Watson, JAMES CRAIG, LL. D.: astronomer; b. in Elgin County, Ontario, Canada, Jan. 28, 1838, of American parents, who soon afterward settled in Michigan; graduated at the University of Michigan 1857; became teacher of mathematics there, and assistant at the observatory; was appointed Professor of Astronomy 1859, of Physics and Mathematics 1860; became director of the observatory in 1863; discovered twenty-three asteroids; went to Iowa in 1869, and to Sicily in 1870, to observe the eclipses of the sun, and in 1874 was the head of the very successful American expedition which observed the transit of Venus at Peking, China. In 1867 he was elected a member of the National Academy of Sciences. For his discovery of six asteroids in one year he was in 1870 awarded the Lalande gold medal of the French

Academy of Sciences. He contributed to many scientific journals, prepared various astronomical charts, and was author of *A Popular Treatise on Comets* (1860) and *Theoretical Astronomy, relating to the Motions of the Heavenly Bodies revolving around the Sun* (1868). D. at Madison, Wis., Nov. 23, 1880.

Watson, JOHN, M. A., LL. D.: professor of philosophy; b. in Glasgow, Scotland, Feb. 25, 1847. He was educated in Glasgow University, and was appointed Professor of Moral Philosophy in Queen's University, Kingston, Canada, in 1872. His principal works are *Kant and his English Critics* (New York, 1881); *Schelling's Transcendental Idealism* (Chicago, 1882); *The Philosophy of Kant as contained in Extracts from his own Writings* (New York, 1888); *Comte, Mill, and Spencer* (New York, 1895). J. M. B.

Watson, JOHN, A. M., D. D.: Presbyterian minister and author; b. of Scottish parents at Manning-tree, Essex, England, in 1850; was educated at Edinburgh University (1866-70); studied theology at New College, Edinburgh, and at Tübingen, Germany; was ordained minister of the Free Church in Logiealmond, Perthshire (the *Drumtochty* of his stories), in 1875; was collegiate minister of St. Matthew's Free Church, Glasgow, 1877-80, when he was called to Sef-ton Park Presbyterian Church, Liverpool. In 1893 he began writing under the name of *Ian Maclaren*. Is the author of *Beside the Bonnie Brier Bush* (1894); *Auld Lang Syne* (1895); *Kate Carnegie, The Mind of the Master, and The Cure of Souls* (1896), the last mentioned being the lectures on preaching delivered by him at Yale University in 1896, when he lectured extensively in the U. S.

Watson, MUSGRAVE LEWTHWAITE: sculptor; b. at Hawkdale, near Carlisle, England, 1804; educated at Raughton School; spent several years in a law-office; went to London 1824; studied sculpture in private, aided by the friendly counsel of Flaxman; spent several years (1825-28) in Rome; became an assistant to Chantrey, whom he soon left on account of his haughty manners, and to Belmes; was employed by New College, Oxford, to execute from Chantrey's models the fine group of Chancellors Eldon and Stowell now in the library of University College; made statues of Queen Elizabeth (for the Royal Exchange), Flaxman, Allan Cunningham, *Hebe* and *Iris*, a bas-relief of the *Burial of Sarpedon*, a statuette of Chaucer, and the model for the bas-relief of the battle of St. Vincent for the Nelson column. D. in London, Oct. 28, 1847. R. S.

Watson, RICHARD: clergyman; b. at Barton-upon-Umber, Lincolnshire, England, Feb. 22, 1781; printed at the age of nineteen an *Apology for the People called Methodists*; was ordained 1800; soon afterward joined the Methodists of the New Connection, but returned to the Wesleyan body 1812, and became secretary of its missionary society 1817. D. in London, Jan. 8, 1833. He was the author of *Theological Institutes* (6 parts, 1823-28); *The Life of the Rev. John Wesley* (1831); *A Biblical and Theological Dictionary* (1831); *An Exposition of the Gospels of Matthew and Mark* (1833), and other theological treatises, collectively republished with *Memoir of his Life* (13 vols., 1834-37).

Watson, SERENO, M. D., Ph. D.: botanist; b. at East Windsor Hill, Conn., Dec. 1, 1826; graduated at Yale College 1847, and at the medical department of the University of New York; was botanist to the geological exploration under Clarence King 1868-69; assistant in the Gray herbarium, Harvard College, 1871; curator Gray herbarium 1888-92. In 1889 he was elected to the National Academy of Sciences. His principal publications are *Botany* (vol. v. of the U. S. Geol. Explor. of the 40th Parallel, 1871); *Bibliographical Index to North American Botany* (1878); *Contributions to American Botany* (1873-91). D. at Cambridge, Mass., Mar. 9, 1892. CHARLES E. BESSEY.

Watson, THOMAS: poet; b. in London, England, about 1557; educated at Oxford University; studied law in London; spent some time in Paris with members of the Walsingham family; settled in London, and acquired a high reputation by his pastoral and amatory poems, which rivaled in popularity those of his friends Spenser and Sidney. D. in 1592. He was the author of a translation of Sophocles's *Antigone* into Latin (1581); *Ekatompattia, or Passionate Centurie of Love* (1582); *Melibæus, sive Ecloga in Obitum Domini Francisci Walsinghami* (1590); *The Tears of Fancie, or Love Dislained* (1593); and many other poetical works, some of which have perished. The three last named were carefully edited by Edward Arber in his *English Reprints*

(1870). Watson's love sonnets, many of which were imitations of Ferraboseo, Ronsard, and other foreign poets, were artificial and frigid. Revised by H. A. BEERS.

Watson, WILLIAM: poet; b. at Wharfedale, Yorkshire, England, in 1855; educated at private schools. In 1876 he contributed to the Liverpool *Argus* his first poems and a series of articles on German musicians. A year or two after this he removed to Southport. His first volume of poems, *The Prince's Quest* (1880), attracted little attention. *Epi-grams of Art* (1884) was favorably reviewed. In 1885 he contributed to the *National Review* a series of sonnets, *Ter tenebrosus*, attacking the policy of the British Government in Egypt. His *Wordsworth's Grave and other Poems* (1891) and his tribute to Tennyson entitled *Lachrymæ Musarum* (1892) first gave full evidence of his powers, especially in elegiac poetry and in verse of a thoughtful, reflective character on literary themes. His obituary poem on Tennyson came under the notice of Mr. Gladstone, and the poet received a civil pension from the Government of £200, which has since been increased. Among his other publications are *Poems* (1893); *Excursions in Criticism* (1893); *The Eloping Angels* (1893); and *Odes and other Poems* (1894). See *Note on a New Poet*, by Grant Allen, *Fortnightly Review*, lvi., 196. HENRY A. BEERS.

Watsontown: borough (incorporated in 1867); Northumberland co., Pa.; on the Susquehanna river, and the Cent. Penn. and the Penn. railways; 9 miles N. of Lewisburg, 23 miles S. of Williamsport (for location, see map of Pennsylvania, ref. 4-G). It is in an agricultural region; contains 5 churches, 9 graded schools, 2 national banks with combined capital of \$110,000, a tannery, saw and planing mills, car-shops, 2 table and furniture works, and shoe and nail factories, and has a weekly newspaper. Pop. (1880) 1,481; (1890) 2,157. EDITOR OF "RECORD AND STAR."

Watsonville: city; Santa Cruz co., Cal.; on the Pajaro river, and the Southern Pac. Railroad; 20 miles E. S. E. of Santa Cruz, and 5 miles from Monterey Bay, Pacific Ocean (for location, see map of California, ref. 8-C). It is in a sugar-beet and fruit-growing region, and has 6 churches, 4 State banks with combined capital of \$170,000, a daily and 3 weekly newspapers, and a beet-sugar factory with beet-crushing capacity of over 1,000 tons and sugar-manufacturing capacity of 200 tons a day. Pop. (1880) 1,799; (1890) 2,149; (1895) estimated, 3,000. EDITOR OF "PAJARONIAN."

Watt, JAMES, LL. D., F. R. S.: inventor; b. at Greenock, Scotland, Jan. 19, 1736; manifested in childhood great mechanical ingenuity, having constructed an electrical machine at the age of fourteen; spent some time at Glasgow (1754-55), learning to make mathematical instruments; practiced this trade at London 1755-56; returned to Glasgow; was appointed instrument-maker to the university; studied French, German, and music; constructed an organ; obtained the friendship of Adam Smith and other eminent men; began about 1758 a series of experiments on steam as a motive power, along with his friend Robison, afterward Professor of Natural Philosophy in Glasgow; constructed a model high-pressure steam-engine 1761, a second much improved model 1765, a third 1768; took out a patent Jan., 1769, on his separate condenser for steam-engines; occupied himself for some years with land-surveying, the engineering of the Forth and Clyde and the Caledonian Canals, building bridges, improving the navigation of the Clyde and the harbors of Glasgow and Greenock; became in 1773 a partner with Matthew Boulton, founder of the famous Soho works, near Birmingham, where in 1775 they began the manufacture of steam-engines, which were rapidly improved by the addition of new features. He was also the inventor of various devices unconnected with the steam-engine. He retired from business in 1800, and died at Heathfield, Aug. 25, 1819. He was buried beside Boulton in Handsworth church, a statue by Chantrey was erected in Westminster Abbey by national subscription, and a copy in bronze stands in front of the Manchester Infirmary. See J. P. Muirhead's *Origin and Progress of the Mechanical Inventions of James Watt* (3 vols., 1854); Thurston's *History of the Growth of the Steam Engine* (New York, 1879); and *Lives* by Muirhead (1858), Smiles, and Lord Brougham.

Watt's inventions in connection with the Newcomen engine, the improvements upon which constitute his claim for distinction, have made that machine the prime mover of the world. He adapted it to its original purpose, the pumping of water from mines, etc., gave it enormously greater economy in use of steam and fuel than it had in the hands

of Newcomen, and applied it to the rotation of a shaft, and thus made it applicable to the driving of every sort of machinery, thereby making possible the steamship, the steam locomotive, the modern railway, and the whole system of manufacturing industries. These improvements consisted mainly in the invention of the separate condenser, the steam-jacket, and the double-acting engine. His first improvements were directed toward the improvement of the engine by reducing its wastes of steam "by keeping the cylinder as hot as the steam which entered it," as he stated his plan. This reduction of the internal wastes—the largest by far of all the losses of energy in the engine of his time—gave the world the modern "Cornish engine," the most economical of its class and time, and only recently superseded by the compound pumping-engine. Watt proposed to adapt his engine to the propulsion of the steamboat and of the locomotive on the railway; but his time and thought and energies were completely taken up with the work of improving and introducing the stationary engine in its various fields; and that work was left to other inventors. His patent of 1784 embodies a considerable number of inventions, accessories of the steam-engine proper, as the governor, steam-gauge, and water-gauge, which were essential to its successful use. Revised by R. H. THURSTON.

Watt, ROBERT: physician and bibliographer; b. in Ayrshire, Scotland, May, 1774; was in early life a farm-laborer and cabinetmaker; studied at Glasgow University 1793-97, and later studied medicine in Edinburgh; was licensed to practice surgery and pharmacy 1799; resided as a surgeon at Paisley 1799-1810; removed to Glasgow in the latter year, and lectured there on surgery with great success, becoming physician to the Glasgow Infirmary and president of the faculty of physicians and surgeons of that city. D. at Glasgow Mar. 12, 1819. He was the author of several medical treatises, and of an important work, *Bibliotheca Britannica, or a General Index to British and Foreign Literature* (Edinburgh, 4 vols. 4to, 1821-24), published after his death by his sons John and James Watt, who had aided him in the work. Revised by H. A. BEERS.

Watteau, Fr. pron. wā'tō', ANTOINE: painter; b. at Valenciennes, France, Oct. 10, 1684. He went to Paris in absolute destitution while a boy, and was employed by an artist named Métayer, then with Claude Gillot, a scene-painter, and afterward with a far more able man, Claude Audran. Two pictures of military subjects, painted when he was about twenty-one years of age and preserved only in engravings, excited attention and enabled him to pursue his studies in a more formal way. About 1717 he was received into the Academy of Fine Arts, and as every person so received comes in as the representative of some particular branch of art, he was designated as *Peintre des Fêtes Galantes*, which might be translated a "painter of court pastorals." This title was afterward given to other artists. He had early developed a most elaborate system of painting, which may be described as painting the whole picture in middle tints and then adding touches, sometimes of more vivid color and sometimes of high light, the ground painting showing between the new touches and giving great harmony and the effect of brilliant color, while yet there is but little pure red, blue, etc. As a technical artist Watteau ranks very high, there are few more consummate workmen, and painters generally love his pictures. As regards his subjects, he seldom abandoned the general one denoted by his Academy title. There are always parties of richly dressed women distributed in groups in shaded groves, elegant picnics, country processions, masked balls, and courtly scenes of all sorts. In 1720 he went to England, where he lived for a year, but, his health failing, he returned to France and died July 18, 1721, at Nogent-sur-Seine. The Louvre has one large picture, *L'Embarquement pour Cythère* (Embarkation for the Island of Cythera); and in the collection of La Caze, *Gilles, l'Indifférent*, and *Finette*. There is nothing by him in the National Gallery, but in the Dulwich Gallery, near London, are two very beautiful pictures. He is represented also in Edinburgh National Gallery, the Berlin Museum, the Dresden Gallery, and the Hermitage, near St. Petersburg.

RUSSELL STURGIS.

Watterson, HENRY: journalist; b. in Washington, D. C., Feb. 16, 1840. Owing to defective eyesight he was educated privately, but at the age of eighteen entered the profession of journalism in Washington, D. C., where he became connected with *The Democratic Review* and *The States*. In 1861 he went to Nashville, Tenn., and there edited *The*

Republican Banner. At the beginning of the civil war he entered the Confederate army, and served in various capacities; performed staff duty 1861-63, and later was chief of scouts in Gen. Joseph E. Johnston's army. After the war he resumed the editorship of the *Banner*; but he soon settled in Louisville, Ky., where in 1867 he became editor of *The Louisville Journal*, succeeding George D. Prentice. In 1868 the *Journal* was consolidated with *The Louisville Times* and *The Louisville Courier* to found *The Louisville Courier-Journal*, of which he became part owner and editor-in-chief. He served as a Democratic member of Congress from Aug., 1876, till Mar., 1877, and has been a delegate to national Democratic conventions, presiding in 1876 over the one held in St. Louis, Mo. As a public speaker, especially on political subjects, he is well known. In addition to contributions to periodicals he published *Oddities of Southern Life and Character* (Boston, 1883).

MARCUS BENJAMIN.

Wattle-bird: the *Anthochaera carunculata*, so named from the large wattles on its neck. It is a native of Southern Australia, of large size and bold, active habits, living on the honey and insects it obtains from the flowers of species of *Banksia*, which cover the waste lands of that region. It has a loud, disagreeable note. It is about the size of a magpie, grayish brown above, each feather striped and bordered with white, the tail brown, long, wide, and graduated. It is hostile to other birds. The yellow wattle-bird, *A. inauris*, is a gregarious bird of Australia, of some importance for the excellent oil which it abundantly affords.

Wattle-fnrkey: a name sometimes applied to the brush-turkey or *Talegalla lathamii* of Australia. See BRUSH-TURKEY and MEGAPODIDÆ.

Wattmeters: instruments for measuring the power expended in electric circuits. The unit of power in the C. G. S. system is the watt. It is equal to 10^7 ergs per second. One horse-power is equivalent to 746 watts. A kilowatt is 1,000 watts, and is equal to about $1\frac{1}{3}$ horse-power.

If a direct current is measured in amperes, and the electromotive force or electric pressure in volts, then the product of the two represents the power of the electrical current in watts. Thus an arc lamp requiring 10 amperes and 45 volts difference of potential between its terminals absorbs 450 watts of energy, or $\frac{2}{3}$ ths of a horse-power. A 110-volt incandescent lamp, taking one-half an ampere, requires 55 watts to maintain it at normal candle-power. If it gives light equal to 16 candles, it requires very nearly 3.5 watts per candle.

With direct currents the power can be determined by measuring the current and the voltage and taking their product. But with alternating currents, in which the current and electromotive force do not arrive at their maximum values at the same instant—in other words, where the two differ in phase—the power can not be measured in the same simple way. It is necessary to have an instrument which takes into account the product of the instantaneous values of the electric current and the electric pressure, and integrates or sums up all these products throughout a complete period of the alternating current.

Wattmeters are either indicating or integrating. The former indicates the rate at which work is being done at any instant; the latter registers the energy consumed during any interval of time, as, for example, a month.

Indicating Wattmeters.—The principle of the electro-dynamometer, illustrated in Fig. 1, is employed in the wattmeter. It consists of two coils of wire, A B and C D, the first fixed and the second movable. When a current passes through the two in series the movable coil is displaced by the dynamic action between parallel currents, and it turns in the direction of the arrow. It may be brought back to its zero position by turning the torsion head, T, or the deflection may be read by means of an attached pointer.

When the same current traverses both coils, the force of deflection is proportional to the square of the current, since the doubling of the current in either coil doubles the force.

If now the fixed coil be traversed by the main current

and the suspended coil be separately connected as a pressure coil to the terminals of the resistance or translating device, in which the power expended is to be measured, then the mutual force between the two coils will be proportional at any instant to the product of the two currents—that is, to the product of the working current and the electric pressure.

In Fig. 2 the fixed coil F F carries the entire current passing through the translating device T, such as a lamp, while the movable coil P is connected to the mains on opposite sides of T. The instrument can then be calibrated so that its scale shall read directly in watts or kilowatts. In the diagram the pressure current is also carried round the field coil, but in a direction opposite to the main current. The object is to make a correction for the current passing through the pressure coil, for this also passes through the field coil in addition to the current actually required to operate the electrical device T. The third terminal I is employed only for calibrating purposes with currents from independent sources.

An instrument operating on this principle can be used either with direct or alternating currents, since the forces tending to turn the movable system are the same whether the currents both go in one direction through the coils or in the other. If only one of the currents be reversed, the couple tending to turn the system is also reversed. This is as it should be, since the instrument then takes account of the fact that when an alternating current and electromotive force differ in phase, during a part of each period the circuit is absorbing power from the source, and during the remainder of the period it is returning power to the source, since the direction of the electromotive force relative to the current is then reversed. When the two are in the same direction the source is giving energy to the circuit, but when they are in opposite directions the circuit is returning energy to the source. The same relations exist in a flywheel, in which there is a give and take of energy as the speed changes. During an increase of speed the flywheel absorbs energy, but during a decrease of speed it gives out energy to run the system or to aid the source. The deflection of the wattmeter will be due to the difference of these two opposite actions.

Recording Wattmeters.—Recording wattmeters give the integrated energy expended during any period of time. They are strictly energy-meters. The principle may be explained by a description of the Thomson wattmeter, which received the highest prize at Paris in competition with all others.

It consists of a vertical shaft resting in a jeweled bearing and carrying near its upper end an armature of several coils without an iron core. These coils are connected to the bars of a small commutator near the upper bearing of the shaft, and on this commutator rest two light springs. The coils are wound with many turns of fine wire, and in series with them is a high non-inductive resistance at the back of the instrument (Fig. 3). The field coils of this motor are the two large coils clearly shown in the figure. An endless screw on the shaft engages with a wheel in the registry-train, and the rotations of the armature are thus recorded on the dials.

On the lower part of the shaft is mounted a copper disk which rotates between the poles of three permanent magnets. Currents are generated in the disk by its motion, and the device constitutes a magnetic damper for the regulation of the rotation so as to make the speed proportional to the energy to be registered.

The armature is connected to the circuit as a pressure coil, and the field coils are in series with the translating

FIG. 2.

FIG. 1.

device. The torque operating the motor is made up conjointly of the two magnetic fields, due to the current in the field-coil on the one hand and the current proportional to the electric pressure on the other. The speed of rotation

FIG. 3.—Two-wire meter (low capacity).

therefore takes into account not only the variations of the current in the mains, but those of the electric pressure as well. In an ordinary electric motor the speed decreases as the field is made stronger, but in this motor the speed increases directly with the field strength. This difference is explained by the fact that the counter electromotive force is very small in comparison with the resistance of the armature circuit, so that the current through the armature is not affected by the speed, which therefore increases with the field current, as in the case of a series motor on a constant-current circuit. The efficiency of the device as a motor is sacrificed to secure the qualities required in a registering meter.

In this instrument, as in the indicating wattmeter, a reversal of either current with respect to the other reverses the torque on the armature. This wattmeter therefore takes account of both the absorption and the restoration of the energy, or registers the difference between the output and the intake of energy.

The Aron wattmeter, which has been used to some extent in Germany, operates in a very different manner. Two clocks, adjusted to run normally at the same rate, are mounted in the same case. The pendulum of one ends in a coil of fine wire carried by a suitable fork, in such a manner that it can oscillate back and forth along the axis of another larger fixed coil. The movable coil is connected as a pressure coil, and the fixed coil as a main circuit coil. The rate of this clock is therefore determined by the mutual action of the two coils, and its variation is proportional to the product of the electric pressure and the main current. The gain of the measuring pendulum is then a measure of the energy which has been absorbed. Both clocks act on the same dial train, so that the dials register numbers which a constant of the instrument converts into watt-hours.

HENRY S. CARHART.

Watts, ALARIC ALEXANDER: journalist; b. in London, England, Mar. 16, 1799; became a teacher at Putney and at Manchester; published a successful volume of *Poetical Sketches* (1822); was successively editor of the *Leeds Intelligencer*, the *Manchester Courier*, and the *London Standard*; founded and conducted for ten years the *United Service Gazette* 1833-43; consumed his property by six chancery suits with his partner in that enterprise; edited a series of annual volumes, *The Literary Souvenir* (1825-35);

published his selected poems, *Lyrics of the Heart* (1851); and received in 1853 a pension of £100 a year. D. at Kensington, Apr. 5, 1864. See the *Life* by his son (2 vols., 1884).

Revised by H. A. BEERS.

Watts, GEORGE FREDERICK, D. C. L., LL. D.: figure and portrait painter; b. in London in 1817; studied at the Royal Academy (where he first exhibited in 1837), and later in Florence, and in 1847 won a prize of £500 in London for a cartoon representing *Alfred Inciting the Saxons to Prevent the Landing of the Danes*, which is now in one of the committee-rooms of the Houses of Parliament; has painted important frescoes in Lincoln's Inn and other buildings in London; is also a sculptor. He is, however, known chiefly as a portrait painter, some forty of the most distinguished men in Great Britain having sat to him, and by his imaginative compositions, one of which, *Love and Life*, exhibited at the Columbian Exposition in Chicago in 1893, was presented to the U. S. Government and is now on exhibition in Washington. He was elected a Royal Academician in 1868, received first-class medals at the Paris Exposition of 1878, and at that of Antwerp in 1885; received the decoration of the Legion of Honor in 1878. A collection of his works was exhibited at the Metropolitan Museum, New York, in 1884-85, and attracted considerable attention. Studio in London.

WILLIAM A. COFFIN.

Watts, HENRY, F. R. S.: chemist; b. in London, England, Jan. 20, 1815; received a thorough scientific education, and became a teacher, but, owing to an incurable impediment in his speech, was unable to obtain a professorship and became editor of the journal of the Chemical Society in 1850 and librarian in 1861; translated Gmelin's *Handbook of Chemistry* (18 vols., 1848-55) for the Cavendish Society. His best claim to distinction is his *Dictionary of Chemistry* (5 vols., 1863-68; Supplements in 1872, 1875, 1881; new edition by Morley and Muir, 4 vols., 1889-94). D. in London, June 30, 1884.

Watts, ISAAC: hymn-writer; b. at Southampton, England, July 14, 1674; son of a Nonconformist schoolmaster, by whom his early education was directed; studied at the Southampton free school and at Rev. Thomas Rowe's Dissenting academy in London; became a private tutor at Stoke Newington in 1696; became in 1698 assistant minister and in 1702 pastor of the Mark Lane Independent congregation, London; was forced by ill health in 1712 to retire from the active work of the ministry, and having gone on a visit to his friend Sir Thomas Abney, at Theobald's, Newington, was persuaded to remain there indefinitely as a guest, and so continued for thirty-six years, until his death Nov. 25, 1748. He was buried in Bunhill Fields. Watts was of diminutive size and somewhat deformed in person, and was never married. He had a high reputation as a preacher, and was much beloved for his cheerfulness, his wit, and his truly philosophical traits of character. He was the author of *Logic, or the Right Use of Reason in the Inquiry after Truth* (1725), *The Improvement of the Mind* (1741), and many volumes of religious and educational treatises, but is best remembered by his *Psalms and Hymns*, which has ever since contributed largely to the services of song in nearly all branches of English-speaking Protestant denominations. Monuments have been erected to his memory in Abney Park and Westminster Abbey, a statue by Chantrey was dedicated at Southampton in 1861, and the foundation of a memorial hall was laid there May 6, 1875. His *Complete Works* were edited by Drs. Jennings and Doddridge (6 vols., 1754), and biographical sketches have been written by Dr. Johnson, Milner, and Southey. Revised by H. A. BEERS.

Watts, ROBERT, D. D.: Irish Presbyterian minister, professor, and author; b. at Moneylane, County Down, Ireland, July 10, 1820; educated at the Royal Academical Institution of Belfast, Lafayette College, Pennsylvania, Washington College, Virginia, and Princeton Seminary; was founder and pastor of Westminster church, Philadelphia, 1852-63; assistant secretary of the Presbyterian board of education, Philadelphia, 1860-63; pastor of Gloucester Street church, Dublin, 1863-66; and since 1866 Professor of Systematic Theology in the Assembly's College, Belfast. Besides contributing frequently to theological and scientific reviews, Dr. Watts has published *Calvin and Calvinism* (Edinburgh, 1866); *Utilitarianism* (Belfast, 1868); *What is Presbyterianism?* (1870); *Prelatic Departures from Reformation Principles* (Edinburgh, 1871); *Arminian Departures from Reformation Principles* (Edinburgh, 1871); *Atomism* (Belfast, 1874); *Herbert Spencer's Biological Hypothesis* (1875);

The Doctrine of Eternal Punishment (Belfast, 1877); *The New Apologetic* (Edinburgh, 1879; revised ed. 1890); *The Newer Criticism* (Edinburgh, 1882); *The Rule of Faith and the Doctrine of Inspiration* (London, 1885); *The Reign of Causality* (Edinburgh, 1888); *Dr. Briggs's Theology Traced to its Organic Principle* (1891); and *Driver's Introduction Examined* (1892). C. K. ROY.

Watts, THOMAS HILL: Governor of Alabama; b. in Butler co., Ala., Jan. 3, 1820; graduated at the University of Virginia 1840, and began the practice of law at Greenville, Virginia 1841; was member of the State Legislature 1842-45; moved to the city of Montgomery, and was again elected to the Legislature in 1849, becoming a member of the State Senate in 1853; was strongly opposed to the policy of secession, but cast his fortunes with his State; first entered the Confederate military service as colonel of a regiment, but after the battle of Shiloh (Apr., 1862), where he greatly distinguished himself, resigned to take the position of Attorney-General in President Davis's cabinet. He became Governor of Alabama in 1863, but was deposed from this office under the reconstruction policy of the Federal Government. He afterward continued the practice of law in Montgomery. D. in that city Sept. 16, 1892.

Wat Tyler: the leader of the peasants' revolt in the reign of Richard II., King of England. For many years the discontent of the peasants had been gathering. The Statute of Labourers (1349) fixing the maximum of wages, the teachings of Wycliffe and of the itinerant preacher John Ball, arousing hostility to the clergy and discontent with existing social conditions, and the attempts to force the emancipated workmen to return to the condition of vassals, had combined to develop in the peasantry a spirit of revolt. Finally, the expenses of the lingering war with France having exhausted the ordinary revenues, the Parliament assembled at Northampton imposed a poll or capitation tax (Nov., 1380) on each male or female above the age of fifteen years. This was rigorously enforced, and became the occasion of disturbances in several places. At Dartford, in Kent, a laboring man, one Walter or Wat, known as "the Tiler" from his occupation, struck dead a tax-collector, whom he accused of gross insult to his daughter, early in June, 1381, and calling his neighbors to shield him from punishment, soon found himself at the head of a considerable multitude; and the excitement spreading over the nine southeastern counties, a march against London was determined on for the redress of grievances. A vast mob, usually said to have numbered 100,000, marched on London, and took possession of the southern portion of the city. The king met one division of this force, composed chiefly of the Essex peasantry, at Mile End on June 14, 1381, and by fair promises induced them to return home. The other body, composed of the men of Kent, burned the Duke of Lancaster's palace, plundered a portion of the city, seized the Tower, put to death the lord treasurer, Sir Robert Hales, and the Archbishop of Canterbury, destroyed the Savoy Palace, the archbishop's palace, and the priory of St. John's, Clerkenwell, and advanced to Smithfield (June 15), where they were met by some of the authorities, with the young king at their head. In the parley which ensued the arrogance of Wat was so great that Sir William Walworth, the lord mayor of London, rushed upon him and killed him on the spot. Richard declared to the excited mob that he would be their leader himself, and actually conducted them out of the city. On the following day they were attacked by Sir William Knollys, dispersed, and their leaders mercilessly punished. Seven thousand are said to have been killed in fight or executed after the revolt was suppressed, and as the king was false to his promises the movement failed of its immediate object. F. M. COLBY.

Waugh, EDWIN: dialect-writer; b. at Rochdale, Lancashire, England, Jan. 29, 1817; educated at the commercial academy of that place; was apprenticed to a bookseller and printer; worked at his trade as a journeyman nearly ten years; was then appointed secretary to the Lancashire public school association for the promotion of a national plan of secular education; filled that post five years, and then devoted himself entirely to literature, having by his cultivation of the dialect of his native county won the designation of the Lancashire poet. He was the author of *Sketches of Lancashire Life and Localities* (1855; 4th ed. 1869); *Poems and Lancashire Songs* (1859; new ed. 1870); *Rambles in the Lake Country and its Borders* (1862); *Tufts of Heather from the Lancashire Moors* (1864); *Irish Sketches*; *Home*

Life of the Lancashire Factory-Folk (1866); *Saucho's Wattle*, a series of northern anecdotes; *The Chimney Corner*, a series of country tales (1879); *Roads out of Manchester*; *The Limping Pilgrim*; and other works. In 1882 he received a pension of £90 from the civil list. D. at New Brighton, Cheshire, Apr. 30, 1890. A selection from his poems appeared under the title *Poesies from a Country Garden* (2 vols., 1865). A complete edition of his writings in ten volumes was issued at Manchester in 1881-83. Revised by H. A. BEERS.

Waukegan: city; capital of Lake co., Ill.; on Lake Michigan, and the Chi. and N. W., and the Elgin, Joliet and East, (Belt Line) railways; 36 miles N. of Chicago, 50 miles S. of Milwaukee, Wis. (for location, see map of Illinois, ref. 1-G). It is on a bluff 80 feet above and overlooking the lake, has a deep, improved harbor and a fine beach, and is a shipping point for iron, lumber, salt, and coal. Many Chicago business men have summer and permanent residences here. The city is in an agricultural region; has a public park, improved water-works, paved streets, high school, public library, a national bank with capital of \$50,000, a State bank with capital of \$50,000, and a daily and three weekly newspapers; and is principally engaged in the manufacture of railway supplies, barbed wire, plumbers' hardware, zinc oxide, leather dusters, builders' hardware, starch, carriages and wagons, leather, and machinery. Pop. (1880) 4,012; (1890) 4,915. F. T. RADECKE, CITY EDITOR OF "REGISTER."

Waukesha, waw'ke'-shaw: village; capital of Waukesha co., Wis.; on the Fox river, 5 miles from its source (Pewaukee Lake), and on the Chi. and N. W., the Chi., Mil. and St. P., and the Wis. Cent. railways; 20 miles W. of Milwaukee, 98 miles N. of Chicago (for location, see map of Wisconsin, ref. 7-F). It is one of the principal health resorts in the State, has magnesian springs that are recommended for kidney and liver diseases, and is connected with Pewaukee Lake by electric railway. The village has gas and electric-light plants, water-works, county, town, and village buildings, 9 churches, 5 public schools, Roman Catholic and Lutheran parochial schools, Carroll Academy (a classical and scientific school), the Wisconsin Industrial School for boys, 2 national banks with combined capital of \$200,000, and 3 weekly newspapers. There are quarries of dolomite building-stone, railway-car shops, several flour-mills, 2 breweries, malleable iron plant, and cast-iron works. Pop. (1880) 2,969; (1890) 6,321; (1895) 7,222. THERON W. HAIGHT.

Waukon': town; capital of Allamakee co., Ia.; on the Chi., Mil. and St. P. Railway; 18 miles W. of the Mississippi river (for location, see map of Iowa, ref. 2-J). It is in an agricultural and fruit-growing region; contains 7 churches, high school, convent school, business college, public library, a national bank with capital of \$50,000, and 2 State banks with combined capital of \$65,000; and has 2 newspapers, several flour-mills, wagon-factories, creamery, and canning-factory. The town is an important market for live stock. Pop. (1880) 1,350; (1890) 1,610; (1895) State census, 1,852. EDITOR OF "STANDARD."

Waupaca: city (chartered in 1875); capital of Waupaca co., Wis.; on the Waupaca river, and the Wis. Cent. Railroad; 40 miles N. W. of Oshkosh, 135 miles N. W. of Milwaukee (for location, see map of Wisconsin, ref. 5-E). It is in an agricultural region, has excellent water-power, contains the State Soldiers' Home, and has 2 national banks with combined capital of \$100,000, 2 weekly newspapers, several foundries and flour-mills, woolen-mill, and potato-starch factory. The city is a summer resort with many attractions, including a chain of picturesque lakes. Pop. (1880) 1,392; (1890) 2,127; (1895) State census, 2,823. EDITOR OF "REPUBLICAN."

Waupun': city; Fond du Lac and Dodge eos., Wis.; on the Chi., Mil. and St. P. Railway; 18 miles S. W. of Fond du Lac, 68 miles N. W. of Milwaukee (for location, see map of Wisconsin, ref. 6-E). It is in an agricultural region; contains 9 churches, 2 public high schools, the State prison, and a national bank with capital of \$50,000; and has 2 weekly newspapers, manufactories of carriages, pumps, windmills, cigars, umbrellas, cane goods, and, in the prison, shoes. Pop. (1880) 2,353; (1890) 2,757; (1895) 3,216. PROPRIETORS OF "LEADER."

Wausau, waw'saw: city; capital of Marathon co., Wis.; on both sides of the Wisconsin river, and on the Chi. and N. W. and the Chi., Mil. and St. P. railways; 40 miles N.

of Stevens Point, 180 miles N. W. of Milwaukee (for location, see map of Wisconsin, ref. 4-D). The surface has a gradual ascent from the river on both sides. The city is provided with numerous parks, paved streets, electric lights, and water-works with reservoir capacity of 3,000,000 gal. per day, and has 3 banks with combined capital of \$260,000 and deposits exceeding \$1,000,000, and a daily and 6 weekly newspapers. Among the notable buildings are the county courthouse (cost \$100,000), the county insane asylum (cost \$125,000), and the city-hall (cost \$25,000). There are 19 churches, viz.: Methodist Episcopal, Roman Catholic, German Lutheran, and Presbyterian, 2 each; and German Methodist, Baptist, German Baptist, Norwegian Lutheran, Swedish Lutheran, Evangelical Lutheran, Evangelical, Apostolic Evangelical, German Reformed, Protestant Episcopal, and Universalist, 1 each. The educational institutions comprise 10 public schools, with 48 teachers and 2,300 pupils, and 2 Roman Catholic and 3 Lutheran parochial schools, with a total enrollment of about 700. The annual tax levy is \$65,000; receipts from water rent and licenses, \$25,000; expenditures, \$90,000; bonded debt, \$165,000; and assessed valuation, \$3,530,000. Business interests include about 40 manufacturing plants, which employ about 1,800 people. There are 6 large sawmills, 2 flour-mills, 3 box-factories, several planing-mills, 2 quartz sand-mills, 2 tanneries, 7 cigar-factories, extensive granite quarries, furniture-factory, wood-novelty works, boiler-works, and other plants. Wausau was settled in 1842; was first known as Big Bull Falls, because of the falls in the river here; and was first given railway accommodations in 1874. Pop. (1880) 4,277; (1890) 9,253; (1895) State census, 11,013.

EDITOR OF "CENTRAL WISCONSIN."

Wau'soon: village; capital of Fulton co., O.; on the Lake Shore and Mich. S. Railway; 12 miles N. of Napoleon, 33 miles W. by S. of Toledo (for location, see map of Ohio, ref. 1-D). It is in an agricultural region, 12 miles from the Maumee river; is an important trade center; and has electric lights, large public school, 2 private banks, 2 large flour-mills, public library, and 3 weekly newspapers. Pop. (1880) 1,905; (1890) 2,060; (1895) estimated, 2,400.

EDITOR OF "REPUBLICAN."

Wauters, vō'tēr, ĔMILE: historical and portrait painter; b. in Brussels, Nov. 29, 1846; pupil of Portaëls in Brussels, and of Gérôme in Paris; received second-class medals at the Salons of 1875 and 1876, and medals of honor at the Paris Expositions of 1878 and 1889; received the decoration of the Legion of Honor (1878), and of the Orders of Leopold of Belgium and Francis Joseph of Austria; member of Brussels, Vienna, and Madrid Academies. *Madness of Hugh Van der Goes* is in the museum, and *Citizens of Brussels demanding the Constitution of Duke John IV.* in the city-hall at Brussels. His studio is in Brussels. W. A. C.

Wave-lengths: See WAVES.

Wavellite: a mineral, a hydrous aluminum phosphate, named after Dr. Wavell (d. 1829), who discovered it in Cornwall, England. It occurs near Bellows Falls, N. H.; at the Washington mine, Davidson co., N. C.; and in York and Chester eos., Pa. It is found usually in radiated spheroidal masses of white or yellow-green or brown color, translucent, harder than calcite, approaching fluor; crystal-system, rhombic.

Wave-motion: See WAVES.

Wave-offerings: in the Hebrew ritual, those offerings which were borne by the offerer upon his hands before the priest and were *waved* by the priest moving the offerer's hands in a horizontal direction. Most commonly, doubtless, this ceremony took place at the offering of private peace-offerings (Lev. vii. 29-34), but it also occurred in connection with the offerings enjoined at the consecration of priests (Ex. xxix. 24, 26), the dedication of Nazarites (Num. vi. 20), the jealousy-offering (Num. v. 25), the trespass-offering of the leper (Lev. xiv. 12), and at the offering of the sheaf of new grain at the Passover (Lev. xxiii. 11), and the loaves of first ripe grain and peace-offering lambs at the Feast of Weeks (Lev. xxiii. 17-20). The meaning of the rite is plain when it is noticed that the parts waved were almost exclusively those parts of the sacrifices which were allotted to the priests as a gift from Jehovah. The swinging forward meant the presentation to God, the swinging backward God's return of the gift for the use of his priest (*Oehler*). SAMUEL MACAULEY JACKSON.

Waverley Novels: See SCOTT, SIR WALTER.

Waverly: village (founded in 1836); Morgan co., Ill.; on the Jacksonv., Louisv. and St. L. and the St. L., Chi. and St. P. railways; 19 miles E. S. E. of Jacksonville, the county-seat, and 25 miles S. W. of Springfield (for location, see map of Illinois, ref. 7-C). It is in an agricultural and dairying region, and has 8 churches, graded schools, 3 private banks, a weekly newspaper, creamery, tile-works, and several flour-mills and grain elevators. Pop. (1880) 1,124; (1890) 1,337; (1895) estimated, 1,800. EDITOR OF "JOURNAL."

Waverly: city; capital of Bremer co., Ia.; on the Cedar river, and the Burl., Ced. Rap. and N., the Chi. Gt. West., and the Ill. Cent. railways; 12 miles N. of Cedar Falls, 28 miles S. E. of Charles City (for location, see map of Iowa, ref. 3-1). It is in a dairying and stock-raising region, contains Wartburg College (Lutheran), and has 6 churches, graded public schools, 20 creameries and cheese-factories, creamery-supply factory, furniture-factory, a national bank with capital of \$100,000, a State bank with capital of \$50,000, a loan and trust company with capital of \$25,000, and 4 weekly newspapers. Pop. (1880) 2,345; (1890) 2,346; (1895) 2,916. EDITOR OF "INDEPENDENT."

Waverly: village; Tioga co., N. Y.; on the Chemung river, and the Del., Lack. and W. and the Erie railways; 18 miles E. S. E. of Elmira, 19 miles W. S. W. of Owego (for location, see map of New York, ref. 6-F). It is the shipping-point for a large agricultural and dairying region; has electric lights and electric railways connecting the city with Sayre and Athens, Pa.; and has a union school, several grammar and primary schools, 5 churches, town-hall, opera-house, a national bank (capital \$50,000), a State bank (capital \$50,000), and 3 weekly papers. Pop. (1880) 2,767; (1890) 4,123; (1895) estimated, 7,000. EDITOR OF "TRIBUNE."

Waverly: village (laid out in 1829); capital of Pike co., O.; on the Scioto river, the Ohio Canal, and the Norfolk and West. and the Ohio S. railways; 16 miles S. of Chilli-cothe, 29 miles N. of Portsmouth (for location, see map of Ohio, ref. 7-E). It is in an agricultural, tobacco-growing, and stock-raising region, and has a private bank, 3 weekly newspapers, union school, saw, flour, and planing mills, furniture-factories, tannery, and distilleries. Pop. (1880) 1,539; (1890) 1,567.

Waves [deriv. of the verb *wave* < O. Eng. *waflan*, waver, hesitate; Icel. *vāfa*, vibrate]: the forms assumed by parts of an elastic medium whose particles are in a state of oscillation—that is, move to and fro within certain limits. In certain kinds of waves the particles move in the direction in which the wave is propagated. Of this kind are sound-waves in the air, water, etc. (See ACOUSTICS.) In waves of light, radiant heat, and electro-magnetic vibrations which take place in the ether, the oscillations are transverse to the line of propagation. (See LIGHT.) This article is divided into two parts, the first treating of waves in ether, and more especially of light-waves and their lengths, and the second of the different kinds of waves on the surface of sheets of water.

I. WAVES IN ETHER.

The sensation of light is, in general, produced as the consequence of some phenomenon going on at a distance, e. g. a candle burning or a gas heated to incandescence. The process by which this effect is carried across the intervening space is now known to be a succession or train of waves. This is perfectly analogous to the result produced on the shores of a pond of water when waves are caused by the dropping of pebbles into the middle of the pond, or to a sound being heard by means of waves in the air, which are sent out by a distant horn. In all wave-motions the individual particles of the medium through which the waves are passing merely vibrate to and fro; the *form* alone advances. In the case of light we know, further, that the waves are not in ordinary matter like air or glass, but are in a medium called ether, which permeates all space, and which is present between the smallest portions of ordinary matter. Molecules of matter act like so many obstacles in the ether, loading it and hindering the free passage of the ether-waves.

All waves are characterized by certain properties. The length of a wave is the distance between two consecutive points where the state of the motion is identically the same, or, as ordinarily expressed, it is the distance from crest to crest or from hollow to hollow. The frequency or wave-number is the number of "crests" which pass by any fixed point in one second of time. When a train of waves passes from the free ether into the ether which has ordinary

matter immersed in it—e. g. when light passes from a vacuum into air or glass, or when it passes from one kind of matter into another—the wave-length is changed, owing to the influence of the molecules of matter; but the frequency remains unchanged. So the frequency is the permanent characteristic of a train of waves. The length of the wave is characteristic only for a given medium under definite conditions. The frequency, however, can not be measured directly, whereas the wave-length can; but in expressing the values for wave-lengths care must be taken always to define the conditions under which they are measured.

These ether-waves may be produced in many ways. Every portion of matter is sending them out as the result of molecular vibrations, which can be increased or decreased by the application or withdrawal of heat. Any oscillating electric charge or current also causes them. It is found by experiment that these waves may have various lengths, ranging from $\frac{1}{100000000}$ ths of a centimeter to a distance measured in kilometers, and that different effects are produced by different waves. If they have lengths lying between $\frac{1}{10000000}$ ths and $\frac{1}{8000000}$ ths of a centimeter—i. e. if they are about $\frac{1}{8000000}$ th of an inch long, they produce on the retina of the eye the sensation of light. The shortest visible waves give rise to the sensation violet; the longest, the sensation red; those of intermediate length, the sensations blue, green, yellow, etc. Waves slightly longer than these visible ones may be detected by their heating effect or by their influence on phosphorescent bodies. Waves much longer may be measured by electrical appliances. Waves shorter than the visible ones produce certain chemical reactions, and may be measured by photographic means.

Apart from purely theoretical reasons, the chief interest in the determination and knowledge of wave-lengths of ether-waves depends upon two facts.

1. A luminescent vapor or gas is emitting trains of waves of definite frequencies, which are characteristic of the substance in a given condition. And since the frequencies are definite, so are the wave-lengths for any specified medium. The light coming from any source, when analyzed into separate trains of waves by a prism or grating, is said to form its spectrum. Thus copper vapor has a characteristic spectrum; hydrogen, another, etc.

2. A vapor can absorb—i. e. prevent passing—waves having the same frequencies as those it would emit if it were more incandescent. So, if on the examination of any light certain waves which are characteristic of some known vapor are shown to be wanting, it is evident that the light must somewhere on its course have passed through a comparatively cool layer of this vapor.

Owing to the importance of these facts, measurements have been made of the wave-lengths in the spectra of all known substances; and the spectra of all possible sources of light, such as the sun, comets, etc., have been carefully studied to see whether certain waves are present. With the apparatus and methods in use great accuracy can be obtained, and the information thus acquired is of great use. The purity of any chemical element may be tested by heating it or otherwise rendering its vapor luminescent, because the smallest trace of impurity would make itself known by emitting its characteristic waves. The composition of many chemical substances can be easily learned by a study of the spectra emitted. New elements or substances may be discovered, or the existence of new compounds proved, if spectra are observed which are not characteristic of other substances. Much can be learned about the constitution of the sun, the planets, and many of the stars. If the light is examined which comes from the sun, it is found that many waves are absent, whereas if the sun were simply a white-hot solid mass there would be none missing within certain limits. Further, experiments prove that, almost without exception, all these waves which are absent are exactly those which would be emitted by incandescent vapors of certain known substances. This proves, then, that these vapors must form an atmosphere around the immensely hot nucleus of the sun, and thus demonstrates the existence in the sun of the substances producing the vapors. A further study of the solar spectrum, and a comparison of it with the spectra of known elements under known conditions, furnishes considerable information about the temperature of the sun, and about the successive layers of vapors which surround the nucleus. Similarly, a study of the spectra of the stars, planets, comets, and nebulae supplies accurate information about their history, their temperature, and condition. In certain cases there are slight differences between the wave-lengths of the vapors as

known here on the earth and those which appear due to the same vapors in the spectra of the stars or planets. These discrepancies may be due to two causes: One is a possible difference between the pressure or temperature of the vapor on the star or planet and that of the vapor as produced on the earth. The other is the possible motion of the star or planet toward the earth, or away from it. If it is approaching the earth, more waves are crowded into a given space than would naturally be there, and so the distance between two crests—i. e. the wave-length—is lessened by a certain amount. Similarly, if the star is receding from the earth, the wave-length will be increased. These changes in the wave-length can be measured, and, as a rule, it is not difficult to determine their exact cause. See SPECTRUM, SUN, and STARS.

A noted application of the properties of waves and their lengths has been made by Prof. Albert A. Michelson, of Chicago, in comparing the international standard of length, the centimeter, with the wave-length of a particular kind of light. The centimeter is the $\frac{1}{100}$ th portion of the length of a certain metal rod which is kept in Paris, when the rod is at the temperature of melting ice. This is a perfectly arbitrary length, and the bar is liable to accident and to slight changes. So far as is known the frequency of any train of waves sent out by a definite vapor under definite conditions is a fixed, unalterable quantity. Consequently the wave-length of these waves when passing through any definite medium is also a fixed quantity, and thus affords a fixed standard of length which is liable to no change and which can easily be measured anywhere on the earth's surface and at any epoch of time. Prof. Michelson has made a comparison of the length of the standard bar in Paris with the wave-length of a certain train of waves emitted by cadmium vapor, the external conditions being, of course, accurately determined and noted, so that, even if the standard bar be destroyed or injured, the centimeter can be accurately constructed and restored by laying off a definite number of wave-lengths of light.

It is found that wave-lengths may be measured to a degree of accuracy that limits the error to less than one part in 200,000. The method in universal use is to compare the wave-lengths of the spectrum under investigation with those previously observed and measured. By determining the differences between these wave-lengths and using a method of interpolation, the desired quantities can be found. In order to have certain wave-lengths which can be used as standards, many observations and measurements have been made and recorded. The most reliable method in use is one which depends upon the knowledge of some one standard wave-length, and upon the comparison of the others with this one by means of micrometric measurements. This method is due to Prof. Henry A. Rowland, of Baltimore, and is based upon the use of a concave grating, the properties of which were discovered by him. The standard wave-length now universally adopted is that of 5896.156 Ångström units (such a unit being $\frac{1}{100000000}$ th of a centimeter) for that one of the waves due to sodium vapor which is called D, when the vapor is in the condition it is on the sun and when the wave-length is measured in air at 20° C. and a pressure of 76 cm. of mercury. The scale of wave-lengths which is based upon this standard is ordinarily known as Rowland's scale. The most accurate measurements of wave-lengths have been made by Rowland, working in Baltimore, and by Kayser and Runge, in Hanover, Germany. Rowland has given especial attention to the wave-lengths in the solar spectrum and in the spectra of certain elements. Kayser and Runge have made no observations on the solar spectrum, but have made a most careful study of the spectra of the elements. They have measured with the greatest care the wave-lengths characteristic of each element, and have sought to find mathematical relations between the waves of any one spectrum, and also between the waves of the spectra of different elements. Their investigations show that a careful comparison of wave-lengths throws considerable light upon the structure of molecules and upon their modes of vibration. There are two classes of spectra which even a superficial inspection shows to be subject to some simple mathematical law. One is the so-called fluted or band spectrum, which is illustrated by the spectra of carbon, nitrogen, water-vapor, and a great many compound substances. The other is the line spectrum of hydrogen or others similar to it. Groups of waves like the hydrogen series are common to sodium, zinc, cadmium, and other elements. The wave-lengths of the waves forming a band

spectrum obey an exceedingly simple mathematical law, which can be thus expressed:

$$\frac{1}{\lambda} = a + bn^2,$$

where λ is the wave-length; a and b are constant numbers for any one band; and n is each one in turn of the series of numbers 0, 1, 2, 3, etc. This law was discovered almost simultaneously by several physicists who were engaged on spectrum-work, but it was first published by Deslandres, and is sometimes called by his name. It can, however, be regarded as only a first approximation, for Kayser and Runge have shown that the law which best expresses the wave-lengths of certain bands is

$$\frac{1}{\lambda} = a + be^{cn} \sin dn^2,$$

where a, b, c, d, e are constants; and n is in turn each one of the integer numbers.

The wave-lengths of the waves forming the hydrogen spectrum obey a law which is quite different. It was discovered by Balmer in 1885, and is sometimes called Balmer's law. It may be expressed thus:

$$\lambda = \lambda_0 \frac{n^2}{n^2 - 4},$$

where λ is the wave-length; λ_0 is a certain constant; and n is in succession each one of the numbers 3, 4, 5, 6, etc. It was noticed by many observers that there were several substances whose spectra bore a close resemblance to that of hydrogen, but Kayser and Runge were the first to make any systematic study of them. They succeeded in finding a simple modification of Balmer's formula, which would quite well express the law of distribution for the wave-lengths of all these spectra which have groups or series analogous to the hydrogen one. Their law may be written:

$$\frac{1}{\lambda} = A + Bn^{-2} + Cn^{-4}$$

where λ is the wave-length; $A, B,$ and C are constants characteristic of any one series of wave-lengths; and n is in turn each one of a series of integer numbers.

Besides this simple arrangement of waves in bands or series there are many other mathematical relations which have been discovered and elaborated, notably by Kayser and Runge and Rydberg. If the spectrum of any substance—e. g. carbon or nitrogen—contains several bands, not alone do the individual wave-lengths of each band obey Deslandres's formula, but the bands themselves are also distributed according to the same law. In the spectra of many elements which contain series like the hydrogen one, the waves which form the members of the series are double or triple. (The sodium spectrum contains a series of doubles; the zinc spectrum, a series of triples, etc.) It has been shown that for any one series the difference between the frequencies of the two (or three) waves forming the double (or triple) is a constant quantity. Further, applying Kayser and Runge's formula—

$$\frac{1}{\lambda} = A + Bn^{-2} + Cn^{-4}$$

—to the spectra of the elements which form a group of allied chemical substances, such as zinc, cadmium, and mercury,

or magnesium, calcium, and strontium, it is found that the constants $A, B,$ and C follow certain general numerical laws.

It is interesting to note that by the use of these mathematical relations Kayser and Runge and Rydberg have been able to predict the existence of certain waves in the spectra of certain elements; and these predictions are all being gradually verified. Their chief importance, though, lies in the fact that by means of them some knowledge of the structure of molecules may perhaps be finally obtained.

JOSEPH S. AMES.

II. WAVES IN WATER.

Water is distinguished from solid bodies by its mobility—that is, by the freedom with which its elementary particles move with reference to one another. It results from

this mobility that a disturbance communicated to particles of water at any point becomes the occasion of disturbance to contiguous particles, and through these to particles more remote, propagating itself in this manner to great distances in the form of oscillatory movements called waves.

The physical characters of waves are familiar to all. A stone dropped into standing water is followed by a series of circular ridges, spreading till they reach the shore or become so indistinct as to escape observation. Upon the great ocean the phenomenon presents itself on a grander scale. The crests of waves attain at times a height of 30 feet and move with the velocity of a railway passenger-train. During a first sea-voyage, upon observing such liquid hills approaching the vessel with such a velocity, it is difficult to divest one's self of the impression that the latter is in danger of being shattered to fragments. Yet it receives but a moderate shock, and is lifted with a movement which, to the voyager who is accustomed to it, is not even unpleasant. Were the mass of water moving with the velocity of the wave, the effect upon vessels would be disastrous, as is readily seen in the rapidity with which a stranded vessel is broken up when exposed to the full force of the waves. The character of the wave is here so changed by the shelving ground that the water has a rapid movement.

In a body of water the movement of any particle is controlled by the proximity of other particles. No particle can move without occasioning a movement of other particles, and it can move only in such a manner as is consistent with the movement of the entire mass. Each particle moves in a closed orbit around its position of rest, returning to the same position at regular intervals. This fact can be verified by observation. If the effect of waves upon a small body floating in the water is noted, it will be seen that the latter is not carried along by the wave. When the crest of the wave passes the body it moves a short distance in the direction of the wave-motion; when it is in the hollow of the wave it moves slightly in the opposite direction. If a float which gradually sinks in the water is watched, it will be found that these movements are not confined to the surface, but extend as deep as the observation reaches. The particles of water move forward rising and sinking, and return sinking and rising, describing a closed orbit, but whether this orbit is circular or elliptical can not be learned by observation. Mathematicians who have investigated this subject find that in water of very great depth the orbit of each elementary particle is an exact circle whose center is in the position occupied by the particle when at rest. These circular orbits are greatest at the surface of the water, being there equal in diameter to the height of the wave. They diminish rapidly farther down, so that when the water at the surface has a movement of 20 feet, causing waves 20 feet high from trough to crest, it has at a depth of 50 feet a movement of only 7 feet, and at a depth of 200 feet a movement of not more than 4 inches.

The figure below shows how the circular movements of the different particles of water combine to produce the undulations of the surface which we call waves. AB is the surface of the water when at rest. The circles are the orbits of the particles at the surface, which for a wave moving leftward are supposed to be in motion in a direction opposite that of the hands of a clock. The particle h , whose position of rest is h , is at the highest point of its orbit; the next particle to the right, k , whose position of rest is k , is slightly past the

Waves.

summit of its orbit, and farther to the right each particle is in a little more advanced position than the one preceding. The particle a , whose position of rest is a , is at the lowest point of its orbit. The surface of the water at the instant under consideration is represented by the curved line CD , a being the highest point or crest of the wave, a' the lowest point or trough of the wave. The motion continuing, the crest advances toward the left, and when the particle h has reached the lowest point of its orbit that point becomes the trough of the wave, and a' , having then reached the highest point of its orbit, is the crest of the succeeding wave. The horizontal distance between the crests of two consecutive

waves is called the length of the wave. The particles of water which when at rest lie all in the same vertical line, constituting a vertical filament of water, all arrive during wave-motion at the summits of their orbits at the same instant. The orbits diminish in diameter downward, so that at a depth of a few hundred feet the movement practically ceases. The lower part of the filament remains immovable and its upper part bends like a stalk of wheat in a field under the action of the wind. When the crest of the wave coincides with the filament, the latter is erect and elongated. It then bends in the direction of the wave's motion and returns to its erect position when the trough of the wave passes. It is then shortened and thickened. It then bends in the direction opposite to that of the wave's motion, and so on.

The form of the wave is cycloidal, but it is not the common cycloid, which is a curve traced by a point on the circumference of a circle rolling upon a straight line. Were this the case, the height of the wave would bear the same proportion to its length that the diameter of a circle bears to its circumference; whereas there is not necessarily any definite relation between the height and length of the wave. In the same system of waves the same relation between the height and the length will always be found; but a slight change in the direction or intensity of the wind gives rise to a different system in which a different relation exists. Different systems of waves often occur at the same time. It is a matter of common observation at the seashore that at intervals a wave occurs much higher than the preceding. This arises from the coincidence of two waves belonging to different systems. To the same cause is due the "seas" which break over the decks of vessels during storms, carrying away everything not securely fastened.

The velocity of a wave depends upon its length. To find this velocity when the length is known, the radius of a circle whose circumference is the length of the wave is first found. Designating this radius by r , the velocity is the same that a heavy body would acquire in falling freely through a height equal to one-half r . To find the radius of the orbit of a particle at a given depth below the surface, divide the given depth by r , and find the number of which this quotient is the natural logarithm. Divide r by this number, and the quotient will be the radius sought. Waves in deep water usually arise from the action of the wind, and their motion when unobstructed is in the same direction as the wind to which they owe their origin. How powerfully the wind acts in acceleration of the molecular movements to which waves are due will appear upon a little reflection. The elevated part of the wave is fully exposed to the action of the wind, and here the particles of water are moving in the same direction as the wind. The trough of the wave, in which the particles are moving in the opposite direction, is mainly screened from the action of the wind by the neighboring crest. When the wind begins to blow while the water is smooth, it might appear difficult to understand how it can originate waves, since the wind would seem to exert a uniform pressure upon all parts of the surface. The wind, however, never acts with a perfectly uniform and steady pressure. There is always enough of inequality to cause a ruffling of the surface, and the minute waves, once formed so as to present a surface to the direct action of the wind, are rapidly increased in magnitude. They continue to increase until they have attained a velocity nearly equal to that of the wind.

The tendency of waves is to form in long lines at right angles to the direction of the wind. This tendency is the more marked in proportion as the expanse of water is unlimited and the wind unvarying in force and direction. It is rare, however, that an opportunity is obtained to observe the phenomenon of waves in its entire simplicity. Under the most favorable circumstances the eye can follow the wave longitudinally but a very short distance. Neither, if one fixes the eye upon the crest of a wave and endeavors to follow its movement, can it be traced to any great distance before it disappears and a new wave arises. The more common case is a system of waves caused by a local wind, crossed in different directions by other systems originating in distant parts of the ocean, and by waves reflected from the shore, the whole often forming a tumultuous commotion of waters, in which scarcely any law of movement can be recognized. This shows that different simple movements of the elementary particles may coincide and superpose themselves upon one another in all conceivable ways.

The preceding refers to waves in deep water—that is, water

so deep that the bottom exerts no influence upon the movements of the elementary particles. These move in precisely the same manner as though the depth were infinite. Hence the preceding is called, for distinction, the theory of waves in water of infinite depth. In water of moderate depth the proximity of the bottom exerts an influence the more marked in proportion as the depth is less. Where the depth is considerable, this influence manifests itself in a slight horizontal movement of the water at the bottom. As the depth diminishes, this horizontal movement increases, until finally, at slight depths, the particles have the same horizontal movement at the bottom as at the surface, while the vertical movement is greatest at the surface and diminishes to nothing at the bottom. The particles thus move in orbits which are often nearly circular at the surface, and become more and more flattened toward the bottom, where they are simply straight horizontal lines. The most important difference between waves in infinite depth and those in finite depth is that in the former the velocity with which the wave travels appears to have no relation to the depth, depending solely upon the magnitude of the wave; whereas in the latter the velocity depends upon the depth, being, according to the most trustworthy observations, equal to that velocity which a heavy body acquires by falling freely through a height equal to half the depth, measured from the top of the wave.

J. Scott Russell, an English marine engineer, made very extended and valuable researches upon the subject of waves. These researches were undertaken at the instance of the British Association for the Advancement of Science, and the results are detailed in a provisional report made to the association in 1837, and published in its *Transactions* for 1837, and a more complete report in 1844. The following are some of the conclusions arrived at: (1) The existence of a *great primary wave* of fluid, differing in its origin, its phenomena, and its laws from the undulatory and oscillatory waves which alone had been investigated previous to the researches of Mr. Russell, has been confirmed and established. (2) The velocity of this wave in channels of uniform depth is independent of the breadth of the fluid, and equal to the velocity acquired by a heavy body falling freely by gravity through a height equal to half the depth of the fluid, reckoned from the top of the wave to the bottom of the channel. (3) The velocity of this primary wave is not affected by the velocity of impulse with which the wave has been originally generated; neither does its form or velocity appear to be derived in any way from the form of the generating body. (4) This wave has been found to differ from every other species of wave in the motion which is given to the individual particles of fluid through which the wave is propagated. By the transit of the wave the particles of the fluid are raised from their places, transferred forward in the direction of the motion of the wave, and permanently deposited at rest in a new place at a considerable distance from their original position. There is no retrogradation, no oscillation; the motion is all in the same direction, and the extent of the transference is equal throughout the whole depth. Hence this wave may be descriptively designated the *great primary wave of translation*. The motion of translation begins when the anterior surface of the wave is vertically over a given series of particles; it increases in velocity until the crest of the wave has come to be vertically above them; and from this moment the motion of translation is retarded, and the particles are left in a condition of perfect rest at the instant when the posterior surface of the wave has terminated its transit through the vertical plane in which they lie. This phenomenon has been verified up to depths of 5 feet. (5) The elementary form of the wave is cycloidal; when the height of the wave is small in proportion to its length, the curve is the prolate cycloid; and as the height of the wave increases, the form approaches that of the common cycloid, becoming more and more cusped until at last it becomes exactly that of the common cycloid with a cusped summit; and if by any means the height be increased beyond this, the curve becomes the cuspate cycloid, the summit assumes a form of unstable equilibrium, the summit totters, and, falling over on one side, forms a crested wave or breaking surge. (6) A wave is possible in forms of channel where the depth is not uniform throughout the whole breadth. . . . In the sloping or triangular channel the velocity is that due to one-third of the greatest depth. In a parabolic channel the velocity is that due to three-eighths or three-tenths of the greatest depth, according as the channel is convex or concave. (7) The height of a wave may be indefinitely increased by propagation into a channel which becomes narrower in the form of

a wedge, the increased height being nearly in the inverse ratio of the square root of the breadth. (8) If waves be propagated in a channel whose depth diminishes uniformly, the waves will break when their height above the surface of the level fluid becomes equal to the depth at the bottom below the surface.

In Russell's completed report, published in the report of the British Association for 1844, he states that he had in the interim extended his inquiries to what he calls the negative wave of translation, being a wave which is propagated not as a ridge, but as a cavity in the surface of the water. He gives the following summary of his conclusions on this subject:

"The characteristics of this species of wave of the first order are—(1) that it is negative or wholly below the level of repose. (2) That it is a wave of translation, the direction of which is opposite to the direction of transmission. In other words, the movement of the fluid particles is in one direction, that of the wave in another. (3) That its anterior form is that of the positive wave reversed. (4) That the path of translation is nearly that of the positive wave reversed. (5) That its velocity is, in considerable depths, sensibly less than that due by gravity to half the depth reckoned from the lowest point, or the velocity of a positive wave having the same total height. (6) That it is not solitary, but always carries a train of secondary waves.

"It is important to notice that the positive and negative waves do not stand to each other in the relation of companion phenomena. They can not be considered in any case as the positive and negative portions of the same phenomena, for the following reasons: (1) If an attempt be made to generate or propagate them in such a manner that the one shall be companion to the other, they will not continue together, but immediately and spontaneously separate. (2) If a positive wave be generated in a given channel and a negative wave behind it, the positive wave, moving with the greater velocity, rapidly separates itself from the other, leaving it far behind. (3) If a positive wave be generated and transmitted behind a negative wave it will overtake and pass it. (4) Waves of the secondary class, which consist of companion halves, one part positive and the other negative, have this peculiarity, that the positive and negative parts may be transmitted across and over each other without preventing in any way their permanence or their continued propagation. It is not so with the positive and negative waves of the first order. (5) If a positive and negative wave of equal volume meet in opposite directions they neutralize each other, and both cease to exist. (6) If a positive wave overtake a negative wave of equal volume they also neutralize each other and cease to exist. (7) If either be larger, the remainder is propagated as a wave of the larger class. (8) Thus it is nowhere to be observed that the positive and negative wave coexist as companion phenomena.

"These observations are of importance for this reason, that it has been supposed by a distinguished philosopher that the positive and negative waves might be corresponding halves of some given or supposed wave."

J. Scott Russell's researches were undertaken mainly with reference to navigation on canals. He concludes that the most economical velocity for a boat on a canal is that of the wave of translation which it causes—that is to say, the velocity due to one-half the depth. A boat moving with this velocity remains constantly on the crest of the wave, whereas a boat moving with a greater or less velocity is constantly generating new waves, which precede or follow it, and these waves are created at the expense of the motive power. Unfortunately this conclusion is of little practical value, as, in an ordinary canal of 5 feet depth, it would require a velocity of something over 9 miles an hour, which can not be attained with horses.

The great primary wave of translation occurs in canals, rivers, and estuaries. It does not occur on the open sea except in the form of a tide. This is a wave corresponding in all respects to the great primary wave of translation. It moves with a velocity very near that due to one-half the depth of water, and it affects the water through its entire depth. The fact noted by Russell that the height of a wave may be indefinitely increased by propagation into a narrowing channel, accounts for the enormously high tides observed on some coasts. For instance, in the Bay of Fundy the tide rises to a height of 60 feet, while it is not over 12 feet on the coasts of New England. Also in the Bristol Channel there is a tide of about 18 feet at the entrance, while at Chepstow it attains the height of 50 or 60 feet.

These phenomena result from the concentration of the energy of a moving wave of water into a narrowing space.

A series of experiments upon waves was made in 1859 by Bazin, an officer of the French Corps of Engineers. He had a perfectly straight and regular channel about 6½ feet wide, the bottom of which was inclined at the rate of about 1½ feet in 1,000, which gave him an opportunity of observing the effect of the diminishing depth upon the velocity and form of the wave. For the case of isolated waves, stations were established at distances of 60 to 65 feet, at which the time of the passage of the wave was noted. A few results of these observations are given below. They refer to positive waves—that is, to those which are wholly above the general water-level. These were generated by the sudden admission of a certain volume of water into the canal.

No. of points of observation.	Depth of water before the passage of the wave, feet.	Height of the wave, feet.	VELOCITY OF THE WAVE, FEET PER SECOND.		Remarks.
			Observed.	Calculated.

13	0.64	0.36	7.13	6.51	The wave broke between the 12th and 13th points of observation.

The wave traveled about 100 feet before passing the first point of observation. Here it moved as a perfectly symmetrical undulation, unaccompanied by any other wave. As the depth diminished the height of the wave increased and its velocity diminished as indicated by the figures; the front of the wave became steeper, till finally it broke into a mass of foam, and, resolving itself into a number of smaller waves, pursued its course. It generally broke before the depth became equal to the height of the wave, not fully verifying Russell's law in that respect. The velocity of the wave is computed according to the law announced by Russell, and agrees very well with observation. If too much water was admitted the entire mass did not continue together as a single wave. The superfluous water was thrown off, and formed one or more separate waves. Experiments were made upon negative waves, generated by suddenly withdrawing a quantity of water from the channel. This differed from the positive wave in this respect—it could not be generated singly. It was always accompanied by a series of oscillatory waves. Its velocity, however, contrary to the view expressed by Russell, was very nearly the same as that acquired by a heavy body in falling freely a height equal to one-half the depth of water reckoned from the lowest point of the wave. Bazin found that these waves were propagated according to the same law in moving as in still water, due allowance being made for the velocity of the current. The negative wave diminishes and decays much more rapidly in still water than the positive wave; which latter has, according to Russell, a remarkable longevity. This observer found that a wave of this description 6 inches in height was diminished only 1 inch by traveling 700 feet. Another, starting with a height of 6 inches, was 2 inches high after a journey of 3,200 feet. Both the negative and positive waves diminish much more rapidly in moving than in still water.

The breaking of a wave occurs when the conditions under which it finds itself do not admit of the necessary movements of the fluid particles. The movement of a wave in water of diminishing depth is the most common case. Another is the case above noticed of the solitary wave, which, when formed of a magnitude greater than corresponds to

the depth of the channel, spontaneously separates itself into two or more smaller waves. When a wave originating in deep water rolls toward a shoaling beach the water constituting the top of the wave is moving, at any given instant, toward the shore—that at the bottom in the opposite direction. This results from the circular movement of the fluid particles. This movement ceases at the instant of breaking, and the upper part of the wave moves forward toward the shore, while the lower part moves backward. This movement extends nearly to the shore, the great volume of water set in motion by the breaking waves moving toward the shore upon the surface and returning at the bottom. This action constitutes the under-tow which often proves dangerous to surf-bathers.

Waves always approach the shore in a direction nearly at right angles to the general line of the shore, whatever be the direction of the wind. This arises from the fact that if the wave approach in a direction inclined to the shore, the end nearest to the shore moving in shallow water is retarded, tending to swing the wave round into a direction at right angles to the shore. At a distance of 2 or 3 miles from the shore the waves usually move in the direction of the wind.

When the shore rises perpendicularly out of deep water, the waves do not break. They simply oscillate, rising a little higher at the shore than elsewhere, and are reflected, forming a new system of waves running in the opposite direction. It is said that vessels can lie off such a shore in the heaviest storms without danger. This fact is sometimes turned to account in the construction of breakwaters, which have latterly been made as perpendicular walls. In water so deep that the waves do not break, this form is well calculated to withstand their action. In shallow water, or where, as sometimes happens, the action of the waves and shore-currents is such as to deposit a bank of gravel or sand at the foot of the breakwater, causing the waves to break, their action is very destructive.

Earthquakes are sometimes accompanied by waves of formidable proportions, inundating shores ordinarily high above the reach of the tide. During the earthquake which destroyed the city of Lisbon in 1755 a wave 40 feet high rolled upon the shore. An Englishman residing there recorded in his journal that shortly after this wave ships at anchor in the deep river Tagus were observed resting on the ground. The wave was followed by two others of nearly the same height. A wave 60 feet in height reached Cadiz on the same occasion. The sea rose 20 feet in the Antilles, where the tide rarely exceeds 2 feet. Similar phenomena have been observed to accompany South American earthquakes. Humboldt relates that at Callao he saw a series of waves 10 or 14 feet high in the midst of a dead calm, which he supposed to originate in submarine earthquakes.

The force of waves as they break upon a shelving beach, and the circular movement of the water is transformed into a forward movement, is terrific. Constructions designed to withstand the force of waves tax to the utmost the resources of engineering. Thomas Stevenson relates that during the construction of the lighthouse at Barra Head, one of the Hebrides islands, he saw the waves move a stone measuring 500 cubic feet. The breakwater at the French port of Cherbourg is composed of an immense bank of loose stone, protected in parts by blocks of concrete measuring 700 cubic feet each. The bank is surmounted by a wall about 20 feet high. During the storm of Dec. 25, 1836, stones weighing nearly 7,000 lb. were thrown over the top of this wall, while many of the enormous concrete blocks were moved, some of them as much as 60 feet, and two of them were turned over. Hagen relates that in the harbor of Cette, during the storm of Aug. 20, 1857, a block of concrete measuring 2,500 cubic feet, which must have weighed 125 tons, was moved upon its bed something over 3 feet. Thomas Stevenson constructed an instrument for the direct measurement of the force of waves. He found that during the heaviest storms the force exerted by the waves of the Atlantic upon a solid surface exposed to their action is upon an average 614 lb. per square foot during the summer months, and 2,086 lb. during the winter months. The greatest pressure observed was 6,083 lb. per square foot.

A remarkable phase of wave-movement, alluded to by J. Scott Russell as the "tidal bore," is occasionally presented upon tidal rivers. The advent of the flood-tide is preceded and announced by a wave, sometimes of formidable dimensions, which runs up the river, announcing its advance by a great noise, and sweeping away all floating bodies which it

encounters on its passage. It occurs in India on the Hugli, in South America on the Amazon, upon the Seine and the Dordogne in France, where it is known as the *maree*, and in many other places. It is also recognizable by close inspection upon several smaller rivers. It occurs in considerable force on the Severn in England. It has been observed with great interest upon the Seine by the French engineer officers. It occurs only at the period of high or spring tides. The first wave has a height of 7 or 8 feet. It is followed in rapid succession by four or five smaller waves, and after their passage the water is found to have risen 4 or 5 feet above low tide. Those who have studied the subject give the following explanation of this remarkable phenomenon: At the period of dead low water the river is very low, and is flowing rapidly toward the sea. To better understand what occurs, we may conceive the rise of the tide to take place by a series of sudden jumps at regular intervals. That is, instead of supposing the tide to rise uniformly at the rate of say 1 foot in 12 minutes, let us consider what would take place if it were to rise suddenly 1 inch each minute. The first rise would move up the stream as a kind of wave, leaving a little deeper water behind than before it. The second would move a little faster than the first, both on account of the increased depth, and also by reason of the slightly diminished current. It accordingly very soon joins the first, and both advance as a single wave. Every successive wave, for the same reason, moves a little faster than the preceding, and all join the initial wave. Now, though the rise of the tide does not take place by perceptible sudden jumps, as supposed, it nevertheless does consist of a great number of very small increments of depth, and the influence of each successive increment of depth moves up the river faster than that of the preceding, so that all are concentrated into one grand wave. Where there is sufficient depth for the development of wave-motion, the bore does not break. In shoal water it breaks continually, and it does not, like other waves, exhaust itself by breaking, as its power is continually renewed. It has not been shown that the breaking wave follows the law of the great primary wave in moving with the velocity due to one-half the depth reckoned from the top of the wave. An ordinary flood moving down the channel of a river is an example of the great primary wave. Where the flood results from the sudden accession of a great volume of water to a shallow channel it moves with all the characters of the tidal bore. Such a flood may result from the bursting of a reservoir or from the storms which occur in mountainous regions of warm countries.

Thus far the undulatory wave has been considered, whose velocity depends on the wave-length, and the great primary wave whose velocity depends on the depth of water. There is a third class of waves distinguished from both the preceding. This distinction results from the peculiar character of the surface of water. An exceedingly thin film at the surface appears to lose in some degree the character of a fluid, and to acquire a certain stiffness and coherence not possessed by the general mass. (See LIQUIDS.) Its action is seen in the bubbles which float on the surface of water where there is a slight fall. The falling water carries down masses of air into the standing water. These masses, on rising, do not escape into the atmosphere directly, but lift the coherent film of the surface and remain momentarily inclosed in little hemispherical cells.

The tenacity of this film is so slight as to exert no appreciable influence upon ordinary undulatory waves; but the slight disturbances called ripples caused by a light puff of wind or by a stone dropped into still water are so strongly influenced by surface tension that they must be regarded as a distinct order of waves. The tension of the surface acts downward at the crest of the wave and upward at the trough. It increases the force with which the displaced particles tend to regain their positions. Its effect is to cause the wave to move faster than it would move under the action of gravity alone, just as an increase of the elastic force of a spring increases the rapidity of its vibrations.

The subject of waves in water can not be regarded as complete in its practical aspect without considering the pulsations which occur in closed pipes. An impulse communicated at any point to the water filling a closed pipe has the effect of putting the contiguous particles in a state of compression. This state of compression travels through the pipe with a velocity practically independent of the head or state of compression previously existing in the water. There is this analogy between the velocity of pulsations in pipes and waves in open channels: The latter move with the velocity

which a heavy body would acquire in falling a distance equal to half the depth of water in the canal. The former move with the velocity which a heavy body acquires by falling through a height equal to half that of a column of water representing its elastic force. The elastic force of any substance is the ratio which any force applied to it bears to the change of volume occasioned by the same. A pressure of one atmosphere, represented roughly by a column of water 34 feet high, diminishes the volume of water $\frac{1}{200000}$ part. The elastic force of water therefore is represented by a column of water 680,000 feet high. A heavy body falling one-half this distance would acquire a velocity of 4,677 feet per second. Experiment shows the velocity of pulsations or sound-waves in water a little greater than this, viz., 4,708 feet.

The force mains leading from the pumps in town water-works systems are constantly traversed by pulsations resulting from the action of the pumps. Every stroke of the pump causes a momentary increase of pressure which travels through the force main and all connecting pipes with a velocity of 4,708 feet a second. Reaching the open end of the pipe the pressure is released, and a negative wave travels back toward the pump. A pressure-gauge communicating freely with such a pipe is in a constant state of violent movement.

The subject of waves or pulsations in pipes is intimately connected with the impulse which occurs when the movement of water in the pipes is suddenly checked. To understand the nature and intensity of the force so generated a pipe of indefinite length, in which the water moves with a velocity of say 3 feet a second, may be selected as an illustration, and suppose this movement to be instantaneously arrested by the closing of a gate or valve. A great pressure is immediately developed at the valve, and this pressure is transmitted backward through the pipe with a velocity of 4,708 feet a second. That is to say, the water at a distance of 4,708 feet from the valve would come to rest in one second after the closing of the valve, and during that time would move 3 feet. The pressure developed by the arrest of motion is sufficient to diminish the length of a column of water 4,708 feet long by 3 feet, which is $\frac{1}{156933}$ of its entire length. Now a pressure of one atmosphere diminishes the length of a column of water by $\frac{1}{200000}$ part, so that the above diminution of $\frac{1}{156933}$ corresponds to 12.75 atmospheres, or to a head of $12.75 \times 34 = 435.5$ feet. It results from this mode of treating the question that the pressure resulting from an instantaneous arrest of movement does not depend upon the length of the pipe.

For the convenience of those who would like to pursue the subject of waves further the following sources of information are indicated. The labors of Newton, Laplace, Bernoulli, and Lagrange need not be particularized. They are interesting only as a part of the history of the subject. To Franz Gerstner is due the credit of having first solved the problem of wave-movement upon the assumption of a finite displacement of the fluid particles. His essay is contained in the *Transactions of the Royal Bohemian Scientific Society (Abhandlungen der kgl. Böhm. Gesellschaft der Wissenschaften)* for 1802. It was also separately printed at Prague in 1804, and is likewise contained in Gilbert's *Annalen*, vol. xxxii., as well as in Webers' *Wellenlehre*. This latter was published by the brothers Ernst Heinrich Weber and Wilhelm Weber at Leipzig in 1825. It is entitled *Wellenlehre auf Experiment gegründet* (Theory of Waves founded upon Experiment). J. Scott Russell's researches, as already mentioned, are contained in the *Reports of the British Association for 1837 and 1844*. The most complete theoretical exposition of the subject is Prof. G. B. Airy's essay entitled *Tides and Waves*, contained in the *Encyclopædia Metropolitana*, vol. v. of Mixed Sciences. It is here treated in a thoroughly scientific manner and in the utmost generality, presupposing very high mathematical attainments on the part of the reader. Prof. Airy affirmed that his formulas agreed as well as could be expected with the results of Scott Russell's experiments, but this assertion was emphatically denied by the latter. Hagen's researches upon this subject are contained in the *Transactions of the Royal Academy of Sciences of Berlin (Abhandlungen der Königl. Akademie der Wissenschaften zu Berlin)* for 1861. They are also embodied in substance in his great work, *Handbuch der Wasserbaukunst* (Handbook of Hydraulic Architecture, Berlin, 1841-65), part 3, vol. i. He extends and verifies Franz Gerstner's theory of waves in deep water, and presents a theory of his own for waves in shoal water.

His conclusions as to waves in shallow water are somewhat at variance with those of Russell and other experimenters. The memoir of Bazin is contained in the *Mémoires présentés par divers Savants à l'Institut Impérial de France* (Paris, 1865). The work is in two parts, the first relating to the flow of water in channels, the second to waves. Later writers on this subject include Farnshaw, Kelland, and Greene. Stokes's *Reports on Hydrodynamics* in the *Transactions of the British Association* are valuable, and rich in references. Prof. Greenhill has given the mathematics of the subject very fully in the *American Journal of Mathematics*. Prof. P. G. Tait's article in the *Encyclopædia Britannica* is valuable. J. P. FRIZELL.

Wavre, waw'r: town: province of Brabant, Belgium; on the Dyle; 15 miles S. E. of Brussels by rail (see map of Holland and Belgium, ref. 10-B). It has some breweries, tanneries, paper-mills, and cotton-spinning factories, but is best known in connection with the WATERLOO (q. v.) campaign. The Prussians under Blücher having been defeated by Napoleon at the battle of Ligny took the route to Wavre, and arriving there on June 17, 1815, were able to come to the aid of Wellington at Waterloo on the following day. Pop. (1891) 7,575.

Wax [O. Eng. *weahs*: O. H. Germ. *wahs* (> Mod. Germ. *wachs*): IceL. *var*: cf. Lith. *vazkas*: Russ. *voski*, which are possibly loan-words]; a generic term given to several substances chemically unlike, but resembling each other in the physical properties familiar in the wax of bees—for example, animal wax and vegetable wax. The vegetable world furnishes numberless wax-like bodies, only a few of which have been carefully examined, almost every plant, in fact, secreting a wax-like substance, especially in the seeds or in the fruit. The animal kingdom furnishes (1) the typical beeswax; (2) a kind of insect wax from the Orinoco and Amazon valleys, known as Andaquies wax; (3) Chinese wax, formerly supposed to be of vegetable origin; and (4) SPERMACEI (q. v.).

Beeswax.—This is the wax of which bees form their cells. (See BEE.) Common beeswax is yellow, has an agreeable and peculiar smell, feels a little greasy, but more sticky, and moulds readily under the warmth of the fingers. Light bleaches it if exposed in thin sheets. It then becomes white wax, and is somewhat less fusible than before. A mixture of potassium bichromate and sulphuric acid also bleaches wax. Nitric acid and chlorine also bleach it, but the substitution product formed by the action of chlorine gives off irritating vapors of hydrochloric acid in burning the candles formed of such wax. If wax is agitated with dilute sulphuric acid—2 parts of water to 1 of acid—in presence of some fragments of nitrate of sodium, enough nitric acid is set free to destroy the feeble yellow color of the wax, and thus bleach it without injury. It is worth remembering, in this connection, that Gay-Lussac in his attempts to bleach wax by chlorine discovered one of the important laws of modern chemistry—that of *substitution*—by virtue of which chlorine, etc., may replace hydrogen in the constitution of organic bodies without a change of the typical form. Beeswax is freed from honey and adhering impurities by melting and stirring with water, which dissolves the traces of honey; the heavy solids fall to the bottom, and the wax forms a cake on the top of the water.

Bleached wax fuses at about 145° F. It is insoluble in water, but dissolves readily in oils, fats, and essences. By Lewy's analysis it contains carbon 80.2 per cent., oxygen 6.4 per cent., and hydrogen 13.4 per cent. It consists essentially of three substances, separable from each other by alcohol—(1) *myricine*, insoluble in boiling alcohol, and consisting chiefly of myricyl palmitate, $C_{15}H_{31}(C_{30}H_{61}O_2)$; (2) *cerotic acid*, $C_{27}H_{54}O_2$; (3) *ceroline*, which remains in solution in cold alcohol.

The uses for wax are numerous and important. Its property of preserving tissues and preventing mould or mildew were well known to the ancients, who used cere-cloth for embalming, and wax for encaustic painting, as in the wall-pictures of Pompeii. Wax candles and tapers play an important part in the processions and ceremonies of the Roman Catholic Church. Wax is used by the manufacturers of glazed ornamental and wall papers and on paper collars and cuffs for polishing the surfaces. It is used in varnishes and paints, and for the "stutling" of wood which is to be polished, as for pianos, coachwork, fine furniture, and parquette floors. Electrotypers use wax in forming their moulds. Wax is an important ingredient in preparations for covering sur-

faces of polished iron and steel to prevent rust. Combined with tallow, it forms the coating of canvas and cordage to prevent mildew, as in sails, awnings, etc. Artificial flowers consume much wax, and its use appears to be extending.

Wax Candles.—To form these candles, wicks of twisted (not plaited) Turkey cotton are suspended from a ring or hook over a cauldron of melted wax, and a workman pours over them a stream of wax from a ladle, revolving each in succession to equalize the flow of the wax over the surface, until about one-third the intended size is obtained, when, after cooling, the same operation is repeated until the candles are about half size. While still warm they are then removed from the hooks, and rolled between two marble slabs to give them a cylindrical form and straightness. The upper end of the candle is now formed by cutting down the wax to a metal tag which covered one end of the wick. The candles are then suspended again on the hook, changing ends, and the operation of basting and rolling repeated until the desired size is attained. The lower ends are then cut off to an even length. Large wax candles, used at church altars, are formed up from thin slabs of wax by rolling them over the wick and finishing as before. Wax tapers are made by a sort of wire-drawing process, the wicks, wound on a drum, being drawn through the molten wax at a regulated temperature, passing through graduated holes to size the tapers, and thence to a cooling drum.

Andaquiés wax (*cera de los Andaquiés*) is a peculiar wax produced by a little bee called *cereja* by the Tamas Indians, of the Rio Caqueta on the plains of the Amazon, above the Magdalena river. These insects build on the same tree numerous combs, each of which yields from 100 to 250 grammes of yellow wax, about 3 to 8 oz. troy, which, purified by boiling water, has a slightly yellowish color and melts at about 170° F.

Carnahuba wax is the product of a palm (*Copernicia cerifera*) growing in Northern Brazil, and especially in the province of Ceara, forming a thin layer on the surface of the leaves. It scales off easily from the cut leaves when dried in the shade, and is readily fused and moulded into candles. It is soluble in boiling alcohol and in ether, and on cooling shows a crystalline structure. It melts at 185° F., and is very brittle and readily powdered. (See VEGETABLE WAX.) **Chinese or Insect wax** is a dazzling white wax called by the Chinese 白蠟 (*q. v.*) or "White wax." For a full account of its preparation see Hosié's *Three Years in Western China* (London and New York, 1890), pp. 189-201.

Fossil Wax (Ceresin).—Under the so-called fossil wax are several distinct mineral hydrocarbons of the general formula C_nH_{2n} , belonging to the ethylene series—one especially of which (ozokerite) is of considerable economic importance as a substitute for beeswax, which in many physical properties it much resembles. The fossil paraffins are: (1) *Urpehtite*, from Urpeth colliery (*Johnston*), melting at 102° F., sp. gr. .885, and soluble in cold ether; it adheres to the fingers and stains paper. (2) *Hatchettite*, from Scotland (*Johnston*), a soft wax, sp. gr. .916-983, pearly, glistening, yellowish in color, greasy to the feel; melts at 115° F., dissolves very sparingly in cold ether and boiling alcohol, crystallizing as it cools from the hot ethereal solution. (3) *Ozokerite*: the original mineral was from Slanik in Moldavia, and was wholly soluble in ether; that from Boryslav, in Galicia, is insoluble in cold ether, but largely so in hot ether. Its sp. gr. is .944, and melting-point 140° F. (4) *Zietrisikite*, like the last-named in nearly all physical characters; as hard as beeswax or harder; melts at 194° F., has a density of .9-946, and is distinctly separated from ozokerite by its almost complete insolubility in ether. It occurs at Zietrisika, in Moldavia, in large masses.

It is asserted by some chemists that this series of fossil wax does not afford paraffin, as found in nature, but that this body is a product of transformation of the native hydrocarbons in the process of manufacture, just as petroleum is changed in part to paraffin during the process of distillation of the crude oil.

Ceresin is a trade-term applied to the purified ozokerite from Drohobiez and Boryslav, in Galicia, and from Gresten, in Austria. The crude product, freed by fusion from sand, clay, and other impurities, is of a deep-brown color, with a greenish tint, has a sp. gr. of .940 to .990, exhales a naphthalene-like odor, and in hardness, fracture, and plasticity greatly resembles beeswax. It is very combustible, burning with a pure rich flame of high illuminating power. It dissolves with difficulty in oil of turpentine. It is purified and bleached by means of Nordhausen sulphuric acid, which attacks only

the foreign bodies in the ozokerite, leaving the colorless hydrocarbon untouched. It is used for all purposes for which beeswax is employed, and by its higher melting-point is capable of uses to which the former is not adapted. It is said not only to retard, but entirely to prevent, rancidity in ointments—a most valuable quality. Large deposits of ozokerite have been found in Utah, and in 1890 the product from this source was 350,000 lb. Revised by IRA REMSEN.

Waxahach'ie: town (founded in 1847); capital of Ellis co., Tex.; on the Houston and Tex. Cent. and the Mo., Kan. and Tex. railways; 30 miles N. of Dallas, 180 miles N. E. of Austin (for location, see map of Texas, ref. 3-I). It is in an agricultural and stock-raising region, and has a new county court-house (cost \$150,000), 6 churches, a public and 4 private schools, 3 national banks with combined capital of \$300,000, a private bank, 2 street-railway systems, electric-light plant, a daily and 4 weekly newspapers, 2 cotton-compresses, 2 flour-mills, and a \$50,000 cottonseed-oil mill. In 1894-95 its cotton receipts aggregated 60,000 bales. Pop. (1880) 1,354; (1890) 3,076; (1895) estimated, with suburbs, 6,000. EDITOR OF "WEEKLY ENTERPRISE."

Wax-myrtle: See BAYBERRY.

Wax-palm: a name given to various wax-producing palms, especially to *Copernicia cerifera* (see CARNAHUBA PALM, PALM FAMILY, and WAX) and *Ceroxylon andicolum* of the Andes.

Wax-plant: the *Hoya carnosa*, a climbing greenhouse shrub of the *Asclepiadaceæ* or milkweed family, a native of the East Indies, deriving its name from the wax-like appearance of its clustering white flowers.

Waxwing: a name applied to the birds of the passerine genus *Ampelis* because the inner wing-feathers and occasionally the tail-feathers are tipped with little appendages like flattened drops of red sealing-wax. These are borne by both sexes, and while they are usually best developed in old birds are found in the young as well. The waxwings are 7 or 8 inches in length, the plumage is thick, soft, and of a peculiar brownish ash above, ranging from ashy to almost cinnamon brown. There is a long pointed crest. There are three species, the well-known cedar bird, *Ampelis cedrorum* of North America, the Asiatic, *A. phœnicopterus*, found in Northeastern Asia and Japan, and the Bohemian waxwing, *A. garrulus*, which occurs in the northern part of Europe, Asia, and North America. They prefer fruit and berries, but also eat worms and insects. See CHATTERER.

F. A. LUCAS.

Waxwork: a plant. See BITTER-SWEET.

Waxy Degeneration: a diseased condition of certain tissues of the living body, in which parts of organs are changed into the substance known as amyloid. Though an albuminoid, it has reactions somewhat like those of starch. It takes a deep-brown red from iodine, and on the further addition of sulphuric acid becomes blue. Organs seriously affected by waxy degeneration, when cut, have a half-transparent look. The spleen, liver, and kidneys are frequent seats of the disease, and it is prone to occur in syphilitic and tuberculous persons and in those in whom there has been long-standing suppuration.

Way [O. Eng. *weg*; Germ. *weg*; Goth. *wigs*; cf. Lat. *via*, way, O. Eng. *wegen*, move, Lat. *ve'here*, carry, Sanskr. *vah*, carry]: in law, a right which a person or a community may have of passing at will, but in a given course, over the land of another. As thus employed the term is to be carefully distinguished from the sense attaching to it when used, or as an equivalent for, the term highway. The latter always signifies a road—that is, a defined strip of land dedicated to the use of the public at large and under the control of the public authorities, while a way is the *right* which one person may have to use the land of another person in a particular manner, without reference to the course or path which may be taken or employed in the exercise of that right. Nevertheless, the right which each member of the community has to use the highway for legitimate purposes is not the less a right of way because it may be exercised in common by the whole body of the public.

Ways may arise in a variety of modes and may attach to persons in several different relations. The most convenient classification of these rights, however, is that which is based on the circumstances and conditions under which they arise. As thus contemplated, four different forms or varieties of ways may be distinguished: 1. *Ways that are easements*. An easement may be defined as a privilege, without profit,

which the owner of one tenement has a right to enjoy in respect of that tenement in or over the tenement of another person, by reason whereof the latter is obliged to suffer some use of his tenement which would otherwise be unlawful, or to refrain from some use of it which would otherwise be lawful. That way, then, is a true easement, which is claimed in respect of the tenement, or premises, of the person enjoying it, and which is therefore an appurtenance of such premises, passing with them and having no independent existence apart from them. Such a way is popularly described as belonging to the land in respect of which it is exercised, rather than to the owner for the time being of such land, and this popular description is fairly expressive of the real nature of the right. (See EASEMENT.) 2. *Ways in gross.* Rights sometimes called "easements in gross" are such as appertain to an individual, entirely without reference to any property belonging to him. Such rights not being enjoyed in respect of any tenement are not properly classified as easements, though, in the mode of their exercise and in the nature of the privilege enjoyed, there is no distinction between them and easements proper. There is this radical difference, however—a right in gross, being a merely personal privilege, can not be transferred by the person who may for the time being be in the enjoyment of it, and it will of necessity die with him, whereas an easement has all of the vitality and perpetuity of the tenement, or estate, to which it pertains. (See SERVITUDES.) 3. *Customary ways.* Though this phrase points to the mode in which these rights originate, rather than to the circumstances under which they may exist, the term comprehends a large and important class of privileges akin to easements, and yet differing from them in important particulars. The English law presents many cases of community rights over the land of individuals. Thus the inhabitants of a certain village or the members of a certain trade may have the right to use the land of some individual for purposes of recreation, or of erecting booths and holding a fair, or of crossing it to go to church or to market. The right is regarded as the result of an immemorial custom, too ancient and too long acquiesced in to be disputed, and it covers the case of every person who belongs to the community or group enjoying the right, no matter how short or long his membership may be. Such rights are very common in England, but they can hardly be said to exist in the U. S., New Hampshire being the only State in which they have been recognized. In several of the States it has been expressly decided that rights claimed by custom can not exist in the U. S., as there can be no customs of immemorial antiquity in a new country. 4. *Public rights of way.* A few simple and indispensable privileges with respect to the property of private individuals are recognized by the common law as vested in the whole body of citizens of the State, or in the public at large. The most familiar examples of these common rights are the rights of way in highways, in certain private streams (see *LAW OF RIVERS*, under RIVERS), and upon the seashore (see RIPARIAN RIGHTS). These may also arise, like the customary rights above described, from immemorial user, but they are to be distinguished from the latter by their "common"—i. e. universal—character. A custom which extends throughout the kingdom, or state, ceases to be a custom: it is a part of the "common" law, and has no need to justify itself. Ways of this description exist equally in the U. S. and in England.

In respect of the nature and extent of the use permitted, the Roman law distinguished three grades of the right under consideration: *iter*, for foot passengers only; *actus*, for passage either on foot or with horses, vehicles, or cattle; and *via*, which, in addition to the uses above specified, included also that of drawing heavy burdens. The term *via*, like our term highway, carried with it also the implication of a defined path or roadway, though, unlike highway, it comprehended private as well as public ways. Although there is in our law no classification of ways in accordance with these distinctions, the right may exist in these several degrees.

The principal modes in which ways may be acquired are as follows: 1. *By grant.* This is the usual and characteristic way by which all easements come into existence. It is in effect an express gift or conveyance by an owner of land, by deed, of a right to use his land for the purpose of passing and repassing in a certain course. A person who, upon alienating a portion of his land, expressly retains or reserves out of the estate conveyed a right of way over it for the more convenient enjoyment of the unsold portion,

also acquires his easement by grant. 2. *By implication.* Where a conveyance is silent on the subject, but the situation of the land and its past and present uses and modes of enjoyment seem to require such a construction of the deed, an easement may be implied in favor of the grantor or grantee, as the case may require. The best illustration of an easement by implication is afforded by the so-called way of necessity. A way of necessity arises when A, being owner of land, conveys a portion thereof to B, so surrounded by other tracts that B is entirely cut off from access to any highway. Under such circumstances B has "of necessity" a right of way appurtenant to his parcel over the remaining land of A to a convenient highway, although the deed makes no mention of such a right. The same result follows in favor of A if he retains the isolated tract, while selling all the lands by which it is surrounded. 3. *By prescription.* Long-continued user, dating back to time beyond legal memory, is the equivalent of a grant in establishing an easement of a way. The period during which such user must continue in order to ripen into a right has generally been fixed by statute or judicial decision at twenty years. See PRESCRIPTION.

The foregoing methods of creating rights of way are applicable only to such rights as are in the nature of easements, as above described, and easements of way can originate only in one or other of those methods. It remains to describe the several modes in which ways that are not easements may arise, viz.: 4. *By license.* This is the usual and sufficient manner of creating or conferring the privileges known as rights in gross. The permission may be oral or written, but it is in any event, excepting when coupled with a valid interest or property right, revocable at the pleasure of the owner of the land over which the right is exercised. 5. *By custom.* This method of establishing the class of privileges known as customary rights, or more commonly as rights by custom, has been explained above in describing the nature of those rights. A custom, in order to have the effect of justifying such an encroachment on private property rights, must not only be of great antiquity, but must also be reasonable and continuously observed. 6. *By dedication.* This term signifies the owner's act in giving the public at large rights of way over his land, and the consequent creation of a highway. It may be evidenced by any formal or informal act, signifying the owner's consent to such use, from the execution and recording of a deed to the silent acquiescence in the public use of his land for highway purposes. 7. *By common law.* The operation of a universal custom in imposing a public burden upon private property has been referred to above in connection with public rights of way.

Rights of way, whether in the nature of easements or of personal rights, have the common characteristic that they must be exercised in strict conformity with the nature and extent of the right existing in the case in question. A right to pass and repass on foot can not be availed of to justify a way for cattle or wagons; a right which is appurtenant to an adjoining tenement can not be enjoyed by a stranger, nor for any and all purposes even by the owner of such tenement. The use of the latter must always be in connection with or with respect to such tenement. Otherwise, his use of the way is a trespass. Moreover, there is in the U. S. no such thing as an unlimited right of way. A way always contemplates a definite course or route between certain fixed points, and no other course may be taken but the one so determined. The owner of the land over which the right of way exists may make any use of his property which is not inconsistent with the ordinary and reasonable exercise of the right by the person or persons enjoying it. He may, accordingly, erect a bridge or arch over the path, road, or area in which the way is exercised, provided he does not thereby materially impair its utility as a way of the kind in force. But he is under no obligation to provide or keep in repair any path or road for the exercise of the way. It is the duty of the person claiming the right to make his own road and keep it in repair. For that purpose he may enter upon the land at all reasonable times, and do whatever is reasonably necessary to keep his path or road in condition for use. If the road becomes "founderous" or impassable, without the fault of the owner of the premises, the person having the right of way may not diverge and take another path even temporarily. The right, having once been fixed at and by a certain line, can not be changed without the consent of the owner of the burdened land. It is otherwise, of course, where the road has been

rendered impassable or inconvenient by the act of the tenant of the freehold. In the case of highways, however, the interests of the public have dictated a different rule. There, if the road becomes impassable from any cause, a traveler may go over the adjoining land, even though in so doing it becomes necessary for him to do damage to fences or crops. But, as is elsewhere explained (see HIGHWAY), the rights of the owner of the soil over which a highway has been laid out are in all essential particulars identical with those which the owner of a servient tenement, subject to a private right of way, retains in the land affected by such right. His dominion over and his right to use and enjoy his land are affected only so far as such right of way necessarily interferes with the same. Any unauthorized use of the highway is as much a trespass upon his rights as if committed on any other portion of his lands.

There are several satisfactory modern treatises on the law of easements in which the law of ways is adequately considered. See especially works of Gale, Goddard, and Washburn on *Easements*; Leake on *Uses and Profits of Land* (part iii. of his *Digest of the Law of Land*); and Gray's *Cases on Property*, vol. ii. GEORGE W. KIRCHWEY.

Waycross: city: capital of Ware co., Ga.; on the Bruns. and West., the Sav., Fla. and West., and the Wavc. Air Line railways; 60 miles W. of Brunswick, 96 miles S. W. of Savannah (for location, see map of Georgia, ref. 7-I). It has a national bank with capital of \$50,000, a State bank with capital of \$50,000, and a daily, a monthly, and two weekly periodicals, and is principally engaged in the manufacture of lumber and naval stores. Pop. (1880) 628; (1890) 3,364; (1895) estimated, 6,500. EDITOR OF "HERALD."

Wayland: town (incorporated in 1835); Middlesex co., Mass.; on the Sudbury river, and the Boston and Maine Railroad; 15 miles W. of Boston (for location, see map of Massachusetts, ref. 2-II). It contains the villages of Wayland and Cochituate, has 4 churches, high school, 7 district schools, and a public library (founded in 1850 and said to have been the first free library in the U. S.), and is principally engaged in agriculture and the manufacture of shoes. In 1894 it had an assessed valuation of \$1,500,000. Pop. (1880) 1,962; (1890) 2,060; (1895) 2,026.

Wayland, FRANCIS, D. D., LL. D.: educator; b. in New York, Mar. 11, 1796, of English parents; graduated at Union College 1813; studied medicine and began practice at Troy, but, having joined the Baptist church (1816), devoted himself to the ministry; studied theology one year at Andover; was tutor in Union College 1817-21; pastor of the First Baptist church at Boston, Mass., 1821-26; became president of Brown University Feb., 1827, having previously filled for some months the professorship of Mathematics and Natural History in Union College; retired from the presidency in 1855, and was for fifteen months (1857-58) acting pastor of the First Baptist church at Providence, and was highly distinguished as a pulpit orator. D. at Providence, R. I., Sept. 30, 1865. He was the author of several volumes of sermons and addresses; *Elements of Moral Science* (1835); *Elements of Political Economy* (1837); *Limitations of Human Reason* (1840); *Thoughts on the Collegiate System of the United States* (1842); *Elements of Intellectual Philosophy* (1854); *Life of Rev. Adoniram Judson, D. D.* (2 vols., 1853); and other works. His *Life* was written by his sons Francis and H. L. Wayland (2 vols., 1867), also by Prof. J. O. Murray, of Princeton (Boston, 1890).

Revised by J. M. BALDWIN.

Wayland, HEMAN LINCOLN, D. D.: educator and journalist; b. at Providence, R. I., Apr. 23, 1830; educated at Brown University, graduating 1849, and Newton Theological Institution; tutor in the University of Rochester 1852-54; pastor Main Street Baptist church, Worcester, 1854-61; chaplain Seventh Connecticut Regiment 1861-64; Professor of Rhetoric and Logic, Kalamazoo College, Mich., 1865-70; president of Franklin College, Indiana, 1870-72; editor *National Baptist*, Philadelphia, 1872-94; editor of *The Examiner* 1894; joint author with his brother Francis of *Life and Labors of Francis Wayland* (1867); author of *Faith and Works of Charles II. Spurgeon* (1892); and numerous public addresses and sermons. C. H. THURBER.

Wayland the Smith: a favorite Germanic hero both in modern folk-lore (his cave is pointed out in Berkshire) and in the ancient myths. As Weland he appears, with brief allusion to his legend, which found its best development among Low German traditions, in the oldest English lyric,

The Lay of Déor; and in King Alfred's time he was selected as representative figure of the national past. "Where," asks the translator of Boethius, paraphrasing a verse of his original—"where are the bones of cunning Weland the Goldsmith, most famous of yore?" As Völundr he is one of the best-known heroes of Eddic poetry. (See Vigfusson-Powell, *Corpus Poeticum Boreale*, i., 169.) His father was Wade, a giant, whose "boat" is mentioned by Chaucer (*Merchant's Tale*, 1424), and who seems to have been a popular person in his own right: "tale of Wade," says Chaucer (*Troilus*, iii., 614). Wayland himself is the deified smith of Germanic heathendom, founder of an art held in the highest possible repute. The best praise of a weapon was to call it "Wayland's work"—the phrase occurs in the *Beowulf* and elsewhere—while, for the finer art of ornaments, Wayland is the goldsmith without a peer. According to the legend he owned "seven hundred arm-rings." The story of Wayland, particularly in the laming and flying episodes, seems to have suffered contamination. Bugge goes so far as to declare (*Studier*, pp. 22, note, 131) the myth to be an outright copy "from Greek and Latin narratives," and the name to be a corruption of Vulcans. Nevertheless, we may accept Wayland as a Germanic hero and demigod. His name probably means "the skillful or artful one." For his legend in detail, see P. E. Müller, *Sagabibliothek*, and W. Grimm, *Heldensage* (3d ed.).

FRANCIS B. GUMMERE.

Wayne: village (platted as Derby's Corners in 1834); Wayne co., Mich.; on a branch of the Rouge river, and on the Flint and Pere Marq. and the Mich. Cent. railways; 18 miles W. of Detroit, 26 miles N. of Monroe (for location, see map of Michigan, ref. 8-K). It has 5 churches, graded public school, a State bank with capital of \$25,000, a private bank, 2 weekly newspapers, and manufactories of cigars, carriages, brick, and peppermint oil. The first house was erected in 1824, and the village was incorporated in 1869 and 1877. Pop. (1880) 919; (1890) 1,226; (1894) State census, 1,555. EDITOR OF "WAYNE COUNTY REVIEW."

Wayne: city (founded in 1880); capital of Wayne co., Neb.; on the Chi., St. P., Minn., and Omaha Railway; 45 miles S. W. of Sioux City, Ia. (for location, see map of Nebraska, ref. 9-G). It is in an agricultural, sugar-beet growing, and stock-raising region, contains the Nebraska Normal College, 2 public-school buildings, 2 national banks with combined capital of \$125,000, and 2 State banks with capital of \$125,000, and has 4 weekly newspapers. Pop. (1890) 1,178; (1895) estimated, 2,000. EDITOR OF "HERALD."

Wayne: town (founded by G. W. Childs and A. J. Drexel in 1887); Delaware co., Pa.; on the Penn. Railroad; 14 miles W. of Philadelphia (for location, see map of Pennsylvania, ref. 6-J). It has 6 churches, a public school, 4 private schools, 2 public halls, 2 large summer boarding-houses, sewerage, steam-heating, and electric-light plants, waterworks, a trust company, country and cricket clubs, and many handsome residences. It is a charming place of suburban residence. Pop. (1890) 997; (1895) estimated, 2,500. EDITOR OF "TIMES."

Wayne, ANTHONY: soldier; b. at East Town, Chester co., Pa., Jan. 1, 1745; educated at the Philadelphia Academy; became a surveyor and an intimate friend of Franklin; was agent of a land company in Nova Scotia 1765-66; married and settled on a farm in Chester County 1767; was elected to various county offices; was a member of the Pennsylvania convention and of the Legislature of 1774; served on the committee of public safety 1775; soon afterward raised a company of volunteers and became colonel of a regiment of Pennsylvania troops 1776; was wounded at the battle of Three Rivers; was commissioned brigadier-general Feb. 21, 1777; joined Washington in New Jersey; commanded a division at the battle of Brandywine, Sept. 11, being stationed at Chadd's Ford to oppose the passage of the river by Knyphausen; fought all day and effected a successful retreat at sunset; took command of a flying detachment of 1,500 men for the purpose of harassing the British rear, but was surprised at Paoli (close to his own homestead) by superior numbers on the night of Sept. 20, and lost fifty-three men; was acquitted of blame by a court martial held at his own request; led the right wing at the battle of Germantown Oct. 4; made a raid within the British lines in the winter of 1777-78, capturing numerous horses and cattle and abundance of forage; contributed by his skillful maneuvers to the victory of Monmouth June 28, 1778; led the attack at the storming of

Stony Point on the night of July 15-16, 1779, considered the most brilliant feat of arms of the whole war; was wounded in the head; received from Congress a vote of thanks and a gold medal; acquired the name of "Mad Anthony Wayne," and became the favorite popular hero; exhibited much address in suppressing a mutiny of the Pennsylvania line at Morristown Jan., 1781; joined La Fayette in Virginia Jan. 7; made with a part of a brigade a daring attack upon the whole British army at Green Spring or Jamestown Ford July 6, and by a bayonet charge disconcerted a projected maneuver against La Fayette; was present at the surrender of Cornwallis, after which he was sent to join Gen. Nathanael Greene in the South; defeated the Creek Indians June 23-24, 1782; took possession of Charleston, S. C., after its evacuation Dec. 14; retired to his farm in Pennsylvania after the war; served in the Pennsylvania Assembly 1784-85, and in the convention that ratified the U. S. Constitution; became general-in-chief of the U. S. army with the rank of major-general Apr. 3, 1792, and took command of an expedition against the Western Indians, whom he defeated at Fallen Timbers, or Maumee Rapids, Aug. 20, 1794; concluded with them the treaty of Greenville 1795, and while on his return homeward died at Presque Isle (now Erie), Pa., Dec. 15, 1796. His remains were removed in 1809 to Radnor church, near Waynesburgh, Pa., where a monument was erected by the Pennsylvania Society of the Cincinnati July 4, 1809. His *Life*, by Gen. John Armstrong, is in Sparks's *American Biography*, and his *Regimental Orderly Book* was printed at Albany in 1859.

Revised by F. M. COLBY.

Wayne, JAMES MOORE, LL. D.: jurist; b. at Savannah, Ga., in 1790; graduated at Princeton 1808; became a lawyer and politician at Savannah; sat in the Legislature; presided over two constitutional conventions; was mayor of Savannah 1823, judge of the superior court of Georgia 1824-29, member of Congress 1829-35; was an efficient debater, an advocate of free trade, and an active supporter of the policy of President Jackson, by whom he was appointed an associate justice of the Supreme Court of the U. S. Jan. 9, 1835, and gave especial attention to admiralty jurisprudence. D. at Washington, D. C., July 5, 1867.

Waynesboro: city (laid out as a town in 1783, incorporated as a city in 1888); capital of Burke co., Ga.; on the Cent. Railroad of Ga.; 32 miles S. of Augusta, 100 miles N. W. of Savannah (for location, see map of Georgia, ref. 4-J). It has 7 churches—3 Baptist, 2 Methodist Episcopal, a Presbyterian, and a Protestant Episcopal—2 academies, 4 lower-grade schools, a State bank with capital of \$50,000, and a weekly newspaper; contains manufactories of cottonseed oil, guano, agricultural implements, and wagons; and was the scene of a battle in the war of the Revolution and of one in the civil war. Pop. (1880) 1,008; (1890) 1,711; (1895) 1921.

EDITOR OF "TRUE CITIZEN."

Waynesboro: borough; Franklin co., Pa.; on the Mont Alto and the West Md. railways; 14 miles S. E. of Chambersburg, 50 miles S. W. of Harrisburg (for location, see map of Pennsylvania, ref. 6-E). It is near South Mountain and Antietam creek, and in the civil war the majority of the Confederate army passed through it on the way to Gettysburg and on the following retreat. It has 8 churches, 2 public graded schools, Academy of Music, 2 national banks (combined capital, \$125,000), several creameries, manufactories of ice-machines, engines, separators, steam-plows, grinders, tools, lathes, and agricultural implements, and 2 weekly newspapers. Pop. (1880) 1,888; (1890) 3,811; (1895) estimated, 4,500.

EDITOR OF "KEYSTONE GAZETTE."

Waynesburg: borough (laid out in 1796); capital of Greene co., Pa.; on Ten Mile creek, and the Waynes and Wash. Railroad; 45 miles S. of Pittsburg (for location, see map of Pennsylvania, ref. 6-A). It is in an agricultural, stock-raising, oil, and natural-gas region, contains Waynesburg College (Cumberland Presbyterian), 2 national banks with combined capital of \$225,000, several planing and flour mills, a carriage-factory, and a foundry, and has 4 weekly newspapers. Pop. (1880) 1,208; (1890) 2,101.

EDITOR OF "INDEPENDENT."

Waynflete, or Wainfleet, wān'fleet, WILLIAM OF, otherwise called **William Patten, or Barbour;** bishop; b. at Waynflete, Lincolnshire, England, about 1405; educated at Winchester and at Oxford University; became head master of Wykeham's school at Winchester 1429; was appointed by King Henry VI. first master of his newly founded col-

lege at Eton 1442; became provost of Eton Dec., 1443; succeeded Cardinal Beaufort in the bishopric of Winchester 1447; founded Magdalen Hall, Oxford, 1448; converted it into a college with a liberal endowment 1456; also founded a free school in his native town; was lord high chancellor to Henry VI. during the disastrous years 1456-60, resigning three days before the battle of Northampton, and was generously treated by the victorious Yorkists. D. Aug. 11, 1486, and was buried in a magnificent chapel in Winchester Cathedral.

Wazan' (Rohlf's *Wesun*): a holy city of Morocco; beautifully situated in a fertile region about 75 miles S. of the Straits of Gibraltar. It was founded toward the end of the ninth century by Muley Tayeb, a direct descendant of the Prophet. The sheriff is superior in sanctity to the sultan himself. He is enormously rich, and the fact that he is a descendant of the Prophet makes him adored by all Mohammedans. The faithful throughout Morocco pay tribute to him, but a large part of the wealth coming to him is disbursed in charity and hospitality. Frequently hundreds, and sometimes thousands of pilgrims who come to kiss the hem of his robe of office are entertained at his expense. The sultan is not regarded as fully installed in his exalted place until he has been officially recognized by the saint of Wazan. Fugitives from justice are safe within the town, and not even the sultan's body-guard dare arrest a person who appears as a suppliant at the tomb of the founder of Wazan. In the mosque containing the tomb is a collection of about a thousand Arabic manuscripts. The religious authority of the present sheriff (1895) has been greatly diminished by his pronounced friendship for Europeans, his marriage with an English Christian, and his almost continuous absence from Wazan, where he is represented in his sacred character by one of his sons, while he spends most of his time in Tangier. Pop. perhaps 3,000.

C. C. ADAMS.

Weakfish: the *Cynoscion regalis*, also called *squeteague*; very common along the eastern coast of the U. S. It belongs to the family *Scianidae*, and has as associates several other species, mostly peculiar to the southern coast of the U. S.—viz., *C. thalassinum*, *C. nothum*, and *C. maculatum*. These species are all distinguished by their elongated shape, the prominence of the lower jaw, and the armature of the upper one with canine teeth; the dorsal fin has nine or ten spines, and the anal fin one small spine. The weakfish is distinguished by its color, which above is pale brownish, with a decided greenish tinge, grading below into silvery; on the back and sides are irregular vermicular blotches disposed in an oblique direction, tending forward and downward; the ventral and anal fins are yellowish, the others neutral. It generally averages between 1 and 2 feet in length, and is found along the entire eastern coast S. of Cape Cod, but is most common in the warmer waters. It does not ascend into the fresh waters. It is a rather voracious fish, and readily seizes the hook, but its mouth is easily torn, and to this characteristic (weakness of mouth) the name refers.

Revised by F. A. LUCAS.

Wealden (weald en) Formation [*wealden* is from the Weald, a district of Kent and Sussex, England; O. Eng. *weald*, forest, wood]: a series of fresh-water strata of the Cretaceous period, first studied in the Weald. The formation occurs also in Germany. Its animal fossils comprise the iguanodon, *hyaosaurus*, pterodactyl, and numerous species of turtles. Its vegetable fossils consist chiefly of ferns and the gymnospermatous orders of conifers and cycads. The fruits of several species of both orders have been found, and in some places the rolled trunks of different species of coniferous wood occur in enormous quantities.

Revised by G. K. GILBERT.

Wealth [M. Eng. *welthe*, deriv. of *wela*, weal < O. Eng. *wela*, *weola*, wealth, deriv. of *wel*, well > Eng. *well*]: a term that is used in two distinct senses: (1) the national sense, in which it includes all things which contribute to the happiness of mankind; (2) the individual sense, in which it is confined to those things which command a price. By business men the word is commonly used in the latter sense; by political economists it is chiefly used in the former sense, even when they define it in the latter one. To avoid this confusion it has been proposed to substitute the term *propriety* for the individual sense of the word wealth. A large part of the modern science of POLITICAL ECONOMY (*q. v.*) deals with the relation between the individual acquisition of property and the growth of national wealth. The attempts to estimate the national wealth in dollars and cents,

as is often done, involves a confusion of the two senses of the word, and the result is misleading. A. T. HADLEY.

Weare, MESHECH: b. at Hampton, N. H., June 16, 1713; graduated at Harvard 1735; studied and practiced law; sat several years in the Legislature; was Speaker 1752; commissioner to the Colonial Congress at Albany 1754; became a justice of the Supreme Court and chief justice 1777; was counselor from Rockingham County and chairman of the committee of safety 1775; was chosen president of the State 1776, and annually re-elected during the war, in which he rendered great services to the defense of the Northern colonies from Burgoyne's invasion, raising and equipping the forces sent to the frontier under Gen. Stark; and was again chosen president under the new Constitution 1784. D. in Hampton Falls, N. H., Jan. 14, 1786.

Wearing: See TACKING AND WEARING.

Weasel [M. Eng. *wesele* < O. Eng. *wesle*; O. H. Germ. *wesala* > Germ. *wiesel*]: any one of various small animals, species of the family *Mustelidae*, and especially of the genus *Putorius*. These are especially distinguished by the small number of molars, there being only thirty-four teeth in all, viz., M. $\frac{1}{2}$, P. M. $\frac{3}{3}$, C. $\frac{1}{1}$, I. $\frac{3}{3}$; the lower sectorial molar tooth has no inner tubercle; the body is very slender and elongated, especially in the small species, and so much so as to have obtained the name vermiform; the tail is moderate; the feet are essentially digitigrade. Weasels are among the boldest and most bloodthirsty of carnivorous animals, and especially destructive to poultry, which they generally seize by the neck, proceeding to devour the carcasses leisurely after sucking their blood, or perhaps, leaving satisfied with quenching their thirst for blood alone. The species are mostly confined to cold and temperate regions, although a few extend into tropical countries. The generally recognized species in North America are the *Putorius vulgaris*, or little weasel; the *P. longicauda*, nearly related to the former, found in the Upper Missouri and Platte countries; the *P. frenata*, or bridled weasel, of the southwestern U. S.; *P. cicognanii*; and the common *P. richardsoni*, which has come to be considered as distinct from the Old World ermine, *P. erminea*, with which it was long confounded. In Europe and Northern Asia are found a number of other species more or less closely related to those of North America. See also **ERMINE**. Revised by F. A. LUCAS.

Weather [(with change of *d* to *th* under Scandinavian influence) < O. Eng. *wæder*; O. H. Germ. *wædar* (> Mod. Germ. *wetter*): Icel. *væðr*, wind, air, weather]: the current or passing state of the atmosphere, especially the conditions which affect man and his interests. It differs from climate, which represents the average of these conditions, or the average of all weathers. Climate changes slightly and slowly, but weather is constantly changing. The descriptive terms applied to weather—as cold, warm, dry, damp, wet, calm, windy, rainy, snowy—do not require special definition, and are used in a relative sense. For instance, what would be called cool weather in Cuba might be very warm weather at Mt. Desert in Maine; and what would be called dry at Greytown, Nicaragua, would be damp or wet at Santa Fé, New Mexico. By settled weather is meant a condition in which there is little intensity and little change in the meteorological elements from day to day. The opposite is variable weather. The weather of the Southern States and the Pacific coast is relatively settled; the most variable weather in the U. S. is along the northern boundary from the Rocky Mountains eastward. A spell of weather is the continuation of one type, especially in regions of variable weather, and a change of weather is the change from one type to another.

Weather is often named by a sort of metaphor referring to its effects. Thus fair weather is originally one suited to ordinary commercial operations, but it has been modified in its use by the U. S. Weather Bureau to indicate the absence of rain and of complete cloudiness. Foul weather is that unsuited for such operations, generally rainy and windy; dirty weather is that with low-flying clouds and slight driving rains; soft weather is that when the snow by melting, or the soil by rain, has softened and impeded travel. Again weather is bright, sharp, tonic, sweltering (or sultry) according to its physiologic, and dull, close, gloomy, according to its psychic effects. The weather preceding an approaching storm is especially noted for its effects in producing neuralgia and rheumatic pains, and this is, in large part, due to the increasing humidity. Indeed, changing humidity, by changing the rate of evaporation of the surface of the skin, and consequently its temperature, pro-

foundly affects the individual and contributes largely to his comfort or discomfort. It is this which makes the difference between the bright and cheerful hot weather of arid regions (with temperature perhaps at 110° F.) and the muggy insufferable weather—close, moist, and sweltering though the thermometer may be at only 95° F.—which precedes summer thunder-storms in the Eastern States. The temperature of evaporation is substantially the temperature that is felt, and it is this that makes the hot weather of New Mexico quite as endurable as that of Ohio. See HARRINGTON'S paper *Sensible Temperatures* (Trans. Am. Clim. Assoc., 1893-94, 368-374). See **CLIMATE, METEOROLOGY, AND WEATHER BUREAU**. MARK W. HARRINGTON.

Weather Bureau: a branch of the U. S. Department of Agriculture, established July 1, 1891, to take charge of the meteorological work of the Government which had grown up since 1870 under the Signal Service of the Department of War. This bureau is intrusted with the forecast of the weather, storms, and floods, with the distribution of such warnings, and with the compilation and distribution of such climatic or meteorological data as are required by the public interest. The bureau has about 1,000 paid employees, the most of whom devote their entire time to its service. Its annual cost has been on the average \$838,100, while the annual cost for the years 1882-91 of the Meteorological Service (under the army, but not including the cost of military signaling) was \$924,700. The annual saving resulting from the work of the bureau can not be estimated with certainty, but is undoubtedly many times the cost. The percentage of correct forecasts varies, but the general average is four out of five. It is lowest in ordinary weather and highest in storms or severe weather of any sort. In hurricanes from the West Indies it sometimes reaches five out of five, or 100 per cent. Under the U. S. Weather Bureau is a federal system of State Services which perform efficient aid in collecting information of a detailed character. The most of the civilized states now have weather services, all a development since 1870, but the function of weather forecasts attracts most attention in the U. S., Great Britain, France, Prussia, Saxony, and Russia. A special service in Hong-kong is devoted to the forecast of typhoons.

MARK W. HARRINGTON.

Weatherford: city; capital of Parker co., Tex.; on the Gulf, Colo. and S. Fé, the Tex. and Pac., and the Weather, Min. Wells and N. W. railways; 40 miles N. W. of Cleburne, about 66 miles W. of Dallas (for location, see map of Texas, ref. 2-H). It is in an agricultural and stock-raising region, contains Weatherford College (Methodist Episcopal South), the Texas Female Seminary (Cumberland Presbyterian), a public high school with library, and 3 national banks with capital of \$500,000, and has 3 weekly newspapers. Pop. (1880) 2,046; (1890) 3,369.

Weather-glass: an instrument for indicating the state of the atmosphere, as the **BAROMETER** and **HYGROMETER** (*qq. v.*).

Weatherly: borough (incorporated in 1863); Carbon co., Pa.; on the Lehigh Valley Railroad; 10 miles E. of Hazleton, 14 miles N. W. of Manch Chunk (for location, see map of Pennsylvania, ref. 4-1). It is in a coal-mining region, and has 6 churches, 12 schools, a building and loan association, a weekly paper, a large silk-mill, railway-shops, bicycle-factory, and brick-works. Pop. (1880) 1,977; (1890) 2,961; (1895) estimated, 3,500. **EDITOR OF "HERALD."**

Weathersfield: town; Windsor co., Vt.; on the Connecticut river; 3 miles W. of Claremont, N. H., 63 miles S. of Montpelier (for location, see map of Vermont, ref. 8-C). It contains the villages of Weathersfield, Weathersfield Center, Weathersfield Bow, Amsden, Ascutneyville, Perkinsville, and Felchville, and has a Baptist, a Protestant Episcopal, 2 Congregational, and 2 Methodist Episcopal churches, 2 hotels, and manufactories of apple-jelly, lime, lumber, butter-tubs, cider, soapstone sinks, shingles, carriages, and chair stock. Pop. (1880) 1,354; (1890) 1,174.

Weather-signals: a code of signals, consisting of flags, cylinders, and cones, or whistles, adopted by the various national meteorological services to convey their forecasts of temperature, weather, and storms to the general public. The U. S. code consists of a series of flags for weather and temperature, a series of whistles from stationary engines for the same, and a series of flags for wind. The first two are used inland, the last at the ports.

The flag signals for weather and temperature are seven in

number: (1) A square white flag for clear or fair weather; (2) a square blue flag for rain or snow; (3) a square flag with the upper half white and the lower half blue for local storms; (4) a black triangular flag for temperature, above the others when the temperature is to rise, below when it is to fall; (5) a white square flag with a black square in the center to forecast a cold wave; (6) a red square flag with a black square center to forecast a severe storm; (7) a red pennant as an information signal at ports is also used in Sacramento and San Joaquin valleys in California to indicate the approach of a "hot norther."

Interpretation of Displays.

- No. 1, alone, indicates fair weather, stationary temperature.
- No. 2, alone, indicates rain or snow, stationary temperature.
- No. 3, alone, indicates local rain, stationary temperature.
- No. 1, with No. 4 above it, indicates fair weather, warmer.
- No. 1, with No. 4 below it, indicates fair weather, colder.
- No. 2, with No. 4 above it, indicates warmer weather, rain or snow.
- No. 2, with No. 4 below it, indicates colder weather, rain or snow.
- No. 3, with No. 4 above it, indicates warmer weather with local rains.
- No. 3, with No. 4 below it, indicates colder weather with local rains.
- No. 1, with No. 5 above it, indicates fair weather, cold wave.
- No. 2, with No. 5 above it, indicates wet weather, cold wave.

These signals can be distinguished only within a radius of 2 or 3 miles (at the farthest), are invisible directly to windward or leeward, or in a calm, soon become too discolored to distinguish, and wear out rapidly.

The whistle signals are in some respects better. They are blown at fixed hours, and to one listening for them can sometimes be made out at a distance of 10 miles. The first whistle to attract attention is a long blast of from fifteen to twenty seconds' duration. After this warning signal has been sounded, long blasts (of from four to six seconds' duration) refer to weather, and short blasts (of from one to three seconds' duration) refer to temperature, those for weather to be sounded first.

Blasts.	Indicate.
One long.....	Fair weather.
Two long.....	Rain or snow.
Three long.....	Local rain.
One short.....	Lower temperature.
Two short.....	Higher temperature.
Three short.....	Cold wave.

Interpretation of Combination Blasts.

- One long, aloneFair weather, stationary temperature.
- Two long, alone.....Rain or snow, stationary temperature.
- One long and one short.....Fair weather, lower temperature.
- Two long and two short,Rain or snow, higher temperature.
- One long and three short.....Fair weather, cold wave.
- Three long and two short....Local rains, higher temperature.

For the ports the storm-signal as above (square red with a black center) is combined with a pennant which indicates the direction of the wind. A red pennant above the storm-signal indicates N. E. winds; below, S. E. A white pennant above, N. W. winds; below, S. W. winds. Two storm-signals one above the other is the forecast for a hurricane, or for the very severe and dangerous gales which sometimes pass the Great Lakes and North Atlantic coast. At some ports lights are used at night, a red light for easterly winds, and a white above a red for westerly.

On European coasts the system of signals devised by Fitzroy is used with some modifications. It consists of a large cylinder and cone which can be suspended and which will appear the same from whatever point viewed. The cylinder indicates the storm and is below; the cone, the direction of the wind—pointing upward for a northerly direction (from N. W. through N. to S. E.); pointing downward, the opposite. The cylinder is now discontinued in

Great Britain. At night lanterns are hung at each angle of the cone and (to represent the cylinder) at the four angles of a square.

MARK W. HARRINGTON.

Weaver-bird: any member of the *PROCEDE* (*g. v.*), a family of finch-like birds peculiar to Africa and parts of Southern Asia. They are named from their remarkable woven nests, which are constructed so as to protect the eggs and young from snakes and monkeys. Some are huge, heavy, and massive, clustered together in large numbers, and bearing down the branches with their weight. Others are light, delicate, and airy, woven so thinly as to permit the breeze to pass through their net-like interior, and dangling daintily from the extremity of some slender twig. Others, again, are so firmly built of flattened reeds and grass-blades that they can be detached from their branches and subjected to very rough handling without losing their shape, while others are so curiously formed of stiff grass-stalks that their exterior bristles with sharp points like the skin of a hedgehog. Many of the weaver-birds are brightly marked. They feed on seeds and insects, especially beetles. See NESTS OF BIRDS.

Revised by F. A. LUCAS.

Weaving: the act or art of forming from threads or filaments any textile fabric. These fabrics are formed in the machine called a Loom (*g. v.*), and in a general way may be said to be formed of two series of threads or filaments interlaced at right angles, technically known as warp and filling. In the length of the fabric the threads are warp, and those which interlace with the warp are the filling threads. Notwithstanding the great variety of textile fabrics, there are but three underlying principal movements in their formation—that is, in weaving; these may be arrived at in various manners and by many different mechanisms, but are, without exception, to be found in the following order: "shedding," "picking," and "beating up." The warps may be arranged in the looms differently; they may be on a single warp-beam at the back, or on more than one; the warp-threads are drawn through the eyes of the various loom-harness and through the reed—usually before the warp is placed in the loom—then fastened to the cloth-roll at the front, and the warp is ready to be woven. The first movement is to form a shed; this is accomplished by raising some of the loom-harness and depressing others, thereby raising a part of the warp-threads and lowering the remainder; the space between these two parts of the divided warp is the shed. The second movement is to pass through this shed the filling, after which the third movement, to complete the formation, is to beat up the filling-thread toward the cloth-roll. Another shed is formed, as before, a new filling-thread picked—that is, thrown across and through the shed—this thread beaten up against the one which preceded it, and these three movements, continually repeated, produce the fabric and constitute the operation of weaving.

Origin of the Art.—It is not known who were the first to practice weaving, when it was first practiced, or what fabric was first produced; yet the art is well classed as one of the earliest. The Chinese claim that they have certain documents or records which show silk-weaving to have been practiced over twenty-five centuries before the Christian era. By some archaeologists Egypt is credited with being the mother of the invention. Joseph Strutt says in *View of the Dress and Habits of the People of England*, "The Egyptians put a shuttle in the hands of their goddess Isis to signify that she was the inventress of weaving." Several references in the Bible narrative (*Lev. xiii. 47-59*, etc.) to "warp and woof" show that in the fifteenth century before Christ the Israelites were familiar with the art. It is very evident that among the Hindus, Chinese, and Egyptians the art has been practiced for many centuries. The fact that several countries widely separated seem to have practiced weaving extensively as far back as history or tradition goes, and also that in principle the practice of weaving to-day is not different from that of the most remote methods reported, would help to substantiate the belief that mechanisms for weaving may have been invented independently by several races.

Weaving in India.—Even to the present time many Hindus hold to their primitive mode of making textiles, and cause much wonder by producing fabrics of great delicacy and beauty. They have acquired by their continued application to old customs patience, alacrity, and a great delicacy of touch, enabling them to equal, except in quantity, the output of some of the best modern looms, and all with the simplest of appliances. These are described in the

Circle of Mechanic Arts by Martin, as follows: "The loom consists merely of two bamboo rollers, one for the warp and the other for the web" (woven cloth) "and a pair of gears. The shuttle performs the double office of shuttle and batten, and for this purpose is made like a huge netting-needle, and of a length somewhat exceeding the breadth of the cloth. This apparatus the tanty (weaver) carries to a tree, under which he digs a hole large enough to contain his legs and the lower part of the gear. He then stretches his warp by fastening his bamboo rollers at a due distance from each other on the turf by wooden pins. The balance of the gear he fastens to some convenient branch of the tree over his head. Two loops underneath the gear, in which he inserts his great toes, serve instead of treadles, and his long shuttle, which also performs the office of batten, draws the weft through the warp, and afterward strikes it up close to the web."

Growth of the Art.—History discloses the fact that the manufacture of fabrics kept moving westward from Egypt and Asia, as did civilization. Italy seems to have been the first European country to enter into woolen and cotton manufacturing, and it was from Italy that the other European countries obtained a knowledge of the art. In the tenth century Flanders led in the manufacture of woollens. "The art of weaving seems to be a gift bestowed upon them by nature," one author states in writing of the Flemings; and another, that "all the world was clothed from English wool wrought in Flanders." This was up to the eleventh century, and during that century, while William the Conqueror was King of England, the Flemings came into England in large numbers, and introduced wool-manufacturing. Later, in the early part of the twelfth century, in the reign of Henry I., many more immigrated into England, and the beginning of one of her principal industries was made. Just when cotton fabrics were first produced in England is not known, but early in the seventeenth century, Roberts, in *Treasures of Traffic*, in speaking of Manchester, says, "they buy cotton wool in London that comes from Cyprus and Smyrna, and work the same into fastians, vermilions, and dimities, which they return to London." The art may be said to have been introduced into America by the Puritan settlers of New England early in the seventeenth century.

In the nineteenth century weaving as an industry has taken wonderful strides. This was and is due to the improvements in the loom. Up to 1785 the power-loom was unknown, nor was it a success until the beginning of the nineteenth century. Hand-weaving had alone been practiced, and the weaving was done by the operators in their own homes, they having in most cases spun their own yarns. The development of machinery for preparing yarns, beginning about the middle of the eighteenth century, was a step which greatly increased the demand for an improved loom, a loom that would automatically produce the movements then made by the hands and feet of the weaver. The hand-loom in use in the eighteenth century was still very simple, the first improvement of note being that of the shuttle motion. The shuttle, until the invention of the "fly-shuttle" by Kay in 1733, was thrown through the shed from and by the hand of the weaver; by an arrangement of springs and straps, it was now driven from a box at one end of the batten or lathe through the shed, to a box at the opposite end; the propelling power was the hand still, but imparted to the shuttle through the strapping. Soon after this the rising and falling shuttle-box was introduced, which allowed the entrance of various colored filling-threads without stopping the loom. Even with this improvement, weaving was not an easy or rapid operation; the shed for all that had to be formed by the depressing of the treadles connected with the harness by the weaver, and the filling must be beaten up against the woven cloth by hand.

Cartwright, in 1785, having never seen any one weave, and though not a mechanic, but a minister of the Church of England, conceived the idea of producing textile fabrics automatically, and after one or two attempts gave to the world a loom approaching very nearly in form as well as principle the modern plain loom. On the foundation thus laid other inventors have built, until to-day the loom combines some of the most wonderful mechanical inventions, and produces fabrics automatically and with rapidity, which equal if not excel the most beautiful made by hand.

Ribbon-weaving.—As early as 1745 John Kay, with an associate, secured patents for a ribbon-loom which could be run by power; the loom was really only the "Dutch engine loom" remodeled and improved; and from all available re-

ports the improved loom seems to have been very similar in construction to the ribbon-loom of to-day except that the speed was much slower and the movements of the various harness very limited.

Ribbon-weaving is accomplished in a compound loom, having but one set of harness and one lathe or batten, yet a series of warp-beams and individual rollers for the woven ribbon, each warp also having its own shuttles. These shuttles work positively—that is, are not thrown across, but are passed through the sheds of their respective warps by a rack-and-pinion arrangement, the shuttle passing through one warp taking the place of the shuttle which simultaneously passes in the same direction through the shed of the next adjoining warp, and so back again as the shuttles move in the opposite direction. By this arrangement as many as thirty or forty ribbons or tapes may be woven at once in the same loom. The application of the Jacquard machine to the ribbon-loom, and the box-motion, allowing the use of five or six different shuttles, have so developed ribbon-weaving that some of the most beautiful textiles are these narrow fabrics. The early application of power to the ribbon-loom seems to have had no connection with the development of the modern power-loom, however.

Weaving by Power.—The application of power to the loom necessitated, among the many attachments, an arrangement whereby the loom would stop if the filling should become exhausted in the shuttle or should break; an attachment to wind up the cloth-roll automatically and keep the warp at an even tension; also a mechanism to stop the loom if the shuttle failed to reach its destination. Should the shuttle get caught in the shed, without something to stop the loom before the stroke of the lathe the warp would be broken out. After numerous improvements and many different inventions toward the same end, the weaver has reached a point where he has but little to do with a single loom. On plain white fabrics of cotton, as sheetings and shirtings, one weaver can run from six to eight looms, running from 180 to 250 picks a minute, and on heavy woolen or worsted suitings, woven on broad looms, one weaver can keep two running with a speed of ninety to ninety-five picks. Comparing this speed and the increased production with the varying production of the hand-loom, one weaver to a loom, the product of which was governed by his physical ability and endurance, the wonderful advance made during the nineteenth century will be readily understood.

Filling Stop-motion.—While there are many different stop-motions used by weavers and loom-builders, the description of one may answer for all. The object being to stop the loom when the shuttle leaves no thread in the shed as it passes through, a "filling-fork" is arranged on the loom-lathe in connection with a series of levers which control the driving motion of the loom; this fork is held in such a position by the filling-thread that it can not touch the levers, but so soon as the shuttle passes without leaving a filling-thread, the fork, having nothing to hold it away from the levers, comes in contact with them and immediately stops the loom. For extremely fine fabrics this stop-motion must be very delicate and carefully adjusted.

Shuttle Protector.—In 1796 an invention, still used, was made, called the "stop-rod motion," designed to stop the loom when the shuttle fails to pass entirely through the shed. It consists of an iron rod which runs the width of the loom on the face of the lathe, having a dagger projecting toward the breast-beam at the front of the loom, and fitted with an arm at each end, these arms being in contact with certain fingers on the shuttle-boxes at either end of the lathe. When the shuttle enters the box the finger is pressed outward and the arm in contact with it gives a vibrating motion to the rod just as the filling is being beaten up; should the shuttle not enter the box, however, the rod is left in such a position that the dagger strikes a lever so arranged as to immediately stop the loom and hold the lathe at a distance, so that none of the warp-thread may be broken, even in case the shuttle is in the shed at the time.

Another means to prevent the breaking of the warp, used principally in silk-weaving, is the "loose reed." The reed is hinged at the top and is held firmly as the lathe beats up so long as the shuttle is in the shuttle-box, but is released at the bottom and swings away from the cloth should the shuttle not reach the box, stopping the loom.

Jacquard Weaving.—More than any other invention the artistic quality of textiles is due to the Jacquard machine (see Loom) and to its subsequent development. The machine may be attached to a great variety of looms, from

those weaving narrow brocade ribbons to those immense looms weaving rugs, tapestries, art-squares, etc., some 8 or 10 yards broad. This class of weaving requires great skill in adjusting the mechanism of the loom and likewise great care and skill on the part of the weaver, though the machine has been brought to such a state of perfection that it may be handled with the ease of much simpler looms.

Pile Weaving.—Under this head would come the weaving of all pile carpetings, velvets, plushes, etc. The general construction of each is similar; a body-warp and a pile-warp are bound together by a single filling which interlaces with the body-warp. A shed is formed with the warp thread for the pile raised, and a small wire rod is inserted and beaten up, the pile-warp is lowered, and the filling interlaces again with the body-warp, binding the pile-warp into the body of the fabric; this arrangement continues, and after ten or twelve loops have been formed the wires, which have been left in the loops they have helped to form, are withdrawn one at a time, and again inserted in succeeding sheds to form other loops. For the Brussels carpet and all loop-pile fabrics the wires are round, but for fabrics with a cut pile they are fitted with a knife at one end which cuts the loop as the rod is withdrawn; or the rods may be grooved on one side, as for velvet-weaving, and the cutting be done by running a rivet—a small knife made for the purpose—along the groove in the rod and under the loops.

Much of interest could be said of gauze-weaving, for which the warps are mounted specially in the loom, and are usually woven from more than one warp-beam, and terry-weaving—the production of Turkish towels—woven both on the pile-fabric principle and in specially arranged looms. The weaving of glass-cloth is particularly interesting. The fabric is formed as if it were silk, with each third or fourth pick of spun glass; the loom stops on the shed for the glass filling, and this is inserted by hand, the strand of spun glass being placed on a narrow flat strip of wood which is passed through the shed and deposits the glass strand between the warp-threads; the strip of wood is removed, the glass filling beaten up, three or four picks of silk inserted to bind it, another glass thread placed in its shed, and so on. There are also hair-cloth-weaving, upholstery-weaving, the weaving of wire-cloths, and the weaving of many specially constructed fabrics on looms built purposely to produce them, or by means of adjustments of the ordinary looms. See COTTON MANUFACTURES, TEXTILE-DESIGNING, and TEXTILE FABRICS.

LOUIS CLARK.

Webb, ALEXANDER STEWART, LL. D.: soldier; son of James Watson Webb; b. in New York, Feb. 15, 1835; graduated at the U. S. Military Academy 1855, and became second lieutenant of Second Artillery; served in Florida and on frontier duty 1855-57; as Assistant Professor of Mathematics at West Point 1857-61; was promoted first lieutenant April 28, 1861, captain Eleventh Infantry May 14, and major of the First Rhode Island Artillery Sept. 14. He was engaged in the battle of Bull Run July 21; served in the defenses of Washington, and with the Army of the Potomac in the Virginia Peninsula campaign; was chief of staff Fifth Corps until June 23, 1863, when he was commissioned a brigadier-general of volunteers and assigned to the Second Corps. At Gettysburg his brigade met the assault at the angle on the third day, where Gen. Webb was wounded. He received a bronze medal for his gallantry in this action. In the subsequent operations of the campaign he commanded a division (Second Corps), gaining the brevet of lieutenant-colonel for gallantry at Bristow Station Oct. 14, 1863. In the Richmond campaign of 1864 he led a brigade in the battles of the Wilderness and Spottsylvania, being severely wounded in the latter fight (May 12), and, disabled from active service, he served as chief of staff to Meade from Jan., 1865, till the surrender of Lee, and subsequently, until Feb., 1866, as acting inspector-general of the military division of the Atlantic, having been mustered out of the volunteer service the month previous. In July, 1866, he was appointed lieutenant-colonel Forty-fourth Infantry, and served at West Point until 1868. He was in command of his regiment and on other duty thereafter until Dec. 2, 1870, when he was honorably discharged. In 1869 he accepted the presidency of the College of the City of New York. He was breveted major-general U. S. volunteers, and colonel, brigadier-general, and major-general U. S. A. He published *The Peninsula: McClellan's Campaign of 1862* (New York, 1882), and articles on the war in *The Century* magazine.

Webb, CHARLES HENRY: humorist; b. at Rouse's Point, N. Y., Jan. 24, 1834; ran away to sea when a boy, and, returning after three years, went into business in Chicago. From 1860 to 1863 he was on the staff of *The New York Times*. In 1863 he went to California, and in the following year founded *The Californian*, which he edited till 1866; wrote for other San Francisco papers and for the Eastern magazines; became a well-known humorous correspondent of *The New York Tribune* and other papers under the signature of John Paul, and traveled in Europe in that capacity 1876. He afterward became a banker and broker in New York. He is the inventor of an adding-machine, and author of several burlesque dramas; also of *John Paul's Book* (1874); *Parodies, Prose and Verse* (1876); and *Vagrom Verse* (1889).
Revised by H. A. BEERS.

Webb, GEORGE JAMES: composer; b. in Wiltshire, England, June 24, 1803; removed to the U. S. in 1830; was for many years professor in the Boston Academy of Music; in 1871 removed to New York; prepared, with T. B. Hayward, *The Musical Cabinet* (1832), and with William Mason *The Melodist*; contributed to William Russell's *Orthophony* (24th ed. 1864), and was author of *The American Glee-Book*, *The Common-School Songster*, *The Vocal Class-Book for Schools*, *The Massachusetts Collection of Psalmody*, and other musical works. D. at Orange, N. J., Oct. 7, 1887.

Webb, JAMES WATSON: journalist and diplomat; son of Gen. Samuel B. Webb; b. at Claverack, N. Y., Feb. 8, 1802; entered the U. S. army as second lieutenant of artillery Aug., 1819; was promoted to a first lieutenant in 1823, and the next year was made assistant commissary of subsistence; became adjutant Third Infantry 1826; was stationed in 1820 at Chicago, twelve years before the first house was erected there; in 1827 resigned his commission and took charge of *The Morning Courier*, which had been established in New York in May of that year; in 1829 purchased *The Enquirer* and united the two under the name of *The Morning Courier and New York Enquirer*, and became sole editor, and the next year sole proprietor—positions he held for thirty-four years, until the absorption of the paper by the *World*. This journal was at an early period identified with the interests of the Whig party, and was an able advocate of its principles. In 1851 Gov. Hunt, of New York, appointed him engineer-in-chief of the State of New York, with the rank of major-general. In 1849 he was appointed minister to Austria, and in 1861 to Turkey, but did not accept either appointment. In 1861 he was appointed by President Lincoln envoy extraordinary and minister to Brazil, where he served two terms of four years each. Being in Paris in 1865, he negotiated a secret treaty with the Emperor Napoleon for the removal of the French troops from Mexico. Gen. Webb resigned the mission to Brazil in 1869, and afterward resided in New York city. He published *Altowan, or Incidents of Life and Adventure in the Rocky Mountains* (2 vols., New York, 1846); *Slavery and Its Tendencies* (Washington, 1856); and a pamphlet on *National Currency* (New York, 1875). D. in New York, June 7, 1884.

Webb, SAMUEL BLATCHLEY: soldier; b. at Wethersfield, Conn., Dec. 15, 1753; joined the Revolutionary army, and took part in the battle of Bunker's Hill, where he was wounded. He was soon appointed aide-de-camp to Gen. Putnam; became private secretary and aide-de-camp to Gen. Washington, with the rank of lieutenant-colonel, June 21, 1776; was engaged in the battles of Long Island and the Brandywine; was wounded at White Plains and at Trenton; raised, and organized almost entirely with his own funds, the Third Connecticut Regiment, of which he took command 1777; was captured with his regiment by the British fleet in Gen. Parson's unfortunate expedition to Long Island Dec. 16, 1777, and not exchanged until 1780, when he succeeded Baron Steuben in the command of the light infantry, with the brevet rank of brigadier-general; was an intimate and trusted friend of Washington throughout the war, and subsequently was one of the sixteen officers who founded the Society of Cincinnati at Newburg-on-the-Hudson June 19, 1783; and was selected to hold for Washington the Bible on which he took the oath of office as first President of the U. S. in New York city in 1789. In the same year he settled at Claverack, Columbia co., N. Y., where he died Dec. 3, 1807.

Webb, SIDNEY, LL. D.: social economist; b. in London, England, July 13, 1859; educated in Switzerland and Mecklenburg-Schwerin; second Whewell scholar in international law and moral and political philosophy, Cambridge; Bacon scholar, Gray's Inn; was awarded a studentship for Roman

law and jurisprudence by the council of legal education, Trinity, 1883; called to the bar, Trinity, 1885; entered civil service Dec. 2, 1878; resigned 1891. He is the author of *Socialism in England* (London, 1889); *The Eight Hours Day*, in conjunction with Harold Cox (London, 1891); and *The London Programme* (London, 1892).—His wife BEATRICE (Potter) is the author of *The Co-operative Movement in Great Britain*.

Webb City: city (founded in 1876); Jasper co., Mo.: on the Kan. City, Ft. Scott and Mem., the Mo. Pac. and the St. L. and San Fran. railways; 9 miles S. by W. of Carthage, the county-seat (for location, see map of Missouri, ref. 7-12). It is a lead and zinc mining center, with a weekly output valued at \$25,000, and is surrounded by an agricultural and fruit-growing region. There are 8 churches, high-school building (cost \$30,000), 2 ward schools (cost \$10,000 and \$6,000), 2 opera-houses, water-works system (cost \$100,000), electric lights, electric railway connecting with Carthage and Centerville, a national bank with capital of \$50,000, 2 State banks with combined capital of \$50,000, and a weekly and 3 daily newspapers. Pop. (1880) 1,588; (1890) 5,043; (1895) 7,480. EDITOR OF "REGISTER."

Webbe, WILLIAM: author; b. in England in the sixteenth century; received a university education; translated Vergil's *Georgics* into English hexameters, and published *A Discourse of English Poetrie, together with the Author's Judgment touching the Reformation of our English Verse* (London, 1586), republished in vol. ii. of Haslewood's *Ancient Critical Essays upon English Poets and Poetry* (2 vols., 1811-15), and edited by Edward Arber in vol. xi. of his *English Reprints* (1870). Webbe also wrote *Tancred and Gismond, a Tragedy* (1592). Revised by H. A. BEERS.

Webber, CHARLES WILKINS: journalist and explorer; b. at Russellville, Ky., May 29, 1819; went in 1838 to Texas, then struggling for independence; was for several years connected with the famous Texan Rangers, seeing much of wild and adventurous life on the frontier; returned to Kentucky and studied medicine; afterward entered Princeton Theological Seminary with a view to the Presbyterian ministry, but abandoned that purpose, and settled in New York as a writer for literary periodicals, especially *The New World*, *The Democratic Review*, and *The Sunday Dispatch*; was associate editor and joint proprietor of *The Whig Review*; projected, with the two sons of his friend Audubon the naturalist, a monthly magazine of mammoth size, to be illustrated with copper-plate colored engravings by Audubon, but published only the first number; was engaged in an unsuccessful attempt to lead an exploring and mining expedition to the region of the Colorado and Gila rivers 1849, and in 1855 went to Central America, where he joined the filibuster Walker in Nicaragua, and was killed in a skirmish on Apr. 11, 1856. He was the author of *Old Hicks the Guide, or Adventures in the Comanche Country in Search of a Gold-Mine* (1848); *The Gold-Mines of the Gila* (1849); *The Hunter Naturalist, etc.* (1851), with 40 engravings from original drawings by Mrs. Webber; *Wild Scenes and Song-Birds* (1854), with 20 colored illustrations from drawings by Mrs. Webber; *Tales of the Southern Border* (1852); *Spiritual Vampirism* (1853); *Shot in the Eye, and Adventures with the Texan Rifle Rangers* (1853), and other works.

Revised by H. A. BEERS.

Weber, väber, ERNST HEINRICH: physiologist; b. at Wittenberg, Germany, June 24, 1795; studied medicine at Leipzig, and was appointed Professor of Comparative Anatomy there in 1818; in 1840 also of Physiology. His principal works are *Anatomia Comparativa Nervi Sympathici* (1817); *De Aure et Auditu Hominis et Animalium* (1820); *Lehre vom Bau und von der Verriichtung der Geschlechtsorgane* (1846); *Der Tastsinn* (in vol. iii. of Wagner's *Handwörterbuch der Physiologie*); and a number of minor essays and monographs collected in 1851 under the title *Annotiones Anatomice et Physiologicæ*. D. in Leipzig, Jan. 26, 1878.

Weber, FRIEDRICH ALBRECHT: Sanskrit scholar; b. at Breslau in Silesia, Feb. 17, 1825; educated at the Universities of Breslau, Bonn, and Berlin, 1842-45; privat docent at Berlin 1848-56; assistant professor 1856-67; Professor of Sanskrit University of Berlin since 1867; member of the Royal Academy; editor or author of *White Yajurveda* (3 vols., London, 1849-59); *Indische Studien* (17 vols., Berlin, 1849-89); *Indische Skizzen* (1857); *Indische Streifen* (3 vols., 1868-79); *Vorlesungen über ind. Literaturgesch.* (1852; 2d ed. 1876); *Verzeichniss der Sanskr. Handschriften der kgl.*

Bibliothek (2 vols., 1853-92); *Malavikā und Agnimitra übersetzt* (1856); also various lesser works and contributions to the *Abhandl. der kgl. Acad. d. Wissensch.* B. I. W.

Weber, GEORG: historian; b. at Bergzabern, in Rhenish Bavaria, Feb. 10, 1808; studied first theology, afterward history and literature, at Erlangen; spent several years in Heidelberg as tutor in an English family; visited Switzerland, Italy, and France, and was appointed director of the normal school of Heidelberg. He published *Lehrbuch der Weltgeschichte* (2 vols.); *Geschichte der Deutschen Litteratur*; *Allgemeine Weltgeschichte für die gebildeten Stände* (15 vols., 1857-80), and, with M. H. Holtzmann, a history of the Hebrew people and the origin of Christianity (2 vols., 1867). D. at Heidelberg, Aug. 10, 1888.

