administration and most successful in its results. In 1876 he was nominated without considerable opposition by the national Democratic convention for the presidency of the U. S. At the election he received a much larger popular vote than any other candidate, and 184 uncontested electoral votes. Only one additional electoral vote was required for his election, while twenty additional votes were required for the election of the rival candidate. Owing to differences of opinion as to the proper mode of counting electoral votes and passing

upon contested returns, the settlement of the matter was intrusted by Congress to a specially appointed tribunal known as the PRESIDENTIAL ELECTORAL COMMISSION (*q. v.*), which decided in favor of the Republican electors in every contested case, and certified to the election of Rutherford B. Hayes, the Republican candidate for the presidency. Impressed with the conviction that Mr. Tilden had been lawfully elected to the presidency, the Democratic party continued to regard him as its candidate for the succeeding election, in 1880, but he was obliged by failing health to decline the nomination and withdraw from public life. Despite Mr. Tilden's retirement the Democratic party seemed determined to nominate him for the presidency in 1884, public opinion refusing to concentrate upon any other candidate, and it was not till he had again publicly declared his unalterable determination not to return to public life that his party made another choice. During the latter part of his life he spent most of his time at Graystone, his country home on the banks of the Hudson, where he died Aug. 4, 1886. After providing for his heirs Mr. Tilden bequeathed the bulk of his property for the establishment of the Tilden Trust to found a free library and reading-rooms in the city of New York. This clause gave rise to a long contest, which was decided on appeal in favor of the heirs on Oct. 27, 1891. Mrs. William B. Hazard, however, though entitled by this decision to half of the estate, relinquished over \$2,000,000 of her share for the purpose of carrying out Mr. Tilden's wishes. On Feb. 22, 1895, it was agreed by representatives of the Tilden Trust Fund, the Astor Library, and the Lenox Library to consolidate these institutions into a single library to be known as the New York Public Library—Astor, Lenox, and Tilden Foundations. See John Bigelow, *The Life of Samuel J. Tilden* (New York, 1895). Revised by F. M. COLBY.

Tiles [O. Eng. *tigel*, like Germ. *ziegel*, an early loan-word from Lat. *tegula* > Fr. *tuile*; Ital. *tegola*; Span. *teja*]: originally, flat slabs of baked clay. A tile is broader and thinner, a brick is thicker, and there is no absolute distinction between the two; thus the thin ancient Roman bricks used for wall-facing are often called tiles or tile-bricks. In common usage tiles are of three principal kinds—roofing-tiles, tiles for walls and floors, and drainage tiles. Roofing-tiles may be divided into (1) flat, overlapping tiles, which are used nearly as shingle or slate is used, and which have either a projection made in the solid mass or holes for nails by which they are kept in position; (2) pan-tiles, which are in section both convex and concave—that is, have an *∞* curve, the convex part lapping over the concave part; and (3) ridge-tiles, which are used not only for the topmost ridge or crest of the roof, but also for the projecting hips. There are many varieties of each of these kinds of roof-tile; thus one system of roofing provides flat tiles with small half-tubes of the same material to cover the joints between the flat tiles, and adaptation of the principle of the ridge-tile to a kindred use. Roofing-tiles have sometimes been enameled, and are much better for being so, from the waterproof character of the enamel. Such tiles are also frequently in brilliant colors: roofs made decorative in this way are known both in Asia and Europe, and in ancient and modern times. Perhaps the most remarkable instance of a large roof made decorative in this way is St. Stephen's Cathedral in Vienna. In Western France during the Middle Ages and at the time of the Renaissance roofs were commonly decorated in this way with the addition of crest ornaments and *épis* made of the same brilliant enameled earthenware. Modern taste is rather for unglazed tile, and finds great beauty in the unpolished surface and the slight variation of tint, increased by the varying angles at which the tiles are laid. Unglazed tiles absorb water readily. All tiles are heavy, and necessitate an expensive roof structure.

Tiles for floors and walls are of great variety in form and size and decoration. Old houses in the south of Europe, and even houses of no great pretension, have their rooms floored with tiles of red clay not finer than common bricks, but hard baked and practically a variety of terra-cotta. Throughout the Middle Ages hard-baked clay tile was in very common use for flooring, and the usual method of decorating this was to inlay clays of different colors in the body of the tile, yellow in red, and the like. Some of these tile floors still preserved are of great beauty. Down to the first half of the nineteenth century such tiles were in common use as far north as Holland. Paving with bricks passes imperceptibly into tile-paving, and the sidewalks of Baltimore

offer many instances of hexagonal pieces of baked clay, which may be either bricks or tiles, according to their thickness. In the fifteenth and sixteenth centuries flooring, especially of chapels, oratories in private houses, and other rooms considered especially notable, were paved with enameled tiles of great beauty, but extremely perishable. A few such floors remain nearly intact in France and in Italy, as at the manor-house of Oiron, in the department of Deux-Sèvres, at the famous castle of Écouen, in the Cathedral of Ravenna, and in the Church of San Domenico at Naples. These beautiful tiles were less used for wall-decoration, because, in a room sufficiently important to call for rich ornament, the walls were usually in stone like the exterior, and because a protecting dado, if required, would naturally be of wood. In modern times, however, with the growing tendency to decorate closed and confined interiors with something more effective than plastering, there has been an increased use of tile, painted and glazed and decorated with large and brilliant patterns, or even elaborate pictures, the principles of design in which are akin to those of decorative windows. Thus Théodore Deck produced splendid wall-decorations covering whole sides of large rooms with admirably conventionalized landscapes, consisting each of perhaps 800 square tiles.

In all the above-mentioned instances the surface is smooth, but much beautiful wall-tiling has been made with figures in slight relief. The Persians of the fifteenth and sixteenth centuries excelled in these. Such decoration has been traditional in Persia since antiquity (see *Earthenware, Glazed and Enameled*, under PORTERY AND PORCELAINS), and in that later epoch they produced what are probably the most beautiful wall-tiles ever made, sometimes in relief, but much more often smooth and painted with conventional flower-patterns. The use of these tiles extended to the Mohammedan nations of the West; the finest specimens known are in the mosques of Cairo, and similar examples occur as far W. as Spain. Tiles with figures in relief are made in the U. S. at Chelsea, Mass., Beaver Falls, Pa., Indianapolis, Ind., Trenton, N. J., and Zanesville, O.

Encaustic tiles are those modern tiles made in imitation of the mediæval ones mentioned above, different-colored clays being inlaid upon a clay background and all fired together. The term has no particular significance, and must be considered as a mere trade-name.

BIBLIOGRAPHY.—Mediæval earthenware tiles are well treated in *Les Carrelages émaillés du Moyen Âge, etc.*, by Emile Amé; Turner and Parker, *Domestic Architecture of the Middle Ages* (4 vols., 1851, etc.); Henry Shaw, *Specimens of Tile Pavements* (1852); Viollet-le-Duc, *Dictionnaire Raisonné de l'Architecture* (for roof-tiles, see article *Tuile*; for floor-tiles and wall-tiles, article *Carrelage*). Many works contain colored and other illustrations of fine ancient tiles; for Oriental ones see Prisse d'Avenne, *L'Art Arabe*; Bourgoin, *Les Arts Arabes*; for European specimens, see Jacobsthal, *Süd-Italienische Fliesen-Ornamente*, and Meurer, *Italienische Majolika-Fliesen*. RUSSELL STURGIS.

Tilland'sia [Mod. Lat., named by Linnaeus in honor of Dr. Elias Tillands, a Finnish botanist]: a genus of epiphytic air-plants of the family *Bromeliaceæ*. There are many species, eight of which are natives of the southern parts of the U. S. Of these, *T. usneoides*, the long or Spanish moss, is the best known. It is abundant in the more humid districts of the South, where it hangs in long festoons from the trees. Its central fiber is largely used in stuffing mattresses. The plant is used in making an ointment asserted to be a cure for hemorrhoids, and in winter it is eaten by cattle. Revised by CHARLES E. BESSEY.

Tillemont, tēl'mōn', LOUIS SÉBASTIEN LE NAIN, de: ecclesiastical historian; b. in Paris, Nov. 30, 1637; educated by the Jansenists of Port Royal; studied theology at the seminary of Beauvais; took holy orders in 1672, and became subdeacon at the St. Lambert; retired in 1677 to the monastery of Port-Royal, and, when the Government closed this institution in 1679, to his estate of Tillemont, between Vincennes and Montreuil, where he died Jan. 10, 1698. He wrote *Mémoires pour servir à l'Histoire ecclésiastique des six premiers Siècles* (16 vols., Paris, 1693-1712); *Histoire des Empereurs et des autres Princes qui ont régné durant les six premiers Siècles de l'Eglise* (6 vols., 1692-1738); *Vie de Saint Louis* (first published by the French Historical Society, 6 vols., 1847-51). Revised by S. M. JACKSON.

Tillett, WILBUR FISK, A. M., D. D.: clergyman; b. at Henderson, Vance co., N. C., Aug. 25, 1854; educated at Trinity College, North Carolina, Randolph-Macon College, Virginia, and Theological Seminary, Princeton, N. J.; entered the ministry of the Methodist Episcopal Church South; was pastor at Danville, Va., 1880-82; Professor of Systematic Theology, dean of the theological faculty, and vice-chancellor of Vanderbilt University 1882-95. Besides frequent contributions to religious and secular periodicals, he has published *Our Hymns and their Authors* (1889) and *Discussions in Theology* (1890). A. OSBORN.

Tilley, Sir SAMUEL LEONARD, K. C. M. G.: statesman; b. at Georgetown, Queen's County, New Brunswick, May 8, 1818; educated at the County Grammar School. He was a druggist until 1854; represented St. John, New Brunswick, in the Legislative Council of the province 1850-51, 1854-56, 1857-65, 1866-67; was a member of the Executive Council, New Brunswick, 1854-56, 1857-65, 1866-67; during those several periods held the office of Provincial Secretary, and from Mar., 1861, to Mar., 1865, was leader of the Government. He had a seat in the Parliament of Canada 1867-73, 1878-85; was appointed Minister of Customs for the Dominion July 1, 1867; acting Minister of Public Works 1868-69; Minister of Finance for a short time in 1873, and from 1878 until 1885. He was lieutenant-governor of New Brunswick from Nov., 1873, until July, 1878, and was reappointed to the same office Oct. 31, 1885. He was a delegate to the Charlottetown union conference in 1864, to that in Quebec the same year, and to the London colonial conference 1866-67. He was knighted in 1879, and received the degree of LL. D. from the University of New Brunswick in 1890. D. June 25, 1896. NEIL MACDONALD.

Tillman, BENJAMIN RYAN: politician; b. in Edgefield co., S. C., Aug. 11, 1847; was educated at Bethany Academy, and engaged in farming. He was Governor of South Carolina from 1890 to 1894, and was then elected U. S. Senator. As Governor he was well known for the dillicult but persistent enforcement of the dispensary law, assuming for the State a monopoly of alcoholic beverages.

Tillman, SAMUEL ESCUE: soldier and educator; b. near Shelbyville, Tenn., Oct. 2, 1847; graduated at the U. S. Military Academy June, 1869; promoted second lieutenant Fourth Artillery; transferred to the Corps of Engineers as first lieutenant June 18, 1872; served on frontier duty in Kansas 1869-70; at the military academy as Assistant Professor of Chemistry, etc., 1870-73 and 1879-80, and as Assistant Professor of Philosophy 1875-76; as assistant astronomer to the U. S. expedition to Tasmania to observe the transit of Venus 1874-75; as assistant engineer on the explorations W. of the 100th meridian (Wheeler survey) 1873-74 and 1876-79 in Arizona, New Mexico, California, Nevada, Utah, Idaho, and Montana; Professor of Chemistry, Mineralogy, and Geology at the U. S. Military Academy since Dec. 21, 1880; author of *Elementary Lessons in Heat and Essential Principles of Chemistry*. JAMES MERCUR.

Tillodon'tia [Mod. Lat.; from Gr. *τίλλειν*, pluck, tear + *ὄδους*, *ὀδόντος*, tooth]: a group of extinct Tertiary mammals, now regarded as forming a distinct order, possessing characters intermediate between carnivores, rodents, and ungulates. In *Tillotherium*, the typical and best-known genus, the skull resembles in shape that of the bear. The orbits are confluent with the large temporal fossa, which are separated at the middle line of the skull by an obtuse sagittal crest. The nasals are stout, and expanded behind. The dental formula in the adult is incisors, $\frac{3}{3}$; canines, $\frac{1}{1}$; premolars, $\frac{3}{3}$; molars, $\frac{3}{3}$. The anterior incisors, both above and below, are large, curved, scapiform, and faced in front with enamel. They grow from persistent pulps, and strongly resemble the corresponding teeth of rodents. The canines are small. The upper molars are peculiar, and the lower are of the palæotherium type. The brain-cavity is small. As in most Eocene mammals, the hemispheres are small, and extend but slightly over the cerebellum or over the olfactory lobes. The latter were large and projected well forward. The cerebellar fossa is large, expanded transversely, and extends above the cerebral cavity. The vertebra resemble those of some carnivores; the cervicals were short, the lumbar large. The radius and ulna were separate and of nearly equal size. The scapoid and lunar bones were distinct. The feet were plantigrade, apparently fitted for digging, and each had five toes. There was a well-marked third trochanter on the femur, and the tibia and fibula were distinct. The best-known species (*T. foducis*,

Marsh) was about two-thirds the size of a tapir. The genus *Tillotherium* represents a distinct family. A second family of this order is represented by *Stylinodon*, in which the molars are rootless, subquadrate in transverse section, and faced with enamel within and without. O. C. MARSH.

Tillotson, JOHN, D. D.: archbishop and preacher; b. at Sowerby, Yorkshire, England, in Oct., 1630; was educated at Clare Hall, Cambridge, where he was made a fellow in 1651. He was originally a rigid Puritan, and in 1657 became tutor in the family of Cromwell's attorney-general, but at the Restoration went over to the Established Church, in which he took orders, and became in succession curate of Cheshunt, rector of Kedington, preacher at Lincoln's Inn, dean of Canterbury, prebendary of St. Paul's, and, in 1691, Archbishop of Canterbury, having in the meanwhile served as clerk of the closet to William III, and as member of the commission appointed in 1689 to revise the English liturgy. He took an active part in measures in opposition to Roman Catholicism, opposed the declaration of Charles II. in favor of liberty of conscience, and was an earnest advocate of the exclusion of the Duke of York from the succession. He ranks among the foremost of English preachers, and in lieu of preaching with the Puritan prolixity or the pedantic clumsiness of the Established Church he established the practice of speaking in plain almost familiar style, while at the same time his culture commended him to scholars. He published during his lifetime several volumes of sermons, and left many more in manuscript, and for the copyright of these his widow received 2,500 guineas. Several editions of his *Sermons*, in twelve and fourteen volumes, were published. His complete works have been published (3 vols. fol., London, 1707-12, and 10 vols. 8vo, 1820), and many of his sermons have been translated into French and German. D. in London, Nov. 22, 1694. Revised by S. M. JACKSON.

Tilly, JOHANN TSKERLAES, Count von: general of the Thirty Years' war; b. in the castle of Tilly, near Gembloux, province of Brabant, Belgium, in Feb., 1559; being a younger son, was destined for the Church, and educated by the Jesuits, but preferred the military profession; served under Parma in the Netherlands, and under Duke Philip Emanuel of Lorraine in Hungary, and was in 1610 appointed field-marshal by Duke Maximilian of Bavaria. When the Thirty Years' war broke out he was made commander-in-chief of the army of the Holy League; suppressed the insurrection in Bohemia after the battle of Prague Nov. 8, 1620; won the battles of Wimpfen and Höchst in 1622, and Stadthohn in 1623, and drove the Protestants from the Palatinate. He defeated Christian IV. at Lutter Aug. 27, 1626, and with Wallenstein forced the Protestants to the Peace of Lübeck. Appointed commander-in-chief also of the imperial army after the dismissal of Wallenstein in 1630, he stormed Magdeburg May 20, 1631. The brutal outrages committed by the Wallons and Croats on entering the city have left a stain on Tilly's reputation, though it is questionable how far he was responsible for them. He was utterly defeated by Gustavus Adolphus at Breitenfeld Sept. 17, 1631, and again on the Lech Apr. 5, 1632, in which battle he was mortally wounded. D. at Ingolstadt, Apr. 20, 1632. F. M. COLBY.

Til'sit: town of Prussia, province of East Prussia; on the Niemen; 65 miles N. E. of Königsberg by rail (see map of German Empire, ref. 1-K). It is regularly built, and in a fertile and well-cultivated district. It manufactures cloth, hosiery, oil, paper, chemicals, has several sugar-refineries and important fisheries for eel and salmon, and carries on a considerable trade in grain, hemp, flax, wool, and horses. It is famous for the Treaty of Til'sit concluded between Napoleon and the Czar Alexander in 1807 after the humbling of Prussia by the French. By this peace the foundation was laid for a Russian-French alliance, and Prussia lost nearly half of her territory. Pop. (1890) 24,545.

Til'sonburg: post-village, Oxford County, Ontario, Canada; on Big Otter creek; 16 miles N. of Port Burwell (see map of Ontario, ref. 5-C). It has good water-power, large lumbering interests, and is a station on the Grand Trunk and Michigan Central railways. Pop. (1891) 2,163.

Tilt Cove: port of entry; on White Bay, Newfoundland; 230 miles by steamer N. W. of St. John. It is a picturesque village on the border of a lovely lake, and owes its importance to a rich copper mine which is actively worked. There is also a vein of nickel, occurring in a regular lode; the copper, however, is in pockets or bunches. The harbor is not very good. Pop. about 800.

Tilton: town; Belknap co., N. H.; on the Merrimack and Winnipiseogee rivers, and the Concord and Montreal Railroad; 10 miles S. W. of Laconia, and 18 miles N. of Concord (for location, see map of New Hampshire, ref. 8-F). It contains the villages of Tilton and East Tilton; has five churches, a national bank with capital of \$70,000, a savings-bank, a union graded school, and the New Hampshire Conference Seminary and Female College; and is principally engaged in the manufacture of woollen goods, hosiery, and pulp. Pop. (1880) 1,282; (1890) 1,521.

Tilton, THEODORE: journalist; b. in New York, Oct. 2, 1835; was educated at the New York Free Academy (now the College of the City of New York); entered on journalism at an early age, and in 1856 was employed upon the *New York Independent*, to the editorship of which he succeeded upon the resignation of Henry Ward Beecher in 1863. In 1872, in consequence of disputes, his connection with *The Independent* was discontinued, and he established *The Golden Age*, a weekly journal, which he conducted till 1874. In that year he brought suit against Mr. Beecher, whom he charged with criminal intimacy with his wife, claiming damages of \$100,000. The suit lasted six months, and the jury were unable to agree upon a verdict. He published *The American Board and Slavery* (1860); *Memorial of Mrs. Browning* (1862); *The King's Ring* (1866); *The True Church* (1867); *The Sexton's Tale and other Poems* (1867); *Sanctum Sanctorum, or Proof-sheets from an Editor's Table* (1871); *Life of Victoria C. Woodhull* (1871); *Tempest-tossed*, a novel (1875); *Thou and I*, poems (1880), and other works. He was for many years a popular lecturer. Since 1883 he has resided in Europe. Revised by H. A. BEERS.

Timæus, tî-mee'ūs (Gr. *Τίμαιος*): Greek historian of Tauromenium, in Sicily; b. 352 B. C. The greater part of his long life was spent in Athens, where he studied rhetoric under Philiscus, a pupil of Isocrates. D. in Sicily in 256. His *History of Sicily*, in sixty-eight, or, according to others, thirty-eight books, told the story of the island from the oldest times to 264 B. C., and that of Italy and Carthage as well. Famous also was his chronological work *The Victors of the Olympic Games* (*Ὀλυμπιονίκαι*). Timæus was a closet historian, and his writings showed a lack of familiarity with the practical problems of statesmanship. He made diligent use of his authorities, but he was a determined fault-finder, and for this censoriousness, as well as for his other shortcomings, he was mercilessly criticised by Polybius. His style found few eulogists. Fragments in Müller's *Fragmenta Historicorum Græcorum*, vol. i., pp. 193-233.

B. L. GILDERSLEEVE.

Timber and Timber-trees [timber is O. Eng. *timbor*, *timber*; O. H. Germ. *zimbar*, *timber*, house, room (> Mod. Germ. *zimmer*, room); Goth. *timrjan*, build; cf. Lat. *domus*; Gr. *δῶμος*; Sanskr. *dama*, house, and Gr. *δέμειν*, build]; wood suitable for constructive purposes, as for making buildings and ships, or for furniture, tools, and the like; also the trees furnishing such material. The most prominent species of timber-trees used in the U. S. are the following:

(1) *Coniferous Division*.—Of those of the Atlantic States and Canada, the most important, and for its uses the best in the world, is white pine (*Pinus strobus*), in England called Weymouth pine. Hard-pine lumber, variously called yellow pine, pitch-pine, etc., is most largely furnished, and of best quality, by *P. palustris*, the long-leaved pine of the Southern States. *P. rigida*, the Northern pitch-pine, both in the Northern and Southern States furnishes a similar but inferior and generally smaller timber; and excellent hard pine is yielded by the short-leaved pine (*P. echinata*); while the loblolly-pine at the South (*P. taeda*) and the red or Norway pine at the North (*P. resinosa*) furnish a softer and less resinous lumber. Larch or hackmatack (*Larix laricina*) of the North furnishes a very valuable lumber, important in ship-building. Next are the spruces, with wood tougher than white pine, but more liable to shakes and splits. Black spruce (*Picea mariana*) has the widest range and yields the best lumber, especially prized for spars. White spruce (*P. canadensis*) is a smaller tree, and the wood inferior. Hemlock-spruce (*Tsuga canadensis*) furnishes at the North a valuable but coarse lumber, very liable to shakes and of moderate durability. The balsam-firs, both the Northern species (*Abies balsamea*) and that of the mountains in the South (*A. fraseri*), are of no value for timber, being small trees, with soft wood, lacking strength and durability. Of the cypress tribe, the bald cypress of the Southern States

(*Tarodium distichum*) furnishes lumber of great size and much durability, but light and shaly; while the arborescent or white cedar of the North (*Thuja occidentalis*) and that of the Middle and Southern States (*Chamaecyparis thyoides*) yield small timber of exceeding durability, especially for posts; and red cedar (*Juniperus virginiana*) furnishes a red and fragrant fine-grained wood of the greatest durability and value. The yew occurs as a tree only in a limited part of Florida, as does its relative the stinking cedar (*Torreya taxifolia*), rendering their excellent timber practically unimportant.

In the Pacific States and Rocky Mountain region the coniferous trees are numerous, and some are of immense height and girth. Of soft-wooded or white pines no one equals the white pine of the East. The sugar-pine (*Pinus lambertiana*), with its immense trunks, takes its place, but the wood is much coarser-grained. *P. ponderosa*, with its heavy wood, furnishes excellent hard-pine lumber, less resinous than the Eastern species; and there are several other species intermediate as to the character of the wood. For spruces, the *Pseudotsuga taxifolia* or Douglas spruce, of Oregon and California, is far the best of the race, as well as the largest. The hemlock-spruce and the larch are represented by species very like the Eastern; while the Menzies spruce (*Picea sitchensis*) surpasses the black spruce; and the balsam-firs are represented by several nobler species, which furnish better lumber. The express tribe is represented by several expresses of considerable value; also in Oregon and northward by an arborescent (*Thuja gigantea*), vastly surpassing the Eastern species in size and value for timber, and in California by the famous redwood (*Sequoia sempervirens*), the light and reddish wood of which is incomparable for building and excellent for interior finish. See SEQUOIA.

(2) *Amentaceous Trees*.—The oaks are the most important, and the most valuable species is the white oak (*Quercus alba*), which in the Atlantic States takes the place of the *Q. robur* of Europe. It grows to a height of 80 to 100 feet and a diameter of 6 or 7 feet, and yields handsome logs. The wood is of a pale-reddish color, straight-grained, compact, tough, strong, durable, and shrinks but little. It is used for frames of structures where strength and durability are required, coachmaking, coopering, ship-building, and for a great variety of purposes in the domestic arts. For cabinet-making and interior decoration it is highly valued. The other annual-fruited species come next to this in value—viz., chestnut-oaks, post-oak, bur-oak, etc. In the Southern States, along the coast, the live-oak (*Q. virginiana*) represents a peculiar type, and for ship-building is prized above all others, but it does not give large timber. Its height is from 40 to 50 feet; diameter, 1 to 2 feet. The wood is yellowish when first cut, and deepens to a dark brown with age; it is hard, tough, strong, heavy, and very difficult to work, on account of the grain being waved or twisted. The pores are minute, and the silver-grain very bright and distinct. The biennial-fruited oaks have a more porous wood, unfitted for casks to hold liquids, less durable, and less strong. The best of them—viz., black oak (*Q. velutina*)—is found on poorer soils than the white oak, and grows to the height of 80 to 90 feet, with a diameter of 4 to 5 feet. The wood is reddish, porous, and coarse-grained. The outer bark is greatly used for tanning, and the inner bark, called quercitron, for dyeing. Red oak (*Q. rubra*) is used for similar purposes, though it is inferior in quality. Spanish oak (*Q. digitata*) and willow-oak (*Q. phellos*) are superior; and so are laurel or shingle-oak (so called because the wood was used for shingles). California and Oregon have oaks of peculiar species, some of them valuable timber-trees, but none which equal white oak. Chestnut (*Castanea dentata*) is a large tree, of the Atlantic States only, essentially of the same species as the European, yielding a coarse-grained and porous but durable lumber, easily worked, and valuable for wainscoting, etc. The medullary rays can not be traced in it. The American beech (*Fagus utroponicea*) has a very close-grained and hard wood, like that of the European species, of which joiners' tools are made. Iron-wood (*Ostrya*) and horn-beam (*Carpinus*), as the names denote, have very hard wood, but they are rather small trees, peculiar to the Atlantic States, with corresponding species in the Old World. The hickory, in several species, is peculiar to the Atlantic States. The shell-bark or shag-bark (*Hicoria ovalis*) is the best, but all have a very tough and hard wood of remarkable strength, much prized for tools and the like. The walnut (*Juglans*) is known in the Atlantic States by

two species—i. e., white walnut or butter-nut (*J. cinerea*), the favorite wood for gunstocks and of late for wainscoting and cabinet-work, but a small tree; and black walnut (*J. nigra*), the most important of native woods for the cabinet-maker, a tree of ample size. The heart-wood is of a violet color when first cut, but upon exposure becomes dark. It is far superior to the European walnut; it is strong, tough, durable when seasoned, and not apt to warp and split. It has a fine and compact grain, and is susceptible of a high polish. The birches are valuable timber-trees of the second class, having a hard and fine-grained wood, valued by cabinet-makers. Of the five species which in the Atlantic States and Canada form good-sized trees, the black or sweet birch, sometimes called cherry-birch (*Betula lenta*), is most prized, being excellent for furniture; and yellow birch (*B. lutea*) is equally good, but lighter in color. Poplars or cottonwoods (*Populus*) make large trees, as do some willows, but the wood is weak, soft, and usually of no durability.

(3) *Other Deciduous Trees*.—Only the most important can be mentioned. Plane-tree, buttonwood, or sycamore (*Platanus occidentalis* of the Atlantic States, and a corresponding species in California) deserves notice on account of the size which the trunk may attain, but it soon becomes hollow, and the wood, which is handsome on account of the strong silver-grain, is useless for the purposes it would otherwise be well adapted for. The laurel family is represented in the East by the sassafras, and in California by a laurel (*Umbellularia californica*), the light-colored and variegated wood of which is extremely beautiful. Elms are given only to the eastern side of the continent, and white elm (*Ulmus americana*) is the most noted species, a large tree, with handsome but not very durable wood. Slippery elm (*U. pubescens*) is a smaller tree, and the reddish wood is tougher. The ashes are timber-trees of the first class, of which there are six species in the Atlantic and two in the Pacific States. The yellowish wood is very firm and tough, but comparatively light, straight-grained, and easy to work. White ash (*Fraxinus americana*) is the best and most used, and is unexcelled for purposes where strength, elasticity, and durability are needed, and it is preferred to chestnut for interior finish. Black ash (*F. nigra*), a smaller tree, has tougher wood, easily separable into layers, and is therefore used for hoops and strong basket-work. American holly (*Ilex opaca*) of the Atlantic States, like the European species, has a very fine-grained and compact white wood, used for ornamental cabinet-work, wooden screws, etc. Tupelo, pepperidge, or sour-gum trees (*Nyssa*) of two or three Atlantic States species, and sweet gum (*Liquidambar styraciflua*), mostly have a very tough wood, of various uses, but not much used as timber; and flowering dog-wood (*Cornus florida*), although the wood is prized, is seldom large enough to form a timber-tree. The Kentucky coffee-tree (*Gymnocladus dioica*) is a stately tree, of peculiar aspect, with handsome rosy or brownish wood, well suited for cabinet-work. Honey-locust is of little account, but the true locust (*Robinia pseudacacia*) affords a timber equal to live-oak and red cedar in durability, especially valued for treenails and in naval architecture generally. Maples are fine trees, of which one species on the Pacific coast and two or three on the Atlantic side are important for timber. Sugar-maple (*Acer saccharum*) is much the most valuable, having a hard and close-grained wood, of light color and silky luster when polished, and the varieties called curled and bird's-eye maple are greatly prized for cabinet-work. The soft maples, so called from the character of their wood, are the white or silver maple (*A. saccharinum*) and the red or swamp maple (*A. rubrum*), the former a large and the latter a medium-sized tree, the wood of which is used for lasts, for carvings, etc. Lindens or lines, in the U. S. commonly called basswood, of which there are two well-marked species in the Atlantic, but none in the Pacific States, are first-class forest-trees for size, and their soft and white fine-grained wood is excellent for coach-bodies, interior of cabinets, and various purposes where lightness with moderate strength is demanded. Tulip-tree (*Liriodendron tulipifera*), sometimes called whitewood, but in the eastern part of the Mississippi valley (where it abounds and develops its noblest proportions) commonly known as poplar, has a light and soft wood, like that of the linden, but more valuable and much more extensively employed for the same purposes. This noble tree is of the magnolia family, which in the cucumber-tree and in the great-flowered magnolia of the Southern States furnishes two other fine trees of the same character of wood, but of comparatively small use.

(4) *Exotic Timber-trees*.—Those of Europe are analogues of those of the U. S.—i. e. different species of pine, larch, spruce, oak, beech, elm, ash, linden, etc., only the chestnut being the same or nearly so—but are far fewer in species and in kind, tulip-trees, gum-trees, locusts, hickories, sassafras, bald cypress, red wood, etc., being wholly wanting. As to foreign woods of tropical regions imported for the use of cabinetmakers—such as mahogany, Spanish cedar (*Cedrela odorata*), rosewood, lignum-vitæ, and the like—they are mostly treated under their names in this work. See FORESTRY and PRESERVATION of TIMBER.

BIBLIOGRAPHY.—C. S. Sargent, *Report on the Forests of North America* (exclusive of Mexico), in vol. ix. of the tenth census of the U. S. (1884); *Silva of North America* (1891).

Timbre: See ACOUSTICS and VOICE.

Timbuc'too: town of the Sudan, Central Africa; capital of the Fulbe state Massina; 10 miles N. of the Niger, near the desert of Sahara, in lat. 16° 49' N., lon. 3° 7' W. (see map of Africa, ref. 3-B). It is in an unhealthy and unproductive district; provisions have to be brought to it from distant places; but for the traffic between Northern and Central Africa it is of great importance, and although it has repeatedly suffered severely from being conquered and sacked by the Moors and by neighboring tribes, it has always risen again and is still increasing. Dates, European manufactures, firearms, gunpowder, tobacco, and paper are brought here through Sahara and exchanged for gums, ostrich-feathers, gold-dust, and palm oil. The rapid development of its commerce has been hindered by the rivalry and jealousy between the British and French merchants. The town is poorly built; it consists mainly of one-story mud huts and, with the exception of a mosque dating from 1325, it contains few buildings worth noticing. It was formerly surrounded by walls. The inhabitants, variously estimated at from 5,000 to 20,000, are indigenous Negroes, but mixed with them are Tuaregs, Fulahs, Bambaras, Mandingoes, Arabs, and representatives of the merchants of Mogadore, Morocco, Fez, and other places in Northern Africa. The city seems to date back to the twelfth century, but was visited by no European until Laing reached it in 1826. See Lenz, *Timbuktu, Reise durch Marocco, die Sahara, und den Sudan* (2 vols., 1884); Constantin, *Alger et Tombouctou* (1885); Caron, *De Port Louis au port de Tombouctou* (1891).
Revised by M. W. HARRINGTON.

Timby, THEODORE RUGGLES, S. D., LL. D.: inventor; b. at Dover, N. Y., Apr. 5, 1822; he attended a common school, and early showed an inventive faculty; in 1841 submitted to the chiefs of engineering and ordnance a revolving battery to be constructed of iron, the first practical suggestion for the use of iron in the construction of military defensive works, and in 1843 filed a caveat in the U. S. Patent Office for "a metallic revolving fort to be used on land or water, and to be revolved by propelling engines located within the same, and acting upon suitable machinery"; in 1862 he made an agreement with the contractors and builders of the original Monitor for the use of his patent covering the turret system. The most important of his patents are the cordon of revolving towers across a channel (1862); the mole and tower system (1880); the subterranean system (1881); the tower and shield system (1885); and the hemispheroidal system (1889). He also originated in 1862 the plan of firing heavy guns by electricity.

Time [O. Eng. *tima*; Icel. *timi*; Dan. *tid*, time (an hour) < Teuton. **ti-*, found also in **ti-di* > Germ. *zeit*, time; Eng. *tide*. See TIDES]: The measurement of time is of such importance in modern life that a description of the methods by which it is made and the principles which govern it will be interesting. Measurements of long periods, months, and years depend on astronomical phenomena, especially the motions of the sun and moon. Measurements of fractions of a day are made by observing the different directions of the sun, or in our time by clocks and watches.

The longest unit of time which can be determined directly by observation is the year. This is the time occupied by the earth in one revolution around the sun; but, as shown in the article YEAR, there is a slight ambiguity as to the time when a revolution shall be regarded as complete. The sidereal year, which is properly that of the earth's revolution, is slightly longer than the solar year on which the seasons depend. Since it is the change of seasons which fixes the length of the year for practical purposes, the solar year is that universally used both in astronomy and in daily life.

The next shorter unit of time is the lunar month or the interval between one new moon and the next. As this interval is neither an entire number of days nor an aliquot part of a year, it is no longer used as a measure of time. It has given way in most nations to the calendar month.

The most certain and exact measure of all is the day. This is the most obvious measure, because on it depends the alternation of day and night, and it is the most exact because the time of the earth's revolution on its axis remains unchanged, so far as observation has yet shown, from century to century. If it varies at all the change does not amount to one-thousandth of a second in a century. The time of one revolution of the earth on its axis is called the "sidereal day" because it is equal to the interval between two passages of a star across the meridian of a place. Owing to the annual revolution of the earth around the sun the sidereal day does not coincide with the interval between two transits of the sun over the meridian. If the sun and the star cross at the same moment to-day, the sun will be nearly four minutes later than the star in crossing to-morrow. In the course of a year the number of revolutions which the earth actually makes on its axis is one greater than the number of days; hence the sidereal day can not be used for the purposes of daily life and the solar day must take its place.

The true or apparent solar day is the interval between two transits of the sun over the meridian. Were this interval invariable no difficulty would be found in using the true solar day as a measure of time; but as a matter of fact it is always changing. Owing to the varying velocity of the earth in its orbit and to the obliquity of the ecliptic the difference between a transit of the sun and that of a star will sometimes change by more than four minutes and sometimes by less than four minutes in a day. Thus the solar days are a little longer at some seasons and a little shorter at others.

A hundred years ago, when men depended mainly on observations of the sun, or on a sun-dial or a meridian-mark, for their time, the difference caused no trouble, but when accurate clocks and watches were introduced they had to be constantly set forward or back in order to keep time with the sun. Thus arose the distinction between mean solar time and apparent solar time, two quantities which may be defined as follows:

Apparent solar time is time measured by the actual passage of the sun over the meridian. Owing to the variability of this measure, apparent time is a varying quantity. *Mean solar time* is defined by the motion of a fictitious sun called "the mean sun," which is imagined to move with perfect uniformity, being sometimes behind the true sun and sometimes in advance of it. The hours of this time are those measured by a perfectly regulated clock. The difference of these two times is called the *equation of time*. The diagram on the next page shows the way in which this equation varies in the course of a year. The straight line in the center of the diagram may be supposed to represent the equable course of mean time, while the curved line passes to the left or right of the straight one according as the sun is ahead of the mean-time clock or behind it. It will be seen that about Apr. 15, June 15, Aug. 31, and Dec. 24 the two lines cross; at those periods the mean-time clock and the sun coincide. From Dec. 24 until Apr. 15 the sun is behind the clock; the greatest difference occurs about Feb. 10, when the sun does not cross the meridian until about fifteen minutes past twelve by the clock. During May the sun is ahead of the clock, from June 15 to Aug. 31 behind it again, and then ahead of it from September until December. About Oct. 27 the sun is so far ahead as to pass the meridian sixteen minutes before noon by the clock.

Local Time.—On the system of measuring the day by the sun, noon at any place is the moment at which the mean sun passes the meridian of that place. To speak with more exactness, it is the moment at which the place passes under the sun as the earth revolves. Owing to the roundness of the earth different places pass under the sun at different times; one may say, in fact, that noon continually travels around the earth, reaching every part of it in succession during intervals of one day. Noon takes about three hours to pass from New York to San Francisco. When it is noon at San Francisco it is one o'clock in the region of the Rocky Mountains, two o'clock in the Mississippi valley, three o'clock in the Atlantic coast, four o'clock in Labrador, eight o'clock at Greenwich, etc. Hence, when it is noon at any one place, say New York, it is later than noon at every point farther

east in longitude, and earlier at every point further west. The difference is four minutes for every degree of longitude.

So long as men did not travel rapidly this difference of time caused no inconvenience; but when railways were in-

the Delaware river. Let the observer be able to fire a cannon, the sound of which could in imagination be heard all the way to the Mississippi valley. He knows the exact instant when the mean sun reaches his meridian. This instant is for him noon. At this moment of noon he fires his cannon. It would take thirty-eight seconds for the mean sun to pass from the observer's meridian to that of the High School. Supposing sound to travel instantaneously, an observer at the High School would hear the gun thirty-eight seconds before his own noon. Of course the farther we move toward the W. the longer it would take the mean sun to reach us, and therefore the earlier in the day we should hear the sound. An observer at Pittsburg would hear the report about twenty minutes before noon, and one at Newark, O., at half-past eleven. But an inhabitant of New York would not hear the report until four minutes past twelve at that place, because the mean sun marked noon for him four minutes before it marked noon for the observer E. of Philadelphia. On the meridian of Boston the report would be heard at sixteen minutes past their noon, and on the meridian of Calais, Me., the difference would be half an hour. Thus between the meridian of Calais, Me., and Newark, O., there would be a range of one hour in the local time. The rule for standard time then is simply this: That within this whole belt—that is, the belt included between the meridians of Calais, Me., and Newark, O., railways and the public shall use the time (which is called Eastern time) determined by the observer E. of Philadelphia, who, as we have placed him, is situated exactly 75° in longitude or five hours in time W. of Greenwich. Going farther west, say to Cincinnati, it will be more than half an hour before noon when the gun is heard—in fact, only twenty-three minutes past eleven. Therefore for Cincinnati a new meridian of 90° W. of Greenwich is taken, which passes near New Orleans, St. Louis, and Davenport. The mean sun crosses this meridian one hour after it crosses that at Philadelphia, and the moment of crossing is taken as noon, not only for all places on the meridian, but for all places within half an hour E. or W. of it; this time is called Central. At Denver the St. Louis noon gun would be heard at eleven o'clock. So we pass a new meridian near Denver, which is 105° W. of Greenwich, and which the sun does not reach until two hours after it has passed Philadelphia, and one hour after it has passed St. Louis. The time of this meridian (called Mountain time) is used for all the places whose time does not differ from it by more than half an hour. A fourth meridian is that of 120° from Greenwich, and it passes near the Pacific coast, E. of Sacramento and Stockton, where the time is called Pacific time. The moment when the sun crosses this meridian is taken for noon for all places not more than half an hour distant from it E. or W. Thus the traveler who wishes to know the time actually used at any railway station, or by the inhabitants of any city, has only to change his watch by one or more entire hours, the minutes remaining the same.

This is a great improvement on the old system, but every improvement in human affairs has its drawbacks, and standard time is no exception. The drawback in this case is that noon corresponds to the transit of the mean sun only on the four standard meridians of Philadelphia, St. Louis, Denver, and that of a point a little E. of Sacramento. If people had to set their watches by the sun, as they did a hundred years ago, this would be a great inconvenience. It is, however, little felt in these days of telegraphs and railways, when nearly every one to whom local time is important can set his watch by the clock of a railway station, or of a telegraph office. It might also be inconvenient if the farmer in Ohio were obliged to take his mid-day meal by standard time, which for him would mean the time of St. Louis. But if he deems this of importance he has only to set his dinner hour at half-past eleven instead of twelve. It will then correspond to the middle of his mean day or to his noon. If he is near the Pennsylvania border, where the time of the Philadelphia meridian is used, and he waits until half-past twelve by his standard time he will have his dinner at true noon at his place.

It must also be remembered in this connection that the almanac times of sunset necessarily correspond to the old local time, and not to standard time. Suppose, for example, that on the parallel of latitude for Philadelphia, which answers for New York, Pittsburg, Cincinnati, St. Louis, Denver, San Francisco, and in fact for almost the entire range of the Middle States, the sun is put down in the almanac as setting on a certain day at twenty minutes past six. The

Diagram showing comparison of mean (or clock) time with solar (or apparent) time, at the several seasons of the year. The perpendicular central line represents mean time, and the curved line solar time, at mean noon. If the central line be taken to represent standard Eastern time, the dotted lines represent the local mean time for New York and Washington.

roduced it became a source of great confusion. The Bostonian visiting New York would find his watch eleven minutes fast. If he traveled farther west he would find his watch more and more ahead of the local time at every station he reached. Every railway chose its own meridian for running its trains, and a traveler could never determine at what time by his watch a train was booked to leave unless he knew what meridian the railway time was referred to. To lessen this confusion what is called standard time was introduced in 1883.

Standard Time.—The relation of standard time to local time is so little understood that some explanation is necessary. Suppose an astronomical clock to be set up some 6 miles E. of the Central High School of Philadelphia, across

sun sets at Philadelphia five minutes after it does at New York, at Cincinnati thirty-seven minutes after it does at Philadelphia, and so on. It does not pass from place to place by jumps, but gradually, as the earth revolves. Twenty minutes past six, local time, at New York will be twenty-four minutes past six standard time, and so the standard time of sunset will differ four minutes from the almanac. At Newark, O., the error will be nearly half an hour in either direction, and although the almanac will give twenty minutes past six as the time of sunset, the standard time of sunset will be only ten minutes before seven. Hence if the almanac is used by the farmer to set his clock by sunset or sunrise, he must either use the local time of his own meridian or make a proper allowance, never more than half an hour, for the difference between his own meridian and the standard meridian.

In European countries, Greenwich time, six hours faster than Central time in the U. S., is used by the railways of Great Britain, Belgium, and Holland, and it is the legal time for all purposes in Great Britain and Belgium. Ireland uses Dublin time, and France that of Paris. Middle European time, one hour faster than Greenwich time, is used on the railways in Sweden, Germany, Austria-Hungary, Servia, and Western Turkey. It is the legal time for all purposes in Sweden and the German empire, and in 1894 was adopted in Denmark and Switzerland. Eastern European time, two hours faster than Greenwich time, is used by the railways of Eastern Turkey, Bulgaria, and Roumania. The time of the 135th degree of east longitude, nine hours faster than Greenwich time, is the official standard time used for all purposes in Japan. The Australasian colonies adopted standard time Jan. 31, 1895, thus making Melbourne, Sydney, and Brisbane time ten hours ahead of Greenwich time, while Adelaide, Perth, and Wellington are respectively nine, eight, and eleven hours ahead.

Sidereal Time.—Owing to the revolution of the earth around the sun, the sidereal day, as already defined, is three minutes fifty-five seconds shorter than the solar day. To state the case with entire precision, 365.2422 mean solar days, which is the solar year, are equal to 366.2422 sidereal days. In sidereal time the day is divided into twenty-four hours, the hour into sixty minutes, and the minute into sixty seconds, exactly as in solar time. The sidereal clock is one whose pendulum is a little shorter than that of the ordinary seconds clock, so as to keep sidereal time. All the units of this time are shorter than those of the solar time in the same proportion, and the sidereal clock gains one day in a year on the ordinary clock, which is a gain of nearly one second in six minutes. Once a year, at the vernal equinox, near Mar. 21, the two clocks agree. At all other times they differ. In astronomy, sidereal time is not used as a standard of measuring time, but only for finding or expressing the right ascensions of the heavenly bodies. S. NEWCOMB.

Time, in music: rhythm. Music, every sound, and every rest or intermission of sound, necessarily occupies some portion of time. The duration of such sound or rest is not absolute, but relative—i. e. it is not measured by clock-time, but depends upon the rate or speed assigned to any piece of music by the composer or performer. When that rate is once determined, then the duration of each individual note or sound is also determined, as would be the case with the minutes and seconds of a clock if its rate of motion were subject to change. Notes and rests represent portions of time in the order of $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, etc. If the duration of the semibreve should be equal to 8 seconds of time, then the minim would occupy 4 seconds, the crotchet 2, the quaver 1, and so on; and if the duration of the semibreve should be arbitrarily fixed at more or less than 8 seconds, the shorter notes must all conform and preserve their relative proportions. This is the simplest and most elementary office of time in music. (See LARGE and NOTATION.) Notes written in a continued series without any regular divisions or periodical accent, would be unmeaning and unfit for the expression of musical sentiment and beauty, except in very rudimentary forms. Regularity of accent and rhythm is at the foundation of all excellence in modern music, which is therefore written in regular periods, phrases, etc., with smaller divisions into measures or bars. These measures are of several kinds, representing various styles of movement and peculiarities of accent, the leading idea being that musical sounds tend to fall into rhythmical groups of equal duration, and that these groups may be reduced into two classes, having one, two, or four times in a bar, and the other having three. Regularity of rhythm is an essential

element in all grades of musical composition. There is a certain degree of interest created in the mind even by the repeated strokes of a drum when marked off into groups by a periodical accent. In such a case there is no diversity of musical sound, but yet the mind receives pleasure from such regularly recurring accents or pulsations. A succession of such will naturally fall into groups of twos or threes, or, in technical language, it will be *duple* or *triple*, binary or ternary. Other distinctions, as imagined by musicians of the eighteenth century, are unreal and have no philosophical basis. The reduction of all musical times into the genera of *duple* and *triple*, says a writer, "would long ago have been recognized had music made advances equal to other arts and sciences." *Duple* or *common* time (embracing also the *quadruple*) contains two or four equal beats in a bar, with the accent on the first part of each bar, and (in the latter) an inferior accent on the third beat. In ordinary common time each bar contains a semibreve, or shorter notes unitedly equivalent to it in value. It is known by a large C at the clef, with or without a stroke drawn through it. In church music this time is often written with two semibreves or four minims in a bar. The figures $\frac{2}{4}$ indicate another mode of writing common time, every bar containing *two-fourths* (or the half) of a semibreve. These kinds of common time are essentially one. The ear can detect no difference between them if in performance a bar of one is made equal to a bar of the other in *velocity*. Thus the strain variously written at *a, b, c* in Ex. 1 might be played by three instruments simultaneously without the least difference being perceptible even to the most critical ear.

EX. 1.—MM $\text{♩} = 80$.

In regard to accent it was formerly assumed that in a bar with four equal beats the first only was accented, and in a bar of two equal beats the first was accented and the last unaccented. In actual practice, however, this nice distinction vanishes. Albrechtsberger remarks that the difference between these two is not a real one, as "a bar of four crotchets or beats is really only a double bar of two-crotchet time." *Triple* time contains three equal beats in each bar. Like common time, it may be written in minims, crotchets, or quavers, and marked as $\frac{3}{2}$, $\frac{3}{4}$, and $\frac{3}{8}$, which figures give the time-value of each bar as compared with the semibreve. In old collections of music, pieces may be found in $\frac{3}{4}$ time, each bar containing only three semiquavers, or their value in other notes or rests. *Compound* time is a modification of the above simple times, produced by a mingling of the triple element with the duple or quadruple; as when the two crotchets of a bar in two-four time are turned into two groups of three quavers each, or when the same process is applied to a bar in three-four or any other triple time. See Ex. 2, at *a* and *b*.

EX. 2.—*a* *b*

The forms of compound *common* time in most ordinary use are $\frac{6}{8}$ and $\frac{9}{8}$, the former having 6 crotchets (or their value) in each measure, and the latter having six quavers (or their value). The times marked $\frac{12}{8}$ (twelve quavers) and $\frac{12}{16}$ (twelve semiquavers) are less frequently used by modern composers. The forms of compound *triple* time are chiefly $\frac{9}{8}$, having the value of nine crotchets in each measure, and $\frac{9}{16}$, with the value of nine quavers. In the writings of the old masters, and even as late as the time of Beethoven, we find several other varieties of time (and various modes also of indicating the times already described), such as

- $\frac{7}{8}$, $\frac{5}{8}$, $\frac{3}{8}$, $\frac{4}{4}$, $\frac{5}{4}$, $\frac{6}{4}$, $\frac{7}{4}$, $\frac{9}{4}$, $\frac{10}{4}$, $\frac{11}{4}$, $\frac{12}{4}$.

Much of the difficulty attending the study of musical time would disappear if it were borne in mind that the ear, and not the eye, is the proper judge in all questions of this nature. There are indeed certain reasons of convenience for writing common or triple time in four or five different modes, but the ear infallibly reduces them all to one, provided that they all proceed at the same rate. Everything, in fact, depends on velocity, for in an *adagio* in two-crotchet time every *quaver* may equal in duration a *minim* in moderately quick or four-minuta time. The ear knows only one kind of common time; and the most experienced musician can not detect a difference between the groups at *a, b, c,* and *d* in Ex. 3 when performed at the same speed.

That the same remarks will apply to the several forms of triple time needs no demonstration. They are various only to the eye, but are recognized by the ear as essentially one.

Timócreon (Gr. Τιμοκρέων) of Ialýsus, in Rhodes: a lyric poet who took sides with the invaders during the Persian war. He is famous for his poetical tirade against Themistocles, and for his enmity against Simonides, the friend of Themistocles, was pilloried by Simonides in a familiar epithaph, which may be paraphrased:

Hearty drinker, hearty eater,
Hearty railler, hearty later,
Here I lie beneath this stone—
Rhodian Timócreon.

The chief fragments are found in Plutarch's *Life of Themistocles*. See also Bergk's *Poetae Lyrici Graeci* (Ath ed. vol. iii., pp. 536-541).

B. L. G.

Timóleon (Gr. Τιμολέων): a native of Corinth and a member of one of the most prominent families of the city. He put to death his brother, Timophanes, who attempted to overthrow the democratic constitution of their native city and make himself tyrant. In 344 B. C. an embassy arrived from Syracuse in Sicily, a colony of Corinth, and demanded the intervention of the mother city in the struggle between Hicetas and Dionysius the Younger, each of whom wished to become master of the city, and were ruining it by their strife. The aid was willingly granted, and Timoleon was appointed commander of the expedition. Although the armament was very small, he succeeded in expelling both Dionysius and Hicetas, established a democratic constitution, re-peopled the city, and brought it in a very short time into a most flourishing state. This excited the jealousy of the Carthaginians, and under the command of Hasdrubal and Hamilcar they sent an army of 80,000 men against Syracuse, but Timoleon, although his force numbered only 12,000 men, attacked them while crossing the Crimissus, routed them completely in 339 B. C., and a treaty was concluded by which the Ialýsus was fixed as the boundary between the Greek and Carthaginian dominions in Sicily. He also expelled Hicetas from Leontini and Mamercus from Catania, introducing free constitutions in all the Greek cities of Sicily. The last years of his life he spent in retirement in Syracuse, living as a private citizen, though enjoying the greatest fame and honor throughout the Greek world. D. in 337 B. C. An annual festival was instituted in Syracuse in honor of his memory.

Revised by J. R. S. STERRETT.

Timon (Gr. Τιμων): surnamed The Misanthrope; an Athenian citizen who lived at the time of the Peloponnesian war, and was embittered against mankind by the ingratitude of his friends. He is frequently alluded to by the comic poets of the period, was made the subject of one of Lucian's most famous dialogues, and has been rendered especially familiar by Shakespeare's play, which goes back ultimately to Lucian's dramatic sketch. *Timonium* was the name of Mark Antony's retreat at Alexandria and is the equivalent of "grolery."

B. L. G.

Timon of Phlius; a man of letters who flourished at Athens about 275 B. C. His authorship was varied and multitudinous, embracing poetry and prose, tragedies, satyr-drama, elegy, but he is chiefly known as a satirist or writer of *Silli* (Σίλλοι). His brilliant satire was aimed at the dogmatic philosophers, for he himself was a skeptic, and the form which he employed, the heroic hexameter, is noteworthy, as it became the vehicle for the classic satire of Rome.

The remains of Timon may be found in Diogenes Laertius, ix., 109-112. Ed. by Wach-muth in *Corpusculum poetis epicis ludibunda* (1855).

B. L. G.

Timoor: another spelling of the name TIMUR (*q. v.*).

Timor, *té-môr'*: an island of the Malay Archipelago, the largest of the chain which stretches eastward from Java; between lat. S. 16 and 10 25 S., and between lon. 123 25 and 127 10 E.; area, 11,967 sq. miles. It is traversed from E. to W. by a range of lofty mountains, which everywhere show marks of volcanic agencies; earthquakes are frequent. Along the shore the districts are very fertile and densely peopled, and in these rice, sugar, indigo, papaw, sago, pineapples, and coconuts are cultivated. Buffaloes, oxen, pigs, and fowls are plentiful; turtles, pearl-oysters, and elegant coral are found along the shores; gold-dust and timber are exported. The inhabitants are partly Malayans, partly Oceanian Negroes, and as the population belongs to two different races, in the same manner the fauna and flora of the island belong to two continents, to Asia and to Australia. The Dutch have a residency, Kupang, in the south-western part of the island, the Portuguese, a district (6,200 sq. miles with about 300,000 inhabitants) with the chief town, Deli, in the northeastern.

Revised by M. W. HARRINGTON.

Timor-Laut, -*lowt'*, or **Tenimber Islands**: a group of islands belonging to the Malayan Archipelago, and lying E. of Timor. Their area is estimated at 2,120 sq. miles; their population at 20,000. The larger ones, Timor-Laut and Larat, are volcanic; the smaller of coral formation. Birds are numerous and brilliant, especially cockatoos.

Timótheus (Gr. Τιμοθεος): the most admired Greek musician of his day; flourished toward the close of the fourth century B. C. His innovation consisted in the use of a chorus in rendering the so-called *Nome* (*vómos*) and in the employment of mimetic action to enliven the delivery. B. L. G.

Timothy, or **Herd's-grass** [*timothy* is from Timothy Hanson, who carried the seed to the southern colonies of North America about 1720]: the *Phleum pratense*, one of the best of forage-grasses, a native of Europe, and much cultivated there and in the U. S. In Pennsylvania, etc., the red-top, *Agrostis vulgaris*, is called herd's-grass. Timothy will not stand close pasturage, but affords fine crops of the best of hay.

Timothy [from Lat. *Timótheus* = Gr. Τιμοθεος, one who honors God]: a disciple and companion of Paul; b. at Lystra or Derbe in Lycaonia, Asia Minor, probably about 20 A. D., the offspring of a Greek father and a Jewess; was carefully trained in a knowledge of the Jewish Scriptures by his mother Eunice and his grandmother Lois, who were Christians, but was not circumcised until Paul in his second missionary journey selected him as a companion. He became the most constant and devoted of Paul's numerous fellow workers; was regarded by him with truly paternal affection, and employed as "the messenger of the churches," as the apostle's "other self," in the execution of the most responsible spiritual commissions, and was doubtless his amanuensis in the preparation of most of the Epistles, his name being associated with Paul's, in a manner to suggest some degree of joint authorship, at the head of the Second Epistle to the Corinthians, those to the Philippians and Colossians, and the two to the Thessalonians. Whether he shared in the voyage to Italy is uncertain, but he afterward appears at the side of Paul while a prisoner in Rome, and finally as overseer of the important church at Ephesus, where Paul addressed him two canonical Epistles. His later history is unknown, as the tradition of his martyrdom under Domitian rests upon no evidence.

Revised by S. M. JACKSON.

Timothy, First and Second Epistles to: epistles addressed by Paul to Timothy, the former in 64, the latter in 65 or 66, both from Rome. They are chiefly occupied with instruction in the duties of a spiritual teacher, mingled with some admonitions of a personal nature and some references to Timothy's personal history; and the Second Epistle is endowed with a peculiar interest from its references to Paul's anticipated martyrdom, this being probably the last extant production of his pen. With the similar letter to Titus they constitute the so-called Pastoral Epistles. See PAULINE EPISTLES.

Revised by S. M. JACKSON.

Tim'perley, C. H.: printer and author; b. in Manchester, England, about 1794; entered the army, and was wounded at the battle of Waterloo; resumed his early occupation of engraver and copperplate printer, and in 1821 became a letter-press printer; wrote *Annals of Manchester*; *Printer's Manual* (1838); *Dictionary of Printers and Printing*, with

the Progress of Literature, etc. (1839; the second edition of 1842 includes the two last works); *Songs of the Press, and other Poems relative to the Art of Printers and Printing* (1845). D. about 1848.

Timrod, HENRY: poet; b. in Charleston, S. C., Dec. 8, 1829. He was educated at the University of Georgia, studied law and supported himself as a private tutor until the civil war, when he became war correspondent for *The Charleston Mercury*, and in 1864 assistant editor of *The South Carolinian*, at Columbia. The burning of Columbia during Sherman's march to the sea broke up his business, and after two years of poverty and ill health he died at Columbia, Oct. 6, 1867. His *Poems*, many of which were inspired by the war, were published in 1873 in New York, with a memoir by Paul Hayne. H. A. BEERS.

TIMS, THOMAS DILLON: financier; b. at Castle Pollard, Ireland, Jan. 6, 1825; entered the civil service of Canada in 1858; in 1865 was appointed Government superintendent of engraving and printing of the first issue of legal-tender notes; in 1867 reported upon financial system for the Province of Quebec; same year placed in charge of Dominion affairs in Halifax; in 1868 appointed to inquire into the management of Government railways in Nova Scotia; 1868-72 organized financial department and savings-banks in Nova Scotia and New Brunswick; and 1872-73 established branches of the Finance Department and savings-banks in British Columbia and Manitoba. He was appointed financial inspector of the Dominion in 1870, and is inspector of Dominion savings-banks and sub-treasurer and auditor of Government railways. NEIL MACDONALD.