Weber, KARL MARIA FRIEDRICH ERNST, BARON VON: composer; b. at Eutin, near Lubeck, Germany, Dec. 18, 1786; early showed a talent for art, especially for music, but received a rather forced and desultory education, as his father—successively a soldier, a financial agent, a chapel-master, and then the leader of a band of strolling actors—wished to make him a musical prodigy, such as Mozart had been. Wandering about from place to place, young Weber published in 1798 his first composition, six fuggetti for the piano, and wrote his first opera, *Die Macht der Liebe und des Weins*. The result, however, did not answer his expectations, and for a couple of years father and son devoted themselves to the improvement of the recent invention of lithography by Senefelder. In 1800 their enthusiasm and means of subsistence were spent. Young Weber returned to his art, and produced the opera *Das Waldmädchen*, which was performed at Chemnitz, and in the following year *Peter Schmolz und seine Nachbarn*, which was performed in 1802 at Augsburg; neither of these works, however, produced any great effect. In 1803 he went to Vienna, where he studied under Abbé Vogler, a spirited and peculiarly gifted teacher of music, and by his recommendation he received in 1804 a place as director of music at the theater of Breslau. Here he began to compose a great opera, *Rübezahl*, which he never finished, and of which only the overture exists in a much altered form, *Der Beherrscher der Geister*; but the place did not agree with his tastes, and in 1806 he became private secretary to Duke Ludwig of Würtemberg. At this, the most dissolute court in Europe, he spent four years in idleness and dissipation. In 1810 he left Ludwigsburg morally and bodily impaired, in debt, and in disgrace. Once more he met with Abbé Vogler in Darmstadt, and under the influence of the atmosphere which he breathed here he again took up music, composed the cantata, *Der erste Ton*, several sonatas, overtures, etc., transformed the *Waldmädchen* into the *Sylvana*, which was performed with some success at Frankfurt, and wrote the operetta *Abu Hassan*. After traveling in Germany and Switzerland, he settled in 1813 in Prague as director of the opera, and remained there till 1816, doing good service and establishing for himself a wide reputation. He possessed great ability as an operatic manager, and his music (in 1814) to Körner's war-songs, among which were *Lützows wilde Jagd*, *Schwertlied*, etc., and his great cantata *Kampf und Sieg* after the battle of Waterloo, were true revelations of his genius, and spread his fame all over Germany. In 1816 he went to Dresden as director of the royal opera. The place was not without difficulties. The Italian opera was the pet of the court, and the great work of Weber's life was to drive the Italian opera out of Germany. Not one of his great operas was first brought on the stage in Dresden. *Preciosa* and *Der Freischütz* were first performed at Berlin, Mar. 15 and June 18, 1821, *Euryanthe* at Vienna Oct. 25, 1823, and *Oberon* at London Apr. 12, 1826. The success of *Der Freischütz*, however, was instantaneous and very great. In Berlin it annihilated the influence of Spontini. It became a favorite on the operatic stage of Northern and Central Europe; it exercised a decided influence on Marschner and Mendelssohn, on Meyerbeer and Auber, on all modern music, even on Richard Wagner; and as it was the first, it is still one of the freshest musical embodiments of the romantic spirit. Weber conducted in person the first performance of *Oberon*, and died soon after, June 5, 1826, in London. He was buried in Moorfields chapel, but in 1844 his remains were taken to Dresden, where in 1860 a fine statue of him by Rietschel was raised in front of the theater. His *Autobiography* and other writings were edited in 1828 in 3 vols. by Theodor Hell. Revised by DUDLEY BUCK.

Weber, WILHELM EDUARD: physicist; brother of ERNST HEINRICH WEBER; b. at Wittenberg, Oct. 24, 1804; studied

natural science at Halle; was appointed Professor of Physics at Göttingen in 1831, but dismissed in 1837 for political reasons; accepted a chair in 1843 at Leipzig, but returned in 1849 to Göttingen, and died there, June 23, 1891. In connection with his brother, Ernst Heinrich, he published in 1825 *Die Wellenlehre*; in 1836, with his brother Eduard Friedrich (1801-71), *Mechanik der Menschlichen Gewerkezeuge*; and in 1840, in connection with Gauss, *Resultate aus den Beobachtungen des magnetischen Vereins, with an Atlas des Erdmagnetismus*. From 1846 to 1867 he also published a series of essays on the connection between electricity and magnetism under the title *Elektrodynamische Massbestimmungen*. Physical science is indebted to him for the demonstration by experiment of two fundamental laws concerning the working of the electro-dynamic force which had formerly been applied by Ampère as mere hypothetical inferences.

Weber River: a river of Utah. It rises on the west slope of the Uinta Mountains, flows northward through a series of cañons connecting agricultural valleys for 175 miles, and empties into Great Salt Lake near the middle of its eastern shore. The wild gorge made by the river through the Wasatch Mountains, known as Weber Cañon, is traversed by the Union Pacific Railway between Echo and Ogden. The mean volume of the river at Ogden is estimated at 2,000 cubic feet per second. Its waters are extensively used for irrigation. At Ogden there is an immense delta built by the river in ancient Lake Bonneville. ISRAEL C. RUSSELL.

Weber's Law: See PSYCHO-PHYSICS.

Webster: town (incorporated in 1832); Worcester co., Mass.; on the French river, and the Boston and Albany and the N. Y. and New Eng. railways; 16 miles S. of Worcester (for location, see map of Massachusetts, ref. 3-F). It contains Chaubunagungamaug Lake of 1,225 acres; has 7 Protestant and 3 Roman Catholic churches, a high school, 13 graded schools, 3 parochial schools, public library, a national bank with capital of \$100,000, a savings-bank with deposits of over \$1,000,000, and 2 weekly newspapers; and is principally engaged in the manufacture of cotton and woolen goods and shoes. It has a self-sustaining water-works system, electric lights, and 2 hotels, and in 1894 had a revenue of \$53,000, expenditures of \$48,000, assessed valuation of \$3,124,707, and no debt. Pop. (1880) 5,696; (1890) 7,031; (1895) 7,799. REV. HENRY A. BLAKE.

Webster, DANIEL: orator and statesman; b. at Salisbury, N. H., Jan. 18, 1782; the son of Ebenezer Webster, an officer in the Revolutionary army, and a descendant of Thomas Webster, who settled in New Hampshire about 1636. On account of feeble health Daniel was educated at home and by private tuition in his boyhood, but spent nine months at the Phillips Academy, Exeter, where he showed an extraordinary fondness for reading, and great powers of memory. In 1797 he entered Dartmouth College, where, though he never became distinguished as a student, he acquired great reputation on account of his unusual gift for clear and forcible expression as a speaker. He was a great reader of history, and acquired considerable familiarity with the Latin authors. For one year he edited a weekly newspaper, and his fame as a speaker was such that when he was eighteen he delivered an oration at Hanover on July 4, 1800. In 1801 he began the study of law in an office at Salisbury, but was soon forced to interrupt his studies and teach school, in order to contribute to the support of his family. While teaching in Freiberg, Me., he increased his income by working as a copyist in the office of the Register of Deeds. During this period he delivered a Fourth of July oration which emphasized the necessity of strictly adhering to the Constitution, thus showing already the bent of his mind. After a year he returned to the study of law, and later entered the law office of Christopher Gore, in Boston. Admitted to the bar in Mar., 1805, he began the practice of law in Boscawen, N. H., and on the death of his father, in 1807, assumed his debts and the support of the family. In the following year he removed to Portsmouth, and almost immediately rose to prominence at the bar. At this time of his life he profited greatly from the friendship and advice of Jeremiah Mason, the foremost lawyer of the State, and one of the greatest advocates of the time. Webster was not only admired for his abilities, but was personally popular for his social qualities. His income was now ample, but his tastes were not simple, and he had become so accustomed to debt that henceforth he almost seemed to regard it as the normal condition of mankind.

Early attracted to politics, he showed his fitness for a po-

litical career by his occasional addresses and speeches. He had inherited strong views as a Federalist from his father, and the cast of his mind was peculiarly conservative. In 1804 he published a pamphlet entitled *An Appeal to the Old Whigs*; in 1805, a Fourth of July oration at Salisbury; in 1806, another at Concord; and in 1808, a pamphlet on the *Embargo*, in all of which the prominent thought is the importance of the Constitution and the republic. In 1809 he delivered a Phi Beta Kappa oration on *The State of Our Literature*, but at this period he was chiefly absorbed in the practice of his profession. In his Fourth of July oration in 1812 he set forth his attitude toward the war. Maintaining that "maritime defense, commercial regulations, and national revenue" were the corner-stones of the Constitution, he declared that these interests had been abused by the course of the Government, and he held that the navy had been neglected because the Federalists had advocated its improvement and increase. In one particular he departed from the policy of the New England Federalist. He said: "With respect to the war in which we are now involved, the course which our principles require us to pursue can not be doubtful. It is now the law of the land, and we certainly are bound to regard it. Resistance and insurrection form no part of our creed. . . . If we are taxed to carry on this war, we shall disregard certain distinguished examples and shall pay. If our personal services are required, we shall yield them to the precise extent of our personal liability. At the same time the world may be assured that we know our rights and shall use them. We shall express our opinions on this, as on every measure of the Government—I trust without passion, I am certain without fear. By the exercise of our constitutional right of suffrage, by the peaceable remedy of election, we shall seek to restore wisdom to our councils and peace to our country." This shows his attitude toward an unpopular law. With him the only way to deal with it was to make it appear unwise by popular discussion, and procure its repeal. This oration, so consonant with his subsequent attitude on the Fugitive Slave law, was widely circulated, and caused his election to the Thirteenth Congress, in which he took his seat in May, 1813. He was at once made a member of the committee on foreign relations, and his speeches in the House soon made it clear that he was not only the foremost man of the party, but one of the ablest leaders in Congress. In the course of the discussion of the project for a national bank, he laid the foundation of his fame in financial matters. Opposing a measure which would have led to inflation, he declared himself the foe of irredeemable paper. The bill was lost by a single vote, but, moved by the entreaties of Calhoun, Webster consented to its reconsideration, and after its objectionable features were removed it was passed. In the Fourteenth Congress he introduced a resolution requiring all Government dues to be paid in coin, in treasury notes, or in notes of the Bank of the United States, and in a speech of great power showed the absolute necessity of a specie basis in all financial matters. His resolution brought about specie resumption, and established a sound currency. In 1816 he removed to Boston, and for the next seven years devoted himself to practice. When he began his career at Boston, at the age of thirty-four, he had become one of the leading lawyers in the land, and had established a reputation as one of the most powerful speakers in Congress, and one of the ablest statesmen in the country in matters of finance. He had already defined his position on the tariff as a free-trader in principle, and a very moderate protectionist when protection was unavoidable; had opposed the war, but had kept himself entirely clear of the separatist movement in New England, which had found expression in the HARTFORD CONVENTION (*q. v.*). On Mar. 10, 1818, his argument in the celebrated Dartmouth College case not only called to himself the admiration of the whole people, but, notwithstanding the adverse prepossessions of a majority of the judges, secured one of the most important decisions ever rendered by the Supreme Court. It has been estimated that gifts to educational and other beneficent institutions amounting to more than \$500,000,000 have been protected from legislative interference by the decision thus secured. His oration of Dec. 22, 1820, on the two-hundredth anniversary of the landing of the Pilgrims at Plymouth, placed him at the very head of American orators, and in the opinion of many proved him the equal of the most eloquent speakers of England or the Continent. John Adams, who had been present at the trial of Hastings, declared that Burke was no longer entitled to be called the greatest of

modern orators. The profound impression made by the Plymouth oration was deepened by that on the laying of the corner-stone of Bunker Hill Monument in 1825, and by the eulogy on Adams and Jefferson one year later. These, the most important of his occasional addresses, were followed in the course of years by one on *Science in Connection with the Mechanic Arts*; one on the *Character of Washington*; one on the occasion of laying the corner-stone for the enlargement of the Capitol at Washington; and one on the death of Judge Story.

He was re-elected to Congress from the Boston district in 1822, and took his seat in 1823, at the very time when the old party lines were breaking down. Within a few days of his appearance in the House, he delivered a remarkable speech in support of the motion which he had introduced to provide for a commissioner to inquire into the affairs of Greece. While deprecating any intermeddling on the part of the U. S. with European affairs, he showed that the country still had an important duty to perform in the exercise of a proper influence on the public opinion of the Old World, and he discussed the great question of the future destiny of the U. S. in its relation to other nations. During the same session as chairman of the judiciary committee he defended with much difficulty, but with final success, the Supreme Court against the attempts made to curtail its powers. At a later period he also carried through a measure for its reorganization and the increase of the number of judges. In the second session of this Congress he defined his position on the general subject of internal improvements by his great speech on the *Cumberland Road*, taking the ground that this line of policy must be carried out from the purest national motives. He also defended the policy of selling public lands at a low price to encourage immigration. The speech was that of a national statesman, and it greatly enhanced his reputation, especially throughout the West. During this same period of his career he was prominent in debates on the tariff, and as a representative of the New England Federalists proposed the promotion of commercial interests by a moderate tariff which should lead to free trade. In one of his great speeches on the subject of protection, he said: "It is the true policy of Government to suffer the different pursuits of society to take their own course, and not to give excessive bounties or encouragements to one over another. This also is the true spirit of the Constitution. It has not, in my opinion, conferred on the Government the power of changing the occupations of the people of different States and sections and of forcing them into other employments." This passage is of great significance in showing his spirit before 1824; because when the tariff of that year, notwithstanding his opposition to it, was passed, he regarded the policy of the country as reversed, and from that time forward was a supporter of what Henry Clay called "the American policy" of protection. In 1828 he defended his course by declaring that the country had adjusted itself to the new conditions, and that steadiness and permanency of policy were of the utmost importance, but this new attitude subjected him at that time and ever afterward to severe criticism.

While he was delivering his speech on the tariff of 1824, he was informed that the Supreme Court had called for the next morning the great case of *Gibbons vs. Ogden*, which involved the constitutional right of the State of New York to grant a monopoly of its tide-waters. Webster worked all night in preparation, and in the morning made a speech of five hours, and secured a decision which Judge Wayne said "released every creek and river, every lake and harbor in the country from the interference of monopolies."

Elected to the Senate by the Legislature of Massachusetts in the year 1827, he was involved in the famous debate that arose from FOOTE'S RESOLUTION (*q. v.*), 1829, in regard to the methods of administering the public lands of the West. At this time the South was bitterly hostile to the tariff of 1828, and the nullification doctrines of 1798 and 1799 (see NULLIFICATION) were reasserted with great energy. The resolution led to a discussion of the question of the constitutional rights of the Federal Government and of the individual States. It also involved the question of the right of the individual States to nullify an act of the general Government, and withdraw from the Union. The most important characteristic of Webster's political creed had ever been a spirit of nationalism as distinguished from the spirit of sectionalism. He was in consequence peculiarly well fitted by his political history to be the champion of the Union cause. As he himself said, his whole life had

been a preparation for the reply to Hayne. His speech of Jan. 26, 1830, proclaimed the doctrine of nationalism, and depicted the direful results of nullification with such eloquence and power that the views expressed became an integral part of the political creed of a vast majority of the people of the country. In the bank controversy of 1832, Webster criticised President Jackson's position in assuming the right to pronounce upon the unconstitutionality of the bank's charters, the Supreme Court having already pronounced upon them, and his speech revealed an extraordinary knowledge and grasp of financial subjects. The reputation thus gained was strengthened by his discussion of the President's course in the following campaign. After the removal of the deposits, Webster delivered in Boston a powerful speech in which he predicted the results that came in the financial crash of 1837.

Webster seemed a natural candidate for the presidency, but he had taken a prominent part in a great number of important matters, and had aroused opposition even in his own party. He supported the candidacy of Harrison, and became his Secretary of State. The great achievement of this period of his life was his negotiation of the Ashburton treaty, fixing the northeastern boundary-line between the U. S. and the British possessions. During Lord Palmerston's administration the irritation arising from the boundary dispute was such that war seemed imminent. Webster agreed with the opinion expressed years before by the Government of President Monroe, that the forty-ninth parallel would be a fair line of division in the Northwest; but the British had claimed a line as far S. as the Columbia river, while in the U. S. there had grown up a party whose watchword was "Fifty-four Forty or Fight." The death of Harrison, before the negotiations were concluded, obliged Webster to decide whether he would resign with his colleagues or remain in Tyler's cabinet, in order to complete a treaty of so great importance. He decided to brave the unpopularity of taking the latter course, and in so doing rendered the country a most valuable service; but although the treaty has since received the hearty approval of historical and diplomatic critics, it exposed Webster to considerable censure both from the "jingo" politicians of those days and from the equally numerous class that declared him a deserter from the Whig party, on account of his refusal to join his colleagues in abandoning President Tyler. In May, 1842, feeling that the treaty was secure, he resigned the secretaryship. A speech in defense of the Ashburton treaty was delivered in the Senate on Apr. 6 and 7, 1846, and will be found in his published writings. Though the northwestern boundary was not settled by this treaty, it was a hint given by Webster that led Great Britain to propose the line that was subsequently adopted. The next two years he devoted to his private affairs, and the practice of his profession. He supported Clay's candidacy in 1844, and on Mar. 4, 1845, returned to the Senate. In the next presidential campaign Webster was again spoken of as a candidate, but he had no prospect of success, and the party united on Gen. Taylor. Though opposed to the choice of a military candidate, and distrusting Taylor on account of the uncertainty of his political views, Webster in his Marshfield speech, while admitting that the nomination was "one not fit to be made," advised his friends to vote for Taylor, as a safer alternative than the Democratic candidate.

On the accession of Taylor the first great problem to demand a solution was the organization of the territory ceded to the U. S. at the end of the Mexican war. During his whole career, Webster had taken a prominent part in opposing not only the introduction of slavery into new territories, but also the acquisition of new territory into which slavery might be introduced. He had opposed the annexation of Texas, the Mexican war, and the treaty by which California and New Mexico had been ceded to the U. S., basing his opposition on the grounds, first, that the territory of the U. S. was already extensive enough, and, secondly, that the acquisition of new territory would involve at least the liability of the extension of slavery. Throughout his career his course in these matters had been vigorous, consistent, and well understood. When therefore the resolutions which made up what is known as the Clay compromise of 1850 were presented, many, not understanding the fundamental articles of his political creed, looked to him as the natural leader of the opposition. In this expectation they were, of course, disappointed. After his great speech on *The Constitution and the Union*, Mar. 7, 1850, he was grossly charged with an abandonment of a life-long policy in order

to conciliate the South and secure its support two years later for the presidency. In judging his course at this time certain fundamental peculiarities of his political philosophy should be constantly kept in mind. While he had always been the foe of the extension of slavery, he had always urged the faithful execution of the laws and of the Constitution, and had regarded the preservation and the strengthening of the Union as of paramount political importance. Moreover, he had observed with pain the widening breach between the North and the South, which if not arrested, would, in his opinion, lead inevitably to secession, and he held that peaceable secession was impossible. It was but natural, therefore, that he should welcome any compromise not repugnant to his fundamental beliefs. It was to allay the prevailing excitement, to settle all questions in political dispute, and thus remove the danger of threatening disunion, that Clay came forward with the compromise measures of 1850. Before doing so, he called upon Webster and explained his purpose in detail. Webster at once gave his approval, and promised to support the compromise in the Senate. This he did in the masterly speech of Mar. 7, basing his action on the following propositions: First, the country is in danger of disunion; second, this danger has come from real grievances on both sides; third, these grievances must be removed by mutual concession, and by a just administration of the laws; fourth, the measures propose a just and reasonable solution of every political problem now disturbing the peace of the country; fifth, the failure to adopt these or similar measures may lead to secession, and peaceable secession is impossible. In arguing some of these points Webster gave great offense to many of his old friends in the North. For example, in regard to the abolition societies, he said: "I do not think them useful. I think their operations for the last twenty years have produced nothing good or valuable." Then, after showing how, in 1832, a debate occurred in the Virginia House of Delegates on a proposition for the gradual abolition of slavery, he pointed out that after the abolition movement began in 1835, slavery everywhere "drew back and shut itself up in its castle. The bonds of slaves were bound more firmly than before. Their rivets were more strongly fastened." He offended a still larger number by his refusal to sanction the application of the Wilmot proviso (see WILMOT, DAVID) to the newly acquired territory. The ground, he urged, was the general fact that the new territory was of such a nature that slavery could never be introduced into it, and that consequently to insert the proviso would accomplish nothing, and at the same time would greatly irritate the South by a course which would be interpreted as indicating an unwillingness to abide by the terms of the Missouri compromise. California had already applied for admission to the Union under a constitution with slavery excluded, and from New Mexico slavery had been excluded by nature herself. He concluded this part of his argument by saying: "Wherever there is a substantial good to be done, wherever there is a foot of land to be prevented from becoming slave territory, I am ready to assert the principle of the exclusion of slavery. I am pledged to it from the year 1837, I have been pledged to it again and again, and I will perform those pledges; but I will not do a thing unnecessarily that wounds the feelings of others or that does discredit to my own understanding." But perhaps he gave the most serious offense by his position in regard to the surrender of fugitive slaves. For him it was enough to stand by the plain requirement of the Federal Constitution that fugitive slaves should be delivered up to their owners. During the first forty years of the history of the Government the propriety of this constitutional provision had scarcely been questioned. Even now it was the fundamental law of the land, and could not be altered without a change in the Constitution. It was therefore as binding as any other law. But there had grown up in the North a moral and religious sentiment to which this constitutional requirement was utterly abhorrent. This sentiment often went so far as to refuse obedience to this provision of the Constitution. Webster not only did not share that feeling, but he believed that it was fraught with the gravest danger. He said plainly to the North as well as to the South that every provision of the Constitution must be carefully protected and enforced, including the clause providing for the extradition of fugitive slaves. He therefore was in favor of the enactment of a more perfect fugitive slave law.

No speech in the history of the country ever made so profound an impression. He seemed to have spoken to 30,000,000 of people. His utterances were generally approved

by the South and by a considerable part of the North. By large numbers, however, they were received with sorrow, by many even with indignation. The flood-gates of vituperation and calumny were opened, and Webster was foully charged with most revolting vices for the purpose of breaking his influence. (See Swisshelm in *Independent*, Apr. 11, 1878, for curious evidence on this point.) The compromise measures, with some unimportant modifications, were passed, however, and secession, probably in consequence of their passage, was postponed to a time when the cause of the Union was relatively very much stronger and consequently very much more sure of success.

On the accession of President Fillmore, July 9, 1850, Webster was persuaded a second time to take the position of Secretary of State. During the next two years he conducted the foreign affairs of the Government with tact, dignity, and good judgment, but his health was rapidly failing, and in July, 1852, he expressed a desire to the President to resign. Mr. Fillmore, however, persuaded him to retain his office. As the presidential nomination of 1852 drew near his friends made a concerted movement in his behalf; but the effort only showed that in the course of his career, and especially during the last two years, he had aroused the earnest opposition of the strenuous abolitionists in all parts of the country. Gen. Scott was nominated by the Whigs, but as the Whigs were divided, and the Democrats were unanimously determined to resist all attempts to renew the slavery agitation, Webster advised his friends to vote for the Democratic candidate. In the course of the summer his health failed rapidly, and on Oct. 24, 1852, this mighty supporter and defender of the Union, whom history must ultimately recognize as one of the very greatest Americans, died at Marshfield as he was nearing the end of his seventy-first year.

AUTHORITIES.—The six volumes of the *Works of Daniel Webster* contain what he regarded as the most important of his speeches, and they are the most valuable of all sources of information concerning his views on many of the subjects on which he spoke; but a complete knowledge can not be obtained without frequent consultation of the records of Congress for speeches and utterances not contained in his collected works. Of biographical works, George Ticknor Curtis's *Life of Daniel Webster* (2 vols., 8vo) is the standard, and is by far the most important. Wilkinson's *Webster, an Ode* (1882), is important, and contains invaluable *Notes and Illustrations* in defense of Webster. Lodge's *Daniel Webster*, in the American Statesman Series, condemns vigorously the course of Webster in 1850. Of the formal histories of the period, those of Schouler, Rhodes, and Von Holst are of importance. The speeches of Clay and Calhoun must be read for an adequate view of the sectional feelings during the later period of Webster's life.

C. K. ADAMS.

Webster, JOHN; dramatist; b. in England toward the close of the sixteenth century; was associated with Dekker, Chettle, Drayton, Marston, Rowley, Middleton, Munday, Heywood, and Wentworth Smith in writing some of their plays, and ultimately became an author on his own account. Of his personal history nothing is known. Among his dramas are *The White Devil* or *Vittoria Corombona* (1612); *The Duchess of Malfy* (1623); *Appius and Virginia* (1624); and *The Devil's Law Case*. Webster's genius was exclusively tragic; his diction is sometimes Shakespearean, but he exaggerated the terrible into the horrible, and the morbid gloom and ferocity of his pictures of life are unrelieved by Shakespeare's sweetness, or by any humor. Webster's dramatic works have been edited by Dyce (4 vols., 1830) and by Hazlitt (4 vols., 1857-58). Revised by H. A. BEERS.

Webster, NOAH; lexicographer; b. at West Hartford, Conn., Oct. 16, 1758; graduated at Yale College 1778, serving in the Continental army during a part of his college course; studied law while teaching school at Hartford; was admitted to the bar 1781; taught a classical school at Goshen, Orange co., N. Y., 1782-83; prepared there his spelling-book, grammar, and reader, printed under the title *A Grammatical Institute of the English Language, etc., in Three Parts* (Hartford, 1783-85), a work so successful that the sale of the spelling-book has exceeded 60,000,000; printed an edition of Gov. Winthrop's *Journal*; wrote political articles for the *Hartford Courant* 1784; published *Sketches of American Policy* (1785), advocating the formation of a Federal Constitution; traveled in the Southern States the same year to petition their legislatures to favor a

copyright law; delivered a course of lectures on the English language in the principal Atlantic cities 1786; taught an academy in Philadelphia 1787, in which year he issued a pamphlet, *An Examination of the Leading Principles of the Federal Constitution*; edited in New York Dec. 1787, to Nov., 1788, the *American Magazine*, an unsuccessful enterprise; practiced law at Hartford 1789-93; married a daughter of William Greenleaf of Boston 1789; returned to New York and in Nov., 1793, founded a daily paper, the *Minerva*; published in his paper, over the signature of Curtius, an elaborate defense of Jay's treaty; settled in New Haven 1798; published *A Brief History of Epidemics* (2 vols., 1799); *Rights of Neutral Nations in Time of War* (1802); a *Compendious Dictionary of the English Language* (1806); and a *Philosophical and Practical Grammar of the English Language* (1807); devoted himself thenceforth to the great labor of his life, the preparation of the *American Dictionary of the English Language* (2 vols. 4to, 1828). He resided at Amherst, Mass., 1812-22; was influential in the establishment of Amherst College, and was president of its first board of trustees; returned to New Haven 1822; visited Europe 1824-25, pursuing his philological studies at the Bibliothèque du Roi, Paris, and completing his dictionary by the aid of the libraries of the University of Cambridge, and devoted his leisure for the remainder of his life to the revision of that work and of his schoolbooks, and to the preparation of a series of intermediate dictionaries. D. in New Haven, May 28, 1843. He had superintended in 1840 the publication of the 2d edition of his *Dictionary* (1840-41), carefully revised and with the addition of several thousand words. A 3d edition was edited by his son-in-law, Prof. Chauncey A. Goodrich, D. D. (1847), as also the 4th edition (pictorial, 1859), the latter containing 99,798 words. A 5th edition, with 114,000 words, 3,000 illustrations, and extensive revisions in every branch, but especially in etymology, was brought out in 1864 by Prof. Noah Porter, D. D., afterward president of Yale College. The latest revision is that of 1890 (*Webster's International*). Webster's minor publications are very numerous. See *Life of Noah Webster*, by Horace E. Scudder (Boston, 1882).

Revised by H. A. BEERS.

Webster, Sir RICHARD EVERARD, Q. C.: jurist; b. in England, Dec. 22, 1842; educated at King's College and Charterhouse Schools and Trinity College, Cambridge; called to the bar 1868; queen's counsel 1878; acquired one of the largest and most valuable law practices in England; Attorney-General in Lord Salisbury's administration 1885-86, 1886-92, and 1895- ; in 1885 represented Lancaster in Parliament; in the same year represented the Isle of Wight, and still represents that constituency. In 1893 he was one of the British representatives in the Bering Sea arbitration case.

Webster City: city (founded in 1854); capital of Hamilton co., Ia.; on the Boone river, and the Chi. and N. W., the Ill. Cent., and the Web. City and S. W. railways; 75 miles N. of Des Moines (for location, see map of Iowa, ref. 4-G). It is in an agricultural and coal-mining region, and has public and German Lutheran schools, several iron furnaces, shoe-factory, manufactory of temperance drinks, and a daily, a monthly, and 4 weekly periodicals. Pop. (1880) 1,848; (1890) 2,829; (1895) State census, 5,095.

EDITOR OF "GRAPHIC-HERALD."

Webster Groves: village; St. Louis co., Mo.; on the Mo. Pac. Railway; 10 miles S. W. of St. Louis (for location, see map of Missouri, ref. 4-J). It is the place of residence of many St. Louis business men, and has seven churches, public high school, separate district schools for white and colored children, private school for grammar and academic courses, and a kindergarten. Pop. (1890) 1,783; (1895) estimated, 2,500. W. P. HAZARD, SECRETARY OF BOARD OF EDUCATION.

Wecker, LOUIS, de, M. D.: ophthalmologist; b. at Frankfurt-on-the-Main, Sept. 29, 1832; studied medicine at Würzburg, Berlin, Paris, and Vienna, graduating M. D. at Würzburg in 1855 and at Paris in 1861. He had studied diseases of the eye under Arlt, von Graefe, Jaeger, Desmarres, and Sichel, and after 1862 he practiced his specialty in Paris. Among his more important works are *Traité des maladies des yeux* (Paris, 1863); *Traité des maladies du fond de l'œil* (Paris, 1870); *Thérapie oculaire* (Paris, 1878); *Chirurgie oculaire* (Paris, 1879); *Précis d'ophtalmoscopie clinique* (Paris, 1881); *Les Indications de l'extirpation simple* (Paris, 1885); and with Landolt *Traité complet d'ophtalmologie* (Paris, 1883-84). S. T. ARMSTRONG.

Weddahs: another spelling of VEDDAHS (*q. v.*).

Wedderburn, JAMES; psalmodist; b. at Dundee, Scotland, about 1500; edited with his brother Robert *Ane Compendious Buik of Godly and Spirituall Songs, collectit out of Sundrie Partes of the Scripture, wyth sundrie of uther Ballades changed out of Prophane Sangs, for avoyding of Sinne and Harlotrie* (printed at Edinburgh about 1548). This was the principal psalm-book used in Scotland. He was also the reputed author of *The Complaynt of Scotland* (1548), "the only classic work in old Scottish prose." D. in England about 1564.

Wedgwood, JOSIAH, F. R. S.: manufacturer of fine pottery; b. at Burslem, Staffordshire, England, July 12, 1730; was the younger son of a potter in easy circumstances, and descended from a family identified for several generations with the ceramic art; was apprenticed to his brother Thomas in 1744; worked at the potter's wheel several years; was lame from his sixteenth year as the result of a severe attack of smallpox; entered into business for himself with a partner named Harrison, at Stoke, in 1752, manufacturing the ordinary cheap wares then in demand, to which, however, his superintendence gave an artistic finish previously unknown; was from 1754 to 1759 partner of Thomas Wheelton, the most eminent potter of his day; devoted himself for many months to a careful study of, and experiments upon, the fictile materials then in use, resulting in the invention of a green "tortoise-shell" earthenware, having the smoothness and brilliant appearance of glass, from which he made toilet-vessels, services of dessert, knife-handles, and articles of *verlu*; established himself in business at his native place in 1759; perfected in 1761 a fine cream-colored ware, specimens of which, being presented to the queen, Charlotte of Mecklenburg, obtained him the title of queen's potter and permission to entitle his new art-product "queensware." He rapidly acquired a considerable fortune, of which he made a liberal use; married his cousin, Sarah Wedgwood, Jan. 25, 1764; was the most efficient promoter of Brindley's Grand Trunk Canal, to which he subscribed £1,000, and for which he cut the first sod at Burslem July 26, 1766; adapted the engine-lathe to the uses of his art; produced in 1766 his fine black "basaltes" or "Egyptian" ware, and shortly afterward his celebrated jasper ware; formed a partnership in 1768 with Thomas Bentley, of Liverpool, a man of fortune and artistic tastes; made experiments in the qualities of many kinds of clays, importing from the Cherokee district of South Carolina a fine porcelain clay; opened his celebrated establishment near Burslem which he named Etruria June 13, 1769; began about this time to produce copies of classical vases and other ancient masterpieces, chiefly from the engravings in Sir William Hamilton's *Antiquities*; opened in 1770, at Chelsea, a branch establishment for the painting and finishing of his wares; opened in London soon afterward a salesroom of his own, which became a fashionable resort of the nobility; received large orders from the Continent, especially from Catherine II. of Russia, for whom he executed a service of many hundreds of pieces, each representing a different English landscape; was elected to the Royal Society and to the Society of Antiquaries; invented the pyrometer; employed Flaxman and other great artists as his modelers; executed magnificent copies of the famous Barberini or Portland Vase 1790. He was highly esteemed by the royal family, enjoyed the intimate friendship of the Duke of Bridgwater, Earl Gower, and other prominent noblemen, and was regarded by his contemporaries as the father of his art in modern times. D. at Etruria, Jan. 3, 1795.—His sons JOHN and JOSIAH, and their descendants, have continued his business to the present day. The naturalist Charles Darwin was the son of his daughter Susanna, and other descendants have been prominent in literature or science. His statue, by Davis, has been erected at Stoke-upon-Trent, and a memorial institute was opened at Burslem Oct. 26, 1863. His biography has been written by Llewellyn Jewett (1865) and by Miss Eliza Meteyard (2 vols., 1865-66), who is also author of *Memorials of Wedgwood* (1875) and *Wedgwood Handbook* (1875). See POTTERY AND PORCELAIN.

Revised by RUSSELL STURGIS.

Wedlock: See MARRIAGE.

Wednesbury, wenz bür-reë: town of England; in Staffordshire, near the sources of the Tame; 8 miles N. W. of Birmingham (see map of England, ref. 9-G). It is in the center

of a rich iron and coal district, and has extensive manufactures of ironware of almost every description. The Perpendicular church of St. Bartholomew is built on the site of a temple of Woden, whence the Old English name *Wodnes-beah*. Pop. of the parliamentary borough, returning one member (1891), 69,083.

Wednesday [M. Eng. *wednesdai*, *wodnesdai* < O. Eng. *Wōdnes dæg*, Woden's day (used as translation of Lat. *Mercurii dies*, Wednesday, liter., Mercury's day)]: the fourth day of the week; so named in consequence of an identification of the Northern god Woden or Odin with the Roman Mercurius. By the old superstition Wednesday was considered not particularly lucky nor particularly dangerous.

Weed, STEPHEN HINSDALE: soldier; b. in New York in 1834; graduated at the New York Free Academy 1850, and at the U. S. Military Academy July, 1854, when commissioned brevet second lieutenant of artillery; promoted first lieutenant 1856; served on the Texan frontier and in the Florida war 1855-57, and the Utah expedition 1858-61. Promoted captain in the Fifth Artillery May 14, 1861, he was engaged at regimental headquarters and on recruiting duty from August to November, and at Camp Greble, Pa., Nov., 1861, to Mar., 1862, when, joining the Army of the Potomac, he commanded his battery throughout the Peninsular campaign of 1862, and at Manassas, Antietam, and Chancellorsville, in all of which battles he displayed great bravery. After Chancellorsville he was given command of the artillery brigade, Fifth Corps, and June 5 was appointed a brigadier-general of volunteers. At Gettysburg he commanded a brigade of artillery, Fifth Corps, and in the terrible struggle of July 2, 1863, for the possession of Little Round Top, he was instantly killed at the head of his command, on the spot now marked "Weed's Hill." Revised by JAMES MERCUR.

Weed, THURLOW: journalist and party leader; b. at Cairo, Greene co., N. Y., Nov. 15, 1797; was cabin-boy on a Hudson river vessel when ten years of age; entered a printing-office at Catskill two years later; worked in several villages in the interior of New York; was a volunteer on the northern frontier of New York in the war of 1812-15, serving as quartermaster-sergeant; established in 1818 *The Agriculturist* at Norwich, Chenango co., N. Y.; edited several other papers during the ensuing ten years, among which was *The Anti-Masonic Enquirer* at Rochester 1826-27. He was twice elected to the New York Assembly 1826-30; contributed largely to the election of De Witt Clinton as Governor 1826; settled at Albany in 1830; founded there *The Evening Journal*, a newspaper established in the interests of the party then being formed in opposition equally to the administration of President Jackson, as represented by the "Albany Regency," and to the nullification policy of Calhoun; was an original leader of the Whig party; contributed largely to the election of Gov. Seward in 1838 and 1840, to the nomination of Harrison in 1836 and 1840, and to his election on the latter occasion; became known as the most adroit of party managers, but declined to accept any public office; was active in promoting the nomination of Gen. Taylor in 1848 and of Gen. Scott in 1852; exerted his influence in 1856 and 1860 in favor of the nomination of William H. Seward, but rendered cordial support to Fremont and Lincoln; was an advocate of the energetic prosecution of the war 1861-65; visited Europe at the request of President Lincoln Nov., 1861, remaining abroad until June, 1862, and exerted an important influence upon English opinion through his personal relations with leading statesmen; withdrew from *The Evening Journal* in 1862; settled in New York city 1865, and was editor of *The Commercial Advertiser* 1867-68, after which he retired from active journalism, but continued throughout the administration of President Grant, and especially during the grave constitutional crisis ensuing upon the election of 1876, to exert a powerful influence upon the counsels of his party, and was a frequent contributor over his own signature to the columns of the political journals. He published *Letters from Europe and the West Indies* (Albany, 1866), and some interesting *Reminiscences in the Atlantic Monthly* (1870) and in other periodicals, and prepared an autobiography which was edited by his daughter and published in 1882. D. in New York, Nov. 22, 1882. Revised by F. M. COLBY.

Weeden, WILLIAM BABCOCK, A. M.: soldier and author; b. at Bristol, R. I., Sep. 1, 1834; son of John E. Weeden, M. D.; educated at Brown University; became a manufacturer of woollen goods at Providence; in 1861 became second lieutenant in the first battery; enlisted in Rhode Island

for three years' service in the Union army; was promoted captain; chief of artillery of division commanded by Brig.-Gen. Morell; was engaged at the siege of Yorktown, and in the battles of Hanover Court-house, Mechanicsville, Gaines's Mill, and Malvern Hill; resigned in Aug., 1862, and returned to business life; author of *Morality of Prohibitory Liquor Laws* (Boston, 1875); *Social Law of Labor* (Boston, 1882); *Economic and Social History of New England 1630-1789* (2 vols., Boston, 1890).

Weedsport: village; Cayuga co., N. Y.; on the Erie Canal, and the Lehigh Val., the N. Y., Cent. and Hud. Riv., and the W. Shore railways; 9 miles N. of Auburn, 22 miles W. of Syracuse (for location, see map of New York, ref. 4-F). It is in an agricultural region, and has 5 churches, Union public school, 2 private banks, 3 weekly newspapers, corset and basket factories, and agricultural-implement works. It is an important coal-shipping point. Pop. (1880) 1,411; (1890) 1,580. EDITOR OF "SENTINEL."

Weehawken: township; Hudson co., N. J.; on the Hudson river, and the N. Y., Ont. and West, and the West Shore railways (for location, see map of New Jersey, ref. 2-E). It has 2 churches, a public and a Roman Catholic school, 2 reservoirs of the Hackensack Water Company (reorganized) with capacity of 15,176,000 and 29,760,000 gal. respectively, a high service-tower with capacity of 150,000 gal., a regulating-tank with capacity of 283,000 gal., and a lard-refinery. Weehawken is probably the largest coal depot in the U. S., having the coal docks of the Pennsylvania Coal Company, the Delaware and Hudson Canal Company, and the Erie Railroad Company, and also the freight sheds of the last. It is also noted as the Hamilton-Burr dueling-ground. Pop. (1880) 1,102; (1890) 1,043; (1895) State census, 2,577. GEORGE E. REYNOLDS, SURVEYOR.

Week [O. Eng. *weoec*, *wicu*, *wecuc*; O. II. Germ. *wohha* (*wehha*) > Mod. Germ. *woche*; Icel. *vika*; Goth. *wikō*]: a period of seven days, forming a subdivision of the lunar month, corresponding to the four quarters of the moon, or about 7½ days. It was in common use among the ancient Hebrews, who, in Ex. xx. 11, referred its origin to the creation of the world, and in Deut. v. 15 to the exodus from Egypt. It was not a Hebrew invention, however, as may be seen from Josephus, Philo Judæus, Clemens of Alexandria, and others. It was found as a civil institution in the very earliest times among the Hindus, Persians, Assyrians, and Egyptians. But the Jews were the only nation with which the week had a religious signification. With the Egyptians, Assyrians, etc., the seventh day was simply a day of recreation; with the Jews it was the day of worship, the Sabbath. The Greeks divided the month into three periods of ten days (*decades*), and the Romans gathered the days into periods of eight days (*octidies*); with both, the first day of the period was the market-day, on which country people came to town and stirred up both business and public life. The period of seven days, the week proper, was introduced to the Romans and Greeks partly by Christianity (which may be inferred from the fact that the term *sabbath* was adopted), partly by the Egyptian astronomy and astrology. Among the Jews the days of the week had no names; they were simply counted. The Egyptians, however, named them after the seven planets then known, and in the following way: they arranged the planets according to their distance from the earth, beginning with the most distant; ascribed a planet to each hour, and named the day after the planet which reigned over its first hour. This method of appellation was adopted by the Romans, so that when Saturn presided over the first hour of the first day, which consequently became *Saturday*, the first hour of the second day would fall to the sun, etc.

Weekes, HENRY, R. A.: sculptor; b. at Canterbury, England, in 1807; studied sculpture under Behnes and at the Royal Academy, where he entered 1823; was many years the principal assistant of Chantrey, whom he succeeded in his studio at Pimlico 1841; was elected to the Academy 1862, and became Professor of Sculpture there May 16, 1873. He executed the first bust of Queen Victoria (1837), statues of Cranmer, Latimer, Ridley, Wellesley, Bacon, Hunter, Harvey, Charles II., and many others, and gained a gold medal for the best treatise on the fine-art section of the Great Exhibition of 1851. D. May 29, 1877.

Weeks, EDWIN LORD: genre-painter; b. in Boston, Mass., in 1849; pupil of Bonnat and Gérôme, Paris; honorable mention Paris salon, 1884; third-class medal 1889; first-class medal Paris Exposition, 1889. He paints principally scenes

in India and other Eastern countries. *The Last Voyage—Souvenir of the Ganges* and *A Rajah of Jodhpore* are two of his most important works. His studio is in Paris.

WILLIAM A. COFFIN.

Weeks, Feast of: See PENTECOST.

Weenix, JAN, the younger; painter; b. at Amsterdam, Holland, in 1640; pupil of his father, Jan Baptist Weenix. Although the son was only twenty when his father died, he had already so completely learned the latter's method that it is often impossible to decide whether it was the father or the son who painted the picture. He painted figures, animals, birds, landscapes, ruins, fruit, flowers, and portraits, but he is most famous for his hunting scenes and dead game. His coloring surpassed his father's. Weenix was at Utrecht between 1664 to 1668, and at Bensburg near Cologne from 1702 till 1712 in the employment of the Elector of the Palatinate. D. at Amsterdam, Sept. 20, 1719. England possesses many works by this master. He is well represented also in Berlin, Dresden, Munich, Paris, Petersburg, and The Hague. W. J. S.

Weenix, JAN BAPTIST; painter; b. at Amsterdam, Holland, in 1621. He studied under Micker, Bloemart, and N. Moijart, after which he went to Italy and lived in Rome 1642-46. He returned to his native city, where he remained till 1649, when he went to Utrecht; painted there till 1657. The remaining years of his life he spent at the Château de Ter Mey in the neighborhood. D. near Utrecht, Oct. 31, 1660. Pictures bearing a later date may be attributed to his son and pupil, Jan Weenix. J. B. Weenix painted landscapes with figures, pictures of the seacoast, Italian ruins, scenes of everyday life, dead game, etc. He rarely attempted poetical or historical subjects. W. J. S.

Weeping: the act of shedding tears, accompanied, especially in children, by facial distortion and involuntary muscular contractions in other parts of the body. For the purpose of secreting and conducting the tears there is a special apparatus placed within the orbit at its upper part, consisting of a body called the lachrymal gland; of a reservoir, the lachrymal sac; of certain canals which collect the tears from the inner angle and convey them to the lachrymal sac; and of a tube, the lachrymal duct, by which the secretion is carried from the sac into the nose. Aside from the office of the tears in expressing certain emotions, they serve to lubricate and keep moist the lining membrane of the eyelids and external coat of the eyeball, the conjunctiva. The secretion of tears, whether for emotional or ordinary physiological purposes, is effected through the intermediation of the fifth pair of the cranial nerves and the sympathetic nerves.

Sobbing, which is a species of weeping, appears to result in part from the attempt to restrain the emotions, and from a cause analogous to that which induces sighing—namely, the demand of the system for additional aëration of the blood—a process which intense emotion serves to disturb.

Weeping Water: city; Cass co., Neb.; on the Weeping Water river, and the Mo. Pac. Railway; 30 miles E. of Lincoln, 41 miles S. by W. of Omaha (for location, see map of Nebraska, ref. 10-II). It is in an agricultural, lime-burning, and stock-trading region, contains Weeping Water Academy (Congregational), public high school, and a national bank with capital of \$50,000, and has a weekly newspaper. Pop. (1880) 317; (1890) 1,350.

Weever: See TRACHINIDE and also GREAT WEEVER.

Weevil [M. Eng. *wivel* < O. Eng. *wifel*; O. II. Germ. *wibel* > Mod. Germ. *wiebel*; cf. Lith. *vabalas*, beetle, probably connected with the word *to weave*]; a name properly applied to many snout-beetles (*Curculionida*), but more particularly to the insects belonging to the genus *Bruchus*, formerly included among the *Rhynchophora*, but now placed in a family (*Bruchidae*) which connects the snout-beetles with the leaf-beetles (*Chrysomelidae*), and has greatest affinities with these last. The snout-beetles are characterized by the extension of the head into a snout or proboscis, at the tip of which the jaws are placed. By means of this snout the eggs are inserted where the larvæ are destined to live. The larvæ are, with few exceptions, footless, clumsy grubs, with a horny head, and live within the blossoms, fruits, seeds, stems, or roots of plants. Some few even live within leaves. There are over 400 described North American species of the *Curculionida* proper. The following are among the more notable in their hirval habits: *Conotrachelus nenuphar*, the plum-weevil (see CURCULIO), works, as larva, in the flesh of stone fruit, and transforms in the

ground; *C. crategi* infests the pear and quince; *Anthonomus prunicida* works in the stones of plums, and transforms therein; *A. quadrigibbus* works in apples and other pip fruit; *Cœliodes inaequalis* works in grapes; *Analcis fragariae* injures the crown and root of the strawberry; *Bariolus trinotatus* bores the stems of the potato; *Ithycerus novaboracensis* breeds in the twigs of oaks; *Pissodes strobi* burrows in the tips of pines; *Ilylobius pales* in the stems and roots of *Pinus sylvestris*; *Magdalis arnicollis* works under the bark of elms; *Dorytomus mucidus* breeds in the blossoms of cottonwoods and willows. *Balaninus* comprises species with very long snouts, and known as "nut-weevils," different species infesting different nuts, as *caryæ*, hickory nuts; *sagi*, chestnuts; *uniformis* and *quercus*, acorns. *Rhynchophorus zimmermanni*, the largest species, breeds in the palmetto palm.

Though the term weevil, when used alone, is often very loosely and incorrectly applied by farmers to several insects that affect wheat, and particularly to the wheat-midge (*Cecidomyia tritici*)—a little orange, dipterous maggot that affects the growing ear—it strictly belongs to the grain-weevil (*Calandra granaria*), which is the greatest pest to stored grain, and frequently reduces a lot of wheat to mere husks before its presence is noticed. The beetle is about one-eighth of an inch long, of a deep chestnut-brown color,

with nine deeply punctured striae along each elytron, and without wings. The female with her snout makes an oblique puncture just under the skin of the stored grain, and lays an egg therein, from which egg there hatches a whitish grub that devours the substance of the kernel and undergoes its transformations within the hull. In from forty to fifty days from hatching the perfect weevil eats its way out. Several generations are produced each year, and when once the insect is established it increases at an alarming rate, more particularly in warm climates. There is a closely allied form, known as the rice-weevil (*Calandra oryzae*). The habits of the two are similar. Both infest most kinds of dry grain, including maize, and both are widespread over the world. The remedies used against weevils are principally kiln-drying, sulphur fumes, and sprinkling of air-slaked lime among the grain. The best antidote is cleanliness. All rubbish that can harbor weevils should be burned, cracks filled up, the walls whitewashed, and a general supervision had over the grain, which should be kept as cool as possible, and well aired.

The *Bruchidae*, or weevils proper, mostly breed in the seeds of leguminous plants; their larvæ are fat, clumsy, wrinkled grubs, and in some instances are provided with short legs. Their eggs are glued to the outside of the pod. The new-born larva eats directly through the pod and into the seed, the hole of entrance closing up if the pod is yet green. The pea-weevil (*Bruchus pisi*) affects peas, one individual appropriating the contents of one pea; the eggs are laid while the pod is forming. The bean-weevil (*Bruchus fabae*) infests beans, several individuals developing in the same bean. Revised by J. S. KINGSLEY.

Wehlrite: See PERIDOTITE.

Weidner, REVERE FRANKLIN, D. D., LL. D.: theologian; b. at Centre Valley, Lehigh co., Pa., Nov. 22, 1851; graduated at Muhlenberg College 1869, and Philadelphia Seminary 1873; pastor at Phillipsburg, N. J., 1873-78, and Philadelphia 1878-82; Professor of Dogmatics and Exegesis, Augustana Theological Seminary, Rock Island, Ill., 1882-91. Since 1891 he has been chairman of the faculty of the Lutheran Theological Seminary at Chicago, Ill. He is a voluminous author in almost all departments of theology. His works include *Theological Encyclopædia*, *Studies in the Book, Introduction to Dogmatic Theology*, *Introductory New Testament Greek Method*, *System of Christian Ethics*, *Commentary on Mark*, etc. HENRY E. JACOBS.

Weigela [Mod. Lat., named from C. E. Weigel, a German naturalist]; a shrub found in China by the celebrated nat-

a, *Calandra granaria*; b, *C. oryzae*. (The small outlines show the natural size.)

uralist Dr. Robert Fortune, by whom it was introduced into England and named *W. rosea*, but afterward found to be identical with *Diervilla*, a genus introduced into Europe from Canada in the eighteenth century. Its proper name is *D. florida*; other commonly cultivated species are *D. japonica*, *D. grandiflora*, and *D. floribunda*. In the U. S., where there are two indigenous species, it is known as "bush honeysuckle."
C. E. BESSEY.

Weighing-machines: machines or contrivances used to ascertain the heaviness of bodies.

Weight is the result of the attraction of gravitation upon a body, and as the force of gravity is not the same at different parts of the earth's surface, so the weight of any piece or body, if by weight we mean the effect of gravity upon it, differs according to the place at which it is weighed. Thus a mass of iron which weighs 1,000 lb. at the equator would weigh 1,005 lb. at the pole; 500 lb. at a point 2,000 miles below the surface or 1,650 miles above it; 2,600 lb. on the surface of Jupiter, and 28,000 lb. on the surface of the sun. As ordinarily used, however, weight does not mean the absolute heaviness of a body or the effect of gravity upon it, but the relative heaviness—that is, its heaviness as compared with that of a certain piece of metal which is taken as a standard, and weighed at the same place and under the same conditions. For the standards of weight—the pound and the kilogramme—see WEIGHTS AND MEASURES.

For the comparison of standard weights with each other, for governmental and scientific purposes, instruments of the utmost possible refinement, such as chemical balances, are required, so as to make the error of ascertainment of their relative weights as small as possible. For commercial purposes such refinement is not attempted, but it is desirable that the error of weighing be so small that it can create no dissatisfaction in the mind of either buyer or seller, or user of the weights for any purpose. In chemical analysis, the largest allowable error must be less than the limit of accuracy of the process used by the chemist, say, $\frac{1}{1000}$ th of 1 per cent.

The mechanical principles upon which weighing-machines are based are various, but in general they all have one idea in common, that of opposing to the force of gravitation, which acts upon the body to be weighed, some resistance the amount of which can be determined and expressed in weights of the accepted standard. The several mechanical principles which have been adopted or proposed for weighing-machines are enumerated below, with examples of their application.

1. *The Elasticity of Metal or other Substances.*—An illustration of this principle is seen in the simple weighing-machine shown in Fig. 1, consisting

FIG. 1.—Elementary weighing device.

of a flexible steel strip, *a*, rigidly fastened at one end to a firm pedestal, *b*, and carrying at its outer end a pan, *c*. A 1-lb. weight placed in the pan, *c*, will bring the pointer down to the mark 1 on the graduated standard, 2 lb. brings it down

to the mark 2, and so on. By finely graduating the index-plate, and by reading carefully the position of the pointer upon it after it ceases vibrating, a fairly accurate weighing-machine for a limited range of purposes is obtained. Weighing on this machine is done by the method known as "weighing by substitution," which consists in substituting for the substance on the scale-pan, whose weight is to be determined, standard weights sufficient to produce exactly the same effect on the scale. The sum of the standard weights so used is the weight of the substance. This method of substitution is employed in the very finest weighing for scientific purposes, because it avoids many of the errors common to the ordinary methods of balancing a weight on one side of a scale-beam against a weight on the other.

Another form of machine, using the flexibility of this same metal strip, might be made by fastening or supporting the strip at each end and noting the deflection of the middle point. A railway bridge might thus be used as a

weighing-machine to weigh the trains that cross it; the heavier the train, the greater being the deflection.

The most common illustration of the use of the principle of the elasticity of metals is seen in the ordinary spring-balance, which consists simply of a spirally wound wire which is held at one end, the weight to be weighed being suspended from a hook at the other. These wire coils may be used either in compression or in extension. The common form of balance with a pointer rotating on a dial is just the same with the addition of a small rack and pinion to give the rotary motion.

Instead of the elasticity of metal we may use that of other substances, such as cork, India-rubber, or even air. Suppose a blacksmith's bellows, perfectly free from leaks and with its outlet closed. Place a pound weight on the upper plate of the bellows and it will be depressed slightly. Two pounds will depress it twice as much or nearly so. Thus an index scale of depressions corresponding to certain weights might be constructed and the bellows thus become a weighing-machine.

The common gas-holder of the gas-works may be used as a weighing-machine. It consists of an inner tank inverted in an outside tank which is filled with water. Gas is introduced into the inner tank, raising it to a certain height. Weights are now placed on the top of the inner tank, depressing it in proportion to the amount of weight. The amount of the depression recording the pressure to which the contained gas is subjected is also a record of the weight applied.

2. *The Buoyancy of Liquids.*—

The common hydrometer used for determining the density of liquids (Fig. 2) illustrates this principle. It may also be used to determine the weight of small bodies by the method of substitution, since equal weights placed in the pan at the top depress the instrument the same distance. On the same principle a boat or any vessel floating in water may be used as a weighing-machine. When the vessel is unloaded, the water-line is at a certain mark. As the vessel is loaded, it sinks deeper and deeper in the water, and successive marks, showing the amount of water the vessel is drawing, also measure the weight of the cargo placed on board.

FIG. 2.—Hydrometer.

3. *The Chain-balance.*

—What is called the chain-balance is described in various works, but it is rarely if ever used in practice. It consists simply of two upright posts, *c d*, Fig. 3, and carrying at its outer end a pan, *c*. A 1-lb. weight placed in the pan, *c*, will bring the pointer down to the mark 1 on the graduated standard, 2 lb. brings it down to the mark 2, and so on. By finely graduating the index-plate, and by reading carefully the position of the pointer upon it after it ceases vibrating, a fairly accurate weighing-machine for a limited range of purposes is obtained. Weighing on this machine is done by the method known as "weighing by substitution," which consists in substituting for the substance on the scale-pan, whose weight is to be determined, standard weights sufficient to produce exactly the same effect on the scale. The sum of the standard weights so used is the weight of the substance. This method of substitution is employed in the very finest weighing for scientific purposes, because it avoids many of the errors common to the ordinary methods of balancing a weight on one side of a scale-beam against a weight on the other.

FIG. 3.—Chain-balance.

4. *The Pendulum or Bent-lever Balance.*—

This is a balance which has had rather limited application hitherto, the most common form being a cheap and not very accurate letter balance, for weighing a few ounces. It consists in its

FIG. 4.—Bent-lever balance.

simplest form of a bent arm, *a*, Fig. 4, carrying at the end of the vertical portion a weight, *c*, and at the end of the horizontal portion the scale-pan, *d*, suspended from a pivot, *b*. It is evident that as weights are placed in the scale-pan they will cause the weight, *c*, to move outward from the supporting pillar until the leverage of the arm and weight on one

FIG. 5.—Hydrostatic balance.

side of the pillar counterbalances the effect of the weight in the scale-pan. The balance may be made a standard by marking on the graduated index the position at which the arm comes to rest under the application of successive weights.

5. *The Hydrostatic Balance.*—The most elementary form of this balance is shown in Fig. 5. It is based on the principle of the hydrostatic press

or common hydraulic jack. There are two communicating cylinders, one very much larger than the other, each fitted with a piston. Leakage and friction being left out of the account, a weight placed on the piston of the smaller cylinder will balance a weight on the piston of the larger cylinder which is as many times greater as the area of the larger piston is greater than that of the smaller. By substituting for the pistons flexible metallic diaphragms, the objections of leakage and piston friction are avoided, and upon this principle is constructed the hydraulic weighing apparatus used in the Emery testing-machine.

6. *The Even Balance.*—Weighing-machines based on the principles already referred to are of quite restricted application. The simplest, most ancient, and most universally used form of weighing-machine is the even balance, a crude form of which is shown in Fig. 6. It consists of a rigid beam of metal, with three pivots, or "knife-edges," firmly inserted in it, so that their edges are in the same plane,

FIG. 6.—Even balance.

and the end pivots exactly equidistant from the central pivot. The central knife-edge rests on a horizontal plate fastened in the upright support, and a bifurcated hanger rests on each of the end knife-edges, carrying the weighing-pans beneath. The principles of this balance are more fully described in the article BALANCE. The pivots and central plate, and also the portions of the hangers which rest on the end pivot, are usually made of hardened steel, but in some fine chemical balances agate knife-edges and plates are used.

7. *The Lever or Steelyard Balance.*—The even balance has one serious objection as a weighing-machine for heavy weights, viz.: the necessity of placing weights in one pan of the balance equal to the weight of the substance which is being weighed in the other. For weights up to 10 or 20 lb. this is no great inconvenience, but when we wish to weigh hundreds or thousands of pounds it becomes intolerable. This led to the adoption in very early times of the lever balance or, as it is sometimes called, the Roman steelyard, which is illustrated in the weighmaster's scale, Fig. 7. The principle upon which this balance is based is that of the lever, namely, that a heavy weight suspended from the end of

FIG. 7.—Weighmaster's steelyard scale.

the short arm of the lever may be balanced by a smaller weight suspended from the end of the long arm, the weights being inversely proportional to the lengths of the arms, or the product of the heavier weight multiplied by the length of the short arm being equal to the product of the lighter weight multiplied by the length of the long arm. In practice the steelyard balance does not generally have a pan support or weight-holder attached to each end of the balance, but only to the short end, while on the long arm there is a movable weight, which may be placed at any position required to balance the weight suspended from the short arm. Marks and nicks are placed upon the beam to indicate the positions at which the movable weight should be placed to counterbalance certain definite weights suspended from the short arm.

8. *The Compound Lever Balance.*—This is merely an extension of the principle of the steelyard, by using two or

FIG. 8.—Compound lever balance.

more steelyards linked together as shown in the sketch, Fig. 8. If a weight of 100 lb. is suspended from the short arm of a beam whose arms are to each other as 10 to 1, a force of 10 lb. applied at the end of the long arm will balance it, but this force may be applied by means of a second lever. If this second lever also has a ratio of lengths of arms of 10 to 1, 1 lb. applied at the end of the long arm of the second lever will balance 100 lb. at the end of the short arm of the first lever, the weights of the levers of course being first counterbalanced so as to remain in balance when unloaded.

One form of a compound lever scale is shown in the Boston market scale, Fig. 9. The pan which holds the article to be weighed, instead of being attached directly to the short arm of the lever, is connected by a secondary lever, an adjustable counterpoise being arranged to balance the weight of the beam or long arm of the lever.

FIG. 9.—Boston market scale.

9. *Scales with Pans supported above the Beam.*—The even balances and lever balances heretofore discussed all have scale-pans suspended from the beams, but for many purposes suspended scale-pans are inconvenient and pans supported above the beam are desired. In order to make a successful upright-pan balance it is necessary to allow the pan supports to move on the end of pivots and at the same time to insure that they remain in a vertical position, no matter what deviation from the horizontal the beam may take in its oscillation. This is accomplished by adding to the structure a parallel motion, shown in the sketch, Fig. 10, placing a second beam, more slender than the first, underneath the latter, and pinning each pan support near its lower end to this lower beam by a pin, so that while both beams oscillate together the pan supports, slightly rotating on the pins, preserve a parallel and vertical position. If a pound weight be placed on each pan, the scale will balance, and if either weight be moved to any side or corner of the pan it will still balance, eccentricity of loading having no effect to disturb the equilibrium. This is the principle of all upright-pan pivot

FIG. 10.—Model of upright-pan scale.

balances. In ordinary knife-edge upright-pan scales, such as the one shown in Fig. 11, an ordinary grocer's counter scale, the lower beam is hidden in the casting, close to the table. The lower beam is sometimes made in two parts, being cut in half in the middle of its length, each half being separately pivoted to the central support. Each half of the lower beam is then called a radius arm. The balance shown in Fig. 11 is provided at one end with a pan for holding the article to

FIG. 11.—Even balance with side beam.

be weighed and at the other with a plate for holding the various weights. Such balances sometimes have besides the weight a graduated side beam attached to the lever or principal beam, with a movable poise upon this side beam.

10. *The Platform Scale.*—To obtain an elementary idea of the principle of the platform scale, let the reader refer back to Fig. 8 and imagine four equal steelyard levers like the one at the left of the cut, which carries 100 lb., so disposed at the corners of a rectangle that the ends of their longer arms nearly touch each other, and a double bifurcated hanger extending from the pivots at these ends downward to the central pivot of the lever of the third order shown at the right of the cut. The relative lengths of all the levers remaining as before, 10 to 1, it is evident that 4 lb. placed in the small pan of the lower lever will balance 400 lb.—that is, 100 lb. on each of the four primary levers. Now substitute for the 400 lb. and the pans a rectangular platform placed above the four levers, and provided with

FIG. 12.—Fairbanks platform bearing.

four short feet which rest in the links hanging on the pivots of the short arms of the four levers, and load this platform so that the total load including the platform equals the weights of the pans and 400 lb.; it is then evident that the machine thus constructed will be in equilibrium when 4 lb. are in the pan at the extremity of the lower lever. The upward force of 4 lb. acting at the outer pivot, instead of being thus counterbalanced, may be carried by a system of levers and links to any point at which it may be more convenient to counterbalance it by a weight in a pan, or by a weight sliding on a graduated beam. This is the general principle of all platform scales. In practice, the means of transmitting the weight of the platform and its load to the primary levers, and the form of the links, levers, etc., required for carrying the several forces developed to the point where the weight is to be registered, vary considerably. One of the methods of supporting the load on the primary lever, used in the Fairbanks scale, invented by Thaddeus Fairbanks, of Vermont, patented June 13, 1831, is shown in Fig. 12. Each lever, F, is provided at its extremity with knife-edged bearings placed in a stirrup depending from the fixed frame timber, A, surrounding the pit in which the platform and its adjuncts are arranged. At a suitable distance from the just-mentioned extremity of the lever are knife-edged bearings, G; an iron casting, D, extends downward from the platform, B, and, passing astride of the lever, F, rests on the knife-edges, G, at each side of the lever.

If, now, the load to be weighed could be dropped vertically upon the platform, B, this arrangement would be sufficient; but in practice the load is drawn in wagons or cars, as the case may be, upon the platform, and on striking the edge of the latter gives it a positive lateral movement which tends to make the casting, D, scrape upon the knife-edges, G; and this dulls the knife-edges and impairs the accuracy of the apparatus. In order to prevent this lateral movement of the platform, B, check-rods, E, are extended from the fixed frame timber, A, to the platform, with the object of resisting the lateral strain. In the Howe scale the check-rods are dispensed with, and freedom secured to the platform without involving the frictional movement or scraping of the casting, D, upon the knife-edge. This is done, as shown in the figures of Howe's platform bearing (Fig. 13) and railroad scale (Fig. 14), by making the main levers, A, of elbow shape, their upper ends connecting by rods, C, with the center levers, E, from which, through a supplemental lever, F, and rods, G, motion is communicated to the beam. The lower ends of the elbow levers, A (the form of which is shown in the larger view), have knife-edges resting on chilled iron blocks, these knife-edges forming the fulcrums of the said levers. The short arms of these levers have knife-edges, which receive the bearings of the casting, N. In the upper side of the casting, N, are two shallow cup-shaped recesses which receive the balls or spheres, K, and on these rest the cupped bearings, B, fastened to the timber of the platform. The center levers, E, of course, work on knife-edges. When the load strikes the edge of the platform the movement of the latter simply causes it to sway slightly on the spheres, and this is immediately corrected by the gravity of the platform itself.

FIG. 13.—Howe platform bearing.

11. *The Flexure-pivot Balance.*—For over 2,000 years the knife-edge has been practically the only form of pivot used in even balances and steelyards, round pivots being rarely, if ever, used, on account of their excessive friction. The knife-edge itself, however, is open to objections from its lack of permanency, being susceptible to injury from bruising, crushing, and corrosion. The plates on which the pivots act are also subject to grooving, and the bearing-points of the plates on the hanging links suspended from the end pivots also are apt to change their position relative to the knife-edge, so that slight inaccuracy is thus introduced in the weighing. These objections have been overcome by two kinds of fixed pivots, the flexure pivot and the torsion pivot. The flexure pivot is simply a thin plate of steel, one end of which is clamped to the beam, and the other to the fixed support, as shown in the sketch, Fig. 15. An oscillation of the beam causes a slight flexure of the steel plate. Balances on this principle were patented by J. M. Taurines, of Paris, in 1861, and by F. D. Artingstall, of

FIG. 14.—Howe railroad scale.

Manchester, England, in 1862, but they have not come into commercial use.

In 1872, and also in 1883 and 1884, A. H. Emery obtained

U. S. patents on weighing-machines in which are combined the principles of the flexure-pivoted beam and the hydrostatic balance with flexible metallic diaphragms which has already been referred to. In 1879 he completed, at a cost of over \$100,000, his famous testing-machine on this combination of principles, which has since that date been in the service of the U. S. Government at the arsenal at Watertown, Mass.

FIG. 15.—Beam with flexure pivot.

It is used for testing the strength of metals and other materials of construction, and has a capacity of 800,000 lb., for strains of either tension or compression, and can test specimens of any length up to 30 feet.

FIG. 16.—Truss with flat wire for a torsion balance.

Attempts have been made to adapt the flexure-pivot system to ordinary scales and balances, but mechanical difficulties have thus far prevented their commercial success, although a number of testing-machines have been made under the Emery patents.

12. *The Torsion Balance.*—Gauss and Weber, of the University of Göttingen, experimented many years ago upon

FIG. 17.—Torsion-balance counter scale.

balances with a twisting wire for a pivot, but their experiments and those of some others who followed them were unsuccessful in producing a commercial balance. One of the causes of the failure of the earlier experiments was the want of a correct way of stretching the wire.

FIG. 18.—Druggist's torsion balance counter scale.

This was remedied in 1882 by Prof. Frederick Roeder, of Cincinnati, who stretched the wire in the form of a brazen loop over a rigid metallic stretcher. A greater trouble, and one which seemed to be fatal to the hopes of the torsion balance, was the fact that as soon as the torsion band or wire was given sufficient size to make it strong

enough to carry a desired weight the elasticity of the wire became so great as to destroy the sensitiveness of the balance. Dr. Alfred Springer, Prof. Roeder's associate, discovered that the objectionable effect of the elasticity of the wire could be entirely overcome by making the beam "top-heavy," that is, by raising its center of gravity above the point of support or axis of oscillation. He thus used the force of gravity to overcome the resistance of the wire to being twisted.

FIG. 19.—Torsion-balance prescription scale.

Numerous patents upon weighing-machines using torsion pivots were granted to

Messrs. Roeder and Springer, L. M. Hosea, and the writer of this article, between 1882 and 1887. Many forms of balances upon the torsion principle are now in commercial use, while other forms, especially adapted to the automatic weighing of grain, are still in the experimental stage. Fig. 16 represents the form of truss used for ordinary grocers' and druggists' even-balance scales, with the flat wire stretched upon it. This being the middle truss, the beams, upper and lower, are rigidly attached to it at their middle points, their outer ends being attached to the wires of similar trusses, without the supporting feet, which carry the scale pans, thus forming a parallel motion. Fig. 17 shows a torsion scale made in 1884. The heavy ball, carried on a standard fastened to the lower beam, gives the necessary high center of gravity, and its vertical adjustment regulates the sensitiveness to any degree that may be desired. Figs. 18 and 19 show more modern forms of these balances, the first being a druggist's counter scale of 10 lb. capacity, sensitive to $\frac{1}{2}$ grain, and the second a prescription scale with a capacity of $\frac{1}{2}$ lb., and sensitive to $\frac{1}{16}$ grain. These balances have shown a remarkable durability, on account of the entire absence of rubbing friction, and scales made upon this principle in 1882 are still (1895) in use with no apparent diminution of their original sensitiveness. WM. KENT.

Weights and Measures: instrumental means employed for the exact determination of quantity. Such instrumentalities are indispensable in science, in mechanical and ornamental art, and in all the variety of exchanges which constitute commerce. And as the usefulness of a system of weights and measures to those who employ it depends on the unvarying identity of its determinations, it has been a part of the public policy of every organized community, from the earliest period of civilization, to regulate such systems by law, defining the units which shall be used in measuring each species of quantity, with their multiples and sub-multiples, and providing carefully constructed standards to which the measures in actual use among the people shall be required to conform. The misfortune has been that, in past centuries, this kind of legislation has been left almost wholly in the hands of local magistracies, who have proceeded without any attempt at concert; so that in Europe, previously to 1800, scarcely a town of any commercial importance could be found, from one end of the Continent to the other, which had not its independent system of weights and measures. The embarrassment to commerce growing out of this diversity of systems was enormous. Simply to learn them was a task which few attempted, and fewer accomplished. To transform values from one into another, resort was necessary to tables, or to arithmetical rules mechanically applied, involving a large expense of both time and labor.

It is a rather curious fact that, while the mediæval systems of European weight and measure are so almost endlessly various, the similarity of their nomenclature throughout would seem to indicate a common origin. All the way from Norway, for instance, to Spain, Italy, Greece, and the Mediterranean islands, the unit of length is called everywhere the foot, and the unit of weight, the pound; and these terms, moreover, have been in use for more than 2,000 years, and have been handed down directly from the republics of Greece and the Roman empire. The word pound is simply the Roman *pondus*, a "weight," and the unit it originally represented was doubtless entirely arbitrary; but the word foot is significant, and points at once to an original prototype in nature.

The foot, as a measure of length, made its first appearance in Greece. Tradition asserts that the Olympic foot (for there were several Grecian foot-measures) was derived from the foot of Hercules. As Hercules is a mythic character, this is only to say that, at some time, a unit of length of determinate value was adopted for general use, in order to remove the uncertainties which necessarily existed when the human foot was the measure, and every man was at liberty to use his own. This determinate standard may very possibly or probably have been the length of some particular foot—the foot of some chief or hero—but after its adoption it became practically arbitrary, and the unit of length could no longer have been a dimension of the human person, but must have had for its representative an invariable bar of wood or metal.

In this example of the Grecian foot we have an illustration of the manner in which, until the introduction of the modern metric system, all units of measure originated. They were not the creation of legislation. Legislative au-

thorities have only interposed to regulate and secure uniformity and permanence in systems found already in existence. These systems have grown up in the rudest stages of society by a sort of social necessity. Without some standard of measurement, however imperfect, there can be no exchange of commodities founded on the idea of equivalence of value. And even in isolation, the uncultivated savage is forced by the exigencies of his situation to adopt some expedient by which to compare magnitudes of length, or bulk, or height, or distance. He will have need of measures in providing for his immediate personal wants—in the construction of his rude dwelling, his garments, his implements of labor, and the weapons with which he pursues his game. These must, of course, bear some convenient proportion to the dimensions of the person whose use they are designed to subservise; and nothing is more natural than that the person itself, or some of its members, should be directly employed as instruments of measurement in their construction. The same standards will then be naturally applied to other objects between which in the progress of time similar comparisons become necessary.

In regard to measurements of distance, another idea suggests itself, equally growing out of the circumstances and habits of uncivilized man. Before man had learned to subjugate animals to his service, his only means of locomotion were such as he possessed in common with these; and in estimating the moderate distances from his dwelling to which his daily walks might extend, no expedient would be more likely to suggest itself than to count his steps. Thus arose the fundamental unit of itinerary measure, which is still more or less employed for rude determinations—i. e. the pace. The Romans employed this measure, and when the distances to be measured were such as to require a larger unit, they used the *mille passuum*, 1,000 paces, from which has been derived the mile of the present day.

The nomenclature of the metrological systems of all nations furnishes abundant evidence of the original derivation of measures of length everywhere from the dimensions of the human person. The foot is a unit of comparatively modern origin. Long before Greece made any figure in history the Egyptians, the Assyrians, and the Babylonians, with whom the Israelites were contemporaneous, monopolized whatever of science and cultivation the world then possessed; and among these the cubit, derived from the length of the fore arm, of which it is the name, was the unit of linear measure, as it continues to be among their descendants to this day. With the Israelites, moreover, all the subdivisions of this unit purported to be dimensions of the person. The cubit contained two spans; the span, three palms; the palm, four digits. By a curious accident one of the identical original rules employed by Egyptian builders has been preserved to our time, and is now in the British Museum. It had been carelessly left in a hollow portion of the masonry of a temple at Karnak, and built up out of sight, was discovered among the ruins, and was brought to light uninjured after having been hidden 3,000 years. It is a two-cubit rule, and it measures exactly the breadth of the descending entrance-passage of the great pyramid of Ghiz-h. Considering that the pyramid is some centuries older than the temple in which the rule was found, this accordance furnishes a striking evidence of the care bestowed on the preservation of standards of measurement in that early age.

Other measures derived from the person, of which the origin or date is unknown, are the ell (*ulna*), derived, like the cubit, from the fore arm; the Italian *braccio*, the Portuguese *braga*, the Swiss *brache*, and the Spanish *brazo*, all signifying the length of the arm; the English yard, from O. Eng. *gyrdan*, to "gird," as signifying the girdle or measure of the body's circumference; the English fathom, also from O. Eng. *fæðm*, embrace, the length of two arms; to which may be added the hand, and perhaps the nail, in England, the *pouce*, or thumb's breadth, in France, and the *pulgada* in Spain, and *pollegada* in Portugal, meaning the same thing.

It is only for measures of length that the dimensions of the human person can furnish prototypes. For other descriptions of quantity the original units must have been chosen very much at random. Measures of capacity may have been derived from the content of some natural vessel, as, for instance, a gourd or the shell of a coconut. The *homer*, as a measure of dry capacity among the same people, signified a heap, and the *gomer*, a diminutive of this, and the hundredth part of a *homer*, signified a heap also.

These names indicate that the estimate of quantity must have been made by the eye alone, and must have been vague in the extreme.

The use of weights implies some acquaintance with the balance, and therefore some degree of advancement in the arts of industry. Weights were therefore not introduced till some time after measures of length, capacity, and probably surface had become familiar. Measures of surface were naturally derived from those of length. These four classes—viz., measures of length, of surface, of volume, and of weight—are all that are commonly understood in speaking of weights and measures. But more or less intimately connected with these is the measure of value (see MONEY and COINAGE); besides which there are sundry measures belonging more properly to science, such as TIME (treated under that title and under CALENDAR); temperature (see THERMOMETRY and THERMOMETER), and angular quantity (see TRIGONOMETRY).

Though the descriptions of quantity to be measured requiring consideration here are only the four first above enumerated, yet the numbers of systems of measurement which have been simultaneously in use in the same country and among the same peoples have been usually much greater. Thus, of measures of length there are at present among us one unit for carpentry and mechanics, the foot; another for textile fabrics, the yard; another for field-surveying, the chain; and another for road-measure, the mile. The foot is subdivided to inches and lines, or inches and binary sub-multiples; the yard, to quarters and nails; the chain, to links and decimals; and the mile, to furlongs and rods. The superficial measures, which are the squares of these units, are equally diverse, with the addition of the agrarian dimension of the acre. Of capacity-measures there are, for liquids, the gallon, quart, pint, and gill; for cereals and other dry substances, the bushel and peck; and for firewood, the cord. Of weights there are, for ordinary commerce, the avoirdupois pound, with its sexdecimal subdivisions, and for large masses its irregular multiples of the quarter, hundred, and ton; for hullion, plate, and coin, the pound troy, irregularly subdivided; for drugs and medicines, the apothecaries' pound, equal to the troy pound, but differently subdivided; and for gems, the carat. This multiplication of systems, which is wholly unnecessary, has added much to the difficulty of dealing with problems relating to quantity.

The earliest legislation of Great Britain in relation to the subject of weights and measures is contained in the 25th chapter of the reaffirmation of the Great Charter under Henry III. (9 Hen. III., A. D. 1225), which simply declares that they shall be uniform throughout the realm; and a more explicit statute of the following year founds the measures of capacity upon weight. A later statute of 1266 (51 Henry III.) founded measures of weight upon determinate numbers of wheat-corns. Moreover, in this early period, as among the ancients, the units of commercial weight were also units of coin-weight. Thus the statute referred to provided that "an English penny, called a *sterling*, round and without any clipping, shall weigh thirty-two wheat-corns in the midst of the ear, and twenty pence do make an ounce, and twelve ounces one pound, and eight pounds do make a gallon of *wine*, and eight gallons of wine do make a London bushel, which is the eighth part of a quarter." The pound thus determined, known as the tower pound, or the sterling or easterling pound, continued to regulate the metrological system of England down to 1496, when it was superseded for this purpose by the troy pound (12 Hen. VII.). It was a pound of 15 ounces, each ounce being equal to 360 troy grains, or to three-quarters of a troy ounce; whence the weight of the penny sterling was only 22½ grains troy. The grain-weight troy was not, therefore, the weight of a grain of wheat, as the word would seem to indicate. The grain of *mare*, used in France in the time of Charlemagne and later, was about four-fifths as heavy as the troy grain; and this, though still exceeding the grain of wheat, is nearer to it, and was probably derived from it. The easterling pound was the pound of the Eastern nations of Europe, and, as we may infer from Camden, was introduced into England in the time of Richard Cœur de Lion.

It is matter of controversy at what period the troy and avoirdupois pounds were introduced into England. The earliest statute in which the troy pound is mentioned is one of 1414 (2 Hen. V.), intended to regulate the charges of goldsmiths for gilding silver plate. In 1496, however, it was by statute of 12 Hen. VII. substituted for the ster-

ling pound for the regulation of measures of capacity, the sterling pound continuing to be used at the mint; but by a subsequent statute of 1527 (18 Hen. VIII.), this last was definitely abolished. In the earliest statutes in which the word *avoirdupois* is used—viz., 9 Edw. III. (1335) and 27 Edw. III. (1353)—it is applied not to a system of weights, but to the goods themselves which are to be weighed.

The earliest legislation in regard to measures of length found in the British statute-book is of date 1324 (17 Edw. II.), and provides that the inch shall have the length of three barleycorns, round and dry, laid end to end; that 12 inches shall make a foot, and 3 feet a yard. Previously to the Conquest, the British yard, according to Prof. Wackerbarth of the University of Upsala, Sweden, had about the length of 39.6 inches. It was reduced in length in 1101 by being adjusted to the arm of Henry I.; but the artificial standards, deposited in the exchequer, were very ill cared for, and became soon untrustworthy; which may have perhaps suggested this reference to a new though exceedingly imperfect natural standard, the barleycorn.

During the eighteenth century attention was drawn to this subject, and legislation was proposed, if not perfected, aiming at an exactness before unattempted. Careful comparisons of the British, French, and Roman standards appear in the *Transactions* of the Royal Society for 1736, 1742, and 1743. Graham, the eminent horologist, determined the length of the seconds pendulum in London to be 39.130 inches, afterward corrected to 39.14 inches; and prepared for the society a standard yard in 1742. In 1818 a royal commission was appointed by a writ of the privy seal, with Sir Joseph Banks, president of the Royal Society, as chairman, which, after making a thorough investigation, made recommendations which were embodied in a statute which went into effect Jan. 1, 1826. This enacted that "the straight line or distance between the centres of the two points in the gold studs in the straight brass rod now in the custody of the clerk of the House of Commons, whereon the words and figures 'Standard Yard, 1760,' are engraved, shall be, and the same is hereby declared to be, the original and genuine standard of that measure of length or linear extension called a yard"; and that the same distance, "the brass being at the temperature of sixty-two degrees by Fahrenheit's thermometer, shall be, and is hereby denominated, the 'Imperial Standard Yard,' and shall be, and is hereby declared to be, the unit, or only measure of extension wherefrom or whereby all other measures of extension whatsoever, whether the same be linear, superficial, or solid, shall be derived, computed, and ascertained." The act also provided that in case such standard should be lost or injured it should be restored by reference to the length of "the pendulum vibrating seconds of mean time in the latitude of London in a vacuum at the level of the sea"; which length was declared to be 39.1393 inches. In regard to weights, it declared a brass 1-lb. weight made in the year 1758, then in the custody of the clerk of the House of Commons, to be authentic, and named it the "imperial standard troy pound." It further declared that the said standard pound should contain 12 oz. of 20 pennyweights, each pennyweight containing 24 grains, "so that 5,760 such grains shall be a troy pound; and that 7,000 such grains shall be, and are hereby declared to be, a pound *avoirdupois*." For the ease in which such pound should be lost or injured, provision was made in the original bill for its restoration by reference to the weight of a cubic inch of water, which, as weighed in a vacuum, "by brass weights also in a vacuum, at the temperature of 62° of Fahrenheit's thermometer," was declared to be "equal to 252.724 grains." Before its final passage, however, in 1824, the weight of the cubic inch of water weighed by brass weights *in air* (declared to be 252.458 grains at 62° F. and 30 inches barometric pressure), was substituted for the weight *in vacuo*. As to measures of capacity, it was enacted that the standard measure, whether for liquids or for dry goods, should be the gallon, containing, at the temperature of 62° F., with the barometer at 30 inches, 10 lbs. *avoirdupois* weight of distilled water weighed in the air; and the construction of such a measure of brass was ordered, which was to be called the "imperial standard gallon." It is further declared that the standard gallon ascertained by this act is equal in bulk to 277.274 cubic inches at the temperature of 62° F.

In 1834 the houses of Parliament were destroyed by fire, and with them the "original and genuine" standards. Practical difficulties were found in the way of replacing the yard by the means prescribed in the act. A commission ap-

pointed in 1838 under Airy, the astronomer-royal, reported against the pendulum method, and taking the best secondary evidence produced a standard bar of gun-metal, 38 inches long and 1 inch square, the distance between two lines on which, crossing two gold studs, is one yard, at 62° F. and 30 inches barometric pressure. The pound was reproduced from the copy in the mint. These standards were legalized by act of Parliament (18 and 19 Vict., chap. 72). The Weights and Measures Act of 1878 (41 and 42 Vict., chap. 49) regulates the law, rendering all old and local weights and measures, other than imperial ones, illegal.

Early in the colonial history of the U. S. the British exchequer standards of weights and measures had been legalized by many of the colonial legislatures. They were not always specified by name in the earlier acts, but were always implied, and in subsequent legislation were sometimes incidentally named. Thus in Virginia, an order of the General Assembly of Mar. 5, 1623 (S. S. 1624), directed that no weights or measures should be used, but such as should be sealed by officers appointed for the purpose. But by an act of Feb. 23, 1631-32, it was ordained "that a barrel of corn should be accounted five bushels of Winchester measure," which was then the British bushel; and another act, of Oct. 5, 1646, provided that "no merchant or trader, whether English or Dutch, shall trade with other weights and measures than according to the statute of Parliament in such cases provided." In Massachusetts also an act of 1647 directed the treasurer of the commonwealth to "provide weights and measures of all sorts for continual standards." Other statutes provided that casks should be "of London assize." In 1750 a set of brass and copper *avoirdupois* weights and measures was imported from the British exchequer, and in 1765 the treasurer was required to procure a balance and a set of troy weights. After the Revolution, by act of Feb. 26, 1800, the principal provisions of the colonial statutes in regard to weights and measures were confirmed. New Hampshire and Vermont appear to have followed Massachusetts in their colonial legislation as to measures of capacity, but in neither of them was there any distinct recognition of troy weight. Rhode Island passed no statute on the subject at all. In Connecticut, after the Revolution, it was enacted (Oct., 1800) "that the brass measures, the property of this State, kept at the treasury—that is to say, a half-bushel measure containing one thousand and ninety-nine cubic inches, very near, a peck measure, and a half-peck measure, when reduced to a just proportion—be the standard of the corn-measures of this State which are called by those names respectively; that the brass measures ordered to be provided by this Assembly—one of the capacity of two hundred and twenty-four cubic inches, and the other of the capacity of two hundred and eighty-two cubic inches—shall be, when procured, the first of them the standard of a wine-gallon, and the other the standard of the ale or beer gallon in this State; that the iron or brass rod or plate ordered by this Assembly to be provided—of one yard in length, to be divided into three equal parts for feet, in length, and one of those parts to be subdivided into twelve equal parts for inches—shall be the standard of those measures respectively; and that the brass weights, the property of the State, kept at the treasury—of one, two, four, seven, fourteen, twenty-eight, and fifty-six pounds—shall be the standard of *avoirdupois* weight in this State." By the colonial laws of the same State, it appears that there were public standards provided as early as 1670, and in 1752 the gallon of 231 cubic inches had been established. As this was the gallon of Queen Anne (1706), which continued from her time down to 1826 to be the standard wine-gallon of England, and as the gallon of 224 cubic inches is the old gallon of Henry VII. (1496), it is difficult to account for the enactment just cited. The half-bushel of 1,099 cubic inches was never at any time a British measure. Connecticut never by express law sanctioned the use of troy weights, but, in her tax-laws, silver plate is rated at \$1.11 an ounce, by which a troy ounce must have been intended. The earliest legislation sanctioned the London assize of casks. The provincial legislature of New York, on June 19, 1703, established all the British weights and measures for the province "according to the standards in the exchequer." In 1829, however, in a revision of the statutes, a provision was embodied adopting the British imperial bushel, and a gallon measure capable of containing 8 lb. of distilled water at maximum density. In the same code it was also provided that the standard yard should bear to the pendulum beating seconds at Columbia College, New York city, *in vacuo*,

at the level of the sea, the proportion of 1,000,000 to 1,086-141. New Jersey in Aug. 1725, adopted the exchequer standards of England. The same was done in Pennsylvania in 1700, in Delaware in 1705, and in Maryland in 1671. The colony of North Carolina prohibited the use of any weights and measures but such as should be constructed "according to the standard in the English exchequer." South Carolina in 1768 passed an act requiring the public treasurer to procure avoirdupois weights of brass or other metal, and also a bushel and other measures of capacity, "according to the standard of London." In Georgia no colonial legislation appears to have taken place upon this subject. After the Revolution, by act of Dec. 10, 1803, the standard of weights and measures established by the city corporations of Savannah and Augusta is declared to be the standard of the State till such time as the Congress of the U. S. shall have made a different provision. Of the States admitted to the Union since the adoption of the Constitution of 1787, some have passed laws similar to those above described, and some have not legislated at all. The case of Louisiana was peculiar. Before the acquisition of that territory by the U. S. the weights and measures used in the province were those of the old standard of Paris. An act of the Legislature of Dec. 21, 1814, required the Governor to procure, at the expense of the State, weights and measures corresponding with those used by the revenue officers of the U. S., to be deposited with the Secretary of State, and to serve as the general standard for the State.

The condition of the matter of standards of measure in the U. S. is (1895) essentially as follows: Although the Constitution authorizes Congress to fix the standard of weights and measures, this power has never been definitely exercised, and comparatively little legislation has been enacted on the subject. Its importance was recognized by Washington, Jefferson, and Adams, and as early as 1790 Jefferson proposed to "reduce every branch to the decimal ratio already established for coins, and thus bring the calculation of the principal affairs of life within the arithmetic of every man who can multiply and divide." The failure on the part of Congress to exercise the powers conferred by the Constitution made it necessary for the executive branch of the Government to take action in the way of procuring standards for use in the collection of revenue, and other operations in which weights and measures were required. A brass scale by Troughton, of London, was obtained by the U. S. Coast and Geodetic Survey in 1814. It was 82 inches in length, and a part of it (from the 27th to the 63d inch line) was tentatively adopted as the unit of length. A platinum meter and kilogramme were procured by Gallatin in 1821, and a copy of the English troy pound was brought from London, also by Gallatin, in 1827. The latter became, by act of Congress 1828, the standard of mass for the mint of the U. S., and, although totally unfit for the purpose, it has since continued to be the legal standard for coinage purposes. In 1830 an examination of the standards of weight and measure used in the principal custom-houses of the country disclosed large discrepancies, and led to the adoption by the Treasury Department of the Troughton scale as a standard of length and the avoirdupois pound derived from the troy pound of the mint as the unit of mass. At the same time, the department adopted the wine gallon of 231 cubic inches for liquid measure, and the Winchester bushel of 2,150.42 cubic inches for dry measure. In the meantime most of the States had passed laws relating to weights and measures, as explained above, and the standards adopted were in many instances essentially different, so that the confusion which had prevailed during and since the colonial period promised to become greater rather than less. In order to encourage uniformity, the Secretary of the Treasury was authorized in 1836 to cause a complete set of all weights and measures adopted as standards by the department for the use of the custom-houses and for other purposes to be delivered to the Governor of each State in the Union for the use of the States respectively, thus furnishing material standards, the adoption of which would secure practical uniformity throughout the country. These standards were generally adopted by action of the State authorities, and in this way the words *pound* and *yard* have come to have everywhere in the U. S. the same meaning as far as their practical use is concerned, although rigorously speaking the standards of no two States can agree exactly. There are still wide differences and great confusion in the legislation affecting volume units, especially where it is attempted to relate volume to mass as in defining the number of pounds in a bushel of various grains, fruits, etc.

The first and almost the only general legislation on the subject of weights and measures was the act of Congress of July 28, 1866, making the use of the metric system lawful throughout the U. S., and defining the weights and measures in common use in terms of the units of that system. In 1875 an international metric convention was agreed upon by the principal governments of the world, including the U. S., at which it was undertaken to establish and maintain at common expense a permanent international bureau of weights and measures, the first object of which should be the preparation of a new international standard metre and a new international standard kilogramme, copies of which should be made for distribution among the contributing governments. This distribution was effected by lot in 1889, and the U. S. received metres Nos. 21 and 27 and kilogrammes Nos. 4 and 20. They are made of an alloy of platinum with 10 per cent. iridium. On Jan. 2, 1890, metre No. 27 and kilogramme No. 20 were adopted as the national prototype metre and kilogramme.

The pound and yard, which, by reason of their adoption by the Treasury Department, had become the customary units throughout the country, were based upon standards copied from those in use in England in the early part of the nineteenth century, as explained above. After the destruction of the latter at the burning of the Parliament House in 1834, it was the policy in the U. S. to make the yard and pound the exact equivalents of the new imperial standards adopted by Great Britain, although these were derived from surviving copies of the old units, and unquestionably differ slightly from them. The earlier standards—namely, the Troughton scale and the mint troy pound—were quite inferior in construction and unsuitable for standards of high precision. Accurate copies of the new imperial standards were received at the office of weights and measures in Washington, and became the prototypes for all refined comparisons. This practice could not affect, however, the legal requirement that the troy pound should be the standard for coinage purposes.

During recent years, and especially since the receipt of the national prototype metre and kilogramme, it has been the practice to make final reference to accepted metric standards. The law of 1866 had defined the yard in terms of the metre so accurately that the most recent and most carefully conducted comparisons do not show it to be in error, and the pound in terms of the kilogramme so as not to differ from the English pound avoirdupois by as much as 1 part in 100,000, and in view of these facts, and in the absence of any material normal standards of customary weights and measures, the Secretary of the Treasury, on Apr. 5, 1893, formally approved the recommendation of the superintendent of weights and measures, that in the future the international prototype metre and kilogramme be regarded as the fundamental standards of length and mass for the U. S. Government, and that the customary units, the yard and the pound, be derived from them in accordance with the act of July 28, 1866. The result of this action is that, as far as the jurisdiction of the Treasury Department extends in this matter, the yard is now defined as being $\frac{3600}{39.37}$ of a metre, and the pound avoirdupois $\frac{7000}{70.306}$ of a kilogramme, thus putting these standards in direct relation with those of other civilized nations, in all of which, with only one or two exceptions, the metric system is now in use. The only legislation on the subject of weights and measures by which the entire country is affected, except the act of 1866 above referred to, is an act establishing a gauge for sheet metal, and another approved July 12, 1894, in which Congress defined eight units for the measure of electrical quantity. These units are derived from the fundamental units of length, mass, and time of the metric system. They were agreed upon by an international congress of electricians which met in Chicago in 1893, and have been essentially accepted by Great Britain and other foreign governments. They are defined in the article on UNITS (*q. v.*).

Weights, Atomic: See CHEMISTRY.

Wei-hai-wei, wā-hī-wā: a port on the north coast of the Shantung promontory, China; lat. 37° 30' N., lon. 122° 28' E. The harbor is large and well sheltered on all sides, an island (Liu-kung-tao), in the mouth of the bay on which the town stands, protecting it from the N. E. winds. For some years it was the seat of an important arsenal and strongly fortified, but was taken and dismantled by the Japanese after a stubborn resistance in the spring of 1895.

Weil, HENRI: classical scholar; b. at Frankfort-on-the-Main, Germany, Aug. 26, 1818; studied in Bonn, Berlin, and Leipzig; took the degree of Doctor of Letters in Paris 1845; associate professor at the Faculty of Letters in Strassburg in 1847; was naturalized in 1848, appointed professor at the Faculty of Letters at Besançon in 1849, and in 1876 called to Paris as Professor of Greek at the École normale supérieure and the École des hautes études. Among his publications, chiefly devoted to Greek oratory and tragedy, are his editions of *Æschylus* (2d ed. 1884); seven plays of *Euripides* (2d ed. 1879); *Les harangues de Démosthène* (2d ed. 1881); *Les plaidoyers politiques de Démosthène* (2 vols., 1877-86); and his famous treatise, entitled *De l'ordre des mots dans les langues anciennes comparées aux langues modernes* (Paris, 1845; 3d ed. 1879). ALFRED GUELMAN.

Weifen, vī'len, JOSEPH, von: dramatist; b. at Tetin, Bohemia, Dec. 28, 1828; studied at Prague and Vienna; served in the Austrian army in Hungary in 1848, and was appointed Professor of History and Geography at the engineering academy of Znaim in 1854, Professor of the German Language and Literature at the military academy in Vienna, and custodian at the imperial library in 1861. His poems, *Phantasien und Lieder* (Vienna, 1853) and *Männer vom Schwerte* (Vienna, 1855), attracted some attention, and several of his dramas had still more success—*Tristan* (Breslau, 1860; 2d ed. 1872); *Edda* (Vienna, 1865); *Drahomira* (Vienna, 1867); *Graf Horn* (Leipzig, 1871); and *Der neue Achilles* (Leipzig, 1872). D. in Vienna, July 3, 1889.

Revised by JULIUS GOEBEL.

Weimar, vī'mār: capital of the grand duchy of Saxe-Weimar; on the Ilm, and on the Prussian and Thuringian-Saxon railways (see map of German Empire, ref. 4-F). It is a quiet, neat, pleasant, and aristocratic place, contains few imposing edifices, and has hardly any trade or manufactures; its population is 24,546 (1890). In 1547 it became the permanent residence of the Ernestine line (the Albertine line reigns in Dresden), and was conspicuous during the second classical period of German literature, when Wieland, Herder, Goethe, Schiller, and many lesser authors at the court of Karl August filled the world with the fame of their classicism. The grand-ducal castle, rebuilt in 1774 after the great fire, is very rich in relics and memorials of that time. Other places of interest are a park established by Karl August and Goethe, the library with 180,000 vols. besides statues and portraits, the state archive with rich historical treasures, the court theater, Goethe's house (from 1782-1832) now opened as a Goethe museum, Schiller's humble residence (from 1802-05), the permanent exposition of art and art industry, containing also a Japanese museum, all these combining to make the "German Athens" a literary center which is visited by thousands from all civilized countries. In the grand-ducal burial vault Schiller and Goethe rest side by side. Within the old parish church are the tombs of Herder and Duke Bernhard of Weimar (see BERNHARD), the hero of the Thirty Years' war. Beautiful statues of princes and poets adorn the city and the classical environs, where are the castles of Belvedere, Tiefurt, Ettersburg, and Ossmanstedt with Wieland's grave. See Franke, *Weimar und Umgebungen* (Weimar, 1886). HERMANN SCHOENFELD.

Weimar: town (founded in 1873); Colorado co., Tex.; on the S. Pac. Co.'s Railroad; 16 miles W. of Columbus, the county-seat (for location, see map of Texas, ref. 5-J). It has 6 churches, a private and 2 public schools, 2 private banks, a weekly newspaper, electric lights, oil-mills, and manufactories of vinegar, bluing, sash and doors, corn and cotton planters, and post-hole diggers. Pop. (1880) 626; (1890) 1,443; (1895) estimated, 1,800. PUBLISHER OF "MERCURY."

Weimar, Duke of: See BERNHARD.

Weinsberg, vīns'bārch: small town; 3 miles E. N. E. of Heilbronn, in the kingdom of Württemberg, Germany; formerly a free imperial city; in the Neckar district, in the center of the densely populated Weinsberg valley; a station of the Württemberg state railways (see map of German Empire, ref. 6-E). Pop. (1890) 2,313. It has a classical school and an interesting church built in the thirteenth century in the Roman style. Over the town are the picturesque ruins of the castle Weibertreu, so called in memory of the famous legend celebrated by Bürger's ballad. Emperor Conrad III., after the victory over Count Welf in 1140, besieged the rebellious vassal in Weinsberg and, irritated by the desperate resistance of the besieged, he ordered—so the legend runs—that all the men in the town should be put to death, and

only the women should leave the town with their most precious property. On the day of surrender the women marched out carrying their husbands on their backs. The stratagem succeeded. See Dillenius, *Chronik von Weinsberg* (Stuttgart, 1860); Bernheim, *Die Sage von den treuen Weibern zu Weinsberg* (1875). HERMANN SCHOENFELD.

Weir, weer: city; Cherokee co., Kan.; on the Kan. City, Ft. Scott and Mem. and the St. L. and San Fran. railways; 31 miles E. of Parsons, 137 miles S. of Kansas City (for location, see map of Kansas, ref. 8-K). It is in a coal-mining region, and has a zinc-manufacturing plant with capacity of 78,000 lb. of spelter a day. There are 6 churches, 3 public schools, a State bank with capital of \$7,000, and 2 weekly newspapers. Pop. (1880) 376; (1890) 2,138; (1895) 3,020. EDITOR OF "WEIR CITY TRIBUNE."

Weir, HARRISON WILLIAM: illustrator; b. at Lewes, England, May 5, 1824; was apprenticed to a wood-engraver at London; gave great attention to natural history and studied water-coloring painting; was one of the original members of the Society of Painters in Water-colors; became noted for his wood-engravings of animals in the *Illustrated London News*, the *Children's Friend*, the *Band-of-Hope Review*, and other periodicals, and by his illustrations to several books on natural history. He is the author of *The Poetry of Nature* (1865); *Funny Dogs with Funny Tales*; *The Adventures of a Bear*; *Bird Stories, Old and New*; *Our Cats*, and *all about Them*, and other works, some of which were illustrated by himself.

Weir, JOHN FERGUSON: portrait and genre painter; b. at West Point, N. Y., Aug. 28, 1841; pupil of his father, R. W. Weir; visited Europe in 1868; National Academician 1866; director of the Yale School of Fine Arts, New Haven, 1869. He is also a sculptor. *The Culprit Euy*, *Christmas Bell*, *Forging the Shaft*, and *The Confessional* are among his principal works. His studio is in New Haven. W. A. C.

Weir, JULIAN ALDEN: portrait, landscape, and genre painter; b. at West Point, N. Y., Aug. 30, 1852; pupil of his father, R. W. Weir, and of Gérôme in Paris; member Society of American Artists 1877; National Academician 1886; member of American Water-color Society; honorable mention Paris Salon 1882; second-class medal Paris Exposition, 1889, and third-class medal for drawings. The works of his earlier period are somber in tone and possess depth of color and distinction of general aspect. Since 1887 he has followed the impressionist methods of painting and produced a number of landscapes that are notable for luminous and atmospheric quality. His pictures, whatever their style or manner of painting, are marked by artistic treatment. His studio is in New York. WILLIAM A. COFFIN.

Weir, ROBERT WALTER: historical and genre painter; b. at New Rochelle, N. Y., June 18, 1803; pupil of Jarvis; began to paint portraits in 1821; went to Florence in 1824 and studied with Benvenuti; National Academician 1829; Professor of Drawing at the U. S. Military Academy 1837-79. D. in New York, May 1, 1889. His *Embarkation of the Pilgrims* is in the Capitol at Washington, D. C. W. A. C.

Weisshaupt, vīs'howpt, ADAM: the founder of the Society of the ILLUMINATI (*q. v.*).

Weismann, vīs'mān, AUGUST: naturalist; b. at Frankfort-on-the-Main, Germany, Jan. 17, 1834; studied medicine at Göttingen, and was for a time physician to the Archduke of Austria; then turned to zoölogy, and for many years has been professor in the University of Freiburg in Baden. He has published numerous papers on the structure and development of insects and crustacea, and later has devoted himself to more philosophical questions. His writings have been the greatest stimulation to research of any since the publication of Darwin's *Origin of Species*. Among his most important works are *Entwickelung der Dipteren* (Leipzig, 1863); *Beiträge zur Kenntniss der Daphnoiden* (Leipzig, 1876-80); *Studies in the Theory of Descent* (1880); *Essays on Heredity* (1888-92); and *Germ Plasm* (1893). For his peculiar views, see HEREDITY. J. S. K.

Weiss, wis, JOHN: author; b. in Boston, Mass., June 28, 1818; graduated at Harvard College in 1837; taught at Chauncy Hall and Jamaica Plain; entered the Cambridge Divinity School in 1840; passed the winter of 1842-43 in Heidelberg, Germany; graduated at the Harvard Divinity School, and settled in Watertown in 1843; withdrew on account of strong anti-slavery opinions, and went in 1847 to New Bedford; left soon by reason of failing health; spent some years in repose, quiet study, and travel; was minister

again in Watertown 1859-70; retired in order to devote himself to literature; published in 1845 a translation of Schiller's philosophical and æsthetic essays, *Æsthetic Prose; Life and Correspondence of Theodore Parker* (2 vols, New York, 1864); *American Religion* (Boston, 1871); *Wit, Humor, and Shakespere* (Boston, 1876); *The Immortal Life* (Schiller, 1880). Weiss was one of the leading disciples of the Transcendental philosophy, an ardent abolitionist, a zealous champion in the cause of woman's political emancipation, and an apostle of rationalism in religion. D. in Boston, Mass., Mar. 9, 1879. Revised by J. W. CHADWICK.

Weissbrunn: See VESPERIN.

Weissenfels, vîs'en-fels: a city in the Prussian province of Saxony; station of two Prussian state railways; on the Saale, 18½ miles S. W. of Leipzig (see map of German Empire, ref. 4-F). It has considerable trade in wool and grain, and several cotton spinning and weaving factories, and manufactures leather goods, paper, porcelains, and articles of gold and silver. Sandstone and coal are worked in the vicinity. Weissenfels has a spacious market-place, three fine churches, a teachers' seminary, a deaf-mute institute, and a pro-gymnasium. Pop. (1890) 23,779. U. S.

Weitspekan Indians: a family of North American Indians of Northeastern California. They take their name from *Weitspek*, a village at the junction of the Trinity and Klamath rivers. The family has also been called Yurok, a Karok (Quoratean) word signifying *down* or *below*.

The area occupied by the family includes the territory from the junction of the Trinity and Klamath rivers to the Pacific, extending northward a short distance beyond the mouth of the Klamath and Little and Mad rivers. It is therefore mainly within the limits of Humboldt co., California. The tribes were separated into two divisions—the Yurok, inhabiting Klamath river and the coast from a few miles above the mouth of the latter river southward to Gold Bluff; and the Chilula, extending from the latter point to the southern boundary of the family, particularly along Redwood creek. The latter, however, were long ago removed to the reservation of the Hupa, by which tribe they were absorbed.

The Yurok are physically inferior to the Karok, their eastern neighbors. On the coast the natives are inclined to be pudgy, while the inland inhabitants of the Klamath are of finer form. They are also much darker than the Karok, and have lower foreheads and more projecting chins. Both the Yurok and Chilula, like nearly all the Californian tribes, were divided into a number of petty villages, each with a political head of only nominal authority. The Yurok recognized also a tribal chief.

The houses of the Yurok are similar to the Karok habitations. They are squarely constructed of split poles or puncheons planted erect in the ground and covered with a flattish puncheon roof. Sometimes this cabin is erected on the level ground; more frequently, however, it is built over a circular cellar 12 or 15 feet in diameter. They depend for their livelihood largely upon their own labor, being employed by neighboring miners, and as pack-train drivers, farm hands, etc. They make and sell canoes of redwood (the capacity of some being 5 tons) and transport passengers and merchandise on the river. The women weave from willow twigs and pine roots large round mats, hats, and water-tight baskets of various shapes and designs for household use. The Yurok cling to the use of the bow and arrow, although in the latter points of metal have succeeded the primitive stone arrowheads. They continue to use flint and jasper knives in cleaning and cutting salmon. This fish forms their principal food, and large quantities are obtained by means of nets woven of pine roots or grass, as well as by the spear and line.

Being strictly a maritime people, the Yurok are rather inferior hunters, but expert and fearless watermen. They are monogamists; marriage is practically by purchase, the purchase price being returned to the husband by the wife's father in event of divorce, which is easily obtained. The dead are buried in a recumbent posture, and a fire is made on certain nights in the vicinity of the grave, presumably to guide the departed soul on its darksome journey. They believe in the transmigration of the soul, and that the wicked return in the form of weak animals, to be harried and devoured. They now recognize the existence of a Supreme Being, known to them as "Gard," which would seem to denote Christian influence. At the time of the advent of the whites into their country the Yurok are said to have

numbered about 5,000. In 1870 the population was about 2,700, which number has considerably decreased. See INDIANS of NORTH AMERICA. J. W. POWELL.

Weitzel, GODFREY; soldier; b. in Cincinnati, O., Nov. 1, 1835; graduated at the U. S. Military Academy July, 1855, and became second lieutenant of engineers; served in the construction and repairs of fortifications about New Orleans until 1859, when he was transferred to West Point as Assistant Professor of Engineering. In the early part of the civil war he served in the defense of Fort Pickens Apr.-Sept., 1861, and was chief engineer in the department of the Ohio Oct.-Dec., 1861. On the organization of Gen. Butler's expedition to New Orleans Weitzel was selected as chief engineer. He planned the capture of New Orleans, and on its fall was appointed acting military commander and mayor of the city. Commissioned brigadier-general of volunteers Aug. 29, 1862, he drove the Confederates from the La Fourche district, the battle of Labadieville occurring Oct. 27. He commanded the district until Apr., 1863, when he joined his force to that besieging Port Hudson, and, upon its surrender, was given the first division of the Nineteenth Corps; engaged in the expedition to Sabine Pass. In Apr., 1864, he was ordered to Virginia, and was chief engineer of the Army of the James (May-Sept., 1864), constructing the defenses of Bermuda Hundred and Deep Bottom, and in command of second division of Eighteenth Corps was engaged in the various operations of that army, including the actions near Drury's Bluff. In Nov., 1864, he was promoted major-general, and in December was given the Twenty-fifth Corps. He accompanied Butler's unsuccessful expedition to Fort Fisher as second in command. The troops N. of the Appomattox were assigned to him in Mar., 1865, and on the morning of Apr. 3 he took possession of Richmond. He commanded a military district in Texas Apr., 1865, to Mar., 1866, when he was mustered out of volunteer service. He received the brevets of major, lieutenant-colonel, colonel, brigadier and major general in the regular army. Returning to duty with his corps, in which he was made major in Aug., 1866, he was afterward engaged on engineering work in connection with the Louisville and Portland Canal, St. Mary's Falls Canal, improvement of the falls of the Ohio, etc., and on lighthouse construction, and was promoted lieutenant-colonel of engineers 1882. D. in Philadelphia, Mar. 19, 1884. Revised by JAMES MERCUR.

Weizsäcker, vîts'sek-er, KARL HEINRICH, von, Ph. D., D. D.; Protestant theologian; b. at Oehringen, Württemberg, Germany, Dec. 11, 1822; became privat doцент of theology at Tübingen 1847; professor there, in succession to Baur, 1861; and chancellor of the university in 1890. In 1848 he became preacher at Stuttgart, in 1851 court chaplain, in 1859 was made a member of the superior consistory. Of his numerous publications may be mentioned *Zur Kritik des Barnabasbrief aus dem Codex Sinaiticus* (Tübingen, 1863); *Untersuchungen über die evangelische Geschichte, und den Gang ihrer Entwicklung* (Gotha, 1864; 2d ed. Freiburg im Br., 1891); *Lehrer und Unterricht an der evangelisch-theologischen Facultät der Universität Tübingen von der Reformation bis zur Gegenwart* (Tübingen, 1877); *Das apostolische Zeitalter der christlichen Kirche* (Freiburg im Br., 1886; 2d ed. 1892; Eng. trans., *The Apostolic Age of the Christian Church*, London and New York, 1894); and especially his much admired translation of the New Testament, which is one of the best productions of the kind (Tübingen, 1875; 7th ed. Freiburg im Br., 1894).

SAMUEL MACAULEY JACKSON.

Welch, ASHBEL; civil engineer; b. at Nelson, N. Y., Dec. 4, 1809. In 1827 he began engineering work on the Lehigh Canal. In 1835 he was appointed chief engineer of the Delaware and Raritan Canal, and later he located and built the Belvidere and Delaware Railroad. In 1853 he prepared the plans for the Delaware and Chesapeake Canal. After 1862 he was manager, and later president of the Pennsylvania Railway lines in New Jersey. He was the first to introduce in the U. S. the block system of operating trains. He was the author of papers on railway engineering and economics. In 1881 he was elected president of the American Society of Civil Engineers. D. at Lambertville, N. J., Sept. 25, 1882. MANSFIELD MERRIMAN.

Welch, PHILIP HENRY; humorist; b. at Angelica, N. Y., Mar. 1, 1849. He was engaged in mercantile business till 1882, when he became connected with the Rochester, N. Y., *Post-Express*. In 1884 he joined the staff of the New York *Sun*, furnishing its columns with jokes and short humorous

dialogues which became famous. These he turned off in exhaustless profusion, many of them from his sick-bed, during a long and painful illness. D. in Brooklyn, N. Y., Feb. 24, 1889. He was the author of *The Tailor-made Girl* (1888) and *Said in Fun* (1889).

HENRY A. BEERS.

Welch, WILLIAM HENRY, M. D., LL. D.; pathologist; b. at Norfolk, Conn., Apr. 8, 1850; graduated at Yale College 1870, and at the College of Physicians and Surgeons, New York, 1875; studied pathology at the Universities of Strassburg, Leipzig, Breslau, and Berlin; was demonstrator of Anatomy and Professor of Pathological Anatomy in Bellevue Hospital Medical College, New York, 1878-83; in 1884 was elected Professor of Pathology in Johns Hopkins University, and has been pathologist to Johns Hopkins Hospital, Baltimore, since its opening in 1889. He was president of the Medical and Chirurgial Faculty of the State of Maryland in 1891-92. He is the author of the sections on pathology and pathological anatomy in the fifth (1881) and sixth (1886) editions of Flint's *Theory and Practice of Medicine*; of the chapter on *Organic Diseases of the Stomach* in Pepper's *System of Medicine* (1885); of the chapter on *General Considerations concerning the Biology of Bacteria, Infection and Immunity* in Pepper's *Text-book of the Theory and Practice of Medicine* (1894); of the Cartwright lectures on the *General Pathology of Fever* (1888); and of numerous papers on pathological and histological subjects in German and American medical journals.

S. T. ARMSTRONG.

Welcker, *vel*ker, FRIEDRICH GOTTLIEB: Greek scholar and archaeologist; b. at Grünberg, Hesse, Germany, Nov. 4, 1784; studied at Giessen; was tutor in the home of Wilhelm von Humboldt in Rome (1806-09); called to the chair of Archaeology at Giessen; took part in the French campaign (1814); professor at Göttingen in 1816, at Bonn 1819; deposed for political reasons in 1832, but soon reinstated. Owing to failing eyesight, however, he retired in 1861. D. at Bonn, Dec. 17, 1868. Welcker was one of the greatest classical scholars of the nineteenth century, and his numerous writings on Greek literature, mythology, and art possess a permanent value. Only a few of the most famous can be mentioned here: *Alle Denkmäler* (5 vols., Göttingen, 1849-64); *Griechische Götterlehre* (3 vols., Göttingen, 1863); *Die griechische Tragödie mit Rücksicht auf den epischen Cyclus geordnet* (3 vols., Bonn, 1841), an epoch-making work; *Der epische Cyclus* (3 vols., Bonn, 1835-49; 2d ed. 1865-82); *Aeschyleische Trilogie* (Darmstadt, 1824; supplement, Frankfurt, 1826). Editions of Aleman, Hippoman, Philostratus's *Imagines*, Theognis, Hesiod's *Theogony*; *Kleine Schriften*, 6 vols., among which the treatises on *Sappho* and *Prodicus* are especially noteworthy. See the biography by Reinhold Kekulé (Leipzig, 1880).

ALFRED GUDEMAN.

Weld, **Wold**, or **Dyer's Weed**: the *Reseda luteola*, an annual herbaceous plant which is a native of the southern parts of Europe, but has been naturalized in the U. S. It contains a yellow coloring-matter termed luteoline which is highly esteemed for its durability, and ranks among vegetable dyes next to the Persian berry. Luteoline is extracted from the plant by treatment with boiling water; it is more soluble in alcohol and in ether; when heated it sublimes and condenses in yellow needles; it furnishes yellow lakes with lead acetate, alum, and tin chloride, and is extensively used for imparting a gold color to silks and for paper-staining. The entire plant is also employed for dyeing purposes in Europe, including England, but its consumption has greatly diminished since the introduction of quercitron. In preparing baths from weld the exhausted plant should be removed from the liquid, and the latter used as soon as possible, as its decoction speedily undergoes decomposition on exposure to the air.

Welde, THOMAS; clergyman; b. in England about 1590; studied at Trinity College, Cambridge; graduated 1613; took orders in the Church of England; was for some years minister of a church at Farling, Essex; being molested as a Puritan by the ecclesiastical authorities, emigrated to New England; arrived at Boston June 5, 1632; was ordained the following month as first minister of the church of Roxbury; received in November as a colleague John Eliot; took part at the trial of Mrs. Anne Hutchinson as an opponent of her peculiar doctrines 1637; was associated with Eliot and Richard Mather in 1639 in making the translation of the Psalms known as the "Bay Psalm-book" (*The Whole Book of Psalms faithfully translated into English Metre*, Cambridge, 1640), which was the first volume printed in New

England; was sent with Hugh Peters to England in 1641 as agent for the colony—a post he filled until 1646, when he was dismissed and requested to return, but remained in England; was afterward pastor of a church at Gateshead, near Newcastle-upon-Tyne; accompanied Lord Forbes to Ireland, and resided there some time; subsequently returned to England, and was ejected from his living for non-conformity 1662. D. Mar. 23, 1662. He published *A Short Story of the Rise, Reign, and Ruin of the Antinomians, Familists, and Libertines that infected the Churches of New England* (London, 1644; 2d ed. 1692), a celebrated tract of which another shorter version, *Antinomians and Familists condemned*, etc. (1644), appeared about the same time, leaving it doubtful which is the original edition, and whether Gov. John Winthrop may not have been the chief author, as maintained by several antiquaries. It was answered by Rev. John Wheelwright in his *Mercurius Americanus*, etc. (1645).

Revised by S. M. JACKSON.

Welding [cf. Dan. *välde*, boil, gush; Swed. *välla*, weld; Germ. *wellen*, boil, well up, weld]; a term applied to a phenomenon exhibited by iron, platinum, and probably some other metals, consisting in the assumption at a certain temperature of a glutinous cohesion between surfaces, accompanied, in the case of iron, with a considerable degree of plasticity and viscosity. It is doubtful whether this character as manifested in iron differs in nature from the same character as assumed by semi-fused shellac or sealing-wax. It is one of the most important properties, in a practical sense, of both iron and platinum, for without it neither of these valuable metals could be readily or cheaply obtained in large homogeneous masses. The process of puddling iron is founded on the welding cohesiveness produced at the heat of the puddling-hearth as the iron gradually loses its carbon and other contaminating impurities. The tool of the operative causes the particles of iron, as they gradually "come to nature," to cohere together gradually into a ball. The same remark applies to the processes of obtaining soft iron direct from the ore in bloomeries or Catalan forges. Platinum is obtained in masses by forming it into sponge by chemical means, then compressing this into a cylinder, which, when heated highly and hammered, welds into a compact homogeneity. See also ELECTRIC WELDING.

Revised by R. H. THURSTON.

Weldon: town; Halifax co., N. C.; on the Roanoke river, and the Atl. Coast Line and the Seaboard Air Line railways; 80 miles S. of Richmond, Va., and 97 miles E. of Raleigh (for location, see map of North Carolina, ref. 2-I). It is in an agricultural region, with excellent water-power, and has 6 churches, 2 public and 2 private schools, a State bank with capital of \$10,000, a weekly newspaper, large vineyard, and several mills in its vicinity. Pop. (1880) 932; (1890) 1,286; (1895) 1,800. EDITOR OF "ROANOKE NEWS."

Welhaven, *vel*-haa-fen, JOHAN SEBASTIAN CAMMERMEYER: poet; b. at Bergen, Norway, Dec. 22, 1807; studied at the University of Christiania; began to lecture on philosophy in 1840; was appointed professor in 1846. In 1832 he published *Henrik Wergelands Digekunst og Charakter*, and thereby opened that memorable controversy which forms the introduction to modern Norwegian literature. (See NORWEGIAN LITERATURE.) In 1833 he founded *Vidar*, a weekly paper, which in 1836 was transformed into a daily paper, the *Constitutionelle*, and in 1834 he published the book which became the center of the whole contest, *Norges Dømring* (Norway's Twilight), a collection of sonnets, in which he attacked with merciless sarcasm the prejudices and narrow tendencies of the awakening national spirit, and unfolded his own wider views and loftier ideas. Another collection of poems, without any polemic tendency, appeared in 1851, and a third in 1863. D. in Christiania, Oct. 21, 1873. His collected works were published in 8 vols. in Copenhagen (1868).

Revised by D. K. DODGE.

Welland: river of Ontario, Canada; an affluent of the Niagara, which it joins above the falls after a course of about 60 miles. It forms part of the Welland Canal, which connects Lake Erie with Lake Ontario.

Welland, formerly called *Merrittsville*: post-village; capital of Welland County, Ontario, Canada; on Welland river, Railway, and Canal, and on Canada Southern Railway; 12 miles S. of St. Catharine's (see map of Ontario, ref. 5-E). It has a fine water-power. Pop. (1891) 2,035.

Welland Canal: a canal connecting Lakes Ontario and Erie on the Canadian side of the Niagara river. It was con-

structed in 1833 and enlarged in 1871, the present length being 263 miles; number of lift locks, 25; total rise of lockage, 327 feet; size of locks, 270 by 45 feet; width of canal, 100 feet; depth on sills, 14 feet. The total cost up to June 30, 1890, was \$27,264,802, and the amount of tolls annually collected on freight, passengers, and vessels is about \$220,000. It is open on an average for 241 days in the year.

MANFIELD MERRIMAN.

Wellton, JAMES EDWARD COWELL: educator and author; b. at Tonbridge, England, Apr. 25, 1854; educated at Eton and at King's College, Cambridge, of which he afterward became a fellow and tutor, and graduated senior classic in 1877. He was made head master of Dulwich College in 1883, and head master of Harrow School in 1885. He is the author of *Sermons preached to Harrow Boys, The Spiritual Life and other Sermons*, and of standard translations of Aristotle's *Politics, Rhetoric, and Nicomachean Ethics*.

Well-drilling or Well-boring: the operations by which deep holes of comparatively small diameter are sunk into the earth for the purpose of obtaining water or other substances, such as petroleum or gas. Similar holes are drilled in the search for coal, iron ore, salt, and other minerals, and although in this case water is not the object in view, yet work of this character can properly be considered as well-drilling. The principal feature of well drilling or boring—that which distinguishes it from the digging of ordinary water-wells or the sinking of a shaft of a mine—is that all of the operations are conducted from the surface, the hole being generally from 3 to 6 inches in diameter.

Two distinct methods of well-sinking are commonly included under the terms well-drilling and well-boring, viz., the grinding with pressure, by which a hole is made, and the pounding or shattering of the rocks by a heavy chisel-pointed bar. The two methods and the machinery adapted to their application are represented in their highest development on the one hand by the diamond drill (see **BLASTING**), and on the other by the rope drill or ordinary oil-well apparatus. The first cuts or bores a hole, either cylindrical or annular, and in any desired direction; the other pounds and shatters a hole by its own weight, descending vertically. The advantages possessed by one over the other result from the foregoing facts; the diamond drill can be made to penetrate any rock hard enough to stay in place, while the percussion drill, more simple in construction and operation, is cheaper, requires labor less skilled, and rapidly pierces the softer, horizontally bedded rocks.

The pounding or percussion drill is in common use for sinking deep wells either for fresh water, brine, petroleum, or gas, while the diamond drill, occasionally employed for this purpose, is of greatest utility in exploring the harder, inclined rocks for coal, iron ore, and the precious metals. Although both, strictly speaking, are mining tools, the latter is more commonly identified with the discovery of metals.

An iron bar tipped with steel drawn to a blunt cutting edge, if repeatedly raised a few inches and dropped upon a rock, cuts a depression. By slightly turning the bar each time it is raised and causing the chisel edge to strike across the mark left by the preceding blow the depression becomes a nearly circular hole. If the bar is repeatedly raised, turned, and let fall the hole deepens until the powdered rock prevents further progress. If water is now put into the hole the rock dust becomes soft mud and can be readily drawn out, allowing the drilling to go on again for a time. This is a common method in use in many quarries. To make a deep well the same principle is employed; the tools are made larger, heavier, and longer, and are generally suspended from ropes. To manipulate these it is necessary to employ machinery more or less complicated, but in all cases the operations are essentially the same as that just described.

The first step in the development of deep-drilling machinery from the simple bar is the use of a spring pole to raise the drill. A small tree of suitable elasticity is cut and trimmed into a long pole, the butt firmly fastened to the ground and the top inclined upward at an angle of about 30 degrees to the horizon. From the tip the drilling-rod is suspended. By pulling the end of the pole down the drill strikes its blow and then is lifted by the tendency of the pole to become straight again. In this way the labor is greatly reduced, since it is far easier to pull down the drilling-rod than to lift it. The mud is removed from the hole by means of a suitable bucket of small diameter or other device lowered and raised when the hole is deep by a rope

and windlass. Wells of from 2 to 3 inches in diameter and 100 feet or even more in depth are frequently drilled in this manner, two men working at a time and making a progress of about 15 feet a day, or more or less according to the hardness of the rocks encountered.

The second degree of development is the use of horse-power to raise the drill, suitable devices being employed, such that rotary motion from a treadmill or capstan is converted into a rapid vertical lift and fall. From this it is but a short step to the use of steam-power, by which the largest results are accomplished. With horse-power wells of from 3 to 4 inches in diameter are often drilled to depths of from 100 to 300 feet or more, while with steam depths of 4,000 feet are not rare. By far the greater number of deep wells are now drilled by steam, hand-power and horses being used in putting down shallow wells in localities where machinery is expensive and labor cheap.

Wells, ranging generally from 1,000 to 2,000 feet in depth, are being drilled in the U. S. at the rate of about 300 a month. These are mainly in the oil and gas regions of Pennsylvania, Ohio, and Indiana. The machinery in common use throughout the country for the purpose of deep drilling, whether for water or oil, has been developed and brought to its present state of perfection in these oil-fields, where certain standard sizes and patterns have been adopted after years of trial and change. The various tools, engines, pipes, etc., made in these localities are used not only throughout the U. S., but in foreign countries as well. A description therefore of the apparatus employed in drilling an oil-well applies to the machinery used for probably nine-tenths of the artesian or other deep wells of the U. S.

The most prominent object about a deep-drilling well is the derrick or rig, a framework tower 20 feet square at bottom, tapering to 4 feet at top, and usually 72 feet high. This tower is for the purpose of carrying two pulleys, the crown pulley in the center and the block through which the sand-line runs. Over the crown pulley runs the cable by which the drilling tools are suspended and raised or lowered, while the sand-line is a smaller rope used to draw out the sand-pump or bailer, by which the hole is cleaned at short intervals during the drilling.

At one side of the rig are the bull-wheels or windlass upon which the cable is wound, and at the other the walking-beam, a heavy timber 20 feet long hung in the center so that it can oscillate up and down. One end comes directly over the hole, and the other can be attached by a pitman to a crank driven by the band-wheel, which in turn is belted to the engine. This large band-wheel can also be made to run the sand-reel or long windlass carrying the sand-line, one end of the reel being drawn when in use by a powerful lever against the band-wheel. The band-wheel imparts motion in a third way, viz., by means of an endless bull-rope turning the bull-wheels which wind or unwind the cable. Without moving from his position on the floor of the derrick, the driller can start, stop, or reverse his engine, run the sand-line or cable in or out of the hole, or control the motion of the walking-beam, and in short, by a few simple mechanical devices can perform all the operations of putting the drilling tools in or out, cleaning the hole, and drilling.

A "string" of drilling tools consists of a bit 4 feet long, weighing 150 lb.; an auger-stein about 40 feet long, and weighing 1,300 lb.; the jars, 6 feet or more long, weighing 300 lb.; the sinker-bar, 16 feet long, weighing 600 lb.; and the rope socket of 75 lb. on top. The total length of the string of tools is 60 feet, and when suspended from the crown pulley by means of the cable, $\frac{1}{4}$ inches in diameter, the tools swing inside the derrick, and when necessary can be stood up out of the way. When in use the tools are lowered into

FIG. 1.—Machinery and derrick used in well-drilling: On the extreme left is the boiler for generating steam, and next to it is the engine, above which is a wooden tank for holding water for the boiler. To the right of this, and in the center of the picture, is the band-wheel, and diagonally above this the walking-beam. In the lower part of the derrick, and at the extreme right, are the bull-wheels.

the hole by means of the bull-wheels, then are raised a few inches, and the rope is securely clamped to the temper-screw hanging to the end of the walking-beam, the rope above the

FIG. 2.—Principal drilling tools: 1, 8-inch bit; 2, 5½-inch bit; 3, auger-stem; 4, jars; 5, sinker-bar; 6, rope-socket; 7, one of a pair of wrenches used in screwing tools together; 8, drilling cable held by clamps and hung from temper-screw above; 9, gauge used when dressing 8-inch bit.

point of attachment being allowed to hang freely. By means of the temper-screw the tools can be gradually lowered as drilling progresses, the screw running down 5 feet.

The bit or cutting tool is pointed with steel, has an obtuse cutting edge, usually either 8 inches or 5½ inches across, according to the size of hole to be made. Bits as large as 12 or even 14 inches across are used in starting the hole in clays or unconsolidated rocks. The auger-stem is to give weight to the bit and efficiency to the blow. The jars consist of two long flat links, faced on the inside with steel, playing into each other and allowing a vertical movement of about 9 inches. They divide the string of tools into two parts, acting in a degree independently of each other. Above the jars is the sinker-bar, whose purpose is to give efficiency to the upward blow of the upper half of the jars. The jars are used mainly to loosen the tools if the lower part becomes wedged or stuck in the hole. In such cases a direct pull is of little effect and may result in breaking the cable, while a series of sharp upward blows given by the rapid pulling open of the links of the jars generally starts the wedged tools. The jars are not made for giving a downward blow, and may be broken if thus used.

After drilling has progressed the length of a "screw"—viz., 5 feet—the tools are hoisted out, and water thrown in if the hole is dry. The sand-pump or bailer, a tube 16 feet or more long with a valve in the bottom, is then run in on the end of the sand-line, and when full of mud and water is drawn out and emptied, the operation being repeated until the hole is free from mud. Then a new bit, sharpened and of full width, is put on the end of the tools; they are run in, and drilling goes on again. The rope is constantly turned at the surface, first in one direction and then in the other, thus causing the bit slowly to revolve and cut a round hole. Drilling and sand-pumping alternate with each other as

rapidly as possible, the operations continuing day and night by twelve-hour shifts until the work is done.

In Canada and a few localities in the U. S. drilling is done by means of wooden rods instead of a rope. These extend from the jars to the top of the hole, being screwed together end to end by iron joints. There are certain advantages, in that the tools are under better control, but the time consumed in unjointing a long string of rods and putting them together again each time the drill is changed is a serious drawback, and there is always danger of breaking or unscrewing the rods when in use.

It is necessary that at least the upper part of the well, where the rocks are soft or unconsolidated, be lined with casing. This not only keeps the walls from falling in, but also, if properly set, keeps out surface or other waters. It is usual to drill the hole as rapidly as possible, and then slip the casing in, its diameter being less than that of the drill. Sometimes this can not be done on account of the instability of the walls, and then it is necessary to adopt some modification, as, for instance, drilling ahead a short distance, and then driving the casing down. The devices employed to overcome difficulties of this kind are very numerous, each being adapted to a special need. The casing is usually of wrought iron, put together by means of screw joints and collars, and will stand a pressure of from 1,000 to 3,000 lb. per square inch. Near the top of the well sometimes as much as 100 feet or more of large wooden casing is used. This not being water-tight serves merely to keep loose earth from falling in. Some of the shallower wells have been cased with spirally jointed sheet-iron casing, but this has not always been satisfactory on account of the difficulty of making tight joints.

The cost of drilling varies greatly according to the locality and character of rock penetrated. The minimum is in the oil regions, where hundreds of wells are being drilled, and where manufactories of tools are near at hand. Away from these headquarters the cost may be two, three, or even four times as much. Under the most favorable circumstances a 1,500-foot well can be drilled and cased through surface rocks for \$2,000, and one 2,000 feet deep for \$2,300. Usually, however, the expenses will be far greater. Wells of from 500 to 1,000 feet in depth are relatively more expensive than those of from 1,200 to 2,000 feet, since the cost of preparation is about the same in all cases. The total outlay may be from \$1,200 to \$1,800. Also holes of great depth—of 3,000 feet and upward—are more costly in proportion to the depth, as the machinery and tools must be larger and heavier. In the western part of the U. S. the contract cost of completing artesian wells to depths of 1,000 feet or more is as high as \$4 or even \$5 per foot.

Owing to the small size of the hole and the great depths at which work is done, there is constant danger of delay or obstruction by accidents to the drilling tools. These may be deflected by cross bedding of the rocks or by jointing planes, and the hole must be straightened before they can do effective work; or they may become wedged by bits of rock falling in, or by the new bit sticking in the bottom of the hole made by the old worn bit so that it can not be jarred loose. A more serious matter, however, is where the tools or rope break, leaving a mass of iron and steel to be removed. All of these and other mishaps are usually successfully overcome by the use of innumerable ingenious devices. Almost anything from a bolt to a complete string of tools and rope can be recovered from a hole by the use of proper "fishing tools." These are designed to grasp objects, either of rope, wood, or metal, and to tighten their hold as they are withdrawn. Rope can be cut by an arrangement of knife-edges, and the smooth ends of broken tools can be caught by "slip-sockets," whose grip is so tenacious that jarring may go on for hours. All of this work often takes place in a hole 5½ inches in diameter and from 1,000 to 2,000 feet or more below the surface.

F. H. NEWELL.

Welles, GIDEON: cabinet officer; b. at Glastonbury, Conn., July 1, 1802; educated at Norwich University, Vt.; studied law; was editor and proprietor of the *Hartford Times*, a Democratic paper, 1826–36, and continued to contribute to its editorial columns till 1854; supported the candidacy of Gen. Jackson for the presidency; was a member of the State Legislature 1827–35; was chosen State comptroller in 1835, and was elected to that office in 1842 and 1843, having in the meanwhile been for several years postmaster of Hartford. From 1846 to 1849 he was chief of a bureau in the U. S. Navy Department. He was an original member of the

Republican party, and as chairman of the Connecticut delegation at the Chicago convention was influential in securing the nomination of Lincoln for the presidency; was Secretary of the Navy through the administrations of Lincoln and Johnson, and through his energy the strength and efficiency of the navy were greatly increased, though at such great expense as to provoke hostile criticism. He was identified with several important reform movements, notably the agitation for the abolition of imprisonment for debt, and was pronounced in his anti-slavery views. D. in Hartford, Conn., Feb. 11, 1878. Revised by F. M. COLBY.

Wellesley, wel'lee: town (incorporated in 1881); Norfolk co., Mass.; on the Boston and Albany Railroad; 3 miles E. of Natick, 15 miles W. by S. of Boston (for location, see map of Massachusetts, ref. 5-1). It contains the villages of Wellesley, Wellesley Hills, Wellesley Farms, Wellesley Falls, and Unionville; is the seat of WELLESLEY COLLEGE (q. v.); and has 4 churches, high school (new building cost \$40,000), 13 district schools, Dana Hall, several private schools, water-works, electric lights, electric railway to Natick and Newton, 2 hotels, and a weekly and a monthly periodical. The town also contains the celebrated Italian gardens of H. H. Hunnewell, who has presented the town with a fine hall, a park of 10 acres, and a public library with 10,000 volumes. In 1894 Wellesley had an assessed valuation of \$7,500,000 and a debt of \$100,000. Pop. (1885) 3,013; (1890) 3,600; (1895) 4,229. EDITOR OF "COURANT."

Wellesley, ARTHUR: See WELLINGTON.

Wellesley, RICHARD COLLEY, Marquis Wellesley, K. G., D. C. L., and Earl of Mornington: soldier and statesman; brother of the first Duke of Wellington; b. at Dublin, Ireland, June 20, 1760; educated at Oxford; succeeded to the titles of Viscount Wellesley and Earl of Mornington, and took his seat in the Irish House of Peers; was elected to the British House of Commons for Bernalston 1785, and for Saltash 1786, but was unseated in the latter year; advocated in the Irish Parliament, during the regency debate of 1789, the restriction of the powers of the prince during the minority of the king; became, in consequence, a favorite of George III.; obtained an election from Windsor; was made one of the Lords of the Treasury; was raised to the House of Lords as Baron Wellesley, and appointed Governor-General of India Oct. 4, 1797; arrived at Calcutta May, 1798; found the native powers of India ripe for a struggle against the British rule; sent a small British force into the territories of the nizam, ordering him to disband his levies and to surrender 124 French officers; dispatched an army under Gen. Harris against the capital of Mysore Feb. 3, 1799, committing himself to Madras to superintend the operations, which resulted in the storming of Seringapatam May 4; divided the territories of Mysore with the nizam, and made his brother, Col. Arthur Wellesley, governor of Seringapatam July, 1799; was created Marquis Wellesley in the peerage of Ireland Dec. 2, 1799; received the thanks of Parliament, and refused £100,000 of prize-money offered by the East India Company; directed his attention with success to the commercial interests and the internal organization of the British Empire in India; sent in 1801 a force of 7,000 men up the Red Sea against the French in Egypt; had a quarrel with the board of directors and tendered his resignation 1802, but was induced to withdraw it; engaged in a desperate but victorious struggle with the Mahrattas 1803-05; founded a college for the cultivation of Indian literature; inaugurated surveys of the country and effected great financial reforms, making his administration the most memorable in Anglo-Indian history; returned to England Aug., 1805; was received with honor by the Government and the East India Company, which conferred upon him an annuity of £5,000; was ambassador in Spain 1808-09; Secretary of State from Dec., 1809, to Jan., 1812; was designated as Prime Minister in May, 1812, but was unable to form a cabinet; rendered invaluable parliamentary support to his brother during the campaigns of the Peninsula and of Waterloo; accepted the office of Lord-Lieutenant of Ireland Dec., 1821; was recalled on the accession of his brother to the premiership, 1828, owing to a difference of opinion between them on the "Catholic question"; and was lord chamberlain 1835, but resigned from public life the same year on account of advanced age and straitened circumstances, and was the recipient of a testimonial of £20,000 from the East India Company. D. at Kingston House, Knightsbridge, London, Sept. 26, 1842, and was buried in the vault at Eton College chapel.

Statues have been erected in London and at Calcutta. He published several political pamphlets shortly before his death, and privately printed a small volume of poems in English, Latin, and Greek, entitled *Primitiæ et Reliquiæ* (1840; 2d issue 1841). His *Dispatches, Minutes, and Correspondence, etc.*, during his administration in India (5 vols., 1836-37), and his *Dispatches and Correspondence* during his mission to Spain (1838), were edited by R. Montgomery Martin, and his *Memoirs and Correspondence* (3 vols., 1846) by Robert R. Pearce. Revised by F. M. COLBY.

Wellesley College: an institution of learning devoted exclusively to the higher education of women; in the village of Wellesley, on Lake Waban, about 15 miles from Boston. The grounds comprise 300 acres, and for many years before the establishment of the college had been cultivated as a gentleman's country-seat. The main building is 475 feet long and five stories high. It is of brick trimmed with freestone. Since the opening of the college in 1875 three buildings for purposes of instruction have been added; the school of music in 1881, the Farnsworth school of art in 1889, and the chemistry building in 1894; also Stone Hall and 8 cottages for dormitories. The college is chartered by the State, and empowered to confer all collegiate and honorary degrees that are conferred by any Massachusetts college or university. There were in 1895-96 800 students and 98 teachers and other officers. Julia J. Irvine, M. A., is the president. The standard of study is the same as that of the foremost colleges for young men. The library contains 46,000 volumes; the apparatus, cabinets, and laboratories are extensive.

Wellfleet: town (incorporated in 1763); Barnstable co., Mass.; on the N. Y., N. H., and Hart. Railroad; 14 miles S. E. of Provincetown (for location, see map of Massachusetts, ref. 4-K). It contains the villages of Wellfleet and South Wellfleet; has a Methodist Episcopal church, public high school, five district schools, and a public library; and is principally engaged in fishing. In 1894 it had an assessed property valuation of \$611,063. Pop. (1880) 1,875; (1890) 1,291; (1895) 968.

Wellhausen, vel how-zen, JULIUS: biblical critic; b. at Hameln-on-the-Weser, Germany, May 17, 1844; studied at Göttingen under Ewald 1862-65; became privat docent there in the theological faculty 1870; Ordinary Professor of Theology at Greifswald 1872; changed to the philosophical faculty at Halle 1882, because he was convinced that he was no longer even a Protestant; went in the same capacity to Marburg 1885, and to Göttingen 1892. He is a leader in the school of Old Testament criticism which denies historical value to the supernatural element in the Old Testament, and indeed sees nothing in the book but literature, whose authorship and date, consequently, are in general not those traditionally assigned to them. (See HEXATEUCH.) His principal works are *Der Text der Bücher Samuëlis* (Göttingen, 1871); *Pharisäer und Sadducäer* (Greifswald, 1874); *Prolegomena zur Geschichte Israels* (Berlin, 1878; 4th ed. 1895; Eng. trans., *History of Israel*, Edinburgh and London, 1885); *Muhammed in Medina. Das ist Yakidits Kitab al Maghazi, in verkürzter deutscher Wiedergabe herausgegeben* (Berlin, 1882); *Skizzen und Vorarbeiten* (1884-92); *Die Composition des Hexateuchs und der historischen Bücher des Alten Testaments* (2d ed. 1889); *Israelitische und Jüdische Geschichte* (1894). SAMUEL MACAULEY JACKSON.

Welling, JAMES CLARKE, LL. D.: educator and editor; b. at Trenton, N. J., July 14, 1825; graduated at Princeton College 1844; became associate principal of the New York Collegiate School 1848; editor of *The National Intelligencer*, Washington, D. C., 1856-65; clerk of U. S. court of claims 1862-67; president of St. John's College, Annapolis, Md., 1867-70; Professor of Belles-Lettres in Princeton College 1870-71; president of Columbian University 1871-94. He also was president of the Philosophical Society of Washington, president of the Anthropological Society, regent of Smithsonian Institution, and chairman of the executive committee and president of the Corcoran Gallery of Art. D. at Hartford, Conn., Sept. 4, 1894. W. H. WHITSITT.

Wellington: capital of New Zealand; on an inlet of Cook's Strait, on the west shore of Port Nicholson. It is well built, has an excellent harbor, and is connected by railway with Auckland. It carries on a considerable trade, exporting wool, tallow, and gum. It was founded in 1840, and became capital of the colony in 1865. Pop. (1891) 31,021; (1896) 41,758. M. W. H.

Wellington: city; capital of Sumner co., Kan.; on the Slate creek, and the Atch., Top. and S. Fé, and the Chi., Rock Id. and Pac. railways; 29 miles S. of Wichita, 270 miles S. W. of Kansas City (for location, see map of Kansas, ref. 8-G). It is in an agricultural region; has 3 national banks, combined capital \$200,000, a private bank, 2 loan and investment companies, public high school, and a daily and 3 weekly newspapers. Pop. (1880) 2,694; (1890) 4,391; (1895) 3,657.

Wellington: village; Lorain co., O.; on the Cleve., Cin., Chi. and St. L. and the Wheeling and Lake Erie railways; 10 miles S. of Auburn, 36 miles S. W. of Cleveland (for location, see map of Ohio, ref. 2-G). It is one of the principal markets for dairy products in Ohio, the shipment of cheese alone amounting to 6,000,000 lb. annually. It has 5 churches, public school with 10 departments, a national bank with capital of \$100,000, 2 weekly newspapers, foundry, bending-works, flour-mills, and common lumber and lard-wood mills. Pop. (1880) 1,811; (1890) 2,069.

EDITOR OF "ENTERPRISE."

Wellington, ARTHUR MELLE: civil engineer; b. at Waltham, Mass., Dec. 20, 1847; was educated at the Boston Latin School, and later was an engineering student in the office of John B. Henck. From 1867 to 1885 he was in active engineering practice and chief engineer of the location and construction of several railways. He located the difficult railway line from Vera Cruz to the city of Mexico. In 1887 he became editor of *Engineering News*, New York. He published *Computation of Earthwork* (New York, 1874); *Economic Theory of Railway Location* (New York, 1876; greatly enlarged edition 1887); and edited the *Car-Builder's Dictionary* (1884). D. in New York, May 16, 1895. M. M.

Wellington, ARTHUR WELLESLEY, K. G., Duke of; soldier; b. at Dangan Castle, County Meath, Ireland, May 1, 1769; was the third son of Garrett Wellesley, first Viscount Wellesley and Earl of Mornington (d. 1781), who attained some distinction as a musical composer, and of Anne Hill Trevor, eldest daughter of Arthur, first Viscount Dungannon. He received his earlier education at Eton College, after which he spent six years in the military seminary at Angers, France, then under the direction of the celebrated engineer Pigneron. Having entered the army as ensign Mar. 7, 1787, he was rapidly pushed by family influence through the lower grades of the service, and on Sept. 30, 1793, attained the rank of lieutenant-colonel of the Thirty-third Foot. In the meanwhile, in the summer of 1790, he had been elected to the Irish Parliament for the borough of Trim, where his family possessed preponderating influence, and in the following year he was appointed aide-de-camp to the Earl of Westmoreland, Lord-Lieutenant of Ireland. He saw his first field-service under the Duke of York in the Netherlands in 1794, when, having obtained through his brother's influence the command of the Thirty-third regiment, he embarked at Cork for Ostend; joined the main body of the army at Antwerp, and commanded three battalions during the disastrous retreat of the British army through Holland Jan., 1795, conducting himself with credit in several skirmishes with the French. Having been commissioned colonel in May, 1796, he embarked for India with his regiment in the same year, arriving at Calcutta Feb., 1797, and was placed in command of the subsidiary forces furnished by the nizam for the campaign against Tippu Sultan 1799. In the victory of Malvalli he bore a prominent part, and on May 4 commanded the reserves in the trenches at the assault and capture of Seringapatam. Having been appointed governor of Mysore by his brother, the governor-general (see WELLESLEY, RICHARD COLLEY), he waged a campaign against a celebrated Mahratta freebooter, Dhundia Wagh, self-styled the king of the two worlds, whom he defeated and killed Sept. 10, 1800. He was named second in command to the expedition sent to Egypt 1801, but was prevented by illness from embarking. Appointed major-general in Apr., 1802, he commanded the expedition against the Mahrattas, and restored the Peshwa Apr.-May, 1803; besieged and took Ahmadnagar Aug. 8-12; entered Aurungabad Aug. 29; defeated Sindhia at the decisive battle of Assaye Sept. 23, and again at Argannu Nov. 29; took the great fort of Gawilghar in December, and concluded a treaty with Sindhia Dec. 30, imposing upon him stringent conditions. For these services he was knighted and received the thanks of the king and Parliament 1804. In Nov., 1805, he took part in Lord Cathcart's expedition to Hanover. He married Lady Catharine Pakenham, second daughter of the third Earl of Longford, Apr. 10, 1806, and was soon afterward elected to the British Parliament for

Newport, Isle of Wight. In Apr., 1807, he became Chief Secretary for Ireland under the Duke of Richmond. Holding a command under Lord Cathcart, he took part in the expedition against Copenhagen, and negotiated the capitulation of that city Sept. 7, 1807. In the summer of 1808 he was made commander-in-chief of the forces sent to the Peninsula, and having landed at Corunna in July, offered his aid to the Galicians for the expulsion of the French, but the offer being declined, he re-embarked; landed at Mondego Bay, Portugal, Aug. 1, and defeated Gen. Laborde at Roliça Aug. 17. On Aug. 20, 1808, he was superseded in the chief command by Sir Harry Burrard, but on the following day gained over Junot the brilliant victory of Vimeira, which again won him the thanks of Parliament. On Aug. 31 he signed the armistice which led to the convention of Cintra. Returning to England at the end of the year, he resumed his seat in Parliament Jan., 1809, but again took the field in the following spring, having been placed in the chief command of the Peninsula forces on the death of Sir John Moore. Passing the Douro in the face of the French army, he entered Oporto May 12, and was appointed by the prince regent marshal-general of the Portuguese army in the same month. On July 27-28 he defeated the French under Marshals Victor and Sebastiani in the battle of Talavera, but was compelled by the non-co-operation of the Spanish army to fall back on Badajoz, crossing the Tagus at Arzobispo Aug. 4. For the third time he received the thanks of Parliament, and was further rewarded by being created Baron Douro of Wellesley and Viscount Wellington of Talavera with a pension of £2,000 Sept. 4, 1809. He now fortified his famous triple lines of intrenchments, 30 miles in length, between the Tagus and the Atlantic, at TORRES VEDRAS (q. v.). Having repulsed Masséna at Busaco Sept. 27, 1810, he again occupied the lines of Torres Vedras Oct. 10. On Apr. 11, 1811, he received the thanks of Parliament for the liberation of Portugal. In the following month he gained the victory of Fuentes de Onoro, took Almeida, and invested Badajoz, but retreated on June 10 within the frontiers of Portugal. He carried Ciudad Rodrigo by assault Jan. 19, 1812, for which he was made by the Spanish regency Duke of Ciudad Rodrigo and a grandee of Spain, and by his own government created Earl of Wellington with a further pension of £2,000. Having taken Badajoz by storm Apr. 6, routed Marmont with great slaughter at Salamanca July 22, and occupied Madrid Aug. 12, he was made generalissimo of the Spanish armies, created Marquis of Wellington Oct. 3, and granted £100,000 by Parliament. In the spring of 1813 he entered Spain with 200,000 men in two columns; obtained a signal victory over King Joseph and Jourdan at Vitoria June 21, capturing 150 cannon and driving the French into the Pyrenees. On July 3 he was made field-marshal of Great Britain and Duke of Vitoria in Spain. Siege was now laid to San Sebastian and Pamplona, but at first without success. From July 27 to 31 Wellington gained a series of battles in the Pyrenees. On Aug. 31 he took San Sebastian by assault, and early in October crossed the river Bidassoa into France. Pamplona capitulated on Oct. 31, after which he took up his headquarters at St. Jean de Luz. On Dec. 10-18 he repulsed Soult, and leaving two divisions to blockade Bayonne pursued him and defeated him at Orthez Feb. 27, 1814, and at Toulouse Apr. 10, occupying the latter place two days later. Learning of the occupation of Paris he went thither, and from there to London, where he arrived on June 23, having in the meanwhile been made Marquis of Douro and Duke of Wellington (May 11). In August he went to Paris as ambassador to the restored monarch, Louis XVIII., attended the Congress of Vienna Jan., 1815, and took command of the British army in Flanders in April on the return of Napoleon from Elba. He repulsed Ney at Quatre Bras June 16, and two days later gained, with the Prussian marshal Blücher, the decisive battle of WATERLOO (q. v.), after which he crossed the French frontier and marched upon Paris June 21. From 1815 to 1818 he was commander-in-chief of the allied army of occupation in France. For his services in the campaign he was richly rewarded. Sixty thousand pounds were awarded to him as Waterloo prize-money. The King of the Netherlands bestowed on him the title of Prince of Waterloo, and the British nation presented him with the valuable estate of Strathfieldsaye, Hampshire. He attended the Congress of Aix-la-Chapelle for the evacuation of France (1818), and in the same year was created field-marshal of Austria, Russia, and Prussia. Through his appointment as master-general of the ordnance, Jan. 1, 1819, he secured a seat in the British

cabinet. He attended the Congress of Verona in 1822, and was afterward ambassador to Russia. From Jan. 8, 1828, to Nov. 15, 1830, he was Prime Minister in the Tory interest, steadily opposing Roman Catholic emancipation and all projects of parliamentary reform, on which account he was hooted in the streets of London, the windows of Apsley House were broken by the mob, and an attempt was made to burn his country residence June, 1832. On Jan. 29, 1834, he was appointed chancellor of Oxford University. He was Secretary of State for Foreign Affairs from Dec., 1834, to Apr. 8, 1835, and in 1841 he was a member of the cabinet without a portfolio. He gave a reluctant support to the free-trade measures of Sir Robert Peel. He was president of the privy council 1845-46, after which he declined further political honors on account of advanced age, though he continued to attend the House of Lords and was assiduous in the discharge of his duties at the court of the youthful Queen. He died of apoplexy at Walmer Castle, Kent, his official residence, as lord warden of Cinque Ports, Sept. 22, 1852; received a magnificent funeral, and was buried near the tomb of Nelson in the crypt of St. Paul's Cathedral, London, Nov. 9. In person he was of middle size, but strongly built, and his capacity for enduring fatigue gave him the familiar title of "the Iron Duke." His leading characteristics as a soldier were invincible resolution and singleness of purpose, combined with a full measure of caution. His political, social, religious, and literary instincts were pre-eminently conservative—a fact which brought him into unpopularity during the agitations for reform, but did not detract from the affectionate pride and veneration with which he was regarded by his countrymen during the protracted evening of his life. Numerous statues and memorials have been erected to his memory, and works illustrative of his military exploits are naturally abundant. The most notable personal biographies are those of Maxwell (3 vols., 1839-41), Stoequeler (2 vols., 1852-53), Brialmont (3 vols., 1856-57), Yonge (2 vols., 1860), and Hooper (1 vol., 1889). His *Dispatches* (33 vols. 8vo, 1852-80) and his *Supplementary Dispatches and Memoranda*, the first eight volumes edited by Col. John Gurwood, the others by his son Arthur Richard, the second duke (1807-84), exhibit him in a most favorable light, and constitute invaluable materials for history. The present duke, who was born in 1846, is the eldest son of Lord Charles Wellesley, the Duke of Wellington's second son, who succeeded his childless uncle in Aug., 1884.