Tim'sah, Lake [Arab. *timsâh*, crocodile]; previous to Nov., 1862, a small body of brackish water in the middle of the Isthmus of Suez, but since the completion of the Suez Canal a lake covering about 6 sq. miles. It is one of a series of lakes intersected by the canal (the Bitter Lakes, Lake Balah, and Lake Menzaleh), which appear to be the remains of an ancient strait separating Asia and Africa. It is supposed to be a portion of the *Kem-ur* (great black water) on the eastern Egyptian frontier mentioned in the papyrus of the twelfth dynasty, now in Berlin, and also a portion of the "sea of reeds" across which the Israelites passed at the Exodus. (Müller, *Asien und Europa*, Leipzig, 1893.) On Lake Timsah is the town of Ismailia, which served as headquarters during the construction of the canal. CHARLES R. GILLETT.

Timuquan'an Indians: a family of North American Indians named after an ancient town situated on St. John's river, Florida. The Timukua term *ati-muca*, ruler, lord, embodied in the title, perhaps refers here to a preponderating influence of that town, like the word capital. The area occupied by these people during the sixteenth and a part of the seventeenth century coincided very closely with the northern portion of what is now Florida; and the southern part of the peninsula, held by Calusan and Tekestan tribes, must have used dialects cognate with the Timukua. The oldest map of the region gives the names of thirty-eight villages, and other sources about twenty-two more. The names of the sixty towns are enumerated in the *Seventh Annual Report of the United States Bureau of Ethnology*. Nothing is known of the political subdivisions of this ancient people except the names of five head chiefs existing there in 1564: Satoriwa, Holata Utina, Potanu, Onethaqua, and Hostaqua. But these are only local designations of five confederacies, for it was customary in those times to call chiefs by the names of their respective tribes. From the writings of the missionary Fr. Francisco Pareja (1612) it may be inferred that there existed at least seven dialects spoken by that people—Timukua, Potanu, Hafi, the Fresh-water District, Tucururu, Mocanu (on the coast), and Santa Lucia de Acuera. This last one probably corresponded with the dialect of the "province" of Asis, spoken on the west coast, N. of Cape Canaveral. To judge by the reports left by the chroniclers of the sixteenth century, these Indians were bold fighters and stubbornly opposed the Spanish invaders. About 1706 their villages were broken up by an armed mob from the English colonies during a war with the Spanish troops in Florida, and their remnants fled to the eastern shore of the peninsula. No trace of Indians speaking this language can be found, but in ancient times they must have been numerous. See De Bry, *Brevis narratio* (Frankfort-on-the-Main, 1591; sketches of the country and people, engravings, and map); Romans, *East and West Florida* (New York, 1775); René de Laudonnière's report in French's *Hist.*

Coll. of Louisiana (New York, 1869). See also INDIANS OF NORTH AMERICA.

F. W. HODGE.

Timur', or Tamerlane' (the latter name being a corruption of TIMUR LENK—that is, Timur the Lame): Mongol conqueror; b. about 1336 at Kesh, near Samareand, the son of a chief of a Mongol tribe and a descendant of Genghis Khan, in 1369 he became chief of his tribe, and from his capital, Samareand, established a firm and orderly government in his dominions. He then set out on his career of conquest, which resulted in the subjugation of the whole of Central and Western Asia, from the Chinese wall to the Mediterranean and from the Siberian steppes to the mouth of the Ganges. In 1393 he stood on the banks of the Dnieper threatening Moscow, but he turned to the S., burnt Azof, and retreated into Asia. In 1398 he conquered Northern Hindustan, whence he sent an immense amount of booty to Samareand, and meditated pushing onward to the S., when he was called by the Eastern emperor and some of the princes of Asia Minor to aid in repelling the Turks led by their great chief Bayazid (or Bajazet). On July 20, 1402, the two huge armies, led by Bajazet and Timur, met each other on the plain of Angora, and the Turks were completely routed; Bajazet himself was taken prisoner. In 1404 Timur prepared for a grand expedition to China, and in the beginning of the following year crossed the Jaxartes at the head of a large army of veteran troops, but died at Otrar, Feb. 17, 1405, and his empire soon became dismembered. His cruelty and that of his soldiers were beyond description. Thousands of his captives were put to death, and he is said on one occasion to have had an enormous pyramid built of the skulls of his slaughtered foes. As an administrator, however, he seems to have shown moderation as well as statesmanlike foresight and ability. See *Histoire de Timur-Béi* (4 vols., Paris, 1721; translated into French by Pietis de la Croix from the Persian text by Sharifu 'd-Din). F. M. COLBY.

Tin [O. Eng. *tin*; O. H. Germ. *zin* (> Mod. Germ. *zinn*): Icel. *tin* (Fr. *étain*, Lat. *stannum*): a lustrous, white metal, not easily affected even by moist air at low temperatures; soft, malleable, of low tenacity, quite ductile at 212° F. (100° C.), a moderately good conductor of heat and electricity; not sensibly volatile at ordinary furnace-heat, fusing at 442° F. (227.8° C.), having after fusion a specific gravity of 7.292. Very pure tin in blocks is sometimes disintegrated by extreme cold. It is one of the oldest of known metals, being mentioned in the Pentateuch, and obtained long before the Christian era by the Phœnicians from the British isles, hence called Cassiterides (from *κασσίτερος*, tin). Pliny's *stannum* was an alloy of silver and lead, perhaps also tin, which he called *plumbum album*, white lead; the alchemists called it Jupiter, and gave it the symbol of that planet, Σ . The most important ore is the oxide, called cassiterite, tin-stone, and tin ore; it occurs in veins, when it is called mine tin, and also as rolled pebbles in alluvial deposits, furnishing excellent ore, known as stream-tin and wood-tin. It is generally a dark-brown mineral, very hard, of sp. gr. 6.4 to 7.1; crystallizing in tetragonal prisms, with pyramidal ends; generally has a high, vitreous luster, and contains 78.67 per cent. of tin. A far less abundant and less valuable ore is stannite or tin-pyrites, a sulphide of tin, copper, iron, and zinc, with 27.2 per cent. of tin and 29.3 per cent. of copper. Native metallic tin has probably never been found. A little tin has been detected in meteoric iron, some zinc-blendes, and several rare minerals.

According to Charles M. Rolkner, in *The Mineral Resources of the United States for 1894* (U. S. Geological Survey), the supply of tin has steadily increased from about 50,000 gross tons in 1886 to the following quantities in 1894:

England.....	long tons	8,800
Straits Settlements, shipped to Europe and America ..		46,734
Straits Settlements, shipped to India and China.....		4,655
Banca, sales to Holland.....		6,139
Billitong, sales to Holland and Java.....		4,764
Bolivian, imported into England.....		3,482
Sing Kep.....		261
Mexico.....		10
Japan.....		40
Burma.....		65
Russia.....		8
Portugal and Spain.....		258
Germany.....		350
Austria.....		65
Total.....		82,045

To this should be added about 10,000 tons produced by the Australasian colonies.

Rolker estimates that of this total 82 per cent. is derived from stream-tin. The principal source of tin is the Malay peninsula, and notably Perak, a state under British protection on the west coast, which is divided by three mountain-chains into three plains parallel to the coast-line, the Larut, Perak, and Kinta valleys. The deposits are alluvial, and although the tin-bearing stratum is regularly distributed throughout the deeper plains, it assumes proportions worthy of working only within a certain distance of the foot-hills. It is covered with 6 to 26 feet of unproductive overburden, and carries from 2 lb. and upward of tin-stone to the cubic yard. The tin-stone is generally deep brown, but is found whitish gray and rose in color in the Kinta valley. Perak produced in 1893 18,821 long tons of tin. Next to Perak in importance are the deposits of Selangor, a native state under British protection, the principal district being the Kwalla Lumpur. Sometimes as many as three stanniferous layers occur, running in depth from 3 to 40 feet; the average value of the gravel is 0.5 per cent. of tin-stone. The total product of Selangor in 1890 was 8,798 long tons. Some tin is also mined in Pahang, Malacca, Sunjic-Ujong, and in the Siamese states. In all of these sections coolie labor is employed in washing the gravel, and the majority of the diggings are worked by Chinese companies.

In Burma tin is found on the Tenasserim river and its tributaries. The mines of the island of Banca are largely owned by the Dutch Government. They are washings, the tin-bearing layer of about 3 feet in thickness being covered by 25 to 35 feet of overburden. The average product per man per annum is 0.72 ton of tin. In the fiscal year 1891-92 Banca produced 5,755 gross tons of tin, the principal districts being Djebos, Blinjoe, Soengeiliat, Merawang, Paing-Kalpinang, and Soengleislaian. Nearly all the metal coming from Billitong and the adjoining island of Sing Kep comes from alluvial diggings, the principal districts being Manggar, Poeding, and Linggar. The total product in the washing season 1891-92 was 6,384 gross tons. A sliding scale of paying wages to the coolies prevails, they being guaranteed a minimum of \$48.24 for the working year.

Nearly every Australian colony produces some tin. In New South Wales, which reached a maximum of 8,680 tons in 1883 and produced 2,637 tons in 1893, both lode-mining and stream-washing are pursued, the latter being more important. Two groups of tin-drifts are known—those of recent origin and the Tertiary deep leads capped by lava, in which the gravel is often so cemented together as to make crushing necessary. These Tertiary river-channels are at a depth of 20 to 137 feet, and vary in width from 18 to 400 feet. The stanniferous layer is usually 3 feet thick, but swells up to 13 feet. In Queensland, which produced 2,389 tons of tin ore in 1892, the leading alluvial districts are the Severn river and the Wild river diggings.

Tasmania has been an important tin-producer, and promises to continue to be so. Its maximum product was in 1878, with 5,369 tons, the output in 1893 having been 3,129 tons of white tin. The alluvial deposits, which range in age from Miocene to recent, are in the northeast district along the valleys of the Ringarooma and George's river. It is for lode-mining, however, that Tasmania is conspicuous, the principal dependence being large stockworks or impregnations of granite low in tin, some of them paying for working down below 1 per cent. of tin ore. The Mt. Bischoff is the most famous of these mines, having paid during a brief career 210 dividends, to 1894 aggregating £1,342,500. In 1892 the company worked 70,584 tons of rock and 960 tons of concentrated sands, which yielded 2,235 tons of black tin containing 68.31 per cent. of tin.

Tin has been continuously mined in Cornwall from the time of the Phœnicians, and for many centuries was the principal source of supply for the world. The ore is found in the "Killas," a metamorphic clay slate, and along its line of junction with granite. In some instances the mines have reached great depth, and some of them have penetrated to considerable distances under the sea. A number of them are still very remunerative, but on the whole the Cornish tin-mining industry has declined in importance.

In Bolivia tin deposits are met at intervals along the eastern border of the Bolivian table-land from Lake Titicaca to near the Argentine boundary. The principal mines are those of the Potosi and Oruro, the tin being sometimes associated with silver.

Germany has old tin mines at Zinnwald, Kahlenberg, and Altenberg, Saxony, while Schlaggenwald and Graupen were once famous producers in Austria.

In Mexico some mining has been done in the state of Durango.

In the U. S. efforts at mining have been made in the greisen lodes on King's Mountain, N. C., at the Martha Cash mine, Irish Creek, Rockbridge co., Va., and at the Broad Arrow deposit, Clay co., Ala. In the Black Hills, S. D., very extensive prospecting has been done at Harney's Peak, and large works were built, but no production of any consequence has been recorded. For a brief period tin-mining was conducted at Tenascal on the San Jacinto estate near Riverside, Cal., but the operation did not pay. Tin is reported also from Texas at Barringer Hill, Llano County, and on Herman and Willow creeks, Mason County, but no work has been done.

The most important alloys of tin are britannia metal, 75 to 94 parts of tin, 5 to 16 parts of antimony, and 2 to 8 parts of bismuth; pewter, 4 of tin and 1 of lead; queen's metal, 9 of tin and 1 each of antimony, bismuth, and lead; fine solder, 2 of tin and 1 of lead; common solder, equal parts of each; coarse solder, 2 of lead and 1 of tin; speculum metal, 1 of tin and 2 of copper (but variable) with sometimes a little arsenic; bell metal, 78 of copper and 22 of tin, with sometimes a little zinc and lead; bronze, with less tin than bell metal, and with 3 to 4 of zinc; gun-metal, best with 9 of copper and 1 of tin; sheathing for ships, 32 of copper and 1 of tin; fusible metal, with 1 of lead, 2 of bismuth, and 1 of tin (fuses at 200.7° F.); amalgam of tin and mercury for coating mirrors; and Babbitt metal; type metal, also, for fine work, contains a little tin. Melted tin is used to coat sheet-iron (tin-plate) and copper; copper, zinc, brass, and iron can also be tinned in the wet way; and tin has been successfully deposited on textile fabrics. Phosphor-tin is largely used for the manufacture of phosphor-bronze. See TIN-PLATE.

COMPOUNDS OF TIN.—Stannous chloride, SnCl_2 , is formed by dissolving tin in hydrochloric acid; it is a powerful reducing agent, and is used as a mordant under the name of *salt of tin*. Stannic chloride, SnCl_4 , can be formed by heating corrosive sublimate with tin filings, or by passing chlorine over melted tin. It forms with chloride of ammonium a double salt, called *pink salt*, used for a red dye. An impure stannic chloride, formed by the action of nitric and hydrochloric acids on tin, is used for brightening and fixing red colors, under the name of *nitro-muriate of tin*, composition, or *tin solution*. Stannous oxide, SnO , stannous hydrate, $\text{Sn}_2\text{H}_2\text{O}_3$, and sesquioxide of tin, Sn_2O_3 , are unimportant commercially. Stannic oxide, SnO_2 (*putty powder*), is formed when tin is heated above fusion in the air. It forms two hydrates; one of these, stannic acid, H_2SnO_4 , forms various stannates, the stannate of soda being used as a mordant in calico-printing; arsenic-stannate of soda is also employed. The other is metastannic acid, produced by the action of nitric acid of sp. gr. 1.3 upon tin. Dried at 212° F. (100° C.), it is $\text{H}_2\text{Sn}_2\text{O}_7$. It becomes anhydrous on ignition. Monosulphide of tin, SnS , and sesquisulphide, Sn_2S_3 , are of little interest. The bisulphide, SnS_2 (*mosaic gold*), can be obtained by powdering an amalgam of 12 parts of tin and 6 of mercury, and heating it in a flask with 7 parts of sulphur and 6 of sal-ammoniac; other proportions are also used. Tin forms many other chemical compounds of little general interest. Revised by CHARLES KIRCHHOFF.

Tinam'idæ [Mod. Lat., named from *Tinamus*, the typical genus, from Fr. *tinamou*, from the S. Amer. name]; a family of birds, the sole one of the order *Cryptari*, containing the tinamous, a group of remarkable species of small or medium size, peculiar to Central and South America. They are characterized by having the bones of the palate arranged as in the ostriches, the bones of the pelvis free behind, and a keeled sternum of peculiar pattern. Although Huxley kept the *Tinamidae* with the *Carinatæ* he recognized the importance of the above combination of characters, by making the group one of the four main divisions of that section. Others writers justly consider that the divisions *Ratitæ* and *Carinatæ* are not natural, and that this fact is well shown by the *Tinamidae*, Dr. Stejneger places them in the super-order *Dromæognathæ*, just after the apteryxes, while Dr. Fürbringer puts them in the *Alector ornithes*, between the apteryxes and fowls. In external appearance the species resemble the quails and partridges more than any other familiar birds; the head is rather small, the neck rather short, and the back and tail depressed; the bill is rather slender and mostly straight, but more or less decurved at the tip, and with the upper mandible overhanging the lower; the

base is covered with a membrane which encroaches on the nostrils; the wings are rounded behind, concave, and short; the tail is short, and sometimes quite rudimentary, and more or less concealed by the decumbent coverts; the tarsi moderate or stout, and provided with large plates in front, the anterior toes well developed and entirely free, the posterior small and elevated or wanting; the claws are curved. The species differ in habits, some inhabiting the thickest forests and others open plains. They feed chiefly on grains, and indeed resemble in many respects the partridges, etc., which they replace in South America. The females generally lay about a dozen (but some not more than half a dozen) eggs, which look as if polished, and are deposited in rude nests made on the ground. The young follow their mother as soon as hatched. There are about fifty species, distributed among the genera *Tinamus*, *Nothocercus*, *Crypturus*, *Rhynchotus*, *Nothoprocta*, *Nothura*, *Toniscus*, *Edromioides*, and *Tinamotis*. Revised by F. A. LUCAS.

Tineal: See BORAX.

Tineker, MARY AGNES: novelist; b. at Ellsworth, Me., July 18, 1833. She was educated at the academy at Blue Hill, Me.; became a Roman Catholic in 1863 and served as a hospital nurse at Washington during a part of the civil war. She afterward lived in Boston till 1873, when she went to Italy, returning to Boston in 1887. She has been a frequent contributor to *The Catholic World*, and has published a number of works of fiction, including *The House of Yorke* (1872); *Signor Monaldini's Niece* (1879); *By the Tiber* (1881); *The Jewel in the Lotus* (1884); *Aurora* (1885); and *Two Coronets* (1889). H. A. BEERS.

Tinctures [from Lat. *tinctura*, a dyeing, deriv. of *tingere*, *tinctum*, tinge, dye, whence Eng. *tinge*, *tinge*]: in pharmacy, solutions of medicinal substances in alcohol. In their preparation the medicine should be dried and pulverized, and as a rule it is found advantageous to use diluted or aqueous alcohol as the solvent, as by this means numerous substances which are insoluble in anhydrous alcohol can be brought into solution; but many of the tinctures prepared in this way undergo acetous fermentation, which difficulty is best obviated by preserving them in well-closed and completely filled bottles. Maceration and digestion accelerate the preparation of tinctures, but percolation is extensively practiced. Occasionally the expressed juice of the plant is dissolved in alcohol, which method is especially applicable to the preparation of tinctures of narcotics, such as opium and belladonna. Revised by H. A. HARE.

Tindal, MATTHEW, LL. D.: deistical writer; b. at Beer Ferris, Devonshire, England, in 1657; studied at Oxford, where he took his degree in 1676; became fellow of All Souls 1677, and in 1685 was made LL. D., shortly after which he went over to the Roman Catholic Church, but returned to the Church of England when the revolution of 1688 seemed imminent. After the revolution he held several legal positions, and received from the crown a pension of £200. He took an active part in the polemics of his day, and in 1706 published *The Rights of the Church Asserted*, in which he took ground against the prevalent High Church doctrines. This gave rise to sharp controversies, during which he put forth two *Defenses*, in which he treated of the obedience due to princes, the law of nations, the liberty of the press, and the rights of mankind in matters of faith. In 1710 he issued a pamphlet, *The New High Church turned Old Presbyterian*, in opposition to the famous sermon of Dr. Sacheverell. The House of Commons ordered the productions of both controversialists to be burned publicly. In 1730 he put forth his most noted work, *Christianity as Old as the Creation*, in which he argued that in Christianity there was nothing which human reason might not have discovered without a special revelation; this called forth a host of replies, and a defense by himself of the doctrines which he had advanced. He also wrote a second volume of his work, of which only the preface has been published. D. at Oxford, Aug. 16, 1733. Revised by S. M. JACKSON.

Tindale, WILLIAM: See TYNDALE, WILLIAM.

Tinder [O. Eng. *tynder*; O. H. Germ. *zuntara* (> Mod. Germ. *zunder*): IceL. *tundur*; cf. Germ. *zünden*, kindle]: a material, usually composed of half-burned linen, formerly used in kindling fires. A flint and steel ignited the tinder, which inflamed in turn a sulphur match. Amadou, touch-wood, and touch-paper were substitutes for tinder.

Tinea: See FAVUS.

Tine'ida [Mod. Lat., named from *Tinea*, the typical genus, from Lat. *ti'nea*, worm, moth]: a family of *Lepidoptera* including many species, among them the moths so destructive to clothes. The developed insects are of small size, have a slender body, elongated, narrow wings, which when the insect is at rest are rolled round the body, and which are edged with long fringes; the maxillary palpi are very large, and the antennæ are long and filiform. The larvæ are elongate, and generally provided with numerous (14 to 18) feet, although occasionally entirely footless. They differ among themselves chiefly in the form and furniture of the head (whether hairy or naked), the development of the maxillary and labial palpi, and the form of the wings. The imagines are found mostly on the sheltered side of hedges, etc.; the larvæ burrow in leaves, stems, grain, etc., of plants, as well as other substances, such as cloth. The most notable species are the clothes moth (*Tinea flavifrontella*), the carpet moth (*Tinea tapetzella*), and the grain moths (*Tinea granella* and *Gelechia cerealella*). The clothes moth is light buff, glanced with a silvery iridescence on the wings and tawny on the head. It makes its appearance in the Northern U. S. in May or June. The female lays her eggs in cloth, generally woolens, sometimes cotton, and whitish larvæ are soon hatched therefrom. The carpet moth has yellowish-white but black-based fore wings, dark-gray hind wings, and white head. Benzine and carbolic acid, and precautions as to cleanliness, are the best antidotes to the ravages of these little pests. Revised by E. A. BIRGE.

Tinel, EDGAR: composer; b. in Belgium, Mar. 27, 1854; educated at first by his father, who was a schoolmaster and organist. In 1863 he entered the conservatory in Brussels, and in 1873 carried off the first prize for piano-playing. He also at this time made his first essays on composition. In 1877 he won the Prix de Rome with a cantata *De Klooke Roeland*, and when Lemmens died in 1881 he succeeded him as organist of the church in Mechlin. He has composed some fine organ music, incidental music for Corneille's *Polyeucte*, and other works. His greatest work is his oratorio *St. Francis d'Assisi* to a text by the Flemish poet Lodewijk de Koninck. It has been performed in Berlin and New York. D. E. HERVEY.

Tinghai: See CHUSAN.

Tinker's Weed: See FEVERWORT.

Tinne, tin'ne, ALEXANDRINA PETRONELLA FRANCINA: traveler; b. at The Hague, Holland, Oct. 17, 1839, the only child of a rich English merchant; received an excellent education; traveled after the death of her father through most European countries, Syria, Palestine, Egypt, etc., and settled in 1861 in Cairo. From Feb. 2, 1863, to Mar. 29, 1864, she undertook a grand journey of exploration from Khartum to the Bahr el-Ghazal, the western arm of the White Nile. She invited Baron von Heuglin and Dr. Steudner to accompany her, and the valuable scientific results of the expedition were communicated in John A. Tinne's *Geographical Notes of an Expedition in Central Africa*, in the *Transactions of the Historic Society of Lancashire and Cheshire* (Liverpool, 1864); von Heuglin's *Die Timnesche Expedition im westlichen Nilquellgebiet*, supplement to Petermann's *Mittheilungen* (1865); and Th. Kotschy and Peyritsch's *Pflanzl. Timneana* (1867). From Tripoli she started on another expedition, Jan. 30, 1869, with the purpose of reaching the upper Nile through Bornu, but at Fezzan she was murdered by her Arab attendants, Aug. 1, 1869.

Revised by M. W. HARRINGTON.

Tinnevelly: town and district of the southernmost part of Madras, British India (see map of Southern India, ref. S-E). The former is an important Protestant missionary center, and contains a Hindu college. Pop. (1891) 24,768.

Tino: same as TENOS (*q. v.*).

Tinoc'eras [Mod. Lat.: Gr. *τίνεισθαι*, punish + *κέρας*, horn]: a genus of extinct herbivorous mammals from the Eocene of Wyoming and Utah, and the first known representative of a remarkable group now regarded as forming a distinct order, Dinocerata, so named from the best-known genus, *Dinoceras*. This genus may be taken as typical of the order, and its principal characters are as follows: The skull is long and narrow, the facial portion being much produced. It supports three separate pairs of osseous elevations, some of which may have been the bony support for horns. They form the most conspicuous feature of the skull, and suggested the name of the genus, "the terrible-

horned." The smallest pair are near the end of the nasal bones; a larger pair rise from the maxillary or cheek bones, in front of the orbits; while the largest pair are on the parietal bones, and are supported by an enormous crest, which extends from near the orbits around the lateral and posterior margins of the cranium, nearly surrounding a deep depression upon the crown of the head. The dental formula in *Dinoceras* is as follows: incisors, $\frac{2}{2}$; canines, $\frac{1}{1}$; premolars, $\frac{3}{3}$; molars, $\frac{3}{3}$. The premaxillaries are toothless, as in ruminants, and may have supported a callous pad also, as in that group. The upper canine teeth are deeply implanted in the maxillary bones. They are long, decurved, and trenchant, separated by an interval from the molar teeth, which are comparatively small. The lower incisors and canines were approximate, projecting forward, and separated from the small molars. The lower jaw sends down a massive process on each side near its extremity, apparently for the support and protection of the large upper canines while the mouth was closed. The cervical vertebrae are longer than in the elephant, while the legs are short and the skull elongated, so that the head could easily reach the ground. The feet were short and stout, and there were five toes before and behind, but the carpal bones form interlocking series, and the astragalus articulated with both the navicular and cuboid bones. The metapodial bones are of moderate length, and their articular surfaces for the phalanges nearly flat, or even concave, indicating but little motion in the toes. In the hind limb when at rest the knee-joint was straight, as in the elephant and man, instead of being considerably flexed, as in nearly all quadrupeds. The brain-cavity of *Dinoceras*, however, is the most remarkable feature of this remarkable genus. It proves that the brain was smaller than any more recent mammal, whether living or fossil, and was even less than in some reptiles. The entire brain was so diminutive that it could perhaps have been drawn through the neural canal of all the presacral vertebrae, certainly through the cervicals and lumbar. Besides the genera already mentioned, there was at least one other, *Uinatherium*, closely allied. These animals were all large, some of them nearly equaling the elephant in size.

O. C. MARSH.

Tin-plate: sheet-iron or sheet-steel coated with tin. *Terne-plate* is sheet-iron or sheet-steel coated with an alloy of tin and lead, the latter predominating. The manufacture of tin-plate originated in Bohemia prior to 1600. Early in the seventeenth century it was introduced into Saxony. In 1625 Andrew Yarranton visited Saxony, and learning the methods of manufacture, started works on a small scale at Pontypool, Monmouthshire, England, but failed to continue the enterprise. In 1720 John Hanbury built a plant at Pontypool. This second start led to the development of the industry in Wales, which soon dwarfed the production of the older centers, and gave the principality the unchallenged control until the industry was finally successfully introduced in the U. S. In 1872 and 1873 two firms, Rogers & Burchfield, of Leechburg, Pa., and the United States Tin Plate Company, at Demmeler, near Pittsburgh, Pa., started the manufacture of tin-plate, but were forced to abandon it. It was not until the passage of the Tariff Act in 1890, which granted a protection of 2-2 cents a pound under certain conditions, that the manufacture was started on a large scale by numerous concerns. The principal aid to its establishment was the low price of steel. Formerly the sheets to be coated were made of iron, the production of which involved a large expenditure of skilled labor. The introduction of steel as the new material, with its substitution of machinery for labor, brought the labor cost per unit of product so much closer on both sides of the Atlantic that numerous works have been started since the passage of the Tariff Act in 1894, which reduced the duty to 1-2 cents per pound.

Originally the sheets were made from iron produced with charcoal as a fuel, so that when pig-iron smelted with coke was puddled to make the sheets, the term "coke tin-plates" was introduced to designate this method of manufacture. Now no charcoal is employed, so that the term charcoal plates refers merely to the quality, and openhearth and Bessemer steel have almost entirely superseded puddled iron. The method of manufacture may be described as follows: The steel ingot as cast in the steel-works is rolled into a bar about 7 inches wide and from $\frac{1}{2}$ to $\frac{3}{4}$ inch in thickness, which is sheared into lengths weighing about 19 lb. each. The bar after being heated is rolled as a single plate until it can be

easily doubled, that is, the sheet can be folded over. When this point has been reached the sheet is folded over, reheated, and is then rolled doubled up. The reheating, doubling, and rolling is repeated three times, so that a pack is produced which consists of eight sheets. After the pack has been trimmed and squared the sheets are separated from one another. During the process of reheating and rolling the sheets have been covered with a layer of scale. The black plates, as they are called, must be cleaned by pickling in hot dilute sulphuric acid. This black-pickling is now done in machines, which also provide for the washing away of the acid adhering to the plates. The continued rolling has hardened the steel, but this is softened by annealing, which is accomplished by exposing the sheets in tightly closed iron vessels to a dull red heat for a period varying from ten to twenty hours. In order to smooth the surface of the sheets they are rolled when cold, the operation being repeated if necessary. This hardens the steel, which is again annealed and finally is pickled, this "white pickling" being done in a more diluted solution. The sheets are then ready to be tinned. The apparatus consists of a set of pots, heated by fire-places. The first operation is to plunge the plates into heated palm oil, to remove the moisture and heat the sheets. Then they are allowed to soak for a while in a pot filled with molten tin covered with palm oil. The tinman passes them over to the washman, who allows them to remain for a little while in a pot filled with molten tin, and brushes both sides carefully. Finally they are passed into the patent pot filled with tin, in which a series of rollers revolve through which the plates pass singly, stripping off the surplus material and by their tension determining the thickness of the coating of tin. There are a number of different designs of such patent pots, among the leading ones being the Morewood, Leyshon, Newbold, and Norton. The plates are finally rubbed with bran and with sheepskin, are sorted, and are packed into boxes.

The standard sizes are 10 inches by 14 inches, or 14 inches by 20 inches, the thickness or gauge varying. The latter is designated by arbitrary marks, IC being No. 30 gauge, weighing 107 lb. per box of 112 sheets of 14 inches by 24 inches; IX is of No. 28 gauge, IXX of No. 26 gauge, and IXXX of No. 24 gauge. For several years lighter plates weighing 80, 85, 90, 95, and 100 lb. per box of 112 sheets, 14 by 24 inches, have been made.

No exact statistics of production of tin-plate in Wales are available. The exports were 448,379 gross tons in 1891, and 379,172 gross tons in 1893. The British home consumption was estimated at 65,000 to 75,000 tons. The U. S. imported the bulk of the Welsh tin-plate. The maximum was reached in 1889, when the imports were 331,311 gross tons. In 1893 the quantity imported was 253,485 gross tons. Since 1891 the production of tin-plate in the U. S. has expanded very rapidly. It reached 123,606,707 lb. in 1893 and amounted to 84,726,746 lb. in the first six months of 1894.

CHARLES KIRCHHOFF.

Tintoretto: See ROBUSTI, JACOPO.

Tiogga River: a river which rises in the west part of Bradford co., Pa. Its general course is northward through Tioga co., Pa. At Painted Post, Steuben co., N. Y., its waters enter the Chemung river. The upper part of Tioga valley affords much semi-bituminous coal of great value.

Tipitapa (river): See NICARAGUA.

Tippecanoe' City: village: Miami co., O.; on the Great Miami river, and the Cin., Ham. and Dayton Railroad; 14 miles N. of Dayton, 14 miles S. of Piqua (for location, see map of Ohio, ref. 5-C). It contains manufactories of paper, glucose, excelsior, flour, and brooms, a high school, a national bank with capital of \$60,000, and a weekly newspaper. Pop. (1880) 1,401; (1890) 1,465.

Tippecanoe River: a river of Indiana, rising in Tippecanoe Lake, Kosciusko County. It pursues a devious S. W. course for 200 miles, and falls into the Wabash. On the banks of this river, at the present village of Battle Ground, in the county and township of Tippecanoe, Gen. Harrison fought and defeated the Indian tribes commanded by the Prophet, the brother of Tecumseh, Nov. 7, 1811. In the middle of the night, when the whole force, consisting of 300 regular troops and 500 militiamen, was asleep, the Indians suddenly made the attack upon the camp. A desperate fight ensued, the Indians several times advancing and retreating; but after daylight they were finally defeated and dispersed by the two mounted companies belonging to Harrison's force. They left forty of their dead on the field; Harrison's

loss was sixty killed and twice as many wounded. On the following day the Prophet's city was visited; it was found completely deserted, and was burned down. Harrison, nevertheless, considered it prudent to effect a speedy retreat, more especially on account of the great number of wounded with which he was encumbered, and he consequently fell back upon Vincennes. Revised by F. M. COLBY.

Tip'perah: name of a tribe, a feudatory state, and a district of Northeast British India. The tribe is of Tibet-Burmese relationship, occupies the parts of Bengal and Assam adjoining Upper Burma, and numbers about 60,000, of whom about two-thirds are in the principality, one-fourth in the British district, and the remainder in Assam. The native state is called Hill Tipperah by the British and lies in the extreme east of Bengal, adjoining Assam and Upper Burma with the district of Tipperah on the W. and Noakhali and Chittagong on the S. Area, 4,086 sq. miles. Pop. about 100,000. The rajah belongs to the Tipperah tribe. The country is hilly with much jungle and swamp and many rivers. Travel is chiefly by boat; the principal crop is rice; the government is despotic and patriarchal. There are no towns, and Agartala, the capital, is simply the residence of the rajah. The district of Tipperah lies between the preceding and the river Meghna. Area, 2,491 sq. miles. Pop. 1,500,000. It is flat and open, abundantly supplied with streams, many of which are affected by the tide; is fairly fertile and principally devoted to rice; and is traversed N. and S. by a railway. The capital is Comillah (pop. about 15,000), and the largest town Brahmanbaria (17,500).

MARK W. HARRINGTON.

Tipperary: county; in the province of Munster, Ireland. Area, 1,659 sq. miles. For the most part, the county lies in the basin of the river Suir, and touches the Shannon on the N. W. The surface is generally level, and the mountains which diversify it are rather groups of peaks than portions of connected ranges. These mountains are the Galtees (3,000 feet high), Knockmeledown (2,700 feet), and Slieve-namon on the S., Keeper Mountain (2,100 feet) on the W., and the Slievardagh Hills on the E.; completely isolated is the curious peak the Devil's Bit, the center and source of many popular legends. The soil is a rich calcareous loam, and in the district called the Golden Vale, around the town of Tipperary, is exceedingly fertile and productive. Agriculture, especially dairy-farming, is the principal occupation. Coal, copper, lead, and zinc are found, but not worked, and the formerly flourishing woolen-trade is nearly extinct. The antiquities of the county are numerous and interesting, both those from the Anglo-Norman and Celtic periods. The ruins of Holy Cross, in the city of Cashel, is a noble specimen of the monastic remains of the mediæval period, as the Castle of Cahir is of the military and baronial architecture of the same age. Pop. (1891) 172,882. Tipperary, the county-town, 110 miles by rail S. W. of Dublin, has a butter-market (see map of Ireland, ref. 12-F). Pop. (1891) 7,274. In 1890 a new Tipperary was founded, as part of a plan of campaign against land-owners, but proved a miserable fiasco in the following year.

Tippoo' Sa'hib: Sultan of Mysore; b. Nov. 19, 1749, a son of HYDER ALI (q. v.); was instructed in European tactics by French officers, and distinguished himself in the war against the British, defeating them at Perimbakum Sept. 10, 1780, and on the banks of the Kolerun Feb. 18, 1782. On Dec. 7, 1782, Hyder Ali died, and Tippoo Sahib then prepared for a still more energetic prosecution of the war. Apr. 28, 1783, he took Bellnore, and soon after also Mangalore, but in the meantime peace had been concluded between Great Britain and France, so that Tippoo Sahib was compelled also to conclude peace at Mangalore Mar. 11, 1784, but on advantageous conditions. He continued to intrigue against the British, and in 1790 the war was renewed. In spite of his brilliant tactics in laying waste the Carnatic almost to the gates of Madras, and thereby for a time baffling his enemies, he was finally defeated, and was compelled in 1792 to sue for peace by ceding half of his dominions and paying 3,030 lakhs of rupees. However, he still intrigued with the French, and when Napoleon landed in Egypt Oct. 18, 1798, the British East India Company determined to crush its enemy before it might become too late. On Feb. 22, 1799, the company declared war against Mysore, invaded the realm with two armies, and shut up the sultan in his capital, Seringapatam. Here he fell May 4, 1799, while fighting on the walls; his dominions were confiscated by the company, and the spoils from his palace were carried to London.

During the last years of his reign, after 1792, his government was of a very oppressive character, but he was exceedingly popular among his subjects, and after his death he was considered a martyr to the faith of Islam by Mohammedans in general.

Tipton: city; capital of Tipton co., Ind.; on Cicero creek, and the Lake Erie and West. Railroad; 38 miles N. of Indianapolis (for location, see map of Indiana, ref. 5-E). It is in an agricultural region, contains new a court-house (cost \$190,000), a jail (cost \$35,000), canning factory, flour, saw, and planing mills, and stove factory, and has 2 private banks and 3 weekly newspapers. It is in a natural-gas belt. Pop. (1880) 1,250; (1890) 2,697; (1895) estimated, 5,000.

EDITOR OF "TIMES."

Tipton: town (founded in 1840); capital of Cedar co., Ia.; on the Burl., Ced. Rap. and N. and the Chi. and N. W. railways; 40 miles N. W. of Davenport, 42 miles S. E. of Cedar Rapids (for location, see map of Iowa, ref. 5-K). It is in an agricultural region, and has 6 churches, large public-school building, a national bank with capital of \$50,000, 2 State banks with combined capital of \$75,000, 2 weekly newspapers, a carriage-factory, machine-shop, creamery, and poultry-packing establishment. Pop. (1880) 1,299; (1890) 1,599; (1895) 2,244.

EDITOR OF "ADVERTISER."

Tipton: town; Moniteau co., Mo.; on the Mo. Pac. Railway; 25 miles S. of Booneville, 27 miles E. of Sedalia (for location, see map of Missouri, ref. 4-G). It is in an agricultural region, with coal, lead, and zinc mines in the vicinity, and has a high school, several factories, a State bank with capital of \$20,000, an incorporated bank with capital of \$25,000, and a weekly newspaper. Pop. (1880) 989; (1890) 1,253.

Tiraboschi, tēe-raā-bos'kēe, GIROLAMO: literary historian; b. at Bergamo, Italy, Dec. 28, 1731; educated by the Jesuits, whose order he afterward joined. He taught in Brescia and Milan, producing in the latter university his *Felera Humiliatorum monumenta* (1766), an account of the order of Humiliati. In 1770 Francis III., duke of Modena, appointed him librarian of that city, where he remained until his death June 4, 1794. The chief result of his labors in Modena was the great *Storia della Letteratura italiana* (14 vols., 1770-82; reissued, in an amplified and corrected form, 1787-93). Though now antiquated, it still remains an example of thoroughness in method. His other monumental work is the *Biblioteca modenese* (6 vols., Modena, 1781-86), devoted to the history of Modenese authors. This was followed by the *Memorie storiche modenese* (1793-94), and a *Codice diplomatico*, which was in process of compilation at the time of his death. He worked upon the *Enciclopedia italiana* and the *Giornale d'Italia*, and issued many biographical and other monographs. The best edition of the *Storia* is that printed in Milan (16 vols., 1822-26). J. D. M. FORD.

Tirard, tēe'raar', PIERRE EMMANUEL: statesman; b. in Geneva, Switzerland, Sept. 27, 1827, of a French family; was educated in his native city, but moved in 1846 to Paris as chief of an exporting-house in jewelry. An open enemy of the second empire, he was elected mayor of the second arrondissement of Paris Nov., 1870, and a member of the National Assembly Feb., 1871. After an energetic protest against the assumptions of the Commune, he resigned his mayorship and fled to Versailles. In 1876 he was elected a member of the legislative Assembly, and took his seat among the republican left. In 1879-81 he was Minister of Agriculture and Commerce and exercised considerable influence on the formation of the tariff. He was head of the cabinet in Carnot's administration 1887-88, and again 1889-90. D. in Paris, Nov. 4, 1893. He published *Du Développement de la bijouterie et de l'orfèvrerie par la liberté des titres de l'or et de l'argent* (1868). F. M. COLBY.

Tiree', or **Tyree:** an island of Scotland, one of the Inner Hebrides; 13 miles long and 6 miles broad. It is low except on the S., where hills reach 400 feet, and destitute of wood, but affords good pastures. Oats, barley, and potatoes are raised, but the inhabitants are mostly engaged in fishing and rearing poultry. Pop. (1891) 2,600.

Tire'sias (Gr. *Τειρεΐας*): a celebrated soothsayer in Thebes. He was blind, but understood the language of the birds, and lived to a great age. Even after his death he did not lose his power of prophecy. He had a famous oracle near Orchomenus, but after a plague it became silent. The Greek mythology tells many stories of the origin of his blindness and soothsaying power.

Tir'hakah [Heb. = Egypt. *Tu-h-r-q, Taharqa, Tihara-qa*; the *Turkos* or *Tarakos* of Manetho]; an Ethiopian king (702-664 B. C.); an ally of the Egyptian king Shabataka of the twenty-fifth dynasty against Sennacherib (Senehrib) of Assyria, when the latter was subduing Syria and Palestine. The rumor of the approach of Tirhakah into Palestine caused Sennacherib to hasten affairs connected with Hezekiah of Judah and himself to advance toward Egypt, but a sudden pestilence caused an abrupt retreat to Nineveh, where he was soon afterward assassinated. Later, Tirhakah deposed and killed Shabataka (693 B. C.) and usurped the Egyptian throne, becoming the last king of the twenty-fifth dynasty. The remainder of his life was occupied with struggles against the Assyrian power and in attempts to achieve the freedom of Egypt. For his alliances with Hezekiah of Judah and other Phœnician and Syrian princes he was severely punished by Esarhaddon and Assurbanipal, kings of Assyria, who defeated him within Egypt itself and pursued him as far as Thebes, causing him to retreat into Ethiopia (672 and 667 B. C.). According to Greek writers he was a great warrior, but his own lists of conquered peoples are evidently copied from those of his predecessors. He was active in building operations at Thebes, but particularly at his original capital, Napata, near Gebel Barkal, in Nubia, where he erected a temple. C. R. G.

Tirlemont, *têr'le-môn'*: town; in the province of Brabant, Belgium; on the Grande-Geete; 30 miles E. S. E. of Brussels by rail (see map of Holland and Belgium, ref. 10-F). The churches of St. Germain, dating in part from the ninth century, and Notre Dame, founded in 1298, are its chief architectural features. It manufactures machinery, woolen stuffs, hosiery, leather, soap, malt, and gin, and carries on an active general trade. Pop. (1891) 16,157.

Tir'nova: town; in Bulgaria; on the Jantra, an affluent of the Danube; 35 miles S. S. E. of Sistova (see map of Turkey, ref. 3-D). It was the capital of the Bulgarian kingdom until 1394, and continued to be the seat of the Bulgarian patriarchate until its suppression in 1767. It has large dye-works and manufactures cloth and copper utensils. Pop. (1893) 12,858. E. A. G.

Tiro, MARCUS TULLIUS: the freedman and pupil of Cicero, to whom he became an amanuensis. He was also an author of some reputation, writing several works, including a life of his patron. To him is due the collection of Cicero's *Letters*. He is commonly believed to have invented the art of short-hand writing, hence the name *Nota Tironis* or *Tironiana*. (See *Stenography*.) It is believed he lived to the age of 100. Revised by M. WARREN.

Tirol: another spelling of *TYROL* (*q. v.*).

Tirso de Molina: See *TELLEZ, GABRIEL MAESTRO PRAY*.

Tiryns, *tîrinz* (Gr. *Tîrōns*): in Argolis; one of the most ancient cities of Greece. Its inhabitants appeared in history for the last time at the battle of Plataea, but shortly thereafter the city was destroyed by the Argives, though its massive walls still exist to excite the wonder of the visitor. Tiryns was excavated by Schliemann in 1884. See his *Tiryns*, but, better still, Schuchhardt, *Schliemann's Excavations* (London, 1891), and Perrot and Chipiez, *History of Art in Primitive Greece* (London, 1894). J. R. S. S.

Tischbein, *tish bin*, JOHANN HEINRICH WILHELM: painter; b. at Haina, Hesse, Feb. 15, 1751; received his first instruction in painting from his father, uncle, and elder brother, who all were painters of reputation; went in 1770 to the Netherlands, in 1779 to Rome, in 1787 to Naples, where he was director of the Academy of Painting from 1790 to 1799; returned in the latter year to Germany and settled in Hamburg. He painted many portraits, among which is one of Lady Hamilton, and some historical and allegorical pictures, but he is most widely known as an engraver. The Hamilton collection of Greek vases, published first in Naples, was his work. Of his original etchings the largest collection is a series of illustrations from Homer, published at Göttingen 1801-01. D. at Eutin, July 26, 1829. RUSSELL SCURGIS.

Tischendorf, LOBEGOTT FRIEDRICH KONSTANTIN, LL. D., D. C. L.: biblical scholar; b. at Lengenfeld, Saxony, Jan. 18, 1815; studied theology and philology at Leipzig 1834-38; was appointed Professor of Theology there in 1845. From an early period of his life he concentrated his study on a critical revision of the text of the New Testament; made extensive journeys in Europe, examining the materials for such a revision contained in the various European libraries, and visited Egypt, the Sinaitic Peninsula, Syria, and Pal-

estine in 1844, 1853, and 1859, the last time at the expense of the Russian Government. From the monastery of Sinai he brought back the famous *Codex Sinaiticus*, the oldest Greek manuscript of the Bible, which is now preserved in St. Petersburg, and was published in 1862 in 4 vols. fol. at the expense of the Emperor Alexander II. He has told the romantic story of its recovery in *Die Sinaiibibel* (Leipzig, 1871). The *Codex Sinaiticus* is written upon vellum sheets of extreme fineness and beauty and consists of 346 leaves, of which 199 contain 22 books of the Old Testament and Apocrypha in the Septuagint version, beginning at the first book of Chronicles, while the remaining 147 present the whole of the New Testament, the Epistle of Barnabas, and a part of the Shepherd of Hermas. (To these should be added the 43 leaves of the Codex Friderico-Augustanus.) D. in Leipzig, Dec. 7, 1874. The principal results of Tischendorf's researches were several critical editions of the New Testament, but he also published *Codex Ephraemi Syri* (1843); *Monumenta Sacra Inedita* (1846); *Evangelium Vaticanum Ineditum* (1847); *Codex Amiatinus* (1850); *Codex Claromontanus* (1852); *Novum Testamentum Vaticanum* (1867); *Monumenta Sacra Inedita, nova Collectio* (9 vols., 1854-65); *Acta Apostolorum Apocrypha* (1851); *Evangelia Apocrypha* (1853); *Apocalypse Apocrypha* (1866); *Reise in den Orient* (2 vols., 1845-46); *Aus dem heiligen Lande* (1862); and *Wann wurden unsere Evangelien verfasst?* (1865); translated into English, *When were our Gospels written?* and many other languages). His prolegomena to the 8th ed. of his larger Greek New Testament were completed in a remarkable manner by C. R. Gregory, who examined every uncial and very many cursive MSS. of the New Testament (Leipzig, 1884-90). Revised by S. M. JACKSON.

Tis'ri [= Heb. *tishrî*, deriv. of Chald. *sherâ*, open, begin]: the first Hebrew month of the civil year and the seventh of the ecclesiastical year. It corresponds to part of September and October.

Tissaphernes: Persian satrap. He was appointed satrap of Lower Asia by Darius II. Nothus in 414 B. C. In the reign of the latter's successor, Artaxerxes II., Tissaphernes received the command also in Asia Minor after the death of Cyrus at the battle of Cunaxa. His attempt, however, to punish the Greek cities which had supported Cyrus was unsuccessful. They were supported by the Spartans, and the Persians were defeated by Agesilaus in Lydia. Meanwhile his treachery and cowardice had made him contemptible in the eyes of Artaxerxes, and on the instigation of Parysatis, the king's mother, he was assassinated at Colossæ, Phrygia, in 395.

Tissot, *tê'sô'*, JAMES: genre-painter; b. at Nantes, France, Oct. 15, 1836; pupil of Lamothe and Flaudrin; medal, Salon, 1866; first-class medal, Paris Exposition, 1889. He lived for a number of years in London and did not exhibit in the Salon after 1870. He reappeared, however, at the Salon of the Champ de Mars in 1891 with a series of pictures representing the life of Christ. One of his earlier works, *The Meeting of Faust and Marguerite*, painted in 1861, is in the Luxembourg Gallery, Paris. W. A. C.

Tissues: See *HISTOLOGY* and *FIBROUS TISSUES*.

Tisza, *tee sâ*, KOLOMAN BOROSIENÖ, von: statesman; b. at Grosswardein, Hungary, Dec. 16, 1830; was educated for the civil service, and became a member of the Hungarian Reichstag in 1861. At first a leader of the moderate radicals, he founded a new liberal party made up for the most part of the followers of Deák, and controlled the majority in the Reichstag. He held the portfolio of the Interior in the ministry of Wenkheim, and on Oct. 21, 1875, became Prime Minister of the Hungarian cabinet, a position which he held for over fourteen years. Possessing the confidence of the majority of the nation, he has done more than any other Hungarian statesman in reorganizing the state and, while promoting harmony between his own and the imperial Government, in raising the position of Hungary to one of controlling importance in the Hapsburg empire. In 1876-78 he opposed the policy of Russia respecting Turkey, but acquiesced in the proposed Austrian occupation of Bosnia and Herzegovina as a necessity of the war, and when the financial condition of the imperial government prevented that occupation, he resigned with his co-ministers. Subsequently, however, he resumed his office, which he held till 1890, retaining his seat in the new parliament. See *Visi, Koloman Tisza* (Budapest, 1886). F. M. COLBY.

Tit: See *TITMOUSE*.

Titanic Dioxide, generally called **Titanic Acid** (TiO_2) [*titanic* is deriv. of *titanium*. See TITANIUM]: a compound which constitutes three distinct mineral species—*octahedrite*, *brookite*, and *rutile*. A synonym of octahedrite is *anatase*, and a synonym of brookite is *arkansite*. Of the three mineral forms of titanic dioxide, *rutile* is far the most abundant. The commoner varieties have a peculiar reddish tinge, and a luster of a peculiar dark metallic brilliancy on the cleavages, which, with its high density, enables it to be distinguished at a glance by those expert in minerals. Its hardness is between those of quartz and felspar. The crystals are dimetric or tetragonal, and usually prismatic, sometimes acicular, and are found in the latter form penetrating transparent quartz-crystals from side to side in a great many directions, like needles, forming interesting cabinet specimens known as "rutilated quartz." In these cases the rutile needles have evidently been first formed, crossing a cavity filled with the menstruum from which they were deposited, in which the quartz has subsequently crystallized out from the same or some other menstruum. In the U. S. there are a great many localities in which rutile is found. *Brookite* is trimetric or orthorhombic in crystallization, translucent, with cleavage less distinct than rutile, but having the same metallic adamantine luster. It has been found in small crystals in North Carolina placer gold, at Paris in Maine, and at Ellenville in Ulster co., N. Y., and in a number of foreign localities. At the celebrated mineral locality at Magnet Cove, Ark., it is found as the variety *arkansite*, so called by Prof. Charles U. Shepard, which is described as iron-black and opaque, though nearly pure titanic oxide, according to Whitney and Danour. *Octahedrite*, or *anatase*, is tetragonal like rutile, but with very different angles and cleavages. It is usually octahedral in form, highly lustrous like diamond, and sometimes mistaken for it in placer washings. In North America, it occurs in dolomite at Smithfield, R. I.

Revised by IRA REMSEN.

Titanium [Mod. Lat., named in fanciful allusion to the Titans, from Lat. *Titānes* = Gr. *Τῑτῑνες*, Titans]: an element first discovered by Dr. William McGregor, in examining the mineral now called *menaccanite*, from Menachan in Cornwall, in 1791. It was afterward found by Klaproth (in 1794) in *rutile*, and called by him in 1797 *titanium*. Titanium is quite an abundant element. For a long time certain cubical crystals of a copper color found in blast furnaces were believed to be metallic titanium, but Wöhler proved that these contain cyanogen and nitrogen. The element is obtainable by heating the double fluoride of titanium and potassium with sodium. It is described as a dark-green, heavy powder, which can not be burnished and is infusible. Titanium occurs in many minerals. The three minerals *rutile*, *brookite*, and *anatase* are all TITANIC DIOXIDE (*q. v.*). *Menaccanite* or *ilmenite*, in which titanium was first discovered, contains titanic dioxide with iron oxides. *Sphene* or *titanite* contains titanate and silicate of calcium. *Perovskite* is simple calcium titanate, and it is very common in magnetic iron ores and many other minerals. Titanium forms three chlorides, $TiCl_2$, a black powder, $TiCl_3$, lustrous dark-violet scales, and a colorless transparent liquid tetrachloride, $TiCl_4$. It is believed to form two compounds with oxygen, the sesquioxide, Ti_2O_3 , and the dioxide, TiO_2 . The chief practical interest that attaches to titanium is in consequence of its frequent occurrence as a constituent of iron ores, chiefly of magnetite, which passes into ilmenite or menaccanite, the two apparently occurring mixed in all proportions, and called titaniferous iron ore. Such ores are liable to be very pure—that is, free from sulphides and phosphates—but, unfortunately, it happens that the titanium is excessively difficult to flux out from the mass, leading apparently to form slags of very difficult fusibility, thus limiting their use greatly. It has been reported that this obstacle has been overcome.

Revised by IRA REMSEN.

Titanotherium [Mod. Lat.; Gr. *Τῑτῑν*, a Titan + *θηρῑον*, wild beast]: a genus of extinct mammals first found in the Mauvaises Terres, or Bad Lands, of South Dakota. The formation is Miocene, and the bones of this animal were the first fossils obtained from the region. Later researches in Nebraska and Colorado have shown that this genus is but one of an extinct family of herbivorous mammals including several genera, viz., *Titanotherium*, *Brontotherium*, *Brontops*, and others. The best-known genus is *Brontotherium*, and its principal characters are as follows: The skull is long and depressed, and resembles that of the rhinoceros. There is a pair of large horn-cores on the anterior part of the skull, in

front of the orbits. They stand on the maxillary bones, and are placed transversely, as in ruminants. The nasal bones are greatly developed and firmly co-ossified. They are produced in front, and overhang the nasal orifice. The dental formula is as follows: incisors, $\frac{2}{2}$; canines, $\frac{1}{1}$; premolars, $\frac{3}{3}$; molars, $\frac{3}{3}$. The brain-cavity is small in proportion to the skull. The cerebral hemispheres did not extend at all over the cerebellum, and but little over the olfactory lobes. The neck was stout and of moderate length. The atlas is large, and much expanded transversely; the axis massive, and its odontoid process stout and conical. The lumbar are slender and smaller than the dorsals. There are four sacral vertebrae. The caudals indicate a long and slender tail. The limbs were intermediate in proportion between those of the elephant and the rhinoceros. The radius and ulna are separate. The carpal bones are shorter than in the rhinoceros, and support four stout toes. The fibula is separate from the tibia. There were three toes on the hind foot, of nearly equal size. None of the bones of the skeleton is hollow. The *Brontotherida* nearly equaled the elephant in size, but the limbs were shorter. The nose was probably flexible, as in the tapir, but evidently there was no true proboscis. All the remains yet known are from the Miocene beds of the Rocky Mountains, in South Dakota, Nebraska, Wyoming, and Colorado. O. C. MARSH.

Titans [from (and transl. of) Lat. *Titānes* = Gr. *Τῑτῑνες*]: in Greek mythology, the children of Uranus and Gæa, numbering, according to the most common record, twelve—six male, Oceanus, Coeus, Crinis, Hyperion, Iapetus, and Cronus; and six female, Themis, Rhea, Tethys, Phœbe, Mnemosyne, and Themis. Uranus feared his own children, and shut them up in Tartarus, but by the aid of Gæa they broke out of the prison, overthrew their father, and placed Cronus on the throne. The curse, however, which Uranus let fall on his children was fulfilled. Cronus was dethroned by his own son, Zeus, and the Titans were once more imprisoned in Tartarus, where the Cyclopes and Hundred-handed were set to watch them. Among their descendants were Atlas, Prometheus, Helios, Hecate, and Selene.

Revised by J. R. S. STERRETT.

Tite, SIR WILLIAM, F. R. S.: architect; b. in London, England, in 1802; educated at a private school; was articled as a pupil to Mr. Laing, the architect of the custom-house; was intrusted with the rebuilding of the Church of St. Dunstan's-in-the-East, which he executed so successfully in the Gothic style, then recently become popular, as to gain a high reputation; was employed to erect a Gothic church for the celebrated Edward Irving; subsequently built many public and private edifices, including some of the largest railway stations of England and France; became architect to the new Royal Exchange 1840; was for some time president of the Architectural Society and of the Royal Institute of British Architects; was elected Liberal member of Parliament from Bath 1855; was governor of the London and Westminster Bank and of the Bank of Egypt and member of parliamentary committees on banking, and was knighted in 1869. He published some essays and lectures, and was author of a *Descriptive Catalogue of the Antiquities found in the Excavations at the New Royal Exchange* (1848), and other miscellaneous writings. D. Apr. 20, 1873.

Tithes [M. Eng. *tithe*, *tethe* < O. Eng. *tīoða*, liter., tenth, a tenth, for *teog(e)ða*; cf. Goth. *tīgus*, a decade: Gr. *δεκάς*]; taxes, consisting of one-tenth of the annual profit of land, stock, or labor, which, instituted by Moses, was paid by the Jews for the maintenance of the Levites and in compensation for their service in the temple (Lev. xxvii. 30-33; Num. xviii. 21-24). Of this tithe the Levites paid a tenth to the priests (Num. xviii. 26, 28). Deut. xiv. 22-29 enjoins the payment of a second tithe which was either to be eaten before the Lord, if it were in produce, or turned into money and the money spent for food to be eaten at the central sanctuary. In this feast the Levites shared. Every third year there was apparently a third tithe in kind which was to be eaten by all comers to the feast. Tithes were known also to Roman law, but are no part of New Testament legislation. In the Christian Church they were first enjoined about 350 as due for the support of the clergy, recommended by the Second Council of Tours, 567 (see Harduin's *Councils*, iii., 368), and first decreed by the Second Council of Macon, 585 (see Harduin, iii., 461). They were not firmly established, however, in Germany, France, and England until the ninth century, and in the Scandinavian countries not until the eleventh century. Even before the period of the Reformation, but

especially after that time, the tithes became subjects of bargains, of buying and selling, like other property. Originally they were paid in kind, but in the eighteenth century a certain sum of money was generally substituted. In France they were finally abolished by the Revolution. In England tithes were collected from early times in support of the Church. Such tithes up to the value of 40s. must be paid. See J. Selden, *History of Tithes* (London, 1618); H. W. Clarke, *History of Tithes* (1891; 2d ed. 1894). See also HEREDITAMENTS.

Revised by S. M. JACKSON.