Wellingtonia gigantea: the name under which the *Sequoia gigantea* was first made known to the world. See SEQUOIA.

Wellington Island: See MAGALLANES.

Wells [M. Eng. *welle* < O. Eng. *wella*, *wylla*, deriv. of *wellan*, well up, surge, boil: Germ. *wellen*. Cf. WELDING]: a term which was originally applied to natural flowing springs, but which has come to designate artificial excavations or shafts sunk in the ground to obtain supplies of water.

Living springs were the only sources of drinkable water known to primitive man, and the construction of excavated wells dates from a time when social institutions were so far organized as to secure to individuals, or at least families or tribes, long enjoyment of the fields and the pastures of which they had taken possession. In Persia, at the present time, he who sinks a well in waste lands becomes the proprietor of the land irrigated by its waters, and it is supposed that this was the case in Palestine in ancient days, and that this accounts for the opposition encountered by Abraham and by Isaac in holding or digging wells (Gen. xxi., xxvi.). In pastoral life, and especially in the climates in which pastoral industry appears to have been first largely practiced, water is the first requisite for the establishment of a camp or the temporary occupancy of feeding-grounds for cattle. The nomad Bedouins now rarely if ever dig wells. For their small herds the slender threads of living water found here and there in the desert, cisterns and pools accumulated from the winter rains, suffice, and in many of their habitual routes of travel they still find a supply of water in wells excavated, like those of Jacob and of Beersheba, in the patriarchal ages. Ancient writers speak of wells in the North African desert several hundred feet deep, and their accounts have been confirmed by modern travelers; but in a large part of that waste a continuous sheet of water exists at depths so moderate as to be easily reached by cutting through the bed of indurated sand which overlies it. The wells of the Sahara are square excavations, not walled up with stone, but lined with a framework of palm-trunks, and they yield an abundant sup-

ply of water for cattle and for irrigating the small gardens which Arab industry finds it convenient to till. The water often rises to the surface and pours over like that in an artesian boring, and the wells are choked in a few years by fine sand brought up by the flow. The removal of the sand is a difficult and dangerous operation, as the work must be performed under water, and it is the special vocation of a sort of guild or corporation.

In the East wells are generally round, and when not cut through solid rock are generally stoned, as in Europe. In their present condition they are usually without a curb, the orifice being closed by a flat stone, and they are unprovided with any apparatus for raising the water, the traveler being expected to furnish his own rope and bucket. In ancient times, as is apparent from the Scriptures (e. g. Gen. xxiv. 16-20), access to the water of some wells was had by descending steps, and the water was dipped out with a vessel. The Greek and Roman wells were provided with curbs, and it appears that these were used long before the general employment of sweeps or of pulleys for hoisting the bucket, for the edges of the most ancient curbs are everywhere cut into channels by the friction of the rope drawn over them, which would not be the case if the water-vessels had been attached to a sweep or to a rope passing over a pulley suspended from above. The *shadoof*, a rude structure resembling a well-sweep, is commonly used in the East to raise water from wells, reservoirs, and rivers.

The economical and sanitary value of water, and the frequent difficulty and expense of procuring it, gave wells great importance in the eyes of the ancient world, and those distinguished for purity or abundance of water were regarded with almost idolatrous reverence. Hence great care was bestowed upon their construction and preservation, and they were often sumptuously decorated and provided with many useful as well as ornamental accessories. Many ancient well-curbs of fine material and workmanship are found in museums of ancient art, and some of those in the Vatican—particularly one of marble, thought to be Etruscan—are among the most admirable works of sculpture in that great museum. In India, too, valuable wells are considered and treated almost as temples. Of remarkable wells mention may be made of that in the citadel at Cairo, traditionally ascribed to the patriarch Joseph. This is several hundred feet in depth, and is surrounded by a double winding ramp by which beasts of burden can descend and bring up water. There is a very similar well, though not of very ancient construction, at Orvieto.

In many parts of Europe, centuries after the introduction of Christianity, wells were believed to possess miraculous powers, and were resorted to by those who desired to avert misfortunes, to win the affection of others, or to bring calamity upon enemies, the end being gained by application of the water, often accompanied with the recital of a prayer or formula, or by casting pins, pebbles, or other articles into the wells. "Wishing wells" and "cursing wells" are not uncommon in Great Britain.

The ingenious and simple method of obtaining water by driving a small iron tube, provided with a perforated hollow conical point of steel, a few feet into the ground and applying a hand-pump to the orifice, deserves special notice as an economical and speedy process which in many cases obviates the necessity of common wells altogether. See WATER, ARTESIAN WELLS, WELL-DRILLING, etc.

Wells: an old city, and a municipal and parliamentary borough in Somersetshire, England; 20 miles S. W. of Bath (see map of England, ref. 13-G). It is said to have received its name from St. Andrew's Well, which from its abundant sources sends small rivulets of running water through all the principal streets. The city is the see of a bishop. The cathedral was begun in 704, but much enlarged in 1138. It has a central tower 178 feet high, and its interior is richly decorated. Its western façade is ornamented with 300 statues. The bishop's palace was founded 1088, and is surrounded with high walls and a moat. Pop. (1891) 4,822.

Wells: town (settled about 1640, incorporated in 1653); York co., Me.; on the Boston and Maine Railroad; 28 miles S. W. of Portland (for location, see map of Maine, ref. 11-A). It contains the villages of Wells, Wells Depot, Wells Branch, Ogunquit, Webhannet, and Maryland Ridge, and has 7 churches, 2 public libraries, 5 summer hotels, and lumber, shingle, and grist mills. Pop. (1880) 2,450; (1890) 2,029.

Wells: village; Faribault co., Minn.; on the Chi. Mil. and St. P. Railway; 20 miles N. W. of Albert Lea, 38 miles

S. of Mankato (for location, see map of Minnesota, ref. 11-E). It is in an agricultural region, and has 9 churches, 2 public school buildings, railway repair-shops, 8 grain elevators, a 300-bbl. flour mill, large creamery interests, a national bank with capital of \$50,000, a State bank with capital of \$25,000, a private bank, and two weekly newspapers. Pop. (1880) 661; (1890) 1,208; (1895) 1,702. EDITOR OF "ADVOCATE."

Wells, DAVID AMES: economist; b. at Springfield, Mass., June 17, 1828; graduated at Williams College 1847, and at Lawrence Scientific School, Cambridge, 1851; assistant professor there 1851-52; was associated with Dr. A. A. Hayes as a chemist at Boston 1853-55; patented in 1856 several improvements in bleaching; was a member of a publishing-house in New York 1857-58; settled at Norwich, Conn.; visited Europe on commissions of the U. S. Government 1862 and 1867; was U. S. special commissioner of the revenue 1866-70; produced on that subject fifteen important reports; became university lecturer on political economy at Yale College 1872; visited Europe 1873; delivered in that year an address before the Cobden Club in London; was chosen a foreign associate of the French Academy of Political Sciences, in the place of John Stuart Mill, deceased, 1874; has been since 1867 a strong advocate of free trade; has taken considerable part in the efforts for civil-service reform, and was an unsuccessful Democratic candidate for Congress at the special election of Apr., 1876. He edited among other works the *Annual of Scientific Discovery* (Boston, 16 vols., 1850-65). Among his earlier writings are *Familiar Science* (1856); *The Science of Common Things* (1857); *Elements of Natural Philosophy* (1857); *Principles and Applications of Chemistry* (1858); *First Principles of Geology* (1861); and the extensively circulated political pamphlet *Our Burden and our Strength* (1864). He has been a voluminous writer on financial and economic subjects. In this class of his writings may be mentioned *The Creed of the Free-Trader* (1875); *Production and Distribution of Wealth* (1875); *Robinson Crusoe's Money* (1876); *The Silver Question or the Dollar of the Fathers vs. the Dollar of the Sons* (1878); *Our Merchant Marine, etc.* (1882); *A Primer of Tariff Reform* (1884); *Practical Economics* (1886); *A Study of Mexico* (1887); *A Short and Simple Catechism* (1888); and *Relation of the Tariff to Wages* (1888).

Revised by F. M. COLBY.

Wells, HORACE: dentist; b. at Hartford, Windsor co., Vt., Jan. 21, 1815; studied dentistry in Boston, and in 1836 began the practice of his profession in Hartford, Conn. As early as 1840 he expressed his belief that nitrous oxide could be used to prevent the pain of dental and other operations, and four years later he publicly demonstrated its efficacy as an anæsthetic. From this time on he daily extracted teeth under the influence of the gas, and other dentists in Hartford adopted the same practice with like success. Early in 1845 Wells went to Boston and communicated his discovery to Dr. W. T. G. Morton, his former pupil and partner, and to Dr. Charles T. Jackson, and others. At a lecture afterward given before the class at the medical college his experiment failed through the carelessness of the operator. Wells was hooted at and hissed out of the amphitheater by the students, and he was pronounced a charlatan and his anæsthetic a humbug. On Oct. 27, 1846, Jackson and Morton published to the world, by letters patent, the discovery of *lethum* as an anæsthetic, but this was seen at once to be nothing but pure sulphuric ether. Each claimed the honor of discovering anæsthesia by ether; but while they were sending bulletins to the Institute of France Wells sailed for Europe, in Dec., 1846, to lay his claims before that body as the real discoverer of anæsthesia. His mission was a failure, and he returned in Mar., 1847. Notwithstanding the successful use of nitrous oxide in Hartford as an anæsthetic in such important operations as the amputation of the thigh and the excision of tumors, it was nevertheless supplanted by ether, and Wells's claim to the discovery of anæsthesia was unrecognized. Later he went to New York to lay his claims before the profession of the great metropolis. Soon after his arrival he showed signs of mental aberration, and on Jan. 14, 1848, in a fit of madness, he ended his life with his own hands. He was author of the pamphlet *A History of the Application of Nitrous Oxide Gas, Ether, and other Vapors to Surgical Operations* (1847). A bronze statue of him stands in Bushnell Park, Hartford. He ranks as an independent discoverer of the principle of anæsthesia, for his claim antedates all but that of CRAWFORD W. LONG (q. v.), who did not publish his discovery till 1849.

Wells, WILLIAM CHARLES, M. D., F. R. S.: scientist; b. at Charleston, S. C., in May, 1757; educated at Dumfries and at Edinburgh, Scotland; studied medicine at Charleston; was a surgeon in the British service in Holland; returned to Charleston early in 1781; practiced medicine there, and became a printer, bookseller, and merchant; went with the loyal troops to St. Augustine, Fla., Dec., 1782; published there the first weekly newspaper in that province, and was captain of loyal volunteers; went to England May, 1784; settled in London 1785; became physician to the Finsbury Dispensary 1790, and to St. Thomas's Hospital 1798; published his *Essay on Single Vision with Two Eyes* (1792) and his celebrated *Essay on Dew* (1814), for which he was awarded the gold and silver Rumford medals by the Royal Society 1816. Darwin states that in a paper read before the Royal Society in 1813 Wells recognized distinctly the principle of natural selection. D. in London, Sept. 18, 1817. His *Autobiography* was published in 1818, and a new edition of his *Essay on Dew* appeared in 1866.

Wellsboro: borough; capital of Tioga co., Pa.; on the Fall Brook Railway; 81 miles N. of Williamsport (for location, see map of Pennsylvania, ref. 2-F). It is in an agricultural and mining region, and has 2 national banks with combined capital of \$150,000, 3 weekly newspapers, several saw and planing mills, tanneries, carriage-factories, and marble-works. Pop. (1880) 2,298; (1890) 2,961.

EDITOR OF "ADVOCATE."

Wellsburg: city (founded in 1790); capital of Brooke co., W. Va.; on the Ohio river, and the Pitts., Cin., Chi. and St. L. Railway; 16 miles N. of Wheeling (for location, see map of West Virginia, ref. 3-G). It is in an agricultural and wool-growing region, with natural gas and extensive coal mines in its vicinity, and has new city buildings, large public school, a national bank with capital of \$100,000, 2 private banks, a weekly newspaper, 7 glass-factories, 2 paper-mills, a sack-factory, and several cigar-factories. Pop. (1880) 1,815; (1890) 2,235. EDITOR OF "PAN-HANDLE NEWS."

Wellston: city (founded in 1876); Jackson co., O.; on the Balt. and O. S. W., the Cin., Ham. and Day., and the Ohio S. railways; 10 miles N. of Jackson, the county-seat, and 35 miles S. E. of Chillicothe (for location, see map of Ohio, ref. 7-F). It is in a coal-mining region, and has 12 churches, 5 public-school buildings, several iron-foundries, machine-works, and mills, a national bank with capital of \$50,000, and 2 weekly newspapers. Pop. (1880) 952; (1890) 4,377; (1895) estimated, 7,500. EDITOR OF "SENTINEL."

Wellsville: city; Montgomery co., Mo.; on the Wabash Railroad; 18 miles E. S. E. of Mexico, 90 miles W. of St. Louis (for location, see map of Missouri, ref. 4-I). It is in an agricultural region, and has 7 churches, 3 hotels, several flour-mills, grain elevators, and woolen-mills, tobacco-factory, canning-factory, a State bank with capital of \$25,000, and 3 weekly newspapers. Pop. (1880) 867; (1890) 1,142; (1895) estimated, 1,700. EDITOR OF "OPTIC NEWS."

Wellsville: village; Allegany co., N. Y.; on the Genesee river, the Erie Railroad, and the Wells, Couder. and Pine Creek branch of the Buff. and Susquehanna Railroad; 8 miles S. by W. of Belmont, 26 miles S. W. of Hornellsville (for location, see map of New York, ref. 6-D). It has 2 national banks with combined capital of \$150,000, a high school, a free public library, a daily, a semi-weekly, and a weekly newspaper, and several foundries, machine-shops, and tanneries. It is the center for the Allegany oil-field, and has large dairying interests. Pop. (1880) 2,049; (1890) 3,435. E. W. BARNES, EDITOR OF "REPORTER."

Wellsville: city (laid out in 1823); Columbiana co., O.; on the Ohio river, and the Penn. Co.'s Railroad; 20 miles N. of Steubenville, 48 miles N. W. of Pittsburg, Pa. (for location, see map of Ohio, ref. 3-J). It is in an agricultural and coal-mining region, and has 9 churches and chapels, a parochial, a private, and 3 public schools, a national bank with capital of \$50,000, a private bank, 4 foundries and machine-shops, 4 brick-works, 3 potteries, 2 sewer-pipe and terra-cotta works, railway-shops, rolling-mill, boiler-works, soap-factory, and a weekly, a quarterly, and 2 daily periodicals. The massacre of the family of Logan, the celebrated Mingo chief, took place 2 miles below Wellsville in 1774. Pop. (1880) 3,377; (1890) 5,247; (1895) estimated, 6,000. EDITOR OF "UNION."

Wellwood, Sir HENRY MONCREIFF: See MONCREIFF.

Welsby, WILLIAM NEWLAND: law writer and editor; b. at Acton, Cheshire, England, 1803; studied at a private

school in Oakham, and afterward entered Cambridge University, graduating in 1823; studied law and was admitted to the bar in the Middle Temple in 1826, and after several years of successful practice on the Chester circuit was appointed junior counsel to the Government; in July, 1841, became recorder of Chester, and held this position till he resigned, shortly before his death at Chester, July 1, 1864. He published, with several associates, *Reports of the Decisions of the Court of Exchequer*, from 1836 to 1856 (27 vols.); edited, either alone or with associates, Chitty's *Collection of Statutes of Practical Utility* (4 vols., 1851-54); Archbold's *Criminal Pleading*; Sir Christopher Rawlinson's *Municipal Corporation Acts* (2d ed. 1849), besides other works; and was the author of *Lives of Eminent English Judges of the Seventeenth and Eighteenth Centuries* (1846). See the *Law Times*, vol. xxxix., p. 418. F. STURGES ALLEN.

Welsh, HERBERT: philanthropist; b. in Philadelphia, Dec. 4, 1851; son of John Welsh, minister to Great Britain 1877-79; graduated at the University of Pennsylvania in 1871, and afterward spent two years in Europe, devoting a portion of that time to the study of art in Paris. On his return he gave his attention to philanthropic projects, and after a visit to the Sioux reservation in 1882 became a zealous champion of the rights of the Indians, striving to induce the Government to adopt a more humane and consistent policy in its dealings with them. With this end in view he founded the Indian Rights Association, which has succeeded in carrying through several reform measures, and has exposed and defeated schemes to defraud the Indians. The holding of land in severalty, which was for a long time advocated by him, was finally introduced by the passage of the Dawes Bill. Other reforms that he has sought to carry out are the education of Indian children and the extension of law to the reservation. Among his writings are *Four Weeks among some of the Sioux Tribes of Dakota and Nebraska in 1882* and *Report of a Visit to the Navajo, Pueblo, and Hopai Indians of New Mexico and Arizona in 1884*.

Welsh Calvinistic Methodist Church, in Wales and the U. S. See METHODISM and PRESBYTERIAN CHURCH.

Welsh or Cymric Language [*Welsh* is from O. Eng. *welisc*, *welisc*, deriv. of *wealh*, foreigner, Celt (see WALES); *Cymric* is from Welsh *Cymrag*, Welsh, deriv. of *Cymry*, Welshmen]; the language of the people of Wales (and of Monmouthshire, England), who, after the end of the Roman occupation, were united under the name of the *Cymry* (land associates). They are entirely distinct from the "Cimmerians" of the ancients. Welsh is a Celtic language, and is most closely related to the Bretonic of Basse-Bretagne, and with the now extinct Cornish of Cornwall. Though up to the eighteenth century it was, like all the Celtic dialects of the British isles, stealthily yielding to the English, it received at the end of that century, through the efforts of certain enthusiastic patriots, a new impulse, so that since then the number of those who speak Welsh has rather increased than declined. In imitation of a mediæval usage there is now held yearly an Eisteddfod (*q. v.*), or competitive exhibition, at which the best productions in Welsh poetry and music are awarded prizes. The successful poets are again called bards, and receive special bard-names. Furthermore, the Welsh language receives support from the Nonconformist sects, whose preaching services and Sunday-schools are conducted in Welsh, and whose religious books are published in the same language. There are published also over a score of newspapers in Welsh, several among the Welsh in the U. S. On the other hand, the number of those who speak only Welsh and not English is in constant decline. Certain *Ogam* inscriptions (see IRISH LANGUAGE) upon tombstones were long regarded as the oldest monuments of the Welsh language. These have now proved, however, to be Irish; after the withdrawal of the Romans Irish chiefs held sway from time to time in Wales. Leaving out of account a few glosses in manuscripts from the eighth century on, the literary monuments of the Welsh first begin to appear in fuller compass in manuscripts of the twelfth century, though the texts themselves are often older. The most important literary work of ancient Wales, the collection of laws, dates back in its substance to King Howel, or Hywel Da, of the tenth century. See WELSH LITERATURE. See also Walter's *Das alte Wales* (1859); Rhys, *Lectures on Welsh Philology* (2d ed. 1879); and Zeuss, *Grammatica Celtica* (2d ed. by Ebel, 1871).

The modern Welsh period begins with the Reformation

in the sixteenth century. The language then used in the Bible translations and other religious writings is the basis and standard for the literary language of to-day. The Welsh of the newspapers is less strict and admits many Anglicisms. The language of poetry mixes the old with the new. The present colloquial Welsh diverges strongly from the literary language, and differs widely according to locality. The two main groups are the North-Welsh and the South-Welsh dialects. The best modern grammars are those of Spurrell (1848) and of Rowlands (1853); dictionaries, those of Owen Pughe (3d ed. 1866) and Silvan Evans (1887 ff., incomplete). See CELTIC LANGUAGES.

R. THURNEISEN. Translated by BENJ. I. WHEELER.

Welsh Literature: the literature written in the Welsh or Cymric language. The earliest names which occur in the history of Welsh literature are those of the four bards Aneurin, Taliessin, Llywarch Hên, and Myrddin, called in Welsh *y Cynfeirdd* or the First Bards; but the date and authenticity of the poems ascribed to them, and even the existence of the bards themselves, have been called in question. Sharon Turner, in his *History of the Anglo-Saxons*, which appeared in 1799, treated these poems as historical documents; and in reply to the criticisms of John Pinkerton and Malcolm Laing, who disputed the claims of the poems to be considered authentic, he published in 1803 his *Vindication of the Genuineness of the Ancient British Poems of Aneurin, Taliessin, Llywarch Hên, and Myrddin*, in which, however, he argued for the genuineness of only a few of the poems of Taliessin. In 1849 Thomas Stephens published his *Literature of the Kymry*, in which he subjected the poems to a critical analysis, and admits the *Gododin* of Aneurin, and twelve out of the seventy-seven poems attributed to Taliessin to be genuine and as old as the sixth century. D. W. Nash, in his *Taliesin, or the Bards and Druids of Britain*, published in 1858, limits his inquiry to the Taliessin poems, and attempts to prove that none of the poems is older than the twelfth century. Matthew Arnold, in his *Study of Celtic Literature*, shows how Nash has suppressed the facts which tell against his contention; and W. F. Skene, in his *Four Ancient Books of Wales*, calls Nash's work "a very clever piece of special pleading." Prof. Rhys (*Hibbert Lectures*, 1886) regards Myrddin and Taliessin as mythical personages; Myrddin is the Merlin of the romances, and the second element of Taliessin's name is identical with Ossin, or Ossian, the name of the mythic poet of the Gaels. The oldest versions of the works of the *Cynfeirdd* are given in Skene's *Four Ancient Books of Wales*; they are taken from the *Black Book of Carmarthen*, which was written in the twelfth century, and is, with the exception of two fragments of the ninth century, the oldest Welsh MS. extant, *The Book of Aneurin*, the *Book of Taliessin*, two MSS. of the thirteenth century, and the *Red Book of Hergest*, a MS. of the fourteenth century. In these texts several of the poems are irregular in metre, and have faulty rhymes; but no philologist seems to have tested the effect on rhyme and scansion of transforming the words into their known or hypothetical sixth century forms. On the whole, the poems which seem to lay most claim to this early date are the *Gododin* of Aneurin, the poems of Llywarch Hên, and a few of the poems attributed to Taliessin. The *Gododin* is a poem of 939 lines, commemorating the battle of Cattraeth, which was fought between the Strathclyde Britons and the Saxons of Deira and Bernicia about the year 567. It relates the prowess of the British warriors, and contains numerous instances of the feeling for color and the clear perception of nature which distinguish the poetry of the Celts. The fall of the British at Cattraeth is attributed to their over-indulgence in the wine and mead cups—"wine and mead from golden vessels was their drink," "mead was their liquor and it proved their bane."

The principal works of Llywarch Hên are his *Song in Praise of Urien*, his *Elegy on Cynuddylan*, his *Ode to his Old Age and Lament for his Sons*. Matthew Arnold, in his *Study of Celtic Literature*, instances in the poems of Llywarch Hên the fierce, passionate melancholy, which he calls the "Titanism of the Celt";

"O my crutch! is it not the first day of May? The furrows, are they not shining; the young corn, is it not springing! Ah! the sight of thy handle makes me wroth . . ."

"How evil was the lot allotted to Llywarch, the night when he was brought forth! sorrows without end and no deliverance from his burden."

Mrs. Hemans has paraphrased part of Llywarch's lament and four stanzas of the *Elegy on Cynddylan*:

The Hall of Cynddylan is gloomy to-night,
Since he is departed whose smile made it bright!
I mourn; but the sigh of my soul shall be brief,
The pathway is short to the grave of my chief.

But Mrs. Hemans's versions give no indications of the terseness of Llywarch's style; as when, discoursing on the helplessness of old age and on the shortness of man's life, he introduces, suddenly and without preface, the following triplet:

This leaf, tossed to and fro by the wind,
Woe to it its fate!
Oft, it was born but this year;

and proceeds with his reflections, leaving to his reader the application of the simile. Nearly all the poetry of Llywarch Iŷen consists of rhymed triplets, of which the first two lines are usually of the peculiar form called *paladr englyn*. The first line of a *paladr* contains from nine to twelve syllables, the second line usually five or six. The last word of the first line comes after the rhyme of the line and alliterates or rhymes with a word at the beginning of the second line; thus:

Kyt delei gymry ac elyflu oloeger
Allawer o bell tu.

The twelve triplets contained in the ninth century fragments above alluded to are of exactly this form; and Prof. Rhys has detected a perfect *paladr* in an inscription of the fifth or sixth century. (Rhys's *Arthurian Legend*, p. 385.) This discovery shows that the metre is old enough to satisfy all the claims of age made on behalf of the poems; but it does not prove those claims. For the *paladr*, as an essential part of an *englyn*, is to this day one of the most widely practised of Welsh metres.

Taliessin was anciently styled *Pen Beirdd*, that is, Chief of Bards; but the merit of the few indisputably early Taliessin poems does not bear out this description of him, and indeed falls far short of that of the works of Aneurin and Llywarch Iŷen. It is possible that these poems were written by a real Taliessin, who in later times was confused with a mythical Taliessin celebrated by tradition as Pen Beirdd, and to be equated with the Gaelic Ossian. Myrddin's name is purely mythical, and all his poetry was written for him by twelfth century bards.

There are not many poems which claim to have been written during the period between the sixth and twelfth centuries. A few attributed to Cuhelyn, Elaeth, and Meigant are found in the *Black Book of Carmarthen*, and one to Tyssilio in the *Red Book of Ihergest*; but, as Skene remarks, "the number of such poems is so small that, if the poems attributed to the bards of the sixth century really belong to that period, there is an interval of several centuries, during which such a literature either never existed or has perished." In prose, however, the period is represented by the famous laws of Howel Dda, which were composed in the tenth century.

The twelfth century witnessed a great revival of Welsh literature. The *Mabinogion* and older Arthurian tales, which had been handed down by oral tradition, were now committed to writing. Geoffrey of Monmouth in 1145 wrote in Latin the legendary history of Britain, and in twenty years' time Arthur and his knights were household names throughout Europe (Nutt's *Holy Grail*, p. 229.) The continental Arthurian tales found their way to Wales, and formed the basis of the later Welsh romances. The *Red Book of Ihergest* contains eleven Welsh tales and romances, which were published, with an English translation, by Lady Charlotte Guest, in 1849, under the title of *The Mabinogion, from the Llyfr Coch o Ihergest*. Of the eleven, four only are entitled to the name *Mabinogion*; and these, with three other tales, form the older group, and are of purely Welsh origin; the remaining four, though all the proper names in them are Welsh, bear marks of foreign influence. Of the older tales, two only relate to Arthur, one of which, the tale of Kullweh and Olwen bears the stamp of the most remote antiquity; the other five, including the four *Mabinogion* proper, contain no mention of Arthur's name. The later romances are purely Arthurian; one of these furnished Tennyson with the materials for his *Geraint and Enid*. No description can be attempted here of the magic beauty of these tales; it has been described in glowing words by Matthew Arnold, and by John Richard Green in his *Short History of the English People*, and the reader may form some estimate of it from the excellent translation of Lady Charlotte Guest.

The other prose works of the twelfth and thirteenth centuries consist of Welsh histories, original and translated, the Welsh grammar of Edeyrn Dafod Aur, and several works on theology.

The poetry of this period is chiefly heroic. It begins with a long ode by Meilir to the memory of Grifudd ap Cyman, Prince of North Wales, who died in 1137. There also exists a fragment by Meilir referring to an event which took place in 1080; but the poem was not necessarily (as Stephens assumes) written at that date. Almost every line of Meilir's poetry exhibits the echoing rhymes and alliteration which developed by degrees into the *cyghanedd* of the fourteenth century. Meilir was followed by his son Gwalchmai, who wrote several odes in honor of Owain Gwynedd, son and successor of Grifudd ap Cyman. One of these odes is given in the *Specimens* of the Rev. E. Evans, to whom Bishop Percy (editor of the *Reliques*) wrote of it that it was "one continued fiery torrent of poetic flame, which, like the eruptions of Ætna, bears down all opposition." This ode has been rendered into English verse by Gray, under the title of *The Triumphs of Owen*. But the most remarkable of Gwalchmai's works is a poem entitled *Gorhoffedd Gwalchmai* (Gwalchmai's Boast), which contains the bard's reflections in camp at dawn when he has been keeping watch all night. Gwalchmai was in his turn followed by his two sons—Meilir, who composed a quantity of devotional poetry, and Einion, whose most important work is *An Elegy on Nest the daughter of Hywel*, but who is best known as the hero of a famous fairy legend preserved in the Iolo MSS. The twelfth century is noted in the history of Welsh literature for its poet-princes, Owain Kyveliog, the Prince of Powys, and Howel the son and successor of Owain Gwynedd, mentioned above. Two poems of Owain Kyveliog have come down to us, the more important being *The Hirlas Horn*, a rendering of which will be found in Mrs. Hemans's works. The extant works of the other poet-prince, Howel ab Owain, consist of a fine patriotic ode and a series of exceedingly beautiful love-lyrics.

Kynddelw, at once the most difficult and the most voluminous of mediæval bards, flourished during the latter part of the twelfth century. His style is usually so involved and complicated that it is difficult to estimate his poetical merit. His younger contemporary, Llywarch ap Llywelyn, one of the bards of Llywelyn the Great, was a poet of very uncommon power.

The praises of the greatest of Welsh princes, Llywelyn ap Iorwerth, were also celebrated by other bards, among whom Dafydd Benfras, Einion ap Gwgawn, Elidir Sais, and Einion Wann deserve mention. The next generation of poets comprises the bards of Llywelyn's grandson, Llywelyn ap Grifudd, the last Prince of Wales, who was killed in 1282. Llygad Gwr wrote a panegyric in five parts upon this prince; Bleddyn Vardd and Grifudd ab yr Ynad Coch wrote elegies upon him, that of the latter being among the most impassioned and truly poetical verses in the language. (See Stephens, *Literature of the Kymry*.) We have been able to mention only a few bards of the twelfth and thirteenth centuries, but some conception of the extent of the poetical literature of the period may be gathered from the fact that the *Mygyrian Archaeology* alone contains the works of twenty-eight bards who flourished during that time.

The fourteenth century has been called "the golden age of Welsh poetry." The tumult and perils of war no longer occupy the muse of the bards; with the exception of elegies, which the inherent melancholy of the Celt will at all times produce, almost the only subjects of song are nature and love. Perhaps the earliest of the new school of bards was Rhys Goch ap Rhiccart, who wrote a number of exquisite love-songs, of which a collection of twenty is preserved in the Iolo MSS. Stephens has discussed these poems at some length.

The intrusting of a love-message to a bird or other creature seems to have been introduced into Welsh poetry by Rhys Goch, though Dafydd ap Gwilym is usually credited with its introduction. The former has several of these love-messengers:

A nightly companion am I to the nightingale,
Let her quickly go with my vocal song
And thou, lark, bard of morning dawn,
Show to this maid my broken heart.

Dafydd ap Gwilym is considered by some critics to be the greatest of Welsh bards; he is also one of the few of whose history we have some little knowledge. He was born in 1300 and died in 1368. His father, Gwilym Gam, was dis-

inherited on account of his liaison with Arduvul, Davydd's mother. Davydd was brought up by his maternal uncle, Ivor the Generous, at Maesalee, in Monmouthshire; his bardic instructor was another uncle, Llywelyn ap Gwilym, of Dol Goch in Cardiganshire. He lived the life of a troubadour, and was a welcome guest at every mansion in the country. He fell in love with Morvudd, the daughter of Madoc Lawgam, at Newborough, in Anglesey, and inscribed to her seven score and seven odes. Morvudd was married against her will to Cynvrig Cynin, an officer in Edward III.'s army. Davydd cloped with her; they were caught, and a heavy penalty was imposed upon the bard, which the men of Glamorgan paid for him. As a poet of nature Davydd ap Gwilym stands almost unrivalled. See an article by Prof. Lewis Jones in the *Transactions of the Cymmrodorion* (1893).

The three eisteddfods called those of the Renaissance were held in Davydd ap Gwilym's time, one at the house of each of Davydd's uncles, and the other at the house of the three brothers of Marchwial, in Flintshire. It was probably at these eisteddfods that the *cyghanedd* was perfected and made a *sine qua non* of Welsh poetry. The *cyghanedd* is of three kinds; the first consists of a repetition of the same consonants in the same order at the two ends of the line, as in Davydd ap Gwilym's

Breuddwyd yw ebrwydded oes;

here the four consonants *b, r, d, d* are repeated, but the repetition of only one consonant if properly placed will form a correct *cyghanedd*. The meaning of the above line is "The swiftness of life is as a dream"; thus it is seen that a practiced bard need not write jargon even when he uses the most elaborate *cyghanedd*. The second kind consists of a rhyme in the middle of the line, and a correspondence of consonants between the second rhyming word and the end of the line, thus:

Gwall dolau a gemau gwffdd.

The third and simplest is a correspondence of sound between the penultimate syllable of the line and some other syllable in the line, thus:

*Ae yng nghyfnod dy fodau.
Ysgwyd heyth o ber ffeithydd.*

Nearly the whole of Davydd ap Gwilym's poetry is written in a metre of seven syllables, every line of which contains one of the three kinds of *cyghanedd*. Each of the three takes an endless number of forms, according to the position of the consonants and rhyming syllables; and as the accent is irregularly placed, poetry in *cyghanedd* is really less monotonous to read than in the regular feet of English poetry. The rudiments of the *cyghanedd* are found in the earliest Welsh poetry, and it practically continued to be the inseparable characteristic of all Welsh verse down to the last century, and is widely practised even now.

Several other bards of note took part in the proceedings of the three eisteddfods of the Renaissance. Madog Benyras, one of the three brothers of Marchwial, wrote an elegy on Davydd ap Gwilym, which is printed in the works of the latter, and which proves its author to have been a poet of no mean order. Siôn Cent, called in English Dr. John Kent, wrote a large number of religious odes, and became a follower of Wyclif; many of his poems, including a scathing diatribe on the monks, are printed in the Iolo MSS. Rhys Goch Eryri and Iolo Goch are also mentioned in connection with these eisteddfods. Iolo Goch lived to see the insurrection under Owen Glendower, and wrote stirring odes of encouragement to the Welsh leader. We have still to mention Gruffudd Gryg, who engaged with Davydd ap Gwilym in a poetical contention of considerable length, and Gruffudd ap Meredith ap Davydd, whose *Elegy on Gwenhwyfar of Anglesey* is one of the finest things of its kind in the language. Two famous poems, the *Ode on Myrionny Vychan of Dinas Bran*, by Howel ab Einion, and the *Elegy on Lleucu Llwyd*, by Llywelyn Goch, must also be ascribed the former to the earlier half and the latter to the second half of the fourteenth century. The golden age of poetry seems to have produced very little prose literature. Davydd Ddu of Hiraddng wrote a treatise on poetry and metre; Gruffudd ab Adda ap Davydd composed a number of tales and fables; and a few works on geography and other branches of knowledge, contained in the *Red Book of Ihergest*, were probably written during this period.

After Iolo Goch we meet with few names of distinction until we come to the middle of the fifteenth century. At

the great eisteddfod held at Caermarthen in 1451, Llawdden perfected the rules of *cyghanedd*, and Davydd ab Edmwnd arranged the twenty-four metres of Welsh poetry. The new rules of *cyghanedd* exhibit a remarkable insight into the phonological laws of the language, but the too rigid observance of those laws, and, more particularly, the limitation of all poetical composition to the twenty-four arbitrary metres, had a crippling effect on the poetry of the succeeding age. Lewis Glyn Cothi, whose works were published in a volume of 510 pages at Oxford in 1837, flourished between 1450 and 1490. His works consist almost entirely of eulogy and elegy, and are interesting chiefly to the historian; but they are not without occasional passages of some beauty, as when he contrasts "the white shroud of Maredudd" with "the black gown of Morgan his father." About this time flourished Ieuan Brydydd Hir, whose poem on *Old Age* is still well known; and Maredudd ap Rhys, whose *Ode on Fishing*, in which he compares himself to the famous fisherman Madoc the son of Owain Gwynedd, has been adduced in support of the theory that the latter discovered America before Columbus! Ieuan Deulwyn and Lewis Morgannwg represent South Wales at this time; and shortly afterward Guttun Owain, bard and historian, and disciple of Davydd ab Edmwnd, appears in the north. His fellow disciple, Tudur Aled, who was also a nephew of the master, flourished from 1480 till 1525. Tudur Aled is one of the most famous of Welsh bards, and some of his lines are still current among the proverbs of Wales, such as—

*Hysbys y dengys y dyu
O ba radd y bo'i wreiddyn.*

The objectiveness of Davydd ap Gwilym's poetry, still reflected in Davydd ab Edmwnd, now gives place to a subjectiveness which is very pronounced in Tudur Aled, and culminates in William Llwyn, a most eloquent bard who flourished about 1550, and in Siôn Tudur, who lived to welcome the publication of Dr. Morgan's Bible in 1588. No great prose work seems to have been written between 1450 and 1550; and the historical works of Guttun Owain and Lewis Morgannwg have not been published.

The first Welsh printed book appeared in 1546, and is of little interest from the literary point of view. It contains the alphabet, a calendar, the Creed, the Lord's Prayer, the Ten Commandments, etc. In 1567 Dr. Griffith Roberts published at Milan his Welsh grammar, written in Welsh, and exhibits a rare degree of literary merit. In the same year the first complete translation of the New Testament was published in Welsh by William Salesbury (who had published a small Welsh and English vocabulary in 1547). In point of language Salesbury's Testament and Roberts's grammar present a striking contrast. Dr. Roberts, by acknowledging the facts of sound-change in words borrowed from Latin, was enabled to discover several of the laws governing that change; Salesbury wished to ignore those facts, and attempted to restore every borrowed word into its original Latin form; thus for *dibynnu* he wrote *dependu*, for *eghweys* he wrote *eccles*, and so rendered his Testament unintelligible to the people for whom it was designed. The whole Bible, translated into natural and clear Welsh by Dr. William Morgan, Bishop of St. Asaph, appeared in 1588. A new version, revised by Bishop Parry, with the assistance of Dr. John Davies, of Mallywd, appeared in 1620, and is, with a few orthographical modifications, the version of the Welsh Bible still in use. About the middle of the seventeenth century Morgan Llwyd published eight works in defense of the Puritans, of which *The Book of the Three Birds* is the most important. In 1671 Charles Edwards published his *History of the Faith*, an original work of great merit, which has gone through several editions since that date. Almost all other books published in Welsh during the seventeenth century were translations of second-rate English theological works. In the early part of the century Edmund Prys composed his metrical version of the Psalms, which is sung in the chapels and churches of Wales to the present day. The only other poet of this period that need be mentioned is Hugh Morris, of Pontymeibion, who popularized the regularly accented song metres, though he continued the use of the *cyghanedd* even in these. Hugh Morris was the first, and perhaps the greatest, of the Welsh ballad-writers. He died in 1709 in his eighty-eighth year.

Ellis Wynne published his *Visions of the Sleeping Bard* in 1703. The work is not original in its conception, being based upon the *Visions* of the Spanish writer Quevedo, but it is generally admitted to be, with the exception of the *Mabinogion*, the finest Welsh prose ever written. In 1718

Theophilus Evans published his Welsh history under the title of *Drych y Prif Oesoedd*. Historically the work is of no value; the argument is often puerile and the criticism contemptible; but it possesses a certain distinction of style, and relates the old legends with a certain charm, which won for it great popularity among successive generations of Welsh readers. Lewis Morris, of Anglesey, one of the most brilliant and versatile of Welshmen, was born in 1702. He was an able mathematician and mineralogist; he surveyed the coast of Wales for the admiralty, and superintended the working of the king's mines. His skill in medicine and surgery brought the poor from all directions to seek his help, which was never refused. A contemporary triad says of him that "he could build a ship and sail it, make a harp and play it, compose a *cywydd* and sing it." In his leisure hours he applied himself to the study of Welsh literature and antiquities, and wrote a number of short poems in a light vein, which possess a sparkle almost unequaled in the whole range of Welsh poetry. But his indirect influence on the development of Welsh literature is not to be measured by his written works. He became the bardic instructor of the Rev. E. Evans (Ieuan Brydydd Iir, the younger), who, at the suggestion of Bishop Percy, published in 1764 the *Specimens of Welsh Poetry* alluded to above, and of Goronwy Owen, the greatest bard who had appeared since Tudur Aled. Goronwy was born in 1722, of poor parents, in a remote corner of Anglesey: he was educated, by the aid of Lewis Morris, at the Bangor Grammar School and Jesus College, Oxford; he failed to obtain acuracy in Wales, and lamented his exiled lot in a series of poems which surpass the greatest elegiacs of Tudur Aled. His works furnished the models for all the best poetry in *cyghanedd* written in the nineteenth century. Lewis Morris also, together with his brother Richard Morris, was chiefly instrumental in founding the Welsh Society in London, which has done so much since for Welsh literature. The chief members of that society during the latter part of the eighteenth century were Owen Jones (Owain Myvyr) and William Owen (afterward Dr. Owen Pughe), who jointly edited the works of Davydd ap Gwilym, published in 1789 in a thick octavo volume, and compiled, with the collaboration of Iolo Morgannwg, *The Myrhyrian Archaeology*, published in three large volumes, 1803-08, at the expense of Owain Myvyr, who spent £2,000 on the publication. This work contains most of the extant works of the earliest bards up to the fourteenth century, the mediæval historical romances, the Welsh laws, and other treasures of Welsh literature. Dr. Pughe also published in 1803 his Welsh dictionary, in which he refers every word to an imaginary Welsh root, and unhesitatingly distorts it, if necessary, to suit his theory. Pughe's efforts to promote the study of the old literature are laudable, but he produced a baneful effect upon the written Welsh of the nineteenth century. Iolo Morgannwg was the last of a school of Glamorganshire bards, who had rebelled against the decisions of the Caermarthen eisteddfod of 1451, and, to uphold their own authority, had invented a system of bardism, with bardic rites and a bardic congress or *gorsedd*, proclaiming these to have been handed down from the time of the Druids. Iolo, the inheritor of their traditions, resuscitated the eisteddfod, and grafted upon it their *gorsedd*, which called itself "the Gorsedd of the Bards of the Isle of Britain." It is to the eisteddfod that we owe some of the best works of the nineteenth century bards. Meanwhile a religious revival had taken place in Wales in the early part of the eighteenth century, and had produced the hymns of Williams of Pantycelyn and of Anne Griffiths. Griffith Jones, of Llanddowror, had founded his 3,000 schools, in which the people were taught to read the Welsh Bible; these had been followed by the foundation in 1780, by Thomas Charles, of the Sunday-schools, which in a short time found their way into every parish and village in the country, and literally converted the Welsh people into a nation of readers. The prose writings of the nineteenth century are chiefly theological, deriving their inspiration from the religious movement, but also partly literary, deriving their inspiration from the eisteddfod. Of the more important literary works we may mention the histories of Carnhuanawc and Gweirydd ap Rhys; the critical essays of Gwallter Mechain and Dr. Lewis Edwards; the works of the brothers Roberts of Llanbrynmair; the life-sketches of Dr. William Rees; the novels of Mr. Daniel Owen; and the Welsh encyclopædia of Messrs. Gee, of Denbigh, published in ten bulky volumes, and now passing through a second edition. The poets of this century are exceedingly numerous; the most eminent are Rob-

ert ap Gwilym Idu, the epigrammatist; Dewi Wyn, the author of the famous ode on *Charity*; Ieuan Glan Geirionnydd, the most polished of Welsh hymn-writers; Eben Vardd, the author of *The Fall of Jerusalem*; Emrys, the poet of nature; Islwyn, the poet of melancholy; and Ceiriog, the Welsh Béranger. The production of fresh literature is increasing rather than declining, and the number of its readers may be gauged by the extent of Welsh periodical literature. In 1828 there were, according to John Blackwell (Alun), 14 monthly periodicals published in Welsh, to the pages of which the peasantry were almost the only contributors. At the time of writing (1895) there are issued, of periodicals printed entirely in Welsh, 2 quarterlies, 2 bi-monthlies, about 20 monthlies, and about 24 weekly papers; and Welsh reading is given in 14 English papers circulating in Wales. See Stephens's *Literature of the Kymry* (2d ed. 1876).

J. MORRIS JONES.

Welsh Onion [*Welsh* = Germ. *Walsch*. See WALES]: another name for the CIBOL (*q. v.*).

Welwitsch, wel wích, FREDERICK, M. D., F. L. S.; botanist; b. at Klagenfurt, Austria, Feb. 25, 1806; spent eighteen years in the Portuguese possessions of Western Africa, where he collected over 40,000 specimens of plants, which he brought to England, and published several works on African botany and on natural history. D. in London, Oct. 20, 1872. In 1863 he discovered at Mossamedes, West Africa, a remarkable plant which he named *Tumboa*, but which was subsequently named by Dr. J. D. Hooker *Welwitschia mirabilis*. It is placed among the *Gnetaceæ*, an order nearly allied to the conifers; is never above a foot high, though its trunk is sometimes 6 feet in diameter; is found only in an elevated rainless, stony plateau; attains an estimated age of above a century; produces flower-stalks 12 inches high, cones 2 inches long, and two flat leaves 6 feet long, which lie prostrate upon the ground. Revised by C. E. BESSEY.

Wemyss, FRANCIS WEMYSS CHARTERIS DOUGLASS, Earl of: See ELCHO.

Wen: a cystic tumor occurring upon the surface of the body, especially on the scalp. It originates by the occlusion of a follicle of the skin or scalp, and the subsequent slow accumulation of sebaceous matter secreted by the lining of the cyst. The tumor, therefore, is round and symmetrical, and, causing a distension of the overlying skin or scalp, is smooth and shiny. It may be soft, semi-solid, or indurated, according as its contained sebaceous matter is fluid, rich in pulaceous fatty granules, or has had its fluid elements absorbed, leaving only inspissated and calcific substance. The wen is a harmless, non-malignant tumor. Whether single or present in large numbers, its removal is easy and harmless.

Wenceslas, or **Wenzel**: Emperor of Germany (1378-1400); b. at Nuremberg, Feb. 20, 1361; a son of the Emperor Charles IV., of the house of Luxemburg. A violent and self-indulgent ruler, he was unable to cope with the difficulties that the disordered state of the empire at that time presented. In Bohemia, which was his hereditary dominion, and of which he had been crowned king when only three years old, he ruled with the highest degree of arbitrariness and cruelty. He was unable to compose the difficulties between the princes and the free cities, and in his reign the foundation of Swiss independence was laid by the victory at Sempach over the house of Hapsburg. In 1393 he caused John Nepomuk to be tortured and thrown into the Moldau, and soon afterward the Bohemian nobles, who hated him for the partiality he showed toward the Germans, formed a conspiracy against him, headed by his own brother, Sigismund, King of Hungary, seized him, and held him a prisoner at Prague for several months. He was finally restored to liberty, but his power was thenceforth much circumscribed in Bohemia. In Germany, where his influence never had been great, he finally lost all authority, and when he sold the duchy of Lombardy to one of the Visconti and allied himself with France for the purpose of ending the papal schism by deposing both Boniface IX. and Benedict XIII., the electors of Mentz, Cologne, Treves, and the Palatinate assembled at Oberlahnstein and formally deposed him (Aug. 20, 1400). Rupert of the Palatinate, who was elected emperor in his stead, was never generally acknowledged, but when, after the death of Rupert in 1410, Sigismund of Hungary was elected emperor, Wenceslas renounced his claims on the German crown, though he continued to bear the title till his death Aug. 16, 1419. See Lindner,

Geschichte des Deutschen Reichs unter König Wenzel (1875-76), and *Reichstagsakten unter König Wenzel* (edited by Weizsäcker, 1868-77). F. M. C.

Wendell, BARRETT: author; b. in Boston, Mass., Aug. 23, 1855; graduated at Harvard College 1877; became instructor in English at Harvard 1880, and assistant professor of that subject 1888; has published the works of fiction *The Duchess Emilia* (Boston, 1885) and *Rankell's Remains*; also *English Composition* (New York, 1891); and *Collon Mather* in *Makers of America Series* (1891).

Wend Language: See SLAVIC LANGUAGES.

Wends: originally a general designation of the Slavs by their Teutonic neighbors, the word being derived according to Šafařík from a Slavonic root (Pol. *woda*, Russ. *voda*, Lithuanian *wandū*, water), and thus designating the people dwelling about water. The Wends are supposed to have been the earliest dwellers on the Baltic coast, and to have been driven away by the Goths (the *Guttones* of Ptolemy) in the fourth century B. C. (Cf. Bradley, *The Story of the Goths*.) At present by Wends are understood the Slavs of Upper and Lower Lusatia (Germ. *Lausitz*, derived from Slav. *lug* or *luzá*, a low, marshy country), who are entirely surrounded by Germans and have no connection whatever with other Slavs. They call themselves Serbs (*Serhjo*), and were called *Sorbs* or *Sorabi* by the old German chroniclers. According to the earliest historical reports the Wendish country extended about from the Saale and Spree to the Bober, i. e. from the present site of Berlin to the Lusatian Mountains, or over Brandenburg, Saxony, and Lower Silesia. Their language belongs to the western branch of the Slavic family, is closest cognate to Czech, and divides itself into two strongly differing dialects: Upper Sorabish and Lower Sorabish. Mucke's statistics, *Statistika tužiskich Serbow* (Bautzen, 1884-86), give the total number of the Wendish-speaking people at 173,469 (98,059 Upper Sorbs, 75,410 Lower Sorbs). The Wends are rapidly being Germanized. The people, mostly peasants, have a rather insignificant literary development, mostly of a religious character. The literary society *Mačica serbska* (founded in 1847 at Bautzen) issues a periodical, *Casopis matiny serbskeje*, the chief depository of literary production in Wendish; also a weekly paper in Bautzen, *Serbske Nowiny* (Wendish News). There are several good grammars. The best for Upper Wendish is Pfuhl's *Leut und Formenlehre der oberlausitzisch-wendischen Sprache* (Bautzen, 1867); also that by Liebsch (1884); the only one for Lower Wendish is Hauptmann's *Niederlausitzisch-wendische Grammatica* (Lübben, 1871); Schmalzer's *Volkshieder der Wenden*, with a map of the Wendish language domain, and a translation of Wendish folk-songs is excellent (2 vols., Grimma, 1841-43); also see R. Andree, *Wendische Wanderstudien* (Stuttgart, 1873); and *Sprachgebiet der lausitzer Wenden* (Prague, 1873). The *Winds*, a name given by the Germans to the Slovenes of Carinthia, Carniola, and Styria, are a different Slavic branch, to be carefully distinguished from the Wends.

HERMANN SCHOENFELD.

Wendt, rent, HANS HINRICH, Ph. D., D. D.: Protestant theologian; b. in Hamburg, Germany, June 18, 1853; became privat docent of theology at Göttingen 1877; professor or extraordinary 1881; ordinary professor at Kiel 1883, at Heidelberg 1885, at Jena 1893. He wrote *Die Begriffe Fleisch und Geist in biblischen Sprachgebrauch* (Gotha, 1878); *Die Christliche Lehre von der menschlichen Vollkommenheit* (Göttingen, 1882); *Die Lehre Jesu* (2 vols., 1886-90; Eng. trans. of 2d vol., *The Teaching of Jesus*, 2 vols., Edinburgh, 1892); *Die Aufgabe der systematischen Theologie*, inaugural (Jena, 1893). S. M. J.

Wener, Lake: the largest lake of the Scandinavian peninsula; in the southern part of Sweden; 30 miles from the Cattegat, at an elevation of 144 feet; area, 2,150 sq. miles. It receives the Clara-elf, and sends its waters to the Cattegat through the Götha-elf. It is connected with Lake Wetter by canals, and thus an inland communication is established between the Baltic and the Cattegat.

Weno'na: city; Marshall co., Ill.; on the Chl. and Alton and the Ill. Cent. railways; 20 miles E. of Lacon, the county-seat, 20 miles S. of La Salle (for location, see map of Illinois, ref. 4-E). It is an important grain center, and has bituminous coal mines, zinc-works, a national bank with capital of \$50,000, a private bank, and a weekly newspaper. Pop. (1880) 911; (1890) 1,053; (1895) estimated, 1,600.

EDITOR OF "INDEX."

Wens'leydale, JAMES PARKE, Baron: jurist; b. at Highfield, near Liverpool, England, Mar. 22, 1782; in 1799 entered Trinity College, Cambridge, as a pensioner, graduated in 1803, and became a fellow of Trinity in 1804. In 1813, after practicing for several years as a special pleader, he was called to the bar, at the Inner Temple, and, choosing the northern circuit, soon gained a large practice, hereby acquiring that familiarity with maritime law for which he was afterward noted as a judge. In 1820 he was chosen to assist the crown officers in the trial of Queen Caroline before the House of Lords, and in 1828, without any parliamentary or political interest, was appointed a puisne judge of the king's bench. On the death of Baron Taunton he was transferred to the exchequer, and made a member of the privy council, 1834. He retained his seat in the exchequer until, resigning in Dec., 1855, he was created a life peer, and called to the House of Lords by Lord Palmerston. This gave rise to the discussion as to his right to sit and vote in Parliament, which resulted in the rejection of the limited peerage scheme, and the grant to him of a new patent whereby he was made a hereditary peer with the title of Baron Wensleydale of Walton; but as he died childless, the title became extinct. He was one of the last judges to deliver written judgments systematically, many of his being valuable as legal treatises. D. at Amptill Park, Bedfordshire, Feb. 25, 1868. F. STURGES ALLEN.

Wentletrap [from Dutch *wenteltrap*; Germ. *wendeltreppe*, winding staircase, wentletrap; *wenden*, turn + *treppe*, stair, stairs]: any shell of the family *Scalariidae* of gastropod mollusca. The shells are white, with the whorls ornamented by transverse ribs. Some of the species are said to secrete a purple fluid. About 150 species are known, mostly from tropical seas, though several occur on the New England shores. A single specimen of the Chinese species (*Scalaria pretiosa*) has been sold for \$250, but now will bring not more than one or two dollars. J. S. K.

Wentworth, BENNING: Governor of New Hampshire; b. at Portsmouth, N. H., July 24, 1696; graduated at Harvard 1715; became a merchant; was frequently elected to the Assembly; was appointed a member of the council 1734; was royal Governor from 1741 to 1767; made grants of land in Southern Vermont, occasioning the famous conflict with New York concerning jurisdiction over the New Hampshire grants, and gave to Dartmouth College 500 acres of land, on which its buildings were erected. D. at Portsmouth, Oct. 14, 1770. The town of Bennington, Vt., was named in his honor.

Wentworth, CHARLES WATSON: See ROCKINGHAM, MARQUIS OF.

Wentworth, Sir JOHN, Bart., LL. D.: Governor of New Hampshire; nephew of Gov. Benning Wentworth; b. at Portsmouth, N. H., Aug. 9, 1737; graduated at Harvard 1755; went to England as agent of the province 1765; obtained through the Marquis of Rockingham the appointments of surveyor of the king's woods in America and that of Governor of New Hampshire, which he held in 1767-75; gave its charter to Dartmouth College; encouraged agriculture and promoted the settlement of the colony; went to England at the outbreak of the war of the Revolution (1775), and remained there until peace was declared. His property was confiscated; was Lieutenant-Governor of Nova Scotia 1792-1808, and was created a baronet 1795. D. at Halifax, N. S., Apr. 8, 1820.

Wentworth, THOMAS: See STRAFFORD, EARL OF.

Wenzel: See WENCESLAS.

Werdau, wär dow: one of the chief manufacturing towns in the kingdom of Saxony; a central station of the Saxon state railways; on the Pleisse, about 40 miles S. of Leipzig (see map of German Empire, ref. 4-G). It manufactures cloth, yarn, and wool, has important dyeing establishments and machine-shops, furnishing especially spinning-machines, and electric-light machines. Werdau was first mentioned as a town in 1304, and in 1398 it was purchased by the Margrave of Meissen. Pop. (1890) 16,253. H. S.

Werder, wärder, AUGUST, Count von: general; b. at Schlossberg, East Prussia, Sept. 12, 1808; entered the Prussian army in 1825; took part in the Russian campaigns in the Caucasus in 1842-43; became a member of the staff in 1846; was raised to the rank of lieutenant-general in 1866, and led the Third Division at Gitschin and Königgrätz in the campaign against Austria. In the war against France in 1870 he was a member of the staff of the crown

prince, but soon received the command of the Baden-Württemberg Army-corps, which he led at Wörth Aug. 6, 1870. He conducted the siege of Strassburg; was made a general of infantry after the capitulation of the fortress; and repulsed victoriously (Jan. 15-17, 1871) the attack of Bourbaki at Belfort, which success made him very popular in Southern Germany. His statue was raised at Freiburg. In 1875 he was invested with the insignia of the order of the Black Eagle. In 1879 he was retired from the army and created Count von Werder. D. at Schloss Grüssow, Pomerania, Sept. 12, 1887. See von Conrad, *Leben des Grafen August von Werder* (1889). Revised by F. M. COLBY.

Weregild, or Wergild: in old Teutonic law, a fine exacted of a murderer or perpetrator of other heinous crime against the person. In case of a murder the guilty party paid to the relatives of the deceased a certain sum varying with the rank of the victim, and thereby purchased immunity from their vengeance. Among the Anglo-Saxons the value of a man's life was fixed according to his rank, and the fines for murders ranged from 200s. for killing a churl (*ceorl*) to 7,200s. for killing the king.

Wergeland, v̄ar-ge-l̄and, HENRIK ARNOLD THAULOW: poet; b. at Christiansand, Norway, June 17, 1808; studied theology at the University of Christiania; received in 1836 an appointment at the library; became keeper of the archives of the state in 1840. D. Aug. 12, 1845. In 1830 he published *Skabelsen, Mennesket og Messias* (The Creation, Man, and the Messiah), a very long lyric poem, in which he gave expression to the religious and philosophical thoughts with which he was filled at that time. Besides many tragedies, vaudevilles, farces, etc., he wrote *Jøden* (The Jew); *Jan van Huysums Blomsterstykke* (Jan van Huysum's Flower-piece); and *Den Engelske Lods* (The English Pilot) (1845), the last being his most interesting poem. His influence on Norwegian literature and civilization can by no means be measured by the aesthetic worth of his works. (See NORWEGIAN LITERATURE.) A good selection of his works appeared in 1859 in 1 vol. His collected works (9 vols.) appeared at Christiania, 1852-57. See Lassen, *Henrik Wergeland og hans Samtid* (2d ed. Christiania, 1877).

Revised by D. K. DODGE.

Werner, v̄ar'ner, ABRAHAM GOTTLÖB: geologist; b. Sept. 25, 1750, at Wehrau, Upper Lusatia, where his father was director of smelting-works; studied at the mining-school of Freiberg and at the University of Leipzig, and was appointed Professor of Mineralogy in 1815 at Freiberg, Saxony, where he died June 30, 1817. His writings are not numerous, comprising only a few minor books, or pamphlets—*Ueber die äussern Kennzeichen der Fossilien* (Leipzig, 1774; translated into English by Weaver, Edinburgh, 1849); *Kurze Klassifikation und Beschreibung der Gebirgsarten* (Dresden, 1787); and *Neue Theorie über Entstehung der Gänge* (Freiberg, 1791; translated into English by Charles Anderson, Edinburgh, 1809). But by his lectures, to which students from all European countries gathered, he gained many disciples, and his theory, the so-called Neptunian, forms a most important chapter in the history of geology. In 1845 the Wernerian Society was founded in Edinburgh by one of his disciples, Robert Jameson.

Werner, FRIEDRICH LUDWIG ZACHARIAS: dramatist; b. at Königsberg, Germany, Nov. 18, 1768; studied law at the university there, and entered the Prussian civil service in 1793, holding office in Warsaw till 1805, then in Berlin. While in Warsaw he wrote in 1800 his first drama, *Söhne des Thals*, inspired by his enthusiasm for the Freemasons, and in 1804, the *Kreuz an der Ostsee*, to which Hoffmann composed the music. In Berlin he wrote *Martin Luther, oder die Weihe der Kraft*, and *Der 24ste Februar*. This last drama is known in the history of literature as one of the worst examples of the so-called *Schicksalstragödie* in which Fate is made the absolute ruler of human destiny—not the Mohammedan fate, which may fill the heart with fanatical enthusiasm, but a peculiar, mystic, and fantastic power, merely fit to strike the imagination with terror. The whole play is, like his other dramas, the outburst of an ill-regulated imagination, though its author was not without dramatic and poetic talent. It made a great sensation, and called forth scores of imitations. In 1807 Werner resigned his office in the Prussian service; traveled in Germany, Switzerland, and France; visited Goethe at Weimar and Madame de Staël at Coppet; went in 1809 to Rome; joined the Roman Catholic Church Apr. 19, 1811; was ordained a priest in 1814; preached in Vienna during the Congress,

and created a sensation by the peculiar blending, in his sermons, of coarseness and real power. He spent 1816-17 in Podolia in the house of Count Choloniowski, but in the latter year he returned to Vienna, where he continued to preach with great effect till his death Jan. 17, 1823. His *Sämmtliche Werke*, with a biography by Schütz, were published in 13 vols. (Grimma, 1839-41), and contain, besides the above dramas, the tragedies *Attila*, *Wanda*, *Königunde*, and *Die Mutter der Makkabäer* (1820), lyrical poems, hymns, sermons, etc. See Hitzig, *Lebensabriss Z. Werners* (Berlin, 1823); H. Düntzer, *Zwei Bekehrte* (Leipzig, 1873); I. Minor, *Die Schicksalstragödie* (1883). Revised by JULIUS GOEBEL.

Wernerius: See IRNERIUS.

Wernigerode, v̄ar-n̄e-ḡa-r̄o de: district-town of Prussian Saxony, and chief place of the county belonging to the Stolberg family; at the north base of the Hartz Mountains, about 12 miles S. W. of Halberstadt. It has manufactures of wooden wares, cigars, woolen and linen fabrics, bricks and tiles. The castle of the Counts of Stolberg, with a fine view over the Hartz, has a select library of 95,000 vols. Pop. (1890) 9,966.

Wershetz: See VERSECTZ.

Wesel, v̄ä-zel: fortified town of Rhenish Prussia; at the confluence of the Rhine and the navigable Lippe, 46 miles S. W. of Münster (see map of German Empire, ref. 4-C). It is a station of the Rhenish railway system; has considerable traffic by steamboats with Amsterdam; exports wood and fish, and manufactures metal goods, pianofortes, sugar, etc. A railway bridge and a bridge of boats cross the Rhine here, both of which are protected by Fort Blücher as the *tête-de-pont* on the left bank. Wesel was once a member of the Hansatic League, but lost its importance after the revolution of the Netherlands against Spain. A monument erected in 1835 commemorates the death of eleven officers of Maj. Schill who were shot by order of Napoleon in 1809 after their unsuccessful attack on Stralsund. Pop. (1890) 20,724, more than one-half Roman Catholics.

Weser, v̄ä-z'er: a river of Europe formed by the junction of the Fulda (which rises in the Rhöngebirge, on the frontiers of Prussia and Bavaria) and the Werra (which rises in the Thüringerwald), at Minden, Hanover, whence it flows northward, and enters the North Sea after a course of 250 miles. It is navigable for small craft to Minden, for vessels of considerable size to Bremen, but ships of the largest size ascend no farther than Bremerhaven, which is at its mouth, and was built for the accommodation of such vessels. This river is not of much consequence for traffic, though it communicates with the Elbe by a canal.

Wesley, CHARLES, M. A.: clergyman and poet; youngest son of the Rev. Samuel Wesley, rector of Epworth, Lincolnshire; b. at Epworth, Dec. 18, 1708, o. s. (Dec. 29, n. s.). In 1716 he was sent to Westminster School, under his elder brother, SAMUEL WESLEY (q. v.). In 1721 Charles was admitted king's scholar at St. Peter's College, Westminster; in 1726 entered Christ Church College, Oxford. While there he became so serious, devout, and zealous that the wits at Oxford called him and his godly companions "Methodists," a title which had been given derisively to rigidly religious persons a century before. When, with his brother John, he was about to embark for America with Oglethorpe in 1735 he was ordained deacon, and soon after presbyter. After preaching in Frederica, Ga., he returned to England, reaching there on Dec. 3, 1736. On Whitsunday, May 21, 1737, he experienced the "witness of adoption," by which he was raised to a higher plane in the divine life—an event commemorated in his immortal hymn, "O, for a thousand tongues to sing!" Being excluded from the churches of the Establishment because of his "Methodism," he began at once to co-operate with his brother in his great work of evangelization. He traveled extensively in England and Wales, and was very successful as a preacher. But he is chiefly renowned as "the poet of Methodism." He wrote more than 6,000 hymns on every religious theme, versifying large portions of the Scriptures, including most of the Psalms. His hymns constitute the staple of the Methodist hymnals. D. in London, Mar. 29, 1788. Charles Wesley married in 1749 Sarah Gwynne, of Wales, by whom he had eight children. His eldest son, CHARLES, b. Sept., 1757, inherited the musical genius of his parents, and in his third year learned from his mother to play on the harpsichord. A year later his father introduced him to Dr. Boyce, a leading musician in London, where his astonishing precocity in

music led to the proposal that he should be a chorister in the chapel royal, an offer his father declined. For half a century, till his death in 1834, he had no rival at the organ, unless it was his brother SAMUEL, b. Feb. 24, 1766, who at the age of three played "God save great George, our king!" Fischer's minnet, which he had caught from street organs. The best organists in London took pleasure in teaching the two brothers gratuitously, as they could learn anything and play the hardest music at sight. Samuel became the foremost composer and performer of his age. He composed a high mass for the chapel of Pope Pius VI., who thanked him in a Latin letter written to the apostolic vicar in London. D. in London, Oct. 11, 1837. One of his sons, SAMUEL SEBASTIAN WESLEY, Mus. Doc. (1810-76), became equally distinguished as a musician. He was organist of several cathedrals, director of the "Three Choirs Festivals," and composed much important music. See *Lives of Charles Wesley* by Jackson (1841-49) and Telford (1886), and Stevenson's *Memorials of the Wesley Family* (1876). The poetical works of Charles and John Wesley were edited in a series of 13 vols., by Dr. George Osborn (London, 1868-72).

Revised by J. F. HURST.

Wesley, JOHN, A. M.: founder of Methodism; son of the Rev. SAMUEL WESLEY (*q. v.*) and Susannah (*Annesley*) Wesley; b. at Epworth, Lincolnshire, England, June 17, 1703, o. s. (June 28, n. s.). When nearly six years of age he narrowly escaped burning to death in a fire which consumed the Epworth parsonage. He received his early training principally from his mother. At the age of eleven he was sent to the Charterhouse School, London, where he made great attainments; in 1720 was sent to Christ Church, Oxford. Here he acquired extraordinary proficiency in all kinds of learning, especially in the classics, logic, and theology. He was ordained deacon Sept. 19, 1725, and presbyter Sept. 22, 1728; obtained a fellowship in Lincoln College, Oxford, Mar. 17, 1726; during that year assisted his father at Epworth; was made Greek lecturer and moderator of the classics Nov. 7, 1726; took his M. A. degree in Feb., 1727, and in that year he became his father's curate at Epworth and Wroote, but as it was necessary for him to reside at Oxford, he resigned the curacy and returned to Oxford Nov., 1729. He then became the head of the society at Oxford composed of Charles Wesley, and others, who were derisively called "Methodists" because they were so methodical in their lives and strict in the performance of religious duties. In 1735 the two brothers accompanied Oglethorpe to Georgia—John to be a missionary to the Indians, and Charles to be secretary to the Governor and a clergyman in the colony. The way was not opened for the mission to the Indians; and as the colonists would not endure the rigid, ascetic discipline which the Wesleys wished to enforce (being then of the extreme High-Church party), they returned to England, Charles in 1736, and John in 1738; but the first Sunday-school established in America is said to be the one organized by John Wesley in Savannah. He was all the time a sincere and devout Christian, full of good works, but he had not a clear sense of pardon by the witness of the Spirit, as he subsequently had. He says: "In the evening (of May 24, 1738) I went very unwillingly to a society in Aldersgate Street (London), where one was reading Luther's preface to the Epistle to the Romans. About a quarter before nine, while he was describing the change which he works in the heart through faith in Christ, I felt my heart strangely warmed. I felt that I did trust in Christ, Christ alone, for salvation; and an assurance was given me that he had taken away my sins, even mine, and saved me from the law of sin and death." While he was seeking this experience—viz., May 1, 1738—he formed the first Methodist "society," in Fetter Lane, London. The following summer he visited Count Zinzendorf and the Moravians in Germany to study their discipline and to intensify his spiritual life. On his return from Germany, being excluded from the churches of the Establishment because of his "Methodism," he imitated Whitefield, preaching in the fields and in private houses, wherever occasion served. The foundation-stone of his first chapel was laid in Bristol May 12, 1739. An old foundry in Moorfields, London, was purchased, and opened for preaching Nov. 11, 1739. Wesley says: "In the latter end of the year 1739 eight or ten persons came to me in London and desired that I would spend some time with them in prayer, and advise them how to flee from the wrath to come; this was the rise of the *united society*." From that period to the close of his life he was incessantly engaged in preach-

ing, forming societies, governing them, providing them spiritual help. As their members increased rapidly in various parts of the kingdom, and as few clergymen would co-operate with him, while some repelled his followers from their churches, he was led to employ laymen to preach, though not to administer the sacraments. In 1742 Wesley instituted *class-meetings*—first at Bristol, where they were originated for the purpose of paying a debt on the chapel, but as they were found admirably adapted to maintain godly discipline and Christian fellowship, they became an important and permanent feature of Methodism. He held his first conference at the Foundry in London June 25, 1744, when there were present four clergymen, besides himself and his brother Charles, and four lay-preachers—ten in all. In Aug., 1744, he preached his last sermon before the University of Oxford. At the next conference (Aug. 1, 1745) only one clergyman besides himself and brother was present, the other seven being lay-preachers. The third conference was held at Bristol May 12, 1746. It was attended by John and Charles Wesley, John Hodges, and six lay-preachers. The work was then systematically arranged and divided into "circuits," and the call and qualifications of preachers were defined substantially as in the present Methodist Discipline. Twelve "assistants" were then recognized. Thus originated the Wesleyan system of itinerancy. In June, 1748, he opened Kingswood School, near Bristol, an institution designed for the education of preachers' sons and others. This was the nucleus of the system of literary and theological institutions which now obtains among the Methodists. At the twenty-seventh conference, held Aug. 7, 1770, "minutes" were adopted which led to a more formal and permanent separation from the Calvinistic Methodists, who were in connection with Whitefield and Lady Huntingdon. A sharp and prolonged controversy took place, in which the saintly Fletcher of Madeley came to the help of Wesley and defended his evangelical Arminianism against the fierce attacks of Toplady, Richard and Rowland Hill, and others. The Wesleyan Methodists have never since "leaned toward Calvinism." When he was fourscore years of age, he had "the Deed of Declaration" executed, Feb. 24, 1784, by which the government of the connection was assigned legally to the conference, consisting of 100 preachers and their successors forever. This fixed the *status* of British Wesleyan Methodism with regard to both doctrine and discipline. In 1766 two Irish local preachers, Philip Embury and Robert Strawbridge, began to preach in New York and Maryland; and at the conference in 1769, Wesley sent to America two traveling preachers, Richard Boardman and Joseph Pilmoor, to take charge of the societies they had formed. In 1770 he set down in the appointments, "No. 50, America." In 1771 he sent over Francis Asbury and Richard Wright, and in 1773 Thomas Rankin and George Shadford. As the work increased so rapidly in America, as the colonial Church of England, to which the Methodists generally had looked for the sacraments (their own preachers not being empowered to administer them), was virtually extinct, as the English bishops would not ordain ministers for America, and as Wesley had long before ceased "to be theologically or ecclesiastically a High Churchman," and had repudiated the theory of prelatical succession, recognizing the parity of bishops and presbyters as to order, being importuned by the American societies, he provided them with an ordained ministry. In 1784 he ordained Richard Whatecoat and Thomas Vasey as elders, or presbyters, and the Rev. Thomas Coke, a clergyman of the Church of England, as superintendent, or bishop. At a conference in Baltimore Dec., 1784, Bishop Coke, assisted by the Rev. Philip William Otterbein of the German Reformed Church and others, consecrated Francis Asbury bishop, and ordained others as elders, or presbyters, and deacons. Thus originated Methodist *episcopacy*. At first, Wesley, being intensely loyal, wrote against the American "rebellion," but when he saw the hand of God in it, he wrote a powerful letter to Lord North, imploring the Government to stop the war. When, therefore, the colonies had acquired their independence, Wesley was fully prepared to take this important step. Speaking of the American brethren, he said: "We judge it best that they should stand fast in that liberty wherewith God has so strangely made them free." He abridged and modified the liturgy, offices, ordinal, and Articles of the Church of England for the Methodist Episcopal Church in America, as, with some changes, they are used by that Church to this day. This was the crowning act of his life. He ordained a few ministers for special service in England and Scotland, and he would have ordained more of them,

but he wished to keep his connection, as far as possible, within the pale of the national establishment. But for this he would have organized his societies in Great Britain and Ireland into an Episcopal Church, like the Methodist Episcopal Church in America. Wesley's constant prayer was to lay down his body with his charge "and cease at once to work and live." His prayer was answered, for he labored on to the last. It has been well said of him: No man, perhaps, ever accomplished so much. He rode, chiefly on horseback, 5,000 miles, and preached 500 sermons every year for nearly fifty years; arranged and governed his societies, which numbered before his death some 80,000 members; carried on an immense correspondence; read every work of note as it came from the press; wrote commentaries on the Bible, grammars of the Hebrew, Greek, Latin, and French languages, works on logic and philosophy, controversial treatises, journals, sermons, etc., and abridged over 100 volumes for "A Christian Library." His generosity was limited only by his means. In later life, though he realized £20,000 by his writings, his personal expenses did not average £100 a year, and he left nothing at his death. His life was often in danger from the fury of mobs, and his sensitive spirit felt keenly the contempt of the higher classes, his equals, yet he could say, "None of these things move me." He lived in constant activity, cheerfulness, and trust in God. Like the rest of the Wesley family, he was fond of music and poetry. He published several volumes of tunes for the organ and voice, and quite a library of hymns and poems. He wrote elegant hymns himself, and is accredited with the admirable translations from the German, French, and Spanish found in his hymn-books. He was a keen and judicious critic, and many of the hymns of his brother Charles, Dr. Watts, Herbert, and others were greatly improved by his pruning and correction. He married in 1757, Mrs. Mary Vézelle, a woman of cultivation and apparent piety, but she proved a very vixen, who did all in her power to ruin him. He bore her treatment with marvelous forbearance till she finally robbed him of important papers and left him forever, whereupon he calmly said, *Non eam reliqui, non dimisi, non revocabo*. He died in London, Mar. 2, 1791, surrounded by some of his preachers and other friends, exclaiming, "The best of all is, God is with us." He was buried Mar. 9 at City Road chapel, where a marble tablet commemorates his life and labors. On Mar. 30, 1876, a marble tablet to the memory of John and Charles Wesley, showing their profiles, and also representing John Wesley preaching on his father's tomb at Epworth, where he was excluded from the church, was unveiled in Westminster Abbey by Dean Stanley in the presence of the president of the conference, Dr. Jobson, who designed the tablet, and others. See the *Lives* by Hampson, Whitehead, Southey (1820; new ed. 1889); Tyerman (1870; new ed. 1876); Rigg (1875); Watson, with notes by Summers, Telford (1886), Overton (1891); Isaac Taylor's *Wesley and Methodism*; *Journal of John Wesley*, in his *Works*, 7 vols. See METHODISM.

Wesley, SAMUEL, St.: divine; grandson of Bartholomew Wesley, or Westley; b. at Winterborn-Whitechurch, Dorset, 1662; educated at Exeter College, Oxford (B. A., 1688); soon afterward he married Susannah, daughter of Dr. Samuel Annesley, "the St. Paul of the Nonconformists." In 1692 he was appointed to the parish of South Ormsby, in Lincolnshire, where he also acted as domestic chaplain to the Marquis of Normandy, who desired him to be raised to an Irish episcopate, but William and Mary and Archbishop Tillotson disapproved. Having dedicated his *Life of Christ* to Queen Mary, she presented him with the living of Epworth in Lincolnshire, of which he was rector thirty-nine years, and where he died Apr. 22, 1735. He was the father of nineteen children, had to assist poor relatives, met with many reverses, and never had more than £200 a year for his salary. He is frequently described as a Tory and a High Churchman, but he was no Jacobite or bigot. He was the eulogist of William and Mary and Tillotson, who headed the Low-Church party. He was a prolific author. His great works were *The Life of Christ, an Heroic Poem*; *Dissertations on the Book of Job*, in Latin; and *Euclid's Hymn to the Creator*. As an author he is best known by his two hymns, found in Methodist hymnals, "Behold the Saviour of mankind," and "O Thou who when I did complain." See *Life and Times of the Rev. Samuel Wesley*, by Tyerman; A. Clarke's *Wesley Family*; and the various *Lives* of John and Charles Wesley.

Revised by ALBERT OSBORN.

Wesley, SAMUEL, JR., A. M.: eldest son of the Rev. Samuel Wesley and brother of John and Charles Wesley; b. in London, Feb. 10, 1690. In 1704 he was sent to Westminster School, where he was admitted in 1707. In 1711 he went to Christ Church, Oxford. After taking his A. M. degree he became usher in his old school at Westminster, and by the advice of his friend Bishop Atterbury entered into holy orders. In 1732 he became head master of Blundell's free grammar school at Tiverton, where he remained till his death Nov. 6, 1739. He was one of the founders of the first infirmary set up at Westminster, now St. George's Hospital. He belonged to the old High Church school, and did not co-operate with his Methodist brothers. He began writing charity hymns when he was about twenty years of age. The first edition of his poems was published in quarto in 1736; a second, with additions, was published in 1743, and an edition was published, with a *Life* of the author, by William Nichols, in 1862. He is best known by his hymns in the Methodist hymn-book, and a poem on the death of a young lady, "The morning flowers display their sweets."

Wesleyans and Wesleyans, Primitive: See METHODISM.

Wesleyan University: the oldest college under the control of the Methodist Episcopal Church; located at Middletown, Conn. In 1829 a joint committee, appointed by the New York and New England conferences, issued proposals inviting the towns within a specified region to compete for the location of the proposed college by the offer of subscriptions. In response to these proposals two large stone buildings in the city of Middletown, erected five years before for the American Literary, Scientific, and Military Academy, but recently vacated by the removal of that institution to Norwich, Vt., were offered to this committee as a gift, on the condition that an endowment fund of \$40,000 should be raised for the college. This offer, accompanied by a subscription of \$18,000 from the citizens of Middletown, was at once accepted; the remainder of the \$40,000 was raised, and the college organized and chartered under the name of the Wesleyan University. Its first class, numbering 6, was graduated in 1833. In the year 1895 the faculty comprised 32 professors and instructors; the students numbered 288. In 1872 the curriculum was revised and expanded by the introduction of a considerable number of elective studies; indeed, Wesleyan University was one of the first of New England colleges to adopt what may be called the modern college curriculum. The college now offers three courses of study of four years each. In 1872 the doors of the college were opened to women. Within the decade 1868-78 the material interests of the college were greatly advanced, three elegant buildings being erected—a library, the gift of Isaac Rich, Esq.; the memorial chapel, which commemorates the eighteen alumni and students who fell in the civil war; and the Orange Judd hall of natural science, the gift of him whose name it bears. In 1894 a large modern gymnasium was erected. The total value of the buildings, grounds, and collections of the college, as given in the report of the treasurer made in 1894, was \$650,000. The whole amount of its productive property in 1894 was about \$1,126,000. The library numbers about 43,000 volumes; the observatory contains a 12-inch refracting telescope by Alvan Clark & Sons; well-appointed laboratories, with chemical and physical apparatus and cabinets, illustrating the departments of geology and natural history, furnish the undergraduate with facilities for the study of physical science. The presidents of the college have been Wilbur Fisk, D. D., 1831-39; Stephen Olin, D. D., LL. D., 1839-41; Nathan Bangs, D. D., 1841-42; Stephen Olin, D. D., LL. D., second term, 1842-51; Augustus William Smith, LL. D., 1851-57; Joseph Cummings, D. D., LL. D., 1857-75; Cyrus D. Foss, D. D., 1875-80; John W. Beach, D. D., LL. D., 1880-87; John M. Van Vleck, LL. D. (acting), 1887-89; and Bradford P. Raymond, D. D., 1889. C. T. WINCHESTER.

Wessel, JOHAN HERMAN: poet; b. in the parish of Vestby, Norway, Oct. 6, 1742. In 1761 he entered the University of Copenhagen, but relinquished his academic studies the following year. The rest of his life he spent at the Danish capital, supporting himself by giving private lessons in the modern languages and leading a purposeless existence. As a result partly of his poverty, partly of delicate health, he early lost his naturally cheerful temperament and sank into a deep melancholy. In 1772 he published anonymously his burlesque tragedy *Kjerlighed uden Strømper* (Love without Stockings), the most original Danish drama since Holberg.

While intended primarily to ridicule the prevailing taste for the artificial French tragedy, which had shortly before been imitated in Nordal Brun's *Zarine*, Wessel's work survived the occasion that gave it special point, as it is also a satire on national affectation in general. His later works, though often displaying keen wit, and occasionally real pathos, are of comparatively slight importance. Neglected by the French-infected court and conscious of the failure of his life, Wessel died at Copenhagen, Dec. 29, 1785. His collected works, edited by J. Levin, appeared in 1862.

D. K. DODGE.

Wessel, ves'sel, JOHANN, also called **Gansfort** (the name of a village from which his family probably came): philosopher; b. at Gröningen, Holland, about 1420; was educated in the school at Deventer, then under the leadership of the celebrated Gerhard Groot, and enjoyed the friendship of Thomas à Kempis, who was sub-prior of the neighboring monastery of Mt. St. Agnes at Zwolle; went to Cologne, where he learned Greek and Hebrew, the Thomist theology, and studied Plato and Augustine; resided for many years at Paris, where he took part with great energy in the controversy between nominalism and realism, on the nominalistic side; became renowned as a teacher, and had among his pupils Reuchlin and Agricola, then taught at Basel, and stayed for some time at Heidelberg, teaching philosophy, but turned more and more decidedly away from the whole scholastic method based on Aristotle, and began to be suspected of holding heretical views; retired finally to his native city, and died there Oct. 4, 1489. According to Ullmann, he was pre-eminently the *theological* forerunner of the Reformation. Personally, he escaped persecutions, but his writings, by which he belongs to the Reformers before the Reformation, were partly burned by the monks. The remaining works were first published by Luther in 1522 under the title *Farrago Rerum Theologicarum*; afterward by Johann Lydius (at Gröningen, 1617). His *Life* has been written by B. Bähring (Leipzig, 1846), and by J. Friedrich (Regensburg, 1862). See also C. Ullmann's *Reformatoren vor der Reformation*, 2d vol. (1842; English translation 1855).

Wesseling, ves'sel-ing, PETER: classical scholar; b. at Steinfurt, Westphalia, Jan. 7, 1692; studied at the Universities of Leyden and Franeker; appointed Professor of Eloquence at Franeker in 1723, at Utrecht in 1735; editor of *Diodorus* (2 vols. folio, 1746), and of *Herodotus* (together with Valekenær, 1763). He died at Utrecht, Nov. 9, 1764. See L. G. Boot, *De vita et scriptis Wesselingii* (1874); Ruhnen, *Elogium Hemsterhusii*, p. 30. ALFRED GUDEMAN.

Wessex: a kingdom founded by the West Saxons in the southern part of the island of Britain early in the sixth century and forming a part of the so-called HEPTARCHY (*q. v.*). About 495 two Saxon chieftains, Uerdic and Cynric, led a band of colonists to the coast of what is now Hampshire, and founded there a settlement which in the course of the next twenty-five years became important enough to give its rulers the title of kings. Its dominion was extended westward, and included many of the native Britons as subjects. To the N., however, lay the powerful kingdom of Mercia, which checked the advance of the West Saxons in that direction, seized their possessions N. of the Thames, and at one time threatened them with the permanent loss of their independence; but with the decline of Mercia Wessex stood forth as the leading state in England. Its king, Egbert (800-836), established the West Saxon supremacy, and after him the kingship of Wessex carried with it the rule of all England.
F. M. COLBY.

Wesson: town (founded in 1866 by J. M. Wesson): Copiah co., Miss.; on the Illinois Cent. Railroad; 46 miles S. of Jackson, the State capital, 135 miles N. of New Orleans (for location, see map of Mississippi, ref. 8-F). It is a summer resort of citizens of New Orleans; is in an agricultural region; and has six churches, large high-school building, a State bank with capital of \$30,000, a weekly newspaper, and a manufactory of cotton and woolen goods, having 1,400 operatives and a monthly pay-roll of \$25,000. Pop. (1880) 1,707; (1890) 3,168; (1895) estimated, 4,000.

EDITOR OF "MIRROR."

West, ANDREW FLEMING, Ph. D.: educator and author; b. at Allegheny, Pa., May 17, 1853; educated at Princeton College; classical fellow at Princeton 1874; classical teacher in Hughes High School, Cincinnati, O., 1875-81; principal of Morris Academy, Morristown, N. J., 1881-83; since 1883

Professor of Latin in Princeton College. He has published an edition of *The Andria and Hewton Timorumenos of Terence* (New York, 1888); *The Philobiblion of Richard de Bury* (Groslier Club, New York, 1889); and *Aleuin, and the Rise of the Christian Schools* (New York, 1894). C. K. H.

West, BENJAMIN: painter; b. at Springfield, Chester co., Pa., Oct. 10, 1738. When a child he showed great disposition for art, and although his parents were Quakers, he was allowed to follow his inclinations. One of his relations took him to Philadelphia, where he received some instruction from William Williams, an artist; then removed to Lancaster, Pa., where he attempted portraiture, and painted a *Death of Socrates*. At the age of eighteen he established himself as a portrait-painter in Philadelphia, but in 1758 removed to New York, and in 1760, through the liberality of merchants in New York and Philadelphia, he went to Rome, where he became known to Mengs and other painters of the time. He painted several pictures there, including a *Cimon and Iphigenia* and an *Angelica and Medora*. He went to England in 1763 and established himself in London, by the advice of Reynolds and Wilson. He painted several pictures for the Archbishop of York, and this brought him to the notice of George III., who made West his historical painter and gave him commissions that occupied the artist from 1769 to 1801. Among the works executed for the king were twenty-eight illustrating the progress of revealed religion, many portraits of members of the royal family, and a *Death of Wolfe*, in which the figures are clothed in the costume of the period, contrary to the practice of the classical school then dominant. In 1768 he aided in founding the Royal Academy of painting, sculpture, and architecture, and in 1792 succeeded Sir Joshua Reynolds as president of this institution. He retained this office almost uninterruptedly for twenty-three years. In 1802 he painted a picture of *Christ healing the Sick in the Temple*, a copy of which is in the Pennsylvania Hospital in Philadelphia. West died in London, Mar. 11, 1820, and was buried in St. Paul's Cathedral. Among his works owned in the U. S. are *Death on the Pale Horse*, in the Pennsylvania Academy, Philadelphia; *Penn's Treaty with the Indians*, in Independence Hall, Philadelphia; and *King Lear*, in the Boston Museum of Fine Arts. A full-length portrait of West, by Sir Thomas Laurence, is in the Wadsworth Gallery, Hartford, Conn. See Galt, *The Life, Studies, and Works of Benjamin West, P. R. A.* (London, 1820); Dunlap, *History of the Rise and Progress of the Arts of Design in the United States* (1834); Tuckerman, *Book of the Artists* (New York, 1867).
W. J. S.

West, STEPHEN, D. D.: clergyman and author; b. at Tolland, Conn., Nov. 13, 1735; graduated at Yale College 1755; studied theology while teaching school at Hatfield, Mass.; became chaplain of Hoosick Fort 1757; succeeded Jonathan Edwards as missionary to the Stockbridge, Mass., Indians 1758; was pastor of the Congregational church at Stockbridge 1759-1818, having resigned the charge of the Indian mission 1770, at which date he adopted the Hopkinsian theological opinions, having previously been an Arminian; was one of the original trustees of Williams College. He was the author of *An Essay on Moral Agency; Remarks on Edwards's Enquiry on Freedom of the Will* (New Haven, 1772; enlarged 1794); *The Duty and Obligation of Christians to Marry only in the Lord* (1773); *An Essay on the Scripture Doctrine of the Atonement* (1785); *An Inquiry into the Ground and Import of Infant Baptism* (1794); *The Life of Rev. Samuel Hopkins, D. D.* (1805); and *The Evidences of the Divinity of Christ* (1816). D. at Stockbridge, May 15, 1819.
Revised by S. M. JACKSON.

West Bend: city; capital of Washington co., Wis.; on the Milwaukee river, and the Chi. and N. W. Railway; 20 miles W. of Ozaukee, 34 miles N. of Milwaukee (for location, see map of Wisconsin, ref. 6-F). It is in an agricultural and dairying region, and has excellent water-power. There are 6 churches, a public and 2 parochial schools, a private bank, 3 weekly newspapers, foundry and machine-shops, grain elevators, grist-mill, brewery and malt-houses, and harness, pocket-book, and hub and spoke factories. Pop. (1880) 1,273; (1890) 1,296; (1895) 1,766.

EDITOR OF "DEMOCRAT."

Westboro: town (incorporated in 1717); Worcester co., Mass.; on the Boston and Albany Railroad; 12 miles E. of Worcester, 32 miles W. by S. of Boston (for location, see map of Massachusetts, ref. 3-F). It has 5 churches, high school, 10 common schools, public library, a State Hospital for the Insane, the Lyman Reform School for boys, a na-

tional bank with capital of \$100,000, a savings-bank, 2 hotels, a weekly newspaper, and manufactures of boots and shoes, straw hats, bicycles, bicycle sundries, iron bedsteads, and sleighs. In 1894 it had an assessed valuation of nearly \$3,000,000. Pop. (1880) 5,214; (1890) 5,195; (1895) 5,235.
EDITOR OF "CHRONOTYPE."

West Boylston: town (incorporated in 1808); Worcester co., Mass.; on the Boston and Maine Railway; 8 miles N. of Worcester, 40 miles W. of Boston (for location, see map of Massachusetts, ref. 3-G). It contains the villages of West Boylston, Oakdale, Valley, Central, Old Common, West Boylston Station, Lower Factory, and Harrisville; has 4 churches, high school, 15 district schools, public library, and 2 hotels; and is principally engaged in dairying and in the manufacture of cotton goods, boots and shoes, and church organs. In 1894 it had an assessed valuation of about \$1,250,000. Pop. (1880) 2,394; (1890) 3,019; (1895) 2,968.

West Branch: village; Ogemaw co., Mich.; on the Mich. Cent. Railroad; 60 miles N. of Saginaw (for location, see map of Michigan, ref. 5-J). It is in a lumbering region, and has 2 private banks and 2 weekly newspapers. Pop. (1880) 139; (1890) 1,302; (1894) 1,223.

West Bridgewater: town (incorporated in 1822); Plymouth co., Mass.; on the N. Y., N. H. and Hart. Railway; 3 miles N. W. of Bridgewater, 25 miles S. of Boston (for location, see map of Massachusetts, ref. 4-I). It contains the villages of West Bridgewater, Cochesett, Matfield, Westdale, and Jerusalem; has 2 churches, high school, 9 district schools, public library, and the Howard Seminary; and is principally engaged in the manufacture of boots, shoes, and machinery. In 1894 it had an assessed valuation of nearly \$1,000,000. Pop. (1880) 1,665; (1890) 1,917; (1895) 1,747.

West Bromwich: town of England, in Staffordshire; 5½ miles N. W. of Birmingham, in the center of a rich coal and iron district (see map of England, ref. 10-G). It has large manufactures of glass, gas, and iron goods, firearms, swords, cutlery, and agricultural implements. The borough returns one member to Parliament. Pop. (1891) 59,489.

Westbrook: city; Cumberland co., Me.; on the Presumpscot river, and branches of the Boston and Maine and the Maine Cent. railways; 6 miles N. W. of Portland (for location, see map of Maine, ref. 10-B). The river is capable of developing 9,000 horse-power, and more than half of this amount is utilized in the manufacture of paper, dress silk, gingham, cotton warp, hosiery, seamless bags, and other articles. The Stroudwater, which flows through the city, is capable of developing additional power. The city is connected with Portland by electric railway, and has 8 churches, full system of public schools, a parochial school, the Walker Memorial Library, a trust company with capital of \$50,000, and a weekly newspaper. In 1894-95 the receipts and expenditures were \$168,746, and the bonded debt was \$127,400. Pop. (1880) 3,981; (1890) 6,632.
EDITOR OF "CHRONICLE."

West Brookfield: town (incorporated in 1848); Worcester co., Mass.; on the Boston and Albany Railroad; 29 miles E. N. E. of Springfield, 69 miles W. by S. of Boston (for location, see map of Massachusetts, ref. 3-F). It is drained by the Chicopee and Ware rivers; contains 2 churches, 9 district schools, and a public library; and is principally engaged in the manufacture of shoes and corsets. Pop. (1880) 1,917; (1890) 1,592; (1895) 1,467.

Westbury, RICHARD BETHELL, Baron; statesman and judge; b. at Bradford, Wiltshire, England, June 30, 1800; graduated at Oxford 1818; became a fellow of Wadham College, studied law, and was admitted (1833) to the bar at the Middle Temple; became distinguished as an equity lawyer; was returned to Parliament in 1832; was made queen's counsel 1840; knighted and appointed Solicitor-General Dec., 1852; carried through the House of Lords the Succession Duty Bill, the Oxford University Reform Bill, the bill for the abolition of ecclesiastical courts, and other important measures; was Attorney-General under Lord Palmerston Nov., 1856, to Feb., 1858; carried, against great opposition, measures for the abolition of the ecclesiastical testamentary courts and for the establishment of the divorce and probate courts, the judgeship of which latter was offered to him, but declined; was a second time Attorney-General, from June, 1859, to June, 1861, when he was raised to the peerage, and became Lord Chancellor under the title of Baron Westbury; assisted in carrying important measures of law reform relating to bankruptcy, landed estates, and

professional education; resigned the great seal July 4, 1865. He did much by his decisions as chancellor to mould the development of English equity jurisprudence, and especially in patent law, joint-stock company law, and ecclesiastical appeals. D. July 20, 1873. He left no printed works of any note, except his decisions. F. STURGES ALLEN.

West Chester: borough; capital of Chester co., Pa.; on the Penn., and the Phila., Wilm. and Balt. railways; 16 miles N. of Wilmington, Del., and 27 miles W. of Philadelphia (for location, see map of Pennsylvania, ref. 6-1). It is in an agricultural and mineral region, and contains a State Normal School (building cost \$400,000), the Chester County Hospital, the county prison, 3 national banks with combined capital of \$525,000, 6 private banks, and a savings-bank. There are 2 Friends' meeting-houses, and a Roman Catholic, 3 Methodist Episcopal, 2 Baptist, and 2 Protestant Episcopal churches, 4 public-school buildings, 2 Friends' schools, a parochial and many private schools, a public library, law library, 2 theaters, and a monthly, 2 daily, and 5 weekly periodicals. Marshall Square contains a unique arboretum, a soldiers' monument, and one of the three handsome fountains which adorn the borough. The industrial establishments include a creamery, cold-storage and ice plants, printery, steam laundry, and manufactures of stockings, separators, carriages, spokes and wheels, umbrella tags, and sash and doors. The borough had an assessed valuation in 1895 of over \$6,300,000. Chester County was divided in 1786, when Turk's Head became West Chester, the county-seat of the remaining part of Chester County, and the new county of Delaware retained the old county-seat of Chester. Pop. (1880) 7,046; (1890) 8,028; (1895) estimated, 10,000.

DANIEL W. HOWARD.

Westcott, BROOKE Foss, D. D.; bishop and author; b. near Birmingham, England, Jan. 12, 1825; fellow of Trinity College, Cambridge, where he graduated 1848 with honors both in classics and mathematics; took orders in the Church of England 1851; was assistant master of Harrow School 1852-69; became preacher to the University of Cambridge 1859; examining chaplain to the Bishop of Peterborough 1868, canon of Peterborough Cathedral 1869, Regius Professor of Divinity at Cambridge Nov. 1, 1870, and honorary chaplain to the Queen Apr., 1875. Bishop of Durham 1890. He is the author of *Elements of the Gospel Harmony* (1851), being the Norrisian prize essay for the previous year; *A History of the Canon of the New Testament during the first Four Centuries* (1855; 5th ed. 1881); *Characteristics of the Gospel Miracles*, being sermons preached before the University of Cambridge (1859); *An Introduction to the Study of the Gospels, with Historical and Explanatory Notes* (1860; 6th ed. 1882); *The Bible in the Church, a Popular Account of the Collection and Reception of the Holy Scriptures in the Christian Churches* (1864; 9th ed. 1885); *The Gospel of the Resurrection, Thoughts on its Relation to Reason and History* (1866; 5th ed. 1884); *A General View of the History of the English Bible* (1868; 2d ed. 1879); commentaries on John's Gospel (Speaker's Commentary), John's Epistles (1883; 2d ed. 1886), and Hebrews (1889); and several volumes of sermons and minor works. With Dr. Hort he edited the monumental edition of the Greek New Testament from the oldest authorities (2 vols., 1881).

Revised by S. M. JACKSON.

West Duluth: village; St. Louis co., Minn.; on St. Louis Bay, and the St. P. and Duluth and the Duluth Transfer railways; 4 miles S. W. of Duluth (for location, see map of Minnesota, ref. 6-G). It has a State bank with capital of \$50,000, a weekly newspaper, and a number of factories. Pop. (1890) 3,368.

Westerly: town; Washington co., R. I.; on the Pawcatuck river, and the N. Y., N. H. and Hart. Railroad; 5 miles N. of Long Island Sound (for location, see map of Rhode Island, ref. 11-L). It contains the villages of Westerly, White Rock, Potter Hill, Niantic, and Avondale, each having a post-office, and the summer resorts of Watch Hill and Noyes's Beach. The town was originally known by the Indian name Misquamicut; was incorporated May 14, 1669, as the fourth town in the colony and under its present name; and had its name changed to Haversham in 1686 and again to Westerly in 1689. The principal industries are granite-quarrying, for which the town is widely noted, and the manufacture of cotton and woolen goods. Pop. (1880) 6,104; (1890) 6,813; (1895) State census, 7,636.

WESTERLY.—Principal village in town of the same name; situated 5 miles from the mouth of the Pawcatuck river, which

here divides the States of Rhode Island and Connecticut; 44 miles S. W. of Providence. It has water-works, gas, electric-light, and electric street-railway plants, 10 churches, public library in Soldiers' Memorial building, 4 hotels, 4 national banks, 4 savings-banks, cotton, woolen, thread, silk, and planing mills, machine-shop, printing-press factory, numerous granite quarries, a weekly and 2 daily newspapers, and is a distributing point for S. Rhode Island and E. Connecticut.

GEORGE H. UTTER, EDITOR OF "DAILY SUN."

Westermann, ANTON: classical scholar; b. in Leipzig, Germany, June 18, 1806; studied at the university; privat doцент 1830, professor extraordinary 1833, ordinary 1834; resigned 1865. D. in Leipzig, Nov. 24, 1869. He was a learned and prolific writer. His chief works are *Geschichte der Beredsamkeit in Griechenland und Rom* (2 vols., 1835); *Paradorographi* (1839); *Mythographi* (1843); *Biographi Graeci* (1845); edited Pseudo Plutarch's *17th X Oratorum*; Stephans Byzantius; Heraciti *Epistole*; *Lysias*; selected *Orations* of Demosthenes (often re-edited). He also wrote *Questiones Demosthenicae* (4 pts., 1837); *Untersuchungen über die in die attischen Reden eingelegten Urkunden* (1850); *Index Graecitatis Hyperidae* (1864); re-edited Vossius's *De historicis Graecis*; and translated Leake, *The Demes of Attica*. See Bursian, *Geschichte der klassischen Philologie in Deutschland*, pp. 890-894.

ALFRED GUDEMAN.

Western Australia: the westernmost of the seven Australasian colonies, the first in area and last in population; comprising the whole of Australia W. of the meridian of 129° E., which separates it from South Australia; area estimated at 975,876 sq. miles, or about one-third of the Australian continent. A large proportion of this area is in heavy timber—sandalwood; the jarrah, the karri, the tuart, and other species of Eucalyptus. The coasts are estimated at 3,000 miles in length, but good harbors are few. The habitable part of the colony is confined to the coast, along which the settled portion stretches for 1,200 miles and from which it extends inland for about 150 miles. The climate is salubrious and enjoyable, the average temperature at the capital being 64° F. and the rainfall 34 inches. The extreme northern part of the colony, called the Kimberley district, is of tropical character; is rich in minerals; and the interior appears less arid. The rivers of the entire colony are short, and not suitable for navigation. Agriculture is at present possible over only a small fraction of the colony, owing chiefly to lack of labor. In 1895 only 331 sq. miles were under cultivation, or about one part in 2,948. The live stock in 1895 consisted of 58,506 horses, 200,091 horned cattle, and 2,229,832 sheep. It is estimated that in the north there are 20,000,000 acres of fairly watered pasture-land affording good grazing. Gold is worked in the north and in the southwest, and is found in many other parts of the colony. The export of gold in 1893 amounted to 110,890 oz., valued at £421,385, and the production has greatly increased of late years. There are also mines of silver, copper, lead, and tin, and the prospective mineral wealth is very great. The chief export is wool; then come gold, pearls and pearl-shell, timber and sandalwood, and skins. The total value of the exports in 1893 was £918,147, and of the imports £1,494,438. There were 1,184 miles of railway open for traffic at the end of 1894, and a scheme is on foot to connect this colony with South Australia by rail, as it has already been connected by telegraph. There are 3,578 miles of telegraph line, with 4,303 miles of wire. The legislative power rests in an elective parliament of two houses, and the executive in a governor appointed by the British crown and assisted by a responsible ministry. It became a self-governing colony in 1890, and both houses became fully elective in 1893. The entire population in 1891 was 49,782—29,807 males and 19,975 females. These figures do not include the aborigines, whose total number can not be estimated with any approach to accuracy. There were 5,670 of them employed as servants in 1891. At the end of 1893 the population was estimated at 65,064, of whom 12,424 were in Perth, the capital, and 8,000 at Fremantle, its port. See Hart, *Western Australia in 1893* (1894); Mennell, *The Coming Colony* (1894).

MARK W. HARRINGTON.

Western College: an institution under the control of the United Brethren in Christ; founded in 1856. It was located in Western, Linn co., Ia., and was removed to Toledo, Tama co., Ia., in 1881. It is supported by six co-operating conferences. These are in Iowa, Wisconsin, Minnesota, Illinois, and Colorado. The main college is 150 by 80 feet, three stories high, with a basement. It contains recitation-rooms,

society-rooms, lecture-room, library, and laboratories. The college has two boarding-halls and the Bright memorial conservatory building. The faculty, headed by L. Bookwalter, A. M., D. D., as president, consists of six professors, assisted by resident lecturers, tutors, and instructors. There are six courses of study, with subordinate departments of music, business, elocution, and art. Both sexes are admitted on equal terms. In 1893 there were 15 instructors, 410 students, and 5,000 volumes in the library.

L. BOOKWALTER.

Western Dwina: See DWINA.

Western Empire: a name sometimes applied to the western provinces of the Roman empire between the years 395 and 476. The term is misleading, for, while in this period there were two emperors, one of whom resided in Italy and had direct control over the western provinces, the empire remained in theory one, and the acts of each emperor were binding through the whole empire.

C. H. H.

Western Islands: See AZORES.

Western Reserve University: an institution founded in Cleveland, O., in 1884. This step was taken by the trustees of Adelbert College, and most of the trustees of the college are also trustees of the university. The object of the organization was to effect a confederation of several institutions either already existing or to be erected, under one general management and control. The university now embraces the following departments:

1. Adelbert College, the academical department, under its old charter, but operated in unison with the methods and aims of the university. See ADELBERT COLLEGE.

2. The college for women, organized in 1888 by the university, and in full operation, with thirteen professors and instructors, and a course of study on the same grade as that of Adelbert. It has \$172,000 endowment, and grounds and buildings worth \$120,000 more.

3. The college of medicine, formerly known as the Cleveland Medical College, organized in 1844 as the medical department of Western Reserve College, and transferred to the university in 1884. It has twenty-four professors and instructors, a four-years' graded course; occupies a building erected for it by John L. Woods, at a cost of about \$250,000. It has also a permanent fund amounting to \$150,000, and operates a dispensary with \$50,000 endowment.

4. The college of dentistry, established in 1892. This has nine professors and instructors, and a constantly growing body of students.

5. The college of law, opened in 1892. It has ten professors and instructors, with the support and co-operation of the Cleveland bar.

6. The graduate department, opened in 1892. Under the direction of the faculties of Adelbert College and the college for women.

7. The Western Reserve Academy, at Hudson, O., preparatory and classical school, belonging to Adelbert College.

All these departments have courses of study leading to degrees. The whole number of students in 1894-95 was 535. The president of the university is Rev. Charles F. Thwing, D. D., LL. D. E. BUSINELL, SECRETARY AND TREASURER.

Westerville: village (platted in 1854); Franklin co., O.; on the Alum creek, and the Cleve., Akron and Col. Railway; 12 miles N. of Columbus, with which it is connected by electric railway (for location, see map of Ohio, ref. 5-E). It is in an agricultural region; has 6 churches, several public schools, a private bank, and a weekly and 2 monthly periodicals; and contains saw, planing, and flour mills, large broom-factories, brick and tile works, and manufactories of wagons and stump-pullers. Westerville is the seat of Otterbein University (United Brethren, opened in 1847), which in 1894 had 18 instructors, 274 students, and 6,000 volumes in its library. Pop. (1880) 1,148; (1890) 1,329; (1895) estimated with suburbs, 1,800. PUBLISHERS OF "PUBLIC OPINION."

West Farnham, or Farnham: an important railway center on the Canadian Pacific and Central Vermont railways; near the junction of the two main branches of the Yamaska river, Canada; about 39 miles from Montreal (see map of Quebec, ref. 6-B). The water-power is excellent though not fully utilized. The place has a fine railway station, a model school, Church of England and Methodist churches, and a Roman Catholic church with a convent and college. An iron bridge spans the river. There is an extensive building for the manufacture of beet-root sugar. The local trade is kept active by the export of agricultural products and the railway machine-shops. Pop. (1891) 2,822. J. M. HARPER.

Westfield: town (old Indian name, Woronoco); Hampden co., Mass.; on the Westfield river, and the Boston and Albany and the N. Y., N. H. and Hart. railways; 9 miles W. of Springfield, 108 miles W. by S. of Boston (for location, see map of Massachusetts, ref. 3-1). It lies in a picturesque valley, is laid out with broad streets and avenues, and has a large public park, Woronoco, possessing many natural advantages. There are 8 churches, one of the largest public high-school buildings in the State, a State normal school (building cost \$150,000), several district schools, kindergarten and primary schools connected with the normal school, and public library of over 15,000 volumes, 2 national banks with combined capital of \$400,000, 2 savings-banks with combined deposits of over \$2,250,000, and 3 weekly newspapers. The public-school system costs \$40,000 annually. The town has an excellent water-supply, obtained from Montgomery Mountain, 7 miles distant. The plant was completed in 1874 at a cost of nearly \$250,000. It also has an extensive sewerage system. Westfield is noted as a manufacturing place, particularly of whips. Other important manufactures are organs, steam-heaters, cigars, paper, thread, and brick. In 1894 the town receipts were \$278,737; expenditures, \$227,349; net debt, \$289,200; and assessed valuation, nearly \$8,000,000. Pop. (1880) 7,587; (1890) 9,805; (1895) 10,663. M. L. CLARK.

Westfield: village; Union co., N. J.; on the Cent. Railroad of N. J.; 7 miles W. of Elizabeth, the county-seat, and 19 miles S. W. of New York (for location, see map of New Jersey, ref. 3-D). It is attractively laid out on an elevated site as a residential place, and has a Netherwood water system, electric lights, and macadamized roads. There are Baptist, Congregational, Methodist Episcopal, Presbyterian, Protestant Episcopal, and Roman Catholic churches, 2 public and 2 private schools, a national bank with capital of \$50,000, a building and loan association, an athletic clubhouse, and 2 weekly papers. Pop. (1880) 2,216; (1890) 2,739; (1895) 3,713. EDITOR OF "UNION COUNTY STANDARD."

Westfield: village (incorporated in 1833); Chautauque co., N. Y.; on the Chautauque creek, and the Lake Shore and Mich. S. and the N. Y., Chi. and St. L. railways; 17 miles S. W. of Dunkirk, 59 miles W. of Buffalo (for location, see map of New York, ref. 6-B). It has 6 churches, a union school and academy with two endowed scholarships, gravity water system and electric-light plant (both owned by the village), public library founded by Hannah Patterson with \$100,000, railway-shops, a national bank with capital of \$50,000, and a weekly and a monthly periodical. The surrounding country is devoted almost exclusively to grape-culture. Pop. (1880) 1,924; (1890) 1,983; (1895) estimated, 2,300. EDITOR OF "REPUBLICAN."

Westfield: borough; Tioga co., Pa.; on the Cowanesque river, and the Fall Brook and the Addison and Penn. railways; 26 miles N. by W. of Wellsboro, the county-seat, and 58 miles N. of Lock Haven (for location, see map of Pennsylvania, ref. 2-F). It is in an agricultural and dairying region, and has a private bank and a weekly newspaper. Pop. (1880) 579; (1890) 1,128.

Westfield River: a river that rises by three branches (the north, middle, and west branch) in the Green Mountains and their foothills in Berkshire and Hampshire cos., Mass. The main stream begins at Huntington, Mass. Throughout most of its course it is turbulent, affording good water-power. It finally runs southeastward and joins the Connecticut opposite Springfield, Mass. In its lower course it is often called the *Agawan*.

Westford: town (incorporated in 1729); Middlesex co., Mass.; on the Boston and Maine and the Concord and Montreal railways; 6 miles S. W. of Lowell (for location of county, see map of Massachusetts, ref. 2-II). It contains the villages of Westford, Central Village, Graniteville, Forge, Brookside, Westford Corner, and Parkerville; has 4 churches, 15 district schools, and public library; and is principally engaged in agriculture, granite-quarrying, and the manufacture of machinery and woolen goods. In 1894 it had an assessed property valuation of \$1,146,688. Pop. (1880) 2,147; (1890) 2,250; (1895) 2,418.

West Grove: village; Chester co., Pa.; on the Phil., Wil. and Balt. Railroad; 40 miles S. W. of Philadelphia (for location, see map of Pennsylvania, ref. 6-1). It has extensive rose-nurseries, casket and knitting factories, a national bank with capital of \$50,000, and a weekly and a monthly periodical. Pop. (1880) 269; (1890) 1,521.

West Hartford: town (incorporated in 1854); Hartford co., Conn.; on the north and south forks of Park river, and the N. Y. and New Eng. Railroad; 5 miles W. of Hartford (for location, see map of Connecticut, ref. 8-G). It was set off from the town of Hartford; contains the villages of West Hartford and Elmwood; and has four churches, a public library, high school, electric railway connecting with Hartford, Farmington, and Unionville, and pipe-bending and brick and pottery works. In 1894 the grand list was \$2,752,-626. Pop. (1880) 1,828; (1890) 1,930. C. W. MANWARING.

West Hoboken: town; Hudson co., N. J.; 160 feet above tide-water; 1½ miles W. of Hoboken ferry on the Hudson river, directly opposite New York (for location, see map of New Jersey, ref. 2-E). It has 5 churches, 4 public schools, Roman Catholic school, a monastery of the Passionist Fathers, convent of the Sisters of St. Dominic, Masonic hall, a trust and savings institution with capital of \$125,000, and 2 weekly newspapers. It is principally engaged in the manufacture of silk goods, for which there are five plants. Pop. (1880) 5,441; (1890) 11,665; (1895) State census, 18,296. GEORGE E. REYNOLDS, SURVEYOR.

West India Company, Dutch: See DUTCH WEST INDIA COMPANY.

West Indies: an archipelago forming a curved chain from Florida and Yucatan to the northern coast of South America, framing the Caribbean Sea on the N. and E., and separating it from the Gulf of Mexico and the Atlantic. The islands fall naturally into four groups—the Bahamas, the Greater Antilles, the Caribbean chain, and the Venezuelan or Leeward group. The Bahamas are clustered irregularly along a line beginning E. of Southern Florida (separated by the Florida Channel) and extending southeastward almost to the coast of Santo Domingo. They include some twelve or fifteen larger and a multitude of smaller islands, generally connected with each other by shallows or "banks." Some of them have hills of no great height, but portions of all are formed of consolidated shell and coral sand. The group is, in fact, a reef formation gathered about a skeleton of older land; it may be regarded as an outlying portion of the Florida peninsula. The Bahamas lie partly to the N. of the tropic, but the Gulf Stream sweeps past and through them on its way to the Atlantic, warming the air, so that the climate and productions of all are essentially tropical. The name Greater Antilles is commonly used to distinguish Cuba, Santo Domingo, Puerto Rico, and Jamaica, the largest of the West Indian islands; physically the group also includes some smaller islands near these—Mona, Isle of Pines, Tortuga, the Caymans, etc. They are essentially different in character from the Bahamas, being formed in great part of mountain chains. In some places—especially in Santo Domingo—the mountains rise in splendid precipices from the sea; elsewhere they slope back through verdant valleys to interior ranges 8,000 to 10,000 feet high. It is said that an English admiral, to illustrate the appearance of Santo Domingo, crumpled a sheet of paper in his hand and threw it on a table; and the figure would be equally apt for Cuba or Jamaica. Two principal east and west chains may be traced—one running through Cuba and along the northern side of Santo Domingo, and the other on the southern side of Santo Domingo, reappearing in the Blue Mountains of Jamaica. The significant fact was first noticed by Humboldt, that the northern chain is on a line with the east and west Anahuac range of Mexico, which embraces the highest peaks and nearly all the volcanoes of that country. Continued still farther W. the line strikes the volcanic Revillagigedo islands in the Pacific. (See MEXICO.) It should be noted, however, that the Greater Antilles contain no active nor recent volcanoes, though the frequency of earthquakes shows that they are on a line of volcanic disturbance. In Puerto Rico the mountainous character is much less marked, and E. of it the scattered group called the Virgin islands is rocky and precipitous, but of no great height; it may be included either in the Greater Antilles or in the Caribbean chain. The latter (called also the Lesser Antilles or Windward islands) departs abruptly from the east and west trend of the Greater Antilles, and belongs, in fact, to a different mountain system. The islands are small but generally high—2,500 to 4,000 feet—forming a very regular, slightly curved north and south line on the eastern side of the Caribbean Sea; nearly every one contains an active, quiescent, or extinct volcano. The group is, in fact, a chain of volcanic mountains, partially submerged, so that the islands are frequently separated by very deep channels. Barbados alone

is outlying, to the E.; it is comparatively flat, and probably belongs to the fourth group, or that forming an east and west line off the coast of Venezuela. Its islands are properly outlying portions of the South American continent. Trinidad and Tobago, as well as Barbados, are generally classed with the Caribbean group, but by their animals and plants as well as by their physical characters, they are clearly South American. The remaining islands—Margarita, Curaçoa, Oruba, etc.—are sometimes called collectively the Leeward islands, though this name is more commonly applied to a British colony forming a portion of the Caribbean group. Nearly all the West Indian islands are fertile, abundantly watered (except a few of the smaller and low ones), and well adapted for the culture of sugar-cane, tobacco, coffee, and cacao, which form the staple products and exports. Beyond a little gold in the Greater Antilles, copper in Cuba, and asphalt in Trinidad, they have no mineral wealth, but their forests are rich in cabinet woods and drugs. The climate of all is essentially the same—tropical, but free from extreme heat even in the summer months, and generally salubrious except in a few coast towns where yellow fever is endemic. The warm and rainy season is from June to October, and this is the time of hurricanes, to which all but the most southerly islands are occasionally subject. During the winter months the West Indies are deservedly popular resorts for tourists and invalids.

History.—Columbus, seeking a westward route to Asia, first saw the land of the New World in one of the Bahamas (Oct., 1492). Subsequently he discovered all of the Greater Antilles, and many of the smaller islands. As they were then supposed to be outlying portions of Asia or "The Indies," they were called West Indies—i. e. those which had been reached by sailing westward, in contradistinction to the East Indies which soon after were reached by an eastwardly route around the Cape of Good Hope. The first Spanish settlement in the New World was on the island of Santo Domingo (1493), and from it, directly or indirectly, nearly all the other Spanish conquests radiated. The Spaniards also settled Cuba, Jamaica, and Puerto Rico, and they had a small colony on Trinidad; but from the first they despised the smaller islands, and after the rich discoveries in Mexico and Peru the West Indies were neglected and partially depopulated. During the seventeenth century various French, English, and Dutch adventurers settled in the Caribbean islands and the Bahamas, and the Spaniards made only feeble attempts to dislodge them. In 1640 the sugar-cane began to be planted systematically, and led to wonderful prosperity, which attracted crowds of immigrants, 50,000 British subjects arriving in Barbados alone in one year. Jamaica was seized in 1655 by the English, who have held it ever since. Bands of adventurers and freebooters, drawn together by their common hatred of the Spaniards, at length formed the roughly organized body called the buccaneers, with their principal stronghold in Tortuga; thence they ravaged the towns of the Greater Antilles and the Spanish Main, eventually crossing the Isthmus of Panama to the Pacific. French buccaneers from Tortuga passed over to the western part of Santo Domingo, which was soon recognized as a French colony. (See the article BUCCANEER.) In 1660 a division of the islands was agreed upon between England and France, but this arrangement was of little avail to prevent frequent violent changes of ownership resulting from European wars. Subsequent events, growing out of the French Revolution, led to the independence of Santo Domingo, and it is now divided between the republic of HAITI and the DOMINICAN REPUBLIC (*q. v.*). The Bahamas were settled and retained by the English. During the wars of the eighteenth and early part of the nineteenth centuries the Caribbean islands frequently changed hands, either by conquest or treaty; the greater part now belong to Great Britain. France holds Martinique, Guadeloupe, and some smaller islands; Denmark has three islands in the Virgin group; the Netherlands retain Curaçoa and some neighboring islets, with a settlement in the Caribbean group; and Venezuela holds Margarita and some of the other islands near her coast. Of all the possessions of Spain in the New World she now retains only Cuba, Puerto Rico, and some neighboring islets. African slaves were early introduced in most of the islands, and their (freed) descendants of Negro or mixed blood form a large proportion of the population. Of the Carib and other Indian tribes which occupied the islands before the Spanish conquest only insignificant remnants survive. Some of the islands under British dominion have imported large numbers of Hindu coolies as workmen.

The following table exhibits the approximate areas and the populations (1890 or 1891) of the various political divisions:

NATIONALITIES.	Islands and dependencies.	Area in sq. miles.	Population.
Spanish.....	Cuba and dependencies.....	42,220	1,631,687
	Puerto Rico and dependencies.....	3,714	807,708
	Bahamas.....	5,450	48,000
British.....	Jamaica and dependencies.....	4,492	648,498
	Leeward islands.....	701	127,723
	Windward islands.....	507	137,824
	Barbados.....	166	182,322
Danish.....	Trinidad and Tobago.....	1,868	218,415
	St. John, St. Thomas, and San-ta Cruz.....	127	32,786
Dutch.....	Curaçoa and dependencies.....	403	45,162
French.....	Martinique.....	381	177,000
	Guadeloupe and dependencies.....	722	165,809
Venezuelan.....	Margarita.....	450	40,000
Dominican.....	Santo Domingo.....	18,045	610,000
Haitian.....	Santo Domingo.....	10,204	572,000
Total of West Indies.....		90,450	5,445,024

HERBERT H. SMITH.

West Liberty: town (founded in 1855); Muscatine co., Ia.; on the Burl., Cedar Rap. and N. and the Chi., Rock Isl. and Pac. railways; 16 miles S. E. of Iowa City, 38 miles W. by N. of Davenport (for location, see map of Iowa, ref. 6-K). It is in an agricultural, dairying, and stock-raising region; has four churches, high and primary schools, a State bank with capital of \$50,000, a private bank, and a weekly newspaper; and contains a creamery, carriage-factory, and brick and tile works. It is an important shipping-point for choice stock, horses, cattle, and hogs. Pop. (1890) 1,141; (1890) 1,268; (1895) 1,481. EDITOR OF "INDEX."

West Liberty: village; Liberty township, Logan co., O.; on the Mad river, and the Cleve., Cin., Chi. and St. L. Railway; 8 miles S. of Bellefontaine, 10 miles N. of Urbana (for location, see map of Ohio, ref. 4-D). It has good water-power, several flour-mills and machine-shops, public high school, an incorporated bank with capital of \$15,000, a private bank, and a weekly newspaper. Pop. (1880) 715; (1890) 1,200.

Westmacott, SIR RICHARD, R. A.: sculptor; b. in London, England, in 1775, son of a sculptor, from whom he learned the rudiments of his art; studied under Canova at Rome 1793-97; obtained the first premium from the Academy of Florence 1794; became an associate of the Royal Academy 1805, and an Academician 1816; succeeded Flaxman as Professor of Sculpture at the Royal Academy 1827, and was knighted 1837. Among his most noted statues are those of Addison, Pitt, Fox, Erskine, Nelson, the Dukes of Bedford and York, that of Achilles in Hyde Park and of George III. at Windsor, and those of Cupid and Psyche in the possession of the Duke of Bedford. Other works are an alto-relievo, *The Dream of Horace*, numerous monuments in St. Paul's Cathedral and Westminster Abbey, and the groups of sculpture on the marble arch at Cumberland Gate and the pediment of the British Museum. D. in London, Sept. 1, 1856. Revised by RUSSELL STURGIS.

Westmacott, RICHARD, R. A., F. R. S.: sculptor; son of Sir Richard Westmacott; b. in London, England, in 1799; studied sculpture under his father; was in Italy 1820-26; was in general an imitator of his father's style, but with a preference for mythological and religious compositions; was elected associate 1838, and Academician 1849, and succeeded his father as Professor of Sculpture 1857. D. in London, Apr. 19, 1872.

Westmeath: an inland county of Ireland, province of Leinster, bordering on the Shannon. Area, 708 sq. miles. The surface is hilly, especially in the northern part, and much diversified by lakes, rivers, and forests. The soil is fertile, but only a small part of it is under tillage. Oats and potatoes are the common crops, and breeding and fattening of cattle is the principal occupation. Pop. (1891) 65,028. Chief towns, Mullingar and Athlone.

Westminster: city; capital of Carroll co., Md.; on the Western Md. Railroad; 34 miles N. W. of Baltimore (for location, see map of Maryland, ref. 1-E). It has 7 churches, several public and private schools, 3 national banks with combined capital of \$275,000, a savings-bank with capital

of \$10,000, a private bank, a monthly and 2 weekly periodicals, gas and electric light plants, steam flour-mills, phosphate-works, and machine-shops. The city is the seat of Western Maryland College (Methodist Protestant), which in 1894 had 16 instructors, 254 students, and 3,000 volumes in its library. Pop. (1880) 2,507; (1890) 2,903.

EDITOR OF "AMERICAN SENTINEL."

Westminster, Hugh Lupus Grosvenor, First Duke and Third Marquis of: son of Richard, the second marquis, and his wife, Elizabeth Mary, daughter of the first Duke of Sutherland; b. in London, England, Oct. 13, 1825; was member of Parliament for Chester 1847-69; succeeded to the marquise on the death of his father Oct. 31, 1869, and was created a duke 1874. He married his cousin, Lady Constance Leveson-Gower, daughter of the second Duke of Sutherland, in 1852, and in 1882 Katherine, daughter of Baron Chesham. He is reputed the wealthiest nobleman in Europe.

Westminster Abbey: a conventual church in Westminster, a district included in the modern town of London. The monastery and church were dedicated to St. Peter, but as the sovereigns of England have been crowned in the abbey church for the last 1,000 years, and as it is the place where persons of celebrity have been buried for nearly as long, the church building itself has a special repute although the monastery has disappeared.

Architecture.—Long before any portion of the present building was in existence there stood upon the same spot a Saxon church. That church, built within what was called Thorney Isle, from its being covered with brushwood, was connected long before the Conquest with a monastic body of the Benedictine order, who named the place of their abode the Western Monastery, or Westminster, to distinguish it, some say, from St. Paul's in London, which was called East Minster. The first church here of which, architecturally considered, we possess any knowledge was that built by Edward the Confessor, and consecrated Dec. 28, Holy Innocents' Day, 1065. Though built by a Saxon king, it was in the Norman style, cruciform in shape, and exceeding in magnificence any sacred building at that time in England; and there still remains, under what is called the pyx-house, a noble crypt pertaining to the Norman structure. Henry III. rebuilt the greater part of the abbey church in the style denominated Early English; and it is his work that is seen in the transepts and the choir. He had previously raised a Lady chapel at the east end; and then, when he erected the choir and transepts, he transferred the high altar to the place it now occupies, and reared behind—between it and the Lady chapel—a lofty shrine, to which he removed the body of Edward the Confessor. That shrine, somewhat mutilated, still remains. The nave was built under the Edwards, and the west front and its grand window, as well as the completion of the nave and aisles, belong to the latter part of the fifteenth century. Henry VII. pulled down the Lady chapel, and built that which now bears his name, a charming specimen of the florid architecture of the period—i. e. late Perpendicular—with richly mullioned windows and roof in fan-vaulting. The gates are beautiful specimens of metal-work. Sir Christopher Wren was the architect of the upper part of the western towers, which are by no means in keeping with the rest of the church. The extreme length of the whole is 531 feet, and the width across the transepts 203. The width of the nave and aisles is 79 feet; of the choir, 38; and of Henry VII.'s chapel, 70. The height of the roof is 102 feet, an unusual elevation in England. The present cloisters were built in the thirteenth and fourteenth centuries. The chapter-house is an architectural gem of about 1250, restored after long neglect.

History.—The historical associations of the abbey can best be studied in Dean Stanley's *Memorials*. The coronation-stone brought from Scotland by Edward I. may be seen under the coronation-chair used by Richard II., which ever since, there is reason to believe, has been occupied by the English sovereigns during the solemnity of their inauguration. The funerals of kings and queens have also taken place in the minster. The remains of Oliver Cromwell, who never wore the crown, were for a time in a vault under Henry VII.'s chapel, having been deposited there with a pomp which royalty could not exceed. In the chapter-house the Commons met when that body became an assembly distinct from the Lords, and repeated their sittings there as late as the end of the reign of Henry VIII. The history of

the abbey is interwoven with that of the English Reformation. One of the Protestant martyrs, Thomas Bilney, was arraigned before Cardinal Wolsey in the Westminster chapter-house. The abbey fell at the time of the dissolution of the monasteries, and the abbot was succeeded by a dean. In Queen Mary's time it was restored, but after Elizabeth's accession the present institution of dean and chapter were established. Convocations were transferred to Westminster in the time of Henry VIII. The convocation that acknowledged the royal supremacy was held here. In the time of Elizabeth the bishops met in Henry VII.'s chapel. In the Jerusalem chamber the bishops debated the final alterations made in the Book of Common Prayer in 1662; and afterward some of the most exciting scenes connected with the history of Convocation in the reigns of William III. and Anne occurred in the chamber itself, or in that part of the abbey where the lower house had been convened. The fortunes of the abbey have followed those of the nation. The Westminster Assembly was held in the Jerusalem chamber, and when, during the civil wars and Commonwealth, Episcopal worship was interrupted, Presbyterians and Independents occupied the pulpit; while with the restoration of Charles II. worship resumed its former character. While Dr. Stanley was dean (1863-81), proceedings occurred in the abbey of national interest. Sermons on Sunday evenings have been preached here to vast audiences; and for a number of years—on the evening of St. Andrew's Day, Nov. 30, set apart for intercession on behalf of missions—a layman professor, Max Müller, a Presbyterian clergyman, Dr. John Caird, and a Congregational missionary, Dr. Robert Moffat, delivered lectures from the lectern in the center of the nave; also, celebrations by Roman Catholics have been held within its walls since 1890.

Monuments.—The tombs and monuments in the abbey are exceedingly numerous, and the life-stories of those who are buried under the pavement or commemorated on the walls would almost form a national biography. Some of the principal are grouped together according to the grounds on which history builds their fame. Sovereigns and members of royal families have graves and tombs in the chapels of Edward the Confessor and Henry VII. Edward himself lies under the shrine which bears his name, and which is curious as a work of art belonging to the age of Henry III., who is buried on the north side. And next to him lies Edward I. On the south side lie Edward III. and Richard II., and to the E. Henry V. in the beautiful chantry named after him. In the center of Henry VII.'s chapel the founder and his wife repose side by side; at the west end is the sepulcher of Edward VI. In the north aisle are Queen Elizabeth and her sister Mary; in the opposite aisle is Mary Queen of Scots. Close to the tomb of Henry VII. we meet with the grave of King James; Charles II. is buried at the east end of the north aisle. His grave is unmarked; so is that of William III. Queen Anne was laid next her sister Mary in the southern aisle. George II. was the last of the kings interred in the abbey. The interment was in Henry's chapel. The north transept is distinguished as the resting-place of eminent statesmen—Pitt, Fox, Wilberforce, Canning, Peel, Palmerston. In the south transept is "Poets Corner." Here lie Chaucer, Spenser, Beaumont, Ben Jonson, Cowley, Dryden, Addison, Tennyson; also hard by are monuments to Shakspeare, Milton, Isaac Watts, Goldsmith, and Johnson. Numbers of generals, admirals, courtiers, divines, men of letters, etc., are covered by the marble pavement or have memorials by the pillars or on the walls. Two slabs on the central floor of the nave mark the last home of George Stephenson and David Livingstone. See *Memorials of Westminster*, by Dean Stanley (London, 1868; supplement 1869). Revised by RUSSELL STURGIS.

Westminster Assembly: an assembly which convened in Westminster Abbey, London, in 1643, and which has exercised a great and lasting influence on the history and development of Presbyterianism. After some unsuccessful attempts to obtain the sanction of the king, it was summoned by ordinance of the two houses of the English Parliament. It was intended that it should include among its members adherents of all the chief parties among English-speaking Protestants with the exception of that of Archbishop Laud, whose innovations and despotic tendencies had been one main cause of the troubles in Church and state. Almost all the clerical members were in episcopal orders, three or four were bishops, five afterward rose to be so, and several were known to be favorable to the continuance of episcopacy and

to side with the king rather than with the Parliament. Places were found for some of the ministers of the French churches in England, for one or two representatives of the Church of Ireland, and for some who had been pastors of the English churches in Holland; while invitations to send commissioners were addressed to the Church of Scotland, and, it is said, also to the churches of New England. The Assembly, as originally constituted by the ordinance, consisted of 121 divines and of 30 lay assessors, of whom 10 were peers and 20 commoners. Additions were made from time to time, chiefly to supply the places of those who had failed to attend or had been removed by death. The purposes for which, according to the ordinance, the Assembly was convoked were to vindicate the doctrine of the Church of England from all calumnies and false aspersions, and to recommend such further reformation of her discipline, liturgy, and government as might "be agreeable to God's holy word, and most apt to procure and preserve the peace of the Church at home, and nearer agreement with the Church of Scotland and other Reformed churches abroad." But when the Parliament, feeling their need of Scottish aid, acceded to the Solemn League and Covenant and urged the Scotch to send deputies to the Assembly, its objects were extended; and to promote the covenanted uniformity it was empowered to prepare a new confession of faith and catechism, as well as directories for public worship and church government which might be adopted by the churches of the three kingdoms. It retained to the last, however, that advisory character which has made some question whether it was properly an ecclesiastical synod at all, though in this respect it only resembled an ordinary English convocation, and in those respects in which it differed from that body it may claim the benefit of what is said in chap. xxxi., sec. ii., of its Confession.

It was on Saturday, July 1, 1643, that the divines, with the two Houses and a great congregation, met in Westminster Abbey, and after sermon by Rev. William Twisse, who had been named as prolocutor, the Assembly was constituted in the chapel of Henry VII., in which only three years before Laud's unfortunate convocation had been held. On the names being read over, it was found that "threescore and nine" had obeyed the summons of the Parliament. Bishop Brownrigg sent an excuse for his absence; Bishop Westfield and a few other royalists and conformists were actually present, and by the retention of their canonical habits seemed, as Fuller says, "the only Nonconformists." The most of the divines came not in canonicals, "but in black coat or cloak and bands, in imitation of the foreign Protestants," and probably a more correct idea of the appearance of the Assembly may be formed from the plate of the French synod prefixed to the first volume of Quiek's *Synodicon* than from the plate of the Assembly so common in England. The meetings continued to be held in the chapel of Henry VII. till after the arrival of the Scottish commissioners, and were chiefly occupied with the revision of the first fifteen of the English Articles. Soon after, the Covenant was subscribed by the Assembly and the House of Commons, and the last remaining royalist, Dr. Featley, of Lambeth, was expelled for opposing it, and for revealing the proceedings to Ussher, then in the king's quarters at Oxford. The Assembly was now authorized by the houses to treat of the questions of Church government and worship; and about the same time, that it might have the benefit of a fire, it removed from Henry VII.'s chapel to the Jerusalem chamber, which since that time has generally been the meeting-place of the upper house of Convocation.

The debates on the subject of Church government were keen and protracted, and unexpected obstacles arose which for a time retarded a settlement. Twisse, Gataker, Palmer, Temple, and several other learned divines who were cordially on the side of the Parliament were inclined toward what they termed primitive episcopacy, under which the presbyters and their president governed the churches in common. Ultimately they agreed to acquiesce in the Presbyterian system as affording the only chance of constituting a comprehensive national Church, with such reasonable powers of self-government as would prevent the recurrence of the oppressive despotism under which they had so long groaned. The Scotch commissioners and their more thoroughgoing associates, the Puritans of the school of Cartwright, had for the sake of union occasionally to forego the claim of a *jus divinum* for the details of their polity, and to rest contented with the phrase "lawful and agreeable to the word of God," instead of "expressly instituted or commanded." The In-

dependents, though fewer in number than either of the other parties, yet, backed up by their political friends outside, proved more unyielding, and in the end resolved rather to seek for toleration outside the national Church than for comprehensiveness within it if it were not to be constituted more in accordance with their system than the majority of the Assembly were willing to allow. It was therefore agreed to lay aside the discussion of these topics for a time, and proceed to take up subjects on which there was likely to be a greater amount of harmony.

The subjects on which least disagreement was expected were those relating to the form of public worship and the statement of doctrines. Early in 1644 the Assembly remitted each of these to a small committee to prepare materials for the decision of them, and to bring these first before the large committees, and then before the Assembly. In this way the *Directory for Public Worship* was prepared in 1644, considerable progress was made with a practical *Directory for Church Government* in 1644-45, though the printing of it was delayed till 1647, and in 1645-46 the *Confession of Faith* was elaborated, and finally put into the shape in which it is still printed in Scotland. In the two following years the Assembly elaborated the *Catechisms*, and prepared the Scripture proofs for them as well as for the *Confession of Faith*. It spent part of the time also in attempting to complete its answers to the famous Erastian *Queries* of the House of Commons, and gave its sanction to certain papers in answer to the Independents, formally drawn up by its grand committee. These last appeared ultimately in the volume entitled *The Grand Debate concerning Presbytery and Independency*. The former were never completed and published, but it is said that the substance of them is given in the preface to the *Jus Regiminis Ecclesiastici Divinum*, prepared by the London ministers. After 1648 the Assembly occupied itself almost exclusively with the examination of those appointed to ecclesiastical charges or desiring license as expectants or probationers, and it was only occasionally that the full quorum of forty could be brought together. The 1,163d session was held Feb. 22, 1649, when all its important labors had been fully concluded. The subsequent sessions are not numbered, but the last of which an entry is made in the minutes took place on Mar. 25, 1652. These minutes, which are pronounced by competent judges to be almost entirely in the handwriting of Adoniram Byfield, are still preserved. The whole of them were transcribed at the expense of the Church of Scotland, and the more important portion of them has been published in Edinburgh. The Assembly was not formally dissolved, but, as Fuller says, "it dwindled by degrees," and "vanished with the Parliament" which gave it birth. See WESTMINSTER STANDARDS.

Most divergent estimates have been formed of the merits of this Assembly from the time it met down to our own day. Clarendon has spoken of its members and their work with great contempt, and others have "damned them with faint praise"; but Baxter, perhaps as competent as any among their contemporaries to give an impartial verdict, did not hesitate to affirm that "the divines there congregated were men of eminent learning and godliness, and ministerial abilities and fidelity; and being not worthy to be one of them myself, I may the more freely speak that truth which I know even in the face of malice and envy, that, as far as I am able to judge by the information of all history, . . . the Christian world since the days of the apostles had never a synod of more excellent divines." "This," as Dr. Stoughton, one of the most competent judges in our own day, observes, "is high praise, but it comes nearer the truth than the condemnatory verdicts pronounced by some others. The Westminster divines had learning, scriptural, patristic, scholastic, and modern, enough and to spare, all solid, substantial, and ready for use." Hence their work has stood the test of time, and is still valued and honored. Almost all of them were graduates of the Universities of Oxford and Cambridge. Several of them had been honored to suffer in defense of the truths they taught, and many of them had the courage afterward to brave suffering, insult, and poverty rather than renounce their creed or abandon their views of church polity and discipline.

Westminster Confession of Faith and Catechisms: See WESTMINSTER STANDARDS.

Westminster Hall: a large hall, all that remains of the ancient palace of Westminster. It is a very large room to have a roof unsupported by columns, being 68 feet wide in the clear, and covered by an open timber roof, the finest in existence, and which has remained perfect except for minor repairs since the close of the fourteenth century. In its present form it was built during the reign of Richard II. When the new Westminster palace was designed after the fire of 1834, it was proposed to make Westminster Hall a part of it, but Sir Charles Barry, who was successful in the competition among the architects, treated it as a vestibule or entrance hall, which it remains. The public pass through the whole length of the hall from north to south, ascend the stairs at the southern end to St. Stephen's porch, then turn to the east and enter the new building at St. Stephen's Hall. Members of Parliament, on the other hand, may at their choice pass through a door half way up the hall in the middle of the east side or, skirting the hall on the east, may pass along a cloister on Star Chamber Court. The peers do not enter here at all, but by a separate entrance on old Palace Yard. Westminster Hall has been the scene of many stirring events. Here Sir Thomas More and the Protector Somerset were tried and condemned. Not to mention other trials, King Charles I. here appeared before the High Court of Justice, while the banners of Naseby hung over his head. Here the seven bishops just before the Revolution were acquitted, Dr. Sacheverell and the rebel lords of 1745 were convicted, and Warren Hastings passed through that ordeal which has been rendered so famous by the eloquence of Burke and Sheridan and by the most brilliant assemblage, perhaps, ever seen in a court of justice. It must be also mentioned that here Oliver Cromwell was inaugurated as Lord Protector of England. At the coronation of George IV., Westminster Hall witnessed a coronation banquet, and at the same time the challenge of the king's champion on horseback in complete armor.

Westminster Hall was long the center of the English law courts; abutting on it were the court of chancery, the court of king's or queen's bench, the court of common pleas, and the court of exchequer. Revised by RUSSELL STURGIS.

Westminster Palace: the great building fronting on the Thames in the southwestern part of London in which are the meeting-rooms of the Houses of Parliament of Great Britain and Ireland together with the libraries, committee-rooms, etc., necessary for parliamentary business. It takes its name from the Royal Palace which formerly stood on this site, but which was nearly abandoned at the time of Henry VIII. The Houses of Lords and Commons assembled within the old walls. The latter began to meet in St. Stephen's chapel in the reign of Edward VI. St. Edward's, or the Painted Chamber, was used by the Lords and Commons when they came together for conferences. In the year 1834 a terrible fire destroyed the whole pile, so long interwoven with the royal and national history of England.

The new palace of Westminster occupies the site of the old one. It has four fronts. The east, or river front, presents a façade of 900 feet, divided into compartments, pinnacled with tracery, and decorated with statuary and coats-of-arms. The other fronts are in the same style, and exhibit the same profusion of ornament. Three principal towers adorn the edifice—the Royal Victoria tower, the cen-

tral tower, and the clock tower. The first is 340, the second 300, and the third 320 feet in height. The present chambers occupied by the two houses are richly adorned with historical paintings, stained glass, carving, and metal work. The royal entrance, the royal gallery, the central hall, the passages, and the libraries are all elaborately decorated.

Revised by RUSSELL STURGIS.

Westminster School: one of the seven great public schools of England. As it now exists, it was founded by Queen Elizabeth in 1560, but there was an abbey school long before. The school-room was a dormitory of the abbey, and the college hall was the abbot's refectory, built by Abbot Litlington under Edward III. The dormitory was built by the Earl of Burlington in 1722. According to an old custom, the boys at Christmas perform one of Terence's plays, with a prologue and epilogue written for the occasion and suited to the times. Westminster School can boast of distinguished men among its masters and pupils. Of the latter were Ben Jonson, George Herbert, Giles Fletcher, Cowley, Dryden, Prior, Churchhill, Cowper, Southey; the statesmen Sir Harry Vane, Halifax, Warren Hastings, Marquis of Lansdowne, Burdett, Graham, and Earl Russell; the warriors Marquis of Anglesey, Lord Combermere, Lord Raglan; and, among other celebrated men, Locke, South, Christopher Wren, Atterbury, Gibbon.

Westminster Standards: a title under which are sometimes comprehended all the church books drawn up by the Westminster Assembly, at others only those relating to doctrine, and accordingly, though these were drawn up last, they will be treated of first in this article.

(1) *Confession of Faith.*—A committee was appointed by the Assembly "to prepare matter for a joint confession of faith" as early as Aug. 20, 1644. It consisted of Drs. Gouge, Temple, and Hoyle, Messrs. Gataker, Arrowsmith, Burroughs, Burgess, Vines, and Goodwin, together with the Scotch commissioners. A fortnight later Dr. Smith and Messrs. Palmer, Neweomen, Herle, Reynolds, Wilson, Tuckney, Young, Ley, and Sedgewick were added to the committee. In all probability the material afterward embodied in the Confession was, in part at least, prepared by this committee. But the digesting of the matter into a formal "draught" was, on May 12, 1645, intrusted to a small committee consisting, apparently, of Drs. Temple and Hoyle, Messrs. Gataker, Harris, Burgess, Reynolds, Herle, and the Scotch commissioners. On July 7, 1645, Dr. Temple "made report of that part of the Confession of Faith touching the Scriptures," and it was read and debated. The following day Messrs. Reynolds, Herle, and Neweomen (to whom were afterward added Messrs. Tuckney and Whitaker) were appointed a committee to "take care of the wording of the Confession," as its articles should be voted in the several sessions. On July 16 report was made from the committee of the heads of the Confession, and these were distributed among the three large committees of the Assembly, to be by them elaborated and prepared for more formal discussion. All were repeatedly read and debated, paragraph by paragraph, and sometimes word by word, in the Assembly. On Sept. 25, 1646, the first nineteen chapters, and on Dec. 4 of that year the whole Confession, were finally passed, and then presented to the Houses of Lords and Commons. They gave orders that 600 copies should be printed for the use of members of Parliament and of the Assembly, and that Scripture proofs should be added to the Confession, which was accordingly done. In 1647 the Confession was approved by the Church of Scotland in the form in which it had passed the Assembly, and it was subsequently ratified by the Scottish Parliament. In 1648, under the title of "Articles of Christian Religion," and with certain changes, most of which were afterward adopted by the Savoy Conference, it was passed by the English Parliament.

Sources and Character of the Confession.—It has been maintained that the Assembly's confession was derived mainly from foreign sources, and even that it "bears unmistakably the stamp of the Dutch theology in the sharp distinctions, logical forms, and juridical terms into which the reformed doctrine had gradually moulded itself under the red heat of the Arminian and Socinian controversies." But there is conclusive evidence that in its general plan, and in the tenor and very words of its more important articles, it was derived not from foreign but from native sources. It may confidently be traced up to those confessedly Calvinistic or Augustinian articles which are supposed to have been prepared by Ussher, and in 1615 were

adopted by the convocation of the Irish Church. This was before the Synod of Dort had met, or the bitterness and heat which the debate of the Arminian controversies occasioned had extended to Britain. In these articles we have the main sources of the Assembly's Confession of Faith, and almost its exact prototype in its statement of all the more important and essential doctrines of Christianity. In the order and titles of many of its chapters, as well as in the language of whole sections or subdivisions of chapters, and in many single phrases, and *voes signate* occurring throughout their Confession, the Westminster divines followed very closely in the footsteps of Ussher and his Irish brethren. The minutes clearly show that the attempt to determine questions left open by the Synod of Dort was seldom made, and that when it was made it was strenuously resisted by the pupils and successors of the English divines, who claimed to have moderated the conclusions of that synod. With respect to the doctrine of the covenants, and the juridical phraseology which some assert were imported into England through Cocceius (whose chief work on the subject, however, was not published till after the Confession had been framed), there is nothing taught by the Westminster divines which had not in substance been found by Rollock, in Scotland, and Cartwright, in England, half a century before, while there is an advance on what is taught in the Dutch *Synopsis Purioris Theologie* of 1642. In regard to the important chapters on "The Holy Scripture," on "God's Eternal Decree," on "Christ the Mediator," and on "The Lord's Supper," which so largely determine the character of the Confession, the resemblance to the Irish articles, both in language and arrangement, is so close that hardly a doubt can be entertained either of the sources from which it was derived, or of the design of its framers in following in the footsteps of Ussher. They meant their Confession to be in harmony with the *consensus* of the Reformed churches; they desired it to be a bond of union, not a cause of strife, among those who adhere to the sum and substance of the doctrine of the Reformed churches.

The Confession, under the title of *The Humble Advice of the Assembly of Divines now by authority of Parliament sitting at Westminster concerning a Confession of Faith*, etc., was printed at London in Dec., 1646, without proofs, and in May, 1647, with proofs, for the use of the Houses of Parliament and the Assembly. A copy of this last edition was taken to Scotland by the commissioners, and from it 300 copies were printed for the use of the General Assembly there. After being approved by that body, it was published in Scotland with the title *The Confession of Faith agreed upon by the Assembly of Divines*, etc., and, to the indignation of the House of Commons (which had not yet approved of it), this was reprinted by a London bookseller in 1648. In the same year it was, with the omission of part of chapters xx. and xxiv., and the whole of chapters xxx. and xxxi., and with some minute verbal alterations, approved by the two houses, and published under the title *Articles of Christian Religion, approved and passed by both Houses of Parliament after advice had with the Assembly of Divines*, etc. But in this instance the Assembly proved too strong for the Parliament, even though the Savoy Conference sided with the latter; and the Confession continues to be printed in Britain in the form in which it was drawn up by the Assembly and approved by the Church of Scotland. Under the title of *Truth's Victory over Error*, Dickson, Professor of Divinity in Edinburgh, published a brief catechetical exposition of the Confession in 1649.

(2) *Catechisms*.—The catechism which Baillie reports to have been drawn up and nearly agreed to in the end of 1644 was probably that which had been almost completed, and to a considerable extent had been passed, by the Assembly while still occupied with its Confession of Faith. But on Jan. 14, 1646-47, upon a motion made by Mr. Vines, it was ordered, "That the committee for the Catechism do prepare a draught of two catechisms, one more large, and another more brief, in which they are to have an eye to the Confession of Faith and to the matter of the Catechism already begun." The Larger Catechism was first proceeded with. This appears distinctly from the minutes of the Assembly, though the opposite view is still sometimes maintained. It may be admitted that the Shorter one at times embodies more of the materials of the original Catechism, and seems to be less directly drawn from the Confession of Faith, but it was not cast into its present shape till after the Larger one was completed, and all the Scotch commissioners except Rutherford had left the Assembly. Tradition attributes to

Gillespie the answer given in it to the question, What is God? but so far as can be ascertained from the minutes the answer to that question, even in the Larger Catechism, was not moulded into its present shape till after Gillespie returned to Scotland, but remained somewhat of the same form as it bears in the original draught and in the catechisms of Ussher and Cartwright. Some suppose that the Smaller Catechism of Cartwright was a good deal followed by the Assembly's committee; but no accurate comparison has yet been instituted between the Assembly's catechisms and those which had previously appeared in England, especially during the years immediately preceding. Tuckney had the chief share in digesting the Larger Catechism into its present form, and he was also convener of the committee which prepared the Shorter, though some think that in its more concise and severely logical answers they discern traces of the handiwork of Wallis, the mathematician. Both catechisms, as has been well observed by the younger McCrie, "are inimitable as theological summaries; though when it is considered that to comprehend them would imply an acquaintance with the whole circle of dogmatic and controversial divinity, it may be doubted whether either of them is adapted to the capacity of childhood. But if too little regard has been paid in former days to the *intelligent* training of our youth in such catechisms, . . . experience has shown that few who have been carefully instructed in our Shorter Catechism have failed to discover the advantage of becoming acquainted in early life, even as a task, with that admirable 'form of sound words.'"

Ridgley's *Body of Divinity* is virtually an exposition of the Larger Catechism. Alleine, Vincent, and Flavel in England, and Fisher, Willison, and several others in Scotland, have published expositions of the Shorter Catechism.

(3) *Directory of Public Worship*.—This occupied the attention of the Assembly during the greater part of the year 1644, and received the sanction of the English houses of Parliament on Jan. 3, 1644-45, though one or two alterations were made in March following to meet the views of the Scotch. It was approved by the Scotch General Assembly and Parliament in Feb., 1645, with one reservation. The first English edition bears the date of 1644, but was really published in what, according to our reckoning, would be Mar., 1645. The first Scotch edition bears the date of 1645, and has been recently reprinted by the Messrs. Blackwood with an historical introduction and notes by Dr. Leishman, of Linton. From the preface, as well as from the testimony of those engaged in framing it, we may clearly infer that the Directory was not intended to form a new liturgy, the very words of which might be turned by the minister into a fixed and unvarying form of prayer. The meaning of its framers, as they themselves tell us, only was that there might be "a consent of all the churches in those things that contain the substance of the service and worship of God," and that the ministers might, "if need be, have *some help and furniture*, and yet so as they become not hereby slothful and negligent in stirring up the gifts of Christ in them, but that each, by taking heed to himself and the flock of God committed to him, and by wise observing the ways of Divine Providence, may be careful to furnish his *heart and tongue with further or other material of prayer and exhortation* as shall be needful on all occasions." Its minuter directions have never been regarded as rigidly binding, but it were much to be wished that more heed were given to these wise and weighty counsels.

(4) *Church Government and Discipline*.—Two treatises on these subjects proceeded from the Westminster Assembly. The preparation of the former, to which it set itself shortly after subscribing the Covenant, was attended with many difficulties. It was entitled by its framers *Propositions concerning Church Government*, but it is now generally known as the *Form of Church Government*, and under this title it is still printed, along with Scotch editions of the Confession of Faith. The greater part of it had been drawn up before Feb., 1645, and the same month was presented apparently in manuscript to the Scotch Assembly, which approved of it as far as then completed, with certain reservations, and agreed to carry it out in practice as soon as it should be ratified without substantial alteration by the English Parliament. It never was so ratified. The best friends of Presbytery in England became satisfied that they must be contented to get the assent of their countrymen to their system as one that was lawful and agreeable to the word of God, and that could be justified by considerations of reason and expediency in many details for which divine warrant could not be claimed.

Urged by these and the friends of comprehension generally, the Assembly set itself in 1645 to prepare its *Directory for Church Government* and discipline. Henderson took special interest in the preparation of this, and furnished, in part at least, its materials, and all the Scotch commissioners assented to it. To a large extent it was adopted by the English Parliament in 1648 in their *Ordinance as to the Form of Church Government*. It was printed in Scotland in 1647, and reprinted, along with Henderson's *Form and Order of the Government of the Church of Scotland*, in 1690, and use was made of it in drawing up the *Form of Process* in the Church of Scotland in 1707, but it was never formally approved of, nor is it so well known as it deserves to be.

ALEX. F. MITCHELL.

Westmorland: northern county of England; area, 790 sq. miles. The surface is mountainous, the mountains, of which some rise over 3,000 feet, alternating with moorland, heath, and lakes. Useful minerals abound, and coal, lead, and copper mines are worked. Agriculture is in a backward state and of small consequence; the raising of sheep and geese is one of the principal occupations. Pop. (1891) 66,098.

West Newbury: town (incorporated in 1820); Essex co., Mass.; on the Merrimac river; 8 miles S. E. of Newburyport, 32 miles N. of Boston (for location, see map of Massachusetts, ref. 1-1). It contains a high school, 11 district schools, public library, and 2 churches, and is principally engaged in agriculture, and the manufacture of shoes and combs. In 1894 it had an assessed valuation of over \$1,000,000. Pop. (1880) 1,989; (1890) 1,796; (1895) 1,643.

West Newton: borough; Westmoreland co., Pa.; on the Youghiogheny river, and the Balt. and O. and the Pitts. and Lake Erie railways; 33 miles S. E. of Pittsburg (for location, see map of Pennsylvania, ref. 5-B). It is in an agricultural region, and has a private bank, a weekly newspaper, and large coal, coke, limestone, and lumber interests. Pop. (1880) 1,475; (1890) 2,285.

Weston: village; York County, Ontario, Canada; on the Humber river, and the Canadian Pac. and the Gr. Trunk railways; 8½ miles N. W. of Toronto (for location, see map of Ontario, ref. 4-D). It is in an agricultural region, and has flour, grist, and woolen mills, foundry, carriage-factory, windmill, and pump-works, and a weekly newspaper. Pop. (1881) 1,000; (1891) 1,191.

Weston: town (incorporated in 1712); Middlesex co., Mass.; on the Charles river, and the Boston and Maine and the Fitchburg railways; 13 miles W. of Boston (for location, see map of Massachusetts, ref. 2-II). It contains the villages of Weston and Kendall Green; has a high school, 6 district schools, public library, and 4 churches; and is principally engaged in agriculture. In 1894 it had an assessed valuation of over \$3,000,000. Pop. (1880) 1,448; (1890) 1,664; (1895) 1,710.

Weston: town (founded about 1832); Platte co., Mo.; on the Missouri river, and the Kan. City, St. Jo., and Council Bluffs Railroad; 9 miles N. of Leavenworth, Kan., and 32 miles N. W. of Kansas City (see map of Missouri, ref. 3-D). It has 9 churches, 2 public-school buildings, 2 private banks, 3 club-houses, a weekly newspaper, several saw-mills, roller flour-mill, distillery, brewery, carriage and wagon shops, and pork-packing establishments. Pop. (1880) 1,329; (1890) 1,127.

EDITOR OF "CHRONICLE."

Weston: town; capital of Lewis co., W. Va.; on the W. Fork of the Monongahela river, and the W. Va. and Pitts. Railroad; 70 miles S. E. of Parkersburg, 80 miles S. by E. of Wheeling (for location, see map of West Virginia, ref. 7-H). It is in an agricultural and stock-raising region; contains the First State Hospital for the Insane, a national bank with capital of \$100,000, a State bank with capital of \$50,000, a saw-mill, a planing-mill, and a flour-mill; and has four weekly newspapers. Pop. (1880) 1,516; (1890) 2,143; (1895) estimated, 2,500.

EDITOR OF "DEMOCRAT."

Weston, THOMAS: adventurer; b. in England about 1575; became a merchant in London; advanced £500 to the agents of the Leyden Pilgrims 1620 when fitting out the Mayflower expedition, but soon abandoned his connection with them as unprofitable, and personally began in 1622 another settlement at Wessagussett (now Weymouth) under a grant given by the king to Sir Ferdinando Gorges. His settlers were improvident, and soon had to be supported by the Pilgrims at Plymouth, and most of them, like Weston himself, returned to England where he died after 1624.

Westphal, JEST FÄÄL, KARL FRIEDRICH OTTO, M. D.: alienist; b. in Berlin, Germany, Mar. 23, 1833; studied at the Universities of Berlin, Heidelberg, and Zurich; in 1857 was appointed assistant in the Charity Hospital, Berlin, at first having charge of the smallpox wards, but in 1858 being transferred to the wards for mental diseases; in 1861 was a privat docent of psychiatry at the University of Berlin, becoming in 1869 professor extraordinary, and in 1874 Professor of Diseases of the Mind and Nervous System. Through his efforts the system of severity and restraint practiced in the insane wards was abolished. In 1868 he became associate editor and subsequently editor of the *Archiv für Psychiatrie und Nervenkrankheiten*. D. of paresis, at Constance, Jan. 27, 1890. S. T. ARMSTRONG.

Westphal, RUDOLF: classical scholar; b. at Oberkirchen, Schaumburg, Germany, July 3, 1826; studied mathematics, chemistry, classical and Oriental languages at Marburg; 1852 privat docent in Tübingen; 1858-62 professor extraordinary in Breslau; retired to private life, but in 1873 accepted a call to the University of Moscow, Russia. D. at Stadthagen, Germany, July 10, 1892. Westphal's enduring fame rests upon his contributions to Greek music and versification. His chief work was first published in 1865. The third edition, entirely rewritten, is entitled *Theorie der musischen Künste bei den Hellenen*: vol. i., *Rhythmik* (1885); vol. ii., *Griechische Harmonik und Melopöie* (1886); vol. iii., part i., with the collaboration of H. Gleditsch, *Allgemeine Theorie der griechischen Metrik* (1887); part ii., by A. Rossbach, *Griechische Metrik mit besonderer Rücksicht der Strophenhaltungen* (1888). His editions of *Hepphastion*: *Pseudo-Plutarch's De musica*; his treatise on Aristoxenus of Tarentum; *Metrik und Rhythmik des klassischen Hellenenthums* (Leipzig, 1883); *Die Musik des griechischen Alterthums nach den alten Quellen neu bearbeitet* (Leipzig, 1883) must also be mentioned. The versatility of Westphal is shown by the following titles of works, all of which are indispensable to the student of the respective subjects: *Methodische Grammatik der griechischen Sprache* (2 vols., Jena, 1872); *Prolegomena zu Aeschylus's Tragödien* (1869); *Theorie der neuhochdeutschen Metrik* (2 vols.); *Vergleichende Grammatik der indogermanischen Sprachen* (1873, of which the first volume only, dealing with the verb, appeared); a translation of *Caullus*, with introduction and notes (Breslau, 2d ed. 1869). See *Bursian's Geschichte der klassischen Philologie in Deutschland*. ALFRED GUEDEMAN.

Westphalia: province of Prussia; bounded by the Rhine province, Holland, Hanover, Schaumburg-Lippe, and Lippe-Deilmold, Brunswick, Hesse-Nassau, and Waldeck. It has existed in its present form since the Vienna Congress of 1815. Area, 7,892 sq. miles; pop. (1890) 2,428,661 Germans, with a dialect of their own tending toward the Low German or *Plattdeutsch*. The surface of Westphalia is mountainous or hilly, except in the circuit of Münster, which is a low plain. The Ems, the Veichte, and the Lippe are the natural waterways, so far as they are navigable. Manufacturing and agriculture are the chief industries. The soil is barren in the north and northeast, but very fertile in the southern valleys. Westphalia's chief wealth, however, is in its mineral treasures. Next to the Rhine province it is the richest province in iron; in zinc it is next to Silesia; in copper next to Saxony; and richest of all in coal, lead, sulphur, antimony, also in marble, stones, slate, and salt deposits. There are thirty-four mineral springs, some of them quite famous. Besides iron-working and stone-cutting, all kinds of textile industries have been carried on since the fourteenth century around the great center of Bielefeld. Grain and flax, hemp and hops are raised in large quantities; the foremost commercial cities are Bielefeld, Iserlohn, Dortmund, and Minden, the port on the Weser. There is a great railway system with Hamm as its central station. The province is divided into the three circuits: Münster, Minden, and Arnsberg. The seat of the highest provincial administration is in Münster, where there is a Roman Catholic theological and philosophical academy (university until 1818). HERMANN SCHOENFELD.

Westphalia, Treaty of: See TREATIES.

West Pittston: See PITTSTON.

West Plains: city; capital of Howell co., Mo.; on the Kan. City, Ft. Scott and Memphis Railroad; 118 miles S. E. of Springfield, 130 miles S. of Jefferson City (for location, see map of Missouri, ref. 8-H). It is in a fruit-growing region, particularly apples and grapes; has large farming, stock-

raising, and lumbering interests, 2 State banks with combined capital of \$55,000, and 2 daily and 3 weekly newspapers. Pop. (1880) 351; (1890) 2,080; (1895) estimated, 3,500.

EDITOR OF "GAZETTE."

West Point: city (laid out in 1828); Troup co., Ga.; on the Chattahoochee river, and the Atlanta and West P. and the West. of Ala. railways; 16 miles S. W. of La Grange, 87 miles S. W. of Atlanta (for location, see map of Georgia, ref. 4-F). It contains 4 churches, large public school, an opera-house, 2 private banks, 3 cotton-factories with combined annual consumption of 24,000 bales, ginnery and cotton-seed-oil mill with annual output of 3,000 tons, and an iron-foundry with annual output valued at \$50,000. Pop. (1880) 1,972; (1890) 1,254; (1895) estimated, 1,400, with a like number in the suburb on the Alabama side of the State line.

W. J. MCKEMIE, SUPERINTENDENT OF PUBLIC SCHOOL.

West Point: town (founded in 1857); capital of Clay co., Miss.; on the Ill. Cent., the Mobile and Ohio, and the South. railways; 97 miles N. of Meridian, 150 miles S. E. of Memphis, Tenn. (for location, see map of Mississippi, ref. 5-H). It is in an agricultural and cotton-growing region; contains 6 churches, the Southern Female College, the West Point Military Academy, public graded schools, a national bank with capital of \$75,000, and 2 weekly newspapers; and has machine-shops and foundries, manufactories of electric-light dynamos and engines, brick and tile factory, hard-wood and lumber mill, sash, door, and blind factory, milling and ginning establishment, box and ice factories, carriage and wagon shops, and other industries. Pop. (1880) 1,786; (1890) 2,762; (1895) estimated, 3,500.

"FORUM" PUBLISHING COMPANY.

West Point: town; capital of Cuming co., Neb.; on the Elkhorn river, and the Fre., Elk. and Mo. Val. Railroad; 38 miles N. W. of Fremont, 74 miles N. W. of Omaha (for location, see map of Nebraska, ref. 9-G). It is in a wheat and corn growing region; contains 2 national banks with combined capital of \$100,000, a State bank with capital of \$30,000, and 4 weekly newspapers; and has several woolen, grist, and paper mills, creamery, grain elevator, stockyards, brewery, and carriage and furniture factories. Pop. (1880) 1,009; (1890) 1,842.

EDITOR OF "REPUBLICAN."

West Point: military post and seat of the U. S. Military Academy; Orange co., N. Y.; on the Hudson river, and the N. Y., Ont. and West., and the W. Shore railways; 52 miles N. of New York, 94 miles S. of Albany (for location, see map of New York, ref. 7-J). The eastern side of the Point is a nearly straight, precipitous shore, while the northern side, curving so as to form a bay at its western extremity, has a comparatively gentle slope, and commands a fine view up the river. On the northwestern part of this slope is Camp Town, containing barracks for soldiers, storehouses, etc. Farther N., at the extremity of a plain called the German Flats, is the cemetery, the burial-place of many distinguished officers of the army, and still a little to the N. is Washington's Valley, where stood the house occupied by Washington in 1779. The Military Academy is situated on a level terrace 160 feet above the river, flanked on the W. by rocky heights; of these the one on which stand the ruins of Fort Putnam is the nearest and most prominent. On the S. the heights approach the river, leaving only room for a road southward, leading to the village of Highland Falls and to Forts Montgomery and Clinton. A road westward over the mountains leads to Newburg and the surrounding country. The principal buildings of the academy are at the southern end of the terrace; the quarters of the officers and professors are on the west side and along the roads leading southward and westward. In the northern angle of the bend, opposite the Point, is Constitution island, a rocky mass rising 130 feet above the river, connected by a broad marsh with the east bank. Just N. of the island are the West Point Foundry and the village of Cold Spring; farther N. rises the lofty Bull Hill, with Breakneck in the distance. N. W. of the Point, on the west side of the river, are Crow Nest and Storm King, and beyond is the town of Newburg at the extremity of the upper reach of the river, which viewed from West Point appears like a mountain lake. The Government tract of land at West Point contains about 2,330 acres, most of which was purchased in 1790 from the son of one of the original patentees; the rest was purchased in 1824 and 1889. Jurisdiction was ceded by New York to the U. S. over a part of the tract in 1826, and over the remainder in 1875 and 1889. The Government also purchased in 1879 a tract of land of about

50 acres, including in this a small body of water, called Round Pond, used as an addition to the water-supply of the post, from which it is distant about 5 miles. In the war of the Revolution West Point and other advantageous sites on the Hudson were fortified for the purpose of holding control of the navigation of the river. A strong chain supported by a boom was stretched across the river to Constitution island, for the purpose of preventing the ascent of the river by the British war-vessels. For further information, see Boynton's *History of West Point*. See MILITARY ACADEMIES.

Revised by JAMES MERCUR.

West Point: town; King William co., Va.; at the confluence of the Pamunkey and Mataponi rivers, and on the Southern Railway; 38 miles E. of Richmond (for location, see map of Virginia, ref. 6-I). It has regular steamship communication with Baltimore, New York, and Boston, a private bank, and a daily and two weekly newspapers; and is principally engaged in lumbering and oyster-packing. Pop. (1880) 557; (1890) 2,018.

Westport: town (incorporated in 1835); Fairfield co., Conn.; on Long Island Sound, the Saugatuck river, and the N. Y., N. H. and Hart. Railroad; 45 miles N. E. of New York (for location, see map of Connecticut, ref. 12-D). It was set off from the towns of Fairfield, Norwalk, and Weston; contains the villages of Westport, Saugatuck, and Green's Farms; is engaged in agriculture and the manufacture of morocco, cotton twine, satchels, planes, and buttons; and has a high school and a weekly newspaper. In 1894 it had a grand list of \$2,217,567. Pop. (1880) 3,477; (1890) 3,715. JOHN S. JONES, EDITOR OF "WESTPORTER-HERALD."

Westport: town (incorporated in 1787); Bristol co., Mass.; partly on the Atlantic Ocean; 8 miles S. of Fall River (for location of county, see map of Massachusetts, ref. 5-I). It contains the villages of Westport, North Westport, South Westport, Westport Factory, Head of Westport, Central Village, Westport Point, and Westport Harbor; has 3 summer hotels, 3 churches, high school, 19 district schools, and public library; and is engaged in agriculture, fishing, and manufacturing. In 1894 it had an assessed valuation of about \$1,500,000. Pop. (1880) 2,894; (1890) 2,599; (1895) 2,678.

West Randolph: See RANDOLPH, VT.

Westropp, HODDER MICHAEL; archaeologist; b. about 1825; graduated at Trinity College, Dublin, 1847; studied art in Italy, giving especial attention to religious archaeology. D. at Ventnor, Isle of Wight, Apr., 1884. Among his works are *Epochs of Painted Vases, an Introduction to their Study* (1856); *A Handbook of Archaeology, Egyptian, Greek, Etruscan, and Roman* (1867); *Influence of the Phallic Idea in the Religions of Antiquity* (1873); *Handbook of Pottery and Porcelain; Prehistoric Phases*; and *Lectures on Roman Archaeology*, originally delivered before the Archaeological Society of Rome.

West Rutland: town (set off from Rutland and organized in 1887); Rutland co., Vt.; on Ottercreek, and the Del. and Hudson Railroad; 4 miles W. of Rutland, 54 miles S. W. of Montpelier (for location, see map of Vermont, ref. 7-B). By its separation from the former town of RUTLAND (q. v.) the principal marble quarries, for which the region is noted, came within its area. It contains a Baptist, Congregational, Methodist Episcopal, Protestant Episcopal, and two Roman Catholic churches. Its banking business is transacted in Rutland. Pop. (1890) 3,680.

West Springfield: town (incorporated in 1774); Hampden co., Mass.; on the Connecticut and Agawam rivers, and the Boston and Albany Railroad; 2 miles W. of Springfield (for location, see map of Massachusetts, ref. 3-E). It contains the villages of West Springfield, Mittineague, and Merrick; has 5 churches, high school, 30 district schools, public library, and 3 hotels; and is principally engaged in agriculture and the manufacture of paper. In 1894 it had an assessed valuation of nearly \$4,000,000. Pop. (1880) 4,149; (1890) 5,077; (1895) 6,125.

West Stockbridge: town (incorporated in 1774); Berkshire co., Mass.; on the N. Y., N. H. and Hart. Railroad; 10 miles N. of Great Barrington (for location, see map of Massachusetts, ref. 2-C). It contains the villages of West Stockbridge, Centre, State Line, Williamsville, and Rockdale Mills; has a Congregational, a Methodist Episcopal, and a Roman Catholic church, a public high school, eight district schools, and a public library; and is principally engaged in agriculture, iron-mining, and the manufacture of lime. Pop. (1880) 1,923; (1890) 1,492; (1895) 1,257.

West Troy: village (incorporated in 1836); Albany co., N. Y.; on the Hudson river, and the Del. and Hudson Railroad; directly opposite the city of Troy and 4 miles N. of Albany (for location, see map of New York, ref. 5-J). It is connected with Troy by an iron bridge across the river, accommodating electric cars for passengers and freight, and also by three lines of steam-ferry, and is connected with Albany by steam and electric railways. It is at one of the entrances of the Erie and Champlain Canals into the Hudson river, at the head of river navigation, and connected by river and canals with Lakes Erie, Ontario, and Champlain. The village is in a noted manufacturing region, is well laid out, and has streets paved with granite, thorough sewerage, improved water-works, and electric lights. There are 10 churches: Roman Catholic 3, Methodist Episcopal 2, Presbyterian 2, and Baptist, Protestant Episcopal, and Reformed, each 1; a parochial and 4 public schools, Union Free School library; a national bank with capital of \$100,000; and a weekly newspaper. The industries comprise the manufacture of woolen goods, street-cars, bells, stoves, scales, car-journal bearings, harness-snaps, ladders, and sashes, doors, and blinds. The village receipts in 1894 were \$69,533; the debt was \$386,000; and the assessed property valuation, \$4,337,346. Pop. (1890) 12,967. Here in 1807 the U. S. Government established an arsenal, known as WATERVLIET ARSENAL, on a reservation of 109 acres of ground within the present limits of the village. It has one of the largest plants for the construction of field, coast defense, and siege ordnance in the U. S., and also factories for the manufacture of shot and shell, gun-carriages, equipments for field and siege service, and small ammunition. Other buildings include two large stone magazines for storing powder and ammunition. During the Mexican and civil wars from 1,000 to 1,500 men and women were employed here day and night preparing materials of war, and since 1892 the foundry and construction-works have been kept busy on the great guns required for the army and for coast-defense works. The arsenal fronts the river and has a wharfage of about 1,000 feet. The reservation, through which the Erie Canal passes, has quarters for the officers, barraeks for the soldiers and civilian employees, hospital, and tasteful gardens.

T. I. HARDIN, EDITOR OF "JOURNAL AND DEMOCRAT."

West Union: city (founded in 1849); capital of Fayette co., Ia.; on the Burl., Ced. Rap. and N. and the Chi., Mil. and St. P. railways; 36 miles N. of Independence, 84 miles N. W. of Dubuque (for location, see map of Iowa, ref. 3-J). It is in an agricultural and dairying region, and has 11 churches, water-works, a national bank with capital of \$100,000, 2 State banks with combined capital of \$109,500, 2 large creameries, and 3 weekly newspapers. Pop. (1880) 1,551; (1890) 1,676; (1895) 1,801. EDITOR OF "GAZETTE."

West Virginia: one of the U. S. of North America (South Atlantic group); the twenty-second State admitted into the Union; capital, Charleston.

Location and Area.—It lies between lat. 37° 30' and 40° 30' N., lon. 0° 45' and 5° 30' W. of Washington; is bounded on the N. W. by Ohio, on the N. N. E., and E. N. E. by Pennsylvania and Maryland, on the E., S. E., and S. by Virginia, and on the S. W. by Virginia and Kentucky; area by U. S. census, 24,780 sq. miles, of which 135 sq. miles are water surface.

Physical Features.—On the eastern border of the State are the Alleghany Mountains proper, lofty spurs of which trend northward toward the Ohio. Three physical regions are clearly indicated: (1) The Eastern Plateau, on which is the loftiest mountain elevation in the State, and which embraces nine counties, viz., Mercer, Monroe, Greenbrier, Pocahontas, Randolph, Tucker, Pendleton, Hardy, and Hampshire. (2) The Central Plateau, which stretches across the State from N. to S., having a mean elevation of about 1,000 feet, and an average width of about 25 miles. On its southern portion, a northern continuation of the Cumberland range, are lofty elevations, some of the peaks of which, in Raleigh and Wyoming Counties, are estimated at from 3,000 to 3,500 feet in height. (3) The Ohio Valley Plain, along the Ohio

river and the entire northwestern border of the State, from Wayne to Hancock Counties, in which are twelve of the most populous counties of the State. Here the elevation is from 575 to 850 feet. In addition to these there is what is called the Potomac region, which is drained by the upper waters of the Potomac, and in which are eight counties—Jefferson,

Seal of West Virginia.

Morgan, Berkeley, Hampshire, Mineral, Hardy, Grant, and Pendleton. The lowest depression W. of the mountains is at Kenova, at the mouth of Big Sandy river, which is 575 feet above the Gulf. At Charleston the altitude is 601 feet; Wheeling, 645; Grafton, 967; Clarksburg, 1,035; Lewisburg, in Greenbrier County, 2,200; Bluefield, in Mercer County (2,555); the Fairfax Stone, in Tucker County, 2,300; Big Sewell Mountain, in Fayette County, 3,500; Keeney's Knob, in Summers County, 3,700; Panther Knob, in Pendleton County, 4,000; Turkey Bone Mountain, in Randolph County, 4,210; and Spruce Knob, 4,860, which is the highest point of land in the State. In the Potomac region, E. of the mountains, the lowest depressions are at Harper's Ferry, where the elevation is but 279 feet above tide-water at Washington, and at Martinsburg 391 feet.

Soil and Productions.—There are no transportation soils; all are native and come from the disintegration of limestones, sandstones, and various admixtures of shales and clays, forming, respectively, calcareous soil, sandy soil, and clayey soils and loams. These elements insure great fertility, and the lands are therefore productive to the very mountain-tops. Wheat, corn, and all the cereals yield abundantly. Almost all the fruits known to the temperate zone are grown, and fruit-culture is developing rapidly. The State lies central in the great Blue Grass region, which stretches from the banks of the Kentucky river to the lakes of Western New York.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms.....	62,674	72,773	16.1
Total acreage of farms.....	10,193,779	10,321,326	1.3
Value of farms, including buildings and fences.....	\$133,147,175	\$151,880,300	14.1

* Increase.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	681,728	12,611,968 bu.	\$7,188,882
Wheat.....	298,056	4,816,478 "	2,889,887
Oats.....	155,931	2,884,724 "	1,125,042
Rye.....	14,806	118,448 "	67,515
Buckwheat.....	13,966	315,632 "	195,692
Tobacco.....	3,737	2,634,585 lb.	263,459
Potatoes.....	32,018	1,664,936 bu.	949,014
Hay.....	546,260	557,185 tons	5,939,592
Totals.....	1,846,502	\$18,619,933

On Jan. 1, 1895, the farm animals comprised 169,844 horses, value \$6,581,572; 7,601 mules, value \$373,084; 180,442 milch cows, value \$3,509,597; 329,570 oxen and other cattle, value \$4,932,221; 635,535 sheep, value \$1,137,734; and 378,830 swine, value \$1,480,317—total head, 1,701,822; total value \$18,014,525.

Same Scale. H

Mineral Resources.—The State has a coal area of 16,000 sq. miles, divided into five districts, viz., the Flat Top, Kanawha, New River, Northern, and Upper Potomac, and in 1893 ranked fourth in production, the output being 10,708,578 short tons, valued at \$8,251,170. The same year the State ranked second in production of petroleum, having an output of 8,445,412 barrels, valued at \$5,425,522. This petroleum is identical with that of Pennsylvania, excepting a portion of that from the Volcano and Burning Springs districts, which yield a natural lubricating oil of high grade. The total production in the State to the close of 1893 was 20,481,855 barrels. The production of salt, of the common fine and common coarse grades, was 210,736 barrels; value, \$68,222. Quarry outputs were restricted by the business depression showing sandstone to the value of \$46,135 and limestone to that of \$19,184. The value of the natural gas consumed was \$123,000. There were seven mineral springs whose waters were bottled for commercial use, and twelve mineral spring resorts. The iron-ore production of Virginia and West Virginia together was 616,965 long tons, valued at \$1,050,977.

Climate.—The climate is salubrious and agreeable. The warm season is long, but the heat is not intense. At Morgantown, in the north, the mean temperature of winter ranges from 34 to 42°, and of summer from 70 to 75° and in the southern part of the State the range is from 2° to 5° higher. The mean annual temperature of the whole State is 56.4°, and the average rainfall 44.2 inches, Lewisburg, with an elevation of 2,200 feet, having 35.75 inches, and Kanawha Salines, elevation about 570 feet, 55.84 inches.

Divisions.—For administrative purposes the State is divided into fifty-five counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1880.	Pop. 1890.	COUNTY-TOWNS.	Pop. 1890.
Barbour	6-I	11,870	12,702	Philippi	378

* Reference for location of counties, see map of West Virginia.
 † Formed since census of 1880.
 ‡ Population in 1895, on extension of corporate limits, 12,500.

Principal Cities and Towns, with Population for 1890.—Wheeling, 34,522; Huntington, 10,108; Parkersburg, 8,408; Martinsburg, 7,226; Charleston, 6,742; Grafton, 3,159; Clarksburg, 3,008; Benwood, 2,934; Moundsville, 2,688; Hinton, 2,570; New Cumberland, 2,305; Charleston, 2,287; Wheeling, 2,235; Keyser, 2,165; and Weston, 2,143.

Population and Races.—In 1860, 376,688; 1870, 442,014; 1880, 618,457; 1890, 762,794 (native, 743,911; foreign, 18,883; male, 390,285; female, 372,509; white, 730,077; colored, 32,717, including 32,690 persons of African descent).

Industries and Business Interests.—The census returns of 1890 showed that 2,376 manufacturing establishments reported. These had a combined capital of \$28,118,030; employed 21,969 persons, to whom \$8,330,997 was paid in wages; used materials that cost \$23,729,089; and had an output valued at \$38,702,125. The principal industries, according to the value of output, were the manufacture of iron and steel, \$7,490,934; lumber-mill products from logs or bolts, \$5,239,340; flour and grist mill products, \$3,902,994; nails and spikes, \$3,140,931; refined petroleum, \$1,171,374; coke, \$1,130,762; glass, \$945,234; planing-mill products, \$910,640; tanned and curried leather, \$896,120; malt liquors, \$747,402; cigars and cigarettes, \$562,060; and foundry and machine-shop products, \$506,513. In 1893 there were 4 iron-furnaces, 6 rolling-mills and steel-works, 856 cut-nail machines, and a wire-nail works in operation. The production of pig iron was 81,591 long tons against 154,793 tons in 1892. The coke industry in 1893 had 75 establishments, with an aggregate of 7,354 ovens and 132 in process of building. During the year 1,745,757 short tons of coal were used, and 1,062,076 short tons of coke produced, valued at \$1,716,907. Coal-mining held its place as the distinctive industry of the State.

Finance.—The State has no bonded debt. In 1894 the State receipts were \$1,650,703; expenditures, \$1,496,500; assessed valuations, real, \$145,737,960; personal, \$51,502,003—total, \$197,239,963. The State tax rate was 35 cents per \$100.

Banking and Insurance.—In 1895 there were 26 national banks with combined capital of \$3,076,000; 50 State banks with capital of \$2,779,122; 4 private banks; and an incorporated bank with capital of \$30,000. Sixty-eight fire-insurance companies were authorized to transact business in the State, of which 5 were State corporations.

Means of Communication.—In 1894 the State had 1,847 miles of railway, and the taxable value of all railway property was \$21,299,486. Three great trunk lines cross the State from E. to W., connecting the commerce of the East with that of the Mississippi valley. These lines are the Baltimore and Ohio, the Chesapeake and Ohio, and the Norfolk and Western. In addition to these there are several local lines of importance, including the Ohio River, the West Virginia Central and Pittsburg, the West Virginia and Pittsburg, and the Cumberland Valley and Martinsburg railways.

Churches.—The census of 1890 gave the following statistics of the religious bodies having each a membership in the State of over 1,000:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Methodist Episcopal North	827	822	48,925	\$902,153
Baptist, Regular, North	478	459	34,154	381,200
Methodist Episcopal South	482	410	25,064	382,250
Roman Catholic	67	67	15,053	340,155
United Brethren in Christ	259	254	12,242	140,645
Methodist Protestant	230	222	10,652	153,545
Presbyterian in the U. S.	87	83	5,995	222,950
Disciples of Christ	85	83	5,807	42,202
Presb. in the U. S. of America	44	41	4,275	308,300
Baptist, Regular, Colored	71	61	4,223	59,000
Protestant Episcopal	61	66	2,906	276,687
Baptist, Free-will	32	31	1,668	34,000
Lutheran, United Synod in the So.	21	22	1,518	38,725
Lutheran, General Synod	5	5	1,108	69,000

Schools.—The public-school system embraces primary, graded, high, and normal schools, and a State University. The legal school age is from six to twenty-one years. In 1894 there were 282,770 children of school age, of whom 200,789 were enrolled in the public schools. There were 5,167 country and village schools, with 5,302 buildings valued at \$2,376,386, in which 5,747 teachers were employed. The State Normal School—Marshall College—is located at Huntington, with branches at Fairmont, Glenville, Shepherdstown, West Liberty, and Concord. These schools had

1,030 students. A Colored Institute is maintained at Farm. The State University, open to both sexes, at Morgantown, is one of the most thoroughly equipped institutions of its kind in the South, and in 1894 had 16 instructors, 247 students, and 7,047 volumes in its library.

Libraries.—According to U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, West Virginia had 7 libraries, containing 36,980 bound volumes and 3,128 pamphlets. The libraries were classified as follows: General, 2; college, 2; and school, law, and historical, each 1. In 1894 a State museum was opened to the public in the Capitol. It contains the exhibit of the State at the World's Exposition in Chicago and the collections of the State Historical and Antiquarian Society.

Post-offices and Periodicals.—In Jan., 1895, there were 1,802 post-offices, of which 30 were presidential (1 first-class, 4 second-class, and 25 third-class), and 1,772 fourth-class. Of the total 229 were money-order offices and 4 were limited money-order offices. There were 12 daily, 1 semi-weekly, 141 weekly, 1 bi-weekly, and 12 monthly periodicals—total, 167.

Charitable, Reformatory, and Penal Institutions.—These include a penitentiary, at Moundsville; Reform School for males, at Pruntytown; School for the Deaf and Blind, at Romney; First Hospital for the Insane, at Weston; and Second Hospital for the Insane, at Spencer.

Political Organization.—The Governor, auditor, State superintendent of free schools, treasurer, and attorney-general, all elected for four years, constitute the executive department, and also compose the board of public works. The Legislature consists of a senate of 26 members, each elected for four years (half every two years), and a house of delegates of 71 members, each elected for two years. Sessions of the Legislature are held biennially, and limited to forty-five days. The judiciary department comprises the supreme court of appeals, circuit courts, corporation courts, and justices of the peace. The supreme court of appeals is composed of four judges elected for twelve years, three of whom make a quorum. Three terms of the court are held annually, one each at Charleston, Wheeling, and Charlestown. There are thirteen judicial circuit courts and fourteen circuit judges, each elected for eight years. A circuit court is held three times a year in each county, and special terms are authorized. A judge of any circuit may, upon request, hold court in any other circuit. Corporation courts, having special jurisdiction, are established in cities or towns. Criminal courts, having jurisdiction in criminal matters only, are established in counties and cities where required. Each county is divided into magisterial districts with not less than three nor more than ten in any county, and each district elects one justice, or if the population exceeds 1,200, two. These justices have jurisdiction in misdemeanor and civil cases to the extent of \$300, but not in felonies.

History.—The territory now embraced in West Virginia was first visited by a white man, John Lederer, in 1669-70, when he was in the service of Gov. Berkeley as an explorer. The same year Robert Chevalier La Salle saw the western part of the State when descending the Ohio river. The Knights of the Golden Horseshoe accompanied Gov. Spotswood, of Virginia, over the Blue Ridge in 1716. John Van Metre traversed the valley of the south branch of the Potomac about 1725. The first white man to make a home within the present limits of the State was Morgan Morgan, who built his cabin in what is now Berkeley County, in 1727. The land grant of Lord Fairfax, for the "Northern Neck" of Virginia, extended far into what is now West Virginia, and the Fairfax surveyors, on Oct. 17, 1746, planted the "Fairfax Stone" at the head waters of the north branch of the Potomac to mark the western limit of the grant. France laid claim to all that part of the State W. of the mountains, basing her title upon the right of discovery, and when the English began to cross the mountains, France sent an expedition from Canada to bury leaden claim plates at the mouths of the principal tributaries of the Ohio. In the French and Indian war of 1755 Gen. Braddock marched through the eastern part of the State to the fatal field of Monongahela. The Shawnee Indians had numerous towns and villages in this region, but the title to all the territory included in the State appears to have been vested in the Six Nations, for by them the land was ceded to the King of England by the treaty of Fort Stanwix, now Rome, N. Y., in 1768. The Shawnees, Delawares, Mingoes, and other tribes N. of the Ohio, however, claimed that the territory thus ceded belonged to them, and refusing to yield it waged war along

the Virginia border from the date of cession until the treaty of Greenville in 1795. In this period there were many bloody engagements on the soil of West Virginia, and at Point Pleasant, at the mouth of the Great Kanawha, on Oct. 10, 1774, occurred the most desperate battle ever fought with the Indians in Virginia. When the Revolutionary war opened the pioneers of this region were the first troops from the south side of the Potomac that joined Washington at Boston. At the beginning of the war of 1861-65, when Virginia passed the ordinance of secession, a majority of the people W. of the mountains resolved to remain in the Union, and early set about the formation of a new State. Meetings were held in several counties, but the first one, the object of which was to secure united action, met at Clarksburg on Apr. 22, 1861. The first Wheeling convention was held in May following, and the second Wheeling convention, which met on June 11, provided for the organization of a new State. On June 20, 1863, West Virginia was admitted to the Union. The present constitution was adopted in 1871. Under an appropriation of \$3,885,200 the U. S. Government is creating slack-water navigation on the Big Kanawha river by means of locks and dams, from the Ohio river at Point Pleasant to a point near Kanawha Falls in Fayette County, a distance of 90 miles.

GOVERNORS OF WEST VIRGINIA.

VIRGIL A. LEWIS.

West Virginia University: an institution established in 1867 with the proceeds of the congressional land grant of July 2, 1862. It is located at Morgantown, in the north-western portion of the State. It has property worth about \$300,000, an endowment of \$110,000, and receives from the U. S. Government \$15,000 annually for agricultural experiment station work, and \$20,000 from the Morrill fund. It has eight academic schools, five professional and technical schools, and several special courses. It offers seven courses for degrees. It has a faculty of twenty-two professors, besides the staff of the experiment station. It is finely equipped for work in its civil, mining, and mechanical engineering departments, and for agriculture and horticulture. Tuition is free to West Virginian students. For the session of 1894-95 there were 283 students enrolled. P. B. REYNOLDS.

Wethersfield: town (settled in 1635); Hartford co., Conn.; on the Connecticut river, and the N. Y., N. H. and Hart. Railroad; 2 miles S. of Hartford (for location, see map of Connecticut, ref. 8-II). It contains the villages of Wethersfield and South Wethersfield; is connected with Hartford by electric railway and with Hartford and New York by a daily steamboat line in the open season; has the State prison, a high school, public library, the Webb house where Washington and Rochambeau met in 1781, and a monthly periodical; and is engaged in agriculture, packing and shipping garden seeds, and the manufacture of copying-presses and mattresses. Pop. (1880) 2,173; (1890) 2,271.

Wette, WILHELM MARTIN LEBERECHE, de: See DE WETTE.

Wetter, wet ter: the second largest lake of Sweden; 80 miles long, 13 miles broad; area, 733 sq. miles. It is 290 feet above the sea, and sends its surplus water to the Baltic through the Motala. It is connected with Lake Wener by canal.

Wettstein, wet stin, JOHANN JACOB: New Testament critic; b. at Basel, Switzerland, Mar. 5, 1693; studied theology; was appointed field-preacher to a Swiss regiment in the Dutch service, and in 1717 deacon in the Reformed church of his native city. From this office he was dismissed in 1730 on

account of deviations from the accepted Reformed creed, and in 1733 became Professor of Church History in the Remonstrants' College in Amsterdam, where he died Mar. 22, 1754. His principal works are *Prolegomena ad Novi Testamenti Græci Editionem accuratissimam* (1730; reprinted and re-edited by J. Semler, Halle, 1764) and a critical edition of the New Testament (2 vols., Leyden, 1751-52), in which "he did not venture to put new readings in the body of his page, but consigned those of them which he recommended to a place between the text and the full list of various readings. Beneath the latter he gave a commentary consisting principally of a mass of invaluable illustrations and parallels drawn from classical and rabbinical literature, which has formed a storehouse for all later commentators." Revised by S. M. Jackson.

Wexford: county of Ireland, province of Leinster; bordering E. on St. George's Channel and S. on the Atlantic. Area, 901 sq. miles. In the northern part the surface is elevated, and rises in Mt. Leinster and Blackstairs, but from this ridge it gradually slopes down into a level plain, which along the coast is fringed with swamps and marshes. The soil is fertile, and better cultivated than in most parts of Ireland. Good crops of wheat, barley, oats, and potatoes are gathered, and cattle-breeding, dairy-farming, and fishing are carried on with success. Pop. (1891) 111,778.

Wexford: capital of the county of Wexford, Ireland; on the right bank of the Slaney, which here is lined with a handsome quay; 93 miles by rail S. of Dublin (see map of Ireland, ref. 12-1). Its harbor is shallow, and accessible only for small craft; still its export trade in agricultural and dairy produce is important. It was an early Danish settlement, and was also one of the earliest landing-places of the Anglo-Norman invaders. Pop. (1891) 11,541.

Weyden, wīden, ROGIER van der, also called ROUGELET DE LA PASTURE and ROGEREUS DE PASCUS; painter; b. at Tournay, Belgium, about 1400. He was the founder of the Brabant school of painting, which had its center in Brussels. In 1426 he was apprenticed to Robert Camdin, of Tournay, to learn painting, but he may have practiced some other form of art previous to this. In 1432 he was enrolled as master in the Painters' Guild at Tournay. In 1436 he was elected town painter of Brussels, and painted about this time the four subjects in the Golden Chamber of the Hôtel de Ville illustrative of Justice, so much admired by contemporaries. These were destroyed by a fire which consumed part of the building during the French bombardment in 1695. He went to Italy in 1449, probably at the invitation of Leonello d'Este, of Ferrara, for whom he worked. In 1450 he was at Rome during the great jubilee held by Pope Nicholas V. He painted for the great Italian patrons of art—the Sforzas, the Medici, and Alfonso, of Naples—and he aided in spreading the northern method of oil-painting through Italy, where his work was extremely admired. On his return to Brussels commissions were unceasing. He had married at Tournay while young, and had several children, but in 1462 he and his wife entered a holy fraternity. He died in Brussels, June 16, 1464, and was buried in the Church of St. Gudule. The chief pictures remaining of this artist are as follows: a *Descent from the Cross*, in the Madrid Gallery; a triptych in the Berlin Gallery, painted for the Carthusian convent of Miraflores, near Burgos, Spain; also a triptych representing St. John the Baptist; a replica of the latter, in the Stuedel Institute, at Frankfort-on-the-Main; also a *Madonna*, with saints bearing the Medici arms; a triptych in the Belvedere of Vienna; a

triptych representing *The Last Judgment*, in the hospital at Beaune; a *Deposition* in the Uffizi, at Florence, supposed by Crowe and Cavalcaselle to be part of the triptych painted for Leonello d'Este; a triptych in Grosvenor House, London. *The Seven Sacraments*, at Antwerp, is not accepted by some authorities as Rogier's work. The London National Gallery contains two works by this master. The influence of Rogier van der Weyden is recognizable in the works of Dietrick Bouts, Hans Memling, Martin Schöngauer, and many other artists less known to fame. See Crowe and Cavalcaselle, *Early Flemish Painters* (1857; 3d ed. 1879); the monograph by Wauters (Brussels, 1856); and Pinchart's *Roger de la Pasture*, *Bulletin des Commissions Royales d'Art et d'Archéologie*, vol. xi., p. 408 (Brussels, 1867). W. J. S.

Weymouth, wā mūth: town (settled in 1623, incorporated in 1635); Norfolk co., Mass.; on the south shore of Boston Harbor, and on two branches of the Old Colony System of the N. Y., N. H. and Hart R. R., and the Quincy and Boston and Braintree electric railways; 12 miles S. of Boston (see map of Massachusetts, ref. 3-1). The town contains 7 villages (with a post-office in each), and has 16 churches, 2 high, 8 grammar, and several graded schools, Tufts Library (containing over 16,000 volumes), 2 national, 3 savings, and 2 co-operative banks, a weekly newspaper, and manufactures of boots and shoes, fireworks, hammocks, and phosphates. Pop. (1880) 10,570; (1890) 10,866; (1895) 11,291.

Whale [M. Eng. *whal* < O. Eng. *hwæl*; Germ. *wal*, *wal-fisch*; Icel. *hvalr*. Cf. WALRUS]; any one of several large Cetaceans, representing several different families, and even different sub-orders. The only character shared in common by them, independent of those characteristic of the order, is the large size. The families to which the forms thus distinguished belong are, of the whalebone whales or *Mysticete*, families *Balanopterida* and *Balanida*; and of the toothed whales, the families *Physcterida* and *Ziphiida*. The large species of *Delphinida* are also known as whales—e. g. *Delphinapterus beluga*, called the WHITE WHALE (*q. v.*), and the species of *Globicephalus*, generally designated as blackfish, etc. See WHALE-FISHERY and WHALEBONE WHALES.

Whaleback Steamers: vessels in which the hull has a form roughly resembling the back of a whale. The designer was Alexander McDougall, a sea-captain of Duluth, Minn., who brought them out about 1890. In two years he had constructed, mainly for use on the Great Lakes of North Amer-

A whale-back steamer, the Christopher Columbus.

ica, vessels of this class having an aggregate tonnage of 70,000. They proved to be very moderate in their demand for power, and were soon successful commercially. The section of the vessel is oval, the decks as well as the bilges are rounded, and, driven by steam-power solely, unhampered by masts and sails, the steamers are both easy to propel and quiet in motion. The seas are taken over them without obstruction, and produce no effect upon the movement of the ship. It is also claimed that their form gives peculiar facilities for securing good workmanship, and a

tight as well as singularly strong hull. Whaleback steamers have been used mainly as grain-carriers, but the Christopher Columbus, a steamer of about 3,000 tons burden, was employed throughout the period of the World's Columbian Exposition, in Chicago in 1894, to carry passengers between the city and the Exposition-grounds, and proved a very satisfactory vessel for that work. Later she plied as a passenger-steamer between Chicago and Milwaukee. This ship is 362 feet over all, 42 feet beam, and 24 feet deep, driven by triple-expansion engines of 2,600 horse-power. Her average speed is nearly 20 miles an hour. The shipyard where these vessels are built is at West Superior, Wis.

R. H. THURSTON.

Whalebone: the horny, elastic lamina obtained from whales of the sub-order *Mysticete*, although the best, and practically all that is used, comes from the right whale (*Balena mysticetus*). It is attached to either side of the upper jaw, with the fibrous portion in and unbroken edges out, thus forming a sort of filter through which the water passes as it is expelled from the jaws, the small fish, etc., which comprise the food of the animal, being thus retained. Its fibers have very little lateral cohesion, and can easily be removed in the form of long filaments; the blades, 300 of which are sometimes present on each side of the mouth, are arranged in parallel series, resembling somewhat the roof of a house in shape; they are usually about 8 to 12 feet in length, 10 to 12 inches in breadth, and $\frac{1}{4}$ inch in thickness. In the manufacture of useful articles from whalebone the blade is first cut in parallel prismatic slips, which are then dried and leveled by planing, the shavings being sometimes utilized as a stuffing for mattresses. When heated by steam it softens, and can then be bent or moulded in forms which it retains if allowed to become cool under pressure. The essential constituent of whalebone appears to be albumen, its hardness being probably increased by the small proportion of calcium phosphate. Whalebone has been employed for the ribs of umbrellas and parasols, stiffening of stays, framework of hats, and in the manufacture of whips, canes, ramrods, archery bows, fans, screens, etc.; but steel rods have been substituted for it for several of these purposes with improved results.

Revised by F. A. Lucas.

Whalebone Whales: whales distinguished by the possession of whalebone. This substance is a peculiar epidermal development arising from each side of the median line of the roof of the mouth, and may be looked upon as modified hair. Teeth are existent in a rudimentary condition in the fetus, but are not functionally developed, and are absorbed and disappear before birth; the supraaxillary bones are not extended backward over the frontal bones, but are produced outward in front of the orbits; the olfactory organ is distinctly developed, and the nasal bones project forward, and are not overlapped at their distal ends; the lower jaw has its rami bowed out, and connected at their symphyses by fibrous tissue, and not by suture. They are distinguished from the toothed whales chiefly in that the head is more depressed above toward the margin of the jaw, the eyes situated nearly above the angle of the mouth, and the lower jaw and throat more baglike. The forms thus combined exhibit two primary modifications of structure, which by some are considered as of family value, but by others as indicative of only sub-family rank:

(1) The typical whalebone whales (*Balanidae*) have the skull greatly arched at the maxillary region, and the rostrum narrow and compressed at the base; the frontals have the orbital processes prolonged, and extremely narrow and rounded on the upper surface; the supramaxillary bones are entire at their posterior margins; the tympanic bones large and ovoid; the lower jaw has the coronoid processes almost obsolete; the cervical vertebrae are coalesced together; and the manus is comparatively broad, and has five fully developed fingers.

(2) The finback, humpback, and scragg whales (*Balenopteridae*) have the skull but slightly arched at the maxillary region; and the rostrum broad at the base, depressed, and gradually tapering; the frontals have the orbital processes moderately prolonged, broad, and flat on the upper surface; the supramaxillary bones are deeply excavated at their posterior margins; the tympanic bones elongated and ovoid; the lower jaw has the coronoid processes more or less developed; the cervical vertebrae in whole or in part separated; and the manus is narrow, and only four digits are developed, the first being wanting.

To the family *Balanidae* belong the bowhead or Green-

land whale and several distantly related species inhabiting warmer and Antarctic waters, which have been differentiated, but probably on insufficient grounds, into as many as six genera. The bowhead is the most valuable of all the whales from a commercial point of view, and is the species especially hunted by the whalers fitted out for the Arctic seas. Although not the longest, it is the stoniest of known species; its head is proportionately larger and more ungainly than any other of the sub-orders, and forms about one-third of the animal's entire length. Individuals occasionally reach a length of 60 or 70 feet, although not often found much exceeding 50. In proportion to its size it is the richest in oil-giving characters; individuals have been known to yield nearly 300 barrels. Its whalebone, which is of a black color, and developed in strips gradually attenuated toward the end, is also the most esteemed, and 3,500 lbs. or more have been obtained from a single individual. It is a timid animal, and rarely turns upon its pursuers, as do some of the species of *Balenopteridae*. "Sometimes, when engaged in feeding, it remains down for twenty-five minutes or more. The depth to which the animal descends when pursued is not accurately known, for, as a general rule, it has been captured 'on soundings' in the Arctic Ocean and Bering Sea, as well as in the Sea of Okhotsk, where the depths in places do not exceed 100 fathoms, and from that to less than 50. Sometimes it has been taken in very shallow water; yet this animal when in deep water has been known to 'sound out' a line, in its descent and return, equal to a mile in length." (*Scammon*.) The species is now sought for chiefly in Bering Sea, and in the Arctic Ocean N. of it. According to Scammon, "the bowheads of the Arctic may be classed as follows: 1st class—the largest whales, of a brown color; average yield of oil, 200 barrels; 2d class—smaller, color black; yield of oil, 100 barrels; 3d class—the smallest, color black; yield of oil, 75 barrels. Those belonging to the last-named class are generally found among the broken floes, the first of the season, and they have been known to break through ice three inches in thickness, that had been formed over water between the floes. They do this by coming up under and striking it with the arched portion of their heads." Hence they have been called ice-breakers. The whalers strive to be on their hunting-grounds in the early summer, and they frequently reach the latitude of 72° N., and sometimes, in open seas, even beyond.

The family *Balenopteridae* is much richer in forms and decided contrasts than the *Balanidae*. There are three primary types. In the *Balenopterinae* the throat is longitudinally plicated; a high, erect, and more or less falcate dorsal fin exists; the frontal bones have orbital processes nearly as broad at the outer extremity as the base, and somewhat narrowed; the manus is moderate, and has four digits, none of which have more than six phalanges. These are mostly very large whales, which have been grouped under the generic names *Balenoptera*, *Physalus*, *Sibbaldius*, and *Rudolphius*. The *Megapterinae* have also the throat longitudinally plicated, but the dorsal fin developed as a mere hump; the manus is very long, and the digits are segmented into many phalanges; these are the humpback whales, which have been grouped under the genera *Megaptera*, *Poesopoma*, and *Eschrichtius*. Finally, the *Agaphelinae* are characterized by the plications of the throat being obsolete, and not more than two in number, and by the dorsal fins being entirely undeveloped. To this group belong the genera *Agaphelus* of the Atlantic Ocean, and *Rhachianectes* of the Pacific. The most gigantic of known cetaceans belong to the family and to the genera *Physalus* and *Sibbaldius*. The *Sibbaldius sulfureus* of the western coast of America has been reported to reach an equally great length. The body in these animals is relatively slender, and they are capable of great speed. Fourteen species have been credited to the American coasts.

Revised by F. A. Lucas.

Whale-fishery: the capture of whales for commercial purposes. It is an industry of long standing, the first recorded whale-fishery having been carried on along the Basque coasts of France and Spain, where, as early as the tenth century the southern right whale, *Balena biscayensis*, was pursued in the Bay of Biscay. About the end of the sixteenth century the supply of these whales began to fail, and a little later the species was all but exterminated on the coast of Europe. At this time, however, the Greenland or right whale, *Balena mysticetus*, a larger animal with more oil and better whalebone, was discovered, and the whale-fishery was promptly transferred to the Arctic Ocean in the

vicinity of Spitzbergen, where the Dutch established a village by the name of Smeerenberg for trying out the oil. After the extermination of the whales in that vicinity the fishery was carried on along the shores of Greenland; Smeerenberg was abandoned, and the blubber taken to Holland. At this period the Dutch led in the whale-fishery, and in 1680 260 ships and 14,000 sailors were engaged in the industry. The Dutch and French fisheries were destroyed by the wars at the close of the eighteenth century, during which England held possession of the North Sea, and from that time on the English have stood first in Europe, reaching the highest point about 1815, when 154 vessels were employed in whaling. Since then the business has declined, and at present Dundee and Peterhead are the only two whaling-ports in the United Kingdom. The American whale-fishery may be said to date from the settlement of New York and New England, one of the arguments for settling on Cape Cod being the presence of large whales of the best kind for oil and bone. At its inception whaling seems to have been carried on in a somewhat desultory manner, by boats from shore, or by small vessels, and, judging from the number of laws on the subject, and the importance attached to whales picked up adrift, it would appear that whales were frequently killed, or mortally wounded and then left to wash ashore or to be secured later. In 1644 the town of Southampton, L. I., was systematically divided into wards to watch for whales which might come ashore, and by 1669 the whale-fishery was actively prosecuted in that locality, twelve whales having been taken by the end of March. By 1700 Nantucket, or Sherburne, as it was then called, had advanced to the first rank as a whaling-port, and in 1726 shore-whaling reached its highest mark, eighty-six whales having been taken in that year. New Bedford, which now stands first in the whale-fishery, did not engage in that industry until 1760 or thereabouts.

In 1846, 722 whaling vessels, aggregating 231,406 tons, hailed from the U. S., and the catch of that year was worth \$21,000,000. In 1854 the value of oil and bone had fallen to \$10,766,521, and in 1880 to \$2,659,725. Statistics for 1894 show that the U. S. had but eighty-five vessels engaged in whaling, and that during the year they took 272,300 lb. of whalebone, worth \$803,285; 339,223 gal. of sperm oil, worth \$189,965; and 273,105 gal. of whale oil, valued at \$88,759; a total of \$982,009. While the final decline of the whale-fishery is due to the growing scarcity of whales and the introduction of mineral oils and substitutes for whalebone, the American fishery has been particularly unfortunate in other ways. The war of the Revolution put an end to all whaling save that carried on by Nantucket, and even this was almost destroyed. Then came a revival, followed by the war of 1812, and finally during the civil war the Arctic whaling fleet was burned by the Confederate privateer *Shenandoah*. After all this came the loss of thirty-three out of forty vessels which were crushed by the ice in 1871.

The right whale or bowhead, *Balana mysticetus*, is commercially the most important, on account of the whalebone, the oil being a secondary consideration, and this species is taken in the Arctic Ocean and Davis Strait, usually in the vicinity of ice. The southern right whales, *Balana biscayensis*, *japonica*, *australis*, and *antipodarum* are taken respectively in the North Atlantic, North Pacific, and Antarctic seas, but have become scarce, and their capture forms a comparatively unimportant branch of the whale-fishery, although the pursuit of the first-named species gave rise to the whale-fishery. These species frequent the vicinity of land to bring forth their young, and this fact, coupled with regard for their offspring, has led almost to their extermination, since it was the habit of whalers, especially those of Australia and New Zealand, to kill the young and then take the mother. The finbacks, *Balaenoptera*, and humpbacks, *Megaptera*, yield comparatively little oil, and their bone is almost worthless; still, in spite of their size and power, the introduction of steamers, bomb-lances, and harpoon-guns has rendered their capture practicable and profitable in many places, notably on the coast of Norway. These animals are often killed in shallow water, as in Massachusetts Bay, where they sink, but rise in a few days and are towed ashore. The sperm whale, *Physeter macrocephalus*, furnishes the best grade of oil; it is taken in the warmer parts of the Atlantic, Pacific, and Indian Oceans. The bottlenose, *Hyperoodon rostratum*, a relative of the sperm whale, furnishes a good oil, and, although of comparatively small size, is taken from steamers in the North Sea in considerable numbers.

The early harpoon was that with a V-shaped point, and the lance had a leaf-shaped point, or one much like the blade of a putty-knife. A great improvement was effected when the head of the harpoon was made with a single long barb, so pivoted to the shaft as to set at right angles to it when a strain was put upon the line attached to the harpoon. Though many patterns of harpoons have been devised, this is still the favorite for throwing by hand. Certain styles of harpoons are shot from heavy swivel-guns, mounted either on the bow of a boat or on the forward part of a steamer, and these are employed in the finback and bottlenose fisheries of the North Sea. Still other harpoons are fired on the principle of a rocket, and are so constructed that while the head fastens to the whale, a bursting charge, contained in the rear portion, explodes and kills the creature, while in another piece of apparatus thrown by hand a bomb-lance, attached to the handle, is fired as soon as the harpoon has entered a certain depth. The use of the bomb-lance has rendered the killing of whales safer and more expeditious; this "lance" consists of a hollow cylinder, 12 to 20 inches long, pointed at one end, feathered at the other to make it fly straight. The lance is filled with powder, fired from a short, heavy gun from the shoulder, and so timed as to explode in the body of the whale.

Whaling was originally carried on in boats from stations on the shore, and the whales when discovered were pursued, harpooned, and when tired out killed by means of long lances thrust by hand. Next came the employment of sloops and other small sailing craft which ventured but a short distance from shore, and these were superseded by larger vessels as the whales became scarcer, until barks and ships were the standard whalers, and a voyage lasted three years or more. The best whaling-vessels are bark-rigged auxiliary screw steamers, that is, sailing-vessels equipped with an engine of moderate power and a propeller which can be raised when the breeze is favorable.

Owing to the increasing scarceness of whales some of the British and American steam whalers have of late years wintered in Arctic seas, the former in Davis Strait, the latter at the mouth of Mackenzie river, where they awaited the coming of the whales at the breaking up of the ice in spring. These measures were successful in 1893, when 294 bowheads were taken by the U. S. Arctic fleet, one vessel, the *Narwhal*, capturing forty-eight whales worth \$180,000. In 1894 the whaling was poor, probably as a result of the former season's catch, and it seems as if profitable whaling were drawing toward a close. It had been hoped that the Antarctic seas might contain profitable grounds, but steamers dispatched there met with small success, and it is probable that the whales once reported there were simply those which in the winter sought the vicinity of Australia and New Zealand, where they were exterminated.

See Scammon, *Marine Mammals of the Northwestern Coast of North America* (1874); Starbuck, *History of the American Whale Fishery, in Report of Commissioner of Fish and Fisheries for 1875-76* (1878); *Fisheries and Fishery Industries of the United States*, sec. v., vol. ii. (1887), better known as quarto *Fishery Report*. F. A. LUCAS.

Whale Oil: the liquid portion of the fat of the common whale, differing from that obtained from the *Physeter macrocephalus* (sperm oil) in possessing a darker color and more disagreeable odor. It possesses a sp. gr. of .927, contains small quantities of spermaceti, and does not become solid above 32° F., while sperm oil has a sp. gr. of .868, and remains semi-solid at 44° F. Whale oil can be deodorized by agitation with bleaching-powder.

Whang-hai: an old spelling of Hwang-hai, the YELLOW SEA (*q. v.*).

Wharf and Wharfing [wharf < O. Eng. *hwærf*, a bank or dam to keep out water]: A wharf is a broad plain space or surface resting upon the shore of a harbor or a navigable stream, and generally projecting out beyond the lowest ebb of the tide, so that vessels may moor at its sides or end. Its purpose is to afford a convenient place at which vessels may load and unload—that is, on which goods may be deposited when taken out of a ship or preparatory to being put on board a ship. In the U. S. wharves are generally constructed by driving piles into the bed of the harbor or river, and covering them with a flooring of timber-work and plank; but they are sometimes built of stone upon abutments and piers. It is plain that a wharf must necessarily abut upon the space where the tide ebbs and flows, and that it may extend beyond that space. It is a settled doctrine of the common

law that this portion of land between high and low tide, called the "shore," belongs to the government, and that the harbor or river beyond the lowest ebb is under the exclusive control of the government. A wharf, therefore, built without governmental authority would be a public nuisance. In Great Britain the crown, in the U. S. the several States, hold the power to authorize and regulate the construction and use of wharves. As a matter of fact, this authority has been frequently ceded away, either to municipal corporations or to private persons. The State of New York, for example, has granted the shore of Manhattan Island to New York city, and that city owns the wharves which fringe its territory, and which it leases to individual occupants. In other States the shore and the right to construct wharves thereon have often been conveyed to the proprietors of the adjacent uplands.

WHARFING is the business carried on by the occupant of a wharf, either owner or lessee, who is termed a wharfinger. He is a bailee for hire, for he receives and keeps the goods placed in his custody. He is entitled to demand a compensation, called wharfage, for the privilege of mooring a vessel at his wharf, and there receiving or discharging her cargo, and for the storage of goods. The amount of these fees, since the business is one of a quasi-public nature, is often regulated by statute. (See, e. g., the New York Consolidation Act (Laws of 1882, chap. 410), secs. 716, 798-802.) The wharfinger is bound to exercise ordinary care and diligence in respect of the goods placed in his custody—that is, deposited on his wharf—and is responsible for losses caused by ordinary negligence. Unlike the warehouseman and most other bailees, he has a general lien on the goods of a customer for any balance due him on account. See LIEN.

Wharncliffe. JAMES ARCHIBALD STUART-WORTLEY MACKENZIE, BARON; b. in England, Oct. 6, 1776; served in the army 1791-1801; entered Parliament 1797; was created Baron Wharncliffe July 12, 1826; was Lord Privy Seal Dec. 15, 1834, to Apr., 1835, and became president of the council 1841. D. in London, Dec. 19, 1845. He was a great-grandson of the celebrated Lady Mary Wortley Montagu, whose *Letters and Works* (5 vols., 1837) he edited. He was the originator of that standing order of the House of Lords known as the Wharncliffe order. A similar order has been adopted by the House of Commons, and the meetings held in conformity with this order have since their introduction been popularly known as "Wharncliffe meetings."

Wharton, FRANCIS, D. D., LL. D.: jurist; b. in Philadelphia, Pa., Mar. 7, 1820; graduated at Yale in 1839; studied law and was admitted to the bar in 1843; and in 1845 became assistant district attorney in Philadelphia, where he practiced for many years; in 1856 he went to Kenyon College, Ohio, as Professor of Logic and Rhetoric, and remained there until about 1863, and then went abroad; returned to the U. S. and was ordained in the Protestant Episcopal Church, and became rector of St. Paul's church, Brookline, Mass., also holding at the same time professorship of Canon Law, Polity, and Apologetics in the Divinity School at Cambridge, Mass., and of International Law in the Boston Law School; in Mar., 1885, he was appointed by the President of the U. S. counsel to the State Department at Washington, D. C., in matters of international law; and in 1888, under a resolution of Congress, was made editor of the Revolutionary diplomatic correspondence of the U. S. D. at Washington, D. C., Feb. 21, 1889. He was a man of extremely varied attainments, and remarkable rather for the breadth of his knowledge than for minute accuracy in scholarship. His best-known work is a *Treatise on the Criminal Law of the United States* (1846), which is a standard work, and has passed through many editions, besides which he also wrote many others, including *State Trials of the United States during the Administrations of Washington and Adams* (1849); *Precedents of Indictments and Pleas* (1849); *Treatise on the Law of Homicide in the United States* (1855); *Treatise on Theism and Modern Skeptical Theories* (1859); *The Silence of Scripture, a Series of Lectures* (1867); *Treatise on the Conflict of Laws, or Private International Law* (1872); *The Law of Agency and Agents* (1876); *Commentary on the Law of Evidence and Civil Issues* (1877); *Commentary on the Law of Contracts* (1882); *Commentary on Law* (1884); *Digest of the International Law of the United States* (1886); *Treatise on the Law of Evidence and Criminal Issues* (8th ed. 1880). F. S. A.

Wharton, GRACE and PHILIP: See THOMSON, KATHARINE.

Wharton, PHILIP, Duke of; politician; son of Thomas, the first marquis; b. in Dec., 1698; made a secret marriage at the age of sixteen; succeeded to the marquise Apr., 1715; studied under a strict Calvinistic tutor at Geneva 1716, but ran away to Avignon, where he recognized the Pretender and is said to have received from him the title of Duke of Northumberland; proceeded to Paris; soon afterward took a seat in the Irish House of Peers 1716; distinguished himself in debate; was made Duke of Wharton in the English peerage Jan. 28, 1718; entered the British House of Lords 1720; distinguished himself against the ministry; soon impoverished himself by his extravagance; edited a semi-weekly paper, *The True Briton*, 1723-24; went to Vienna, and thence to Madrid, 1726; took service under the Pretender; was aide-de-camp to the Count of Torres at the siege of Gibraltar; was made colonel of an Irish regiment in the Spanish service; was attainted of treason in England, and his property was confiscated; visited Rome, Paris, and other parts of Europe, and died in poverty at Tarragona, Spain, May 31, 1731. His *Life and Writings* appeared in the following year (2 vols., 1732). His *Poems* had been published in 1727. Revised by F. M. COLBY.

Wharton, THOMAS, Marquis of; Whig statesman; b. in England about 1640; eldest son of Philip, fourth Baron Wharton; entered Parliament soon after the Restoration; took a prominent part in the opposition to Charles II.; was sent to the Tower for joining in the complaint against the long prorogation of Parliament Feb. 17, 1677; was one of the first to join the Prince of Orange 1688; was appointed comptroller of the royal household and privy councillor Feb., 1689; succeeded to the family title 1696; fought a duel with Viscount Cheyney 1697; was commissioner to negotiate the union with Scotland, for which service he was rewarded with the titles of Viscount Winchenden and Earl Wharton Dec. 23, 1706; was Lord-Lieutenant of Ireland 1708-10, with Addison for his secretary, and became Privy Seal on the accession of George I., Sept., 1714, and Marquis of Wharton and Malmesbury Feb. 15, 1715, having been a zealous Whig and supporter of the Hanoverian succession, and a skillful party manager, though notorious for licentiousness. D. in London, Apr. 12, 1715. He was the reputed author of the famous Irish ballad *Lillibullero*.

What Cheer; city; Keokuk co., Ia.; on Coal creek, and the Burl., Cedar Rap. and N. and the Chi. and N. W. railways; 12 miles N. W. of Sigourney, the county-seat, and 70 miles S. E. of Des Moines (for location, see map of Iowa, ref. 6-1). It is in a coal-mining and agricultural region, and has 6 churches, 3 public-school buildings, a national bank with capital of \$50,000, a State bank with capital of \$30,000, 3 weekly newspapers, and district fair-grounds. Pop. (1880) 719; (1890) 3,246; (1895) 2,675.

EDITOR OF "PATRIOT."

Wheaton, New; city; capital of Whatcom co., Wash.; on Bellingham Bay, and the Bell, Bay and Brit. Col., the Gr. North., and the N. Pac. railways; 125 miles N. of Seattle (for location, see map of Washington, ref. 1-C). It is in an agricultural, lumber, and mineral region, and has large commercial interests that are promoted by exceptional facilities for transportation by rail and water. The harbor is nearly landlocked, about 7 miles in diameter, and with 5 to 13 fathoms of water. A State road is being constructed from the city over the Cascade Mountains, across the celebrated Mt. Baker pass, to the gold and silver mines, the grazing-lands, and the Columbia river. The city contains a State normal school, and has a court-house built of native stone, new city-hall, gravity water-works supplied from Lake Whatcom, 4 miles distant, the noted Cornwall coal mine, improved sewerage, electric-lighting and street-railway plants, 2 national banks with combined capital of \$110,000, a private bank, and a daily, a tri-weekly, and 2 weekly newspapers. The former city of Whatcom and the town of Schome were consolidated under the name of New Whatcom in Dec., 1890. Pop. (1880) not in census; (1890) Whatcom, 4,059; Schome, 2,700—total, 6,759; (1895) estimated, 7,500.

EDITOR OF "REVELLE."

Whately, RICHARD, D. D.: Archbishop of Dublin; b. in London, England, Feb. 1, 1787; studied at Oriel College, Oxford; took a double second-class in honors 1808; became a fellow of Oriel 1811; took orders in the Church of England; was intimately associated at Oriel with Keble, Arnold, Pusey, John Henry Newman, and others destined to become innovators in British theology; was noted for his wit, his freedom of thought and action, and fondness for

debate; was Bampton lecturer 1822; rector of Halesworth, Sussex, 1822-25; principal of St. Albans Hall, Oxford, 1825-30; Professor of Political Economy in the University of Oxford 1830-31, and was appointed by Earl Grey Archbishop of Dublin 1831, in which capacity he was charged with the difficult task of carrying out, in the details of social, political, and religious life, the principles embodied in the Roman Catholic Relief Act. He was for twenty years the leading member of the Irish national board of education, for which he wrote several educational books; endowed the professorship of political economy in the University of Dublin; promoted the extension of the "national system" of unsectarian education in Ireland; won the confidence and co-operation of the Roman Catholic Archbishop Murray, but resigned his seat at the board in 1853 from inability to work in harmony with Archbishop (afterward cardinal) Cullen, and from the covert opposition of illiberal clergymen of the Church of England. He filled the posts of Bishop of Kildare, visitor of Trinity College, president of the Royal Irish Academy, and chancellor of the order of St. Patrick. Archbishop Whately was regarded as one of the founders of the "Broad Church" party, and was distinguished for "large munificence, genial hospitality, ever-ready wit, and solid common sense." D. in Dublin, Oct. 8, 1863. Among his numerous works are *The Use and Abuse of Party Feeling in Matters of Religion* (Oxford, 1822), being the Bampton lectures for that year; *Essays on some of the Peculiarities of the Christian Religion* (1825); *Elements of Logic* (1826); *Elements of Rhetoric* (1828); *Essays on some of the Difficulties in the Writings of the Apostle Paul, and in other Parts of the New Testament* (1828); *View of the Scripture Revelations concerning a Future State* (1829); *Introductory Lectures on Political Economy* (1831); *Essay on the Omission of Creeds, Liturgies, and Codes of Ecclesiastical Canons in the New Testament* (1831); *The Kingdom of Christ delineated* (1841); *Introductory Lessons on Christian Evidences* (1841); *Introductory Lessons on the Study of St. Paul's Epistles* (1849); *English Synonyms* (1851); *Cautions for the Times* (1853); *Bacon's Essays, with Annotations* (1856); *Introductory Lessons on Morals* (new ed. 1860); *Introductory Lessons on Mind* (1859); *Introductory Lessons on the British Constitution* (1859); *Lectures on some of the Parables* (1859); *Lectures on Prayer* (1860); *A General View of the Rise, Progress, and Corruptions of Christianity* (1860); and *Miscellaneous Lectures and Reviews* (1861). His daughter, Miss E. Jane Whately, edited his *Miscellaneous Remains* (1864) and *Earlier Remains* (1864); and also published her father's *Life and Correspondence* (2 vols., 1866). Two volumes of *Memoirs* (1864) were published by William J. Fitzpatrick.

Revised by J. M. BALDWIN.

Wheat [M. Eng. *whete* < O. Eng. *hwæte* : O. H. Germ. *weizzi* (> Mod. Germ. *weizen*); Icel. *hveiti* ; Goth. *hwæitēs* ; Lith. *kvietys*, wheat; cf. *white*]; one of the most valuable of the cereals, the *Triticum sativum* (Lam.) of the family Gramineæ; distinguished by a spike bearing spikelets on opposite sides of a hollow and jointed stem which rises zig-zag, and forms notches at each joint. The kernels have a longitudinal furrow on one side, and are inclosed by glumes or chaff which frequently bear awns. The plant is not now known in a wild state, but many botanists believe that it had its home in the western part of Asia. The cultivation of wheat is as old as the history of man. Chinese records mention it at a date earlier than 2000 B. C. It is not known to have grown in America until after the discovery of that continent by Columbus. Two forms of wheat are cultivated for food: one in which the glumes are easily removed by the ordinary methods of threshing, the other, in which they adhere firmly to the kernel like barley, and is known as spelt. The former includes by far the greater part of the world's crop. Spelt is chiefly grown in the mountainous districts of Europe. The varieties of wheat are classified by agriculturists as spring and winter, bearded and beardless, and also according to the color of the grain, as red, amber, white, etc. Spring wheat is grown mostly in the colder latitudes, the seed being sown early in the spring, sometimes even before the frost is out of the ground. The grain ripens and is harvested the same season the seed is sown. Winter wheat is sown in the autumn, the grain maturing the following summer. This kind of wheat is grown mostly in latitudes where the rigor of winter is less severe than in the spring wheat districts. The terms *bearded* and *beardless* are used merely to indicate whether the glumes

bear awns or not. The color of the kernel gives little indication of productiveness or quality. The red varieties, as a rule, are more hardy than the lighter-colored grains.

Climate and Cultivation.—The quality of the grain is influenced by climate and soil, the principal change being in the proportion of gluten; the greater proportion of gluten the more valuable the grain for food. The varieties producing the hardest kernels are most prized for flouring purposes. Soil, climate, and cultivation also have a great influence on the character of the plant. It is clearly shown that by means of these winter wheat can be changed to spring wheat and *vice versa*, white to red, and the character of the awns also greatly changed. For the best results it is necessary that the wheat plant be given a chance to make its growth during cool weather, either in the early spring or late autumn in order to induce tillering. Under these conditions a much greater yield is secured than when the whole growth is made during warm weather. It is an exacting plant, and requires, thorough preparation. The best prepared soil is thoroughly compacted below, and finely pulverized at the surface. Whenever winter wheat follows a crop of spring grain, it is best to plow as early as possible after the spring crop is harvested, that plant food in the soil may be liberated by cultivation, and the soil compacted before the wheat is sown. The time of sowing will vary with different localities, the farther N. the earlier, and later the farther S. The best results are obtained by sowing with a grain-drill. Varieties that tiller well do not require so much seed. The size of the kernels and time of seeding governs to quite an extent the amount of seed sown, late seeding requiring more seed. As a rule, from 1 to 2 bush. an acre are usually sown. As wheat is usually harvested, it yields about two and a half times as much straw and chaff as grain. The greater the yield of grain to the acre, the greater the proportion of grain compared to the chaff and straw.

Composition and Fertilizers.—The cultivation of wheat is best suited to mixed husbandry, or where it can be grown in a rotation with other crops. Continued cultivation, by ordinary methods, without manure, so exhausts the land that the crop becomes unprofitable. In some of the Western States of the U. S. large areas formerly given wholly to the cultivation of wheat are now used for other purposes on account of the exhaustion of the soil for this crop. Wheat removes from the soil a much larger amount of nitrogen than of either phosphoric acid or potash. The following table gives the percentage of the principal elements of plant food removed from the soil by wheat and its products. These percentages are the average of a large number of American analyses of wheat:

	Moisture.	Ash.	Nitrogen.	Phosphoric acid.	Potash.
Wheat (spring).....	14.35	1.57	2.35	0.70	0.34
Wheat (winter).....	14.75	2.33	0.89	0.61
Wheat straw.....	12.56	3.81	0.59	0.12	0.01
Wheat chaff.....	8.05	7.18	0.79	0.70	0.42
Wheat bran.....	11.74	6.25	2.67	2.89	1.61
Wheat flour.....	9.83	1.22	2.21	0.57	0.54
Wheat middlings.....	9.18	2.30	2.63	0.95	0.63

FODDER ANALYSES OF WHEAT AND ITS PRODUCTS GIVEN IN PER CENT.

	Protein.	Crude fiber.	Nitrogen, free extract.	Fat.
Wheat (spring).....	12.5	1.8	71.2	2.2
Wheat (winter).....	11.8	1.8	72.0	2.1
Wheat flour.....	10.8	0.2	75.0	1.1
Wheat bran.....	15.4	9.0	53.9	4.0
Wheat straw.....	3.4	38.1	43.4	1.3

Harvesting and Threshing.—Modern inventors have wrought great changes in the manner of harvesting. In the great wheat districts of America the grain is now wholly harvested by power machines, horses being generally used. On smaller farms the twine-binder is used, which cuts and binds the grain into bundles by means of horse-power. On more extended farms or ranches machines called headers are used, which gather the heads of grain with as little straw as possible. These machines are also constructed for threshing the grain as fast as it is cut, leaving sacks filled with wheat scattered over the field. See REAPING AND MOWING MACHINES.

Diseases.—Several fungus diseases attack this crop with more or less severity. Among the most disastrous are rusts,

one of which, caused by the fungus *Puccinia graminis*, is the most prevalent. (See RUSTS.) Beardless and white varieties are more liable to be attacked than the bearded and red varieties. Hot, wet weather just before the wheat ripens is favorable to the growth of these fungus parasites. Early ripening varieties are more likely to escape than those which ripen later. All forms of rust attack the wheat after germination, and are not caused by the seed being contaminated. Other forms of fungus cause diseases known as smut. See SMUTS.

Insect Enemies.—One of the greatest enemies to the wheat plant in the U. S. is the Hessian fly (*Cecidomyia destructor*), a small two-winged gnat somewhat resembling a mosquito. It produces two or three broods, the fly laying its eggs in the autumn between the leaf and the main stalk. The young passes the winter in this position in pupa form, known as the flaxseed stage, which seed it very much resembles. In the spring the adult emerges and lays eggs between the leaf and stalk farther from the ground. The stalks are weakened and produce a poor quality of grain, many stalks breaking over and remaining ungathered by the reaper. Late seeding is practiced to prevent or diminish its ravages. Chinch bug (*Blissus leucopterus*) has done great injuries in the States drained by the Mississippi river. It is a small insect, not more than one-sixth of an inch in length. The eggs are deposited beneath the ground, the young feed on the roots, then the leaves. Their numbers are often so great that whole crops are entirely destroyed. The most effective means of combating them has been by spreading a contagious disease among them by means of infected bugs. Spraying the fields with insecticides and burning the stubble are recommended. Wheat midge (*Diplotis tritici*), a small gnat, deposits its eggs in the wheat blossoms. The young feeding on the undeveloped grain cause it to shrivel, and thus produce a worthless or inferior quality of berry. No remedy is known. Some varieties of wheat are less likely to be attacked than others. Varieties known as bearded and long berry red are most likely to escape ravages. White grubs, the larva of the genus *Lachnosterus* (May beetles), frequently do considerable damage to young wheat in the fall by feeding upon the roots. Skunks and crows often come to the relief of the farmer at this time, and destroy large numbers of these insects. Wire worms, the larval form of click beetles or elaters, feed on the roots of wheat and frequently do considerable damage. No satisfactory remedy has been found, although thorough tillage and compacting the soil has proved beneficial.

Production.—The annual estimate of the Hungarian Government of the world's production in 1895 was as follows in bushels:

IMPORTING COUNTRIES.		EXPORTING COUNTRIES.	
France	301,573,000	Russia	415,053,000
Italy	11,898,000	United States	400,017,000
Germany	103,550,000	India	237,456,000
Spain	86,528,000	Hungary	150,361,000
Great Britain	46,811,000	Asia, excluding Turkey	70,950,000
Austria	45,392,000	Roumania	62,414,000
Belgium	21,377,000	Argentina	60,905,000
Portugal	7,376,000	Bulgaria	52,182,000
Switzerland	5,300,000	Canada	51,065,000
Denmark	5,106,000	Africa	47,094,000
Scandinavia	5,106,000	Turkey	42,555,000
Netherlands	3,404,000	Anstralia	35,746,000
Greece	3,120,000	Servia	8,511,000
Total	749,531,000	Total	1,653,140,000
Grand total	2,402,671,000		

In the U. S. the average production in 1870-79 was 312,152,728 bush.; in 1880-89, 449,695,359 bush.; and in 1890-94, 476,678,028 bush. The largest annual production since 1880 was in 1891—611,780,000 bush. In the calendar year 1894 the production was 460,267,416 bush., valued at \$225,902,025, from 34,882,436 acres. The following States yielded a product of 5,000,000 bush. and upward each:

Ohio	48,441,471	Kentucky	11,005,963
Indiana	43,611,064	Iowa	10,737,400
Minnesota	37,752,453	Oregon	10,411,071
Kansas	35,315,259	Wisconsin	9,36,176
North Dakota	33,635,900	Washington	9,108,420
Illinois	33,312,370	Nbraska	8,754,900
California	30,376,705	Maryland	7,313,201
Missouri	23,353,920	Virginia	6,995,249
Michigan	20,232,058	Texas	6,803,150
Pennsylvania	18,848,700	New York	6,297,400
South Dakota	15,934,255	Tennessee	5,897,788

GEORGE C. WATSON.

Wheatear, or Fallowchat: the *Saxicola oenanthe*, a European bird of the family *Turdida*, allied to the CHAT

(*q. v.*), ranges from Africa in winter to the North of Europe in summer, is 6½ inches in length, generally colored ash-brown and buff, marked with white and black, and is easily trapped as a delicacy for the table. It feeds on worms and insects, and the male sings well in confinement. F. A. L.

Wheatley, HENRY BENJAMIN: philologist and bibliographer; b. at Chelsea, England, May 2, 1838; clerk to the Royal Society 1861-79; aided in founding the Early English Text Society and was its honorary secretary until 1872; became assistant secretary to the Society of Arts 1879; is secretary of the Topographical Society of London and of the Index Society; edited for the Text Society, from the original MS., Alexander Hume's quaint treatise, *Of the Orthographie and Congruitie of the Britan Tongue* (1865); *Mertin, or The Early History of King Arthur, a Prose Romance* (part i., 1866); and Peter Levin's *Manipulus Vocabulorum, a Rhyming Dictionary* (1868); compiled a *General Index to the Works of Thomas de Quincey* (1863); is author of a curious essay entitled *Of Anagrams* (Hertford, 1862); and of *Round About Piccadilly and Pall Mall* (1870); *What is an Index?* (1878); *Samuel Pepys and the World he lived in* (1880); *Bookbinding* (1882); *Decorative Art* (1884); *How to Form a Library* (1886); *How to Catalogue a Library* (1887); *Literary Blunders* (1893); and other works; edited Wraxall's *Historical and Posthumous Memoirs* (5 vols., 1884); and from the original MS. *Pepys' Diary* (1894).

Revised by HENRY A. BEERS.

Wheatley, PHILLIS: See PETERS, PHILLIS.

Wheat Midge: See WHEAT (*Insect Enemies*).

Wheat-moths: several lepidopterous insects which devour grain in the bin. Of these the best known is *Tinea granella*, an insect closely allied to the ordinary clothes-moth. Its larva devours the flour out of the kernels of wheat, and covers the shells with its thick web. Thorough cleanliness, whitewashing, and the use of coal oil tend to prevent its ravages, and the grain should be frequently shoveled over. An open lamp will also allure many of the flying moths to their own destruction. The Angoumois grain-moth (*Gelechia cerealella*) is another similar insect of the same family.

Wheaton: city; capital of Du Page co., Ill.; on the Chi. and N. W. Railway; 25 miles W. of Chicago (for location, see map of Illinois, ref. 2-G). It is in an agricultural, dairying, and stock-raising region, and has 8 churches, 2 public schools, new water-works plant (cost \$60,000), public library presented to the city by J. Q. Adams (cost \$50,000), a private bank, and 4 weekly newspapers. It is the seat of Wheaton College (Congregational, founded as Illinois Institute in 1853, chartered under its present name in 1860), which in 1894 had 16 professors and instructors, 287 students, \$50,000 in productive funds, and \$15,000 in total income. Pop. (1880) 1,160; (1890) 1,622; (1895) estimated, 2,500.

EDITOR OF "WHEATON ILLINOIAN."

Wheaton, FRANK: soldier; b. in Providence, R. I., May 8, 1833; educated as a civil engineer at Brown University; employed as assistant on the U. S. and Mexican boundary survey and Government surveys 1850-55, when he became first lieutenant in the First U. S. Cavalry; became lieutenant-colonel of volunteers July 10, 1861; was promoted brigadier-general of volunteers from Nov. 29, 1862, and commanded a brigade Sixth Corps at the storming of Marye Heights and battle of Salem Heights, May 3-4, 1863; in command of a division at battle of Gettysburg; detached from the Army of the Potomac Dec. 30, 1863, to defense of Harper's Ferry; rejoined that army Mar., 1864, and in command of brigade Sixth Corps from Wilderness battles to front of Petersburg; detached with his corps to defense of Washington July, 1864, participating in the Shenandoah campaign, and in command of a division from Sept. 20 to close of the war; was breveted from lieutenant-colonel to major-general for gallantry in battle; mustered out of volunteer service Apr. 30, 1866; appointed major Second Cavalry Nov. 5, 1863, and after promotion through the regular grades became a brigadier-general Apr. 18, 1892.

Wheaton, HENRY, LL. D.: jurist and author; b. at Providence, R. I., Nov. 27, 1785; graduated at Rhode Island College (now Brown University) 1802; studied law; was admitted to the bar 1805; spent eighteen months at the law school at Poitiers, France, 1805-06; studied some months in London 1807; practiced law at Providence 1807-12; settled in New York in 1812; edited the *National Advocate*, the organ of the administration party, 1812-15, in which he

published some notable articles on the question of neutral rights in connection with the existing war with Great Britain; became division judge-advocate of the army Oct. 26, 1814; was justice of the marine court of the city of New York May, 1815-July, 1819; reporter of the Supreme Court of the U. S. 1816-27; delegate to the convention for forming a new constitution for New York 1821; member of the New York Assembly 1823; was associated with Benjamin F. Butler and John Duer in a commission for revising the statute law of New York 1825; was U. S. *chargé d'affaires* to Denmark 1825-37; displayed great diplomatic skill in the settlement of the vexed question of the Sound dues; was appointed minister resident at the court of Prussia 1835, and was soon (1837) made minister plenipotentiary, filling that post until 1846, during which period he exercised a general superintendence over the relations of the U. S. with European continental governments, and became distinguished by his writings on international law, and by his settlement of the questions relating to the Scheldt dues, the tolls on the Elbe, and the rights of naturalized citizens of the U. S.; was chosen a corresponding member of the French Institute 1843, and a foreign member of the Royal Academy of Science at Berlin 1846; signed an important treaty with Germany (1844), which was rejected by the U. S. Senate for political reasons, but has served as the basis of later treaties, and was requested to resign in 1846 by President Polk, much to the "astonishment and indignation of both parties at home and all parties abroad"; was complimented with public dinners in New York and Philadelphia on his return to the U. S. 1847, and was immediately chosen lecturer on International Law at Harvard University. D. at Roxbury, Mass., Mar. 11, 1848. He was the author of *A Digest of the Law of Maritime Captures and Prizes* (1815); *Reports of Cases Argued and Adjudged in the Supreme Court of the United States 1816-27* (New York and Philadelphia, 12 vols., 1826-27); *A Digest of the Decisions of the Supreme Court of the United States from its Establishment in 1789 to 1829* (2 vols., 1820-29); *The Life of William Pinkney* (1826); *A History of the Northmen, or Danes and Normans, from the Earliest Times to the Conquest of England by William of Normandy* (London, 1831); *The Elements of International Law, with a Sketch of the History of the Science* (Philadelphia, 1836; London, 2 vols., 1836); *Histoire du Progrès du Droit des Gens en Europe depuis la Paix de Westphalie jusqu'au Congrès de Vienne, avec un Précis historique du Droit des Gens européen avant la Paix de Westphalie* (Leipzig, 1841), written in unsuccessful competition for a prize offered by the French Institute, and translated into English by William B. Lawrence under the title *A History of the Law of Nations in Europe and America from the Earliest Times to the Treaty of Washington* (New York, 1845); *An Inquiry into the Validity of the British Claim to a Right of Visitation and Search of American Vessels suspected to be engaged in the Slave-trade* (1842); contributed to Dr. Andrew Crichton's *History of Scandinavia* (1838); and published many articles in the *North American Review* and other periodicals, and numerous historical, political, and literary addresses or essays. His great work on *International Law* has become a recognized standard in the English language, and has been edited by rival commentators, William B. Lawrence (with a biography, 1855) and Richard H. Dana, Jr. (1866), and also in England by A. C. Boyd.

Revised by P. STURGES ALLEN.

Wheatstone, Sir CHARLES, F. R. S., LL. D.: physicist; b. at Gloucester, England, in Feb., 1802; was in early life a manufacturer of musical instruments; was led by his profession to investigate the laws of sound and their application to music—subjects on which he published several papers; became in 1834 Professor of Experimental Philosophy in King's College, London; was chosen a fellow of the Royal Society 1836; read to that body his *Contributions to the Physiology of Vision*, as a consequence of which researches he soon afterward (1838) invented the stereoscope; began in June, 1836, with William F. Cooke, a series of successful experiments in electro-magnetism, with a view to the transmission of intelligence over copper wires; took out, along with Cooke, in May, 1837, a patent for a magnetic telegraph, which was not, however, practically operated until after that of Morse; invented also an electro-magnetic alarm and various instruments for registering thermometrical and barometrical indications and transit observations in astronomy; was one of the jurors in the class for health, light, and electricity at the Paris Universal Exposition of 1855; received

from Napoleon III. the decoration of the Legion of Honor; was knighted by Queen Victoria 1868; was a vice-president of the Royal Society and received its royal medal in 1840 and in 1868 its Copley medal for his researches in acoustics, optics, electricity, and magnetism; was made LL. D. by the University of Edinburgh Apr. 12, 1869, and elected foreign associate of the French Academy of Sciences June 30, 1873. D. in Paris, Oct. 19, 1875. A British official commission, consisting of Sir Mark I. Brunel and John F. Daniell, declared under date of Apr. 27, 1841, that Wheatstone was the person to whose scientific researches the practical application of the telegraph was due. His *Scientific Papers* were collected and published by the Physical Society of London in 1879.

Revised by R. A. ROBERTS.

Wheatstone's Bridge: an ingenious device for comparing electrical resistances. It was introduced by Sir CHARLES WHEATSTONE (*q. v.*) (*Philosophical Transactions*, 1843, ii., p. 323). A similar arrangement had been described by Christie, ten years earlier. In the diagram an electrical circuit is

Wheatstone's bridge.

divided, between A and B, into two branches: Branch ACD contains two resistances, R_1 and R_2 . Branch ADB contains two resistances also, R_3 and R_4 . Whenever C and D are at the same potential no current will flow through the galvanometer, the terminals of which connect those points. C and D will be at the same potential whenever $\frac{R_1}{R_2} = \frac{R_3}{R_4}$. When R_2 and the ratio $\frac{R_3}{R_4}$ are known, R_1 is given by the above equation. This arrangement is Wheatstone's bridge. The method of procedure consists in "balancing" the bridge by a variation of the known resistances until no current flows through the galvanometer. Its convenience, accuracy, and adaptability are such that it has become the most widely used of all methods of measuring electrical conductivity. The bridge is sometimes called Wheatstone's balance.

E. L. NICHOLS.

Whedon, DANIEL DENISON, D. D., LL. D.: educator and editor; b. at Onondaga, N. Y., Mar. 20, 1808; graduated at Hamilton College 1828; studied law; was Professor of Ancient Languages at Wesleyan University, Middletown, Conn., 1832-43; became a preacher of the Methodist Episcopal Church 1836; was Professor of Rhetoric, Logic, and History at the University of Michigan 1845-53, and became editor in 1856 of the *Methodist Quarterly Review*, which place he held until 1884, and general editor of the publications of the Methodist Book Concern, New York. He was the author of *Public Addresses, Collegiate and Popular* (Boston, 1856); *The Freedom of the Will as a Basis of Human Responsibility, etc.* (1864); and a *Commentary on the New Testament* (5 vols., 1860-75, seq.) of a strongly anti-Calvinistic character. He supervised also a *Commentary on the Old Testament* (7 vols., 1880-86; one volume yet to appear). D. at Atlantic Highlands, N. J., June 8, 1885.

Wheel: an instrument formerly used as a means of torture and of execution in criminal proceeding, the torture or execution being called *breaking on the wheel*. It is said to have been first used in Germany, where the criminal was laid on a cart-wheel and his extended limbs fractured with blows of an iron bar. In other countries a different form of frame was used, such as a St. Andrew's cross. Breaking on the wheel was abolished in France at the Revolution, but was used in Germany as late as 1827. It is now obsolete in all civilized countries.

F. STURGES ALLEN.

Wheel-and-axle: one of the so-called mechanical powers. It is an application of the principle of the lever. There are two cylinders with a common axis, with differing radii—the smaller being termed the *axle*, the larger the *wheel*. Suppose a cord is wound around the wheel in one direction, and another cord around the axle in the contrary direction. The condition of equilibrium of weights attached to these cords is that the product of each of the weights into their respective radii should be equal. See **WHEELWORK**.

Wheel-animalcule: See **ROTIFERA**.

Wheeler, BENJAMIN IDE, Ph. D.: philologist; b. at Randolph, Mass., July 15, 1854; studied at Colby Academy, New London, N. H., and Brown University, where he graduated in 1875. He then spent four years in Germany at Berlin, Leipzig, Jena, and Heidelberg. He taught in the Providence High School and in Brown, Harvard, and Cornell Universities. In 1886 he was given the chair of Comparative Philology in Cornell, and in 1888 his professorship was extended to include Greek. In 1895-96 he was director of the American School for Classical Studies in Athens, Greece. He is the author of *The Greek Noun-accent* (Strassburg, 1885); *Analogy and the Scope of its Influence in Language* (1887); *Introduction to the Study of the History of Language* (1890, joint author); and is a contributor to various magazines and journals; associate editor of *Johnson's Universal Cyclopaedia* in charge of comparative philology and linguistics (1892-95).

Wheeler, JOSEPH: soldier and legislator; b. at Augusta, Ga., Sept. 10, 1836; graduated at the U. S. Military Academy and appointed a brevet second lieutenant of dragoons in 1859; promoted second lieutenant Sept., 1860; resigned Apr. 22, 1861, and entered the Confederate service as lieutenant of artillery. He was rapidly promoted through the grades of colonel, brigadier, and major-general to lieutenant-general, and commanded the Cavalry Corps of the Western army from 1862 until the close of the civil war. He served with distinction at Shiloh, Corinth, Perryville, Murfreesboro, Chickamauga, and the many battles in Georgia under Johnston and Hood, and he was specially selected to cover the retreat of the Confederate army from Shiloh, Corinth, and Perryville. He commanded the cavalry in Bragg's Tullahoma campaign and in Longstreet's movement against and Bragg's retreat from Knoxville. He opposed Sherman's march to the sea, checking his advance at Waynesboro and Aiken. Gen. Wheeler was noted for his tireless energy and vigilance, which enabled him to make many captures of prisoners and supplies. During the war he was wounded three times and had sixteen horses shot under him. He received the thanks of the Confederate Congress and of the State of South Carolina. Since 1881 he has been a member of Congress from Alabama. In 1888 he was appointed a regent of the Smithsonian Institution. **JAMES MERCUR.**

Wheeler, WILLIAM ADOLPHUS; lexicographer; b. at Leicester, Mass., Nov. 14, 1833; graduated at Bowdoin College 1853; was an assistant to Dr. Joseph E. Worcester in the preparation of his quarto *Dictionary* (1856-59); contributed to the new illustrated edition of Webster's *Dictionary* (1864); published separately *A Dictionary of the Noted Names of Fiction, etc.* (Boston, 1865); edited Hole's *Brief Biographical Dictionary* (New York, 1866), and a *Dickens Dictionary* (1873); began a *Shakspearian Cyclopaedia*; aided Richard Soule, Jr., in his manuals of spelling and reading; became in 1867 assistant superintendent of the Boston Public Library. D. at Roxbury, Oct. 28, 1875. He left unfinished an index to anonymous literature, entitled *Who Wrote It?* completed and edited by Charles G. Wheeler (1881), and *Familiar Allusions* (1882).

Revised by H. A. BEERS.

Wheeler, WILLIAM ALMON, LL. D.: Vice-President of the U. S.; b. in Malone, Franklin co., N. Y., June 30, 1819; studied for two years at the University of Vermont; was admitted to the bar in 1845, and rose rapidly in his profession. He was for several years superintendent of schools for Franklin County. He was elected as a Whig member of the Assembly 1849-50, but joined the newly formed Republican party in 1856. He was a member of the Senate of New York in 1858 and 1859, and president *pro tem.* of that body; was a member and president of the New York constitutional convention in 1867-68; was elected a Representative in Congress to the 37th, 41st, 42d, 43d, and 44th Congresses. For several years he was much engaged in banking and railroad affairs. He was one of the organizers

of the bank of Malone, and held the position of cashier and chief managing director. In the political complications which arose in Louisiana during the session of the Forty-third Congress, Mr. Wheeler was conspicuous, having been chairman of the special committee of the House of Representatives that visited Louisiana, and finally adjusted the difficulties existing there on the basis of "the Wheeler compromise." He was Vice-President of the U. S. from 1877 to 1881, after which he lived in retirement. D. at Malone, N. Y., June 4, 1887. **Revised by F. M. COLBY.**

Wheeling: city and port of entry, and the capital of Ohio co., W. Va.; on the Ohio river, and the Balt. and O., the Ohio River, the Pitts., Cin. and St. L., the Wheel. and Elm Gr., the Wheel. and Lake Erie, the Cleve., Lorain and Wheel., and the Wheel. Bridge and Term. railways; 63 miles W. of Pittsburg, 141 miles E. of Columbus, O. (for location, see map of West Virginia, ref. 3-G). The city is divided into eight wards, one—the seventh—being Zane's island, more than a mile long, containing 400 acres, and connected with the mainland by a suspension bridge of 1,010 feet span, and a steel bridge over which pass electric railways, running to neighboring towns in Ohio. The principal streets run parallel to the river several miles, intersected by cross streets extending back to the large hills on the E. Steamboats carry freight to all points on the Ohio and Mississippi rivers.

There are two large parks outside the city limits, none within. The most notable buildings are the city-hall and court-house, U. S. custom-house and post-office, Fourth Street M. E. church, St. Matthew's P. E. church, City Bank of Wheeling, Rogers Block, and the public schools.

Churches, Schools, and Charities.—Methodist Episcopal churches, 10; Roman Catholic, 3, including a cathedral; Protestant Episcopal, Presbyterian, and Lutheran, 3 each; German Independent, Christian, Baptist, and Mission, 2 each; United Presbyterian, 1, besides a Jewish synagogue. The public schools number 8, one in each ward; are modern in character and equipment, have an enrollment of 4,834 pupils, and cost annually \$86,529; 13 parochial schools have an enrollment of 1,540; and 6 academic and private schools an enrollment of nearly 300. The charitable institutions are 5, for the aged, friendless, and orphans, a Roman Catholic hospital, and a Protestant hospital.

Finances and Banking.—The municipal receipts are \$387,775; expenditures, \$378,798; net debt, \$724,277; and property valuation, \$22,553,124. Banking facilities are supplied by a national bank with capital of \$200,000, and 7 State and 4 savings banks.

Business Interests.—Wheeling is principally a manufacturing city. The large deposits of bituminous coal and the natural gas in the surrounding country furnish a fuel of such cheapness and facility in use as to give an exceptional advantage over many other points. There are 4 steel and iron plants with 9 blast furnaces, capacity 2,060 tons Bessemer pig daily; 4 steel-works, each having two 5-ton converters, capacity 2,100 tons daily; 2 large glass-factories; 4 potteries, annual output valued at \$750,000; a steel tube and casing works, 4 tobacco and 46 cigar factories, 4 foundries and stove-works, 2 boiler-works, 6 breweries, 4 ice plants, 3 machine-shops, brass foundry, 4 planing-mills, 3 carriage and wagon factories, 2 axle-factories, hinge-factory, etc.

History.—The first settlement of Wheeling was made by Col. Ebenezer Zane in 1769. In consequence of Indian hostilities a stockade fort—Fort Henry—was built at Wheeling to protect the border in 1774. On Sept. 1, 1777, this fort was beset by about 300 Indians, who killed fifteen of the settlers. It sustained another attack in 1781, and again Sept. 11, 1782, was besieged by a British captain and forty regular soldiers and 260 Indians for two days, but they were repulsed by Col. Zane and his little garrison, without loss. The town was laid out by Col. Zane in 1793; was first incorporated in 1806; incorporated as a city in 1836; made the capital of the "restored government of Virginia" in 1861; was the meeting-place of the convention which formed the State of West Virginia in 1863; and was the capital of the State in 1863-70 and 1875-85. Pop. (1880) 30,757; (1890) 34,522; (1895) estimated, 40,000.

WILBUR C. BROCKUNIER.

Wheellock, ELEAZAR, D. D.: educator; b. at Windham, Conn., Apr. 22, 1711; graduated at Yale College 1733; was ordained pastor of the Second Congregational church at Lebanon, Conn., Mar., 1735, remaining there thirty-five years; established a school 1754; had as a pupil an Indian

boy, Samson Oocom (see OOCOM, SAMSON), whose proficiency led to the establishment of Moor's Indian Charity School, which grew into DARTMOUTH COLLEGE (*q. v.*), for which he obtained a large tract of land in New Hampshire and removed thither as first president of the college Aug., 1770. One of his pupils at Lebanon was the celebrated Indian chief Joseph Brant. He published several *Narratives of the Indian Charity School* (1762-75), together with an abstract of McClure and Frisbie's mission to the Delaware Indians W. of the Ohio. D. at Hanover, N. H., Apr. 24, 1779. A *Memoir* by Rev. Drs. Elijah Parish and David McClure appeared in 1810.

Revised by GEORGE P. FISHER.

Wheelock, JOHN, D. D., LL. D.: educator; son of Dr. Eleazar Wheelock; b. at Lebanon, Conn., Jan. 28, 1754; entered Yale College 1767; went to Hanover, N. H., with his father 1770, and graduated with the first class at Dartmouth College 1771; was tutor there 1772-74; represented Hanover in the Legislature 1775; served as major and lieutenant-colonel in the army of the Revolution, and was a member of Gen. Gates's staff; was chosen successor to his father as president of Dartmouth College 1779, though only twenty-five years of age; was given the chair of Civil and Ecclesiastical History in 1782; visited England to raise funds 1783; was partially successful, but lost the money and papers by shipwreck off Cape Cod; was removed from office 1815 in consequence of an ecclesiastical controversy, but restored 1817. D. at Hanover, Apr. 4, 1817, leaving half his estate to Princeton Seminary.

Wheelwork, or Gearing: a train of wheels, usually toothed, by means of which continuous rotation is communicated from one revolving axis to another. Frictional gearing, however, is that kind of wheelwork in which motion is transmitted from one wheel to another by the mere contact of the rims of the wheels. In this system it is convenient to have one of the contact surfaces (preferably that of the driver) covered by some softer material than the contact surface of the other. If the latter is of cast iron, the former will be either of wood, leather, rubber, or paper. In frictional gearing it is necessary that the smooth faces of the wheels shall be constantly pressed together. Circular V-shaped grooves and projections have been often turned upon the faces of cast-iron wheels to make the friction more effective. Teeth are generally provided, however, which, by interlocking, render the slipping of one circumference upon another impossible. Wheelwork usually receives a special designation, depending on the relative positions of the axes of the wheels. When the axes are parallel, it is called *spur-gearing*; when the axes intersect, *bevel-gearing*; and when the axes are not parallel and do not intersect, *skew-bevel* and *screw-gearing*.

One of the most important requirements in wheelwork is that smooth and continuous motion shall be communicated from the driver to the follower. In frictional gearing this always takes place, but in toothed gearing a constant ratio of the angular velocities of the two wheels in gear, without shocks, can be attained only by special forms of teeth; the investigations for the development of these forms of teeth have occupied geometers for a long period. The forms of cross-section which have been found to produce a constant ratio of the angular motions are found generally by the rolling of curves on the pitch-circles of the wheels, tracing points in the rolling curves producing epicycloidal forms of teeth, which remain in contact with a limited amount of sliding between the curved faces of the teeth. These forms are also often involutes of the circles which form the bases of the teeth; the difference between involute teeth and epicycloidal teeth being that the curves of the former are single continuous curves forming the entire sides of the teeth, while in epicycloidal teeth the curve of a tooth is made up of two separate curves joined at the pitch-circle.

In common gearing, where great accuracy is not required, the curves of the teeth are often composed of arcs of circles drawn according to special geometric rules, these resulting curves being a sufficient approximation to the epicycloids which are traced in the more exact constructions. Instruments to facilitate this drawing of approximate profiles are called *odontographs*. The ratio of the angular velocities in spur and bevel gearing is always inversely proportional to the radii of the pitch-circles of the wheels or to the numbers of teeth in the wheels. In skew-bevel gearing this ratio is inversely proportioned to the radii at the throats or smallest parts of the hyperboloids which form the bases

of the wheels; and in screw-gearing the angular velocities are inversely proportional to the number of threads. In two wheels which work continuously together during a complete revolution the pitch of the teeth (or the distance between the same points of two teeth, measured on the pitch-line) in both wheels must be the same. The pitch must also be an aliquot part of the circumference of each; hence the ratio of the numbers of revolutions in a given time must be expressible in whole numbers. To be interchangeable, epicycloidal teeth of wheels must have their profiles all drawn with the same rolling circle, and an effort has been made to fix this by agreement as the circle whose diameter is one-half the pitch-diameter of the wheel of twelve teeth in that pitch. In screw-gearing the normal pitch, i. e. the pitch as measured on a helix of the screw cylinder which cuts the teeth at right angles—must be the same in both wheels. The screw and worm wheel is an example of screw-gearing in which the axes are at right angles, the diameter of the screw being much smaller than that of the wheel.

In a train of wheelwork where spur-wheels are employed and the axes parallel, the ratio of the numbers of revolutions of the first and last wheels may be found by multiplying the numbers of teeth in all the drivers for a numerator, and of all the followers for a denominator. The resulting ratio will be that of the number of revolutions of the first wheel divided by the number of revolutions of the last wheel.

The subject of wheelwork is fully developed in Willis's *Principles of Mechanism*, in Rankine's *Machinery and Millwork*, and in other works on mechanism.

Revised by F. R. HUTTON.

Wheelwright, JOHN: clergyman; b. in Lincolnshire, England, about 1592; graduated at Cambridge, where he was a classmate of Oliver Cromwell 1614; took orders in the Church of England; was vicar of Bilsby, near Alford, 1623-31; was silenced for nonconformity by Archbishop Laud; went to Massachusetts 1636; was chosen pastor of a church at Braintree; was a brother-in-law of the celebrated Anne Hutchinson, whose religious opinions he defended; preached a sermon at Boston on Fast Day, 1637, which was declared seditious by the General Court; was banished from Massachusetts 1638; removed with his partisans to New Hampshire; founded Exeter on the Squamscott, organizing a church there, but that territory being subsequently claimed by Massachusetts, removed with a part of his church to Wells, Me., 1643; was allowed to return to Massachusetts 1646; resided at Hampton 1646-54; was in England 1657-60; was settled in 1662 as pastor at Salisbury, N. H., where he died Nov. 15, 1679. He published, in answer to Thomas Weld, *Mercurius Americanus, or Observations on a Paper entitled Of the Rise, Reign, and Ruin of the Familists, Libertines, etc., in New England* (London, 1645); and a *Vindication* (1654). See Savage's edition of Winthrop's *History*, also the volume of Wheelwright's *Writings* with memoir edited by Charles H. Bell (Boston, 1876).

Revised by GEORGE P. FISHER.

Whelan, RICHARD VINCENT, D. D.: bishop; b. at Baltimore, Md., Jan. 29, 1809; educated at Mt. St. Mary's College, Emmitsburg, Md., where he became a teacher and was "prefect of studies"; graduated in theology and philosophy at the seminary of St. Sulpice, Paris, 1831; was ordained to the priesthood at Versailles the same year; was professor at St. Mary's College 1832-35; performed mission work at Harper's Ferry, Martinsburg, and in other towns of Virginia and Maryland 1835-40; was consecrated Bishop of Richmond Mar., 1840; took the title of Bishop of Wheeling on the division of the diocese in 1851; settled at Wheeling, where he built up a seminary for young ladies and a convent at Mt. de Chantal; was a member of the Vatican Council of 1869-70, and was opposed to defining the dogma of papal infallibility, but gave in his adhesion after its promulgation. D. at Wheeling, July 7, 1874.

Revised by J. J. KEANE.

Whelk [*M. Eng. welk, wikk* < *O. Eng. wiloc, weoloc, woloc*]; a name popularly applied in a vague manner to species of gasteropod molluscs belonging principally to the families *Buccinida* and *Muricida*, but more especially to the former, the type of that family (*Buccinum undatum*) being the common whelk of England. The species of the two families agree in having shells whose body-whorls are inflated, whose spire is moderately exerted, while the aperture is notched and produced forward or enalculated. The animals have elongated filiform tentacles; the eyes placed outside the

tentacles: the odontophore or lingual ribbon long and straight, and armed with three longitudinal rows of teeth; and the foot comparatively short. The representatives of the two families are distinguished by differences in the dentition of the odontophore. Of the species mentioned below only the last *Purpura lapillus* belongs to the *Muricidae*. *Buccinum undatum* and some related species are very common in the colder seas, and form one of the chief elements of the food of the codfishes. In England whelks are sometimes used as an article of food, but their principal value is as bait. The shell of the almond or red whelk (*Chrysodomus antiquus*) of the market is used in the Shetland islands and some other places for a lamp, being suspended, mouth upward, by a string around the middle or toward the ends, from a nail in the wall or roof. The species of *Fulgur* and *Sycotypus* are common to the Atlantic shores of North America, and are the common large univalve shells of the coasts. *Purpura lapillus* is a very abundant species in the northern seas, and may be found in large numbers clinging to the rocks between tidemarks, as well as lower down, and especially where seaweed is abundant. It secretes a white fluid, which turns blue on exposure to the air.

Whewell, hyū'el, WILLIAM, D. D., F. R. S.: educator and author; b. in Lancaster, England, May 24, 1794; studied at Trinity College, Cambridge; graduated 1816; became a fellow there; took orders in the Church of England; was Professor of Mineralogy 1828-32, of Moral Theology or Casuistry 1838-55; was master of Trinity College from 1841, and vice-chancellor of Cambridge University from 1855 to his death, at Cambridge, Mar. 5, 1866. He long enjoyed the reputation of possessing more universal information than any other man in England. He was the author of several text-books on mathematics, mechanics, and dynamics: *Astronomy and General Physics considered with Reference to Natural Theology* (1833), being the third Bridgewater treatise; *A History of the Inductive Sciences from the Earliest to the Present Time* (3 vols., 1837; 3d ed. 1857); *The Philosophy of the Inductive Sciences* (2 vols., 1849); remodeled in 3 parts, 1858-60); *Lectures on the History of Moral Philosophy in England* (1852); *Of the Plurality of Worlds, an Essay* (1853); *Lectures on Political Economy* (1863); and *The Platonic Dialogues for English Readers* (3 vols., 1859-61), besides many minor papers. An account of his writings, with selections from his correspondence, by Isaac Todhunter, appeared in 1876, and a *Life* by Mrs. Stair Douglas in 1881.

Whey [O. Eng. *hwēg*; Dutch *wēi*]: the serum of MILK (*q. v.*), obtained when the casein of milk is coagulated by means of rennet or acids, as in the manufacture of CHEESE (*q. v.*). It forms a clear, straw-colored liquid, and contains the water and sugar (lactose) of the milk. The whey produced in cheese-making is usually fed to swine, although good butter can be made from it.

Whiehoof, BENJAMIN, D. D.: clergyman; b. in Shropshire, England, Mar. 11, 1610; entered Emmanuel College, Cambridge, 1626; became a fellow there 1633; became distinguished as a tutor; took orders in the Church of England 1636; was appointed Sunday lecturer at Trinity church and preacher to the university; became incumbent of North Cadbury, Somersetshire, 1643, provost of King's College 1644, and rector of Milton, Cambridgeshire, 1649; favored the Puritans during the great rebellion and the protectorate; was deprived of his provostship at the Restoration 1661, but obtained the living of St. Anne's, Blackfriars, 1662, and the vicarage of St. Lawrence, Jewry, 1668. D. at Cambridge in May, 1683. He was regarded as "one of the heads, if not the chief founder, of the latitudinarian school of English divines," and enjoyed great fame as a preacher, and was one of the Cambridge Platonists. He published nothing, but his friend, the Earl of Shaftesbury, whose genius was kindred to his own, edited his *Observations and Apophthegms* (1688) and his *Sermons* (1698); and Dr. John Jeffery edited his *Moral and Religious Aphorisms* (repub. in enlarged ed. 1753) and his *Discourses* (3 vols., 1701-03), to which Dr. Samuel Clarke added a 4th (1707). An edition of *Sermons* (4 vols., 1751) was accompanied by a *Life* by Drs. Campbell and Gerard, who also edited the best edition of his complete works (4 vols., Aberdeen, 1751).

Whidaw-finch: See WIDOW-BIRD.

Whiff, **Sail-fluke**, **Marysole**, or **Carter**: the *Lepidorhombus megastoma*, a fish of the flatfish family (*Pleuronectidae*), related to the turbot of the northern European coasts.

The body is rather elongated, the height being contained two and two-thirds times in the total length, without including caudal; the scales are small and pectinated; the lateral line describes a semicircular curve above the pectoral; the eyes are on the left side, and close together; the teeth in a band on the jaws, and present also on the vomer, but not on the palatines; the dorsal commences on the snout in advance of the eyes; the ventrals have a long base, but are free from the anal. The whiff does not seem to be a very abundant fish anywhere, although it is "well known to the Cornish fishermen, who apply the name of 'carter' to it. It keeps on sandy ground at no great distance from land, and takes a bait, so that it is caught as often as any of the salt-water flatfishes, but is not so highly esteemed for the table, chiefly from being so thin." Its nearest representative on the American coast is the *Citharichthys microstomus* of the sandy shores of the Middle States.

Whig [clip-form of the Scottish term *whiggamore*, a horse-driver; from the so-called "whiggamore raid" in 1648]: a party designation employed in the past both in Great Britain and in the U. S. In the former country it first came into use about 1648, when it was applied to the Scotch Presbyterians who had rebelled against the crown, and it was used in 1679 in the course of the debates on the Exclusion Bill in the British Parliament as the name of the country party with the intention of stigmatizing the members of that party as rebels. From this time it was the accepted designation of the more progressive party in British politics—the party opposed to the Tories—but after the passage of the Reform Bill, in 1832, it was gradually superseded by the term Liberal. For a description of the general character of the Whig party in Great Britain, see the article POLITICAL PARTIES, and for some account of the part it played in history, see GREAT BRITAIN (*History*).

In the American colonies of Great Britain it was applied to those who favored independence of the mother country, while supporters of the crown were called Tories; but a more important and more lasting use of the name was to designate the party that arose at the close of the so-called "era of good feeling," and was composed of those members of the Democratic-Republican party who favored a national bank, a protective tariff, a system of internal improvements, and in general held to a loose construction of the Constitution. Toward the end of J. Q. Adams's administration those who held these views assumed the name of National Republicans, as opposed to the Democratic Republicans. The former voted for Adams in the election of 1828 and the latter for Jackson. From this time the line of division is clear, and in 1834 the new party was termed Whig, implying opposition to executive encroachment, Jackson having seemed to his opponents guilty of a gross usurpation of power in the removal of the deposits from the U. S. Bank in the preceding year (Oct. 1, 1833). The Whigs agreed in little else than hostility to Jackson and the Democrats, and generally betrayed a willingness to sacrifice definiteness of purpose to numerical strength. Their programme was therefore often illogical or vague, and their presidential candidates were often men of ambiguous political principles. Not till 1840 did they win the presidency, and then by the selection of candidates of whom one held doubtful political views and the other afterward turned against the party that had elected him. The representatives of the old National Republicanism were passed by. The death of Harrison and succession of Tyler weakened the party, which was soon at variance with the executive. Nevertheless, in the campaign of 1844 the Whigs ventured to nominate Clay and adopt a definite policy, which may be summed up in the following words of the platform: "A well-regulated national currency; a tariff for revenue to defray the necessary expenses of the Government, and discriminating with special reference to the protection of the domestic labor of the country; the distribution of the proceeds from the sales of the public lands; a single term for the presidency; a reform of executive usurpations; and generally such an administration of the affairs of the country as shall impart to every branch of the public service the greatest practicable efficiency, controlled by a well-regulated and wise economy." The doubtful attitude of Clay on the question of the annexation of Texas cost his party the Southern vote without gaining for it the support of the Abolitionists, and the Whigs were defeated at the polls. As sectional interests became more potent in forming party lines, it was evident that the Northern and the Southern Whigs could not be

held together. The rupture took place on the question forced upon the country by the Wilmot proviso (see WILMOT, DAVID) to prevent the extension of slavery to States formed out of the territory acquired from Mexico. Taylor, the Whig candidate for the presidency, was elected in 1848, but soon after his accession a body of Southern Whigs withdrew and refused to act further with their party, and on the questions that arose during the year 1850 the Southern Whigs voted generally with the Democrats. At the same time the Northern Whigs were losing ground on account of their half-hearted policy on the slavery question, and were fast subdividing into factions. At last, in 1852, the Southern members of the party tried to force upon it the recognition of the compromise of 1850 as a finality. The Northern Whig leaders accepted this, but it caused such defections at the polls as to cost them the election and ruin the party as a national organization. The Southern Whigs drifted into the ranks of the DEMOCRATIC PARTY (*q. v.*), while the Northern wing was ultimately absorbed in the REPUBLICAN PARTY (*q. v.*). See also the article UNITED STATES (*History*).

F. M. COLBY.

Whimbrel [from *whimper*]: a wading bird of the genus *Numenius* (*N. phaeopus*), related to the common curlew (*N. arquata*), but considerably smaller, and hence also called half-curlew and jack-curlew in England. It is found not only in Europe, but also, in the winter season of the northern hemisphere, in Africa and Asia.

Whin: See DYERS' BROOM.

Whinchat, or **Furzechat** [*whinchat* is from *whin*, furze + *chat*, a kind of bird]: the *Saxicola* (or *Pratincola*) *rubetra*, a little European bird of the family *Turdidae*. It considerably resembles the stonechat, but is smaller, and is also considerably less than the wheatear. Like the latter, it is highly prized for the table, and is trapped in great numbers in the autumn, when fat. It is an excellent song-bird in confinement. See CHAT.

Whipping-post: a post to which a person is tied to be whipped. The phrase is used, however, to designate the institution of whipping as a means of punishment or torture, and specifically as a means of punishing for crime. As a means of torture, whipping or flogging has been in use among all nations in those stages where torture was inflicted, and consequently more or less in use also as a form of criminal punishment. Until recent years its use, practically unlimited short of death, by shipmasters at sea to enforce discipline among their crews, has been universal, but its abuse and the excessive cruelties practiced have led to its restriction or abolishment by statute in Great Britain and the U. S., as well as in some other countries. As a form of criminal punishment it was in use among the Romans, and at the common law whipping was inflicted on persons of inferior condition guilty of petty larceny or other minor offenses; but in the earliest times it appears not to have been inflicted on gentlemen. In Great Britain as well as in the U. S. whipping as a punishment for crime remained legal for some time after its general use became almost entirely obsolete. Thus in the U. S. in the early years of the nineteenth century whipping had been abolished or became disused in most of the States, except as to slaves, who were subject to it until the extinction of slavery.

In the U. S. the Constitution of the U. S., as well as the constitutions of most of the individual States, contains a clause forbidding cruel or unusual punishments, and numerous attempts have been made to establish as a legal proposition that this punishment is of such a nature as to come within this exclusion. But at the time these words, "cruel" and "unusual," were so incorporated in the Constitution of the U. S. and of the early States, the Legislatures have acted upon the assumption that whipping was not cruel or unusual within the meaning of those clauses, and the courts, both Federal and State, have held that the authors of the constitutions could not have intended to include whipping in the meaning of those terms (2 Curtis's *Reports*, 194).

At present whipping is authorized by statute in only a few of the U. S.; but its use is constantly being advocated as a punishment for certain brutal crimes, such as wife-beating, in the States where it does not exist, and is by many persons believed to be the only effectual remedy for those forms of crime. So late as the fall of 1895 a grand jury in the District of Columbia recommended that it be used in such cases.

The provisions of the various States with regard to it

vary too much, and are subject to too much change to be here given in detail; but the provisions of the law of Great Britain may be given in effect, and afford a good example of the modern conservative use of this form of punishment as a preventive of crime.

The old laws of Great Britain allowed the whipping of women as well as men; but now by 1 Geo. IV., c. 57, no female may be whipped. The Criminal Law Consolidation Acts of 1861, with subsequent statutes, authorize the punishment of whipping to be inflicted upon males below sixteen years of age who have been convicted of any one of various offenses, such as malicious injury to property, larceny, embezzlement by servants or clerks, accusing of infamous crimes, etc., and except where no special provisions have been made as to the punishment of whipping, so that the common law remains in force, the court must specify the number of strokes and the instrument to be used.

In the case of an offender whose age does not exceed fourteen years, the number of strokes inflicted must not exceed twelve in number, and the instrument must be a birch rod. In the case of an offender not over sixteen years of age, the number of strokes must not exceed twenty-five, and the instrument must be a birch rod; and in the case of any other offender the number of strokes must not exceed fifty. In no case can the whipping be inflicted after the expiration of six months from the passing of the sentence. In Scotland no offender older than sixteen years of age may be whipped for theft or crimes against the person or against property.

In countries other than Great Britain and the U. S., whipping is still generally comparatively common as a form of criminal or political punishment. F. STURGES ALLEN.

Whipple, ABRAHAM: naval officer; b. at Providence, R. I., Sept. 16, 1733; in early life commanded a merchant-vessel in the West Indies trade; was captain of the privateer Game Cock during the French war 1759-60, capturing in a single cruise twenty-three French prizes; headed in June, 1772, the expedition which burned the British revenue-schooner Gaspe in Narragansett Bay; was made commodore of two armed vessels fitted out by the colony of Rhode Island June, 1775; became commander of the Columbus Dec., 1775, and afterward of the schooner Providence, which captured more British prizes than any other vessel, but was itself finally taken by the British; was placed in command of the light frigate Providence, with which he adroitly escaped from the blockade of Narragansett Bay; captured eight richly laden vessels from the Jamaica fleet 1779, and attempted with a squadron to relieve Charleston, S. C., when besieged by the British, but was captured and held a prisoner until the close of the war. He was subsequently a farmer at Cranston, R. I., until 1788, when he became connected with the Ohio Company, and settled at Marietta, O., where he died May 29, 1819.

Whipple, EDWIN PERCY: literary critic; b. at Gloucester, Mass., Mar. 8, 1819; educated in the public schools of Salem; was for some time a clerk in a bank at Salem; entered a Boston banking-house 1837; and was superintendent of the reading-room of the Merchants' Exchange from its foundation in 1837 until 1860, from which time he devoted himself exclusively to literature. He became a frequent contributor to the principal reviews and magazines, and a popular lecturer before lyceums and collegiate literary societies. He published *Essays and Reviews* (2 vols., New York, 1848-49); *Lectures on Subjects connected with Literature and Life* (1849); *Character and Characteristic Men* (1867); *The Literature of the Age of Elizabeth* (1869); *Success and its Conditions* (1871). A complete edition of his works appeared in 6 vols. (1871). D. in Boston, June 16, 1886. *Recollections of Eminent Men* (1887), *American Literature and other Papers* (1887), and *Outlooks on Society, Literature, and Politics* (1888) were published posthumously. Revised by H. A. BEERS.

Whipple, HENRY BENJAMIN, D. D., LL. D.: bishop; b. at Adams, Jefferson co., N. Y., Feb. 15, 1822; prepared for college, but, owing to ill health, went into business; in 1847 became a candidate for holy orders, and pursued theological studies privately; was ordained deacon 1849, in Trinity church, Geneva, N. Y., by Bishop de Lancy; took charge of Zion church, Rome, N. Y., Dec. 1, 1849; was ordained priest July 16, 1850, in Sackett's Harbor by Bishop de Lancy; became rector of the Church of the Holy Communion, Chicago, Easter, 1857; was chosen Bishop of Minnesota June 30, 1859; and was consecrated in St. James's church, Richmond, Va., Oct. 13, 1859. In 1860 Bishop Whipple, with

others, organized the Bishop Seabury Mission, out of which has grown the Cathedral of Our Merciful Saviour, the Seabury Divinity School, Shattuck School, and St. Mary's Hall, which have made Faribault one of the educational centers of the Northwest. The bishop is known as the "apostle" of the North American Indians, among whom he has planted successful missions. In 1888, as the senior bishop present of the American Church at the third Lambeth Conference, he received from the University of Cambridge the degree of LL. D. He has published a number of occasional sermons and addresses, and several of his discourses have appeared in volume form.

Revised by W. S. PERRY.

Whipple, SQUIRE: civil engineer; b. at Hardwick, Mass., Mar. 24, 1804; graduated at Union College 1830; was engaged in the surveying of several canal and railway routes. In 1840 he patented an iron bridge truss of the bowstring type, of which several were built over the Erie Canal. In 1847 he issued a small theoretical and practical work on bridge-building, which contained the first exact analysis of stresses in trusses and of the principles of economic design, published in the U. S. Soon after 1852 he erected several bridges of the "Whipple trapezoidal type," a form which subsequently was extensively adopted. He also patented a lift drawbridge. He was the author of *The Way to Happiness* (Utica, 1847); *A Work on Bridge-building* (1847; enlarged ed. 1869); and *The Doctrine of Central Forces* (1866). He was made an honorary member of the American Society of Civil Engineers in 1868. D. at Albany, N. Y., Mar. 15, 1888.

MANSFIELD MERRIMAN.

Whipple, WILLIAM: signer of the Declaration of Independence; b. at Kittery, Me., Jan. 14, 1730; was in early life a sea-captain in the West India trade; subsequently a merchant at Portsmouth, N. H., where he acquired a considerable fortune; was a member of the provincial congress 1775, of the Continental Congress 1776; signed the Declaration of Independence; was brigadier-general of New Hampshire troops at Saratoga 1777; co-operated with Sullivan at the siege of Newport 1778; and was a member of Congress 1778-79, financial receiver of the State of New Hampshire 1782-84, and judge of the superior court from 1782 to his death, at Portsmouth, Nov. 28, 1785.

Whip-poor-will [named in imitation of its cry]: the common designation in the U. S. of species of birds of the genus *Aurostomus* of the family *Caprimulgidae*. These are characterized by the bill being very small; the nostrils shortly tubular; the gape furnished with long, stiff, and sometimes pectinated bristles, which project beyond the end of the bill; the wings broad, rounded, and with the first quill shorter than the third; the tail broad and rounded; and the tarsi moderate and partly feathered above. The chief distinctive characters, in contrast with the night-hawks, are found in the bristled gape and the form of the tail, and in this respect, as well as others, the species agree with those of the genus *Caprimulgus*, or the typical goat-suckers of the Old World, to which they are, indeed, very closely related. "The common species, and presumably the others, are nocturnal in their habits, remaining silent and keeping within the shady recesses of the forests during the daytime. As soon as the sun has disappeared and the night-insects are in motion" they leave their retreats for exercise and in search of food. In the early part of the evening, and then for only a brief period, they emit their peculiar cry, the notes repeated with great rapidity, but with clearness and power, six or seven times in as many seconds. They are to be heard chiefly in clear weather. In the daytime their haunts are deep ravines, shady swamps, and extensive pine-groves. They lay their eggs upon the ground, generally among fallen leaves, and make no regular nest. Their eggs are two in number, and are white and somewhat spotted.

Revised by F. A. LUCAS.

Whirlwind: air in spiral inflowing motion, the analogue of a whirlpool in water. Whirling motions are common to all fluids, and are the rule in the atmosphere. When the conditions causing the whirling motion are symmetrical, a complete whirl results, and is called a whirlwind. This may be of any size, from the eddy at a street corner or the whirlwind over a dusty road on a hot afternoon to a hurricane a thousand miles in diameter. In the former case the observer can see the entire whirl, in the latter he sees but a small part, and the wind at the point of observation is so slightly curved that it seems to be straight-lined. The rotation of the earth gives a uniform direction to all whirls large enough to make its twist effective—from right to left

in the northern hemisphere and opposite to this in the southern. See METEOROLOGY, CYCLONES, HURRICANES, and WINDS.

M. W. H.

Whisky, or Whiskey [from Irish-Gaelic *uisge*, water, as clip-form of the compound word *uisgebeatha* (whence Eng. usquebaugh), literally, water of life, *eau de vie*]: the spirituous liquor obtained by distilling fermented infusions of barley, rye, wheat, corn, oats, etc. According to some authorities, the art of distillation was first introduced in England in the reign of Henry II., but it is more probable that it was known and practiced in Ireland previous to this date. Directions for preparing *uisge-beatha* or *aqua vitæ* are contained in the *Red Book of Ossory*, compiled over 500 years ago, at which time it was chiefly used as a medicine, being considered a panacea for all diseases. Spirits that contain over 60 per cent. of alcohol are termed "high-wines" or common spirits; those containing 90 per cent. of alcohol are known as "cologne spirits," the name whisky being usually given to the product of a former distillation containing about 50 per cent. by weight of alcohol. In Great Britain the largest amount of whisky is made in Scotland; large amounts are made in Ireland, chiefly in Dublin; in the U. S. the principal supply comes from Kentucky (termed Bourbon whisky, from Bourbon co., Ky.), Pennsylvania (Monongahela County), Ohio, Illinois, Indiana, and Maryland; large quantities of whisky are also made in Canada. The grains used vary greatly in composition. In Scotland and Ireland malted barley is extensively employed, but a mixture of malted barley with raw grains (oats, etc.) is also very largely used. In the preparation of Bourbon whisky a mixture of 50 to 60 per cent. of Indian corn with 40 to 50 per cent. of small grain (containing about 10 per cent. malt, the balance being rye) is taken; for Monongahela whisky only rye is used, it being mixed with 10 per cent. of malt; while in Canada a mixture of rye, wheat, or corn with 5 per cent. of malted barley is chiefly employed. The quantity of alcohol afforded by the different grains is influenced by the proportion of starch, including the small amount of sugar, they contain; 2 lb. of starch will give a quart of spirit containing 30 per cent. of alcohol, or 100 lb. of starch will give 35 lb. of alcohol, equal to 4.375 imperial gal. One hundred pounds of the following grains afford the following quantities of a spirit containing 45 per cent. of alcohol: Wheat, 40 to 45 lb.; rye, 36 to 42 lb.; barley, 40 lb.; oats, 36 lb.; buckwheat, 40 lb.; maize, 40 lb. In the manufacture of whisky the starch of the grain is first changed into dextrin and glucose in the process of *mashing*, chiefly by the action of the *diastase* (a peculiar nitrogenous substance formed by the germination of the grain), which, although it exists in malt only in the very small proportion of 0.003 per cent., must be present in order that the conversion shall take place rapidly. Yeast is next added to the saccharine liquid to induce fermentation, by which the sugar is converted into alcohol and carbon dioxide; and the alcohol is finally concentrated by distillation. The essential features of the process of whisky-making are therefore the preparation of the vinous mash and the distillation of the alcohol.

Preparation of the Mash.—A quantity of water of a temperature of 150° F. is first run into the mash-tub, which is best made of circular cast-iron plates, and then the ground mixture of malt and grain is added, and the whole is thoroughly mixed. The malt used should be lightly kiln-dried by the heat of steam to avoid imparting an empyreumatic smell to the product, although this flavor is agreeable to some persons, and was formerly purposely given to whisky (notably to the famous "poten whisky" of Ireland) by drying the malt by means of burning turf. During the process of mashing, the liquid gradually acquires a sweet taste and a greater specific gravity. When it has attained its maximum density it is drawn off, and more water, of a temperature of 190° F., added to the residual grain and allowed to infuse with it for one to two hours. This second wort is added to the first, and a third quantity of boiling water poured over the remaining mixture, which is afterward used for the first liquor in the mashing of fresh meal and malt. In beer-making (see BEER) the brewer does not require complete saccharification, some dextrin being necessary; but the distiller desires to obtain the greatest amount of sugar possible. The mash is next cooled down to the proper temperature for fermentation (70° F.) by passing it through a series of pipes surrounded by cold water, and it is then introduced into the fermentation-vat. Formerly 4 per cent. of yeast was added to the wort, but at

present not over 1 to 1½ per cent. is used, three-fourths of which is added directly, the remainder only after the second day of the process. As fermentation advances the temperature of the wort increases about 20° F., but it should not be allowed to attain to over 95° F., in order to avoid acetification, which can be detected by an increased density of the wort and by the odor of acetic acid. The time occupied in the process of fermentation varies from three to nine days. Owing to the disappearance of the sugar and the formation of carbon dioxide and alcohol, the specific gravity of the liquid decreases, the operation being considered finished when the greatest degree of attenuation has been reached. Distillers strive to reduce the density of the wort to that of water, but even then a considerable quantity of sugar remains undecomposed, sometimes amounting to one-fifth of the entire saccharine matter. This difficulty is due to the fact that the alcohol first formed tends to prevent the further decomposition of the remaining wort into sugar, and can be remedied by removing the alcohol as soon as it is produced by diminishing the pressure in the fermentation-vat with an air-pump, which enables the alcohol to be distilled off at 125° F. When, instead of a mixture of raw grain and malt, only the latter is taken, the process employed is slightly different. Five hundred bushels of the ground malt are first mashed with 9,000 gal. of water having a temperature of 160° F., and as soon as saccharification has taken place, 6,000 gal. of the wort are drawn off and cooled to 60° F., after which it is run into the fermentation-vat and a mixture of London-porter yeast and quick Scotch barm added. The fermentation is usually completed at the end of two or three days, when 1 lb. of soap is added for every 100 gal. of the mash, and the mixture introduced into the still. In malt-whisky distilleries 1 bush. of malt should yield 2 to 2½ gal. of proof spirits. In localities where potatoes abound, this root is occasionally employed for the preparation of a vinous mash. The dry substances of potatoes constitute about 28 per cent., three-fourths of which is starch. The conversion of this starch into glucose can be effected either by the action of malt or by that of dilute sulphuric acid. In the former case the potatoes, after cleansing, are cut into small pieces and thoroughly incorporated with boiling water, malt (generally a mixture of malted rye and barley) then being added, and the process of mashing and cooling conducted as described above. The proportion of malt used is variable, but 5 per cent. is the average amount employed. In the preparation of the mash by the use of sulphuric acid, the raw potatoes are first converted into a pulp, which is thrown into a large vat containing water. When the starch has settled to the bottom of the vessel the supernatant liquid, which contains the albumen of the potatoes, is removed by means of a siphon, and the residue transformed into glucose by boiling with a very diluted sulphuric acid for about five hours, the point of complete conversion of the starch being ascertained by the iodine test. The fluid is next run through a wooden strainer, in order to remove the cellular tissue present, and the free acid is neutralized by the addition of chalk. The precipitated gypsum is then allowed to settle, the clear liquid being now ready for the fermentation-vat. The fermentation of potato-mash is carried on in a manner similar to that employed with malt, 4 per cent. of yeast being added, and from sixty to seventy hours required for the operation. One hundred pounds of potatoes afford about 16 lb. by measure of proof spirits. In Germany and Holland, where the sugar-beet is extensively cultivated, the poorer grades of a crop are often converted into spirits by fermentation and distillation, the process of mashing being omitted, as the sugar exists ready formed in the beet-root. Spirits can also be obtained from horse-chestnuts, acorns, etc., by proper treatment; 100 lb. of the former can be made to yield 34 lb. of a spirit containing 36 per cent. of alcohol. In the preparation of alcohol from this source the addition of 10 per cent. of barley malt is advisable. During the fermentation of the mash in the preceding operations it is customary to expose the vats to the action of the atmosphere for the first few days, after which time they are tightly closed in order to prevent the escape of the carbonic acid and the formation of acetic acid. The products of the fermentation of saccharine solutions include, in addition to carbon dioxide and alcohol, small proportions of glycerin and succinic acid.

Distillation of the Mash.—The fermented wort consists of volatile and non-volatile substances, the former comprising water, alcohol, fusel oil (a mixture of amylic, butyric, and propylic alcohols), small amounts of acetic acid, etc., the latter being vegetable fiber, decomposed and undecomposed yeast, malt, grain, salts, and small quantities of lactic and succinic acids and glycerin. Upon heating it to boiling in a still (see DISTILLATION) these bodies are separated, the vapors given off consisting essentially of alcohol and water. The boiling-point of the mixture is intermediate between that of alcohol and water (173° and 212° F.), but as distillation advances it becomes higher and the proportion of water carried over increases. The first distillate is termed "low-wines" or "singlings" which on redistillation constitute the "faints," the term whisky being usually applied to the spirit obtained by the distillation of the "faints," although diversity exists in the method of separating, purifying, and naming the different grades of spirit. It is not possible by simple distillation to separate the water from the alcohol completely, the purest spirit that can be obtained in this way still containing 11 per cent. of water. By carrying on the distillation to the furthest point, in order to obtain the greatest possible quantity of alcohol, a danger of promoting the formation of fusel oil is incurred, as this mixture boils at a much higher temperature than alcohol. Fusel oil has an unpleasant fiery and nauseous flavor, which is communicated to spirits containing it. Its complete removal can be effected by diluting the contaminated alcohol with water and redistilling, only the first part of the distillate being collected; but owing to the great expense thus incurred this is seldom resorted to. Fusel oil is chiefly contained in spirits prepared from potatoes, although it is also often present in that obtained from grain, especially when the solid substances introduced into the still have been allowed to become strongly heated, and undergo destructive distillation. The very numerous improved stills employed at present in the manufacture of spirits effect the separation of the alcohol and water either by causing the mixtures of alcoholic and aqueous vapors to pass through the alcohol at first distilled, by which process heat is generated and a secondary evaporation of the alcohol induced, or by cooling the mixed vapors to such a degree that only the water and fusel oil are condensed and returned to the body of the liquid. The nauseous smell and taste of bad whisky are often removed by filtration through, or distillation from, charcoal. Fusel oil can also be removed by oxidation with manganic acid (Attwood's process), by agitating the contaminated spirit with olive oil, or by distilling it from "gray salt" (potassium or sodium hydroxide) and "white salt" (potassium carbonate); likewise by agitating 665 parts of the spirit with 1 part of bleaching-powder, when a flavor resembling that of brandy is imparted to the product. A very large proportion of the whisky consumed in the U. S. and elsewhere is artificially prepared by reducing the raw products of the distillation of malt or potato spirits with water and adding certain substances to give a desired flavor. Creosote, for instance, is sometimes added to impart a whisky flavor to inferior grades of spirit; methyl alcohol is also used, but probably to a less extent. The presence of fusel oil in a liquor will often become apparent on simply removing the alcohol by evaporation; it is also detected by distilling the sample and adding sulphuric acid to the portion that distills between 230° and 240° F., when a red color will be produced; or by treating this portion of the distillate with sulphuric and acetic acids, when amylic acetate will be evolved; likewise by oxidation with potassium bichromate and sulphuric acid, by which the characteristic odor of valerianic acid will be engendered. If a small quantity of silver nitrate is added to a spirit containing fusel oil, this latter compound separates in the form of a black powder on allowing the mixture to stand exposed to the sunlight for a short time. The presence of creosote can often be detected by its imparting a blue color to ferric chloride. Pure whisky, when recently prepared, is nearly colorless, but if preserved in casks it gradually acquires a brownish color. It contains minute quantities of acetic, butyric, and valerianic acids, and, if distilled from a copper still, traces of this metal may also be present. It has a specific gravity ranging between 0.922 and 0.94, and should contain from 48 to 56 per cent. (by weight) of absolute alcohol.

In Great Britain and in the U. S. the excise on whisky has for many years been so great a source of revenue to the Government that there is no doubt of the fact of this and other spirits being consumed in a much larger quantity than is consistent with health and morality. In the U. S. an excise was first imposed on spirits in 1791. This was removed shortly afterward, but was again restored in 1812. Since

then the amount of tax has varied greatly; in 1862 it was 20 cents per proof gallon; in 1864 it ranged from 60 cents to \$2; in 1868 it was 50 cents; in 1872, 70 cents; in 1886 it was 90 cents; and in 1895 it was \$1.10, under provisions of the Tariff Act of 1894. In the fiscal year ending June 30, 1894, the total amount of whisky produced and deposited in distillery warehouses was: Bourbon, 15,518,349 taxable gal.; rye, 10,026,544; other (wheat, corn, malt, copper, and potato), 14,439,336; total, 39,979,229 gal. The total of distilled spirits was 90,535,781 gal., and the total revenue receipts thereon were \$85,259,252. The following table shows the production of whisky by States in the fiscal year 1893-94 in taxable gallons:

STATES.	Bourbon.	Rye.	Other.	Aggregate.
Alabama			13,734	13,734
Arkansas		2,143	80,592	82,735
California	15,144			15,144
Colorado			584	584
Connecticut		4		4
Georgia		780	278,689	279,469
Illinois	30,265	39,266	3,557,826	3,617,357
Indiana	404,020	11,116	3,077,345	3,492,481
Kentucky	14,591,178	1,426,162	1,178,132	17,195,472
Maryland		2,064,422	179,435	2,243,857
Minnesota	36,136	13,020	26,947	76,103
Missouri	174,121	4,248	82,292	260,661
Nebraska	6,750	7,707	92,471	106,928
New Jersey		311,601		311,601
New York	90,232	33,013	9,093	132,338
North Carolina		2,960	654,383	657,373
Ohio	147,142	340,781	4,379,056	4,866,979
Oregon			3,120	3,120
Pennsylvania		5,414,479	42,832	5,457,311
South Carolina			45,327	45,327
Tennessee			571,502	571,502
Texas			30,653	30,653
Virginia		104,780	62,258	167,038
West Virginia	5,962	187,298		193,250
Wisconsin	32,553	57,600	68,065	158,218
Totals, 1894	15,518,349	10,026,544	14,434,336	39,979,229
Totals, 1893	40,835,873	16,702,240	17,305,773	74,843,886
Decrease, 1894	25,317,524	6,675,696	2,871,437	34,864,657

The internal revenue receipts on the manufacture of distilled spirits in the fiscal year ending June 30, 1895, were \$79,862,627.

Revised by IRA REMSEN.

Whisky Rebellion: the name applied to the popular resistance to the excise laws in the four western counties of Pennsylvania in 1794. The assumption by the Federal Government of the right to levy an excise met with serious opposition on political grounds as dangerous to the liberty of the individual, but in Western Pennsylvania in addition to political opposition there was a strong feeling that the tax was an unfair discrimination against the people of that region. There whisky was the staple product and in such general demand that, like tobacco in colonial times, it served as a medium of exchange. The usual price being a shilling a gallon, a tax of 7 cents a gallon, as by the act of May, 1792, seemed excessive, and the law was further objectionable on account of the official inspection of private property which it entailed. Attempts to enforce the law met with violent resistance and those who conformed to its provisions were visited with insults and abuse. Those who took part in these outrages took the name of Tom the Tinker, and threatening posters over this signature appeared throughout the disaffected region. In July, 1794, an attempt to serve writs on the violators of the law provoked an attack on the house of the inspector which resulted in the killing of one of the rioters; and on the following night blood was again shed in an encounter with the marshal and his men. The mail was robbed at the instigation of David Bradford, one of the ringleaders, who afterward induced the insurgents to call out the militia, seeking thereby to involve so many in the crime of resisting legal authority that the Government could not inflict the full measure of punishment. Pittsburg, some of whose inhabitants had given offense to the "Whisky Boys," as they were called, was threatened with destruction and obliged to expel the offending persons from the town. In Western Pennsylvania the movement was fast becoming an open rebellion, and the spirit of revolt was spreading in the neighboring counties of Virginia and Maryland. Governor Mifflin of Pennsylvania hesitated to take decided action, and would not at first call out the militia. The President, however, acted with vigor and made a requisition for about 13,000 militia from the States of Pennsylvania, New Jersey, Virginia, and Maryland. They were ordered to be ready

to move by Sept. 1, but before that date commissioners were dispatched by the President and the Governor of Pennsylvania to offer amnesty to the insurgents on condition of complete submission. At a meeting of the malcontents at Parkinson's Ferry some fiery speeches were made, but it was nevertheless agreed to send a committee to treat with the commissioners. One of the delegates at this meeting was Albert Gallatin, who favored a moderate policy and at a subsequent conference prevailed on his associates to accept the terms offered by the commissioners. The attitude of the people in the four counties, however, was still threatening, and it was not till the troops had actually begun their westward march that the insurgents lost courage. On the approach of the troops in October, commissioners from the insurgents met them with assurances of peace, but these not being regarded as sufficient the army kept on and entered Parkinson's Ferry. Many arrests were made and two of the prisoners were convicted of treason, but they were afterward pardoned by the President. At the first show of force the insurrection subsided at once. So far as immediate results were concerned it was of slight importance. Its chief significance lies in the fact that it was the first attempt forcibly to resist the Federal Government, that it decided the question whether the militia of one State would invade the soil of another at the call of the President, and that the precedent of a Federal exise was successfully established. See James Carnahan, *The Pennsylvania Insurrection of 1794*, in *Proceedings of the New Jersey Historical Society* (vol. vi., 1851-53); also J. B. McMaster, *History of the People of the United States* (vol. ii., 1885).

F. M. COLBY.

Whist [etymology unknown; generally considered as a deriv. of *whist!* silence! sh! so called because the game requires silence and attention]: a game of cards, played by four persons, two being partners against the other two. The game is chiefly remarkable from the fact that it is the only one in which it is not only permitted but expected that the partners shall inform each other of the various combinations of cards that they hold; and this not by word of mouth, but by the order in which they play them under varying conditions of the game and score. To such an extent has this been carried that it is a task of no mean difficulty to master the many conventionalities in use by experts at the present day, and yet without this knowledge one can not be considered a fine player, no matter how shrewd he may be in other respects.

Elements.—The elements of the game are comparatively simple. A full pack of fifty-two cards is used. They are dealt one at a time to each player in rotation, and the last one is turned up, the suit to which it belongs being the trump for that deal. The player to the left of the dealer begins by leading any card he pleases, and the others must follow suit if they can; not to do so when able is called "revoking." Should any player have none of the suit led, he can either trump it or throw away a card of another suit, which is called "discarding." If none of the four cards played is a trump, the highest card of the suit led wins the trick, the rank of the cards being ace, king, queen, knave, ten, nine, eight, seven, six, five, four, three, two. Trumps win against all other suits, the highest trump played taking the trick. Whoever wins the trick has the lead for the next one. When more than six tricks have been gained by one side, it is usual to lay apart all those above six, as they are the only ones that count. For instance, if after the whole thirteen have been played, one side has gained five and the other eight, the latter counts two by cards, the former nothing. The ace, king, queen, and knave of trumps are called honors, and if honors are counted, the partners are entitled to claim one point for each honor that they hold more than their adversaries. The side first making five points, or under the American laws seven, is the winner of the game, and the side winning two out of three games wins the rubber. If the first two games are won by the same partners, the third is not played.

Modern Whist.—A careful examination of the rather extensive literature of whist will show that it is a popular fallacy to suppose that the leading principles of whist strategy are modern. Nothing is more common than the claim that the original lead of the longest suit is the peculiar feature of modern whist. There is no evidence that it was ever considered good play to lead singletons. The essential difference between modern whist and the style of game which we call old-fashioned lies in the recognition of the principle

stated by Clay: "It is of more importance to inform your partner than to deceive your adversary." This is not universally true, and it might be qualified by saying that information is of more use to the strong hand than to the weak, for when the adversaries develop great strength, or a partner shows decided weakness, to give exact information would be very bad whist.

The almost universal adoption of the information-giving mode of play required that there should be some generally understood method of communication, and a system was slowly elaborated by the best players and by writers on the game, which, while keeping in view the original purpose, trick-making, proceeded upon the principle that where any one of two or more cards would equally answer the purpose in view, the selection should be made in accordance with conventional rules for the purpose of giving information. For instance, a player with the lead, having the ace and king of a suit, might play either so far as trick-making was concerned, but for his partner's information he should always play the king, which, by its winning, would indicate the ace; therefore if a player first led the ace it would inform his partner that he had not the king.

Modern whist may then be divided into two parts: (1) The purely conventional rules, which must be learned from books or gathered from other players; (2) the strategy of the game, which depends on the shrewdness of the individual, and the skillful use of the information afforded by the conventional plays. One can become a fair player with the first without the second, but not with the second without the first. The combination of both makes the expert. Unfortunately the tendency of latter-day whist is so to complicate the conventional part of it that most persons mistake it for the entire matter, and never reach the second stage. All modern works on whist are devoted too much to conventionalities, only one, Foster's *Duplicate Whist*, being exclusively devoted to strategy.

These conventional methods of communication, which every player should know by heart, may be divided into two classes, those used in *attack* and those required for *defense*. In attack the facts required to be known are: (1) The general strength or weakness of the hand and the best suit it contains—shown by the original lead. (2) Whether the suit is "established" or not, and if not how much establishing it needs—shown by always leading from certain combinations of cards in certain ways under similar conditions. (3) The assistance that can be given to the partner—shown by the return leads and the management of trumps. (4) The number of trumps held—shown by leading them, by "calling" for them, by "echoing," by "passing," and by "forcing." In defense the partners require to know: (1) What chance there is of stopping the adverse suits—shown by the second-hand play, and by the last player winning the trick with the lowest possible card. (2) The suits which are best protected. (3) The suits which it is desirable to have led; and (4) the suits which it is necessary to avoid—all shown by the discard. The details of this system are briefly as follows:

In Attack.—1. The strongest suit is usually selected for the original lead. It may be strong numerically, as five or six cards, or intrinsically strong by reason of high cards. If there is a choice the numerically strong suit should be selected, the high cards in the other being kept as cards of re-entry. The point to which the manœuvres of all good players tend is to establish and bring in their long suit. It is useless to play for this unless the suit is accompanied by some card of re-entry, and the holder or his partner has probably sufficient trump strength to defend it. When a player has no good suit, or a long weak suit without any card of re-entry, it is better to lead some card, even from a short suit, which will warn the partner at once that the hand is weak. Such leads are called "forced." If the hand contains five trumps it is usually best to lead them, regardless of the remainder of the hand. Four trumps should be led from if the leader or his partner has an established suit, with a probable card of re-entry. Three, or even less, may be led from if the rest of the hand is unusually strong, or if it is desirable to stop the adversaries from trumping.

2. *Leads.*—The condition of the suit led from is shown by the card selected from each of the various combinations. The king is led if it is accompanied by either the ace or the queen, or both. The ace is led if there are five or more cards in the suit, or if it is accompanied by both the queen and knave, with or without other cards. The queen is led

if accompanied by the knave and ten and there is no higher card in the suit. The knave instead of the king is led from the sequence of king, queen, knave, and not less than five cards in the suit. The ten is led if accompanied by the knave and the king. Having none of these combinations, the fourth-best card is selected to inform the partner that three higher remain in the hand, but that they do not form any of the combinations from which a high card would be led. When a weak suit of only three cards is led from, the highest is played, unless it is an ace, king, or queen. Queen may be led if the knave is present. Trumps may be led differently when the object is not to exhaust them immediately, but simply to play them as the strongest suit. The fourth-best may be led, even with ace and king, or king and queen, or ace and four or more others. Holding the four honors, or ace, king, and queen, the lowest of the winning cards is first played. Other combinations are led from as in plain suits.

On the second round of a suit the player leads the best card of the suit if held, or holding two or more equally the best, the lowest that will win the trick. Holding second and third best, such as queen and knave, after the ace has been played he leads the queen if three of the suit remain; the knave if four or more. If a card which is not the best wins, such as a king led from king and queen, the partner may be assumed to have the best, and a small card be led to him. A queen led is followed by the knave if three cards remain, by the ten if four or more. A fourth-best is followed by the best if held, or by another small one.

American Leads.—A system of leading in which an attempt is made to show the number in the suit as well as the combination of high cards has lately been advocated by Hamilton, Fisher Ames, and "Cavendish" in his twentieth edition. The idea is old, and has been several times unsuccessfully advocated during the nineteenth century. The key to it is that the king is not led if there are more than four cards in the suit. From ace, king, the ace is led; from ace, king, queen, the queen; from the four court cards, the knave. The system has been on trial for several years, but is still condemned by a number of those recognized as players of the first class, also by such writers as Drayson, Pembroke, Mogul, and Foster. The chief objection to it is that on the first round these leads may mean anything, and on the second they seldom convey more than the leads in general use. Of the nine principal combinations from which court cards are first played, it is usual to lead the king from five, the ace from two, and the queen and knave from one each. The new system, by rejecting the king, has to make the ace, queen, and knave each represent three of these nine combinations, which often leads to confusion. The new leads are very attractive to those who think giving information is the chief object in whist, and winning the game a secondary consideration. When opposed to mere book players they do little harm, but they put weapons into the hands of a shrewd adversary, and are particularly weak when opposed to false cards judiciously played.

3. *Partner's Duties.*—A systematic method of leading enables the partner to estimate the probable contents of the leader's hand. If an ace is led the leader may be credited with at least four more of the suit, or both queen and knave, but not the king. If king is led he has either ace or queen, perhaps both. If queen is led he has neither ace nor king, but probably both knave and ten. If ten is led he has probably both knave and king. If a knave is led he has either king and queen, with a long suit, or he has a very weak hand. When a small card is led it is probably the best suit, and the partner does his best to win the trick, but as cheaply as possible. Holding ace and king, the king wins it the most cheaply. Holding ace and queen, the queen may be "finessed."