Titian, tish an, or **Vecellio**, vā-che'lli-ō, TIZIANO; painter; b. at Pieve di Cadore, Italy, in 1477. At the age of ten years he was sent to Venice, where he first studied the principles of art with Sebastiano Zuccato; he then worked with Gentile Bellini, but soon preferred the instruction of Giovanni Bellini, whom he left to work under Giorgione. In 1507 Giorgione and Titian painted together at the Fondaco de' Tedeschi, decorating the exterior with frescoes. Titian was after this invited to Padua, where he executed three frescoes in the building called the Senola del Santo, the oratory or service-house of St. Anthony, in 1511. At the death of Giovanni Bellini, Titian received the order to continue the work in the hall of the Grand Council of the ducal palace at Venice, which Bellini had left unfinished, and the senate showed their satisfaction with the work done by conferring on him an office which brought 120 crowns a year and the obligation of painting for eight crowns the portrait of every doge created during his lifetime. Pietro Lando, Francesco Donato, Marcantonio Trevisano, and the Venieri were all painted by the great master, who on account of the infirmities of age was unable to portray the last two doges of his time. In 1517, at the call of Alfonso d'Este, Titian went to Ferrara and executed several great works, among them the *Bacchus and Ariadne*, and the *Sacrifice to the Goddess of Festivity and The Bacchanal*, both in the Madrid Gallery. Titian was employed by princely clients until 1523. He was then recalled to Venice to paint the Doge Gritti, and his fresco above a staircase of the ducal palace of *St. Christopher carrying the Christ Child* is one of this period, and an example of his power in this branch of painting. His marriage took place about this time, and in 1530 he was already a widower with three children. In 1530 Titian was called to Bologna to paint a portrait of Charles V., who had come there to meet the pope. He then went to Mantua with the Duke Federigo Gonzaga to execute several commissions for him. He returned in 1532 to Bologna to paint a second portrait of the emperor, and was then rewarded by receiving the order of the Golden Spur, which brought with it the title of Count Palatine of the Lateran. Ten years later Titian was again called to Bologna to paint a portrait of Pope Paul III. In 1545 he was in Rome, where he produced one of his most famous portrait-pieces, representing the pope and his relatives the Cardinal Alessandro Farnese, and the Duke Ottavio Farnese, the pope's relatives. Titian spent but one year in Rome, and must have declined the post offered to him, according to Vasari, at the death of Sebastiano del Piombo by the holy father. In 1547 Titian was summoned to Augsburg by the emperor, who employed him to paint the portraits of the great or noble men around him there. Titian was in great favor with the emperor, and after two years of court life he returned to Venice much the richer, but always greedy of wealth, even showing himself servile in his anxiety to obtain it. He returned to the imperial court in 1550. Philip II., King of Spain, showed himself as great a patron and friend of Titian as his father. We read of his writing an order to the governor of Milan to pay up the arrears of Titian's pension of 400 crowns, granted by his father, but he seems to have been less ready to pay his own debts, for in Titian's letters, written in the last year of his life, he recalls to Philip the work of the past twenty years, for which he has not been paid. Vasari wrote his notice of Titian during the painter's life-time, and describes how he went to visit him in Venice, where he was still painting in his house. Titian lived luxuriously, and received all the princes and learned and famous men of his time. He had the most pleasant and courteous manners. He is the only painter who worked for a period of ninety years. He was carried off by the plague Aug. 27, 1576. He had among his scholars his younger brother Francesco, his son Orazio, his nephew Marco, and his cousin Cesare. Among his most famous pictures are the *Tribute Money* of the Dresden Gallery; the *Sacred and Profane Love*, in the Borghese Gallery, Rome; the *Assumption of the Virgin*, in the Academy

at Venice; the *Presentation of Giovanni Pesaro to St. Peter*, in the Antwerp Museum; the *Entombment*, in the Louvre; and the *Bacchus and Ariadne* and *Venus and Adonis* in the London National Gallery. For further information, see Crowe and Cavalcaselle, *Life and Times of Titian* (London, 2d ed. 1881); R. P. Heath, *Titian*, portrait and illustrations; S. Ticozzi, *Vite dei Pittori di Cadore* (1819); J. Northcote, *The Life of Titian*. W. J. STILLMAN.

Titicaca, tō-tōs-kaa kāa; the largest inland lake of South America; on the confines of Bolivia and Peru, 12,545 feet above sea-level. Area, 3,200 sq. miles. The Titicaca, often called the Bolivian plateau, is the most remarkable of the high inclosed basins of the Andes. It is situated between the Eastern Cordillera, here called the Andes, and a broken and irregular western range, known collectively as the Cordillera Real; the latter includes the highest and most imposing mountains in Bolivia, but has comparatively low passes between Lake Titicaca and La Paz. Northward, the basin is separated from the plateau of Cuzco and the Amazonian watershed by the Vileñaflota cross-range; southward, other cross-ranges mark its limits with smaller mountain basins near the boundary of the Argentine Republic. The Titicaca basin is thus completely inclosed. It is about 600 miles long from N. to S., 150 miles wide, and has an area of probably 100,000 sq. miles. The average elevation is about 13,000 feet, but the surface is irregular, with isolated hills and low mountains, and partial cross-ranges. Much of the land is sterile, and the climate is so cold that most cereals will not grow; yet the basin supports a considerable population, mainly of Aymara Indians, who plant potatoes, quinoa, etc. The most important Bolivian copper mines are situated in it, and it contains silver and other metals, and perhaps coal. Lake Titicaca is near the northern end. It is irregular in form, contains several small islands, and projecting peninsulas nearly cut off portions on the southern and eastern sides. Near the eastern shore it attains in some places a depth of over 700 feet; elsewhere, and especially at the southern end, there are extensive shallows, covered with tall reeds. For a long time the only navigation was by curious Indian rafts or boats, made of bundles of reeds; small steamboats now ply between the southern end and Puno on the W., whence a railway runs to Arequipa and Mollendo; this is one of the routes from the Pacific to La Paz. The islands, peninsulas, and shores contain many ruins, some of the Incan period, others (as the celebrated Tiwanacua ruins in Bolivia) much older. Some of the most interesting remains are on the peninsula of Copacabana, near the southern end of the lake crossed by the boundary between Peru and Bolivia. This was a sacred place of the Incas, connected with many of their traditions. In modern times it has been celebrated for a chapel with an alleged miraculous painting of the Virgin, which is yearly visited by thousands of pilgrims. The reedy shallows were long the haunts of Uru Indians, who issued from their secret recesses to attack the Spaniards; the few who remain are harmless. From the southern end of the lake issues the Desaguadero, a deep and rapid river, 190 miles long, lying entirely in Bolivia. It empties into Lake Aullagas or Poopó, which is rather a swamp than a true lake, and has a much smaller area than Titicaca. Beyond this the waters are lost in swamps and sands. It is probable that the whole basin was formerly filled with water, forming an inland sea. See Squier, *Peru* (New York, 1877). HERBERT H. SMITH.

Titicns, or **Tietjens**, tect yens, THERESE CAROLINE JOHANNA; singer; b. in Hamburg, Germany, of Hungarian parents, July 18, 1831. She appeared for the first time at the Hamburg Opera in 1849 as Lucrezia Borgia, and achieved an immediate success. She went to Frankfort, and in 1856 to Vienna, where she was also well received. Subsequently she was engaged for her Majesty's theater in London. She appeared as Valentine in *The Huguenots*, Apr. 13, 1858. Her impersonation was much admired and each repetition of the opera increased her reputation. She afterward sang at Covent Garden and at Drury Lane, as well as at her Majesty's theater, and remained in London until 1876, when she visited the U. S. In the same year she had a large beautiful concert at the Albert Hall, London. Her last stage appearance was made May 19, 1877, as Lucrezia. Her voice was a rich and sweet soprano, extending to the highest register. Her versatility was remarkable, and she sang in so perfectly opposite rôles as Semiramide and Piles. Her voice was also well suited to sacred dramatic music and oratorio. D. in London, Oct. 3, 1877. B. B. VALENTINE.

Titin'ius: a Roman comic poet, who, after the death of Terence, was the first to exhibit the so-called *Fabule Togate*, the scenes of which were drawn from Roman life, and not based upon Greek plays. He was especially skillful in the delineation of character. Fragments of his plays, over 180 verses and fifteen titles, are collected by Ribbeck (*Com. Rom. Frag.*), pp. 133-160.

Titlark, or Pipit [*titlark* is *tit*, a small bird + *lark*; *pipit* is a name given on account of its note]: any bird of the genus *Anthus* and group or sub-family *Anthinae*. The titlarks are generally associated with at least the wagtails (*Motacillinae*) in a family, *Motacillidae*, and contrasted with them by the comparative shortness of the tail (shorter than the wings), which is emarginated, and has the two central feathers shorter than the lateral, and all broadest near their ends, and boldly round at the extremities. They are

American titlark.

mostly grayish brown, and in the under parts variously streaked. Over fifty species are known, and almost every land has representatives of the group. They are birds of passage, insectivorous and graminivorous, rather fine songsters, and graceful in appearance and movements. Three species are found in the U. S.—namely, *Anthus pensilvanicus* (American titlark or pipit), *A. spraguei* (Missouri skylark), and *A. cervinus*; a fourth species (*A. pratensis*, or European titlark) sometimes straggles into Greenland and Alaska.

Revised by F. A. LUCAS.

Title [from O. Fr. *title* > Fr. *titre* < Lat. *títulus*, inscription, label, title]: in law, a word often used as synonymous with property, or right of ownership, but in its technical signification denoting the sources of such right, or the facts and events whereby property in land or goods is acquired. In this sense the common law divides all titles to real property into two classes—*by descent* and *by purchase*. Title by descent includes the single mode of acquisition through inheritance; title by purchase embraces all other methods. A more convenient classification is that which places in one group the several methods of acquisition of property, real and personal, by acts *inter vivos*, and in a separate group the different modes of acquiring property on the death of the former owner. The first class will then include (a) *original acquisition* (accretion, finding, etc.); (b) *lapse of time* (prescription and limitation); (c) *eminent domain*, or the taking of land by or under the authority of the State; and (d) *conveyance* (including gift as well as sale), which may be effected in various forms, but is now, in the case of real property, usually accomplished by deed, known as a grant, and, in case of personal property, by delivery or writing. In case (a) it is assumed that there was no previous ownership of the property; in cases (b) and (c) the acquired title has no reference to such previous ownership as may have existed; while (d) presents the ordinary case of the transfer of the right of property from one to another.

The second class comprehends the various modes in which the death of the owner operates to transfer property, viz.: (a) *descent*, (b) *occupancy*, (c) *gift causa mortis*, and (d) *wills*.

For more detailed information concerning the several modes of acquisition above enumerated, the reader should consult the several articles bearing those titles. See also Digby's *History of the Law of Real Property*, chap. x.; Schouler's *Personal Property*, vol. ii.; and the treatises of Williams on *Real Property* and *Personal Property*.

GEORGE W. KIRCHWEY.

Titmouse, Tit, or Tomtit [*titmouse* < M. Eng. *titemose*, *titemose*; *tit*, small, small bird + O. Eng. *māse*, a kind of small bird; cf. Germ. *meise*, titmouse]; any bird of several species of the family *Paridae*. They are small birds with soft and lax plumage, a stout conical bill shorter than the head, the wings rounded and short, and the sides of the toes expanded into a palm. The group belongs chiefly to the Northern hemisphere, and more to the Old World than to the New; North America possesses but thirty species and

The blue tit.

sub-species out of nearly a hundred. They are mostly birds of dull plumage, although there are some exceptions, like the blue tit of Europe (*Parus caeruleus*), which is blue and yellow. *Parus wollweberi*, the species found in the western parts of the U. S., and its eastern relative, *P. bicolor*, are crested. The CAPE TITMOUSE (*q. v.*) is found at the Cape of Good Hope. One of the most familiar species is the CHICKADEE (*q. v.*), which, like most of the group, is a hardy bird. Titmice feed on insects and seeds; some nest in holes of trees, others make curious and for the size of the bird large, bottle-shaped structures; the eggs are numerous, eight or nine, and two broods are frequently raised in a season.

F. A. LUCAS.

Titus: a disciple and companion of St. Paul, to whom one of the canonical epistles of the New Testament is addressed. He was a Gentile, but his native place is uncertain, the probability being in favor of Antioch, as he first appears as a delegate from the church of that city, accompanying Paul to Jerusalem. He was a companion of the apostle in his next missionary journey to Asia Minor and Macedonia, and was twice charged with important missions to the church at Corinth. At some time—whether before or after Paul's (first) imprisonment can not be ascertained—Titus took part with Paul in founding the churches in Crete, where he was laboring as an evangelist when Paul's pastoral Epistle was written. He appears to have rejoined Paul at Nicopolis in Epirus, and was thence sent into Dalmatia, from which time all certain traces of him disappear. Tradition makes him Bishop of Crete.

Revised by S. M. JACKSON.

Titus: Bishop of Bostra, in Arabia; d. during the reign of Valens; one of the most distinguished fathers of his time, and spoken of with the highest praise by Jerome. Of his life nothing is known but his conflict with Julian the Apostle, who accused him of inciting the Christians to use violence. His work against the Manichaeans was published by P. de Lagarde in the complete Syriac version (Berlin, 1859); a partial Latin translation is found in Migne, with the Greek text of the first three books.

S. M. J.

Titus, Epistle to: one of the so-called pastoral Epistles of the New Testament canon, written by Paul to convey instruction as to the work in Crete, with the execution of which Titus had been commissioned. If the hypothesis of

Paul's second imprisonment be true, this Epistle and the first to Timothy were written during Paul's journey to Asia Minor and Greece, before his last imprisonment. The Epistle, it is thought, was written from Nicopolis, probably the Epirote town of that name, and not the Macedonian city. See PAULINE EPISTLES. Revised by S. M. JACKSON.

Titus Fla'vius Sabi'nus Vespasia'nus (commonly called by his prenomen **TRUS**): Roman emperor (79-81); b. Dec. 30, 40 A. D.; a son of Vespasian and Flavia Domitilla. Titus was educated with Britannicus, the son of Claudius, with whom he formed an intimate friendship. He served under Vespasian in the Jewish war, and on Vespasian's return to Rome as emperor in 69 Titus was left as commander-in-chief, and finished the war by taking and destroying Jerusalem, Sept. 8, 70. After his accession to the throne (June 24, 79) Titus disappointed the general expectation by ruling justly and humanely. The *delatores* (informers) were punished, and prosecutions for treason came to an end. Many splendid public buildings, the Colosseum, the baths, etc., were finished and dedicated with magnificent festivals for the people; and the emperor showed a generous disposition to help the people under the great calamities which befell them during his reign—the destruction of Herculaneum, Pompeii, and Stabia by the terrible eruption of Vesuvius; the conflagration in Rome in the following year, by which the Capitol, the library of Augustus, and many of the most magnificent edifices of the city were destroyed; and, finally, the plague. Titus died Sept. 13, 81, at Reate, in the Sabine country, and was succeeded by his brother Domitian.

Revised by C. H. HASKINS.

Titus Livius: See LIVY.

Titusville: city (village founded in 1832, city incorporated in 1867); Crawford co., Pa.; on the Dunkirk, Alleg. Val. and Pitts. and the West. N. Y. and Pa. railways; 28 miles E. of Meadville, the county-seat, and 100 N. of Pittsburg (for location, see map of Pennsylvania, ref. 2-B). It is regularly laid out on a plateau which slopes to the S., affording natural facilities for drainage, of which advantage has been taken in the construction of an excellent system of sewerage. Water for domestic use and manufacturing purposes is obtained from inexhaustible wells, and is pumped directly to the places of consumption. The city owns the water-works and one of two electric-lighting plants, and contains illuminating and fuel gas plants. There are 10 churches and 2 synagogues, 5 large public-school buildings and a high school, several hotels, a national bank with capital of \$300,000, a State bank with capital of \$150,000, a private bank, and a daily, a monthly, and 4 weekly newspapers. Titusville has been an important oil-center since 1859, when E. L. Drake successfully drilled the first petroleum well in North America on Oil creek, 2 miles S. of the city. (See PETROLEUM.) The city has several pipe-line systems for conveying both crude and refined petroleum in different directions, and its principal manufactures are in connection with the petroleum industry. These include engines, boilers, car-tanks, oil storage-tanks, and the various kinds of machinery used in connection with petroleum; refineries for making illuminating oil, gasoline, etc.; and plants which turn out various products of paraffin, including soap. Other articles that are manufactured in this city are harness, steel, acids, furniture, novelty goods, steam-heaters and radiators, and leather. Pop. (1880) 9,046; (1890) 8,073; (1895) estimated, 9,000.

H. L. HERSHBERG,

SECRETARY TO THE BOARD OF TRADE.

Tichey, tîc-oo-chef', FËDOR IVANOVICH: poet; b. near the town of Briansk, Russia, Nov. 23, 1803. He filled diplomatic positions in Munich and Turin from 1823 to 1841; served in the bureau of censors in St. Petersburg from 1844 until his death July 15, 1873. His occasional short poems, which had long found little favor, suddenly became popular in 1854. Tichey may be regarded as a late member of the romantic school prevalent earlier in the century, though he had more dreaminess and delicacy than passion. He was an ardent Slavophil, but his patriotic pieces are not his best. His complete works were published in 1886. His writings have been translated into German (H. Noe, Munich, 1861). See biography of him (in Russian) by his son-in-law, I. Aksakov (1874), and article by M. de Vogüé in *Regards historiques et littéraires* (1892).

Timmen, tîc-oo-men', or **Tynmen**: town of Siberia; government of Tobolsk; on the Thura, an affluent of the Ob; 90 miles S. W. of Tobolsk (see map of Asia, ref. 3-E). It is the oldest, but at the same time one of the handsomest and

most prosperous, of the Siberian cities. It is a central point on the Trans-Siberian railway, an entrepôt for the traffic between Russia, Siberia, the Kirghiz territory, Bokhara, and China, and has extensive manufactures of leather, tallow, candles, pottery, mats, wooden articles, carpets, and coarse woolen fabrics. Pop. (1891) 36,763.

Revised by M. W. HARRINGTON.

Tiverton: town; in Devonshire, England; at the confluence of the Exe and Loman; 14 miles N. by E. of Exeter (see map of England, ref. 14-E). It has some fine buildings, including a church, portions of which date from the fifteenth century, and Blundell's free grammar school, the later buildings of which were erected in 1880 in the Tudor style at an expense of \$20,000. Lace-making is the principal industry, employing about 1,800 people. Pop. (1891) 10,892.

Tivoli, tîc vî-lîc (anc. *Tibur*): town; 19 miles E. N. E. of Rome, Italy; in a bend of the Anio, left-hand affluent of the Tiber; on the northern versant of Mt. Repoli, 1,060 feet above sea-level (see map of Italy, ref. 6-E). It is a station on the railway connecting with Rome. It is a busy town and manufactures woollens, thread, and wire. The falls of the Anio were utilized for the plant established in 1892 for the electric illumination of Rome. Tivoli was founded about 500 years before Rome, and is equally noted for its natural beauties and for its ruins and antiquities. It has long been a favorite pleasure resort for the Romans, and with it are associated the names of Mæcenas, Horace, Propertius, Catullus, Hadrian, and Zenobia. Among the objects of interest are the Temple of the Sibyl, the falls of the Anio, and the constructions to protect the city from the river, the ruins of the villa of Varus, of the so-called villa of Mæcenas, now believed to be the temple of Hercules the Conqueror, that of Hadrian, and that of Este. Pop. 10,950.

M. W. H.

Tixtla, tîcst-lâ: a town and the former capital of the state of Guerrero, Mexico; in a valley 5 miles E. of Chilpancingo, the present capital; about 4,000 feet above sea-level (see map of Mexico, ref. 8-II). The valley here forms a fertile and well-watered plain, and the town is surrounded by gardens and fruit-trees. In 1811 Tixtla was captured by Morelos, and soon after he repulsed the royalists here; it was long a revolutionary center. Pop. 8,000. H. H. S.

Tlaxcala, or **Tlascalala**, tlanth'kân-lâ [Mex., liter., land of maize]: an interior state of Mexico, surrounded by Hidalgo, Puebla, and Mexico. Area, 1,506 sq. miles. It is the smallest of the Mexican states, and lies entirely on the plateau. The surface is much broken, and on the western and southern frontier there are high mountains—Malintzin or Malinche, on the S. E., attains 13,500 feet, and is crowned with snow. The principal occupation is agriculture, the most important crops being maize, wheat, and maguey from which the Mexican markets are supplied with pulque. There are few mines, though silver and coal deposits are known. The manufactures, especially of cotton and woolen cloths, are quite important. At the time of the Spanish conquest the territory of Tlaxcala was occupied by the Tlaxcalans, a warlike tribe of the Nahuatlcan stock, who had never submitted to the confederated pueblos of the Mexican valley. They resisted Cortés fiercely (1519), but finally sued for peace and became his allies in the march to Mexico, and the subsequent siege. Pop. of the state (1893), estimated, 142,515; a large proportion are civilized Indians descended from the ancient Tlaxcalans. Tlaxcala, the capital and largest town, is on the railway between Puebla and Apizaco, in the valley of the river Atoyac, which here furnishes water-power for several factories (see map of Mexico, ref. 7-II). It exports grain, hides, cloths, etc. The town is on or near the site of the ancient Indian capital. Pop. about 8,000.

H. H. S.

Tlemeen, tlem-sen': town; in the province of Oran, Algeria; 80 miles S. W. of the city of Oran. It is well built and is in a fine plain, sheltered against the scorching S. winds by a chain of lofty mountains, cultivated with great care, and producing olives, figs, grapes, and other kinds of fruit in abundance. Tlemeen has some manufactures of leather, carpets, and woolen fabrics, and a considerable trade in wool, grain, and fruit. It is on the railway running to Rahgun. Pop. (1891) 19,802.

Revised by M. W. HARRINGTON.

Tmesis [Gr. τμήσις, severance, deriv. of τέμνειν, cut]: a technical term of the old Greek grammarians applying to the Epic usage of separating the verb and its qualifying preverb in cases where the later Attic usage shows a compound verb; thus ὑπὸ δ' ἔσχετο μισθόν (for Attic ἐπίσχετο).

As the Epic really represents the more original usage, the term is a misnomer. The term is often given in modern grammar a wider application covering all cases in which a compound term appears with disjoined elements, as *to us ward, what place soever*.
 BENJ. IDE WHEELER.

Toad [M. Eng. *tode*, *tude* < O. Eng. *tādlic*; cf. TADPOLE]; any one of various species of *Salientia*, or tailless batrachians, having a short body and legs and a warty skin. There are no ribs nor teeth, and the tongue is free behind. The young, like frogs, pass through a tadpole stage. Most of the animals thus characterized belong to the family *Bufo*nidae, although a few belong to other allied groups. Toads are found in all parts of the globe (save, of course, the colder portions) except the Australian region. They live upon insects, grubs, etc., which they catch in large numbers with their peculiarly arranged tongue, which can be rapidly protruded and withdrawn, and are of considerable service to gardeners. They either burrow in the earth at the approach of winter, and there hibernate, or pass the cold season in convenient holes. There is no foundation for the stories that toads are found imbedded in solid rock, or in the trunks of trees, nor are toads poisonous except to the extent that their skin secretes an acrid fluid, which is extremely unpleasant to carnivorous mammals, and is thus protective. The common toad of Europe (*Bufo vulgaris*) is found also in Asia and Northwestern Africa. It is about the same size as the common toad of the U. S. (*Bufo lentiginosus*), but the American species has ridges along the skull, while the European has none. Over 100 species are known.
 F. A. LUCAS.

Toad-fish: any fish representing either of the families *Batrachida* and *Antennariida*. These two forms belong to distinct orders, and have really little in common except a certain hideousness of aspect other than fishes generally have, although they were formerly associated together, even by scientific ichthyologists (e. g. Cuvier), and Günther (*The Study of Fishes*, pp. 467-469) still places them in adjacent families.

The *Batrachida* are carnivorous fishes inhabiting many tropical and temperate seas, but the species are not very numerous. They are bottom fishes, living mostly in the mud, and in some instances ensconce themselves in the empty valves of shells. Fish of the genus *Batrachus* are to be feared on account of their bite, as their teeth and jaws are quite strong, and those of *Thalassophryne* on account of the wounds which they can inflict with their opercular spines. The opercular spines of most of the species are solid, but those of *Thalassophryne* are hollowed, and at their bases are poison-glands. The species are generally of moderate size, but one (the so-called *Batrachus gigas*), made known by Günther in 1869 (*Ann. and Mag. Nat. Hist.*, vol. iii., p. 131), from the Seychelles islands, ranks among the largest of true fishes. Less than twenty species of the family are known, which have been generally distributed under three genera, *Batrachus*, *Thalassophryne*, and *Parichthys*, but the first is a heterogeneous group. The toad-fish of the Atlantic coast of the U. S. is from 10 to 18 inches long, brownish in color in the north and light yellow in the Gulf of Mexico. In spite of its repulsive appearance it is said to be sweet and palatable, by those fishermen and ichthyologists who have had the courage to eat it. See G. B. Goode, *History of Useful Aquatic Animals*, in *The Fisheries and Fishing Industries of the United States*, 1884.

The *Antennariida* (or *Chironactida*) belong to the order *Pediculari*. The family is quite rich in species, remarkable for their grotesque physiognomy and often rich colors. They are mostly inhabitants of the open or deep tropical seas. Not far from fifty species are known. They are divisible among three sub-families and six genera, viz: (1) *Antennariinae*, with the genera *Pterophryne*, *Antennarius*, *Histiophryne*, and *Saccarius*; (2) *Brachionichthyinae*, with the genus *Brachionichthys*; and (3) *Chamaeinae*, with the genus *Chaunax*. The *Pterophryne larigata* builds a nest in the floating seaweed of the open sea.

Revised by E. A. BIRGE.

Toad-spit: See FROG-SPITTLE.

Toadstools: a popular name for the plants of the order *Hymenomyces* of the higher fungi. They are otherwise known as MUSHROOMS (*q. v.*). See also the article FUNGI.

Tobacco [from Span. *tabaco* = W. Ind. (Caribbean or Haitian) *tabaco*, tobacco, liter., the pipe or tube in which it was smoked]: a plant of the genus *Nicotiana* of the family *Solanaceae*, first brought to the knowledge of civilized nations on the discovery of America, where it was found in

use by the natives as far N. as Virginia. Comparatively little notice was taken of this plant until about 1650, when it entered largely into the trade of the American colonies with Europe. Although the genus contains some species that are shrubby, the cultivated plant is everywhere an annual; the best-known species, *N. tabacum*, is an upright plant, having a single stalk from 3 to 6 feet high. The leaves are broad ovate lanceolate, near the ground, and enlarge to 3 feet in length and 1 foot wide, in some varieties, but diminish in size as the stalk rises. The latter is surmounted by a loose panicle or raceme of funnel-formed flowers, usually with a long tube, bearing purple or light-red petals. The seeds are minute, brown or black, and very numerous. The only other species that is much grown is *N. rustica*, a much smaller plant, with greenish flowers and adapted to a cool climate.

The purpose to which tobacco is applied is almost wholly as a tonic, stimulant, or sedative through smoking, chewing, or snuffing. Though no form of direct nutrition is possible, its application to the palate and sensory organs of the mouth undoubtedly supports the strength of those accustomed to its use, calms nervous excitability, and relieves hunger, pain, constraint, and ennui in a remarkable manner. The common testimony of almost all nations and all races ascribes value to this singular plant, though it can not be taken into the stomach without injurious results, and is essentially poisonous in its general properties.

The distinctive and valuable properties are found only in the leaf, which is thick, heavy, and pubescent, becoming oily and semi-resinous as it ripens. This leaf, when the plant approaches maturity, is dried and cured by partial sweating, which effects a chemical change, removing the characteristics of the fresh leaves, and developing a powerful aroma, with strong narcotic and acrid properties. After curing, tobacco, either in leaf or manufactured, will remain a long time without decay or change other than drying, and of the vast quantities that enter into commerce very little is lost from such causes. The constituents that give tobacco its value are readily soluble in water and alcohol, but they have little value as an extract.

The analysis of partially cured and cured leaves of Connecticut tobacco showed the following composition:

CONSTITUENTS.	Unfermented.	Fermented (sweetened).
	Water.....	26.13
Ash.....	17.86	18.91
Nicotine (C ₁₀ H ₁₄ N ₂).....	1.51	1.14
Nitric acid (N ₂ O ₅).....	2.29	2.38
Ammonia (NH ₃).....	0.37	0.44
Other nitrogenous matters.....	10.06	10.58
Fiber.....	8.57	9.38
Starch.....	2.90	3.15
Other nitrogen-free extracts.....	27.06	27.74
Fat.....	3.22	3.13

The average of thirty analyses of the ash of American tobacco gave the following: In the cured leaves, water, 8.12 per cent.; ash, 24.48. In the ash, chlorine, 4.04 per cent.; carbon dioxide, 21.33; sulphuric acid, 5.18; soda, .86; magnesia, 5.78; lime, 20.89; iron and alumina, 2.57; silica, 14.92; phosphoric acid, 2.45; potash, 20.90; carbon, 1.

Production of Tobacco.—The production of tobacco is greater in the U. S. than in any other country, and it may be fairly estimated to furnish one-half the quantity entering the general commerce of the world. According to census returns, the amount of tobacco produced in the U. S. in 1859 was 434,209,461 lb.; in 1869, 262,735,341 lb.; in 1879, 472,661,157 lb.; in 1889, 488,255,896 lb.

Tobacco-plant in flower (*Nicotiana tabacum*).

The average production per acre in the U. S. for the year 1889 was 705 lb., and at that time 692,990 acres of the richest cultivated land were devoted to its growth. Its cultivation is possible in a range almost as great as that of Indian corn, but it is destroyed by frost, and the risk in this respect in the Northern States is very great. The largest-producing countries other than the U. S. are tropical or semi-tropical. Cuba may be estimated to produce 60,000,000 lb. a year, chiefly in the district of Vuelta del Abajo, a rich plain S. W. of Havana, 80 miles in length by 20 in breadth. A Government monopoly long existed in Cuba, but the production and trade were thrown open in 1820. The finest leaf is grown in Cuba for the manufacture of cigars both there and in the U. S. and Europe. Porto Rico produces tobacco in considerable quantity, but not of so good a quality as that of Cuba. Haiti produces more than Porto Rico, chiefly in its northeastern part. Mexico produces largely, and exports a small share only to Great Britain and France. The Central American states produce and export not more than Mexico; New Granada and Venezuela produce and export largely, furnishing 20,000,000 lb. to general commerce, and consuming freely in addition; the town of Varinas is a chief place of export. Peru furnishes a small quantity; Brazil has greatly enlarged its production, and with Uruguay and the Argentine Confederations contributes largely to the European supply—perhaps 20,000,000 lb. British India produces inferior tobacco, which is largely consumed there, and exported to a small extent to Europe. The Philippine islands produce 2,000,000 lb. for export, chiefly to Great Britain and Bremen, from Manila. Java furnishes 20,000 piculs (2,670,000 lb.) for annual export, and China and Japan together as much more, which is brought to Europe. Turkey produces a considerable quantity of fine tobacco, the best being sent from Latakia in Syria. Other localities on the eastern shores of the Mediterranean produce tobacco for the general European supply, and in Italy, Spain, France, and Germany a considerable quantity is grown which does not enter into general commerce, the several state or government monopolies taking practical charge of it, as well as of all that is imported. In the East Indies some of the finest tobacco is grown, which has an established reputation in American and European markets.

Cultivation.—The tobacco-plant is a strong-growing, cross-feeding herbaceous annual, requiring a warm, well-drained soil containing an abundance of available plant-food. As

the plant has great leaf-development an abundance of nitrogen and potash in the soil is of the utmost importance, and it is also essential that the plant-food be comparatively free from chlorides for the production of the best quality of smoking-tobacco. The crop is exhausting in consequence of the large proportion of mineral elements and nitrogenous matter found in the leaves, the ash of the dried leaves yielding 24 per cent. of mineral constituents. The value of the tobacco being wholly in the leaves, great care is taken to increase their size and concentrate the strength of the plant upon them. Thin glossy leaves having a silky texture are most highly prized for cigar-wrappers. The seed is everywhere sown in beds, and the young plants transplanted to the tobacco-fields when 2 to 5 inches high. In the preparation of the seed-bed great care is taken to have the soil dry, warm, well supplied with plant-food, and protected from chilling winds. The plants are set in rows 2 to 4 feet apart, that usually admit of cultivation with a horse. As the tobacco-plant grows rapidly when once established, it is essential to give thorough cultivation as well as an abundance of available plant-food. The flower stem is broken out or topped, and the strength of the plant concentrated on ten to sixteen of the larger leaves. Shoots or suckers grow quickly from the axils of the leaves after topping, and these shoots must be frequently removed. About four months are necessary as the period of growth, and when the leaves are mature light-colored spots appear on them, and they crack or break when folded closely.

Harvesting.—The process usually is to cut the whole stem near the ground, allow the plants to wilt somewhat, and draw them to the shed or tobacco-house, where they are hung on poles to cure. Sometimes, however, the crop is harvested by removing the leaves from the stalk as fast as they ripen, and curing them in tightly made buildings by artificial heat.

Curing and Sorting.—Unless artificial heat is used it is important that the curing-houses be so arranged that the ventilation can be controlled. After the plants are once dried they may be taken down, and the leaves stripped from the stalks whenever the weather is damp. These leaves are tied into bundles, carried to the sorting-house, and sorted into three to seven grades, according to the kind and quality of tobacco. The leaves after sorting are tied into little bundles called hands; these hands are then packed tightly into hogs-heads or boxes for the market. Care is used in handling the tobacco during the sorting process to expose the tobacco only in a damp atmosphere, in order to keep the leaves soft and pliable. After the tobacco is packed it is allowed to pass through a process of curing called sweating before it is used in the manufacture of chewing or smoking tobacco.

Insect Enemies in the U. S.—Among these are *Protoparca celsus*, the Northern tobacco-worm, and *P. carolina*, the tobacco-worm of the Southern States. The adults of these insects, called sphinx-moths, are strong, rapid flyers and at twilight are often mistaken for humming-birds. The eggs are deposited singly on the tobacco-leaves, where they soon hatch. The larva, known as hornworm, is a voracious feeder and does great damage, particularly to the varieties of tobacco used for cigar-wrappers. The larva burrows in the ground to pupate, where it moults and becomes a chrysalis and remains in the ground in this form until the following spring. The late broods of this insect feed almost wholly upon the tomato-plant. Hand-picking the worm is the chief remedy, although attempts to poison the adult insect have often proved successful. *Greasy cutworm* (*Agrostis ypsilon*), one of the commonest of American cutworms, feeds also on corn, cotton, and other plants. The eggs are laid on weeds or grass, hatch out in a day or two, the larvae drop to the ground, burrow and feed on roots until the following spring when they come to the surface of the ground, and often do great damage by eating off the young plants; the damage is done almost wholly at night. The *flu-belle*, or tobacco-fly (*Crepidodera cucumertis*), lives through the winter in a winged state, and attacks the young plants in the seed-bed and in the fields soon after transplanting. The remedies are covering the beds with netting and sprinkling the plants with a decoction of tobacco-water. The *boll-worm* (*Heliothis armigera*) sometimes damages tobacco when corn and cotton are scarce; the only remedy is hand-picking the larva. The *meadow-grasshopper* (*Oedipoda vulgare*) and the *locusts*, of which there are several species (*Melanoplus femur-subrum* is the most common), all do more or less damage, particularly if the tobacco-fields are near pasture or meadow land.

Diseases.—The tobacco-plant is subject to comparatively few diseases, and these rarely result in serious damages. The *brown rust* prevails to a greater or less extent every year, and is caused by an abnormal physiological condition of the leaf structure caused by excessive wet or drouth, or any cause that produces a weak growth. The *white speck* of tobacco is supposed to be caused by the fungus *Macrosporium tabacum*, although its history is not well understood. *White veins* occur in the cured product and have been attributed to a variety of causes.

Manufactured tobacco is technically distinguished from both the cured leaf and from cigars or snuff. It is made from ordinary or inferior leaf by twisting, pressing, or cutting, and assumes various forms and names. In the U. S., as elsewhere, sirnps and licorice are largely used in its preparation, though adulteration with other leaves or deleterious substances rarely occur. In Great Britain adulteration is carried to great extremes, and stringent laws have been enacted to suppress it. Great improvements have taken place in cutting, preparing, and flavoring tobacco manufactured for chewing and smoking. Cavendish, navy, twist, negro-head, etc., are standard names or brands in the trade for that which is compressed in solid forms; "fine-cut" is shredded and loose in fibrous masses, cut by delicate machinery from leaf of good quality and flavored acceptably. Smoking-tobacco is prepared of every grade and quality, but usually from broken leaves, stems, and inferior parts. In the U. S. less of such grades, or of smoking-tobacco generally, is made or consumed than in Europe, and the tax being relatively higher compared with the small original cost of the materials, little is manufactured in this form for general trade.

The following table gives the number of pounds of manufactured tobacco produced in the U. S. during the year 1893:

STATES.	Plug.	Fine-cut.	Smoking.	Snuff.
Alabama	5,619		110	
Arkansas	986		3,793	
California	15,225		72,720

Cigars (Sp. *cigarro*; Fr. *cigare*) constitute the most important form in which tobacco is consumed for smoking, and in fact the largest aggregate in general consumption in any form; and their greater value induces every effort to produce leaves suited to covering cigars by the growers. The cigar is of Spanish or Spanish colonial origin, and it was long in use in Spain before its general adoption by other nations. The greatest skill in the manufacture of cigars has always been shown by Spanish or Cuban artificers, and Havana has been the seat of the best manufacture for a century or more. The materials used for filling must be good, and must be skillfully arranged and combined so as to secure a proper firmness with a good draught. The wrappers must be of elastic and moistened leaf, so applied as to form a perfect ovoid cylinder, one end of which is closed and the other open. Uniformity in size, length, weight, and color is essential. Cigars are tied in bundles of twenty-five to fifty each, and these are packed in boxes of Spanish cedar

containing two, three, or four bundles, usually 100 in a box. The Spanish cedar is largely exported to the U. S. for making boxes, and is also imitated in American cedar, but the general form of tying and packing is tenaciously adhered to. Nearly one-half in value of all tobacco grown is made up into cigars.

Cigarettes are small rolls of fine smoking-tobacco inclosed in paper wrappers; they are largely made in Cuba and in the U. S. They are ranked and counted as cigars for revenue purposes. *Cigarrillos* is the Spanish term for cigarettes or small cigars.

Average quantity of tobacco used for 1,000 cigars, 19.44 lb.; average quantity of tobacco used for 1,000 cigarettes, 3.41 lb.

Snuff has been made from a very early period, first and most largely by the Spanish, who prepared it with care and scented it with various materials. Next the Netherlands, Scotland, and England extended and popularized its use. For many years Scotch snuff has been the favorite in commerce, and large manufactures have existed in Great Britain, with a moderate production in the U. S. The export and import of snuff have not been usually distinguished from manufactured tobacco; the amount, however, has been large, and the consumption in Great Britain larger than all elsewhere. The manufacture was originally conducted by grinding the leaf in conical mortars, and more or less was produced in all tobacco-consuming countries. It is now ground in iron mills by steam-power. The old and standard brands of snuff were *maccaboy*, originally from Martinique and Spain; *rappee*, or the French; and that known as Scotch, or *Lundyfoot*. There has been a great decline in the use of snuff in Great Britain and Germany since 1850, and in the U. S., with local exceptions, an even greater decline.

Revised by GEORGE C. WATSON.

TOBACCO, CHEMISTRY AND PHYSIOLOGICAL RELATIONS OF.—The most important ingredient of the tobacco-leaf is the alkaloid *nicotine*, which is present, in the dried leaf, in quantities varying from 2 to 6 per cent. Pure nicotine ($C_{10}H_{14}N_2$) is a colorless, oily liquid of a strong alkaline reaction, disagreeable smell, and hot, acrid taste. It is volatile, inflammable, soluble in water, alcohol, ether, and oils. On exposure to light it turns to a reddish-brown color. With acids it forms crystallizable salts. Nicotine was first isolated by two German chemists, Posselt and Reimann, in 1828. It is a virulent poison, a single drop sufficing to kill a rabbit in less than four minutes. *Nicotianine*, or *tobacco-camphor*, is a principle obtained by distilling the leaves, whether fresh or dry, with water. This is a fatty substance,

occurring in the form of minute acicular crystals, having little taste, but a tobacco-like smell. Besides these principles, tobacco contains albumen, resin, and gum, and an unusual quantity (from 16 to 18 per cent, and over) of inorganic ingredients. Lime composes from 25 to 50 per cent, of the ash, and potash about 30. Nitric, phosphoric, and malic are among the acids that occur. By dry distillation tobacco affords a dark empyreumatic oily substance (oil of tobacco), of the peculiar strong smell of old, foul tobacco-pipes, and an exceedingly acrid, sharp, disagreeable taste. This oil is apparently a complex substance, and, like nicotine, is an exceedingly powerful poison. *Tobacco-smoke*, according to careful analyses by Vohl and Eulenberg, contains no nicotine, but does contain the whole series of the pyridine (volatile) bases, whose conjoint effect upon the animal system is substantially the same as that of nicotine; and also, among other ingredients, ammoniacal compounds, hydrogen cyanide, a number of organic acids, and of hydrocarbons of the benzene or analogous series.

The effects of tobacco upon the animal system have been critically studied by experimenting with nicotine upon animals. This alkaloid is one of the most powerful of nerve-poisons, producing tetanic convulsions, followed by paralysis, and death through failure of respiration. The cerebrum is little affected, and the pulse-rate, while first lessened, is afterward quickened. The pupil is contracted. In man, tobacco taken in sufficient quantity to show poisonous effects produces giddiness, faintness, and an indescribable feeling of sinking and misery, followed shortly by intense nausea, severe and long-continued vomiting, and great relaxation and feebleness of the muscular system. The skin becomes pale and moist, and the pulse exceedingly feeble. More or less of these effects may persist for a day and more after the poisoning. They are familiarly seen in young lads when first beginning to smoke. As to poisonous dose, there is none, for not only do different persons vary in their susceptibility to tobacco, but habit also makes an enormous difference in the effect following a given dose; so that, as is well known, very large quantities of tobacco can be smoked or chewed without the development of any of the above-mentioned poisoning. In sufficient dose, tobacco proves a dangerous and even fatal poison. The symptoms are, in general, an intensification of those just described—namely, intense nausea and vomiting, faintness, muscular debility, cardiac failure, and general prostration. Often, too, there are violent pains in the abdomen, cramps, convulsions, and profuse purging. An injection *per rectum* of an infusion representing the strength of 30 grains of tobacco has several times killed, and death may take place within an hour from the time of receiving the poison. Extensive external applications of tobacco may also cause poisoning, and even death. There is no antidote, and in cases of acute poisoning the stomach or bowels should be evacuated by appropriate means, and restorative agents employed, such as alcoholics, ammonia, the application of heat, friction, and artificial respiration. *Chronic poisoning* by tobacco, such as occurs from undue indulgence in the weed as a luxury, shows itself in *dyspepsia*, the smoker experiencing loss of appetite, especially in the morning, dry foul tongue and thirst; and in *nervousness*, as evinced by a general physical and mental restlessness, with undue susceptibility to external impressions, and by tremulousness of the muscles and palpitation or irregular action of the heart. With smokers, also, a form of chronic irritability, and even inflammation, of the throat and tonsils is exceedingly common. Graver evils, such as paralysis, mental decline, and loss of sight from wasting away of the optic nerve, have been charged to excessive use of tobacco; but when we consider the enormous number of persons who indulge heavily in the weed, and the comparatively rare occurrence of the affections in question, where there is not some other obvious and valid cause for the same, the claim that tobacco is to blame for the disease must be received with caution. *Moderate* use of tobacco by persons with whom it "agrees" (i. e. does not produce obviously injurious effects) often calms and soothes the exhausted or irritated nervous system, helps digestion, promotes the function of the bowels, removes the sense of fatigue, and tends to compensate for an insufficient food-allowance. The popular question whether good or harm follows the habitual use of tobacco is too broad to admit of a single sweeping answer. According to present physiological knowledge the facts bearing on this subject are as follows: In the first place, tobacco is not a general necessity for the human race; for individuals, whole classes, and even entire races of men, have at-

tained a very high physical and mental development without the use of the agent. In the second place, to young persons, under twenty-five years or so, tobacco, even in small quantity, is so apt to disorder health in some way or other that for such it should be considered generally harmful. Third, many persons, even adults, can never indulge at all in tobacco without being to some degree poisoned. For such individuals common sense teaches that the weed is to be regarded as wholly noxious. Fourth, an enormous number of persons can and do use tobacco (the actual quantity consumed varying with the individual) not only without apparent present disturbance of health, but with maintenance of as full physical and intellectual vigor, freedom from sickness, and longevity, as are found with non-consumers. To say that such individuals, did they abstain, would be still more hearty or long-lived is to assert that which obviously can be neither proved nor disproved. Finally, the exigencies of our artificial civilization often demand a continued overtaxing of either the physical, intellectual, or emotional faculties, and in some such cases, especially where the sufferer is past the most vigorous period of life, tobacco in moderation often seems to counteract in some measure the evil effects of the strain, disposing to emotional and physical calm, removing fatigue, assisting digestion, and supplementing a scanty food-supply. If, then, the abatement of morbid symptoms and restoration of the bodily functions to their normal status be beneficial, we must accord to tobacco in the present instances the right to be regarded as a useful agent. But in connection with this topic it is proper to bear in mind the fact, that while tobacco in due moderation may be often apparently harmless, and even, under some circumstances, useful, yet that to indulge in an excess which, for the individual, is injurious, is both easy and tempting, and, as a matter of fact, is an exceedingly common habit. Any tobacco-consumer, by reverting to the symptoms of chronic tobacco-poisoning detailed above, can easily determine for himself whether he is or not crossing the "poison-line" in his use of the luxury. As to the relative power of the various modes of consuming tobacco, it is probable that a given quantity of a given leaf will most promptly and powerfully affect the system if *chewed*, next if *smoked*, and least if taken as *snuff*. In the matter of smoking, again, less of the active principles will reach the mouth if the tobacco be smoked in a clean pipe than if a foul one be taken, and less with a pipe, if clean, of porous material, like meerschaum, and with a reasonably long stem, than where the same tobacco is smoked as a cigar or cigarette. With both pipe and cigar or cigarette, again, the last portion smoked is proportionately stronger than the first, for it becomes saturated with a certain percentage of the smoke-ingredients of the earlier portions, mechanically arrested in their passage. Actual *inhalation* of tobacco-smoke, as practiced by many cigarette-smokers, apart from an injurious irritation of the air-passages themselves, determines quick and full absorption of the volatile elements of the smoke, and so a maximum of effect from a given quantity of leaf. Partly for this reason, and partly because, from the convenience of the cigarette, cigarette-smokers are apt to keep their systems almost continuously under the influence of the weed, this class of consumers affords a proportionately high percentage of subjects of chronic tobacco-poisoning. There is no reason to charge deleterious effects upon the paper ordinarily used in cigarette-manufacture. The time of day and state of the stomach also modify the effect of tobacco, however used, the influence being comparatively stronger earlier in the day or upon an empty stomach than in the evening or after a meal.

Medicinal Uses.—In medicine tobacco is used solely for its relaxing influence upon the muscular system. Before the introduction of anesthetics it was thus sometimes employed in cases of visceral spasm, or where hernias or dislocations were to be reduced, but its use in these circumstances is almost obsolete. In tetanus the drug has been tried, and shows, as might be expected, a certain power in blunting the irritability of the motor tract of the spinal cord, and thus reducing the severity of the spasms. It has been given in this disease in the form of nicotine, administered by subcutaneous injection in doses of a small fraction of a drop. In asthma some sufferers find relief from smoking tobacco, but as a rule the remedy is not of much use. The most common way of administering tobacco for medicinal purposes is by giving an infusion of the leaf by enema, but great prudence is necessary, as the drug thus introduced is a powerful and even dangerous remedy. Externally, lotions and ointments of tobacco have been used for various purposes, but

anything like an extensive application is in the highest degree dangerous, fatal poisoning having more than once occurred in consequence.

EDWARD CURTIS.

Toba'go (originally *Tabaco* or *Tabago*): an island of the West Indies, 20 miles N. E. of Trinidad. Length from N. E. to S. W., 26 miles; area, 114 sq. miles. It is essentially mountainous except at the southwestern end, but the highest peak hardly exceeds 2,000 feet; portions are still covered with forest, the valleys and lower lands are well cultivated, the principal products being sugar and cacao. The island is generally regarded as one of the Caribbean group, but by its structure, fauna, and flora it is, like Trinidad, an outlying portion of the South American continent. It was seen by Columbus in 1498, was first settled by the Dutch (1632 and 1654), passed into French possession, and in 1763 was ceded to Great Britain. Since 1889 it has been a dependency of the colony of Trinidad. Tobago is evidently the island which Defoe describes as the home of his imaginary Robinson Crusoe. Pop. (1891) 18,353; this includes less than 200 whites. The capital and principal port, Searborough, has about 1,200 inhabitants.

HERBERT H. SMITH.

Tobikhar' Indians: See SHOSHONEAN INDIANS.

Tobit, Book of [*Tobit* = Lat. = Gr. *Τωβίτ*, *Τωβείτ*, from (supposed) Heb. *Tōbhīth*, liter., goodness]: an Apocryphal book of the Old Testament, found in the Septuagint. Scholars differ as to the date when it was written, some making it as early as the fourth century B. C., and others as late as the second century A. D. Old texts of it are extant in Greek, Aramaic, Syriac, and Latin, and texts not so old in Hebrew. It is canonical with the Roman Catholics and some of the Orientals.

R. G.

Tobler, ADOLF: Romance philologist; b. at Hirzel, in the canton of Zurich, Switzerland, May 24, 1835; studied especially at Bonn under the guidance of Diez; later visited Italy and Paris; was for a time a teacher in a cantonal school in Switzerland, and in 1867 at the University of Berne; but in the same year accepted a call to the University of Berlin as extraordinary professor, where he still remains, having been made ordinary professor in 1870. Since 1881 he has been a member of the Berlin Academy. Among his published works are *Darstellung der lateinischen Conjugation in ihrer romanischen Gestalt* (1857); *Gedichte von Jehan de Condet* (1860); *Mittheilungen aus altfranzösischen Handschriften*, i. (1870); *Vom französischen Versbau aller und neuer Zeit* (1880; 3d ed. 1894); *Die altvenezianische Uebersetzung der Sprüche des Dionysius Cato* (1883); *Das Buch des Ugonon da Laudho* (1884); *Das Sprachgedicht des Girard Patey* (1886); *Vermischte Beiträge zur französischen Grammatik* (1886; a second series 1894; both reprinted with additions from the *Zeitschrift für romanische Philologie*, in which he began in 1894 a third series), besides many articles in various periodicals and in the publications of the Berlin Academy. Here may be mentioned also the volume *Abhandlungen, Herrn Prof. Dr. Adolf Tobler zur Feier seiner fünfundzwanzigjährigen Thätigkeit als ordentlicher Professor an der Universität Berlin von dankbaren Schülern in Ehrerbietung dargebracht* (1895). All his work bears the marks of a wide and thorough scholarship, and perhaps no other scholar has thrown so much light on questions of historical syntax in the Romance languages, notably for Old and modern French.

E. S. SHELDON.

Tobolsk': a government of Siberia, bounded W. by the Ural Mountains, and extending from the Kirgheez territory to the Arctic Ocean. Area, 539,659 sq. miles. The western and southern part of the country is occupied by spurs of the Ural and Altai Mountains, from which the land slopes toward the Arctic Ocean in one extensive plain. The northern portion of this plain, between lat. 66° N. and the ocean, is a frozen swamp during nine months of the year; the middle portion, between lat. 58° and 66° N., is a forest region, inhabited by hunters and producing excellent fur; the southern portion is good agricultural land, where rye, barley, oats, and the fruits of Middle Europe are raised. Iron, copper, silver, gold, and platinum abound in the Ural Mountains, and mines are extensively worked. Manufactures of leather, soap, and woolen fabrics, and an important transit trade between Europe and Asia, are carried on. Pop. (1889) 1,313,400.

Revised by M. W. HARRINGTON.

Tobolsk: capital of the government of Tobolsk, Siberia; at the confluence of the Tobol and the Irtysh, in lat. 58° 12' N. (see map of Asia, ref. 3-E). It is a handsome

town, though most of its houses are built of wood, and it carries on manufactures of leather, soap, and tallow, besides fishing and ship-building. Pop. (1891) 22,651.

Tocantins. *tō-kān-teens'*: a river of Brazil, rising in Southern Goyaz, flowing with a general northerly course, and entering the Atlantic through the Pará, which may be regarded as its estuary. The Pará receives, through the network of channels S. W. of the island of Marajo, a large volume of Amazonian water, exceeding the outflow of the Tocantins proper; hence the Tocantins is commonly called a branch of the Amazon, and commercially it belongs to the Amazon system. The lower portion is very broad and lake-like. About 200 miles above the city of Pará navigation is interrupted by a series of rapids; above these it is freely navigable for many hundred miles. On the western side it receives the great river ARAGUAY (*q. v.*), which is also navigable for a long distance, and by its length, volume, and direction may be considered the true head. The upper Tocantins (so called above the junction of the Araguay) receives many tributaries, the most important being the Manuel Alves, which, with the main river, forms part of the boundary between Goyaz and Maranhão. Small steamers ply on the upper Tocantins and Araguay, and canoes pass the rapids to Pará; ultimately this river system must form the outlet of Goyaz and Eastern Matto Grosso. The banks have hardly any inhabitants except Indians; rubber and Brazil-nuts are brought down to Pará. Length (from Pará), by the upper Tocantins, about 1,700 miles; by the Araguay, 1,900 miles.

HERBERT H. SMITH.

Tock: another spelling of TOK (*q. v.*).

Tocology: See OBSTETRICS.

Tocqueville, Fr. pron. *tōk'veel'*, ALEXIS CHARLES HENRI CLÉREL, de: publicist; b. at Verneuil, Seine-et-Oise, France, July 29, 1805; studied law, and in 1830 became an assistant magistrate. In 1831 he was commissioned to investigate the penitentiary systems of the U. S., which he visited in company with Gustave de Beaumont. In 1832, having returned from the U. S., he resigned his office, and in 1835 gave to the public the first volume of his work *De la Démocratie en Amérique* (On Democracy in America, 4 vols., 1835-40), which met with a brilliant success. About this time he married Mary Mottly, an English lady. De Tocqueville, though himself opposed to democracy, foretold its rapid growth in the world, and was the first to write a systematic work of political science on the facts of democratic government as observed in the U. S. In 1838 he was made a member of the Academy of Moral and Political Sciences, and in 1839 he was elected to the Chamber of Deputies. He became a member of the French Academy in 1841. In 1848, having been elected to the Constituent Assembly, he lent his support to the cause of order. In 1849 he was Minister of Foreign Affairs from June 2 to Oct. 31. The *coup d'état* of Dec. 2, 1851, drove him from the public service. He published *L'ancien Régime et la Révolution* in 1856. His complete works, including his correspondence, were published in 9 vols. (Paris, 1860-65). D. at Cannes, Apr. 16, 1859.

Toen'yo: a town of the state of Lara, Venezuela; on the Toenyo river; 40 miles S. W. of Barquisimeto and 2,067 feet above the sea (see map of South America, ref. 1-C). It is finely situated in a wide valley, and is the center of one of the most important agricultural districts of Venezuela; the exports are coffee, hides, sugar, etc. It was founded in 1545. There are several tanneries. Pop. (1889), with the immediate vicinity, 15,383.

H. H. S.

Toda, Tuda, or Tudawa: a singular race of people of Dravidian stock, inhabiting parts of the Neilgherry Hills in Southern India. In 1858 they numbered only 337 persons and they do not now exceed 750, yet they are the dominant people of their region, and receive from the inferior tribes a heavy tribute. They have a peculiar language, of doubtful relationship, which is unwritten. Their religion is the worship of departed spirits and of the sun. Their only industry is the herding of buffaloes for their milk and butter. They practice polyandry, all the brothers of one family having but one wife in common. The men, however, claim and receive, at certain seasons, the rights of temporary husbands to the women of the subject villages. The Toda men are tall and well-proportioned, and in many respects are a superior race of men. See Marshall, *Phrenologist among the Todas*, containing a grammar by Pope (1873); Grigg, *Manual of the Nilgiri Hills* (1880).

Revised by M. W. HARRINGTON.

Todd, CHARLES SCOTT: soldier; son of Judge Thomas Todd; b. near Danville, Ky., Jan. 22, 1791; graduated at William and Mary College 1809; became a lawyer at Lexington 1811; took part as brigade quartermaster and judge-advocate of Gen. Winchester's division in the war of 1812; became captain of the Twenty-eighth Infantry May, 1813; was aide to Gen. Harrison at the battle of the Thames; was appointed assistant inspector-general Nov. 1, 1813, inspector-general (rank of colonel) Mar. 2, 1815; settled at Frankfort, Ky.; was secretary of State of Kentucky 1817, member of the Legislature 1817-18; editor of *The Cincinnati Republican* 1840, in which capacity he took a leading part in the campaign in favor of his former commander, Gen. Harrison, to whose biography, prepared by Benjamin Drake (1840), he also contributed; and was minister to Russia 1841-45. D. at Baton Rouge, La., May 14, 1871.

Todd, HENRY JOHN: clergyman and man of letters; b. in England in 1763; graduated at Oxford about 1785; took orders in the Church of England; became successively a minor canon of Canterbury, vicar of Milton 1792, rector of All Hallows, London, Keeper of the MSS. at Lambeth Palace 1803, rector of Settrington, Yorkshire, 1820, prebendary of York 1830, and Archdeacon of Cleveland 1832. He edited *Johnson's Dictionary* (1814), and the works of Milton (1801; 4th ed. 1843) and of Spenser (1805); wrote biographies of Milton, Spenser, Gower, Chaucer, Cranmer, and Bishop Walton; and *An Authentic Account of our Translation of the Bible, and of the Translators* (1831). D. at Settrington, Dec. 24, 1845. Revised by BENJ. IDE WHEELER.

Todd, JON, D. D.: clergyman and author; b. at Rutland, Vt., Oct. 9, 1800; graduated at Yale College 1822 and at Andover 1826; was pastor of the Congregational church at Groton, Mass., 1827-31, of the Edwards church at Northampton 1833-36, of the First Congregational church in Philadelphia 1836-42, and of the First church at Pittsfield, Mass., 1842-72; was one of the founders of Mt. Holyoke Female Seminary, and for some years president of the trustees of the Young Ladies' Institute at Pittsfield, where he died Aug. 24, 1873. He was the author of *Lectures to Children* (Northampton, 2 vols., 1834; 2d series 1858); *Student's Manual* (1835); *Truth made Simple* (1839); *The Young Man* (1843); *The Daughter at School* (1854); *Mountain Gems* (4 vols., 1864); *Woman's Rights* (1867); *Sunset Land, or the Great Pacific Slope* (1869); *Old-fashioned Lives* (1870), and other popular works, some of which, especially the *Student's Manual*, have had a large circulation, and exerted great influence in the U. S. and in Great Britain. See *John Todd, the Story of his Life, told mainly by himself* (New York, 1876). Revised by H. A. BEERS.

Todd, THOMAS: jurist; b. in King and Queen's co., Va., Jan. 23, 1765; received a good English education; was a soldier in the war of the Revolution; emigrated to Kentucky 1786; became a lawyer at Danville; was several years clerk of the district court, and subsequently of the court of appeals, of which he was judge 1801-06; was chief justice of Kentucky 1806-07, and a justice of the U. S. Supreme Court from Mar. 3, 1807. D. at Frankfort, Feb. 7, 1826.

Todhunter, ISAAC: mathematician; b. at Rye, England, in 1820; studied at University College, London; graduated in 1848 as senior wrangler at Cambridge, where he became a fellow and mathematical lecturer of St. John's College. He was the author of a series of text-books in elementary and higher mathematics which are remarkable for their clearness of exposition. D. at Cambridge, Mar. 1, 1881.