When the partner of the original leader wins the first trick he may do any one of four things: 1st. Lead trumps, if he has five or more, or four with an established suit and a card of re-entry. 2d. Lead back the best card of the leader's suit, if he holds it, before introducing his own. 3d. Lead his own suit, if it is worth trying to establish. 4th. Return the leader's suit, with the lowest if he has three or more remaining; with the higher if only two, no matter what they are. When the original lead is a trump the partner should always return it if he has one.

4. *Trump-signals.*—Counting the trumps is very important. Leading them at the right moment decides many a game. A player not having the lead, but wanting trumps out, can "call" for them if he has two cards such as the

five and three of a suit led, by playing the five first, then the three. The best players are divided in opinion as to the value of this artifice, some thinking it an unmixt evil. It is very useful to the beginner, as by its use a more experienced partner can direct him.

When a player leads trumps his partner can show four or more by "calling" in the trump suit. This is known as the "echo." The absence of the echo shows he has not four. A player may show four trumps by "passing" a doubtful trick; as when he is second player to a small card led of a suit of which he has none. A player leading a suit with the evident intention of "forcing" his partner to trump it shows strength in trumps, as it is usually bad play to do so with a weak trump hand. When an adversary leads trumps it is always well to "force" him to use his trumps for ruffing. Many fine hands are ruined by being forced. The usual rule is: "Always force the strong, seldom the weak, never both."

In Defense.—1. The second player to an adverse lead of a small card should play a high card if he has any combination from which he would lead a high one. If he holds king, knave, ten, and a small card, he should play the ten second hand; or holding king and queen, with others, the queen. This will indicate to his partner that he holds certain combinations of high cards in the adverse suits. The fourth player may win a trick with a knave, showing his partner that he holds still higher cards, as the leader could not have held both ace and king, or king and queen, or all three of them, and the third player could not hold any of them.

2. When the adversaries play a strong attacking game, as by leading trumps, or when a player is weak in trumps, he must keep guard on the adversaries' suits, and discard from his own or his partner's. When a player can not follow suit to an adverse lead of trumps he usually discards from his best-protected suit.

3. It must not always be assumed that a player on the defensive wants the suit led from which he discards. If he has no trumps, and if he "calls" in his discards, the suit in which he calls should be led to him by his partner at the first opportunity. The discard of the best of a suit will also show the command of it.

4. When a player on the defensive discards the lowest of a suit, it is not wise to lead that suit to him. When he discards the second-best of a suit he does so to show that he has not the best, and can not win a trick in that suit.

When a player wins the first trick of an adversary's original lead he must be guided by his position at the table. If he is second player he must open another suit; but if fourth player it is usually better to lead back the same suit than to open a weak one of his own.

Many of the stratagems in use by experts can be learned only by long practice at the whist-table. These are such as finessing, underplay, placing the lead, false cards, making tenaces, holding up winning cards, refusing to win tricks, and delusive discards. A most important thing is judgment of character, and no one can play his best among strangers.

Duplicate Whist.—For the purposes of match play there has lately come into use the form of whist known as "duplicate," called "rejoué" in Foster's *Duplicate Whist*. The cards are dealt as usual, but each player lays the one he plays in front of him on the table, the winner of the trick taking a counter from thirteen previously placed there. The cards of each of the players are kept separate, and are preserved by some one of the many mechanical devices invented for the purpose. Each deal is called a "hand," and a new pack is required for every deal, until an agreed number have been played, usually 12, 16, 20, or 24. The original hands are then, one at a time, placed on the table again, face down, and taken up and replayed; but the cards originally held by one pair of partners are now given to the other. Each side should make thirteen tricks in the original and the duplicate play taken together; if they fail to do so the number is the measure of their loss. If one pair, having the lead, make eight tricks out of thirteen on the original play, and the other pair with the lead make only seven on the duplicate play of the same cards, the latter have lost a trick. It is usual to have four players on each side, arranged at two tables, the hands played at one table being taken to the other for the overplay, to prevent any chance of the hands being memorized. This form of whist is supposed to eliminate luck. It does not do so entirely, but it is the nearest approach to it yet suggested.

Dummy and Double Dummy.—In dummy two are partners against one, who turns face up on the table his dummy partner's cards, which he plays to suit his own hand. The main point in the game is to lead up to dummy's weak suits and through his strong ones. In double dummy two single players each turn up their dummy partner's cards. This game is entirely analysis, like chess. There is only one work exclusively on dummy, *Le Whist à Trois*, by Charles Lahure. It has never been translated.

Laws of Whist.—There are at present extant two codes of laws: the English, generally known as the "Club Code," given in full in *Carendish on Whist*, and the American Whist League Code, given in full in Foster's *Whist Manual*. Their chief differences are as follows: In the English code the game is five points, honors are counted, and rubbers are played. The penalty for a revoke is the loss of three tricks, or the deduction of three points from the score of the revoking players, or the addition of three points to that of their adversaries. The last trick may be seen. In the American code the game is seven points, no honors are counted, and no rubbers played. The value of the game is determined by deducting the score of the losers from seven. The penalty for a revoke is the loss of two tricks. The last trick can not be seen. There are ninety-one laws in the English code, forty in the American. The following should be familiar to every player:

In scoring games the penalty for a revoke counts first, tricks next, and honors last. When the players begin a hand at the score of four they can not count honors; they must make the odd trick to win the game.

Honors, unless claimed before the trump card of the following deal is turned up, can not be scored.

An erroneous score can be corrected at any time during the game in which it occurs.

A misdeal loses the deal. The dealer may not count the cards he has dealt, nor the remainder of the pack.

Exposed cards, such as cards played in error, two or more played at once, or a card dropped face upward on the table, must be left there, and can be called by the adversaries; but the adversaries can not prevent their being played when the opportunity offers.

If a player leads out of turn the adversaries may call a suit from the player in error or from his partner when it is next the turn of either of them to lead. If the other three have played before the error is discovered it can not be rectified.

A revoke is established after the trick in which it occurs is turned and quitted. The revoking players can not win the game that hand, no matter what they score.

Any player may ask the others to indicate which of the cards on the table they played, provided the cards have not been touched for the purpose of gathering them.

History and Literature.—The origin of the game is a mystery, although some writers on the subject fancy they have solved it. The word "whist," so spelled, occurs for the first time, so far as known, in *Hudibras the Second Part*, published in 1663:

But what was this? A game at whist. . . .

Several attempts have been made to derive whist from the old French and Italian games of "triumph," referred to by Rabelais and other writers early in the sixteenth century. This has now been abandoned by the best judges. The English game of "ruff and honors" is sometimes put forward as the father of whist; but Charles Cotton, in the *Compleat Gamester*, published in 1674, follows up his description of the game ruff and honors by specifying whist as a different game. In both games only twelve cards were dealt to each player; but in ruff and honors the whole pack was used, the trump being turned from the remaining four, and these four were "ruffed," or taken in by the holder of the ace of trumps. In whist the four deuces were thrown out of the pack, and the forty-eighth card was turned up for trump. A variation known as "whisk and swabbers" seems to have flourished about the same time, the "swabbers" being a parasite growth, resembling the "joker" in a euchre pack. In all these the game was nine points, honors were counted, and the players could "call" at eight. Early in the eighteenth century it became the custom to use the entire pack of fifty-two cards, thus introducing the odd trick, and ten points became the game, honors being called at eight as formerly.

Hoyle.—It does not appear that whist was originally in favor among the better classes of society, who devoted their

time to piquet, ombre, and quadrille. Daines Barrington informs us that about 1728, a little whist school used to meet at the Crown Coffee-house in Bedford Row, London. Its leading spirit seems to have been the first Lord Folkestone, and it is to be regretted that he did not anticipate the famous little whist school of 1860 by keeping some record of their studies and publishing the results. All that is known of their game is that they established, if they did not discover, the advantage of leading from strong suits, of studying their partner's hand, and of playing to the score. It is more than probable that the famous Edmund Hoyle was a frequenter of the Crown, and, if not actually a member of the school, was familiar with its teachings, to which he added a number of calculations on odds and an artificial method of arranging the cards in the hand so as to assist the memory. This fund of information he communicated to private pupils for the sum of one guinea, but in 1742-43 he published his laws under the name of the *Short Treatise*. The only copy known to be genuine of the first edition of this remarkable book is in the Bodleian. The laws laid down by Hoyle were revised by the members of White's and Saunders's, and remained the authority for over a century. Hoyle died in 1769, yet for forty years after his death his book was the standard work on whist.

Paine's *Maxims* was published about 1770, and was regarded as the authority about the beginning of the nineteenth century.

Matthews.—About 1804 Thomas Matthews published his *Advice to the Young Whist Player*. This rapidly became the authority, and is still regarded by experts as one of the best works on whist, most of the modern writers borrowing from it very freely. The author was regarded as the best player of his day, and there are many who believe that he and Deschappelles were the only two men that ever mastered the game. In the seventh edition (1813) short whist spoken of for the first time, and some notes on its influence on whist strategy.

In 1822 Admiral Burney brought out his *Treatise*, largely plagiarized from Matthews, and in 1835 Matthews's work was rewritten by Major A.

Deschappelles.—In 1839 a Frenchman, M. Deschappelles, who enjoys the reputation of being the finest whist player that ever lived, published his *Traité du Whiste*, a commentary on the then existing laws, and of no value to the modern player. He was famous for his finesse, and all who played with him seem to have acknowledged his genius; yet not a single game of his is extant, and only one *coup* bears his name.

"Cœlebs," in 1851, makes the first mention of the new universal trump-signal. Many other writers followed, such as Bob Short, Cam, and Walker. All these followed the maxim system more or less closely, and their works suggest the idea of a collection of lectures delivered to stupid partners at the whist-table, hastily noted down at the time, and given to the printer without further revision.

Cavendish.—In 1862, under the title of *The Laws and Principles of Whist*, a writer adopting the pseudonym of Cavendish made the first attempt to state the general principles of play, and for the first time published illustrative hands. This work is still the standard all over the world.

In 1864 James Clay published his *Short Whist*. He was one of the finest players of his day, but not so exact nor so logical a writer as Cavendish. The famous *Westminster Papers* were issued from 1868 to 1879, forming a most interesting collection of whist jottings and examples of the skill of famous players. Dr. Pole's *Theory of Whist* appeared in 1870. It is ingenious, but considered unsound, as it fails to take into account the theory of weak leads. His *Philosophy of Whist* is an abstruse essay on the intellectual and scientific aspects of the game.

Drayson.—In 1879 Maj.-Gen. Drayson published the *Art of Practical Whist*, in which the ante-penultimate leads were given for the first time. The principles of these leads has since been erroneously attributed to N. B. Trist, who suggested in a letter to the *Field* that they be called fourth-best leads. Drayson also introduced some radical changes in the management of trumps, and he is regarded as the authority on that subject.

Proctor published in one volume the whist matter that had appeared in *Knowledge* from month to month. "Pembroke," a bitter opponent of the ultra refinements of the modern school, wrote *Bumblepuppy* and the *Decline and Fall of Whist*, two very bright essays on how *not* to play whist. In 1889 Foster's *Whist Manual* was published, fol-

lowing closely upon his invention of the "self-playing whist cards." In the *Manual* he collected the latest and best systems of play, and arranged them with a view solely to enabling the student to master them rapidly and easily. Systematic exercises with the cards were given for the first time, the play of the second hand was simplified, and his discovery of the eleventh rule was published. A second series of the self-playing cards followed, then a *Pocket Guide to Modern Whist*, Foster's *Duplicate Whist*, and *Whist Strategy*, and *Whist Tactics*.

In the U. S. several authors have published works on whist. "G. W. P." wrote *American Whist*, *Whist Universal*, and *Whist in Diagrams*. Instead of following the usual custom and presenting the results of the experience of the best players up to his own time, this author insisted on certain theories of his own. Fisher Ames has published two works—*A Practical Guide to Whist* and *American Leads at Whist*. They follow the new style of leading, and are written on the maxim system. C. D. P. Hamilton's *Modern Scientific Whist* is the most voluminous work on the subject so far published. It contains 600 pages of exhaustive analysis, every possible position of the cards being illustrated in diagram. He advocates the informatory game, with the American system of leads.

R. F. FOSTER.

Whistler, JAMES ABBOTT McNEILL: figure, landscape, and portrait painter; b. in Lowell, Mass., in 1834; pupil of Gleyre in Paris; settled in London in 1863; received a third-class medal at the Paris Salon of 1883, and a first-class medal at the Paris Exposition of 1889; became an officer of the Legion of Honor 1891, and a member of the Society of American Artists 1880. His works are individual in character, and are notable for subtle color-harmony. He is one of the greatest of modern etchers, and has painted some masterly portraits. His *Portrait of my Mother*, painted in 1872 and exhibited in New York at the Society of American Artists in 1882, was, in 1892, bought by the French Government for the Luxembourg Gallery, Paris. He published *The Gentle Art of Making Enemies* (1890; enlarged ed. 1892). His studio was in London for a number of years, but in 1892 he removed to Paris.

WILLIAM A. COFFIN.

Whiston, WILLIAM: clergyman and mathematician; b. at Norton, Leicestershire, England, Dec. 9, 1667; educated at Tamworth School; entered Clare Hall, Cambridge; obtained a fellowship there 1693, and became a mathematical tutor; took orders in the Church of England 1693; was chaplain to the Bishop of Norwich 1694-98, and vicar of Lowestoft 1698-1701; became deputy to Sir Isaac Newton the Lucasian professorship of Mathematics at Cambridge 1701, and succeeded to that chair in 1703, but was deprived of it and expelled from the university Oct. 30, 1710, in consequence of having expressed Arian views in the Boyle lectures; was pronounced a heretic by the convocation of 1711; was pardoned by an "act of grace" 1715; removed to London, where he gave private lectures on astronomy and natural philosophy; was an active writer on theological subjects; became a Baptist and a Millenarian, and gathered a congregation in his own house to which he expounded "primitive Christianity" and predicted the advent of the millennium and the restoration of the Jews to Palestine in 1766. He was the author of *A New Theory of the Earth* (1696). Of his many other works the best known are *The Accomplishment of Scripture Prophecies* (1708); *Primitive Christianity Revived* (5 vols., 1711-12); *The Primitive New Testament* (1745); and his translation of the *Works of Josephus* (folio, 1737), which has been carefully revised by Rev. A. R. Shilleto, in Bohn's Library (1890). A curious and interesting account of his life is given in his *Memoirs* (1749-50). D. in London, Aug. 22, 1752.

Revised by S. M. JACKSON.

Whitaker, Rev. NATHANIEL, D. D.: b. on Long Island, N. Y., Feb. 22, 1732; graduated at Princeton College in 1752; entered the ministry, and took charge of a church at Chelsea, near Norwich, Conn., where he remained until 1761, when he was deputed by the Scotch Society for the Advancement of Learning (of which there was a branch in Connecticut) to visit Scotland, England, and Wales for the purpose of obtaining donations for the establishment of an institution of learning in America for the education and christianization of the North American Indians. He took with him Rev. SAMSON OCEON (*q. v.*), an educated Indian, who had been licensed to preach by the Presbyterian denomination. The General Assembly of the Church of Scotland warmly sympathized with their plans and pur-

poses. In England the mission also met with favor. (See *Extracts of Several Sermons Preached in the City of Bristol by Nathaniel Whitaker and Samson Occom*, Bristol, 1766.) The Earl of Dartmouth, then secretary of American affairs, received the strangers with great kindness, and generously promoted their object by his benefactions. The king, George III., it is said, himself gave £400 to the cause. From different sources there was contributed to the fund, during the two years of Dr. Whitaker's visit to Europe, the sum of £11,000, to which considerable additions were afterward made before the outbreak of the American Revolution. With an endowment so obtained, Dartmouth College at Hanover, N. H., was founded. On his return from Europe, Dr. Whitaker formed a Presbyterian church at Salem, Mass., and officiated there for a number of years. He afterward removed to Maine and thence to Virginia. Many of his sermons were published and extensively circulated throughout New England. He was an ardent Whig, and zealously supported the cause of the colonies in their struggle for independence in 1776. D. at Woodbridge, Va., Jan. 21, 1795. Revised by S. M. JACKSON.

Whitaker, OZI WILLIAM, D. D.: bishop; b at New Salem, Mass., May 10, 1830; graduated at Middlebury College, Vermont 1856; was principal of the North Brookfield (Mass.) High School for four years; graduated at the General Theological Seminary of the Protestant Episcopal Church in 1863; was ordained deacon in Boston July 15, 1863, and priest Aug. 7 of the same year; was rector of St. John's church, Gold Hill, Nev., from Oct., 1863, to July, 1865; was rector of St. Paul's, Englewood, N. J., from Oct., 1865, to Feb., 1867; became rector of St. Paul's, Virginia City, Nev., in Apr., 1867; was elected missionary Bishop of Nevada and Arizona in 1868, and consecrated in New York Oct., 1869. Bishop Whitaker was elected assistant Bishop of Pennsylvania in 1886, and became the dioecesan on the decease of Bishop Stevens in June, 1887. Revised by W. S. PERRY.

Whitby: town; in the North Riding of Yorkshire, England; at the mouth of the Esk in the North Sea; 54 miles N. N. E. of York (see map of England, ref. 5-1). It has a good harbor, protected by two piers, 300 and 800 yards long, jutting out into the sea; drydocks for building and repairing ships; manufactures of sailcloth and cordage, and an extensive trade. Jet, alum, and iron ores are exported. A monastery founded here in 657 by St. Hilda was burned by the Danes in 867, and was rebuilt in 1078 as a Benedictine abbey for monks. Pop. (1891) 13,274.

Whitby: town of Ontario, Canada; capital of Ontario County; on the north shore of Lake Ontario; on the Grand Trunk Railway, 31 miles E. of Toronto (see map of Ontario, ref. 4-E). Its port is one of the best on the Canadian shore of Lake Ontario. Its original name was Windsor, but this was changed because of the Windsor on the Detroit river. Pop. (1891) 2,786. M. W. H.

White, ANDREW DICKSON, LL. D., L. H. D.: educator; b. at Homer, N. Y., Nov. 7, 1832; removed in childhood to Syracuse; graduated at Yale College 1853; traveled in Europe; was several months an *attaché* of the U. S. legation in Russia; studied at the University of Berlin 1854-55; was Professor of History and English Literature at the University of Michigan 1857-63; visited England 1863; returned to Syracuse; was State Senator 1863-66; introduced the bills which codified the school laws, created the new system of normal schools, and incorporated Cornell University; was chosen first president of that institution 1866; visited Europe to purchase for it books and apparatus and to study modern educational methods; has been a liberal contributor to the university, in which, besides the presidency, he filled the chair of Modern History until his resignation June 17, 1885; was one of the commissioners sent by President Grant to Santo Domingo to study the question of annexation 1871; was U. S. minister to Germany 1879-81, and to Russia 1892-94; was appointed a member of the Venezuela boundary commission Jan. 1, 1897, and ambassador to Germany in 1897. He presented his historical library, comprising about 20,000 volumes, besides some 10,000 pamphlets and many rare manuscripts, to Cornell University, and has since enlarged the gift by continued benefactions. Author of *Outlines of Lectures on Medieval and Modern History* (Detroit, 1861; Ithaca, 1872, etc.); *A Word from the Northwest* (1863), in reply to Dr. W. H. Russell; *The Plan of Organization for Cornell University* (1868); *The New Education* (1868), being his inaugural address; a *Report on the Co-education of the Sexes* (1871); *Paper Money Inflation in France* (1876, 1882);

A History of the Doctrine of Comets (1887); *A History of the Warfare of Science with Theology in Christendom* (2 vols., 1896); and many addresses and magazine articles, mainly on historical, political, and educational topics.

Revised by GEORGE L. BURR.

White, CHARLES ABIATHAR, A. M., M. D.: geologist; b. at North Dighton, Mass., Jan. 26, 1826; removed to Iowa in 1839, and graduated at Rush Medical College, Chicago, 1863; was State geologist of Iowa 1866-70; Professor of Natural History in the Iowa State University 1867-73; from 1873-75 held a similar position at Bowdoin College, and since 1874 has been connected with different national geological surveys. He was appointed geologist to the U. S. Survey 1882, and paleontologist 1883, which office he still holds in connection with honorary curatorship in U. S. National Museum. He was elected a member of the National Academy of Sciences 1889. His principal works are *Report on the Geological Survey of the State of Iowa* (1870); *Manual of the Physical Geography and Institutions of the State of Iowa* (1873); *Bibliography of North American Invertebrate Paleontology*, contributions to *Invertebrate Paleontology*, Nos. 1, 2, and 8 (1879-83); *A Review of the Non-Marine Fossil Mollusca of North America* (1883); *A Review of the Cretaceous Formations of North America* (1891); *The Texan Permian and its Mesozoic Types of Fossils* (1891); and other scientific works, numbering in all nearly 200 titles. An *Annotated Catalogue* of his writings was published in Washington, D. C., in 1885. Revised by C. H. THURBER.

White, GILBERT: clergyman and author; b. at Selborne, Hampshire, England, July 18, 1720; educated at Basingstoke School and at Oriol College, Oxford; graduated 1743; became a fellow of Oriol 1744, retaining that place through life; became senior proctor of the university 1752; took orders in the Church of England, but declined ecclesiastical preferment, though officiating as curate at his native village, where he spent most of his life upon his paternal estate, chiefly occupied in those minute observations in natural history on which his fame is based. D. at Selborne, June 20, 1793. He was the author of *The Natural History and Antiquities of Selborne in the County of Southampton* (1789) and *The Naturalist's Calendar, with Observations in Various Branches of Natural History* (1795), a posthumous work made up from his papers by Dr. John Aikin. Among the naturalists who have published annotated editions of these two works (usually published together) may be mentioned Sir W. Jardine (1833), Capt. Thomas Brown (1835), Edward T. Bennett (1837), Blyth and Mudie (1850), Edward Jesse (1850), Rev. J. G. Wood (1854), Frank Buckland (London, 1875), and Richard Jefferies (1887). The newest edition (2 vols., New York 1895) has an Introduction by John Burroughs. A volume of his *Letters* was issued by J. E. Harting (1876).

White, HENRY KIRKE: poet; b. at Nottingham, England, Mar. 21, 1785; was the son of a butcher; was apprenticed to a stocking-weaver, and afterward to an attorney, in whose office he found time to study the classics and several modern languages, as well as English literature, drawing, and music; began to write verses for magazines in his fifteenth year; gained several prizes offered by publishers of periodicals; printed a volume, *Clifton Grove, a Sketch in Verse, with other Poems* (1803), which won for him the high regard of Southey and other men of letters, by whom he was encouraged to study for the ministry; obtained a sizarship at St. John's College, Cambridge, 1804; was for two years at the head of his class, and became a tutor in mathematics, but destroyed his health by excessive study, and died of consumption at Cambridge, Oct. 19, 1806. His papers were placed in the hands of Southey, who published his *Remains, etc., with an Account of his Life* (2 vols., 1807; vol. iii., 1822), which obtained for him a permanent place in English literature. A republication of his *Poetical Works* was issued (London, 1869). Revised by H. A. BEERS.

White, HORACE, M. A.: journalist; b. at Colebrook, N. H., Aug. 10, 1834; graduated at Beloit College, Wis., in 1853. He was for many years connected with *The Chicago Tribune*, and was its editor 1865-74. Since 1883 he has, conjointly with E. L. Godkin, edited *The Evening Post* (New York). Besides editing other economical works, he is the author of *Money and Banking, Illustrated by American History* (Boston, 1895).

White, HUGH LAWSON: jurist; b. in Iredell co., N. C., Oct. 30, 1773; son of Gen. James White (1739-1821), a pioneer

settler of Knoxville, Tenn., where he removed 1786. The son served as a volunteer against the Cherokee Indians 1792; studied at Philadelphia 1794-96; read law at Lancaster, Pa.; began practice in Knoxville 1796; was judge of the State Supreme Court 1801-07 and 1809-15; became U. S. district attorney 1807, State Senator 1809 and 1817, president of the State Bank of Tennessee 1815, and commissioner of Spanish claims 1820; was U. S. Senator 1825-35 and 1836-39; president *pro tem.* of that body 1832; received the electoral votes of Georgia and Tennessee for President of the U. S. at the election of 1836; and resigned his seat in the Senate 1839, in consequence of having received from the Legislature instructions requiring him to vote contrary to his judgment. D. at Knoxville, Tenn., Apr. 10, 1840. A *Memoir, with Selections from his Speeches and Correspondence* (Philadelphia, 1856), was prepared by Nancy N. Scott, one of his descendants.

White, JOHN: clergyman; b. at Stanton, St. John, Oxfordshire, England, in 1574; educated at Oxford; became perpetual fellow of New College 1595, and rector of Trinity church, Dorchester, 1606; was one of the most efficient promoters of the colonization of New England, and especially of Dorchester and Gloucester, Mass., both by his pen and by his personal influence; was known as the patriarch of Dorchester, and was a member of the Westminster Assembly of divines. D. at Dorchester, England, July 21, 1648. He was the author of *The Planter's Plea, or the Grounds of Plantations Examined and Usual Objections Answered* (London, 1630); *The First Century of Scandalous, Malignant Priests Made and Admitted into Benefices by the Prelates* (1643); *A Commentary upon the Three First Chapters of Genesis* (1656), etc. Revised by S. M. JACKSON.

White, JOHN WILLIAMS: Greek scholar; b. at Cincinnati, O., Mar. 5, 1849; graduated at Ohio Wesleyan University, Delaware, O., 1868; appointed Professor of Greek and Latin at Willoughby College, Ohio, 1868; at Baldwin University, Ohio, 1869; tutor of Greek in Harvard College 1874; assistant Professor 1877-84, when, upon the death of Prof. Sophocles, he was elected to fill the vacant chair. He published numerous school-books and a number of archaeological papers, and is one of the editors of Ginn's College Series of Greek Authors. ALFRED GUDEMAN.

White, JOSEPH BLANCO: author; b. at Seville, Spain, July 11, 1775, of an Irish Catholic family settled in Spain; was known in Spain as JOSÉ MARIA BLANCO Y CRESPO; was ordained a priest 1799, but soon lost confidence in Roman Catholicism, though continuing in its priesthood until 1810, when, in consequence of the political crisis in Spain, he went to England; was tutor in Lord Holland's family; conducted a monthly Spanish paper, *El Español* (1810-14), rendering services to the cause of Spanish independence, which were rewarded by the English Government with a life-pension of £250; took orders in the Church of England; resided in London as a man of letters, producing several works in Spanish and English; conducted (1822-25) another Spanish journal, *Los Variedades*, and was editor of the short-lived *London Review* (1829); was tutor in the family of Archbishop Whately at Dublin 1832-35, after which he avowed himself a Unitarian; settled at Liverpool, where he died May 20, 1841. Among his publications were *Letters from Spain, by Leonadio Doblado* (1822); *Practical and Internal Evidence against Catholicism* (1825); *The Poor Man's Preservative against Popery* (1825); *Second Travels of an Irish Gentleman in Search of a Religion* (2 vols., 1833); and an instructive autobiography in the form of letters, addressed chiefly to Archbishop Whately, edited by Rev. J. H. Thom as a part of *Life and Correspondence* (3 vols., 1845). Blanco White's *Night and Death* was called by Coleridge the finest sonnet in the English language.

White, PEREGRINE: the first child of English parentage born in New England; was the son of William White and his wife Susanna, passengers in the Mayflower, and was born on that vessel in Cape Cod Bay on Nov. 20, 1620; became a citizen of Marshfield, where he was given 200 acres of land in "consideration of his birth"; was "vigorous and of a comely aspect"; filled various civil and military offices, and reached a good old age, dying at Marshfield, July 22, 1704. His father died during the first winter at Plymouth, and his mother married Gov. Edward Winslow, theirs being the first marriage in New England.

White, RICHARD GRANT: Shakespearian scholar; b. in New York city, May 22, 1821; graduated at the University of New York 1839; studied medicine and law; was admit-

ted to the bar 1845; was associate editor of the *New York Courier and Enquirer* 1851-58; and subsequently, 1860-61, of the *World*; wrote largely for reviews and magazines, chiefly on music, Shakespeare, and social subjects, to which he added some essays on the English language; was the writer of the "Yankee Letters" in the *London Spectator* 1863-67, and for nearly twenty years was chief clerk of the U. S. revenue marine bureau in the district of New York, resigning in 1878. He was the author of *Biographical and Critical Handbook of Christian Art* (1853); *Shakespeare's Scholar* (1854); *The Authorship of the Three Parts of Henry VI.* (Cambridge, 1859); *National Hymns, a Lyrical and National Study for the Times* (New York, 1861); *The New Gospel of Peace* (4 parts, Cambridge, 1863-66); an anonymous political satire which acquired great celebrity; *Memoirs of the Life of William Shakespeare, with an Essay toward the Expression of his Genius, etc.* (Boston, 1865), an abridgment of which formed part of the first volume of his scholarly annotated edition of Shakespeare (12 vols., Boston, 1857-65); and *Words and their Uses* (New York, 1870). He appended notes to, but did not edit, Burton's *Book-hunter* (1866), and collected and edited *Poetry of the Civil War* (1866). In 1880 he published *Every-day English*, and also *The American View of the Copyright Question*; in 1881, *England Without and Within*, which has been generally accepted by British critics as one of the most correct and impartial views of English character and English life ever presented; in 1883, *The Riverside Shakespeare*, with biography, introductions, and notes (3 vols., Cambridge); in 1884, *The Fate of Mansfield Humphreys*, a novel. He was the author of a series of articles on the failure of the public-school system in the U. S. (1881) which provoked much controversy. A volume of *Studies in Shakespeare*, made up from his contributions to various periodicals and revised just before his death, was published in Boston in 1886. D. in New York city, Aug. 8, 1885.

Revised by W. J. ROLFE.

White, WILLIAM, D. D.: bishop; b. in Philadelphia, Pa., Apr. 4, 1748, or according to some authorities, Mar. 24, 1747, or 1748; graduated at the College of Philadelphia 1765; studied theology in England; took orders in the Church of England 1770; was rector of Christ church and St. Peter's in Philadelphia 1779-1836; was chaplain to Congress when in session at York, Pa., 1777, and continued in his chaplaincy 1777-85 and 1789-1801; was a friend and pastor of Washington; presided at the first Episcopal convention held in America, Sept. and Oct., 1785; wrote the constitution of the Church then adopted; was chosen bishop of the diocese of Pennsylvania 1786; proceeded to England with his fellow bishop-elect (of New York), Dr. Samuel Provoost; was consecrated at Lambeth Palace chapel by the Archbishop of Canterbury Feb. 4, 1787, being the first American bishop in the line of succession from Canterbury; was president of the first Bible Society established in the U. S., and of several charitable institutions, and, with Bishop Seabury, of Connecticut, as the first "House of Bishops" of the American Church, revised the *Book of Common Prayer* for the use of the American Episcopal Church. Bishop White received holy baptism in Christ church, Philadelphia, May 25, 1748; there received his first communion; and there, May 28, 1787, his first ordination took place. In this church Bishop White consecrated six bishops for various sees. D. in Philadelphia, July 17, 1836. He was the author of *The Case of the Episcopal Churches in the U. S. considered* (1782); *Lectures on the Catechism* (1813); *Memoirs of the Protestant Episcopal Church in the United States* (1820; 3d ed. by Rev. B. F. De Costa, D. D., New York, 1880); and other works. A *Memoir*, by Rev. Dr. Bird Wilson, appeared in 1839. Revised by W. S. PERRY.

White, WILLIAM HENRY, C. B., LL. D., F. R. S.: civil engineer and naval constructor; b. at Devonport, England, Feb. 2, 1845; educated at the Royal School of Naval Architecture; graduated head of his class in 1867; until 1883 was employed in the construction department; 1883-85 chief constructor Elswick works in charge of ship-building department; since 1885 director of naval construction to the admiralty and assistant controller of the navy; designed the cruisers Blake and Blenheim; fellow of the Royal Societies of London and Edinburgh; vice-president of the Institute of Naval Architects; member of the Institution of Civil Engineers and the Iron and Steel Institute. He has published a *Manual of Naval Architecture, a Treatise on Ship-building* and numerous memoirs and papers. W. R. HUTTON.

White Ants: See TERMITES.

Whitebait: a name given in England to small fishes which were long supposed to belong to a peculiar species (*Clupea alba*), and even to a special generic type (*Rogenia*) of the *Clupeida*, but which are now known to be merely the young of the common herring (*Clupea harengus*) and the sprat (*Clupea sprattus*). The differences in physiognomy and in dentition between the young and old of the *Clupea* are sufficient to have afforded some reasons for a distinction originally, especially in connection with the differences of habits. The name whitebait is limited to fishes which are under 6 inches in length and whose sides are almost uniformly white. Such fishes begin to make their appearance in the river Thames in England about the end of March or early in April, and during the summer months are caught in immense quantities.

White Bear: See BEAR and URSIDE.

White Bear Lake: village; Ramsey co., Minn.: on the White Bear Lake, and the St. Paul and Duluth Railroad; 12 miles N. by E. of St. Paul, 15 miles N. E. of Minneapolis (for location, see map of Minnesota, ref. 9-F). It is a summer resort, 920 feet above sea-level, in an agricultural and stock-raising region, does its banking in Minneapolis and St. Paul, and has a weekly newspaper. Pop. (1880) 435; (1890) 1,356; (1895) 1,334.

White Copper: an alloy, commercially called **Packfong**. See NICKEL and PAKTONG.

Whitefield: town; Coos co., N. H.; on the Concord and Montreal and the Maine Cent. railways; 11 miles S. of Lancaster, 125 miles N. of Concord (for location, see map of New Hampshire, ref. 4-E). It contains the villages of Whitefield and Hazen's, and has 4 churches, high school, parochial school, public library, 5 hotels, a banking and trust company, several lumber-mills, an overall and shirt factory, tub and box factories, a bobbin-factory, a large fancy stock farm, and a weekly newspaper. Pop. (1880) 1,828; (1890) 2,041. E. H. WESTON, EDITOR OF "NEWS."

Whitefield, GEORGE: preacher; b. at Gloucester, England, Dec. 16, 1714; son of an innkeeper, but the grandson and great-grandson of clergymen; in St. Mary's grammar school acquired the rudiments of learning, and there gave indications of extraordinary talent for public speaking. He entered the University of Oxford in his eighteenth year as a Pembroke servitor. Having become intimate with the Oxford Methodists, as certain pious students were called, and having undergone a great moral change, he resolved to devote himself to the ministry; was ordained June 20, 1736, in the choir of Gloucester Cathedral, and the following week he preached his first sermon there.

He went to London, at first to read prayers in the Tower chapel, but, having begun to preach at Bishopsgate church, his fame soon spread over the city, and shortly he was engaged four times on a single Sunday in addressing audiences of enormous magnitude. Having addressed multitudes in other parts of his native county, he spent some weeks in Bristol. His friends, the Wesleys, urged him to go to America, and in 1738 he visited Georgia, but returned the same year to raise funds for the needy colonists and to receive priest's orders. When again in the city of Bristol, he pondered what had been said to him there some time before—"What need of going abroad? Have we not Indians enough at home? If you have a mind to convert Indians, there are colliers enough in Kingswood." He hasted to Kingswood, as he says, and preached before immense audiences with such power that "hundreds and hundreds of them were soon brought under deep conviction, which, as the event proved, ended in a sound and thorough conversion." Then he visited Wales with Howell Harris, and, beginning at Cardiff, proceeded from town to town, laboring in every place with all his accustomed ardor. The effects produced were very striking, and an excitable people, as were the inhabitants of the principality, yielded to the force of the preacher's appeal and to the power of those divine truths which he proclaimed. In Aug., 1739, he sailed again for America, preached at Philadelphia, New York, and other places; established an orphanage at Savannah; and in 1740 visited New England, where his preaching was highly successful, but met with bitter opposition from some of the clergy. In 1741 he returned to England.

At length a dispute arose between Whitefield and Wesley. The tide for a time turned against the former, "and at Kennington Common," he says, "I had not above a hun-

dred to hear me." He had to begin his work afresh, and was encouraged by Beza's words: "Calvin is turned out of Geneva, but, behold, a new Church arises!" On a common near Braintree he preached to 10,000. Then he went to Scotland, but the churches would not hold the congregations. He continued preaching, always twice, often three, and once seven times, a day. We find him in Gloucestershire, and again in Wales, and once more in London. He returned to Scotland, caused a wonderful revival at Cambuslang, and then reappeared in London, having traversed the kingdom, preaching wherever he went.

In 1744 Whitefield sailed to America for the third time. In 1748 he recrossed the Atlantic, and was sent for by the Countess of Huntingdon to preach in her drawing-room to the nobility, among whom were Chesterfield and Bolingbroke. Scotland was revisited; so was the west of England. From Bristol he writes: "Yesterday God brought me here after having carried me a circuit of about 800 miles, and enabled me to preach to upward of 100,000 souls." Immense consternation was caused in London by an earthquake in Mar., 1750; people thought the world was coming to an end. Whitefield addressed a multitude in Hyde Park, telling them God's true prophecy of the world's end. Afterward he visited Ireland and Scotland, and then a fourth time crossed the ocean. We find him in England again before the year's end, and, after preaching there, hasting once more to the other side of the Tweed. The Tabernacle and Tottenham Court chapels were built in 1753 and 1756, and there he gathered crowded congregations. Again and again he repeated his visits to Scotland, filling up the intervals with home engagements. He went to America a fifth, a sixth, and a seventh time. He preached every day at Boston from Sept. 17 to 20, 1770; then traveled to Newburyport, preaching two hours at Exeter, N. H., Sept. 29, on the way. He went that evening to Newburyport, Mass., where he died the next day (Sunday), Sept. 30, 1770.

Whitefield's intellectual powers were not of a high order, but he had an abundance of that ready talent which makes the popular preacher; and beyond all natural endowments there was in his ministry the power of evangelical truth, and, as his converts believed, the presence of the Spirit of God. His voice was marvelously varied, and he ever had it at command—an organ, a flute, a harp, all in one.

His works, with a memoir, by J. Gillies, have been published in 7 vols. (London, 1771-72). Among the *Lives* are those by Philip (1837), Andrews (1864), and Tyerman (2 vols., London, 1876-77; 2d ed. 1890). The best description of Whitefield's personal peculiarities is in Rev. W. Jay's *Memoirs of Cornelius Winter*. Revised by J. F. Hurst.

Whitefish: any fish of the family *Salmonidae* and genus *Coregonus*. These have the form essentially similar to that of the salmon and trout, although less graceful, and with a stouter tail; the scales are also larger, but are of moderate size; the mouth has a narrow cleft, and the upper jaw projects more or less beyond it, or is truncated; the maxillary bones are short and broad; the teeth are wanting or extremely minute; the suborbital bones are well developed; the dorsal fin has thirteen to fifteen rays, the anal thirteen to sixteen; the adipose dorsal fin is moderately developed; the stomach recalls a horseshoe by its form; the pyloric appendages are very numerous. The species are generally distributed in the colder waters of the northern hemisphere, especially affect the still waters of lakes and ponds, and are rather local in their distribution. About thirty species are known, distributed between Europe, Asia, and North America. Among the most notable of the American species is the *Coregonus albus*, or common whitefish of the lakes, one of the most important of the economical fishes of the great system of northern lakes. Extensive warehouses exist for its storage in and near the large cities and towns on the lake borders. See FISHERIES.

White Flux: a mixture of potassium carbonate, nitrite, and nitrate. See FLUX.

Whitefriars: an ancient precinct in London, between Fleet Street and the Thames, deriving its name from the church of the Carmelite monks, or "White Friars," founded by Sir Richard Grey in 1241. It also bore the cant name of Alsatia. Salisbury Court, Whitefriars, enjoyed for centuries the privileges of a sanctuary—at first for criminals, and subsequently for debtors only—until 1697. Whitefriars theater was a flourishing institution during most of the dramatic career of Shakespeare (1580-1613), but was pulled down at the latter date.

White Hall: city: Greene co., Ill.; on the Burlington Route and the Chi. and Alton railways; 24 miles S. by W. of Jacksonville, 65 miles N. of St. Louis (for location, see map of Illinois, ref. 7-C). It is in an agricultural region, with an abundance of coal and potter's clay in the vicinity, and has Baptist, Christian, Methodist Episcopal, Presbyterian, and Roman Catholic churches, high school, school property valued at \$25,000, 2 private banks, a daily and 2 weekly papers, electric-light plant, and manufactories of stoneware, sewer-pipe, flour, and machinery. It is an important shipping-point for live stock. Pop. (1880) 1,716; (1890) 1,961; (1895) 2,203. EDITOR OF "EVENING REPUBLICAN."

Whitehall: village (incorporated in 1867); Muskegon co., Mich.; on White Lake, and the Chi. and W. Mich. Railway; 5 miles from Lake Michigan, 16 miles N. W. of Muskegon, the county-seat (for location, see map of Michigan, ref. 7-II). It is in an agricultural and lumbering region; is a popular summer resort; contains a graded public school, a savings-bank with capital of \$25,000, tannery, several shingle and lath mills, bicycle-factory, wagon-factory, and many summer residences of Chicago and Grand Rapids business men; and has a weekly newspaper. Pop. (1880) 1,724; (1890) 1,903; (1894) 1,741. EDITOR OF "FORUM."

Whitehall: village: Washington co., N. Y.; on Lake Champlain, Poultnier river, the Champlain Canal, and the Del. and Hud. Railroad; 24 miles W. by S. of Rutland, Vt., 76 miles N. by E. of Albany (for location, see map of New York, ref. 3-K). It is in a ravine at the foot of Skene's Mountain; has a union free school with library, 2 national banks with capital of \$150,000, gas and electric-light plants, and 2 weekly newspapers; and has excellent water-power, several shipyards, silk and knitting mills, grist-mills, saw and moulding mills, railway-shops, and minor industries. The village has a large lumber trade. Pop. (1880) 4,270; (1890) 4,434; (1895) 5,556. EDITOR OF "CHRONICLE."

Whitehaven: town: county of Cumberland, England; on the Irish Sea, near the entrance of the Solway Frith; 41 miles S. W. of Carlisle (see map of England, ref. 4-E). It is well built, finely situated, and has a good harbor, with a wet dock of 5 acres, two piers, each over 300 yards long, and a lighthouse. It has manufactories of sailcloth, soap, earthenware, and cordage, iron-smelting works and foundries, and exports large quantities of coal from the rich collieries in its neighborhood. Whitehaven returns one member to Parliament. Pop. (1891) 18,044.

White Haven: borough (founded about 1825, incorporated in 1843); Luzerne co., Pa.; on the Lehigh river, and the Lehigh Val. and the Cent. of N. J. railways; 25 miles N. of Mauch Chunk, 30 miles S. E. of Wilkesbarre (for location, see map of Pennsylvania, ref. 3-H). It has seven churches, complete system of graded public schools, Roman Catholic parochial school, a State bank with capital of \$25,000, and a weekly newspaper. It was for many years, and till the timber was exhausted, the principal seat of the vast Lehigh lumber interests; now it is principally engaged in agriculture and manufacturing. Pop. (1880) 1,408; (1890) 1,634; (1895) estimated in corporate limits, 1,800; including suburbs, 3,500. EDITOR OF "JOURNAL."

Whitehead, WILLIAM: poet; b. at Cambridge, England, in 1715; educated at Winchester School and at Clare Hall, Cambridge, where he became fellow 1742; wrote the tragedies *The Roman Fathers* (1750) and *Creusa, Queen of Athens* (1754); a comedy, *The School for Lovers* (1762); a farce, *The Trip to Scotland* (1770), and a number of minor poems, which procured him the honor of being appointed poet-laureate on the death of Cibber (1757). He resided many years in the family of Lord and Lady Jersey, first as tutor to their son, whom he accompanied 1754-56 on a European tour, and obtained in 1755, through Lady Jersey, the post of secretary and registrar of the order of the Bath. D. Apr. 14, 1785. Revised by H. A. BEERS.

White House: the residence of the President of the U. S. See WASHINGTON.

White Lead: See LEAD.

White Locke, BULSTRODE: politician; b. in London, England, Aug. 2, 1605; studied at St. John's College, Oxford; sat in the Parliament of 1626 and was called to the bar in that year. He was elected to the Long Parliament 1640, and acted with the Parliamentary party, but always so prudently as to guarantee his safety if the Cavaliers should triumph. He was chairman of the committee for conducting

the impeachment of the Earl of Strafford 1640-41, but tried to avert civil war, and was one of the Parliamentary commissioners to treat with Charles I. at Oxford. He opposed the Self-Denying ordinance; was a commissioner of admiralty 1645; was a member of the commission sent to Uxbridge to negotiate a treaty of peace 1645; was one of the commissioners of the great seal 1649, but refused to take part in the trial of the king, which he disapproved; was appointed ambassador to negotiate a treaty with Queen Christina of Sweden Sept., 1653; became a commissioner of the treasury 1655, and Speaker of the House of Commons 1656; was commissioner of the great seal to Richard Cromwell, and president of the council of state during the interregnum. He accepted the Restoration and was included in the Act of Oblivion, but afterward took no active part in politics. D. at Chilton, Wiltshire, in 1675. He left in MS. an autobiography and several other works, among which are his *Memorials of English Affairs, or an Historical Account of what passed from the Beginning of the Reign of King Charles I. to the Restoration of King Charles II.* (1682; reprinted in 1732 and 1852) and a *Journal of the Embassy to Sweden* (1772; edited by H. Reeve, 1855).

White Mountains: a group of peaks in Northeastern New Hampshire, usually regarded as forming a part of the Appalachian system. They rise boldly from a deeply eroded plateau and are drained by several clear, swift streams. Of these the most important are the Saco, flowing S. E. across the southern portion of Maine to the Atlantic, and the Pemigewasset and Ammonoosuc, which find their way westward to Connecticut river. Several of the higher peaks in the eastern portion of the range have been named in honor of Presidents of the U. S. For this reason the name Presidential Range is applied to them. The western portion of the group is known as the FRANCONIAN MOUNTAINS (*q. v.*). The White Mountains culminate in Mt. Washington which, as determined by the U. S. Signal Service, has an elevation of 6,286 feet, and with the exception of Mt. Mitchell, North Carolina, 6,688 feet high, is the highest point in the U. S. east of the Mississippi. The heights of several splendid peaks grouped about Mt. Washington have been ascertained by the Appalachian Club. The more prominent of these are Mt. Adams, 5,819 feet; Mt. Jefferson, 5,736 feet; Mt. Madison, 5,381 feet; Mt. Clay, 5,554 feet; Mt. Monroe, 5,396 feet. There are, besides, many peaks of less prominence, all of which are forest-covered, rugged, and picturesque. Of the Franconian group the only one exceeding 5,000 feet is Mt. Lafayette, 5,269 feet high. The area of the entire group may be taken at about 800 sq. miles. A station of the U. S. Weather Bureau has been maintained on the summit of Mt. Washington since 1871.

Since early in the nineteenth century the White Mountains have been much visited by tourists and seekers after health. For many years access was had to them by means of stage-coaches, but in time the railway came, and a through line from Portland extends through Crawford Notch, bisecting the range and connecting on the west with several trunk railways. Not the least remarkable of the sights of this region is the railway by which a locomotive with cars attached climbs Mt. Washington, rising 3,625 feet in 3 miles. See T. Starr King, *The White Hills, their Legends, Landscape, and Poetry* (Boston, 1839; new ed. 1887); and Julius H. Ward, *The White Mountains* (New York, 1890) with a bibliography. ISRAEL C. RUSSELL.

White Nun: See SNEW.

White Plains: village; capital of Westchester co., N. Y.; on the N. Y. Cent. and Hud. River Railroad; 22 miles N. E. of New York (for location, see map of New York, ref. 8-J). It is the new seat of the Bloomingdale Asylum for the Insane (cost \$2,000,000, opened in 1894), and contains the county court-house, new Hall of Records, Alexander Institute (Presbyterian, opened in 1845), Institute, Lyceum, and Westchester County Law Libraries, 2 public-school buildings, 2 private schools, 2 State banks with combined capital of \$150,000, and a savings-bank. There are 3 weekly newspapers. The village was the scene of a battle Oct. 28, 1776, in which the British under Gen. Howe drove the Americans from Chatterton Hill, W. of Bronx river, with a loss to the latter of 180 killed, wounded, and prisoners. Pop. (1880) 2,381; (1890) 4,042; (1895) estimated, 6,000; with suburbs, 7,000. EDITOR OF "WESTCHESTER NEWS."

White River: a stream that rises by several heads in the Ozark Hills in Northwestern Arkansas, takes a circuit of 100

miles in Missouri, returns to Arkansas, and after a course of some 900 miles reaches the Mississippi river at a point 15 miles above the mouth of the Arkansas, into which a part of its waters are discharged. It is navigable by large steamboats to Batesville, Ark., 380 miles.

White River: a stream in Indiana that rises by two forks. The east or Driftwood fork (called also Blue river), flowing from Henry County, is 250 miles long, and is navigated to Rockford. The west fork, the longer arm, rises in Randolph County, and crosses the State. It is 300 miles long, and is navigable at high water 150 miles to Martinsville. The main stream is 50 miles long, and flows into the Wabash.

White River Junction: village; Hartford town, Windsor co., Vt.; at the confluence of the Connecticut and White rivers, and on the Boston and Maine, the Cent. Vt., and the Woodstock railways; 14 miles E. of Woodstock, 64 miles S. by E. of Montpelier (for location, see map of Vermont, ref. 7-C). It is an important commercial distributing point, and has a public high school, national bank with capital of \$100,000, a savings-bank, and a weekly newspaper. Pop. (1880) 763; (1894) estimated, 1,500.

Whitesboro: town (founded in 1848); Grayson co., Tex.; on the Mo., Kan. and Tex. and the Tex. and Pac. railways; 70 miles N. of Fort Worth (for location, see map of Texas, ref. 2-I). It is in an agricultural and stock-raising region, and has 5 churches, graded public school with over 400 pupils, and a weekly newspaper. Pop. (1880) 773; (1890) 1,170; (1895) estimated, 2,000. EDITOR OF "NEWS."

White Sea: a large inlet of the Arctic Ocean, penetrating into European Russia for a distance of 380 miles, with a breadth of from 30 to 150 miles. It is frozen from October to May, and is rich in herring and codfish.

Whitestone: village; Queens co., N. Y.; on Long Island Sound, and the Long Island Railroad; 2 miles N. E. of Flushing, 11 miles N. E. of New York (for location, see map of New York, ref. 8-K). It has an excellent harbor, several summer hotels and boarding-houses, two weekly newspapers, and a number of tinware and other factories. Near by are Fort Schuyler, on Throgg's Neck, and the U. S. military post at WILEY'S POINT (*q. v.*), commanding the eastern entrance to New York harbor. Facilities for boating have made the village a popular summer resort. Pop. (1880) 2,520; (1890) 2,808; (1895) estimated, 3,200. EDITOR OF "HERALD."

White Sulphur Springs: city; capital of Meagher co., Mont.; on a stage line, 40 miles E. of the North. Pac. Railroad; 65 miles E. by S. of Helena, the State capital (for location, see map of Montana, ref. 6-F). It is in an agricultural, stock-raising, and gold, silver, copper, and coal mining region; is a health resort, with thermal springs long noted for their curative properties; and has 3 churches, large graded school, a national bank with capital of \$200,000, and 2 weekly newspapers. Pop. (1890) 640; (1895) estimated, 1,400. EDITOR OF "ROCKY MOUNTAIN HUSBANDMAN."

White Sulphur Springs: See CHITTENANGO SPRINGS.

White Sulphur Springs: noted health resort in Greenbrier co., W. Va.; on the line of the Ches. and Ohio Railroad; 91 miles W. of Staunton and 227 miles W. by N. of Richmond (for location, see map of West Virginia, ref. 10-II). It has a beautiful location, is within from 20 to 40 miles of the Hot, Sweet, Red, Salt, and Blue Sulphur Springs, and has been visited by whites since 1778. The temperature of the water is 62°, and the principal substances found in solution are nitrogen, oxygen, carbonic acid gas, hydrosulphuric acid, sulphates of calcium and magnesium, and carbonate of calcium, and the effect is alterative and stimulant. There are large swimming-baths and numerous mud-baths. The locality is one of the most popular health and summer resorts in the South, and has large hotel and cottage accommodations.

White Swelling: the popular name for a chronic inflammation of the joints. The disease is now recognized as a form of tuberculosis of the joints.

Whitelthroat: the *Sylvia undata*, or *Currucia cinerea*, a very abundant European warbler whose song is rather sweet and very energetic. It is a favorite cage-bird, 5½ inches in length, colored reddish and whitish brown, with a throat of pure white. There are several other warblers called whitelthroat in Great Britain.

White Walnut: See BUTTERNUT.

Whitewash: a preparation of slaked lime, thinned to a milky consistence, and used for whitening walls. Skimmed

milk, glue, zinc sulphate, tallow, and various pigments are sometimes added. Some of them form insoluble compounds with lime, and thus add to the permanency of the wash.

Whitewater: city (incorporated in 1885); Walworth co., Wis.; on the Whitewater river, and the Chi., Mil. and St. P. Railway; 45 miles S. E. of Madison, 51 miles S. W. of Milwaukee (for location, see map of Wisconsin, ref. 7-B). It is in an agricultural, dairying, and stock-raising region; contains a State Normal School, a collegiate institute, a national bank (capital \$125,000), and a State bank (capital \$75,000), and has two weekly newspapers, several cheese-factories, furniture, sash, and door factories, paper-mill, wagon-factory, and other industries. Pop. (1880) 3,617; (1890) 4,359; (1895) 3,799. EDITOR OF "REGISTER."

Whitewater River: a stream in Indiana; formed by two forks (the east and west), which unite at Brookville. The stream enters Ohio, and joins the Great Miami 6 miles from its mouth. Length to source, 100 miles.

Whitewater River: a river in the S. E. of Missouri and the N. E. of Arkansas. It rises in St. Francis County, flows southward, receiving in Scott County an East Fork which rises in Cape Girardeau County, and joins the complicated lake and river system of the S. E. of Missouri. After a course of 250 miles its waters are for the most part discharged into St. Francis river in Arkansas.

White Whale: a small cetacean, the *Delphinapterus leucas*, belonging to the family *Delphinidae*, common to all the northern seas, and on the eastern coast of North America extending southward at least as far as the Gulf of St. Lawrence, where it is quite abundant. The form is essentially similar to that of the common porpoise, but the head is rounded forward and the cervical region has somewhat of a contraction; no dorsal fin is developed, and hence the name *Delphinapterus*—i. e. porpoise without a fin; the color is a spotless white. These whales sometimes attain a length of 20 feet, or even more, but the average is perhaps about 13 feet. They frequently ascend a considerable distance up large rivers (e. g. the St. Lawrence). They often associate together in troops, but are also observed "in lines of seldom more than two or three abreast, or more frequently in single file, spouting irregularly," and showing little of the form above water. They are captured with harpoons and lances, as in ordinary whaling, as well as in nets. Revised by F. A. LUCAS.

Whitewood: a name given in the U. S. to the wood of the TULIP-TREE (*q. v.*). The bark of *Canella alba* (see CANELLA ALBA) is called whitewood bark. Other whitewoods are *Pittosporum bicolor*, of Australia, etc., *Oreodaphne leucocylon*, *Lagunaria pattersoni*, *Tabebuia leucocylon*, and many other trees, mostly tropical.

Whitfield, HENRY: clergyman; b. in England in 1597; son of an eminent lawyer; received a university education, and studied law; took orders in the Church of England; was minister of Orkley, Surrey, where he sheltered a number of Puritan ministers during the persecution of Archbishop Laud, from which he ultimately suffered himself, in consequence of his refusal to read in church the *Book of Lawful Sunday Sports*; emigrated to New England with many of his old parishioners 1637; was one of the founders of Guilford, Conn. (1639), where his house, built in that year, and one of the oldest in the U. S., is still standing; made a liberal use of a handsome fortune, and was esteemed one of the chief founders of New Haven colony; returned to England 1650, and became minister at Winchester, where he died in 1658. He was the author of *Helps to Stir up to Christian Duties* (London, 1634); *The Light Appearing more and more towards the Perfect Day, or A Farther Discovery of the Present State of the Indians in New England, etc.* (1651; new ed. New York, 1865); and *Strength out of Weakness, or A Glorious Manifestation of the Further Progress of the Gospel among the Indians in New England* (1652; new ed. New York, 1865).

Whitfield, ROBERT PARR, M. A.: paleontologist and geologist; b. near New Hartford, Oneida co., N. Y., of English parents, May 27, 1828; in 1835 went with his family to England, returning to the U. S. in 1841; learned the trade of spindle-making; had charge of the instrument department of a telegraph and philosophical instrument establishment, Utica, N. Y., for about eight years; assistant to James Hall, State geologist of New York, on the paleontological work of the State natural history survey 1856-77; teacher and afterward Professor of Geology and Paleontology in the

Rensselaer Polytechnic Institute, Troy, N. Y., 1872-77; curator of the geological department of the American Museum of Natural History, New York city, from 1877. His paleontologic work has consisted largely in the description and characterization of species, genera, and higher groups. Its chief results appear in the following publications: *Natural History of New York State, Reports on Paleontology* (issued since 1856); *United States Survey of Fortieth Parallel* (under Clarence King, vol. iv., part ii., in connection with Prof. Hall, 1877); *Paleontology*, in vol. ii. *Geological Survey State of Ohio*, several papers in association with Prof. Hall (published in 1875); *Geology of Wisconsin*, in vol. iv. *Palaontological Report* (prepared in 1877 and 1878; published in 1882); *The Black Hills of Dakota, Paleontology* (published 1880); *Geology of the State of New Jersey*, vol. i. *Paleontology; Cretaceous Fossils of New Jersey* (1885; issued by U. S. Geological Survey with co-operation of State of New Jersey); and *Bulletins of the American Museum of Natural History*, which are edited by him.

Revised by G. K. GILBERT.

Whitgift, JOHN, D. D.: archbishop; b. at Great Grimsby, Lincolnshire, England, about 1530; educated at Queen's College and at Pembroke Hall, Cambridge, under Ridley and Bradford; was chosen a fellow of Peterhouse 1555; took orders in the Church of England; became chaplain to the Bishop of Ely, and rector of Feversham, Cambridge-shire, 1560; was appointed Lady Margaret Professor of Divinity 1563, Regius Professor of Divinity, master of Pembroke Hall and of Trinity College, Cambridge, all in 1567; became chaplain to Queen Elizabeth, prebendary of Ely 1568, vice-chancellor of Cambridge 1570, dean of Lincoln 1571, prebendary of Lincoln 1572, Bishop of Worcester and vice-president of the Marches of Wales 1577; succeeded Edmund Grindall as Archbishop of Canterbury 1583; showed himself intolerant both of Roman Catholicism and of Puritanism, managing the Star-Chamber prosecutions with great rigor; obtained a decree against liberty of printing June, 1585; became privy councillor 1586; founded a hospital and grammar school at Croydon 1595, and took part in the conferences at Hampton Court Jan., 1604. D. at Lambeth Palace, Feb. 29, 1604. His theological *Works* were edited for the Parker Society (Cambridge, 3 vols., 1851-54) by Rev. John Ayre. His *Life* was written by Sir George Paule (1612), by John Strype (1718), and in Hook's *Lives of the Archbishops of Canterbury*.

Revised by S. M. JACKSON.

Whiting: the *Merlangus vulgaris*, a European fish of the family *Gadida* and related to the true codfishes. As in them, the body is moderately elongated and covered with small scales; the head conic; the mouth deeply cleft; the upper jaw longest; the teeth in bands in the upper and lower jaw and on the vomer, but absent on the palatines; the dorsals three and the anals two; it differs from the true codfishes especially in that no barbel is developed at the chin; the color above is very dark and almost black, and below grayish; a black spot is developed in the axil of the pectoral fin. The species is esteemed for the excellence of its flesh, which is said to surpass in delicacy that of any other representative of the family. The whiteness of its flaky muscles, added to its lightness as an article of food, recommends it particularly to invalids. It is quite common in the seas of Northern Europe, and is fished for throughout almost the entire year, but is more abundant in winter, when it approaches the shore—it is believed, to spawn. Its average size is about 12 or 16 inches, with a weight of 1½ lb., although it sometimes attains a weight of 3 or 4 lb. It is a voracious fish, and seizes indiscriminately any of the Mollusca, worms, small Crustacea, and young fishes. It appears to prefer sandy banks, but shifts its ground frequently in the pursuit of the various fry of other fishes, upon which it subsists. Although repeatedly claimed to be an inhabitant of the Atlantic coast, it has not yet been found thereon, the hake (*Merluccius bilinearis*) having been mistaken for it. On some parts of the coast the name "whiting" is also applied to the *Menticirrus nebulosus*, more generally known as the Kingfish (*q. v.*).

Whiting: town; Lake co., Ind.; on Lake Michigan, and the Penn. Co.'s Railroad; 17 miles S. E. of Chicago (for location, see map of Indiana, ref. 1-B). It has a fine harbor, 5 churches, public and German Lutheran parochial schools, large oil refinery, a private bank, and 2 weekly newspapers, and is principally engaged in refining and shipping petroleum. Pop. (1880) 115; (1890) 1,408; (1895) estimated, 5,000.

EDITOR OF "DEMOCRAT."

Whiting, WILLIAM HENRY CHASE: soldier; b. in Mississippi 1825; graduated at the U. S. Military Academy at the head of his class July 1, 1845, when appointed second lieutenant in the Corps of Engineers. Until 1853 he served in the construction of the defenses of Pensacola harbor, Florida, and Baltimore, Md., and in the improvement of rivers and harbors in Texas, of the defenses of San Francisco 1853-55; was in charge of the construction and repair of fortifications on the South Atlantic coast, and the improvement of various rivers and harbors in that section, including Cape Fear and Savannah rivers, 1856-61. He resigned his commission of captain of engineers Feb. 20, 1861, to join the Confederate service, in which he became a major-general, and commanded a division in 1863. Fort Fisher, at the mouth of Cape Fear river, was planned and constructed by him, and he was given command of it in 1864. He successfully defended it against the first attack under Gen. Benjamin F. Butler, but succumbed to Gen. Alfred H. Terry in Jan., 1865, when he was severely wounded and taken prisoner; was removed to Governor's island, New York harbor, where he died Mar. 10, 1865.

Whiting Pond: See BIB.

Whittling: See BULL-TROUT.

Whitlow, better known as FELON; a painful inflammation, ending in suppuration, of the tissues surrounding the phalangeal bones of the hands and feet. The last joint of the fingers is the most frequent situation. The immediate cause is probably always some injury, but certain forms of deterioration of the blood and general health predispose. The exact nature of the disease in question is abscess formation beneath the periosteum, the fibrous sheath surrounding the bone. There results from this a tense swelling of the finger or toe, with redness and local heat, and intense pain of a throbbing and later boring character. The intensity of the pain is due to the fact that the collection of pus is confined beneath the periosteum. In unfavorable cases, where no escape of the pus occurs spontaneously or as a result of incision, death of the bone, necrosis, may take place, and a loss of one or more joints not infrequently results. The treatment of felons should be early incision down to the bone. Poultices and anodyne lotions are poor substitutes for the radical procedure. WILLIAM PEPPER.

Whitman: town (incorporated in 1886); Plymouth co., Mass.; on the N. Y., N. H. and Hart. Railroad; 16 miles N. W. of Plymouth (for location, see map of Massachusetts, ref. 3-1). It contains the villages of Whitman, East Whitman (or South Abington Station), and Auburnville; has a high school, 19 district schools, public library, 6 churches, a savings-bank, and a weekly newspaper; and is principally engaged in the manufacture of boots, shoes, tacks, eyelets, wire nails, and boxes. The assessed valuation in 1894 was \$3,342,560. Pop. (1880) 3,024; (1890) 4,441; (1895) 5,744.

EDITOR OF "TIMES AND COURIER."

Whitman, CHARLES OTIS, LL. D.: naturalist; b. at Woodstock, Oxford co., Me., Dec. 14, 1842; graduated at Bowdoin College 1868; studied at Leipzig, receiving the degree of Ph. D. in 1878, and in the same year was appointed Professor of Zoölogy in the Imperial University of Tokio. He returned to Europe in 1880, and studied at the Naples Zoölogical Station. Returning to the U. S. he served as assistant in zoölogy at Harvard University, carrying on with Alexander Agassiz some splendid researches upon the early development of the bony fishes. The years 1886-89 were spent in Milwaukee as director of a laboratory for the study of inland waters. In 1889 he was called to the head of the department of zoölogy in the Clark University, and in 1892 was given the head professorship of Zoölogy in the University of Chicago. Dr. Whitman has been the director of the Marine Biological Laboratory at Woods Holl, Mass., since its foundation in 1888. His writings are largely upon the structure and development of worms, and the development of the vertebrates. He has published *Methods of Research in Microscopical Anatomy and Embryology* (Boston, 1885); has been editor of the microscopical department of the *American Naturalist* since 1883; and established in 1887 the *Journal of Morphology*, the leading zoölogical periodical in America.

J. S. KINGSLEY.

Whitman, SARAH HELEN (Power): poet; b. at Providence, R. I., in 1803; married in 1828 John Winslow Whitman, a lawyer at Boston, who died in 1833, after which she resided at Providence. She was the author of *Hours of Life, and other Poems* (1853); *Edgar Allan Poe and his*

Critics (1860); and, with her sister, ANNA MARSH POWER, of a volume of *Fairy Ballads* (revised ed. 1867-68). D. at Providence, June 27, 1878. A volume of her *Poems* was posthumously issued (Boston, 1879). She is best remembered for her friendship with Poe, to whom she was at one time engaged to be married. Revised by H. A. BEERS.

Whitman, WALT: poet; b. at West Hills, Long Island, N. Y., May 31, 1819. He was a son of Walter Whitman and Louisa Van Velsor. The father was of English, the mother of Dutch descent. While the poet was yet a child the family moved to Brooklyn, where the father worked at his trade of carpentering, and where young Whitman attended common school till he was thirteen years old. He then went into a printing-office and learned to set type. At the age of sixteen or seventeen, he taught a country school on Long Island, and began writing for newspapers and magazines. In 1839 and 1840 he edited and published at Huntington *The Long Islander*, a weekly newspaper. For the next ten or twelve years he was mainly employed in printing-offices as compositor, with an occasional contribution to periodical literature. It is during this period that he began studying the life of New York and Brooklyn, and familiarizing himself with all classes and conditions of men, and with all trades and occupations, going freely, as he says in his poems, "with powerful uneducated persons," making friends among working men, and giving full swing to his democratic proclivities. He occasionally appeared as a speaker at political mass-meetings both in New York and on Long Island, and was much liked. He made friends with pilots and stage-drivers, and spent much of his leisure time on the Brooklyn ferryboats and Broadway omnibuses. It is reported of him that about this period he drove a Broadway stage one whole winter that a disabled driver might lie off without starving his family.

In 1846-47 he became editor of the Brooklyn *Daily Eagle* newspaper, and was an occasional contributor to the *Democratic Review*. He also at this time wrote several novels, one of them called *Frank Evans*. When thirty years of age he set out on an extended tour through the Middle, Southern, and Western States, fetching up finally in New Orleans, where he tarried a year or more, finding employment as editorial writer on the *Crescent*. He returned to Brooklyn, and in 1850 started *The Freeman* newspaper as an organ of the Free-soilers, doing most of the writing himself.

From 1851 to 1854 he worked at his father's trade of carpentering, building and selling moderate-sized houses. The conception of his *Leaves* began to shape itself in his mind during this period. He frequently stopped work to write his poems. In the spring of 1855 the first issue of the *Leaves* appeared, a small quarto of ninety-four pages. A second issue, with many additions, appeared in 1856. The third edition was published in 1860 in Boston. In 1862 Whitman left Brooklyn and became a volunteer nurse in the army hospitals in Washington and in Virginia, continuing his services till the close of the war and later, supporting himself at first by writing letters to *The New York Times*. He is said to have personally visited and ministered to over 100,000 sick and wounded Union and Confederate soldiers. From 1865 to 1873 he found employment as a Government clerk in Washington. His war poems, *Drum Taps*, appeared in 1866. His services in the army hospitals impaired his health, and in the beginning of 1873 he suffered a light stroke of paralysis. He shortly afterward moved to Camden, N. J., where he continued to live, health seriously impaired, till his death Mar. 26, 1892. He never married; he accumulated but little property, and was most of the time his own publisher. In person Whitman was over 6 feet in height, and of fine physical proportions. As a man he inspired very strong attachment among all classes. He is buried in a granite tomb of his own designing in a cemetery near Camden. His *Leaves of Grass*, the title under which he at last included all his poems, has probably excited more discussion and called forth more hostile criticism than any other literary production of the time in which its author lived. It is an unrhymed, unmeasured work of over 10,000 lines, in its form aiming only to follow the law of the innate forms of organic nature, and in its substance celebrating life, sex, comradeship, democracy, America, as they are illustrated by the poet's own personality and environment. Whitman's ambition was not merely to be a sweet and popular singer, his scheme looked to much more than that; he would be a prophet and law-giver of his country and time; he would rival in his day and land the

character and office of the ancient teachers and seers. He deprecates any study of his work merely as literature or art, his final purpose being ethical and religious. His work has won high approval in Europe, but has been generally neglected or condemned by his own countrymen on account of its outspokenness, which in Massachusetts resulted in the authorities objecting to the sale of his *Leaves of Grass* "on the ground of immorality." Portions of *Leaves of Grass* have been translated into various European languages. Since his death three books have appeared in England mainly devoted to him, to wit, *Walt Whitman*, by William Clarke; *Browning and Whitman, a Study of Democracy*, by Oscar L. Triggs; and *Walt Whitman, a Study*, by John Addington Symonds. In 1883 a *Life of Whitman* was published by Dr. R. M. Bueke, of London, Canada. Various editions of his *Leaves* have appeared from time to time since 1870; the final edition, being prepared by the author a few weeks before his death, was published in Philadelphia in 1893. Whitman's prose works are included in a volume called *Specimen Days and Collect*, published in 1883. His *Democratic Vistas* and *Hospital Memoranda* are in this volume.

JOHN BURROUGHS.

Whitney, ADELINE DUTTON (Train): author; b. at Boston, Mass., Sept. 15, 1824; married at the age of nineteen to Seth D. Whitney, of Milton, Mass., where she has since resided; has long been a favorite contributor to magazines, especially those for the young. She is the author of *Foot-steps on the Seas, a Poem* (Boston, 1857); *Mother Goose for Grown Folks* (New York, 1860; revised eds. Boston, 1870, 1882); *The Boys at Chequasset* (Boston, 1862); *Faith Gartney's Girlhood* (1863); *The Gaycoothys, a Story of Threads and Thrums* (1865); *A Summer in Leslie Goldthwaite's Life* (1866); *Patience Strong's Outings* (1868); *Ilithero, a Story of Yesterday* (1869); *Real Folks* (1872); *Pansies*, verse (1872); *The Other Girls* (1873); *Sights and Insights* (1876); *Bonnyborough* (1885); *Homespun Yarns* (1887); *Bird Talk*, verse (1887); *Daffodils*, verse (1887); and other works.

Revised by H. A. BEERS.

Whitney, ASA: manufacturer and inventor; b. in Townsend, Mass., Dec. 1, 1791. After working in his father's blacksmith-shop and learning the trade he worked in Swansea, N. H., on cotton-mill machinery for two years or more; in 1813 removed to Brattleboro, Vt., and engaged in the same business, but was burned out and lost all his savings; removed to Brownsville, Jefferson co., N. Y., and for the next twelve years, in company with U. Walton, manufactured cotton machinery, nails, etc.; in 1826-30 made the machinery for a cotton-mill and engaged in the manufacture of cotton goods, but was unsuccessful; in 1830 was appointed master-machinist in the Mohawk and Hudson Railway shops, and in 1833 became superintendent of the road. In 1839 he was appointed a canal commissioner of the State of New York, and served two years, having charge of the Champlain Canal and the eastern division of the Erie Canal. In 1842 he removed to Philadelphia, and became a partner with Matthew Baldwin in the manufacture of locomotives; four years later devoted his energies to the work of perfecting car-wheels by a new process, and in 1848 began their manufacture on a large scale. Using only the best qualities of iron, testing the wheels at every stage, and annealing them thoroughly by a process of his own invention, it was soon found that these car-wheels were not liable to breakage, and were practically indestructible. The manufacture constantly increased, and for some years previous to his death about 75,000 wheels were produced annually. D. in Philadelphia, June 4, 1874. He was a man of great benevolence, and at his death left \$50,000 to found a chair of dynamical engineering in the University of Pennsylvania.

Whitney, ELI: inventor; b. in Westboro, Mass., Dec. 8, 1765; graduated at Yale College 1792; went to Georgia; studied law while residing in the family of the widow of Gen. Nathanael Greene, by whom he was stimulated to devise a machine for cleaning seed-cotton, in which he succeeded, having invented the cotton-gin; suffered much from violence and fraud, the idea of his invention having been stolen by others, but formed a partnership with a Mr. Miller and commenced the manufacture of the machines near the town of Washington, Ga., in 1795; was voted by the Legislature of South Carolina a sum of \$50,000 for his invention, which he succeeded in collecting only after many years of litigation; received a percentage for five years upon the use of his gins from the State of North Carolina, and was promised the same by Tennessee, but without

results; turned his attention to the manufacture of firearms, entering into a contract with the U. S. Government 1798, and reaped a fortune from his various improvements in their manufacture, which rapidly increased and became the origin of the flourishing village of Whitneyville, Conn. D. at New Haven, Conn., Jan. 8, 1825.

Whitney, JAMES AMAZIAH, M. A., LL. D.: lawyer and author; b. at Rochester, N. Y., June 30, 1839; received a common school education; in 1868 became editor of a weekly publication, the *American Artisan*, and was elected the first president of the New York Society of Practical Engineering; in 1870 became Professor of Agricultural Chemistry in the American Institute. In 1872 he established himself as a solicitor of U. S. and foreign patents, and in 1876 was admitted to practice in the U. S. circuit courts. His writings have related largely to the law of patents for inventions, to questions of public policy, and to international law. In addition he has published *The Chinese and the Chinese Question* (1880; enlarged ed. 1888), in which he advocated the exclusion of the Chinese; *Notes of Travel in Western Europe*; and several volumes of poems. A collective edition of his poetical works was issued in 1886.

Whitney, JOSIAH DWIGHT, LL. D.: geologist; brother of Prof. William D. Whitney; b. at Northampton, Mass., Nov. 23, 1819; graduated at Yale College 1839; was for many years employed on State and national geological surveys, including Ohio, the Lake Superior region, Mississippi, and California, where he was (1860-74) State geologist; has been since 1865 Sturgis-Hooper Professor of Geology in Harvard University, and is a prominent member of the American Association and of the National Academy of Sciences. He was the author of *The Metallic Wealth of the United States* (Philadelphia, 1854); *A Report on the Upper Mississippi Lead Region* (1862); *The Geological Survey of California* (1864-70); and *The Yosemite Guide-book* (1869); translated *Berzelius on the Blouppipe* (1845); was joint author with Prof. John W. Foster of a *Report on the Geology of the Lake Superior Land District* (1851-52), and with Prof. James Hall of a *Geological Report on Ohio* (1858). Mt. Whitney, the highest peak of the Sierra Nevada, was named in his honor. D. Aug. 19, 1896. Revised by C. H. TURNER.

Whitney, WILLIAM COLLINS, LL. D.: lawyer; b. at Conway, Mass., July 5, 1841; graduated at Yale College in 1863 and at the Harvard Law School in 1864, and soon after began the practice of law in New York city. He was made inspector of the city schools in 1872, and in the same year failed of election as the candidate of the Reformed Democracy for district attorney; was appointed corporation counsel in 1875, and reappointed in 1876 and 1880, resigning in 1882; U. S. Secretary of the Navy 1885-89, his administration being marked by the completion of several vessels that formed the nucleus of a modern U. S. navy.

Whitney, WILLIAM DWIGHT: philologist; b. at Northampton, Mass., Feb. 9, 1827; entered the sophomore class of Williams College in 1842; graduated 1845; teller in a bank at Northampton 1845-49, devoting his leisure time chiefly to amateur studies in natural history; during the summer of 1849 was assistant of the U. S. Geological Survey; in the autumn of 1849 went to Yale College to pursue, under the instruction of Prof. E. E. Salisbury, the study of Sanskrit, which he had begun by himself in the preceding year. In 1850-53 he spent three winter semesters at the University of Berlin, studying with Weber, Bopp, and Lepsius, and two summer semesters with Roth at Tübingen. In 1851 he began, in association with Roth, preparations for an edition of the *Atharvaveda*, the first volume of which appeared in 1855-56. The second volume, with which the last years of his life were occupied, was nearly completed at the time of his death, and will receive final revision at the hands of his pupil, Prof. C. R. Lanman. He was appointed in 1854 Professor of Sanskrit in Yale College, and retained this position down to the time of his death, coupling with it during most of his life instruction in comparative philology and in German. From 1857 to 1884 he was corresponding secretary of the American Oriental Society, and from 1884 to 1890 its president; during all this time he was its chief spirit and the leading contributor to its *Journal*. He was also the first president of the American Philological Association (1869-70), and was represented by an article in nearly every one of the first sixteen volumes of the *Transactions* of the society. His work is characterized by rigid faithfulness to facts, a clearness and simplicity of statement that comes

from a complete mastery of the material, and a sobriety of judgment and general good sense that have their basis in perfect sanity of mind. His greatest achievement was in the field of Sanskrit. Here, beside the above-mentioned edition of the *Atharvaveda*, his leading works are *Sanskrit Grammar* (1879; Germ. trans. 1879; 2d ed. 1889); *Supplement to Sanskrit Grammar: the Roots, Verb-forms, and Primary Derivatives* (1885); *Alphabetisches Verzeichniss der Versanfänge der Atharva-Samhita* (1857); *Atharvaveda-Prätigākhyā* (text, trans., notes, 1862); *Tāittiriyā-Prätigākhyā* (1871)—for this awarded the Bopp premium by Berlin Academy; *Index Verborum to Atharvaveda* (1881). Among his contributions to the general science of language may be mentioned *Language and the Study of Language* (1867); *Life and Growth of Language* (1875); *Oriental and Linguistic Studies* (2 vols., 1873-74). He was editor-in-chief of *The Century Dictionary*, and prepared or supervised the preparation of a number of books intended for school use, such as a German dictionary, grammar, and reader, French grammar, etc., and *Essentials of English Grammar* (1877), which last has been of great service in dislodging the erroneous conceptions of language implied in the statements of the traditional grammar. D. at New Haven, June 7, 1894. For a sketch of his life, see *Atlantic Monthly*, March, 1895. REJ. IDE WHEELER.

Whitney, Mount: a mountain in Southeastern California, has an elevation of 14,522 feet, and is the highest peak in the U. S., not including Alaska. Its eastern slope is exceedingly precipitous, and rises nearly 11,000 feet above Owens valley, which skirts its base. The summit was occupied by Prof. S. P. Langley in 1881 for the purpose of making observations on solar heat. ISRAEL C. RUSSELL.

Whitsunday, or Whitsuntide: See PENTECOST.

Whittaker, JAMES THOMAS, M. D., LL. D.: clinician; b. in Cincinnati, O., Mar. 3, 1843; graduated M. D. at the Medical College of Ohio in 1865; in the same year was appointed acting assistant surgeon in the U. S. navy; was Professor of Physiology in his *alma mater* from 1870-80, and Professor of Theory and Practice of Medicine from 1880-94; was lecturer on pathology to the Good Samaritan Hospital, Cincinnati, from 1870 to 1880, and on clinical medicine 1880-92. His principal works are *Lectures on Physiology* (1879); *History of Tuberculosis* (1887); *Theory and Practice of Medicine* (Philadelphia, 1893). S. T. ARMSTRONG.

Whittemore, THOMAS, D. D.: editor and author; b. in Boston, Mass., Jan. 1, 1800; was successively apprenticed to a Morocco-dresser, a brass-founder, and a boot-maker; studied theology under Rev. Hosea Ballou; preached to Universalist churches in Milford 1821 and Cambridgeport 1822-31; settled at Cambridge; was joint editor of the *Universalist Magazine*, sole editor and proprietor for nearly thirty years from 1828 of its successor, *The Trumpet*; sat repeatedly in the Massachusetts Legislature, and was president of the Vermont and Massachusetts Railroad. D. at Cambridge, Mar. 21, 1861. He was the author of *The Modern History of Universalism* (Boston, 1830; enlarged ed. 1860); *Notes and Illustrations of the Parables of the New Testament* (1832); *Songs of Zion* (1836); *A Commentary on the Revelation of St. John* (1838); *A Plain Guide to Universalism* (1839); *The Gospel Harmonist* (1841); *Conference Hymns* (1842); *Sunday-school Choir* (1844); *Life of Walter Balfour* (1853); *Life of Rev. Hosea Ballou* (4 vols., 1854-55); an *Autobiography* (1859); and tracts in favor of Universalism. He edited Dr. Southwood Smith's *Illustrations of the Divine Government* (1831), with an *Appendix*. Revised by J. W. CHADWICK.

Whittier, JOHN GREENLEAF: poet; b. in East Parish of Haverhill, Mass., Dec. 17, 1807, of Quaker parentage. He received a common school education, spending his boyhood on a farm. He was eighteen years of age when his first poem was published in William Lloyd Garrison's *Free Press*. He wrote the ode sung at the dedication of Haverhill Academy in 1827, and was thereafter a pupil in that institution for two terms, earning the means to pay for books and tuition in part by making slippers. At this time he wrote many verses for *The Haverhill Gazette* and other periodicals, few of which are preserved in any collection of his works. In Jan., 1829, he was called to Boston to edit *The American Manufacturer*, a political newspaper, and in August of the same year returned to Haverhill on account of the failing health of his father. He was editor of *The Haverhill Gazette* for the first six months of 1830. In July, 1830, he became

editor of the *New England Review*, a political paper of Hartford, Conn. While editing this journal he made a small collection of his poems and prose sketches which was published in Hartford Jan., 1831, entitled *The Legends of New England*. His principal ambition at this period was in the direction of political preferment, and he favored the policy of Henry Clay. He was appointed delegate from Connecticut to the national convention at Baltimore, called to nominate Clay for the presidency. Serious illness prevented his attending the convention and compelled him to resign the editorship of the *Review* in Jan., 1832. For several years thereafter he lived upon his Haverhill farm, a part of the time editing the *Gazette*. His poem *Moll Pitcher* was published anonymously in 1832. Early in 1833 he wrote an anti-slavery pamphlet, *Justice and Expediency*, and in December of that year was a delegate to the national anti-slavery convention in Philadelphia. He was secretary of the convention and on the committee with Garrison to draw up the "declaration of sentiments," which was the formal opening of the war upon the institution of slavery. He represented his native town in the Legislature of Massachusetts in 1835, and was re-elected to the next Legislature, but declined to serve on account of ill health. In 1836 he sold his farm and removed with his mother and sister to Amesbury, Mass., where he resided to the close of his life. His poem *Mogg Megone* was published in a miniature volume in 1836, this being the first book exclusively of verse that appeared with his name upon its title-page. In 1837 a collection was made of his anti-slavery poems, entitled *Poems written during the Progress of the Abolition Question in the United States between the Years 1830 and 1838*. He spent a few months in 1837 in New York, acting as one of the secretaries of the American Anti-Slavery Society. In 1838-40 he was editing the *Pennsylvania Freeman* in Philadelphia. His office was sacked and burned by a mob in May, 1838. A collection of his poems was published in Philadelphia by Joseph Healy in the same year. He returned to his Amesbury home in 1840, and in addition to the spirited lyrics with which for several years he endeavored to arouse the conscience of the people of the U. S. in the matter of slavery, he occasionally sent out ballads, exquisitely sweet and simple, illustrating many phases of New England life and character. These ballads were collected in 1843 in a volume entitled *Lays of my Home*, published in Boston, and this collection was the first book from which he derived any pecuniary benefit. He was on several occasions candidate for Congress of the Liberty party, but declined the position in 1843, when there seemed to be a prospect of being elected. In 1844-45 he edited *The Middlesex Standard*, Lowell, Mass., and for this paper wrote a series of prose articles which were in 1845 published in Boston under the title of *The Stranger in Lowell*. In 1846 a collection of his anti-slavery poems, *Voices of Freedom*, was published in Philadelphia. He was corresponding editor of *The National Era*, published in Washington, for thirteen years (1847-60), contributing to it many poems and prose articles. Several volumes were compiled from these writings—viz., *Leaves from Margaret Smith's Journal*, an imaginary description of New England in early times (Boston, 1849); *Old Portraits and Modern Sketches* (Boston, 1850); *Literary Recreations and Miscellanies* (Boston, 1854); *Songs of Labor* (Boston, 1850). A little volume entitled *The Supernaturalism of New England*, dealing with the superstitious beliefs of the people, was published in New York in 1847, and republished in the same year in London. Other works of this period were *Poems*, a complete collection, illustrated by H. Billings (Boston, 1849); *A Sabbath Scene*, satirizing the fugitive-slave law, illustrated (Boston, 1853); *The Panorama* (Boston, 1856); *Poetical Works*, blue-and-gold edition (2 vols., Boston, 1857); *Home Ballads, Poems, and Lyrics* (Boston, 1860); *In War Time* (Boston, 1863). When *The Atlantic Monthly* was started in 1857 he became one of its principal contributors, and thereafter to the end of his life much of his best work appeared in that periodical. In 1866 was published his poem *Snow Bound*, a graphic picture of an isolated New England homestead in winter, in which are many fine touches delineating each member of the family in which his youth was spent. The great popularity of this poem gave him at once a pecuniary independence he had not before enjoyed. Then followed *The Tent on the Beach* (1867); *Among the Hills* (1869); *Miriam* (1871); *The Pennsylvania Pilgrim* (1872); *Mabel Martin* (1874); *Hazel Blossoms*, including poems by his sister (1875);

Vision of Echarl (1878); *The King's Mission* (1881); *The Bay of Seven Islands* (1883); *St. Gregory's Guest* (1886); *At Sundown* (1892). Assisted by Lucy Lareom, he edited a collection of poems entitled *Child Life* (1871); *Child Life in Prose* (1874); and an anthology, *Songs of Three Centuries* (1876). During all his life he had a deep interest in public affairs, and took pains to make his influence felt in shaping the policy of his party. He was a member of the electoral college of Massachusetts in 1860 and 1864. He was never married. After the death of his sister, in 1864, a niece had charge of his household until her marriage in 1876. He then spent some months of each year, for the remainder of his life, with relatives at Oak Knoll, Danvers, retaining, however, his residence at Amesbury. He died at Hampton Falls, N. H., Sept. 7, 1892. A complete collection of his writings in prose and verse, which had received his careful revision and annotation, was published in Boston in 1888. It comprises four volumes of poems and three of prose, and is known as the "Riverside" edition. He will be longest remembered, perhaps, for his descriptions of natural scenery, touching the heart by the simplicity and tenderness with which he recounted the scenes and friendships of his youth, and quickened the religious spirit by giving poetical expression to the highest and holiest aspirations. The catholicity of this Quaker's faith is illustrated by the fact that his verses fill a large place in the collections of hymns for public worship in use in many different Christian denominations. In 1895 his complete poetical works were published in a single volume known as the "Cambridge" edition, and this volume includes all his latest verses, besides some fragments found among his papers. The same matter is arranged in a *Handy Volume* edition of four volumes.

Whittier's biographies have the following titles and dates: *John Greenleaf Whittier: his Life, Genius, and Writings*, by W. Sloane Kennedy (Boston, 1882); *John Greenleaf Whittier, a Biography*, by Francis H. Underwood (Boston, 1884); *John G. Whittier, the Poet of Freedom*, by W. Sloane Kennedy, in "American Reformers" Series (Boston, 1892); *A Memorial of John G. Whittier, from his Native City*, published by authority of the city council of Haverhill (1893); *Life of John Greenleaf Whittier*, by W. J. Linton (London, 1893); *Whittier: Notes of his Life and his Friendships*, by Mrs. James T. Fields (New York, 1893); *Personal Recollections of John G. Whittier*, by Mary B. Claffin (New York, 1893); *Life and Letters of John Greenleaf Whittier*, by Samuel T. Pickard, in two volumes, illustrated (Boston, 1894). SAMUEL T. PICKARD.

Whittington, SIR RICHARD; b. at Pantley, Gloucestershire, England, about 1350; younger son of Sir William de Whityngdon, lord of the manor of Pantley, who died 1360. Richard was obliged to seek his living, and, according to a well-known legend, walked to London and was apprenticed there to a merchant. At one time, however, he started to run away, but while seated at the foot of Bighgate Hill, seemed to hear in the chime of Bow Bells—

Turn again, Whittington,
Thrice lord mayor of London.

He then returned, and later married Alice Fitzwarren, daughter of his employer; became a wealthy merchant, his first capital having been derived from the sale of a cat in an Eastern market; was lord mayor of London 1397, 1406, and 1419; carried on the business of a mercer; made loans to Henry IV. and Henry V.; bought on the Continent the wedding trousseaux for the Princesses Blanche and Philippa, of which the invoices are still in existence and died in 1423. Having no children, he left his large estate to public or charitable objects, among which were the rebuilding of Newgate prison, the founding of a college and of the libraries at Guildhall and of the Grey Friars, and the repair of St. Bartholomew's Hospital. He shared with Richard Harnden the expense of rebuilding the nave of Westminster Abbey, and during his magistracy ordered the compilation of a sort of directory of the city of London, containing curious accounts of its mediæval customs and privileges. This work, called the *Liber Albus* (or White Book), was written in 1419, in Latin and Anglo-Norman, by John Carpenter, common clerk of the city, and was first translated by Henry T. Riley 1862. Interesting particulars respecting Whittington are given by Mr. Riley in the preface to the above work, and his memory as an historical character has been vindicated by Rev. Samuel Lysons in his book, *The Model Merchant of the Middle Ages, exemplified in the Story of Whittington and his Cat* (London, 1860).

Whittlesey, CHARLES: geologist, mining engineer, and archaeologist; b. at Southington, Conn., Oct. 4, 1808; removed to Ohio in 1813; graduated at West Point 1831; served one year as lieutenant and then resigned to study and practice law; editor of the *Cleveland Whig and Herald* 1836-37; assistant on first Geological Survey of Ohio 1837-39; from 1844 until the civil war gave principal attention to the geology and mineral resources of the northern portions of Michigan, Wisconsin, and Minnesota, being connected at times with the surveys in charge of Owen and Foster and Whitney, and at other times with various mining companies. During the war he served as engineer, and was promoted to a colonelcy in 1861, but resigned on account of ill health in 1862. D. at Cleveland, O., Oct. 18, 1886. He was a pioneer in American archaeology, investigating Indian mounds, caves, and rock inscriptions in Ohio and about Lake Superior. The list of his minor writings is long, and they are scattered through many periodicals. Some of them were collected by himself under the title *Fugitive Essays*, and published at Hudson, O., in 1852. Among his more extended as well as more important papers are three printed as Smithsonian Contributions to Knowledge: *Fluctuations of Level in the North American Lakes* (1860); *Ancient Mining on the Shores of Lake Superior* (1863); *The Fresh-water Glacial Drift of the Northwestern States* (1866). G. K. GILBERT.

Whitworth, Sir JOSEPH, Bart., F. R. S., LL. D., D. C. L.: mechanic and engineer; b. at Stockport, England, 1803; became a tool-maker, and from 1833 to 1854 devoted himself to the improvement and production of those machine tools which made his name known throughout the civilized world. He was the first to manufacture and introduce into general use standard gauges for mechanical work of such accuracy as to secure uniformity in the products of all shops using them. He also established the standard screw-threads now used in Great Britain, Russia, Italy, and Germany, and known throughout the world. In 1854 he also turned his attention to the manufacture of rifles, and in 1857 submitted for trial a small-arm far superior to any then existing, and embodying the principles upon which modern improvements have been based, viz., reduction of bore (.45 inch), an elongated projectile (3 to 3½ calibers), more rapid twist (one turn in 20 inches), and extreme accuracy in manufacture. This rifle, after distancing all others in competition, was rejected by the British Ordnance Board as being of too small caliber for a military weapon. In the construction of cannon, he was equally successful in his products, and unsuccessful in their adoption, making in 1862 a rifled gun of high power, whose proportions were almost the same as those used to-day; but this was rejected by the ordnance board, and the progress of improvement in ordnance retarded in Great Britain nearly twenty years by the adoption of the Woolwich patterns. To secure a gun-steel which would satisfy his requirements, he perfected the process of "fluid compression," now used for the manufacture of the highest grades of mild steel not only for guns, but also for steamer's shafts, etc. Space will not allow a reference to his many other contributions to mechanical science and art. In addition to his degrees from Oxford and Dublin, he was appointed by Napoleon III. to the Legion of Honor in 1868, and made baronet in 1869. In 1869 he gave £100,000 to found scholarships for the promotion of mechanical science, from which every year £3,000 is distributed among the younger engineers of England. His writings include *Miscellaneous Papers on Mechanical Subjects* (1855); *Papers on Practical Subjects: Guns and Steel* (1873); and *Essays on Mechanical Subjects* (1882). D. at Monte Carlo, Italy, Jan. 22, 1887. JAMES MERCUR.

Whitworth Guns: See ARTILLERY.

Whooping Cough: an infectious and epidemic disease, generally occurring but once in the life of an individual, and usually during infancy or childhood. It is characterized by paroxysms of convulsive coughing, followed by a long ringing inspiration, whence the name. The duration of the disease varies from two to several months. It is the chin-cough of early English physicians, the *pertussis* of Sydenham, and the *coqueluche* of French authorities, and was formerly confounded with the catarrhal affections, which it much resembles in its symptoms. The specific cause has not as yet been positively demonstrated, though it is claimed that a certain bacillus is the germ peculiar to the disease. The simple disease is seldom fatal, but when complicated with pulmonary disease is very dangerous.

Whortleberry, Hurtleberry, or Huckleberry: a well-known American edible berry, being the fruit of plants of the genera *Gaylussacia* and *Vaccinium*, constituting with *Chiogenes* a sub-order of the *Ericaceae*, or HEATH FAMILY (q. v.). Some of the species are known as blueberry and checkerberry in various parts of the U. S. See also BILBERRY and HUCKLEBERRY.

Whydah: the chief port of Dahomey, Africa; on the Slave Coast, Gulf of Guinea (see map of Africa, ref. 5-U). Several European trading firms were established there, and Whydah was the chief center of foreign trade in Dahomey before the French practically acquired the country (1893). The best overland route from Abomey, the capital, to the sea reaches the coast at Whydah. Palm oil is the chief article of export. C. C. A.

Whydah-bird: See WIDOW-BIRD.

Whympier, EDWARD: traveler and wood-engraver; b. in London, England, Apr. 27, 1840; educated at Clarendon House School; became a draughtsman on wood; made a series of journeys on the Continent, in one of which, in 1861, he ascended Mont Pelvoux, reputed the highest mountain in France; discovered from its summit another peak, the Pointe des Écrins, 500 feet higher, which was subsequently ascended by him (1864); was chosen a member of the Alpine Club 1861; made for several years a series of bold ascents of Alpine summits before considered inaccessible, culminating in that of the Matterhorn July 14, 1865, when four of his companions lost their lives; traveled in North-west Greenland, collecting fossiliferous deposits for the British Museum, and made a second visit to Greenland for a similar purpose in 1872; ascended the principal peaks of the Ecuadorian Andes in 1879-80. Author of *Swiss Pictures, drawn with Pen and Pencil* (1866); *Scrambles among the Alps 1860-69* (London, 1871); and *The Great Andes of the Equator* (3 vols., 1891-92). His brother, FREDERICK WHYMPIER, b. in London, July 20, 1838, is author of *Travel and Adventure in Alaska* (1868) and *The Heroes of the Arctic and their Adventures* (1875). M. W. H.

Whyte-Melville, GEORGE JOHN: See MELVILLE, GEORGE JOHN WHYTE.

Wicelius, or Witzel, GEORG: theologian; b. at Vacha, Eisenach, on the Werra, 1501; studied theology at Erfurt, and was ordained a priest, though in 1520 he had been in Wittenberg, and heard Luther and Melancthon; was appointed curate at Vacha, where he embraced the Reformation and married. He preached against ecclesiastical abuses and the oppression of the common people. From Vacha he went as parish priest at Wenigen-Lupnitz, in Thuringia, but was compelled to leave because he was suspected, unjustly, of sympathy with the peasants in the Peasants' war. In 1525 he was appointed pastor of Niemeck, a town 27 miles S. S. W. from Potsdam, on Luther's recommendation, but relapsed into Romanism, attacked with great violence the Lutheran doctrines concerning good works and the Church, and had a falling out with the Lutheran leaders, and was expelled in 1530. He led a wandering life henceforth, never staying long in a place. For a time he was at Eisleben, then at Dresden; in 1540 was in Fulda, where he wrote his *Querela pacis*; in 1554 removed to Mayence, where he lived in retirement till his death, 1573. His principal work was his *Typus ecclesiasticus*, 5 vols. (1540-48). See G. L. Schmidt, *Georg Witzel ein Altkatholik des 16. Jahrhunderts* (Vienna, 1876). Revised by S. M. JACKSON.

Wichern, Wichern, JOHANN HEINRICH: philanthropist; b. in Hamburg, Germany, Apr. 21, 1808; studied theology at Göttingen and Berlin; started, after his return home, a Sunday-school for the poorest and most abandoned children of the city, and ultimately had 500 pupils under his care; opened in 1833 at Horn, near Hamburg, the *Rauhe Haas*, a reformatory for vagrant children, the miserable, often weak-minded, but often also wicked-minded, children who were received being portioned off into families of twelve, and placed under the charge of a young workman, who taught them a trade, the beneficial effects of which institution were so great that it was soon imitated, not only in various places in Germany, but also in Great Britain, France, and Holland. In 1848 the Protestant Ecclesiastical Assembly at Wittenberg combined, for the purpose of united action, all the inner missions under one central committee, at the head of which Wichern was placed, and finally, in 1858, the Prussian Government appointed him superintendent of all penal and correctional institutions of the country.

He published *Die innere Mission* (Hamburg, 1849; 3d ed. 1889); *Die Behandlung der Verbrecher* (Hamburg, 1853); *Der Dienst der Frauen in der Kirche* (Hamburg, 1858; 3d ed. 1880). From 1844 he issued the monthly *Fliegende Blätter des Rauhen Hauses*. D. in Hamburg, Apr. 7, 1881. His *Life* was written by Oldenburg (Hamburg, 2 vols., 1881-86) and Krummacker (Gotha, 1882).

Wichita, wish-i-taw: city (founded in 1870); capital of Sedgwick co., Kan.; on both sides of the Arkansas river, and on the Ate., Top, and S. F., the Chi., Rock Is. and Pac., the Mo. Pac., the St. L. and San Fran., and the Wichita and West. railways; 100 miles S. W. of Emporia, 161 miles S. W. of Topeka (for location, see map of Kansas, ref. 7-G). It is the center of a great wheat-growing and stock-raising region, and an important commercial shipping-point. The city is laid out regularly, has a mild and healthful climate, and is provided with improved systems of water-works, sewerage, gas and electric street-lighting, and electric street-railways. Griswold, Linwood, and Riverside parks are conveniently situated and well adapted to public purposes. The public buildings include the U. S. Government building, county building, city-hall, city hospital, and the Carey hotel. There are 37 churches and other places of worship, viz.: Methodist Episcopal, 8; Presbyterian, 7; Baptist, 5; Congregational, 4; Christian, 2; Lutheran, 2; Roman Catholic, 2; and Protestant Episcopal, Unitarian, United Brethren, German Reformed, Friends, Adventist, and Scientist, each 1. The public schools have an enrollment of over 6,000 pupils, and cost about \$71,000 per annum. Advanced instruction is afforded by Garfield University (Christian, chartered 1886), Wichita University, Fairmount Institute, All Hallows' Academy, Lewis Academy (Presbyterian), Southwestern Business College, and the Wichita Commercial College. There are 2 national banks with combined capital of \$250,000, 2 State banks with combined capital of \$250,000, a private bank, and 3 daily and 12 weekly newspapers. Among charitable institutions are 2 hospitals, 2 homes for children, and a home for reformed women. The business interests of the city comprise extensive stock-yards and meat-packing houses, wholesale houses in general merchandise, and manufactories of agricultural implements, chemicals, flour, sash and doors, wagons, spring beds and mattresses, brooms, hose-couplers, harness, bottled goods, trunks, soap, and ice. Pop. (1880) 4,911; (1890) 23,853; (1895) 20,841. CHARLES K. HATTON.

Wichita Falls: town; capital of Wichita co., Tex.; on the Wichita river, and the Wichita Valley Railway; 51 miles N. E. of Seymour, 113 miles N. W. of Fort Worth (for location, see map of Texas, ref. 1-G). It is in an agricultural and grazing region, and has 2 national banks with combined capital of \$150,000, and 3 weekly newspapers. Pop. (1880) not in census; (1890) 1,987.

Wick: a royal and parliamentary burgh of Scotland; capital of the county of Caithness; at the mouth of the Wick; 161 miles by rail N. N. E. of Inverness and 263 miles N. of Edinburgh (see map of Scotland, ref. 4-II). It is at the head of a small bay, which affords good harbor accommodation for vessels of light draught and the large fleets of fishing-boats engaged in the herring-fishery, of which this is a very important center. The town consists of Wick proper, on the northern bank of the river, and Pulteney, on the southern. Pop. (1891) 8,464.

Wickliffe, JOHN: See WYCLIF.

Wicklow: county of Ireland, bordering E. on the Irish Sea; area, 781 sq. miles. The surface rises in the middle in a group of mountains 3,000 feet high, sometimes well wooded and picturesque, sometimes barren and wild. On the slopes of these mountains are good pastures and tracts of fertile soil. Crops of oats, potatoes, and wheat are grown, and there is some dairy farming. Pop. (1891) 61,934. Chief town, Wicklow; pop. 3,390.

Wicksteed, PHILIP HENRY, M. A.: clergyman and author; b. at Leeds, England, Oct. 25, 1844; educated chiefly at University College, London, Manchester New College, and Leyden University; pastor successively of Mary Street chapel, Taunton, Old chapel, Dunkinfield, and Little Portland Street chapel, London; university extension lecturer in London; lecturer on sociology, Oxford; warden of University Hall, London. He is the author of *Dante, Six Sermons* (1880); *Alphabet of Economic Science* (1888); *Henrik Ibsen, Four Lectures* (1892); and has published translations from the Dutch as follows: Ort and Hooykaas's *Bible for*

Young People (6 vols., 1873-79); Kuenen's *National Religions and Universal Religions* (1882) and *Pentateuch* (1886); and from the French, Reville's *Native Religions of Mexico and Peru* (1884); and d'Alviella's *Origin and Growth of the Conception of God* (1892).

Wiclif: See WYCLIF.

Wicopy: See LEATBER-WOOD.

Widdin: town; in Bulgaria; on the Danube, near the Servian frontier; surrounded by morasses and strongly fortified (see map of Turkey, ref. 2-C). Large vessels can ascend the Danube to its harbor, and an important trade is carried on in wool, skins, furs, tallow, salt fish, and wheat. The Russians were defeated here in 1828. Pop. (1893) 14,551. E. A. G.

Widgeon, or **Wigeon** [from O. Fr. *vigeon*, *vingeon*, widgeon < Lat. *ripio*, *ripionis*, a kind of small crane]; any duck of the genus *Mareca*. The bill is shorter than the head (about equal to the claw of the inner toe), rather high, with its sides parallel nearly to its end, the end somewhat obtusely pointed, and the nail at the tip a third as broad as the bill itself; the tail is pointed, and less than half the length of the wings. Four species are known, two of which are inhabitants of the northern hemisphere, and two of the southern. The northern species are closely related, and are, on the whole, representatives of each other in their respective countries, but both wander sometimes beyond their natural limits. The European widgeon (*M. penelope*) has the head and neck reddish brown or cinnamon, with the feathers of the former slightly spotted with dusky, and those of the latter nearly uniform; the head is further diversified by cream color on the top, and by green in a band around the eye, and in a few spots behind it. The American widgeon (*M. americana*) is distinguished by the head and neck being in the main grayish, with the feathers of the former thickly spotted, and of the latter banded with black; the head is also relieved by white on the top, and by green in a broad and continuous patch around and behind the eye. The species remain farther to the southward than many of their kindred, the American widgeon breeding in Northern Dakota and Montana. Revised by F. A. LUCAS.

Widow: See DOWER.

Widow-bird ([by analogy of *widow*) for *whidah-bird*, named from *Whidah* (or *Whydah*), in Dahomey, West Africa, where the bird abounds); any species of *Vidua* and related genera belonging to the family *Ploceidae*. See WEAVER-BIRDS. The species have the bill conic, but more or less arched, and advancing on the forehead in a point; the wings are moderate, "with the first quill spurious; the second nearly as long as the third; the third, fourth, and fifth nearly equally long"; the tail is variable, but in the males some of the coverts and tail-feathers are usually greatly developed; the tarsi are slender, shorter than the middle toe, and covered in front with large plates; the toes are rather slender, and the hind one especially so, being as long as the inner; the claws are all long and moderately curved, and the hindermost developed. The species are peculiar to Africa. They feed chiefly upon grains. The nest is generally complex, and elaborately woven. The excessive development of the plumage, and especially the tail-feathers, of the males is peculiar to the breeding season. About sixteen or seventeen species are known, the most familiar of which are the *Vidua principalis* and *V. paradisæa*. Revised by F. A. LUCAS.

Widukind: See WITTEKIND.

Wieck, CLARA: See SCHUMANN, ROBERT.

Wiedersheim, wee'ders-him, ROBERT ERNST EDWARD: anatomist; b. at Nürtingen, in Würtemberg, Germany, Apr. 21, 1848; educated in the gymnasia of Stuttgart and Lausanne, and then studied medicine in the University of Tübingen. During the Franco-German war he served in the German army as assistant surgeon. At the close of the war he returned to his studies, first at Würzburg, then at Freiburg in Baden, and passed his final examination in Jan., 1872. He was then appointed prosecutor to Kölliker at Würzburg; in 1876 he went to Freiburg as Extraordinary Professor of Anatomy, and in 1881 was made ordinary professor. Most noticeable among his works are his two manuals of comparative anatomy, and his papers on the skull of the Urodele Batrachia, the anatomy of the Cæcilians, development of Proteus, and on the appendicular skeleton of the vertebrates. His work in completing Ecker's monograph on the frog should also be mentioned. J. S. KINGSLEY.

Wieland, vee'länt, CHRISTOPH MARTIN: poet; b. at Oberholzheim, Württemberg, Sept. 5, 1733; received a careful education from his father, in the school of Klosterbergen, near Magdeburg, and under a private tutor at Erfurt. He wrote Latin and German verses when only twelve years old. In 1750 he went to the University of Tübingen for the purpose of studying law, but soon devoted himself exclusively to philology, philosophy, and literature. Following an invitation of Bodmer, whom he had sent his unfinished epic *Hermann*, he went in 1752 to Zürich, and remained for two years in the house of Bodmer as the latter's guest and literary assistant. He then accepted a position as a private tutor at Berne, deeply engaged all the while in various kinds of literary production, though without any remarkable result. From 1760 to 1769 he lived at Biberach, a free imperial city not far from his birthplace, where he held an office in the civil service, and here, or rather at the residence of Count von Stadion in the neighboring Warthausen, he came in contact with the German nobility, whose life, half sentimental and half frivolous, greatly influenced him, and produced an entire change in his views and in his literary productions. In this period he wrote *Don Sylvio de Rosalva* (1764), *Komische Erzählungen* (1766), *Agathon* (1767), all of a very captivating but rather doubtful character; the didactic poem *Musarion* (1768), very elegant in its form, and in those days very startling in its ideas; and a prose translation of Shakspeare in 8 vols. (1762-66), which was the first introduction of the English poet to the German public. In 1767 he received a chair of philosophy in Erfurt, and held it to 1772, in which year he published, among other things, *Combabus* and *Der neue Amadis*, a comic poem in 18 songs. In 1772 he was called to Weimar as tutor to the young duke, and he remained there till his death Jan. 20, 1813, residing partly in the city itself, partly at his estate in the neighborhood, Osmannstedt, where he was buried in the garden. With Goethe, Schiller, and Herder he was on intimate terms, though the enormous literary activity which he developed followed other courses and sometimes occasioned collisions. He edited *Teutscher Mercur* (1773-95), *Attisches Museum* (1796-1804), and *Neues Attisches Museum* (1805-09); translated and annotated the epistles and satires of Horace (1788-89), all the works of Lucian, and Cicero's letters (5 vols., 1808-12); wrote *Oberon* (1780), his best and most celebrated work, a romantic epic, translated into English by W. Sotheby (London, 1826); *Neue Göttergespräche* and *Geheime Geschichte des Philosophen Peregrinus Proteus* (1791), imitations of Lucian; *Geschichte der Abderiten* (1774); translated into English by H. Christmas under the title *The Republic of Fools, being the History of the State and People of Abdera in Thrace*, 2 vols., London, 1861; *Aristipp und einige seiner Zeitgenossen* (1800-01), his last romance. The first collected edition of his works was published by himself in 42 vols. (1794-1802), the second by Gruber in 50 vols. (1818-28); subsequently several other more or less complete editions have appeared. Of his letters the most important collections are *Ausgewählte Briefe* (4 vols., 1815), *Auswahl denkwürdiger Briefe* (2 vols., 1815), and *Briefe an Sophie La-Roche* (1820). Considered by themselves, simply as productions of art, Wieland's works have, with a few exceptions, lost somewhat of their interest. The frivolity of his humor, the sensuality of his imagination, are covered, but not always redeemed, by the sprightliness of his wit and by the quickness and compass of his feeling. After Luther, he is the first great poet in the German literature to whom verse was a natural form of speech, and beneath the elegance and refinement of form, which he learned partly from the French and partly from the Greek literature, there moves in all his works a native grace, a genuine spirit of sweetness and cheerfulness. He thus made German fiction attractive to the upper classes of German society, which had hitherto neglected it, and became an important element, the model of naturalness, in the education of Goethe. Many important issues in modern literature in Germany—the worship of Shakspeare, the enthusiasm for the Middle Ages, etc.—can be traced back to him as one of their sources or found in him one of their earliest and most effective supporters. His statue by Gasser was raised in Weimar Sept. 4, 1857. See Gruber, *Wielands Leben* (1827); Löbell, *Entwicklung der deutschen Poesie* (Brunswick, 1858); Hallberg, *Wieland* (1869); E. Ranke, *Zur Beurtheilung Wielands* (1885); Mnneker, *Wielands Hermann* (1882); L. Hirzel, *Wieland und Martin und Regula Känzli*; Pröhle, *Lessing, Wieland, Heine* (1877). Revised by JULIUS GOEBEL.

Wieliczka, vye'e-litch kä: mining town in Austrian Galicia, 6 miles S. E. of Cracow (see map of Austria-Hungary, ref. 3-11); celebrated for the largest and richest salt mines in the world. The time of their discovery is unknown, but that they were known as early as the year 1044 is historically proven. King Casimir the Great of Poland was the first to work the mines, and Augustus II. improved their cultivation by the introduction of skilled Saxon miners. By the first partition of Poland in 1772 they fell to Austria. The mines now extend under the town from E. to W. 4,000 meters, from N. to S. 1,200 meters, and 386 meters in depth, and are worked by more than 1,000 men. They yield annually about 65,000 tons of salt. The strange labyrinth of underground streets, squares, and chambers with pillars, columns, statues, and candelabra, all hewn out in the salt, and the two lakes navigated by small boats, are unparalleled elsewhere. Pop. of town about 6,280. H. S.

Wien, veen: See VIENNA.

Wiertz, veertz, ANTOINE JOSEPH: painter; b. at Dinant, Belgium, Feb. 22, 1806, in humble circumstances; was admitted as a pupil in the art school of Antwerp in 1820; won the great prize in 1834; studied for some years in Rome, and settled after his return at Brussels. The first period of his artistic career (1834-48) is characterized by colossal representations of mythological or biblical subjects—*Contending for the Body of Patroclus* (1835), 20 by 30 feet; *the Revolt of the Angels*, *the Flight from Egypt*, *the Triumph of Christ* (1848), 50 by 30 feet—and by very fierce polemics against certain features of modern art-life. He refused to sell any of his pictures; offered his *Patroclus* as a prize to him who could show thoroughly the mischievous influence of journalism on art; put his own name on a picture by Rubens, sent it to the committee of a Paris exhibition, and made the unfortunate judges the laughing-stock of Europe when they rejected it. In 1847 the Belgian Government built him a large studio after his own designs, and between 1848 and 1853 he succeeded in perfecting the discovery of a new method of painting, which he called *peinture mate*, and which combines the qualities of fresco and oil painting. In the later period of his life (1853-65) his polemical temper developed into a grotesque humor, and his pictures became less pretentious in size and richer in conception: *The Last Cannon*, *A Second after Death*, *Napoleon in Hell*, *Precipitate Inhumation*, *Visions of a Head cut off*, etc. Devoting himself almost wholly to these quaint and gloomy subjects, he allowed the artistic qualities of his pictures to be inferior to what his great abilities might have made them, though he kept to the end some of the vigor and the freshness of his prototype, Rubens. He bequeathed all his pictures to the state, and they are now exhibited in the so-called Wiertz Museum, his former studio. He also wrote *Eloge de Rubens* (1840) and *L'École flamande de Peinture* (1863), both of which were crowned by the Belgian Academy. D. at Brussels, June 18, 1865. See Labarre, *Antoine Wiertz* (Brussels, 1866). Revised by RUSSELL STURGIS.

Wiesbaden, vees'baa-den: town; province of Hesse-Nassau, Prussia; beautifully situated at the foot of Mt. Taunus, on the Salzbach, an affluent of the Rhine (see map of German Empire, ref. 5-D). It is neatly built, and one of the most popular watering-places of Germany. It contains fourteen hot saline springs, of which the principal has a temperature of 156°, and is very copious. These springs, which are considered efficacious in cases of gout and rheumatism, were known to the Romans (*Aqua Mattiaca*), and they are now generally used by about 80,000 persons each season. Pop. (1895) 74,122. Revised by M. W. HARRINGTON.

Wife: See MARRIED WOMEN.

Wiffen, BENJAMIN BARRON: editor; b. near Woburn, Bedfordshire, England, in 1794, of a Quaker family; devoted himself to the study of Spanish literature, and especially of the Spanish Reformers of the sixteenth century, whose numerous writings he rescued from long neglect by the publication, with the assistance of Don Luis de Uroz y Rios, of *Reformistas Antiguos Españoles, or the Works of Spanish Reformers reprinted and edited* (29 vols., 1848-69), with biographical and bibliographical notices. His collections are now in the library of Wadham College, Oxford. D. Mar. 18, 1867. See Robertson's *The Wiffen Brothers*.

Wiffen, JEREMIAH HOLMES: poet and translator; brother of Benjamin Barron Wiffen; b. at Woburn, England, in 1792; was for a number of years a schoolmaster, and subsequently librarian to the Duke of Bedford at Woburn Abbey,

retaining that position until his death May 2, 1836. He published poetical translations of Garcilaso de la Vega (1823), and of Tasso's *Jerusalem Delivered* (2 vols., 1824-25), and *Historical Memoirs of the House of Russell from the Norman Conquest* (2 vols., 1833), besides several volumes of original verse. He contributed poems to the annuals, and made some translations from the Welsh *Triads*.

Wigan: town; in Lancashire, England; on the Douglas; 18 miles W. N. W. of Manchester (see map of England, ref. 7-F). It is in the center of a rich coal-field, and has iron and brass foundries, paper-mills, cotton-spinning factories, and manufactures of cotton goods, nails, edge tools, and chemicals. Wigan returns one member to Parliament. Pop. (1891) 55,013.

Wigeon: See WIDGEON.

Wigglesworth, MICHAEL: clergyman; b. probably in Yorkshire, England, Oct. 18, 1631; was taken to Charlestown, Mass., by his father 1638, and thence in the same year to New Haven, Conn.; graduated at Harvard 1651; became tutor and fellow there; studied divinity; was ordained minister of the church at Malden 1656; had some skill as a physician, and was offered the presidency of Harvard 1684, but declined on account of ill health, being "a little feeble shadow of a man." He preached the election sermon 1686, and the artillery election sermon 1696. D. at Malden, June 10, 1705. Author of *The Day of Doom, or a Poetical Description of the Great and Last Judgment, with a Short Discourse on Eternity* (1662), which went through two editions in England, and was long one of the most popular books in New England (6th ed. 1715). In it occurs the famous passage assigning to non-elect deceased infants "the easiest room in hell" (verse clxxxi.). Another small volume, "intended for poetry" (*Allibone*), was entitled *Meal out of the Eater, or Meditations concerning the Necessity, End, and Usefulness of Afflictions unto God's Children, all tending to Prepare them for and Comfort them under the Cross* (1669; 6th ed. 1770). He left in MS. a poem entitled *God's Controversy with New England*, printed in the *Proceedings of the Massachusetts Historical Society*, 1871. An edition of his *Day of Doom*, with the addition of other poems and a *Memoir, Autobiography, and Sketch of his Funeral Sermon by Rev. Cotton Mather*, has been issued by William H. Burr (New York, 1867), and John Ward Dean published a *Sketch of his Life, with a Fragment of his Autobiography, some of his Letters, and a Catalogue of his Library* (Albany, 1863; new ed. 1871).

Revised by S. M. JACKSON.

Wight, wit, ORLANDO WILLIAMS: author; b. at Centreville, N. Y., Feb. 19, 1824; educated at Westfield Academy and at Rochester Collegiate Institute; ordained to the Universalist ministry; settled as a literary man at Brooklyn, N. Y.; subsequently studied medicine, and practiced in Wisconsin; appointed State geologist and surgeon-general 1874; health commissioner of Milwaukee 1878-80; health officer of Detroit. He was the author of *Lives and Letters of Abelard and Heloise* (1853; new ed. 1861); edited *The Philosophy of Sir William Hamilton* (1853); twelve volumes of *Standard French Classics* (1859, seq.); and *The Household Library* (18 vols., 1859, seq.); translated, with Frederick W. Ricord, Victor Cousin's *Course of the History of Modern Philosophy* (2 vols., 1852); and *Lectures on the True, the Beautiful, and the Good* (1854); *Maxims of Public Health* (1884); and *People and Countries, travels* (1888); and aided Miss Mary L. Booth in her translation of Henri Martin's *History of France* (4 vols., 1863). D. at Detroit, Mich., Oct. 19, 1888.

Revised by H. A. BEERS.

Wight, Isle of: an island in the English Channel, belonging to the county of Hampshire, England, from which it is separated by the roadstead of Spithead. Area, 145 sq. miles. It is traversed from E. to W. by a range of chalk downs rising between 600 and 700 feet, which presents a great variety of fine scenery. The soil is very fertile, and the climate remarkably mild and equable. Wheat, vegetables, and fruits are extensively cultivated, and a fine breed of sheep is reared on the downs. The island is much resorted to as a bathing-place and by consumptives. The island was known as *insula Vectis* by the Romans, who conquered it in the reign of Vespasian, and there are many evidences of the Roman occupation. Near the town of Cowes is Osborne House, where Charles I. was imprisoned for a short time, and which is a favorite residence of Queen Victoria. Pop. (1891) 78,718.

Wigram, Sir JAMES: jurist; b. at Walthamstow, England, in 1793, of Irish descent; educated at Trinity College, Cambridge; graduated in 1815, and became a fellow of Trinity in 1817; was called to the bar at Lincoln's Inn 1819; took up chancery practice, and was made king's counsel in 1834; entered Parliament for Leominster 1841; vacated his seat, and was knighted and made second vice-chancellor Oct., 1841; held this office until 1850, when, after becoming totally blind, he retired, and was granted a pension of £3,500. D. July 29, 1866. He is the author of *An Examination of the Rules of Law respecting the Admission of Extrinsic Evidence in Aid of the Interpretation of Wills* (2d ed. 1835), of which the second American edition was annotated by Theodore W. Dwight, LL. D., and of *Points in the Law of Discovery* (2d ed. 1840). F. STURGES ALLEN.

Wigton, or Wigtown: county of Scotland, occupying the southwestern corner of the country, and bordering S. on the Irish Sea and W. on the North Channel; comprises the western district of the ancient province of Galloway, Loch Ryan, and Luce Bay, which almost intersect the county from the peninsula, 28 miles long, which is known as the Rhinns of Galloway. The surface is undulating, and gradually rises toward the N. to a height of 1,500 feet. It consists to a great extent of moorland, interspersed with small lakes, but it contains some fine pastures where an excellent breed of cattle is reared, and some tracts of good soil highly cultivated. Pop. (1891) 36,062. The chief towns are Stranraer, Wigton, Newton-Stewart, Whithorn, Glencuce, and Portpatrick. Wigton, the county-town, is a royal burgh with a population of 1,509. It is 126 miles S. W. of Edinburgh. Here on May 11, 1685, an old woman and a girl were tied to stakes and drowned by the incoming tide because of their refusal to take the Abjuration Oath.

Wijnants: See WYNANTS.

Wilamowitz-Möllendorf, ULRICH, von: classical scholar; b. in Markowitz, Posen, Germany, Dec. 22, 1848; studied in Bonn and Berlin; privat docent in Berlin 1874; professor ordinarius in Greifswald 1876; since 1883 in Göttingen. His chief works are: *Analecta Euripidea* (1875); *Callimachus* (1882); *Æschylus's Agamemnon* (1885) and Euripides's *Hippolytus* (1891), translated into German verse; Aristotle's *Athenian Constitution* (with Kaibel, 1891); Euripides's *Heracles* (2 vols., 1889; 2d ed. 1895), with introduction and commentary; *Aus Kydathen in Philologische Untersuchungen* (vol. i., 1880); *Antigonos v. Karystos* in vol. iv. (1881); *Homericische Untersuchungen* in vol. vii. (1884); *Isyllus von Epidaurus* in vol. ix. (1886); *Aristoteles und Athen* (2 vols., 1894); *Die Theoydideslegende* (1877); *Die Bühne des Aeschylus* (1886); *Die sieben Thore Thebens* (1891), etc. Editor of M. Haupt's *Opuscula* (3 vols., Leipzig, 1876). ALFRED GUDEMAN.

Wilber: village (founded in 1873); capital of Saline co., Neb.; on the Big Blue river, and the Burl and Mo. River Railroad; 31 miles S. W. of Lincoln (for location, see map of Nebraska, ref. 11-G). It is in an agricultural region; has 6 churches, court-house, high school, 2 State banks with combined capital of \$75,000, and 3 weekly newspapers; and has 2 large flour-mills, steam grain elevators, and cigar-factories. Pop. (1880) 710; (1890) 1,226; (1895) estimated, 1,600. PUBLISHER OF "REPUBLICAN."

Wilberforce, ROBERT ISAAC: clergyman and author; son of William; b. at Bloomfield House, near Clapham Common, England, Dec. 19, 1802; graduated at Oxford 1823; became fellow, tutor, and examiner at Oriel College; took orders in the Church of England; was for some years vicar of East Farleigh, Kent, and of Burton Agnes 1840; became archdeacon of the East Riding of Yorkshire Jan. 14, 1841, and prebendary of York Feb. 8 of the same year; resigned these preferments 1854 on being received into the Roman Catholic Church at Paris, and entered an ecclesiastical academy at Rome with a view to the priesthood. He was a joint author of his father's *Life*, and author of *The Five Empires, an Outline of Ancient History* (1840); *Rutilius and Lucius, or Stories of the Third Age* (1842); *Church Courts and Church Discipline* (1843); *The Doctrine of the Incarnation* (1848); *The Doctrine of Holy Baptism* (1849); *A Sketch of the History of Erastianism* (1851); *The Doctrine of the Holy Eucharist* (1853); 2 vols. of *Sermons* (1850-54); and *An Inquiry into the Principles of Church Authority, or Reasons for Recalling my Subscription to the Royal Supremacy* (1854). D. at Albano, near Rome, Feb. 3, 1857.

Revised by J. J. KEANE.

Wilberforce, SAMUEL, D. D.: bishop; third son of William; b. at Clapham, England, Sept. 7, 1805; educated at Oriel College, Oxford, and graduated 1826; took orders in the Church of England; became curate of Checkendon, Oxfordshire, 1828; rector of Brixton (Brightstone), Isle of Wight, 1830; select preacher before the University of Oxford 1837 and again 1845; archdeacon of Surrey 1839; rector of Alverstoke, Hampshire, 1840; canon of Winchester Cathedral 1840; chaplain to Prince Albert 1841; sub-almoner to the Queen 1844; dean of Westminster Mar., 1845; Bishop of Oxford and *ex-officio* chancellor of the order of the Garter Nov., 1845; lord high almoner to the Queen Nov., 1847; and Bishop of Winchester Oct., 1869. He was a leader of the High Church party, but an opponent of ritualism; was distinguished for eloquence and wit, for his efficiency as a bishop, and for his skill as a debater in convocation and in the House of Lords. The versatility of his opinions earned him the sobriquet of "Soapy Sam," by which he was popularly known, because, as he wittily explained, "he was always in hot water, and always came out of it with clean hands." He was killed by a fall from his horse, near Dorking, July 19, 1873. He was author of *Note-Book of a Country Clergyman* (1833); *Eucharistica* (1839); *Sermons preached before the University of Oxford* (2 series, 1839-62); of several other volumes of sermons; *The Rocky Island, and other Parables* (1840); 14th ed. 1870; new ed. 1892); *A History of the Protestant Episcopal Church in America* (1844); *Heroes of Hebrew History* (1870; new ed. 1892); *Speeches on Missions* (1874); and many miscellaneous publications. See his *Life*, by Canon A. R. Ashwell and his son Reginald Gaston Wilberforce (3 vols., 1881-82; condensed by the son, 1888); cf. G. W. Daniell, *Bishop Wilberforce* (1891).

Revised by S. M. JACKSON.

Wilberforce, WILLIAM: philanthropist; b. at Hull, England, Aug. 24, 1759. As early as 1773 he published in a newspaper a letter "in condemnation of the odious traffic in human flesh." At the age of nine he was sent to the grammar school of Hull, and in 1776 he entered St. John's College, Cambridge, and being the master of an independent fortune, of a genial temper, self-indulgent, playful, and witty, and thrown without restraint into the society of "as licentious a set of men as could well be conceived" (to use his own words), the risk to his health, his morals, and his general welfare was extreme. Notwithstanding his temptations to idleness, he became a good classic and creditably passed the college examinations. At Cambridge he formed an acquaintance with William Pitt, which afterward ripened into intimacy. Having determined to enter public life, he offered himself for Hull (in 1780), and after a sharp contest was elected to Parliament. In 1784 he was elected to represent the county of York, a success which seemed to open before him the most gratifying prospects. The years 1785-86 witnessed a change in his religious convictions which modified the whole course of his future life. The result of this was that he began in 1787 a series of efforts for the reformation of manners, and especially for abolishing the African slave-trade. The latter subject was brought into Parliament, and after overcoming many obstacles he opened the debate against the traffic on May 12, 1789, in a speech of great beauty and power. In this philanthropic effort he was supported by Burke, Pitt, and Fox. Although defeated, he renewed the effort whenever there seemed a chance of success, and finally, in 1807, after a struggle of nearly twenty years, had the joy of seeing the bill making it illegal for a British citizen to carry on the slave traffic passed by both houses. It received the royal assent on Mar. 25, and became the law of the land. In 1797 Wilberforce published his book entitled *A Practical View of the Prevailing Religious System of Professed Christians in the Higher and Middle Classes of this country, contrasted with Real Christianity*. In 1825 Wilberforce retired from Parliament after a continuous service of nearly forty-six years, during which his labors had been conspicuous and unceasing for every measure, public or private, tending to ameliorate suffering, to relieve the oppressed, and to elevate the moral and religious condition of the kingdom. Among the most important of these were his efforts in behalf of the Bible and missionary societies, for Roman Catholic emancipation, against the war with America, for christianizing India, and for abolishing the slave-trade and slavery.

After leaving Parliament, he retired almost altogether from public life, and went to live upon a small estate at Highwood near London. This, however, on account of a

loss of property, he was obliged to relinquish in 1831, after which he lived with his sons in Kent and the Isle of Wight. Three days before his death he had the intense pleasure of learning that the House of Commons had passed to its second reading the bill for the abolition of slavery, and he thanked God he had lived to see England spend £20,000,000 sterling in such a cause. He died in Cadogan Place, London, July 29, 1833, and, in accordance with the wishes of the nation, was buried in Westminster Abbey, "side by side with Canning, at the feet of Pitt, and within two steps of Fox and Grattan." *The Life of William Wilberforce*, 5 vols. 8vo, was written by his sons Robert Isaac and Samuel (1838; new ed., abridged, 1843); his *Correspondence* (edited by the same, in 2 vols.) appeared in 1840.

Revised by SAMUEL MACAULEY JACKSON.

Wilbraham: town (incorporated in 1763); Hampden co., Mass.; on the Chicopee river, and the Boston and Albany Railroad; 9 miles E. of Springfield (for location, see map of Massachusetts, ref. 3-E). It contains the villages of Wilbraham and North Wilbraham; has 3 churches, 9 district schools, and a public library; is noted as the seat of Wesleyan Academy (M. E., chartered in 1824); and is principally engaged in agriculture and the manufacture of paper. The town had an assessed valuation in 1894 of \$744,600. Pop. (1880) 1,628; (1890) 1,814; (1895) 1,740.

Wilbrandt, vöelbrañt, ADOLPH: poet; b. at Rostock, Germany, Aug. 24, 1837; studied in his native city, in Berlin, and in Munich, where for some time he edited a daily paper; visited Italy and France, and settled in 1871 in Vienna, where in 1881 he was made director of the Hofburg theater. In 1889 he resigned this position, and has since been living at Rostock, devoting himself entirely to literary pursuits. He has written a number of dramas which have been acted with success on all the principal stages of Germany; the tragedies *Graf Hammerstein* (1870); *Gracchus* (1872); *Arria und Messalina* (1874); *Giordano Bruno* (1874); *Nero* (1876); *Kriemhild* (1877); and the comedies *Jugendliebe* (1872); *Natalie* (1878). In the novels, *Adams Söhne* (1890), *Hermann Hinger* (1892), and *Der Dornenweg* (1894), he has treated skillfully the great social and literary questions of the day.

Revised by J. GOEREL.

Wilbur, JOHN: preacher of the Society of Friends; b. at Hopkinton, R. I., July 17, 1774; opposed the introduction of religious views at variance with the original doctrines of that society; was accused in 1838 by several members of Rhode Island yearly meeting of circulating in his conversation and writings opinions and statements derogatory to the character of the celebrated Joseph John Gurney, then (1837-40) visiting the U. S.; was sustained by a large majority in his own monthly meeting (that of South Kingston), but that body having been dissolved and its members added to the Greenwich meeting, he was formally disowned by the latter body Jan., 1843, and its action was confirmed by the quarterly meeting and the Rhode Island yearly meeting. His supporters were, however, sufficiently numerous in Rhode Island and other parts of New England to form an independent yearly meeting, the members of which were known as Wilburites. They are very conservative and not aggressive. The census of 1890 gives them 4,329 members. D. at Hopkinton, May 1, 1856. He published some polemical pamphlets, and his *Journal and Correspondence* (Providence, 1859) have appeared since his death. See the *History of the Society of Friends in America*, by A. C. and R. H. Thomas (New York, 1894), pp. 266, seq.

Revised by S. M. JACKSON.

Wilcox, CADMUS MARCELLUS: soldier; b. in Wayne co., N. C., May 29, 1826; graduated at the U. S. Military Academy, and was commissioned brevet second lieutenant of infantry July, 1846; served in the war with Mexico. In July, 1861, he was commissioned colonel of the Ninth Alabama Regiment, and in October appointed a brigadier-general in the Confederate army. In Virginia he commanded a brigade in Longstreet's corps, was at the second battle of Bull Run, Fredericksburg, Chancellorsville, Salem Heights, Gettysburg, etc.; promoted to be major-general Aug., 1863, and commanded a division in the Mine Run campaign and throughout the campaign of 1864-65, ending with the surrender at Appomattox Court-house; chief of division of railroads, general land office, Washington, 1888-89. D. in Washington, D. C., Dec. 2, 1890. Author of *Rifles and Rifle Practice* (New York, 1859); a translation of *Austrian Infantry Evolutions of the Line* (1860); and *History of the Mexican War*.

Revised by JAMES MERCUR.

Wileox, ELLA (*Wheeler*): poet; b. at Johnstown, Wis., about 1845; educated at the University of Wisconsin. In 1884 she was married to Robert M. Wilcox, of Meriden, Conn., to which place she removed, and subsequently to New York city. Her published volumes of verse include *Maurine* (Milwaukee, 1882); *Poems of Passion* (Chicago, 1883); and *Poems of Pleasure* (1888). A novel, *Mal Moulée*, appeared in 1885.

H. A. B.

Wild, HEINRICH: meteorologist and physicist; b. in Uster, canton of Zurich, Switzerland, Dec. 17, 1833. He was educated in Zurich at the gymnasium and the university until 1854, after which he studied physics in Königsberg. In 1857 he took the degree of Ph. D. in Zurich, and then worked for some time with Kirchhoff and Bunsen in Heidelberg. At Easter, 1858, he accepted the position of privat-docent in physics at the University in Zurich and at the Federal Polytechnic, and was in the same year called to Berne as Professor of Physics and director of the astronomical observatory or "Sternwarte," which he expanded into a meteorological Centralanstalt for the canton of Berne, and a meteorological observatory with self-registering apparatus. An inspection of the Swiss system of weights and measures, confided to him by the Bundesrath, led to the establishment of a "Federal Normal-Eichstätte," a reform which he carried out and completed by 1867. In May, 1868, he was called to St. Petersburg as a member of the Imperial Academy of Sciences and director of the Central physical Observatory, where at his initiative and under his physical direction there resulted a complete reorganization and extension of this latter institution and of the system of meteorological observations in Russia connected with it, and the establishment in 1876 of a special meteorological and magnetic observatory in Pavlovsk. Wild's scientific achievements have been more particularly in the domain of optics, metrology, electricity, meteorology, and terrestrial magnetism. The "polaristrobometer" (optical saccharimeter) invented by him is universally known; he also invented a polarization photometer (generally known as photometer and uranophotometer). Metrology is indebted to him for a new optical method for the intercomparison of line-to-line with end-to-end measures of length and for other improvements in methods of weights and measures that were proposed and carried out by him since 1870. In the field of electricity we owe to Wild not only the discovery of the thermo-electric streams in fluids and investigations into the laws of tension in electrolytes, but also, in more recent times, his precise determination of the absolute unit of resistance (the ohm). Of the numerous works by Wild in the field of meteorology and terrestrial magnetism, a small proportion are contained in the publications of the *Naturforschende Gesellschaft*, of Switzerland, but the greater part are to be found in the *Annalen des physikalischen Central-Observatoriums für Russland*, edited by him since 1865, and in the new *Repertorium für Meteorologie*, also published under his direction by the Academy of Sciences of St. Petersburg.

Wild Animals (in law): See FERE NATURE.

Wildbad, wildbäd: a small town of Württemberg, in the Black Forest; noted for its thermal springs and baths, the alkaline water of which ranges from 90 to 100 F. in temperature, considered useful in gout and rheumatism. Pop. (1890) 3,446.

Wildcat: a popular name for any one of several species of the genera *Felis* or *Lynx*. See CAT and LYNX.

Wild Cherry: the *Prunus serotina* (Ehrhart); a very common tree throughout North America, growing in all parts of the U. S. In the Western States it attains a height of from 80 to 100 feet, but in the Atlantic States it is usually much smaller. The fruit is small, about the size of a large pea, and when ripe is of a shining blackish-purple color. The wood of the wild cherry is much prized by cabinet-makers for its fine grain, handsome tint, and susceptibility to high polish. The inner bark, taken from all parts of the tree, furnishes the drug known as wild cherry. By a mistake the Latin official designation of this drug is *Prunus virginiana*, which is properly the botanical name of the choke-cherry, a different tree. Wild cherry bark is in pieces of various sizes, without epidermis, and of a light-cinnamon color. It has the odor of peach-leaves and an agreeable aromatic taste, with a flavor of bitter almonds. The important ingredients of the bark are tannin, and the peculiar principles *amygdalin* and *emulsin*, which by mutual

reaction in the presence of water develop a volatile oil containing a small percentage of hydrocyanic acid. Preparations of wild cherry bark are principally employed for the purposes of a mild and agreeable stomachic tonic, a gentle expectorant in bronchial affections with an irritative cough, and to impart a pleasant flavor to compound medicinal preparations.

Revised by H. A. HARE.

Wilde, OSCAR FINGAL O'FLAHERTIE: author; b. in Dublin, Ireland, 1856; son of Sir William Robert Wills Wilde, a surgeon, and of Jane Francesca, Lady Wilde, a woman of letters; studied at Portora Royal School, Enniskillen, then entered Trinity College, Dublin, where he obtained the Berkeley gold medal for Greek; took the Newdigate prize for English verse at Oxford 1874; studied at Magdalen College; graduated 1877; went to London 1879; became the apostle of the aesthetic movement, and was satirized under the name of "Postlethwaite" in *Punch*; lectured on art subjects in the U. S. 1882, and subsequently in England and Paris; was condemned in 1895 to penal servitude for two years for infamous conduct. Among his works are *Poems* (1880); *The Picture of Dorian Gray*, a novel; *The Happy Prince and other Tales* (1888); *Intentions*, essays (1891); *Lord Arthur Savile's Crime and other Stories* (1891); the tragedies *Guido Ferranti* (1890) and *The Duchess of Padua*; and a number of comedies, including *Lady Windermere's Fan*, *A Woman of No Importance*, and *The Importance of being Earnest*. These were played in England and the U. S., and were cleverly epigrammatic in dialogue, but wanting in dramatic interest, and distinguished by a cheap cynicism and an affectation of smartness.

Revised by H. A. BEERS.

Wilde, RICHARD HENRY: author; b. in Dublin, Ireland, Sept. 24, 1789. His parents removed to the U. S. in 1797, and settled in Baltimore, and when he was thirteen his mother moved to Augusta, Ga. Under many difficulties he studied law; was admitted to the bar, and soon rose to high distinction in his profession. He was at different times attorney-general of Georgia and U. S. representative from the same State. He wrote a number of poems, including the famous lyric *My Life is Like the Summer Rose*, and published in 1842 *Conjectures and Researches Concerning the Love, Madness, and Imprisonment of Torquato Tasso*. While studying in Italy he discovered Giotto's portrait of Dante. A posthumous poem, *Hesperia*, was published at Boston in 1867. On retiring from Congress in 1835 he visited Europe, and spent several years in literary pursuits. After his return from Europe in 1843 he moved to New Orleans, where he renewed the practice of law with unusual success, and was elected Professor of Constitutional Law in the University of Louisiana. D. of yellow fever in New Orleans, Sept. 30, 1847.

Wifebeest: See GNU.

Wiltenbruch, wild'en-bröchl, ERNST, von: dramatist; b. at Beyrut, Syria, Feb. 3, 1845; son of the Prussian consul-general; went to Germany 1857; entered the Prussian army and fought as an officer in the campaigns of 1866 and 1870; studied law at the University of Berlin; entered the civil service. He is one of the most talented of the younger German dramatists, and his plays—*Die Karolinger* (4th ed. 1887); *Hadt* (4th ed. 1884; translated into English by V. Heller, Philadelphia, 1891); *Der Menonit* (3d ed. 1886); *Täter und Thue* (1882); *Christoph Marlow* (1884); *Die Quiltzouts* (188); *Der neue Herr* (1891)—have been performed with great success in most German cities. He has also published a number of short stories and novels, of which *Der Meister in Tanagra* (1880) is the best. His *Lieder und Gesänge* (877) and *Dichtungen und Balladen* (1884) contain many powerful ballads and hymns, the most popular of which is *Das Hexenlied*.

JULIUS GOEBEL.

Wilder, ALEXANDER, M. D.: physician and author; b. at Verona, Oneida Co., N. Y., May 13, 1823; graduated at the College of Medicine of Syracuse University 1850; was a teacher and editor; practiced as an eclectic physician, and became in 1867 resident of the Eclectic Medical College of the city of New York; lecturer on physiology and physiological medicine 1873-77; held successively the chairs of Physiology and zehological Science in the U. S. Medical College; author numerous monographs, including *The Inter-marriage of Indred* (New York, 1870); *The Worship of the Serpent* (187); and *The Ganglionic Nervous System* (1887); edited Wropp's *Ancient Symbol-Worship* (New

York, 1873); Taylor's *Eleusinian and Bacchic Mysteries* (1875); and R. Payne Knight's *Symbolical Language of Ancient Art and Mythology* (1876); and has prepared a translation of Iamblichus *On the Mysteries*.

Revised by S. T. ARMSTRONG.

Wilder, Burt Green, B. S., M. D.: comparative anatomist; b. in Boston, Mass., Aug. 11, 1841; graduated at the Lawrence Scientific School, Harvard University, 1862; in 1863 became a licentiate of the Massachusetts Medical Society, and was appointed assistant surgeon of the Fifty-fifth Massachusetts Infantry (Negro); later served as surgeon until the regiment was discharged in 1865; after a course of medical study at Dartmouth College entered the medical department of Harvard, graduating in 1866. In the same year he became assistant in comparative anatomy in the Museum of Comparative zoölogy at Harvard. He also served a year as curator of herpetology in the Boston Society of Natural History and in the winter of 1867-68 gave a course of university lectures on the morphological value and relations of the human hand. In 1867 he was elected Professor of zoölogy in Cornell University; was also Professor in the Medical School of Maine (Bowdoin College) 1874-84, and in 1876-77 lectured on zoölogy in the medical department of the University of Michigan. In 1885 he was chosen president of the American Neurological Association. Since 1880 he has given much time to the simplification of anatomical nomenclature, mainly along lines indicated by Barclay and Owen. With Prof. Simon H. Gage he is author of *Anatomical Technology as Applied to the Domestic Cat* (1882-86, 1892). His own contributions to periodical literature are numerous. The close of his twenty-fifth year of service in Cornell University was signalized by the publication of *The Wilder Quarter-Century Book*, a collection of papers by some of his former pupils.

Wilderness, Battles of the: contests between the U. S. and Confederate armies in Northern Virginia, May 6-7, 1864. The general character of the region in which they took place is that of a wilderness, by which name it is locally known. In this locality thickets of pine, scrub oak, and other trees occupied a soil composed of sand and clay, unfavorable to agriculture and very swampy when wet. Two good roads pass through this region from Orange Court-house to Fredericksburg, uniting at the place called Chancellorsville. During the winter of 1863-64 the U. S. forces, under command of Gen. Meade, were encamped near the Orange and Alexandria Railroad, between the Rappahannock and the Rapidan, the Fifth Corps guarding the railroad back to Bristoe's Station. The opposing army, under Gen. Lee, occupied a strong line, partly intrenched, on the south bank of the Rapidan, extending from Mine Run westward to Orange Court-house and Gordonsville, covering Richmond, and threatening Washington if the Union army uncovered it by a flank movement. In Mar., 1864, Gen. Grant, then commander of all the Union armies, took up his headquarters with Gen. Meade's army. Gen. Meade broke camp at midnight May 3-4, and began moving toward the Rapidan, the right, consisting of the Fifth Corps (Warren's) and the Sixth Corps (Sedgwick's), to cross at Germana Ford; the left, comprising the cavalry (Sheridan's) and the Second Corps (Hancock's), to cross at Ely's Ford, 6 miles below. Before sunset Meade's army was established with but slight opposition in the Wilderness, with the Fifth Corps and a division of cavalry on the right, next the enemy. Gen. Grant, at 6 p. m. on the 4th, ordered an advance toward Lee next morning. Lee, however, had determined to give battle in the Wilderness, which, familiar to his soldiers, was but partially known to their opponents, and had also set his army in motion to meet his adversary. Accordingly, on the morning of May 5, the Fifth Corps and the advance of Lee's army met, a fierce encounter between some 25,000 men opening this bloody campaign. At intervals during the day others of the opposing columns met, and engaged with much valor and loss of life on both sides. The evening of May 5 found both armies face to face, and an inevitable and momentous conflict impending on the morrow. The Ninth Corps (Burnside's) and that of Longstreet on the Confederate side had not yet reached the field, toward which they marched that night. At dawn on May 6 the battle was renewed along all the opposing lines, and continued with unceasing movements and attacks, with much loss of life, until dark. The day closed with the two armies holding substantially the positions of the night before. On the morning of May 7 both armies were behind intrenched

lines, each too much exhausted to renew the fight. Gen. Grant then determined to move to his left, thus covering a new line of communication with Washington either by Fredericksburg and the railroad or by Port Royal, the Rappahannock, and the Potomac, and threatening Lee's communications with Richmond. This was begun after dark on the 7th, the Fifth Corps having the advance toward Spottsylvania Court-house. Gen. Lee, however, anticipated this, and having a shorter road, his main force reached there first, and the battles of Spottsylvania followed, which for convenience are herewith described, although the "Wilderness" battles proper are considered to have ended with the movement of May 7.

SPOTTSYLVANIA, BATTLES OF, May 8-21.—The advance cavalry of the Union army occupied this place early in the morning of May 8, but were compelled to withdraw before their enemy's advancing infantry. The Fifth Corps forced the enemy back until it found itself confronting the corps of Longstreet, and severe fighting followed. During the day the Sixth Corps joined the Fifth, and a combined attack was made by them at dark, but without result. The other corps of both armies continued to arrive and take up positions, attended with constant fighting and severe loss of life. May 9, 10, and 11 were passed in movements and bloody conflicts, without being decisive. These actions include the fights at Laurel Hill—a name borne upon the records of many regiments—and near this Gen. Sedgwick was killed, and the command of the Sixth Corps was assigned to Gen. Wright. Early on the morning of the 12th a general assault was made by Gen. Grant upon Lee's position. The Second Corps (Hancock's) carried a salient, capturing a division, and twenty cannon, but the subsequent resistance was so obstinate that no decisive result was obtained. The 13th to the 18th was spent in demonstrations, conflicts, and reorganization while awaiting re-enforcements. Unable to force the position at Spottsylvania, Gen. Grant issued orders for a movement toward North Anna river, around the right of Gen. Lee. The latter delayed this movement until the 21st by moving out a heavy force on the afternoon of the 19th, which attacked Gen. Grant's right, but after a sharp conflict it was driven back. Lee began to move as soon as his adversary did, and established his forces on the south bank of the North Anna, where the battles were again renewed.

NORTH ANNA, BATTLES OF, May 23-26.—The Fifth Corps reached the North Anna on the afternoon of the 23d, closely followed by the Sixth Corps, the Second and Ninth coming up about the same time. Gen. Warren effected a crossing the same afternoon without much opposition. Soon after getting into position he was violently attacked, but repulsed the enemy with great loss. Hancock on the left effected a crossing after some fighting. On the 24th the Sixth Corps crossed, taking position on Warren's right. The attempt of Burnside, on the center, was repulsed. Finding the enemy's position on the North Anna stronger than either of his previous ones, Gen. Grant withdrew on the night of the 26th to the north bank, and moved to turn the right of the enemy's position. The battle of **COLD HARBOR** (*q. v.*) was the next serious engagement between the two armies, and following this the movement to the James river was made. The Union losses between May 5 and June 15 were, killed, 7,620; wounded, 38,342; missing, 8,967—total, 54,929. The Confederate loss is not officially reported, but, though large, was much less than that sustained by Gen. Grant, probably not reaching beyond one-half of it. See Humphrey's *The Virginia Campaign of 1864-65*; Scribner's War Series; *The Battles and Leaders of the Civil War*; and *The Official Record*.

Wiley, Harvey Washington, Ph. D., LL. D.: chemist; b. near Kent, Jefferson co., Ind., Oct. 18, 1844; educated at Hanover College (A. B. 1867), Indiana Medical College (M. D. 1871), Harvard University (B. S. 1873), and University of Berlin (1878); Professor of Latin and Greek (1868-71), and of Chemistry (1873-74) at Butler University, Indianapolis, Ind.; Professor of Chemistry, Indiana Medical College, 1873-77, and in Purdue University 1874-83. During 1881-83 he was also State chemist of Indiana, and in 1883 became chief of the division of chemistry of the U. S. Department of Agriculture. He is connected with various

scientific societies, among them the American Chemical Society, of which he was president in 1893 and 1894. He has published a large number of scientific papers, government reports, and bulletins, etc., besides *Principles and Practice of Agricultural Analysis* (3 vols.).

Wilfrid, or Willfred: saint; b. in the Saxon kingdom of Northumbria about 634, of a noble family; studied at the monastery of Lindisfarne, where he became a monk; traveled in France and Italy, residing some time at Rome; built a monastery at Ripon 663; was commissioned by King Alfrid to regulate the usages of the Northumbrian Church upon the time of celebrating Easter, on which subject a famous council was held at Whitby (664) in the royal presence; was appointed by the king Bishop of York, and consecrated as such at Paris, but was opposed by Ceadda (St. Chad), who had taken possession of the see in his absence; retired to his monastery for three years; was put in possession of the bishopric 669; was ejected by King Egfrid, who divided the diocese into three bishoprics; visited Rome for redress, and obtained the papal decision in his favor, but was imprisoned nine months on his return, and never recovered possession of his see. D. at the monastery of Oundle, Apr. 24, 709.

Revised by J. J. KEANE.

Wilhead: See WILLEHAD.

Wilhelm: the German form of WILLIAM (*q. v.*).

Wilhelm, Wilhelm, KARL: composer; b. at Smalcaid, Prussian province of Hesse, Sept. 5, 1815; son of an organist; studied at Frankfort and under Spohr at Cassel; was a teacher of music in Crefeld and director of the Liedertafel 1840-65. In 1854 he composed the music to *Die Wacht am Rhein*, and when this song became immensely popular during the Franco-German war the Prussian Government gave him a pension. D. at Smalcaid, Aug. 26, 1873. A monument to his memory was erected at Crefeld.

Wilhelmina, Wil-hel-mee-nā, HELENE PAULINE MARIE: Queen of the Netherlands; only child of King William III. of Holland by Queen Emma his second wife; b. at La Haye, Aug. 31, 1850; succeeded to the throne on the death of her father 1890, her mother being regent.

Wilhelmite: See WILLEMITE.

Wilhelmshaven, Wil-helms-haa-fen: a fortified seaport of Germany, on the Jade Bay of the North Sea (see map of German Empire, ref. 2-D). In 1853 Prussia bought the coast district from Oldenburg for 500,000 thalers, and it has since spent much labor and great expense in order to transform the bay into a good naval harbor. Basins, of which the largest is 420 meters long and 260 meters broad, were dug in the muddy ground of the marsh and then separated from the bay by a dam. The new harbor was first used by the navy at the beginning of the war with France. On the western side of the principal basin are three parallel dry docks, 160 meters long, which, as well as the basin, are walled with granite. To the E. this basin is connected with the bay by a canal walled with granite and provided with sluices. Besides the naval harbor there is a commercial harbor, which, however, is rather insignificant; it is not walled, has no sluiced canal, and is separated from the bay only by an earthen dam. The whole harbor is surrounded by fortifications, strongest where they face the sea, and provided with ordnance of the heaviest caliber. Since the war with France immense sums have been spent on these fortifications. The town of Wilhelmshaven has grown up since the harbor was built; it is chiefly a military colony, and has excellent barracks. Pop. 15,471.

Wilhelmshöhe: See CASSEL.

Wil'ibrord, or Willibrord: saint; called "the apostle of the Frisians"; b. in the Saxon kingdom of Northumbria about 658, his father's name being WILGIS; was placed in childhood in the monastery of Ripon, then governed by (Saint) Wilfrid; embraced the monastic profession while very young; spent twelve years in Ireland, studying under the care of (Saint) Egbert and the monk Wybert or Wigbert, who had preached in Friesland; was ordained a priest about 689; went to Friesland in 690, landing near Utrecht, and was joined there by (Saint) Swilbert and ten or eleven other English monks; was well received by Pepin the Big, the Franconian ruler of Friesland; is said to have visited Denmark; made a visit to Rome 692; obtained ecclesiastical authority from Pope Sergius, and during a second visit (696) was ordained Bishop of the Frisians under the name of CLEMENS; converted large numbers of the natives by his preaching, enjoying the patronage of Charles Martel; is

claimed as founder of the see of Utrecht, where he built the Church of Saint Saviour, and spent his last years at a monastery he had established (698) at Echternach, near Treves, where he died Nov. 7, 739. His festival is celebrated Nov. 6. Considerable uncertainty exists respecting the events of his career. His *Life* was written by Aleuin (d. 804) in two forms, the one in prose (13 fol. pp.), the other in verse (4 pp.); reprint by Jaffe, *Bib. rev. germ.*, vi., 39, *seq.*; Eng. trans. (London, 1877); cf. P. P. M. A. Thijm, *Der heilige Willibrord* (Münster, 1863). Revised by S. M. JACKSON.

Wilk: See WHELK.

Wilkes, CHARLES: rear-admiral U. S. navy; b. in New York, Apr. 3, 1798; entered the naval service of the U. S. as midshipman Jan. 1, 1818. He conducted the U. S. expedition (1838-42) to explore the Southern and Pacific Oceans, a narrative of which he published (abridged ed. New York, 1851), and to the detailed report of the expedition, giving the scientific results obtained, he contributed the volumes on meteorology and hydrography. In 1861 he was ordered to the West Indies in command of the frigate San Jacinto to search for the Confederate cruiser Sumter. Learning that the Confederate commissioners Slidell and Mason were on their way to Europe in the British mail-steamer Trent, he intercepted that vessel and took from her the commissioners, whom he conveyed to Boston. This act met the approval of his department and of Congress, and the commissioners were for a time held as prisoners in Fort Warren, but subsequently surrendered by the U. S. Government to Great Britain. In 1862 he was placed in command of the Potomac flotilla to co-operate with the Army of the Potomac, but on the withdrawal of that army from the Virginia peninsula, was ordered to command the flying squadron organized for the purpose of breaking up blockade-running between the Southern States and the West Indies. Many captures were made. In July, 1866, he was promoted rear-admiral, and soon after placed on the retired list. Among his published works, other than those above mentioned, are *Western America, including California and Oregon* (Philadelphia, 1849) and *The Theory of the Wind*, with maps and charts (New York, 1856), etc. The London Geographical Society awarded him its gold medal in 1848. D. in Washington, D. C., Feb. 8, 1877. Revised by C. BELKNAP.

Wilkes, JOHN: political agitator; b. at Clerkenwell, London, England, Oct. 17, 1727; educated at Hertford and Aylesbury schools and at the University of Leyden; traveled on the Continent; married in 1749 Miss Mead, a lady of fortune ten years his senior, from whom he was separated after the birth of a daughter; became colonel of the militia and high sheriff of Buckinghamshire; was elected to Parliament from Aylesbury in 1757; began in June, 1762, the publication of a weekly paper, *The North Briton*, in opposition to the administration of Lord Bute; printed in his No. 45 (Apr. 23, 1763) some comments on the king's speech on summoning Parliament which led to the issue of a general warrant for his arrest and the seizure of his papers; was committed to the Tower Apr. 30, but was soon released by order of Chief Justice Pratt of the common pleas, who decided that general warrants were "unconstitutional, illegal, and also absolutely void." The House of Commons, however, declared No. 45 of *The North Briton* to be a "seditious libel," caused it to be burned by the hangman Nov., 1763, notwithstanding a popular commotion, and passed a special law for the prosecution of its author. Wilkes meanwhile won a suit against the Under-Secretary of State for seizure of his papers, being awarded £1,000 damages, but was expelled from the House of Commons Jan. 19, 1764; was prosecuted at the instance of the House of Peers before Lord Mansfield on the charge of republishing No. 45, and also for printing and publishing an obscene poem called *An Essay on Woman*, and was found guilty of both charges by the court of king's bench Feb. 21, 1764, when, having previously fled to France, he was outlawed; returned to England in 1768; was chosen to Parliament for the county of Middlesex (including the city of London); surrendered himself to the court of king's bench; was re-arrested, rescued by the mob, but went voluntarily into confinement; was the occasion, on the meeting of Parliament, of a riot in St. George's Fields May 10, 1768, in which several lives were lost, and was sentenced for his former offense to pay £1,000 fine and to imprisonment for twenty-two months. His outlawry was reversed by Lord Mansfield, but he was expelled from the House of Commons for the new offense of libeling Lord Weymouth, but was returned

without opposition at the new election. Though declared by Parliament incapable of a seat, he was three times chosen by his constituency, until, on the ground of illegality of votes cast for him, an opponent who had received but few votes was declared elected. These events caused great commotion in England; Wilkes became the idol of the people at large, being considered a martyr to the cause of liberty, received costly presents, extricated himself from bankruptcy by the aid of a subscription of £20,000, and was awarded £4,000 damages from Lord Hardwick for false imprisonment (Nov., 1769). In Apr., 1770, he was set at liberty, was chosen alderman of London, and took his seat in Parliament, where a vain attempt was made to force him to appear at the bar in the capacity of alderman. He was elected sheriff of London 1771, lord mayor 1774, in which year he was re-elected to Parliament; had the resolutions of the House on the elections expunged May, 1782, and was chamberlain of London from 1779 to his death, in that city Dec. 27, 1797. He published many political speeches and pamphlets, including a correspondence with "Junius," edited *Catullus* (1788) and *Theophrastus* (1790), and left a large *Correspondence*, which was edited by Almon, with a *Memoir* (5 vols., 1805). The best of his numerous biographies are by J. S. Watson (1870), W. F. Rae (1870), and Fitzgerald, *Life and Times of John Wilkes*. Revised by F. M. COLBY.

Wilkesbarre, or Wilkes-Barre, wilks bär-rē; city; capital of Luzerne co., Pa.; on the Susquehanna river, and the Cent. of N. J., the Del. and Hud., the Del., Lack. and W., the Lehigh Valley, the N. Y., Susq. and W., and the Penn. railways; 18 miles S. W. of Scranton, 144 miles N. by W. of Philadelphia (for location, see map of Pennsylvania, ref. 3-11). The city extends N. and S. $3\frac{1}{2}$ miles and E. and W. $1\frac{1}{2}$ miles; is located in about the center of the celebrated Wyoming valley, and has 75 miles of streets, of which 8 miles are paved with asphalt, and $13\frac{1}{2}$ with vitrified brick, wood, or stone, 31 miles of sewerage, steam-heating plant, mountain water-supply, paid fire department, and gas and electric street-lights. The public square, whereon is located the court-house and county offices, contains 4 acres. Among the more notable public buildings are a fine city-hall, court-house, jail, hospital, two first-class theaters, a Grand Army Hall, Young Men's Christian Association building, Historical Society, Ousterhout Free Library, and the armory of the Ninth Regiment, N. G. P. The city contains 35 churches: 11 Methodist Episcopal, 7 Presbyterian, 4 Baptist, 4 Lutheran, 4 Roman Catholic, 2 Protestant Episcopal, 1 Congregational, 1 synagogue, 1 Salvation Army barracks. There are 17 brick and stone-trimmed public-school buildings; 6,800 enrolled day pupils, 1,000 enrolled night-school pupils; annual expenditure from taxation, \$100,000; from State appropriation, \$40,000. There are 5 parochial schools with 4,000 pupils, 2 business colleges, an academy for boys, and a seminary for young ladies. The charitable institutions include a hospital, Home for Friendless Children, and Home for Aged Women. The city expenditures in 1894 were \$311,900; the assessed valuation of property was \$5,749,000; actual valuation, \$35,000,000; net city debt, \$311,450; and value of city real estate, \$250,000. In 1895 there were 3 national banks with combined capital of \$975,000, 3 State banks with combined capital of \$550,000, and a savings-bank with capital of \$150,000. There are 2 large lace manufactories, silk-mill, 4 foundries, axle-works, 3 locomotive and engine-shops, wire-rope works, gun-works, cutlery-works, 2 immense breweries, and many manufactories of iron, steel, wood, and leather. The mining and preparing of anthracite coal for market, the business center of which is in the city, makes the greatest demand for labor, and is the foundation of the city's wealth, giving employment to 36,000 men and boys. The total annual output of coal here is 12,000,000 tons. The city as well as the whole valley of Wyoming is underlain with seams of anthracite coal of an average aggregate thickness of 56 feet. Wilkesbarre was settled mainly by people from Connecticut in 1769; incorporated as a borough in 1806; and chartered as a city in 1871. Pop. (1880) 23,329; (1890) 37,718; (1895) estimated, over 45,000, and including the near-by boroughs, all connected by steam and electric railroads with the city, 120,000.

HARRY HAKES, M. D.

Wilkie, Sir DAVID: painter; b. at Cults, Fifeshire, Scotland, Nov. 18, 1785; studied painting in the Trustees' Academy, Edinburgh, and at the Royal Academy, London, where in 1806 he exhibited his celebrated *Village Politicians*, quickly followed by *The Blind Fiddler* (1807), *The Card Players*

(1808), *Rent Day* (1809), and *Village Festival* (1811), which obtained him great popularity; was chosen an associate of the Royal Academy 1809, and an academician 1811; produced during the ensuing twelve years many notable pictures, including a group of *Sir Walter Scott and his Family* (1817) and the *Chelsea Pensioners reading the Gazette of the Battle of Waterloo* (1822), executed for the Duke of Wellington, which is generally considered as the most perfect representative of his genius. Subsequently he changed his style, sought to emulate the depth and richness of the coloring of the old masters, and chose elevated, and even heroic, subjects, to the height of which he could never fully raise himself. He spent three years (1825-28) on the Continent on account of ill health, visiting Italy and Spain. But though the quasi-high art of his later years left the public rather cool, he never lost his popularity. He was made painter in ordinary to George IV. Jan., 1830; was knighted by William IV. 1836; made portraits of those sovereigns and of Queen Victoria; executed a fine painting of the *First Council of Queen Victoria*; visited Palestine and Egypt in 1840. D. at sea near Gibraltar on his homeward voyage, June 1, 1841. He made a few very beautiful etchings and dry-points. Several volumes of engravings of his best works have been issued, including *Oriental Sketches* (1843); *The Wilkie Gallery* (1850); and *The Great Works of Sir David Wilkie* (1867), with a *Memoir* by Mrs. C. Heaton. His *Life, Journals, and Correspondence* (3 vols., 1843) were published by his friend, Allan Cunningham. Revised by RUSSELL STURGIS.

Wilkie, WILLIAM: poet; b. at Dalmeny, West Lothian, Scotland, Oct. 5, 1721; educated at the University of Edinburgh; became a successful farmer; was ordained minister of the Scottish Kirk at Ratho 1753, and became Professor of Natural Philosophy in the University of St. Andrews 1759. He was the author of *The Epigoniad, a Poem in Nine Books* (1747; 2d ed. 1759), an epic upon the taking of Thebes, which procured for its author the title of the Scottish Homer, and a volume of *Fables* (1768) after the manner of Gay. D. Oct. 10, 1772. Revised by H. A. BEERS.

Wilkins, JONAS, D. D.: theologian and scientist; b. at Fawsley, Northamptonshire, England, in 1614; educated at New Inn and Magdalen Halls, Oxford, graduating in 1631; took orders in the Church of England 1635; was a zealous adherent of Parliament during the great rebellion, and signed the Solemn League and Covenant; was chiefly instrumental in forming at London in 1645 the club of scientists which became the nucleus of the Royal Society; became warden of Wadham College Apr. 13, 1648; married a sister of Oliver Cromwell 1656; was appointed by Richard Cromwell master of Trinity College, Cambridge, 1659; was ejected at the Restoration 1660; became prebendary of York 1660; obtained the favor of Charles II., who made him rector of St. Lawrence, Jewry, London, 1662; became preacher to Gray's Inn; was one of the charter members and councilors of the Royal Society 1663, and became Bishop of Chester 1668. He was the inventor of the perambulator or measuring-wheel; was a mathematician and physicist, a skillful mechanic, untiring in his experiments, a philologist of great erudition, and a noted theologian and pulpit orator. D. in London, Nov. 19, 1672. He was the author of *Discovery of a New World* (1638, treating of the habitableness of the moon and the possibility of a passage thither); *Mercury, or the Secret and Swift Messenger, showing how a Man may with Privacy and Speed communicate his Thoughts to a Friend at any Distance* (1641); *Mathematical Magick, or the Wonders that may be performed by Mechanical Geometry* (1651). His *Mathematical and Philosophical Works* were published in 1708 (new ed., 2 vols., 1802), with a *Life of the Author and an Account of his Works*.

Wilkins, MARY ELEANOR: author; b. at Randolph, Mass.; was educated at Mt. Holyoke Seminary, and early removed to Brattleboro, Vt., whence she returned to Randolph in 1883. Her magazine stories, faithful delineations of New England rural life, began to attract notice about 1886. She published collections of short stories, *The Adventures of Ann* (1886); *A Humble Romance* (1887); *A New England Nun* (1891); *Young Lucretia* (1892); *Giles Cory, Yeoman*, a play (1893); *Jane Field*, a novel (1893); and *Pembroke*, a novel (1894), hitherto her most powerful and sustained work, which has been received with high praise in England as well as in the U. S. for its dramatic presentation of the pride and obstinacy hereditary in the Puritan character. In 1895 her story, *The Long Arm*, won the prize of \$2,000 offered by a firm of publishers for the best detective story. H. A. B.

Wilkinsburg: borough; Allegheny co., Pa.; on the Penn. Railroad; 7 miles E. of Pittsburg (for location, see map of Pennsylvania, ref. 5-A). It has a national bank with capital of \$50,000, a Protestant Episcopal parish library, and a weekly newspaper, and is closely identified with the business interests of Pittsburg. Pop. (1880) 1,529; (1890) 4,662; (1895) estimated, 12,000. EDITOR OF "CALL."

Wilkinson, JAMES: soldier; b. in Maryland in 1757; joined the Revolutionary army and in Jan., 1778, was appointed secretary of the board of war, of which Gates was president. A quarrel arising with the latter at the time of the Conway cabal, Wilkinson resigned his secretaryship, and in July, 1779, was appointed clothier-general of the army. He settled in Kentucky after the peace, and engaged in mercantile affairs. He commanded an expedition against the Wabash Indians 1791-92; was promoted to be brigadier-general Mar., 1792, and commanded right wing of Wayne's army at Maumee Rapids. Dec. 15, 1796, to July 13, 1798, and June 15, 1800, to Jan. 27, 1812, he was general-in-chief of the army, serving on the Western frontier; one of the commissioners to receive Louisiana from the French in 1803, he was Governor of that Territory 1805-06; ordered to command on the Mississippi Dec., 1808, he was recalled to Washington in 1810, and tried by court martial in 1811 on charges of corruptly receiving money from Spain and being in complicity with Aaron Burr. The court acquitted him with credit, and he returned to the Southern department. In 1813 he was appointed major-general, and transferred to the Northern frontier. His plans for the occupation of Canada totally failed. He was superseded in command, but a court of inquiry ordered in 1815 acquitted him of all blame. On the reorganization of the army in 1815, he was discharged, and passed the later years of his life upon his estates in Mexico. He published *Memoirs of My Own Times* (3 vols., Philadelphia, 1816). D. near the city of Mexico, Dec. 28, 1825. See Gayarre's *Spanish Domination in Louisiana* (New York, 1854) and Gilmore's *Advance Guard of Western Civilization* (1887).

Wilkinson, JEMIMA: religious leader; b. at Cumberland, R. I., about 1753; educated as a Quaker; recovered from a severe fever, attended by an apparent suspension of life, 1773, after which she asserted that she had been raised from the dead to instruct mankind; professed to work miracles, and made proselytes, with whom she settled (1789) on a tract of 14,000 acres in the present town of Torrey, Yates co., N. Y., where a village named Jerusalem was built. D. there July 1, 1819. At her death the sect was entirely broken up. See D. Hudson, *History of Jemima Wilkinson, a Preacheress of the Eighteenth Century* (Geneva, N. Y., 1821); and *Memoir of Jemima Wilkinson . . . containing an Authentic Narrative of her Life and Character, and of the Rise, Progress, and Conclusion of her Ministry* (Bath, N. Y., 1844). Revised by S. M. Jackson.

Wilkinson, Sir JOHN GARDNER, F. R. S., D. C. L.: Egyptologist; b. at Haxendale, Westmoreland, England, Oct. 5, 1797; son of Rev. John Wilkinson. He was educated at Harrow School and Exeter College, Oxford, and in 1821 went to Alexandria. During a long residence in Egypt he made a complete survey of the country and became acquainted with its antiquities. The results of his labors were embodied in his various works, but principally in his *Manners and Customs of the Ancient Egyptians*, which is still valuable for its numerous illustrations and archeological material. It was reissued in a new and revised edition by Dr. Samuel Birch in 1879. Wilkinson was knighted in 1839. His collection of Egyptian, Greek, and other antiquities, together with his collection of coins and medals, are preserved at Harrow School. D. at Llandoverly, Wales, Oct. 29, 1875. A list of his works includes the following titles: *Materia Hieroglyphica* (Malta, 1828); *The Topography of Thebes and General View of Egypt* (1835); *The Manners and Customs of the Ancient Egyptians* (2 series, 6 vols., 1837-41; 3d ed., 5 vols., 1847); *Modern Egypt and Thebes* (2 vols., 1843; 2d ed. 1844, republished as Murray's *Handbook for Travelers in Egypt*, 1847; new ed. 1857); *Dalmatia and Montenegro* (2 vols., 1848); *The Architecture of Ancient Egypt* (1850); *The Fragments of the Hieratic Papyrus at Turin* (1851); *A Popular Account of the Ancient Egyptians* (2 vols., 1853); *The Egyptians in the Time of the Pharaohs* (1857); *On Colour* (1857); and contributions to Rawlinson's translation of *Herodotus* (4 vols., 1858-60; 3d ed. revised, 1876). A memoir was published by his widow in 1876. C. R. G.

Will: that function of the mind which manifests itself in action or conduct. The word voluntary is used only of acts which proceed from the will. The theory of the will is one of the most important divisions of human psychology; for according as human action is construed, its relation to the mechanical processes of the brain (its so-called freedom), the influence of one person upon the conduct of another, etc., the whole philosophy of life with its responsibilities, duties, etc., takes on one form or another.

History of the Theory.—The Greeks can not be said to have worked out a doctrine of the will before Aristotle. This great thinker, however, noticed facts and made distinctions which now rest at the basis of the most thoroughgoing analysis of the voluntary life. Aristotle divided the mental powers or faculties into two great classes—those which belong to the receptive side of the soul's life, the cognitive; and those which manifest the soul in action, the motive, faculties. Under the latter head he included not only all that is covered by the words will, volition, and the like, but also the emotional life, holding that it is the function of emotion to excite to action. Another important doctrine of Aristotle's was his subtle distinction between will in its generic sense and volition in its special sense—a distinction which is now current in the psychologies. Aristotle was the first also to lay the basis of ethics distinctly in the psychology of the will, reaching a doctrine of the freedom of the will from which modern thinkers freely draw.

In the Middle Ages philosophy was narrowly theological, and the will held a prominent place; this the more since the philosophy of Aristotle dominated all attempts at original thought. Controversy waged mainly about the problem whether the human soul had freedom "by nature" or only "by grace." It was not until the awakening of philosophy in Descartes and the inductive thinkers in Britain that the actual nature of the mind began to be studied for itself.

Even when philosophy became more independent and aware of her own problems, the start toward a theory of the mental life was extraordinarily mistaken. The theory of knowledge became, in all countries where philosophy sprang up, the one problem, so much so that the history of modern philosophy is largely a history of theories of knowledge. Kant asked the question, "How is knowledge possible?" a question which had been asked for a hundred years both in England and France; but the corresponding question, "How is action possible?" was either not asked at all or answered by corollaries from some theory of knowledge. The truth of this statement may be seen by examining the table of contents of the great works on philosophy which have been produced even up to 1850. The neglect of the will has worked two mischievous results—apart from the impoverishment both of philosophy and of life—i. e. the will has been left to the more dogmatic treatment of the theologians, who have found it necessary to bring to it certain theological presuppositions; and, in the second place, the breach between philosophy and theology has been widened since modern psychology has given to philosophy a more adequate theory of action than that on which theology has based some of her important doctrines.

The endeavor to introduce the data of the active life into philosophy, however, did not come from psychology, in the first instance, but from certain philosophers who were impressed with the lack of touch of the older intellectual schemes with the real problems of life. In Germany the attempt was made by Schopenhauer and his followers, especially von Hartmann, to construct a philosophy, not upon the function of knowledge alone and its criticism, but upon the fundamental active tendencies of human nature. Will was made the one potency of animate life; the very impulse to know, a manifestation of will; and the category of action, the final term of explanation. Before this there had been desultory attempts to find a place for will in the theory of the world; such were all those theories which held that in the consciousness of volition or effort we have immediate knowledge of the soul as an independent essence—the view of the French spiritualists, Royer-Collard, Maine de Biran, Jouffroy, etc., and the Scottish philosophers Reid, Brown (though these in less measure). But these attempts were too superficial or too eclectic to have permanent influence.

It was therefore in part, at least, through the influence of the Schopenhauer philosophy that the will has become one of the leading topics and the point of freshest analysis in the whole range of modern psychology. It is also a leading task of philosophical theory to compromise with Schopenhauer by making the notion of activity one of the basal

concepts of thought. The theism of the present is trying to incorporate into the traditional arguments considerations drawn from the psychology of the will.

Genesis of Volition.—The attempt to find the place of volition in the general theory of the rise and development of the child's faculties has given rise to much discussion. Bain's view may be taken as typical of the class of views which make volition an affair of relative complexity in the ordinary associative processes of consciousness. Certain kinds of action come to be associated with various pleasure-giving experiences; and the subsequent voluntary performance of the same movements is secured by this association, and they are performed for the sake of the pleasure. So also Spencer and the later associationists generally. The sense of effort, on this view, is an incident of complexity of sensation. Other theories which account for volition in terms of compounded and associated sensations—i. e. Preyer's—differ only in the details of the elements involved, and the order in which these elements take their rise in the infant's consciousness. Another group of theories, holding equally to the genetic or "natural history" view of volition, find the origin of this function on the active side of the mind. These men—i. e. James, Münsterberg, Baldwin—locate the first exhibition of volition in the attention, and reduce the problem to that of the rise of so-called "voluntary attention." On this view the will is a matter of successful synthesis of elements, sensational and other; and the analysis of the experiences of effort, etc., is largely a search for the elements, in any particular case, which enter into the synthesis of attention. The view which finds attention a matter of relatively constant tension or strain, therefore, thinks it has accounted for volition only when it has traced the rise of attention in the child, and also its place in the race history of mind. This class of views finds the fact of volition a case of the larger phenomenon of mental accommodation, and so finds its genesis in the child in connection with those muscular experiences, i. e. random movements (in common with Bain, Preyer, etc.), suggestion (Guyau, Janet), imitation (Baldwin), by which accommodation in general proceeds. Another class of thinkers hold that the phenomenon of volition is a purely spiritual affair, and deny it a natural history in the sense explained. With them are the philosophers (i. e. Wundt) who carry the concept of will back of volition to include the active side of consciousness everywhere, and so hold that no analysis of effort throws any light upon the real genesis of it.

Analysis of Volition.—Coming to the full-fledged experience of volition or choice, certain profound questions confront the psychologist. If we ask what is actually in the mind at the very moment of a hard-fought choice or mental decision, we again find various views on what seems so simple a matter of description. The older schools held to one of two positions respectively. One class (again mainly the associationists) said that what was in consciousness then could be described thus: A conflict of motives was going on analogous to the play of forces in any case of complex action of forces in the physical world. The outcome, in one case as in the other, must be a resultant of the various forces—that is, the strongest or controlling motive would win, and action on this motive would follow. This view was—and is—supported by all the evidence from pathology which shows that a motive may become so imperative—an idea so "fixed"—that no effort or persuasion can prevent action upon it; also by the force of the analogy from the physical forces, represented in this instance by the processes in the brain which accompany the mental experience of volition.

The other answer to the question runs thus: The experience of volition is not exhausted by a statement of the motives which are appealing at the time to the agent. He is conscious behind it all that he is weighing these motives and coming to a decision upon their relative value to him; this consciousness is evidence that the analogy of the play of motives to that of physical forces is false.

The newer insights of psychologists are restating both of these positions. Those who refuse to recognize the force of the physical analogy are nevertheless yielding the point that analysis is exhausted in the statement of the actual play of the so-called motives to conduct; but, on the other hand, the associationists are having to enlarge the concept "motive" to include a great variety of influences which can not be clearly stated in terms of the physical analogy, i. e. the so-called sub-conscious, the influence of suggestion, social and other. This increasing *rapport* is influential in

bringing the differences of psychologists to a minimum, and, on the other hand, in throwing the question of interpretation over into metaphysics. How far the physical analogy can be forced upon mental facts is a question for philosophy to decide, and those who discuss it are becoming more and more disposed to interpret even the play of the physical forces in terms of mental process, or at least to hold to a theory which preserves the relative autonomy of both kinds of reality.

Moreover, although psychology finds no reason to admit in its analysis any elements other than those of content, yet it finds the changes of content governed by a principle or law which seems to be different from that of the composition of forces. This principle is known as that of synthesis or APPERCEPTION (*q. v.*). Each new pulse of thought seems to have a unity of its own, and while the elements of earlier mental states may sometimes be detected in it, yet the unity is that of a function, itself complete and indivisible. For this reason psychology is constrained to ask for some adequate explanation of the unity and continuity of the mental life before it gives up the contention that mental reality is both as valid as physical, and furnishes—when supported by the considerations due from metaphysics—as good an ultimate category of explanation of existence in general. This is especially pertinent in the matter of volition. For here the unity of outcome is so obtrusive that the ordinary man is startled when he hears any doubt thrown on the independence of his relation to the alternatives which appeal to him for choice. He fails to see how he, the actor, can be identified with the actions which he is thinking of performing.

Freedom of the Will.—We now see to what narrow margins of interpretation the time-honored question of "freedom" is confined by modern psychology. If we admit—as the foregoing considerations lead us to admit—that (1) there is no choice but what is confined to the elements or motives at the time in consciousness, and (2) the agent as such has no power to make for himself new motives, and (3) that the synthesis which follows and is called choice is always the forming of a new mental unit out of these old elements—then we must admit certain facts about freedom. (1) A man is free in the sense that nothing forces his choice. This is only to deny the resultant theory based on the physical analogy. But (2) the agent is nothing apart from the motives which come up in his consciousness and stand for his character; and so by a fair interpretation his synthesis or choice is conditioned upon these elements. Choice, then, is always conditioned; if the conditions, the motives, the character, were different, then the choice would be different. To say that the agent is capable of acting outside of these conditions is to say that he can be somebody else. But yet he is not caused. To say that he is caused or forced is to say that the only way that a series of conditions in the world can operate is under the law of conservation of energy or composition of forces. This is to make the mechanism of the physical laboratory the final explaining category of reality. The final form of statement therefore of the question of freedom is this: How can a phenomenon be *conditioned* upon a group of earlier phenomena, and yet not be *caused* by them? The difficulty which some have in conceiving that inviolable conditions do not mean in all cases causation arises from the mental habit which we all acquire of identifying all cases of unbroken sequences in time, and even logical sequences as well, with the particular series of events in nature upon which the notion of physical causation rests. But an adequate analysis even of these series of sequences shows difficulties in the way of considering the so-called necessity that an effect be explained entirely in terms of its cause as an ultimate fact. The effect, no less than the cause, may have some deeper guarantee in the nature of things; and with this admission we open the door to a possible recognition of the kind of union spoken of as mental synthesis as a candidate for "ultimate" honors. Lotze seems to have some ground for thinking that the only analogy we have to rationalize physical causation by is to be drawn from the unity which shows itself in consciousness beneath complexity of content, and through the temporal sequences which make up the stream of thought.

Psycho-physics of Will.—Another great question which modern psychology asks of all the mental functions is that covered by the general word psycho-physics, i. e. the question of the physical process which goes on in the brain during the continuance of the mental function in question.

This question assumes very great importance, in the case of volition, since here the metaphysics of the relation of mind and body comes into prominence. If we are to hold that there is any interaction of any kind between the two kinds of existences—any interchange of energy—here is the place to look for it, here in the voluntary management of the movements of the body by the agent. Historically the modern discussion of this question began with Descartes, who propounded the famous doctrine of "occasional causes," especially to meet this case. This doctrine holds that the will to move the hand is not the efficient cause of the actual movement, that there is no passing of energy from the mind to the body, but that the act of volition is only the "occasion" upon which the discharge of the energies of the brain go forth. The further question as to what arrangement must subsist between the two in order that this occasion may be just the occasion requisite and no other, led to two further positions. The doctrine of "pre-established harmony" was developed by Descartes's disciples; it held that the arrangement whereby the mental volition was the occasion of just the right movement and no other was one pre-established between two independent substances from their creation, and to extend for all time. The other doctrine inspired by the position of Descartes is that the mind in volition does not increase or decrease the amount of physical energy disposable in the brain for movement, but only directs it into one channel rather than another. The mind, by thus directing the discharge of energy, decides what movements of the body shall take place.

The theory of "pre-established harmony" is not now widely held in the dualistic form presented by Descartes, but it is widely prevalent in the doctrine which goes under the name "double-aspect theory." According to this theory—held by men who wish to avoid metaphysical discussion and to restrict themselves to the facts on both sides—the series of mental changes found in consciousness on one hand, and the series of physical changes in the brain on the other hand, may be considered as two independent sets of events, each set pursuing its own course, and not interfered with by the other. This assumes, of course, that since certain mental determinations—as the volition to raise the right hand—is always accompanied by the actual rise of the hand, this concomitance must in some sense be the result of prearrangement, even though there be no intelligence involved in it. The second view of the two referred to—i. e. that the will has a directive office in connection with the discharges of brain energy—is mainly held by those who are concerned to maintain a dualism in philosophy. It is openly fallacious, however; for it is plain that force can not be directed into one channel rather than another without doing work—i. e. removing a resistance, etc.—in the system of forces in question; but to say that the will can do this is to say that it can put forth physical force, and that is the original view which the theory of "direction" is intended to supersede.

The later theories of the psycho-physics of will may be divided into two types: 1. Theories which frankly rule out the mind considered as an independent kind of existence, or even as a sort of existence which has any laws of action of its own apart from the processes of the brain. This general view is called the "epi-phenomenon" theory, since it considers consciousness merely as an added phenomenon, a piece of by-play to the material processes going on in the brain. It is the position in psychology which is demanded by a thoroughgoing materialism in philosophy. 2. The other class of views holds to the relative phenomenal independence of both mind and brain, recognizing that if laws of action are formulated for the behavior of material bodies—the laws of mechanics, chemistry, etc.—solely from the facts of observation of the material world, then there is the same reason and justification for the formulation of laws of the behavior of mind, the laws of association, apperception, etc., solely from the facts of observation of the events which take place in consciousness. This leads to the recognition of the law of conservation of energy in the brain at the same time that the mental stream of events is held to pursue its own course under laws of its own. The further question as to how these two systems of events are, or came to be, in harmonious relation to each other, that is left to the metaphysician. He, in turn, may hold the dualism to be ultimate, or he may, by a line of argument which is not in place here, show that the laws of mind are really immanent in the external world, and constitutive of it. See *PSYCHOLOGY AND PHILOSOPHY*.

J. MARK BALDWIN.

Will (or LAST WILL, or TESTAMENT): a formal act or instrument whereby a person disposes in whole or in part by anticipation of the property which he shall leave at his death. Such an act, in order to be properly described as testamentary, may or may not be revocable at the pleasure of the testator, though its revocable or "ambulatory" character is perhaps the most obvious and important feature of the English and American will, but it has the invariable characteristic that it will not take effect and thus operate to transfer the property of the testator until the death of the latter. This has not always and everywhere been the case, however, the will in its primitive form having sometimes been nothing more than a present alienation of property in contemplation of death, the donor perhaps reserving certain rights of user and enjoyment in the property in the event of his recovery.

Origin and History.—The right of testation is by no means inherent in or essential to the existence and due recognition of property rights in general. Although the practice of allowing the owner of property in some measure to direct its disposition after his death is of very ancient origin, it is even in its most restricted form a comparatively late development out of the conception of the right of private property, while in the comparatively unrestricted form in which we know it the practice is of very recent origin. The right of testation, like that of free alienation, has been won only slowly, and is wholly the creature of positive law. Indeed, the history of human society shows that among most of the civilized races there have been long periods of time during which the right of alienation, including that of testation, was regarded as incompatible with the right of property as that was understood. In those primitive communities in which the patriarchal system prevailed property was conceived of as belonging in a sense to the family and not absolutely to the patriarchal head of the family. The right of intestate succession, of heirship, was thus established long before that of testation, and the will in the modern sense of the term, as a disposition of property outside the regular and lawful line of succession, was long regarded as an encroachment upon the rights of the lawful heir. The true historical and legal view of succession therefore differs widely from the popular view. According to the latter, it is the duty of every prudent citizen who has any property to leave at his death to dispose of the same by will, the statutes of descent and distribution being intended only to carry into effect in a general way the intentions of those who die without having made such disposition. From the legal point of view, however, intestacy and inheritance by operation of law are the normal state of affairs.

According to the best modern authorities the right of testation existed in a qualified form in ancient Egypt as early as the fifteenth century B. C., but it did not appear in Greece before the time of Solon, nor is there any evidence of its legal recognition in Rome before the Twelve Tables. It did not exist among the Hindus (except perhaps in Bengal) before the English conquest, nor in any but the most rudimentary form among the ancient Hebrews. There is no trace of the will in the codes or customs of the barbarian conquerors of Rome. As Sir Henry Maine has pointed out, "to the Romans belongs pre-eminently the credit of inventing the will," an institution "which," he declares, "next to contract, has exercised the greatest influence in transforming human society." But, as he also shows, this very Roman testament from which all modern wills have sprung, originally performed very different functions from those which have attended it in more recent times. "It was at first not a mode of distributing a dead man's goods, but one among several ways of transferring the representation of the household to a new chief." (Maine, *Ancient Law*.) Indeed, it is not until the end of the Middle Ages that wills become a recognized device for diverting property from the family and of distributing it according to the fancy of the owner. But the law has never in any age or country allowed free and unrestricted range to the testator's will. He has always been more or less fettered in the testamentary disposition of his estate by considerations of public policy and the rights of the family to which reference has been made above, and it seems unlikely that the process of emancipation which has removed most of those restrictions will go much further. Indeed, so far as present indications show, the tendency to free testamentary alienation seems for the present to have been completely checked by those conservative instincts of society to which the modern democratic régime is giving legal expression, the interests of the

family on the one hand and those of the community at large on the other being equally guarded by recent legislation in England and the U. S. Instances of this legislation will be found in the last subdivision of this article.

GEORGE W. KIRCHWEY.

ROMAN AND MODERN EUROPEAN LAW.—In early Roman law it seems that patricians, at least, could obtain some modification of the law of inheritance, as far as their estates were concerned, by means of private bills, passed by the patrician assembly. The ordinary testament of the republican period, however, was originally a conveyance of the entire estate, with the understanding that the conveyee should not enforce his right during the life of the conveyor. The forms observed were those of "manicipation" or sale, which required the presence of the conveyee, a scale-holder, and five witnesses. Such a conveyee might, however, be charged with a trust; and by substituting for the heir a purely fiduciary conveyee, whose instructions were written in sealed tablets, the conveyance became simply a mode of giving effect to the last will of the testator. The conveyee and the scale-holder gradually sank into the position of ceremonial figures like the witnesses; and the ordinary testament of the later Roman law was simply a written instrument signed by the testator in the presence of seven witnesses and signed and sealed by these witnesses. Imperial legislation introduced several other forms of testation, some of which (e. g. the testament intrusted to the local court of first instance and made a part of its records) have passed over into modern European legislations. The modern codes have established still other forms. One of the most important of these is the so-called holographic testament, which is written out in full by the testator with his own hand, is signed and dated by him, and is valid without calling in witnesses or observing any further formality.

Heirs and Legatees.—In accordance with its theory of universal succession (see SUCCESSION), the classical Roman law required that the testator's estate should be bestowed as an entirety upon one or more heirs. These could be charged with the duty of delivering to other persons special things or paying to them definite sums, but all such bequests or legacies implied the previous appointment or "institution" of an heir, and became effective only when he became owner of the inheritance. The testamentary heir thus combined the powers and duties of a modern executor, with the rights of a residuary legatee. By the *lex Falcidia* (40 B. C.) it was provided that, after the debts of the estate had been paid, the heir should retain, as against the legatees, at least one-fourth of the inheritance. In the imperial period it was recognized, that bequests made in precatory form (*fidei commissa*) were enforceable, and that such bequests might transfer the whole estate. (The heir, however, retained, in such a case, the "Falcidian fourth," unless the testator expressly provided to the contrary.) It was also recognized that bequests might be made in a less formal codicil, executed later than the formal testament; and it was decided that even where no testament had been made, bequests might be made by codicil, and that such bequests were binding upon the intestate heirs (the so-called intestate codicil). The effect of these changes was to make the distinction between inheritances and legacies, on the one hand, and between testaments and codicils, on the other, of little practical importance. In modern European law these distinctions have become still fainter. Testament was unknown to the Teutonic peoples, and was introduced into Northern Europe by the Roman Church; but even in the ecclesiastical practice the Roman testament was modified by Teutonic ideas, and further changes have been introduced by modern legislation. In the majority of European countries to-day a will made up entirely of special bequests is not necessarily regarded as an intestate codicil, nor does its execution necessarily devolve upon the intestate heirs. Provision may be made, as at English law, for the payment of the debts and bequests by special executors.

Capacity.—At Roman law nearly all persons of sound mind and above the age of puberty could dispose of their property by testament. At modern European law minors have not, as a rule, full powers of testation. At French law, for example, a person under sixteen can make no testament; a person over sixteen and under twenty-one can dispose, by testament, of only one-half of the amount which he might bequeath if of full age. A general capacity of taking by testament is attributed to natural persons; but juristic persons (corporations, foundations) can take only by virtue of express legal authorization.

Limitations.—At classical Roman law the power of the testator was theoretically unlimited; he might will away all his property from his next of kin, even from his children. The only restriction imposed was that children must be expressly disinherited, not merely passed over. In practice, however, a testament which carried the entire property out of the family was easily overturned as "undutiful." Imperial legislation afterward established the rule that a testator could not will away all his property from descendants or parents him surviving. A quota was reserved for them, one-third or one-half of the estate, according to their number. Modern codes contain similar rules, at least as regards surviving descendants. The *Code Napoléon*, which goes furthest in this direction, reserves for a single child one-half of the estate; for two children, two-thirds; for three or more children, three-fourths. If there are no descendants, one-half of the estate is reserved if there are ascendants in both lines, and one-fourth if there are ascendants in either line. Some of the European codes also create a reserved share for the surviving husband or wife.

In the French law these protected persons are really the heirs in the Roman sense; the whole estate vests in them, and the person to whom the free share of the estate is left, *à titre universel*, is really only a legatee. In the Austrian code, however, and in the German draft code, the estate vests in the testamentary heirs, and the reserved portion is recovered from them as if it were a debt owed by the estate.

All of these persons, however, to whom a share is reserved may forfeit it by gross misconduct. The grounds upon which they may be disinherited are specifically set forth in each of the modern codes. For literature, see SUCCESSION.

MUNROE SMITH.

ENGLISH AND AMERICAN LAW.—The will of the English law, notwithstanding its derivation from the Roman testament, differs widely in conception, form, and effect from the latter. The beneficiaries under it are not the testator's heirs; they do not succeed to his entire inheritance as such, but only to such specific gifts or separate amounts as he bestows upon them individually; they do not become liable for his debts, but the personal estate, which devolves primarily upon the executor, and the real estate, which vests under the will in the devisees to whom it is given, constitute in law separate funds (known respectively as personal and real assets) for the payment of the testator's debts. The legatees of personal property derive their title not directly from the testator, but from the executor, who occupies a representative character closely analogous to that of the Roman heir. (See SUCCESSION.) It was doubtless in virtue of this representative character, and not as a specific legatee, that the executor of the English law was anciently entitled to the undistributed residue of the personal estate. The continuity of person, which was preserved in Rome by personifying the inheritance in the interval between the death of the *pater familias* and the accession of the heir, is secured in English law by the fiction that the appointment of the executor relates back to the date of the testator's death. (Holmes, *Common Law*.) These points of similarity between the English executor and the Roman heir are clearly traceable to the ecclesiastical tribunals in which the English law of wills was developed. While the law administered in those tribunals was avowedly a part of the native common law of the English people, yet, being expounded and applied by men who, for the most part, had no common-law training and whose learning was that of the Romanized canon law (the bishops, or "ordinaries," and their delegated officers), it was naturally and perhaps unconsciously moulded into forms resembling those of the Roman law. While it was only the characteristic English will—i. e. the will of personal property—which came within the ecclesiastical jurisdiction, that jurisdiction survived in all cases affecting the personal estates of deceased persons, through all changes in the power and authority of the Church, down to the reorganization of the judicial system of England after the middle of the nineteenth century.

The English law of wills, as thus developed, prevails to-day in the several U. S. as well as in Great Britain and her colonies. The only important exceptions are Scotland, the State of Louisiana, and the Province of Quebec, in which the civil law of Rome continues, with some modifications, to regulate the right of testation. Mexico and the rest of the Spanish-American states also generally follow the Roman law. In Louisiana and Quebec the law is contained in civil codes based on the *Code Napoléon*; in England and

the U. S. generally it is embodied in statutes in which the nature and extent of the right, the manner in which it must be exercised, and the persons who may exercise it, are explicitly set forth. The English legislation on the subject runs back to the 27th Hen. VIII. (A. D. 1535), and is comprehensively summed up in the existing Statute of Wills, passed in 1837 (1 Vict., ch. 26). It is this prevailing English and American doctrine of wills which is expounded in the following subdivisions of this article.

What may be given by Will.—Personal property has always been subject to disposition by will. The principal restrictions with which this right was guarded in early English law are described in the article SUCCESSION (*q. v.*). These restrictions upon the bequest of personal property have long since disappeared from our law, and the owner of such property may now, as the popular expression is, "disinherit" those of his own household and lavish his estate upon strangers. Some States of the U. S. furnish an exception to this rule, however, by virtue of legislation securing to the widow an interest of one-third in the personal estate of which her husband dies possessed. In the same category should perhaps be placed the statutes which have been enacted in many of the States, making void devises to charities in excess of one-third or one-half of the estate of a testator who leaves wife or children, though there is nothing in this legislation to prevent a total diversion of the estate to stranger beneficiaries who do not come under the description of charities. In the law of Louisiana and of Quebec, on the other hand, the principle of *rationabilis partes*, which prevailed in the early English law, is fully recognized, and the testator who has children is restrained from disposing of his whole estate. One child may claim one-third of the inheritance, two may claim half, and three are entitled to two-thirds, as their *légitime*, or reasonable share, of the estate.

It seems also to be clearly established that in the era antedating the Norman conquest real property could also in many cases be disposed of by will. This was certainly true of those *bochlands*, the "boch" (book or charter) conferring which expressly granted the right to devise the same, though it was probably not true of allodial holdings generally. But the rapid development of the feudal system after the Conquest speedily abolished the right of devising freehold estates, and, excepting in a few localities, where local usage was strong and tenacious enough to withstand the feudalizing process successfully, this continued to be the rule of English law for upward of four centuries. Of course, this had no application to leasehold estates, which, being relegated to the position of personal property, could be freely bequeathed as such. See LANDLORD AND TENANT, PROPERTY, and TENURE.

The way in which the doctrine of uses and the practice of conveying lands to one person for the benefit and use of another affected property rights, and especially the transfer of substantive rights in real property, is explained in the article USES (*q. v.*). Notwithstanding the incapacity of real property to pass by will, the "use" of such property might be freely devised by any one in whom it was vested, whether he was also holder of the legal title or not. It was mainly in order to remedy and prevent this manifest evasion of the law forbidding the devising of real property that the Statute of Uses was enacted in 1535 (27 Hen. VIII., cap. 10). But the practice of thus indirectly and surreptitiously devising lands had become too firmly entrenched to be done away with, and only five years after the Statute of Uses (1540, 32 Hen. VIII., cap. 1) the first English Statute of Wills was enacted. This made possible the devising of certain kinds and portions of lands held by free tenures, and subsequent legislation speedily extended the right so as to include all lands that were held in fee. To-day all real property may, under certain restrictions, be as fully and freely transferred by will as personal property. The most important exceptions are those created by the statutes of mortmain, which prohibit a gift of lands to corporations unless they are expressly empowered by statute to receive devises; those created by statute in England and in many of the American States, which in various forms and with much diversity of detail limit the power of testators in respect to the time and amount of their testamentary gifts to religious or charitable institutions and for distinctly religious or charitable purposes; and that—by far the most important one in the U. S.—which prevents a husband from depriving his widow of her dower or its equivalent. To these should be added the restriction contained in the

homestead laws which have been enacted in some States of the U. S., which make void a husband's devise of homestead lands.

In whose favor Wills may be made.—Beyond the excepted classes last enumerated, the law places no limitation upon the capacity to receive testamentary gifts. Wills may be made in favor of, and property real and personal may be bequeathed to, all persons, whatever may be their disabilities to perform any positive act which shall be legally binding, including married women, infants, lunatics, idiots, persons of unsound mind, and the like, as well as all those in the full possession of their mental faculties and in the enjoyment of all the legal rights belonging to manhood.

By whom Wills may be made.—As a general proposition, all persons are empowered to make a valid will except those disqualified through lack of the requisite age, through coverture, or through mental incapacity. (1) *Age.*—The statutory rule is almost universal that a person must have attained the age of twenty-one years before he or she can make a will of lands, and the same age is frequently, and perhaps generally, required for a will solely of personal property. In New York males of eighteen and females of sixteen are competent to bequeath personal estate. In Connecticut, California, and Nevada both males and females, and in Vermont, Maryland, and Illinois the females, acquire the full testamentary capacity in respect of lands as well as chattels at the age of eighteen. (2) *Coverture.*—Formerly the law denied to married women any testamentary power over lands, and admitted only a partial authority in the bequest of personal estate. Recent legislation in the U. S. (see MARRIAGE and MARRIED WOMEN) has to a very great extent removed these restrictions, and has clothed married women with the same power to devise and bequeath their separate property as that held by single women. (3) *Mental Incapacity.*—It is a fundamental doctrine that a sufficient mental capacity in the testator—that is, sound and disposing mind and memory—is essential to the validity of any will. This rule excludes idiots, lunatics—unless the instrument is executed during a lucid interval—persons completely intoxicated at the time of the execution, and persons of unsound mind or weak mind to such degree that they are unable without assistance to call up to memory the property which they possess or the individuals who would naturally be the recipients of their bounty, or to comprehend without prompting the nature of the act in which they are engaged while making a testamentary disposition. A will is also invalid when procured by fraud, or by undue influence exerted upon a testator of enfeebled mind and memory, even though he might possess a sufficient testamentary capacity if left to exercise his own judgment unforced by the external pressure.

The Form and Execution of Wills.—Formerly all wills of personal property as well as those testamentary dispositions by which the use of lands was transferred were oral, and the first Statute of Wills (1540), which for the first time made real property devisable, while it required a writing (but no signature or formal execution) for a devise of lands, made no change in the will of personal property. It is certain that it became customary for testators at an early period to commit their testamentary intentions to writing, but this did not become obligatory in the case of wills of personal property until the enactment of the present Statute of Wills, already referred to (1837). The existing legislation, both in the U. S. and in England, concerning the form and execution of wills, is constructed upon the same model, applies alike to wills of real and of personal property, and differs only in minor points of detail. All wills, except in the single case to be mentioned hereafter, must be in writing. The following formalities must be observed in order that the execution—the *factum*—may be complete: (1) The instrument must be subscribed or signed at the end by the testator, or by some one in his presence and by his direction. In some of the States the statutory language still remains "signed" without the words "at the end," and this, it has been decided, is complied with wherever in the instrument the signature appears, even at the commencement. (2) The signature must either be affixed, or must be acknowledged by the testator to be his own, in the presence of each of the witnesses. (3) The testator must declare the instrument to be his last will in the presence of each of the witnesses. This step, which is technically termed the "publication," is of the utmost importance, and was borrowed directly from the Roman mode of execution. (4) There must be a certain number of witnesses, who act as

such in all that they do at the request of the testator, which request may be made by him personally or by some one in his presence. In most of the States the required number is two, but in some it is three. (5) These witnesses must all sign the will at the end thereof, usually in the presence of the testator; some of the statutes add that the witnesses shall sign in the presence of each other. If the testator's name is written by an amanuensis, it is often required that he should be one of the attesting witnesses. While all these five steps are necessary to the validity of a will, a substantial compliance is sufficient. A *codicil* is an appendix annexed to the main will after its execution, whereby the testator makes some change in or addition to his former dispositions, and it must be signed, published, and attested in the same manner as the original. Verbal or *unexecuted* wills are, by the existing legislation in England and in a great majority of the American States, permitted to be made only by soldiers in active service during war and by sailors while at sea; in a very few States, however, the privilege is extended to all persons *in extremis* in respect to a limited amount of property. The statutes authorizing nuncupative wills contain various provisions intended to prevent imposition or mistake, by requiring a certain number of witnesses, and frequently that the testator's declaration should be reduced to writing and attested within a short time after his death—generally thirty days—and that the will itself must be offered for probate before the expiration of a limited period from its execution, often fixed at six months.

Revocation.—The revocation of a will may be express or implied. (1) *Express.*—As the statutory law requires that the intent of the testator in the execution shall be manifested by a compliance with certain fixed formalities, so it demands that the contrary act shall be done in a manner which leaves no doubt as to his real purpose. An express revocation may be affected by a subsequent will, which in plain and absolute terms annuls any and all former ones, or which, without such formal clause, disposes of all the estate in manner inconsistent with the prior bequests. It may also be made by the destruction or cancellation of the instrument, if done by the testator himself or under his direction with the intent thereby to revoke—*animo revocandi*. The statutes often enumerate the modes, as burning, tearing, obliterating, canceling, and destroying. (2) *Implied.*—An implied revocation is wrought by the subsequent marriage of the testator and the birth of children, or by either. A will made by a single woman is annulled by her marriage. In the greater number of the American States the will of a man is revoked by his subsequent marriage and the birth of children for whom it makes no provision. In England and in some of the States the same effect is produced by the marriage alone. In a very few States the implied revocation results from the subsequent birth of a child or children who are left unprovided for by the testator. As a general rule, however, such children receive the portions to which they would have been entitled had their father died intestate, and the will stands, subject to the necessary deduction from its bequests.

Gifts causa mortis.—Gifts of this nature, being essentially testamentary in character, really constitute a sort of informal will, free from the technical and sometimes inconvenient requirements of the statutes governing the execution of formal testaments. They constitute a considerable though legitimate infringement upon the statutory law of wills, and are apparently a survival of the ancient practice of bequeathing chattels without formal act or instrument. Such a gift can be made only in contemplation of death. It has this in common with the gift *inter vivos* that it is not consummated without such delivery as would suffice to pass the legal title, but, like the testamentary gift proper, it is revocable at the pleasure of the donor, and is revoked *ipso facto* by his recovery from the illness which occasioned the gift. It is therefore, like gifts by will, ambulatory and conditional. The only well-defined limitations on the exercise of the right are (1) that only personal property can pass by *donatio causa mortis*, and (2) that not the whole nor substantially the whole of a man's estate can be given in this way—certainly not in one comprehensive gift to one person. But even this last limitation would not stand in the way of the giving of a coin or jewel or other single article or, probably, of several such articles, conditionally, to one person, even though such article or articles constituted the whole of the donor's estate. See **GIFT**.

For the rules concerning the construction and interpreta-

tion of wills, see the article on **INTERPRETATION**. In connection with the general subject of wills the reader may also consult the articles on **EXECUTOR**, **LEGACY**, **PROBATE**, and **SUCCESSION**. The best treatises are those of Jarman on *Wills* and Williams on *Executors*. The works of Schouler, Redfield, and Chaplin may also be consulted with advantage.

Revised by GEORGE W. KIRCHWEY.

Willamette River: a branch of the Columbia; rises in the Cascade Mountains in Oregon, and flows first N. W. and then N. through a beautiful region, extremely fertile and now well settled. It is navigable for ships to Portland, 15 miles. Twenty-five miles from its mouth are the Willamette Falls, at Oregon City. The river here falls 40 feet perpendicularly, but a canal and locks have been constructed at a cost of over \$500,000, so that small steamboats, for two-thirds of the year, can pass up to Eugene City, more than 130 miles. At Oregon City the river furnishes a noble water-power.

Revised by I. C. RUSSELL.

Willard, EMMA C. (Hart): educator; b. in Worthington parish, Berlin, Conn., Feb. 23, 1787; educated at the village academy; began to teach school at an early age, and after her marriage to Dr. John Willard at Middlebury, Vt., opened at that place a boarding-school for girls 1814; introduced several new studies and many improvements upon the ordinary methods of instruction; wrote *A Plan for Improving Female Education* (1819), which was submitted in MS. to Gov. De Witt Clinton of New York; obtained his encouragement for her project, and by a special act a portion of the State fund for academies; opened a school under his patronage at Waterford, N. Y., 1819; removed the school to Troy May, 1821; wrote several school histories and other educational books; superintended the seminary with great success until 1838, when she resigned it to her son and his wife; published her *Journal and Letters from France and Great Britain* (1833), devoting the profits (about \$1,200) to the assistance of a school for women in Athens, Greece, which owed its origin to her; settled at Hartford, Conn., 1838. D. at Troy, Apr. 15, 1870. Among her numerous publications were *A History of the United States* (New York, 1828); *Universal History* (1835); *Ancient Geography*; a volume of *Poems*, containing the favorite piece, *Rocked in the Cradle of the Deep* (1830); *The Motive Powers which produce the Circulation of the Blood* (1846); *Respiration and its Effects* (1842); *Last Leaves of American History* (1849); and *Morals for the Young* (1857). See the biography by John Lord, LL. D. (New York, 1873). A statue of Mrs. Willard was unveiled in Troy, N. Y., Apr. 15, 1895. Her great prominence in the history of education in the U. S. is due especially to the fact that the cause of higher education for women found in her its most earnest and successful advocate.

Revised by C. H. THURBER.

Willard, FRANCES ELIZABETH, LL. D.: reformer; b. near Rochester, N. Y., Sept. 28, 1839; graduated at the Northwestern Female College, Evanston, Ill., 1858; was a successful teacher in several Western towns; director of the Genesee Wesleyan Seminary at Lima, N. Y., 1866-67; in 1871-74 was Professor of *Æsthetics* in Northwestern University, and dean of the Woman's College connected with it. In 1869-71 she traveled in Europe, Egypt, and Palestine, and on her return delivered lectures in Chicago. She is the author of *Nineteen Beautiful Years*, a biographical sketch of a deceased sister (1864); *Glimpses of Fifty Years* (1889); *A Great Mother* (1894), and other works. She became president of the Woman's Christian Temperance Union in 1879; founded the World's Woman's Christian Temperance Union in 1883, and has been president of the same since 1888. She is editor-in-chief of *The Union Signal*, the official organ of the White Ribbon movement.

Willard, SAMUEL: clergyman; son of Major Simon Willard; b. at Concord, Mass., Jan. 31, 1640; graduated at Harvard 1659; studied divinity; was minister of Groton from 1663 until driven away during King Philip's war, 1676; became colleague pastor with Rev. Thomas Thatcher over the Old South church, Boston, Apr. 10, 1675; succeeded to the pastorate in the same year; opposed the witchcraft delusion of 1692; and was vice-president (exercising full powers as president) of Harvard College, as successor to President Mather, from 1701 until his death, at Boston, Sept. 12, 1707. He was twice married and had twenty children; author of *A Complete Body of Divinity*, posthumously published in a folio volume under the editorship of Joseph Sewall and Thomas Prince (Boston, 1726), and of various minor religious treatises. Revised by GEORGE P. FISHER.

Willard, SIDNEY; educator; son of Joseph Willard, president of Harvard College; b. at Beverly, Mass., Sept. 19, 1780; graduated at Harvard 1798; was librarian there 1800-05; studied theology, and sometimes preached, though he never held a pastoral charge; was a member of the famous Anthology Club; was Hancock Professor of Hebrew and Oriental Languages at Harvard 1807-31, filling also the chair of English Literature, and for some years that of Latin; was frequently a member of the Massachusetts Legislature, and once of the executive council, and was mayor of Cambridge 1848-50. He was the author of a *Hebrew Grammar* (Cambridge, 1817) and *Memories of Youth and Manhood* (2 vols., 1855); was one of the founders of and a contributor to the *Literary Miscellany*; also founder and editor of the *American Monthly Review* (4 vols., 1832-33); wrote largely for the *Monthly Anthology*, the *North American Review* (18 papers, 1816, seq.), the *General Repository*, and the *Christian Examiner*. D. at Cambridge, Dec. 6, 1856. Revised by GEORGE P. FISHER.

Willcox, ORLANDO BOLIVAR; b. at Detroit, Mich., Apr. 16, 1823; graduated at the U. S. Military Academy, and appointed second lieutenant of artillery July, 1847. On the outbreak of war in 1861 he took command of the First Michigan Volunteers, which he led at Bull Run, where he was wounded and taken prisoner, and was held until Aug., 1862, part of the time as hostage for Confederate privateers. His commission of brigadier-general of volunteers was dated from the day of his capture. At South Mountain and Antietam he commanded a division of the Ninth Corps, and at Fredericksburg was in command of that corps. During the riots arising from the enforcement of the draft in Indiana in 1863, Gen. Willcox was placed in command there. He was engaged in East Tennessee from Sept., 1863, until Mar., 1864, then transferred to the Army of the Potomac, and in the Richmond campaign of that year commanded a division of the Ninth Corps, through the Wilderness battles to Petersburg, participating in the capture of that city. He subsequently commanded various military districts until Jan., 1866, when he was mustered out. Resuming his profession at Detroit, he was also U. S. assessor of internal revenue until July, 1866, when he re-entered the army as colonel of the Twenty-ninth Infantry; transferred to the Twelfth Infantry in 1869. Brevet brigadier and major-general for gallantry at Spottsylvania and capture of Petersburg; became brigadier-general 1886; retired Apr. 16, 1887; governor of the Soldiers' Home in Washington, D. C., Feb., 1889, to June, 1892. He published *Shoepack Recollections* (Boston, 1856) and *Faca, an Army Memoir by Major March* (1857). Revised by JAMES MERCUR.

Willdenow, vil'de-nō, KARL LUDWIG; botanist; b. in Berlin, Germany, Aug. 22, 1765; d. there, July 10, 1812; Professor of Botany in Berlin. His principal works are *Flores Berolinensis Prodrromus* (1787); *Grundriss der Kräuterkunde* (1792); the fourth edition of Linné's *Species Plantarum* (1797-1830); the last volumes completed by Link; *Caricologia* (1805); *Hortus Berolinensis* (1816; edited by Link). CHARLES E. BESSEY.

Wilthead, or Wilhead; saint; b. in Northumbria, England, early in the eighth century; was educated at York; became a priest; went as a missionary to the pagans of Friesland shortly after the martyrdom of (Saint) Boniface; was supported by Pope Adrian I. and by Charlemagne; became Bishop of "Wigmodia" (afterward Bremen) 787; built there a noble cathedral, and had great success in the conversion of both Friesland and Saxons. D. in Bremen, in 789. His feast is celebrated Nov. 8. He was the author of a *Commentary on the Epistles of Paul* and of several works still in MSS. See Smith's *Dictionary of Christian Biography*, and Dehio's *Geschichte des Erzbisthums Hamburg-Bremen*. Revised by J. J. KEANE.

Willemite, or Wilhelmite [named after Wilhelm I., King of the Netherlands, by the mineralogist Levy; also called *troostite* (the New Jersey ore)]: a native silicate of zinc, of composition O_2SiZn_2 ; rhombohedral in crystallization; generally yellowish, greenish, or salmon-colored; generally opaque, but sometimes translucent, or even transparent; hardness somewhat below feldspar. Willemite, which is not common in Europe, occurs at some localities in New Jersey—about Franklin and Stirling—almost in rock-masses, constituting a very valuable zinc ore.

Willems, JAN FRANS; philologist and author; b. at Bouchout, near Antwerp, Belgium, Mar. 11, 1793; at the age of

twelve was sent to Lierre to study music and singing; gained a local reputation as an amateur actor and a composer of satirical verses; became interested in the old Flemish language and literature; in 1809 was sent to Antwerp to study in a notary's office; won in 1811 a prize offered for the best poem on the battle of Friedland; published in 1818 an ode, *Ven de Belgen* (To the Belgians), and in 1819-20 a treatise, *Over de Nederduytsche Taalen Letterkunde* (2 vols., Antwerp), his object being to induce the Government and the authors of Belgium to use Dutch as an official and literary language, claiming that it was only a modified form of early Flemish; became the leader of the Flemish movement (see FLEMISH LANGUAGE AND LITERATURE); was alternately favored and slighted by the Dutch and Belgian Governments, according as the anti-Dutch or anti-French tendency of the Flemish movement could be used; was appointed keeper of the archives at Antwerp, but on the separation of Belgium from Holland, 1830, was removed, and in 1831 settled at Eecloo, near Ghent, where he published numerous works, including versions of *Reineke Vos* (Reynard the Fox), to which he ascribed a Flemish origin, and editions of the rhymed chronicles of Jan de Kierck and Jan van Heelu (Brussels, 1836; Ghent, 1840). In 1835 he became keeper of the archives of Ghent; in 1837 founded a quarterly review, the *Belgisch Museum*. D. at Ghent, Jan. 24, 1846. His *Life* was written by Snelaert (Ghent, 1847).

Willemstad, willem-stād: capital of the island of CURAÇOA (*q. v.*), and of the Dutch West Indies; on the south side of the island, at the mouth of a channel which expands into a large lagoon; the channel and part of the lagoon form a capacious and safe harbor, admitting the largest vessels. Willemstad is a place of great commercial activity, being a central station of the European trade with the northern coast of South America. It has the appearance of a town in Holland. Pop. about 11,000. H. H. S.

Willes, Sir JAMES SHAW, LL. D.: b. at Cork, Ireland, in 1814; educated at Trinity College, Dublin (graduated in 1836); then studied law in London with Mr. Chitty, and was called to the bar at the Inner Temple in 1840, practicing for several years before this as a special pleader; became the acknowledged leader of the junior counsel, and in 1850 was appointed a commissioner to examine and report on the subject of reform in the system of common law procedure, and he was the chief author of the acts on that subject passed in 1852, 1854, and 1860, the important services which he rendered in this matter leading to his appointment as a judge of the court of common pleas in 1855, when he was knighted; from 1851-1855 was tabman in the court of exchequer, where his chief practice was. He was a man of remarkable memory and acumen, and was perhaps the most learned judge of his time; was placed on the Indian law committee in 1861, and on the English and Irish law committee in 1862. With Sir Henry S. Keating he edited Smith's *Leading Cases* (1849). The amount of work he accomplished was enormous, and at last he gave way under the strain and committed suicide in a fit of insanity at Otterspool, Hertfordshire, Oct. 2, 1872. F. S. A.

Willet, or Stone Curlew: the *Symphemia semipalmata*, a bird of the snipe family found in North and South America. It is about 16 inches long, ashy above, speckled, with blackish, white, or slightly rufous or brownish below. It is a fine game-bird, and its eggs and flesh are prized as food. The name willet is derived from its note, "pilt-will-willit." F. A. L.

Willet's Point: U. S. military reservation; opposite Fort Schuyler, Throgg's Neck, at the west end of Long Island Sound, N. Y.; 2½ miles S. of Whitestone, 20 miles N. E. of the Battery, New York city (for location, see map of New York, ref. 7-B). The site, consisting of 136 acres, was bought by the Government in 1857 and 1863, for the purpose of building a fort to co-operate with Fort Schuyler in defending the eastern entrance to New York harbor. This fort was begun in 1862, but owing to radical changes in the means of attack and defense during the civil war, work upon it was suspended, and it still remains unfinished. In 1864 the Grant General Hospital was located here, and many temporary buildings were erected. At the close of the war three companies of the U. S. Engineer battalion were ordered here to establish an engineer dépôt for stores and materials, a school of practice, and a station for experiments with torpedoes. The present organization of the school was authorized by the Secretary of War in 1885, and is substantially as follows: The academic staff consists of the

commandant, the three company commanders, and the battalion adjutant and quartermaster, the adjutant as secretary of the staff, and the quartermaster as instructor in photography; the student officers consist of from ten to sixteen lieutenants of engineers who are on duty with the companies, and of an additional detail of from seven to ten lieutenants from other arms of the service for the special course in torpedoes. The engineer lieutenants usually are sent to the school directly after graduation at West Point, and remain about two and a half years. The other officers are detailed after some service with their regiments, and remain at the school ten months. The instruction, which is divided into a winter and a summer course, is intended to be practical as well as theoretical, and includes the following subjects, viz.: Submarine mining, including electricity, high explosives, and torpedo warfare; military engineering, including operations of armies in the field, sea-coast defense, modern siege operations, ordnance, field fortifications, and pontooning; civil engineering, including surveying, river and harbor improvements, hydrographic surveys, steam engineering, building superintendence, estimates, etc.; practical astronomy, including the use of instruments employed on geodetic and boundary surveys; military photography, including methods of map-reproduction, the use of the camera, development, printing, etc. The non-commissioned officers and privates, of whom there are from 350 to 400 at the post, are instructed in tactics, pontoon-drill, photography, torpedo-drill, and in several industrial trades, such as carpentry, blacksmithing, engineering, and, when necessary, in common-school studies.

WILLIAM R. KING, LIEUT.-COL. U. S. ENGINEERS.

Willett, MARINUS: soldier; b. at Jamaica, L. I., July 31, 1740; was a lieutenant in DeLancey's regiment during the French war, and was distinguished at the unsuccessful assault upon Fort Ticonderoga; served in Col. Bradstreet's expedition against Fort Frontenac; entered McDougal's regiment as second captain early in 1775; was a captain under Montgomery in the Canada campaign of 1775-76, commanding the post of St. John until Jan., 1776, when he returned home; became lieutenant-colonel of the Third New York Regiment 1776; defended Fort Stanwix against the regulars, Tories, and Indians commanded by St. Leger Aug., 1777; made a successful sally as a diversion in favor of General Herkimer; held the fort until its relief by Arnold; joined the army in New Jersey June, 1778; was present at Monmouth; accompanied Sullivan in his campaign against the Six Nations; was sheriff of New York 1784-92; declined the post of brigadier-general in the expedition sent against the Western Indians 1792, and succeeded De Witt Clinton as mayor of New York in 1807. D. in New York, Aug. 22, 1830. He left an autobiography, from which A. *Narrative of the Military Actions of Col. Marinus Willett, etc.* (New York, 1831), was prepared and edited by his son, William M. Willett.

Willey, HENRY: botanist; b. at Geneseo, N. Y., July 19, 1824; educated at the academy in that town and the Bridgewater (Mass.) Normal School; was for several years a teacher; studied law and practiced in New York State; removed to Massachusetts 1858, and after teaching for a time became editor of *The Daily Evening Standard* at New Bedford. As a botanist has occupied himself especially with lichens, his principal publications being *List of North American Lichens* (1873); *Statistics and Distribution of North American Lichens*, in *Bull. of Buffalo Nat. Hist. Soc.* (1873); *Lichens of the Yellowstone*, in *U. S. Geol. Surv. Terr.* (1873); *Lichens of Colorado* (1874); *American Lichenography*, in *Proc. Essex Inst.* (1867); *An Introduction to the Study of Lichens* (1887); *Synopsis of the Genus Arthonia* (1890); *Enumeration of the Lichens found in New Bedford, Mass.* (1892). He also edited part ii. of Tuckerman's *Synopsis of the North American Lichens* (1888). CHARLES E. BESSEY.

William: the name of four kings of England. (1) WILLIAM I., THE CONQUEROR, King of England (1066-87); h. at Falaise, Normandy, in 1027 or 1028, the bastard son of Robert the Devil, Duke of Normandy, by the beautiful Arletta, a tanner's daughter of Falaise; was educated at the court of King Henry I. of France; succeeded by his aid to the ducal throne of Normandy on the death of his father in 1035, and married, in 1053, Matilda, a daughter of Count Baldwin V. of Flanders. In his many feuds with his vassals and neighbors, and with the King of France, he showed himself a man of superior talents, and his ambition was fully on a par with his power. As the English king, Ed-

ward the Confessor, had no children, William laid claim to the succession, his grandmother, Emma, being a sister to Edward. It is said that the king himself acknowledged the claim, and William maintained that Harold had pledged himself on a visit to Normandy in 1064 that he would not oppose his succession. Nevertheless, when Edward died (Jan. 5, 1066), Harold was elected king by the Anglo-Saxon nobles, and rejected William's demand that he should fulfill his promise. The Norman duke thereupon formed an alliance with Tostig, Harold's banished brother, composed his affairs at home, and having secured from Pope Alexander II. a declaration that his claim was just, and a blessing on the expedition, gathered a large force in the harbor of St.-Valéry, at the mouth of the Somme, crossed the Channel, and landed at Pevensey Sept. 29. On Oct. 14 was fought the battle of Hastings or Senlæ between him and Harold; the Anglo-Saxons were completely routed, Harold fell, and, Dec. 25, William was crowned King of England at Westminster. His government was at first conciliatory, but as one insurrection followed another, and found support both from the Scots and the Danes, he adopted severe measures, subjecting the conquered to heavy fines and confiscations. With the capture of Ely (1071), where Hereward had kept up an obstinate resistance to the invaders, the conquest of England was complete, and in 1072 William forced the Scottish king, Malcolm III., to do him homage. The whole country between the Tees and the Humber was laid waste, and every Saxon was expelled from his position in the administration, the courts, and the Church, and supplanted by a Norman. The estates of the fallen or banished Saxon nobles were partitioned out to the Norman lords; but, in order to prevent the concentration of too much power in the hands of a vassal, care was taken that the lands thus bestowed should not be contiguous. A network of military stations was spread over the whole country—strongly fortified castles, from which the feudal Norman kept the Saxon population in absolute submission. In 1068 the curfew-bell was introduced, at the sound of which every light and fire in the country should be extinguished, and between 1080 and 1086 a survey was taken of the Conquest and the division of the spoil—the so-called Domesday Book (*q. v.*). The landholders were obliged to swear fealty to the king, who, while retaining the forms of feudalism, exalted the royal authority and laid the foundation of a strong kingship, in marked contrast to the feebleness and uncertainty that characterized the feudal monarchies of the Continent. In the political system that he established, the upper ranks and great positions were filled by the Normans, while the native population made up the lower orders in the feudal scale. Though a harsh ruler he administered a rude kind of justice, repressing the tyranny and violence of his nobles as a menace to his own authority. As the Anglo-Saxon Chronicle says, "He would permit no plunder save his own." Besides the establishment and consolidation of his power in England, William carried on a series of wars on the Continent with his son, with Brittany, with the King of France, etc. In a campaign against France he was injured by a fall from his horse at Mantes-sur-Seine. He was brought to Rouen, and died there Sept. 9, 1087. He was buried in the Church of St. Stephen at Caen. (See Thierry, *Histoire de la Conquête de l'Angleterre par les Normands* (1825); Freeman, *History of the Norman Conquest of England* (1867); Palgrave, *England and Normandy* (1851-64); and Stubbs, *Constitutional History of England* (1874).) —(2) WILLIAM II., REUFUS, King of England (1087-1100), b. in Normandy in 1056, son of William the Conqueror; was educated in England by Lanfranc, and succeeded to the throne of England on the death of his father, while his elder brother, Robert, took possession of Normandy. He was soon (1088) involved in war with the partisans of his brother in England, who stirred up a serious rebellion, which, however, he soon put down with the aid of his English subjects. Two years later he carried the war into Normandy, and forced his brother to consent to humiliating terms of peace. He also waged war with Scotland, invaded Normandy a second time in 1094, quarreled with the King of France, and attempted to conquer the Welsh. He came finally into possession of Normandy when, in 1096, Robert mortgaged the country to him on setting out for the Holy Land. He was planning to secure Aquitaine, but before he could take possession of this new dominion he was shot by Walter Tyrril, or Tirl, while hunting in the New Forest, Aug. 2, 1100. He built London Bridge and completed London Tower and Westminster Hall. (See Freeman, *Reign of*

William Rufus.—(3) WILLIAM III., King of Great Britain and Ireland (1689-1702) and stadtholder of the Netherlands (1672-1702), a son of William II., Prince of Orange and stadtholder of the Netherlands, and Mary, the eldest daughter of Charles I., King of England, b. at The Hague, Nov. 4, 1650, ten days after the death of his father. His mother died in 1661; Louis XIV. took possession of the family estate of Orange; Oliver Cromwell persecuted him as a Stuart; and in the Netherlands, where his father had exerted himself to make the stadtholdership hereditary in the family of Orange, Jan de Witt carried through a law which prevented any person from being at the same time stadtholder and commander-in-chief of the military forces of the republic. Nevertheless, in 1672, when France and England attacked the Netherlands, and Jan de Witt had been murdered, William was made stadtholder and commander-in-chief, and by his military and diplomatic talents he freed the country from the grasp of Louis XIV. much in the same way as his ancestor had wrenched it from the grip of Philip II. He succeeded in detaching England from France, and the Peace of Nymwegen (1678) was at least honorable to the republic. In 1677 he married his cousin Mary, eldest daughter of James, Duke of York, and heir-presumptive to the English crown, and in the contest between the king and the people, which became almost desperate, as soon as James ascended the throne, he naturally became the center of the opposition. In 1688 he was invited by a large number of the most prominent men in England to interfere, and on Nov. 5 of the same year he landed at Torbay with an army of 15,000 men. James fled to France, deserted by all, and on Feb. 13, 1689, was deposed by Parliament, and William and Mary were established on the throne. James afterward went to Ireland, where the Roman Catholic population rose in favor of him, but he was completely defeated in the battle of the Boyne, and in Ireland, as well as in Scotland, all Jacobite movements were successfully suppressed. In Dec., 1689, England joined the Grand Alliance against France, which William had formed between Austria, Spain, and the Netherlands. From 1691 William himself commanded the allied army in the Netherlands, and although he was defeated at Steenkerke (Aug. 4, 1692) and at Neerwinden (July 19, 1693), he nevertheless prevented France from making any progress. At La Hogue the French fleet was nearly annihilated in 1692, and by the Peace of Ryswick (1697) England and the Netherlands lost nothing and France was utterly exhausted. Louis XIV., however, had by no means given up his ambitious plans, and England had just determined and publicly announced that it would take part in the Spanish war of succession when William died Mar. 8, 1702, in consequence of a violent fall from his horse. In England he was not loved, and his position was often very difficult, especially after the death of Mary (Dec. 28, 1694). He was entirely destitute of all those small arts by which a man in a superior position so easily wins the confidence, good will, and enthusiasm of his inferiors; but the soundness and elevation of his political views, and the sagacity and self-sacrificing energy with which he carried them out, have probably never been doubted. His great task was to resist Louis XIV., and in him political absolutism and religious intolerance; and he fulfilled it. (See Trevor, *Life and Times of William III.* (1835); Vernon, *Court and Times of William III.* (1841); Macaulay's *History of England*; and H. D. Traill, *William III.* in *Twelve English Statesmen Series* (1888).)—(4) WILLIAM IV., King of Great Britain, Ireland, and Hanover (1830-37), b. in London, Aug. 21, 1765, the third son of George III.; was educated for the navy; became a lieutenant in 1785, an admiral in 1801, and lord high admiral in 1827; was created Duke of Clarence in 1789, became heir-presumptive to the crown in 1827, and succeeded to the throne June 26, 1830. The chief event of his brief reign was the movement for parliamentary reform, which was secured by the Reform Act of 1832. Though he had professed to be a Whig and in favor of liberal measures, his blundering and irresolute conduct obstructed the much-needed reform, and by prolonging the crisis exasperated the people. D. at Windsor, June 20, 1837. He had entered in 1790 into a connection with an actress, Dora Jordan, by whom he had ten children, but he left her in 1811 for political reasons, and in 1818 he married a German princess. He was succeeded in Hanover by his brother, and in England by his niece, Victoria. For a further account of the events of his reign, see the articles on his ministers, GREY, CHARLES; MELBOURNE, WILLIAM LAMB; and PEEL, ROBERT. P. M. COLBY.

William: the name of three kings of the Netherlands, descending from the brother of William the Silent of Orange-Nassau.—WILLIAM I. (1815-40), was born at The Hague, Aug. 24, 1772, the eldest son of William V., Prince of Orange-Nassau and stadtholder of the Dutch republic, and married, Oct. 1, 1791, Friederike Luise Wilhelmine, a daughter of Frederick William II. of Prussia. When the National Convention of France declared war against the republic (Feb. 1, 1793), William assumed the command of the Dutch army, but on Jan. 18, 1795, he embarked with his father and the rest of the family at Scheveningen, and went to England. Aug. 29, 1802, he received the principality of Fulda, together with Corvey, Dortmund, and Weingarten, which had been given to his father in compensation for the Netherlands, and he now resided for several years at Fulda. On his father's death (Apr. 9, 1806), he came into possession of the hereditary estates of the family, Nassau-Dietz, but having allied himself with Prussia and accepted a command in the Prussian army, he was taken prisoner at Jena by the French, and all his possessions were confiscated by Napoleon. He was soon released from his captivity, and fought against the French at Wagram, but lived subsequently in retirement at Berlin until after the battle of Leipzig. The Hollanders now rose against the French, and on Nov. 29, 1813, William landed at Scheveningen, and was hailed by the people as their sovereign. By the Congress of Vienna the kingdom of the Netherlands, consisting of Holland and Belgium, was formed, and on Mar. 16, 1815, William I. was proclaimed king. In compensation for his hereditary possessions, which were given partly to Prussia, partly to Nassau, he received the grand duchy of Luxembourg. The combination of Holland and Belgium proved a blunder. By the revolution of 1830, Belgium seceded, and was recognized as an independent kingdom by the powers at the conference in London Dec. 20, 1830. William I., however, would not submit to this decision, but continued his protest and resistance up to 1839 in a very foolish manner. This and other circumstances made him unpopular, and on Oct. 7, 1840, he found it advisable to abdicate in favor of his son. He went to Berlin with an enormous fortune, and died there Dec. 12, 1843.—WILLIAM II. (1840-49), b. at The Hague, Dec. 6, 1792, the eldest son of William I., was educated in the military academy of Berlin and the University of Oxford; served in the Spanish and British armies against the French, and distinguished himself at Quatre-Bras and Waterloo, where he was wounded. On Feb. 21, 1816, he married the Grand Duchess Anna Paulovna, a sister of Alexander I. of Russia. As king, he restored order to the finances, which had fallen into utter confusion during the reign of his father, but showed himself very unwilling to enter on any political reforms. Nevertheless when, in 1848, the fermentation became dangerous in the country, he consented to a thorough reorganization of the government, but died before the new constitution could be established Mar. 17, 1849.—WILLIAM III., b. at The Hague, Feb. 19, 1817, the eldest son of William II.; married June 18, 1839, Sophie, a daughter of King William of Württemberg, and succeeded to the throne Mar. 17, 1849. When the German union was dissolved in 1866, he succeeded in separating Limburg and Luxembourg from all connection with Germany, and annexed the former completely to the Netherlands. Concerning the latter, negotiations were opened by Napoleon III., who wanted to buy it, but these negotiations were frustrated by Bismarck, and Luxembourg was declared neutral under the sovereignty of the house of Orange-Nassau by the treaty of May 11, 1867. Though notoriously licentious in his private life, he was a politic and progressive ruler, and in internal affairs his government was very successful. In 1879 he married the Princess Emma of Waldeck-Pyrmont, by whom he had two daughters, the elder of whom, the Princess Wilhelmina, became the heir to the throne. D. at the Castle of Loo, Nov. 23, 1890.

William I., Emperor of Germany and King of Prussia: b. in Berlin, Mar. 22, 1797; the second son of King Frederick William III. and Queen Luise, a Princess of Mecklenburg. He grew up with the humiliating impressions of the defeat of Jena, but distinguished himself in the campaigns of 1813-14 against France. All his life through he was an enthusiastic soldier, indefatigable in the military service, even in its minutest details. When his father died (1840), and his elder brother, Frederick William IV., became king, he received the title of Prince of Prussia as heir-presumptive,

but for many years was not prominent in political affairs. He was considered an absolutist, and for this reason, as well as on account of his military inclinations, he was very unpopular. On the outbreak of the revolution in 1848 he was compelled to leave the country and go to England. On his return in the same year he entered the Prussian national assembly as member for Wirsitz and delivered a speech in which he declared himself in favor of constitutional government. In the spring of 1849 he took command of the military force sent against the South German insurgents, and quickly suppressed the revolution in the Palatinate and Baden. Later, when the supremacy of the Austrian policy in German affairs was felt with much regret in Prussia, public opinion underwent a change concerning the prince, and people began to look at the strength and firmness of his character as a support of the greatness of Prussia. He was nevertheless by no means popular, and frequent collisions arose between him and the people when he came to the head of the Government as regent Oct. 9, 1858, and as king Jan. 2, 1861. It was the reorganization of the army which aroused the bitterest opposition. The king considered this measure as the most effective means of elevating the Prussian state, while the people looked at it as an instrument of oppression. There followed what is known as the "Conflict Time," in which neither the king nor his opponents in the Prussian chamber would give way, and the former, in order to carry out the scheme of military reform, was obliged to rely on the upper house for supplies in direct opposition to the spirit of the constitution; but the resolution and energy of Bismarck won in the end, and the reorganization was effected. In the war with Denmark (1864) the army proved able and effective, and the king began to be popular. This change was more apparent in 1866, when, under the personal leadership of the king, brilliant victories were won over Austria and her German allies. The Landtag readily granted an indemnity for all military expenditures. By the *publicandum* issued from Ems July 26, 1867, William placed himself at the head of the newly formed North German union, and assumed for himself and his successors to the Prussian crown the rights and duties connected with this new dignity. But the greatest glory was gained by the king in the war with France (1870-71). The refusal of Napoleon III.'s demand for territory on the Rhine and the thwarting of his designs on Belgium and Luxemburg had made war probable, and all measures were taken to insure success when the conflict came. The war was desired by the king and Bismarck as the means of strengthening Prussia and attaining German unity. Napoleon's folly in the matter of Prince Leopold of Hohenzollern's candidacy for the Spanish throne offered a welcome opportunity of refusing his demands and making him appear as an aggressor in the war that followed. In the negotiations with the French ambassador, Benedetti, in Ems July, 1870, the king's presence of mind, courage, and dignity won general admiration, and the enthusiasm for him increased every day as the German army pushed farther into France and gained one victory after another. Moved partly by the brilliancy of the victory, partly by the personality of the victor, the German princes, so long divided, finally agreed in offering the imperial crown of Germany to King William, and he accepted it at Versailles Jan. 18, 1871. On Mar. 15, 1871, he returned to Berlin. Here a new contest awaited him. The internal state of Germany, especially on the ecclesiastical field, needed a development in a liberal direction, and the policy of Bismarck soon brought about a conflict with the Roman Curia. (See *KULTURKAMPF* and *FALK LAWS*.) The next difficulty to be dealt with was the socialist agitation, which had increased to an alarming extent. In 1878 occurred Hödel's attempt on the emperor's life, and this was soon followed by the murderous assault of Dr. Nobiling, who succeeded in wounding his victim. Influenced by these events the Reichstag passed Bismarck's anti-socialist law, which expired in 1881, but which has been several times renewed. Despite this repressive policy the Social-Democratic party increased in strength, and the emperor and Bismarck competed for the favor of the laboring man by a plan of social reform based on the principles of state socialism. An illustration of this paternal policy is Bismarck's law for the insurance of workmen against accidents. In his foreign policy the emperor showed himself determined to keep what had been gained from France, but to avoid war if possible. To insure peace he endeavored to make Germany so strong that none dare attack her. To guard against a combined attack from Russia

and France he formed a military alliance with Austria-Hungary and Italy, the *Dreibund*. D. in Berlin, Mar. 9, 1888.

Revised by F. M. COLBY.

William II.: German emperor and King of Prussia; b. Jan. 27, 1859, eldest son of Frederick, second German emperor and eighth King of Prussia, who was eldest son of William I. He received a thorough military training and instruction in administrative methods. On the death of his father, June 15, 1888, he became emperor and early showed himself a resolute upholder of the traditional rights and dignity of his office. His speeches inspired the fear that his policy would be reactionary, his tone being that of a monarch convinced of his divine right. He was soon at variance with Bismarck, who, finding himself unable to retain his influence, resigned in 1890. Some of the important features of the reign are the strengthening and renewal of the Triple Alliance, the legislation in favor of the workingman, and the cession to Germany of Heligoland. William II, married Feb. 27, 1881, Princess Victoria of Schleswig-Holstein-Augustenburg.

William, THE SILENT: See WILLIAM OF NASSAU.

William and Mary, College of: an institution of learning near Williamsburg, Va.; in its antecedents the oldest in the U. S., dating back to 1617, and in its actual operation standing next to Harvard College, having been founded in 1693. A grant of land for the establishment of an Indian college and an English seminary of learning at Henrico was made by the Virginia Company in 1619, and £1,500 was raised by the bishops of England for the encouragement of Indian education. A collegiate school was opened at Charles City in 1621, but was suspended by reason of the Indian massacre of 1622, and a second project, to found a university to be called *Academia Virginicensis* or *Oxonensis*, on an island near the mouth of the Susquehanna, failed on account of the death of its chief advocate, Edward Palmer. In 1660 the colonial assembly of Virginia voted to purchase land for a college and free school. Subscriptions of money were received from Gov. Berkeley and others in the colony as well as in England, and in 1691 the assembly sent Rev. James Blair, D. D., to secure a charter from the English crown. King William and Queen Mary approved. The charter was signed in Feb., 1693, and the Government appropriated, toward the support of the college, lands, funds, a duty on exported tobacco, and all fees and profits arising from the office of surveyor-general. Dr. Blair became the first president. Six masters or professors, who were graduates of Oxford and Cambridge, were appointed. Several scholarships were founded, a school for Indians was established about 1697, and at Dr. Blair's death (1743) the college was highly prosperous. It was the wealthiest college in America when the war of the Revolution broke out, but the war deprived it of all endowments, save 20,000 acres of land, by the sales of which a new moneyed endowment of about \$200,000 was obtained. In 1781 the buildings were occupied alternately by the British and the French and American troops, and while used as hospitals by the latter were injured by fire. The college exercises, however, were interrupted for a few months only. During the civil war the college was closed, the buildings and grounds were occupied by U. S. forces, and several buildings, together with the library and apparatus, were destroyed. In 1869 the main building was restored, and the college was reopened; but in 1882 financial embarrassment made it necessary to close its doors. In 1888 the general assembly of Virginia appropriated \$10,000 a year, subsequently increased to \$15,000 to establish in connection with collegiate training "a system of normal instruction and training." The college was reopened in Oct., 1888, with a full faculty, and has since enjoyed fair success. In 1893, by an act of Congress, it received \$64,000 indemnifying it for losses sustained during the civil war.

The present faculty consists of a president, Lyon G. Tyler, six full professors, and three tutors. It confers the degrees of master of arts, bachelor of arts, bachelor of letters, and licentiate of instruction. There are seven departments. As an adjunct to the department of pedagogy a well-equipped model school is carried on in Williamsburg. The library contains about 8,000 volumes. The number of students in 1894-95 was 160. The institution is undenominational. Among its distinguished alumni have been Thomas Jefferson, James Monroe, and John Tyler, Presidents of the U. S.; Benjamin Harrison, Carter Braxton, Thomas Nelson, and George Wythe, who, with Jefferson, were signers of the

Declaration of Independence; Edmund Randolph, chief draughtsman and author of the Constitution; John Marshall and Bushrod Washington, jurists; and Lieut.-Gen. Winfield Scott. The Phi Beta Kappa Society, established to promote literature and patriotism among the youths of the colony, was founded at William and Mary in 1776. Until 1776 the chancellors of the college were, with several exceptions, the bishops of London. George Washington was chancellor 1788-99. See *The History of the College of William and Mary* (Baltimore and Richmond, 1874) and *Circular of Information, Bureau of Education*, No. 1. (Washington, 1887).

LYON G. TYLER.

William of Champeaux: anglicized form of GUILLAUME DE CHAMPEAUX (q. v.).

William of Malmesbury: See MALMESBURY.

William of Nassau, sometimes called **William of Orange**, or **William the Silent**: b. at Dillenburg, Nassau, Apr. 14, 1533; was the eldest son of Count William of Nassau-Dillenburg and his second wife, Juliana von Stolberg, both of whom were Protestants. In 1544 he inherited from his cousin, Renatus of Nassau, the principality of Orange in Provence, whence he derived the title of Prince of Orange, and extensive estates in the Low Countries, and he was now sent to Brussels, where he was educated at the court in the Roman Catholic faith. When he was fifteen years old he became a page to Charles V., who employed him, while still a young man of twenty years, in the highest military and diplomatic positions, and on his abdication (1555) recommended him in the strongest terms to his son and successor. In the beginning, Philip II. also seemed inclined, if not to put confidence in him, at least to use him. He held high offices in the provinces; he negotiated the preliminary arrangements for the Peace of Cateau-Cambrésis in 1559; and he was one of the four hostages—the Duke of Alva was another—whom Spain sent to France as a guaranty for the fulfillment of the treaty. While there the French king, Henry II., one day told him that there existed a secret treaty between him and Philip II. for the purpose of destroying all Protestants within their dominions; but, although this communication must have shocked and angered him, such was his self-possession and presence of mind that the news was received as carelessly as it was given. His discretion on this occasion earned for him the sobriquet of "The Silent," which, however, in no wise applies to his general character, for in his usual bearing he was frank and cordial. As a young man he kept a magnificent household, and exercised a most generous hospitality. Soon, however, after his conversation with Henry II., he found other use for his money, for he rose immediately in opposition to Philip II., and never, as long as he lived, gave up his resistance for one moment. As governor of Holland and Zealand he refused in 1564 to allow the establishment of the Spanish Inquisition in these provinces; and although he had not signed the compromise which the *hugues* or Beggars presented to the regent, Margaret of Parma, in 1566, yet he supported their demands at the court. When, finally, Philip II. decided to send the Duke of Alva as governor-general to the Netherlands with a large Spanish army, William resigned all his offices and retired with his family to Germany. As soon as Alva arrived, the most arbitrary measures for the religious and political suppression of the provinces were carried out, often with incredible atrocity. William was summoned to appear before the council which had condemned Egmont and Horn, and his eldest son, a boy of thirteen years, who studied at the University of Louvain, was seized and carried to Spain, where he was held in captivity for twenty-eight years. In 1568 he raised an army by his own funds, and afterward invaded the country, but although he gained some advantages, he was unable either to rouse the population to a general revolt or to bring Alva to a decisive battle; and he was soon compelled by lack of money to disband his army. In 1572 he made a new attempt, and with greater effect. In 1570 he had issued letters of marque to privateers, and these "Beggars of the Sea" inflicted great damages on Spanish commerce, especially since they early in 1572 had come into possession of Briel and Flushing, which formed a solid basis for their operations and commanded the navigation of the Scheld and the Meuse. Thus war with Spain appeared to be a remunerative trade, while obedience had proved to be utter desolation and ruin, and, consequently, on the approach of William with a new army, the province of Holland rose in open rebellion, and its states chose William, stadtholder in

July, 1572. Gelders, Overijssel, Zealand, and Utrecht immediately joined, and although William, failing to obtain aid from the French, was again compelled to disband his army, war nevertheless now began to be carried on in a regular manner against the Spaniards. The military successes which the Hollanders achieved under the leadership of William were not very remarkable, but the heroism of the people was displayed on many occasions, as in the defense of Leyden. It soon became apparent that the provinces under Spanish rule were impoverished, while the provinces under William's administration prospered. By degrees the hatred to the Spaniards spread throughout the southern provinces, even among the Roman Catholics, and in Oct., 1576, William brought about the so-called "Pacification of Ghent," by which all the provinces united for the purpose of driving the foreign soldiers out of the country and establishing religious toleration. The southern provinces, however, soon separated from the league, and returned under the Spanish rule. In Jan. 23, 1579, was signed the "Union of Utrecht," by which Philip II. was formally deposed. On Mar. 15, 1580, Philip II. put a price of 25,000 crowns on William's head, and after several attempts which failed, one Balthazar Gérard finally succeeded in shooting him, at Delft, July 10, 1584. He had been four times married, and left twelve children, of whom the two sons, Maurice and Frederick Henry, became very celebrated. See Motley, *The Rise of the Dutch Republic* (1856); Klose, *Wilhelm I. von Oranien* (1864); Herrmann, *Wilhelm von Oranien* (1873); Juste, *Guillaume le Taciturne* (1874); Barrett, *William the Silent* (1883); and Kallig's *Wilhelm von Oranien* (1885). Revised by F. M. COLBY.

William of Orange: See WILLIAM III. of England.

William of Tyre: historian; b. in Syria, about 1137; educated at Antioch and Jerusalem; visited France and Italy; was made Archbishop of Tyre in 1175; was one of the six bishops who represented the Latin church at the Lateran council (1179); wrote *Historia de Orientalibus Principibus*, and a history of the crusades between 1127 and 1184. It is entitled *Historia Rerum in Partibus Transmarinis Gestarum*, and is one of the finest specimens of mediæval historiography, full, accurate, and impartial. It was first printed by Bongarsius (Basel, 1549), afterward by Migne. There are German and French translations.

William of Wykeham: Bishop of Winchester and chancellor of England. b. at Wykeham or Wickham, Hampshire, England, in 1324, of poor parents; was educated at Winchester School; became private secretary to his patron, Sir John Scures, by whom he was recommended to the notice of Edward III., who received him into his service as clerk of the royal works then being carried on at Henley and at Yethampstead May, 1356; became "chief keeper and surveyor of the castles of the king at Windsor, Leeds, Dover, and Hadlee" Oct. 30, 1356; was virtually the architect of Windsor Castle, which was built under his eye, as also of Queensborough Castle in the Isle of Sheppey; took holy orders; became rector of Pulliam, Norfolk, 1357, prebendary of Lichfield 1359, of London and Southwell 1361, of Lincoln 1362, of York Mar., 1363, and Archdeacon of Northampton and of Lincoln the same year; was appointed keeper of the privy seal 1364, Secretary of State 1366; Bishop of Winchester 1367; was Lord Chancellor 1367-71; founded St. Mary's College at Winchester and New College, Oxford, 1373; was deprived of the temporalities of his see and excluded from Parliament 1376, but restored on the accession of Richard II. (1379); completed his munificent foundation at Oxford 1386; was again chancellor 1389-91, and rebuilt Winchester Cathedral 1395-1405. D. at South Waltham, Sept. 24, 1404. A splendid monument was erected to his memory in Winchester Cathedral. See *Three Chancellors—Lives of Wykeham, Wycliffe, and Sir Thomas More* (1860), by an anonymous writer, and *Life*, by G. H. Moberly (1887). Revised by S. M. JACKSON.

Williams, ALPHEUS STARKEY: soldier; b. at Saybrook, Conn., Sept. 20, 1810; graduated at Yale College 1831, but continued his studies in the law school there two years longer; in 1836 removed to Michigan, and took up his residence in Detroit, where he began to practice law; was chosen alderman of that city in 1843, city recorder in 1844, and from 1840 to 1844 was judge of probate of Wayne County. In 1843 he became proprietor of the *Detroit Daily Advertiser*, of which he was also editor until 1848. In the war with Mexico he served as lieutenant-colonel of the First Michigan Volunteers, and was postmaster of Detroit from

1894 to 1853. On the outbreak of civil war he was (May 17, 1861) appointed a brigadier-general of volunteers, and afterward commanded a division in the Shenandoah; succeeded to the temporary command of the Twelfth Corps in 1862, which he led at South Mountain, at Antietam (after the fall of Gen. Mansfield), and until Apr., 1863; in temporary command of corps at Gettysburg; transferred with his corps to Tennessee in October, and engaged at Lookout Mountain. In Sherman's Atlanta campaign of 1864 he commanded a division of the Twentieth Corps, succeeding to the command of that corps Nov. 11, which he held during the march to the sea and the campaign in the Carolinas. He was mustered out of service in Jan., 1866; was U. S. minister to Salvador 1866-69; and member of Congress 1875-78. D. in Washington, D. C., Dec. 21, 1878. Revised by JAMES MERCUR.

Williams, EDWARD: poet and Celtic scholar; better known by his bardic name of Iolo MORGANWYG; b. in the parish of Llanercvan, Glamorganshire, Wales, in 1745; was associated with Owen Jones and William Owen Pughe in the editorship of the great collection of ancient Welsh literature known as the *Myvyrian Archæology* (3 vols., 1801-07); published *The Fair Pilgrim, a Poem translated from the Welsh* (1792), and *Poems, Lyrical and Pastoral* (2 vols., 1794, in the former of which appeared *An Ode on the Mythology of the Ancient British Bards, in the manner of Taliesin*, accompanied by notes and specimens of "Triads" containing the metaphysical and religious doctrines of the old Druidical bards, alleged to have been copied from the MS. of a Welsh poet of the sixteenth century. This publication gave rise to a controversy as to the genuineness of these "Triads," and the alleged MS. was never produced. Williams was a friend of Southey, and was recognized as the best Welsh writer of his time. D. at Flemingstone, Wales, Dec. 17, 1826. His posthumous Welsh work, *Secrets of the Bards of the Isle of Britain* (1829), was edited by his son, Taliesin Williams. An amusing volume, *Recollections and Anecdotes of Edward Williams* (1850), was published by Elijah Waring.

Williams, ELEAZAR: missionary; b. at Caughnawaga, N. Y., about 1787; son of Thomas Williams by an Indian woman, and supposed to have been a descendant of Rev. John Williams, of Deerfield, Mass., known as "the redeemed captive." He was educated at Longmeadow, Mass.; served in the American army in the war of 1812-15, being wounded at Plattsburg; became a missionary of the Protestant Episcopal Church among the Oneida and St. Regis Indians, and subsequently among the tribes at Green Bay, Wis. About 1842 the claim was made that he was the dauphin of France, son of Louis XVI. and Marie Antoinette, and a narrative of his having been rescued from prison at Paris and brought to the U. S. gradually gathered form, and was embellished with all necessary details, including the total loss of memory by the young prince in consequence of his sufferings in prison. The story was brought out by Rev. J. H. Hanson in a famous article in *Putnam's Magazine—Have we a Bourbon among us?*—in 1853, expanded the following year into a volume entitled *The Lost Prince*. Belief in this story was much aided by a remarkable personal resemblance to the Bourbon type. Williams died at Hogsansburg, N. Y., Aug. 28, 1858. He was the author of an *Iroquois Spelling-Book* (1813); a translation of the *Book of Common Prayer* into Iroquois (1853); a political tract against the British (1815); and a *Life of Thomas Williams* (1859).

Revised by F. M. COLBY.

Williams, EPHRAIM: soldier; b. at Newton, Mass., Feb. 24, 1715; served in Canada against the French in the war of 1740-48, attaining the rank of captain; received from the Massachusetts Legislature a grant of 200 acres of land in the present townships of Adams and Williamstown, upon which he erected Fort Massachusetts 1751, and was made commander of the whole line of frontier posts W. of the Connecticut river, and on the renewal of war with the French in 1755 led a regiment of Massachusetts troops to join Sir William Johnson in his projected invasion of Canada; made his will while on the march, leaving his property to found a free school at Williamstown (see WILLIAMS COLLEGE); fell in an ambuscade of French and Indians near the head of Fort George, N. Y., and was killed at the first fire Sept. 8, 1755. On the spot where he fell a monument was erected in 1854 by the alumni of Williams College.

Williams, GEORGE HENRY: jurist; b. at New Lebanon, N. Y., Mar. 23, 1823; educated at an academy in Onondaga

County; was admitted to the bar 1844; settled in Iowa; judge of the first judicial district 1847-52, and a presidential elector in 1852; was chief justice of Oregon Territory 1853-57; member of the Oregon constitutional convention 1857; U. S. Senator 1865-71; member of the commission which settled the Treaty of Washington for settling the "Alabama claims" 1871; and was Attorney-General in President Grant's cabinet 1872-75. He was nominated chief justice of the U. S. Supreme Court 1873, but not confirmed by the Senate, and practiced law in Washington after resigning his seat in the cabinet.

Williams, GEORGE HUNTINGTON: geologist; b. in Utica, N. Y., Jan. 28, 1856. He graduated at Amherst College in 1878, and then studied in Germany, making a specialty of petrography, and obtained the degree of Ph. D. at Heidelberg in 1882. On his return to the U. S. he was called to the Johns Hopkins University, where he was advanced, until in 1892 he became Professor of Inorganic Geology. He studied the geology of Maryland with success, and prepared numerous memoirs on that subject, also in his own specialty of petrography, contributing bulletins to the U. S. Geological Survey. To him is due an electric machine for cutting and grinding thin sections of rocks and the petrographic microscope. He was a member of foreign and American scientific societies, vice-president of the Geological Society of America, and a member of the international jury of awards at the Columbian Exposition in Chicago, 1893. Besides some seventy-five papers contributed to the literature of his specialty, as well as much cyclopaedia work, including charge of departments for *Johnson's Universal Cyclopaedia* and *The Standard Dictionary*, he was the author of an excellent work on the *Elements of Crystallography* (New York, 1890). D. at Utica, N. Y., July 12, 1894.

MARCUS BENJAMIN.

Williams, HENRY SHALER, Ph. D.: paleontologist and geologist; b. at Ithaca, N. Y., Mar. 6, 1847; graduated at the Sheffield Scientific School, Yale University, 1868; after teaching at Yale and at the Kentucky University became Professor of Geology and Paleontology at Cornell University 1879; resigned his position in 1892 to accept the chair of Geology at Yale, where he succeeded James D. Dana; became chairman of the section of geology and geography of the American Association for the Advancement of Science, 1892; secretary of the International Congress of Geologists at Washington 1891. His most extensive studies have pertained to the Devonian and Carboniferous systems, and he has made important contributions to their stratigraphy and paleontology. Among his publications are *The Classification of the Upper Devonian* (*Proc. Am. Assoc. Adv. Sci.*, 1885); *Fossil Faunas of the Upper Devonian* (*Bull.* 3, U. S. Geol. Survey, 1884, also *Bull.* 41, 1887); *The Cubozoa Zone and its Fauna* (*Bull. Geol. Soc. America*, 1890); *Correlation Papers, Devonian and Carboniferous* (*Bull.* 80, U. S. Geol. Survey, 1891).

G. K. G.

Williams, ISAAC: clergyman and author; b. at Cwincyn-felin, near Aberystwith, Wales, Dec. 12, 1802; studied at Trinity College, Oxford; graduated 1826; took orders in the Church of England 1829; became a fellow of Trinity 1831; was curate successively of Windrush, St. Mary the Virgin's, Oxford, and Bisley; was associated with Keble, Newman, and Pusey in the "Tractarian" movement, having written the tracts Nos. 80, 86, and 87, and was a successful imitator of Keble as a sacred poet; was defeated by Garbett in his candidacy for the professorship of poetry at Oxford 1842; was a contributor to the *Lyra Apostolica*; wrote numerous theological treatises imbued with a vein of mysticism and symbolism, and spent his later years in complete retirement at Stinchcombe, Gloucestershire, where he died May 1, 1865. He was the author of *The Cathedral, or the Catholic and Apostolic Church of England, in verse* (London, 1838); *Hymns* (1839); *Thoughts in Past Years* (1842); *Harmony and Commentary on the Whole Gospel Narrative* (8 vols., 1842-45); *The Baptistery* (4 parts, 1842-44); *The Christian Scholar* (1849); *The Altar* (1849); *The Seven Days, or the Old and the New Creation* (1850); *The Apocalypse* (1852); *The Beginning of the Book of Genesis* (1861); *The Psalms interpreted of Christ* (3 vols., 1864-65); and other works. See his *Autobiography* (1892).

Revised by S. M. JACKSON.

Williams, JAMES DOUGLAS: Governor of Indiana; b. in Pickaway co., O., Jan. 16, 1808; settled in Knox co., Ind., in childhood; received a common-school education; became a farmer and stock-raiser; was frequently elected as a Democrat to the lower house of the Legislature; was State

Senator 1859-67 and 1871-75; chosen member of Congress 1874, serving as chairman of the committee on accounts; was a member of State board of agriculture seventeen years, and its president four years, and was chosen Governor of Indiana over Gen. Benjamin Harrison at election of Oct., 1876, after one of the most exciting contests in the political history of the U. S. He was widely known by the sobriquet of "Blue Jeans," given him by his supporters on account of the farmer's costume which he ordinarily wore. D. in Indianapolis, Nov. 20, 1880.

Williams, JOHN, D. D.: archbishop; b. at Aber-Conway, Carnarvonshire, Wales, Mar. 25, 1582; educated at Ruthin School; graduated at Cambridge 1603; became a fellow of St. John's College; and took orders in the Church of England 1609. He was successor to Bacon as lord keeper of the great seal July 10, 1621, to Oct. 25, 1626, and was consecrated Bishop of Lincoln Nov. 11, 1621. In the negotiation of the Spanish marriages 1622-23 he took an active part, thereby making a bitter enemy of Buckingham; used his court influence against monopolies and illegal exactions, and displayed moderation in the management of the Star-Chamber tribunal; preached the funeral sermon of James I. 1625; offended the new sovereign, by whom he was dismissed from the keepership the following year; supported the Petition of Right 1628; was three times prosecuted by Archbishop Laud before the Star Chamber on a charge of betraying the king's secrets; was condemned, after eight years' legal proceedings, to imprisonment, suspension from his bishopric, and successive fines of £10,000 and £8,000; was confined four years in the Tower 1636-40, until released by the Long Parliament and restored to his diocese; caused the withdrawal of the bishops from the House of Lords on the occasion of the impeachment of Strafford; advised the king to assent to the execution of that minister; became Archbishop of York Dec. 4, 1641; was soon afterward sent to the Tower with eleven other bishops for protesting against the validity of acts passed during their enforced absence from the House of Lords; was released 1643; was a firm supporter of the king during the great rebellion, and fortified and held Conway Castle. D. at Glodded, Mar. 25, 1650. He wrote a treatise in opposition to Laud's innovations in church ceremonies. His *Life*, under the Latin title *Serinia reserata* (London, 1693), was written by Bishop John Hacket and by Ambrose Philips (Cambridge, 1700; 2d ed. 1703). In London, 1869, there was privately published the *Correspondence between Archbishop Williams and the Marquis of Ormond*.
Revised by S. M. JACKSON.

Williams, JOHN: clergyman; b. at Lampeter, Cardiganshire, Wales, in 1726; became an Independent minister of Socinian views; was noted for classical scholarship, and was pastor of a Dissenting congregation at Sydenham, near London, from 1758 to his death, at Islington, in 1798. Among his works are *A Concordance to the Greek Testament, etc.* (1767); *A Free Inquiry into the Authenticity of the First and Second Chapters of St. Matthew's Gospel* (1771; 2d ed. 1789); and some works on the alleged discovery of America by the Welsh.
Revised by S. M. JACKSON.

Williams, JOHN: scholar; b. at Ystradmeirig, Cardiganshire, Wales, in 1792; educated at Baliol College, Oxford; took orders in the Church of England; was classical instructor at Winchester College and at Hyde Abbey School; was incumbent of Lampeter, Wales, several years; was appointed, by the influence of Sir Walter Scott, rector of the New Edinburgh Academy; preached the funeral sermon of Scott; and became archdeacon of Cardigan 1833. He was the author of *The Life and Actions of Alexander the Great* (1829; 3d ed. 1860); *Claudia and Padens, an Attempt to show that Claudia, mentioned in St. Paul's Second Epistle to Timothy, was a British Princess* (Llandovery, 1848); *Gomer, or a Brief Analysis of the Language and Knowledge of the Ancient Cymry* (2 parts, 1854). D. at Busley Heath, Hertfordshire, Dec. 27, 1858.
Revised by H. A. BEERS.

Williams, JOHN: missionary; b. at Tottenham, near London, England, June 29, 1796; was apprenticed to an ironmonger, and acquired great skill in mechanical arts; was ordained a minister 1816, and sent by the London Missionary Society to the South Pacific islands; labored several years in the Society islands with great success, acquiring the native languages; visited the Hervey islands, and founded a mission at Raratonga 1823; built with his own hands a vessel 60 feet long, with which for four years he explored the neighboring groups of islands, including the Samoan; returned to England 1834; superintended the

publication of the New Testament in the Raratongan language; raised £4,000 for the purchase and outfit of a missionary ship, with which, accompanied by other missionaries, he returned to Polynesia 1838; renewed his explorations, and reached the New Hebrides, where he was about to plant a mission when he was killed and eaten by the cannibals of Erromanga Nov. 20, 1839. He was the author of that famous missionary classic *A Narrative of Missionary Enterprises in the South Sea Islands* (London and New York, 1837; 56th thousand 1865). Several memoirs were published, the most complete being that by Rev. Ebenezer Prout (1843).
Revised by S. M. JACKSON.

Williams, JOHN, D. D., LL. D.: bishop; b. at Deerfield, Mass., Aug. 20, 1817; was a student at Harvard, but graduated at Trinity College 1835; was tutor and professor in that institution; subsequently trustee and chancellor; studied divinity; ordained deacon in the Protestant Episcopal Church Sept. 2, 1838, and advanced to the priesthood Sept. 26, 1841; was rector of St. George's, Schenectady, N. Y., 1842-48; president of Trinity College 1848-53; became assistant Bishop of Connecticut 1861, and sole bishop Jan., 1865. He is the founder and head of Berkeley Divinity School, Middletown. On the death of Bishop Alfred Lee in 1887, Bishop Williams became the presiding bishop in the Protestant Episcopal Church. Author of *A Translation of Ancient Hymns of the Holy Church* (Hartford, 1845); *Thoughts on the Gospel Miracles* (New York, 1848); *Studies on the English Reformation*, being the Paddock lectures for 1881; *Studies in the Book of the Acts* (1890); and *The World's Witness for Jesus Christ*, the Bedell lecture for 1881; and other religious publications. He edited Bishop Harold Browne's *On the XXXIX. Articles*, with notes.
Revised by W. S. PERRY.

Williams, JONATHAN: soldier; b. at Boston, Mass., May 20, 1750; was employed in the office of a commercial house in Boston; made frequent business voyages to the West Indies and to England. He was secretary to his granduncle Benjamin Franklin, ambassador to France. While abroad he studied the military sciences, and made himself acquainted with standard works on fortification. Returning with his relative in 1785, he resided near Philadelphia, where he was for several years a judge of the court of common pleas. On Feb. 16, 1801, he entered the army. In December he was appointed inspector of fortifications, and took command of the post of West Point and the duties of instruction of the artillerymen and engineers. The act of Mar. 16, 1802, fixing the military peace establishment, separated the two corps and provided for the present Military Academy, of which the "principal engineer" should have the superintendency. Under this act Williams was retained as major of engineers (Apr. 1, 1802; lieutenant-colonel July 8, 1802), and at once assumed the duties of superintendent at West Point, where he continued until June 20, 1803, when on a question of rank he resigned from the army. An adjustment of the point at issue was arranged, however, and Apr. 19, 1805, Williams, at the request of President Jefferson, returned to the army as chief engineer, with the rank of lieutenant-colonel, resuming also the superintendency of the Military Academy. While exercising the latter duty he devoted himself personally to the fortifications of New York harbor and most of the forts which constitute its inner line of defense, being promoted colonel and chief engineer Feb. 23, 1808. Fort Columbus, Castles Williams and Clinton (Castle Garden), and a work similar to the last named (Fort Gansevoort) located 2 or 3 miles higher up the river, were planned by him and built under his immediate supervision. Castle Williams was the first "casemated" battery erected in the U. S. (built 1807-10), and was planned after the system of Montalembert, with which Col. Williams had made himself acquainted in France. Upon the declaration of war with Great Britain in 1812 he was at Castle Williams, and being the senior officer present claimed command of that work. The authorities at Washington, however, assigned the command to another, whereupon Col. Williams resigned July 31, 1812. Returning to Philadelphia, he was elected to Congress in 1814, and devoted his leisure to literary pursuits. He was vice-president of the American Philosophical Society; author of a *Memoir on the Use of the Thermometer in Navigation* (1799); *Elements of Fortification* (translation, 1801); *Kosciusko's Movements for Horse Artillery* (1808); of numerous military and philosophical works; and translator of several works on military

science. He was an officer of decided merit, and justly styled the "father of the Corps of Engineers." D. in Philadelphia, Pa., May 16, 1815. Revised by JAMES MERCUR.

Williams, MONIER: See MONIER-WILLIAMS, MONIER.

Williams, OTHO HOLLAND: b. in Prince George's co., Md., in Mar., 1749; entered the Revolutionary army before Boston as lieutenant of a rifle company 1775; became major of a rifle regiment and was wounded and taken prisoner at Fort Washington, N. Y., 1776, but soon exchanged; made colonel of the Sixth Maryland Regiment, with which he accompanied Gen. De Kalb to South Carolina; was adjutant-general of the Southern army under Gens. Gates and Greene from 1780 until the end of the war; rendered efficient service at the battle of Camden and during Greene's retreat, when he commanded a light corps which acted as a rear-guard; took an active part, commanding the Maryland Brigade, at the battles of Guilford and Hobkirk Hill; decided the victory by a brilliant charge at Eutaw Springs; was made brigadier-general May, 1782, and was collector of customs for Maryland from 1783 to his death, July 16, 1794. He wrote a *Narrative of the Campaigns of 1780*. A *Skeetch* of his life was published by Osmond Tiffany (Baltimore, 1851).

Williams, ROGER: founder of the State of Rhode Island; b. in London, England, in 1607. He studied at Sutton's Hospital (later the Charter-house School) and graduated at Pembroke College, Cambridge, Jan., 1626. He took orders in the Church of England, and obtained a benefice in Lincolnshire; but soon became a decided Nonconformist or "Separatist." He embarked for New England at Bristol, Dec. 1, 1630, with his wife Mary, on board the ship *Lyon*, and arrived off Nantasket, Mass., Feb. 5, 1631. He was immediately chosen to supply the pulpit of John Wilson, minister of Boston, during the latter's contemplated visit to England, but declined on the ground that that Church was "an unseparated people." He soon made known some "novel opinions," denying the right of magistrates to punish breaches of the Sabbath or other offenses against religion, coming thereby into collision with the authorities of the colony, and soon afterward he went to Plymouth, where he labored as assistant to Rev. Ralph Smith, a rigid Separatist, supporting himself by manual labor, though also engaging in trade in a limited way. He acquired the Indian language, which stood him in good stead during all his after-life. Leaving Plymouth with a number of adherents in 1633, the Church having refused to sanction "divers of his singular opinions," Williams proceeded anew to Salem, where he assisted Mr. Skelton, though without formal ordination. A treatise which he had written at Plymouth to prove the title of the Massachusetts Company to its lands incomplete without purchase from the Indians, Williams now sent to Gov. Winthrop at the latter's request. Its examination by the Governor and assistants, Dec. 27, 1633, resulted in a vote censuring the author. Williams was nevertheless, on Mr. Skelton's death, Aug., 1634, settled as pastor of the Salem church. The resident's oath, instituted Apr. 8, 1635, Williams refused to take. "He would not renounce an oath which he had taken and substitute another which bound him to obey whatever laws the magistrate might deem wholesome. The reason assigned for the new oath, moreover, was to guard against 'episcopal and malignant practices.' This gave it the appearance of a law to restrain liberty of conscience." Williams was cited before the general court held July 8, when he maintained his opinions in a protracted debate. The Salem people having before the court a claim, which all admitted to be just, for some land at Marblehead Neck, and the court refusing to give them the land so long as the Church stood by Williams, the Salem church sent letters, indited by Williams, to the other churches of the colony, rebuking the magistrates for their "heinous sin," and demanding that they be admonished therefor. This turned public sentiment against the Salem church, and a majority refused to go with Williams further. The Salem church's letter to the other churches and Williams's letter to the Salem church to persuade it to refuse communion with the others till Salem's wrongs were righted, were declared "full of anti-Christian pollution," and brought him before the court again in September. His own church now "had him under question for the same cause, and he, on his return home, refused communion with his own church." Williams's final appearance before the court occurred at Newtown (Cambridge), Oct. 8, 1635, when he was charged with having taught various doctrines subversive of

the civil authority and of having "writ letters of defamation both of the magistrates and churches." He maintained his opinions in a formal debate with Rev. Thomas Hooker, whom the court had appointed to try and convince him. On the following day, Oct. 9, the court delivered its sentence. Williams was ordered to depart out of the Massachusetts jurisdiction within six weeks. Subsequently he was permitted to remain in Salem until the next spring, provided he should not "go about to draw others to his opinions." As people resorted to his house to hear him, he was alleged to have violated this condition. In January he was cited to Boston, but declined to go, as by so doing he should hazard his life. Capt. Underhill was dispatched to Salem with a sloop under orders to arrest him and put him aboard ship for England. Underhill came too late, as Williams had been gone three days, "but whither they could not learn." With four companions Williams "steered his course" for the land of the Narragansetts, being "sorely tossed for one fourteen weeks in a bitter winter season, not knowing what bread or bed did mean." Of the Indian chief Ousamequin he purchased a tract of land at Manton's Neck, on the east bank of Seekonk river, and in Apr., 1636, commenced to plant. But his old friend the Governor of Plymouth "lovingly advised" him "that he had fallen into the edge of their bounds." Williams and his associates, William Harris, John Smith, Joshua Verin, Thomas Angell, and Francis Wickes, therefore, about June 1, removed "to the other side of the water," and, landing at a point near the present St. John's church in Providence, began the founding of that city. Making a "covenant of peaceful neighborhood" with the surrounding Indians, they proceeded to frame articles of agreement with one another, binding themselves to subject themselves to the will of the majority "only in civil things." Embracing now the principles of the Baptists, Williams was immersed, and, with some ten companions, in Mar., 1639, formed a Baptist church, but four months later he withdrew from it, and was never again connected with any church. In 1643 he visited England, and obtained a charter for his plantation through the influence of Sir Henry Vane. While in London he printed his *Key into the Language of America, or an Help to the Language of the Natives in that Part of America called New-England, Together with Brief Observations of the Customes, Manners, and Worships, etc., of the Aforesaid Natives in Peace and Warre, in Life and Death, etc.* (1643; new ed. by John Pickering, Providence, 1827), and two controversial treatises—*Mr. Cotton's Letter, Lately Printed, Examined and Answered* (1644) and *The Bloody Tenent of Persecution for Cause of Conscience, discussed, in a Conference betweene Truth and Peace, etc.* (1644), which elicited replies from Cotton and others. He returned to Providence 1644, landing at Boston in September, but refused to act as governor of the colony. He again visited England to secure a confirmation of the charter, starting in Nov., 1651, remaining in London between two and three years, and returning in June, 1654. He was for some time a teacher of the Hebrew, Greek, Latin, French, and Dutch languages, employing the conversational method of instruction. He became acquainted with Cromwell and Milton, and was intimate with Sir Henry Vane. With Mrs. Anne Sadleir, daughter of his early patron, Sir Edward Coke, Williams had a curious correspondence. He published *The Bloody Tenent yet more Bloody, by Mr. Cotton's endeavour to wash it white in the Blood of the Lambr, etc.* (1652); *The Hirling Ministry none of Christ's, or A Discourse touching the Propagating the Gospel of Christ Jesus, etc.* (1652); and *Experiments of Spiritual Life and Health, and their Preservatives* (1652). He returned to Providence early in 1654. He was president of the colony 1654-58, rendering important services to the neighboring colonies, as he had earlier done, by his influence with the Indians and by giving warning of impending hostilities. He refused to sanction in 1672 the proposed exclusion of Quakers from Rhode Island, but engaged in public debate, both at Newport and at Providence, with three Quaker preachers (Stubbs, Burnet, and Edmundson), and published *George Fox digg'd out of his Burrowes, or an Offer of Disputation on fourteen Proposals made this last Summer 1672 (so call'd) unto G. Fox, then present on Rhode-Island in New-England* (Boston, 1676), which elicited Fox's violent rejoinder: *A New England Fire-Brand Quenched, etc.* (1679). D. at Providence between Jan. 18 and Apr. 25, 1683. He was buried on his own estate, where a monument has been erected by his descendants. A statue of him

has also been placed by Rhode Island in the Capitol in Washington, D. C. His *Letters* (sixty-five in number) to the two Governors Winthrop were printed by the Massachusetts Historical Society (1863). The Narragansett Club has published a carefully prepared edition of his works (6 vols., 1866-75). There are biographies by J. D. Knowles (Boston, 1833), William Gannett (1846), Romeo Elton (London, 1852), Oscar S. Straus (1894). See also Samuel G. Arnold's *History of Rhode Island* (vol. i., 1860); Rev. Henry M. Dexter's *As to Roger Williams and his so-called "Banishment" from the Massachusetts Plantation* (Boston, 1876); and Henry F. Waters in *New England Genealogical Register* (July, 1889, pp. 291, seq.). What immortalizes Roger Williams and gives him a high place among the greatest characters of history is that, in spite of towering difficulties, he founded a State—the first in history—which was creedless itself, while welcoming and protecting all creeds whatsoever, thus giving to the principle of separation between Church and state that lodgment in American public law which led later to its adoption into the national Constitution.

E. BENJ. ANDREWS.

Williams, Rowland, D. D.: clergyman and author; b. at Halkyn, Flintshire, Wales, Aug. 16, 1817; educated at Eton and at King's College, Cambridge, and graduated 1841; became fellow and tutor there; took orders in the Church of England, identifying himself with the "Broad Church" movement headed by Arnold and Maurice; was prominent in connection with university reform; became chaplain to the Bishop of Llandaff; vice-principal and Professor of Hebrew at St. David's College, Lampeter, 1850; became vicar of Broad Chalk, Wiltshire, 1859; was prosecuted before the court of Arches for having contributed to the famous volume of *Essays and Reviews*, and was condemned Dec., 1862, but obtained a reversal of judgment from the Privy Council Feb., 1864; resigned his professorship 1862, and resided thenceforth at his vicarage of Broad Chalk, near Salisbury, where he died Jan. 18, 1870. He wrote *Rational Godliness* (London, 1855); *Christianity and Hinduism* (1856); *A Letter to the Lord Bishop of St. David's* (1860); *The Hebrew Prophets, a New Translation* (2 vols., 1868-71); *Broad Chalk Sermon-essays* (1867); *Owen Glendower* (1870); and *Psalms and Litany* (1872). See his *Life and Letters* (2 vols., 1874) by his widow. Revised by S. M. JACKSON.

Williams, Samuel Wells, J. L. D.: missionary and Sinologist; b. at Utica, N. Y., Sept. 22, 1812; graduated at the Rensselaer Polytechnic Institute at Troy, N. Y., 1832; went to Canton, China, as printer to the American mission 1833; assisted in editing the *Chinese Repository*; completed at Macao the printing of Medhurst's *Dictionary*; visited Japan to return some shipwrecked sailors 1837; learned the Japanese language, into which he translated the books of Genesis and Matthew; aided Dr. Bridgman in preparing his *Chinese Chrestomathy*; published *Easy Lessons in Chinese* (Macao, 1842), *The Chinese Commercial Guide* (1844), and *An English and Chinese Vocabulary in the Court Dialect* (1844); visited the U. S. 1845, delivering lectures on China, and procuring from Berlin a new font of Chinese type; published *The Middle Kingdom, a Survey of the Geography, Government, Education, Social Life, Arts, Religion, etc. of the Chinese Empire and its Inhabitants* (2 vols., 1848; 3d ed. 1857; revised ed. 1883), which is still considered the best work of the kind on that country; returned to China 1848; edited the *Chinese Repository* until 1851, when it was discontinued; accompanied Commodore Perry as interpreter on his expedition to Japan 1853-54; published a *Tonic Dictionary of the Chinese Language in the Canton Dialect* (1856); aided Hon. William B. Reed in the negotiation of the Treaty of Tientsin 1858; accompanied Mr. Ward to Peking to exchange the ratifications of 1859; revisited the U. S. 1860-61; went to reside at Peking as secretary of the U. S. legation 1862, then first established in the capital of China; published a fifth edition of the *Commercial Guide* (1863), nearly rewritten; completed and brought out the great work of his life, *The Syllabic Dictionary of the Chinese Language* (4to, Shanghai, 1874); returned to the U. S. in 1875 and settled at New Haven, Conn., where he was appointed Professor of Chinese at Yale College, and where he died Feb. 16, 1884. A new edition of his *Tonic Dictionary*, revised by Dr. Eitel, was published by the British authorities at Hongkong 1876. During the last years of his life he was president of the American Bible Society (elected Mar. 3, 1881), and also of the American Oriental Society.

Williams, Stephen, D. D.: clergyman; son of Rev. John Williams, the "redeemed captive"; b. at Deerfield, Mass., May 14, 1693; was carried captive with his family to Canada by the Indians Mar., 1704; was bought of the Indians by the French governor of Canada, and sent to Boston before the rest of his family, arriving there Nov. 21, 1705; not long afterward wrote a minute narrative of his experiences in captivity; graduated at Harvard 1713; taught school at Hadley 1713-14; was ordained minister of Longmeadow, Mass., Oct. 17, 1716; was chaplain of a regiment in Sir William Pepperell's expedition against Louisburg 1745, of Col. Ephraim Williams's regiment in the expedition to Lake George 1755, and of Col. Thomas Williams's regiment in the campaign of 1756; visited the Housatonic Indians at Stockbridge, Mass., 1734, and was instrumental in the establishment of a mission among them. D. at Longmeadow, Mass., June 10, 1782.

Williams, William: one of the signers of the Declaration of Independence; son of Rev. Solomon Williams; b. at Lebanon, Conn., Apr. 18, 1731; graduated at Harvard; served on the staff of his relative, Col. Ephraim Williams, in the expedition to Lake George 1755; became a merchant at Windham; was long the town-clerk and justice of the peace; was frequently elected to the provincial assembly, of which he was for many years speaker; was afterward a member of the council, of the committee of safety, and of the Continental Congress 1776-77 and 1783-84; was a signer of the Declaration of Independence; and contributed by his pen and his estate to the cause of independence, expending nearly his entire fortune in the patriot cause. D. at Lebanon, Conn., Aug. 2, 1811.

Williams, Sir William Fenwick: soldier; b. in Halifax, Nova Scotia, Dec. 4, 1800, and entered the Royal Artillery in 1825. Having been much employed in Turkey prior to 1848, he was in June of that year appointed British commissioner for the settlement of the Turco-Persian boundary, and in 1854 was made British commissioner with the Turkish army in the East, with the local rank of brigadier-general. His gallant defense of Kars in 1855 won him the promotion to major-general, and he was created a baronet and Knight of the Bath. The order of the Medjidie and the grand cross of the Legion of Honor of France were also bestowed on him. He was a member of Parliament for Calne 1856-59; was in command of the troops in Canada from 1859 to 1865, governor and commander-in-chief of Gibraltar 1870-76; retired 1877. D. in London, July 26, 1883.

Williamsbridge: former village in Westchester co., N. Y.; annexed to New York in 1895; on the Harlem division of the N. Y. Cent. and Hud. Riv. and the N. Y., N. H. and Hart. railways; 13 miles from the New York city-hall (for location, see map of the city of New York, ref. 3-F). It contains 6 churches, 2 public schools, and a part of Bronx Park, and has a weekly newspaper. Pop. (1890) 1,685; (1895) estimated, 4,500. EDITOR OF "COURIER."

Williamsburg: town (founded in 1818); capital of Whiteley co., Ky.; on the Cumberland river, and the Louisville and Nashville Railroad; 17 miles S. of Corbin, 100 miles S. by E. of Lexington (for location, see map of Kentucky, ref. 5-1). It is in a coal-mining region, and has 6 churches, 5 public schools, an academy, a college, a State bank with capital of \$60,000, 2 weekly newspapers, 3 large saw-mills, and 2 planing-mills. Pop. (1880) 208; (1890) 1,376; (1895) estimated, with suburbs, 2,500. EDITOR OF "TIMES."

Williamsburg: town (incorporated in 1771); Hampshire co., Mass.; on the Mill river, and the N. Y., N. H. and Hart. Railroad; 8 miles N. W. of Northampton (for location, see map of Massachusetts, ref. 2-D). It contains the villages of Williamsburg, Haydenville, and Searsville; has a high school, 15 district schools, public library, 3 churches, and a savings-bank (Haydenville); and is principally engaged in agriculture and the manufacture of hardware and brass goods. The bursting of a dam on Mill river at Haydenville in 1874 caused the loss of many lives and the destruction of much property. The assessed valuation of the town in 1894 was \$878,031. Pop. (1880) 2,234; (1890) 2,057; (1895) 1,955.

Williamsburg: city; capital of James City co., Va.; on the Ches. and Ohio Railway; 3 miles N. of the James river, 50 miles S. E. of Richmond (for location, see map of Virginia, ref. 6-1). It is on an elevated plateau between the James and York rivers, about equidistant from either stream; was first settled in 1632; is the oldest incorporated city in the State, and abounds in historic interest. Prior to

the Revolution it was the seat of the royal government, and subsequently, until 1779, the capital of the State. The Capitol was destroyed by fire in 1748, and rebuilt; the latter building was also burned about 1830. The Eastern Lunatic asylum, located here, authorized in 1769 and opened in 1773, is the oldest of the kind in the U. S. Williamsburg is also the seat of WILLIAM AND MARY COLLEGE (*q. v.*). Pop. (1880) 1,480; (1890) 1,831. LEONARD HENLEY, MAYOR.

Williamsburg, Battle of: a conflict during the civil war in the U. S., occurring May 5, 1862. The Confederates evacuated Yorktown on May 4 and fell back toward Richmond. McClellan, sending forward in pursuit the Third and Fourth Corps, preceded by the cavalry under Stoneman and followed the next day by the Second Corps, all under the command of Gen. E. V. Sumner, remained at Yorktown superintending the embarkation of the rest of the army on transports for transfer by water to West Point. Stoneman's advance overtook the Confederate cavalry of the rear guard near the Halfway House, from which point it fell back skirmishing until it occupied a line of twelve redoubts previously constructed as a defensive line across the Peninsula near Williamsburg. Here it was re-enforced, and became strong enough to stop Stoneman's advance. The Union infantry coming up was deployed for the attack, but the lateness of the hour, Hooker's troops not being in position till 11 p. m., and the fact that the ground was covered with woods and tangled undergrowth, led to the postponement of the attack until morning. In the early morning of the 5th the battle was begun by Hooker, whose Third Corps occupied the left of the line. His attack at first promised success, but the Confederates sending back the rest of Longstreet's division, he was held in check, and at about noon was driven back; losing some ground which was regained when Kearny's division came to his support at about 2 p. m. The battle in this part of the field was continued until night without gain on either side. Meanwhile, on the Union right an advance was made under Gen. W. F. ("Baldy") Smith's direction. Hancock, commanding his own brigade and a part of Davidson's, pushed forward across a creek and occupied an abandoned redoubt, from which he advanced and made a vigorous attack upon the enemy's left, with a view to relieving Hooker from the pressure upon him. The Confederates brought up four regiments to meet this attack. Hancock fell back to his position near the redoubt, where he had open ground in his front, and when the Confederates emerged from the woods, turned upon and repulsed them, inflicting upon them a heavy loss. The Confederate left fell back out of fire and remained in line of battle until it joined the rest of the army, when, during the night, it abandoned Williamsburg and retired toward Richmond. The Union losses on May 4 and 5 were 2,283 killed, wounded, and missing. The Confederates report a loss of 1,560 men. See *Battles and Leaders of the Civil War*; A. S. Webb, *The Peninsula*; and *Official Record*, etc. JAMES MERCUR.

Williams College: an institution of learning in Williamstown, Berkshire co., Mass. It owes its origin and name to Col. Ephraim Williams, who fell in 1755 near Lake George in the French and Indian war. On his way to the field of battle, at the city of Albany, he made his will, devoting the bulk of his property to the founding of an institution of learning, which in 1793 was chartered as Williams College. Rev. Ebenezer Fitch, D. D., who had been the principal of the school up to the time of its incorporation as a college, became its first president, and continued such till 1815. The catalogue published in 1795 contained seventy-seven names; the largest number of students under President Fitch was 144. Rev. Zephaniah Swift Moore succeeded him, resigning in 1821. Rev. Edward Dorr Griffin, D. D., followed, and held the office with distinguished success till 1836. What is now known as Griffin Hall was then built, and funds were raised for the library, for the aid of indigent students, and for other general purposes of the college. After Dr. Griffin came Rev. Mark Hopkins, D. D., LL. D., who after a successful presidency of thirty-six years, resigned in 1872. During this period the college grounds were greatly extended, several buildings erected, its corps of instructors enlarged, and an endowment amounting to nearly \$300,000 secured. The next head of the college was Hon. Paul A. Chadbourne, LL. D., formerly president of the State University of Wisconsin, who was succeeded by Prof. Franklin Carter, LL. D., in 1881, under whose management a large extension in endowments and buildings and equipments has taken place. At Williams College in 1806 the first foreign

missionary society formed in the U. S. originated in connection with Samuel J. Mills and his associates. Here, under Prof. Hopkins, was erected the first permanent astronomical observatory connected with a college in North America. Here, also, under Profs. Emmons and Hopkins, originated the first of those college scientific expeditions now so common, followed in later years by others to Labrador, Greenland, Florida, South America, and Central America. The condition of the college at present is highly prosperous; its libraries contain over 40,000 volumes; its cabinet, recitation-rooms, appliances, and apparatus are of the best order; it has eighteen professors and several instructors and assistants; its funds and securities amount to \$850,000; a college hall has been erected where board is furnished at cost. There are a number of scholarships, and an ample charitable fund. Revised by FRANKLIN CARTER.

Williamson: town; Wayne co., N. Y.; on Lake Ontario, and the Rome, Water, and Ogdens. Railroad; 6 miles W. ofodus, 15 miles E. by N. of Rochester (for location, see map of New York, ref. 4-B). It contains the villages of Williamson, East Williamson, and Poultneyville, and has a grain elevator, flour-mills, box-factory, mineral spring, private bank, and a weekly and a monthly periodical. Pop. (1880) 2,745; (1890) 2,670.

Williamson, HUGH, M. D., LL. D.: physician and statesman; b. at West Nottingham, Pa., Dec. 5, 1735; graduated at the University of Pennsylvania 1757; studied theology and occasionally preached; was Professor of Mathematics in the University of Pennsylvania 1760-63; studied medicine at Edinburgh and Utrecht, where he took his degree; practiced at Philadelphia; observed the transits of Venus and of Mercury for the Philosophical Society 1769; visited the West Indies 1772 and England 1773 to procure aid for the academy at Newark, Del.; was examined before the privy council 1774 on the subject of the destruction of tea; spent two years on the Continent 1774-76; engaged in mercantile business at Charleston, S. C., 1777; subsequently settled and practiced medicine at Edenton, N. C.; was a surgeon in the Continental service 1781-82; was a member of the North Carolina Legislature, a delegate to the Continental Congress 1782-85 and 1787-88, to the Federal constitutional convention 1787, and to the State convention that ratified the Constitution 1789, and a member of Congress 1790-93; removed afterward to New York, and was one of the founders of the Literary and Philosophical Society in 1814. D. in New York, May 22, 1819. He published various medical and scientific treatises, and a *History of North Carolina* (2 vols., 1812).

Williamson, ROBERT STOCKTON: soldier; b. in New York in 1824; graduated at the U. S. Military Academy July, 1848. In the civil war he served as chief topographical engineer at the capture of Newberne and Fort Macon, N. C. (Mar.-Apr., 1862), gaining the brevet of lieutenant-colonel for gallantry at the siege of Fort Macon; subsequently engaged in fortifying Newberne until August, when transferred to the Army of the Potomac. Ordered to the Pacific coast in 1863 (in May of which year he attained a majority in the Corps of Engineers), he was for a short time chief topographical engineer of the department, and retained on the staff of the general commanding, until Dec., 1865. From Feb., 1863, he performed the duties of lighthouse engineer, besides having charge at times of the improvement of rivers and harbors on the Pacific coast and of surveys in California and Oregon. Promoted lieutenant-colonel Corps of Engineers Feb., 1869; retired for physical disability June, 1882. In 1868 he published a valuable work *On the Use of the Barometer on Surveys and Reconnoissances* (New York). D. Nov. 10, 1882. Revised by JAMES MERCUR.

WilliamSPORT: city (founded in 1827); capital of Warren co., Ind.; on the Wabash river, and the Wabash Railroad; 24 miles S. W. of Lafayette, 25 miles N. E. of Danville, Ill. (for location, see map of Indiana, ref. 5-B). It is in an agricultural and stock-raising region; has 5 churches, high school, graded school, 2 State banks (combined capital, \$100,000), 2 weekly papers, a building-stone quarry, large grist-mill, electric lights, and several warehouses. Within a distance of 3 miles are extensive coal mines and the Indian mineral springs. Pop. (1880) 913; (1890) 1,062; (1895) 1,684. Editor of "THE REVIEW."

WilliamSPORT: town (founded in 1787); Washington co., Md.; on the Potomac river, the Chesapeake and Ohio Canal, and the Cumberland Valley and the West. Md. railways; 6

miles S. W. of Hagerstown, the county-seat, 15 miles N. N. E. of Martinsville (for location, see map of Maryland, ref. 1-C). It is in a timber region, has excellent water-power, and contains 6 churches, 6 schools for white children and 1 for colored, several flour-mills, sash and door factories, and a national bank with capital of \$100,000. There are 2 weekly newspapers. The city has an extensive trade in bituminous coal and grain. The Confederate army under Gen. Lee crossed the Potomac at this point in June, 1863, when advancing to Gettysburg. Pop. (1880) 1,503; (1890) 1,277; (1895) estimated, 1,600.

EDITOR OF "LEADER."

Williamsport: city (selected for county-seat in 1795, chartered as a city in 1866); capital of Lycoming co., Pa.; on the Susquehanna river, and the Beech Creek, the Williamsport and North Branch, the Fall Brook, the North Cent., the Penn., and the Phil. and Read. railways; 96 miles N. of Harrisburg, 202 miles N. W. of Philadelphia (for location, see map of Pennsylvania, ref. 3-F). It is built on a plain along the river at the base of hills; is regularly laid out, paved with asphalt, wood, brick, and macadam, supplied with water from mountain springs piped beneath the river, and lighted with gas and electricity; and has a steam-heating plant. Local and suburban transit is promoted by five electric railways. The city has 3 public parks, 2 race-courses, Dickinson Seminary, City Hospital, City Mission, Women's Christian Home, Girls' Industrial Home, Y. M. C. A. building, public library, 5 national banks, a State bank, an incorporated and a private bank, with combined capital of \$1,226,000 and surplus of \$970,000, and 4 daily, 8 weekly, and 4 monthly periodicals. It derives its prosperity from its lumber manufactures and diversified industries. The Susquehanna boom, which cost over \$1,000,000, is located here, and catches all logs cut from the vast forests of pine and hemlock on the western branch of the river and its tributaries. There are about 30 sawmills, picket, lath, and shingle mills, sash, door, and blind factories, rubber-works, silkmill, sewing-machine works, iron furnace, furniture, soap, paint, glue, and carriage and wagon factories, boiler-works, and manufactories of wood-working machinery. Pop. (1880) 18,934; (1890) 27,132.

JAMES W. SWEELY, EDITOR OF "THE SUN."

Williamston: village; Ingham co., Mich.; on the Det., Lans. and N. Railroad; 14 miles E. by S. of Lansing, 32 miles N. by E. of Jackson (for location, see map of Michigan, ref. 7-I). It is in an agricultural, coal, and fire-clay region, and has Baptist, Congregational, Methodist Episcopal, and Roman Catholic churches, two public-school buildings, a State bank with capital of \$50,000, and a weekly paper. Pop. (1890) 1,139; (1894) 1,120.

EDITOR OF "ENTERPRISE."

Williamstown: town (incorporated in 1765); Berkshire co., Mass.; on the Hoosac and Green rivers, and the Fitchburg Railroad; 5 miles W. of North Adams, with which it is connected by electric railway, and 42 miles E. of Troy, N. Y. (for location, see map of Massachusetts, ref. 2-C). It contains the villages of Williamstown, South Williamstown, Blackington, Sweet's Corners, and Williamstown Station, and has excellent water-power for manufacturing. There are a high school, 21 district schools, public library, 6 churches, 4 hotels, a national bank with capital of \$50,000, and a weekly and a monthly periodical. The town is principally engaged in bleaching and the manufacture of woolen goods; and has the extensive freight yards of the Fitchburg Railroad. Williamstown is widely noted as the seat of WILLIAMS COLLEGE (*q. v.*). Pop. (1880) 3,394; (1890) 4,221; (1895) 4,887.

EDITOR OF "WILLIAMS WEEKLY."

Williamstown: borough; Dauphin co., Pa.; on the North Cent. and the Williams Val. railways; 20 miles E. of Millersburg, about 50 miles N. E. of Harrisburg (for location, see map of Pennsylvania, ref. 5-G). It is in a mining and coal-shipping region and has 9 churches, 12 schools, 6 hotels, 2 public halls, 2 weekly newspapers, and hosiery-mills and coach-shops. Pop. (1880) 1,771; (1890) 2,324.

EDITOR OF "TIMES."

Williamstown: town; Orange co., Vt.; on the Cent. Vt. Railroad; 10 miles N. W. of Chelsea, 12 miles S. of Montpelier (for location, see map of Vermont, ref. 6-C). It has three churches, a library (founded in 1801), hotel, and manufactories of harness, granite monuments, lumber, shingles, and grist. Pop. (1880) 1,038; (1890) 1,188.

Willibrod: See WILIBROD.

Williman'tic: city (incorporated as a borough in 1833, chartered as a city in 1893); Windham co., Conn.; at the

junction of the Willimantic and Natchaug rivers, which here form the Shetucket, and on the Cent. Vt., the N. Y. and New Eng., and the N. Y., N. H. and Hart. railways; 16 miles N. by W. of Norwich, 32 miles E. by S. of Hartford (for location, see map of Connecticut, ref. 8-J). It is picturesquely situated between the two rivers, has exceptional water-power from a fall of 91 feet in the Willimantic river within the city limits, and contains numerous manufactories in the two valleys. The city owns improved water and sewerage systems, is the only city in the county, and is the trade center of a region having 25,000 inhabitants. There are Baptist, Congregational, Methodist Episcopal, Protestant Episcopal, Swedish Lutheran, African Methodist Episcopal Zion, Roman Catholic, Spiritualist, Unitarian, and Christian Believers churches and missions. The educational institutions include a State Normal-training School, with model schools attached (building completed in 1895, cost \$125,000), Central Public High School, Natchaug graded schools, and St. Joseph's parochial school. There are two libraries, the Public (founded in 1864) and Dunham Hall (founded in 1878).

The municipal receipts in 1894 were \$67,862, expenditures \$66,496; tax rates, city 10 mills, town 9 mills; the funded debt (incurred for water-works and now practically self-sustaining) \$200,000, floating debt \$169,000. In 1895 there were 2 national banks with combined capital of \$200,000, 2 savings-banks with aggregate deposits of nearly \$1,500,000, and two flourishing building and loan associations; and a daily and 2 weekly newspapers. The principal industries are the manufacture of thread, spools, silk, print cloths, cotton warps, hosiery, silk machinery, carriages, and paper boxes, and there are also an iron-foundry, a grain elevator, and a quarry. Pop. (1880) 6,608; (1890) 8,648; (1895) estimated, 9,000.

ALLEN B. LINCOLN.

Willis, NATHANIEL PARKER: author; son of Nathaniel Willis, editor; b. at Portland, Me., Jan. 20, 1806; studied at the Boston Latin School and at Phillips Academy, Andover; graduated at Yale College 1827; gained while an undergraduate a prize of \$50, offered by the *Album* for the best poem, and wrote for his father's paper, the *Boston Recorder*, some religious poems which are still much admired, and were reprinted by S. G. Goodrich under the title *Sketches* (Boston, 1827); edited for Mr. Goodrich ("Peter Parley") two annuals, *The Legendary* (1828) and *The Token* (1829); founded and conducted at Boston *The American Monthly Magazine* (1829-31) until it was merged in the New York *Mirror* (1823-42), of which he became in 1831 associate editor with George P. Morris; traveled in Europe and Asia Minor 1831-36, seeing much of the best literary society, which he described with abundance of personal details in letters to the *Mirror*, collected under the title *Pencilings by the Way* (3 vols., London, 1835, and more completely at New York, 1844); married in England in 1835 Miss Mary Leighton Stace; wrote for numerous English magazines; returned to the U. S. 1836; settled on a beautiful estate on the Susquehanna, near Owego, N. Y., which he called "Glen Mary"; founded, with Dr. T. A. Porter in 1839, a short-lived weekly literary paper, *The Corsair*; revisited Europe in 1839; discontinued the *Mirror* Dec. 31, 1842; conducted, with Gen. Morris, two daily papers, *The New Mirror* (Apr. 8, 1843, to Sept. 28, 1844) and *The Evening Mirror* (Oct. 7, 1844, to end of 1845); lost his wife, and went to Europe for his health 1845-46; published numerous volumes of European correspondence; married Miss Grinnell, of New Bedford, 1846, and established in 1853 a new home at "Idlewild," near Newburg, on the Hudson; joined his friend Morris (Nov., 1846) in the editorship of a new weekly paper, the *Home Journal*, upon which he continued to be occupied until his death, at Idlewild, Jan. 20, 1867. Among his numerous works were *Inklings of Adventure* (3 vols., 1836); *Loiterings of Travel* (3 vols., New York, 1840); *Letters from under a Bridge* (London, 1840); *People I have Met* (1850); *Hurry-graphs* (1851); *A Health-trip to the Tropics* (1854); *Famous Persons and Places* (1854); *The Convalescent, his Rambles and Adventures* (1859); and a volume of *Poems*, which appeared in many editions, some of them richly illustrated. Willis was for many years the most brilliant and popular American magazinist. His published writings (of which a "complete" edition was published in one volume in 1846; *Complete Poems* in one volume in 1868; and *Prose Works* in 13 volumes in 1849-59) include stories, sketches of travel, miscellaneous papers of social observation, and verses secular and religious. See *Nathaniel Parker Willis*, by Henry A. Beers (Boston, 1885).

Wills, THOMAS, F. R. S.: physician and author; b. at Great Bedwin, Wiltshire, England, Jan. 27, 1621; studied at Christ Church, Oxford; took the degree of bachelor of medicine 1646; served in the royalist ranks during the great rebellion; practiced his profession at Oxford; became Sedleian Professor of Natural Philosophy in the university at the Restoration; afterward settled in London; was one of the founders of the Royal Society; became physician to Charles II. 1666; and the same year removed to Westminster. He published several medical works, written in good Latin, of which the most important were *Cerebri Anatome, cui accessit Nervorum Descriptio et Usus* (1664); *Pathologie Cerebri et Nervosi Generis Specimina* (1667); and *De Anima Brutorum* (1672). His complete works were posthumously published in Latin (2 vols., Geneva, 1676; Amsterdam, 1682) and in English, translated by Roger l'Estrange (folio, 1679). D. at St. Martin's, London, Nov. 11, 1675, and was buried in Westminster Abbey.

Willmar: village (founded about 1868); capital of Kandiyohi co., Minn.; on Foot Lake, and the Great North. Railway; 92 miles W. by N. of Minneapolis (for location, see map of Minnesota, ref. 9-C). It is in an agricultural and dairying region, and has 9 churches, 2 public-school buildings, court-house, jail, 2 State banks (combined capital, \$90,000), and 2 weekly newspapers. Pop. (1880) 1,002; (1890) 1,825; (1895) 2,511. EDITOR OF "REPUBLICAN GAZETTE."

Willmore, JAMES TIBBITS: engraver; b. at Handsworth, Staffordshire, England, Sept. 15, 1800; became one of the most eminent of the landscape-engravers who distinguished themselves by their reproductions of the masterpieces of Turner, and was made an associate of the Royal Academy 1843. Among his prints of Turner are *Mercury and Argus*, *The Fighting Téméraire*, and *Ancient Italy*. He also engraved several notable pictures by Eastlake, Landseer, Stanfield, and Creswick. D. Mar. 12, 1863.

Will-o'-the-Wisp: See *IGNIS FATUUS*.

Willoughby: village (settled under the name of Chagrin about 1794); Lake co., O.; on the Chagrin river, and the Lake Shore and Mich. S. and the N. Y., Chi. and St. L. railways; 3 miles E. of Lake Erie, 18 miles N. E. of Cleveland (for location, see map of Ohio, ref. 1-1). It is in a grape and fruit growing region; has five churches, high and graded schools, water-works, electric lights, a private and a branch bank, and a weekly and a quarterly periodical; and is principally engaged in the manufacture of brick and tile machinery and fruit and market baskets and in shipping cheese, milk, and fruit. Pop. (1880) 1,091; (1890) 1,219; (1895) estimated, 1,500. EDITOR OF "INDEPENDENT."

Willoughby, Sir HUGH: explorer; supposed to have been born at Risby, Derbyshire, England, about 1500; acquired military experience in the continental wars; was chosen commander of an expedition fitted out by the Merchants Adventurers at the instance of Sebastian Cabot, and received from Edward VI. a "license to discover strange countries"; fitted out three vessels, one of them under the command of Richard Chancellor; sailed from Deptford May 10, 1553; proceeded to the Arctic regions by the coasts of Norway; but his vessel, having become separated from the others, was detained in the ice somewhere upon the northern coast of Lapland. By a journal, supposed to be his, which was recovered from the Russians, it appeared that his company was living in Jan., 1554, but when his vessel, the *Bona Speranza*, was discovered in the spring of 1554, all the inmates were dead. Richard Chancellor, with his vessel, the *Edward Bonaventura*, discovered the port of Archangel, and thus gave rise to direct commerce with Russia, which did not then extend to the Baltic. A journal of Sir Hugh's voyage to Sept., 1553, is printed in Hakluyt, from a MS. in the handwriting of Michael Lok.

Willow [M. Eng. *wilowe*, *wilwe* < O. Eng. *wilig*; O. Dutch *wilge* > Dutch *wilg*]; any tree or shrub of the genus *Salix*, of which there are over 160 well-recognized species, besides innumerable varieties. Many of the long-leaved shrubby sorts are used in basket-making, and the larger, short-leaved kinds, called *sallows* in England, are in Europe raised in copses for hoop poles; for charcoal, to be used in gunpowder-making; for fence-poles, which when peeled and dried are very durable; for vine-props, hoe-handles, and the like. Willow-wood is also used for steamboat paddles, cricket-bats, and surgeons' splints. It is light, tough, and stands exposure in water very well. Salicine, an active principle from willow-bark, is very useful in medi-

cine. The *S. babylonica*, or weeping willow, has long been an emblem of grief. It is much planted as an ornamental tree. There are about 100 species of willow in North America.

Revised by L. H. BAILEY.

Willow: town (laid out in 1876); capital of Glenn co., Cal.; on the South Pac. Railroad; 21 miles N. of Colusa, 151 miles N. by E. of San Francisco (for location, see map of California, ref. 5-C). It is in an agricultural and fruit-growing region; was named from a willow grove, the only one for miles around, in the center of the town; and has 5 churches, high and district schools, county court-house (erected in 1894 at a cost of \$150,000), a State bank with capital of \$300,000, and a daily and 2 weekly newspapers. Pop. (1880) 750; (1890) 1,176; (1895) 2,200.

PUBLISHER OF "JOURNAL."

Willow-apple: See *GALL INSECTS*.

Willow Family: the *Salicaceae*; a small group (about 200 species) of dicotyledonous trees and shrubs with alternate leaves, and dioecious, apetalous flowers in catkins. The ovaries are free, two to four carpellary, with as many basal-parietal placentae, each with usually many ovules; seeds with a tuft of hairs on the funiculus.

Upon comparison of the structure of the willow flowers with those of the TAMARISK FAMILY (*q. v.*) their similarity may readily be seen. The principal differences are due to the reduction of the willow flowers, whereby they have become didymous and apetalous. The pistils, placental, ovules, and seeds show striking similarities. It is interesting to note that in both families many living twigs detach themselves

A. pistillate flower of willow; B. vertical section of pistil of willow; C. staminate flower of willow; D. section of a flower of the tamarisk, for comparison. All magnified.

spontaneously in the autumn; this is notably the case with the cottonwood tree (*Populus monilifera*).