Tod'idæ [Mod. Lat., named from *To dus*, the typical genus, from Lat. **to dus*, plur. *to di*, a kind of small bird]; a family of birds peculiar to the tropical regions of America. They resemble in physiognomy and form the kingfishers (*Alcedinidæ*), to which they are allied; the bill is moderately long (at least as long as the head) and much depressed, with the tip rounded or pointed; the wings short and rounded; the tail rather short; the tarsi quite slender and long; toes three in front and one behind; and the anterior syndactylous, i. e. united by their first joints; claws short and well curved. In most details of structure of the skeleton and other parts, so far as examined, they resemble the *Momotidæ* and *Alcedinidæ*. They dwell mostly in damp places in South and Central America and the West Indian islands. Except in the breeding season, they remain generally single and alone. When at rest they sit in a crouched manner on the branches, with the head drawn in between the shoulders, and are so dull and stupid that they are easily approached

and caught with the hand. They are nevertheless sufficiently sly to catch insects that come near them. They are said to make their nests generally in holes in the ground, and to lay three or four eggs. Revised by F. A. LUCAS.

Todleben, Gt. lã-ben, FRANZ EDUARD IVASOVICH, Count; soldier; b. at Mitau, Courland, May 20, 1818; educated in the schools at Riga and at the School of Engineering in St. Petersburg; served in the Caucasus against Schamyl 1848-51; was distinguished in the campaign on the Danube 1853-54, and on the outbreak of the Crimean war in the latter year was ordered to Sevastopol on the invasion of the allies. To his genius in developing the inchoate works and in improvising defensive expedients adapted to the peculiar circumstances is attributed the successful defense by which the place resisted for nearly a year (349 days) the efforts of the allied armies. (See SEVASTOPOL.) For his distinguished services at the siege he was breveted major-general and afterward held important positions in the Engineer department. In 1860 he became lieutenant-general and in the following year inspector-general of the Engineer service. When the Russo-Turkish war broke out in 1877, he at first received no command in the field, being passed by for men of inferior ability, but the repeated disasters before Plevna caused him to be summoned to give advice as to the best method of taking the city. Under his direction a regular siege was begun and the garrison cut off from supplies. In December the city capitulated and the entire army surrendered to the Russians. After the peace he was appointed governor-general of Odessa. D. at Soden, Germany, July 1, 1884. He wrote a valuable account of the defense of Sevastopol (French trans., *Défense de Sévastopol*, etc., 1861), and a work on fortifications. See Kinglake, *The Crimean War*, and *Life*, by Krämer (Berlin, 1888).

Tody: any bird of the family TODIDÆ (*q. v.*).

Tofana: See AQUA TOFANA.

To'goland: the smallest of the German protectorates; on the Slave Coast, West Africa. It was placed under the German flag by Dr. Naehrigal (1884), and is, so far, the most prosperous of the German possessions in Africa. Wedged in between French territory on the E. and the British Gold Coast on the W., it has about 35 miles of coast, and an approximate area of 16,000 sq. miles. Pop. about 500,000. Its roads to the interior are important routes to and from the thickly populated portion of the Sudan. The commerce is chiefly confined to a barter trade for palm oil and ivory, but all tropical products may be grown, and the forests abound with oil palms, caoutchouc, and valuable woods. An imperial commissioner controls public affairs; the local laws are made by a council of merchants. Thirty Negro policemen maintain order. About 100 vessels annually visit the coast trading-towns, of which the most important are Little Popo, Bagida, and Lome. C. C. ADAMS.

Togrul Beg: See SELJUKS.

Tok: any one of the small black and white hornbills (*Bucerotidæ*) of the genus *Toccos*, a group distinguished by

The crowned tok.

a thin, compressed beak, and only elevated into a low, sometimes obsolete, crest. These birds are mostly found in

Africa, occurring throughout the larger portion of the wooded districts, the exceptions being *Tocous gingalensis* of Ceylon and *Tocous griseus* of Malabar. They live on fruit and insects and nest in holes of trees. The typical species, *Tocous erythrorhynchus*, is about 18 inches long, and has a bill of a deep-red color. F. A. L.

Tokaido, *tō-kīdō*: the great coast highway between the two capitals of Japan, noted for its fine trees and picturesque views. Leaving the Nihon bridge in Tokio, from which point distances in the empire are measured, it proceeds S. to Kanagawa, thence to Odawara, whence it ascends the Hakone pass (2,970 feet) and descends on Mishima. Afterward it keeps to the coast, passing through Shizuoka, the residence of the deposed Tokugawas (see TOKUGAWA), until it reaches Nagoya. Thence it strikes inland across the Kisogawa valley, by Gifu and Ogaki to Hikone on Lake Biwa, follows the southeast shore line to Otsu, and reaches Kioto after traversing 132½ ri (317 miles). The name is also applied to the provinces through which the highway runs. The inland or mountain road is known as the Nakasendo. J. M. DIXON.

Tokat': town; in Asia Minor, in the vilayet of Sivas; in a beautiful and fertile valley on the Yeshil Irmaç (anc. *Iris*), about 65 miles from the Black Sea (see map of Turkey, ref. 4-G). Founded in the Middle Ages, it became an important trade center, but within a generation the main route has been directed to Trebizond, and Tokat has greatly declined. Its population of over 50,000 has diminished to less than 10,000. Manufacture of copperware is its chief industry. At Guemelek (Comana), 3½ miles to the N., Chrysostom died in exile (407). E. A. GROSVENOR.

Tokay': small town of Northeastern Hungary, county of Zemplin; on the right bank of the Theiss, at the influx of the Bodrog (see map of Austria-Hungary, ref. 5-1). It is famous as the entrepôt of the celebrated Tokay wines, produced in the neighborhood. Annual product about 260,000 gal. Pop. 4,480. Revised by M. W. HARRINGTON.

Tokay Wines: See WINE and WINE-MAKING.

To'kyō: the modern capital of Japan; situated in lat. 35° 40' N., lon. 139° 45' E. from Greenwich; area, nearly 30 sq. miles; pop. 1,150,011 (see map of Japan, ref. 6-1). Since IYAYASU (*q. v.*) set up his residence here in 1590 it has been the real government center of Japan, and is associated with all the traditions of modern Japanese bureaucracy. Its former name was Yedo (Estuary Gate); changed to Tokio (Eastern Capital) when the emperor removed his court hither in 1869. Up to the year 1400 its site was a swampy wilderness, but during the following century a castle was built, and a village arose about it. Iyeyasu enlarged the castle, had the marsh drained, and when, after the battle of Sekigahara, he became complete master of Japan, he converted Yedo into one of the most populous cities in the world by compelling the territorial nobles to spend half of the year within its bounds. The city became a congeries of fenced inclosures, within which the several daimios, with their retainers and servants, established themselves. At this period the waters of the bay approached much closer to the castle walls than they do at present, the siltings of the Sumida river having gradually formed the district known as Tsukiji, i. e. made ground, where the foreign settlement is, and the process continues. The center of the city is the castle, the moat of which, in the form of a spiral, incloses many square miles of the city and encircles the central building two and one-eighth times. This moat is a favorite winter haunt of wild fowl, while in summer the pink lotus makes a gorgeous display of color. In the troubles of the restoration in 1868 the central building of the castle, where the shoguns held their court, was burned down, and the emperor, after leaving Kioto, was obliged to make use of a daimio's residence in the vicinity as a palace. In 1889, however, the court removed to a new palace, in which the Japanese and Western styles of architecture are somewhat bizarrely mingled. This palace is on a less elevated but more extensive site within the inner walls of the castle. As a city, Tokio is loosely built, being, in fact, a collection of villages and inclosures. Many of the houses, even in the heart of the city, have small gardens attached. Lying in an exposed position on the sea edge of a large plain, Tokio is a wind-swept city, and as the houses are mostly (formerly altogether) built of wood, disastrous fires sweep over it from time to time. In 1880, 1881, and again in 1892—to mention only more recent disasters—whole districts were laid in

ashes. The authorities insist on the houses which line the main streets being built fire-proof. The business portion of the city lies in the flat ground between the castle and the sea, and is a network of canals. The Nihon bridge over the Yedo-gawa, a tributary of the Sumida, is the busiest spot in the empire, of which it is the center for purposes of mileage measurement. Here are the fish-market, the warehouses of the steamship companies, the general post-office, etc. The two main parks of the city—Uyeno to the N. and Shiba to the S.—are connected by a long thoroughfare, the backbone of the city. Along this route street-cars and omnibuses ply; elsewhere most of the passenger traffic is carried on in jinrikishas. At Uyeno and Shiba are two fine temples where the Tokugawa shoguns were buried alternately. Between the castle and Shiba lies the official quarter of the city, where cluster the Foreign Office, the War Office, the houses of Parliament, most of the foreign legations, the residences of the princes of the blood royal, etc. This quarter is quite European in its aspect. The central barracks and parade-ground, formerly here, have been moved out farther W. To the N. of the castle is the educational quarter, where is situated the university with four handsome colleges and a library in brick, the grounds extending to 10 acres; here also are the higher Normal School and numerous private schools. All the ground W. of the castle is undulating, frequently with steep bluffs. The Sumida river, which skirts the city on the N. E., is spanned by five long bridges, one of them of iron. On the flat ground across the river there is an extensive suburb. Tokio is a great commercial entrepôt, its situation at the head of its landlocked bay and near the mouths of three large rivers favoring its growth; but Osaka still remains the commercial center of the empire. Politically and socially, however, the influence of Tokio is paramount. The youth of the empire flock here in crowds, to attend schools where they may acquaint themselves with foreign learning and see the wonders of modern civilization; indeed, there is said to be a floating population of this kind numbering at least 70,000. The garrison numbers 7,000. At Tsukiji there is a naval college; the anchorage is off the extreme southern suburb of the city, at Shinagawa, only vessels of light draught being able to make use of the harbor in the river. The city is lighted with electricity, and extensive water-works are in course of construction, the supply being taken from the TAMAGAWA (*q. v.*). A small river, the Yodogawa, flows into the moat at the northern suburb of Koishikawa, where is situated the imperial burying-ground. The crematories of the city are found on the right bank of the Sumida E. of Uyeno. There are two terminal railway stations—at Shiba and Uyeno—connected by a loop suburban line. J. M. DIXON.

Tokugawa, *tō'kōō'gaa'wāū*: a distinguished family which furnished a dynasty of rulers to Japan. Founded in the twelfth century, it rose to greatness in the sixteenth century in the person of IYAYASU (*q. v.*). From 1603 to 1868 a succession of Tokugawa rulers held sway in Tokio, securing tranquility for the country and encouraging those arts for which Japan is now famed. The representative of the line has filled the post of ambassador to Italy. J. M. D.

Toland, JOHN: deistical writer; b. near Redcastle, Londonderry, Ireland, Nov. 30, 1669, of Roman Catholic parents; was originally called JANUS JUNIUS, but changed his name while at school at Redcastle, where he also became a zealous Protestant, and under the patronage of some Dissenters entered the University of Glasgow 1687; removed to that of Edinburgh, where he graduated M. A. 1690; studied theology two years at Leyden, with a view to becoming a Dissenting minister; his first work, *Christianity not Mysterious* (London, 1696; 2d ed. Amsterdam, 1702), was censured by convocation, replied to by Stillingfleet and many others, and burned by the hangman at Dublin; published an *Apology for Mr. Toland* (London, 1697); went to Amsterdam; published there the first edition of *Milton's Works, Historical, Poetical, and Miscellaneous, with a Life* (3 vols. fol., 1697-98), in which he made an indirect attack on the Gospels, which was replied to by Rev. Dr. Offspring Blackall, Bishop of Exeter, in a sermon preached before the House of Commons; wrote a rejoinder entitled *Amyntor, or a Defense of Milton's Life* (1699), which occasioned a polemic with Dr. Samuel Clarke and others; turned his attention to politics; wrote a pamphlet entitled *Anglia Libera* (1701) in favor of the succession of the house of Brunswick, which procured him the favor of the Princess Sophia at the

court of Hanover, and employment in a quasi-diplomatic capacity at Berlin and other German courts; held a theological discussion with Beausobre; returned to England and published *Vindicius Liborius* (1702), a new defense of his first book, in which he asserted his claim to be "a true Christian" and "a good Churchman," but in his *Socinianism truly Stated* (1705) avowed himself a pantheist; in 1704 published *Letters to Serena* (that is, the Queen of Prussia); resided abroad in the employ of Harley 1707-10, and was subsequently a voluminous pamphleteer in London. D. at Putney, Mar. 11, 1722. Among his numerous works were *State Anatomy of Great Britain* (1714); *Nazareus, or Jewish, Gentile, or Mahometan Christianity, containing the History of the Ancient Gospel of Barnabas, etc.* (1718); *Tetradymus* (four treatises, 1720); and a *Life of Servetus* (1724). A biography appeared in 1722, and a collection of his miscellaneous pieces, with a memoir, was published in 1726 by Peter des Maizeaux (again in 1747).

Revised by S. M. JACKSON.

Toledo, Span. pron. tō-lā-dō; one of the oldest cities of Spain, and the capital of a province of the same name (see map of Spain, ref. 16-E). It is built on a circle of seven hills 2,400 feet above the level of the sea, and inclosed on three sides by the Tagus, toward which the town presents steep and abrupt sides, while on the fourth side, where the ground slopes gently, it is defended by two walls—an inner wall built by the Goths in the seventh century, and an outer built by Alfonso VI. in 1109—both profusely adorned with towers and gates. From 467 to 714 it was the capital of the Goths, from 714 to 1085 that of the Moors, and after 1085 it was the residence and capital of the kings of Castile. Its most remarkable edifice is the cathedral, the metropolitan church of Spain, founded in 587, and one of the most magnificent church buildings in the world, 404 feet long, 204 feet wide, and having its chief nave almost overladen with sculpture. Besides the cathedral, the city contains 26 other churches, 37 monasteries, and other architectural monuments; but its general aspect is gloomy and almost desolate. It contains a royal palace that was originally built by King Wamba, rebuilt by Charles V., altered by Philip II., then changed into a military academy, and burned in 1887. The splendor has become sepulchral; the place, which once contained about 200,000 people, had in 1887 only 20,837. Its once flourishing industry has also died out, the only two branches of manufacture alive being those of sword-blades and confectionery.

Revised by M. W. HARRINGTON.

Toledo: town (founded in 1853); capital of Tama co., Ia.; on the Chi. and N. W. Railway; 20 miles E. of Marshalltown, and 50 miles W. of Cedar Rapids (for location, see map of Iowa, ref. 5-1). It is connected with Tama by electric railway; contains Baptist, Congregational, Methodist Episcopal, Presbyterian, and United Presbyterian churches, 2 public-school buildings, 2 State banks with combined capital of \$100,000, and 2 weekly newspapers; and has brick and tile works, scale-factory, and other manufactures. Toledo is the seat of Western College (United Brethren, chartered in 1856), which in 1892 had 25 instructors, 409 students, a library of 5,000 volumes, 3 buildings, and property valued at over \$100,000. Pop. (1880) 1,026; (1890) 1,836; (1895) 2,428.

EDITOR OF "CHRONICLE."

Toledo: city (incorporated in 1837); capital of Lucas co., O.; on the Maumee river near its entrance into Maumee Bay; 53 miles S. W. of Detroit, and 92 miles W. of Cleveland (for location, see map of Ohio, ref. 1-E). At Turtle Light, 7 miles out, the bay expands into the broader waters of Lake Erie, within its limits affording one of the best harbors on the lakes.

Lake Traffic.—The city covers an area of 28½ sq. miles, extending for nearly 8 miles on the eastern and western banks of the Maumee, with a dock front of 25 miles. The largest steamers of the lakes reach these docks with cargoes of iron and copper ore, lumber, salt, fish, and other merchandise from the northern and western ports of Lakes Superior, Michigan, and Huron, and with goods and other traffic from the southern and eastern ports of Lakes Erie, Ontario, and the St. Lawrence river. Converging from the city in all directions are twenty-three important railway lines, bringing hither for manufacture or distribution the coal deposits of Southwestern and Central Ohio, wheat and other cereals from the grain-fields of Indiana and Illinois, and ship-timber from the lumber regions of Northern Michigan and Canada. Toledo is also the terminus of the Miami and Erie Canal. The yearly shipments of wheat, corn, oats,

and rye from Toledo amount to 38,000,000 bush. The city is one of the largest soft-coal markets in the U. S., and one of the greatest clover-seed markets in the world.

Manufactures.—The manufacturing interests are important and diversified. Here, where coal, ore, and limestone most chiefly meet, have arisen extensive works for the manufacture of malleable iron and furnaces for the casting of plows, steam-boilers, car-wheels, and other requirements of iron in the industrial arts. One of the largest wagon-works in the U. S. is located here, and several extensive bicycle-works, besides factories for the manufacture of carriage-wheels and bent work. The milling interests are led by the winter wheat flour-mills of the National Milling Company, with an output of 3,500 to 4,000 barrels daily. The grain interests are represented by several elevators, the largest of which has a storage capacity of 1,500,000 bush. Ship-building is carried on extensively.

Local Interests.—Toledo has an extensive system of water-works on the stand-pipe plan, constructed at a cost of more than \$1,340,000. It has two natural-gas companies furnishing fuel to the city through 200 miles of distributing-pipe. There are 95 miles of electric street-railways. An electric belt-line on both shores of the river connects the villages of Maumee and Perrysburg, bringing them in rapid communication with the city. Toledo has an extensive park system in process of development. The most popular of these parks is that at Riverside, with a fine pavilion and excellent yacht anchorage. Toledo has 356 miles of avenues and streets, with many fine pavements of asphalt and stone. It has 36 public-school buildings and 23 private and parochial schools, a nobly equipped manual-training school connected with the Central High School, and an elegant public library building containing 35,000 volumes. There are 13 banks, 87 churches, 4 hospitals, a soldiers' memorial building, armory, new court-house, and U. S. Government building.

History.—The name the Lady of the Lakes, by which Toledo is so widely known, succeeded an older title, the Miami of the Lakes, by which it was known in its early history. The equable climate, with its superior fishing-grounds, made its site a favorite resort of the Miami Indians before its occupancy by the whites. Later it became an important trading-post, but it was not until the famous victory of Gen. Anthony Wayne at Fallen Timbers in 1794 that peaceful possession by white settlers became possible. Pop. (1880) 50,137; (1890) 81,434; (1895) estimated, 125,000.

FRANCES D. JERMAIN.

Toledo, tō-lā-dō, FRANCISCO, de; Viceroy of Peru; b. in Spain about 1515. He was a younger son of the third Count of Oropesa, was major-domo to the king, and later was sent to Peru as viceroy, entering Lima Nov. 26, 1569. During his administration he settled the disorders which had resulted from the civil wars, and a code of laws, partly founded on those of the Incas, was prepared; this code, known as the *Libro de Tatas*, was in force during the colonial period. The Inquisition was introduced in 1569. The persecution and death of the Inca TUPAC AMARU (*q. v.*) removed the last focus of opposition to the Spaniards, but the narrow and cruel policy shown in this affair produced a burst of indignation against the viceroy. He was relieved Sept. 23, 1581, and on his return to Spain was severely rebuked by the king and imprisoned. D. at Seville, Sept., 1584.

H. H. S.

Toledo War: a term popularly given to a contest extending from 1835 to 1837 in regard to the boundary-line between the State of Ohio and the Territory of Michigan. According to the ordinance of 1787 for the government of the Northwest Territory, the line between the States of Ohio, Indiana, and Illinois on the S. and the territory on the N. was to be an east and west line running through the southern point of Lake Michigan. An old map showed the southern end of the lake at 42° 32' N., while the true location is 41° 37' 19", or about 64 miles farther S. When, in 1805, the Territory of Michigan was organized, the line through the southern point of the lake was adopted; but when Indiana and Illinois were organized as States, the northern line was the one chosen. In 1812 Congress ordered a survey, which was completed in 1817, establishing what was known as the Harris line. The line of the ordinance, claimed by Michigan, was known as the Fulton line. The people of Michigan were especially persistent, as the town, now the city of Toledo, was in the disputed belt. In 1836 the Legislature of Ohio passed an act organizing townships in this territory, which for many years had been under the

control of Michigan. Both State and Territory appealed to President Jackson in vain. The Governor of Ohio called out the militia, and Gov. Mason of Michigan took possession of Toledo. While matters were in this condition Congress, June 15, 1836, admitted Michigan as a State on condition of the acceptance of the Harris line and the northern peninsula, which formed a natural part of the Territory of Wisconsin. This addition, subsequently bringing such great wealth of copper and iron to the State, was finally accepted as an equivalent for the disputed strip at the S., which went to Ohio and Indiana. After formal acceptance of these conditions, Michigan entered the Union as a State Jan. 26, 1837, and peace was restored. C. K. ADAMS.

Toleration: See LIBERTY, RELIGIOUS.

Tolima, tō-le'e-mā: a southern interior department of Colombia; between Cauca, Cundinamarca, and Antioquia. Area, 18,434 sq. miles. It embraces the upper portion of the valley of the MAGDALENA (*q. v.*) between the Central Cordillera on the western frontier and the Eastern Cordillera on the E. Peaks in both these ranges, especially near their junction southward, rise above the snow limit, and nearly the whole surface of the department is mountainous. The climate ranges from tropical, near the river, to cold on the mountains, where there are wide stretches of bleak *paramo*. Gold, silver, and a little copper are mined, but agriculture and grazing are the principal occupations. The roads are very bad. Pop. about 230,000. Capital, Ibagüé. H. H. S.

Tolima: a quiescent volcano of Colombia; in the central Cordillera of the Andes, near the confines of Tolima, Cauca, and Antioquia, and N. W. of Ibagüé. It is the highest mountain in the republic, attaining 18,425 feet; around the central peak and crater are other volcanic vents. Tolima is especially interesting to geologists as one of the few volcanoes at a considerable distance from the sea. It showed signs of activity in 1595 and 1826 to 1829. H. H. S.

Tollens, HENDRIK CAROLUSZON: poet; b. in Rotterdam, Holland, Sept. 24, 1780. His education was not extensive, and all but the last ten years of his life were occupied by the necessities of his mercantile pursuits. In 1846 he was able to withdraw to a country estate at Ryswick, where his last years were given to letters alone. D. at Ryswick, Oct. 21, 1856. Tollens is perhaps the most generally popular of all the Dutch poets of the nineteenth century. He began writing very young, at first translating and imitating French plays; but later he grew discontented with his compositions of this time—the comedies *De Bruiloft* (1799) and *Gierigheid en baatzucht* (1801), and the tragedy *Konstantijn*—and refused to admit them among his works. From 1801 to 1805 appeared the first poems in which he showed his true bent—*Idyllen en minnezangen*. In these we have the sentiment and reflection of the Dutch bourgeois clothed in a style often exaggerated, yet always such as to go to the popular heart. In 1808-15 appeared his *Gedichten*; in 1816, *Tafereel van de overwintering der Nederlanders op Nova Zembla*; in 1818, *Romancen, balladen, en legenden*; in 1821, *Nieuwe Gedichten*; in 1840, *Verstrooide Gedichten*; in 1848 and 1853, *Lauwste gedichten*. A. R. MARSH.

Tolstoï, ALEKSEÏ KONSTANTINOVICH, Count; author; b. in St. Petersburg, Aug. 24, 1817. He was well educated, was for a short time in the diplomatic service, traveled extensively, served as a volunteer in the Crimean war, and for the last eighteen years of his life held a high position at court. He wrote but one novel, *Kniaz (Prince) Serbrianyi* (trans. by J. Curtin, 1893), a work somewhat in the style of Scott, with a well-told story, strongly drawn characters, and presenting a vivid picture of one of the most striking periods of Russian history. This same wild time is portrayed in Tolstoï's fine trilogy, *The Death of Ivan the Terrible* (1865), *Tsar Fedor Ioannovich* (1868), and *Tsar Boris* (1870). The first and the best of these plays has been translated into English verse (F. Harrison, London, 1869). Tolstoï also wrote a short, strong drama called *Don Juan*, besides another unfinished one, *Posadnik*. As a lyric poet he ranked with the best of his day, being especially successful with his ballads and popular verses. D. near St. Petersburg, Sept. 28, 1875. Complete works, 4 vols., 1890-91. A. C. C.

Tolstoï, Count LEV (or LYOFF) ALEKSEEVICH (LEV, pronounced lyoff, = English Leo, which is sometimes used); novelist; b. on the family estate of Iasnáia Poliana, in the government of Tula, Russia, Sept. 9 (n. s.), 1828; entered the University of Kazan in 1843; left without graduating after

three years. Having visited the Caucasus in 1851, he joined the army and took part in various guerrilla expeditions. It was now that he began to write. After the war in the Crimea, in which he served, he gave up military life and resided for a time in St. Petersburg and Moscow, traveled twice in Europe, then in 1861, the year before his marriage, retired to his country estate, which has since been his permanent home. His works fall into three distinct periods. To the first belong his *Detsvo* (Childhood), *Otrechestvo* (Boyhood), and *Iunost* (Youth), also his *Kazaki* (Cossacks), a description of life in the Caucasus, his *Sevastopol*, and other military sketches. The second period is that of his two great novels *Voïna i Mir* (War and Peace, 1865-68), an epic of Russian life, national and individual, at the time of the great struggle with Napoleon, and *Anna Karenina* (1875-78), a marvelous study of passion and its consequences. Soon afterward Tolstoï began to give himself up to the mystical religious and philanthropic ideas which have so completely mastered him that it has been doubted whether he is to be regarded as perfectly sane. His doctrines have been proclaimed in *My Confession*, *In what my Faith Consists* (more usually known as *My Religion*), a *Commentary on the Gospel*, and other works, many of them forbidden in Russia by the censors. As he believes not only in non-resistance to evil and in asceticism, but in communism, the duty of manual labor, and of every one to live like the peasants, it is only with misgivings that he has continued to write, hence all he has done has been with a didactic or polemical aim which has often detracted from its value. Still nothing can entirely quench his genius. Many of his tales for the peasants are admirable, and in even the poorest of his productions we often find pages of splendid power. The best known of his later works are the *Death of Ivan Rich* (1884-86); *The Kreuzer Sonata* (1888); and his drama, *Vlast Tmy* (Power of Darkness). Although the influence of his later ideas has created a sect, his reputation will probably depend on his earlier works, and especially on the two novels. Both of them, as well as the shorter productions that preceded them, display a combination of keenness of realistic insight and wealth of poetical imagination, of a wonderful breadth of view with perfect handling of minute detail, seldom rivaled in all literature. The mastery of style is complete, though the author takes no pains to polish it, any more than he cares to spare us trivial incident. In his story *Khoziain i Rabotnik* (Master and Man, New York, 1895) he seems to have returned to his former manner and to show no diminution of power. Most of his works have been translated into English and other modern languages (in English by Dole, Miss Hapgood, etc.). Among the best-known studies of them are those of de Vogüé, Ernest Dupuy, Lemaître, G. Brandes, Matthew Arnold, Ralston, etc. A. C. COOLIDGE.

Tol'tees, or **Toltec'as** (so called from their principal city, Tollan, supposed to be Tula, in Hidalgo) an Indian tribe, said to have occupied portions of the Mexican plateau during several centuries prior to the advent of the Aztecs. The little that is known of this race comes from Aztec traditions or pictographic records as they were collected by Spanish writers soon after the Conquest. It is related that they came from the north, making temporary settlements at various points, and finally fixing themselves at Tollan about A. D. 661. Lists of their chiefs or "kings" are extant, but these are of very doubtful value; the hero-god, Quetzalcohuatl, is said to have lived in their cities before his final disappearance. About 1013 the Toltecs were overthrown by savage tribes. They then migrated southward and do not appear further in the Aztec accounts, but the Quiché and other Maya nations which appear in Guatemala about this time are supposed by some to be their descendants. The accounts of the Toltecs are so vague and contradictory and so mixed with evident fable that many ethnologists have been inclined to deny their existence altogether; others suppose that they were a small Nahuatl tribe settled at Tula. Those who accept the traditions in their fullest sense claim that the Toltecs ruled a powerful empire extending over a great part of the plateau, and that the Aztec civilization, religion, arts, and picture-writing were derived from them. Probably the truth lies between these extreme views. It is certain that some of the Mexican monuments, notably the great pyramid or mound at Cholula, are older than the Aztec period, and traditions generally assign these to the Toltecs. Ruins near Tula indicate communal structures similar to those of Arizona. Unfortunately nothing is known of the Toltec language, hence the supposed relationship with

the Maya race is conjectural, and the semi-mythical Quiché records adduced in its support have only thrown the whole subject into more confusion.

HERBERT H. SMITH.

Tolu' Balsam [named from *Tolu* (or Santiago de Tolu) in Colombia, South America, whence it is obtained]; a balsamic juice obtained from *Myroxylon toluifera*, a lofty tree of the family *Leguminosæ*. The tree averages 70 feet in height, with a straight trunk rising 40 feet without branching. The balsam is obtained by slashing the bark of the stem through to the wood in many places, and allowing the juice which spontaneously exudes to collect in small calabashes fixed to the tree. The balsam when fresh is a light-brown, thick, resinous substance, but by keeping concretes into a solid, brittle in cold weather, but easily softened by slight warmth. It has a delicate and fragrant odor, most perceptible when the balsam is warmed, and a correspondingly pleasant taste. Its most important constituents are an amorphous resin and cinnamic acid. Balsam of tolu was used by the natives when South America was first explored, and was introduced into Europe in the latter part of the sixteenth century. This balsam has scarcely any medicinal virtue, but is largely used in pharmaceutical preparations and extemporaneous prescriptions to impart to mixtures its agreeable odor and taste. The official preparations of it are a sirup and a tincture, and it is an ingredient of the compound tincture of benzoin.

Revised by H. A. HARE.

Tolu'ca: capital of the state of Mexico, in the republic of that name; 32 miles W. S. W. of Mexico city (45 miles by railway); in a basin of the plateau; separated from the lake valley by a range of mountains (see map of Mexico, ref. 7-G); 8,653 feet above the sea. It is well built and clean, and the climate is cool and salubrious. The town has considerable manufactures. At the time of the conquest it was an important Aztec pueblo, and tradition assigned its foundation to the Toltecs. Pop. (1892) about 17,000. The Nevado de Toluca, a few miles S. of the city, is an extinct volcano over 15,000 feet high and capped with snow. It has been frequently sealed. It is said that on a clear day both the Pacific and the Gulf may be distinguished from its summit.

HERBERT H. SMITH.

Tolu'ene, also called **Toluol**, **Hydride of Benzyl**, **Hydride of Toluyl**, and **Methyl Benzene** [*toluene*, etc. are derivs. of *tolu*]: a hydrocarbon, formula C_7H_8 , discovered in 1837 by Pelletier and Walter in the oily product of the dry distillation of resins. It is obtained by the dry distillation of tolu balsam and many resinous bodies, by the action of potash on benzylic alcohol, and by heating toluic acid with lime; but is most readily prepared by collecting the portion of coal-naphtha which distills between 212 and 248° F., agitating it with sulphuric acid, and redistilling, and collecting the part that goes over between 226 and 230° F. Toluene is the second member of the benzene series of hydrocarbons (*q. v.*), as is shown by its formation from monobrom-benzene by the action of methyl iodide. It forms a mobile liquid of sp. gr. 0.883 at 32° F., and boils at 230° F. It is soluble to some extent in alcohol, in ether, and in the fixed and volatile oils, and dissolves iodine, sulphur, and many resins. A large number of substitution products of toluene are known, the most interesting of which are those of chlorine and nitric acid.

Revised by IRA RIMSEY.

Tolu'ic Acid, also called **Toluic Acid** and **Tolylic Acid** [*toluic* is deriv. of *tolu*]: an aromatic homologue of benzoic acid and an isomer of methyl benzoate, formula $C_7H_6O_2$; produced by the action of nitric acid on cymene or xylene, and by the action of sodium and carbonic acid on bromotoluene. In a pure state it is colorless and tasteless. The fusing-point of the acid is 347° F.; at a higher temperature it sublimes without decomposition, forming fine needles. When heated with lime, toluic acid is decomposed into **TOLUENE** (*q. v.*) and carbonic acid. It is monobasic, and forms crystalline salts.

Tolu'idine, or **Amido Tolu'ene** [*toluidine* is deriv. of *tolu*]: an isomer of benzylamine, produced by reducing nitro-toluene with ferrous acetate or sulphuretted hydrogen; formula C_7H_9N . It dissolves in boiling water, and in alcohol, ether, and chloroform. From a dilute alcoholic solution it crystallizes in large colorless laminae, which evaporate somewhat at the ordinary temperature of the air, and possess a burning taste. Toluidine fuses at 104° F. to a liquid which boils at about 388° F. It imparts a slight blue color to reddened litmus, and forms a series of compounds with many of the acids.

Tomah: city; Monroe co., Wis.; on the Chi., Mil. and St. Paul Railway; 42 miles E. of La Crosse, and 47 miles S. W. of Grand Rapids (for location, see map of Wisconsin, ref. 6-C). It is in an agricultural, lumbering, and cranberry-growing region, and contains 10 churches, the U. S. Government school for the Winnebago Indians, railway-bridge works, a private bank, and 2 weekly newspapers. Pop. (1880) 1,245; (1890) 2,199; (1895) 2,458.

EDITOR OF "JOURNAL."

Tomahawk [from Amer. Ind.; cf. Algonkin *tomchagen*; Mohegan *tumnahegan*; Delaware *tomohecan*]; strictly, the war-club of the North American Indians, but for a long time the name has been given, probably through misapprehension, to the war-hatchet, originally of stone. Europeans introduced steel tomahawks, which were sometimes so made as to serve as tobacco-pipes, the handle forming the stem. The natives used them as battle-axes, and possessed great skill in throwing them so that the edge would strike first.

Tomato [from Span. *tomate*, from Mex. *tomatl*]; any plant of the genus *Lycopersicon* of the family *Solanaceæ*, indigenous to the Andean region. The common tomatoes are offspring of *L. esculentum*, which was introduced into Europe in the middle of the sixteenth century. The fruit, also called tomato, although formerly known as love apple, was at first regarded with suspicion and was grown for ornament, although there is a record of its having been eaten as early as 1583. The suspicion arose from its relationship to henbane, belladonna, nightshade, and other virulent poisons of the *Solanaceæ* (nightshade family). This fear of the plant was not wholly overcome until well into the nineteenth century, and even in the last quarter of the century the fruit has been considered to be associated with the production of cancer. Few fruits are more healthful than the tomato, and it ranks next the potato in economic importance among garden products. A chief reason for the popularity of the plant is the excellence of the canned tomatoes, which are consumed in enormous quantities. The output in the U. S. in 1893 was 4,456,443 cases, of two dozen cans each. The tomato needs a warm, quick soil, and the fertilizers should be such as give much available food, in order that the plant may make the most of the early season. There are a number of books and bulletins upon tomato-growing, some of the latter dealing with the forcing of the crop under glass, which is a growing industry. The leading books are *Tomato Culture*, by Day, Cummins, and Root, and *Livingston and the Tomato* (Columbus, O., 1893).

L. H. BAILEY.

Tomato Blight: See **BLIGHT**.

Tomb: a burial-place of permanent character or of some pretension, especially a structure destined to contain or to cover the body of one to whom some honor is intended to be done; therefore generally a somewhat ornamental monument. In the widest sense, cenotaphs are also tombs because standing for the actual tomb itself, or, in the case of persons lost at sea or the like, as being the only tomb possible. Tombs are often arranged to contain or to cover a number of burial-places; thus the Roman **COLUMBARIUM** (*q. v.*) is the tomb of a large number of persons; the tomb of Augustus and that of Hadrian were arranged with many burial-places, and modern funeral structures set up in the large cemeteries are intended for the burials of a whole family. The great pyramids of Egypt were tombs, and the tombs of another type, the mastabas (see **MASTABA**), though less in size were more elaborate in decoration. Grecian tombs were simple and tasteful, as became a race of such strong common sense and such exceptional gifts in art. The simple flat stone set up at a grave was often carved with all the skill that the time could afford, and these stelæ are found with inscriptions and decorative sculpture. In Athens, after the Peloponnesian war, unusually large gravestones were set up, and some of these are decorated with sculpture of the greatest beauty. The famous stele of Dexileos, upon which is represented in high-relief the young warrior mounted, riding down his enemy, is over 6 feet wide and nearly as high; and others are nearly of the same dimensions. The reliefs upon these very often represent peaceful groups, where personages sit or stand as if in conversation. Sometimes the idea of a farewell, or of regret, is suggested. Sometimes a marble vase with delicate reliefs carved upon it was set up at the grave. Large edifices built as monuments to the dead are not found in Greece, but were common in semi-Greek lands of Asia. The most famous of them was that of King Mausolus of Caria. See **MAUSOLEUM**.

The monuments erected by the Romans are celebrated in

story and tradition, but their form is often altered beyond recognition, even when their mass remains. The Castle of St. Angelo (that is, of the holy angel), in Rome, is the mausoleum of the Emperor Hadrian, stripped of its sculptures, its marble colonnades, and its probably conical superstructure, and crowned with defensive works which make of it a very defensible citadel. The older mausoleum of Augustus, some vestiges of which exist half a mile away, had received the remains of the emperors who succeeded him, until its niches were filled; so Hadrian erected the still more gigantic structure for himself and his successors in office. Private tombs, only inferior in splendor to these imperial ones, remain for study outside the walls of Rome, and the round tower known as the tomb of a Cæcilia Metella had been robbed of its roof and built up into a fortified tower with mediæval battlements, exactly as has been done with the great imperial structures within the walls. Smaller private tombs lined the great highways of approach to the city gates. At Rome those of the Appian Way are well known, ruined as they are. At Pompeii a long street of tombs is found outside of the gate leading to Herculaneum, and others like it are known to exist near other gates. This means that, as burial within the walls was forbidden or made difficult, the place next easiest of access was chosen for the erection of showy memorial structures. For smaller receptacles and such as were deposited within the greater tombs, see SARCOPHAGUS, ROMAN ARCHÆOLOGY, and CATACOMBS.

The tombs of the Middle Ages and of the Renaissance are often of a refined beauty which no Roman work could approach. Both in Northern Europe and in Italy the burial monuments of the later Gothic style are of wonderful interest, and the art of the period can not be understood without a serious study of these structures. What are known as altar-tombs are large sarcophagus-like masses set on the church-floor, and commonly having a life-size effigy of the departed in bronze or stone lying upon the top. These were simple in early times, as may be seen in the Temple church in London, the cross-legged knight in his chain mail forming the only adornment; but in the fifteenth century such tombs become splendid combinations of decorative art of many kinds, as in the Burgundian monuments of about 1400, now in the Dijon Museum, and those which remain where they were first set up in the Church of Brou a century later, at Bourg-en-Bresse. The famous monument of Maria del Carreto (1406) in the cathedral at Lucca is made of a Roman sarcophagus upon which the lovely recumbent statue of the lady by Jacopo della Quercia is placed. Tombs of this character and only less beautiful than these exist by hundreds in Italy, France, Spain, England, and parts of Germany. Still more stately are the out-of-door tombs, but there are few of these. The most important group of them is in Verona, in the crowded little churchyard of Santa Maria Antica, where splendid pillared canopies crowned with blunt spires, which in their turn carried equestrian statues aloft, cover the sarcophagi of the princes of the house of La Scala. Nowhere is the beautiful sculptured detail of Italian Gothic more perfectly seen than here. The Castelbarco monument, standing upon the wall of the churchyard of San Pietro Martire, also in Verona, is worthy of comparison with the La Scala tombs. Verona is rich in Gothic wall-tombs as well; and these exist in great number in Venice and Florence, and in scores of smaller towns in North Italy. Wall-tombs of the Gothic period are known in the north, but here they approach rather the type of the altar-tomb with a canopy over it; they project more into the church, they are rarely confessed as upright wall-pieces. There are a few such, however, and these are of great beauty and value.

The wall-tomb reached its highest development during the Italian Renaissance. In Florence the Marsuppini monument in Santa Croce and that of Lionardo Bruni in the same church, and the two monuments by Mino da Fiesole in the Church of Badia; Mino's tomb of Bishop Salutati in the Cathedral of Fiesole; the tomb of Alessandro Tartagni in San Domenico, Bologna; and finally the two superb structures in Sta. Maria del Popolo at Rome, the tombs of Cristoforo della Rovere and the Cardinal di Castro, are enough to cite. All these were sculptured and put up between 1450 and 1505; and a long list might easily be made of such splendid structures still existing and another list of equally precious ones destroyed.

A complete treatise on tombs would require an analysis of the sculpture with which they are adorned. This is peculiarly the case with those of the post-Renaissance times,

for the architectural design grows feeble and meaningless in the sixteenth, seventeenth, and eighteenth centuries, and the statues, busts, and groups in marble are by far the most important part of these works of art. The same conditions obtain in the nineteenth century. The diminished power of decorative design, characteristic of the epoch, makes it especially difficult to secure a fine monument, because there is no practical purpose to be served, and no strong leading in one or in another direction afforded the architect. But good sculpture can be had. Accordingly, the tombs in modern cemeteries are generally without merit, although some memorial statues and groups are valuable.

With respect to modern structures the term is generally used in the sense of a somewhat large interior, opening out of which are receptacles for coffins, the whole being either excavated in a hillside with a front of masonry in which the door is arranged or built above ground like a chapel or made by a combination of the two systems. In some cases a similar chapel-like structure is erected above or in connection with a single grave; but as a general thing the term is confined to family vaults of some pretension. Memorial structures erected in cemeteries above or near a grave are more often called monuments (see MONUMENT); but when these are long and low, in general shape like the altar-tombs of the Middle Ages, the word tomb is sometimes employed to describe them. In some cases a family burial-place is merely excavated and built below ground, with a slab on the surface which can be raised, and to these also the word tomb may be applied. In short, any structure which is essentially the receptacle of dead bodies or which contains and covers such receptacles, is, if built in advance, permanent, and of some pretension, a tomb. The difference between a grave and a tomb is, then, that the grave is a simple excavation to be filled up when the coffin has been deposited and the tomb is more elaborate, including something of the nature of a building. The large modern cemeteries contain many tombs in addition to the more numerous gravestones and monuments. Some of the larger tombs are occasionally used for divine service on set occasions, such as anniversaries. These buildings are more commonly a parallelogram in plan, with receptacles for coffins built at one end, the space not so occupied being reserved for vestibule, chapel, and the like. The form of an octagon has also been used, the entrance occupying one of the sides, while the receptacles for coffins are arranged, three or four in the height of the wall, on the other sides. The light in such a case comes from above and the central chamber is covered by a cupola or similar roof. All such chapel-like tombs need to be built in a permanent way of solid materials which defy weather, because such a structure is not certain to be cared for or even visited frequently after the lapse of a few years. It results from this that a certain unusual architectural pretension is common to them, and that in the U. S. tombs may be built of cut stone or marble with vaulted roofs and bronze or wrought-iron doors in the neighborhood of towns whose houses and churches are generally of wood.

RUSSELL STURGIS.

Tom'bac [from Portug. *tambaque*, from Malay *tambāga*, copper, from Sanskr. *tāmrika*, made of copper, deriv. of *tāmra*, dark red, copper-colored, copper]: any one of several different alloys of copper and zinc, with about 85 per cent. of copper. An English tombac gave copper 86.38 and zinc 13.61. A German tombac gave copper 84 and zinc 15.5. The alloy of copper 84.5 and zinc 15.5 is very malleable and ductile. Dutch metal, pinchbeck, imitation bronze, prince's metal, and Mannheim gold are similar alloys. A *white tombac*, or *white copper*, has been made, containing copper 75 and arsenic 25.

Tombig'bee River: rises in Northeastern Mississippi, and after a very indirect S. by E. course of 450 miles in Mississippi and Alabama, joins the Alabama river 45 miles above Mobile, and the stream below the junction is called Mobile river. It is navigable to Aberdeen, Miss., 410 miles from Mobile Bay. Revised by I. C. RUSSELL.

Tombs, Sir HENRY, K. C. B., V. C.: b. in Gloucestershire, England, in Nov., 1824; educated at the Sandhurst Military College and at Addiscombe; entered the service in 1842, when ordered to join the Bengal Artillery, and soon engaged in the Gwalior campaign 1843-44, and subsequent active operations; appointed to the artillery staff and engaged in the Sutlej campaign 1845-46; and the Panjab campaign of 1848-49. On the outbreak of the Indian mutiny, Tombs was a brevet major in command of a troop of horse artil-

tery; ordered to join the army for besieging Delhi, he led the force which captured the Redga and commanded the horse artillery at the final assault. Under Sir Colin Campbell he was then engaged in the Oude campaign at Lucknow, etc. He was made lieutenant-colonel Jan., 1858; colonel the following July, and named Commander of the Bath. Besides the many medals of honors heretofore won, the Victoria Cross was now added. He commanded the Bhutan expedition, and was named K. C. B.; major-general 1867. D. at Newport, Isle of Wight, Aug. 2, 1874.

Tombstone: city; capital of Cochise co., Ariz.; on the Ariz. and S. E. Railroad; 19 miles S. by E. of Benson, and 30 miles N. by W. of Bisbee (for location, see map of Arizona, ref. 15-0). It is in an agricultural and a rich silver and gold mining region, and has a daily and 2 weekly newspapers. Pop. (1880) 973; (1890) 1,875.

Tomcod [either *Tom* + *cod*, or (by analogy of *Tom* and *cod*) from Fr. *tacaud*, whiting pout = Amer. Ind., liter., plenty-fish]; in the U. S., any small codfish of the genus *Microgadus*. The tomcoils, in external characters, do not differ from the large codfishes, the anus, however, is under the last rays of the first dorsal fin, instead of being under the first ones of the second, and the skull is essentially different. The species on the eastern coast is the well-known *M. tomcodus*, that on the western (California, etc.) the *M. proximus*.
Revised by F. A. LUCAS.

Tomlinson, CHARLES, F. R. S.: scientist and author; b. in London, Nov. 27, 1808; received an elementary education (all his widowed mother could afford), and at twelve set out to earn his own living; was fond of reading and study, and while serving in many subordinate capacities carried on his own education; taught modern languages and science in a school established at Salisbury by his brother and himself, and in 1838 published the *Students' Manual of Natural Philosophy*; removed to London and became science lecturer at King's College School. He presented to the Royal Society many original memoirs and papers on scientific matters, and wrote many treatises and articles for encyclopedias and magazines, as well as several scientific text-books. Author of Goethe's *Herman and Dorothea* (1849); *The Sonnet* (1874); and a translation of Dante's *Inferno* (1877); author also of *Amusements in Chess*, and *Essays Old and New* (1887). D. Feb. 15, 1897.

Tomlinson, HERBERT: physicist; b. at York, England, Nov. 18, 1845; educated at Christ Church, Oxford, and took honors both in mathematics and natural science at his degree in 1868; was appointed demonstrator of natural philosophy at King's College, London, in 1870. He has presented a number of memoirs to the Royal Society. *The Philosophical Magazine*, etc., on magnetism, electricity, elasticity, internal friction of metals, torsional vibrations, viscosity of air, etc.

Tommaso'o, NICCOLÀ: author; b. at Sebenico, Dalmatia, Oct. 9, 1802; went in 1818 to Padua, where he studied law; later for a time in Milan, and then in Florence, where he enjoyed the friendship of Vieusseux and contributed articles to the *Antologia*. On account of an article wrongly supposed to be written by him he was obliged in 1834 to leave Florence, and went to France, where he published various writings, notably *Dell'Italia* (2 vols., 1835), the novel *Il duca d'Atene* (1837), and *Relazioni des ambasciadere vénitiani sur les affaires de France au XVI^e siècle* (2 vols., 1838). In 1838 he went to Corsica, where he collected material for his *Lettere di Pasquale Paoli* (1846), and the Corsican songs published in his *Canti popolari toscani, corsi, illirici, greci* (4 vols., 1841-12). He then went to Venice, where he remained about ten years. Early in 1848 he was arrested, but was liberated by the people, and became minister of instruction in the provisional government and later went as an envoy to Paris. The return of the Austrians to Venice in 1849 caused his retirement to Corfu. In 1854 he went to Turin, where he undertook work on the great *Dizionario della lingua italiana*, published under his name and that of Bellini, but not completed till some years after his death. In 1860 he was elected a deputy, but resigned, refusing to hold any public office. In 1861 he established himself in Florence, where, in spite of blindness, he continued his literary labors. D. May 1, 1874. Among his numerous publications, religious, philosophical, philological, critical, and political, to say nothing of verse and fiction, besides what has been mentioned above, are the *Dizionario dei sinonimi* (1830 and since); *Commento a Dante* (1837); *Studi critici* (1843); *Rome et le monde* (1851); *Le Lettere*

di Santa Caterina da Siena (4 vols., 1860); *Il secondo esilio* (1862); *Nuovi studi su Dante* (1865); *Storia civile nella letteratura* (1872), etc.
E. S. SHELTON.

Tompkins, DANIEL D.: Vice-President of the U. S.; b. at Scarsdale, Westchester co., N. Y., June 21, 1774; graduated at Columbia College 1795; was admitted to the bar of New York city 1796; was elected to the Legislature, and also to the convention for revising the State constitution 1801; was a member of Congress 1804-05; appointed judge of the New York Supreme Court 1804; was Governor of the State 1807-17; was conspicuous as an advocate of Jeffersonian principles and an opponent of the banks; commanded the third military district during the war of 1812-15, to the success of which he contributed by his energy in calling out troops and equipping them for service, but by his carelessness in keeping accounts was afterward charged with being dishonest; recommended by a special message of Jan. 28, 1817, the abolition of slavery in New York, which was effected by an act to take effect July 4, 1827; was chosen Vice-President of the U. S. 1816 on the ticket with Monroe, and re-elected 1820, when he was an aspirant for the presidential nomination; was chancellor of the University of New York; delegate to the State constitutional convention of 1821, and for a time its president. D. on Staten Island, June 11, 1825.

Tompson, BENJAMIN: poet; b. at Braintree, Mass., July 14, 1642, graduated at Harvard and taught school at Cambridge. He is remembered as the author of *New England's Crisis*, a long poem on King Philip's war, written about 1675, the prologue of which has been often reprinted. D. at Roxbury, Mass., Apr. 13, 1714.
H. A. B.

Tomsk: government of Siberia, bounded W. by Tobolsk, E. by Yeniseisk, and S. by China, between lat. 49 and 61° N., and between lon. 75° and 90° E. The surface is one vast plain sloping from the Altai Mountains, which occupy the southernmost part. The foot of the mountains is covered with extensive forests of oak, cedar, and pitch trees, and on the adjacent steppes live large droves of wild horses and herds of oxen. Where agriculture is pursued, in the central parts of the government, good crops of rye, barley, oats, hemp, and flax are raised, as the climate generally is mild. The northern part is marshy, and partly covered with somber forests of fir and pine. The inhabitants live as nomads; hunting and fishing form important occupations. In the southern part an extensive mining business is carried on. Gold-washing is in many places very remunerative. The mineral wealth is considerable, and an important transit trade between Russia and China is carried on the large system of lakes and rivers which the government contains. Area, 331,159 sq. miles. Pop. (1889) 1,299,729.
Revised by M. W. HARRINGTON.

Tomsk: capital of the government of Tomsk, Siberia; on the Tom, an affluent of the Obi; in lat. 56° 29' N.; 2,809 miles E. of St. Petersburg (see map of Asia, ref. 3-F). It is well built, has some handsome edifices, important foundries, tanneries, soap-factories, and other manufactures, and carries on, besides its transit trade, an active trade in furs, grain, and cattle. The Siberian University was opened here in 1886. Snow falls in October, and in December mercury freezes, but the summer is beautiful and the climate generally healthful. It was almost destroyed by flood and fire on May 16, 1890. Pop. (1891) 41,632.

Revised by M. W. HARRINGTON.

Tom's River: village; capital of Ocean co., N. J.; on Tom's river, and the Cent. of N. J. and the Penn. railways; 4 miles from Barnegat Bay, and 52 miles E. of Philadelphia (for location, see map of New Jersey, ref. 5-E). It is a popular summer resort; contains 5 churches, graded public schools, 3 hotels, national bank with capital of \$50,000, and 2 weekly papers; and is engaged in agriculture, cranberry-culture, coasting trade, and the shipment of fish, oysters, and clams. The village was founded in early colonial days, contained large salt-works, was a noted retreat for privateers in the Revolutionary war, and was burned by the British Mar. 24, 1782. Pop. (1890) 1,147; (1895) estimated with suburbs, 3,000.
EDITOR OF "NEW JERSEY COURIER."

Tomtit: See **TITMOUSE**.

Ton [O. Eng. *tunne*, tun, large vessel; O. H. Germ. *tonna* > Mod. Germ. *tonne*]; a measure of weight and capacity in Great Britain and the U. S. As the former it is equivalent to 20 cwt., and as in Great Britain, and in the U. S. custom-houses, the hundredweight is reckoned at 112 lb., the ton

contains 2,240 lb. In the domestic commerce of the U. S., however, it has become customary to reckon only 100 lb. to the cwt. and 2,000 lb. to the ton; and this usage, in some of the States, has received the sanction of law. Thus in the Revised Statutes of the State of New York it is provided that "the hundredweight shall consist of one hundred avoirdupois pounds, and twenty hundredweight shall constitute a ton." This law was passed in 1851. By act of Congress, when not specified to the contrary, the ton is to be construed as meaning 2,240 lb. The ton of 2,240 lb. is commonly called "the long ton," that of 2,000 lb. "the short ton." The old shipping ton of France was 2,158.43 lb., and the metric ton is 2,204.6 lb. As a measure of the carrying capacity of a ship the ton is 40 cubic feet. This is called actual tonnage. The register ton is 100 cubic feet.

The words *ton* and *tun* are etymologically the same, but the former orthography is usually applied to weights and the latter to liquid measure. The tun in old British ale or beer measure was equal to 216 gal. of 282 cubic inches each, and in old British wine measure to 252 gal. of 231 cubic inches each. A tun of water of the larger of these measures weighs a little over 2,200 lb.; and hence it is supposed that the ton weight was originally derived from the tun measure, of which it is a rough equivalent.

Tonawanda: village: partly in Erie and partly in Niagara cos., N. Y.; on the Niagara river, the Tonawanda creek, the Erie Canal, and the N. Y. Cent. and Hud. River Railroad; 11 miles N. of Buffalo (for location, see map of New York, ref. 5-C). It contains a number of manufactories, principally of lumber, and a union school with library, a national bank with capital of \$100,000, a State bank with capital of \$200,000, and a weekly newspaper.—The village of **NORTH TONAWANDA** (post-office, Tonawanda) has lumber interests, manufactories of merry-go-rounds, etc., and has a daily paper and 2 State banks with combined capital of \$200,000. Pop. Tonawanda (1880), 3,864; (1890) 7,145; North Tonawanda (1890), 4,793.

Tone [from Fr. *ton* < O. Fr. *ton* < Lat. *tonus* = *τόνος*, a stretching, tension, cord, tone, sound, deriv. of *τείνειν*, stretch]: in music, a word having for its primary meaning a *sound*, or the impression made on the ear by a vibrating string or other sonorous body. The derivative meanings of the term relate to the qualities, relations, or conditions of such sounds, as (1) their place on the scale, a high tone or a low tone; (2) the interval made by two sounds, as a major or a minor tone; (3) any special quality of a sound, as a fine, clear, rich, sweet, or feeble tone. In a more technical sense a tone (or whole tone) means one of the steps of the scale, as C—D, G—A, etc. The words step and half-step are much better as scientific terms than whole tone and semi-tone, as the former are not easily confounded in a student's mind with the idea of quality of sound, as is the case with the word tone.

Revised by DUDLEY BECK.

Tone, THEOBALD WOLFE: patriot; b. in Dublin, Ireland, June 20, 1763; educated at Trinity College, Dublin; studied law in London; was called to the bar at the Middle Temple 1789; wrote a number of pamphlets to expose English misgovernment in Ireland; was an ardent sympathizer with the doctrines of the French Revolution; promoted the combination of the Irish Roman Catholics with the Protestant Dissenters in opposition to the British Government; founded at Belfast the first society of United Irishmen 1791; became secretary and agent of the Roman Catholic committee 1792; was involved in secret negotiations with France, on account of which he went to the U. S. 1795; resided a few months at Philadelphia and at Princeton, N. J.; sailed for France Jan., 1796; aided the French Directory in fitting out Hoche's projected expedition to Ireland, in which he was appointed brigadier and adjutant general; served in the Bavarian army 1797; was captured in Sept., 1798, on board a French squadron bound for Ireland; was taken to Dublin, tried by court martial, and sentenced to death, but committed suicide by cutting his throat Nov. 19, 1798.—His eldest son, **WILLIAM THEOBALD WOLFE TONE** (b. in Dublin, 1791), was educated by the French Directory; served in the French army; emigrated to the U. S. in 1816; served a few years in the army; d. in New York, Oct. 10, 1828. He published several works, including the *Autobiography* of his father (Washington, D. C., 1827; new ed. London, 1892).

Toner, JOSEPH MEREDITH, M. D.: physician and author; b. in Pittsburg, Pa., Apr. 30, 1825; graduated at the Jefferson Medical College in 1853; in 1855 took up his residence at Washington, D. C.; in 1872 founded the Toner lecture, in

charge of the Smithsonian Institution, to encourage the discovery of new truths in medicine; contributed largely to medical literature and to medical biography; and devised a system of symbols to indicate geographical localities, which has been adopted by the Post-office Department. He was a member of many medical societies and learned associations, D. Aug. 1, 1896. Among his numerous publications are *Abortion in its Medical and Moral Aspects* (1859); *Maternal Instinct, or Love* (Baltimore, 1864); and a *Dictionary of Deceased American Physicians*.

Tonga Islands: See FRIENDLY ISLANDS.

Tongaland: another spelling of AMATONGALAND (*q. v.*).

Tongue [O. Eng. *tunge*; O. H. Germ. *zunga* (> Mod. Germ. *zunge*); Icel. *tunga*; Goth. *tuggō* < Teuton. *tung-*; O. Lat. *din-gua* > Lat. *lin-gua* < Indo-Eur. *dngh-*]: the organ of the special sense of taste, situated on the floor of the mouth. This body consists of muscles by which it can be protruded, retracted, and curved upward, downward, and laterally. The base or root of the tongue is attached below to the hyoid bone, and the tip of the tongue, when inactive, rests forward against the inner surface of the lower incisor teeth. The tongue consists of two symmetrical halves, with a fibrous middle septum; hence one side may be paralyzed and the other active, as in cases of apoplexy. The upper surface or dorsum of the tongue is essentially the seat of taste. (See figure of taste-bulbs in HISTOLOGY.) It is covered by delicate processes or papillæ, which contain the ultimate ramifications of blood-vessels and the terminal fibers of the nerves of sensation and taste. The fore part and sides of the tongue derive their sense of taste from the gustatory branch of the fifth nerve. The base of the tongue and sides and the larger papillæ receive their special sense through the lingual branch

FIG. 1.—The tongue.

of the glosso-pharyngeal nerve. The facial nerve also has an influence upon taste, paralysis of this nerve impairing the special sense. The papillæ vary in size and length on different parts of the tongue—broad, circumvallate near the base, fungiform and filiform on the anterior part. Food and viands of decided flavor can be definitely tasted and distinguished by a single papillæ, as found when applied through cylindrical glass rods. It is claimed that only the circumvallate and fungiform papillæ contribute to the sense of taste, the filiform to sensation. Sensation (tactile) is more acute in the tongue than elsewhere in the body. Thus Valentin found that distinct perception of two

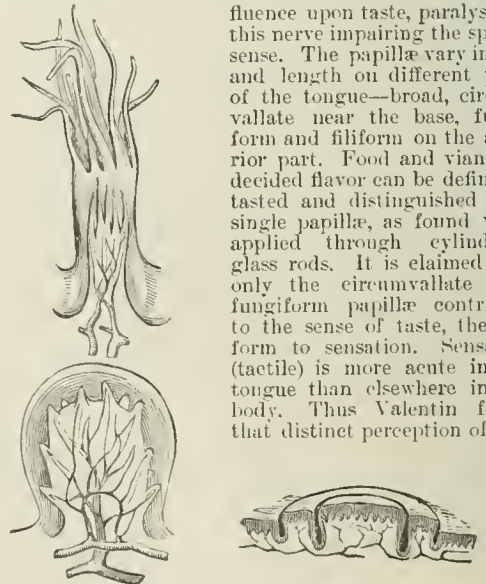

FIG. 2.—Papillæ of tongue: loops of vessels and nerves.

needle-points was obtained at the tip of the tongue when the points were separated only .483 of a Paris line ($\frac{1}{2}$ inch), the most sensitive part elsewhere, the tip of the fin-

ger, requiring 603 of a line. The several papillæ are imbedded in the corium or body of the mucous membrane, which corresponds to the cutis vera of the skin, and are covered with scaly epithelial cells. The tongue may be inflamed from various causes, as hot drinks and irritants. It is often the seat of aphthæ, ulcers, cankers, the result of catarrh of the mouth. A curious form of inflammation sometimes occurs on one lateral half, usually the left, of the tongue (hemiglossitis). There is decided swelling of the affected side. The disease seems of nervous origin. The coated tongue may be due to a relaxed, flaccid, and pale condition of the papillæ, and when noticeably coated has an accumulated stratum of thickened saliva and rapidly exfoliated epithelial cells; the yellow color is the result of the fatty metamorphosis which the cast-off cells speedily undergo. When the stomach is inflamed or irritable, the papillæ of the tongue will often appear as distinct points. The tongue is occasionally attacked by epithelial cancer. Ranula is a cystic tumor beneath the tongue, due to occlusion of some one of the salivary ducts. Exceptionally, in infants the frenum or fibrous cord beneath the tongue is too short; the tongue-tied infant can not nurse well, and when older speaks imperfectly; the cure is by cutting.

Revised by W. PEPPER.

Tonic: in music, the keynote, or prime of a scale.

Tonics [from Gr. *τονικός*, deriv. of *τόνος*, tension, force, strength, tone, deriv. of *τελεω*, stretch. See TONE]: in medicine, a term used to refer generically to the means employed by the physician to remove the condition of debility, general or special. Nourishing food, fresh air and exercise, cold bathing, etc., are thus spoken of as having a tonic effect. Drugs, such as directly improve nutrition, or indirectly accomplish the same end by exciting the appetite and increasing digestive power, are called tonics. The most prominent examples of the former are *iron*, which in anæmia directly stimulates the manufacture of the red blood-corpuscles; *cod-liver oil*, which operates as a fatty food of unusually easy assimilation; *phosphorus*, which in some cases of nervous exhaustion or functional nervous derangements seems to improve the nutrition of the nerve-structures; and preparations of some of the metals, as silver, zinc, mercury, arsenic, which in peculiar conditions of malnutrition tend in some unknown way to determine the nutritive processes back into the healthy channels. Of the drugs which are tonic by improving digestive power, the most serviceable are vegetable bitters, as *cinchona* and its alkaloids, *gentian*, *colombo*, *quassia*, *nux vomica*, etc.; aromatics and spices; acids, both mineral and organic; and weak alcoholic beverages in very moderate quantity. The list might be greatly extended, for it is a general property of irritants that, taken internally in small doses, their irritation tends to increase the activity of the digestive organs and the secretion of the digestive fluids. Revised by H. A. HARE.

Tonic Sol-fa System: a musical notation, and the method of teaching music which grows out of it. It is called a natural system, because it treats music properly as having but one scale or alphabet of seven tones. The other scales are but replicates of this. No lines and spaces are used. It consists of the letters d, r, m, f, s, l, t, which are the initials of the Guidonian syllables doh, ray, me, fah, soh, lah, te (the last changed from se). These notes are applied to all keys alike, in accordance with the tonic principle in music. Tones above the octave are represented by a figure at the top of the letter (d¹, d², etc.); tones below the octave by a figure at the bottom of the letter (s₁, s₂, etc.). The signs for time (rhythm) are based upon the law of accent. A strong accent is represented by a perpendicular line before a note (|); the weak accent is represented by a colon (:); a medium accent by a shorter, thinner line (|). The space between any two accents represents a beat or pulse. The space between two strong accents represents a measure. A dash between two accent-marks shows that the previous tone is to be continued. The four principal forms of measure are herewith given as illustrations:

- Two-pulse measure. Four-pulse measure.
- ||d:m|d:--|} ||l:m|s:m|d:--|--|}
- Three-pulse measure. Six-pulse measure.
- ||d:m:s|d:--:--|} ||d:m:s|d¹:s:m|d:--:--:--|}

In these measures each pulse is supposed to represent a quarter-note. The shorter notes are represented by divisions of the spaces; eighth-notes by a dot in the middle of the space (|d, d:); sixteenth-notes by a comma in the middle of the half-space (|d, d, d.); triplets by inverted com-

mas (|d, d, d:). Other forms are shown by combinations of these signs. Silences (rests) are indicated by the absence of notes in the pulse divisions (|d: |). In the tonic sol-fa system the world's standard of keys is recognized, but no sharp or flat signatures are required. The pitch of a tune is indicated thus at the beginning: Key C, Key G, Key F, etc. Chromatic tones are represented by the old chromatic names written out. The sharps are do, re, fa, so, le; the flats are ra, ma, sa, la, ta. No naturals, double sharps, or double flats are required in tonic sol-fa, as they are only necessitated by the complex nature of the staff notation.

The germs of the tonic sol-fa notation were first used by Miss Sarah Glover, of Norwich, England, as early as 1812. In 1841 John Curwen, a young Congregational clergyman of London, saw its educational value, and thereafter devoted his life chiefly to its development. Through his genius the tonic sol-fa system became not only a complete musical notation, but also a perfect educational method. He introduced many original devices. One was that of indicating each tone of the scale by a position of the hand, which enables the teacher to exercise a class in one and two parts in all keys. Another device is the modulator, by which scales and keys are represented or pictured in their true relationships, as shown in the diagram. This device, combined with the simplicity of the notation, reduces to a minimum the difficulties of modulation, or transition, as the tonic sol-faists prefer to call it. If the key is changed to the dominant (fifth) the *soh* is changed to *doh*, and the other syllables to correspond; thus with any passing change of key that may occur. As a result of this simplicity the tonic sol-fa notation becomes a revelation of the harmonic mysteries of classical music. All vocal music (oratorios, masses, glees, etc.) is printed in this notation in England, and is sung with facility by the common people. Whether the notation is of equal value in instrumental music is a question that is not yet decided. Its value in that is not so self-evident; yet time may prove that its educational power is equally needed with the keyboard as with the voice.

The introduction of tonic sol-fa into the U. S. dates from the publication of a monthly journal, the *Tonic Sol-fa Advocate*, by Theodore F. Seward, in 1881 (since discontinued), and the preparation by him of text-books of the system adapted to the needs of the American public. The relation of tonic sol-fa to the staff notation may be aptly compared with the relation of the Arabic figures to the Roman numerals. As these figures reduced mathematics to a simple expression, and brought its principles within reach of the common mind, so does the tonic sol-fa notation change the relation of music to the entire human race.

THEODORE F. SEWARD.

Ton'ikan Indians: a linguistic stock of North American Indians, whose historically known tribes lived in close proximity to one another, and appear to have spoken dialects not widely differing. About the year 1700 one tribe lived in Avoyelles parish, La.; another, E. from there, at the Tonica Bluffs, on the eastern bank of the Mississippi river; and a third, near the junction of the Yazoo and Mississippi. Politically, these latter belonged to the Chickasaw confederacy. The Tonicians on Tonica Bluffs were steadfast allies of the French colonists. All Tonicians had the reputation of being warlike. A connected history of their migrations, wars, and other deeds can not be composed from docu-

J. W. POWELL.

Tonk: city and state of Rajputana, British India. The state is of very irregular outline, occupying the western slope of the basin of the upper Chambal river. Area, 2,839 sq. miles. Pop. (1891) 380,069, mostly Hindus. The rajah is a Mohammedan Pathan. The city is in lat. 26 11' N., lon. 75° 50' E.; 1,463 feet above sea-level, and a mile from the banks of the Banas river, an affluent of the Chambal (see map of Northern India, ref. 6-D). It is a large town, capital of the state, surrounded by a wall, and protected by a fort. It is a progressive city, and many important hygienic improvements have been introduced. Pop. (1891) 46,069.

MARK W. HARRINGTON.

Ton'ka Bean [*tonka* is from Guianan *tonca*, the native name]: the seed of a noble leguminous tree of Guiana, the *Dipterix* (or *Coumarouna odorata*). The tree grows to from 60 to 90 feet in height; the pods, about 2 inches long, are almond-shaped, and the single seed, over an inch long, is shaped like a large kidney bean and shiny black in color. It abounds in the fragrant principle coumarine, with the composition $C_{11}H_{10}O_4$; is used in scenting snuff and tobacco, and in perfumery. It is also employed to keep moths from woolens. In medicine, it relieves the paroxysm of whooping-cough. Revised by H. A. HARE.

Tonka bean (*Dipterix odorata*). Half of the one-seeded pod.

Ton'kawan Indians [so named from a word of the Weko or Ilueco language, *tonkaueya*, which is said to signify *many staying together*]: a linguistic stock of North American Indians calling themselves Titkan watitch, *indigenous people* (of Texas). Besides the main Tonkawa, two tribes are reported to have spoken dialects of their language, the Mayeyes and the Yakwal, or *drifted people*.

Fragments of this people appear in many parts of Central and Southern Texas—on the Brazos river, in Fayette County, and near Corpus Christi. Before they removed to the Oakland reserve, Oklahoma (1884), they were living around Fort Griffin, Shackelford County, the men serving as scouts to the U. S. troops stationed there. Their pristine home may have been nearer the Rio Grande. In their language they distinguish certain terms used by "old people" from those employed by the younger generation. They have thirteen clans, partly with totem names. They are first mentioned as Tancoayo, in 1719. In 1862 half of their number were massacred 3 miles S. of Anadarko, Indian Territory (now Oklahoma), by surrounding hostile tribes. Their population in 1890 was seventy-eight and in 1892 they were settling on farms allotted to them by the U. S. Government. They are nicknamed Man-eaters by all the tribes living around them.

The pronunciation of the Tonkawan language is easily acquired by Americans and Mexicans. The inflection of their verb is complex and polysynthetic. Verbs and adjectives reduplicate their first syllable to assume a distributive signification. The personal pronoun possesses a dual, and the substantive is inflected by a number of case positions. See INDIANS OF NORTH AMERICA.

J. W. POWELL.

Tonnage: a measure of the capacity of a ship, used for the purpose of registry at her port and for levying harbor and other dues. According to the rule of measurement prevailing in Great Britain prior to the year 1835, it was arbitrarily assumed in the so-called "old measurement" (O. M.) that the depth and the breadth of the ship were equal. One step in obtaining the cubic contents of a ship was to multi-

ply the length by the square of the breadth, and the tonnage dues were levied accordingly. This rule led ship-builders to build vessels that were narrow and deep, and accordingly dangerous in rough weather, as well as highly faulty in their plan of structure. The British Parliament adopted in 1835 a new plan, suggested by Mr. Riddle of the Royal Hospital, Greenwich. The statute of 1835 was modified in 1854, and the Merchant Shipping Act of that year (17 and 18 Viet., c. 104) is the basis of the legislation existing in the U. S. The rules established by law in 1799 in the U. S. continued in force until they were superseded by the act of May, 1864. The principle of the latter is to establish at the outset a mode of ascertaining the length, breadth, and depth of the ship, as well as a *tonnage deck* for the purpose of measurement. This is the upper deck of ships of less than three decks, and the second from below in those having three or more. The length of the "tonnage deck" is then ascertained by the following rule: Measure the length of the vessel in a straight line along the upper side of the tonnage deck from the inside of the inner plank, average thickness, at the side of the stem, to the inside of the plank on the stern timbers, average thickness, deducting from this length what is due to the rake of the bow in the thickness of the deck, and what is due to the rake of the stern timber in the thickness of the deck, and also what is due to the rake of the stern timber in one-third of the round of the beam. The "tonnage length" as thus ascertained is then divided into a number of equal parts, depending upon that length. The statute thus creates six classes of ships (five in the British system) for the purpose of measurement. The principle of the classification is to begin with vessels not exceeding 50 feet in "tonnage length" (measured by the prescribed method), and to divide them into six equal parts (four in the British system), increasing the number of parts by two for each increment of 50 feet. Vessels belonging to these classes are then respectively divided into six, eight, ten, twelve, fourteen, and sixteen parts, according to their length.

The next thing is to find the "transverse area" of the vessel. For this purpose the depth of the ship is to be measured at each point of division as above given, according to a prescribed rule. If the depth at the midship division of the length do not exceed 16 feet, each depth is to be divided into four equal parts. "Then measure the inside horizontal breadth at each of the three points of division, and also at the upper and lower points of the depth, extending each measurement to the average thickness of that part of the ceiling which is between the points of measurement. Number these breadths from above, numbering the upper breadth one, and so on down to the lowest breadth; multiply the second and fourth by four, and the third by two; add these products together, and to the sum add the first breadth and the last or fifth; multiply the quantity thus obtained by one-third of the common interval between the breadths, and the products shall be deemed the transverse area." When the midship depth exceeds 16 feet, the "transverse area" is obtained by dividing each depth into six equal parts, instead of four, and with corresponding changes in other respects. This mode of reckoning gives the "transverse area" at each point of division of the length of the vessel, as already noticed.

The final step is to obtain the register tonnage. For this purpose the "transverse areas" found as above are numbered, beginning with the extreme limit of the length at the bow. The even-numbered areas are multiplied by four, and the odd, with the exception of the first and the last, by two. These products are added together, and to the sum the first and last "transverse areas," if they "yield anything," are added. The quantities thus obtained are to be multiplied by one-third of the common interval between the areas. This product is the cubical contents of the space under the tonnage deck. Divide it by 100, and the quotient is the "register tonnage," subject to certain special additions now to be named. Additions (in accordance with a fixed rule) are made to the tonnage under deck, as above ascertained, in case there be a break, a poop, or any other permanent closed-in space on the upper decks or spar deck available for cargo or stores or the "berthing" or accommodation of passengers or crew. The same addition is to be made when a vessel has a third deck or a spar deck, the tonnage of the space between it and the *tonnage deck* being ascertained in a specified way.

In ascertaining the tonnage of open vessels the upper edge of the upper "strake" (line of planking extending

from stem to stern) is to form the boundary-line of measurement, and the depth is to be taken from an athwart-ship line extending from the upper edge of such strake at each division of the vessel's length.

The register of the vessel at the custom-house must express the number of decks, the tonnage under the tonnage deck, that of the between decks above the tonnage deck, and that of the poop or other inclosed space, each separately. It is deemed of such importance that the registered tonnage should be known that the law provides that it shall be deeply carved or permanently marked upon the main beam of the vessel, and so continued, or it shall no longer be recognized as a registered vessel of the U. S. No vessel need be registered for tonnage that is used for cabins or state-rooms, and constructed entirely above the first deck, which is not a deck to the hull; nor do the provisions concerning this kind of measurement apply to any vessel not required by law to be registered or enrolled or licensed, unless otherwise specially provided.

This system has been adopted with slight modifications by nearly all European countries, and by Haiti in 1882 and Japan in 1884. It was adopted essentially by the International Tonnage Commission at Constantinople in 1873, which fixed the dues to be levied on ships passing through the Suez Canal, the main point of difference being in the rules with regard to the deduction of engine-room. Displacement tonnage is found in the same way as regular tonnage, except that the measurements are made along and from the load water-line, and the final cubic contents are divided by 35. This system is generally considered the fairest measure for the tonnage of naval ships. It has been adopted officially for the war-ships of France, Great Britain, the U. S., and other nations. For yachts, tonnage is measured according to rules which are framed for the purpose of determining time allowances in racing. The rules vary with each yacht club and association, but are mainly modifications of the old measurement tonnage. Revised by R. A. ROBERTS.

Tonnage and Poundage: an ancient tariff on imports and exports levied by the sovereigns of England, nominally for the defense of the realm and the maintenance of the sea-power of the kingdom. This tariff had its origin in the royal dominion over the ports and waterways of the kingdom, which involved the right to regulate commerce and to impose such restrictions and charges upon the same as the public safety and interests should require. (See **TONNAGE DUES**.) By virtue of his royal prerogative, Edward I. (A. D. 1303) levied on all foreign merchants trading in English ports a duty of 2s. per tun on imported wine (which went by the name of *butlerage* or *tunnage*), and 3d. per pound sterling on all other imported and exported merchandise. This tariff was in the reign of Edward III. converted by Parliament into a *subsidy* granted to the king, and British as well as foreign merchants were subjected to its operation. From that time on to the final destruction of the royal prerogative in the matter of customs and revenue by the Long Parliament, the legal status of this tariff remained unsettled. It was, as a matter of fact, habitually voted to the sovereign, usually for life, by Parliament, and, on the other hand, it was as regularly exacted during the earlier years of reigns in which Parliament neglected—some times for several years—to take such action. During the Tudor régime no question was raised as to the right of the crown to levy tonnage and poundage. It was only when the conflict between the Commons and the royal prerogative reached an acute stage, in the reigns of the first and second of the Stuarts, that the legal and constitutional right of the king to levy this tribute was seriously called in question. The tax derives its great historical importance from the part it played in the downfall of Charles I., who, in consequence of the refusal of the Commons to make him the usual life grant thereof, levied it without parliamentary sanction. The Commons remonstrated, and even went so far as to denounce as a traitor any one who should presume to collect or to pay the tax (A. D. 1628-29), but the remonstrance was disregarded and the imposition continued. The Long Parliament succeeded, however, in breaking up this practice by the Tonnage and Poundage Act, which received the royal assent on June 22, 1841, and the right of Parliament to grant or withhold the tax has been practically undisputed ever since. Tonnage and poundage continued to be levied, under the authority of parliamentary grants, for longer or shorter periods, until the final abolition of the tax by the Customs Consolidation Act (passed in 1787).

A good, brief statement of the origin and history of this tax is given in Medley's *English Constitutional History*. For its bearings on the constitutional struggle of the seventeenth century, see S. R. Gardiner's admirable *History of England* (especially vols. vi., vii., and ix.) and his *Constitutional Documents of the Puritan Revolution*.

GEORGE W. KIRCHWEY.

Tonnage Dues: a duty or impost levied by the state on merchant vessels as a fee for the privilege of using the harbors of the state. This tax was formerly based on the number of tons of freight actually carried by the vessel, and was assessed separately for every time that a harbor was actually entered, but it is now measured by the registered tonnage of the vessel, ascertained in the manner set forth in the article **TONNAGE** (*q. v.*), and is usually commuted into an annual tax.

Duties levied by maritime states, by way of toll or tribute, upon all vessels using the territorial waters of the state, are of great antiquity, and flow doubtless from the proprietary rather than the political conception of sovereign rights. From this—which was strictly the ancient and mediæval—point of view the sovereign was looked upon as a great property-owner, owning the bays, straits, and harbors, as well as the seashore and the highways, as portions of the royal domain, and he had the same right to exclude a stranger that any land-owner has to protect himself and his property against trespass. The principle is thus laid down by Azuni, the distinguished author of *The Maritime Law of Europe* (1795): "As the right of sovereignty along the seashore flows from the territorial domain, the sovereign exercises his natural and legitimate empire when he forbids the vessels of strangers to enter his ports or roads, or prescribes to them certain limits for their approach. He has acquired this right by the sacred and inviolable law of property." This right to exclude strangers from the proprietary waters of the state was ordinarily commuted into a tribute arbitrarily exacted for the use of those waters, and this tribute ultimately took on the form of a toll or custom for the maintenance of the guard of the sea and to defray the cost of maintaining the roads and harbors. Accordingly, in the work above referred to, the rule is laid down as follows: "Maritime nations have also a right to impose such contributions and imposts on the territorial sea as they may judge necessary to defray all the charges and expenses which the public security and the convenience of navigation require." It is to this principle that the practice of the Athenians in levying tribute on all ships passing through the Hellespont, and of the Byzantines upon all ships entering the Euxine, is to be referred. In the parliamentary records of the reign of Richard II. (1377-99) in England it appears that a tribute or custom was imposed on every ship that passed through the Northern Admiralty (i. e., "in the sea stretching itself from the Thames mouth all along the eastern shore of England toward the northeast") for the pay and maintenance of the guard or protection of the sea. This was imposed on strangers as well as upon subjects, and was at the rate of 6d. a ton upon every vessel that passed by. In modern times all of these exactions have generally been reduced to the single duty or tax imposed on vessels for the use of harbors, the term "tonnage dues" being now usually coextensive in meaning with harbor dues or port dues, although there is nothing in the rules of international law to prevent the imposition of maritime dues for other purposes. The principle is recognized by all of the authorities from Grotius to Hall. It is thus laid down by Sir Travers Twiss: "Every vessel which casts anchor within the jurisdictional waters of a nation becomes liable to the jurisdiction of that nation in regard to all reasonable dues levied for the maintenance of the general safety of navigation along its coasts."

The laws of the leading commercial nations vary a good deal in respect to the amount and the manner of levying tonnage dues, the tendency of modern legislation being strongly in the direction of the reduction and ultimate abolition of imposts of this character, as constituting a serious restraint on free commercial intercourse. The most noteworthy step in this direction is that which was taken by the Congress of the U. S. in 1886, in passing the Reciprocity Act of that year. By that act the U. S. invited the other commercial nations to adopt the policy of abolishing all light-house dues, tonnage taxes, and similar burdens on commerce, and agreed to abolish tonnage taxes on vessels from the ports of any country which should grant immunity from similar burdens to vessels from ports of the U. S. This gener-

ous and enlightened policy has thus far (1895) been adopted only by Germany and the Netherlands, though it can not be doubted that it will soon become the rule of commercial intercourse throughout the civilized world. By virtue of earlier legislation, reciprocal arrangements for the remission of port charges or harbor dues have been entered into by the U. S. Government with most of the West Indian and Central American nations and colonies, and, so far as the mail-steamships between the U. S. and Brazil are concerned, with the latter country also.

With these exceptions, every vessel belonging to the mercantile marine of the U. S. engaged in foreign trade—vessels employed in the fisheries alone excepted—must pay annually into the Federal Treasury a tonnage tax or duty at the rate of 30 cents per ton. Vessels belonging to foreign states between whom and the U. S. ordinary commercial relations exist pay at the same rate as domestic vessels. But such vessels, not of the U. S., are also subject to a further duty, denominated "light money," of 50 cents per ton. This is levied and collected in the same manner as strict tonnage duties. Ships built within the U. S., but belonging wholly or in part to subjects of foreign powers, are required to pay at double the above rate. This anomalous provision has been much criticised as being a part—and perhaps the least consistent and defensible part—of the illiberal shipping laws of the U. S. (See David A. Wells, *Our Merchant Marine*.) Vessels of the U. S. engaged in domestic commerce are exempt from tonnage duty. This is the case even though such vessels, trading on the northern frontiers, should touch at intermediate foreign ports. Yachts belonging to a regularly organized yacht club of a foreign nation extending like privileges to yachts of the U. S. are also admitted free. (See U. S. Rev. Stat., secs. 1722, 2793, 2931, 3110, 4150–4154, 4216, 4219–4227, 4320, 4335.) From the report of the commissioner of navigation on Oct. 18, 1894, it appears that the amount collected and paid into the Federal Treasury as tonnage tax during the fiscal year ending June 30, 1894, was \$539,028.47. The proceeds of the tax are applied to the support of the Marine Hospital service.

The supreme control over the public territorial waters of the U. S., which belonged primarily to the several States, was by the Constitution surrendered by them and conferred upon the Federal Government. That instrument (Art. I, Sec. 10) expressly forbids any State to levy tonnage duties without the consent of Congress. This consent has never been given nor, it is believed, has it ever been invoked. The best authorities regard the present state of congressional legislation as open to grave objection, as being unnecessarily vexatious, unequal, and therefore unjust in its operation, and not based on sound scientific and commercial principles. In particular it is urged that the tax should be levied on the gross rather than the net tonnage of vessels, and that the same rate of duty should be adopted by all the leading commercial nations. For a particularly intelligent discussion of the subject, with a draft of proposed legislation, the reader is referred to the report of the commissioner of navigation for 1894, above referred to.

GEORGE W. KIRCHWEY.

Tonquin. ton'keen', **Tonkin**, or better **Tongking** (lit., Eastern Capital): a French dependency of Indo-China, on the Gulf of Tonquin, S. of China, N. of Annam, and E. of the Shan States, but the latter boundary is uncertain. Area about 34,740 sq. miles. It consists of a delta which is densely populated and highly cultivated, and a mountain region which is covered with forests and very sparsely inhabited. The delta is that of the Song-Koi or Red river, which bifurcates at Sontai and incloses between its numerous arms grassy level fields, easy to cultivate, fertile, and covered with villages, cities, and rice-fields. The northern branches connect by canals with the Tai-Bin river, thus combining the two deltas into one, and the latter stream is the more navigable. The capital is Hanoi, a city of Chinese aspect, having about 150,000 inhabitants. The chief port is Haiphong, near the coast. The principal crop is rice, but the sugar-cane, cotton, and tobacco are extensively cultivated. There are copper and iron mines of good promise, and coal mines are worked at Hongay, near Haiphong, and at Kebao. In 1892 the imports were valued at 28,432,772 francs, and the exports at 10,735,850 francs. The transit trade to and from Yunnan amounted to 4,990,000 francs in imports, and 3,180,000 francs in exports. The latter trade is by the Song-Koi, and great expectations are entertained as to its future. Tonquin is yet commercially dependent on the British colonies of Hong-

kong and Singapore. A railway is under construction from the head of navigation on the Song-Thuong northward to Langson, near the Chinese frontier, which, when opened, is expected to furnish another important trade route. The road begins at Phu-lang-Thuong, 12 miles N. E. of Bac-ninh, and is to be about 60 miles long. The climate of Tonquin is hot, but not unwholesome; the people are very poor, suspicious, avaricious, industrious, and skillful. The interior trade is largely in the hands of Chinese. The country was annexed by France in 1884, but remains turbulent. Pop. about 9,000,000, divided among fourteen provinces and 8,000 villages.

MARK W. HARRINGTON.

Tonsillitis, or **Tonsilitis** [*tonsillitis* is Mod. Lat., from Lat. *tonsilla*, tonsils (as the form *tonsillitis* is from Eng. *tonsil*) + *-itis*, a medical termination used to denote inflammation]: an acute or chronic inflammation of one or both tonsils, involving the epithelial, glandular, or connective-tissue structures, or more than one of these. The inflammation may be excited by some infectious micro-organism that gains access to the tonsils by the nasal passages or by the mouth; or it may be due to the effects of some specific disease, such as scarlatina, smallpox, or syphilis, which lowers the resistance of the tissues; or it may be due to some constitutional disease, such as gout; or it may be caused by a fungus.

In acute tonsillitis the affected glands become red and enlarged, and if suppuration occurs (see QUINSY) the swelling may be so great as almost completely to block the throat. In chronic tonsillitis the symptoms are similar to those mentioned, but the course of the disease is slower, and often the distended gland vesicles, filled with a yellow secretion, present the appearance of small abscesses. The disease is usually preceded by malaise, chill, and fever; there are a sense of constriction in the throat, a difficulty in swallowing, a thick voice with pain on talking, and often inability to open the jaws. The pain in swallowing may be intense, and the enlargement produced by the inflammation may stretch a muscle (staphylo-salpingeus) which is attached to the orifice of the Eustachian tube and cause pain in the ear and impairment of hearing. The inflammation may extend from the tonsils and involve the anterior and posterior palatine folds, the soft palate, the uvula, and sometimes the epiglottis or the larynx. The salivary secretion becomes viscid and is expectorated with difficulty. The tongue is heavily coated, the breath is foul, there is no appetite, and there is often severe aching pain in the limbs. A first attack is more severe than a subsequent one, and a case that ends in suppuration is more severe than one that terminates by resolution. If the inflammatory symptoms do not subside within five or six days the condition is likely to be that known as quinsy; often resolution will terminate the inflammation in the period mentioned, but a chronic enlargement of the tonsils remains.

Catarrhal tonsillitis is an inflammation of the mucous membrane covering the gland, and if the lacunae are involved it is called follicular or lacunar tonsillitis; the lacunae becoming filled with an inspissated yellow or cream-colored mass of epithelial cells, pus, and micro-organisms, and in rare cases these masses undergo calcareous degeneration. If the gland tissue itself is inflamed the disease is called parenchymatous tonsillitis. If there is an eruption of small vesicles on the tonsils the condition is called herpetic tonsillitis. A circumscribed or general membrane may be formed on the tonsils in diphtheritic tonsillitis caused by the Klebs-Loeffler bacillus, as well as in the mycotic tonsillitis caused by the *Leptothrix buccalis* and other fungi.

The diagnosis of the disease is usually easy because the symptoms indicate that the throat is affected, though occasionally rheumatic pains involving the entire body are so severe that the throat pain sinks into insignificance and is not mentioned. If a membrane has formed on the tonsils its characteristics can only be determined by bacteriological examination.

While, as a rule, the prognosis is favorable, there may be serious complications in consequence of suppuration and ulceration into the internal carotid or external maxillary artery, with hæmorrhage; or there may be suffocation from œdema of the larynx or from a discharge of the pus into the air-passages. Rarely there are complications of the kidneys, or paralysis similar to that following diphtheria.

The disease is treated by keeping the patient quiet, giving from 5 to 10 grains of sodium salicylate made from oil of wintergreen every one or two hours until the fever and muscular pains are relieved, and disinfecting the throat by gar-

gles of hot water containing five drops of carbolic acid and a teaspoonful of sodium bicarbonate (cooking-soda) in a cupful of water. If the throat is too painful to gargle, inhalations of five drops of tincture of benzoin poured on boiling water may be taken. In chronic tonsillitis the patient may be given cod-liver oil, or sirup of the hypophosphites made according to Dr. Churchill's formula; generous diet and bathing should be associated with the treatment; and if the tonsils do not become smaller it is necessary to cut them or to apply the galvano-cautery as recommended by Dr. Charles H. Knight. Chronic enlargement of the tonsils should not be allowed to take care of itself, as it is a fruitful source of ear trouble and of recurrent inflammation.

S. T. ARMSTRONG.

Tonsils: See HISTOLOGY (*The Digestive Organs*).

Tonson, JACOB: publisher; b. at Holborn, London, England, in 1656; was apprenticed to a bookseller; set up business for himself as a stationer in Chancery Lane, near Fleet Street, in 1678; published that same year some of Otway's and Tate's plays and Dryden's *Troilus and Cressida*; was thenceforth the regular publisher of the writings of Dryden, who edited for him the famous *Miscellanies*; brought out the first good edition of Milton's poems; in 1703 a *Caesar*, admitted to be the handsomest specimen of English typography to that date, and in 1709 the first complete octavo edition of Shakspeare; established his shop at Gray's Inn Gate 1697, and at the Shakspeare Head in the Strand 1712; had a warehouse in the Savoy and a printing-office in Bow Street; was printer to the excise, publisher to most of the fashionable authors of the day, and stood at the head of his trade; was secretary to, and one of the founders of, the famous Kit-Kat Club, for whose use he built a room at his villa at Barn Elms on the Thames, which became a place of assembly for the wits. He retired from business in 1720, and devoted himself to the management of an agricultural estate. D. at Ledbury, Apr. 2, 1736. His collection of portraits of the members of the Kit-Kat Club, by Sir Godfrey Kneller, is kept intact by a descendant at Bayfordbury Park, Hertfordshire.

Tonsure [viâ O. Fr. from Lat. *tonsura*, a shearing, clipping, deriv. of *tonde re*, *ton sum*, shear, shave]; in the Roman Catholic and Oriental Churches, the shaving of a portion of the hair from the head of an ecclesiastic. In the Roman Catholic Church the size of the tonsure is not uniform, but its place is at present upon the crown of the head. This is the tonsure of St. Peter. In the ancient Irish and British churches the tonsure of St. James, in which the front part of the head was shaved as far back as a line passing over the top of the head from ear to ear, formerly prevailed. In the Eastern churches anciently the whole head was shaved. The tonsure is one of the preparations for orders, and it is regarded as symbolizing the crown of thorns worn during our Lord's Passion. Revised by J. J. KEANE.

Tontine: the name applied to a financial scheme for securing to the surviving members of an association a proportional share of the profits of those who have died within a stated interval. The name is derived from Lorenzo Tonti, a Neapolitan banker, who proposed to apply this principle in order to raise a fund for the French Government in 1653. The subscribers to the loan were to receive interest from the first, and as deaths occurred the shares of the survivors would be continually increased. The French parliament refused to permit the scheme, but subsequently public tontines were established in France and Great Britain, and private tontine enterprises were carried out in these and other countries. A tontine insurance policy is one in which the policy-holder agrees in common with others to receive no profits till after a certain number of years, and to forego surrender value if he gives up his policy. See LIFE-INSURANCE (*Tontine Dividend*).

Tonty, HENRY, Chevalier de: explorer; son of Lorenzo Tonti; b. at Gaeta, Italy, about 1650; accompanied La Salle to Canada 1678 and in his exploration of the Mississippi; was left in command of a fort near Peoria 1680; made an unsuccessful attempt to found a settlement in Arkansas; took part in an expedition of the Western Indians against the Senecas 1685; twice descended the Mississippi to its mouth in search of La Salle, and a third time to meet Iberville; remained in that region and died at Fort Louis (now Mobile) in Sept., 1704. He contributed to Margry's *Relations et Mémoires an Account of La Salle's Last Expedition*, of which an English translation appeared in London

1698, was republished in New York 1814, and is included in vol. i. of Benjamin F. French's *Historical Collections of Louisiana and Florida* (1846). See Justin Winsor, *Cartier to Frontenac* (1894).

Tooke, JOHN HORNE: political writer and grammarian; b. at Westminster, England, June 25, 1736; son of John Horne, a wealthy poultryer; educated at Westminster and Eton schools and at St. John's College, Cambridge, where he graduated in 1758; became usher in a school at Blackheath, Kent; took orders in the Church of England at his father's desire, but much against his own wishes; became incumbent of a chapel at New Brentford 1760; began his political career in 1765 by writing in defense of Wilkes in the newspapers, but his chief work at this period was a pamphlet entitled *The Petition of an Englishman*; became intimate with Wilkes, whose election to Parliament he strongly advocated, and aided him in founding the Society for Supporting the Bill of Rights 1769, but soon afterward had a bitter quarrel with him; was in consequence denounced in the *Junius* letters, and defended himself with vigor 1771; resigned his living and resumed the study of the law at the Middle Temple 1773; started a subscription for the widows and orphans of the Americans "murdered by the king's troops at Lexington and Concord 1775," for which he was prosecuted by the ministry for libel July, 1777; conducted his own defense; was found guilty of libel, sentenced to a year's imprisonment and a fine of £200; wrote while in prison a *Letter to John Dunning, Esq.* (1778), in which he examined the legal aspects of his trial, and incidentally started upon a grammatical disquisition on the irregularities of the English language; was refused admission to the bar 1779 on the ground of being a clergyman; assumed his additional name in 1782 out of regard to Mr. Tooke, of Purley, who made him his heir; published his chief work, *Epea Pteroenta, or The Diversions of Purley* (1786; vol. ii., 1805), an ingenious treatise on etymology which occasioned much controversy, and has been widely read; was an unsuccessful candidate for Parliament at Westminster 1790 and 1796; was an active member of the Society of Correspondence formed by the admirers of the French Revolution, on which account he was committed to the Tower, tried for high treason 1794, but acquitted; obtained a seat in Parliament for Old Sarum 1801, and passed his later years in affluence at Wimbledon, where he died Mar. 18, 1812. He was never married, but had several natural children, to one of whom he left his estate. See his *Memoirs*, by Alexander Stephens, 2 vols., 1813.

Tooke, THOMAS: economist; son of William Tooke, the historian; b. in St. Petersburg, Russia, in 1774; was for more than forty years successfully engaged in the Russian trade; was a pioneer of free-trade doctrines, and drew up the famous "Merchants' Petition" for free trade in 1820. He was the author of numerous writings on the currency, corn-laws, finance, and banking, including a valuable *History of Prices and of the State of the Paper Circulation from 1798 to 1856, etc.* (6 vols., 1838-57); was the founder of the Political Economy Club (1831), and the promoter of many public enterprises connected with industrial and philanthropic reforms. D. in London, Feb. 26, 1858. After his death his admirers raised a subscription with which they endowed in King's College, London, a "Tooke professorship" of economic science and statistics. F. M. C.

Tooke, WILLIAM: clergyman and historian; b. at Islington, London, England, Jan. 18, 1744; originally a printer, took orders in the Church of England 1771; became soon afterward minister of the English church at Cronstadt, Russia, and was chaplain to the factory of the Russia Company in St. Petersburg 1774-92. D. in London, Nov. 17, 1820. Author of *Russia, or A Complete Historical Account of all the Nations which compose the Russian Empire* (4 vols., 1780-83); *Life of Catharine II., Empress of Russia* (3 vols., 1797); *A View of the Russian Empire during the Reign of Catharine II.* (3 vols., 1799); *A History of Russia A. D. 862-1762* (2 vols., 1800); *Varieties of Literature* (London, 1795, 2 vols., 8vo); *Extracts from Foreign Literary Journals and Original MSS.* (London, 1796, 2 vols., 8vo); of several volumes of sermons, novels, and translations, among which was *The Works of Lucian*, from the German translation by Wieland (2 vols., 4to, 1820); and editor of vols. i.-v. of the *General Biographical Dictionary* (1798).—His son WILLIAM, b. at St. Petersburg in 1777, was a London solicitor, a Liberal member of Parliament 1835-37, and one of the founders and long the treasurer of the Society for the

Diffusion of Useful Knowledge. D. in London, Sept. 20, 1863. He edited the *Works of Charles Churchill* (2 vols., 1804), and wrote *The Monarchy of France* (1855).

Toole, JOHN LAWRENCE: actor; b. in London, Mar. 12, 1832; made his first appearance on the stage at the Ipswich Theater Royal, and in 1852 adopted the stage as a profession, accepting during that year an engagement at the Queen's theater, Dublin. He made his *début* in London at the Haymarket theater as Simmons in *The Spitalfields Weaver*. At the St. James's theater Oct. 2, 1854, he played Samuel Pepys in *The King's Rival*. He became a great favorite with the British public, and for twenty years appeared every season in London. In 1875 he visited the U. S., but his peculiar style of humor was not appreciated and his tour was not successful. He returned to England, and, with the exception of a visit to Australia in 1891, has played regularly in London at a theater under his own management. *A Fool and his Money* was one of his most successful plays. In 1892 he made a great hit at Toole's theater in *Walker, London*.

B. B. VALLENTINE.

Toombs, ROBERT: b. in Wilkes co., Ga., July 2, 1810; educated at the University of Georgia and at Union College, Schenectady, N. Y.; graduated at the latter institution in 1828, and studied law at the University of Virginia. In 1830, before his majority, he was admitted to the bar by special act of the Legislature, and opened an office at the town of Washington in his native county. When the war with the Creek Indians broke out in Alabama in 1836, Toombs raised a company of volunteers, and led them, as captain, to the field, serving under Gen. Scott until the close of the conflict. In 1837-40 and 1842-43 he was a member of the State Legislature, where from the beginning he took a most conspicuous position. He was brought up in the Jeffersonian school of politics, to which creed he always adhered. In 1844 he was elected a member of Congress. He then belonged to the party known as Southern Whigs, and as such supported Harrison for the presidency in 1840, and Clay in 1844. He remained a member of the House until Mar., 1853, when he took a seat in the Senate. While a member of the House the most conspicuous part he acted was on the adjustment measures of 1850, whose passage he helped actively to bring about. He was re-elected to the Senate in 1859, and continued to hold his seat in it until Georgia passed her ordinance of secession in 1861. He was a member of the State secession convention, where he acted a conspicuous part, and was chosen a delegate to the Confederate congress at Montgomery. In that body, as in all other assemblages of which he was a member, he stood among the ablest and most eloquent. He was for a short time Secretary of State in the Confederacy, but resigned that office and took a commission as brigadier-general in the army. He distinguished himself at the second Bull Run and Antietam battles. He resigned his commission and returned to Georgia, where he was made a brigadier-general of the State militia upon the invasion of the State by Sherman in 1864. After the close of the war he left the country, spending his time in Cuba, France, and England, remaining abroad until after the restoration of the privilege of the writ of *habeas corpus* in 1867. He then returned home, but refused to take the oath of allegiance to the U. S., and was in consequence debarred from the rights and privileges of citizenship. He resumed the practice of law, which he pursued with great success. The reconstruction measures of Congress he denounced in the beginning, and continued to denounce, with all the force and power of language he could command. D. at Washington, Ga., Dec. 15, 1885.

Revised by F. M. COLBY.

Tootel, HUGH or RICHARD: See DODD, CHARLES.

Tooth: See TEETH.

Toothache-tree: See PRICKLY-ASH.

Tooth-shells: a popular name given to the molluscs of the order *Scaphopoda* on account of their long, cylindrical, slightly curved shells. See DENTALIUM and MOLLUSCA.

Topaz [M. Eng. *topas*, from O. Fr. *topaze* < Lat. *topazios*, *topazion* = Gr. *τοπάσιον*]: a gem-stone, but not the *τοπάσιον* of Pliny, which is described as opaque and green, was probably some variety of agate or jasper, and was named from its locality, an island in the Red Sea. The *chrysolite* of Pliny and later writers is generally believed to have included the topaz. The mineral species *topaz* is orthorhombic in crystallization, with a fine basal cleavage which causes it to split into lustrous plates—a feature which distinguishes the

white transparent topaz from quartz. Its hardness is 8, between that of quartz and sapphire, and diamond and sapphire scratch it easily. It contains silica, alumina, and fluorine, but the proportions are somewhat uncertain. Groth's formula and Dana's deductions make it $Al_2Si_6O_{25}F_{10}$, which yields the following composition: Silicon, 15.5; aluminium, 29.9; fluorine, 17.6; oxygen, 36.9. This is the true topaz, but the name is much confused among jewelers and collectors by being applied to other transparent yellow stones. Thus *Oriental topaz* is yellow SAPPHIRE (*q. v.*), and the names *Scotch topaz* and *Spanish topaz* are given to yellow quartz. (See QUARTZ.) This latter is the stone commonly sold as topaz by jewelers, and is usually produced by heating smoky quartz, which is thus partially decolorized. The true topaz is of various light colors—yellow, pale green, or blue, and pure white. The finest deep-yellow ones come from the province of Minas Geraes, in Brazil; on heating, these are altered to pink, and are then sometimes called Brazilian rubies. Sherry-colored stones come from Siberia, Colorado, and Texas, and fine green and blue topazes from the Ural Mountains, Ceylon, Japan, and New South Wales.

G. F. KUNZ.

Topazolite: See GARNET.

Topo: the English name of the *Galeus canis*, a shark common in the British seas, and widely distributed elsewhere, but not found in the American waters. It belongs to the family *Galeorhinidae*, and is distinguished by the following combination of characters: The teeth are nearly alike in both jaws, oblique, and notched and serrated ($\frac{3}{4}$ in number); the first dorsal is opposite the space between the pectorals and ventrals; the caudal fin has a single notch, and there are no median pits at its base; the color is the usual slate gray above and lighter beneath. It attains a length of about 6 feet.

Top'e'ka: city; capital of Kansas and of Shawnee co.; on both sides of the Kansas river, and on the Atch., Top. and S. Fé, the Chi., Rock Id. and Pac., the Mo. Pac., and

State Capitol, Topeka, Kan.

the Union Pac. railways; 67 miles W. of Kansas City; elevation, 800 to 890 feet above sea-level (for location, see map of Kansas, ref. 5-1).

Public Improvements.—The city is built on three ridges at right angles to the course of the river, insuring it excellent drainage. There are 118 miles of streets, 26 of which are paved, the pavement averaging 30 feet in width, with a 20-foot parkway for trees between the sidewalk and pavement on each side, and the streets are lighted with 185 2,000-candle-power arc lights. Local transit is accommodated by 30 miles of electric street-railway. The sewerage plant has 39 miles of mains, the gas plant 25 miles, and the waterworks over 33 miles. There are four electric-light and motor plants for commercial uses.

Notable Buildings.—Topeka contains the State Insane Asylum (cost \$700,000), the State Reform School for Boys (cost \$120,000), State Capitol (cost \$2,000,000), county courthouse (cost \$150,000), U. S. Government building (cost \$300,000), city buildings (cost \$100,000), three large hospitals, an Orphans' Home, and a Home for Friendless Women, besides several costly business blocks and the Santa Fé railway offices and shops.

Churches, Schools, etc.—There are 66 church organizations, with a membership of 13,569, owning 87 buildings valued at \$668,400. The churches are divided denominationally as follows: Methodist Episcopal, 15; Baptist, 12; Presbyterian, 10; Lutheran, 5; Christian, 4; Congregational, 4; Protestant Episcopal, 4; Roman Catholic, 2;

and ten other denominations, 1 each. The city has an excellent system of public schools, with an enrollment of 10,264 pupils, employing 115 teachers, and costing \$174,000 in 1894. It includes a high-school building which cost \$85,000. The institutions for higher instruction comprise Washburn College (Congregational, chartered in 1865), educational, on a tract of 160 acres, and having buildings which cost \$175,000; the College of the Sisters of Bethany (Protestant Episcopal, opened 1861, chartered 1870), occupying four squares in the center of the city, and having buildings which cost \$150,000; and the Seminary of the Assumption (Roman Catholic), for both sexes. There are also 4 private schools and academies. In 1895 there were 3 daily, 16 weekly, 8 monthly, and 3 other periodicals.

Banking and Insurance.—In 1895 there were 3 national banks with combined capital of \$650,000, 3 State banks with combined capital of \$413,775, and 2 private banks; 8 investment and loan companies with authorized capital of \$6,810,000; and a fire-insurance company with capital of \$100,000, assets of \$252,502, and surplus over liabilities of \$171,976.

The city was laid out in 1854, incorporated in 1857, and made the State capital in 1861. Since 1885 there have been no saloons in the city. The financial condition of Topeka is exceptionally good. Pop. (1880) 15,527; (1890) 31,800; (1895) 30,151. H. G. LARIMER.

Topelius, ZACHARIAS: poet and novelist; b. near Ny Karleby, Finland, Jan. 14, 1818. After graduating at the University of Helsingfors (1840) he became editor of the *Helsingfors Tidning* (1842), which he made a great force in Finnish literature, retaining his connection with it until 1860. He was Professor of Finnish History at his *alma mater* from 1854 until 1878. His earliest publications, which appeared in his journal, consisted of tales and lyrical poems, the latter of which were collected under the title of *Ljungblommor* (Heather Flowers, 1845-54). In these as well as in *Singer* (1861) and *Nyt blad* (New Leaves, 1870), the influence of RUNEBERG (*q. v.*) is marked. Topelius has also written a number of dramas—*Efter femtio år* (Fifty Years Later, 1851); *Regina af Emmertz* (1854); and a volume of *Dramatiska dikter* (1863). Many of his children's stories have been translated into English. But the work by which he is best known at home and abroad is *Fältskärens Berättelser* (The Surgeon's Stories, 6 vols., 1872-74), a collection of tales dealing with the history of Sweden and Finland during the seventeenth and eighteenth centuries. D. K. DODGE.

Tophet: See GEHENNA.

Tophi: See GOLT.

Topknot: a name given in Great Britain, or at least in British books, to flat fishes (*Pleuronectida*) of the genera *Zenogopterus* and *Scophthalmus* (or *Phrynorhombus*). They are so called from a long filament on the head. These do not agree in special characters, although they resemble each other in physiognomy, the wide (high) oval body, ciliated

Müller's topknot.

scales, sinistral and fringed eyes, narrow interorbital ridge, and long based ventrals. They rarely exceed 7 or 8 inches

in length. Some of the topknots are of the same genus as the turbot, as Eekstrom's *Rhombus norvegicus* and Müller's topknot, *Rhombus punctatus*.

Toplady, AUGUSTUS MONTAGUE: clergyman and hymn-writer; b. at Farnham, Surrey, England, Nov. 4, 1740; was educated at Trinity College, Dublin; took orders in 1762; became vicar of Broad Hembury, Devonshire, 1768; preached at the chapel of the French Calvinists, in Leicester Fields, London, from 1775 to his death there Aug. 11, 1778. He was editor of *The Gospel Magazine* and author of many hymns, chief of which is *Rock of Ages*. His Calvinistic partisanship led him into unhappy controversy with John Wesley. His complete works were published in London 1794 and 1825; his verses, best by D. Sedgwick (1860). See his *Life*, by W. Winters (London, 1872). Revised by S. M. JACKSON.

Töplitz: See TEPLITZ.

Topog'raphy [from Gr. *τόπος*, place + *γράφειν*, write]: the representation of the natural features of a portion of

the surface of the earth on a map, or the natural features themselves. The construction of a topographical map involves the field and office operations of surveying, and the delineation on paper, by means of shading or signs, of the outlines and elevations of the surface.

For popular purposes the representation of hills and mountains by lines drawn along the declivities is very common, the steepest slopes being made the heaviest. While this indicates at once to the eye the elevations, it gives little idea of their absolute or relative heights, and hence the method of contours is more generally employed by engineers. In this method the surface is supposed to be intersected by a series of horizontal planes, and the lines of intersection, called contours, are determined in the field by levels and measurements and then plotted on the map. The figure, which shows a portion of the Yellowstone Park about 7 miles by 8 miles in area, illustrates the contour method of representing topography, all points on the line marked 8,000 being 8,000 feet above ocean-level. The contours are drawn at intervals of 100 feet in vertical height, and the closer together they are the steeper is the slope. If lines be imagined to be drawn perpendicular to the contours they will indicate the direction of the drainage, and it will be seen that all of the creeks cross the contours at right

angles. By the help of accurate contour maps profiles in any direction can be constructed, and much preliminary work in the location of roads be advantageously done.

In addition to the representation of the elevations and streams, topographical maps generally include roads, houses, swamps, and cultivated land. Special signs, mostly conventional, are used for different kinds of crops, as also for sand, grass, and trees, so as to furnish a picture somewhat similar to that which the country would present if viewed from a balloon. Along the coast are shown the shoals, reefs, high and low water lines, together with contours of the beds of the harbors and sounds. Colored topographical maps, in which water is represented in blue, streets in yellow, fields in green, and houses in red, are frequently made when not intended for reproduction.

The field work of topography is usually based on a triangulation, while the details are mapped by means of the plane-table or stadia. The topography and hydrography of the coasts of the U. S. has been mostly done by the U. S. Coast and Geodetic Survey, and a portion of that of the interior by the U. S. Geological Survey. Several States have made topographical maps in connection with their geological surveys. The cost of topographical work ranges from \$5 to \$25 per sq. mile, depending on its accuracy and completeness. See COAST AND GEODETIC SURVEY, GEODESY, HELIOTROPE, HYPOMETRY, LEVELS AND LEVELING, MAP, PLANE-TABLE, STADIA MEASUREMENT, SURVEYING, and TRIANGULATION.

Topolias: See COPAIS.

Topolobam'po Bay: a bay of the Gulf of California, in the northwestern part of the state of Sinaloa, Mexico. It forms an excellent landlocked harbor, and is bordered by plains which could be profitably cultivated but for their dryness; there is no fresh water, and the nearest stream available for irrigation is the Rio Puerte, 25 miles N. It has been proposed to make the bay the terminus of a railway line from Eagle Pass. In 1886 several prominent socialists of the U. S. planned to establish a socialistic colony on or near the bay. A company called the Credit Foncier of Sinaloa was chartered under the laws of Colorado, the leading promoter being A. K. Owen, an engineer who had already been interested in the railway scheme. It was proposed to sell shares to colonists, who should all be employed by the company, receiving in payment scrip which could be used in purchasing supplies, etc., under the principle of state socialism. The company, or community, was to own all lands and conduct all business; a model town was planned, and it was expected that the company would build the railway or a part of it. Several hundred colonists joined the enterprise and went to the bay at different times, beginning in Dec., 1886. They suffered greatly, owing to the difficulty of procuring water and food; an attempt to make an irrigation ditch failed; the colony was divided, part of it joining a company which had been formed in Kansas, and most of those who remained (1895) are settled near the Rio Puerte. The company's scrip is now nearly or quite worthless, and as a socialistic scheme the plan has failed. It is fair to say that this was partly owing to the unsuitable nature of the land. H. H. SMITH.

Top-shells: a collector's name for species of shells of the family *Turbinida*, especially *Turbo marmoratus*, which has a turbinated solid shell with convex whorls. They are found in tropical seas. The family name is derived from the Latin *turbo*, a whipping-top, in allusion to the shape of the species, which is more or less conical or pyramidal.

Top'soe, VILHELM CHRISTIAN SIGURD: novelist; b. in Denmark, 1840. His best-known work is *Jason med det gyldne Skind* (Jason with the Golden Fleece, 1875), the authorship of which was for a long time kept secret. In *Nutidshilleder* (Contemporary Pictures, 1876) he portrays with marked force some of the social abuses of our time. *Fra Amerika* (1872) gives impressions of the U. S. with greater fullness and insight than are commonly displayed by Danish travelers. Three volumes of *Collected Tales* were published in 1890-91. D. K. DODGE.

Toqueville: another spelling of TOCQUEVILLE (*q. v.*).

Torbanite: See FUEL.

Torbay: a fishing-town of Newfoundland, 7 miles N. of St. John's. The anchorage is poor. Pop. about 1,300.

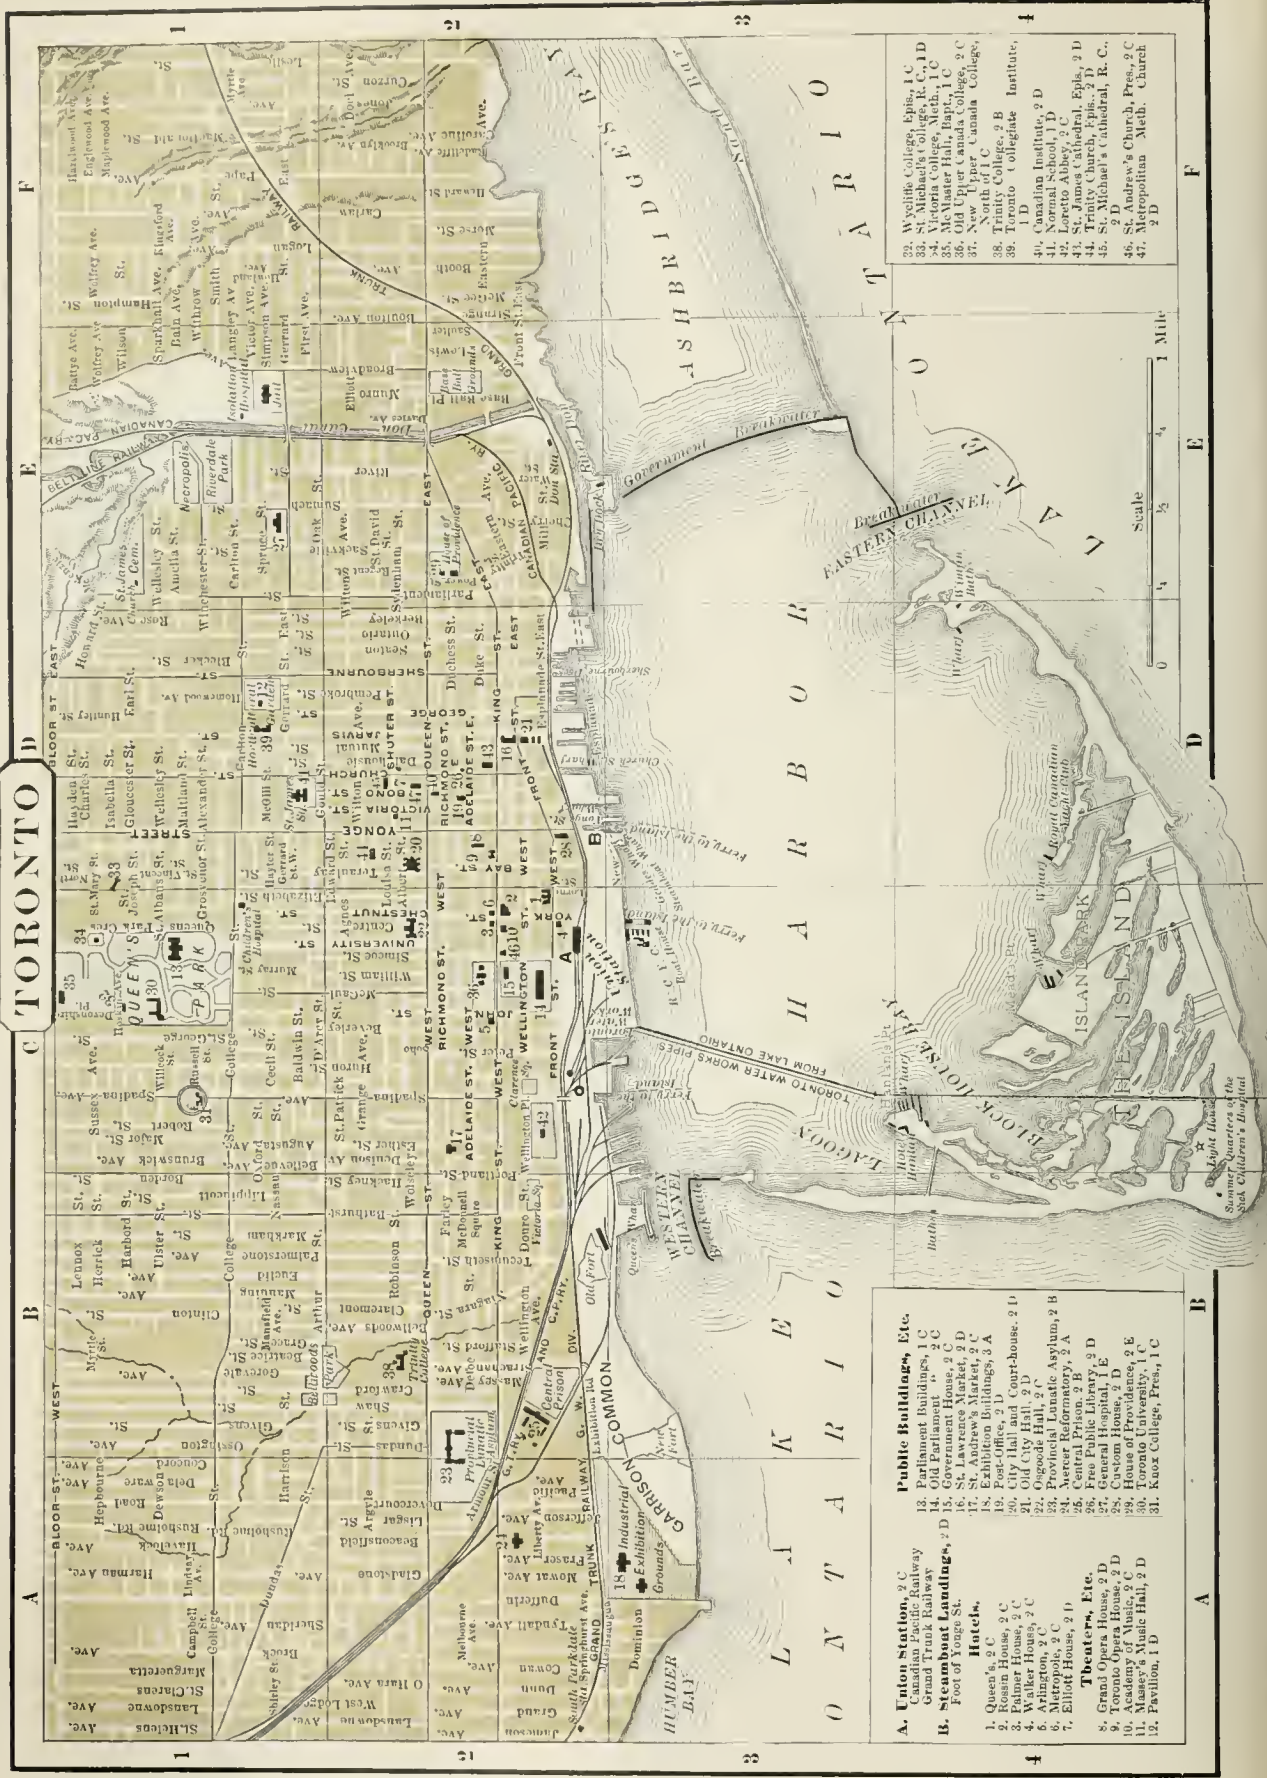

Torbert, ALFRED THOMAS ARCHIMEDES: soldier; b. at Georgetown, Del., July 1, 1833; graduated at the U. S. Military Academy July 1, 1855; assigned to the Fifth In-

fantry; served on frontier duty in Texas and Florida 1856-57, on Utah expedition 1857-60. In the civil war he was engaged, Apr.-Sept., 1861, in mustering New Jersey volunteers into service, and Sept. 16 was appointed colonel of the First Regiment, which he led in the Virginia Peninsular campaign of 1862; assigned to command of a brigade in the Sixth Corps Aug. 28, 1862, and engaged in the second battle of Bull Run, at South Mountain (wounded), and Antietam. Promoted to be brigadier-general of volunteers Nov. 29, 1862, he was on sick leave until June, 1863, when again in command of brigade in Sixth Corps, and engaged in the battle of Gettysburg July 2-3, and subsequent operations of that corps during the winter of 1863-64. In the Richmond campaign of 1864 he commanded the cavalry, remaining with Gen. Grant's army during Gen. Sheridan's raid on Richmond, and first division on the latter's return May 25, being engaged in the frequent actions from May 15 to Aug., 1864. He was chief of cavalry of the middle military division, and engaged in all the operations in the Shenandoah campaign Aug., 1864-Jan., 1865, and frequently in command; in command of the Army of the Shenandoah Apr.-July, 1865, and of various districts in Virginia till mustered out of the volunteer service Jan. 15, 1866. Brevet major for gallantry at Gettysburg, lieutenant-colonel for Lawes's Shop, colonel for Winchester, brigadier-general for Cedar Creek, and major-general for gallant and meritorious services during the war. Resigned his commission of captain Fifth Infantry Oct. 31, 1866; was U. S. minister resident to Central American states 1869-71; consul-general to Havana 1871-73; and U. S. consul-general in Paris 1873-78; was lost at sea off the coast of Florida, Aug. 29, 1880.