The species of this family are widely distributed in the northern hemisphere, but are scarcely found S. of the equator, South Africa and Chili having but one each, while they are wanting in Australia, the Malayan region, and the South Pacific islands. About seventy-five species are natives of North America, of which nine belong to the genus *Populus* (the poplars, cottonwoods, etc.), the remainder being true willows (*Salix*). CHARLES E. BESSEY.

Willow Grouse, or Ptarmigan: a gallinaceous bird the *Lagopus albus*; found in the northern regions of the Old and New Worlds. See *PTARMIGAN*.

Willow Herb: See *EMLOBIUM*.

Willow Springs: city; Howell co., Mo.; on the Kans. City, Ft. Scott and Mem. Railroad; 21 miles N. W. of West Plains, the county-seat (for location, see map of Missouri, ref. 8-11). It is in an agricultural and fruit-growing region, and has a State bank with capital of \$10,000, and two weekly newspapers. Pop. (1880) not reported; (1890) 1,539.

Wills, WILLIAM GORMAN: dramatist; b. in County Kerry, Ireland, in 1830; educated at Trinity College, Dublin; studied art at the Royal Irish Academy; was a portrait-painter at Dublin and in London; author of *Notice to Quit* (3 vols., 1861) and *The Life's Evidence* (3 vols., 1863), both republished in the U. S., and of several successful dramas, among which are *Charles the First* (1872); *Eugene Aram* (1873); *Marie Stuart* (1874); *Jane Shore* (1876); *Olivia* (1878); *Nell Gwynne* (1878); *Black-eyed Susan* (1880); *Sedgemoor* (1881); *Claudian* (1885); *A Royal Divorce* (1891); and in conjunction with Sydney Grundy, *Mudame Pompadour*. D. in London, Dec. 14, 1891.

Wills, WILLIAM JOHN: physician and explorer; b. at Totnes, Devonshire, England, Jan. 5, 1834; educated at the Ashburton grammar school; was apprenticed to his father, Dr. William Wills; pursued his medical studies also in London; emigrated to Australia Oct., 1852; was joined there in the following year by his father, with whom he practiced medicine at Ballarat; became a surveyor; was appointed assistant in the magnetic observatory at Melbourne Nov., 1858; joined the expedition headed by O'Hara Burke for the exploration of the interior of the continent, leaving Melbourne Aug. 20, 1860; crossed the entire continent northward through the deserts, reaching the Gulf of Carpentaria in Jan., 1861, but on their return both Burke and Wills died of starvation near Cooper's creek about July 1, 1861. The journal kept by the latter was recovered and published by his father, *A Successful Exploration from Melbourne to the Gulf of Carpentaria, from the Journals and Letters of William John Wills* (1863).

Willson, DAVID BURT, M. D., D. D.: educator and editor; b. in Philadelphia, Pa., Sept. 27, 1842; educated at the University of Pennsylvania, Jefferson Medical College, Philadelphia, and the Reformed Presbyterian Seminary, Allegheny, Pa.; was in medical service in the U. S. army in 1862, and again in 1863-65; pastor of the Reformed Presbyterian church, Allegheny, 1870-75; and since 1875 Professor of Biblical Literature in the Reformed Presbyterian Seminary, Allegheny. Since 1874 Dr. Willson has been an editor of the *Reformed Presbyterian and Covenanter*, Pittsburg, Pa.; he edited *Lyman's Historical Chart* (Philadelphia, 1867), and has published several addresses, including *The Revised Bible* (Pittsburg, 1881). C. K. HOYT.

Willson, ROBERT, D. D.: bishop; b. in Lincolnshire, England, in 1795; educated at the Roman Catholic Seminary at Oscott; was ordained priest 1825; was stationed several years at Nottingham; was appointed by Pope Gregory XVI. Bishop of Tasmania 1842; returned to England 1847, and communicated to the Government facts proving the barbarous treatment of convicts in Tasmania and on Norfolk island, which through his efforts was speedily remedied; returned to Tasmania 1848, resigned his bishopric from ill health 1865, and returned to England. D. at Nottingham, June 30, 1866. Revised by J. J. KEANE.

Will's Point: town; Van Zandt co., Tex.; on the Tex. and Pac. Railway; 48 miles E. of Dallas (for location, see map of Texas, ref. 2-J). It is in an agricultural region; has 5 churches, a public and 2 private schools, 2 private banks, and a weekly newspaper; is an important shipping-point for cotton, cattle, and hides; and has several flour-mills and cotton-gins. Pop. (1880) 860; (1890) 1,025; (1895) estimated, 1,800. EDITOR OF "CHRONICLE."

Willughby, FRANCIS: naturalist; b. at Wollaton Hall, Nottinghamshire, England, in 1635; graduated at Cambridge about 1656; became a pupil of John Ray in natural history; resided some time at Oxford; traveled extensively on the Continent with Ray, making valuable collections for a work on natural history. D. July 3, 1672. He left many Latin MSS. upon natural history, which were translated, digested, and extended by Ray, who made them the basis of his own labors. (See RAY, JOHN.) It is claimed that Willughby was the most accomplished zoologist of his time, and that he was the author of the system of classification in zoölogy adopted by Linnaeus. Revised by P. A. LUCAS.

Wilmerding: town (founded in 1889); Allegheny co., Pa.; near the Monongahela river, and on the Penn. Railroad; 8 miles S. E. of Pittsburg (for location, see map of Pennsylvania, ref. 5-A). It was laid out for a manufacturing town by the Westinghouse Air-brake Company, and contains a foundry, machine-shops, and other works that employ over 3,000 men. The town site contains forty-two plots, comprising 740 lots, on which several hundred workmen have built homes. The supply of water is from the Monongahela river, near Port Perry; every street is sewerd; natural gas is used for fuel; and the Westinghouse incandescent electric light is in general use. Wilmerding does its banking in Braddock. Pop. (1890) 419; (1895) estimated, 10,000.

Wilmington: city, port of entry, and capital of New Castle co., Del.; on the Delaware river at the junction of its affluents, the Christiana and Brandywine rivers, and on the Balt. and O., the Phil., Wil. and Balt., and the Wil. and North. railways; 28 miles S. W. of Philadelphia, 70 miles N. E. of Baltimore (for location, see map of Delaware, ref. 2-II). There are three freight and passenger steamship

lines to Philadelphia, connecting with the principal points on the Atlantic coast. The city is built mainly on elevated ground, and extends from the river front about 4 miles back, the most thickly settled part lying between the Christiana and the Brandywine rivers. The houses are principally of brick and Brandywine granite, and the streets are neatly paved, shaded well, lighted with gas and electricity, and traversed by electric cars. The city owns five parks and several squares. Among its public buildings are a new U. S. Government building, county court-house, city-hall, U. S. custom-house, public library, auditorium, and Delaware Historical Association hall, the latter over 100 years old. The old Swedes' church, built of stone in 1698, is in excellent preservation, and is used by Trinity Episcopal society. There are 83 churches, divided denominationally as follows: Methodist Episcopal, 31; Baptist, 13; Roman Catholic, 10; Protestant Episcopal, 10; Friends, 2; Lutheran, 2; Presbyterian, 11; Reformed Episcopal, 2; Swedenborgian, 1; and Unitarian, 1. The educational institutions include 26 public and many parochial and private schools, a business college, and a Friends' School. The most prominent charitable and reformatory institutions are the Ferris Reform School for Boys, and the girls industrial school. The Delaware State Hospital for the Insane is located at Farnhurst, 2 miles S., and the almshouse is near it. There are 2 savings-banks with aggregate deposits of \$4,000,000, 2 trust companies with combined capital of \$1,000,000, 6 national banks with combined capital and surplus of \$1,500,000, 18 loan associations, and 5 daily, 8 weekly, 1 semi-monthly, and 3 monthly periodicals. The Brandywine within 4 miles from its mouth has a fall of 120 feet, and furnishes water-power for many factories, including 18 morocco-factories, 17 carriage-factories, 3 paper-mills, Du Pont's powder-mills, 4 ship-building yards, 4 car-building works, 27 iron-works, 4 cotton-factories, 3 hard-fiber works, glass-works, 4 marine railways, phosphate-factory, 2 flour-mills, 2 hosiery-factories, terra-cotta works, dental factory, surgical-instrument factory, wire-cable mill, chemical works, Pullman palace-car works, pulp-mills, and a parlor-match factory. There are numerous brick-yards in the city.

The origin of the city was the building of Fort Christina by the Swedes in 1638. The Dutch captured this fort in 1655, and changed the name to Fort Altena, and the town under direction of Gov. Beekman became Christinaham. In 1731 the village of Willingtöwn, named after Thomas Willing, was begun. The name was afterward changed to Wilmington. The first borough election was held Sept. 8, 1740; the first town-hall was built in 1774; and a city charter was granted in 1832. Pop. (1880) 42,478; (1890) 61,431; (1895) estimated, 76,000. T. W. MULFORD.

Wilwaukee: city (founded in 1847; Will co., Ill.; on the Kankakee river, and the Chi. and Alton Railroad; 15 miles S. by W. of Joliet; 53 miles S. W. of Chicago (for location, see map of Illinois, ref. 3-G). It is in an agricultural and coal-mining region, and has 5 churches, high school, 2 national banks (capital, \$150,000), 2 weekly papers, good water-power, and several manufactories. Pop. (1880) 1,872; (1890) 1,576; (1895) estimated, 2,000. EDITOR OF "ADVOCATE."

Wilmington: city, port of entry, capital of New Hanover co., N. C.; on the Cape Fear river, and the Atlantic Coast Line, the Seaboard Air Line, the Wil. Newb. and Norf., and the Wil. Sea Coast railways; 88 miles S. W. of Newbern, 214 miles N. E. of Charleston, S. C. (for location, see map of North Carolina, ref. 5-H). It is 26 miles above the mouth of the river and 8 miles from the Atlantic Ocean, and is on a peninsula between the river and the ocean. The city is built along the river front a distance of 2 miles and extends back a mile. It is laid out in blocks of 24 acres, with five lots to the block. The principal streets are 99 feet wide; the others 66 feet. The surface is an elevated sand ridge, fairly well drained. Among the noteworthy buildings are the city-hall, court-house, U. S. Government building, U. S. Marine Hospital, the armory of the Wilmington Light Infantry, First Baptist church, Fifth Street Methodist Episcopal church, Grace church, St. John's Protestant Episcopal church, Y. M. C. A. and Y. M. C. U. buildings, and the public schools. The city has a chamber of commerce, a produce exchange, 3 hotels, 5 cemeteries, electric street-railways, water-works, electric lights, 2 national banks with combined capital of \$225,000, a savings and trust company with capital of \$25,000, a private bank, and a monthly, 3 daily, and 5 weekly periodicals.

There are 22 churches for white people and 17 for col-

ored; aggregate value of church property, \$350,000. The educational institutions include 2 public schools for white pupils and 2 for colored, with nearly 3,000 white pupils and nearly 4,500 colored; and 6 private and 4 parochial schools. There is also a library (founded in 1855), with over 5,000 volumes. A Bureau of Associated Charities and a Ladies' Benevolent Society look after the needy and unfortunate, and a County Home, a County House of Correction, and a Seamen's Friend's Society, and the Catherine Kennedy Home for elderly women take charge of special cases. The city has a bonded debt (1895) of \$782,000, and an assessed property valuation of \$7,036,920. The principal business interests are the exportation of naval stores, cotton, lumber, and rice; truck-farming; and the manufacture of cotton goods, fertilizers, cottonseed oil, turpentine, spirits and oil from pine, saw and lumber mill products, and lampblack.

The city was settled in 1730-31 under the name of New-ton; was incorporated under its present name in 1739; and was chartered as a city in 1866. The first newspaper was issued Sept. 1, 1764, and the first overt act of rebellion against British authority occurred in 1765, when the citizens refused to permit the landing of stamps brought in a man-of-war. On July 18, 1775, the militia under Col. John Ashe, who had led the anti-stamp party, captured Fort Johnson, at the mouth of the river, and forced the royal governor to flee. On the secession of North Carolina in 1861, Forts Johnson and Caswell were occupied by State troops. During the war many cargoes were run into Wilmington through the Federal blockading fleet, nearly 300 foreign steamships making the entrance safely with cargoes in the two years 1863-64. For the principal military operations in the vicinity of Wilmington during the war of 1861-65, see FORT FISHER. Pop. (1880) 17,350; (1890) 20,056; (1895) estimated, 25,000.

JOSH. T. JAMES, EDITOR OF "DAILY REVIEW."

Wilmington: city; capital of Clinton co., O.; on the Balt. and O., and the Cin. and Musk. Valley railroads; 55 miles N. E. of Cincinnati, 60 miles S. W. of Columbus (for location, see map of Ohio, ref. 7-D). It is in an agricultural region, and contains 2 national banks with combined capital of \$200,000, an incorporated bank with capital of \$25,000, several mills, bridge-works, auger-bit works, gas and electric light plants, and 3 weekly newspapers. It is the seat of Wilmington College (Orthodox Friends, coeducational, organized in 1870), which in 1894 had 10 instructors, 137 students, and 2,000 volumes in its library. Pop. (1880) 2,745; (1890) 3,079. EDITOR OF "CLINTON REPUBLICAN."

Wilmington: town (chartered in 1763); Windham co., Vt.; on the Deerfield river, and the Hoosac Tunnel and Wilm. Railroad; 20 miles S. W. of Newfane, 96 miles S. W. of Montpelier (for location, see map of Vermont, ref. 10-B). It has Baptist, Congregational, Methodist Episcopal, and Universalist churches, public high school, 12 district schools, savings-bank, 4 hotels, several creameries, lumber-mills, maple-sugar works, and a weekly and 2 monthly periodicals. Pop. (1880) 1,130; (1890) 1,106; (1895) estimated, 1,200.

EDITOR OF "DEERFIELD VALLEY TIMES."

Wilmot, DAVID: jurist; b. at Bethany, Pa., Jan. 20, 1814; educated at the academies of Bethany and of Aurora (Cayuga co.), N. Y.; studied law, was admitted to the bar, and began practice at Wilkesbarre, Pa., 1834; soon removed to Towanda; sat in Congress as a Democrat 1845-51, and moved on Aug. 8, 1846, an amendment to a bill appropriating \$2,000,000 for the purchase of Mexican territory, which became celebrated under the name "the Wilmot proviso": "That, as an express and fundamental condition to the acquisition of any territory from the republic of Mexico by the U. S., . . . neither slavery nor involuntary servitude shall ever exist in any part of the said territory." This proviso was adopted by the House, but rejected by the Senate, and became the starting-point for the "Free-soil" movement of 1848. Mr. Wilmot was president judge of the Thirteenth District of Pennsylvania 1853-61, was a delegate to the Republican national conventions of 1856 and 1860, acting as the temporary chairman of the latter; an unsuccessful candidate for Governor of Pennsylvania 1857; was U. S. Senator to fill a vacancy 1861-63, and was appointed a judge of the U. S. court of claims by President Lincoln 1863. D. at Towanda, Pa., Mar. 16, 1868.

Wilmot, JOHN: See ROCHESTER, EARL OF.

Wilmot, ROBERT DUNCAN: statesman; b. in Fredericton, New Brunswick, Oct. 16, 1809; educated in St. John; en-

gaged in business as a shipowner; represented St. John (city and county) in the New Brunswick Assembly 1846-61, 1865-67; was a member of the executive council of the province 1851-54, 1856-57, again in his own government in 1865, and from 1866 until 1867. He was surveyor-general of province 1851-54; provincial secretary 1856-57; mayor of St. John 1849; a delegate to the colonial conference in London 1866-67; and appointed in 1875 a commissioner on behalf of Canada to the Centennial Exposition at Philadelphia. He became a member of the Canadian Senate in Mar., 1865; a member of the privy council Nov. 8, 1878; was Speaker of the Senate from Nov. 8, 1878, to Feb. 1, 1880; and lieutenant-governor of New Brunswick from the latter date until Oct. 31, 1885.

NEIL MACDONALD.

Wilson: town; capital of Wilson co., N. C.; on the Atlantic Coast Line of railroads; 44 miles E. of Raleigh, 108 miles N. of Wilmington (for location, see map of North Carolina, ref. 3-II). It is in an agricultural and a cotton and tobacco growing region; contains a collegiate seminary for young ladies, an academy, a graded school for colored pupils, a national bank with capital of \$51,000, a State bank with capital of \$50,000, improved water-works, and an electric-light plant; and has a semi-monthly and two weekly periodicals, several cotton-mills, large carriage-factory, plow-works, machine-shops, planning-mills, harness-factory, and a sash, door, and blind factory. Over 5,000,000 lb. of tobacco are handled here annually. Pop. (1880) 1,475; (1890) 2,126; (1895) estimated, 4,000.

MANAGER OF "ADVANCE."

Wilson, ALEXANDER: ornithologist; b. at Paisley, Scotland, July 6, 1766; was trained as a weaver; engaged in peddling; published a volume of poems in 1790 (2d ed. 1791); was sentenced in 1793 for a lampoon, after which event he emigrated, and landed at New Castle, Del., July 14, 1794. He worked for some time as a weaver, and then as a peddler; taught school in various places—in 1802 at Kingsessing on the Schuylkill—and was afterward employed in Philadelphia as editor of the American edition of Rees's *Cyclopaedia*. During his wanderings as a peddler he always took a great interest in observing the life of birds; and this interest was further developed during his residence at Kingsessing by his acquaintance with William Bartram. He determined to write an American ornithology. At his death, in Philadelphia, Aug. 23, 1813, seven volumes of this work had been published; the eighth and ninth were edited after his death by George Ord, and a continuation was given by Charles Lucien Bonaparte (Philadelphia, 4 vols., 1825-33). His poems were published at Paisley in 1816, and at Belfast in 1857, and his statue was raised at Paisley in 1874. See C. Lucy Brightwell, *Difficulties Overcome, Scenes in the Life of Alexander Wilson, the Ornithologist* (London, 1860); Allan Park Paton, *Alexander Wilson the Ornithologist, a New Chapter of his Life* (1863); and a volume of verse, prose sketches, notes, etc., published by Alexander B. Grosart, Paisley, 1874.

Revised by F. A. Lucas.

Wilson, ALLEN B.: inventor in 1849 of the first sewing-machine by which an endless seam could be sewed capable of being turned upon any curve or at any angle at the pleasure of the operator while the seam was being formed. He was born in Central New York in 1827, and learned the trade of a cabinet-maker. In 1850 he also invented the rotary hook and stationary bobbin of the Wheeler & Wilson sewing-machine, by which was obtained a double-thread machine of the greatest speed, with the least expenditure of power and waste of thread, with the smallest wear of parts, adapted to a range of practical articles and fabrics from the lightest want of a family to the heaviest necessity of stitch manufacture. D. Apr. 29, 1888. See the article SEWING-MACHINES.

Wilson, Sir ARCHDALE: soldier; b. at Didlington, Norfolk, England, in 1803; entered the military service of the East India Company 1819 as an officer of artillery; was distinguished at the siege of Bhurtpore 1825-26; participated in the Sikh war 1848-49; became colonel 1854; was brigadier-general of artillery at Meerut at the outbreak of the Sepoy rebellion May, 1857; was the first British officer to encounter the mutineers in the field, defeating them May 30-31; effected a junction with the Delhi field force under Sir Henry Barnard; succeeded to the command of that force on the death of Barnard in July; maintained his position

before Delhi until Sept. 14, when the city was stormed and taken after six days' hard fighting in the streets, for which service he was made a baronet; received the thanks of both houses of Parliament and a pension of £1,000 from the East India Company; was promoted major-general Sept., 1857, and lieutenant-governor Mar., 1858, and took part as commander of the Royal Horse Artillery in the siege and capture of Lucknow, 1858, for which he was again thanked by Parliament. D. in London, May 9, 1874.

Wilson, AUGUSTA (Evans): See EVANS.

Wilson, Sir CHARLES RIVERS: financier; b. in London, Feb. 19, 1831; was educated at Eton and at Balliol College, Oxford; was appointed clerk in the Treasury in 1856; was a private secretary of Mr. Disraeli 1867-68, and of Mr. Lowe 1868-73, when they held the position of Chancellor of the Exchequer; and he became controller of the National Debt Office in 1873. In 1876 he was appointed one of the British administrators of the Suez Canal, and in 1878 was appointed vice-president of the international commission of inquiry into the financial condition of Egypt. On the presentation of their report he was made finance minister to the khedive, and in 1880 was appointed by the new khedive, Tewfik Pasha, president of the international commission of liquidation. In 1881 and 1885 he took part in international negotiations in Paris; in 1892 was one of the delegates at the monetary conference in Brussels; and in 1895 he became president of the Grand Trunk Railway of Canada. In 1880 he received the Turkish order of the Medjidieh, and was made a G. C. M. G. in 1895.

Wilson, Sir DANIEL, LL. D., F. R. S. E.: educator and author; b. in Edinburgh, Scotland, Jan. 5, 1816; educated at Edinburgh University, and engaged in literary pursuits. He was appointed Professor of History and English Literature in University College, Toronto, in 1853; became president of that institution in 1881; was elected president of the Canadian Institute in 1860; president of the Royal Society of Canada in 1885, and was knighted in 1888. He published the following works: *Memorials of Edinburgh in Olden Times* (1847); *The Archaeology and Prehistoric Annals of Scotland* (1851); *Prehistoric Man: Researches into the Origin of Civilization in the Old and the New World* (1862); *Chatterton, a Biographical Study* (1869); *Caliban, or the Missing Link* (1873); *Spring Wild Flowers* (1875); *Reminiscences of Old Edinburgh* (1878); *Anthropology* (1885); and *William Nelson, a Memorial* (1890). D. in Toronto, Aug. 7, 1892. NEIL MACDONALD.

Wilson, FLORENCE. known only by the Latinized form of his name as FLORENTIUS VOLUSENUS; scholar and theologian; b. near Elgin, Morayshire, Scotland, about 1500; educated at the Universities of Aberdeen and Paris; became a member of the households of Cardinals Du Bellay and Sadolet, master of the Latin and Greek school at Carpentras; author of *Commentatio quardam Theologica qua eadem Preceptio est in Aphorismis dissecta* (Lyons, 1539); *De Animi Tranquillitate* (1543; several times reprinted at Edinburgh, the best edition being that of Thomas Ruddiman, 1707); and *Poemata* (London, 1619). D. at Vienna in 1547. His death was commemorated by George Buchanan in sonorous Latin verses, and a *Life* was written by Dr. Lettice. Revised by J. J. KEANE.

Wilson, HENRY: statesman; b. at Farmington, N. H., Feb. 16, 1812; was apprenticed at the age of ten to a neighboring farmer, remaining in his service for eleven years, after which he took up his residence in Natick, Mass. In 1836 he visited Washington, where his first sight of slavery and the domestic slave-trade produced an impression so profound on his mind that he made a solemn resolve to devote his life to the cause of emancipation. In 1840 he was elected a member of the lower branch of the State Legislature; in 1841 and 1845 he was a member of the State Senate; in 1848 was a member of the national convention of the Whig party. In this body, on the nomination of Gen. Taylor on a platform unpledged against slavery extension, he openly renounced his connection with the Whig party, and gave his support to the Free-Soil organization. In 1850 he was again elected to the State Senate, and was made president of that body. He failed of an election as Governor of the State in 1853, but two years afterward he was chosen a Senator of the U. S. in the place of Edward Everett, resigned. During the civil war his name is associated with much important legislation, and he did especially good work as chairman of the committee

on military affairs. In 1872 he was elected Vice-President of the U. S. In the last years of his life he prepared his great literary work, *The Rise and Fall of the Slave Power*, two volumes of which were published before his death, the third and last being left nearly completed in manuscript. He died in Washington, Nov. 22, 1875.

Wilson, HENRY BRISTOW: clergyman and educator; b. in London, England, in 1803; educated at Merchant Taylors' School, of which his father, Rev. Harry B. Wilson, D. D. (1774-1853), was a master and the historian; studied at St. John's College, Oxford; graduated with high classical honors 1825; became a fellow and tutor at St. John's; took orders in the Church of England; was one of the four resident tutors at Oxford who in 1841 issued a joint protest and remonstrance to the editor of *Tracts for the Times* on account of their Romanizing interpretation of the XXXIX. Articles; was successively a select preacher, public examiner, Professor of Anglo-Saxon, and Bampton lecturer (1850) at Oxford; became vicar of Great Staughton, Huntingdonshire, 1851, and was one of the seven clergymen of the Church of England who in 1860 published the famous volume of *Essays and Reviews*, to which his contribution was an essay on *The National Church*; was tried for heresy before the court of arches, and sentenced to a year's suspension from his benefice 1862, but obtained a reversal on appeal to the privy council; was author of *The Communion of Saints, an Attempt to Illustrate the Principles of Church Union* (1851, the Bampton lecture); contributed to *Oxford Essays*, and published sermons and pamphlets on university and theological questions. D. at Lee, Kent, Aug. 10, 1888. Revised by S. M. JACKSON.

Wilson, HORACE HAYMAN, F. R. S.: Orientalist; b. in London, England, Sept. 26, 1786; studied medicine; went to India in 1808 as assistant surgeon in the Bengal service of the East India Company; gave his attention to chemistry; obtained an appointment in the Calcutta mint as assistant to Dr. Leyden, the noted Orientalist; became assay-master and secretary; applied himself with great diligence to the study of Sanskrit literature; was appointed secretary of the Asiatic Society of Bengal on the death of Dr. William Hunter 1811; became secretary to the public instruction committee at Calcutta, and director of studies of the Hindu college at Benares 1819; returned to England in 1832 as Boden Professor of Sanskrit at Oxford University; was appointed librarian at the East India House on the death of Sir Charles Wilkins 1836, and retained both offices until his death, in London, May 8, 1860. Among his numerous works were a *Sanskrit and English Dictionary* (Calcutta, 1819; 2d ed., enlarged, London, 1832); a *Sanskrit Grammar* (1841; 2d ed., Oxford, 1847); *A History of British India from 1805 to 1835* (3 vols., 1844-48); *Ariana Antiqua, a Descriptive Account of the Antiquities and Coins of Afghanistan* (1841); *A Sketch of the Religious Sects of the Hindus* (Calcutta, 1846); *A Glossary of Judicial and Revenue Terms, etc., in Arabic, Persian, Hindustani, Sanskrit, Bengali, Uriya, Marathi, Gujurathi, Telugu, Karnata, Tamil, Malayalam, and other Languages* (1855); and many translations in verse or prose of classical works from the Sanskrit, including *The Megha-Dūta, or Cloud Messenger* (1813; new ed., with vocabulary, 1869); *Select Specimens of the Theatre of the Hindus* (Calcutta, 3 vols., 1827; 2d ed., 2 vols., 1835); the *Vishnu Parāna* (1840; new ed., 6 vols., 1867-70); and *The Rig-Veda Sanhita* (3 vols., 1850-57), comprising about one-half of the hymns of that collection. His collected works were published under the editorship of Rost and Fitz-Edward Hall (13 vols., 1861-67).

Wilson, JAMES: signer of the Declaration of Independence; b. near St. Andrews, Scotland, in 1742; educated at the Universities of Glasgow, St. Andrews, and Edinburgh; emigrated to Pennsylvania 1766; was a tutor in the College and Academy of Philadelphia; studied law; was admitted to the bar 1768; practiced at Reading, Carlisle, and Annapolis, Md.; was a member of the Pennsylvania provincial convention 1774, and of the Continental Congress 1775-77, and again 1782-83 and 1785-87; signed the Declaration of Independence, and wrote several pamphlets on political questions; was commissioned a colonel at the outbreak of the Revolutionary war, but did not serve in the field; settled at Philadelphia 1778; was advocate-general for the French Government in the U. S. 1779-83; was a member of the committee which drafted the Federal Constitution 1787, of the Pennsylvania convention which ratified it, and of the convention which amended the State constitution of Penn-

sylvania in 1790; was appointed in Sept., 1789, one of the first judges of the U. S. Supreme Court, and became in 1790 the first Professor of Law in the College of Philadelphia. He published *Address to the Citizens of Philadelphia* (1784). D. at Edenton, N. C., Aug. 28, 1798. His *Works* (3 vols., 1803-04), consisting chiefly of legal lectures, speeches, and orations, were edited by his son, Bird Wilson.

Wilson, JAMES: naturalist; brother of Prof. John Wilson (1785-1854); b. at Paisley, Scotland, in 1795; studied but never practiced law; traveled on the Continent in 1816, 1819, and 1820-21; settled at Woodville, near Edinburgh, 1824, and died there May 18, 1856. He was the author of *Illustrations of Zoology* (9 parts, 1826-32); *A Treatise on Insects* (1835); *The Natural History of Quadrupeds and Whales* (1838); *The Natural History of Fishes* (1838); *The Natural History of Birds* (1839); *A Voyage round the Coasts of Scotland and the Isles* (2 vols., 1842); and *Illustrations of Scripture, by an Animal Painter*; aided Hugh Murray in his works on Africa, North America, and India, and Patrick Fraser Tytler in his *Progress of Discovery on the Northern Coasts of America* (1832); was joint author with James Duncan of *Entomologia Edinensis* (1834); contributed largely to *Blackwood* and the quarterly reviews, and wrote the articles on natural history in the 7th and 8th eds. of the *Encyclopædia Britannica*. His *Memoirs* (1859) were written by James Hamilton, D. D.
Revised by F. A. LUCAS.

Wilson, Sir JAMES ERASMUS, F. R. S.: dermatologist; b. at Aberdeen, Scotland, Apr. 28, 1809; studied medicine; became lecturer on anatomy and physiology at the Middlesex Hospital Medical School, consulting surgeon to St. John's Hospital, London; a fellow by election of the Royal College of Surgeons 1843; a member of its council 1870, and its president in 1881; gave special attention to diseases of the skin, in which branch he was the leading English authority; founded in 1869 in the College of Surgeons a museum and a professorship of dermatology, and was chosen the first occupant of that chair. He was the author of *Practical and Surgical Anatomy* (1838); *The Anatomist's Vade Mecum, a System of Human Anatomy* (1842); *Diseases of the Skin* (1842); *Healthy Skin* (1845); *History of the Middlesex Hospital* (1845); *Ringworm, its Causes, Pathology, and Treatment* (1847); *On Syphilis, Constitutional and Hereditary* (1852); *The Eastern or Turkish Bath* (1861); *On Food as a Means of Prevention of Disease* (1865); and edited the *Quarterly Journal of Cutaneous Medicine*. He spent large sums of money in charity, and for his benefactions was knighted in 1881. Most of his works have been reprinted, and have had a large circulation in the U. S. D. at Westgate-on-the-Sea, Aug. 7, 1884.
Revised by S. T. ARMSTRONG.

Wilson, JAMES F.: U. S. Senator; b. at Newark, O., Oct. 19, 1828; received a good education, and studied law; settled at Fairfield, Ia., 1853; was elected to the convention for revising the State constitution 1856; sat in both houses of the Legislature; became a member of the State Senate 1859; was president of that body 1861; was a member of Congress 1861-69, serving as chairman of the judiciary committee and as one of the managers of the impeachment of President Johnson, and in 1869 was appointed a commissioner for the Pacific Railroad; was elected U. S. Senator (Iowa) for 1883-89; re-elected for 1889-95. D. at Fairfield, Ia., Apr. 22, 1895.

Wilson, Gen. JAMES GRANT, D. C. L., LL. D.: author; b. in Edinburgh, Scotland, Apr. 28, 1832; was taken to the U. S. in infancy by his father, William Wilson, poet (1801-60); served through the civil war in the southwest under Gens. Grant and Banks, attaining the rank of brigadier-general. Prior to 1861 he had been engaged in the publishing business with his father in Poughkeepsie, N. Y.; settled in New York city at the close of the war. Since 1884 he has been president of the New York Genealogical and Biographical Society, and for three years also president of the American Authors' Guild, of which he was one of the founders. Gen. Wilson was instrumental in erecting the statues of Fitz-Greene Halleck (1877) and Columbus (1894) in the Central Park. Author or editor of *Illinois Officers in the Rebellion* (1863); *Life of Gen. Grant* (1868; 3d ed. 1885); *Mr. Secretary Peppys and his Diary* (1869); *Life and Letters of Fitz-Greene Halleck* (1869); *Sketches of Illustrious Soldiers* (1874); *Poets and Poetry of Scotland, from the Earliest to the Present Time* (2 vols., London and New York, 1876); *Continued History of the Diocese of New York, 1785-1885* (1886); *Bryant and his Friends; Reminiscences of the*

Knickerbocker Writers (1886); Appletons' *Cyclopædia of American Biography* (6 vols., 1886-89); *Personal Recollections of the Rebellion* (1891); *The World's Largest Libraries* (New York, 1894); *Memorial History of the City of New York* (4 vols., 1892-93); and Great Commanders' Series (16 vols., 1892-96).

Wilson, JAMES HARRISON: soldier; b. near Shawneetown, Ill., Sept. 2, 1837; educated at McKendree College and at West Point, where he graduated 1860; became first lieutenant of topographical engineers Sept. 9, 1861, and captain May 7, 1863; served in the Port Royal expedition and at the capture of Fort Pulaski, Ga., for which he was breveted major Apr. 11, 1862; was aide-de-camp to Gen. McClellan at South Mountain and Antietam; became staff lieutenant-colonel of volunteers Nov. 8, 1862; was assistant engineer and inspector-general of the Army of the Tennessee in the campaign against Vicksburg, and in the operations about Chattanooga and Knoxville; was made brigadier-general of volunteers Oct. 31; breveted lieutenant-colonel U. S. army Nov. 24, 1863, for gallantry at Chattanooga; commanded the 3d cavalry division of the army of the Potomac May to Aug., 1864; was breveted colonel May 5 for the battle of the Wilderness; took part in the ensuing battles of that campaign up to and during the siege of Petersburg, and in the Shenandoah valley Aug. and Sept., 1864; commanded the cavalry of the division of the Mississippi from Oct., 1864, to July, 1865; took part in Gen. Thomas's campaign in Tennessee, distinguishing himself at the battles of Franklin and Nashville, and in a cavalry raid into Alabama and Georgia Mar. and Apr., 1865; was breveted brigadier and major-general U. S. army Mar. 13, 1865, for the battle of Nashville and the capture of Selma, Ala., respectively; took Montgomery, Columbus, and Macon; was made major-general of volunteers Apr. 20, 1865; captured Jefferson Davis May 10, 1865; mustered out of volunteer service July 8, 1866; became lieutenant-colonel of Thirty-fifth Infantry July 28, 1866; resigned Dec. 31, 1870; vice-president St. Louis and Southeastern (now Louisville and Nashville) Railroad 1870-76; U. S. civil engineer on improvement of Illinois river, etc., 1871-76; and vice-president N. Y. and N. E. Railroad 1878-80, and its president 1880-83. He is the author of *Life of Gen. U. S. Grant* (1868); *Life of Andrew J. Alexander* (1887); *China; Travels and Investigations in the Middle Kingdom* (1887; new ed. 1894), besides numerous scientific and literary articles.
Revised by JAMES MERCUR.

Wilson, JOHN: clergyman; b. at Windsor, England, in 1588; educated at Eton School 1598-1602; entered King's College, Cambridge, 1602; graduated about 1606; obtained a fellowship; studied law three years at one of the inns of court; took orders in the Church of England; became conspicuous for his Puritanical leanings; took part in the project of the colonization of Massachusetts; emigrated with Winthrop's colony 1630; landed at Salem June 12; removed soon afterward to Charlestown, where he preached under a tree, and instituted (July 30) what was afterward the first church of Boston, consisting of himself, Gov. Winthrop, Isaac Johnson, and Deputy-Gov. Thomas Dudley; was ordained "teacher" of that church Aug. 27 by imposition of hands of the members thereof; was ordained pastor of the church Nov. 22, 1632; visited England in 1631 and again in 1634, returning with his wife Oct. 3, 1635, along with the celebrated Hugh Peters; took a prominent part in the Antinomian controversy as the chief ally of Gov. Winthrop against the party headed by Wheelwright and Mrs. Hutchinson; was chaplain to the Massachusetts forces sent to Connecticut against the Pequots 1636, for which service he afterward received a grant of 1,000 acres of land in the present town of Quincy; accompanied the "apostle" John Eliot on his visit to the Indian settlements, and labored for their interests; was noted for benevolence, hospitality, and readiness in improvising verses, being esteemed by Cotton Mather "the greatest anagrammatist since the days of Adam." D. at Boston, Aug. 7, 1667. Biographies were written by Mather in his *Magnalia* (1702) and by Rev. Dr. A. W. McClure in the *Lives of the Chief Fathers of New England* (6 vols., 1746, seq.). He published in England a theological treatise, *Some Helps to Faith* (1625); a poem, *Famous Deliverances of the English Nation* (1626; new ed. Boston, 1680); a Latin poem to the memory of John Harvard; and a tract, *The Day Breaking, if not the Sun Rising, of the Gospel with the Indians in New England* (1647; new ed. New York, 1865), besides many other occasional productions.

Wilson, JOHN, more generally known by his pseudonym **CHRISTOPHER NORTH**: author and educator; b. at Paisley, Scotland, May 18, 1785; son of a wealthy manufacturer; studied at the University of Glasgow and at Magdalen College, Oxford, where he won the Newdigate prize for English poetry by a poem on *The Study of Greek and Roman Architecture*, and graduated in 1807. In 1808 he bought the estate of Elleray, on Lake Windermere, in Westmoreland, where he lived in intimate intercourse with Wordsworth, Coleridge, and Southey, and published in 1812 the poem *The Isle of Palms*. In 1815 he sold Elleray, removed to Edinburgh, and was admitted to the bar; published in 1816 the dramatic poem, *The City of the Plague*; became one of the chief contributors to *Blackwood's Magazine*, founded in 1817; and was appointed Professor of Morals in 1820 at the University of Edinburgh, in preference to Sir William Hamilton. In 1822 he published *Lights and Shadows of Scottish Life*; in 1823, *The Trials of Margaret Lindsay*; in 1825, *The Foresters*; in 1841, *Essay on the Genius and Character of Burns*; but his most popular productions were his contributions to *Blackwood's Magazine* under the pseudonym of "Christopher North": *Noctes Ambrosiana*, imaginary dialogues, at Ambrose's tavern in Edinburgh, between the leading contributors to *Blackwood* (1822-35); *Dies Boreales, or Christopher under Canvas* (1849-52), etc. In 1851 he resigned his chair at the university. D. in Edinburgh, Apr. 3, 1854. A collected edition of his works was published in 12 vols. by his son-in-law, Prof. Ferrier; his *Life* was written by his daughter, Mrs. Gordon (2 vols., 1862); and a bronze statue of him has been raised in Edinburgh.

Revised by H. A. BEERS.

Wilson, JOHN, D. D.: missionary; b. near Lauder, Scotland, Dec. 11, 1804; educated in Edinburgh, and from 1828 till his death there Dec. 1, 1875, missionary at Bombay, after 1843 in the Free Church. He was one of the most learned and influential of missionaries. Author of *An Exposure of the Hindu Religion* (Bombay, 1832); *A Second Exposure* (1834); *The Doctrine of Jehovah*, addressed to the Parsis (1839; 3d ed., Edinburgh, 1847); *The Parsi Religion* (1843); *The Lands of the Bible Visited and Described* (2 vols., Edinburgh, 1847); *The Evangelization of India* (1849); and *The History of the Suppression of Infanticide in Western India* (Bombay, 1855). See his *Life*, by George Smith (London, 1878).—His son, **ANDREW**, b. in Bombay, 1831, was employed by the East India Company; visited China; traveled in Western Tibet; was author of *The Ever-Victorious Army*, a narrative of the suppression of the Tai-ping rebellion in China (Edinburgh, 1878), and of *The Abode of Snow* (1885; 2d ed., 1876), an account of his travels in the Himalayas. D. June 8, 1881.

Revised by S. M. JACKSON.

Wilson, JOHN LEIGHTON, D. D.: missionary; b. on a plantation at Salem, Sumter co., S. C., Mar. 25, 1809; educated at Union College, Schenectady, N. Y., 1829, and at the Presbyterian Theological Seminary, Columbia, S. C., 1833; sailed for Africa as missionary of the American board at Cape Palmas, West Africa, 1834; in 1842 he was transferred to the Gaboon, where he started a mission. In both places he reduced the language to writing, and prepared grammars and dictionaries, set up printing-presses, and taught the natives to read. He also paid attention to natural history, and is said to have discovered and named the gorilla in 1846. In 1852 he returned home; was a secretary of the Presbyterian board of foreign missions from 1853 to 1861. On the outbreak of the civil war he left for the South, and entered at once into the service of the Southern Presbyterian Church, and combined the functions of secretary of both home and foreign missions until 1872, and he held the latter office till his death at Salem, S. C., July 13, 1886. He was the author of *Western Africa: its History, Condition, and Prospects* (New York, 1857). See his *Life*, by H. C. Du Bose (Richmond, Va., 1895).

SAMUEL MACAULEY JACKSON.

Wilson, JOHN MACKAY: author; b. at Tweedmouth, Scotland, in 1804; was for some years editor of the *Berwick Advertiser*. He was the editor and principal author of an important work, of which 150,000 copies have been sold—*Tales of the Borders, Historical, Traditional, and Imaginative* (6 vols., 1835-40), intended as a companion to the *Waverley Novels*. The last edition, revised and enlarged by Alexander Leighton, appeared in 24 vols. (Edinburgh, 1869). D. at Berwick-on-Tweed, Oct. 2, 1851.

Wilson, Sir ROBERT THOMAS: soldier; b. in Bloomsbury, London, England, in 1777; educated at Westminster and

Winchester schools; took part as a volunteer in the campaign in Flanders 1793-94; was on the staff in Ireland during the rebellion of 1798; served in Holland 1799, in Egypt under Abercromby 1800; accompanied Sir D. Baird to Brazil and the Cape of Good Hope 1805; went with Lord Hutchinson on a secret mission to the allied armies on the Russian frontier 1806-07; served in Portugal and Spain 1808-10, in command of the Lusitanian Legion, and afterward of a Spanish brigade; was British military commissioner at the Russian headquarters in 1812, and at the camp of the allies in the subsequent campaigns in Germany and France; received decorations from the allied emperors; aided in effecting the escape of Count Lavalette at Paris, Jan., 1815; incurred the displeasure of the prince regent by espousing the cause of Queen Caroline; was in consequence dismissed from the army 1821, but was indemnified by a public subscription, and a few years later was restored to his rank; sat in Parliament as a Liberal 1818-31; attained the full rank of general 1841, and was governor of Gibraltar 1842-49. D. in London, May 9, 1849. He was the author of *A History of the British Expedition to Egypt* (1802), etc. Since his death have appeared his *Narrative of Events during the Invasion of Russia by Napoleon Bonaparte and the Retreat of the French Army* (1860), and his *Private Diary of Travels, Personal Services, and Public Events during Missions and Employment with the European Armies in the Campaigns of 1812-13-14, from the Invasion of Russia to the Capture of Paris* (2 vols., 1861, both edited by his nephew and son-in-law, Rev. Herbert Randolph, who also published a *Life* (2 vols., 1863).

Revised by F. M. COLBY.

Wilson, THEODORE DELAVAN: naval constructor; b. in Brooklyn, N. Y., May 11, 1840; served apprenticeship as shipwright at the navy-yard, Brooklyn; appointed a carpenter in the navy 1861; served about two years afloat; was in the fight with the Merrimack in Hampton Roads; ordered to duty as an inspector of the building and repairing of vessels in private establishments in New York and vicinity in 1863; appointed an assistant naval constructor May 17, 1866; served in the navy-yards at Pensacola, Philadelphia, and Washington; was four years instructor in naval architecture and ship-building at the U. S. Naval Academy; promoted to be naval constructor July 1, 1873; appointed member of the first naval advisory board to report upon the number and classes of vessels that should be constructed for the naval service (1881); chief constructor of the navy 1882; resigned in 1893. D. June 29, 1896. He was an honorary member of the Institute of Naval Architects of England, and first vice-president of the U. S. Society of Naval Architects and Marine Engineers. He was the author of *Ship-building, Theoretical and Practical* (New York, 1873), used as a text-book at the Naval Academy.

Wilson, Sir THOMAS: scholar; b. at Stroby, Lincolnshire, England, about 1524; educated at Eton under the celebrated Udal; was sent on an Eton scholarship to King's College, Cambridge, where he graduated in 1546; took orders in the Church of England; became tutor to Henry and Charles Brandon, sons of the Duke of Suffolk by Mary, the ex-Queen of France, both of whom, however, soon died; wrote the biographies of his pupils in a rare Latin volume, *Vita et obitus duorum fratrum Suffolciensium Henrici et Caroli Brandoni* (London, 1551); published *The Rule of Reason, containing the Art of Logic set forth in English* (1551; 9th ed., 1580); and *The Arte of Rhetorique* (1553; 9th ed., 1585), said to be the first critical treatises on logic and rhetoric in English, and incidentally to give the author a title to rank as the founder of English philology, the latter work having been referred to by Shakespeare, and having exerted a powerful influence to purify the English language from foreign idioms. He withdrew to the Continent on the accession of Mary 1553; took the degree of LL. D. at the University of Ferrara; was imprisoned by the Inquisition at Rome on charges said to have been based on his published works; was put to the torture; obtained his liberty at the death of Pope Paul IV., 1555, when the populace broke open the prison of the Inquisition; returned to England soon after the accession of Elizabeth, to whom he became private secretary 1558, acting also as her instructor in various branches of learning; was made master of requests and master of St. Catherine's Hospital, near the Tower; published a translation of *The Three Orations of Demosthenes, Chief Orator among the Grecians, in Favor of the Olynthians, with those his fower Orations against King*

Philip of Macedonie (1570; 2d ed. 1572), which greatly pleased Queen Elizabeth by the obvious analogies it suggested between Philip of Macedon and Philip II. of Spain; issued *A Discourse upon Usurie by way of Dialogue and Orations* (1572; 3d ed. 1584); went as ambassador to the Netherlands 1576; succeeded Sir Thomas Smith as Secretary of State and colleague of Sir Francis Walsingham 1577, and became dean of Durham 1579. D. in London, June 16, 1581. See *Streyper's Annals*. Revised by S. M. JACKSON.

Wilson, Thomas, D. D., LL. D.: bishop; b. at Burton, Cheshire, England, Sept. 20, 1663; educated at Trinity College, Dublin; took orders in the Church of England; became curate of Newchurch Kenyon, Lancashire, 1686; domestic chaplain to the Earl of Derby 1692; traveled on the Continent with that nobleman's son, Lord Strange, 1694-97; and was Bishop of Sodor and Man fifty-seven years, from Jan. 16, 1698, until his death on the island, Mar. 7, 1755. He was "held in the most exalted reputation for apostolic piety and unquenchable zeal in good works," and is even yet prominent in the writings of Matthew Arnold, Ruskin, and their followers as an exemplar of their doctrine of "sweetness and light." He was the author of *The Principles and Duties of Christianity* (1699), in English and Manx (being the first book printed in the language of the Isle of Man); *A short and plain Instruction for the better understanding of the Lord's Supper* (1736; very many later editions); *The Knowledge and Practice of Christianity made easy to the Meanest Capacities, or an Essay toward an Instruction for the Indians* (1740; 20th ed. 1848); *Sacra Privata* (1800; very numerous later editions); several volumes of *Sermons* and other treatises. His *Works* (Bath, 2 vols., 1781) were edited with a *Life* by Rev. C. Crutwell, and again with *Life* by John Keble (7 vols., Oxford, 1847-63).
Revised by S. M. JACKSON.

Wilson, William: poet; b. in Perthshire, Scotland, Dec. 25, 1801; was editor of the *Dundee Review* (1821-23) and of the *Literary Olio* (1824), for which he wrote many poems; resided afterward in Edinburgh as a writer for the press; was intimate with the brothers Chambers; removed to the U. S. 1833; established himself as a bookseller and publisher at Poughkeepsie, N. Y., 1834; wrote under the signatures of Allan Grant and Alpin for *Blackwood's Magazine*, *Chambers's Journal*, the *Knickerbocker*, the *Atbion*, and other Scottish and American periodicals; associated with him his son, James Grant Wilson, in 1856, the firm having previously been Potter and Wilson; edited the *Scottish Songs, Ballads, and Poems of Hew Ainslie* (New York, 1855), and several other volumes. D. in Poughkeepsie, Aug. 25, 1860. A volume of his *Poems* was edited by Benson J. Lossing (1870; revised and enlarged editions 1875, 1884).

Wilson, William Dexter, D. D., LL. D., L. H. D.: clergyman and educator; b. at Stoddard, N. H., Feb. 28, 1816; educated at the Walpole (N. H.) Academy and Harvard University; in 1842 was ordained in the Protestant Episcopal Church; in 1850 became Professor of History and Moral and Intellectual Philosophy in Geneva College (now Hobart), and became Professor of Intellectual and Moral Philosophy in Cornell University at its opening. In 1886 he was retired as emeritus professor and became deacon of St. Andrew's Divinity School, Syracuse, N. Y. His principal works are *Lectures on Psychology, Comparative and Human* (1871); *Introduction to the Study of Metaphysics and Intellectual Philosophy* (1872); *Live Questions in Psychology and Metaphysics* (1877); and *The Foundations of Religious Belief* (1883).
J. M. B.

Wilson, William Lyne: lawyer; b. at Middleway, Jefferson co., W. Va., May 3, 1843; graduated at Columbia College (now University), Washington, in 1860; entered the University of Virginia in 1861, which he left to join the Confederate army; became Professor of Ancient Languages at Columbia College and began studying law at the close of the war; was also Professor of Latin Language and Literature in 1867-71, and studied political economy and politics; and resigned to practice law. In 1882 he was president of the State Senate; was elected to Congress in the same year; and in the latter body he served continuously till 1894, when he was defeated by his Republican opponent. As chairman of the committee on ways and means he prepared the Tariff Bill of 1894, which bore his name, and he vigorously supported it in the House, but did not approve of the Senate amendments. In Apr., 1895, President Cleveland appointed him Postmaster-General in place of Wilson S. Bissell, resigned.

Wilson, Woodrow, Ph. D., LL. D.: educator and author; b. at Staunton, Va., Dec. 28, 1856; was educated at Davidson College, North Carolina, 1873-74, and Princeton College 1875-79; studied law in the University of Virginia 1879-81; history and politics in Johns Hopkins University 1883-86; held successively various college appointments; since 1890 has been Professor of Jurisprudence in Princeton College; and since 1887 lecturer on administration in Johns Hopkins University. On literary and political topics Dr. Wilson is a public lecturer and a contributor to magazines and reviews; he has published *Congressional Government: a Study in American Politics* (Boston, 1885), which has gone through many editions and is widely known and used by foreign publicists; *The State: Elements of Historical and Practical Politics* (Boston, 1889); *Division and Reunion, 1829-1889, in Epochs of American History* (New York and London, 1893); and *An Old Master and other Political Essays* (New York, 1894).
C. K. HOYT.

Wilton: town (incorporated in 1802); Fairfield co., Conn.; on the Norwalk river, and the N. Y., N. H. and Hart. Railroad; 6 miles N. of Norwalk, 16 miles S. of Danbury (for location, see map of Connecticut, ref. 12-D). It was set off from the town of Norwalk; contains the villages of Wilton, North Wilton, South Wilton, Cannon, and Georgetown; has two academies and a boarding-school; and is principally engaged in agriculture and wire-drawing. In 1894 it had a grand list of \$653,264. Pop. (1880) 1,864; (1890) 1,722.

Wilton: town; Muscatine co., Ia.; on the Chi., Rock Id. and Pac. Railway; 12 miles N. of Muscatine, the county-seat, 25 miles W. of Davenport (for location, see map of Iowa, ref. 6-K). It is in an agricultural and stock-raising region, and has 8 churches, the Wilton German-English College, several public schools, excellent artesian water system, and 3 weekly newspapers. Pop. (1880) 1,431; (1890) 1,212; (1895) State census, 1,268.
EDITOR OF "REVIEW."

Wilton: town (settled in 1789, incorporated in 1803); Franklin co., Me.; on the Maine Cent. Railroad; 8 miles S. W. of Farmington, the county-seat (for location, see map of Maine, ref. 8-B). It contains the villages of Wilton and East Wilton, and has six churches, Wilton Academy, and manufactories of carriages, cabinet-work, coffins and caskets, woolen goods, shingles, long and short lumber, and bobbins. Pop. (1880) 1,739; (1890) 1,622.

Wilton: town; Hillsboro co., N. H.; on the Souhegan river, and the Boston and Maine Railroad; 15 miles W. of Nashua, 41 miles S. W. of Concord (for location, see map of New Hampshire, ref. 9-E). It contains the villages of Wilton and West Wilton, four churches, a savings-bank, several lumber-mills, woolen-mill, creameries, and plow, wooden-ware, carriage, and trunk factories. Pop. (1880) 1,747; (1890) 1,850.

Wilton, Joseph, R. A.: sculptor; b. in London, England, in 1722; studied sculpture at Brabant, at Paris, and at Rome, where he gained the jubilee gold medal of Pope Benedict XIV.; spent eight years in Italy, chiefly occupied in copying ancient statues, after which he returned to England; was appointed director of the Duke of Richmond's art gallery in Spring Gardens; became the most popular sculptor in England; was a friend and patron of Richard Wilson the painter, and of Baretti, the lexicographer, and was one of the founders of the Royal Academy. Among his best-known works were busts of Bacon, Cromwell, Newton, Swift, Wolfe, Chatham, and Chesterfield, and the monuments of Wolfe, Admiral Holmes, and Stephen Hales. D. in London, 1803.
Revised by RUSSELL STURGIS.

Wilton Carpets: See CARPETS.

Wilts, or Wiltshire: an inland county in the southwestern part of England. Area, 1,375 sq. miles. In the northern part are extensive plains well suited to agriculture and dairy-farming, which are carried on with great energy. Many hogs are reared here, and Wilton bacon and Wilton cheese are famous. The southern part is hilly, and on the bleak downs a great number of sheep of a fine breed is reared. Woolen stuffs are extensively manufactured; also some cotton, silk, and iron manufactures are carried on. Pop. (1891), 261,997.

Wimbleton: town; in the county of Surrey, England; 8½ miles S. W. of St. Paul's, London (see map of England, ref. 12-J). It is principally noted for its common of 628 acres, where the annual meetings of the National Rifle Association were formerly held. Pop. (1891) 25,758.

Wimpfen, French pron. wān'fān' EMMANUEL FÉLIX, de : soldier; b. at Laon, department of Aisne, France, Sept. 13, 1811; began his military career in Algeria; was made a brigadier-general in the imperial guard in 1855; distinguished himself both in the Crimean and in the Italian wars; was made a general of division in 1859; commanded at Lyons, and was subsequently made governor, first of the province of Algeria, then of that of Oran. In the Franco-German war he received the command, first of the Twelfth, then of the Fifth Army-corps, and during the battle of Sedan, after MacMahon had been wounded, he assumed the command of the whole army, and as such signed the capitulation of Sedan. He published several letters concerning the catastrophe, the memoir *Sedan* (1871) and *Réponse au Général Ducrot* (1871). He was violently attacked by *Le Pays*, and was unsuccessful in the libel suit he instituted against its editor, Paul de Cassagnac. In 1876 he ran for member of the Chamber of Deputies for the arrondissement of St. Denis, but failed. D. Feb. 26, 1884. Besides the above-mentioned publications, he wrote *La Situation de la France et les Réformes nécessaires* (1873) and *La Nation armée* (1876). Revised by F. M. COLBY.

Win'amac: town (founded in 1838); capital of Pulaski co., Ind.; on the Tippecanoe river, and the Pitts., Cin., Chi. and St. L. Railway; 25 miles N. W. of Logansport, 92 miles S. E. of Chicago (for location, see map of Indiana, ref. 3-D). It is in an agricultural region, and has a new county court-house, Christian, Methodist Episcopal, Presbyterian, and Roman Catholic churches, public and parochial schools, 2 private banks, and 3 weekly newspapers. Pop. (1880) 835; (1890) 1,215; (1895) estimated, 2,000.

EDITOR OF "PULASKI COUNTY DEMOCRAT."

Winchell, ALEXANDER, LL. D.: geologist; b. at North East, Dutchess co., N. Y., Dec. 31, 1824; graduated at the Wesleyan University, Middletown, Conn., 1847; was teacher in Pennington Seminary, New Jersey, 1847-48, and of natural sciences at Amenia Seminary, New York, 1848-51, and at Mesopotamia Female Seminary, Alabama, 1851-53; was president of the Masonic Female University at Selma, Ala., 1853; became Professor of Physics and Civil Engineering at the University of Michigan 1853, and of Geology, Zoölogy, and Botany 1855; was president of the Michigan Teachers' Association 1859; State geologist of Michigan 1859-62; Professor of Geology in the Kentucky University 1866-69; director of geological survey of Michigan 1869-71; vice-president of the American Association for the Advancement of Science 1871; chancellor of Syracuse University 1872-74; lecturer in Vanderbilt University, Nashville, Tenn., 1876-78; Professor of Geology and Paleontology in the University of Michigan from 1879 to his death Feb. 19, 1891, at Ann Arbor, Mich. He was the author of *The First Biennial Report of the Geological Survey of Michigan* (1861); *The Grand Traverse Region* (1866); *Genealogy of the Family of Winchell in America* (Ann Arbor, 1869); *Geological Map of Michigan* (1865); *Geological Chart* (1870); *Sketches of Creation* (1870); *Geology of the Stars* (1872); *The Doctrine of Evolution* (1874); *Reconciliation of Science and Religion* (1877); *Preadamites* (Chicago, 1880); *Sparks from a Geologist's Hammer* (1881); *World-Life, or Comparative Geology* (1883); *Geological Excursions* (1884); and *Geological Studies* (1886). He revised portions of *Johnson's Natural History*, 1885. He was a member of numerous scientific societies both in the U. S. and in Europe. In 1890 he was elected president of the Geological Society of America. In American geology what is known as the "Marshall" group was established by him, and fourteen newly discovered species have been named after him. His paleontological researches established seven new genera and 304 new species, most of them fossil. Revised by C. H. THURBER.

Winchendon: town (incorporated in 1764); Worcester co., Mass.; on the Miller river, and the Fitch, and the Boston and Albany railways; 18 miles N. W. of Fitchburg; 36 miles N. by W. of Worcester (for location, see map of Massachusetts, ref. 3-F). It contains the villages of Winchendon, Waterville, and Winchendon Springs; has the Murdock High School (building cost \$100,000), 8 district schools, public library, 7 churches, a national bank with capital of \$200,000, a savings-bank, the New England Home for orphan and destitute children, and a weekly newspaper; and is principally engaged in the manufacture of woodenware, toys, cotton goods, and wood-working machinery. The assessed valuation in 1894 was \$2,362,297. Pop. (1880) 3,722; (1890) 4,390; (1895) 4,490.

Winchester: city; capital of Hampshire, England; on the Itchin; 60 miles W. S. W. of London (see map of England, ref. 13-1). It is the *Caer-Gwent* of the Britons and the *Venta Belgarum* of the Romans. After being taken in 495 by the Saxons, it received its present name, and was for several centuries the capital of England and the residence of its kings. In the thirteenth century it lost its trade, and since that time it has gradually declined. Its cathedral, built in the eleventh century, is a vast but heavy structure, containing many interesting monuments. It is 520 feet long; the breadth at the transepts is 208 feet; the nave is 351 feet long and 86 feet high; the central Norman tower is 186 feet high. Among the monuments of the cathedral are the tomb of William Rufus, the bronze figures of Charles I. and James I., the golden shrine of St. Swithin, etc. Winchester College, one of the great public schools of England, was founded here by Wykcham in 1369-93. Pop. (1891) 19,073.

Winchester: city (founded in 1830); capital of Scott co., Ill.; on the Big Sandy creek, and the Chi., Burl. and Quincy Railroad; 29 miles S. of Beardstown, 84 miles N. by W. of St. Louis, Mo. (for location, see map of Illinois, ref. 7-C). It is in an agricultural region; has a public high school, Baptist, Christian, Methodist Episcopal, Presbyterian, and Roman Catholic churches, 2 private banks, and 2 weekly newspapers; and has 3 grain elevators, 2 flour-mills, meat-packing works, sawmill, and plow and furniture factories. Pop. (1880) 1,626; (1890) 1,542; (1895) estimated, 2,000.

EDITOR OF "STANDARD."

Winchester: city; capital of Randolph co., Ind.; on the White river, and the Cleve., Cin., Chi. and St. L. and the Gr. Rapids and Ind. railways; 25 miles N. of Richmond (for location, see map of Indiana, ref. 5-G). It is in an agricultural and natural-gas region, and has several factories, a soldiers' monument, 2 private banks, and 3 weekly newspapers. Pop. (1880) 1,958; (1890) 3,014; (1895) estimated, 3,800.

EDITOR OF "DEMOCRAT."

Winchester: town; capital of Clark co., Ky.; on the Ches. and O., the Lex. and S., and the Louisv. and Nashv. railways; 18 miles E. of Lexington (for location, see map of Kentucky, ref. 3-I). It is in the famous Blue Grass region; contains the Kentucky Wesleyan College, the Cooper Female Institute, the Winchester Female College, public schools, water-works, electric lights, street-railway, 2 national banks with combined capital of \$375,000, and a State bank with capital of \$200,000; has a semi-weekly and a weekly newspaper; and is principally engaged in agriculture and stock-raising. Pop. (1880) 2,277; (1890) 4,519; (1895) estimated, 6,400.

EDITOR OF "DEMOCRAT."

Winchester: town (incorporated in 1850); Middlesex co., Mass.; on the Boston and Maine Railroad; 8 miles N. E. of Boston (for location, see map of Massachusetts, ref. 2-H). It has 7 churches, high school, 8 district schools, public library, savings-bank, town-hall (cost over \$100,000), and a weekly and a monthly periodical; and is principally engaged in tanning and the manufacture of school furniture. The assessed valuation in 1894 was \$6,206,125. Pop. (1880) 3,802; (1890) 4,861; (1895) 6,150.

PUBLISHER OF "STAR."

Winchester: town; Cheshire co., N. H.; on the Ashuelot river, and the Boston and Maine Railroad; 13 miles W. of Keene, 65 miles S. W. of Concord (for location, see map of New Hampshire, ref. 9-C). It contains the villages of Winchester and Ashuelot, 3 churches, high school, 3 libraries, a national bank with capital of \$150,000, a savings-bank, and manufactories of woolen goods, lumber, palm-leaf hats, and butter and cheese. Pop. (1880) 2,444; (1890) 2,584.

Winchester: town; capital of Franklin co., Tenn.; on the Elk river, and the Nash., Chat. and St. L. Railway; 67 miles N. W. of Chattanooga, 85 miles S. S. E. of Nashville (for location, see map of Tennessee, ref. 7-F). It is in an agricultural, mining, and lumbering region, near the foot of the Cumberland Mountains, is a resort for invalids, and has two State banks with combined capital of \$50,000, several saw-planing, and flour mills, carriage and wagon factories, marble-works, wood-working factories, and a weekly newspaper. Pop. (1880) 1,039; (1890) 1,313.

Winchester: city; capital of Frederick co., Va.; on the Balt. and O. and the Cumberland Val. railways; 88 miles W. by N. of Washington, D. C., 113 miles W. by S. of Baltimore, Md. (for location, see map of Virginia, ref. 3-G). It is in a wheat-growing region; has 14 churches, large public

school, 3 female seminaries, an academy, a national bank with capital of \$100,000, a State bank with capital of \$50,825, and a monthly and 3 weekly periodicals; and contains 4 glove-factories, 2 hosiery-mills, 2 steam planing-mills, flour-mill, a sumach and bark mill, tannery, paper-mill, shoe-factory, and a canning-factory. The place is the key to the valley of the Shenandoah, and during the civil war it was repeatedly occupied by the forces on either side, and in its vicinity were fought several battles. (See CEDAR CREEK.) The city contains national and Confederate cemeteries. Pop. (1880) 4,958; (1890) 5,196; (1895) estimated, 5,800. EDITOR OF "REPUBLICAN LEADER."

Winchester, ELIHANAN; clergyman; b. at Brookline, Mass., Sept. 30, 1751; began preaching to a Baptist church at Newton 1769; was pastor of a church at Rehoboth 1771, and was excommunicated in consequence of his views on close communion; went to South Carolina 1774; preached to the Negroes on the plantations on the Pedee river; became pastor of the First Baptist church at Philadelphia 1780, and, having adopted the doctrine of universal salvation, founded there a Universalist church 1781, after which he traversed several States to propagate his new doctrines, and preached in England 1787-94. He was one of the precursors of the modern system of Universalism, his doctrines being very similar to those preached by his contemporary, Rev. Dr. Charles Chauncy. He was the author of numerous religious treatises, pamphlets, sermons, and addresses, and of several volumes of verse. D. at Hartford, Conn., Apr. 18, 1797. Revised by J. W. CRADWICK.

Winchester, WILLIAM PAULET or POULET, K. G., Marquis of; b. in Hampshire, England, about 1475; dissipated large estates in youth; entered the personal service of Henry VII.; became comptroller and afterward (1536) treasurer of the household to Henry VIII.; was made Baron St. John Nov., 1537; received from Henry VIII. the order of the Garter; was appointed treasurer to Edward VI. 1549; made earl 1550 and Marquis of Winchester Oct., 1551; presided at the trial of Somerset Dec., 1551, in the capacity of lord high treasurer, which post he managed to retain under Mary and Elizabeth, and, according to the testimony of Fuller, "trafficked so wisely and prospered so well that he got, spent, and left more than any subject since the Conquest," the secret of his prosperity being given by himself in the words, "No oak, but an osier." He built a magnificent mansion in Hampshire called Basing House, afterward celebrated for its siege by Cromwell; entertained Elizabeth there in 1560, and died there Mar. 10, 1572. A volume entitled *The Lord Marques' Idleness, containing Manifold Matters of Acceptable Devise, as Sage Sentences, Prudent Precepts, Moral Examples, Sweet Similitudes, etc.*, was printed in 1586.

Winckelmann, vink'el-maun, JOHANN JOACHIM; archaeologist; b. at Stendal, Prussian province of Brandenburg, Dec. 9, 1717, in humble circumstances; studied theology at Halle, medicine at Jena; lived for several years as tutor in a private family, and from 1743 to 1748 as co-rector at the school of Seehausen in Brandenburg, and in 1748 went to Dresden as librarian and secretary to Count Heinrich von Büнау. Here his study of classical archaeology began. Here also he published his first work, *Gedanken über die Nachahmung der griechischen Werke in Malerei und Bildhauerkunst* (1755). This brought him a pension of 200 thalers from Augustus III. of Saxony, and Winckelmann having joined the Roman Catholic Church went to Rome, where he had unrivaled opportunities for archaeological and artistic studies. Soon the original and striking views which resulted from his researches attracted great attention, and in 1763 he was appointed prefect over the antiquities of Rome, and received also a position in the Vatican Library. He visited Florence, where he published *Description des Pierres gravées du feu Baron de Stosch* (Florence, 1760); Naples, Herculaneum, and Pompeii, whence he sent to Dresden *Sendschreiben von den herculanischen Entdeckungen* (1762) and *Nachricht von den neuesten herculanischen Entdeckungen* (1764); and from Rome he contributed many minor essays to various German periodicals, such as *Von der Grazie, Von der Fähigkeit der Empfindung des Schönen, etc.* In 1764 appeared his principal work, *Geschichte der Kunst des Alterthums* (Dresden); and in 1767 his *Monumenti antichi inediti* (Rome). In 1768 he started on a visit to his native country. Arrived at Vienna, he determined to proceed no farther, but on his return he was murdered at Trieste, June 8, 1768, by a professional thief who attempted to steal

some rare gold coins from him. Winckelmann is generally admitted to be the father of modern archaeology. A collected edition of his works begun by Ternau and completed by Heinrich Meyer and Schultz, appeared in Dresden 1808-20, in 8 vols., and another by Eiselein (12 vols., Donaueschingen, 1825-29). His correspondence was edited by P. Forster (Berlin, 1824, 2 vols.). Also see Justi, *Winckelmann, sein Leben, seine Werke und seine Zeitgenossen* (2 vols., Leipzig, 1866-72). Revised by RUSSELL STURGIS.

Wind: See WINDS.

Winder, WILLIAM HENRY; soldier; b. in Somerset co., Md., Feb. 18, 1775; graduated at the University of Pennsylvania, and became a member of the Baltimore bar 1798. In Mar., 1812, he was appointed a lieutenant-colonel of the Sixteenth Infantry, and colonel in July; commanded a successful expedition to the Canada shore from Black Rock Nov. 28, 1812; promoted to be brigadier-general Mar., 1813; was taken prisoner at Stony Creek June 6. In May, 1814, he was appointed adjutant and inspector-general, and when the British forces under Gen. Ross landed below Washington he was placed in command of the militia summoned to defend the capital; was defeated at the battle of Bladensburg, and was unable to prevent the occupation of Washington by the enemy. Honorably discharged June, 1815, he returned to his profession in Maryland, in which he became distinguished, as well as in the State Senate, of which he was a member. D. in Baltimore, Md., May 24, 1824.—His son, JOHN HENRY, b. in Maryland, 1800, graduated at West Point in 1820; was breveted major and lieutenant-colonel for gallantry in the Mexican war; resigned his commission of major of artillery Apr. 27, 1861, and joined the Confederate army, in which he became a brigadier-general; was the commandant of Libby Prison and Belle Isle, and later of Andersonville. D. at Branchville, S. C., Feb. 7, 1865.

Revised by JAMES MERCUR.

Win'dermere, or Winandermere; the largest lake of England; 14 miles long and 1 mile broad. It lies in Lancashire, and is celebrated for the rich beauty of its shores. Its outlet is the small river Leven, which flows southward into Morecambe Bay, an extensive inlet of the Irish Sea, on the west coast of England. A group of islands, the largest of which contains 28 acres, is situated in the center of the lake. The village of Windermere is about a mile from the east shore of the lake. Pop. 1,500.

Wind-flower: See ANEMONE.

Windgalls; puffy swellings about the fetlock joints of horses. They are the same as synovial ganglia or "weeping sinews" in man. Tight bandaging, irritant ointments, and rest may apparently cure them, but they are liable to recur. They usually appear on the hind legs in the form of little oval sacs between the back sinews and the bones, just above the fetlocks. At first the puffs, or windgalls, feel soft and elastic, but after some time, if the animal is employed at hard labor, they will become firm and hard. Rubbing is considered the most effective remedy.

Windham; town (incorporated in 1762); Cumberland co., Me.; on the Presumpscot river, near Lake Sebago; 12 miles N. W. of Portland (for location, see map of Maine, ref. 10-B). It contains the villages of Windham Center, South Windham, North Windham, and Newhall, and has a public library and important manufactures. Pop. (1880) 2,312; (1890) 2,216.

Windham, WILLIAM; statesman; b. in London, England, May 3, 1750; educated at Eton, at Glasgow University, and at University College, Oxford; traveled on the Continent; became a member of Dr. Johnson's Literary Club and a friend of Burke and Fox, with whom he co-operated in denouncing the American war; distinguished himself as an orator; was chief secretary to Lord Northington, Lord-Lieutenant of Ireland, 1783; was returned to Parliament from Norwich in 1784; was one of the managers of the impeachment of Warren Hastings 1787; was a strenuous opponent of the French Revolution and advocate of war with France; was Secretary at War in Pitt's cabinet 1794-1801; opposed the Peace of Amiens 1802; was again Secretary at War, and also for the colonies, in the Grenville administration 1806-07; after which, declining a peerage, he remained in opposition and denounced the Copenhagen and Walcheren expeditions. D. in London, June 4, 1810. He had a great reputation for oratory, and possessed brilliant conversational powers, but as a statesman he lacked vigor and tenacity. He was nicknamed "The Weather-

cock." His *Diary* from 1784 to 1810 was published by Mrs. Henry Baring in 1886, and a *Life* by Thomas Amyot was prefixed to an edition of his *Speeches in Parliament* (3 vols., 1806). His *Select Speeches* (Philadelphia, 1837) were edited in the U. S. by Robert Walsh, who wrote a biographical sketch.

Windhover: See KESTREL.

Windisch, ein'dish, ERNST, Ph. D.; philologist; b. in Dresden, Saxony, Sept. 4, 1844; educated at the University of Leipzig; was employed in cataloguing Sanskrit manuscripts at the India office library in London 1870-71; professor extraordinary at Leipzig 1871; Ordinary Professor of Comparative Philology and Sanskrit at Heidelberg 1872-75, at Strassburg 1875-77, and Professor of Sanskrit at Leipzig since 1877. Since 1880, also, he has been editor of the *Zeitschrift der Deutschen Morgenländischen Gesellschaft*. Among his numerous works are *Der Heliand und seine Quellen* (Leipzig, 1868); *Untersuchungen über den Ursprung des Relativpronomens* (in Curtius's *Studien zur Griech. und Lat. Grammatik*, vol. ii., Leipzig, 1869); *Syntaktische Forschungen* (with B. Delbrück; vol. i., on the subjunctive and optative in Sanskrit and Greek, Halle, 1871); *Kurzgefasste Irische Grammatik* (Leipzig, 1879; Eng. trans., *A Concise Irish Grammar*, Cambridge, 1882); *Irische Texte* (Leipzig, 1880; 2d series, with W. Stokes, i., 1884, ii., 1887; 3d series, i., 1891); *Georg Curtius* (Berlin, 1887); *Ueber das Nyāyabhāṣya* (Leipzig, 1888); *Hivuttaka* (Pali Text Society, London, 1880). S. A. T.

Windischgrätz, wind ish-gräts, ALFRED, Prince von; Austrian field-marshal; b. at Brussels, Belgium, May 11, 1787; entered the army in 1804, and rose rapidly in the service, distinguishing himself especially in the campaigns of 1813-14. In 1826 he became major-general and governor of Prague, and in 1833 general of division and lieutenant field-marshal. After the Napoleonic wars he saw no field service till the Revolution of 1848 broke out in the Austrian empire. The Bohemian agitation for the establishment of a separate self-government under the direct authority of the emperor was for the moment successful, and a Bohemian congress assembled at Prague with the emperor's permission, but here, as elsewhere, the radical element gained the upper-hand. The people demanded to be armed. Windischgrätz refused, and fighting began in the streets. His wife and son were killed by the insurgents, but he continued the contest, and by June 14 was completely successful. The Bohemian congress was dissolved, and Prague placed in a state of siege. No further trouble was experienced from Bohemia during this revolutionary year. Windischgrätz was then placed in command of all the Austrian forces outside Italy, and summoned to Vienna, which was at the mercy of the revolutionary mob. Aided by Jellachich he succeeded in restoring the imperial authority in the city (Oct. 31), after which he entered on the campaign against the Hungarians. In this campaign, after gaining some advantages, he remained inactive, and sought to subdue the country by threatening decrees against the revolutionists, leaving them in the meanwhile time to gather their forces and secure strong positions. Finally, he retreated without accomplishing anything of importance. Superseded in the command, he retired to his estates in Bohemia and applied himself to the preparation of his *Winterfeldzug 1848-49 in Ungarn* (Vienna, 1851). D. Mar. 21, 1862. F. M. COLBY.

Windlass [corruption of M. Eng. *windas*, from leel, *windäss*, windlass, winding-pole; *winda*, to wind + *äss*, beam, pole; Goth. *aus*, pole (?); a form of the wheel and axle, in which the axle is horizontal, while in the capstan it is usually vertical. The axle is made to revolve either by means of handspikes or a winch. The mathematical principles involved are precisely those of the wheel and axle.

Windmills: devices for utilizing the energy of the wind as a motive-power; specifically, wind-driven mechanisms for grinding, pumping, etc. The first use of the windmill for doing work is unknown. Prof. John Beckman, of the University of Göttingen, who made a thorough investigation in regard to its history, and whose work was translated by Mr. William Johnson (London, 1817), found a reference to the use of the windmill among the Bohemians as early as 718, but no trace of it farther East before its more extensive use in France and Germany. Mention was made of the use of windmills in 1105 and again in 1143, but no authentic information in regard to their mode of construction is found until a still later period.

A windmill has four essential parts—a wind-wheel; a shaft or axle to which the wheel is attached, and which is made to rotate by the wheel; wheels and shafts for transmitting the power to the desired place; and a frame for supporting the wheel and other machinery. The manner of making the wheel find the wind has given rise to two classes of these old mills. One, in which the whole frame is turned by hand, as shown in Fig. 1, is called the German mill. The frame rests

FIG. 1.

upon and turns about the post E. In the other only the dome containing the shaft and bevel-wheel is rotated, as shown in Fig. 2. In this case the shaft A and bevel-wheel attached are stationary, but free to rotate. The movement of the dome in this case is sometimes made automatic by extending an arm to the rear of the wind-wheel, and mounting thereon a small wind-wheel, S, whose axis is connected by suitable gearing to the dome in such a way as to turn the dome when the small wheel S rotates. When the wind-wheel is firm to the wind the plane of the small wheel S will

FIG. 2.

be in the direction of the wind and will be at rest, but when the wind veers it will strike the small wheel, setting it in motion and bringing the wind-wheel into the proper position by driving the shaft a, pinion b, beveled-wheel c, and pinion d, which engages a rack e extending around the tower.

The wind-wheel was made of four arms, called whips, fastened at right angles to each other and to the shaft. These arms were 30 or 40 feet long and sometimes longer, sometimes 12 inches in diameter at the large end and 5 or 6 inches at the small end. They were either round or rectangular. Rods were put through them transversely, not in a plane but in a spiral, so that the canvas which was attached to them made a warped surface, as shown in Fig. 3. This form is indicated both by theory and experience. The first rod was about 5 or 6 feet from the shaft and 2 feet or so long, and

made an angle of about 40 degrees with the face of the wheel, the last about 12 degrees, and was about 6 feet long. Sometimes they were symmetrical in reference to the arm, projecting the same distance each side of it; but in others they were unsymmetrical, as shown in Fig. 7, and more nearly rectangular. The shaft of the wheel, when made of

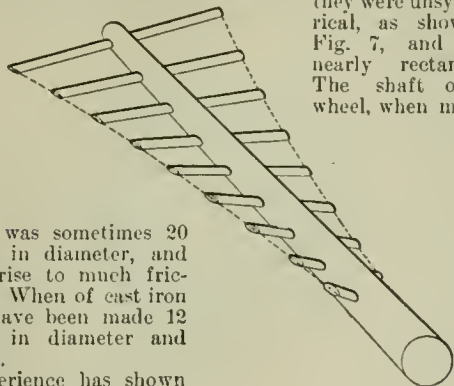

FIG. 3.

wood, was sometimes 20 inches in diameter, and gave rise to much friction. When of cast iron they have been made 12 inches in diameter and hollow.

Experience has shown that the wheel is more efficient if its axis be inclined upward from 8 to 15 degrees, as shown in Fig. 1, but for pumping it is better to substitute a crank or eccentric for the bevel-wheel, in which case the shaft should be horizontal, as in Fig. 9.

A somewhat definite statement in regard to these mills is given in a report by Coulomb, a French scientist, who about the year 1820 made careful observations upon some fifty Dutch windmills near Lille, in Flanders, which were used for the extraction of oil from rapeseed. They were about 66 feet in diameter, width of sails about 6 feet; the sail began about 6 feet from the shaft, where it made an angle with the plane of rotation of 30 degrees, and at the extreme end it was about 12 degrees. The shafts were inclined from 8 to 12 degrees to the horizontal. With a wind of 20.5 feet per second, or nearly 15 miles per hour, when the wheel made thirteen revolutions per minute, it developed about 7 horse-power, which included nearly one-half a horse-power, or about 7 per cent. of the power, for the friction of the shaft. The friction was determined in still air by applying weights at the arms to produce the motion; and the velocity of the wind was determined by stationing two men on slight elevations, 150 feet apart, and noting the time required for a feather to pass over that distance. The sails had over 200 sq. feet each. The wind velocity was from 8 feet per second to 28 feet, with a velocity of the wheel at its circumference of 22 feet to 72 feet per second.

When a sail is compelled to travel across the course of the wind it may be made to move with a greater velocity than the wind by placing the sail at a small angle to the weather. Thus if A B be the direction of the wind (Fig. 4) and the sail,

FIG. 4.

may be so small that B E will be several times D E. It had been observed that the velocity of the outer ends of the arms of a Dutch wheel exceeds considerably that of the wind for the best effect. If the wheel be run freely, doing no work except overcoming the friction of the shaft and resistance of the sails, it will attain a finite uniform velocity; then by applying a resistance in the form of useful work, the velocity may be diminished and more external work be done until the work becomes a maximum. According to Smeaton, the velocity for doing maximum work is two-thirds that it would have if running free, with the machinery below the shaft disconnected. A similar ratio obtains with hydraulic turbines. More than four arms may be used advantageously, and later they were increased to twelve or more. According to Smeaton, seven-eighths of the space within the circle circumscribing the wheel may be used for sails, and the power is diminished if more than that amount of sails be introduced.

Horizontal wheels have been used, in which case the axis is vertical, thus avoiding some of the gearing which is neces-

sary in the vertical wheel. In such wheels if plane sails are used, one-half the wheel must be covered so as to be out of the action of the wind, or other devices be used to put the returning sails out of wind. Such mills have been constructed similar to inflow water turbines, having curved vanes in the wheel and fixed curved guides outside for deflecting the wind into the wheel, which work independently of the direction of the wind. Also since the force of the wind is greater against a concave surface than against a similar convex one, buckets like hollow hemispheres have been used, placing them around the circumference of the wheel. These also work independently of the direction of the wind; but during one-half or more of the rotation the back of the buckets offer resistance to rotation, while the sails, as above described, are effective throughout the circumference. Theory and experience both indicate that horizontal wheels are only about one-fourth as powerful as vertical ones of the same size with sails, so that what is gained by gearing is more than lost in power.

The Sails.—It is not only necessary that the face of the wheel should be toward the wind, but the amount of sail presented to the wind should vary with the speed of the wind where the work to be done is nearly constant. As the speed of the wind increases the amount of sail should be decreased so that the speed of the mill will not be too great. Many ingenious devices have been used to accomplish this object. One is to have the cross-rods project from one side only of the arms, and be sufficiently flexible, so that as the pressure of the wind increases the sticks will bend and so present less canvas to the wind. Another is to hang the canvas at one edge on the arm and support the outer edge by a rope which passes to the next arm, over a pulley down that arm, while all four (or more) of the ropes pass down the hol-

FIG. 5.

FIG. 6.

low shaft at the other end and are attached to a weight. As the pressure of the wind increases it raises the weight and permits the sails to slope more, and as the wind slackens the weight draws the sails back into position. A windmill in Belgium known as Thirion's, with some fifteen narrow sails, had their outer edges attached to a kind of circular frame, which was moved by a centrifugal governor, and set the sails more or less to the weather. This mill had a peculiar mode of connecting-shafts not parallel, consisting of a strong steel spiral spring (Figs. 5 and 6). The strips forming the helix were about half an inch thick and 1 1/4 inches wide, and the diameter of the coil about 12 inches. Such a coupling, when properly made, transmits the power when the shafts make almost any angle with each other. The principle has been applied on a large scale in machine-shops for giving rotary motion to portable metal drills and bits for boring wood, and is known as flexible shafting.

For pumping, the sails may be fixed and the power regulated by a movable fulcrum. The pump piston-rod being attached to one end of a lever, while the other is operated by a cam or eccentric on the shaft of the wind-wheel, the fulcrum between the ends may be moved by a centrifugal governor, so that when the wind is low the length of the arm nearer the mill will be increased, and consequently the other arm shortened. Such an arrangement permits the mill to do some pumping when the velocity of the wind is low. The wheel may be brought to rest by a brake operating on the shaft or on some of the gear-wheels.

Of the Dutch wheels one is mentioned that measured 150 feet in diameter, and exaggerated statements were made to the effect that some of them were 1,000 horse-power. In some cases each mill had a superintendent who gave orders.

like the captain of a sailing craft, to increase or diminish the sail or shift the position of the wheel according to the strength or direction of the wind. Fig. 7 is a view of one credited to the year 1200.

FIG. 7.

parts of the better mills are made to gauge and with templates, so that the parts are interchangeable. This greatly lessens the cost of manufacture and is a convenience in repairing.

The characteristic features of the American mill are the large number of narrow radial slats or sails (plane when made of wood, or generally curved when made of iron); the rudder or tail-piece; the automatic adjustments; and the pyramidal tower, as shown in Fig. 8. Each of these elements is subject to many modifications. The tower was formerly of wood, made on the spot, but more recently it is made of steel, fitted in the shop, and shipped to the place where it is to be erected. Some towers are made of brick or stone. The upper stories may be used for storage-tanks, and the lower ones for sawmills or other small machinery. They are of all heights, suited to circumstances, usually from 30 to 70 feet. *The Scientific American* describes one 150 feet high, claimed to be the highest and strongest windmill tower in the world, on which is mounted a wheel $2\frac{1}{2}$ feet in diameter. Steel frames are rectangular or triangular, as desired.

FIG. 8.

laundry-work, run a dish-washer, blow fans in a dining-room, etc. American mills are made of all sizes, from $\frac{1}{2}$ to 4 horse-power, the latter of which may be some 30 feet in diameter. These are made at the shop, ready to be set up when shipped. Special wheels of 8 or more horse-power are made to order. The rating per horse-power is indefinite. A mill that is rated at 4 horse-power with a fair breeze—say, 20 miles per hour—would be nearly 14 horse-power at 30

miles per hour, and 32 horse-power at 40 miles. But, with all their good qualities, this intermittent power is not suited to manufacturing purposes, when the power needed must be practically uniform and produced at will. Numerous windmills were displaced by the introduction of steam into Great Britain. Both have their proper place, and each readily finds its own. In some cases the windmill may serve as an auxiliary to the steam-engine. At Fair Haven, England, "a 15 horse-power windmill raised in ten months 21,000,000 gal. of water 109 feet, at a saving of 100 tons of coal."

Adjustments.—In order to maintain a more uniform speed with winds of varying velocities, self-regulating devices are made. In the "solid wheel" this is accomplished by turning the wheel "out of the wind." One way of accomplishing this is by means of a lateral vane placed back of and parallel with the face of the wheel. The wind, by acting against this vane, will turn the wheel to one side so that less surface is presented to the wind. The rudder, being parallel or nearly so to the course of the wind, permits the side vane to operate quickly; but that it shall not operate too quickly balancing-weights are used which must be raised while turning the face of the wheel. These weights also act to bring the wheel, when the wind slackens, back into the wind. This system is represented in the Corcoran wheel, Fig. 9,

FIG. 9.

in which B is the rudder, and F the side vane. The first solid-wheel windmill using the side vane was the Eclipse, invented by L. H. Wheeler, formerly of Massachusetts. His first patent was issued in 1867, and his mills are manufactured at Beloit, Wis.

The wheel may also be turned out of wind by placing the vertical support one side the axis of the wheel; then the pressure of the wind against the wheel will turn the wheel about the vertical axis. The Stover windmill is of this type. The plane of the rudder is from 3 to 6 inches to one side of the line of the axis of the wheel, being more for the larger wheels. An objection to this adjustment is that the wheel is never fair with the wind. The Strong windmill is also of this type.

Again, the solid wheel may be adjusted by being so hinged that the wheel may be turned away from the wind while the rudder remains in the plane of the wind. The wheel is held against the rudder by a weighted lever, and when the wind is so strong as to turn the wheel aside it raises the weighted lever at the same time, which, by descent, brings it back into position when the force of the wind slackens. The Buchanan wheel is of this type.

Again, wheels are regulated without a rudder by being

so placed as to receive the wind from behind the tower. The tendency in this adjustment is for the wind to keep the wheel fair with the wind; and a vane is placed beyond the wheel perpendicular to its face, which turns the wheel away when desired. This vane is attached to a weighted lever, which it is forced to raise when turning the wheel away, and

Fig. 10.

weight, as shown by the star in Fig. 10. The wheel here shown is regulated by a centrifugal governor described below.

The action of the wind on the wheel is equivalent to a mechanical couple, and as the resistance is taken off at one point there is a tendency to force the wheel around on the turn-table in the direction of rotation, causing the wheel to turn out of the wind. A weighted lever resists this tendency, but when the pressure of the wind is sufficiently great it raises the weight, and when the wind slackens the weight brings the wheel into the wind again. In this way an adjustment is made, and has been found to work well with small wheels. The Woodmanse windmill is a type of this adjustment.

The speed may also be adjusted by turning the slats, by means of a centrifugal governor, so that they will present more or less surface to the wind. This is called the "sec-

weight, W, forces the spider D forward, which, being joined to Y by the links a, forces Y in the opposite direction from that caused by the centrifugal weights Z. By raising the weight W by means of a cord or chain passing over a pulley and extending to the ground, the edges of the slats may be presented to the wind and the mill stopped. This mill has been very extensively used on railways for filling water-tanks. The Adams mill is governed like the Halliday, but instead of a spider it has a spring on the hub of the wheel, set for a given speed, and when that speed is exceeded the spring is curled up, retarding the motion of the cylinder to which it is attached, pulling the vanes out of wind. From a scientific standpoint the centrifugal governor appears the most perfect, but, practically, the hinging of the slats may make the wheel less stable and less durable than the solid wheel, and the side vane adjustment seems to serve well in practice.

It is quite possible that too much importance has been attached to perfect regulation. There are comparatively few times in the year when a mill will run at a dangerous speed, and it may be better to make the wheel solid and let it run freely without any adjustment up to the dangerous speed, and provide only for the excess. This may not only simplify the construction, but also make the wheel more efficient and more durable.

The aëromotor, shown in Fig. 12, has been introduced to the public at a more recent date. It is the invention of Thomas O. Perry, a graduate of the University of Michigan.

Fig. 12.

After a long experience with this class of mills, and of experimental tests extending over some two years, during which he made over 5,000 dynamometric measurements and tested 61 different forms of wheels in regard to the forms of vanes, the modes of construction, and the best methods of management, he invented this wheel. He appears to have done for the windmill what Poncet did for hydraulic motors, by increasing the efficiency in many cases several fold over previous wheels. The wheel is made of steel, the vanes are curved and riveted to the circular sections, properly braced with tie-rods; all obstructions to the free flow of wind through the wheel are avoided as far as possible, and all unnecessary adjustment avoided. When not used the rudder may be thrown around parallel with the wheel. It runs with a light breeze, and is durable.

Formerly the upper end of the pump-rod was attached directly to a crank driven by the shaft of the wheel, but in many mills of the present day the speed is reduced by gearing. The object is to permit a longer stroke for doing the same work, thereby allowing more time for the valves to get seated; also by reducing the length of the crank, for which provision is made, a short stroke is produced, thus allowing some work to be done with a light breeze. Although not the original inventor, Perry claims to have been the first to have made it a success with the public.

Fig. 13.

Fig. 11.

tional wheel," as opposed to the solid wheel, and was invented by Daniel Halliday (patented in 1854). The Halliday was long manufactured by John Burnham, formerly of Connecticut and later of Batavia, Ill., who is called the "father of the American system." The Halliday Standard wheel is shown in Fig. 11. The arms of the wheel are firmly secured to the spider C, which is firmly secured to the shaft. Y Y are pivoted elbows to which are attached the regulating-rods carrying centrifugal weights, Z. The regulating-rods are connected directly with the slats, so that as Y is moved to the left by the centrifugal weights the edges of the slats are turned more to the weather. To force them back as the wind slackens, the forked lever F, carrying a

Perry also invented the tilting-tower, shown in Fig. 13. Its object is to lower the wheel to the ground for convenience in oiling and repairing.

Some pumping-mills are provided with an automatic arrangement, operated by a float, for throwing the mill completely out of the wind when the tank is nearly full, and bringing it into the wind by a weight when the tank is nearly empty.

Action of the Wind.—A windmill is a prime mover. Its conditions of working differ from those of other motors. Its source of power is not stored nor controllable like that of other powers, but is subject to "the freaks of the wind." Its use, therefore, is chiefly limited to small powers, and where intermittent and irregular power is valuable. These conditions are supplied in a vast number of cases all over the world.

In order to investigate the mechanical properties of the windmill some knowledge of the action of wind is necessary. Wolff, in his work on the *Windmill*, from the records of the Signal Service, gives the average velocity of the wind for each month of the year for fourteen cities widely separated in the U. S., the general average of which is 5,769 miles per month, or about 8 miles per hour; hence it is probable that during half the time it exceeds this amount, and that comparatively few days are likely to pass during which some work may not be done. It is difficult to get the actual velocity of a body of wind because it is so "streaky"—the velocity not only being variable at any given point, but very different from that a few feet distant. The extremes above and below a mean are very great, so that tables should be considered as only approximations, more or less close, to mean values. The pressure of the wind against a plane varies with the temperature, the barometric pressure, and square of the mean velocity. The following table is adopted for ordinary calculations, and is sufficiently accurate for a temperature of about 45° F. at the level of the sea, and is known as Smeaton's results:

VELOCITY OF THE WIND.		PRESSURE.	Remarks.
Miles per hour.	Feet per second.	Pounds per sq. ft.	
1	1.47	0.005	Just perceptible.
2	2.93	0.030	
3	4.10	0.044	
4	5.87	0.079	Gentle wind.
5	7.33	0.123	
10	14.67	0.493	Brisk gale.
15	22.00	1.107	
20	29.34	1.968	Very brisk.
25	36.67	3.075	
30	44.01	4.429	High wind.
35	51.34	6.027	
40	58.68	7.873	Very high storm.
45	66.01	9.963	
50	73.35	12.300	
60	88.02	17.715	
80	117.36	31.490	
100	146.70	49.200	

Extreme pressures and extreme velocities have been reported as high as 180 miles per hour, and pressures of 71 lb. per square foot, but these are exceptional cases, and windmills commercially made are not expected to meet such emergencies.

Mr. Perry, from his dynamometric tests, found that the power of the best-designed wheel that he made gave only 25 per cent. of the power, or energy, of the wind; and that this was more than 80 per cent. above the best commercial wheel which he used in his tests. In these tests the wheel was forced with a known velocity against still air, and the result would be different for a wheel working in variable currents. Since the average of the energies of variable currents exceeds the energy of the average current, the efficiency is probably higher than that given above. The most prejudicial resistance which the wheel has to overcome is the resistance of the air itself.

The efficiency is work done compared with the cost of doing it, and the cost includes the first cost, interest on the capital invested, deterioration, repairs, attendance, lubrication, and fuel (when used) or other power. The last does not enter into consideration in the case of the windmill. The mechanical efficiency of the windmill can not be determined with accuracy, but this is not a serious obstacle commercially, for the actual and continued use of machines and the growth of the business is the best guarantee of merit and economy.

Wolff, writing prior to 1885, made numerical comparisons between windmills and some other motors. He concluded that a windmill employed in pumping water is from 1.75 to 2.25 times as economical as a steam-pump, three times as economical as an Ericsson hot-air engine, and 2.25 times as economical as a gas-engine, all doing the same work; but the cost of the windmill has been much reduced since that time, and the efficiency increased, hence the above ratios are much greater to-day, since the other motors have not changed to the same extent.

The windmill must be ready to run night and day for a succession of years. It should therefore be of durable material and of the best workmanship; steel is being used more and more. The capacity should also be ample to accomplish the work designed; it is vexatious and a loss of time to be hindered for want of capacity. The commercial efficiency is enhanced by the life of the mill, hence a low first cost, if at the expense of workmanship or cheap material, may be a poor investment. In many cases it is also enhanced by storing power by pumping water into tanks or reservoirs, or charging electrical storage batteries for future use.

DE VOLSON WOOD.

Windom, WILLIAM: cabinet officer; b. in Belmont co., O., May 10, 1827; studied law, and began the practice of his profession in Ohio; removed to Minnesota in 1855; member of Congress 1858-68; appointed U. S. Senator July, 1870, to fill a vacancy, and elected Senator for 1871-77; re-elected in 1876; was U. S. Secretary of the Treasury Mar. 5, 1881, to Oct. 27, 1881; re-elected U. S. Senator Oct. 26, 1881, for term ending 1883; became U. S. Secretary of the Treasury Mar. 5, 1889. D. in New York, Jan. 29, 1891.

Windowpane: a name given on parts of the coast of North America to the flatfish *Pleuronectes maculatus*, on account of its thin, transparent body. It is closely related structurally to the turbot of Europe, but is without economic value. J. S. K.

Windpipe: See TRACHEA.

Winds [O. Eng. *wind*; Germ. *wind*; Goth. *winds*; cf. Lat. *ventus*; Sanskr. *vāta*-, from root *vā*-, to blow]; air-currents. Winds are defined by their direction and velocity. The velocity is measured by the ANEMOMETER (*q. v.*), and expressed in miles per hour or meters per second. The greatest velocities attained can be judged only by their effects, as no human structures withstand them; they occur in tornadoes and hurricanes, and have been estimated at 200 or more miles per hour. For estimate by observers without anemometers the following scale is in use by the weather bureau:

NAME.	Miles per hour.	Apparent effect.
Calm	0	No visible horizontal motion to inanimate matter.
Light	1 to 2	Causes smoke to move from the vertical.
Gentle	3 to 5	Moves leaves of trees.
Fresh	6 to 14	Moves small branches of trees and blows up dust.
Brisk	15 to 24	Good sailing breeze and makes white caps.
High	25 to 39	Sways trees and breaks small branches.
Gale	40 to 59	Dangerous for sailing vessels.
Storm	60 to 79	Prostrates exposed trees and frail houses.
Hurricane	80 or more.	Prostrates everything.

Many other scales have been adopted. The best known and the one usually employed at sea is the Beaufort scale, as follows:

Wind force, Beaufort scale.	Common name.	Velocity, miles per hour.
0	Calm	0
1	Light air	3
2	Light breeze	13
3	Gentle breeze	18
4	Moderate breeze	23
5	Fresh breeze	28
6	Strong breeze	34
7	Moderate gale	40
8	Fresh gale	48
9	Strong gale	56
10	Whole gale	65
11	Storm	75
12	Hurricane	90

The velocity of the wind increases as we ascend in the free air, and reaches a maximum at some height unknown, but not great. The decrease of velocity below this plane of maximum is due to friction on the earth's surface, and above the plane to the rarity of the air. Irregularities of the

earth's surface also introduce inequalities in the velocity, which are of so short duration that our ordinary sensations and instruments do not betray them. They have been studied especially by S. P. Langley, whose results are given in a paper entitled *Internal Work of the Wind* (Smithsonian Contributions to Knowledge, No. 884, 1893). These variations within a moving mass of air appear to play an important part in the flight of birds, especially the soaring.

The air when in motion exerts a pressure on obstacles opposed to it which is in the ratio of the area vertical to the direction of the wind, but is much modified by cushions of still air on the exposed surface, by eddies at the margins, etc., due to the physical properties of air. The pressure increases as the square of the velocity. For velocities up to 90 miles per hour, the pressures given by experiment are as follows, where the barometer stands at about 30 inches:

TABLE OF WIND PRESSURES (POUNDS PER SQUARE FOOT).

Indicated velocity.	+ 0.	+ 1.	+ 2.	+ 3.	+ 4.	+ 5.	+ 6.	+ 7.	+ 8.	+ 9.
0..						0.104	0.144	0.190	0.243	0.303
10..	0.369	0.433	0.511	0.586	0.666	0.762	0.853	0.949	1.051	1.16
20..	1.27	1.38	1.50	1.63	1.76	1.90	2.04	2.19	2.34	2.48
30..	2.64	2.81	2.98	3.14	3.32	3.50	3.67	3.87	4.04	4.24
40..	4.44	4.64	4.84	5.07	5.27	5.51	5.72	5.93	6.18	6.40
50..	6.66	6.89	7.12	7.40	7.64	7.88	8.14	8.43	8.69	8.95
60..	9.22	9.49	9.76	10.1	10.4	10.6	10.9	11.2	11.6	11.9
70..	12.2	12.5	12.8	13.1	13.5	13.8	14.1	14.4	14.8	15.1
80..	15.5	15.8	16.2	16.5	16.9	17.3	17.6	18.0	18.4	18.8
90..	19.2									

The velocities indicated are those of the Robinson anemometer. These pressures are notably lower than those usually given, and are most reliable for velocities below 60 miles.

The direction is determined by the wind-vane or anemoscope. In horizontal directions the wind is named by that from which it comes. Thus a north wind is southward bound. The vertical motions of the air—upward or downward—have been but little observed. This is due to the position of the observer, who is tied to the bottom of the aerial ocean whose vertical currents are to be observed. He therefore occupies the most unfavorable position possible for their observation. Our knowledge of vertical currents is chiefly hypothetical, and is confirmed by cloud formation or other results of such motions.

Air-currents are the efforts of the air to restore the atmospheric equilibrium where it has been disturbed. If the earth were smooth and homogeneous, if it did not rotate, and there were no sun, the atmosphere would settle eventually into a state of equilibrium, in which there would be no air-currents. If now the sun should pour its rays on such an earth, the spot immediately beneath the sun would become warmer, the warmer air would rise and flow out above, colder air flow in below, and one regular vortex would be set up. If now the earth should rotate, this vortex would be spread along the whole equator, and would form a ring of ascending air with an impouring layer below and an outpouring one above. Moreover, the rotation of the earth would give a twist to westward for the inflowing and to eastward for the outflowing air. Now, if to these are added irregularities of surface, irregularities in the distribution, formation, and dissipation of cloudiness, and seasonal and diurnal changes, sufficient causes have been found for the variability of winds. As results we have the general circulation of air over the globe, and the modifications of this by a great variety of special winds.

General Circulation.—If the earth were covered with water the general circulation, as determined by William Ferrel, would be that shown in Fig. 1, where the horizontal flow is shown on the sphere and the vertical section at its margin. The broken arrows represent the upper winds. This would consist of—

1. An equatorial ring with calm or light variable winds at the surface. This is the doldrums, and over it the air is ascending.
2. On each side of this are the trade winds, inflowing air at the surface, N. E. in the northern hemisphere, S. E. in the southern; also the westerly antitrades at some elevation. The trades are experienced over a band about 20 wide on the ocean. The stratum of air in motion is shallow, and does not generally extend far on shore. The antitrades are found on the tops of high mountains in the tropics.
3. Outside the trades a band in which, though the weather is settled, the wind is controlled by local instead of general

terrestrial conditions. In this band lie the great stationary high pressures of the world.

4. The temperate regions or zones of variable weather and wind where the prevailing direction is westerly, S. W. below, W. above.

FIG. 1.—General circulation.

5. The polar regions, generally calm, but frequently disturbed by storms.

The equatorial belt moves alternately N. and S. with the changing declination of the sun, completing its movements in a year and causing a corresponding change in the zones mentioned above.

The phenomena following the great KRAKATOA (*q. v.*) eruption indicate that above the system of winds described there is a rapid easterly wind over the equator, changing to S. E. and N. E. as the latitude increases N. and S. respectively.

As an object of registry the wind is a complex quantity, having two elements of different sorts—viz., velocity and direction. The averages for climatic tables are either very voluminous as objects of record or so artificial as to be of little popular use. In the first case they are recorded separately for direction and velocity or for various combinations of these. Or they may be graphically represented by a diagram constructed like a mariner's compass and called a wind-rose.

By giving to the radius representing each wind a length proportional to the length of time and the velocity with which it has blown at a given place during a stated period, such as a year or a month, a wind-rose may be traced which will present at a glance the peculiar condition of this important element of climate at that place. In Fig. 2 the

FIG. 2.

two diagrams, for instance, which represent in this way the average duration of winds in January and July in Maryland, the eye seizes at once the great prevalence of the northwesterly winds in winter and of the southwesterly in summer which is characteristic of the climate of the Atlantic coast. Prof. Heinrich Dove, of Berlin, used a similar method for showing graphically the average condition of the barometric pressure, thermometer, and hygrometer which accompanies the different winds, and calls such diagrams the barometric, thermic, and atmic (hygrometric) wind-roses of the places considered.

In the second case the directions alone, each occurrence counted as one, or the direction, each with its proper velocity, are combined to form a resultant by the principles of

the composition and resolution of forces given in text-books on physics. For this purpose a traverse table may be used. The resultant derived in this way is of little use except in certain technical inquiries, and gives no clear idea of the succession of winds. See Ferrel, *A Popular Treatise on Winds*; also articles CLIMATE, GEOLOGY, and METEOROLOGY.

MARK W. HARRINGTON.

Windsor: town of England, in Berkshire; on the right bank of the Thames; 21 miles W. by S. of London by rail (see map of England, ref. 12-J). The river is crossed here by an elegant iron bridge connecting Windsor with Eton. Windsor is an ancient borough, but has undergone much alteration of late years, owing to the improvement of the castle. (See WINDSOR CASTLE.) The park is next to the castle the most interesting feature of the place. Together with the immediately adjoining forest, it comprises an area of 13,000 acres. It still contains many historic trees, such as Elizabeth's Oak, Shakspeare's Oak, also the Long Walk, laid out in the reign of Charles II., Queen Anne's Ride of Elms, 3 miles long, etc. The oldest planted timber in England, dating back to the time of Elizabeth, is also found in Windsor Park, and not a few oaks may be pointed out of which the age is well established to be more than 1,000 years. Pop. (1891) 12,327. The parliamentary borough returns one member.

R. A. R.

Windsor: town and port of entry; Hants co., Nova Scotia, Canada; on the Avon river, and the Dominion Atlantic Railway; 45 miles N. W. of Halifax (for location, see map of Quebec, etc., ref. 2-B). It is in a region abounding in limestone, gypsum, and other minerals; is the seat of Kings College, University of Windsor; and is principally engaged in ship-building, fruit-growing, and the manufacture of cotton, iron, and wooden goods. It has 2 weekly and 2 monthly periodicals. Pop. (1881) 2,559; (1891) 2,838.

Windsor: town and port of entry; Essex co., Ontario, Canada; on the Detroit river, and the Mich. Cent., the Grand Trunk, and the Canadian Pac. railways; opposite Detroit, Mich., and 110 miles S. W. of London (for location, see map of Ontario, ref. 6-A). It is regularly laid out and substantially built; has a large export trade in salt, fruit, and agricultural products; and is principally engaged in brewing and distilling liquors, and the manufacture of tobacco, cigars, leather, boots and shoes, carriages, etc. It has a daily and three weekly newspapers. Pop. (1881) 6,561; (1891) 10,322.

Windsor: town (settled in 1635; first house built in 1633; named in 1637); Hartford co., Conn.; on the Connecticut and Farmington rivers, and the N. Y., N. H. and Hartford Railroad (for location, see map of Connecticut, ref. 7-II). It contains several villages; has post-offices at Windsor, Poquonock, and Rainbow, and railway stations at Windsor, Wilson's, and Hayden's; and is principally engaged in agriculture, and fruit, vegetable, and tobacco growing. There are 7 churches—Congregational, 2; Roman Catholic, 2; and Methodist Episcopal, Protestant Episcopal, and Baptist, 1 each, and 2 mission chapels; a town high school, 2 kindergartens, public schools in 10 districts, and a young ladies' institute; public library; 2 town-halls; Moore's Park, with a half-mile racing-track, where the Windsor Agricultural Society holds annual fairs; and a trolley line connecting the town with Poquonock, Rainbow, and Hartford. Among the industrial plants are a creamery, canning-works, and manufactories of electrical goods, machine screws, tobacco, worsted goods, underwear, and paper. The banking business of the town is done in Hartford. The assessed valuation of property in 1894 was \$1,375,787, and the town debt \$61,200, chiefly incurred for macadamizing the roads. Pop. (1880) 3,058; (1890) 2,954. The history of the town extends back more than 250 years. The leader of its first settlers was Roger Ludlow, "the father of Connecticut jurisprudence." He is believed to have been the author of the constitution adopted in 1639 by the towns of Windsor, Hartford, and Wethersfield, which united to form the commonwealth of Connecticut. This was the first written constitution in the world, and the model afterward followed in drawing up the Constitution of the U. S., in which the Connecticut delegates exerted great influence. His only monument in Windsor is the "Roger Ludlow School," a modern brick edifice erected in 1893 not far from where he lived. Capt. John Mason, the conqueror of the Pequot Indians, was a Windsor citizen; and so was Oliver Ellsworth, Chief Justice of the U. S., whose home is still standing, and contains many colonial relics of great interest. His body lies in the old cemetery,

and near him the Rev. Ephraim Hewitt, one of the early pastors of the First Congregational Church, whose tombstone, dated 1644, is probably the oldest in New England. Gov. Roger Wolcott is also buried here, and many others bearing the distinguished names of Mather, Allyn, Rowland, Sill, Loomis, Pierson, Hayden, Morgan, Phelps, etc. See *Ancient Windsor* (revised edition), by Henry S. Stiles, M. D., and the *Memorial History of Hartford County*.

REV. F. W. HARRIMAN.

Windsor: city (founded in 1856); Henry co., Mo.; on the Mo., Kan. and Tex. Railway; 21 miles S. W. of Sedalia, 208 miles W. of St. Louis (for location, see map of Missouri, ref. 5-E). It is in an agricultural, stock-raising, and coal-mining region, and has 8 churches, a twelve-room public-school building, 2 State banks (combined capital, \$70,000), and a semi-weekly and a weekly paper. Pop. (1880) 872; (1890) 1,427; (1895) estimated, 1,900.

EDITOR OF "REVIEW."

Windsor: town; Windsor co., Vt.; on the Connecticut river, and the Cent. Vt. Railroad; 78 miles S. by E. of Montpelier, the State capital (for location, see map of Vermont, ref. 7-C). It is in an agricultural region, is an important market for general produce, cattle, poultry, and maple-sugar; and has 6 churches, the State prison, 2 public parks, library (founded in 1882), high school, iron-foundry, machine-shop, manufactories of hardware specialties, lumber, and shoes, a savings-bank, and a weekly paper. Pop. (1880) 1,696; (1890) 1,484.

EDITOR OF "VERMONT JOURNAL."

Windsor Castle: the principal royal residence of the sovereigns of Great Britain since the accession of George III. and frequently occupied by the earlier kings. It is built upon a chalk hill near the river Thames, about 22 miles from London. The older palace of the English kings was at Old Windsor, about 2 miles distant, and considerable doubt seems to exist among antiquaries and historians as to the first English king who built solid work of masonry at Windsor Castle. The most ancient portions are the Garter and Caesar towers, the latter of which forms a bastion of the castle-wall, and abuts upon the winding street called Thames Street. It is one of the most curious antiquities in the whole building. These towers were erected in the reigns of Henry I., II., and III. To the same period belong the south ambulatory of the Dean's Cloister, a door behind the altar in St. George's chapel, and the remains of Domus Regis in the north of the chapel. The Norman gateway near the keep, the groining of the Devil's Tower and King John's Tower, and the Dean's Cloister pertain to the time of Edward III. St. George's chapel was built by Edward IV.; the choir roof by Henry VII.; the outer gateway of the lower ward by Henry VIII.; and the buildings from the Norman gate to the state apartments, including the library, were raised by Queen Elizabeth. But the castle, as it now appears, is almost entirely the creation of George IV.'s reign, when about a million sterling was spent upon the place. The courts, the terrace, the gardens, the slopes, and the parks, all underwent great change and much improvement. The internal changes are even more striking than the external. Suites of rooms decorated and furnished with the utmost magnificence, the corridor which runs round two sides of the quadrangle, and the grand staircases, immensely surpass what was previously to be seen in the castle. Changes have been made in the pictures, some of the old ones having been sent away and others introduced; a museum of curiosities has been arranged in a small gallery on the north side; the library has been improved; the plate-closet, containing silver and silver-gilt services, the engravings, the miniatures, and the drawings are of great value; and the collection of porcelain in the long gallery is thought to be unequalled in Europe; but no facilities are afforded for the study of the works of art in the castle, even when they are national property. The Wolsey chapel contains the tombs of Prince Leopold, Duke of Albany, and the Duke of Clarence. It has been magnificently decorated and contains a cenotaph to the Prince Consort.

Revised by RUSSELL STURGIS.

Windsor Locks: town; Hartford co., Conn.; on the Connecticut river, and the N. Y., N. H. and Hart. Railroad; 12 miles N. of Hartford, 14 miles S. of Springfield, Mass. (for location, see map of Connecticut, ref. 7-II). It was set off from Windsor, the oldest town in the State, and incorporated in 1854, and has an area of 11 sq. miles. Good power for manufacturing is obtained from the Connecticut river by means of a canal. There are 4 large mills engaged in the manufacture of book, cover, plate, enameled, tissue, and

fine copying paper and bristol-boards; also manufactories of cotton warp, novelty yarn, and fancy weaving thread, underwear, paper machinery, Jordan engines, silk goods, rolled steel, school globes and apparatus, carpet-loom chains, rubber rolls, trucks, furniture, lathe-chucks, and iron-foundry products. The town has 4 churches—Orthodox Congregational, Protestant Episcopal, Methodist Episcopal, and Roman Catholic; a public graded school; a Roman Catholic parochial school; Memorial Hall (cost \$33,000), presented by Charles E. Chaffee to J. H. Converse Post, 67, G. A. R.; a savings-bank; and a weekly newspaper. Pop. (1880) 2,332; (1890) 2,758. EDITOR OF "JOURNAL."

Windthorst, rint hōrst, LUDWIG: party leader; b. at Kaldenhof, near Osnabrück, Hanover, Nov. 17, 1812, studied law at Göttingen and Heidelberg; practiced as an advocate in his native city, and entered the lower house of the Hanoverian diet in 1849. As leader of the anti-Prussian, anti-constitutional party he became president of the house and Minister of Justice 1851-53, founding the bishopric of Osnabrück and surrounding the king with Roman Catholics. In 1862 he again became a minister, and forced Hanover into an alliance with Austria. After the annexation of Hanover by Prussia and the formation of the North German Confederacy he became the leader in the Prussian diet of the Hanoverian opposition, and after the proclamation of the German empire, the chief of the Ultramontanist party in the German Reichstag. The indefatigable adversary of Prince Bismarck, he fought against the prolongation of dictatorial rule in Alsace-Lorraine, the expulsion of the Jesuits, the introduction of civil marriage, the establishment of the so-called May laws, the issue of the anti-socialist laws, etc.; and though he suspended his opposition when the Holy See and the German Government came to a compromise, he demanded too important concessions as the price of clerical support, and on their rejection by the Government renewed his attacks. He was re-elected in 1890. D. in Berlin, Mar. 14, 1891.

Windward Islands: originally, the Caribbee islands, or Lesser Antilles; that portion of the West Indian archipelago which forms a north and south chain on the eastern side of the Caribbean Sea, from the Virgin islands to Trinidad. The name was given in allusion to the prevailing winds, which in this region blow almost constantly from the E. (See WEST INDIES.) Officially, the name is now restricted to a British colony, embracing the islands of GRENADA, the GRENADINES, ST. VINCENT, and ST. LUCIA (*qq. v.*). The capital and residence of the governor-general is St. George's, in Grenada. H. H. S.

Wind-work: See GEOLOGY.

Wine and Wine-making [*wine* is O. Eng. *wīn*, an early loan-word from Lat. *vinum*; cf. the *v* in the later loan-word *vin-* (*vinea*) in *vineyard*]: By wine is usually understood the fermented juice of the grape, although the name is occasionally applied also to fermented beverages derived from other fruits. Its preparation dates from the most ancient times. The wines of the ancients, however, were very generally modified by the addition of spices and other condiments to suit the taste of the consumers—a habit still largely prevalent among their descendants on the Mediterranean shores. The taste and demand for strictly pure wines are of comparatively modern date, and their prevalence accounts in part for the decline of the reputation of some of the wines, anciently most esteemed, of Italy, Greece, Asia Minor, and Persia. Wine-making is a complex and dillicult art when the best possible results are to be achieved, and owes much to the progress of modern science.

Grapes to be used in wine-making should be fully ripe; when this is not the case, the juice is deficient in quantity as well as quality, poor in sugar, and rich in acids, and yields a wine deficient in aroma, of a "green" flavor. It is therefore generally necessary to gather the fruit in two or three successive "pickings," leaving the unripe bunches time to mature. Should the natural conditions fail to bring about the full ripening, the defect is sought to be remedied by various devices, such as spreading the bunches on mats or straw in the sun or in warmed rooms; placing them in large vats, in mass, for several days; causing them to freeze, or steaming them moderately. When the weather permits, the grapes are often allowed to become over-ripe to such extent as to make them appear to be wilted; they then yield less, but sweeter and stronger wine (*Ausbruchwein*, Germ.). Finally, in southern countries (Spain, Italy, Greece) wine is frequently made from grapes fully dried, or raisins, the requisite water being added in crushing and pressing. In

vineyards whose product is very valuable, all unripe and decayed berries are carefully handpicked from the bunches, and the latter, or even their berries, assorted as to quality. Where the vineyards are exposed to dust, the fruit is washed by spraying with clean water, since otherwise the wine acquires an "earthy" flavor, which is often erroneously ascribed to the inherent quality of the soil.

Stemming and Crushing.—According to the kind and quality of the wine to be made, the separation of the stems from the berries prior to crushing and fermentation may or may not be desirable, the stems containing much acid and tannin. It is sometimes done by handpicking, but mostly by means of coarse wire sieves or combs, against which the bunches are worked by hand. In California mechanical stemmers and crushers, driven by steam power and capable of working 10 tons of grapes per hour, are in use. The berries are mostly crushed by passing them between ribbed rollers, set so as to avoid crushing any kernels. Sometimes the unstemmed bunches are crushed by treading with clogs or sandals, or by pounding with wooden pestles. The "first run," or juice flowing off spontaneously after crushing, is often kept apart, because of yielding a higher quality of wine.

Pressing.—This is effected by means of presses of every variety of pattern, from the primitive lever and wedge press to the screw and hydraulic, and even the centrifugal process has been successfully used. When the "first run" has been separately received, the pressed juice constitutes the "second run"; while the pressed residue is the pomace, which is thereafter utilized for the production of inferior wine, vinegar, or brandy. The amount of unfermented juice obtained usually ranges from 70 to 80 per cent. of the weight of the berries in the wine grapes proper, which are juicy, with little pulp; while pulpy varieties (mostly used for the table) may yield as little as 60 per cent. But when, as in red-wine making, the pulp is fermented with the juice before pressing, the pomace (skins, pulp, and seeds) may amount to only 7 per cent. of the weight of the bunches, while the stems range from 2½ to over 7 per cent. of the same. The average product of salable red wine per ton of grapes is usually estimated at 150 gal.

Composition of Grapes and Must.—The grape-berries vary considerably in their contents of soluble matters, according to variety and degree of ripeness; viz., from 12-6 per cent. in colder climates to over 28 per cent. in warm regions; insoluble matters from 2.5 to 7 per cent.; water from 70 to 85 per cent. The ash of grapes varies from .4 to .5 per cent., of which from one-half to two-thirds is soluble in water. The ash of must varies from .25 to .4 per cent. of its weight; from 80 to 85 per cent. of this ash consists of alkali (chiefly potash); P₂O₅, about 41.

The proximate ingredients of must may be briefly stated as follows: Water; sugar, in the form of about equal parts of grape-sugar or dextrose, and fruit-sugar or levulose; a little gum and dextrin and pectin; vegetable acids—chiefly tartaric (sometimes racemic), small amounts of malic, citric; fat, wax; albuminoids; tannin; coloring-matter; volatile aroma, pre-existing chiefly in the husks of some kinds of grapes, and distinct from the wine flavor and "bouquet"; ash ingredient—potash, soda, lime, magnesia, oxides of iron and manganese, potassium sulphate, calcium phosphate, chlorine, silica. Potassium is chiefly present as bitartrate, or cream of tartar.

Sugar may be considered the most important ingredient of must, its amount, together with that of the vegetable acids, being largely the index to the probable commercial value of the product. Of all known fruit-juices, grape-must contains the largest amount of sugar, ranging from 13 to over 30 per cent., according to the warmth of the climate or season. From 20 to 25 per cent. is considered a desirable figure for dry wines. In fermentation the sugar is partially or wholly transformed into somewhat less than half its weight of alcohol, about one-half being given off in the shape of carbon dioxide (carbonic acid). Besides common alcohol, there are formed succinic acid, glycerin, and a number of aromatic ethereal compounds, whose presence and quantity materially influence the quality of the wine. Since, moreover, a liquid containing over 12.5 weight per cent. of alcohol ferments slowly or not at all, any excess of sugar of over 25 per cent. may remain undecomposed and sweeten the wine. Wines containing less than 12 per cent. of alcohol seem to owe any sweetness chiefly to glycerin produced in fermentation. The amount of sugar in the must is usually ascertained by means of a hydrometer.

The following table gives the volume-percentage of alcohol contained in some of the best-known wines, varying greatly, of course, from year to year:

Rhenish and Moselle wines.....	9.1 to 12.0
Grüneberger, Naumburger (Northeast Germany).....	6.5
Burgundy, red.....	7.5 to 13.5
Bordeaux, first class.....	7.0 to 11.5
Catawba, Concord, etc.....	8.5 to 12.7
California wines.....	10.5 to 15.0
Port.....	18.0 to 23.0
Sherry.....	17.0 to 21.0

The acids of must rank next in importance to sugar. Their amount varies from .3 to 1.02 per cent., to a certain extent in inverse ratio to the sugar present, since during the later stages of ripening the free acids undergo a rapid diminution; and as on their presence depends, to a large extent, the formation of the peculiar ethereal wine-flavors in fermentation, one cause of the lack of flavor observed in wines of southern countries is obvious. From .6 to .8 per cent. are usual and desirable proportions of acid in musts; but more does not necessarily render the resulting wine more acid, provided abundance of sugar is present.

Of the special nature of the *albuminoids* and other nitrogenous ingredients of must but little is known. Their amount varies from .24 to .83 per cent., and their presence exerts a most important influence upon the fermentation and keeping qualities of wine. Being essential to the formation of yeast, an inadequate supply of these substances causes incomplete fermentation; while an over-supply, though partially precipitated in the lees, is supposed to render the wine liable to spoiling. This assumption is not, however, confirmed by the latest researches.

Tannin is not present in the pure juice, but occurs largely in the skins of some kinds of grapes (red and black) as well as in the stems and seedcoats. Hence close crushing and pressing, and still more the presence of the whole pomace during fermentation, cause the wine to be rich in tannin. Under the same circumstances the coloring-matter of the husks and the acid and tannin of the stems and seed-hulls find their way into the wine in larger quantities, thus causing the more acid and astringent qualities of red wine.

The *fermentation* by which must becomes wine starts spontaneously, under the influence of minute germs adherent to the outside of the berries or afloat in the air, within a time varying, according to temperature, from a few hours to several days after pressing. The must becomes increasingly turbid, gas-bubbles begin to rise, and soon bring with them particles of yeast (see FERMENTATION), which tend to accumulate on the surface. At the same time the temperature begins to rise, reaching 10° to over 20° C. above the outside temperature, according to that temperature and the quantity of the fermenting mass. Fermentation is usually most active between 25° and 30° C., depending somewhat upon the sugar-content of the juice; but wines fermented at high temperatures lack aroma and keeping qualities; hence the use of deep, cool cellars to retard the process and permit the formation of the delicate "bouquets" which characterize the wines of cool climates. Of late, the controlling of the temperature by artificial means, and the starting of the fermentation by means of pure yeast from superior vintages, are attracting increased attention.

In the making of red wines, dark-tinted grapes are crushed and fermented as a whole, with the must, usually in open tanks; thus charging the wine with the color, tannin, and other soluble matters of the grape body; while white wines are made by fermenting alone the previously pressed juice of white or light-colored grapes. This difference in preparation results, of course, in material differences in hygienic as well as other properties. Five to seven days is the usual time for red-wine mashes to complete their first fermentation; the gas carries the pomace to the top, forming the "cap" (Fr. *chapeau*), which is either submerged by stirring-in (Fr. *fouillage*) at least once a day, or may be kept permanently submerged by perforated covers, to favor extraction and the contact of the yeast with the must. To prevent more certainly souring (acidification) by exposure to the air, a solid "floating" cover, leaving an annular space around its circumference for escape of gas, is advantageously employed. Of late, the complete exclusion of air during

red-wine fermentation by various devices is coming into greater favor, and is applied even to the "grand wines" of France. In the fermentation of white musts the accumulation of the yeast at the surface and (in the usual practice) its expulsion at the bung-hole of the fermenting cask retards the action, approximately doubling the times above mentioned. Sandbags on the bung-hole are frequently used to prevent injurious access of air when the fermentation subsides.

After-fermentation.—Upon the subsidence of the violent fermentation, the yeast, with more or less of tartar, gummy and albuminoid matters (*lees*) and grape *débris*, and pomace, settles to the bottom, while the liquid clears and is then carefully drawn off into casks to undergo the after-fermentation, during which the remaining sugar ($\frac{1}{4}$ to 2 per cent.) ferments out slowly, and the formation of the characteristic bouquet begins. Great care must now be taken to prevent access of air and consequent acidification, yet without incurring the risk of bursting the casks by tight bunging. Hence, as the wine diminishes by evaporation through the wood, the empty space must be filled up with other wine (*ullage*), a practice which must thereafter be continued so long as the wine remains in wood. The after-fermentation may last from six weeks to several months; during that time an abundant deposition of lees takes place; these consist largely of tartar (which is difficultly soluble in alcoholic fluids) with some yeast, and gummy and albuminous matters, and are utilized in the manufacture of cream of tartar.

Maturing.—When fermentation has completely ceased the young wine is again drawn (*racked*) off, preferably into smaller casks, in which the maturing or aging is to take place. This process depends essentially on the gradual action of atmospheric oxygen, which enters through the pores of the wood, for in air-tight vessels no bouquet is formed. The maturing process is hastened by frequent racking (every two months), during which the wine is for a short time exposed to the air and absorbs oxygen. Each time this is done the wine becomes slightly turbid ("muddy") and forms a deposit, consisting mainly of products of oxidation, but very commonly in part of fungus vegetation. The suppression of the latter is of capital importance to the preservation of the wine, upon which it feeds, causing a variety of "diseases," which often cause enormous losses. According to circumstances and the nature of the germs present, the wine may incline to turn sour, forming vinegar, or "milksour," with a taste of rancid butter; or bitter, from the bitter ferment that particularly infests old wines; or stale, from the destruction of both tartar and alcohol by a special parasite, etc. Many remedies (mostly antiseptics) have been of old resorted to against these dangers. Among them sulphuring (by burning sulphur in the casks) to kill the germs; fining (adding gelatin and then, in the case of white wines, tannin, thus forming a bulky precipitate); and filtration are the most used; the last named, when employing close-textured unglazed porcelain (*Chamberland*) filters, is very effective. But the most ready remedy is the heating, out of contact with air, to about 65° C., as recommended by Pasteur, which can be done without injury to most wines, while killing the noxious germs and increasing the apparent age.

When, finally, after the lapse of from two to four, and in rare cases even eight years, the wine remains clear when racked, it is "bottle-ripe," and is considered finished. Most wines, however, continue to improve by age in flavor, for a length of time differing for each kind. In the end, even bottled wines become too harsh and acid to be palatable.

Sparkling Wines.—Ordinary "still" wines retain only so much of the gas generated in fermentation as to impart to them a refreshing quality, which soon vanishes on exposure to the air; the wine then becomes "flat." Sparkling wines, of which champagne (so called from the province of France where it is chiefly made) is the type, effervesce on account of an excess of carbonic acid gas contained in them under pressure. This gas is generated in a second fermentation produced in the young wine, subsequent to after-fermentation, by the addition of sugar and (when necessary) yeast-forming matter (gelatin). This is effected in strong bottles tightly corked, and when the fermentation is completed the sediment of yeast is ejected from the mouth of the inverted bottle by dexterous manipulation. Of all wines, champagne is perhaps the most extensively imitated, mostly by forcing into sweetened still wines, or even cider, such gas as is used in the preparation of soda-water.

Sweet or fortified wines are made from certain grapes of high sugar-contents, grown in warm countries, by arresting

the fermentation of the must by the addition of wine-brandy before the sugar has fermented out, and subsequent exposure of the wine thus "fortified" to air at summer heat in partially empty casks, whereby it is matured. Such wines are often sweetened to suit the taste by means of evaporated must; they contain usually from 2 to 8 per cent. of sugar.

Blending of Wines.—Few wines reach the consumer as they would result from the processes above detailed, as applied to one kind of grape. It is the general practice to adapt the various kinds and qualities of wines to the taste of the consumers by the intermixture of such as will improve each other. To this practice no reasonable objection can be made, since from beginning to end intelligent management influences the nature of wine nearly as much as its origin, and it would be difficult to define just what should be understood by "natural wine." Blending is a difficult art, requiring a natural qualification as well as trained judgment, but is greatly aided by chemical wine analysis.

"Doctoring" of Wines.—Of all articles of human consumption wine is probably the one most commonly modified by additions and adulterations. So long as these additions merely make up for deficiencies in what might be considered the normal composition of must (as is done in adding sugar to the must of vintages that have suffered from unfavorable weather), it is questionable whether the consumer has reason to complain; and hence this practice ("chaptalizing") is very general in the colder wine countries, and is hardly made a secret of. The simultaneous addition of water ("gallizing") might claim equal immunity when made on similar grounds, and not for the fraudulent increase of quantity. The manufacture of a wine-like beverage from the pomace, by extraction with sugar-water to such extent as will secure for the resulting juice a proportion of constituents similar to that of natural must ("petiotizing") while not intrinsically objectionable, is liable to great abuse, though vastly preferable to the compounding of so-called wines from materials to which the grape is a stranger, and whose manufacture has to a great extent been supplanted by that of cheap "petiotized" wines. The "piquette" made in France from the pomace by a second fermentation, forming the common beverage of the laboring class, falls under these heads. Aside from these more or less avoidable practices (among which "scheelizing," the addition of glycerin, might also be mentioned), the dark arts of the wine-compounder are innumerable, and often difficult of detection.

Among still wines, those most commonly imitated are the heavy, sweet wines of southern countries, which are to a great extent themselves the result of a comparatively artificial process, and whose general wine-flavor it is relatively easy to reproduce. Raisins and other dried fruits are most commonly the basis of such articles.

Classification of Wines.—The wines of commerce may in a general way be divided into—(1) dry wines, not or at least not obviously sweet, but possessing a more or less distinctive and high flavor—bouquet; (2) sweet or "fortified" wines, permanently and decidedly sweet, and rich in alcohol, with but a general vinous aroma; mostly from southern climates. Between these two classes there are of course all degrees of transition, and in both we find both white and red or tinted wines. Those of France are classed with especial care for commercial purposes.

France stands at the head of wine-producing countries, and produces an especial abundance and variety of red wines, of which those most highly esteemed are grown in the Bordelais and in Burgundy, as well as in Dauphiné. The Bordeaux wines (clarets) have a full, agreeable bouquet, a good deal of body, are spirited yet not heady, with a decided astringency and acid, and permit of considerable dilution with water, with but little loss of zest; they form the bulk of French export wines: first-class are Château Lafitte, Château Latour, Château Margaux, Haut Brion, etc. Second-class clarets are, e. g., those of St.-Julien, St.-Estèphe, Cantenac of the Bordelais, those of the Champagne, the Lyonnais, and Dauphiné. The Burgundy wines, such as Chambertin, Clos Vougeot, etc., are rather heavy, oily, less astringent and acid, with a fine, peculiar aroma, and will not bear shipment to long distances. *Petits vins*, or *vin ordinaire*, is produced in all but eight out of eighty-six departments. The white wines of France are stronger and have more body than the Rhenish wines: first-class are the "Haut Sauterne" of Château Yquem, of the Bordelais; also some white wines of Burgundy and Champagne (Sil-

lery). Other Sauternes, Barsac, etc., count as second-class. Superior dry wines are also produced in the south of France, but most prominent in commerce are the *liqueur* (sweet) wines of Perpignan, Languedoc (Frontignan, Lunel), Rousillon, and the "straw wines" of Dauphiné. In 1875 the wine yield of France was over 1,840,000,000 gal., in 1887, only 535,000,000 gal., owing to the phylloxera, in 1893, 1,300,000,000 gal., and in 1894, not much less than the last amount.

Foremost among the wines of Germany are the high-flavored, dry Rhenish wines, grown from Alsace down to Coblenz, in the valley of the Rhine and its tributaries. Of the white wines (known in England under the collective name of "hock," a corruption of Hochheim), those of Hochheim, Rudesheim, Johannisberg, Forst, the Niersteiner, Marcobrunner; and among the red wines, the Affenthaler and Asmannshäuser are best known. The Moselle wines resemble those of the Rhine in flavor, but are light and acid; the wines of Franconia are also acid, but heavier, and not so high-flavored. Those of Northeastern Germany (Silesia, Saxony) are very acid.

Among the wines of Switzerland, those of the Jura region (Vaud, Neuchâtel, Geneva) are esteemed best. Almost all have a somewhat harsh and earthy taste, and are not exported. That of the Valtelline has some reputation as a stomachic and tonic.

Austria has usually been second to France in the amount of wine produced, but only the wines of Hungary and some of the liqueur wines of the Adriatic provinces are somewhat widely known in commerce, and the aggregate export is quite small. The sweet, fiery, and aromatic wine of Tokay in Hungary is by some esteemed above all others. Many other excellent wines are in high local repute.

Italy produces abundance of wines, which in the north (Piedmont, Tuscany) are chiefly "dry" reds, such as those of Asti, Monte Pulciano, and Fiascone, the Chianti, etc.; while southward, and especially in Sicily, Lachryma Christi and Marsala are best known. Much good material is spoiled by bad management in wine-making. During the worst period of the phylloxera invasion in France, Italy exceeded the latter country in wine production, and supplied much wine to it.

The wine production of the Iberian Peninsula is very extensive and of considerable commercial importance. Both dry and sweet wines are produced. Among the wines exported, the best known are those of Jerez (sherry), Malaga, and Oporto (port). The latter is largely made and blended to suit the English market. The wines of Malaga and Jerez are both of the dry and liqueur class; all are strengthened by the addition of spirit. Of the same general character are the wines of Madeira.

Few of the wines of Greece enjoy a general reputation at present, although the wines of Cyprus and Chios are still praised. They, as well as those of Turkey in Europe and Asia, and Persia, suffer for want of care in preparation, and from the nature of the vessels (goat or hog skins, rendered water-proof by pitch) in which they are too commonly kept or conveyed.

The wines of Southern Russia (Crimea and Bessarabia), though little known to commerce, are now supplying a considerable portion of the demand in that empire, and their production is increasing very rapidly.

In Africa (apart from the Canaries) wine-production has long been established in the Cape Colony, and the (mostly sweet) wines of the Cape enjoy some repute in England and elsewhere. In Algeria, the vine-culture early established by the French now produces a considerable amount of wine. The wines of Constantine enjoy some commercial reputation, but most of the Algerian wines disappear under the blending art of the mother country.

Recently the wines of Australia, resembling in general those of California, have appeared in the English market, and have met with favor. The wines of Chili and Argentina are not known to commerce as yet.

Of American wines, those of California approach most nearly to those of Europe, being made from the same varieties of grapes, of the *vinifera* type, which are unadapted to the climatic conditions E. of the Rocky Mountains. The variety of climates within California seems to render feasible, with proper selection and treatment, the production of all the various types of wines of Middle and Southern Europe. The best wines of California growth are unfortunately now commonly sold to consumers under various French labels, leaving mainly the inferior qualities credited to the State;

which, added to various unfortunate, but in their nature only temporary, commercial conditions, has caused a serious depression in the wine industry there. The high qualities of the best Californian wines, however, have been repeatedly recognized by French experts. The wine product of California has for a number of years ranged from 15,000,000 to 20,000,000 gal.

The wines of the States E. of the Rocky Mountains, made from American grapes only, differ from those of Europe, and all other countries in mostly possessing more or less of the peculiar (foxy) aroma of the berries. As in Europe, the musts frequently fail to acquire, N. of the Potomac, the desirable amount of sugar; which is then supplemented by the addition of cane-sugar, but would be more appropriately supplied from the surplus sugar of California musts, evaporated for the purpose. E. W. HILGARD.

Wineberry: a term applied in the U. S. to *Rubus phoenicolasius*, a raspberry of Japan, introduced as a fruit-plant in 1887, although it was grown before that time as an ornamental plant. The plant is characterized by a hairy reddish covering, and the wine-red berries are inclosed in a husk-like calyx. The fruit is little known. L. H. B.

Wine'breuner, JOHN: religious leader; b. in Frederick co., Md., Mar. 24, 1797; became a minister of the German Reformed Church at Harrisburg, Pa., 1820, but in consequence of a difference of views in regard to revivals seceded from that Church Sept., 1828, and in Oct., 1830, established a new denomination under the title of the Church of God, now more generally known as "Winebreuners." (See article CHURCH OF GOD.) Winebreuner edited for several years *The Gospel Publisher*, now the *Church Advocate*, the organ of his sect, published at Harrisburg, and published a number of books, including *Pronouncing Testament and Gazetteer* (Harrisburg, 1836); *Brief Views of the Church of God* (1840); *A Treatise on Regeneration* (1844); and *Practical and Doctrinal Sermons* (1860). D. at Harrisburg, Sept. 12, 1860.

Winebreuners: See WINEBREUNER.

Wineland: See VINLAND.

Wine-plant: a name sometimes applied to RHUBARB (*q. v.*).

Winer, see'ner, GEORG BENEDIKT: professor of theology; b. at Leipzig, Germany, Apr. 13, 1789; studied theology in his native city; became professor extraordinary there 1819, ordinary professor at Erlangen in 1823 and at Leipzig in 1832, and died there May 12, 1858. He published *Comparative Darstellung des Lehrbegriffs der verschiedenen Kirchenparteien* (Leipzig, 1824; 4th ed. by P. Ewald, 1882; translated into English, *The Doctrines and Confessions of Christendom*, Edinburgh, 1873); *A Grammar of the Chaldee Language as contained in the Bible and the Targums* (1824; Eng. trans. by H. B. Hackett, Andover 1845); and *A Grammar of New Testament Greek regarded as a sure Basis of New Testament Exegesis* (1822; 8th ed. 1894; translated into English by W. T. Moulton, Edinburgh, 1870; 2d ed. 1877); *Biblisches Realwörterbuch* (1820; 3d ed. 1847, 2 vols.), a work of great industry and learning upon all historical, geographical, and archaeological matters contained in the Bible; *Handbuch der Theologischen Litteratur* (1821; 3d ed. 1838), also a very useful work, and distinguished as much by accuracy as by completeness. Revised by S. M. JACKSON.

Wines, ENOCH COBB, D. D., LL. D.: philanthropist; b. at Hanover, N. J., Feb. 17, 1806; graduated at Middlebury College 1827; took charge of the Edge Hill School, Princeton, N. J., 1833; became Professor of Languages in the Central High School at Philadelphia 1838; conducted a boarding-school at Burlington, N. J., 1844-48; was licensed as a Congregational preacher 1849; was pastor of churches at Cornwall, Vt., and Easthampton, Long Island; became Professor of Ancient Languages in Washington College, Pa., 1853, and president of the City University of St. Louis, Mo., 1859; secretary of the New York Prison Association 1862; founded the National Prison Association 1870, of which he became secretary; went to Europe as a representative of the U. S. Government 1871; succeeded in convening representatives of twenty-six governments at the first International Penitentiary Congress at London, July 4, 1872, when he was appointed chairman of a commission which met at Brussels 1874 and at Bruchsal 1875, and called a second international congress to meet at Stockholm 1877. He was the author of *Commentaries on the Laws of the Ancient Hebrews* (New York, 1852; 6th ed. Philadelphia, 1869) and

The State of Prisons and Child-saving Institutions throughout the World (Cambridge, 1880). D. at Cambridge, Mass., Dec., 10, 1879.

Revised by GEORGE P. FISHER.

Winfield: city (founded in 1870); capital of Cowley co., Kan.; on the Walnut river, and the Alc., Top. and S. Fé, the Mo. Pac., and the St. L. and San Fran. railways; 38 miles S. E. of Wichita (for location, see map of Kansas, ref. 8-H). It is the center of a rich agricultural region; is principally engaged in farming and manufacturing; contains churches of the leading denominations, a public high school, Methodist Episcopal and German Lutheran colleges, 3 national banks with combined capital of \$225,000, and a State bank with capital of \$20,000; and has a daily, 5 weekly, and 4 monthly periodicals. Pop. (1880) 2,844; (1890) 5,184; (1895) 5,031.

EDITOR OF "COURIER."

Wingham: village; Huron County, Ontario, Canada; on the Maitland river, and the Gr. Trunk and Canadian Pac. railways; 39 miles W. of Palmerston (for location, see map of Ontario, ref. 4-C). It is in an agricultural and dairying region; derives excellent power from the river, and has saw and flour mills, salt-works, furniture and other factories, a bank, and two weekly newspapers. Pop. (1881) 1,918; (1891) 2,167.

Winkelried, vink'el-réed, ARNOLD, von: patriot; a native of the canton of Unterwalden, Switzerland. According to the legend, he decided by his patriotic self-sacrifice the battle of Sempach July 9, 1386, in which a small Swiss force was engaged with a large Austrian army under Archduke Leopold. By gathering the lances of Austrian halberdiers into his body and bearing them down to the ground, he effected a breach in the Austrian line, through which the Swiss made the attack. A monument was raised to him at Stanz, in Unterwalden, Sept. 3, 1865. The question of the truth of the legend has furnished the subject of an extensive literature. See H. von Liebenau, *Arnold von Winkelried, seine Zeit und seine That* (1862); Kleissner, *Die Quellen zur Sempacher Schlacht und die Winkelried Sage* (Göttingen, 1873); Bürkli, *Der wahre Winkelried—die Taktik der alten Urschweizer* (1886); and T. von Liebenau, *Die Schlacht bei Sempach*, etc.

Winlock, JOSEPH, LL. D.: astronomer; b. at Shelbyville, Ky., Feb. 6, 1826; graduated at Shelby College 1845; became Professor of Mathematics and Astronomy in that institution; was employed at the observatory at Cambridge, Mass., as one of the computers of the *Nautical Almanac* 1852; became Professor of Mathematics in the U. S. navy 1856; was the second superintendent of the *American Nautical Almanac*, succeeding Admiral C. H. Davis in 1856; was for a short time professor at the Naval Academy at Annapolis, Md.; became director of the observatory at Cambridge, Mass., and Phillips Professor of Astronomy in Harvard University 1866; conducted expeditions to Kentucky to observe the solar eclipse of Aug., 1869, and to Spain to observe that of Dec., 1870, and made important improvements in the equipment of the observatory. D. at Cambridge, June 11, 1875. Revised by SIMON NEWCOMB.

Winnebago City: village; Faribault co., Minn.; on the Blue Earth river, and the Chi., Mil. and St. Paul and the Chi., St. P., Minn. and Om. railways; 35 miles S. of Mankato (for location, see map of Minnesota, ref. 11-E). It is in an agricultural region, and has water-works, a Freewill Baptist college, a high school, 2 private banks, and 2 weekly newspapers. Pop. (1880) 993; (1890) 1,108; (1895) 1,638.

EDITOR OF "PRESS-NEWS."

Winnebago Indians: See SIOUAN INDIANS.

Winnebago Lake: the largest body of water entirely within the limits of Wisconsin; traversed by the navigable Fox river. It is 26 miles long, and has a maximum breadth of 10 miles. Area, 212 sq. miles. As shown by railway surveys, it is 748 feet above the sea. It is navigated by steamboats, and abounds in fish of various species. A part of its eastern shore has been curiously walled with stones that have been forced shoreward by the expansion of the ice in winter.

Revised by I. C. RUSSELL.

Winnemue'ca: town; capital of Humboldt co., Nev.; on the Humboldt river, and the South. Pac. Co.'s railway; 144 miles W. of Elko, 170 miles N. E. of Reno (for location, see map of Nevada, ref. 3-G). It is in an agricultural and silver-mining region, is a shipping-point for beef, wool, and grain, and has a national bank with capital of \$110,000, and a daily newspaper. Pop. (1880) 763; (1890) 1,037.

SILVER STATE PUBLISHING Co.

Winnemucca Lake: a body of water occupying a desert valley in Western Nevada. It is 26 miles long from N. to S. with an average breadth of $3\frac{1}{2}$ miles, and is from 50 to 87 feet deep. It is fed almost entirely by Truckee river, which divides and supplies Pyramid Lake also. It is without outlet, and contains 3.6 parts per 1,000 of mineral matter, principally common salt, in solution. ISRAEL C. RUSSELL.

Winnepegoo'sis: the Indian name for Little Lake Winnipeg, a continuation of Lake Manitoba, lying from 30 to 60 miles W. of Lake Winnipeg, into which it discharges through the Fauford and Little Saskatchewan rivers. It is surrounded by wooded prairie land not yet settled.

Win'nipeg: capital of the province of Manitoba, Dominion of Canada; the largest city of the Dominion W. of Lake Superior, and the seventh in size in British North America; situated in 97° W. lon. and 49° 50' N. lat.; at the junction of the Red and Assiniboine rivers (see map of Canada, ref. 9-II). Winnipeg covers an area of about 12,750 acres, a large part of which is not yet built upon. It is divided into six wards for municipal purposes, and its streets are laid out almost entirely on the rectangular system. Public squares, other than the spaces surrounding some of the public buildings, have not been provided, but a board of park commissioners has purchased several open spaces in different parts of the city, which, by degrees, are being converted into public recreation-grounds.

Streets, Public Buildings, and Institutions.—The streets, stores, offices, and larger private houses are lighted by electricity, while gas is also used as an auxiliary or substitute. The street-car service is an electric one, and there are about 14 miles of line in use. Neither of the rivers has been used for commercial purposes by the city for several years, but when a lock has been built to overcome an obstruction 18 miles down the Red river, that stream will be navigable from Winnipeg to Lake Winnipeg, and for its whole distance in the province, and probably for a considerable distance in the U. S. The Assiniboine is a smaller and more sluggish stream, on which are the city water-works, which, together with forty or fifty artesian wells, provide the water-supply of Winnipeg. The city is only partially paved, cedar blocks being used for the roadway, and where wooden sidewalks have been abandoned, granolithic pavement has taken their place. Main Street, running N. and S. from the Assiniboine to the northern limit of the city and parallel with Red river, is the principal business street, though most of the wholesale houses are on Princess Street and its immediate vicinity.

The city-hall and the post-office, both on Main Street, together with the legislative buildings, lieutenant-governor's residence, court-house, and armory—these latter in the southern or Assiniboine side of the city—are the principal public buildings. There is an Anglican cathedral and archbishop's residence at the northern extremity of the city, and 3 other edifices belonging to the Church of England, 6 Presbyterian churches, 5 Methodist, 1 Baptist, 3 (including the cathedral) Roman Catholic, the Roman Catholic cathedral being in St. Boniface, a suburb on the east side of Red river. St. John's College, for Anglicans, the Methodist College, the Presbyterian College, and the Roman Catholic College at St. Boniface comprise the Manitoba University, and there are 11 large public schools. The Winnipeg General Hospital and the St. Boniface Hospital are supported by voluntary, private, and denominational subscriptions with government aid. The Deaf and Dumb Institute is supported by the Provincial Government.

Finances.—Winnipeg is governed by a mayor elected by general vote, and a council of twelve elected by six wards, there being a separate organization of trustees for the government of the public schools, also elected by wards. The real estate of the city was assessed in 1894 at \$18,760,950, and business-tax assessment \$3,240,380, or in all \$22,001,330, with a rate of 19.60 mills on the dollar, including the school assessment, which varies according to the necessity of building. In 1893 it was 4 mills on the dollar.

Industries, Banks, etc.—The business interests of Winnipeg are very varied. The city is not only the capital of the province, but is to a large extent the distributing point for the whole of the territory between Lake Superior and the Rocky Mountains. There is not yet any great manufacturing interest, with the exception of a large flour-mill, linseed-oil mill, lumber-mills, a foundry, and the Canadian Pacific Railway's shops, three barbed-wire factories, and a pork-packing establishment on the St. Boniface side of the Red

river. All the leading banks of Canada have branches in Winnipeg, the city ranking generally third in the monthly return of banking business of the Dominion. There are, in addition, several mortgage and loan companies that advance money on real estate, and a private bank.

History.—Winnipeg was incorporated by act of the provincial Legislature in 1873. At the junction of the Red and Assiniboine rivers the Hudson Bay Company's post, Fort Garry, had drawn round it in course of time a small settlement of traders and retired employees of the company. In 1870, when the Red River expedition, under Col. (later Lord) Wolseley, arrived at Fort Garry to dispossess the insurgent Riel, there was a population of about 200 people within a mile of the fort. This served as the nucleus of the city of Winnipeg. (See MANITOBA.) The rush of people from other parts of Canada, consequent upon the opening up of the country and the decision of the Government to make the capital of the new province at Fort Garry, quickly determined the question of the future central point, and the population rapidly increased. When rail communication through Northern Minnesota was completed, the growth of the city continued more steadily, and was again largely augmented by the construction of the Canadian Pacific Railway and the boom which occurred in 1881 and 1882. The reaction from the boom was felt for a few years, but the settlement of the farming lands, the produce of which passed through Winnipeg, prevented any serious results from the over-speculation, and enabled the city to recover its steady growth. Eight lines and branch lines of railway converge in Winnipeg. Pop. (1881) 7,985; (1891) 25,642; (1896) estimated, 38,000. MOLYNEUX ST. JOHN.

Winnipeg Lake: a large sheet of water situated in Manitoba, Canada, between lat. 50° and 54° N. and lon. 96° 30' and 99° W. It is about 4 miles wide at its south end, narrows very closely in the center, and then extends for about 275 miles, expanding to about 60 miles at its northern extremity. It is the reservoir of a number of rivers, chief among which is the Winnipeg, draining the Lake of the Woods and country W. of the height of land that separates the waters flowing into Lake Superior from those of the west; the Great Saskatchewan, which with the Assiniboine, whose waters also fall into it, drains the Canadian Northwest territories Alberta, Saskatchewan, and Assiniboia; and the Red river, flowing between Minnesota and North Dakota and flowing through Manitoba. Lake Winnipeg discharges through the Nelson river into Hudson Bay. It is about 9,000 sq. miles in area, and 710 feet above the sea—that is, 112 feet higher than Lake Superior. It is rocky and rugged on its east coast, the Laurentian formation prevailing, but flat and marshy on much of the west, where the Silurian formation is found. At the head of the lake is Norway House, formerly one of the chief distributing ports of the Hudson Bay Company. There is a large Icelandic settlement on the west shore, back of which the country is fertile and wooded. The lake produces large quantities of whitefish, the fisheries being worked systematically as well as providing food for the Icelandic settlement and the Indians on neighboring reservations. There is a small trade between the lake and Selkirk in Manitoba, which will be considerably increased when the rapids of St. Andrews, on the Red river, half way between the lake and the city of Winnipeg, have been locked. MOLYNEUX ST. JOHN.

Winnipeg River: a river having its chief sources in the Lake of the Woods, which drains the Rainy River country, and in English river (300 miles long), flowing out of Lake Seul, besides other smaller streams. It is about 530 miles long, and runs through a rocky Laurentian country well wooded with spruce, some pines, tamarac, etc. It is rather a series of small lakes, connected by links flowing over rapids and falls, than a continuous stream. It is navigable by small boats and canoes, but not by steamers; the first rapids are quickly succeeded by others occurring within a few miles of the mouth. The boats and canoes of the Red River expedition, under Wolseley in 1870, reached Manitoba from Lake Superior by this river. There is a mission, and there are one or two Hudson Bay Company's posts on the river, and a few scattered settlers, but the country is not fitted for agriculture. MOLYNEUX ST. JOHN.

Winnipiseog'ee Lake: a body of water in east central New Hampshire. It is of irregular outline, and has an extreme length of 25 miles and a breadth varying from 1 to 10 miles. It is studded with picturesque islands, and is much visited in summer for its charming scenery. Area,

175 sq. miles; elevation, 472 feet. It discharges its clear waters by the Winnipiseogee river, one of the head streams of the Merrimack.

Revised by I. C. RUSSELL.

Winnsboro: city; capital of Fairfield co., S. C.; on the Southern Railway; 35 miles N. of Columbia (for location, see map of South Carolina, ref. 5-E). It is in an agricultural and stone-quarrying region; contains Mt. Zion Institute (chartered in 1777), a graded public school, a national bank with capital of \$100,000, and an incorporated bank (capital, \$81,400); and has a tri-weekly and a weekly newspaper. It was at one time the headquarters of Lord Cornwallis, and for a number of years all the cotton-gins in the U. S. were manufactured here. Pop. (1880) 1,500; (1890) 1,738; (1895) estimated, 1,850.

EDITOR OF "NEWS AND HERALD."