Torch-wood: the *Amyris floridana*, a small tree or shrub of South Florida, having shining leaves, clusters of yellowish-white flowers, and a resinous juice. It belongs to the family *Burseraceae*.

Tordesillas, *tôr-dâ-seôlyâas* (in Portug. *Tordesilhas*), **Convention of:** an important treaty signed by the envoys of Spain and Portugal, at the town of Tordesillas in the former country, June 7, 1494. It related to the rights of conquest of the two countries, and had the most important results. The popes, in several bulls, had given authority to Portugal to conquer and settle Africa and the East Indies. Soon after the discovery of western lands by Columbus, Pope Alexander VI. issued his celebrated bull of May 3, 1493, in which he divided the world by a meridian "100 leagues west of the Azores and Cape Verde islands," and gave to Spain authority to conquer all lands W. of this line, reserving those E. of it for Portugal. By the convention of Tordesillas it was agreed that the divisional meridian should be moved to "370 leagues west of the Cape Verde islands." Very unexpectedly this gave to Portugal the coast of Brazil discovered a few years after, Spain could not reasonably contest the claim, and Brazil was settled by Portuguese. Unfortunately, the terms of the treaty were vague in not mentioning any particular point of the Cape Verde islands from which measurements could be taken, and in not specifying the length of the leagues, several being then in common use; thus disputes arose as to the position of the meridian, and remains of these have come down to our time. Again, as conquests were pushed E. and W., the two nations eventually met on the opposite side of the globe, and here the uncertainty was increased by the defective means then available for determining longitude. For example, the Philippine islands were claimed and held by Spain on the supposition that they lay within her hemisphere; in reality, they were in that assigned to Portugal. H. H. SMITH.

Tore'no, *tô-râ'nô,* JOSÉ MARÍA QUEIPO DE LLANO RUIZ DE SARAVIA, Count of: statesman and historian; b. at Oviédo, Spain, Nov. 26, 1786; took an active part in promoting the uprising of Spain against Napoleon 1808; was sent to England to negotiate for assistance; was a prominent member of the Cortes at the restoration of Ferdinand VII., but, like most of his companions of liberal opinions, was soon driven into exile; was recalled to Spain by the revolution of 1820; again went into exile on the triumph of absolutism 1823; returned to Spain after the death of Ferdinand 1832; became Minister of Finance under the regency 1834, president of the council and Minister of Foreign Affairs 1835, but retired in September and went into voluntary exile. D. in Paris, Sept. 16, 1843. He was the author of an important work on the Spanish war of independence, *Historia del Levantamiento, Guerra y Revolución de España* (Madrid, 5 vols., 1835-37). F. M. COLBY.

Torfæus, THORMODUS [Latinized form of Icel. *Thormodr Torfason*, his true name]: antiquary; b. at Engö, Iceland, May 27, 1636; studied at the University of Copenhagen; was sent by Frederik III. to Iceland in 1662 to collect manuscripts of the sagas; made royal antiquary in 1667 and royal historiographer for Norway in 1682, but was compelled to resign on account of having committed manslaughter in self-defense. He was the first to apply the Icelandic literature to the study of Scandinavian antiquities and history. The most remarkable of his writings are *Series regum Danicæ* (1702); *Historia Vinlandiæ antiquæ* (1705); *Grœnlandia antiqua* (1706); *Historia Rerum Norvegicarum* (4 vols., 1711). D. Jan. 31, 1719. Revised by D. K. Dodge.

Torgau, tōr'gaw; town; in the province of Saxony, Prussia; on the Elbe; 70 miles S. S. W. of Berlin by rail (see map of German Empire, ref. 4-G). It is strongly fortified, and contains barracks, hospitals, magazines, and other military establishments; also manufactures woolen and linen fabrics and hosiery. Pop. (1890) 10,860.

Torii, tō'rii-ee' [lit., bird-perch, or bird-rest]: a construction in wood, stone, or bronze, found in front of every shinto shrine in Japan. It consists of two pillars, set one on each side of the roadway, and joined at the top by two cross-bars, the uppermost of which projects at either end, usually with an upward curve. In all pure Shinto shrines the torii is of unpainted wood; it was originally a perch for the sacred fowls who gave warning of daybreak. Later, especially under the sway of Buddhism, the torii came to be looked upon as a mere portal. The Buddhists were fond of painting it red. J. M. Dixon.

Torna'do [Span., meaning turned, twisted]: a small, local, short-lived, but very violent storm, occurring in the warm season, in the warmer hours of the day, and in very moist air. The tornado is most noteworthy for the very high velocities attained by the innermost part of its whirl, reaching, as far as can be judged by its effects, a speed of 200 or more miles an hour, and consequently exerting a pressure of 200 lb. or more to the square foot on structures opposing the motion. The conditions preceding a tornado are generally those of a thunder-storm exaggerated, and active agitation is sometimes seen beforehand in the clouds. When the storm is formed it has a long, slender funnel extending from the clouds toward the ground. This defines the area of greatest velocity of wind, and where it reaches the ground the destructive effects are greatest. The tornado is often accompanied by intense electric phenomena, and accompanied or followed by torrential rain, sometimes by hail. The path is usually but a few rods wide and a few miles long, and it is generally directed from S. W. to N. E. The destructive effects are experienced only close to the path of the funnel, and are somewhat more severe on the south side of the central path than on the north side. The duration at any spot is but a few seconds. Definite forecasts of storms whose entire destructive area is not a square mile are hardly practicable, but the smallness of this area makes the probability very small that any given spot will ever be traversed by a tornado. Tornadoes occur in the temperate regions generally, where there is enough moisture. In the U. S. they are most usual E. of the Great Plains, in early spring in the South, in late spring and early summer in the Northern States. The alleged greater frequency of tornadoes in late years is an illusion due to the greater perfection of the news-collecting and distributing agencies, and to the greater attention paid by the public to meteorologic phenomena.

The theory of tornadoes presents many difficulties, but they are undoubtedly small vortical wind systems, with a long vertical axis, with contra-clockwise rotation at the ground. Many other local storms are erroneously classed with them, as squalls, derechos, riband-winds, rolls with horizontal axes, etc. A serious source of confusion is to be found in the fact that these local storms are popularly called cyclones. A cyclone is several hundred miles in diameter and only a mile or two deep, with a thickness, therefore, only 1/100th part or so of its diameter. A tornado is only a few scores of feet in diameter and at least several hundred feet high. The first is general, large, and may last several days; the second local, small, lasting at most only an hour or two. MARK W. HARRINGTON.

Tor'neå: river of Northern Europe, forming the boundary between Sweden and Russia; rises in Lake Torneå, in Sweden, flows southward, and enters the head of the Gulf of Bothnia after a course of 230 miles. It is rapid, and celebrated for its beautiful cataracts and salmon-fisheries.

Toron'to: the capital of the Province of Ontario, and the largest city on the Canadian side of the Great Lakes; on a large and finely sheltered bay on the north shore of Lake Ontario, in 43° 39' N. lat. and 79° 23' W. lon. (see map of Ontario, ref. 4-D). The city was founded in 1794 by Maj.-Gen. John Graves Simcoe, first governor of Upper Canada, who gave it the name of York, in honor of the Duke of York, second son of George III. About fifty years earlier the French had built a trading-post (Fort Rouillé) close to the site of the city, but this was subsequently destroyed. Even in Simcoe's day little trace of the stockade remained, if we except the name Toronto—"the place of meeting"—which the Indians gave to it and the region about, and which was adopted for the city in 1834.

The determining factor in the location of the city was obviously the spacious harbor, which gave promise of safe shelter for the fleet and shipping of the lakes, besides the advantages of fine central position, lying directly northward of the mouth of the Niagara river, and close to the Indian highway, by the Humber and Holland rivers, to the Huron country and the trapper's and *voyageur's* lake route to the far West. Later years have justified the selection of the site, and made tributary to the city's commerce the trade of the Ontario Peninsula and of the vast and fertile plains of the Canadian Northwest. Toronto is 39 miles S. E. of Hamilton, at the head, and 160 miles S. W. of Kingston, at the foot, of Lake Ontario. It is 330 miles from Montreal and 500 miles from New York.

Area, Plan, and General Features.—Although not picturesque, in the sense that Montreal and Quebec are picturesque, for it lies too flat, Toronto is not lacking in natural and artistic beauty. Its chief adornment is its fine water front, as seen from the harbor or from the island, a large sandbank 6 miles long, which protects it from the lake. It covers an area of nearly 13 sq. miles, and includes within its municipal boundary, besides the city proper, the once outlying suburbs of Brockton, Parkdale, Seaton Village, Yorkville, and Deer Park. The site has a rising inclination toward the northern limits, 2½ miles from the water front. The shore front extends from the river Humber, on the W., to Norway, in rear of Scarborough Heights, on the E., a distance of 5½ miles.

Streets, Parks, and Buildings.—There are over 300 miles of streets within the compass of the city, the names of many of them denoting an English origin. As a rule, they are well paved and lighted, are neatly laid out, regularly built, and cross each other, almost without deviation, at right angles. The business area lies adjacent to the water front and the esplanade, which is monopolized by the lake traffic and the railways. The residential portion lies chiefly to the northward, bisected by the city's great artery—Yonge Street—which extends to the northern limits of the county of York. This part is adorned by many attractive streets, the chief of which are Jarvis, Sherbourne, Church, Bloor, St. George, and Beverley Streets, all of which contain many fine churches, elegant villas, and prettily ornamented grounds. The business section is chiefly between Front and Queen Streets, and, extending parallel with the lake, from York Street to the market. The notable buildings within this area are the court-house and municipal buildings (in course of erection, 1895), the custom-house, the post-office, the Board of Trade building, the Bank of Montreal, Dominion Bank, Canadian Bank of Commerce, Canada Life, and Confederation Life buildings, Union Station (general railway terminus), the offices of the leading newspapers, several fine hotels and clubs, and the varied marts of industry, exchange, and wholesale and retail commerce. Toronto is rich in public parks, gardens, drives, theaters, and places of recreation and resort. High Park, in the western section, is the largest, and Queen's Park is the most accessible and attractive. One of the most popular summer places of amusement is the island which lies off the city front, and which bears the same relation to Toronto that Coney Island does to New York or New Brighton to Liverpool. The other open-air resorts, other than the public squares, comprise the Horticultural Gardens, Riverdale, Bellwoods, Ketcham, and Stanley Parks, and the exhibition-grounds and garrison common.

Institutions.—The principal educational institution is the National University. In St. James's Square are situated the Provincial Educational Department, the Museum and Art Rooms, and the Normal and Model School buildings. Here are the headquarters of the educational system of Ontario. In the Queen's Park, approached by a wide street, a

mile long, lined with chestnut-trees, is the University and College of Toronto. Affiliated with the university are the theological colleges adjoining, viz.: the Roman Catholic College (St. Michael's), the Presbyterian College (Knox), the Methodist (Victoria), the Baptist (McMaster Hall), and Wycliffe College, the theological training-school of the Evangelical section of the Church of England. Besides the latter, the Anglican communion has, in Trinity University, a fine academical institution and training-college, giving instruction in divinity, law, arts, music, and medicine. Higher education has an historic institution in Upper Canada College, at Deer Park. It was founded in 1829, and was modeled after the great public schools of England. Law has its representative home in Osgoode Hall, situated on Queen Street West, where are the great law courts of the province, together with the Convocation Hall and library of the Law Society of Upper Canada. The public and high schools are fifty-three in number, and the city's annual assessment for their maintenance is, independently of the provincial Government grants, about \$500,000. These schools employ 462 teachers, two-thirds of whom are women, besides ninety-five teachers in kindergartens. The total registered attendance in 1893 was 32,319; the average daily attendance, 23,127; and the cost per pupil, on the basis of average attendance, \$12.98. Besides the cost of education proper, the city taxes itself heavily on behalf of art, industrial, and night schools, and has equipped and maintains, on a liberal scale, a large number of hospitals, charities, and other eleemosynary institutions. The more important of these are the Toronto General Hospital, the Protestant Orphans' Home, the Girls' and the Boys' Home, the Sick Children's Hospital, the Home for Incurables, the House of Industry, the House of Providence, the Convalescent Home, the Homœopathic Hospital, Women's Medical College, Industrial Refuge, and Mercer Reformatory. The parliament buildings of the province, a massive structure in the Queen's Park, contain, besides the single-chambered legislature, the library, the parliamentary committee-rooms, and departmental offices. Government House, the residence of the lieutenant-governor of the province, is on King Street, at the intersection of Simcoe Street. The churches are many and beautiful. The older representative places of worship include St. James's Cathedral and St. George's church (Episcopal), St. Michael's (Roman Catholic), Knox and St. Andrew's (Presbyterian), Jarvis Street (Baptist), and Zion church (Congregational). There are not less than 150 places of worship, exclusive of mission-houses and the headquarters and branch barracks of the Salvation Army. The handsomer structures of a later date include St. Alban's Cathedral (Episcopal); St. James's, St. Andrew's, Central, Westminster, and Bloor Street (Presbyterian); St. Alban's, St. Paul's, and Broadway Tabernacle (Methodist); Bond Street and Hazleton Avenue (Congregational); and College Street, Immannel, Bloor Street, and Walmer Road churches (Baptist).

Government and Finance.—The municipal affairs are administered by a mayor and board of twenty-four aldermen, representing the six wards into which Toronto is divided, aided by an executive committee drawn from the aldermanic board and committees in charge of the various civic departments. The annual civic disbursements exceed \$6,000,000, about half of which is raised by taxation, a considerable sum in addition from fees, licenses, water-rents, and rentals from corporation property. The deficiency is made good from the sale of the city's debentures. Toronto's total net debt at the close of 1893 was about \$16,500,000, against which the city owns property and other assets to the estimated value of \$12,000,000, a large amount of which (the city water-works) is revenue-producing. The value of the assessable real and personal property rose from about \$62,000,000 in 1883 to \$150,766,035 in 1893, on which, in 1893, the tax rate was 17½ mills. The gross revenue from taxation in 1893 was \$2,525,644; from other sources \$766,447.

Commerce and Banking.—Toronto shares with Montreal the repute of being the center of Canadian finance. In these two cities are the headquarters of the great banks of the Dominion, whose total assets, available in the main for the transactions of commerce, exceed \$240,000,000. The city is the chief field of operation for twenty-eight loan companies and building societies, with a combined paid-up capital of over \$20,000,000. Of great service also to the industrial and commercial interests of the city are the operations of the great Canadian and foreign fire and life insurance and loan and savings companies. As a commercial center the city has, if we except Montreal, at the head of

tide water, no rival in the Dominion. The richest province in Canada is tributary to Toronto, and her trade ramifications extend not only from the Atlantic to the Pacific, but to other colonies of Britain, as well as to the chief foreign ports. It is difficult to ascertain with accuracy what is the aggregate volume of the annual trade. In 1894, according to an official report, the value of imports was \$17,731,843, the duty \$3,611,140.99, and the value of exports \$3,984,462.

Communications, Manufactures, etc.—The industries include the manufacture of marine engines, boilers, furnaces, stoves, heaters, safes, track and bridge spikes, bolts, nuts, carriage-irons, forgings, lead-piping, shot, saws, barbed wire farm and factory implements, tools, threshers, white lead, paints, colors, sewing-machines, pianos, organs, silver-plate ware, domestic, church, and office furniture, paper-hangings, window-shades, etc. There are excellent facilities for shipping and transport, and throughout the season of navigation steamers maintain communication with the principal routes of travel, and trade is carried on over the whole chain of lakes. Railways radiate also from the provincial capital in all directions.

History.—In 1884 Toronto commemorated the fiftieth year of its incorporation as a city, and in 1894 it commemorated the hundredth anniversary of the passing of the Constitutional Act of 1791, which set apart the province of Upper Canada and gave rise (1794) to the embryo capital. When Gen. Simcoe and the advance guard of civilization appeared on the site of the city, all that there was of human interest to greet the new comers were two families of Mississaga Indians. By the close of the century, however, much was accomplished. Toronto was fortunate, in its beginnings, in receiving among its sturdy early settlers a considerable contingent of United Empire Loyalists. During the war of 1812 the town was twice sacked and burned by U. S. troops, though on one occasion at serious loss to the invaders. Recovering from this disaster, and receiving considerable accessions to its population, the town advanced apace. In 1834 it rose to the dignity of an incorporated city, having meanwhile largely extended its limits and gained a population of 10,000. Presently Toronto passed into its high prerogative era and accompanying period of political discontent, the issue of which was the rebellion of 1837 and the hard-won measures of reform, culminating in self-government. With the union (in 1841) of the two old Canadas, and the confederation (in 1867) of all the British North American provinces, Toronto forged ahead, and, aided by the railways, extended her bounds, increased her wealth, and made large additions to her population. At confederation she became the capital of the newly named province of Ontario and the seat of the provincial Government.

Population, etc.—In 1871 the population was 56,092; in 1881 it had increased to 86,415; in 1891, with the incorporating of its outlying suburbs, the population rose to 181,220. A special census, taken early in 1895, places the population at 188,914. The city returns three members to the House of Commons at Ottawa, and four members to the provincial Legislature of Ontario, which meets annually at Toronto.

Toronto: village; Jefferson co., O.; on the Ohio river, and the Penn. Railroad; 9 miles N. of Steubenville, the county-seat (for location, see map of Ohio, ref. 4-J). It is principally engaged in manufacturing fire-brick, sewer-pipe, terra-cotta building materials, and pottery, and contains a private bank and a daily and a weekly newspaper. Pop. (1890) 2,536. EDITOR OF "TRIBUNE."

Torpedin'idæ [Mod. Lat., named from *Torpe'do*, the typical genus, from Lat. *torpe'do*, *torpe'dinis*, torpedo, cramp-fish, liter., a numbness, deriv. of *torpe're*, be stiff, numb] a family of skates (see RALE) noted for their electrical powers, which have caused them to be called cramp-fish, numb-fish, etc. About twenty species are known, but those most studied belong to the genus *Torpedo*, three of which occur in Europe and one (*T. occidentalis*) on the east coast of the

U. S. In these the body (including the pectoral fins) is a broad, rounded disk, the large fleshy tail resembling that of a shark. There are two dorsal fins on the tail, and the ven-

The torpedo.

tral fins are distinct from the disk. The mouth is of moderate size, the teeth pointed, and the skin smooth. The electrical organs, apparently formed by a metamorphosis of parts of the adductor and common constrictor muscles, occur on either side of the head, and receive their nerve-supply from the fifth (trigeminal) and tenth (vagus) nerves. Each organ consists of numerous hexagonal prisms, extending from the dorsal to the ventral surface of the body. The walls of these prisms consist of connective tissue in which run nerves and blood-vessels, while the prisms themselves are filled with gelatinous substance in which are "electrical plates" in which the nerves terminate, and which are apparently the modified motor end plates of the muscle. While the anatomy and physiology of these and other electrical organs have been extensively studied, the physics of the electrical generation is as yet unknown. The current produced will deflect a needle, decompose water, etc., and its production is under the control of the will. It is probably employed by the fish as a means of offense and defense. See F. Boll, *Archiv Anal. u. Phys.* (1873, 1876); Du Bois-Reymond, *Monatssch. Berlin. Akad.* (1881); Ewart, *Philos. Trans.* (1888, 1892); Gotch, *Philos. Trans.* (1887, 1888); different views are maintained by Fritsch, *Die elektrischen Fische* (Leipzig, 1887-90).
J. S. KINGSLEY.

Torpedo: See TORPEDINIDÆ.

Torpedo Boats and Vessels: those whose function in battle is the use of torpedoes as a principal weapon, or whose general employment is connected with the transportation of torpedo-supplies and with the maintenance of other torpedo boats and vessels in a state of efficiency.

The classification of torpedo-vessels and torpedo-boats in the order of size, and employing such names as have survived among a somewhat perplexing variety at one time in use, is as follows: torpedo dépôt-ships, torpedo-gunboats or

in cradles on the upper deck in readiness for hoisting out at short notice and in quick time, powerful derricks and steam or hydraulic machinery being installed for this purpose. The torpedo dépôt-ship serves as a movable base from which these boats may operate, departing from an attack on an enemy anywhere within their radius of action, and returning after the attack has been concluded. Torpedo dépôt-ships are armed with a light-gun battery for defense and with automobile torpedoes for attack, and carry a supply of torpedoes and torpedo-stores, not only for themselves and for their own particular flotilla of boats, but sufficient to meet the demands of other boats of the squadron to which they may be attached. They are also equipped with forges and with the tools of a machine-shop, and are available for other repair-work than that of torpedo-boats alone, being of general utility in light repairs of the ships of the squadron and of their engines. They also carry submarine mines, with all the appliances for handling and planting them in any port to be defended, and the electrical appliances required for their operation.

The Vulcan in the British navy and the Foudre in the French furnish two good examples of the torpedo dépôt-ship.

The Vulcan has a displacement of 6,620 tons at a mean draught of 22 feet. Her length is 350 feet and breadth of beam 58 feet. A complete protective deck is fitted, having a thickness of from 2½ inches to 5 inches over the machinery. The indicated horse-power on her trial was 10,250 maximum, and her speed 18½ knots. Her radius of action is calculated at 3,000 miles for a speed of 18 knots, and 12,000 miles at 10 knots. The torpedo armament consists of automobile torpedoes, for whose ejection four launching-tubes are installed, two above and two under water. The gun armament comprises twenty rapid-fire guns. She carries on deck six torpedo-boats, two countermining launchers, and a steam-pinnace. Two heavy cranes, 65 feet in height, worked by hydraulic machinery, are used for hoisting the boats in and out. She is well equipped with workshops and machinery for making repairs. The Foudre has a displacement of 5,970 tons at a mean draught of 20 ft. 2 in. Her length is 370 ft. 8 in., and breadth of beam 51 ft. 2 in.; protective deck, 1-7 to 3-4 inches thick; indicated horse-power, 11,400; speed, 19 knots. Armament, automobile torpedoes, for which five launching-tubes are installed, and sixteen rapid-fire guns, of which eight are 3-9-inch caliber, four are 9-pounders, and four are 3-pounders. She is designed to carry ten torpedo-boats.

Torpedo-gunboats, or torpedo-vessels, are a class which occupy what may be called the middle zone between the cruiser and torpedo craft. They are smaller in tonnage than cruisers of the third class and have a much lighter gun armament, and are, on the other hand, at the extreme of size and of weight of ordnance in the torpedo-boat category. They are of especial importance and value in being sufficiently large to keep the sea for a long period, patrolling the coast and guarding home ports against sudden attacks

Dryad; torpedo-gunboat of the Halyon class.

torpedo-vessels, seagoing torpedo-boats, and first, second, and third class torpedo-boats.

Torpedo dépôt-ships, otherwise known as torpedo-boat transports, torpedo supply and repair vessels, torpedo supply-ships and floating machine-shops, etc., are primarily designed to carry to any required distant point numbers of the smaller or third-class torpedo-boats, which are stowed

by the torpedo-boats of the enemy that might be otherwise unopposed. They may also serve with efficiency as scouts and dispatch-vessels accompanying a cruising squadron. The Halyon, of the British navy, is given as the latest improved individual of this type. The principal dimensions are as follows: Length, 250 feet; breadth of beam, 30 ft. 6 in.; displacement, 1,070 tons at a mean draught of 9

feet. Indicated horse-power, with natural draught, 2,500; with forced draught, 3,500. Mean speed on measured mile, with natural draught, 17.5 knots; with forced draught, 19 knots. The torpedo armament is of 18-inch Whiteheads, to be launched from five tubes, one tube fixed in the bow and four tubes mounted, two on each side on training-carriages. Two 4.7-inch rapid-fire guns constitute the gun armament, one on the fore-castle and one abaft the mainmast. The steaming radius of action of the *Haleyon* class is 2,500 knots at 10 knots an hour.

To the Argentine Republic belongs an enlarged and improved vessel of the *Haleyon* type, the *Patria*, built by the Laird Brothers, of Birkenhead. The displacement is 1,183 tons. Five launching-tubes for torpedoes are installed, and she carries a rapid-fire gun armament of two 4.7-inch guns, four 8-pounders, two 3-pounders, and two machine-guns. Estimated maximum speed, 20 knots.

Closely allied to the torpedo-gunboat is the German torpedo division-ship, in which is also found the equipment of a torpedo supply and repair vessel. This type of vessel is built by Schichau. A summary of the especial characteristics required in these division-ships will serve to indicate their style of construction and the varied nature of the duties to be performed by them. As a class they are intended to serve the purpose of guiding a fleet or division of seagoing torpedo-boats; to have the same or even greater speed than ordinary boats; to be capable of safely riding out any gale; to be able to take on board a full inventory of stores and spare gear for a whole division; to be able to quarter a reserve force of men to replenish crews of boats reduced by casualties; to be fitted with complete workshop arrangements, smiths' forges, etc.; and to be provided with hospital accommodation for the sick and wounded. In common with other torpedo vessels and boats, they are to be armed with automobile torpedoes and rapid-fire guns to enable them to take an active part in an engagement; they are to be of sufficiently strong construction to enable them to ram a hostile torpedo-boat; to have as little draught as possible; to show little surface above the water, thus having small visibility and offering a small target to the enemy; to have large coal-carrying capacity and economical engines, to enable them to make long and fast voyages; and to be cheap in first cost and in maintenance. Division into as many water-tight compartments as practicable, and means for rapidly freeing themselves of water are not omitted.

Two of these having been built for the German Government, they gave such satisfaction that others were speedily ordered. They were 180 feet long and of 22 feet beam, with a displacement of about 250 tons. Each vessel, built throughout of the best steel, is divided into twelve water-tight compartments. The fixed torpedo-tubes, apparatus for launching, and the crew space are forward; abaft this is the workshop, fitted with all necessary tools and appliances; then come the boiler and engine rooms; aft are quarters for the commanding and other officers; next is the hospital; and next are the quarters of mates, etc. Store-rooms and coal-bunkers are judiciously distributed, the latter completely surrounding the boilers and engines. Launching-tubes and rapid-fire guns are distributed to best advantage on deck. The engines, working at 270 revolutions a minute, developed an indicated horse-power of 2,000. The speed on trial was 21 knots, the boat being fully equipped and carrying coal for 2,500 knots at the rate of 10 knots an hour. In a special storm trial for eight hours at full power against a very high sea and a gale of wind, a speed of 18 knots was maintained. A similar but larger boat of 300 tons displacement and 3,000 indicated horse-power, and of estimated speed of 21 knots an hour, was ordered by the Austrian Government.

In addition to services of guidance and care of the boats of its division, a torpedo division-ship will find useful employment in picking up the enemy at times when the torpedo-boats might be quite unable to find him; and also, by virtue of its weight and strength, in clearing passages through booms and in sweeping away nets from a protected vessel.

The latest size of this vessel in favor in Germany is of 220 tons displacement at a mean draught of 9.8 feet, 185.3 feet long, and 21.6 feet beam. In addition to the torpedo armament they carry a gun armament of six 37-millimeter Hotchkiss revolving cannon.

Seagoing torpedo-boats, often called torpedo-boat destroyers and torpedo-boat catchers, are the largest size of torpedo-boats designed to act independently and with a large

radius of action, but without embodying any provision for the repair or maintenance of other torpedo-boats. In these, as in all other torpedo craft, the leading idea of construction has been to install the highest possible power in the smallest possible space compatible with seaworthiness, and to build with the lightest materials consistent with strength. Emulation has been great between maritime nations and among the builders of each nation to produce the boat of highest speed. Victory, resting from time to time with Thornycroft, or Yarrow, or White, of England, with Normand, of France, and with Herreshoff, of the U. S., now appertains to Thornycroft in the record of the torpedo-boat destroyer *Boxer*, which ran over the measured mile during her official trial at the amazing rate of 30.354 knots per hour, equal to 34.95 statute miles.

The accomplishment of such a result as this has been made possible only by the closest study of scientific principles, and their application in shaping the lines of the hull and in designing the machinery so that the maximum of power should prevail with the practical minimum of size and displacement. In no class of marine architecture has progress been more marked and persistent than in the development of torpedo-boats. Each improvement in naval construction and in marine steam-engineering has been incorporated whenever applicable. In these boats, of all classes, are found exemplified the best modern ideas. Twin screws of powerful lines are driven at a surprisingly high rate of speed by multiple-expansion engines, generally installed in pairs, fed with steam by a number of multitubular boilers whose heating surface is relatively large in comparison with the amount of water-space in the boilers. A large grate surface, with closed fire-rooms and forced draught, permits the generation of steam in sufficient quantity to run the boat in a very short period of time after starting the fires, and maintains the steam in quantity and in pressure for all demands made by the engines at their highest rate of speed. The fuel is selected with the greatest care that the best results may be obtained, hand-picked coal of the best quality being the fuel commonly employed at present. Liquid fuel, such as petroleum and other hydrocarbons, finds many advocates, but its successful use has not yet been established. Safety arrangements are in general use, not only in the form of water-tight compartments and great pumping-out power to insure against sinking in case of a damaging wound to the underwater body, but in and around the boilers and engines, to provide immunity from total crippling should any of these important adjuncts be injured. Each engine and each boiler is isolated from the rest, being placed each in a separate compartment, and the steam-piping so connected that they may act in unison or independently one of another. If one engine or any one of the boilers is crippled, it may be shut off from the rest without stopping the boat or withdrawing from action. Many boats have safety arrangements in connection with the boilers, such that in the event of the bursting of a boiler-tube, the furnace-doors are closed automatically, and the escaping steam finds its way out through the smokestack, being shut off from the fire-room, thus saving the firemen. In some boats, also, the furnace-doors are so constructed that in case of the flooding of any boiler compartment, the furnace-doors of that boiler may be closed water-tight and steam maintained in the boiler for a considerable period of time by the coal remaining in the furnaces. Protection to the inmates of the conning-towers is given by steel plating, and in the larger boats the machinery and boiler compartments are also steel plated, and they are additionally protected in all boats by the coal, which is stowed in bunkers surrounding the vital parts of the boat.

The *Boxer* belongs to what is known as the *Havoek* type of torpedo-boat destroyers. The British naval estimates for 1894 provide for forty-two boats of this type, inaugurating a building programme which proposes sixty-four of these boats in all, on the basis of four for each battle-ship completed for the Channel and Mediterranean squadrons. The contracts for building these boats have been distributed among a large number of builders, and such as have been completed up to date have been marvels of success. The *Havoek*, a Yarrow boat, the pioneer of the class, recorded a speed of 27.565 knots on her trial. The *Hornet*, also a Yarrow construction, made 28 knots over the measured mile. Following this, the *Daring*, a Thornycroft boat, made a mile at the rate of 29.268 knots an hour. Finally, the *Boxer*, also built by Thornycroft, attained the greatest speed known, of all vessels of whatever size, at the figure already given—30.354 knots.

All boats of the Havock type follow very closely the general features of the original type, with the exception of certain minor changes in the design, and in a slight increase of size in the later boats. Each contractor has been allowed to install his own type of machinery and boilers. The dimen-

advantages of this large number of boilers are the avoidance of material diminution of the power developed in the event of the disabling of one boiler, and the facilitation of the removal of the boilers when necessary in making repairs. The *Hornet's* eight boilers weigh 43 tons, as against 54 tons, the

The *Hornet*; seagoing torpedo-boat.

sions of the *Havock* are as follows: Length on the load-water line, 180 feet; breadth of beam, 18 ft. 6 in.; displacement, 220 tons at a mean draught of 6 feet. The motive power consists of two triple-expansion engines, fed by two boilers of the locomotive type, with a grate surface of about 100 sq. feet, and a total heating surface of about 5,000 sq. feet. She has three-bladed twin propellers. Her radius of action is about 3,500 knots at a speed of 10 knots an hour. The torpedo armament consists of 18-inch Whitehead torpedoes, for the launching of which three tubes are fitted, one fixed in the bow and two on training-carriages, one on either side of the upper deck. Transportation of the torpedoes about the deck is facilitated by a transporting carriage which runs on a railway from the conning-tower forward to the launching-tubes aft. The gun armament consists of one 12-pounder Hotchkiss rapid-fire gun, mounted on top of the conning-tower, and two 6-pounder rapid-fire guns, abaft the turtle-back. A search-light is mounted on the upper deck. The complement for this type of torpedo-boat is forty-two men all told. Of the important changes in construction affecting the seaworthiness of the boat, the turtle-back may be noted as being carried much farther aft than in preceding torpedo-boats. In the *Havock* and others of the class the turtle-back extends to abaft the conning-tower, where it meets two high bulwarks and two low deck-houses, which give additional protection from water coming on board, to the deck abaft the conning-tower. Another novel feature is the construction of what is practically a double bottom in the forward part of the boat. This is effected by a water-tight flat at the level of the water-line, running from the eyes of the boat to the forward boiler-room bulkhead, the space under this flat being divided, by cellular construction, into lockers for

ammunition, stores, etc. The weight of the *Havock's* two boilers. The boilers of the *Daring* and *Boxer* are the Thornycroft improved water-tube boilers. In the trial of the *Daring* the mean indicated horsepower developed was 4,573, with a maximum of 4,842, and the average number of revolutions of the propellers a minute, for a three hours' run over the measured mile, was 387. In her turning trials the boat's tactical diameter was found to be about 500 feet, and the time occupied in making a complete circle, at 210 revolutions, was 1m, 56s. A serious defect was found in the column of flame, which rose to a height of from 12 to 15 feet above the smokestacks when the boat was running at high speed, and which would render the boat visible at a great distance at night, and would offer an excellent target for the enemy.

A typical French boat of this general class, although much smaller, is the *Chevalier*, a Normand boat, of 125 tons displacement, with an average speed of 27.22 knots on a two-hours' trial. Her length is 154 feet; beam, 15.4 feet; and extreme draught, 6.2 feet. The armament consists of two 18-inch deck torpedo-tubes and two 1-pounder rapid-fire guns. Two Thornycroft boilers furnish steam for two triple-expansion engines, whose cylinders are respectively 15.8, 23.6, and 35.5 inches in diameter, with 15.8 inches stroke. Either one or both of the boilers can be used to feed steam to the engine.

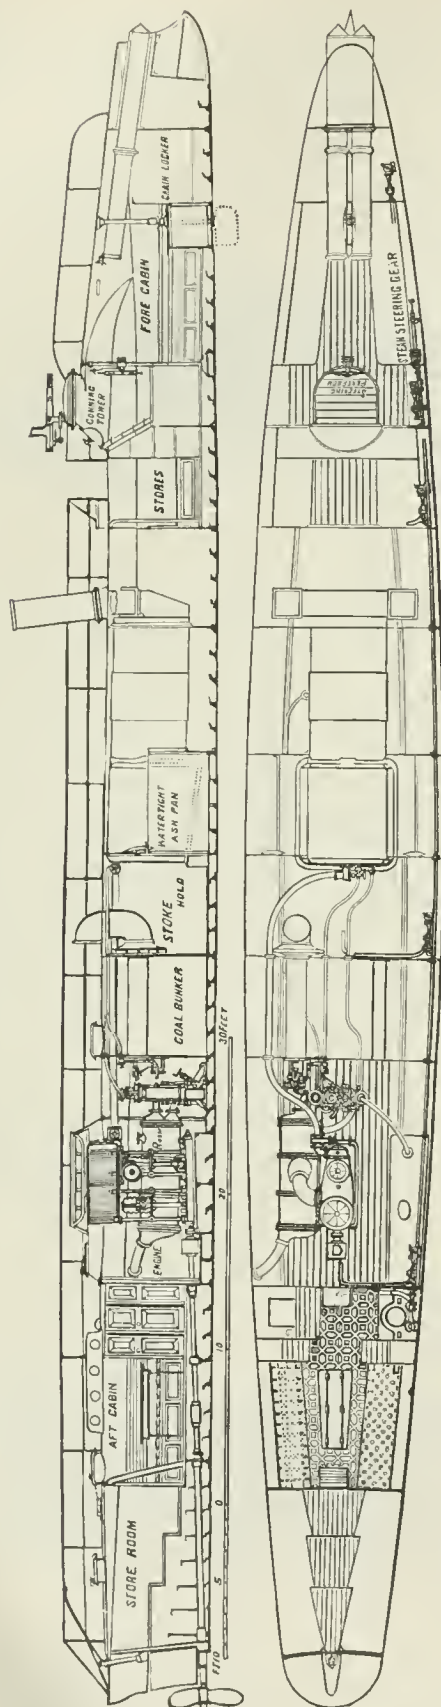

First and Second Class Boats.—It is generally conceded, as the result of experience derived from many trials under all circumstances of weather and sea, that the minimum length necessary to an effective seagoing torpedo-boat is 150 feet. Boats under this length are properly classified, in the decreasing order of size, as first-class, second-class, and third-class torpedo-boats. The limiting lines of size and of

Mousquetaire, French seagoing torpedo-boat.

tonnage in the three classes differ somewhat among different nations, but it may be generally stated that first-class boats are, as a rule, of from 100 to 80 tons displacement; second-class boats of 50 tons or less, and third-class boats of 15 tons and under. First and second class boats find their chief

use in the three classes differ somewhat among different nations, but it may be generally stated that first-class boats are, as a rule, of from 100 to 80 tons displacement; second-class boats of 50 tons or less, and third-class boats of 15 tons and under. First and second class boats find their chief

the home-defense of ports. Stationed in numbers in different ports, or massed at threatened localities, by inland waterways, where such routes of communication exist, their presence would be a constant menace to an investing naval force, which, however powerful, would always be in danger of destruction whenever opportunity might offer for a sortie of the torpedo-boats. The following dimensions are those of one of the most recently constructed first-class boats: Length, 140 feet; breadth of beam, 15 ft. 6 in.; displacement, 110 tons at a mean draught of 5 ft. 4 in. She has engines capable of developing 2,000 indicated horse-power, and her maximum speed is 23.8 knots. Her torpedo armament is of 18-inch Whitehead torpedoes, for the launching of which three tubes are installed. The gun armament consists of three 3-pounder rapid-fire guns.

Third-class boats are designed to be carried on the upper decks of battle-ships, or of torpedo-boat transports, to be hoisted out when occasion for their employment arises. The third-class boats for the U. S. S. Maine and Texas, two for each ship, are excellent examples of the most advanced type of construction of this class of boats. The dimensions of the boats for the Maine are as follows: Length on water-line, 58 ft. 6 in.; breadth of beam, 9 ft. 1 in.; displacement, 14½ tons. The boats are completely decked over, with the exception of two water-tight cockpits, one forward and one aft, and are divided into seven water-tight compartments. The boilers are water-tubular, with 12 sq. feet of grate surface and 440 sq. feet of heating surface. The engines are quadruple expansion, compounded, of the inverted, direct-acting form. A speed of 18 knots with 200 indicated horse-power is expected. The radius of action, at 10 knots an hour, is calculated as 500 knots. The torpedo armament is of 18-inch Whitehead torpedoes with one bow tube for launching, and the gun armament consists of one 1½-inch rapid-fire gun. The complement is five men all told. The material of which the boat is constructed is steel. With the object in view of reducing the weight as much as possible, the Yarrow Shipbuilding Company has recently built, for the French torpedo-boat transport Poudre, an aluminium boat, 60 feet long and of 9 ft. 3 in. beam, and of a displacement of 10 tons; speed, 20½ knots. The decrease in weight over similar boats built of steel is about 2 tons, and the gain in speed is about 3½ knots.

Submarine boats are still practically in their infancy, although the idea is an old one. See the article SUBMARINE NAVIGATION.

The U. S. S. Vesuvius and the Destroyer, a boat sold by the Eriesson Coast-defense Company to the Government of Brazil during the war of the rebellion in that country in 1894, stand as unique examples of ingenious systems worked out to a practical accomplishment, but not yet generally adopted. The Vesuvius has a battery of three pneumatic guns designed to fire projectiles, known as aerial torpedoes, to an extreme range of one mile. These projectiles contain a large charge of high explosive which detonates, either on impact with the enemy, if a direct hit be made, or shortly after entering the water, with a torpedo effect, if the hull be missed. The Destroyer has for its leading feature an Eriesson submarine gun, fixed in the line of the keel and pointing directly ahead, from which a projectile containing a heavy charge of high explosive is discharged by gunpowder impulse. The projectile explodes on impact with the hull of the enemy below the water-line. The effective maximum range of this gun is 600 feet. See NAVY, SHIPS OF WAR, etc. GEORGE F. W. HOLMAN.

Torpedoes [from Lat. *torpēdo*, torpedo-fish, to whose shocks its destructive explosions may be compared]: submarine devices containing explosives and designed to destroy hostile shipping. They are either contrivances propelled through the water so as to strike the enemy's ship or more or less stationary submerged mines, each so arranged as to be set off when a ship is over it. The germ of the idea is found in the Greek fire of the ancients, from which the torpedo has been naturally developed since the introduction of gunpowder into warfare.

Historical Notes.—The earliest "infernal machine" on record dates from the siege of Antwerp in 1585, where an Italian engineer, Zambelli, destroyed an important bridge laid by the enemy over the Scheldt, by setting adrift against it four sews, each carrying a masonry mine heavily charged with gunpowder. Ignition was to be effected either by a slow match, or by a gun-lock discharged by clockwork after the lapse of a certain time. One of these floating mines

exploded against the bridge with tremendous effect, and thus stimulated investigation in a new field of warfare. Other similar attempts were made during the next two centuries by the French, British, and Russians, but, like the fiasco before Fort Fisher in the civil war in the U. S., they usually proved to be failures. The condition now regarded as essential in attacks directed against shipping, that the charge shall be submerged, was totally ignored. To an American engineer officer of the Revolution, Capt. David Bushnell, the credit is due not only of experimentally developing this principle, but also of devising a submarine boat, by which the first attempt to apply it to the destruction of an enemy was ever made. By his fertility of invention and persevering efforts to perfect the new weapon he justly won the right to be considered the originator of submarine mining as practiced at the present time. His first practical trial was made in 1776, use being made of his submarine boat, navigated by Sergeant Ezra Lee. The attack was directed against the *Eagle*, the flag-ship of Lord Howe, lying in New York harbor, and the vessel narrowly escaped destruction. In 1777 Bushnell caused the blowing up of a prize schooner, lying at anchor astern of the frigate *Cerberus* off New London, by means of a drifting torpedo which he had directed against the latter, and which was ignominiously taken on board the schooner. In the following winter he set adrift many torpedoes to annoy the British fleet in the Delaware, thus giving occasion to the so-called Battle of the Kegs, which was commemorated in a humorous song by Hopkinson, the author of *Hail Columbia*. Twenty years later Robert Fulton revived the general ideas of Bushnell, and attempted to introduce submarine warfare in the French navy. He made a submarine boat named the *Nautilus*, by which in Aug., 1801, he blew up a launch in the harbor of Brest—the first instance on record of a vessel destroyed by a submerged charge of gunpowder. Rejected by France, he next induced Great Britain to organize an abortive "catamaran" expedition against the French fleet lying at Boulogne. Although supported by Pitt, and successful in experimentally destroying the brig *Dorothea* by a drifting torpedo, his projects were finally rejected by the British Government as unsuited to the interests of a nation that enjoyed the sovereignty of the sea. Fulton returned disappointed to the U. S., where, after some successful experiments, he finally met a like repulse, largely through the active opposition of Commodore Rogers of the navy. He ultimately abandoned his efforts in submarine mining, as his attention became absorbed in steam-navigation. Although Fulton began his experiments by employing a submarine boat, experience led him to abandon this device. As finally rejected by the U. S. Government, his system included four classes of torpedoes: (1) Buoyant mines, anchored in the channel to be defended, and exploded by a mechanical device set in action by contact with the enemy's hull. (2) Line-torpedoes, designed to be set adrift and fished by the cables of the hostile fleet at anchor. (3) Harpoon-torpedoes, to be discharged from a gun, and thus attached to a vessel and fired by clockwork. (4) Block ship torpedoes, to be carried on booms projecting from vessels of a peculiar type, and exploded by contact with the enemy. The modern system includes all these devices in a modified form, except the third—a fact which sufficiently shows how far Fulton was in advance of his age in appreciating the capabilities of submarine warfare. In the war of 1812 several abortive attempts were made by individuals to employ Fulton's system against British shipping in U. S. waters, but the Government took little interest in the operations, and no success was achieved, although considerable alarm was excited in the fleet of the enemy.

During the next thirty years torpedo warfare was neither forgotten nor neglected in Europe, as many writings abundantly prove, but it was left to Col. Samuel Colt, of Hartford, inventor of the revolving pistol which bears his name, to make the next great advance. It consisted in introducing, as the igniting agent, electricity, at that date considered rather as a toy of the philosopher's laboratory than as a practical force in engineering. Colt began his torpedo experiments in 1829 or 1830, and after years of labor elaborated a system of buoyant submarine mines, to be planted quincuncially in the threatened channel and operated by electricity. To convey the current he devised one of the very first submarine cables ever attempted, which in the winter of 1842-43 he successfully laid across East river, New York harbor. Gutta-percha was then unknown as an insulating material, and Colt employed a wrapping of cotton yarn soaked in asphaltum and beeswax, and, when used in exposed localities,

inclosed in a leaden tube. When designed for torpedo purposes, each cable included two separate conductors, which,

FIG. 1.

entering the mine, were united by a fine platinum wire imbedded in gunpowder. The operator, by sending at pleasure a strong current of voltaic electricity through this bridge, heated the platinum to redness and determined the explosion. For convenience of manipulation the shore-ends of the cables were all led to a casemate. The sketch shown in Fig. 1 was found among Colt's papers after his death, dated 1836; it represents one of his devices for igniting the mines at the proper instant, although it is of course applicable only to an elevated site. A secret believed to relate to a method of making the vessel telegraph her own position died with him. This sketch explains itself. One set of conductors from all the cables are united and permanently attached to a single pole of a powerful battery. The other conductors lead to a map of the channel, and each is secured at the point corresponding to the known position of its mine. The reflector is arranged to throw the image of the hostile ship upon the map, and as it passes over a wire terminal the operator with his other battery-wire closes the proper circuit and explodes the torpedo. Colt's experiments extended over a period of about fourteen years, the latter part of the time under the auspices and at the expense of the Government. He destroyed several vessels at anchor, and finally, on Apr. 13, 1843, accomplished the feat of blowing up a brig under full sail on the Potomac, operating his battery at Alexandria, 5 miles distant. This decisive trial was witnessed by many members of Congress and by the President, and its success at that date stamps Colt as a man of extraordinary ability. The time, however, was not yet ripe for the introduction of the new weapon, and, like those of his predecessors, Colt's plans were ultimately rejected by the Government.

The idea of submarine warfare, although dormant, was by no means dead, as various tentative devices prove; but it was not until the Schleswig-Holstein rebellion in 1848 that they appeared in actual warfare. Prof. Hinly, of the Kiel University, then obstructed the entrance to the harbor of that city by barrel mines of his own invention, operated from the shore by electricity. No attack was attempted by the Danish fleet.

The Anglo-French war with Russia in 1855 furnished the next occasion for the application of submarine mines to harbor defense. Sebastopol, Cronstadt, and Swenborg were protected in this manner by devices of Prof. Jacobi. Unfortunately for the success of his system, the charges were too small (25 lb.), and although explosions occurred under two or three British frigates, no serious damage was done. The fuze consisted of a small bottle of sulphuric acid imbedded in a mixture of potassium chlorate and sugar; the mechanical breaking of the bottle by contact with the vessel effected ignition. The great improvement of placing the igniting apparatus within the torpedo, independent of external levers, is due to Prof. Jacobi, who also first proposed electrical mines to be fired by an operator at a distance. Some abortive attempts at submarine mining were made by the

Chinese in the war with Great Britain in 1857-58, but they resulted in nothing. The Italian war of 1859 gave occasion for Col. von Ebner, of the Austrian Engineers, to employ in the defense of Venice a system of electrical mines more carefully elaborated than any which had preceded it, but no opportunity for practically testing its merits occurred.

It was reserved for American engineers to demonstrate upon a grand scale the important part which the modern torpedo can be made to play in maritime warfare. The civil war of 1861-65 offered conditions peculiarly favorable to its development. The Southern Confederacy was possessed of no fleet worthy of the name, while a long line of seacoast and many navigable rivers exposed its territory to easy assault by water. It could, therefore, well afford to sacrifice most of those routes of communication, provided they could be closed to the war-vessels of the Union. Every variety of torpedo became, therefore, admissible. After some preliminary trials, the service was formally legalized in Oct., 1862, and an efficient bureau was established at Richmond, which continually extended the scope of its operations until the end of the war. Seven U. S. ironclads, thirteen wooden war-vessels, and seven army-transporters were destroyed by torpedoes, and eight more vessels were more or less injured. The Confederates lost four vessels by their own mines, and a fine ironclad, the Albemarle, by the counter-operations of the U. S. fleet. This wholesale destruction occurred chiefly during the last two years of the war; and if at its beginning the system had been as well organized as at its close, the influence which might have been exerted upon the naval operations of the Union forces can hardly be estimated. The details of the Confederate system were published to the world soon after the end of the war, and formed the basis for further investigation and development in many nations. The several devices may be grouped in five distinct classes—stationary torpedoes or submarine mines, automatic drifting torpedoes, infernal machines, offensive spar-torpedoes, and submarine boats.

Stationary Torpedoes, often called Sea-mines.—To form an obstruction in the channel which shall stop the enemy,

FIG. 2.—Frame and pile torpedoes.

FIG. 3.—Swaying boom and turtle torpedoes.

either by his actual destruction or by his fear of it, is the object of this class. Several types were used. The frame-torpedo was one of the most simple. Each shell weighed about 400 lb., and contained 25 lb. of gunpowder. The fuze, consisting of a vial of sulphuric acid imbedded in potassium chlorate and sugar, was placed in the loading-hole, protected by a thin lead cap to be crushed by the vessel. The pile-torpedo, a similar pattern of mine, also shown on the figure, was found in the water-approaches to Savannah. The swaying-boom torpedo was a marked improvement upon this device, since, being free to move, it was not so easily discovered by dragging. To render it still more effective, it was often attached by a line to a "turtle" containing a fuze made upon the principle of an ordinary cannon-primer. The attempt to grapple and raise the boom-torpedo exploded this auxiliary, which was planted in front, so as to be well under the bottom of the enemy. The charge of the boom-torpedo was about 70 lb., and of the turtle 100 lb.; the whole device was called the devil-catcher. Another approved pattern was known as the Singer or Fretwell torpedo, invented by Singer and introduced by Fretwell. The principle of its action was similar to that of the "turtle," the charge (50 to 100 lb.) being fired by a percussion-cap acted upon by an external plunger released when the inverted saucer-cap was thrown off by the touch of the enemy. The weakening of the spring under continued tension, and

the growth of seaweed and shellfish, were found to destroy efficiency after the torpedo had remained a few weeks in position. To obviate this difficulty—which is inherent to all mechanism acting externally—Gen. Rains, when in charge of the laboratory at Augusta, Ga., devised a fuze priming said to consist of fulminating mercury and fulminating silver, which was exceedingly sensitive, a slight blow being sufficient to cause detonation. Fuzes containing it, protected against

FIG. 4.—Singer's torpedo.

FIG. 5.—Barrel-torpedo.

moisture by a lead cap easily crushed by contact, were used in his barrel-torpedoes. These torpedoes contained from 70 to 120 lb. of gunpowder, conical ends of light wood being added to increase flotation and to strengthen the case. The Rains fuze served its purpose well, and was used in land-mines, in hand-grenades, and in several types of torpedoes. Lastly, electrical mines, to be fired by the act of an operator on shore, were employed; but the difficulty of procuring the requisite insulated cable restricted their use, and it is worthy of note that no attempt was made to make them automatic. The charges employed were usually enormous, amounting to 2,000 lb. of gunpowder. The Commodore Jones was destroyed on May 6, 1864, by a torpedo of this type. It was planted in a narrow part of the channel of James river, in about 35 feet of water, and was operated from a pit on the river-bank containing a small Bunsen battery. The Commodore Jones was allowed to advance safely over the mine, which was reserved for the flag-ship, but, the operator hearing the order given to return preparatory to a more thorough search for torpedoes, the vessel was blown up as she backed down stream. She appeared to be lifted bodily by the explosion, and was utterly destroyed, more than three-fourths of her crew being killed or wounded.

Automatic Drifting Torpedoes.—This class was especially designed for rivers where the current, setting in one direction, could be depended upon to sweep the apparatus down to the hostile fleet, and perchance to bring it into contact

FIG. 6.—Drifting torpedo.

FIG. 7.—Current torpedo.

with some vessel. Night was often selected for the attempt, but the ease with which a ship at anchor may be protected by nettings rendered the several devices of little avail. The simple form shown in the figure was used in great

numbers on the James river. A piece of slow-match was arranged to burn down the tube to the charge. These torpedoes were often caught by nets, but did no damage. A more complex arrangement is shown in Fig. 7. This torpedo was often set adrift, connected to a log by a knotted line, which, fouling the anchor-chain, would bring the former to rest under the bottom, when the current acting on the wheel would release the plunger and determine an explosion.

Infernal Machines.—This class of torpedoes is not generally considered to come within the limits of legitimate warfare as practiced at the present day, because it subjects non-combatants to great peril without any previous warning. It was designed to be smuggled on board the Union war-vessels or transports, and thus to effect their destruction. Two types were employed. The most simple was known as the coal-torpedo. It consisted of a metal case containing several pounds of gunpowder, cast and colored to resemble closely a lump of coal. When ignorantly thrown into the furnace it caused the explosion of the boiler. The Greyhound was destroyed in this manner on the James river, as were also several transports on the Western waters. The other type was known as the horological torpedo. It consisted of a case containing a large charge of gunpowder and a clockwork arrangement set to run for a certain time, at the expiration of which it released a plunger and fired the charge. A disastrous explosion was caused in the army powder-fleet at City Point in 1864 by an arrangement of this character which was placed on board one of the barges by a spy. At Mound City a similar explosion was effected.

Offensive Spar-torpedoes.—This form of the weapon afforded the best opportunity for the display of personal gallantry, and several officers won distinction in its use. An outrigger spar from 20 to 30 feet in length carried a torpedo designed to be brought in contact with the enemy's hull and exploded in a hand-to-hand conflict. The Confederates early supplied ram-torpedoes to their ironclad fleet, but a lighter pattern was chiefly used, operated from a special craft termed Davids, by reason of their small size and insignificant appearance as compared with their adversaries. The type used at Charleston was built of boiler iron and was about 35 feet long, shaped like a cigar, with a low combing to exclude the waves. Small engines driving screw-propellers gave a maximum speed of about 7 knots per hour. The torpedo was of copper, charged with about 50 lb. of fine gunpowder. Under cover of the night these boats approached the hostile fleet, trusting to suddenly dart alongside and discharge the torpedo with impunity in the confusion and alarm created by their sudden appearance.

Another type of this class of boats consisted of an ordinary steam-launch equipped in a similar manner. Several of the Union war-vessels—the New Ironsides on Oct. 5, 1863, the Memphis on Mar. 6, 1864, the Minnesota on Apr. 8, 1864, and the Wabash on Apr. 18, 1864—narrowly escaped destruction, and the Confederate ironclad Albemarle was sunk at her moorings by this mode of attack. The latter feat was performed by Lieut. Cushing, U. S. navy, and for its exceptional gallantry it deserves a special description. The boat was an ordinary steam-launch equipped with a Wood and Lay torpedo and a brass howitzer. This torpedo was provided with an air-chamber, and at the proper moment was to be detached from its boom and allowed to rise under the enemy. A strong pull upon the lanyard then released the ball, which, falling on the percussion-cap, ignited the charge. Lieut. Cushing, with a crew of thirteen officers and men, advanced 8 miles up the Roanoke river, passing the Confederate pickets undiscovered. On approaching the Albemarle, moored to the wharf and pro-

ected by a pen of logs about 30 feet from her side, he suddenly darted upon her, and under a heavy fire exploded his torpedo against her bottom, thus sinking her. Most of his party were captured and some were drowned; Lieut. Cushing himself and one man escaped by swimming and threading the swamps to the Union lines.

The Schleswig-Holstein war of 1864, although short, afforded an opportunity for employing defensive mines, and one of the invading vessels was sunk through their agency. The Paraguayan war of 1864-68 furnished the next occasion for submarine warfare. Immediately after the Brazilian fleet entered the waters of that state a fine ironclad, the Rio de Janeiro, was sunk by two torpedoes against which she had struck. Subsequently a division of the fleet ran past the batteries of Curupaity, only to find itself entrapped between two lines of torpedoes, one in front and the other planted in rear, after the passage, to bar the retreat; the defective nature of these obstructions alone prevented a serious disaster. Later in the war the Tamandari was crippled by a submarine mine. The Paraguayan torpedoes belonged to the anchored or drifting class, and the sulphuric-acid fuze was largely used. In the war between Austria and Italy in 1866 the harbors of Venice, Pola, and Lissa were obstructed by mines—the latter after the attack by the Italian fleet. No hostile trial of their efficiency was made. During the Franco-German war of 1870-71 no conspicuous use was made of torpedoes, but the German ports were protected by them, and the French contributed a new device to the list. It is known by the name of the "ball of Verdun," devised by Capt. Bussiére, of the engineers, to destroy a military trestle-bridge thrown by the Germans over the Meuse a short distance below the fortress. It consisted of a large sheet-iron sphere over 3 feet in diameter, heavily charged with gunpowder and provided with a clockwork train, which after a certain time was to discharge a pistol and thus ignite the mine. It was but little heavier than water, and was carefully adjusted so as to make the center of figure and of gravity coincident. A body fulfilling these conditions will be rolled along the deepest part of the channel by the current, and will, of course, be far more difficult of detection than a floating object. The capitulation of the fortress prevented a trial of its efficiency, but many letters were introduced into Paris during the siege by similar balls caught by nets spread for the purpose. In the Russo-Turkish war of 1877-78 the Russians made decisive use of torpedoes. Through their agency the armored fleet on the Danube was held in check without the aid of a single Russian war-ship, and successful invasion was rendered possible. The channel was obstructed by mines at strategic points, and an attack with spar-torpedoes upon the fleet where it had taken refuge in the Matchin branch resulted in sinking the monitor Dula Suife and so completely demoralizing the Turks that no further attempt was made to defend the river. For this gallant exploit the names of Lieuts. Dubasoff and Chostakoff will remain associated with that of Cushing. The Russian ports on the Black Sea were defended against an overwhelming superiority in naval power, directed by Hobart Pasha, through the moral influence of their submarine defenses. A Turkish gunboat, the Suna, was sunk by a contact-mine at the Sulina mouth of the Danube. Eight attacks were made by the Russians, use being made of spar, Harvey, and Whitehead torpedoes. Two of them were successful. In one a steamer was sunk at Batoum on Jan. 25, 1878, by a Whitehead torpedo, the first triumph of the weapon on record. Two failures had preceded, one by the British cruiser Shah against the Peruvian Huascar on May 29, 1877, and the other by the Russians at Batoum on Dec. 20, 1877. In the war between Chili and Peru in 1880-81 both parties made use of torpedoes, but without noteworthy results, except perhaps to throw discredit on the Lay torpedo. During the Franco-Chinese hostilities in 1884-85 two naval vessels were sunk by the French with spar-torpedoes, proving that this weapon is not wholly superseded. During the Chilean revolution of 1891 several attempts were made with Whitehead torpedoes, one of which was successful in sinking the battleship Blanco Encalada and over 150 of the crew. During the war between Japan and China in 1894-95 submarine operations played only a subordinate part. At the battle of the Yalu, the Chinese fired four or five torpedoes ineffectively, while their adversaries appear to have made no attempt to use the weapon. At the attack on Wei-hai-wei, the Japanese torpedo boats entered the harbor on two successive nights, and succeeded in sinking three or four vessels, two of which were ironclads.

FIG. 8.—Spar-torpedo.

FIG. 9.—Wood and Lay torpedo.

ships of war. No effective use of submarine mines is reported.

From the foregoing *résumé* it is apparent that torpedoes are no longer to be regarded as experimental devices, but that they have become recognized weapons of maritime warfare, admitting of very varied applications. They may be employed offensively in the combats between hostile vessels, or they may be used defensively to repel an apprehended attack upon a harbor or district by preventing the passage of the enemy's squadron through the channel of approach. Entirely different principles of construction and of manipulation mark these two classes of the weapon. The former requires the technical skill of a sailor to move the charge into position and explode it within destructive range. The latter differs in no essential respect from the mines so long employed in the defense of land fortifications. Accordingly, in Great Britain, the U. S., and some other countries possessing an extended seacoast, the service of torpedoes has been divided between the navy and the engineers of the army—the former operating offensively afloat, and the latter defensively from the shore. The U. S. naval war college is at Newport, R. I., where the needful investigations are conducted, and where classes of officers receive regular instruction in the use of the new weapons. The naval torpedo station also is at Newport, but at this instruction is given to seamen qualifying for the grade of seaman-gunner only. The army school is at Willets Point, New York harbor, where the subject is experimentally studied, and where the officers and the enlisted men of the engineers are exercised in all the duties of defensive submarine mining. While in general the line of demarkation between the two services is thus plainly marked, some of the weapons—such, for example, as fish-torpedoes steered by electricity—may be conveniently operated either from land or from shipboard, and they would be used in war either by army or navy as occasion might offer.

Offensive Torpedoes.—In offensive torpedo warfare many devices have been proposed from time to time, and subjected

FIG. 10.—Harvey torpedo.

to systematic trial by naval officers. The Harvey torpedo belongs to this type. The charge is contained in a narrow copper vessel, encased in wood strapped with iron, and so ballasted as to ride vertically in the water. A tow-line of wire rope passes from the slings of the torpedo through a block on the yard of a fast steamer to a reel fitted with a brake on her deck. The enemy is passed at full speed, with the torpedo diverging at an angle of about 45° from the quarter, and the course is so directed as to bring the weapon in contact with his hull. Just before striking him the torpedo is made to dive by suddenly slackening the tow-line, and then to rise under his bottom by checking it with the brake. Explosion is effected through the agency of the projecting levers, which when struck either detonate a contact fuze or close an electric circuit, and thus cause the passage of a powerful current through a platinum fuze. These torpedoes are made of various sizes, one of the largest patterns being 45 feet long, 2 feet deep, and 6 inches wide, designed to contain 100 lb. of guncotton or dynamite. The requisite flotation is given by the cork buoys, *a a'*, as when at rest the torpedo sinks by its own weight. This weapon was devised by a skillful sailor, Capt. Harvey, of the Royal Navy, and he claims that it can be successfully used on the high seas even during a gale; but although formerly adopted by several European nations and highly commended, it failed in the Russo-Turkish war (1877-78) and has passed out of use.

A more successful type of offensive torpedo is that known as the Whitehead. The idea developed by this weapon is due to an officer of the Austrian marine artillery, but the first practical trials were made in 1864 by Robert Whitehead, superintendent of iron-works at Fiume, acting upon the suggestions of Capt. Lupis, an officer of the Austrian navy. The torpedo has undergone great improvements between that date and the present time, and the right to use it has been purchased by the U. S. and by most European nations. The latest type consists of an iron and steel vessel in the shape of a spindle of revolution. It is driven by a propeller moved by compressed air. The 18-inch pattern adopted by Austria is claimed to have a speed of 32 or 33 knots for a run of 437 yards, and of 30 knots for one of 875 yards.

The latest British pattern carries a charge of 250 lb. of guncotton of 12 per cent. moisture, with a 16-oz. detonator of dry guncotton. The torpedo can be projected from a launching-tube or started by hand, and is capable of regulating and preserving its depth and direction, within narrow limits, in still water; but cross-currents or seaweed may introduce large variations. It can be set to explode on contact or after a definite time, and either to sink or rise to the surface after finishing its course. The Schwartzkopff torpedo is essentially a Whitehead encased in phosphor-bronze instead of steel. The Howell torpedo, devised by a U. S. naval officer, and patented in 1871, has been slowly developed until it has become a formidable rival of the Whitehead, from which it differs chiefly in motive power. This is derived from the rapid revolution of a heavy fly-wheel transmitted to the propeller shafts by beveled gearing. A speed of 22 knots and, what is more important, an inherent directive force giving great precision of fire are claimed. The U. S. Naval Department has purchased several Howell torpedoes for service, as well as Whiteheads.

Submarine rockets, carrying explosive charges and started from submarine guns, have received and are receiving attention, both in the U. S. and in Europe. Such a weapon, if its course can be successfully controlled, will be especially dangerous in the combats of ironclad vessels at short range, since the blow, being delivered under the armor, can not fail to achieve decisive results.

The fish-torpedo steered and controlled by electricity was first patented by Lieut.-Col. Ballard, Royal Engineers, in Aug., 1870, and again by Lieut.-Col. Foster, U. S. Engineers, in 1872. It has been independently elaborated by Mr. Lay and H. J. Smith in the U. S., and by Col. von Schelha in Russia. The claim to priority in the invention has been the subject of litigation; but the decision of the commissioner of patents (June 13, 1873) has awarded it to Mr. Lay, whose boat has also been brought most conspicuously before the public. This type of torpedo consists essentially of a boat of the Whitehead class, which carries and unreels a coil of insulated wire through which the electric current from a battery on shore or on shipboard can be passed at will to certain electro-magnets. By closing and breaking the circuit, and reversing the direction of the current, valves connected with the motive power are controlled, and thus the rudder may be put to starboard or port, and the engine may be started or stopped. In this manner the motion of the fish is under perfect control from the instant of starting. The motive power may consist of liquefied carbonic acid, or ammonia, or compressed air, or steam peculiarly applied. The boat may be made to move at the surface or below it. Her position is known to the operator from two small flags carried near the water-level, which at night are replaced by two lanterns shaded in front so as not to be seen by the enemy. Any of the modern explosives may be employed, and detonation results from the action of a mechanical fuze or of a circuit-closer and battery. The Lay torpedo proper has been superseded by later patterns; it was a surface boat driven by liquefied carbonic acid. Exposure to projectiles and freezing of the motive power during expansion were among its inherent defects. They have been obviated in its successors, the Wood-Haight and the Patrick, by submerging the torpedo under an unsinkable float and by heating the carbonic acid during the run with sulphuric acid and lime placed around the pipes. A mile has been traversed in an official trial at a speed of 19 miles per hour. A controllable torpedo was proposed by Capt. Ericsson, who supplied his motive power to the engine by a flexible tube drawn after the boat. This motive power was compressed air generated by an engine near the operator; and by regulating the supply the boat was steered without the aid of electricity. A movable torpedo invented by Mr. Sims has been developed at Willets Point since 1879. All parts vulnerable to machine-guns are submerged. It is moved and controlled by electricity conveyed by a cable from a dynamo on shore to an electric motor on board. The charge is 400 lb. of explosive gelatin. The boat, carrying 11,000 feet of cable, had attained in 1885 a speed of about 10 miles an hour in a run of 2 miles, the turning radius not exceeding 300 feet. This was accomplished with a difference of potential at the poles of the dynamo under 350 volts, and a current under 35 amperes. In 1886 Mr. Edison became associated with Mr. Sims in the invention. A new experimental boat was prepared carrying 6,000 feet of cable, and with improved electrical conditions (1,200 volts and 30 amperes). With this torpedo a speed of about 19 miles an

hour for a short run has been obtained; but that these conditions do not over-strain the insulation resistance of any cable the boat can carry has not been proven. The full range of 11,000 feet is regarded as essential in a torpedo suited for defending the harbors of the U. S. The Brennan torpedo has been developed by the Royal Engineers at Chatham, and has been adopted by the British Government. The motive power is supplied by unreeling piano-wire from two drums on board to two drums on shore, the latter driven by a steam-engine of 100 horse-power. A speed of 20 miles an hour, a range of 1.5 miles, and limited lateral control are claimed. The depth of submergence is regulated by a modified Whitehead device, and the position is known from a single steel mast. The charge is 200 lb. The torpedo is operated from an elevated site with the wire in air. Among other experimental torpedoes of this class may be named the Victoria, the Berdan, and the Halpine. The proper field of this weapon appears to be the protection of mine-fields, through which it can pass without doing injury. To a counterminer their anticipated attack would be disheartening. The complexity inherent in their construction, and the consequent large percentage of failures in their attempted runs, have heretofore militated strongly against their adoption in actual service.

Defensive Torpedoes.—To understand the full importance of the submarine mine in defending the great seaports of the U. S. against hostile fleets, it is necessary to consider the changes in ships of war which immediately preceded its introduction. Before the invention of the screw-propeller, vessels in attacking forts were at the mercy of winds and currents; and long experience proved that one gun ashore was more effective than many afloat. Moreover, since stone walls were more resisting to shot and shell than bulwarks of oak, the rule introduced into land defense soon after the invention of gunpowder, that no masonry must be exposed to a direct fire of artillery, could be ignored in water-batteries, thus rendering it easy to mass the guns and provide a heavy fire against hostile shipping, even where the site was restricted. The screw-propeller, followed shortly after by armor-plating and big guns afloat, effected a radical change in the conditions of the problem. The fleet was now free to steam rapidly past the batteries under favorable conditions not before practicable. The class of guns required to assail the armor-plating with a reasonable chance of success was far more bulky and difficult to manœuvre than the former armament of the forts; moreover, it was considered that earthen parapets and substantial traverses must take the place of the compact masonry casemates heretofore in use. The defense thus found itself at great disadvantage. The hostile ships of war, more under control, less vulnerable, and possessed of much higher speed, were to be encountered by guns more unwieldy, and, in most of the harbors, much fewer in number from the naturally contracted sites available for the earthen batteries. The attention of military engineers was thus urgently directed to the devising of some obstruction which, by holding the enemy under fire and depriving him of the comparative immunity resulting from a high rate of speed, should restore to the defense its lost superiority. The modern submarine mine has accomplished this vitally important object. Evidently, if through its influence the guns can be fired 100 times at a slowly moving ship, instead of once at a rapidly passing enemy, the effective power of the battery is multiplied more than 100 times. Independently, therefore, of its own destructive power, the defensive torpedo has become an essential auxiliary of the land gun. Indeed, they are inseparable in a judicious system of harbor defense, for, while the former is necessary to developing the full power of the latter, the latter is no less essential in protecting the former against the operations of the enemy; for it is an admitted principle that electrical submarine mines can not defend themselves without the aid of flanking guns to keep off boats, and of a fort secure against assault wherein to place the necessary batteries and operating apparatus. The trifling expense and superior power of this combination as compared with monitors for harbor defense has effectually disposed of the latter, which at one time were popularly believed to be the only dependence in the future for protecting the great seaboard cities of the U. S. against the dangers of a bombardment. They are now reduced to the grade of a useful auxiliary reserve force, which should not be neglected in a few of the large harbors. The navy is thus released from an irksome confinement to a defensive warfare in ports, and is free to strike effective blows where

the enemy may be most vulnerable to attack, and where he will fear something more than a simple repulse as the result of an unfortunate naval action.

Some of the more important of the recent improvements in submarine mining are the following: The modern explosives (see EXPLOSIVES) have largely superseded gunpowder, because greater power with less bulk may thus be secured. The latter is an important matter, since upon the size of the torpedo depends the depressing effect of the current, and hence the amount of buoyancy necessary to keep the case always high enough to be touched by the enemy in passing. This buoyancy of course regulates the weight of the anchors and the size of the mooring connections, and, in fact, the principal dimensions of the system. The increase in intensity of explosive action is also important, for efforts are being made to give increased strength to the hulls of war-vessels by employing iron in the form known as the double-cellular bottom, thus reducing the destructive range of the torpedo, and exacting the employment of more powerful charges. In England experiments upon the Oberon, a vessel of this type, have shown that the horizontal destructive range of gun-cotton in charges even as large as 500 lb. is restricted to a few feet. This charge was fired on the bottom in 48 feet of water at horizontal distances from the ship of 100, 80, 60, 50, and 30 feet, and finally vertically under her side. Although she was much shaken and injured by some of these shots, only the last burst through the double bottom and sunk the vessel. At the engineer school of defensive submarine mining at Willets Point, N. Y., a long series of trials has been conducted to determine the effective range of different charges of various explosives sunk at different depths below the surface; and by the careful measurements of several hundred explosions the matter has been successfully brought within the scope of mathematical analysis. The formulas and results have been made public, and they confirm the fact of restricted destructive range.

Electricity is now chiefly used as the igniting agent in submarine warfare, because this enables the obstructed channels to be safely traversed by friendly vessels. The mines are usually arranged to be fired at will, or automatically by the touch of the vessel. By the use of proper fuzes (see FUZE) ignition may be effected with certainty. To cause the explosion to occur automatically by the touch of the vessel, a device called a circuit-closer or circuit-breaker, according to the circuit chosen, is employed. Many ingenious devices have been proposed. Even for contact-mines unconnected with the shore, and hence under no control, electricity is now available for ignition; and its use largely reduces the danger of handling and planting the mines. A small battery is placed in the torpedo or in a hollow anchor under it, and its circuit is closed by the enemy.

In the matter of torpedo cases, experience has shown that metal, usually steel, must be employed where the mines are to remain submerged for long periods. Wood in such cases can not be trusted to exclude water, although lager-beer kegs supply a good temporary expedient. It is an essential condition that the form shall be symmetrical, in order to reduce the tendency to rotary motion to a minimum. Wire rope is found to supply the best moorings. The electric current is conveyed by armored cable, not unlike that employed for the Atlantic telegraphs. To avoid a multiplicity of cables, as well as to reduce cost, several different cores are often united in a bundle and included in a common armor.

While the details of the system of submarine mines in use in the U. S., as elaborated by the writer at Willets Point, are not made public, its general features were exhibited at the Centennial Exhibition at Philadelphia in 1876, and are as follows: Two types of electrical mine are in use, the ground and the buoyant. The former is employed in comparatively shallow water, and consists of a case resting upon the bottom and containing a large charge of dynamite. Floating near it, but so far below the water-surface as to be concealed from view, is a buoy carrying a circuit-closer to regulate the current through a fuze imbedded in the former. The buoyant mine is designed for use in deep water, and consists of an anchor holding in position a torpedo that is just below the surface; the latter contains the charge of dynamite, the fuze, and the circuit-closer. If desired, the latter may be carried by a separate buoy so placed that, when touched by outriggers or other torpedo-cutters, the mine will be directly under the vessel. The vessel to be defended is thickly studded by lines of these mines, so arranged with respect to each other that no vessel can pass

without coming in contact with one or more of them. Single-conductor electric cables running from each mine combine in multiple cables, and are extended through a subterranean gallery to a secure bombproof casemate within the fort, where is placed the apparatus by which, at the will of the operator, the mines may be fired by judgment, or be rendered either inert or automatically explosive when struck by a vessel. The system is arranged to permit easy electrical tests, by which any injury at once becomes known, as well as its nature and locus. Wires also extend from the casemate to flanking guns, so that if a boat succeeds by night in cutting a cable or in disturbing a mine, by so doing it draws upon itself a heavy automatic discharge of canister, grape, or shrapnel, according to its distance from the fort. Electric lights are arranged to sweep the lines of mines, and thus give additional security against hostile operations conducted under cover of the darkness. The casemate is connected by telegraph with a lookout, so that the whole system is under the perfect control of an officer who can see what is required, and instantly give the needful orders. For instance, a vessel might be chased by an enemy's cruiser. She could pass with absolute safety the mines, which for her pursuer would at once become deadly engines of destruction.

Detailed maps and plans for the torpedo defense of all the most important channels in the U. S. have been carefully prepared by the board of engineers for fortifications, and are on file in the engineer department at Washington. The casemates and galleries for the introduction of the cables have been actually constructed at several forts. Large stores of torpedo material are being accumulated at Willets Point, where engineer troops receive the training needful to prepare them, in case of sudden war with a maritime power, to plant and operate the defensive mines along the extended seaboard of the U. S.

HENRY L. ABBOT.

Torquatus, TITUS MANLIUS: a member of the celebrated patrician family, the Manlian gens, of ancient Rome; received his surname TORQUATUS in 361 B. C. for slaying a gigantic warrior among the Gauls in single combat on the Anio, and ornamenting himself with the neck-chain (*torques*) of the fallen foe. He was several times consul and dictator, and finished the wars with the Latin League. During one of his campaigns he forbade all single combats. His son, nevertheless, fought with a Latin warrior and slew him, but when he returned to the camp and laid the spoils at the feet of his father, he ordered him to be punished with death; hence the expression, *Manliana imperia*, common in Latin literature.—Another member of the same family, LUCIUS MANLIUS TORQUATUS, was a conspicuous member of the Pompeian party in the civil war. He was praetor when the war broke out in 49 B. C., fought under Pompey at Dyrrachium, went to Africa after the battle of Pharsalia, and was taken prisoner and killed at Hippo Regius in 46 B. C. He was a friend of Cicero, and is introduced by him in his dialogue *De Finibus* as the advocate of the Epicurean philosophy.

Revised by C. H. HASKINS.

Torquay: town; in Devonshire, England; on Tor Bay, an inlet of the English Channel, 23 miles S. of Exeter (see map of England, ref. 15-E). It contains St. John's church, a fine example of modern Gothic architecture, a town-hall, a museum, and a theater. On account of its equable climate, freedom from fogs, and beautiful scenery, it is much frequented as a health resort and watering-place. It has a good harbor, which is used as a yachting station. Pop. (1891) 25,534.

Torque [from Lat. *torques*, a twisted neck-chain, deriv. of *torque're*, twist]; a twisted and bent rod, often of gold, worn as a personal ornament upon the neck by the ancient Celts and other rude races of the Old World.

Torquemada (Lat. *Turrecremata*), JUAN, de: cardinal; b. at Valladolid, Spain, in 1338; entered the Dominican order of friars in Valladolid 1403; was present at the Council of Constance 1417; afterward pursued the study of theology at the University of Paris, where he graduated 1424; became an instructor there; was successively prior of the Dominican convents at Valladolid and Toledo; was called to Rome by Pope Eugenius IV., by whom he was made master of the sacred palace 1431; was papal theologian at the Council of Basel, where he contributed to the condemnation of the doctrines of Wycliffe and Huss, and advocated the doctrine of the Immaculate Conception; participated in the same capacity in the Council of Florence 1439, where he drew up the project of union between the Greek

and Latin Churches, for which he received from the pope the title of defender of the faith and the rank of cardinal; attended the Council of Bourges 1440; became Bishop of Palestrina 1455, and of Sabina 1464. D. in Rome, Sept. 26, 1468. He was the author of *Meditationes* (1467); *Expositio brevis et utilis super toto Psalterio* (1470), which were among the earliest productions of the press at Rome; *Questiones Spirituales Convivii Delicias preferentes super Evangelicis* (1477); *Commentarii in Decretum Gratiani* (Lyons, 6 vols., 1519); of a treatise on the Church and the authority of the pope, on the body of Christ against the Bohemians, on penance, on the Council of Florence, on the Immaculate Conception, and other works. Revised by J. J. KEANE.

Torquemada, JUAN, de: historian; b. at Valladolid, Spain, about 1545. When a young man he went to Mexico, where he entered the Franciscan order; he became an adept in the Nahuatl language, was professor in the Tlalteleolo College, and from 1614 to 1617 was provincial. Torquemada is best known for his voluminous *Monarquía Indiana* (3 vols., folio, Seville, 1615; 2d ed., Madrid, 1723), which gives a vast amount of information on the Mexican Indians, their religion, laws, customs, traditions, etc. Much of this is valuable; but it is badly arranged, and is loaded down with irrelevant matter. He died in Mexico about 1625. H. H. S.

Torquemada, TOMAS, de: inquisitor-general; b. at Valladolid, Spain, about 1420; became a Dominican monk and prior of the monastery of Santa Cruz at Segovia; was appointed by Ferdinand and Isabella first inquisitor-general of Spain 1483; was confirmed in that post by Pope Innocent VIII. in 1487; labored with great vigor and success in organizing the Inquisition throughout Spain, especially at Seville, Cordova, Jaen, and Ciudad Real; drew up the code of procedure subsequently followed, and was influential in causing the expulsion of Jews and Moors from Spain. The number of persons burned during his administration has been greatly exaggerated by Llorente and others. Oscar Peschel and Gams have calculated that not more than 2,000 persons suffered that death in Spain from 1481 to 1524, and not all of those for religious motives. See Gams, *Kirchengeschichte Spaniens*, vol. iii., part ii., p. 72. Torquemada was as much a servant of the state as of the Spanish Church in his conduct as grand inquisitor, since the Spanish Inquisition was largely a civil and political institution. In his later years his authority was curtailed by the appointment of four colleagues by orders of Pope Alexander VI. D. at Avila, Sept. 16, 1498. Revised by J. J. KEANE.

Torre del Greco [Ital., Tower of the Greek, the Greek's Tower]: town of Italy, province of Naples; on the eastern coast of the Bay of Naples, at the foot of Vesuvius, whose eruptions have destroyed it several times (see map of Italy, ref. 7-F). It was always rebuilt, however, and it is very celebrated for its wine and fruits; tunny, anchovy, sardine, and coral fishing are carried on with energy by the inhabitants. Pop. 21,580.

Torre dell' Annunziata [Ital., Tower of the Annunciation]: town of Italy, province of Naples; at the foot of Vesuvius, 12½ miles S. E. of Naples (see map of Italy, ref. 7-F). It is chiefly noted for its thermal springs and its manufactures of arms. Pop. 20,000.

Torreli, ACHILLE: dramatist; b. in Naples, Italy, May 5, 1844; began early to write for the stage; was a volunteer in the Italian army in 1866; became director of the theater of San Carlo in Naples in 1878. His first piece, the comedy *Chi muore, giace*, was written when he was sixteen. It was followed by numerous more or less successful plays—*Il buon vecchio tempo*; *Cuore e corona*; *Prima di nascere* (1862); *Il precettore del re* (1863); *La missione della donna* (1864); *La verità* (1865); *Gli onesti* (1867); *I mariti* (1867); *La fragilità* (1868); *La moglie* (1870); *Nonna scelerata* (1870); *Il colore del tempo* (1875); *Triste realtà*; *Scrollina* (1880); and others. He has also published a collection of lyrical poems, which he styled *Schegge*. J. D. M. FORD.

Torrens, ROBERT: economist; b. in Ireland in 1780; became major-general in India; was for some years a member of Parliament, where he was a vigorous supporter of the Reform Bill, and acquired note as a political economist. His theories had great influence on the statesmen of his time. His views on the corn-laws were finally adopted by Sir Robert Peel and his supporters. D. May 27, 1864. Among his numerous treatises were an *Essay on Money and Paper Currency* (1812); *Essay on the External Corn-trade* (1815); *Essay on the Production of Wealth* (1821); *The Budget, a*

Series of Letters on Financial, Commercial, and Colonial Policy (1841-43); *Tracts on Finance and Trade* (1852), and several single *Letters* on similar subjects addressed to prominent statesmen. F. M. COLBY.

Torrens, WILLIAM TORRENS McCULLAGH: statesman and author; b. at Greenfield, County Dublin, Ireland, in Oct., 1813; son of James McCullagh; graduated at Trinity College, Dublin, 1834; sat in Parliament for Dundalk as an advanced Liberal 1848-52; was elected from Yarmouth Mar., 1857, but was unseated on petition; was returned for Finsbury in July, 1865, and sat for that borough in four consecutive parliaments; was prominent during the American civil war as an advocate of the Union cause; aided Disraeli in 1867 to carry his Household Suffrage Bill, to which he procured the addition of the lodger franchise; introduced in 1868 the Artisans' Dwellings Bill, which was carried after protracted debates; obtained in 1869 an important reform in the management of pauper children by the poor-law guardians in London, and secured in 1870 the adoption of the Extradition Act, and in the same year proposed the creation of the London school board. He assumed in 1863 his mother's name, Torrens. D. in London, Apr. 26, 1894. He was the author of *The Use and Study of History* (Dublin, 1841); *The Industrial History of Free Nations* (2 vols., 1846); *Memoirs of Richard Lalor Sheil, with Anecdotes of Contemporaries* (2 vols., 1855); *Life and Times of Sir James Graham, Bart.* (2 vols., 1863); *The Lancashire Lesson* (1864); and *Our Empire in Asia: how we came by it* (1872). F. M. COLBY.

Torres Strait: the channel which separates New Guinea or Papua from Australia. It is 80 miles broad, but covered with islands and full of shoals and reefs, which make its navigation difficult. It was discovered by Torres in 1606.

Torres Ve'dras: a town in the province of Estremadura, Portugal; 26 miles N. of Lisbon (see map of Spain and Portugal, ref. 17-A). It is best known from the lines of defense constructed here by Wellington in 1810. These consisted, when completed, of 152 distinct works, arranged in three lines, and extended from the Tagus to the sea. They were provided with an armament of 534 pieces of ordnance, and their garrisons were calculated at 34,125 men. The allied army fell back and entered their line Oct., 1810, holding the invading forces at bay till Mar., 1811, when the latter retired discomfited.

Torrey, JOHN, M. D., LL. D.: botanist; b. in New York, Aug. 15, 1796; graduated in medicine in College of Physicians and Surgeons, New York, 1818; was Professor of Chemistry, Geology, and Mineralogy in the Military Academy, West Point, 1824-27, of Chemistry and Botany in the College of Physicians and Surgeons 1827-55, and of Chemistry and Natural History in the College of New Jersey 1830-54; was U. S. assayer in New York 1853-73; was one of the founders of the New York Lyceum of Natural History, of which he was for many years president, and at the request of which he prepared, as early as 1817, while still a medical student, a *Catalogue of Plants growing spontaneously within Thirty Miles of the City of New York* (Albany, 1819); published vol. i. of a *Flora of the Northern and Middle States* (New York, 1824), and a *Compendium* of the same (1826); was appointed botanist of the geological survey of New York 1836; published a monograph on the *Cyperaceae of North America* (1836); began in 1838, in connection with Dr. Asa Gray, the publication in numbers of a *Flora of North America*, which had reached the close of the great natural order *Compositae* when in 1843 the vast accumulation of materials compelled its suspension; published the *Flora of the State of New York* (2 vols., 1843-44), forming vols. vi. and vii. of the *Natural History* of that State; edited Dr. L. D. de Schweinitz's *Monograph of the North American Species of the Genus Carex* (New York, 1825), and Dr. John Lindley's *Introduction to the Natural System of Botany* (New York, 1831), to which he added an *Appendix*; from 1822 to 1858 he edited most of the numerous reports of U. S. surveying and exploring expeditions; was an original member of the National Academy of Sciences and a founder of the Torrey Botanical Club; was a frequent contributor to periodicals and the proceedings of learned societies; was many years a trustee of Columbia College, to which he presented his valuable herbarium and botanical library. D. in New York, Mar. 10, 1873.

Torrey, JOSEPH, D. D.: educator; b. at Rowley, Mass., Feb. 2, 1797; graduated at Dartmouth College in 1816, and at

Andover 1819; was pastor of a Congregational church at Royalton, Vt., 1819-27; Professor of Greek and Latin in the University of Vermont, Burlington, 1827-42; Professor of Intellectual and Moral Philosophy 1842-67; and president of the university 1863-65; author of a posthumous volume of lectures, *A Theory of Art* (1875); editor of the *Remains* (1843) of President James Marsh, and of the *Select Sermons* (1861) of President Worthington Smith, to both of which he prefixed *Memoirs*; and translator of Neander's *General History of the Christian Religion and Church* (Boston, 5 vols., 1854), accompanied by elaborate and scholarly notes. D. at Burlington, Nov. 26, 1867. Revised by S. M. JACKSON.

Torrey'a [Mod. Lat., named in honor of Dr. John Torrey, a botanist]; a genus of trees of the order *Conifera*, allied to the yews (family *Taxaceae*). *T. californica* is a fine ornamental species; *T. taxifolia* of Florida has a durable, strong-

Torrey taxifolia: Leaves half the natural size; staminate and pistillate aments enlarged; fruit and a section redded.

scented, heavy, and close-grained wood and horizontal, whorled branches. It sometimes attains a height of 50 feet. Eastern Asia has several species. *T. myristica* has a useful timber. The seeds of *T. nucifera* afford an oil used in cooking food. When burned the leaves and wood of the torreyas give off a powerful and disagreeable smell.

Revised by CHARLES E. BESSEY.

Torricelli, tor-ré-ehel lée, EVANGELISTA: physicist; b. at Faenza, Italy, Oct. 15, 1608; studied mathematics and physics in Rome under Castelli, and in Florence under Galileo, whom he succeeded in 1642 as professor at the Academy. D. in Florence, Oct. 25, 1647. In 1644 he published his *Opera Geometrica*. His most remarkable discovery is that of the barometer, sometimes called the Torricellian tube.

Torrington: town; Litchfield co., Conn.; on the Naugatuck river, and the N. V., N. H. and Hart. Railroad; 20 miles N. of Waterbury (for location, see map of Connecticut, ref. 8-E). It has 8 churches, 20 public schools, high school, public library, Y. M. C. A. building, a private and a savings bank, a daily and a weekly newspaper, extensive brass-works, and manufactories of hardware, sewing-machine needles, bicycles, and woolen goods. It was incorporated in 1740 and made a borough in 1887, and is celebrated as the birthplace of John Brown, the abolitionist, and of Samuel Mills, the pioneer of American missions. Pop. (1880) 3,327; (1890) 6,048; (1895) 8,955. EDITOR OF "REGISTER."

Torsion [from Lat. *torque're, tor tum, twist*]: the twisting of a bar or shaft around its axis. In the figure is seen

a horizontal bar with one end rigidly fixed in a wall and the other subject to a vertical force, *P*, acting with a lever arm,

BC. The product $P \times BC$ is the twisting moment whose tendency is to cause all horizontal lines on the surface of the bar to assume a spiral form. This moment is resisted by the sum of the moments of the internal shearing stresses which exist in any cross-section. If the bar be circular and of a diameter d , and if S be the shearing unit-stress at the circumference, then

$$P \times BC = \frac{\pi d^3 S}{16},$$

which is the fundamental formula for the discussion of round solid shafts.

The most common investigation is that of the transmission of power by shafts. If H be the number of horse-powers transmitted and n the number of revolutions per minute, the unit-stress, S , for a round solid shaft is $321000 \frac{H}{n d^3}$,

and the diameter required, d , is $68.5 \sqrt[3]{\frac{H}{nS}}$, in which, for

proper security, S may be taken at about 2,500 lb. per square inch for cast iron, 5,000 for wrought iron, and 7,500 for ordinary steel.

Hollow forged steel shafts are coming into use for ocean steamers, their strength being greater than solid shafts of the same sectional area. If D be the exterior and d be the interior diameter, these may be investigated by the formula

$$S = 321000 \frac{DH}{n(D^4 - d^4)}$$

For example, if $D = 17$ inches and $d = 11$ inches, and 16,000 horse-powers be transmitted at fifty revolutions a minute the value of S will be found to be about 25,000 lb. per square inch, which is too high a value for ordinary steel, but which would be a safe unit-stress for nickel-steel.

MANSFIELD MERRIMAN.

Torsion Balance: an apparatus for measuring delicate electrical or other attractions and repulsions. The attraction or repulsion is measured by the resistance offered to it by the torsion of a metal wire or a filament of spun glass, quartz, or other fiber. By this means Coulomb discovered the laws of electrical attraction and magnetic force, and Cavendish deduced a value of the density of the earth. See *EARTH (Density and Mass)*.

Torsk, or Dorse [*torsk* = Dan. : Icel. *þorskr*, codfish; Germ. *dorsch*]: a name applied to the cusk (*Brosmius brosme*), a food-fish of Northern Europe and the eastern coast of the U. S., and also to the Baltic cod (*Gadus callarias*), another food-fish of Northern Europe. They belong to the cod-family, and are eaten fresh, or more generally are salted and dried. The Pacific coast of the U. S. has another torsk, *Brosomphycis marginatus*.

F. A. L.

Torstensson, LENNART: soldier; b. at Torstena, West Gothland, Sweden, Aug. 17, 1603; was educated as a page at the court of Gustavus Adolphus, whom he accompanied in 1630 to Germany; distinguished himself greatly as commander of the artillery in the battle on the Lech in 1632; was taken prisoner before Nuremberg Sept. 3, 1632, and kept for six months in a damp, subterranean dungeon in Ingolstadt by Maximilian of Bavaria; was appointed commander-in-chief of the Swedish army in Germany in 1641, but was compelled by the gout to resign his command in 1646; returned to Sweden; was made Count of Ortala by Queen Christina and governor-general of the province of West Gothland. D. at Stockholm, Apr. 7, 1651. See De Peyster's *Torstensson*, New York, 1886.

Tort [from Fr. *tort*, wrong < Late Lat. *torctum*, liter., nent. of *torctus*, twisted, crooked, perf. partic. of *torque're*, twist]: in English law, such an unlawful invasion by one person of another's rights which are created by law as was remediable by a common-law action. A husband or a wife wrongs the other by marital unfaithfulness; a parent wrongs his minor child by unreasonable chastisement; but in neither case is a tort committed. Neither wrong could be remedied by a civil action at common law. The injured spouse might obtain a divorce; the parent might be prosecuted criminally. It is apparent, therefore, that procedure has played a part in fixing the limits of this branch of the law. Again, one who sells and delivers property to another upon the latter's promise to pay a fixed sum therefor at a fixed date has a right to the stipulated payment. The purchaser's refusal to pay, however, is not a tort, but a breach of contract; the right which is invaded was created by the agreement of the

parties, and not by the law. One who unlawfully invades another's right to personal security, by ASSAULT AND BATTERY (*q. v.*), or by defamation (see *LIBEL AND SLANDER*), or by a NUISANCE (*q. v.*) to health, or his right to personal liberty by false imprisonment, or his right to private property, commits a tort. The rights which are interfered with in all these cases do not originate in any agreement to which the wrongdoer is a party, but are created by the law. His liability for the damage caused by his wrongdoing does not rest upon his consent, as in the case of a breach of contract. Nor, in English law, does it rest upon the moral quality of the act. The actor may be free from actual blame and yet be a tort-feasor. See *TRESPASS*.

In certain cases, the wrongdoer may be sued on contract or in tort, at the option of the injured party. This is true wherever the contract creates a relation out of which springs a legal duty independent of the contract obligation, as in the case of lawyer and client, of consignor and factor, of shipper and common carrier. The carrier who fails to deliver goods received by him may be sued either on the contract of shipment or in tort for breach of the common-law duty to carry safely and deliver. Acts or omissions of this class are sometimes called *quasi torts*. *Taylor vs. Manchester, etc., Ry.*, 11 *Times Law Reports* 27, A. D. 1894.

Scotch law employs the terms *delicts* and *quasi delicts* instead of torts and quasi torts. Those terms were defined by Lord Watson, in a recent case that went up to the House of Lords from Scotland, as follows: "Delicts proper embrace all breaches of the law which expose their perpetrator to criminal punishment. The term quasi delict is generally applied to any violation of the common or statute law which does not infer criminal consequences, and does not consist in the breach of any contract, express or implied. Cases may and do often occur in which it is exceedingly difficult to draw the line between delicts and quasi delicts. The latter class, as it has been developed in the course of the present century, covers a great variety of acts and omissions, ranging from deliberate breaches of the law, closely bordering upon crime, to breaches comparatively venial and involving no moral delinquency." (*Palmer vs. Wick Steam Shipping Co.*, 1894, Appeal Cases 318.) It is clear from this extract that delicts and quasi delicts are not synonymous with torts and quasi torts.

For a full discussion of the nature and classification of torts, the reader is referred to Holmes, *The Common Law*, Lectures 3 and 4; Markby, *Elements of Law*, chap. xvi.; Pollock, *Torts*, bk. i., ch. i.; Ringwood, *Outlines of the Law of Torts*, chap. i.; Wigmore, *Analysis of Tort Relations*, 8 *Harvard Law Review* 200, 377.

FRANCIS M. BURDICK.

EUROPEAN LAW.—Among the private or civil actions of tort (*ex delicto*) given by the Roman law were actions for the recovery of penalty, actions for the recovery of penalty and damages (*actiones mixte*), and actions for the recovery of damages simply. Modern European law generally treats the prosecution of penalty as a matter of criminal law, and confines the action of tort to the recovery of damages. Many of the Roman actions of tort have therefore become criminal actions, and even where the prosecution is instituted only at the demand of the person injured the penalty goes to the state. See *LIBEL AND SLANDER (History of Libel and Slander)*.

It was the general rule of the Roman law that no one was liable for damages *ex delicto* unless wrongful intent (*dolus*) could be shown or inferred. Mere negligence (*culpa*) created no liability unless a duty of diligence had been assumed, and then damages were recovered on the contract, or *quasi ex contractu*, not on tort. In the case of damage to property, however, the *lex Aquilia* departed from the rule and imposed liability for damage occasioned by carelessness. Modern European legislations have generally extended the principle of the *lex Aquilia*, and impose liability for all injuries to the person or to property occasioned by negligence. (See *Code Napoleon*, § 1382, *et seq.*; Austrian Code, § 1295, *et seq.*; German Draft Code, § 704.) The recovery of damages is excluded when the injured person consented to the injury; when the person who inflicted the injury acted in self-defense, or under orders which he was legally bound to obey; also when he was doing what he had a right to do, and (according to some legislations) when he erroneously supposed that he was acting within his rights, provided the mistake was an excusable one. (The German Draft Code declares that a mistake of law may be excusable.) Insanity of course excludes liability; drunken-

ness does not. Infancy (which lasts until the completed seventh year) excludes liability; after that it is a question of the intelligence of the wrongdoer. For damage done by children and lunatics, their parents or guardians are responsible if by due surveillance they could have prevented the injury. For the torts of employees within the general scope of their employment the employer, at French law, is held to the same responsibility as a parent; it is incumbent on him to prove that he could not have prevented the injury. The German codes make the employer liable only when he has chosen unfit persons or has failed to exercise due superintendence. Analogous responsibilities are regularly imposed upon the owner for damage done by animals or things (defective buildings, machinery, etc.).

At Roman law, as at the English common law, the heirs of a person willfully or negligently killed had no claim for damages. The modern codes generally recognize such a claim, and treat the amount of damages as a question of fact. In place of a lump sum to be paid to persons who were dependent upon the deceased for their support, modern German legislation provides for an annuity, limited to the number of years during which support could legally have been claimed from the deceased, and to his expectancy of life at the time the fatal injury was received.

All actions for the recovery of actual damages descend to the heirs of the injured person and run against the heirs of the tort-feasor. The period of limitation is usually a short one; but when the tort-feasor is enriched by his tort, the quasi-contractual claim for the recovery of the unjust enrichment does not expire with the limitation of the action of tort.

MEXUOE SMITH.

Tortoise [M. Eng. *tortue*; cf. O. Fr. *tortis*, crooked, and *tortue*, tortoise < Vulg. Lat. *tortuca*, deriv. of *tortus*, twisted, crooked. So called from its crooked feet]: a name sometimes applied to any species of turtle, but more correctly restricted to those belonging to the family *Testudinida*, a group whose members are distinguished by their club feet, strictly terrestrial habits, and, as a rule, high, arched carapaces. There are something like fifty species of tortoises, inhabiting the warmer portions of the globe, the most remarkable being the large black species found on the Galapagos islands and Aldabra. Although of uniform color these vary in form and proportions, and belong to very distinct species of the genus *Testudo*. At least five species occur on the Galapagos, each confined to a particular island. The shell of some specimens measures over 4 feet in length, the animal weighing as much as 800 lb. They feed entirely on vegetables, are good eaters, and yield an excellent oil. Tortoises of this kind formerly abounded in Mauritius and Reunion, but "they have been eaten off the face of the earth," and the same fate threatens the tortoise elsewhere. The GOPHER (*g. v.*) of the Southern and Southwestern U. S. is a true tortoise, but, as the name is more commonly applied to the pouched rat, care must be taken to specify that the gopher in question is a tortoise. There are three species, *Gopherus polyphemus*, *G. agassizii*, and *G. berlandieri*, the first named being the common Florida species.

F. A. LUCAS.

Tortoise-plant: another name for ELEPHANT'S FOOT (*g. v.*).

Tortoise-shell: the overlapping scales which cover the carapace of *Eretmochelys imbricata*, a large turtle found in the tropical Atlantic and Indian Oceans, and *E. squamata*, a similar species found in the Pacific. They are popularly known as hawk's-bill turtles. Tortoise-shell is remarkable for its plastic quality, which enables the artificer to give it almost any desired shape while under the influence of heat. Pieces of the shell may even be welded together, and the filings and chips are moulded and shaped as desired when heated to the proper temperature. Tortoise-shell is chiefly used for making combs, toilet articles, etc., and inlaying boxes. It is successfully imitated by artificial compounds, such as celluloid, of much less cost. It is customary in some regions to apply heat to the back of the living tortoise, and then remove the plates, but the crop of shell which replaces the first is thin and of inferior quality.

Revised by F. A. LUCAS.

Torto'ua (Lat. *Dertona*): town; province of Alessandria, Italy; about 12 miles E. of the city of Alessandria, on a hill nearly 900 feet above the sea (see map of Italy, ref. 3-C). It was once strongly fortified, but its last defenses were destroyed in 1799 by Napoleon, after the battle of Marengo. The cathedral, dating from 1575, contains some valuable pictures. The principal industries are silk-reeling and

tanning, and there is a local trade in grain and wine. Pop. about 7,150.

Torto'sa: an old, well-built, fortified and busy town in the province of Tarragona, Spain; on the Ebro; 40 miles by rail S. W. of Tarragona; in a fertile and well-cultivated district (see map of Spain, ref. 15-1). Its cathedral, occupying the site of a mosque built in 911, contains much carved work and marbles that are worthy of examination. Other public buildings, including the episcopal palace and town-hall, are commonplace. Tortosa has manufactures of paper, leather, soap, and pottery. Its fisheries constitute the most important industry. Pop. (1887) 25,192.

Tortric'idae: a family of insects. See LEAF-ROLLERS.

Tortric'ida [Mod. Lat., named from *Tortrix* (*Tortric-*), the typical genus, liter., twister, from Lat. *torquere*, *tor-tum*, twist]: a family of serpents of the sub-order *Tortricina*. They are worm-like in appearance; have no constriction separating the head and trunk; the head is shielded above; the maxillary bones have alveolar ridges and teeth; the pupils of the eyes are round; the body is covered with smooth scales; the tail is short and conic, and there are rudiments of posterior extremities. The family has few species, and is mostly confined, and thus restricted, to South America, Southern Asia, and Australia. The typical species, *Tortrix scytale*, is sometimes known as the coral snake, but is not to be confounded with the *Elapida*, which are also frequently designated by the same name; it is a South American species. The Oriental species belong to the genus *Cylindrophis*, and are said to be viviparous. See Günther, *Ann. and Mag. Nat. Hist.*, vol. i., p. 428, 1868.

Revised by F. A. LUCAS.

Tortu'ga (Fr. *Tortue*): an island of the West Indies, N. of the northeastern extremity of Haiti, to which it belongs. Area, about 80 sq. miles. It is separated from the main island by the Tortuga or Tortue Channel, 5 miles wide; the surface is broken, but not very high. It was long the most noted resort and settlement of the buccaneers, where they established a rough form of government; eventually the French adventurers accepted a royal governor from their country; passing the channel they conquered and occupied the western part of Santo Domingo, now the republic of Haiti.

H. H. S.

Tortugas, Florida: See DRY TORTUGAS.

Torture [= Fr. < Lat. *tortura*, a twisting, a wrenching, racking, writhing, deriv. of *torquere*, *tor-tum*, twist]: the infliction of severe pain; specifically, the infliction of severe pain for the purpose of punishing or inflicting revenge, or for the purpose of extracting or forcing evidence or confessions in criminal or ecclesiastical trials. Torture for one purpose or another has been practiced during all ages and among all or nearly all peoples. Among savage races it is most commonly used either as a means of ORDEAL (*g. v.*) or as a means of inflicting revenge or punishment upon captured enemies. As a means of forcing religious conformity, the infliction of torture was carried to an almost incredible extent of cruelty in the later Middle Ages and down to the eighteenth century, especially in Southern Europe, where the Inquisition (*g. v.*) was unchecked in its use.

Judicial torture, as it is called when administered by or under the direction of the courts of law during the trial of causes, has been chiefly directed to the purpose of compelling an accused person during his trial either to confess his crime, clear up contradictions in his previous testimony, disclose his accomplices, reveal other crimes of which he may have been guilty but has not been accused of, or to purge him of the disability of INFAMY (*g. v.*). Judicial torture is rarely used during that stage of a people's existence when ordeals are used, but has very commonly succeeded to the use of ordeals, judicial torture being essentially a product of civilization rather than barbarism.

Although torture is now no longer a part of the jurisprudence of any modern Christian nation, yet until about the end of the eighteenth century, it formed a recognized part of the jurisprudence of European nations, excepting Great Britain and Sweden, and the rules for its application were developed into a regular system as a part of the jurisprudence of jurisprudence.

Among the ancients it appears not to have been practiced among the Hindus, the Hebrews, or the Egyptians. Among the Greeks, however, the use of torture was thoroughly understood and permanently established; as a general rule no freeman could be tortured, but only slaves and captives

who were not members of the body politic of the state. There were various exceptions, as in the case of flagrant political offenses, and among the Rhodians the torture of free citizens was not forbidden.

The people acting as the supreme power, or a despot, could of course decree the torture of any one irrespective of privilege. The evidence of slaves, however, was inadmissible, except when given under torture, and either party to a controversy could demand the torture of his opponent's slaves. The principal modes of torture among the Greeks were the wheel, the rack, the sharp comb, the vault, into which the witness was thrust bent double, the burning tiles, the heavy hogskin whip, and the injection of vinegar into the nostrils.

In the Roman law, upon which the subsequent European systems which recognized torture as a part of their jurisprudence were based, the general principles governing the administration of torture were the same in the earlier days as those of Greece. In later times under the emperors, although nominally still restricted in use to slaves, except in certain specified cases, torture was in fact not infrequently applied to freemen contrary to law; and its use could be authorized in any case by order of the emperor, which power was freely used. There appears to have been no limit set upon the application of torture, but the extent to which it might be carried seems to have been in the discretion of the tribunal; and in Rome, as in Greece, its use was not restricted to criminal cases in respect of slaves, but they might be tortured in any case except for the purpose of testifying against their master. The modes of torture generally authorized by the Roman law were the rack, the scourge, fire in its various applications, and hooks for tearing the flesh.

The barbaric races of Europe with whom the Romans came into contact adopted more or less of the Roman practice of judicial torture; and the Visigoths established a system of torture which continued uninterrupted in Spain from the period of their settlement down to modern times, and their legislation on the subject has been to a great extent a model for other European nations. Generally, however, the use of torture was slow in replacing the barbaric systems of ordeal and sacramental compurgation, and it was not till the latter half of the thirteenth century that the first traces of legalized torture appeared in France, and in Germany it was not used until the fifteenth century, its introduction being powerfully aided by the then increasing rigor and systematization of the Inquisition.

The influence of the Church during the Middle Ages upon the use of torture was to aid in its prevalence, and to add ingenuity in devising new cruelties to be inflicted upon the tortured, although in the earlier centuries St. Augustine, Gregory I., and Nicholas I. had denounced it, and its use had been forbidden. The Church, so far as it could, adopted the Roman law, and torture was inflicted mostly as a means of forcing religious conformity or extorting a confession of heresy. Originally the infliction of torture seems to have been left by the ecclesiastical tribunals to the ordinary civil tribunals, but later they exercised it themselves under a perfected system of rules which culminated in the INQUISITION (*q. v.*), and served as a basis and excuse for the wide extension of the use of torture in civil cases, and furnished innumerable varieties of new forms of torture of unspeakable cruelty. As a result of the interference of the Church the clergy were generally restricted from torture at the hands of the civil courts, the clergy in Catholic countries being specially favored, and the immunity obtained being practically about the same as that accorded to the nobility. In any case, however, the torture inflicted on the clergy by the civil tribunals was of a milder character than that inflicted upon laymen, and much more decisive proof was required before submitting them to torment. If clerical executioners could be had they had the privilege of demanding that they should be tortured only by them. Torture as administered even by the Church, however, was more cruel than the fair construction of the rules of the Church regulating the subject. Owing to the secrecy of its infliction, the helplessness of the accused to prosecute or punish illegal tortures inflicted, and the specious casuistry countenanced in the evasion of the rules, the extent to which torture was carried in any instance, and the cruelties inflicted, rested practically in the discretion of the judges or executioners. The rules themselves generally spoke of it as dangerous and uncertain, and depending largely for its results upon the question of physical strength. The rule that a confession made under torture could not be used against an accused, except it was

afterward confirmed by voluntary confession, was in effect nullified by repetition of the torture upon a subsequent retraction of the confession until the tortured person finally yielded and gave the desired voluntary confession.

From the thirteenth century on the use of torture increased until it finally became established as a permanent part of the judicial machinery of European nations, excepting in England and Sweden. Although torture was never a part of the common law of England as a means of obtaining evidence, there is proof that it was practiced for that purpose under Henry VIII. and his children, and also during the reigns of James I. and Charles I., not only in political cases, but in the case of common crimes. Either with or without royal authority torture was in fact frequently inflicted, especially in the case of alleged witches, and why it did not become a recognized part of the jurisprudence there as well as elsewhere in Europe it is difficult to say. Sir James Fitzjames Stephen says: "Probably the extremely summary character of our early methods of trial, and the excessive severity of the punishment inflicted, had more to do with the matter than the generalities of Magna Charta or any special humanity of feeling."

In the British colonies the use of torture was never legally recognized, and only a few sporadic instances of its use occurred, such as the infliction of PEINE FORTE ET DURE (*q. v.*) upon Giles Cory, in Salem, Mass., in 1692.

Although the system of torture was recognized as a legal means for obtaining evidence for so many centuries, there was never any time when its cruelty was not generally recognized and its use justified as a measure deplorable but necessary for the protection of society; and, from the first until its abolishment, there were those among the foremost thinkers who not only denounced its cruelty, but exposed its uselessness and the utter unreliability of the testimony obtained by its use. Its extreme use and the horrors of its practice during the fourteenth to the eighteenth centuries finally led to a revulsion of feeling, and judicial torture was at length abandoned during the latter half of the eighteenth century, although in some countries it continued to be legally recognized and occasionally practiced, until the early part of the nineteenth century. It was swept away in Saxony in 1783, and about the same time in Switzerland and Austria; in Russia it was partly abolished in 1762, and finally in 1801; in Würtemberg it was abolished in 1806, in Bavaria in 1807, in France in 1789 (being temporarily restored in 1814), in Hanover in 1819, and in Baden in 1831. See Henry C. Lea's *Superstition and Force* (Philadelphia, 1870); Stephen's *History of the Criminal Law of England*; Jardine's *Reading on the Use of Torture in the Criminal Law of England, previously to the Commonwealth*.

F. STURGES ALLEN.

Torn Dutt: See DUTT, TORU.

Tornla Cerevisiæ: the name first given to the yeast-plant. See FERMENTATION (*The Yeast-plant*).

Tory [from *Ir. toiridhe*, pursuer, searcher, plunderer]: a name applied to the Roman Catholic outlaws who lived in the bogs of Ireland during the reign of Charles II.; afterward extended (1679) to all those, whether English, Scotch, or Irish, who were opposed to the bill excluding the Duke of York from the succession. It was thus sought to imply Roman Catholic sympathies on the part of those who favored the duke's succession. Finally, the name came to designate the anti-Whig party in British politics; but as a formal designation it has been replaced by Conservative since 1830. In the war of the Revolution in the U. S. the loyalists were called Tories.

Tosa-riu: the name of a Japanese school of painting, which traces its origin to Fujiwara no Tsunetaka, a native of Tosa, who flourished about the year 1200 A. D. It is a branch of the native or Yamato school, and is the least of all affected by Chinese influences and the fullest of naïve conventions. It is historical in spirit, dealing with famous events in mythology and history, and picturing historic scenes, and was especially cultivated at Kioto. J. M. D.

Tosti, FRANCESCO PAOLO: song-composer; b. at Ortona, Italy, Apr. 9, 1846; studied, practiced, and taught music in Italy until 1875, when he first visited London; made annual visits until 1880, since which time he has remained there permanently. He has written very many popular songs in Italian, French, and English, his most popular one being *For Ever and for Ever*. D. E. H.

Total Abstinence: See ABSTINENCE, TOTAL.

Totemism: a system of beliefs, worship, and social obligations, found in savage communities in nearly every part of the world. The word *totem*, by some authorities spelled *ole*, possessive *olem*, by others *loodain*, or *dodoim*, is from the Ojibway dialect, in which it signifies a family or tribe. As now used in ethnology it means a species or class of animals or plants, or, rarely, of inanimate objects, which is regarded by a horde, clan, or individual, with superstitious respect. A totem must be distinguished from a fetish, which is always an individual object. The savage believes that he is descended from his totem, and that it helps and protects him in all the affairs of life. As a rule, he will not injure, kill, or eat the totemic animal or plant. Even when the totem is a highly dangerous species, as one of the venomous snakes, or the scorpion, it is regarded without fear, and in this case men suspected of being untrue clansmen may be subjected to a practical test. If they survive the deadly bite of the totemic serpent their fidelity is established.

The Clan Totem.—Wherever totemism prevails it is associated with kinship and with tribal subdivisions. Clans are named from their respective totems and identified by rude images or symbols. The North American Indians E. of the Rocky Mountains commonly carved or painted totemic signs on their huts, or embroidered them on tents and blankets. (See *Totemism* under INDIANS OF NORTH AMERICA.) The Alaskan tribes carve them elaborately on the totem posts that guard their houses. In Australia and the Pacific islands tattooing and scarring are methods commonly employed. Not infrequently the totem is painted on the skin and then burned in. Most of the mutilations and adornments characteristic of savagery, such as the breaking of teeth and the wearing of feathers, horns, claws, and beaks, have intimate association with totemism. Sometimes the totem is a part only of the natural object, as among the Omahas, where the buffalo is subdivided into head, shoulder, side, tail, each being the totem of a sub-clan. These split totems, so called, indicate the subdivision of what was once a single clan.

As a Religion.—Dire penalties are supposed to follow any disrespect toward the totem. Some clans even avoid looking at their totem. The Elk clan of the Omahas believe that if any clansman were to touch the male elk he would break out in boils and white spots. The Red Maize sub-clan believe that if they were to eat the red maize they would have running sores around the mouth. The Samoans generally thought that death would follow any injury to the totem. So in Australia sickness and death were supposed to be the penalties for eating the totem. Everywhere the totem is worshipped and propitiated, and in many parts of the world, notably in Samoa, the dead totem is mourned for and buried like a dead clansman. Throughout North America, South America, and Africa totemism had become, before the invasion of the whites, an elaborate ceremonial religion, having its festivals, dances, processions, fasts, and mysteries, its medicine-men and priests, and its secret societies, carefully guarding the sacred tradition.

Social Aspect of Totemism.—Totemism is inseparably bound up with the social organization of savage communities. Marking the limitations of right and obligation, it is an essential factor in primitive law. Men and women owning the same totem must defend one another and redress one another's wrongs. Absolute prohibition of marriage between man and woman of the same totem is the rule. McLennan believed that the explanation of exogamy must be sought in totemism, but it is probable that totemism serves merely as a means of extending an exogamy previously initiated. (See SOCIOLOGY.) Yet we are not warranted in assuming that clan totems were the earliest totemic forms. Clansmen generally have their individual as well as their clan totems. The American Indian boy usually took as his guardian totem or "medicine," to protect him through life, the first animal of which he dreamed during the long and solitary fast observed on attaining maturity. But on the Isthmus of Tehuantepec when a child was expected the relatives drew on the floor figures of animals, one after another, and the one that remained when the infant was born became its totem. A somewhat similar custom prevailed in Samoa. It is probable that the development of clan totems out of individual totems was the first step in the evolution of the clan itself. See SOCIOLOGY.

Nothing is certainly known of the origin of totemism, and none of the theories that have been advanced has proved satisfactory. Herbert Spencer argues that plant and animal worship grew out of ghost-worship through a confu-

sion of names. Tylor attaches chief importance to the act of personifying the objects, which is characteristic of the child and of the primitive man. (See ANIMISM.) McLennan has suggested that confusions of animal fancies and habits, and confusions in knowledge of neighboring herds by each other, may afford an explanation. Perhaps in some combination of imitation with the dream, in which the savage imagines himself transferred into an animal, it is to be found the key to his belief that he and his totem are of one kin.

Tylor, *Early History of Mankind* (London, 1870); Sir John Lubbock, *Origin of Civilization* (London, 1884); W. Robertson Smith, *Kinship and Marriage in Arabia* (London, 1885); A. Lang, *Custom and Myth* (London, 1884); and *Reports of the Bureau of Ethnology*, Washington. FRANKLIN H. GIDDINGS.

Totila: king of the Ostrogoths; chosen in 541 after the defeat and capture of Vitiges at Ravenna by Belisarius. He besieged and conquered Rome in 546, and extended and consolidated the Ostrogothic empire in Italy after the recall of Belisarius in 549, but was defeated and mortally wounded in the battle at Tagina by Narses in 552.

Totipalmata: See STIGANORODES.

Totis, or Totis (Hun. Tata): market-town; in the county of Komorn, Hungary; near the Danube; station of the Budapest-Breck Railway (see map of Austria-Hungary, ref. 6 C). It consists of the town proper, of the upper town, and Tóváros; is situated on a great lake; has a fine castle belonging to the Esterházy family, a parist college with a classical gymnasium, and other schools, sulphur springs, rich marble-quarries, numerous mills, spirit-factories, a large sugar-factory, and a leather-factory. There are remains of an old castle inhabited by King Mathias Corvinus. Considerable forests, vineyards, and pastures are in the vicinity, which is rich in Roman antiquities, coins, urns, etc. The town was founded about 994. Pop. 10,290. HERMANN SCHOLZFELD.

Totonicapam': a town of Guatemala, 60 miles W. N. W. of Guatemala city; on the plateau near the foot of a high mountain (see map of Central America, ref. 3-D). It was a Quiché pueblo before the conquest, and here the tribe gathered to resist the march of Alvarado. Most of the inhabitants are Indians, and some of the better class claim descent from Quiché chiefs. Pop. 20,000. It is the capital of the department of Totonicapam, which has an area of 552 sq. miles and a population (1889) of 158,419. H. H. S.

Totten, JOSEPH GILBERT: military engineer; b. at New Haven, Conn., Aug. 23, 1788; graduated at the U. S. Military Academy July, 1805, and commissioned second lieutenant in the Corps of Engineers; aided his uncle, Jared Mansfield, in the survey of Ohio and the Western territories, resigning from the army 1806; returned to the army, and Feb. 23, 1808, was reappointed a second lieutenant of engineers, and was engaged on the construction of Castle Williams and Fort Clinton, New York harbor, 1808-12. At the beginning of the war with Great Britain, Totten (captain in his corps, July 31, 1812) was assigned to duty as chief engineer of the army under Gen. Van Rensselaer in the campaign of 1812, on the Niagara frontier. He was subsequently chief engineer of the army under the command of Gen. Dearborn, in the campaign of 1813, and of the army under Gens. Izard and M'comb in the campaign of 1814 on Lake Champlain; was breveted major June, 1813, and lieutenant-colonel Sept. 11, 1814; at the close of the war returned to duties in connection with the national coast defenses, and served chiefly at Newport, R. I., where he had charge of the construction of Fort Adams, and continued until Dec., 1838; advanced to the grade of lieutenant-colonel in 1828; appointed colonel of the Corps of Engineers and chief engineer Dec. 7, 1838, and took up his residence in Washington. Col. Totten assumed in 1847 the immediate control of the engineering operations of the army destined to invade Mexico, directing in this capacity the service of Vera Cruz. For his services he was breveted a brigadier-general Mar. 29, 1847, then left the active army and resumed his station at Washington, but was appointed one of the commissioners for arranging the terms of capitulation. On Mar. 3, 1863, he was promoted brigadier-general and chief of engineers, and on Apr. 21, 1861, breveted major-general for long, faithful, and eminent services. DIED

the whole time of his chief-engineership he labored indefatigably to bring the ports and harbors along the whole seaboard into a defensible condition. In addition to the manifold duties of his office, involving the inspection and supervision of the Military Academy, Gen. Totten was an active member of the lighthouse board from its organization in 1851; a regent of the Smithsonian Institution from its establishment in 1846; a corporator of the National Academy of Sciences, created in 1863, and one of the harbor commissioners for the cities of New York and Boston. In 1815 Totten modeled an embrasure for casemated batteries which remained unchanged until 1858, but the casemate continued a subject of study and experiment during most of his life, establishing his right to be considered the inventor of the American casemate, and led to the construction of the embrasure subsequently introduced into the U. S. seacoast forts, and known as the Totten embrasure. He published *Essays on Hydraulic and other Cements* (New York, 1842). D. in Washington, D. C., Apr. 22, 1864.

Tottenville: village; Westfield town, Richmond co., N. Y.; on Staten Island Sound, Raritan Bay, Prince's Bay, and the Staten Island Rap. Trans. Railroad; 20 miles S. W. of New York city (for location, see map of New York, ref. 8-A). It contains 4 churches, a graded public school, 2 weekly newspapers, manufactory of dental goods, a printing, electrotyping, and bookbinding establishment, saw and planing mill, ultramarine-factory, fire-brick and retort works, and several shipyards. Many New York business men live here. The village contains the Billogg mansion, built many years prior to the Revolutionary war, and in which Lord Howe had a conference with John Adams, Benjamin Franklin, and Edward Rutledge, a committee of Congress, concerning the possibility of a return of the colonies to British allegiance. Pop. (1894) 2,563.

EDITOR OF "STATEN ISLAND TIMES."

Toucan: See RHAMPHASTIDÆ.

Toucey, ISAAC, LL. D.: jurist; b. at Newtown, Conn., Nov. 5, 1796; received a private classical education; was admitted to the bar 1818; representative in Congress 1835-39; States attorney for Hartford co., Conn., 1842-44; Governor 1846-47; U. S. Attorney-General 1848-49; U. S. Senator 1852-57; and Secretary of the Navy under President Buchanan 1857-61. D. at Hartford, July 30, 1869.

Touch [deriv. of the verb *touch*, from O. Fr. *tochier*, *toquer* (> Fr. *toucher*), from Teuton. **tukkon*, move suddenly > Germ. *zucken*, twitch, shrug, quiver, start]: the sense by which contact or pressure upon the surface of the body is perceived. Bell and Magendie established the distinction of motor and sensory nerves issuing from the anterior and posterior roots, on either side respectively of the spinal cord. Through these, from every part of the body, the sensory nerves, having received impressions at their bud-like, tactile ends, return impressions to the spinal axis and to the brain; the nerves of the head communicating directly. This power is developed to a variable degree upon different surfaces, the tactile sensibility of some, as the finger-tips and tongue, being very acute, other parts being relatively obtuse. The acuteness of touch is due in part to the number and distribution of nerve-fibers, in part to habitual education of the part. The part which has the most finely educated touch, the tips of the fingers, may be far less susceptible to pain, to heat and cold, or to tickling. The tactile sensibility of parts is measured by means of needle-points in arms movable upon a graduated bar—the instrument termed the "æsthesiometer." The shortest distance on the surface at which distinct perceptions of the two points are felt gives the diameter of the so-called "Weber's circles" of sensibility. From the experiments of Valentin the following will suffice to illustrate. The unit of measure is a line, one-twelfth of an inch:

Tip of tongue.....	0.483 of a line.
Palm of forefinger.....	0.603 "
" " little finger.....	0.733 "
Surface of lip.....	1.500 "
" " eyelid.....	3.833 "
Skin of cheek.....	4.541 "
Forehead.....	6.000 "
Back of hand.....	6.966 "
Lower part of thigh.....	10.208 "
Leg.....	13.708 "
Middle of forearm.....	17.083 "
" " back.....	24.208 "

The finger, tongue, toes, and other surfaces may be highly educated. Each artisan in his special line acquires wonderful tactile recognition of the kind and quality of fabrics, minute sizes, shapes, and relative smoothness of surfaces. The blind learn to read the raised alphabet, recognize persons by feeling their features, and manufacture various articles, many of delicate structure. In the sensitive tactile part at the finger-tip the touch-corpuscles, or nerve termini, are situated near the surface, constituting sensitive papillæ; as many as 108 have been found in one-fiftieth of a square inch. See HISTOLOGY and SENSATION.

Revised by J. MARK BALDWIN.

Touch-paper: a loose bibulous paper which is soaked in solution of saltpeter and then dried. It was used in lighting fires with flint and steel, and is sometimes burned in a room to relieve the paroxysm of asthma.

Touchstone: See JASPER.

Touchwood, or Spunk: (1) the dried fungus *Polyporus igniarius*, used in getting fire with flint and steel; also employed as a port-fire. (See AMADOR.) (2) Also the decayed and crumbling wood of the ash or willow which has undergone dry rot. It is used for the same purposes as the foregoing; and it is remarkable that close examination shows that such wood is always the seat of a growth of fungi much like that referred to above. All the varieties of spunk are much improved by wetting with solution of potassium nitrate or chloride and then drying. Spunk, although a native product of the U. S., is also imported from Europe. It is also called *punk*.

Tougaloo' University: an institution of learning at Tougaloo, Madison co., Miss., established by the American Missionary Association in 1869 and chartered by the State in 1871. It trains colored youth of both sexes, and has as its object the development of Christian character and of such intellectual and manual skill as shall enable young colored people to become efficient leaders in the uplifting of the Negro race. In the heart of a section called "the Black Belt," because of the density of the Negro population, it is admirably located to reach those for whom it is intended. It has ample grounds—a plantation of 500 acres—and plain and substantial buildings. From the first it has combined handwork with headwork. It has now college preparatory, normal, theological, grammar, agricultural, manual-training, nurse-training, and musical departments, with a model primary school as a practice school for the normal students. A strictly pedagogical course of two years is part of the normal work. The John F. Slater fund trustees have given Tougaloo \$3,000 yearly for its normal and manual work. Until the adoption of the new State constitution in 1890 the normal department was in part supported by the State. The enrollment for 1894-95 was 379, with 23 instructors and officers. The school has no endowment, but is supported by the American Missionary Association.

FRANK G. WOODWORTH.

Toul'min, HARRY: jurist; son of Rev. Joshua Toulmin; b. at Taunton, England, in 1767; was several years a Dissenting minister at Chorobert, Lancashire; settled at Norfolk, Va., 1793; was president of Transylvania College 1794-96; secretary of State of Kentucky 1796-1804; was appointed judge of U. S. district court of Mississippi 1804; passed his later years in Alabama; assisted in framing the constitution of that State, and served in its Legislature. He was the author of *A Description of Kentucky* (1792); *Collection of the Acts of Kentucky* (Frankfort, 1802); *Magistrate's Assistant, A Digest of the Territorial Laws of Alabama* (Cahawba, 1823); and other publications, and aided James Blair in the preparation of his *Review of the Criminal Law of Kentucky* (1804). D. in Washington co., Ala., Nov. 11, 1823.

Revised by F. STURGES ALLEN.

Toulmin, JOSHUA, D. D.: clergyman and author; b. in London, England, May 11, 1740; educated at St. Paul's school and at the Dissenting academy of Dr. S. M. Savage; was for some time minister of a Dissenting congregation at Colyton, Devonshire; became in 1765 pastor of a Baptist church at Taunton, where he also conducted the business of a bookseller; subsequently adopted Unitarian views; became prominent in their advocacy, and was pastor of Dr. Priestley's church at Birmingham from 1804 to his death there July 23, 1815; author, among other works, of *Memoirs of Faustus Socinus* (1777) and *Dissertations on the Internal Evidences of Christianity* (1785); was editor of D. Neal's *History of the Puritans* (Bath, 5 vols., 1793-97), with notes

and a memoir of the author, and subsequently published as a supplement *An Historical View of the State of the Protestant Dissenters in England under King William* (1814). A volume of his *Posthumous Discourses* was published in 1818.

Revised by J. W. CHADWICK.

Toulon, too'lon': town; department of Var, France; 42 miles E. S. E. of Marseilles (see map of France, ref. 9-11). It is at the head of a narrow but deep inlet of the Mediterranean, from which it rises like an amphitheater on an acclivity, leaning against a row of lofty hills which encircle the bay. Next to Brest, Toulon is the principal naval station of France, and a fortress of immense strength. It is surrounded by a double-bastioned wall, and all the commanding heights in the neighborhood bristle with forts and redoubts. The harbor is double; one part, given up to commerce, is lined with convenient quays; the other, arranged for naval purposes, is surrounded with ship-building docks, cannon-foundries, ropewalks, magazines, arsenals, schools, hospitals, barracks, and naval establishments of every description; and this part of the harbor is separated from the roadstead by hollow but bombproof moles lined with batteries. Toulon carries on a considerable trade with Algeria. Pop. (1896) 95,276.

Revised by M. W. HARRINGTON.

Toulouse, too'loo': city of France; capital of the department of Haute-Garonne; in a fertile plain on the Garonne and the Canal du Midi; 160 miles S. E. of Bordeaux (see map of France, ref. 9-E). The streets in the older portions are narrow, crooked, and badly paved, the houses built of brick and without any characteristic style, though the broad quays and boulevards that have taken the place of the old walls are handsome thoroughfares. Of the cathedral, dedicated to St. Stephen, the nave dates from the twelfth and thirteenth centuries, the front façade from the fifteenth. The Church of St. Sernin is one of the most beautiful Ro-

Church of St. Sernin

manesque structures in France, begun in the eleventh century, completed in the fifteenth, and with a tower 250 feet high. There are many buildings of unusual interest and the promenades are attractive. Toulouse is the residence of an archbishop, and has seminaries, monasteries, etc., a court for the departments of Haute-Garonne, Tarn, Tarn-et-Garonne, and Ariège, a commercial court, faculties of theology, medicine, and law, many special and general schools, a noted museum, a public library of over 60,000 volumes, and numerous benevolent institutions. It also has military schools, arsenals, powder-factories, etc. The manufacturing industry is important, especially in cloth, woolen and cotton fabrics, machinery and agricultural implements, candles, oil, soap, oilcloth, paper, tobacco, etc. The commerce is very active,

especially in grain, wine, marbles from the Pyrenees, wood, etc. Four large fairs for cloth, woollens, and cattle are held annually. P. p. (1896) 149,963. Toulouse was the name of an ancient French family which ruled independently over the city and the country along the Garonne. In 852 the possession was made a dukedom, and for some time it was united to the countship of Auvergne and the dukedom of Aquitaine. In 1208 Pope Innocent III. waged war against Toulouse, conquered the country, and gave it to Simon of Montfort. His successor, pressed hard by the legitimate heirs of Toulouse, transferred his rights to Louis VIII. of France, and a war ensued between this king and Duke Raymond VII. The country was finally incorporated with France by Philip III. On Apr. 10, 1814, the French under Soult were defeated by Wellington in a battle before Toulouse.

Revised by M. W. HARRINGTON.

Tou'raeo, Turacou, or Turakoo [from the native name]: any one of the plantain-eaters (*Muscophagida*) of the genus *Turacus*, a group of large birds peculiar to the warmer parts of Africa, and characterized by their red and green plumage and conspicuous erect occipital crest. The wings are rounded; tail rather long. The toureaos go in small flocks, dwell in the woods, and feed on fruit. The red pigment of the feathers (known as turacin) is soluble in water, and the birds are temporarily paler after bathing. F. A. L.

Touraine, too'ran': an ancient province of France, in the central part of the country, on both sides of the Loire, with Tours for its capital, consisting of the present department of Indre-et-Loire and part of Vienne. It was inhabited by the Turones when Caesar arrived in Gallia, and was annexed to the French crown in 1201. On the revocation of the Edict of Nantes it suffered very much, as most of its inhabitants were Protestants.

Tourcoing, too'kwän': town of France, department of Nord; 10 miles by rail N. E. of Lille (see map of France, ref. 2-F). It is a large manufacturing place, where great quantities of wool, cotton, and flax are spun and woven into various kinds of fabrics; its breweries, distilleries, and sugar-refineries are also important. Pop. (1896) 73,253.

Tourgee, too'r-2hā, ALUOX WINEGAR; author; b. at Williamsfield, O., May 2, 1838; educated at the University of Rochester, New York; served in the U. S. army in the civil war, and was twice wounded; after the war, settled in the practice of the law at Greensboro, N. C., and at the Southern loyalist convention in Philadelphia, Pa., in 1866, prepared the report on the condition of the Southern States. He was judge of North Carolina superior court in 1868-71. With Messrs. Barringer and Rodman he prepared *A Code of Civil Procedure for North Carolina* (1868); author of *A Fool's Errand* (1879); *Bricks without Straw* (1880); *Hot Ploughshares* (1883); *An Appeal to Caesar* (1884); *Black Ice* (1888); *Letters to a King* (1888); *With Gavage and Swallow* (1889); *Pactolus Prime* (1890); *Murvale Eastman* (1892); and *An Ouling with the Queen of Hearts* (1894). In 1882-85 he edited *Our Continent*, a weekly paper published in Philadelphia.

Revised by H. A. BEERS.

Tourjee, ERES; musician and teacher; b. at Warwick, R. I., June 1, 1834; at a very early age displayed great talent for music; at the age of thirteen was organist of a local church; when seventeen went to Providence, opened a music-store, and began teaching; in 1859 went to East Greenwich, R. I., and founded the Musical Institute; in 1863 went to Europe for further study; returned in 1867, and removed the Musical Institute to Boston and renamed it the New England Conservatory of Music; in 1869 received the degree of Doctor of Music from Wesleyan University, Middletown, Conn.; in 1872, with P. S. Gilmore, organized the World's Peace Jubilee. He held many places during his life and edited a number of musical works. D. in Boston, Apr. 12, 1891.

D. E. HERVEY.

Tourmaline [Cingalese *turamali*]; the first gems of it being brought from Ceylon; a mineral found in granite and metamorphic rocks, and occasionally furnishing fine gems. It is a complex silicate of aluminium, with about 10 per cent. of boron oxide and smaller amounts of other oxides, its varying composites giving rise to different varieties. It occurs in brittle, prismatic crystals, usually three-, six-, or nine-sided, which have a hardness of 7.5. Its color is usually black, but when found in limestones it is often red-brown. Tourmalines of blue, green, pink, and red also occur, frequently with two or three colors in the same crystal. These colored crystals, when transparent, make beautiful

ful gems and have received distinct names. The black is called *schorl*, the white *achroite*, the red *rubellite*, and the blue *indicolite*, or, when clear, *Brazilian sapphire*; and different shades of green, *Brazilian emerald* and *Brazilian chrysolite*; and the yellow, *Ceylon peridot*. Fine red and green tourmalines occur at South Paris and other Maine localities, in the San Jacinto Mountains, California, in Minas Geraes, Brazil, and the island of Elba; pink and red in Madagascar and Southern California; brown and red in Carinthia and Ceylon. The mineral is remarkable also for its optical properties, and is used for experiments in polarized light. The colored tourmalines of Maine are treated of in published works by Dr. A. C. Hamlin, whose collection of them, as well as those of others, has become the property of Harvard University. See also GEM and PRECIOUS STONES.

GEORGE F. KUNZ.

Tournament, or **Tourney** [*tournament* is M. Eng. *turnement* < O. Fr. *torneement*, deriv. of *torneier*, turn round and round, tilt, tourney; *tourney* is from O. Fr. *tournei*, deriv. of *torneier*]: a friendly contest at arms among the warriors of noble birth in the Middle Ages. The term is general, and denotes the gathering of the nobles and knights, the challenging and settling the terms, and the armed struggles themselves, the whole sometimes lasting for many days. All the lodgings in the town would be taken up by visitors, each intending combatant, and perhaps each man of knightly rank, hung out his pennon or banner from his windows, the lists were laid out and fenced in and fitted with seats for ladies and others, and the combats were arranged with care and fought under exact supervision. This was the condition of the tournaments of the fourteenth and fifteenth centuries; before that these gatherings were less ceremonious, and indeed were less frequent, and were often forbidden, not only by the Church, but by kings, as by Philip the Fair of France and Henry III. of England. This would seem to point to much greater danger to life and limb from the earlier tournaments, and it is certain that the arms of war were more used in these than afterward. In fact, the distinction must have been hard to make at first between the judicial duel (see ORDEAL) and the friendly contest between two (see Joust); and in like manner a tournament must have resembled a pitched battle at a fixed place and time, fought to establish a noble's right to an estate or to a title, or merely out of bravado. When, however, the tournaments had become matters of regulation, the arms used were exactly specified and were generally blunt and pointless swords, maces, or clubs of wood, and for the tilting-match, lances with heads divided into three or four blunt points. The defensive armor was enormously heavy, because the rider was not to dismount, but only to run so many courses with the lance and to strike so many blows with the sword or mace. In this way the tournaments became more and more occasions for unbounded display of wealth and splendor, and less and less serious and dangerous as contests of armed men. The death of Henry II. of France, by an accident in the tilt, in 1559, is generally thought to have put an end to tournaments in France; but throughout Europe the changing conditions of warfare and the more critical temper of the revival of learning (see RENAISSANCE) were making them impossible. The name lingered on in England as applied to *riding at the ring*—that is, the trying to carry off a ring on the point of the lance, and the *quintain*—that is, the game of charging a figure which revolved when the shield was struck, and flung a bag of sand at the rider, who had to be active to escape it.

RUSSELL STURGIS.

Tournay': an old but very handsome and interesting town of Belgium, province of Hainaut; 35 miles W. S. W. of Brussels (see map of Holland and Belgium, ref. 11-B). It is on the Scheldt, which here is crossed by several elegant bridges and lined with quays which are planted with trees and afford beautiful promenades. Tournay contains many fine edifices, among which the cathedral in the Romanesque style is the most remarkable, and important manufactures of carpets, porcelain, hosiery, lace, and liqueurs. Pop. (1891) 34,442. Revised by M. W. HARRINGTON.

Tournefort, toorn'fôr', JOSEPH PITTON, de: botanist; b. at Aix, France, June 5, 1656; studied botany and traveled extensively in Southern Europe; was made professor at

the Jardin des Plantes in Paris in 1683; went to the Levant with the support of Louis XIV. 1700-02; was appointed Professor of Medicine at the Collège de France. His *Éléments de Botanique* (3 vols., 1694) he translated in 1700 into Latin, *Institutiones Rex Herbarie*, and this translation was republished with additions by Jussieu in 1719, and translated into English (London, 1719-30). He also wrote *Histoire des Plantes qui naissent aux Environs de Paris, avec leur Usage dans la Médecine* (1698), enlarged by Jussieu in 1725, and translated into English by Martyn (London, 1732), and *Voyage du Levant* (2 vols., 1717; translated into English, 1741). D. in Paris, Nov. 28, 1708.

Revised by CHARLES E. BESSEY.

Tournour, toor-nôr', CYRIL: an Elizabethan dramatist, the dates of whose birth and death are uncertain; author of two powerful but extravagant plays, *The Revenger's Tragedy* (1607) and *The Atheist's Tragedy* (1611), and of a peculiar poem entitled *The Transformed Metamorphosis* (1600). His works were edited by Churton Collins in 1878 (2 vols., London).

Tourniquet [=Fr., deriv. of *tourner*, turn]: an instrument for checking the flow of blood from wounds or during surgical operation by means of pressure applied to the principal artery supplying the blood. A rude but often very useful tourniquet may be made by tying a handkerchief around the wounded limb between the heart and the wound, passing a stick through the handkerchief, and then twisting it till the flow of blood is checked. In the more effective forms a pad is strongly pressed against the main artery by means of a screw. Revised by W. PEPPER.

Tou'ro, JUDAH: philanthropist; b. at Newport, R. I., June 16, 1775; son of Rev. Isaac Touro, a rabbi of the synagogue at Newport; engaged in mercantile business; settled in New Orleans as a merchant in 1802, and acquired a large fortune; served as a volunteer at the battle of New Orleans 1815, where he was severely wounded; gave liberally of his fortune during his lifetime, and at his death, which occurred in New Orleans, Jan. 18, 1854, bequeathed most of his property to the public charitable institutions of that city. Among them was the Touro Almshouse, occupied during the civil war as barracks for colored troops, by whom it was burned.

Tours, toor: capital of the department of Indre-et-Loire, France; 147 miles by rail S. W. of Paris (see map of France, ref. 5-15). It is on a small strip of land between the Cher and the Loire, which here is crossed by one of the most magnificent bridges in Europe, built in 1765-77 by Bayeux, and lined with handsome quays and finely planted promenades. It has a magnificent Gothic cathedral, several other remarkable edifices, and good educational institutions. Silk manufactures were established here by Henry IV., and during Richelieu's time more than 40,000 persons were employed in this branch of industry; but the revocation of the Edict of Nantes drove the workmen into exile, and gave the city a blow from which it never recovered, though its manufactures of silk-stuffs, ribbons, serges, pottery, and confectionery are still extensive. The town has given its name to the famous battle between Charles Martel and the Saracens in 732. The latter were decisively defeated, and Western Europe was saved from subjection to the Mohammedans. During the war with Germany Tours was the seat of the national Government from Sept. 11 to Dec. 10, 1870. It was occupied by the Germans on Jan. 19, 1871. Pop. (1896) 63,267. Revised by M. W. HARRINGTON.

Tours, BERTHOLD: composer; b. in Rotterdam, Holland, Dec. 17, 1838; received his first instruction from his father; afterward studied at Leipzig and Brussels, and thence accompanied Prince Galitzin to Russia. He removed to London in 1861, where he resided until his death (Mar. 11, 1897), composing, teaching, and playing in orchestras and bands. He composed much church music, services, and anthems, which are immensely popular, and also many very popular songs, much good organ music, a number of pieces for piano and also for the violin, and made piano arrangements of many vocal and orchestral scores. D. E. HERVEY.

Tourville, toor'veel', ANNE HILARION DE COTENTIN, Count de: admiral; b. at Tourville, department of La Manche, France, Nov. 24, 1642; was educated for the navy, and made a captain in 1667; distinguished himself in the battle of Agosta 1676; commanded the vanguard in the battle of Palermo 1677; made several successful expeditions against the pirates of Northern Africa 1682-88; was created a vice-admiral in 1689; defeated a Dutch-English fleet off the Isle

of Wight in July, 1690, and pursued the English to the mouth of the Thames; attacked a Dutch-English fleet superior to his own off La Hogue May 29, 1692, and was beaten after twelve hours' fight; was made a marshal in 1693, and defeated and destroyed a Dutch-English fleet off Cape St. Vincent on May 26, 1693. On the outbreak of the Spanish war of succession he was made commander-in-chief of the united naval force of France and Spain in the Mediterranean, but died in Paris May 28, 1701. See Delarbre, *Toussaint et la Marine de son Temps* (1885). F. M. LOEB.

Toussaint Louverture, too-sân loo-vâr tür (or **Louverture**), DOMINIQUE FRANÇOIS; revolutionist; b. near Cap François, Haiti, in 1743. He was a Negro and originally a slave on a plantation belonging to the Jesuits; they gave him the rudiments of education, and passing into the hands of a creole planter he was made overseer. He did not take part in the insurrections until 1791, when he protected the flight of his master before joining Jean François. With the latter he went over to the Spanish Dominicans in 1793; but in 1794 he deserted to the French republicans, carrying with him a large force of blacks. This step gave the republicans overwhelming power, and as Toussaint was now the acknowledged leader of the Negroes and could turn the scale as he pleased, he became the most influential man in the island. He was made commander-in-chief and deputy governor, and the French commissioner, though nominally the highest officer, was left with only a semblance of power. Mainly through Toussaint's generalship the British, who had aided the royalists, were forced to evacuate the island in 1798. Their commander, Gen. Maitland, surrendered the posts directly to Toussaint, refusing to recognize the French commissioner. Soon after an insurrection, secretly incited by Toussaint, drove the commissioner from the island; the mulatto Gen. Rigaud, to whom he delegated his powers, was defeated by Toussaint in 1799, leaving the latter undisputed master of the western or French part of the island. He used his power with great moderation, protected the whites, and proclaimed a general amnesty. As the only available means of restoring agricultural prosperity he forced the Negroes to work on the plantations, securing to them, however, a part of the profits. The eastern part of the island having been ceded to France, he occupied it in 1801. Finally, in July, 1801, he promulgated a constitution which made him president for life. Under his rule the island was unquestionably prosperous, and he had won not only the respect but the enthusiastic devotion of the Negroes. An admirer of Bonaparte, he modeled his actions and conversation after him, and claimed to have seized the supreme power in the same manner. One of his numerous letters to the First Consul was superscribed, "The First of the Blacks to the First of the Whites." Bonaparte paid no attention to these letters, and when Toussaint threw off all semblance of subjection to France he organized an expedition under Leclerc (*q. v.*) to reduce the island to obedience. During the early part of 1802 Toussaint made a desperate resistance, finally capitulating in April. He was pardoned, but two months afterward was arrested for alleged conspiracy and sent a prisoner to France. He died in captivity at the castle of Joux, near Pontarlier, Apr. 27, 1803. HERBERT H. SMITH.

Tow: See **FLAX**.

Towanda: borough; capital of Bradford co., Pa.; on the Susquehanna river, and the Barclay and the Lehigh Val. railways; 82 miles N. W. of Wilkes-barre (for location, see map of Pennsylvania, ref. 2-G). It is in an agricultural and dairying region; has electric and gas lights and water-supply from springs 16 miles distant; and contains the Susquehanna Collegiate Institute (Presbyterian, chartered 1850), 2 national banks with combined capital of \$275,000, a daily, a semi-weekly, and 4 weekly newspapers, an extensive toy-factory, several foundries, planing-mills, and piano, carriage, and furniture factories. Pop. (1880) 3,814; (1890) 4,169; (1895) estimated, 4,500. **MANAGER** of "REVIEW."

Tower: a building or member of a building, simple and compact in its form, cylindrical or prismatic; generally, though not always, higher than wide. The towers of an ancient fortress (see **CASTLE** and **FORTIFICATION**) are to be considered partly as flanking works, projecting from the curtain walls in such a way as to allow of a cross-fire of arrows and the like, and partly as higher structures commanding the top of the curtain walls. In Greek and Roman city walls, and in mediæval castles and towns previous to the thirteenth century, the towers are nearly always higher than the walls and serve both the purposes set above. In the

later fortresses of the Middle Ages they are often of the same height as the walls. The evolution of a defense in front the old means of attack had led to a complete freedom for the garrison of movement from point to point of defensive works, and the towers were often mere bastions, part of the wall and of the same height with it, as notably in the famous Bassin (*q. v.*) of Paris. Height alone is, however, of great utility in defense against attacks by scaling and by escalade, and accordingly the construction of a tower was generally a very lofty and partly isolated tower. In the Italian cities lofty square towers were erected for defense; hundreds of them existed in a single town; but of these very few remain, the greatest number being at San Gimignano, in Tuscany, though several others exist at Bobbio (see **LEANING TOWERS**), at Arrezzo, and elsewhere. The small strong buildings of border barons in the Pyrenees, in Germany, and on the English-Scottish frontier, are commonly in the form of towers; some few of these remain in a partly ruined condition. In parts of the Caucasian mountain country and in Afghanistan whole villages exist of which each important house has a tower of defense into which the family may retreat in case of a violent attack. Church towers, on the other hand, being intended primarily for bell-towers, are made high so as to lift the mouths of the bells well above the church-roof and all surrounding buildings. From this original utilitarian form they passed into one of the chief means of decorative architecture in the Middle Ages, and of this great height was a necessary feature in most cases, although in some English parish churches the tower is hardly higher than its own breadth across the buttresses. Throughout the north of Europe the church tower was generally closely united with the mass of the church, and in some cathedrals as many as six, in one case eight, towers formed part of the original design. In Italy the tower was always a belfry or *campanile*, and was almost wholly detached from the church building.

Small towers forming part of larger masses of building are generally called turrets or *tournelles*, from the French word of the same meaning. These are often carried on corbeling and in projection from the main wall; they frequently contain winding stairs and often serve as watch-towers; oriel windows also are sometimes built in the semblance of such *tournelles*. The *round towers of Ireland* are slender, nearly cylindrical, but built generally with a slight taper, roughly built of stone, and always very near to a church. Only about a dozen remain nearly complete, but there are more than a hundred of which ruins exist. Their purpose has never been satisfactorily explained, though many works have been devoted to them. See **ROUND TOWERS**. RUSSELL STURGIS.

Tower, ZEALOUS BATES: soldier and military engineer; b. at Cohasset, Mass., Jan. 12, 1819; graduated at the U. S. Military Academy at the head of his class, and was appointed second lieutenant in the Corps of Engineers July 1, 1841. After a brief service as assistant with the board of engineers he was recalled to West Point Aug., 1842, serving as assistant professor until Apr., 1843, and as principal assistant professor of engineering Apr.-Aug., 1843, when, returning to duty with his corps, he served as assistant engineer in the construction of the defenses of Hampton Roads, Va. He served with distinction in the war with Mexico, especially at Cerro Gordo, Contreras, and Chapultepec, and in the assault and capture of the city of Mexico. During 1848-61 he was engaged in the construction of fortifications at Portland, Me., and Portsmouth, N. H.; of the defenses of San Francisco, Cal., and as member of the board of engineers for the Pacific coast. He was promoted major of engineers Aug. 6, 1861, and assigned as chief engineer to defend Fort Pickens; breveted lieutenant-colonel for gallant services; and commissioned brigadier-general of volunteers from Nov. 23, 1861, the date of its bombardment. Assigned to command of a brigade in the Army of Virginia in 1862, he was engaged in the battle of Cedar Mountain Aug. 9, and subsequent operations during Pope's campaign in Northern Virginia, and was severely wounded at the second battle of Bull Run. For gallantry at Cedar Mountain he was breveted colonel, and the brevet of brigadier-general was conferred on him for Groveton. From July 8 to Sept. 8, 1861, he was superintendent of the U. S. Military Academy. In Sept., 1861, he was appointed chief engineer of the defenses of Nashville; was engaged in the battle of Nashville, Dec. 15-16, 1864; and from Oct., 1864, was in charge of the fortifications of the military division of the Tennessee. He was chief engineer of the military division of the Tennessee July

1865-Jan., 1866; breveted major-general Mar. 13, 1865. Returning to duty in Jan., 1866, with his corps in which he had attained the rank of lieutenant-colonel Nov., 1865, he was a member of various engineer and special boards, and during 1866-67 had charge of the construction of the defenses of Portsmouth, N. H.; in May, 1867, was appointed a member of the board of engineers for permanent fortifications and river and harbor obstructions; became colonel of engineers Jan., 1874; and was retired at his own request Jan. 10, 1883.

Tower City: city; Schuylkill co., Pa.; on the Williams Valley Railroad; 11 miles W. S. W. of Tremont, and 24 miles W. of Pottsville, the county-seat (for location, see map of Pennsylvania, ref. 5-H). It is in an agricultural and coal-mining region, and has a building and loan association and a weekly newspaper. Pop. (1890) 2,053.

Tower of London: the ancient citadel of the city of London, standing, as the Louvre does in Paris, on the banks of the river, immediately below and outside of the city, which it once defended. Its government has been intrusted since the days of the Conqueror to a high officer called the constable, which office has been held by the Duke of Wellington, Field-marshal Sir John Burgoyne, Sir George Pollock, and Sir William Gomm. The oldest portion is the isolated donjon or keep called the White Tower, built by William the Conqueror, and contains an interesting chapel of the same period. This is now surrounded by a rampart and moat, with inner wall (the Inner Bail), flanked by half-circle towers, each of which has a distinctive name, as the Bell Tower, the Beauchamp Tower, Wakefield Tower (where are kept the regalia), Bloody Tower, Bowyer Tower. There is also within the inclosure the Horse-armory, a museum of ancient armor; St. Peter's church, where are interred the remains of Anne Boleyn, Katherine Howard, Dukes of Somerset ("The Protector") and Northumberland, Lady Jane Grey and her husband, and many other celebrated victims

vultures. This disposition of the corpse is a very ancient one in Iran, and it is inculcated in the *AVESTA* (*g. v.*) as enjoined by Zoroaster. Allusions to the customs are found also in Herodotus (i., 140), who describes it as Magian, and elsewhere in the classics. According to the Zoroastrian religion the elements, fire, earth, and water, were sacred, and not to be defiled; the dead body, as full of corruption and pollution, could not therefore be burned, buried, nor thrown into the water, but was exposed on mountain heights, upon structures called *dakhmas*, as a prey to the dogs and birds. The modern Parsee *dakhma*, or tower of silence, is a structure from 60 to 90 feet in diameter, and from 20 to 30 feet in height, somewhat resembling a gasometer. The interior raised floor upon which the dead bodies are placed is divided, like the spokes of a wheel, into three concentric rows of troughs (*paris* they are called), the outer for men, the middle for women, the inner for children. The center or hub is a great pit (*bhandar*), some 30 feet in diameter, into which the denuded bones, parched and dried in the Oriental sun, are later deposited, and there crumble into dust. All flow and exudation of putrid matter is carefully conducted through disinfecting channels, so that the earth is preserved from defilement, and the sanitary laws are preserved. No one is allowed to witness the descent of the "heaven-sent" birds; the body, it is said, is quite stripped of flesh in an hour or two. Remains of ancient Zoroastrian *dakhmas* are to be seen in Persia, for example, at Teheran, and the principal towers of silence in use to-day by the Parsee community of India are found on Malabar Hill, Bombay. See Dosaibai Framji Karaka, *History of the Parsis*, i., 199-210 (London, 1884); Modi, *A Tower of Silence* (Bombay, 1885).

A. V. WILLIAMS JACKSON.

Towianski, tō-včē-aan'skē, ANDREAS; impostor; b. at Antozwinić, Lithuania, Jan. 1, 1799; studied at Wilna, and made himself conspicuous early in life by his mystical

The Tower of London.

of the headsman. Closely adjacent to the Tower is Tower Hill, the famous place of execution for persons delivered from the Tower to the sheriffs of London for execution. Here suffered (among others) Bishop Fisher, Sir Thomas More, Lord Guilford Dudley, Earl of Strafford, Archbishop Laud, Algernon Sydney, and (1747) Lord Lovat, the last person beheaded in England. Queen Anne Boleyn and Lady Jane Grey were beheaded on scaffolds within the Tower, the site of which is shown, as also the block on which the former suffered. Within the Bloody Tower took place the murders of the princes, sons of Edward IV., and, elsewhere within the precincts, of Henry VI., of the Duke of Clarence, of Sir Thomas Overbury, and of the Earl of Essex.

Towers of Silence: the structures on which the modern PARSEES (*g. v.*), in accordance with the tenets of their faith, dispose of the dead by allowing them to be devoured by

enthusiasm and pretensions of receiving divine revelations; practiced law at Wilna 1818-26. After wandering around in Europe, he went to Paris about 1841, and obtained complete control of Mickiewicz, the great Polish poet, especially by the marvelous manner in which he cured his insane wife. He actually formed a sect which accepted him as a Messiah, but was expelled in 1842. He then tried to get a foothold in Brussels, in Switzerland, in Rome, but in vain. From Rome he was expelled as an impostor, and, returning to Switzerland, he gave up his rôle of a prophet, settled in Zurich, and died there May 13, 1878. See Semkenke, *Towianski et sa doctrine* (Paris, 1859). Mickiewicz wrote in his favor *L'Église officielle et le Messianisme* (2 vols., Paris, 1842-43). Revised by S. M. JACKSON.

Towle, tōl, GEORGE MAKEPEACE; journalist and author; b. in Washington, D. C., Aug. 27, 1841; graduated at Yale College 1861, at Harvard Law School 1863; practiced law in Boston 1863-66; U. S. consul at Nantes, France, 1866-68, and at Bradford, England, 1868-70; managing editor of the *Boston Commercial Bulletin* 1870-71; State senator of Massachusetts in 1890-91; author of *Glimpses of History* (1865); *Henry the Fifth, King of England* (New York, 1866); *American Society* (2 vols., London, 1870); *Beaconsfield* (1878); *Certain Men of Mark* (1880); *England and Russia in Asia* (1885); *England in Egypt* (1886); *Young People's History of England* (1886); *The Nation in a Nutshell* (1887); *Young People's History of Ireland* (1887); and *The Liter-*

ature of the *English Language*, of which he had finished two of its three volumes at the time of his death. He also contributed to English and American periodicals. D. at Brookline, Mass., Aug. 8, 1893. Revised by H. A. BEERS.

Town [O. Eng. *tūn*, inclosure, fence, village, town; O. H. Germ. *tūn*, inclosure (> Mod. Germ. *zahn*, hedge, fence); Icel. *tūn*, inclosure, house; cf. Celtic *durum* in names like *Lugdunum*, Lyons]; a word of varying signification, both in popular speech and in legal usage. In its broadest sense, it includes not only every sort of municipality, without regard to size, origin, or form of government, but also populous districts which are destitute of self-governing powers. It has this generic signification in some statutes. The House of Lords has declared that a town exists, within the meaning of that word in a railway statute, "where there is such an amount of continuous occupancy of ground by houses that persons may be said to be living as it were in the same town or place continuously." (*London Ry. vs. Blackmore*, L. R. 4 H. L. 611.) See also the Towns Improvement Clauses Act, 1847 (10 and 11 Vict., c. 34). As a generic legal term, however, it ordinarily includes only municipalities; that is, political subdivisions less than counties established for local government. It is employed in this sense in § 23 of Magna Charta ("neither a town nor any person shall be distrained," etc.) as well as in modern statutes. (*Banta vs. Richards*, 42 N. J. L. 497.) The common-law definition of the word, in this sense, is "a place with a constable or a church." Baron Parke in *Elliott vs. South Dev. Ry.*, 17 L. J. Exch. 262.

As a specific term it is used (1) to designate a municipality, which is not a city nor a borough nor a village, without regard to its size or form of government. It is so employed in § 13 of Magna Charta—"all other cities and boroughs, and towns, and ports." It has this meaning in Pennsylvania, Maryland, Virginia, and some other States, as well as in the Federal statutes relating to town sites on the public lands. (U. S. R. S., §§ 2380, *et seq.*) (2) In some of the States municipalities are divided into cities, towns, and villages; those having 2,000 inhabitants or more, for example, are declared to be cities; those having less than 2,000 and not less than 500 are towns; those having less than 500 are villages. (See Miss. Code of 1892, § 2911.) Even in such States, however, the term is sometimes used in statutes in its generic sense, and includes unincorporated settlements. (*Murphy vs. State*, 66 Miss. 46.) No variable is the import of this word that its signification in any particular enactment must depend largely upon the occasion and purpose of the law. (*Broome vs. Tel. Co.*, 49 N. J. L. 497.) (3) Again, the term designates a territorial subdivision, which is the unit of local administration. In this sense it is employed by Blackstone, who asserts that it is synonymous with tithing or vill. (1 *Commentaries*, 114.) It bears this meaning in New England, in New York, and in several of the Western States. At first, the New England town consisted of clusters of inhabitants dwelling near each other, but as soon as the territorial boundaries of these village communities were fixed the term was applied to the territory or district. The term township was used interchangeably with town. For example, the General Court of Plymouth ordered, in 1637, that "Ducksburrow shall be a township, and unite together for their better security, and to have the privilege of a town, only their bounds and limits shall be set and appointed by the next court."

TOWNSHIP.—In New Jersey, Pennsylvania, and some other commonwealths, as well as in Canada, the word township is used exclusively to designate this primary division of the State. In the Federal statutes relating to public lands, however, and in the nomenclature of the new western States, the township is a territorial subdivision, made by the intersection of meridians and parallels 6 miles apart, and containing an area of 36 sq. miles, but is not a political subdivision. It has no functions of local government.

The origin of towns, their political powers and duties, and their relations to counties and to States, can not be treated adequately in an article of this kind. For information on these topics, the reader is referred to *Commonwealth vs. City of Roxbury*, 9 Gray (Mass.) 451, and note by the editor, now Mr. Justice Gray; *Hill vs. Boston*, 122 Mass. 344; *Webster vs. Town of Horwinton*, 32 Conn. 131; *Johns Hopkins Studies in History and Political Science*, series i. to viii, inclusive; Howard, *Introduction to the Local Constitutional History of the United States* (1889); De Wolf, *The Town Meeting* (1890); Adams, *Study of Church and Town Government* (1892); *Genesis of the Massachusetts Town*, 2 *Proc. Mass. Hist. Soc.*, vii., 172-264; *The Anglo-*

Saxon Township, by Ashley, *Quarterly Journal of Economics*, viii., 315; Chidmers, *Local Government* (London, 1883); Bryce, *American Commonwealth*, ch. xlviii.; Stubbs, *Constitutional History*, vol. 1., ch. v.; Stubbs, *School Charters*, part i. FRANCIS M. BURDICK.

Townley, CHARLES: archaeologist; b. at Townley Hall, Lancashire, England, Oct. 1, 1757, of a Roman Catholic family; received his education on the Continent under the tutelage of the celebrated John Turberville Neeldham; resided at Rome 1765-72, engaged in the study of antiquities, and enjoying in that pursuit the advice and experience of Winckelmann and other celebrated archaeologists; devoted his large fortune to the formation of a magnificent collection of ancient art, which he subsequently largely increased through his agents and by the purchase of the Nollekens collection, and arranged his museum in two houses which he purchased in Park street, Westminster, where he died Jan. 3, 1805. The Townley Marbles were purchased by the nation for £20,000, and in 1814 his bronzes, coins, and gems were also acquired for £8,200. They now form part of the Græco-Roman collection in the British Museum, of which institution Mr. Townley had been a trustee. He was the author of *Antiquities discovered at Ribchester* (London, 1800).

Townley, JAMES: clergyman; b. in Manchester, England, May 11, 1771, of parents belonging to a Wesleyan congregation; became a local preacher at the age of nineteen, and was a regular minister from 1796 to 1832. He became secretary-general of the Wesleyan Missionary Society in 1827, and presided over the conference at Sheffield in 1829 and over the Irish conference in 1830. He was well versed in all biblical matters, and wrote, among other works, the excellent *Illustrations of Biblical Literature, exhibiting the History and Fate of the Sacred Writings, from the Earliest Period to the Present Century*, including biographical notices of translators and other eminent biblical scholars (3 vols., London, 1824; 2 vols., New York, 1842). D. at Ramsgate, Dec. 12, 1823.

Townsend: town (incorporated in 1732); Middlesex co., Mass.; on the Squamcook river, and the Fitchburg Railroad; 22 miles W. of Lowell, and 44 miles W. N. W. of Boston (for location of county, see map of Massachusetts, ref. 2-4). It contains the villages of Townsend, West Townsend, and Townsend Harbor; has a high school, 12 public schools, public library, a national bank with capital of \$100,000, and an assessed valuation of over \$1,000,000; and is principally engaged in cooperage and the manufacture of furniture. Pop. (1880) 1,967; (1890) 1,750; (1895) 1,780.

Townsend, GEORGE ALFRED: journalist; b. at Georgetown, Del., Jan. 30, 1841; graduated at the Philadelphia High School 1859; became news editor of the *Philadelphia Inquirer*, and subsequently city editor of the *Press*. He was correspondent for the *New York Herald and World* during the civil war, and was in Europe 1860-67 reporting the Austro-Prussian war and the Paris Exposition for American newspapers. He was for several years from 1868 on the staff of the *Chicago Tribune* as editorial writer and correspondent; and has been a successful lecturer and a general contributor to periodicals under the pen-name of *Gath*. He has published several volumes, including *Campaigns of a Non-combatant* (1865); *Poems* (1870); *Washington, Outside and Inside* (1871); *Tales of the Chesapeake* (1880); *The Entailed Hat* (1884); *Katy of Calcutta* (1886); and *Mrs. Reynolds and Hamilton* (1890). H. A. BEERS.

Townsend, LUTHER TRACY, D. D.: clergyman and author; b. at Bangor, Me., Sept. 23, 1836; graduated at Dartmouth College in 1859; studied theology at Andover, where he graduated in 1862; adjutant in the army in 1863-61, from 1873 to 1893 Professor of Practical Theology in Boston University, and since 1893 pastor of Mt. Vernon Place Methodist Episcopal church, Baltimore. Among his numerous works are *Sword and Garment* (1871); *Credo* (1873); *The Arena and the Throne* (Boston, 1874); *The Chinese Problem* (1876); *Supernatural Factor in Religious Revivals* (1877); *Art of Speech* (2 vols., 1880-81); *Mosaic Record and Modern Science* (1881); *Bible Theology and Modern Thought* (1883); *Real and Pretended Christianity* (1884); *The Bible and other Ancient Literature in the Nineteenth Century* (1889); *Some Miracles and Modern Thought* (1891); *Outlines of Theology* (1893). Revised by ALBERT OSBORN.

Townshend, CHARLES, second Viscount Townshend: statesman; b. at Ramham, England, Mar. 10, 1674; succeeded to the peerage on the death of his father H. Townshend.

the first viscount, Dec., 1687; was summoned to the privy council in 1707; was joint plenipotentiary with Marlborough (1709) at the conferences of Gertruydenburg for negotiating a peace with France, and ambassador to the States-General of Holland 1709-10; signed the Barrier treaty at The Hague Oct. 29, 1709; resigned his embassy and returned to England on the fall of the Whig ministry 1712; was censured by the House of Commons for having signed the Barrier treaty, and declared by vote of the same House an enemy to the queen and kingdom; entered into correspondence with the Elector of Hanover, who on his accession to the throne of England made him Secretary of State and Prime Minister Sept. 14, 1714; resigned that post, and was appointed Lord-Lieutenant of Ireland 1717, but never took possession of that office; became president of the council June, 1720, and was again Secretary of State from Feb. 10, 1721, to May 15, 1730, when he retired on account of differences with his brother-in-law and colleague, Sir Robert Walpole. D. at Rainham, Norfolk, June 21, 1738.

Townshend, CHARLES: statesman; grandson of the second viscount; b. in England, Aug. 29, 1735; entered the House of Commons 1747, where he acquired prominence by an eloquent speech on the Marriage Bill 1753. In 1754 he became a lord of the admiralty, but was dismissed for an attack on the ministry in the following year. A supporter of Pitt, he was appointed treasurer of the chamber in Dec., 1756, and in the following spring became a member of the privy council, but in 1760 ranged himself on the side of Bute, and was rewarded with the post of Secretary of War (1761-62). He was for a time in opposition to the Grenville ministry, but toward its close accepted the office of paymaster of the forces (1765), and supported Grenville's Stamp Act of that year. He was appointed Chancellor of the Exchequer and Lord of the Treasury by Pitt Aug. 2, 1766; and was virtually Prime Minister during the retirement of Pitt. His last act was to introduce the celebrated resolutions for taxing the American colonies in 1767. D. in Oxfordshire, Sept. 4, 1767. For the instability of his political opinions he was commonly known as the "Weathercock," but he had an immense parliamentary reputation for oratory and wit. His character has been largely discussed by Macaulay (who said "he was a man of splendid talents, of lax principles, and of boundless vanity and presumption") and by historians of the American war, especially Bancroft, and has been made the subject of a special biography, *Charles Townshend, Wit and Statesman* (1866), by Percy Fitzgerald. F. M. COLBY.

Townshend, CHAUNCY HARE: author; b. in England in 1798; educated at Eton; graduated at Cambridge 1821; took orders in the Church of England, but from ill health never engaged in active professional life. He devoted himself to poetry, literature, and art; formed valuable collections of pictures and other objects of art; gave much time to the investigation of mesmerism, in which he was a firm believer, and spent much of his life at his villa of Monloisir at Lausanne, Switzerland. D. in London, Feb. 25, 1868. By his will he bequeathed most of his art collections to the South Kensington Museum, and left a sum of money and the care of his MSS. to Charles Dickens, requesting him to publish such extracts as would illustrate his religious views. Dickens accordingly issued in Dec., 1869, *The Religious Opinions of the Rev. Chauncy Townshend, published, as directed by his Will, by his Literary Executor*. Mr. Townshend was the author of works on mesmerism and several volumes of poems. Revised by H. A. BEERS.

Township: See **Town**.

Townsville: town of Queensland, Australia; 700 miles N. W. of Brisbane, on Cleveland Bay; lat. 19° 16' S., lon. 147° E.; E. terminus of railway to Hughenden (see map of Australia, ref. 3-1). It is a rapidly growing town, the outlet of a rich agricultural district, but has a poor harbor, which, however, is being improved. It is at the mouth of Ross creek, and climbs Melton Hill, an elevation of about 1,000 feet just behind. It has numerous churches and schools, a hospital, an orphan asylum, a large concert-hall; has special provisions for immigrants in great numbers, and an excellent water-system. Among the industries are a soap-factory, a foundry, and two distilleries. The railway to the W. is rapidly developing the inland basins of the Herbert and Diamantina rivers. Pop. (1891) 8,564; with the suburbs, 15,015. MARK W. HARRINGTON.

Toxæmia: another name for septicæmia or blood-poisoning. See **Blood-poisoning**.

Toxicology [Gr. *τοξικόν*, poison (for *τοξικόν φάρμακον*, poison for smearing arrows, deriv. of *τόξον*, bow) + *λόγος*, discourse, reason]; the science of poisons. It treats of the nature and properties of poisons, their effects upon the animal system, their detection, and the legal questions connected with poisoning. A poison is any substance which, either introduced into or arising in the body, is capable of exercising chemical or vital effects deleterious to health or life. What we speak of as *vital* effects are probably based upon chemical actions, but of such nature that present means of examination will not reveal them. Much depends upon the quantity of the substance acting upon the body; small doses may be tolerated, large quantities poisonous.

The action may be local or general. Among poisons affecting particular parts of the body are such as are corrosive. The symptoms may terminate with the local disturbances, or secondary general symptoms, such as fever, depression, or collapse, may result from the effects of the local disorder rather than from a generalized action of the poison. When the action of poisons is general there is always a dissemination through the blood, which may act simply as a carrier or may itself be altered by the poison.

Entrance into the System.—Poisons may gain access to the system by subcutaneous inoculation, through open wounds, through the mucous membrane of the stomach, of the rectum, or of the vagina, and sometimes through the unbroken skin; and the order in which these avenues are named is that of the rapidity of absorption in each. Volatile poisons may enter the system with the inspired air, and rarer modes of poisoning, such as from the urethral surface, from the eyes, nose, etc., have occasionally been noted.

Circumstances affecting the Action of Poisons.—Every poison must be in liquid or gaseous state to act. Solution may be effected in the stomach, but at times the stomach and intestines free themselves before the solid poison is dissolved. Sometimes elimination is so rapid and absorption so slow that poisoning does not ensue, and thus a substance may be intensely toxic when injected beneath the skin, though harmless in the stomach. The question of absorption depends much upon the character of the poison. Some, particularly certain salts of the heavy metals, exercise so much local change by chemical reaction with the solid tissues that they are absorbed in very small amounts.

After absorption, the effect of poisons depends largely upon the animal species acted upon and upon the individual. It is well known that certain individuals gain by repeated usage a high degree of immunity from the action of certain poisons, such as alcohol, opium, or the like. This immunity may sometimes be inborn; and, on the other hand, there may be marked idiosyncrasy in the opposite direction, so that the individual is affected profoundly or in a peculiar manner by even minute doses of the poison. The remarkable tolerance of entire races for certain poisons is illustrated by the comparatively trivial effects of opium in India. The evidence of the investigation (1893-95) of the British Government shows that the enormous consumption of opium by the natives of India does not lead to anything approaching the evil effects that would result from a like consumption by European races. Alcohol is comparatively trivial in its effects on Europeans as compared with certain savage races among whom it has been introduced.

The fate of poisons introduced into the system varies greatly. Some are absorbed in an unaltered state, circulate in the blood, and are excreted without any change in the urine, sweat, or other excretions. In many cases, however, chemical changes occur, by oxidation, reduction, or various forms of combination. In many cases substances violently poisonous may thus undergo changes which deprive them of toxic properties, as in the case of alcohol, which is soon broken up by oxidation. The place in which the greatest destruction occurs is probably the liver, and in the same organ very frequently a storage of the poison occurs for a time, so that only minute quantities reach the blood at a time, and serious results are prevented.

Symptoms of Poisoning.—These depend upon the nature of the poison, its mode of introduction, and the concentration of the solution or mixture taken. There are in general two groups of cases: (1) those in which intense tissue changes are present, and in which the resulting symptoms are irritative or dependent on absorption of abnormal products of tissue destruction; and (2) those in which the anatomical changes discovered are trivial as compared with the violence

of the symptoms, which mainly spring from the nervous system.

1. Of the first group there are first those in which the poison acts upon some external surface—that is, some surface which may be reached without the entrance of the poison into the blood. (a) The most common form is that in which corrosives act upon the skin, causing redness, vesication, or various degrees of necrosis. (b) A most important group of cases is that in which some irritant, most commonly mineral poison sets up gastro-enteritis (inflammation of the lining of stomach and bowel). The symptoms in such cases are primarily irritative—nausea, vomiting, pain, and purging—the dejecta being mucous, serous, and often bloody. Later, as a result of the copious evacuations, or of reflex nervous influences, depression and collapse ensue. (c) Gaseous irritants, or more rarely liquids, gain access to the respiratory tract, and set up intense inflammatory changes with violent cough, expectoration, and difficulty in breathing. Sometimes they occasion dropsical swelling of the mucous membranes of the larynx—oedema of the larynx—and thus lead to the most intense obstruction to breathing, ending in suffocation.

Of the same large group of poisons acting by tissue change there is a second class in which the poison gains access to the blood, and occasions alterations in that important fluid, or circulating in it leads to pathological changes in various organs. (a) The blood-poisons act in two ways: some enter into combination with the hæmoglobin of the blood, destroying its functional activity, and cause dyspnoea, cyanosis, stupor, and unconsciousness; others occasion more profound alterations of the blood, and when rapidly acting lead to cyanosis, jaundice, hæmoglobinuria, and rapid destruction, while the more slowly acting ones produce a gradually increasing anæmia. (b) The class in which the solid tissues are attacked by poisons carried in the blood is variable in the symptomatology, according as one organ or another is involved. In all the pathological changes in the organs are much the same, cloudy-swelling, fatty degeneration, and necrosis (given in the order of severity) being the alterations produced. When the liver is affected, enlargement of the organ and jaundice are noted, as in phosphorus-poisoning; when the kidney is attacked, albuminuria, bloody urine, or hæmoglobinuria, and other pathological characters of the urine are seen, as in turpentine or cantharides poisoning; when the heart muscle is involved, failing circulation, collapse, and sudden death may ensue, as in some cases of phosphorus-poisoning or chloroformization.