Wino'na: city (settled in 1851, city government organized in 1857); capital of Winona co., Minn.; on the Mississippi river, and the Burl. Route, the Chi. and N. W., the Chi., Mil. and St. P., the Green Bay, Win. and St. P., and the Win. and West. railways; 27 miles N. W. of La Crosse, Wis., 104 miles S. E. of St. Paul (for location, see map of Minnesota, ref. 11-II). It is on a plain between the river and Lake Winona, is surrounded by towering bluffs, including Sugar Loaf and Trempealeau Mountains, and is famed for its beautiful location and picturesque scenery. Two railway bridges and a wagon bridge span the river here. The city has improved water-works and sewerage, electric lights, electric street-railways, and several miles of paved streets. The noteworthy buildings include the U. S. Government building, erected in 1890 at a cost of \$150,000; the State Normal School, built in 1868 and enlarged in 1894, cost \$220,000; High-school building, erected in 1887 at a cost of \$60,000; Winona Seminary for young ladies, cost \$50,000; opera-house, erected in 1893 at a cost of \$50,000; and the public library, with nearly 12,000 volumes. There are 23 churches, 10 public schools, 4 parochial schools, 2 watchmakers' and engravers' schools, and a business college; 2 national banks with combined capital of \$425,000, 3 State banks, two of which had combined capital of \$100,000; a private bank; and 2 daily, a semi-weekly, and 7 weekly newspapers. The city is an important market for grain and other products of this part of Minnesota and the neighboring part of Wisconsin, and has flour and lumber mills, wagon-factories, and agricultural-implement works. Pop. (1880) 10,208; (1890) 18,208; (1895) 20,649.

WILLIAM CODMAN.

Winona: town; capital of Montgomery co., Miss.; on the Ill. Cent. and the Southern railways; 23 miles S. of Grenada, 88 miles N. by E. of Jackson (for location, see map of Mississippi, ref. 5-G). It is an important cotton-shipping point, and has several cotton-gins and grist-mills, 2 State banks with combined capital of \$100,000, and a weekly and a semi-monthly periodical. Pop. (1880) 1,204; (1890) 1,648.

EDITOR OF "TIMES."

Winoos'ki: village; Colechester town, Chittenden co., Vt.; on the Cent. Vt. Railroad; 2 miles N. of Burlington, the county-seat (for location, see map of Vermont, ref. 4-A). It is in an agricultural region; has 4 churches, a graded public school, a savings-bank, electric railway to Burlington and to Fort Ethan Allen, and a weekly newspaper; and is engaged in the manufacture of cotton and woolen goods, iron and brass goods, lumber, carriages, window and door screens, and doors, sashes, and blinds. Pop. (1880) 2,833; (1890) 3,659.

EDITOR OF "JOURNAL."

Winooski (or Onion) River: a river that rises in North-eastern Vermont, flows westward through the Green Mountains, and empties into Lake Champlain at a point 5 miles N. W. of Burlington. It has numerous falls, including those at Middlesex and at Winooski, near Burlington; and in several places has cut deep gorges. It is a beautiful river, about 100 miles long.

I. C. R.

Winslow, EDWARD: governor of Plymouth Colony; b. at Droitwich, Worcestershire, England, Oct. 19, 1595; joined the congregation of the Pilgrim church at Leyden 1617; married in Leyden, embarked in the Mayflower with his wife and his brother Gilbert 1620; was one of the party in the shallop which explored the coasts of Cape Cod and discovered the harbor of Plymouth; lost his wife during the first winter; married Mrs. Susannah White, theirs being the first marriage in New England. During troubles with the natives he offered himself as a hostage to Massasoit, and paid two visits to the residence of that chieftain two days' journey inland, curing him of a severe illness on the second

occasion (1623), thereby gaining his confidence and assuring his friendship; wrote a narrative of his visit to the Indians, which appeared in George Morton's *Relation* (1622); made a voyage to England as agent of the colony 1623, returning with a supply of necessaries and the first cattle; was chosen a magistrate 1624; made a second voyage to England, returning 1625; was chosen governor 1633; went to England again 1635, when he appeared before the council and succeeded in disconcerting a plot for abolishing the self-government enjoyed by the colonists; was confined in the Fleet prison for seventeen weeks by order of Archbishop Laud, on complaint of Thomas Morton, for having at Plymouth taught in the church, being a layman, and having performed the ceremony of marriage as a magistrate; was again governor 1636, and a third time 1644; went to England for the last time 1649, when he was influential in the formation of the Society for Propagating the Gospel among the Indians of New England; remained in England during the Protectorate, being employed in several public capacities, and in 1655 was one of three commissioners sent by Cromwell to direct an expedition against the Spanish settlements in the West Indies. D. at sea of a fever, between Santo Domingo and Jamaica, May 8, 1655, and was buried at sea. A portrait, said to be by Vanduyke, is preserved in Memorial Hall, Plymouth, where are also his chair and other relics. He was the author of *Good News from New England, or a True Relation of Things very Remarkable at the Plantation at Plymouth in N. England; together with a Relation of Customes among the Indians* (1624); given in full in Young's *Chronicles of the Pilgrim Fathers*, Boston, 1841; *Brief Narration, or Hypocresie Unmasked, a True Relation of the Proceedings of the Governour and Company of the Massachusetts against Samuel Gorton, etc.* (1646), re-issued as *The Danger of Toleratng Levellers in a Civill State, etc.* (1649); given in part in Young's *Chronicles*; *New England's Salamander, etc.* (1647); *The Glorious Progress of the Gospel amongst the Indians in New England, with Appendix* (1649); and *A Platform of Church Discipline in New England* (1653). Several of these have been republished by the Massachusetts Historical Society. An elaborate *Genealogy* of the descendants of Gov. Winslow and his brothers was prepared by Dr. David Parsons Holton and Frances K. Holton of New York (New York, 1877).

Revised by S. M. JACKSON.

Winslow, FORBES BENIGNUS, D. C. L.: alienist; b. in London, England, in Aug., 1810; a descendant of the Massachusetts Winslows; went to the U. S. in early life; began the study of medicine at New York; graduated at the College of Surgeons, London, 1835; took his degree of M. D. at Aberdeen; began practice in London; was for some time parliamentary reporter for the *Times*; gave special attention to insanity; was Lettsomian lecturer to the Medical Society of London 1837; opened a private asylum at Sussex House, Hammersmith, and subsequently another in London; founded in 1848 the *Quarterly Journal of Psychological Medicine and Mental Pathology*, which he conducted until 1865; founded *The Medical Critic* 1861; was chosen vice-president of the Juridical Society and president of the Medical Society of London 1853; was a member of the leading scientific societies. D. at Brighton, Mar. 3, 1874. He was the author of *The Application of the Principles of Phrenology to the Elucidation and Cure of Insanity* (1831); *A Manual of Osteology; A Manual of Practical Midwifery; Physic and Physicians* (2 vols., 1839); *The Anatomy of Suicide* (1840); *On the Preservation of the Health of the Body and Mind* (1842); *The Plea of Insanity in Criminal Cases* (1843); *Notes on the Lunacy Act* (1845); *On Softening of the Brain, arising from Anxiety and Undue Mental Exercise* (1849); *The Lettsomian Lectures on Insanity* (1854); *On Obscure Diseases of the Brain and Disorders of the Mind* (1860; 4th ed. 1868); *Light, its Influence on Life and Health* (1867).

Revised by S. T. ARMSTRONG.

Winslow, HUBBARD, D. D.: clergyman and author; b. at Williston, Vt., Oct. 30, 1799; studied at Phillips Academy, Andover, Mass.; graduated with honors at Yale College 1825, and in the Yale theological department 1828; was pastor of the First church at Dover, N. H., 1828-32, and of the Bowdoin Street church, Boston, Mass., 1832-44; was principal of Mt. Vernon (Boston) institute for young ladies 1844-54; took an active part in the discussion of educational questions; was an examiner at Harvard and a trustee of several colleges; visited Europe to inspect educational institutions 1853; edited the *Religious Magazine* and wrote

for numerous periodicals; defended the doctrines of his former instructor, Dr. Nathaniel Taylor, against the attacks of Dr. Bennet Tyler, gaining great repute as a polemical theologian; delivered lectures on scientific, religious, educational, literary, and practical topics, including the duties of citizens; pastor of the First Presbyterian church at Geneva, N. Y., 1857-59, and in charge of the Fiftieth Street Presbyterian church, New York city, 1861-62. D. at Williston, Vt., Aug. 13, 1864. He was the author, among other works, of *The Doctrine of the Trinity* (Boston, 1831); *Controversial Theology* (Boston, 1832); *The Young Man's Aid to Knowledge* (1836); *Appropriate Sphere of Woman* (1837), republished as *Woman as She Should Be* (1838); *Elements of Intellectual Philosophy* (1852); *Elements of Moral Philosophy* (New York, 1856); and *The Hidden Life* (1863).

Revised by S. M. JACKSON.

Winslow, Jacques Bénigne; physician; b. at Odense, Denmark, Apr. 2, 1669; was probably a descendant of the English Puritan family of the name at Leyden, Holland; studied medicine at Paris, where he settled; became in 1743 Professor of Anatomy and Physiology at the Jardin du Roi; made important discoveries in anatomy, of which a memorial remains in the name "foramen of Winslow" borne by an opening in the gastro-splenic omentum. He was the author of *Exposition anatomique de la Structure du Corps humain* (Paris, 1732), which was translated into English, German, Italian, and Latin. D. in Paris, Apr. 3, 1760.

Revised by S. T. ARMSTRONG.

Winslow, John; military officer; b. at Marshfield, Mass., May 27, 1702; grandson of Gov. Josiah Winslow; was a captain in the unfortunate British expedition against Cuba 1740; was prominent in the Kennebec and Acaadian expeditions, being the principal actor in the expulsion of the Acaadians from their homes in 1755; commander at Fort William Henry 1756; took part as major-general in the expedition against Canada 1758-59; became judge of common pleas for Plymouth County 1762; was the founder of the town of Winslow in the district of Maine 1766, and was a member of the Massachusetts Legislature and of the provincial council during the Stamp Act difficulties. D. at Hingham, Mass., Apr. 17, 1774. Most of his family were loyalists, and settled in Nova Scotia during the Revolution.

Winslow, John Ancrum; naval officer; b. at Wilmington, N. C., Nov. 19, 1811. He entered the U. S. navy as a midshipman in 1827; was promoted lieutenant in 1839; served with distinction in the Mexican war; and was promoted commander in 1855 and captain in 1862. In 1863-64 he was given command of the steamer Kearsarge, and assigned to the special duty of pursuing the Confederate privateer Alabama. In June, 1864, he found the Alabama off Cherbourg, France, and blockaded her in that harbor. On the 19th, after notifying Capt. Winslow that he would fight, Capt. Semmes steamed the Alabama out of the harbor, and when 7 miles from shore Capt. Winslow headed the Kearsarge toward the privateer. The latter discharged the first shot, but after an engagement of an hour and a half began to sink; her officers and crew surrendered, and were taken on board the English yacht Deerhound, which had accompanied the Alabama into the fight. Capt. Winslow received the thanks of Congress, and was promoted commodore for his victory. In 1866-67 he commanded the Gulf squadron; in 1870-72 was commander-in-chief of the Pacific squadron; and Mar. 2, 1870, was promoted rear-admiral. D. in Boston, Mass., Sept. 29, 1873.

Winslow, Josiah; governor of Plymouth Colony; son of Gov. Edward Winslow; b. at Marshfield, Mass., in 1629; commanded the Marshfield military company 1652; became major and commander-in-chief of the colonial forces 1658; was chosen deputy 1657, and one of the commissioners of the united colonies 1658, to which post he was annually re-elected until 1670; served several years as assistant governor, and was governor from 1673 until his death, including the trying period of King Philip's war, when he was both *ex officio* and by virtue of his military rank the general-in-chief of all the forces of the united colonies. D. at Marshfield, Dec. 18, 1680. He was the first native-born governor in New England.

Winslow, Miron, D. D., LL. D.; missionary; brother of Drs. Gordon and Hubbard Winslow; b. at Williston, Vt., Dec. 11, 1789; graduated as valedictorian at Middlebury College 1815, and at Andover Theological Seminary 1818; married 1819 Miss Harriet Wadsworth Lathrop (d. 1833);

sailed for Ceylon as a missionary of the A. B. C. F. M. June, 1819; arrived at Jaffna Feb., 1820; labored there and at Oodlooville seventeen years; founded the Madras mission 1836; was president of the native college established at that city in 1840; translated the Bible into Tamil (finished about 1835); published educational and religious books in that language; supervised the mission press; wrote largely for the *Missionary Herald* and other European and American periodicals; prepared a *Memoir of Mrs. Harriet Winslow* (New York, 1835), which was widely read for many years, republished in England, and translated into French and Turkish; and devoted three or four hours daily for nearly thirty years to the preparation of his great work, *A Comprehensive Tamil and English Dictionary of High and Low Tamil* (Madras, 1862), partly based upon MS. materials left by the Rev. Joseph Knight—a work of a highly original character, containing over 67,000 Tamil words. D. at the Cape of Good Hope when on a voyage to America, Oct. 22, 1864.

Revised by S. M. JACKSON.

Winslow, William Copley, Ph. D., Sc. D., LL. D., D. D., D. C. L., LL. D.; archaeologist and journalist; son of Hubbard Winslow; b. in Boston, Mass., Jan. 13, 1840; received his early education at the Boston Latin School; graduated at Hamilton College 1862, and the General Theological Seminary in New York city 1865, after which he spent a winter in Italy, devoting much of his time to archaeological researches in Rome. He assisted in founding the *University Quarterly* 1861; edited the *Hamiltonian* 1862; was assistant editor of the *New York World* 1862-63, and edited the *Christian Times* 1863-65. He officiated temporarily at the Wainwright Memorial church in New York city, and was rector of St. George's church, Lee, Mass., 1867-70, spending his summers in exploring the Adirondaeks. He was chaplain of St. Luke's Home, Boston, Mass., for four years, and had temporary charge of churches in Boston, Taunton, and Weymouth. He was for many years executive secretary of the Free Church Association in the Episcopal Church. He devoted his energies chiefly, however, to the promotion of Egyptian exploration, and was for many years vice-president, secretary, and treasurer of the Egypt Exploration Fund for the U. S. He is an honorary fellow of the Royal Archaeological Society of Great Britain and the British Archaeological Association, and honorary member of many other learned societies, including over twenty State historical societies. He was instrumental in securing many monumental remains from Egypt for the Boston Museum of Fine Arts. Dr. Winslow is a prolific writer and lecturer on archaeological subjects and on colonial history. Among his principal works are *Israel in Egypt* (1883); *The Store City of Pithom* (1885); *A Greek City in Egypt* (1887); *The Egyptian Collection in Boston* (1890); and *The Pilgrim Fathers in Holland* (1891).

Winsor, Justin, LL. D.; historian and librarian; b. at Boston, Mass., Jan. 2, 1831; educated at Cambridge, Paris, and Heidelberg; contributed to the *Christian Examiner*, the *Knickerbocker Magazine*, and other periodicals; superintendent of the Boston Public Library 1868-77; librarian of Harvard University since 1877. Among his more important works are *Bibliography of Original Quartos and Folios of Shakespeare* (1875); *Reader's Handbook of the American Revolution* (1880); *Memorial History of Boston* (editor, 4 vols., Boston, 1880-82); *Narrative and Critical History of America* (editor, 8 vols., 1884-89); *Christopher Columbus* (1891); *From Cartier to Frontenac* (1894); *The Mississippi Basin: The Struggle in America between England and France 1697-1763* (New York, 1895). His contributions to library science are numerous and important. C. H. T.

Winsted; borough; Winchester town, Litchfield co., Conn.; on Mad river, and the Naugatuck Division of the N. Y., N. H. and Hart., and the Phil., Read. and New Eng. railways; 26 miles N. W. of Hartford, 62 miles N. of Bridgeport (for location, see map of Connecticut, ref. 7-F). It contains the villages of Winsted and West Winsted, about a mile apart and connected by one continuous main street about 3 miles in length, following as it does the winding course of Mad river (a branch of the Farmington), which furnishes excellent water-power for manufacturing. The business portion is mainly along the river-bank. Near the western limit of the borough is Long Lake, a natural body of water artificially strengthened, 150 feet above Main Street; area about 400 acres. Superior water-power is furnished by it. The two villages are supplied with water in pipes from Crystal Lake (area about 100 acres), 150 feet

higher up. Winsted is principally engaged in the manufacture of clocks, scythes, book leather, pocket and table cutlery, edge tools, knit goods, undertakers' supplies, pins, wagon-springs, carriage-bolts, and sewing silk. The borough has 2 national banks with combined capital of \$280,000, 2 savings-banks with aggregate deposits of over \$2,250,000, the Beardsley Public Library (founded in 1874), and 2 daily and 2 weekly newspapers, a convent, and an opera-house. It is one of the shire towns of the county, and has a well-appointed court-house. Pop. (1880) 4,195; (1890) 4,846; (1895) estimated, 6,000. EDITOR OF "EVENING CITIZEN."

Winston: city: capital of Forsyth co., N. C.; on the Nor. and West, and the Southern railways; 120 miles W. by N. of Raleigh (for location, see map of North Carolina, ref. 2-F). It adjoins the city of SALEM (*q. v.*), and as the interests of the two cities are nearly identical they are commonly spoken of as one place, by the name of Winston-Salem. Winston has several tobacco warehouses and factories, cotton-mills, iron and wood works, carriage and wagon factories, 3 national banks (combined capital, \$450,000), a State bank (capital, \$200,000), and a daily and 3 weekly papers. Pop. (1880) 2,854; (1890) 8,018. EDITOR OF "TWIN CITY SENTINEL."

Winston, JOHN ANTHONY: Governor of Alabama; b. in Madison co., Ala., Sept. 4, 1812; educated at Lagrange College, Alabama, and at the University of Nashville; settled in 1834 in Sumter County, where he established a large cotton plantation; was a member of the Assembly 1839-40, and again 1842, and of the Senate 1843-52, being president of the latter body 1845-48; engaged in mercantile business at Mobile 1844; was an influential member of the Baltimore convention of 1848, where he was the acknowledged leader of the Alabama Democracy; was the first native-born Governor of Alabama (1853-56); gained the name of the "veto governor" on account of his numerous vetoes of legislative bills; was delegate to the Charleston convention of 1860, and was placed on the Douglas electoral ticket; went as a commissioner to Louisiana in 1861; raised the Eighth Alabama Infantry for the Confederate service; commanded it as colonel at Yorktown and on the Peninsula, being distinguished at Seven Pines, but was soon forced to retire through infirm health; was chosen to the State constitutional convention 1865, and elected U. S. Senator in 1866, but was not admitted to a seat. D. at Mobile, Dec. 21, 1871.

Winter [O. Eng. *winter*; O. H. Germ. *wintar* (> Germ. *winter*); Icel. *vetr*; Goth. *wintrus*; perhaps akin to O. Ir. *find*, white, the winter being named from the color of the snow]; astronomically, that season of the year which begins with the shortest day, Dec. 21, and ends with the vernal equinox, Mar. 21. In ordinary speech, however, winter comprises the three coldest months, namely, December, January, and February, in the U. S., and November, December, and January in Great Britain. In the southern hemisphere the winter months are June, July, and August, and in the tropical zone the rainy season corresponds to the winter.

Winter, JOHN STRANGE: See STANNARD, HENRIETTA ELIZA VAUGHAN.

Winter, WILLIAM: journalist and dramatic critic; b. at Gloucester, Mass., July 15, 1836; was educated in Boston; graduated at the Harvard Law School and admitted to the bar; published a volume of poems, *The Convent and other Poems*, at Boston in 1854, and another, entitled *The Queen's Domain*, in 1858; went to New York in 1859, and was employed as book reviewer on the *Saturday Press* for a year; wrote for *Unity Fair* irregularly for a long time; was dramatic critic for the *New York Albion* from 1861 to 1866, and also assistant editor and literary critic; for five years was managing editor and literary and dramatic critic of the *New York Weekly Review*; in 1865 became dramatic critic of the *New York Tribune*; published a third volume of poems, *My Witness* (1871); *Life of Edwin Booth* (1872); *Thistle-down*, verse (1878); *The Trip to England* (1879); *Poems*, complete edition (1881); *The Jeffersons* (1881); *English Rambles* (Boston, 1883); *Life of Henry Irving* (1885); *Shakspeare's England* (Edinburgh, 1886); *Stage Life of Mary Anderson* (1886); *The Wauverers* (1888). Revised by H. A. BEERS.

Winterberry: any one of several American shrubs, forming a sub-genus of the *Ilex* or holly; more particularly the black alder (*Ilex verticillata*), which ranges from 5 to 12 feet in height, grows on the edges of swamps, bears clusters of small white flowers, and in November and December an abundance of brilliant crimson berries, sometimes employed in domestic medicine as a bitter tonic.

Wintergreen: one of the many popular names (checkerberrry, boxberry, partridge-berry, mountain tea, etc.) for *Gaultheria procumbens*, an evergreen undershrub of the heath family found everywhere in the damp places of the woods of the northern temperate zone, more especially under the shade of evergreens in the forests of Canada and the northern part of the U. S. The stem is from 5 to 6 inches high, with a few leaves, and small flowers appearing in May and June in the axils of the leaves. The berries, which are red, ripen in autumn and remain the winter over. They form a large part of the food of the partridge. Both berries and leaves have the aromatic flavor of sweet birch. See GAULTHERIA. Revised by CHARLES E. BESSEY.

Wintergreen, Oil of, or Oil of Gaultheria: an aromatic liquid contained in the leaves of *Gaultheria procumbens*, also in *Betula lenta* (sweet birch), and probably in the roots of *Polygala paucifolia*, *Spiraea ulmaria*, *Spiraea lobata*, and *Gaultheria hispida*. It is colorless when freshly prepared, but gradually acquires a yellowish or reddish hue; possesses a peculiar sweetish taste and a characteristic and very agreeable odor; has a greater density than any other of the essential oils (1.173), and boils at 412° F. Wintergreen oil contains about 90 per cent. of methyl salicylate (gaultheric acid, C₁₁H₁₄O₂), and 10 per cent. of a terpene termed *gaultherilene*, isomeric with oil of turpentine. (See TURPENTINE.) The former compound, which is an isomer of anisic acid, is obtained in the distillation of the oil by allowing the boiling-point to rise to 432° F., and then collecting the portion that distills over; it can also be prepared artificially by distilling a mixture of 2 parts of crystallized salicylic acid, 2 parts of wood-spirit, and 1 part of sulphuric acid (sp. gr. 1.66), or by treating wood-spirit with salicylic chlorohydrate. Methyl salicylate has a sp. gr. of 1.18, boils at 431° F., and possesses the taste and odor of the oil from which it is prepared. It is slightly soluble in water, dissolves readily in alcohol and in ether, and unites with bases, forming crystalline salts. Its aqueous solution is colored violet upon addition of a ferric salt. The purity of wintergreen oil can be ascertained by means of this reaction, as well as by its very high specific gravity. It is often employed to disguise the taste of disagreeable medicines, and largely in confectionery. Revised by IRA REMSEN.

Winterhalter, zint'er-häl-ter, FRANZ XAVER: portrait and genre painter; b. at Menzeshwand, in the Black Forest, Germany, Apr. 20, 1805. He studied at the Munich Academy and afterward in Rome; received medals at the Paris Salon of 1836 and 1837, and at the Paris Exposition of 1855; officer of the Legion of Honor 1857; order of the Red Eagle 1861; commander in the order of Francis Joseph, and received many other decorations. He settled in Paris in 1834, and was the most fashionable portrait-painter of his time, painting portraits of women especially, and receiving commissions from the royal families of France, Great Britain, Belgium, Prussia, Austria, and other countries. D. in Frankfort-on-the-Main, July 8, 1873. Some of his works are in the museum at Versailles. WILLIAM A. COFFIN.

Winterport: town (formerly part of Frankfort; incorporated in 1860); Waldo co., Me.; on the Penobscot river; 13 miles S. of Bangor, 20 miles N. by E. of Belfast (for location, see map of Maine, ref. 8-E). It contains the villages of Winterport, North Winterport, West Winterport, White's Corner, and Ellingwood's Corner, and has 4 churches, public library, semi-monthly newspaper, and manufactories of clothing, lumber, and grist mills. There is a daily line of steamers to Boston, and a ferry connects with the Maine Central Railroad. Pop. (1880) 2,260; (1890) 1,926. EDITOR OF "ADVERTISER."

Winterset: city (platted in 1849, incorporated in 1857); capital of Madison co., Ia.; on the Chi., Rock Id. and Pac. Railway; 42 miles S. W. of Des Moines (for location, see map of Iowa, ref. 6-F). It is in an agricultural and stone-quarrying region, and has 9 churches, 2 large public-school buildings, 2 national banks with combined capital of \$100,000, a State bank with capital of \$5,330, a private bank, a public library (founded in 1891), and a monthly and 4 weekly periodicals. The city is a trading-point for a large agricultural area. Pop. (1880) 2,583; (1890) 2,281; (1895) State census, 2,703. EDITOR OF "MADISONIAN."

Winther, zint'er, RASMUS VILLADS CHRISTIAN FERDINAND: poet; b. in Fensmark, Zealand, Denmark, July 29, 1796. In 1815 he entered the University of Copenhagen, where his poetical talent soon won recognition from his fel-

low students, and his first collection of poems (1828) immediately brought him national popularity. Among his numerous publications may be mentioned *Nogle Digte* (Some Poems, 1835); *Sang og Sagn* (Song and Legend, 1841); *Lyriske Digte* (Lyrical Poems, 1849); *Nye Digte* (New Poems, 1850). In 1856 he published his masterpiece, *Hjortens Flugt* (The Flight of the Hart), a romantic lyric, dealing with the Danish Middle Ages. Though not the greatest Danish poet, he has given the truest and fullest interpretation of certain elements of the Danish national character. Unlike Oehlenschläger, he never merges into the Scandinavian. D. in Paris, Dec. 30, 1876. Complete Works (11 vols., 1860-72). D. K. DODGE.

Winthrop: town; Kennebec co., Me.; on the Maine Cent. Railroad; 10 miles W. of Augusta, 19 miles N. E. of Lewiston (for location, see map of Maine, ref. 9-C). It has six churches, public high school, a national bank with capital of \$50,000, a weekly newspaper, a sweet-corn cannery, oil-cloth and blanket factories, and agricultural-implement works; and has become a popular summer resort. Pop. (1880) 2,146; (1890) 2,111. EDITOR OF "BUDGET."

Winthrop: town (incorporated in 1852); Suffolk co., Mass.; on the Boston, Revere Beach and Lynn Railroad; 3 miles S. E. of Chelsea, 5 miles N. E. of Boston (for location, see map of Massachusetts, ref. 2-I). It has a high school, 15 district schools, public library, 4 churches, 1 all-year and 9 summer hotels, and a weekly newspaper; is a popular beach resort; and is principally engaged in the manufacture of calfskins. In 1894 it had an assessed valuation of \$4,573,560. Pop. (1880) 1,043; (1890) 2,726; (1895) 4,192.

Winthrop, Fitz-John: Governor of Connecticut; eldest son of Gov. John Winthrop of Connecticut; b. at Ipswich, Mass., Mar. 14, 1638; resided in childhood at New London, Conn.; was educated in England; held a commission under the Protector Richard Cromwell 1658; returned to Connecticut in 1663; was elected to the Assembly 1671; served as major in King Philip's war; was one of the council of Gov. Andros 1686; became a magistrate in Connecticut 1689; was major-general of the expedition against Quebec 1690; was a highly efficient agent of Connecticut in London 1693-98, and Governor of Connecticut from 1698 until his death, at Boston, Nov. 27, 1707.

Winthrop, James, LL.D.: jurist and author; son of Prof. John Winthrop, physicist; b. at Cambridge, Mass., in 1752; graduated at Harvard 1769; was librarian there 1772-87; participated in the battle of Bunker's Hill, where he was wounded, 1775; was for some years chief justice of the Massachusetts court of common pleas and register of probate. He was the author of *An Attempt to Translate the Prophetic Part of the Apocalypse of St. John into Familiar Language* (Boston, 1794); *A Systematic Arrangement of several Scriptural Prophecies relating to Antichrist* (1795); and *An Attempt to Arrange, in the Order of Time, Scripture Prophecies yet to be Fulfilled* (Cambridge, 1803). He contributed scientific papers to the *Memoirs of the American Academy*. D. at Cambridge, Sept. 26, 1821. He bequeathed his valuable library to Allegheny College, Meadville, Pa. Revised by S. M. JACKSON.

Winthrop, John: colonial Governor of Massachusetts; b. near Groton, Suffolk, England, Jan. 22, 1588; studied at Trinity College, Cambridge, 1602-05; is said to have been appointed a justice of the peace at the age of eighteen years. He acquired such influence among the Puritans of the eastern counties and the capitalists of the "Company of the Massachusetts Bay in New England" that he was chosen governor of that body Oct. 30, 1629; was the leader of the great emigration of the following year, when, having sold his Suffolk estates, he sailed in the *Arbella* at the head of a small fleet bearing some 900 colonists; wrote on board the *Arbella* his treatise *A Modell of Christian Charity*; landed at Salem June 22, 1630. Endicott had been appointed by the Massachusetts Bay Company to govern the colony in subordination to the governor and company in London, but a change of great historical importance was now made. The entire government was transferred to America, and Winthrop was appointed Governor. He was annually re-elected Governor until 1634, and by his defeat in the ensuing election escaped the chief responsibility for the proceedings against Roger Williams, in which he nevertheless shared as an assistant. He was again defeated at the election of 1636 by the young Sir Henry Vane, then recently arrived, who was put forward as the champion of the Antinomian

party directed by Wheelwright and Mrs. Hutchinson; but Winthrop defeated Vane in the next election (1637) and held the office till 1640. As a leading opponent of the Antinomians he took an active part in the banishment of Mrs. Hutchinson and her followers, and in the controversy with Vane, which terminated only with the latter's withdrawal to England. He was again Governor 1642-44, deputy Governor 1644-45, and Governor from 1646 until his death, at Boston, Mar. 26, 1649. He left an interesting and valuable body of correspondence, given in his *Life and Letters* (2 vols., 1864-67) by his descendant, Robert C. Winthrop, and a copious *Journal*, which was edited, from the original MSS., with notes, by James Savage, under the title *The History of New England from 1630 to 1649* (2 vols., Boston, 1825-26; 2d ed. 1853). Many of the *Winthrop Papers* were printed in the *Collections of the Massachusetts Historical Society* (3d series, vols. ix. and x.). The facts concerning his ancestry and early life may be found in William H. Whitmore's *Notes on the Winthrop Family and its English Connections* (Albany, 1864). Revised by F. M. COLBY.

Winthrop, John, F. R. S.: Governor of Connecticut; son of John Winthrop, Governor of Massachusetts; b. at Groton, Suffolk, England, Feb. 12, 1606; graduated at Trinity College, Dublin, 1625; studied law at the Inner Temple, London; obtained a commission in the army; participated in the expedition for the relief of the Huguenot garrison at La Rochelle, France, 1627; visited Turkey as an *attaché* of the British embassy 1628; removed to Massachusetts 1631; was chosen a magistrate 1633, and settled at Ipswich, Mar., 1633; went to England the same year; obtained a commission under the grant to Robert Rich, Earl of Warwick, by virtue of which he founded a settlement at Saybrook, at the mouth of Connecticut river, Nov., 1635; built a fort there and acted as governor; removed his family from Boston to Pequot Harbor 1645, and founded New London; was chosen a magistrate of Connecticut 1651, after the union of Saybrook to that colony; was chosen Governor of Connecticut 1657, and annually re-elected through life; went to England 1661; obtained from Charles II. a charter uniting Connecticut and New Haven in one colony, under himself as Governor; was an early member of the Royal Society (founded 1662), and a contributor to its *Transactions*, being well versed in chemistry and physics; represented Connecticut in the congress of the united colonies at Boston 1676, and died there Apr. 5, 1676.

Winthrop, John, LL.D., F. R. S.: physicist; a great-grandson of Gov. John Winthrop; b. in Boston, Dec. 19, 1714; graduated at Harvard 1732; was Hollis Professor of Mathematics and Natural Philosophy in that institution from 1738 until his death; was a profound mathematician and well versed in scholastic discussions; made accurate observations of the transit of Mercury 1740, and that of Venus Jan. 6, 1761, making for the purpose on the latter occasion a voyage to St. John's, Newfoundland; was several years judge of probate for Middlesex County; declined the presidency of Harvard 1769, and again 1774; was a member of the executive council 1773-74, and a firm advocate of political liberty. He was the author of *A Lecture on Earthquakes* (1755); *Two Lectures on Comets* (1759); *Relation of a Voyage from Boston to Newfoundland for the Observation of the Transit of Venus* (1761); *Two Lectures on the Parallax and Distance of the Sun, as deducible from the Transit of Venus* (1769); *Cogitata de Cometis* (1766), communicated by Dr. Franklin to the Royal Society; and other publications. D. at Cambridge, May 3, 1779.

Winthrop, Robert Charles, LL.D.: orator; son of Thomas Lindall Winthrop; b. in Boston, Mass., May 12, 1809; a descendant of Gov. John Winthrop; graduated at Harvard 1828; studied law with Daniel Webster 1828-31; was a Whig member of the Massachusetts Legislature 1836-40, and Speaker of the House 1838-40; a member of Congress 1841-42 and 1843-50; was Speaker of the Thirtieth Congress 1847-49, distinguishing himself through a critical period by his tact as a presiding officer no less than by his graceful eloquence on the floor and his skill in debate. He was U. S. Senator, by executive appointment, to fill the unexpired term of Daniel Webster 1850-51; received a large plurality of popular votes for Governor of Massachusetts 1851, but was defeated in the Legislature; delivered at Boston Nov. 23, 1853, an oration on *Archimedes and Franklin*, which led to the erection of the statue of Franklin in that city; was the orator on the occasion of the inauguration of that monument in 1856, as he had been

at the inauguration of the Boston Public Library 1855, as president of the city library commissioners. He was the efficient president of the Massachusetts Historical Society from 1855 until his resignation in 1885, being also the senior member of that body; and, possessing an ample estate, devoted his leisure to the cause of historical literature, taking little part in political questions after 1854. D. in Boston, Nov. 16, 1894. His speeches in Congress appeared in a volume of *Addresses and Speeches on Various Occasions* (1853), and a second volume, published in 1867, contained, among other notable orations, his eulogies upon William H. Prescott, Josiah Quincy, and Edward Everett. Two other volumes followed, containing his addresses to the close of 1886. He contributed to the *North American Review* and other periodicals, wrote the article on *Washington for Wilson's Presidents of the United States, 1789-94*, and is author of a *Memoir of Hon. Nathan Appleton, LL. D.* (1861); of the *Life and Letters of John Winthrop, etc.* (2 vols., Boston, 1864-67); of a volume entitled *Washington, Bowdoin, and Franklin, with a few Brief Pieces on Kindred Topics* (1876); and *Reminiscences of Foreign Travel, a Fragment of Autobiography, Privately Printed* (Boston, 1894). After his death a volume was issued entitled *Tributes to the Memory of Robert C. Winthrop by the Massachusetts Historical Society*. A painting of him in the Capitol at Washington, presented by citizens of Massachusetts, commemorates his speakership and his Yorktown oration, while another portrait in the hall of the Massachusetts Historical Society is a proper reminder of his services to New England history.

Revised by JAMES GRANT WILSON.

Winthrop, THEODORE: soldier and author; b. at New Haven, Conn., Sept. 22, 1828; graduated with honors at Yale College 1848; traveled in Europe 1849-51 as tutor to a son of William H. Aspinwall; resided two years at Panama in the employ of the Pacific Mail Steamship Company; accompanied Lieut. Strain's expedition in 1853, and made other explorations of South and Central America; studied law at St. Louis, Mo.; was admitted to the New York bar 1855; joined the famous Seventh Regiment of New York on its entering the national service Apr., 1861; was commissioned major in the New York volunteers; became a member of the staff of Gen. B. F. Butler as his military secretary, and was killed at the head of an assaulting column in the earliest formal engagement of the war, at Big Bethel, Va., June 10, 1861. In the *Atlantic Monthly* from June to September of that year were published several spirited sketches of early war-scenes which attracted great attention, and he left ready for the press the materials of five volumes of novels and essays, several editions of which were immediately sold. They were *Cecil Dreeme* (Boston, 1861; 17th ed. 1864); *John Brent* (1862; 14th ed. 1864); *Edwin Brothertoft* (1862); *The Canoe and the Saddle* (1862); and *Life in the Open Air and other Papers* (1863), with a portrait. See *Life and Poems of Theodore Winthrop*, by his sister (New York, 1884).

Winyaw Bay: a body of water in Georgetown co., S. C. It receives the waters of Waccamaw, Pelee, and Black rivers, and is perhaps more properly called the estuary formed by the confluence of those three rivers. It is 14 miles long and 2 miles in average breadth. Large vessels ascend to Georgetown. The main entrance to the bay, called Georgetown entrance, has a brick lighthouse on the north side, lat. 33° 13' 21" N., lon. 79° 6' 44" W., called Georgetown Light.

Wire and Wire-drawing [*wire* is O. Eng. *wīr*; O. H. Germ. *wīara*, fine-drawn gold, gold ornament; IceL. *wīrr*, wire]: The manufacture of wire depends upon the ductility of metals—that is to say, upon their property of being drawn out into attenuated form. This property is quite different from a capacity for working under the hammer—copper, which is third among the metals in the order of its malleability, being sixth in ductility. Gold, however, stands first in both properties, and silver stands second in both. Apparently these were the first metals from which wire was made. The first wire was fabricated by beating the metal into thin sheets, then cutting these into narrow strips or slivers, which were afterward rounded by hammering or filing. Such wire was woven into fabrics with an admixture of textile material—literally, the cloth of gold. The date when silver was first made into wire is uncertain, the earliest that can be fixed being the time of the later Byzantine emperors. The period when the shears, the hammer,

and the file gave way to the draw-plate with graduated holes or dies is not known. The terms "wire-smiths," applied to those who made wire with the hammer, and "wire-drawers" and "wire-millers," applied to those who made it with the die-plate, are both found in German records in the middle of the fourteenth century, and it was doubtless at this time that the draw-plate, which still remains and probably always will remain, the chief appliance in the manufacture of wire, was first invented or brought into use. As the most important use for wire drawn of the precious metals was for purposes of ornamentation, the discovery that by flattening it a given weight could be wound around three times the length of textile fiber was an important step forward, this being the method in which for many purposes gold and silver is applied in ornamentation for tassels, fringe, etc., to this day. Wire was at first manufactured with the draw-plate entirely by hand, but at an uncertain date, probably before the year 1400, a machine, the inventor of which is unknown, was made to operate by water-power. In this, it is said, a lever moved a pair of pincers that opened as they came in contact with one side of the draw-plate, laid hold of the wire, drew it through the hole or die, and after drawing it a certain distance retraced their path, taking a new hold, and repeating the operation. This mechanism was in use in France for making certain kinds of wire well into the nineteenth century, such wire being known by indentations at intervals of about 2 inches along its length where the gripping pincers had taken hold. Nuremberg, so flourishing during the later portions of the Middle Ages in its arts and its manufactures, seems to have been the center from which the art of manufacturing wire extended over Europe, although it is said to have been carried on with very great success in France and Italy. The prosperity of the manufacture in the German city was due to the system of encouraging manufactures by granting exclusive patents, sometimes given by the emperor, sometimes by the council of the city. One of these patentees, Frederick Hagelsheimer, received in 1592 a patent of fifteen years for the making of fine gold and silver wire. This patent appears to have been more than once confirmed, and in 1622 was transformed into a fief or continual privilege to the heirs male of his family. The flattening of wire appears to have been a most important branch of the manufacture, this being done by passing it between rollers. In England wire was made by hand until after the middle of the sixteenth century, and then the art making use of machinery was introduced by foreigners. See Beckmann's *History of Inventions*.

In modern times what is known as gold wire has an exterior of gold and a core of silver, being made by forming a cylindrical ingot of silver and coating the latter with gold. This compound ingot is gradually reduced in size by means of the draw-plate—that is to say, by passing it through a succession of holes or dies in a hardened steel plate—first, through one only slightly smaller than the original diameter of the ingot, then through another still smaller, and so on until the requisite reduced diameter is reached. The finest wire ever made (that substituted for the spider-web lines of telescope micrometers) is made by first covering a platinum wire with solid silver. This compound wire, platinum within and silver without, is then reduced in diameter in the same manner as the gold wire with the silver core just referred to. This compound wire may be thus brought down to a diameter of about $\frac{1}{30000}$ th part of an inch. Assuming a platinum core to be one-tenth the whole diameter, this core will be attenuated to the $\frac{1}{300000}$ th part of an inch. This fine compound wire being then dipped into hot nitric acid, the silver is dissolved and the inner core of platinum remains. Platinum wire was made by this means by the inventor, Wollaston, as fine as the $\frac{1}{150000}$ th of an inch in diameter.

Wire for industrial purposes is for the most part made of iron and steel. Brass and copper wire are also largely made, the methods of the manufacture being substantially the same as with iron. In the manufacture of iron wire, rods of the requisite quality of metal have their surfaces cleaned of scale or oxide, and are then passed through the successively diminishing holes of the draw-plate—for example, ten, fifteen, thirty, or more times, according to the degree of attenuation required. The constant compression of the molecules of metal upon each other hardens the wire, so that it has to be repeatedly annealed during the successive drawings. This is performed by placing the wire in kilns, which are first heated to redness and then allowed to cool gradually. Twenty-four hours is the time ordinarily required for annealing the smaller grades of wire. Six or eight different annealings are

necessary; very small wire requires more. A scale is formed upon the wire at each annealing, and this is removed by pickling in some acid, preferably dilute sulphuric acid. Wire is sold in coils, and those of the more rigid and stiffer kinds are straightened for use by being passed alternately back and forth on two rows of alternating pins placed a slight distance apart. The wire is thus made to pass in a zigzag course through the device, which is termed a riddle, and comes out straight. Cast-steel wire is made from steel rods hammered to about one-quarter of an inch square by a tilt-hammer, and afterward made round on the anvil. A spurious gold wire, called "gold wire of Lyons," is manufactured by heating copper to a red heat and exposing it to the fumes of zinc, which converts the external portion of the metal into brass. Brass wire loses its strength when exposed to the fumes of acid, and even by long exposure to a damp atmosphere. Zinc wire is flexible, and at first as strong as copper, but resumes the original crystalline state of the metal when subjected to the action of boiling water. The uses and applications of wire are too many to be noted. One of the most unique is the production of surfaces for printing calico, in which copper wires are imbedded in the block, then filed down to a flat surface, and thus form the slightly raised figures upon which the pattern is printed.

A remarkable extension of the wire manufacture has of late years occurred from the universal introduction of barbed wire for fences. The wire is provided with points, or barbs, more or less radial to its axis, and this material provides much the greater portion of fencing in many parts of the world. Other fencing wires are made devoid of barbs, one of the best being oval in cross-section and wavy longitudinally, the alternating curves being in the plane of the greatest diameter of the wire. In 1856 an English projector claimed to "improve the tone in strings or wire used for musical purposes" by gilding the same, depositing "the gold by chemical means or coating by any process in which such covering can be produced." The English experiments extend back to 1768, when it was proposed to fold silver around a copper wire with borax between, and then draw the compound strip thus formed through a draw-plate to unite the metal. Silver was to be covered with a layer of gold and drawn in a similar way. Drawing zinc wire at a temperature of from 210° to 310° F. was patented in 1805. In 1852 the coating of wire with molten metal by drawing it through a bath thereof was described in a patent which also showed a method of excluding air from the bath. Among U. S. inventions, one for which much was claimed, was a combined telegraph wire, comprising a steel core and copper exterior, which was asserted to possess greater conductivity and strength in proportion to its weight and cost than the wire commonly used for such purposes. One of the most valuable improvements in wire manufacture was that patented in Aug., 1858, by Henry Waterman, which reduced the cost of tempering flat steel erinoline wire from \$3 a pound to three cents. Previous to this the tempering of such wire was done by winding it in volute coils kept apart by interlaced iron wires, the coils being heated to the requisite degree in a furnace, and then plunged in a hardening bath. In the improved process the wire was drawn through the fire of a furnace, and guided directly from the fire into the hardening bath. It is remarkable that among the 146,119 patents granted in the U. S. previous to the close of the year 1873 there were but five relating to the manufacture of wire, while since that time the improvements have been numerous and important. In 1890 no less than 116 patents were granted for improvements in wire manufacture and articles made from wire.

JAMES A. WHITNEY.

Wire-rope: See ROPES AND ROPE-MAKING.

Wire-worm: a term applied to certain myriapods and the larva of various beetles, but properly restricted to the tough, light-brown, cylindrical larva of various species of elaters, family *Elateridae*. These beetles are well known under the popular names of spring-beetles, click-beetles, skip-jacks, snapping-bugs, etc. (See ELATER.) The family comprises a number of genera and many species, which vary much in size, though averaging about one-third of an inch. The prevailing color is brown, but a few are jet black and others speckled with white. The larva of many species feed upon the roots of living plants, and these are known by the name of wire-worms. The eggs from which they hatch are generally laid loosely in the ground, and the newly hatched larva is invariably pale. The worms are from one to three (or in cold climates even five) years

attaining full growth, according to the species, and undergo a larger number of moults than are necessary to most insects. The head is somewhat flattened, and there are six true legs near it; the body consists of thirteen joints, and the last generally has at its base, beneath, a retractile proleg. When full grown they descend deeper into the earth, and go through their transformations within an oval cavity, most of them issuing as beetles in early summer. Wire-worms are among the greatest insect pests of the farmer, doing more or less damage to all the grasses and cereals, and often eating into and ruining potatoes, onions, turnips, and injuring various other root-crops and bulbous flowers. Wire-worms are always abundant in meadows, and crops grown on pasture or meadow land recently broken suffer most from them. In the U. S. the crops most affected are wheat and Indian corn. The remedies proposed and adopted to counteract their injuries are innumerable. As wire-worms can not subsist on the soil, as does the earth-worm, and as they mostly require about three years to come to full growth, one of the most effectual ways to prevent their injuries is to fallow the land for one year, but in order to be effectual the fallow must be thorough and the ground plowed often enough in summer to keep down the weeds. In a small plot of ground they may be trapped by strewing on the surface sliced potatoes, turnips, lettuce, or other succulent vegetables. Being unusually fond of these, the worms eat into them, and while doing so may be collected and destroyed. Fall plowing, by which the worms are exposed to their natural enemies, especially birds, at a time when most insect-life is sluggish, and submersion, where feasible, are two of the most practicable ways of destroying them on a large scale. Corn soaked over night in copperas-water before planting is generally left untouched by them. As the worms have a great partiality for rape-cake, this, mixed with Paris green and spread in lumps over a field from which domestic animals can be excluded, is probably the best of all the remedies, and it acts at the same time as a manure.

Revised by J. S. KINGSLEY.

Wirt, WILLIAM, LL. D.: lawyer and author; b. at Bladensburg, Md., Nov. 8, 1772; was left an orphan at the age of eight years, and brought up by an uncle; was educated at the grammar school of Rev. James Hunt, of Montgomery County; was afterward tutor nearly two years in the family of Benjamin Edwards, of Maryland, father of Gov. Ninian Edwards, of Illinois; studied law; began practice in Culpeper and Albemarle cos., Va., 1792; married and settled at Pen Park, near Charlottesville, Va., 1795; removed after his wife's death to Richmond 1799; served three years as clerk to the house of delegates; became chancellor of the eastern district of Virginia, and married a second time 1802; settled as a lawyer at Norfolk 1803, and published in the *Virginia Argus* his celebrated *Letters of a British Spy*, which passed through twelve editions; wrote for the *Richmond Enquirer* a series of essays entitled *The Rainbow* 1804; returned to Richmond 1806; was an assistant in the prosecution of Aaron Burr 1807; sat in the house of delegates 1807-08; wrote the collection of essays entitled *The Old Bachelor*, which originally appeared in the *Enquirer* in 1812; was appointed U. S. attorney for the district of Virginia 1816; was Attorney-General of the U. S. for three full terms during the administrations of Monroe and John Quincy Adams 1817-29; delivered at Washington a discourse commemorative of the death of Adams and Jefferson Oct. 19, 1826; settled at Baltimore 1830; and was the anti-Masonic candidate for the presidency of the U. S. 1832, and received for that office the electoral vote of Vermont. D. at Washington, D. C., Feb. 18, 1834. His chief work was *Sketches of the Life and Character of Patrick Henry* (Philadelphia, 1817; 15th ed. Hartford, 1852). His *Life* was written by John P. Kennedy (2 vols., 1849).

Wisbech, wizbēch: town of Cambridgeshire, England; in the Isle of Ely, on the Nene; 40 miles N. of Cambridge (see map of England, ref. 9-K). It is well built, and carries on a variety of manufactures and an active general trade. Vessels of nearly 500 tons can ascend from the Wash. Pop. (1891) 9,395.

Wisby, or **Visby**, ris bi: the only town on the west coast of the Swedish island of Gothland (see map of Norway and Sweden, ref. 12-G.). During the Middle Ages it was an important commercial city. In 1361 the Danish king Waldemar IV, sacked it and destroyed its importance. Only recently it began to recover, and is now a rather thriving commercial place with a population of 7,102 (1891).

Wiscasset: town (incorporated as Pownalboro in 1760, and under its present name in 1802); capital of Lincoln co., Me.; on the Sheepscot river, and the Maine Cent. Railroad; 20 miles N. of the Atlantic Ocean, 50 miles N. E. of Portland (for location, see map of Maine, ref. 10-D). It is a port of entry and a popular watering-place; has Congregational, Methodist Episcopal, and Protestant Episcopal churches, seven public-school buildings, U. S. Government building, a national bank with capital of \$100,000, a savings-bank, and a weekly newspaper; and is principally engaged in commerce, manufacturing, and farming. Pop. (1880) 1,847; (1890) 1,733. EDITOR OF "SHEEPSCOT ECNO."

Wisconsin: one of the U. S. of North America (North Central group); the seventeenth State admitted to the Union; capital, Madison.

Location and Area.—It is situated between lat. 42 27 and 47° N., and lon. 86 53 and 92 53' W.; is bounded N. by Lake Superior, N. E. by the Upper Peninsula of Michigan, E. by Lake Michigan, S. by Illinois, and W. by Iowa and Minnesota; extreme length from N. to S., 300 miles; extreme breadth, 250 miles; coast-line over 500 miles; area, according to the U. S. census, 56,040 sq. miles (35,865,600 acres), of which 1,590 sq. miles are water surface.

Seal of Wisconsin.

Physical Features.—There are

no mountains in Wisconsin; the lowest level is 600 feet above the sea, and the highest 1,800 feet. The greatest swell is the Penokee range of Laurentian or granite hills, running N. E. by S. W., some 30 miles S. of Lake Superior, and forming with its outlying spurs a triple watershed—the northward descent carrying streams flowing into Lake Superior; that sloping to S. E., the feeders of Lake Michigan; and that dipping S. and S. W., the affluents of rivers emptying into the Mississippi. A longitudinal ridge of Niagara limestone follows the shore of Lake Michigan, about 30 miles in the interior, and in the main separates the lake drainage from that of the Mississippi. In the Glacial period Wisconsin, excepting about 10,000 sq. miles in the southwest, was covered by the ice cap, which left about 2,000 minor lakes in the eastern and northern portions, with many picturesque gravel knolls, domes of drift, and moraine peaks and ridges. In the driftless area, deep detritic valleys, erosion cliffs, and castellated outlines are characteristic features. One of the chief characteristics of the State is the diagonal valley occupied by Wisconsin and Fox rivers, and Green Bay. About the center of this valley, at Portage, the Fox and Wisconsin rivers (the one a member of the Great Lakes drainage system, the other flowing into the Mississippi) are separated by a marsh but 1½ miles in width, which is sometimes overflowed in spring. The principal Wisconsin rivers which flow into Lake Superior are the St. Louis, Bois Brulé (a famous trout-fishing stream), Bad, and Montreal; into Green Bay are discharged the Fox, Pensaukee, Oconto, Peshtigo, and Menominee; Lake Michigan receives the Kewaunee, East and West Twin rivers, Manitowoc, Sheboygan, and Milwaukee; and the chief rivers emptying into the Mississippi from Wisconsin are the Wisconsin, Black, Trempealeau, Buffalo, Chippewa, and St. Croix, the latter forming with the interlocking Bois Brulé a famous French fur-trade route. The largest interior lake is WINNEBAGO (*q. v.*).

Soil and Productions.—In the central part of the State are wide areas of comparatively unfertile, sandy soil, derived

from the underlying Potsdam sandstone; in the Penokee range are tracts too rocky for successful agriculture; but for the most part the soils are arable, and some of them highly fertile, consisting in the drift area of sandy and clay loams, derived from the heterogeneous mixture of pre-glacial soils and glacial grindings; and in the driftless S. W., of the results of the decomposition of underlying limestone. Before the advent of whites, heavy forests covered much of the State—oaks, maples, ash, poplars, hickories, and the like. Great regions in the north were timbered with pines, hemlocks, and spruce, with which were mingled many deciduous trees. In the south and west the colonists found large prairies surrounded by forests of hard wood, and also much country in which the woods were dotted with small treeless areas. Most of the timber in the south and east has been removed by agricultural settlers, and the northern conifers have suffered much depletion from lumbering operations; but there remains a large belt of "pinery district." The chief agricultural productions are Indian corn, oats, potatoes, barley, root-crops, grass seed, and wheat; in the southern counties of Dane, Rock, and Jefferson tobacco is an important crop; live stock and dairy products are large interests in the south and east, the latter in 1890 amounting to 303,701,134 gal. of milk, 46,295,623 lb. of butter, and 906,266 lb. of cheese; and there are extensive cranberry marshes, with an annual product of 500,000 bush., in the central and northwestern sections. The severe winters are not favorable to the culture of apples, grapes, peaches, and pears, but small fruits and vegetables are grown in large quantities. The capital invested in nurseries is about \$500,000.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms.....	134,322	146,409	9.0
Total acreage of farms.....	15,353,118	16,787,988	9.3
Total value of farms, including buildings and fences.....	\$357,709,507	\$477,524,507	33.5

* Increase.

The following table, compiled from U. S. reports, shows the acreage, yield, and value of the principal crops in the calendar year 1894:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	787,066	16,292,266 bush.	\$7,331,520
Wheat.....	567,647	9,366,176 "	4,776,750
Oats.....	1,758,967	57,870,014 "	17,361,004
Rye.....	269,476	4,311,616 "	1,853,995
Barley.....	436,398	12,480,983 "	5,616,442
Buckwheat.....	49,532	421,622 "	285,772
Tobacco.....	18,066	14,669,592 lb.	792,158
Potatoes.....	166,497	7,488,315 bush.	3,968,807
Hay.....	1,898,733	2,487,340 tons	19,799,226
Totals.....	5,952,292	\$61,735,674

On Jan. 1, 1895, the farm animals comprised 466,161 horses, value \$20,345,306; 5,025 mules, value \$258,105; 811,012 milch cows, value \$17,647,621; 748,055 oxen and other cattle, value \$11,752,926; 895,756 sheep, value \$1,474,414; and 911,623 swine, value \$5,807,950—total head, 3,837,632; total value, \$57,286,322.

Climate.—The climate is similar to that of other interior States upon the same latitude. The winters are protracted and often severe, the mean winter temperature varying from about 25° in the southern tier of counties to about 15° on the Lake Superior shore; but the atmosphere is dry, and this low temperature does not represent the discomfort it would induce in seaboard States. The summer is brief and warm, the mean temperature varying from about 70° in the extreme south to about 60° in the extreme north; but there are frequent brief rains, and cool southern and eastern winds. The following is a table of means for the entire State for 1893 as computed by the Wisconsin weather service:

MONTHS.	Temperature.	Precipitation.	MONTHS.	Temperature.	Precipitation.
January.....	5° 5' F.	1.48 in.	July.....	71° 1' F.	3.90 in.
February.....	12 7	1.84	August.....	66 7	2.03
March.....	25 8	2.30	September..	59 1	2.32
April.....	40 8	4.45	October.....	48 5	2.49
May.....	52 0	2.54	November..	31 3	1.33
June.....	68 6	2.45	December..	16 0	2.67

Annual mean temperature, 41° 5' F.; annual precipitation, 29.80 in.

As compared with 1891 and 1892, the year was an average of 3° colder; the precipitation was slightly below normal, the average yearly rainfall being 30 inches. The average velocity of wind in 1893 was 8 miles per hour, the highest velocity being 56 miles from the W. on May 11. The total snowfall was 69 inches, a third more than the previous year. The mean barometric pressure was 30 inches, the highest reading being 31.01 (Feb. 3) and the lowest 28.95 (Apr. 20), an extreme range of 2.06 inches, which is above normal. The last severe spring frost was May 8, but there were frosts in northern counties as late as the 28th; killing frosts were reported Aug. 29 and 30, and light frosts at intervals to Sept. 24, when the temperature fell to or below freezing. These were somewhat unusual dates both as to lateness and earliness. During the year there were 124 hail-storms and 67 thunder-storms, the latter most frequent in July.

Divisions.—For administrative purposes the State is divided into seventy counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	*Ref.	Pop. 1890.	Pop. 1895.	COUNTY-TOWNS.	Pop. 1895.
Adams	6-D	6,889	7,532	Friendship

* Reference for location of counties, see map of Wisconsin.
 † Not organized in 1890.

Principal Cities and Towns, with Population for 1890.—Milwaukee, 204,468; La Crosse, 25,030; Oshkosh, 22,836;

Racine, 21,014; Eau Claire, 17,415; Sheboygan, 16,359; Madison, 13,426; Fond du Lac, 12,024; Superior, 11,983; Appleton, 11,869; Marinette, 11,523; Janesville, 10,836; Ashland, 9,956; Wausau, 9,253; Green Bay, 9,069; Watertown, 8,755; Chippewa Falls, 8,670; Stevens Point, 7,896; Manitowae, 7,710; Merrill, 6,809; Kenosha, 6,532; Waukesha, 6,321; Beloit, 6,315; Menomonie, 5,491; Oconto, 5,219; Portage, 5,143; and Neenah, 5,083.

Population and Races.—In 1840, 30,945; 1850, 305,391; 1860, 775,881; 1870, 1,054,670; 1880, 1,315,497; 1890, 1,686,880 (native, 1,167,681; foreign, 519,199; male, 874,951; female, 811,929; white, 1,680,473; colored, 6,407, of whom 2,444 were persons of African descent, and 3,835 were civilized Indians. The aggregate of other Indians was 8,896, of whom 7,915 lived on reservations (Green Bay agency 3,137, and La Pointe agency 4,778) and 981 off. The principal native tribes are Chippewa, Menomonee, and Winnebago; the Stockbridges were removed hither from Massachusetts and the Oneidas from New York.

State Census, 1895.—According to the official reports of the decennial State census the population of the State in that year was 1,937,915, and that of the principal cities and towns was as follows: Milwaukee, 249,290; La Crosse, 28,769; Oshkosh, 26,947; Superior, 26,168; Racine, 24,889; Sheboygan, 21,130; Eau Claire, 18,637; Green Bay (to which Fort Howard was annexed in 1895), 18,290; Madison, 15,550; Marinette, 15,286; Appleton, 14,641; Fond du Lac, 13,051; Janesville, 12,971; Ashland, 12,310; Wausau, 11,013; Watertown, 9,922; Manitowoc, 9,427; Merrill, 8,607; Kenosha, 8,122; Beloit, 7,786; Menomonie, 6,198; Oconto, 6,017; Neenah, 5,781; Portage, 5,419.

Industries and Business Interests.—The U. S. census returns of 1890 showed that 10,417 mechanical and manufacturing establishments reported. These had a combined capital of \$246,515,404, and employed 132,031 persons, to whom \$51,843,708 was paid in wages. The total value of the plants was \$125,455,518, of which \$43,228,127 was invested in machinery, tools, and implements. During the census year materials costing \$145,437,016 were used in the manufactories, whose combined output was valued at \$248,546,164. The following table gives details of industries having an output valued at \$2,000,000 and upward:

PRODUCTS.	Estab-lish-ments.	Em-ployees.	Wages paid.	Value of output.
Lumber-mill products from logs or bolts	853	32,755	\$10,046,413	\$62,115,739
Flour and grist mill products	497	2,300	1,172,505	21,252,297
Malt liquors	107	3,165	1,864,579	14,193,057
Leather	38	2,570	1,371,967	11,161,850
Slaughtering and meat-packing products	28	1,006	501,533	10,657,911
Timber products, not mill manufactures	266	10,123	1,852,757	8,850,705
Foundry and machine-shop products	155	5,304	2,836,433	8,167,290
Butter, cheese, and condensed milk	966	1,817	545,361	6,960,711
Iron and steel	9	1,920	4,613,753	6,501,761
Planing-mill products	88	3,705	1,623,889	6,295,810
Agricultural implements	51	3,031	1,489,673	5,015,512
Paper	19	1,413	695,221	4,216,593
Furniture	130	2,836	1,210,717	3,553,225
Boots and shoes	32	2,155	875,785	2,972,233
Cigars and cigarettes	355	1,967	868,872	2,521,949
Malt	15	378	238,011	2,472,018

The fishing industry is one of much importance. In Lakes Michigan and Superior, according to the census, Wisconsin had capital invested in 1889, \$326,744; number of vessels and boats employed, 956; men employed, 1,484; and value of catch, \$455,030. The State fish commissioners reported that the catch in 1894 amounted to \$869,737, and that the capital invested in the industry was \$1,016,278. The value of the fisheries on the inland lakes and rivers probably amounts to a like figure. The fishing interests of the State are controlled by a State commission which conducts large hatcheries at Madison, Bayfield, and Milwaukee for the artificial propagation of fry, with which the Great Lakes and inland waters are annually stocked.

Finances.—The total receipts of the general fund in the biennial period 1893-94 were \$3,835,732; total disbursements, \$3,693,733; amount of productive school fund on Sept. 30, 1894, \$3,418,760; property valuation on which tax was levied in 1894, \$600,000,000; amount of State tax, \$595,684; total town, city, village, and county taxes, \$14,735,939; State bonded debt, none.

Banking.—On Oct. 3, 1893, there were 76 national banks with an aggregate capital of \$7,019,318, individual deposits of \$18,872,300, and a surplus fund of \$2,009,099; on July 2, 1895, there were 125 State banks, with an aggregate capital of \$6,934,750, and deposits of about \$28,000,000; and 105 private banks with an aggregate capital of about \$1,000,000, and deposits of \$5,000,000.

Means of Communication.—The railway mileage Dec. 31, 1894, aggregated 6,010.06. The leading companies are Chicago, Milwaukee and St. Paul, 1,644.73 miles; Chicago and Northwestern, 1,579.62; Wisconsin Central, 781.96; Chicago, St. Paul, Minneapolis and Omaha, 620.07; Minneapolis, St. Paul and Sault Ste. Marie, 276.02; Green Bay, Winona and St. Paul, 224.80; and Chicago, Burlington and Northern, 222.56. There are but two canals within the State, both small and owned by the U. S. Government, one, now seldom used, connecting Fox and Wisconsin rivers at Portage; the other, convenient for long-shore traffic, connecting the waters of Green Bay and Lake Michigan, at Sturgeon Bay.

Churches.—The census of 1890 gave the following statistics of the religious bodies having a membership of 1,000 and upward in the State:

DENOMINATIONS.	Organiza-tions.	Churches and halls.	Members.	Value of church property.
Roman Catholic.....	646	666	249,164	\$4,859,950
Lutheran, Synodical Conference.....	388	357	83,942	1,306,303
Methodist Episcopal.....	706	705	41,360	1,791,900
Lutheran, United Norwegian.....	187	183	28,717	394,450
Congregational.....	182	196	15,841	1,089,750
Lutheran, Norwegian Evang.....	95	94	15,037	200,800
Baptist, Regular, North.....	192	198	14,152	838,945

Jews.....	8	8	1,231	112,000
Lutheran, Buffalo Synod.....	7	7	1,158	19,600
Seventh-day Baptist.....	10	10	1,078	26,475

Schools.—The provisions made for the education of the children of the State are liberal, \$4,929,191 being expended for the common schools and \$249,331 for normal schools in 1894, in addition to the cost of maintaining private and denominational systems. The total income for public schools in the biennial period ending June 30, 1894, was \$1,712,988. The number of children of school age (between four and twenty) in 1894 was 665,268, of whom 384,243 were enrolled in the public schools.

There were 6,795 public schoolhouses in the State, with 12,581 teachers; 178 high schools; 7 normal schools; State schools for deaf, deaf mute, blind, indigent, and incorrigible children; and a State university. (See WISCONSIN, UNIVERSITY OF.) The State University has also in charge an admirable and far-reaching system of farmers' institutes, and was a pioneer in the work of university extension, having in both these fields special staffs of lecturers. An important work, in connection with public instruction, is the fostering of town and district libraries, the former maintained through withholding a portion of the school fund income and the latter by local taxation. The Roman Catholic Church, in addition to parochial and charitable schools, maintains several colleges, chiefly Pio Nono at St. Francis, Marquette (Jesuit) at Milwaukee, Sta. Clara at Sinsinawa Mound, Ste. Catherine at Racine, and St. Lawrence at Mt. Calvary. The Lutheran colleges are Concordia at Milwaukee, Northwestern University at Watertown, a theological seminary at Wauwatosa, and a mission-house at Franklin. Other denominational colleges are chiefly Beloit and Ripon (Congregational), Lawrence University (Methodist) at Appleton, Milwaukee—Downer (Congregational) at Milwaukee, Racine (Protestant Episcopal), Milton (Seventh-day Baptist), Carroll (Presbyterian) at Waukesha.

Libraries.—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Wisconsin had 83 libraries, containing 453,534 bound volumes and 133,566 pamphlets. The libraries were classified as follows: General, 28; school, 27; college, 15; law, 1; theological, 4; public institution, 2; Y. M. C. A., 1; scientific, 1; historical, 1; society, 2; and not reported, 1. In 1895 there were about 100 public, college, and subscription libraries, with about 600,000 volumes; and 900 small township libraries, under the supervision of the State superintendent of public instruction. The legislature has provided for a State library commission.

Post-offices and Periodicals.—In Jan., 1895, there were 1,800 post-offices, of which 120 were presidential (4 first-class, 23 second-class, 93 third-class, and 1,650 fourth-class). There were 568 money-order offices, 6 money-order stations, and 21 limited money-order offices. The newspapers and periodicals comprised 54 daily, 4 semi-weekly, 467 weekly, 1 tri-monthly, 5 bi-weekly, 7 semi-monthly, 37 monthly, 1 bi-monthly, and 2 quarterly publications; total, 578.

Charitable, Reformatory, and Penal Institutions.—The State board of control, composed of five members appointed by the Governor, has supervision over the Insane Hospitals near Madison and Oshkosh, School for the Deaf at Delavan, School for the Blind at Janesville, Industrial School for Boys at Waukesha, State Prison at Waupun, Home for the Feeble-minded at Chippewa Falls, and the State School for Dependent Children at Sparta. The board also has charge of 23 county chronic-insane asylums, 68 jails, and 51 city and county poor-houses. It officially inspects and reports on all police stations and lock-ups, and all private benevolent institutions; and supervises four semi-State institutions—the Milwaukee Insane Hospital, Milwaukee House of Correction, Wisconsin Industrial School for Girls at Milwaukee, and the Wisconsin Veterans' Home at Waupaca.

Political Organization.—The Legislature is composed of a Senate of 33 members and an Assembly of 100, and members must be voters and residents of their districts. All State, county, and district officers, except school officers, must be voters. The Governor and Lieutenant-Governor must be voters and citizens of the U. S., so also judges, who must be not under twenty-five years of age. Only males, twenty-one years of age, are qualified to vote. If a foreigner, the voter must have resided one year within the State and declared his intention to become a citizen. Indians made citizens by Congress may vote. The classes disqualified are idiots and insane persons; convicts, unless restored to civil rights; U. S. soldiers or marines stationed within the State; those who have a wager pending on the election; and duellists. Members of Congress, U. S. officers, officers of foreign powers, criminals, or defaulters can not be elected to any post of trust, honor, or profit within the State. Sheriffs are ineligible for re-election to succeed themselves. General State elections are held in November, biennially; elections for judges and town and village officers in April. There is a State Supreme Court with five justices, seventeen circuit judges, a probate judge in each county, and in certain cities municipal judges, all elected by popular vote.

History.—Situated at the head both of the Great Lakes and the Mississippi valley, and drained by interlacing rivers which at their sources so closely approach each other that the canoe-voyager can with ease pass from one great water system to the other, the geographical character of Wisconsin became, very early in the history of New France, an important factor in the development of the West. It also was the meeting-point between the Algonkin and Dakotah tribes. In 1634 Champlain, then governor of New France, sent Jean Nicolet, a *coureur des bois* (wood-ranger), to make treaties with the Indians and induce them to trade with the French of Quebec and Montreal. Nicolet landed at the site of Green Bay, ascended the Fox river to about the site of Berlin, and thence went overland to Illinois, returning home, doubtless, by way of the Chicago portage and Lake Michigan. The next recorded visit of whites to Wisconsin was that of the traders Radisson and Groseilliers in 1658-59. They ascended the Fox, and, it is believed, descended the Wisconsin; there is small reason to doubt that they were the first to set eyes on the upper Mississippi. In 1661 they were on Lake Superior, and built a stockade fort on the southwest shore of Chequamegon Bay, near Ashland. It is probable that Father Allouez, the first missionary to Wisconsin, built his mission of La Pointe on the site of this fort. Four years later Allouez established St. Francis Xavier mission at the rapids near the mouth of the Fox, the site of the

present Depere. In 1673 Louis Joliet and Father Marquette tarried at the mission while on their celebrated tour by way of the Fox and Wisconsin rivers to explore the Mississippi river; and after their return Marquette stayed there through the winter and wrote his journal of the trip. In 1674 Marquette made a canoe trip along the Lake Michigan shore of Wisconsin from Green Bay to Chicago, as did also La Salle five years later. It was among the islands of Green Bay that La Salle's Griffin, the first sailing vessel on the upper lakes, was lost in a storm. Another notable traveler in Wisconsin was Du Hut (Du Luth), who in 1680 made a fur-trading trip up the Bois Brulé river and down the St. Croix. Five years later Nicholas Perrot, another *conceur des bois*, appeared in Wisconsin, and for many years was the chief fur-trader of the region, wherein he had several stout stockades. For much of the time he acted for New France as "commandant of the West." Le Sueur, also a fur-trader captain, fortified the Bois Brulé-St. Croix route, and had stockades at La Pointe and on the Mississippi. For upwards of a century Wisconsin played an important part in the forest trade of New France, and Indians from here were largely used as allies of the French in the protracted struggle between France and England for the mastery of the continental interior.

The first permanent white settlement was made by the Langlade family at Green Bay, about the middle of the eighteenth century. At Prairie du Chien, at the junction of the Wisconsin river with the Mississippi, temporary hamlets of *voyageurs* often sprung up, but no permanent settlement was effected there until 1781. Traders were at Milwaukee as early as 1779, but it was not really settled until the trader Vieau's arrival in 1795; Portage and La Pointe trace an uninterrupted settlement to about the same date.

Notwithstanding the treaty of 1783, Great Britain retained possession of the forts on the upper lakes; and Wisconsin being a dependency of Mackinaw, it was practically under British control until the close of the war of 1812-15, although nominally U. S. territory after 1796. Early in the nineteenth century, as a means of helping Astor's fur company, Congress sought to exclude British traders from the district; but U. S. influence was not much felt until the close of the war, when the U. S. Government erected Fort Howard, opposite the then French and Indian village of Green Bay, and Fort Crawford at the fur-trading hamlet of Prairie du Chien. Up to this time the French and their half-bloods held Wisconsin woods and streams; and the fur-trade, in which they acted as agents and *voyageurs* for English firms at Mackinaw and Montreal, was the leading industry. Little by little this French predominance was undermined, at first by the advent of Americans into the lead mines (1827), and then by agricultural settlers from New England and New York State. The Black Hawk war (1832), wherein the Sacs were nearly exterminated, was also an important factor in the opening of the region. Settlement and development now began in earnest. The fur-trade, after the formation of Wisconsin Territory (1836), ceased to be of importance, the non-progressive French element subsided into insignificance, immigrants from the East were attracted by cheap lands on easy terms, and thenceforth Wisconsin was a U. S. Territory, in fact as well as in name, which rapidly grew into a powerful and patriotic State (admitted to the Union in 1848). In the war of 1861-65 Wisconsin took front rank on behalf of the Union, sending to the armies a ninth of her population and over half of her voters. Her death-roll was 12,301, or 16.6 per cent. of her total enlistment of 91,327, and her war expenses aggregated \$11,704,932.55. The famous Iron Brigade was chiefly composed of Wisconsin men.

AUTHORITIES.—The prime source of materials for the original study of early Wisconsin history is the *Wisconsin Historical Collections*, of which thirteen volumes have thus

far been published by the State Historical Society. See also Thwaites's *Story of Wisconsin* (Boston, 1890). Strong's *History of the Territory of Wisconsin* (published by the State, 1885) is a compilation of territorial annals. Lapham's *Wisconsin* (1844; enlarged in 1846) is now out of print; so also are McLeod's *History of Wisconsin* (1846); Smith's *History of Wisconsin* (published by the State, 1854, only vols. i. and iii. issued); and Tuttle's *Illustrated History of the State of Wisconsin* (1875).
REUBEN GOLD THWAITES.

Wisconsin River: a river that rises in Vieux Desert Lake (which is partly in Michigan and partly in Wisconsin); flows in a generally south course to Portage City, Wis., where it turns to the S. W. It reaches Mississippi river 4 miles below Prairie du Chien. Breadth at its mouth, 1,800 feet; elevation, 600 feet. Its length is over 600 miles. It is navigable 200 miles to Portage City, whence a short canal leads to Fox river. The channel of the Wisconsin is much injured by shifting sandbars. The upper part of the river passes through heavy pine forests. Several cataracts, of which the most famous are those of the Dalles of the Wisconsin and Grandfather Bull Falls, break the course of this picturesque stream.
Revised by I. C. RUSSELL.

Wisconsin University of: an institution of higher learning, at Madison, Wis.; incorporated in 1838 and organized in 1848. In 1849 a preparatory department was established; in 1850 the university was formally opened; in 1851 the first college classes were formed. Congress in 1838 granted 46,080 acres of land to the Territory of Wisconsin for the support of a university, and in 1854 it made another grant of the same amount. In 1866 the university also received 240,000 acres of land which Congress had granted to the State in 1862 in accordance with the conditions of the Morrill Act. In 1889 this was supplemented by a grant which will ultimately amount to \$25,000 a year. The university also has the income of the Hatch Act, appropriating \$15,000 per annum for an agricultural experiment station. In 1867 the university was reorganized in accordance with the conditions of the grant. Since 1866 it has received generous State appropriations, among which were \$50,000 in 1870 for the erection of the Ladies' Hall, and \$80,000 in 1875 for the erection of Science Hall. The latter was burned in 1884, together with the apparatus and geological and other collections of great value. For the erection of new Science Hall and to replace apparatus, etc., the State appropriated, in 1885, \$190,000, and \$195,000 in 1887. For the benefit of the university there is levied annually a State tax of nine-fortieths of a mill on a dollar, which yields about \$150,000. Besides this amount, the State provides \$12,000 a year for the support of farmers' institutes, and 1 per cent. of the railroad-license tax, which yields about \$13,000 a year, for the college of engineering. The entire income of the university in 1894 was \$364,000. In 1893 a new building for the college of law was completed at an expense of \$86,000, and in 1894 a gymnasium and armory at a cost of \$116,000. The university domain consists of about 350 acres, extending a mile along the south shore of Lake Mendota. In 1895 the university buildings were more than 20 in number, 10 being of stone and 6 of brick. The staff of instruction in 1894-95 consisted of 50 professors, 17 assistant professors, 25 instructors, 3 assistants, and 29 special lecturers. Students in the same year numbered: Fellows, 13; other graduates, 77; undergraduates in college of letters and science, 785; college of mechanics and engineering, 225; college of agriculture, 213; college of law, 266; school of pharmacy, 41—total, 1,530. The general management of the institution is vested in a board of 14 regents—namely, the State superintendent of public instruction, the president of the university, and 12 members, one for each of the 10 congressional districts of the State, and two for the State at large, appointed for three years by the Governor. The president is chosen by the board of regents. The university comprises a college of letters and science; a college of mechanics and engineering; a college of agriculture; a college of law; a school of pharmacy; a school of economics, political science, and history; and a school of music. All the departments are open to women, the number in attendance in 1894-95 being about 300.
C. K. ADAMS.

Wisdom, Book of: one of the Apocrypha of the Old Testament; written in Greek, apparently during the latter half of the second century B. C. It is a "wisdom" book, like the canonical books of Job, Proverbs, and Ecclesiastes, the New Testament book of James, and several of the Apocrypha. For greater effectiveness, the author speaks in the

name of Solomon. In the earlier copies of the Septuagint it is called the Wisdom of Solomon; but from the time when Jerome demonstrated that Solomon was not its author, his name has been generally omitted from the title. By Roman Catholics the book is regarded as canonical, on the same basis with others of its class. The Greek is more nearly classical than in most of the Apocrypha, and the contents, on the whole, of a high order. Among the numerous older commentaries on the book the most remarkable are by John Rainold (Oxford, 1618); Bauermeister (Göttingen, 1828); and Grimm (Leipzig, 1860). The best accessible Greek text is in Swete's *Old Testament in Greek*. An admirable translation and commentary is that of Dr. Bissell in the American Lange Series. Revised by WILLIS J. BEECHER.

Wise, DANIEL D. D.: clergyman; b. at Portsmouth, England, Jan. 10, 1813; removed to the U. S. 1833; became a minister of the Methodist Episcopal Church; was editor of *The Sunday School Messenger* 1838-43, and subsequently of the *Ladies' Pearl*, *The Rhode Island Temperance Pledge*, and *Zion's Herald* 1852-56; was corresponding secretary of the Methodist Sunday-school Union 1856-72, and Tract Society 1860-72; and editor of Sunday-school and tract publications. Author of more than fifty volumes designed for youth, several under the pseudonym of Francis Forrester, Esq. Revised by ALBERT OSBORN.

Wise, HENRY ALEXANDER: Governor of Virginia; b. at Drummondtown, Accomack co., Va., Dec. 3, 1806; graduated at Washington College, Pennsylvania, in 1825; studied law at Winchester, Va., and then moved to Nashville, Tenn.; returned to his native county, where he continued the practice of law with great success, and soon became actively engaged in politics until the outbreak of the civil war. He was member of Congress 1833-43 and became noted for his vigorous but not always politic expression of his views. He favored the extension of slavery and the annexation of Texas. He was greatly attached to Henry Clay during this period of his life, and, it has been said, was a warm advocate of his nomination for the presidency in the election of 1840. He was influential in securing the nomination of John Tyler for the vice-presidency at that election. In 1843 Tyler nominated him minister to France, and he resigned his seat in the House in expectation of its confirmation, but the Senate, which was so decidedly at war with Mr. Tyler at this time, rejected the nomination. Wise was immediately returned to the House by his constituents. In 1844 Tyler nominated him minister to Brazil. This appointment was confirmed by the Senate. Resigning in 1847, he returned and took an active part in the presidential election in 1848. He was a Cass elector for his State. In 1850 he was a member of the reform convention of Virginia. In 1852 he was again presidential elector on the Pierce ticket. He was elected Governor of Virginia in 1855, and continued in the office until after the John Brown raid in 1859, Brown's execution being one of the last acts of his administration. Wise was decidedly opposed to secession in 1860, but he went with his State after her ordinance of secession. He entered the Confederate service with the commission of brigadier-general, which position he held until the close of the war. After the war he took no active part in politics, but changed his residence to Richmond, where he resumed the practice of law. He published *Seven Decades of the Union, Memoir of John Tyler* (1872). D. at Richmond, Va., Sept. 12, 1876. Revised by F. M. COLBY.

Wise, HENRY AUGUSTUS: naval officer; son of George Stuart Wise, U. S. navy; b. at Brooklyn, N. Y., May 12, 1819; entered the U. S. navy as a midshipman 1834; served on the coast of Florida during the Seminole war, and on the Pacific coast during the Mexican war 1846-48; married a daughter of Edward Everett; was flag-lieutenant of the Mediterranean squadron 1852-54; conveyed the Japanese ambassadors home in the U. S. frigate Niagara 1861; became assistant chief of the bureau of ordnance and hydrography, with the rank of commander, 1862; was promoted captain and chief of that bureau Dec. 1866; resigned his post 1868, and went to Europe for his health. D. at Naples, Italy, Apr. 2, 1869. He was the author of *Los Gringos, or an Interior View of Mexico and California, with Wanderings in Peru, Chili, and Polynesia* (New York, 1849); *Tales for the Marines* (Boston, 1855); *Scamparius, from Gibel-Tarek to Stamboul* (New York, 1857); *The Story of the Gray African Parrot*, for children (1859); and *Captain Brand of the Centipede* (London, 1860; New York, 1864), all under the pseudonym of Harry Gringo.

Wise, JOHN: clergyman; b. at Roxbury, Mass., in Aug., 1652; graduated at Harvard 1673; was settled as pastor at Chebacco, a new parish of Ipswich, 1683; was imprisoned, fined, and deposed from the ministry by order of Gov. Andros for remonstrating against a violation of charter rights in imposing a province-tax without authority from the Assembly (1688); brought a suit against Chief Justice Dudley for denying him the benefit of the Habeas Corpus Act (1689); was deputy from Ipswich in the Legislature of 1689, after the overthrow of Andros; was chaplain to the expedition against Quebec 1690; successfully opposed the scheme fathered by the Mathers for placing the churches of Massachusetts under the jurisdiction of ecclesiastical councils in his two essays, *The Churches' Quarrel Espoused* (Boston, 1710; 2d ed. with the "Cambridge Platform," 1715) and *A Vindication of the Government of New England Churches* (bound with a new edition of the former pamphlet, 1717). A large edition of both essays was printed in 1772, presumably as a political text-book; 4th ed., with historical notice by Joseph S. Clark, D. D., Boston, 1860. According to Dr. Clark "some of the most glittering sentences in the Declaration of Independence are almost literal quotations from the *Vindication*." Revised by S. M. JACKSON.

Wiseheart, GEORGE: See WISHART.

Wiseman, NICHOLAS PATRICK STEPHEN, D. D.: cardinal and archbishop; b. at Seville, Spain, Aug. 3, 1802, of Irish parents; educated at Waterford, at the Roman Catholic College near Durham, and in the English college at Rome; was ordained to the priesthood 1825; became Professor of Oriental Languages in the Roman university 1827, and rector of the English College 1828; returned to England 1835; established with O'Connell the *Dublin Review*, and delivered a course of lectures on Roman Catholic doctrines at St. Mary's, Moorfields, during Lent, 1836; maintained a polemic on the "Real Presence" with Dr. Turton, Bishop of Ely, and published several able works in advocacy of Roman Catholicism; lectured at Rome during Lent, 1837, at which time he induced Pope Gregory XVI. to appoint several additional vicars apostolic in England; was consecrated Bishop of Melipotamos in *partibus infidelium*, and coadjutor to Dr. Walsh of the Midland district of England June 8, 1840; became in the same year president of St. Mary's College, Oscott; visited Rome in 1847, and gave his influence in favor of the measure then preparing for the restoration of the Roman Catholic hierarchy in England; was appointed pro-vicar apostolic of the London district 1848, and vicar apostolic on the death of Bishop Walsh 1849; was summoned to Rome Aug., 1850; aided in preparing the "apostolic letter" of Sept. 29, re-establishing the English hierarchy; was nominated Archbishop of Westminster Sept. 30, and made cardinal Oct. 1, 1850—measures which caused great excitement in England, where they were characterized as a "papal aggression," and gave rise to the Ecclesiastical Titles Act, prohibiting the assumption of local ecclesiastical titles by Roman Catholics, and which remained nominally in force until its repeal in 1872. Cardinal Wiseman was active in the exercise of his new functions, making frequent episcopal journeys through England and Ireland, delivering lectures and speeches, and publishing numerous volumes in support of his doctrines. D. in London, Feb. 15, 1865. He was the author, among other works, of *Horæ Syriacæ* (Rome, 1828); *Lectures on the Connection between Science and Revealed Religion* (2 vols., 1836); *The Real Presence* (1836); *Lectures on the Doctrines and Practices of the Catholic Church* (2 vols., 1836); *Three Lectures on the Catholic Hierarchy* (1850); *Essays on Various Subjects* (3 vols., 1853); *Fabiola, or the Church of the Catacombs* (1855); *Recollections of the Last Four Popes* (1858); *Sermons* (2 vols. 1864); *The Witch of Rosenberg, a Drama in Three Acts* (1866); and *Daily Meditations* (1868). See the *Memoir* by G. White (1865) and Lord Houghton's *Monographs* (1873). Revised by J. J. KEANE.

Wishart, GEORGE: reformer and martyr; supposed to have been a native of Pittarow, Forfarshire, Scotland; b. about 1513; taught Greek at Montrose; began preaching the doctrines of the Reformation about 1535; had to flee to England about 1538; resided and taught at Corpus Christi College, associating with Bilney, Latimer, and other Reformers; published several theological tracts in Latin; returned to Scotland July, 1543; began anew to preach at Montrose, Perth, Ayr, and Dundee, with such effect that in the latter town the populace destroyed the convents and churches of the Black and Grey Friars; made a preaching-

tour of the western counties; was arrested by the Earl of Bothwell at Ormiston; was tried for heresy at St. Andrews Feb. 28, before Cardinal Beaton's ecclesiastical court, composed of several bishops; condemned to the stake, and burned at St. Andrews Mar. 1, 1546. At the stake he predicted the death "within a few days" of the cardinal, who was a spectator from the castle, and the assassination of the latter about three months afterward is alleged to have been in pursuance of a plot to which Wishart was privy, the evidence being the mention of "a Scotchman called Wyszart" in a MS. account of the plot in the State Paper Office. See his *Life*, by Rev. C. Rogers (Edinburgh, 1876).

Wishart, or Wiseheart, GEORGE, D. D.: bishop; b. at Yester, East Lothian, Scotland, in 1609; educated at the University of Edinburgh; became a parish minister at North Leith and at St. Andrews; refused to take the covenant 1639, for which he was deprived of his living and imprisoned; made his way to Newcastle, England, where he preached, and was captured by the Scottish army Oct., 1644; was for some months imprisoned in the common jail at Edinburgh, suffering great hardships; succeeded in joining the celebrated royalist leader James Graham, Marquis of Montrose, to whom he became chaplain; escaped to the Continent 1646; returned to Scotland in the expedition of Montrose 1650, and narrowly escaped sharing his fate; became chaplain the same year to Elizabeth, the ex-electress-palatine and titular Queen of Bohemia; accompanied her to England at the Restoration 1660; became rector of Newcastle-upon-Tyne, and was consecrated Bishop of Edinburgh June 1, 1662. D. at Edinburgh in 1671. He was the author of a *History of the Wars of Montrose* (Paris, 1647), in elegant Latin, a copy of which was tied to the neck of the marquis at his execution. A second part, completing the history to the death of Montrose, was left by Wishart in MS., but was never printed in Latin. English translations of the valuable work were published in 1647, 1652, 1660, 1720, 1756, and 1819. Revised by S. M. JACKSON.

Wish'oskan Indians: a linguistic stock of California Indians formerly occupying the shores of Humboldt Bay and the Eel, Elk, and lower Mad rivers emptying into it. The river settlements did not extend more than 40 miles up the streams, and the principal villages were around the bay. This people was one of the many who were designated by the whites as "Diggers." Their principal food consisted of roots, berries, nuts, and seeds, but they also depended much upon the salmon which ran up their rivers and which they knew how to cure. The natives of the coast also had recourse to mollusks and various other salt-water products. Their principal arms were the bow and arrow, with which, however, they are said not to have been very expert. Their chief industries were basket-making, the manufacture of nets for catching salmon, and of grass ropes for snaring deer and elk. They carried on a trade with the mountain tribes to the eastward, exchanging clams and seashells for acorns, pine-nuts, and grass for basket-making. For raiment the men used the skins of rabbits and deer, cut into strips and made into blankets or cloaks, while the women wore skirts of deerskin and robes for the upper part of the body. The principal tribes were the Patawat on lower Mad river and Humboldt Bay as far S. as Arcata, the Wiyot or Viard at the mouth of Eel river, and the Wishosk near the mouth of Mad river and on the northern part of Humboldt Bay. In 1853 the tribes of this family probably numbered 1,000 to 1,200 souls. They are now almost extinct.

AUTHORITIES.—Powers, *Tribes of California* (Cont. N. A. Eth., iii., Washington, 1877); H. H. Bancroft, *History of California*, vols. i.-vii. (San Francisco, 1884-90). See **INDIANS OF NORTH AMERICA.** J. W. POWELL.

Wismar, vis maär: town; in Mecklenburg-Schwerin, Germany; on a deep inlet of the Baltic, 20 miles by rail N. E. of Schwerin (see map of German Empire, ref. 2-6). It has an excellent harbor, ship-building docks, fisheries, breweries, distilleries, and manufactures of sailcloth, cordage, tobacco, and playing-cards. Its fortifications have been demolished, but a number of old houses still remain. It was founded in the twelfth century, incorporated in 1229, and formerly belonged to the Hanseatic League. Pop. (1890) 16,787.

Wista'ria [Mod. Lat., named from Dr. Caspar Wistar (1761-1818)]; a genus of climbing leguminous shrubs. *W. consequana*, a native of China, is one of the most beautiful spring flowering climbers. *W. frutescens* is a smaller ornamental species, growing wild in the western and southern parts of the U. S. in rich wet soils.

Wister, ANNIS LEE (Furness): translator and author; b. in Philadelphia, Oct. 9, 1830; married Caspar Wister, M. D., in 1854; has contributed to *Lippincott's Magazine*, and translated from the German several excellent novels, among which are Blum and Wahl's *Seaside and Fireside Fairies* (1864); E. Marlitt's *The Old Ma'mselle's Secret* (1868; 8th ed. 1870); *Gold Elsie* (1868); *The Countess Gisela* (1869); *The Little Moorland Princess* (1873); and *The Second Wife* (1874); Wilhelmine von Hillern's *Only a Girl, or a Physician for the Soul* (1870); Hackländer's *Enchanting and Enchanted, or Fairy Spells* (1871); Volkhausen's *Why Did he not Die?* (1871); Von Anor's *It is the Fashion* (1872); Fanny Lewald's *Hulda, or the Deliverer* (1874), and many others. She has written or translated over thirty books.

Revised by H. A. BEERS.

Witchcraft: the cunning of a witch, i. e. of a man or woman who claims to compel supernatural aid. Religion seeks the sympathy and aid of supernal powers by rites open to all and approved by their fellows; witchcraft thinks to extort their help or baffle their wrath by divining and using their secrets. In this broadest sense it is identical with Magic (*q. v.*), and belongs to all times and lands. Old and very generally recognized, however, is a distinction between "white magic," which seeks its power by wisdom and uses it for worthy ends, and "black magic," which wins it by bargain with evil, and uses it in selfishness or malice. By witchcraft is commonly meant the latter, and especially that blackest but wholly imaginary sort, which was for centuries the nightmare of Christendom.

Born into an atmosphere of belief in magic, the early Church seems never to have questioned its reality, while she greatly broadened its scope by stigmatizing as magic all the marvels of rival faiths. Her monotheism and her identification of religion with ethics led her to look on the gods of the heathen as devils and on their worship as witchcraft. Her conversion of the Germanic peoples brought in a host of fresh demons; and it is the name of the seers of this northern faith, *witega, wicca*, which gives us the word *witch*. As the old paganisms faded away, however, the Church rose to a nobler rationalism. Great churchmen like Agobard of Lyons dared to question the popular superstitions, and the canon *Episcopi*, which from the ninth century was the voice of the canon law on this subject, denounced the believer in the witch fables as "an infidel and worse than a pagan." But when, in the thirteenth century, Thomas Aquinas gave its ripest form to the mediæval theology, the symmetry of his scheme seemed to demand for the devil an earthly following not less numerous or loyal than God's faithful, the Church, and bound to their master by similar ties of worship and service. Thus was postulated into existence, by a monkish logician, the "witch," as known to Christian history. For when, a little later, his fellow Dominicans of the Inquisition had by aid of the torture successfully rooted out the heretics, they turned their idle hands and their new instrument to the detection of these viler servants of Satan. It took, indeed, two centuries of inquisitorial sermon and treatise to convince the world of their existence; and not till the torture had forced from its victims, under the fruitful suggestion of their learned judges, what seemed confirmation of all the witch-lore of the classics, as well as of the demonologic suggestions of Holy Writ, did the persecution get fairly under way. But when, in 1484, the bull *Summi desiderantes* of Pope Innocent VIII. sanctioned the worst charges of the witch-hunters, and when to this was added by the German inquisitors, in their *Witch-Hammer* (1489), a code of rules which made detection certain and easy, the victory was won. The Reformation for a little distracted men's minds, but with its first lull, at the middle of the sixteenth century, the persecution burst forth with redoubled fury in all Christian lands, Catholic and Protestant alike, to rage for more than a century, and then smolder to our own day. The figures given for the total number of its victims are wildest guesswork, and those for many local persecutions are scarcely more reliable; but they are as likely to be below as above the truth. We have the names of hundreds who perished in single jurisdictions within the space of two or three years; and the records thus preserved are but chance fragments. No crime was more common. A single Lorraine judge boasted of having sentenced 900; and he was still in the midst of his activity. If the persecution knew fiercer epidemics in Catholic communities, it was more chronic in Protestant. Nor was it mainly old women who suffered. Such might be accused first, but the

witch was always tortured into naming her accomplices, and naturally she named those whom she hated or envied. Riches, learning, beauty, goodness were often so many titles to death. "There are still," wrote the chancellor of the Bishop of Würzburg to a friend in Aug., 1629, "four hundred in the city, high and low, of every rank and sex, nay, even clerics, so strongly accused that they may be arrested at any hour. Some out of all offices and faculties must be executed: clerics, electoral councilors and doctors, city officials, court assessors, several of whom Your Grace knows. There are law-students to be arrested. The Prince-Bishop has over forty students who are soon to be pastors; among them thirteen or fourteen are said to be witches. A few days ago a Dean was arrested; two others who were summoned have fled. The notary of our church-consistory, a very learned man, was yesterday arrested and put to the torture. In a word, a third part of the city is surely involved. The richest, most attractive, most prominent of the clergy are already executed. A week ago a maiden of nineteen was put to death, of whom it is everywhere said that she was the fairest in the whole city, and was held by everybody a girl of singular modesty and purity. She will be followed by seven or eight others of the best and most winsome. . . . There are children of three and four years, to the number of 300, who are said to have had intercourse with the devil. I have seen put to death children of seven, promising students of ten, twelve, fourteen, and fifteen. Of the nobles—but I can not and must not write more of this misery. There are persons of yet higher rank, whom you know and would marvel to hear of." Such, to quote but a single document, was the scope of the witch-persecution. Of the sufferings of its victims, and of the vile charges which blasted their fair names, it were better not to speak. Spain and Scotland were perhaps, next to Germany, the lands of its greatest severity. In England, despite the efforts of witch-hunting James II. and the reign of the Commonwealth, it never, for want of the torture, reached the same height as on the Continent; and in her colonies it was only at Salem in 1691-92, under the influence of Cotton Mather's *Memorable Providences*, that it became a panic.

Skepticism was never wanting, but the first open protest was that of the German physician Weyer, who published in 1563 his brave *De Præstigiis Dæmonum*. His book stirred up here and there a disciple, of whom the most rational was the Englishman Reginald Scot; but it roused adversaries far more numerous and influential, and it was the *Cautio criminalis*, published anonymously in 1631 by the young Jesuit poet Friedrich von Spee, that first gave the persecution pause by laying bare its cruelties and the part played in it by the torture. And it was reserved for the Dutch pastor Bekker to strike it in 1691 a yet deadlier blow by undermining, in his *Betoverde weerd*, the whole theory of human intercourse with the devil. The persecution lingered on, especially in lands where (as in Catholic Spain and South Germany, or in Protestant Scotland and Switzerland) a literal faith in the Bible had rooted it firmly in religion. "The giving up of witchcraft," wrote even the reformer John Wesley in 1768, "is in effect giving up the Bible." The latest legal witch-executions in Europe were at Kempten, Bavaria, in 1775, at Glarus, Switzerland, in 1785, and in the grand-duchy of Posen in 1793; but witches were judicially burned in Mexico as late as 1873.

The literature of the subject is vast, the greater part supporting the superstition. Graesse's *Bibliotheca magica* is still the only attempt at an exhaustive bibliography. The best survey of the subject in English is Lecky's chapter in his *Rationalism in Europe*. Wright's *Narratives of Sorcery and Magic* is more detailed, and Lowell's essay (in his *Among my Books*) is admirable for its terse insight. The most thorough history is Soldan's *Geschichte der Hexenprozesse*, revised by Heppel. Lingin's *Religion und Hexenprozesse* and Baissac's *Les Grands Jours de la Sorcellerie* add something, as does Mr. Lea's excellent chapter on sorcery in his *The Inquisition of the Middle Ages*. Michelet's brilliant and suggestive *La sorcière* is far too largely a work of the imagination. Of monographs on single episodes, Upham's on the Salem panic especially deserves mention here.

(GEORGE L. BURR.)

Witch-elm, Wych-elm, or Scotch Elm: the *Ulmus montana*, a large fast-growing European elm, much planted for ornament and affording good timber. It is very hardy in the U. S.

Witch Hazel: See *HAMAMELIS VIRGINICA*.

Witebsk: See *VITEBSK*.

Witenagemot, wit'e-nā-ge-mōt [= O. Eng., assembly of wise men: *witena*, gen. plur. of *wita*, a wise man + *gemōt* (cf. Eng. *meet*), assembly]: the old Anglo-Saxon national council, the great court of justice and supreme legislative body of the English nation before the Conquest, superior to the *scir-gemot* or county assembly, and itself the offspring of the primitive *folk-mot*, an old Germanic institution. The ealdormen, the high ecclesiastics, and the great landholders as well as the higher shire officers, appear to have had seats in the *witan*, or witenagemot; and probably the freemen who lived near the place of meeting were allowed to sit in the assembly. It elected the king, observing, however, the principle of hereditary succession, though not necessarily choosing the eldest son, and it possessed the right of deposition. Its powers included the making of treaties, the appointing of bishops, the regulation of military and ecclesiastical affairs, the raising of revenue, etc., but its functions differed in different reigns and can not be clearly defined; nor is it easy to trace the descent of the later English Parliament from this council, though in some points there is a close resemblance. The witenagemot was abolished by William the Conqueror, who, however, had previously secured its acknowledgment of his title. See Stubbs, *Constitutional History of England*.

Wither, GEORGE: poet; b. at Brentworth, Hampshire, England, June 11, 1588; entered Magdalen College, Oxford, 1604; was called home "to hold the plow" without a degree 1607, but soon proceeded to London 1608; studied law at Lincoln's Inn; printed in 1613 a volume of metrical satires on the manners of the time, entitled *Abuses Strippt and Whipt*, for which he was thrown into the Marshalsea prison, where he wrote his poem *The Shepherd's Hunting* (1615), and probably *Fidelia*. Among his other poems are *The Motto* (1618); *Philarete* (1622); *Hymns and Songs of the Church* (1623); and *Hallelujah* (1641). He is best known to modern readers by his song *Shall I, Wasting in Despair, etc.* He published many political and devotional pieces in prose and verse; served as captain of horse and quartermaster-general of a regiment in the expedition sent by Charles I. against the Scotch Covenanters 1639; sold his estate and raised a troop of horse for the Parliament 1642; was soon promoted to the rank of major; was commissioned by the Long Parliament a justice of the peace; was made by Cromwell "major-general of all the horse and foot in the county of Surrey"; profited largely by the confiscations of royalist estates, but had to surrender his acquisitions at the Restoration, when he was imprisoned three years in Newgate; was deprived of his library, and passed his last years in poverty. D. in London, May 2, 1667, and was buried in the Savoy church. Revised by H. A. BEERS.

Witherite: a mineral barium carbonate, of the composition BaCO₃, named after William Withering, an English physician and botanist (1741-99), who discovered it in 1784 in a lead mine in Cumberland, England. Its crystallization is right rhombic; it is almost as hard as fluor-spar. It has a white, gray, or yellow color. It is found at a locality near Lexington, Ky., and occurs so abundantly at Fallowfield, Northumberland, England, as to be mined largely, and sold for making plate glass and for chemical uses.

Witherspoon, JOHN, D. D., LL. D.: signer of the Declaration of Independence; b. at Yester, Haddingtonshire (East Lothian), Scotland, Feb. 5, 1722, said to be a descendant of John Knox; graduated at the University of Edinburgh 1742; was licensed to preach 1743; was parish minister of Beith in the west of Scotland 1745-57; joined the Pretender with a corps of militia at Glasgow; was taken prisoner at the battle of Falkirk, but released after two weeks' confinement in Donne Castle; became favorably known as a theologian by several learned treatises; was pastor of the Low church at Paisley from 1757 until 1768, when he accepted the presidency of the College of New Jersey, at Princeton, in which he was inaugurated Aug. 17, becoming also Professor of Divinity there and pastor of the church; identified himself with the interests of his adopted country, taking an active part in the political struggles of the time; was in 1776 the college being for a time broken up, chosen a member of the constitutional convention of New Jersey, and also of the Continental Congress, in which he sat for six years, being one of the signers of the Declaration of Independence and of the Articles of Confederation; opposed in Congress the repeated issues of paper currency, and showed great sagacity in anticipating political contin-

gencies; gave lectures on moral philosophy and rhetoric at the college, of which he greatly raised the reputation and improved the financial condition; visited England in 1783, and again in 1784, to collect funds for the college, with but slight success, the war being too recent; married for the second time, at the age of sixty-nine (1791), a young lady of twenty-three, and resided thenceforth on a farm near Princeton until his death on Nov. 15, 1794. He was totally blind during the last two years of his life. His two daughters by his first marriage married respectively Dr. David Ramsay, the historian, and Rev. Dr. Samuel Stanhope Smith, who succeeded him as president of the College of New Jersey. His *Works* were collected at New York (4 vols., 1800-01) and at Edinburgh (9 vols., 1804), edited with a *Memoir* by Dr. S. S. Smith; they comprise *A Serious Inquiry into the Nature and Effects of the Stage* (Glasgow, 1757); *Considerations on the Nature and Extent of the Legislative Authority of the British Parliament* (Philadelphia, 1774); and a series of essays on social and literary topics entitled *The Druid* (1781). His colossal statue was unveiled in Fairmount Park, Philadelphia, 1876. See *Proceedings and Addresses*, edited by W. P. Breed (Philadelphia, 1877). Revised by S. M. JACKSON.

Withrow, WILLIAM HENRY, M. A., D. D.: author; b. in Toronto, Canada, Aug. 6, 1839; educated at Victoria College and Toronto University; was engaged in the itinerant and stationed ministry of the Methodist Church from 1864 till 1874; since the latter year has been editor of *The Methodist Magazine* published at Toronto. He has published the following among other books: *Catacombs of Rome* (New York and London, 1874); *History of Canada* (Boston and Toronto, 1878); *Lawrence Temple: a Tale* (New York and London, 1881); *Valeria the Martyr of the Catacombs* (New York and London, 1884); *Life in a Parsonage* (Toronto and London, 1885); *Men Worth Knowing* (1886); *Great Preachers, Ancient and Modern* (Toronto, 1886); *Worthies of Methodism* (1886); *Canada, Scenic and Descriptive* (1889); *China and its People* (1893). N. M.

Witness [orig. testimony, evidence < O. Eng. *witnes*, *ge-witnes*, deriv. of *witan*, know; cf. Lat. *vidēre*; Gr. *ιδέναι*, see]: in law, a person who testifies in a judicial proceeding as to the existence of facts material to the issue which is to be decided. In the different forms of trial known to the American and English law, such testimony may be given orally in open court, or it may be taken before some officer, reduced to the form of a written deposition, and read on the trial. It is well settled that originally the functions of the jury and the witnesses were not differentiated. Indeed, the jury was composed of persons of the vicinage, who were supposed to know the facts, the trial of which was committed to them, and who were sworn to find those facts according to such knowledge. It was only at a later date (probably about the middle of the fifteenth century) that the practice arose of producing witnesses to testify in open court to the jury. It is also probably true, as has been said, that "this feature of a jury trial, in our day so conspicuous and indispensable, was then but little considered and of small importance." In the Roman law no fact could be established by the testimony of less than two witnesses (a principle embodied in the maxim, *testis unus testis nullus*), and there is reason to believe that this principle was anciently recognized in England; but such a principle could hardly be expected to survive under a system where the witnesses were of so little importance relatively to the jury, and it is therefore an indirect result of that system that, "as a rule, no particular number of witnesses is required by our law."

As witnesses in court were always put under oath, they were of course always "required to have that amount of maturity, sense, and religious belief which the act of swearing presupposes." But other qualifications were added (many of them obviously derived from those required in the case of jurors) until the system became exceedingly complicated and inconvenient. The most important disqualifications are considered elsewhere. (See EVIDENCE, *The Instruments of Evidence*; MARRIED WOMEN, *Incapacity to Testify*.) Most of these objections to the competency of witnesses have been removed by legislation. The accused in criminal prosecutions are still generally under a disability, though in many of the U. S. they are now permitted, if they choose, to testify in their own behalf. As all the State constitutions protect parties accused of crime from being compelled to furnish evidence against themselves, the prisoners can never be called as witnesses for the prosecution.

It has been universally decided, however, that when the accused does become a witness, he may be cross-examined in the same manner as any other witness for the defense. Religious qualifications have been wholly swept away in a great majority of the States, as being inconsistent with their policy in respect to the separation between the state and religion.

Besides the rules concerning the competency of the witnesses themselves, there are others touching certain classes of facts from which they are either privileged or prohibited from testifying: (1) No one can be compelled to state matters which would tend to criminate himself or render him liable to a penalty. This is a personal privilege of the witness, which he must assert on his own behalf or may waive. (2) An attorney or counselor will not be suffered to disclose facts communicated by or learned from a client in the confidence of a business relation actually existing between them. (3) This rule, which the common law admitted only in the case of lawyers, has been quite generally extended by statute to physicians and to clergymen, who are forbidden to disclose facts discovered concerning their patients or their penitents through the means of their professional relations.

See OATH and TESTIMONY; and consult Sichel on *Witnesses*; Best on *Evidence* (International edition); Stephen's *Digest of the Law of Evidence* (Chase's edition); Thayer's *Cases on Evidence* (chap. v.); Abbot's *Select Cases on Evidence*; and *Harvard Law Review*, v., 249, 295, 357.

GEORGE W. KIRCHWEY.

Witte, ritte, EMANUEL, de; painter; b. at Alkmaar, Holland, 1607. He was a pupil of Vanelst or Van Aalst. He matriculated at his guild at Alkmaar in 1636, and was living at Delft from 1642 to 1649. In 1650 he established himself at Amsterdam, where he painted architectural subjects and interiors with figures. He married in 1653. His works are to be found in the museums of Amsterdam, The Hague, Rotterdam, Brussels, Berlin, Weimar, Hamburg, Düsseldorf, and Brunswick, besides private galleries in England. Sir Richard Wallace's collection possesses a picture by de Witte, and also the National Gallery. D. at Amsterdam in 1692. He is said to have destroyed one of his master-pieces, the monument to Admiral Ruyter, as the latter's son-in-law refused to pay the price agreed upon for it. W. J. S.

Wittekind, or **Widukind**: the leader of the Westphalian Saxons in their wars with Charlemagne. When most of the Saxon chiefs submitted to Charlemagne at the Diet of Paderborn (777), Wittekind fled to Jutland, but returned in 778, while Charlemagne was in Spain, and renewed the war in the Rhine countries. Charlemagne hastened back to Germany, and Wittekind was once more compelled to flee to Jutland. In 782, however, he again returned, and annihilated a Frankish army in the Süntel mountain on the Weser. Charlemagne took a cruel revenge by massacring 4,500 Saxons at Verden on the Aller, but this cruelty occasioned a general rising of the Saxons under Wittekind and Albion. They were defeated, however, at Detmold and on the Hase in 783, and the two chiefs fled to Holstein. Nevertheless, in 785 a reconciliation took place between the emperor and his two great antagonists; they repaired to his camp at Attigny in Champagne, and were baptized, after which event their career is legendary. Of Wittekind it was said that the emperor made him duke of all the Saxons, and gave him Enger as his residence, and that he fell in 807, in the war against Gerold, Duke of Suabia. In 1377 the Emperor Charles IV. raised a monument to Wittekind in the parish church of Eger, where he is said to lie buried. In 1812 another monument was raised to him in Minden, Westphalia. See Diekamp, *Widukind der Sachsenführer* (1877).

Wittenberg, ritzen-bärch: town; province of Saxony, Prussia; on the right bank of the Elbe; 55 miles S. W. of Berlin (see map of German Empire, ref. 3-G). It is famous as the place where the Reformation began. The houses of Luther, Melancthon, and Lucas Cranach are still shown; also the spot, outside the Elster gate, where the papal bull was burned. Luther and Melancthon are buried in the Schlosskirche. The university, once so famous, was incorporated with that of Halle in 1817. Breweries, distilleries, and tanneries are in operation, and woolen and linen goods manufactured. Pop. (1890) 14,458.

Wittrock, VEIT BRECHER, Ph. D.: botanist; b. at Skogsbol, province of Dalsland, Sweden, May 5, 1839; educated in the school at Wenersborg and the University of Upsala; Professor of Botany in the University of Upsala, then in the Bergian Institution, and also director of the Botanical Museum in Stockholm. He traveled extensively in Sweden,

Norway, England, Ireland, Germany, Austria, and Hungary in the study of the botany of these countries. His principal publications are *Försök till en Monographie öfver Algstället Monostroma* (1866); *Algologiska studier* (1867); *Om Götlands och Ölands sötvattens-ulger* (1872); *Prodromus monographiae Edogoniacearum* (1874); *On the Development and Systematic Arrangement of the Pithophoraceae* (1877); *On the Spore-formation of the Mesocarpeae* (1878); *Om Linnæa borealis* (1878-79); *Ueber Schnee und Eislflora* (1883); *De Filicibus Observationes Biologicae* (1891); etc. He is editor of *Acta Horti Bergiani*, and has issued *Erythraee Esiccate* (1884-90), and *Algae uque dulcis Esiccate*.

Witwatersrand: See the Appendix.

Witzel, GEORG: See WICELIUS.

Woad [O. Eng. *wād*; O. H. Germ. *weit* > Germ. *waid*; from Teuton. are Ital. *gualdo*; O. Fr. *gualde* > Fr. *guède*]: a biennial herbaceous plant, the *Isatis tinctoria*, indigenous in Europe, which has been employed from the times of the Romans for dyeing blue. It is cultivated in France and Germany. The leaves possess a pungent odor and an acrid taste. These are either simply dried and sent to market, or by grinding are made into a paste, which is then prepared into balls and allowed to undergo fermentation, after which it is dried. Woad does not appear to contain either indigo-white or indigo-blue (see INDIGO), its coloring qualities being due to the presence of a body termed *indican* (C₂₆H₃₁NO₁₇), which is converted into indigo-blue and *indigluceine* by the action of dilute acids. At present it is chiefly used for the reduction of indigo in the "woad-vats," but is seldom employed by itself for dyeing purposes.

Woadwaxen: See DYER'S BROOM.

Woburn. wōb'ūrn: city; Middlesex co., Mass.; on the Boston and Maine Railroad; 10 miles N. W. of Boston (for location, see map of Massachusetts, ref. 2-II). Its plan is a thickly settled center, with three outlying villages and an area occupied by a small rural population. The general appearance of the center from the railway station is picturesque from the variety of the buildings, the curvature of the streets, and the several rocky elevations near. There are over 63 miles of streets, a public park, several squares, and a notable public library building, one of Richardson's most beautiful creations in stone, the gift of a private citizen, containing 33,203 volumes, 7,686 pamphlets, and 5,000 manuscripts, and having a collection of paintings, busts, and other objects of artistic and antiquarian interest. The birthplace of Benjamin Thompson (Count Rumford) is preserved intact by an association. The churches comprise 3 Baptist, 2 Roman Catholic, 2 (Trinitarian) Congregational, 2 Unitarian, 2 Protestant Episcopal, a Methodist Episcopal, a Scandinavian Evangelical Free church (Congregational), Salvation Army barracks, and All Saints chapel (Congregational). There are 51 public schools, a parochial school, and a private free industrial school—enrollment, public schools, 2,685; parochial, 404; industrial, 379—annual cost of public schools, \$53,219. There is an endowed free lecture course for all citizens, and an incorporated home for aged women. The city receipts in 1894 were \$614,306; expenditures, \$598,981; net debt, \$413,134; property valuation, \$9,464,154. There are a national bank with capital of \$200,000, a savings-bank with deposits of nearly \$1,500,000, a co-operative bank, and a private banking-house. The manufacture of leather is the leading industry. There is an excellent supply of pure water from Horn pond, the largest sheet of water in the city's limits. Electric and horse railways connect the city with adjoining towns and cities. Woburn was the first town set off from Charlestown. The location was established in 1640, and the town was incorporated in 1642. Its territory then embraced the larger part of the present area of Woburn, and the towns of Winchester, Wilmington, and Burlington. In 1888 it became a city. Almost to the middle of the nineteenth century it was largely an agricultural town; railways and manufactures changed its character after 1835; and its growth since 1850 has been comparatively rapid. Pop. (1880) 10,931; (1890) 13,499; (1895) 14,178.

WILLIAM R. CUTLER,

LIBRARIAN, WOBURN PUBLIC LIBRARY.

Woden, or Wodan: See ODIN.

Wodrow, ROBERT: clergyman and author; b. at Glasgow, Scotland, in 1679; educated at Glasgow University, where he became librarian, and became in 1703 minister of Eastwood, Perthshire, where he died Mar. 21, 1734. He was

the author of several works relating to Scottish history. Many of his MSS. are preserved in the Advocates' Library. "The Wodrow Society" was formed at Edinburgh in 1841 for the publication of the early writers of the Reformed Church of Scotland, and has published 24 volumes, of which the earliest consisted of Wodrow's *Correspondence* (3 vols., 1842-43), edited by Rev. Thomas McCrie. The New Spalding Club in 1890 published his *Biographical Collections relating to the Northeast of Scotland*. See his memoir in the new edition of his *History* and in the other works.

Revised by S. M. JACKSON.

Wofford College: an institution at Spartanburg, S. C.; named for Rev. Benjamin Wofford, who gave \$100,000, under the control and management of the conference of the Methodist Episcopal Church South of South Carolina. It was chartered by the Legislature of South Carolina Dec. 16, 1851, and the board of trustees held their first meeting to organize under it at Newbury Court-house Nov. 24, 1853, when they elected a president and four professors, who opened the institution for regular scholastic exercises Aug. 1, 1854. An ample curriculum of studies was prescribed. There are two literary societies—viz., the Calhoun and the Preston, the first organized Oct. 1, 1854, and the second Oct. 16, 1858, named respectively for Hon. John C. Calhoun and Hon. William C. Preston. The buildings were completed Jan. 1, 1855, and consist of a large and elegant college edifice, a president's house, and houses for six professors. They stand on a beautiful campus, inclosing 69 acres, within the corporate limits of the town of Spartanburg. The endowment of the college, originally ample, was almost entirely lost by the civil war, but the trustees and alumni society are making vigorous efforts to restore it and to promote the success of the institution. There were in 1894 8 instructors, 149 students, and a library of 6,000 volumes. Its president (1895) is James H. Carlisle, LL. D.

Wohlgenuth, or Wolgenut, wōl'ge-moot, MICHAEL: engraver; b. at Nuremberg, Germany, in 1434. He was a pupil of James Valsch, and worked for Hermann Schedel, the compiler of the *Nuremberg Chronicle*. Some say he made the drawings only, the blocks being cut by others. He was the master in painting of Albert Dürer. His pupils produced large altarpieces in his workshop, besides carving the adjuncts and church furniture generally. A large altarpiece in the Marienkirche at Zwickau is by him and is dated 1479; in the Vienna Gallery is a *St. Jerome* painted in 1511. Wohlgenuth was also a portrait-painter. D. at Nuremberg, Nov. 30, 1519. A portrait of him by Albert Dürer is in the Munich Gallery. Wohlgenuth is supposed to have been the author of the prints after Schöngauer, twenty-eight in number, signed with the letter W. He also made the designs for A. Hoberger's *Schutzkammer der wahren Reichthümer*, and for other works. W. J. S.

Wojwode. wōi wōd [Pol. *wojwoda*, from *wojna*, war, and *woditś*, to lead; Servian, *vojvoda*; Russ. *voevoda*]: a title exactly corresponding to German *Herzog*, duke, in its original meaning. It gradually became a dynastic title in Poland before the Piasts and of the Roumanian princes in Moldavia and Wallachia, until in 1716 the Turkish sultan bestowed upon the elected prince the title of *hospodar* (Slav. master, lord). In the kingdom of Poland the title of Wojwode passed over to the administrative governors of the provinces, which were accordingly called *Wojewódstwa*. These well-nigh sovereign chiefs, like the old German dukes, governed their provinces in peace and accompanied the elective king with their army in case of war. Each had a seat and a vote in the senate, and they formed the first class of the secular state, holding equal rank with the archbishops; their Latin title was the princely name of *palatinus*. The title of Wojwode in its original meaning of leader in war still exists in Servia and Bulgaria. The Temeswar Banat in Southeast Hungary still bears the Slavic name of Wojwodina. The Polish *Wojewódstwa* (twenty-nine in number in 1772) were abolished in 1832 and changed into governments of the Russian Vistula provinces, as Poland is officially called. H. S.

Wolcot, or Wolcott, JOHN, better known as PETER PIN-DAR: physician and satirical poet; b. at Dodbrooke, Devonshire, England, in May, 1738; served an apprenticeship of seven years to his uncle, a physician and apothecary at Fowey, Cornwall, who ultimately left him a considerable property; accompanied Sir William Trelawney, governor of Jamaica, to that island as his physician 1767; took orders in the Church of England, and obtained a curacy in Jamaica

in 1769, but returned to England on the death of his patron three years later; spent twelve years at Truro, Helston, and other towns in Cornwall as a physician; discovered the merits of the obscure painter Opie, with whom he went to London 1780; made himself conspicuous by his poetical productions, mostly satirical, which involved him in many quarrels. His attacks upon the king were so effective that at one time the ministry purchased his silence by the payment of £300 per annum. Among his satires are *Lyrical Odes*; *An Epistle to the Reviewers*; *Peeps at St. James*; *Royal Visits*; and *The Lousiad*. A collection of these in four volumes was published in 1796. In his later years he became totally blind. D. at Somers Town, London, Jan. 14, 1819. Several editions of his collected *Works* (about seventy in number) appeared in his lifetime, the last in 5 vols. (1816).

Revised by H. A. BEERS.

Wolcott, EDWARD OLIVER, LL. B.: U. S. Senator; b. at Longmeadow, Mass., Mar. 26, 1848; served for a few months as private in the 150th Regiment, Ohio Volunteers, 1864; entered the class of 1870, Yale College, but did not graduate; subsequently received the degree of A. M.; graduated at Harvard Law School 1871; removed to Colorado to practice law; became extensively interested in silver mines; elected as a Republican to the U. S. Senate, 1888; re-elected 1894.

Wolcott, JOHN: See WOLCOT.

Wolcott, OLIVER, LL. D.: signer of the Declaration of Independence; son of Gov. Roger Wolcott; b. at Windsor, Conn., Nov. 26, 1726; graduated at Yale College 1747; served as a captain of New York Volunteers on the Canada frontier 1748; studied medicine, but never practiced; was elected sheriff of Litchfield County 1751; became a judge of common pleas and of probate; was a member of the executive council 1774-86; commissioner of Indian affairs for the northern department 1775; took his seat in the Continental Congress Jan., 1776; signed the Declaration of Independence; commanded as major-general the fourteen Connecticut regiments raised for the protection of New York; joined Gen. Gates with several hundred volunteers, and was present at the battle of Saratoga, where he gained the rank of brigadier-general of the regular army; served in Congress, in the army, or on commissions throughout the war; was Lieutenant-Governor of Connecticut 1786-96, and Governor 1796-97. D. at Litchfield, Conn., Dec. 1, 1797.

Wolcott, OLIVER, LL. D.: cabinet officer; son of the preceding; b. at Litchfield, Conn., Jan. 11, 1760; graduated at Yale College 1778; served as a volunteer to repel the British attack on Danbury 1777, as volunteer aide to his father 1779, and as an officer in the commissary department 1780-81; was admitted to the bar 1781; was employed in the financial affairs of the State government, and subsequently (1784) as a commissioner to settle its accounts with the U. S.; was comptroller of public accounts of the U. S. 1788-89, auditor of U. S. treasury 1789-91, comptroller 1791-95, Secretary of the Treasury 1795-1800, and judge of U. S. circuit court 1801-02; removed to New York city 1802; was a merchant there until 1812; took part with his brother Frederick in founding extensive manufacturing establishments at Wolcottville, near Litchfield; was president of the State constitutional convention 1817, and Governor 1818-27, after which he resided in New York, where he died June 1, 1833.

Wolcott, ROGER: Governor of Connecticut; b. at Windsor, Conn., Jan. 4, 1679; was apprenticed to a mechanic, and never attended a school, but acquired a good education by private study; was commissary in the expedition of 1711 against Canada; served as an officer in subsequent wars with France, and was major-general and second in command at the capture of Louisburg 1745; was successively a member of the assembly and of the executive council, judge of the county court, deputy governor, chief judge of the superior court, and was governor of the colony 1751-54. D. at East Windsor, May 17, 1767. He published a volume of *Poetical Meditations* (New London, 1725), and a pamphlet on church government (Boston, 1761), and left a MS. poem of 1,500 lines entitled *A Brief Account of the Agency of the Honourable John Winthrop, Esq., in the Court of King Charles the Second, Anno Dom. 1662, when he obtained a Charter for the Colony of Connecticut*, which contains a detailed account of the Pequot war. It was printed in the collections of the Massachusetts Historical Society (1st series, vol. iv.).

Wolf [O. Eng. *wulf*; Germ. *wolf*; Goth. *wulfs*; cf. Gr. *λύκος*; Sanskr. *vṛka-*]: the common name for the larger wild species of the family *Canidae* and genus *Canis* which most resemble the dog, and which agree with the ordinary types of that animal in the possession of circular pupils to the eyes and a somewhat bushy tail. The species are somewhat numerous, and the typical representatives are chiefly found in the northern hemisphere and southward to India; but allied species, which are properly called wolves, although more generally designated as wild dogs or foxes, are also found in Africa, South America, and Australia. They agree essentially in their habits with the dogs, and hunt their prey either by surprising or running it down. At some seasons of the year they live, to some degree, in solitude, although they often associate in packs; and especially is this the case in winter, when they combine in the pursuit of game and other objects of prey. In America there are two well-marked species: (1) The large common wolf (*Canis lupus*), identical with or a sub-species of the wolf of Europe and Northern Asia, and (2) the small prairie wolf or coyote (*Canis latrans*), occurring on the plains of the Western States and Territories. (1) The former has an average length of about 4 feet, with a tail of 17 to 20 inches; its color is generally grizzly gray above, but is quite variable, sometimes being black and sometimes white, and with various gradations between the two. These variations were formerly supposed to indicate specific differences, but as they are found in cubs of the same litter, they are now recognized as being not even of sub-specific or varietal importance. (2) The prairie wolf is about 3 feet long or somewhat longer, and has a tail about 16 inches in length. Its color, as in the wolf, is generally gray, but is subject to much less variation than in the former species. It is found more generally on the plains of the great West and in the hydrographical basins of the Missouri and Saskatchewan rivers, and extends southward into Mexico. It is quite prolific, sometimes having as many as ten in a litter. It lives mostly in burrows.

Revised by F. A. LUCAS.

Wolf, WÖLF, CHRISTIAN, Baron: philosopher and mathematician; b. at Breslau, Silesia, Jan. 24, 1679; studied first theology, then mathematics and philosophy at Jena and Leipzig, and began to lecture in the latter city, but was compelled by the invasion of Saxony by Charles XII. in 1706 to leave the country, and received in the following year an appointment as Professor of Mathematics and Natural History at the University of Halle. Here his lectures attracted much attention and drew large audiences, and his writings, mathematical and philosophical, gained for him a great reputation all over Germany, but being opposed to the pietistical tendency which at that period characterized the University of Halle, he was formally accused of heresy by his theological colleagues, and by a cabinet order of Nov. 15, 1723, was ordered to leave Halle within twenty-four hours and the Prussian states within two days. He found refuge in Hesse-Cassel, and lectured for several years with great success at Marburg, but on the accession of Frederick II. he was recalled to Halle in 1740, made chancellor of the university in 1743, a baron in 1745, and died there Apr. 9, 1754. He wrote on mathematics, law, and all the various disciplines of philosophy, and he often issued his works in double editions—one in Latin and one (generally abbreviated) in German. His prominence in the history of philosophy is due more to his method than to his ideas; and indeed his method became universally employed, not only in philosophy, but in all sciences, up to the time of Kant. The characteristic of his method is usually known as "dogmatism," being mainly by definition and analytic statement with little resort to experience. See his *Autobiography*, edited by Wuttke (1841), and the works of Ludovici on his philosophy and its influence, together with the treatment of the *Histories of Philosophy*, by Fischer, Erdmann, and Ueberweg.

Revised by J. M. BALDWIN.

Wolf, EDMUND JACOB, D. D.: theologian; b. at Rebersburg, Center co., Pa., Dec. 8, 1840; educated in Pennsylvania College, the Theological Seminary, Gettysburg, and at Tübingen and Erlangen; entered the ministry 1865; pastor in Northumberland co., Pa., and Baltimore, Md.; in 1874 became Professor of New Testament Exegesis and Church History, Theological Seminary, Gettysburg; author of *History of the Lutherans in America* (New York, 1890); former editor of *The Quarterly Review of the Lutheran Church*, and at present (1895) one of the editors of *The Lutheran World* (Cincinnati, O.).

H. E. JACOBS.

Wolf, FERDINAND: Romance scholar; b. in Vienna, Dec. 8, 1796; studied philosophy and law, but more particularly literary history, and in 1819 was made secretary of the Academy of Sciences in Vienna. D. in Vienna, Feb. 18, 1866. His works, of which there is a long list, are marked by thoroughness of research and a fine critical perception. Especially to be noted are the *Floresta de rimas modernas castellanas* (Paris, 1837); *Ueber die Luis, Sequenzen und Leiche* (Heidelberg, 1841); *Rosa de romances* (Leipzig, 1846); *Studien zur Geschichte der spanischen und portugiesischen Nationalliteratur* (Berlin, 1859); *Histoire de la littérature brésilienne* (Berlin, 1863); and in collaboration with Hofmann, *Primavera y flor de romances* (2 vols., Berlin, 1856). In addition he contributed numerous articles to the *Jahrbücher der Literatur*, published at Vienna, and supplied corrections and new matter to the German translation of Ticknor's *History of Spanish Literature*, for which he also prepared a supplement. J. D. M. FORD.

Wolf, FRIEDRICH AUGUST: classical scholar; b. at Haynrode, Prussian province of Saxony, Feb. 15, 1759; studied classical languages at Göttingen, where, on Apr. 8, 1777, in spite of the strenuous opposition of the authorities, he insisted on inscribing himself as "studiosus philologiae" (in place of *philosophia*). This date has generally been taken as the birthday of the new school of philology inaugurated by Wolf, but the traditional and still widely accepted statement that he was the first so to style himself has been disproved by the matriculation lists of the Göttingen University. On graduating he became a teacher at the seminary of Ilfeld in 1779; rector of the gymnasium of Osterode in 1782; Professor of Philosophy and Pedagogy at Halle in 1783-1807. During this time his extraordinary talent as a teacher, added to his worldwide renown as a scholar, made Halle the most famous seat of classical learning in Germany. Boeckh, Bekker, Buttmann, Bernhardt, and Heindorf, to mention only these, were among his great pupils. With his removal to Berlin University in 1807, in the foundation of which he had taken a conspicuous part, a change came over Wolf. Dissatisfied with his surroundings, and embittered by petty personal quarrels, his usefulness was considerably impaired and his bodily vigor broken. In 1824 he took a journey through Southern France for the sake of regaining his health, but died Aug. 8 at Marseilles. Wolf was the first to systematize and to define the scope of philology, or "Alterthumswissenschaft," to use his own favorite designation. It dealt, according to him, with the study of ancient life and thought in all its various political, social, economic, and intellectual phases as handed down to us in the literary, epigraphic, and monumental documents of the Greeks and Romans. (See his *Encyclopädie der Philologie*, ed. by Stockmann, Leipzig, 1831.) Among the writings that emanated from his prolific pen were his editions of Demosthenes's *Leptineus* (1790), with a valuable introduction; Plato's *Symposium*, *Apology*, *Phaedo*, *Crito*; Hesiod's *Theogony*; Cicero's *Tusculan Disputations*; *Post reditum in senatu*, *De domo sua*, *De haruspicum responsis*, and *Pro Marcello*, all of which speeches Wolf unjustly regarded as apocryphal; Aristophanes's *Clouds*, with a famous German translation; *Litterarische Anekten* (4 vols.), with admirable sketches of classical scholars, that of Bentley being the most noteworthy; *Kleine Schriften* (2 vols.). But all these works are now but little read for their intrinsic value. Wolf's claim to immortality rests upon his *Prolegomena in Homerum* (1795), in which he attempted to prove that the *Iliad* and *Odyssey* are not the work of one author but of several. (See Volkmann, *Geschichte und Kritik der Wolf'schen Prolegomena*, Leipzig, 1874.) It is true that but few, if any, of Wolf's arguments are accepted at the present day; nor is it their originality, strictly speaking, that gives them permanent value, for in some of the most important he was anticipated by Vico and Wood. What gives to this treatise its monumental and epoch-making character is rather the brilliancy of its style, the consummate skill in which the information imbedded in the Homeric scholia, which had only recently been published by Villoison (*q. v.*), is here for the first time scientifically utilized and interpreted, and finally the influence which this iconoclastic treatise exerted upon methodical research in general. For Wolf's arguments and the "Homeric question" in particular, see the article HOMER. The best estimate of Wolf is given by M. Pattison, *Essays* (vol. i., pp. 337-415). See also W. Körte, *Leben und Schriften Friedrich August Wolfs des Philologen* (2 vols., Essen, 1833); I. F. D. Arnoldt, *Friedrich August Wolf in*

seinem Verhältnisse zum Schulwesen und zur Pädagogik dargestellt (2 vols.—vol. i., biography; vol. ii., technical part—Brunswick, 1861-62); Bursian, *Geschichte der klassischen Philologie in Deutschland*. ALFRED GUDEMAN.

Wolf, Hieronymus: classical scholar; b. at Göttingen, Germany, Aug. 13, 1516; pupil of Camerarius and Melancthon. After leading a life of many vicissitudes as a teacher, librarian, and secretary (at the house of Fugger in Augsburg), he finally secured the position of the director of a school at Augsburg in 1557, which he retained till his death Oct. 8, 1580. Wolf was one of the foremost Hellenists of the sixteenth century. His fame now rests upon his elaborate editions, with critical and exegetical notes and Latin translations, of Isocrates (Basel, 1570, fol.) and Demosthenes (Basel, 6 vols. fol.). He also edited a number of Byzantine historians (Zonaras, Choniatas, Nicephorus Gregoras, Laoniceus, Chalcondylas), with Latin translations, thus inaugurating the study of Byzantine history in Germany. Still other editions are the *Enechiridion* of Epictetus; Cebes's *Pinar*; the pseudo-Platonic *Ariochos*; Plutarch's *Demosthenes* and *Cicero*; some of the astronomical treatises of Proclus, Porphyrius, and Hermes; a Latin translation of the non-lexical portions of Suidas; and verbose commentaries to Cicero's *Cato Major*, *Laelius*, *Paradoxa*, and *Somnium Scipionis*. See his autobiography in Reiske's *Oratores Graeci* (vol. viii., pp. 742 ff.); G. C. Mezer, *Memoria Hieronymi Wolfii* (Augsburg, 1862); Schmid, *Encyclopädie der Pädagogik* (vol. x., pp. 433-456); Raumer's *Historisches Tusehenbuch* (pp. 339-389, 1830). ALFRED GUDEMAN.

Wolfboro: town (incorporated in 1770); Carroll co., N. H.; on Lake Winnipiseogee, and the Boston and Maine Railroad; 10 miles S. of Ossipee, 45 miles N. E. of Concord (for location, see map of New Hampshire, ref. 6-G). It contains the villages of Wolfboro Center, North Wolfboro, South Wolfboro, East Wolfboro, and Wolfboro Falls; is a summer resort in an agricultural region; and has five churches, graded public schools, the Brewster Free Academy, public library, Memorial Hall, savings-bank, loan and banking company, gravity system of water-works, electric-light plant, a weekly newspaper, and manufactories of woolen goods, boots and shoes, furniture, carriages, shingles, and marble-work. Pop. (1880) 2,222; (1890) 3,020.

EDITOR OF "GRANITE STATE NEWS."

Wolf-dog: a large variety of the domestic dog, allied to the shepherd's dog, now found almost exclusively in Spain, though formerly common in Ireland and Scandinavia. The name is also applied to a dog of any kind that is trained to protect sheep, etc., against wolves.

Wolfe, CHARLES: poet; b. at Dublin, Ireland, Dec. 14, 1791; studied at Winchester School; graduated at Trinity College, Dublin, 1814; was tutor there 1815-56; took orders in the Church of England 1817, and became curate of the parish of Donoughmore, Ireland. After a visit to the south of France he died of consumption at the Cove of Cork (now Queenstown) Feb. 21, 1823. His poetical *Remains*, with a *Brief Memoir of his Life* (1825; 8th ed. 1846), were published by Archdeacon John A. Russell. His *Ode on the Death of Sir John Moore* is one of the most beautiful of modern poetical compositions.

Wolfe, JAMES: soldier; b. at Westerham, Kent, England, Jan. 15, 1726; son of Lieut.-Gen. Edward Wolfe; entered the army as second lieutenant at an early age; was present at the battles of Dettingen, Fontenoy, Falkirk, and Culloden; distinguished himself at Lafeld 1747, and at the siege of Maestricht 1748; commanded a regiment in the Highlands of Scotland 1749-54; was quartermaster-general in the expedition against Rochefort 1757, and brigadier-general in that against Louisburg, Cape Breton, 1758; was appointed by Pitt major-general and placed in command of an expedition for the conquest of Canada 1759; arrived with 8,000 men in the St. Lawrence in June; was repulsed by Montcalm in a first attack, July 31, and fell in the moment of victory in the battle on the Plains of Abraham, Sept. 13, 1759. He was buried at Greenwich, and monuments to his memory have been erected in Westminster Abbey and at Quebec. His *Life* has been written by Robert Wright (London, 1864). See also Parkman's *Montcalm and Wolfe* (1885).

Wolfe Island: an island township and post-village; at the outlet of Lake Ontario, directly opposite Kingston, Canada, and Cape Vincent, N. Y. It belongs to Frontenac County, Ontario, is about 18 miles long, and has a light-house. Pop. about 2,000, and diminishing.

Wolfenbüttel, wölf-en-büt-tel: town; in Brunswick, Germany; on the Oker; 7 miles by rail S. of Brunswick (see map of German Empire, ref. 3-E). It has an excellent library of 300,000 volumes, of which Lessing was librarian for some time, housed in a handsome building, several educational institutions, and manufactures of lacquered and japanned wares, paper-hangings, leather, and tobacco. It dates from 1046, and in 1193 and 1542 was besieged and taken. Pop. (1890) 14,480.

Wolff, ALBERT: sculptor; b. at Neu-Strelitz, Mecklenburg, Nov. 14, 1814; studied sculpture under Rauch, afterward in Rome, and was made Professor at the Academy of Fine Arts in Berlin 1866. He is especially celebrated for his equestrian statues, of which he produced a great number—Frederick William III. in Berlin, Frederick William IV. in Königsberg, Ernst August in Hanover, Frederick Francis I. in Ludwigslust, etc. D. in Berlin, June 20, 1892.

Wolff, ALBERT: journalist; b. at Cologne, Dec. 31, 1835, was educated in Paris for mercantile pursuits, and afterward studied in the University of Bonn, but finally devoted himself entirely to literature. After trying, with success, various literary branches in the German language, he settled in 1857 in Paris, became secretary to Alexandre Dumas, Sr., and began in 1859 to write for the Parisian papers, *Gaulois*, *Figaro*, *Charivari*, *L'Univers Illustré*, *L'Événement*, etc. Of those articles, which often produced a great sensation, he published various selections in book-form: *Mémoires du Boulevard* (1866); *Les deux Empereurs* (1871); *Victorien Sardou et l'Oncle Sam* (1873), etc. After the Franco-German war he became a French citizen. From that time till his death, Dec. 23, 1891, he contributed specially art criticisms to the *Figaro* and dramatic criticism to *L'Événement*. He also wrote some novels and færes.

Revised by A. G. CANFIELD.

Wolff, JOSEPH, D. D., LL. D.: missionary; b. at Weilersbach, near Bamberg, Germany, in 1795; son of a Jewish rabbi; studied at Stuttgart, Munich, and Weimar; was baptized into the Roman Catholic Church at Prague 1812; completed his education at the Universities of Vienna and of Tübingen, devoting himself to Oriental languages; went to Rome in 1816; was admitted as a student into the Roman College, and afterward into the College of the Propaganda, from which, however, he was expelled in 1818 for heretical opinions; went to London 1819; joined the Church of England; spent two years at Cambridge studying Oriental languages; was ordained as a missionary to the Jews Apr., 1821; made an extensive tour through the East; returned to England 1826; married Lady Georgiana Mary Walpole, daughter of the Earl of Orford, Feb., 1827; embarked in April upon another missionary tour; penetrated through Persia to Bokhara, and thence to Afghanistan, Kashmir, and the Punjab; visited Southern India, Arabia, and Abyssinia, where he learned the Amharic language; returned to England 1834; revisited Abyssinia, Arabia, and India 1836; proceeded thence to the U. S., reaching New York in Aug., 1837; was ordained deacon in the Protestant Episcopal Church; lectured in the principal cities and preached before Congress; returned to England Jan., 1838; was ordained priest at Dublin; obtained the curacy, first of Linthwaite and afterward of High Hoyland, Yorkshire; made a second journey to Bokhara in 1843, at the instance of the British Government, to attempt the release or learn the fate of Col. Stoddard and Capt. Conolly; was himself imprisoned and condemned to death, but saved by the interposition of the Persian ambassador; returned to England 1845, and spent the remainder of his life as parish priest at Isle Brewers, Somersetshire. D. at Isle Brewers, May 2, 1862. He published, among other works, *Researches and Missionary Labors among Jews and Mohammedans* (Malta, 1835); *Journal of Missionary Labors* (1839); *A Narrative of a Mission to Bokhara* (2 vols., 1845); and an autobiography entitled *Travels and Adventures*, etc. (2 vols., 1860).

Revised by S. M. JACKSON.

Wolfman Body [named from Kaspar Friedrich Wolff, a German anatomist and physiologist (1733-94)]: the primitive kidney of vertebrates, the mesonephros of embryologists. In the lower vertebrates it is the chief excretory organ throughout life, but in reptiles, birds, and mammals it disappears during the embryonic stages, its place being taken by the true kidney. All that remains of it in the adult of these groups is the anterior end, which enters into connection with the reproductive organs. The Wolfman body arises as a paired organ from two longitudinal ridges

in the dorsal part of the body cavity. In its primitive condition it consists of a series of transverse tubes connecting the body cavity with a longitudinal tube emptying near the vent. The number of these tubes increases, and in the human embryo the whole reaches its maximum about the seventh week, and in the sixteenth has almost disappeared. The best account of the structure in the higher vertebrates is by Mihalkowies in *Internationale Monatschrift für Anatomie und Histologie* (vol. ii., 1885).

J. S. K.

Wolf-fish: a name given to the fishes of the family *Anarrhichidae* and genus *Anarrhichus*, on account of the fierce aspect and large canine teeth. They are elongated, but stout fishes. The scales are rudimentary; the head has a steep profile; the mouth is widely cleft; the jaws armed with strong conical teeth in and toward the front, and with molars in two rows on the palate and sides of the lower jaw; the dorsal fin is long and sustained by flexible spines; the anal fin is less than half as long as the dorsal, and opposite the posterior half of that fin; the caudal is distinct from the dorsal and anal fins, and rounded behind; the pectorals are large; the ventrals absent. The species are peculiar to the northern seas. The best-marked, and possibly the only ones, are the *Anarrhichus lupus*, found on both sides of the Atlantic Ocean, and *Anarrhichus denticulatus* of Greenland. On the American coast the wolf-fish is found as far southward as Cape Cod, and occasionally even beyond. It is a very ravenous and ferocious fish, and with its powerful jaws can inflict a severe wound even on man. Although repulsive in its appearance, and rarely if ever eaten on the American coast, it is regarded as palatable or even excellent food in different parts of Europe. The skin is in some places used for bags and pockets. The wolf-fish occasionally attains a length of 6 or 7 feet. It mostly lives in deep water, but approaches the shore to deposit its spawn in May and June. This species is also called in various places sea-wolf and catfish, and in the Orkney islands swine-fish, on account of the movements of its nose, which are supposed to simulate those of a hog.

Wölflin, wölf-leen, EDUARD: Latinist; b. at Basel, Switzerland, Jan. 1, 1831; studied in his native city and at Göttingen; privat docent at Basel 1856; professor at a gymnasium in Winterthur in 1861; called to the University of Zurich in 1869, to Erlangen in 1875, to Munich in 1880. Wölflin is the foremost representative, if not the founder, of the historical study of Latin syntax and lexicography; edited Ampelius (1854); Polyanus (2d ed. 1886); Publilius Syrus (1869); Livy, books xxi., xxii., xxiii. (school editions, repeatedly re-edited); Asinius Pollio, *De bello Africano* (with Miodonski, 1889). Among his works are his treatises on the style of Tacitus in the *Philologus* (1866-68); *Die Latinität des Afrikaners Cassius Felix* (1880); *Die altliterarischen Verbindungen der lateinischen Sprache* (1881); *Die Geminatio im Lateinischen* (1882); *Lateinische und romanische Comparation* (1879); *Ueber die Aufgaben der lateinischen Lexikographie* (1882); etc. He is the founder, editor, and one of the chief contributors of the *Archiv für lateinische Lexikographie*.

ALFRED GÜDEMANN.

Wolfram [Germ. possibly *Wolfrahn*, the ancient name of the mineral being *spuma lupi*, wolf's spittle or froth (*rahm* signifying cream)]: mineral tungstate of iron, ferrous tungstate, O₂WFe, though usually containing also from 4 to 20 per cent. of manganous oxide. It is right rhombic; dark brown or black, with a reddish-brown streak; hardness between apatite and feldspar; luster metalloid, sometimes slightly magnetic; specific gravity from 7.2 to 7.5. It is abundant with the Cornish tin ores and in many European localities; in America at Monroe, Conn., with native bismuth; Trumbull, Conn., with massive topaz; in Mecklenburg co., N. C., and a number of other localities. Molecularily considered, it is probably a variable mixture of *ferberite*, ferrous tungstate, and *hübnerite*, manganous tungstate (the latter being also right rhombic) crystallized together.

Wolf River: a river of Mississippi; rises in Marion County, and flows S. into St. Louis Bay, an arm of Mississippi Sound.—Another WOLF RIVER rises in Tippah co., Miss., and flows W. N. W. 100 miles, mostly in Tennessee. It reaches the Mississippi at Memphis.

Wolf River: a river of Wisconsin; rises in the northeast part of the State, flows southward, and after passing through Pewaungan Lake flows into Fox river. It is navigable 150 miles for small steamboats, and affords passage to a vast amount of timber.

Wolfsbane: See MONKSNOOD.

Wolgemut: See WOHLGEMUTH.

Wollaston, WILLIAM HYDE, M. D., F. R. S.: chemist and physicist; great-grandson of William Wollaston; b. at East Dereham, England, Aug. 6, 1766; educated at Caius College, Cambridge; took the degree of M. B. in 1787; graduated in medicine 1793; began to practice at Bury St. Edmunds in 1789, but soon removed to London, where he was not successful, and abandoned the profession; devoted himself to scientific researches, especially to experiments in chemistry, mineralogy, and physics; became secretary of the Royal Society 1806; discovered the metals palladium and rhodium (1803), and a method of making platinum malleable, for which he was awarded the medal of the Royal Society Nov. 30, 1828, and by which he gained £30,000; was the first to detect the dark or Fraunhofer lines in the solar spectrum (1802), and to demonstrate the identity of galvanism and frictional electricity; constructed a sliding scale of chemical equivalents; invented the reflecting goniometer, the camera lucida, and the cryophorus for freezing water by means of its own evaporation; improved the construction of the microscope by means of the "Wollaston doublet" or compound lens; was the first to describe eystie oxide and three new compounds connected with the production of urinary calculi. He was chosen president of the Royal Society 1820. D. in London, Dec. 22, 1828. He presented to the Royal Society £1,000 for the encouragement of experiments. He published thirty-eight papers in the *Philosophical Transactions* (1797-1829). He may be considered the founder of modern British chemistry.

Wollstonecraft: See GODWIN, MARY WOLLSTONECRAFT.

Wolowski, LOTIS FRANÇOIS MICHEL RAYMOND; political economist; b. at Warsaw, Aug. 31, 1810; studied in Paris 1823-27; served in the Polish revolution of 1830; retired to Paris after its suppression; was naturalized in France in 1834; became Professor of Law at the Conservatoire des Arts et Métiers in 1839, and was a member of the Constituent Assembly of 1848, and of the Legislative Assembly of 1849, but retired from politics in 1851. He founded in 1833 the *Revue de Législation et de Jurisprudence*, and established the first Crédit Foncier bank in Paris. Among his works are *De l'Organisation du Travail* (1845); *De l'Organisation du Crédit Foncier* (1849); *Les Finances de la Russie* (1864); *La Liberté commerciale et les Résultats du Traité de Commerce de 1860* (1868); *Le change et la circulation* (1869); and *L'or et l'argent* (1870). D. at Gisors, France, Aug. 4, 1876.

Wolseley, WOŁZŁEĆ, GARNET JOSEPH, First Viscount Wolseley; soldier; b. near Dublin, Ireland, June 4, 1833; entered the British service as ensign Mar. 12, 1852; served in the Burmese war of 1852-53; with Sir John Cheape's expedition against the robber-chief Myattoon; in the siege of Sebastopol from Dec., 1854, to close of the war; in the suppression of the Indian mutiny of 1857-59; and in the war with China (1860). In 1870, in command of the expedition from Canada to the Red River territory, he suppressed the insurrectionary government at Fort Garry, and was created a knight of St. Michael and St. George for his services. In 1873 he was appointed governor of Gold Coast settlement, which had become involved in a war with the Ashantees, and as commander-in-chief of the British forces defeated the enemy's army, occupied and destroyed Coomassie, his capital, and the king's palace, and brought the war to a speedy and successful end. For these services he was made major-general, created K. C. B., and the thanks of Parliament and £25,000 were bestowed upon him; inspector-general of auxiliary forces 1874-76; governor of Cyprus in 1878 and of Natal in 1879; commander-in-chief of British forces in Egypt 1882, winning the battle of Tel-el-Kebir Sept. 13, 1882, which practically closed the war; was raised to the peerage as Viscount Wolseley, and was made general in 1882; in 1884-85 he was commander-in-chief in Egypt, and conducted operations for relief of Khartoum, for which services he was highly honored. In 1888 he was appointed adjutant-general of the army; in 1890 was appointed commander-in-chief of the troops stationed in Ireland, with headquarters in Dublin; in Nov., 1895, succeeded the Duke of Cambridge as commander-in-chief of the British army with limited powers. He is the author of several military works, including an exhaustive biography of the Duke of Marlborough, at present (1895) in course of publication in four volumes.

Wolsey, WOŁZŁEĆ, THOMAS; cardinal; b. at Ipswich, Suffolk, England, Mar., 1471; was educated in Magdalen College, Oxford; studied theology; took holy orders, and received in 1500 the rectorship of Lymington, Somersetshire; was appointed a chaplain to Henry VII. 1505; went to Bruges in 1507 on a special diplomatic mission to the Emperor Maximilian and to Scotland the next year on a similar errand, and for his success was rewarded with the deanery of Lincoln 1509. Henry VIII. made him his almoner 1509, and soon employed him in the most important affairs. He made him Archbishop of York in 1514, Lord Chancellor of England in 1515, and showed him an almost unlimited confidence in all negotiations. Foreign princes courted his favor: the Emperor and the King of France sent him great presents and bestowed pensions on him; the pope created him a cardinal in 1515 and legate in 1519; and from this last year to his fall he acted as if he were really the ruler of England and one of the sovereigns of Europe. His income was royal, and so were his expenses. He built Hampton Court; he founded Christ Church College and seven lectureships at Oxford; he kept a household of from 500 to 800 persons, and showed himself in many ways a patron of science and art. In personal bearing he was haughty and arrogant toward his equals, exceedingly adroit in managing his superiors, and kind and generous toward his inferiors. Twice—on the death of Leo X. (1522) and again on that of Adrian VI. (1523)—the tiara seemed to be within his reach, but both times his plans were foiled by the intrigues of Charles V. and by the opposition of the French bishops. At last his ambition came into conflict with the king's passion. The king wished to be divorced by the pope from Catharine of Aragon, the aunt of Charles V., and Wolsey had to carry through the necessary negotiations; but this task, in any case difficult, proved impossible for a man who, for his own sake, had to tread cautiously and manage people with the greatest discretion. The negotiations seemed to be endless. The king lost his patience, and even began to distrust the cardinal. At last it was evident that he had hopelessly failed. The pope, under the domination of Charles V., refused to grant the divorce. Wolsey was opposed to Henry's marriage to Anne Boleyn, because it might endanger his own position at home by giving the widespread jealousy and enmity around him a firm center. At last Anne Boleyn demanded and obtained from the king the cardinal's dismissal in disgrace, and on Oct. 17, 1529, the great seal was taken from him and he left the court. He retired to his archbishopric, and seemed prepared to end his life in comparative obscurity. But the hatred of his enemies was not yet satisfied, and on Nov. 4, 1530, he was arrested at Cawood on a charge of high treason. He was conducted to London, but on the way thither he fell ill, and died at the monastery of Leicester, Nov. 29, 1530. His *Life* has been written by G. Cavendish (1641), J. Galt (1812), G. Howard (1824), C. Martin (1862), M. Creighton (1888). See Froude's *History of England* (vol. i., 1856) and Williams's *Lives of the English Cardinals* (1868). Revised by S. M. JACKSON.

Wolstan: See WULFSTAN.

Wolverene: a name of the GLUTTON (*q. v.*).

Wolverhampton: town; in Staffordshire, England; 13 miles N. W. of Birmingham (see map of England, ref. 9-11). Besides a number of modern public buildings, the town-hall (1868), an art gallery (1885), etc., it contains St. Peter's church, a cruciform Gothic edifice, which, founded in 996 and rebuilt several times afterward, was restored in 1859-65. The town lies on the western outskirts of the rich mining districts of Staffordshire, which are covered by blast furnaces, forges, rolling-mills, foundries, and every other kind of contrivance by which iron ore is transformed into pig, railway, sheet, rod, hoop, and nail iron, and worked into boiler-plates, locks, hinges, axles, bolts, vises, anvils, and edge tools. Besides hardware, in which branch of manufacture Wolverhampton is one of the leading centers of the world, it has extensive manufactures of tinware, articles of papier-mâché, and japanned and enameled goods. The parliamentary borough returns three members. Pop. (1891) 174,325.

Wolzogen, WÖLT-SÖ'GEN, KAROLINE, VON; author; b. von LENGEFELD, Feb. 3, 1763, at Rudolstadt, Germany; married as her second husband, in 1796, Baron von Wolzogen, chamberlain at the court of Saxe-Weimar. D. at Jena, Jan. 11, 1847. Her brothers were Schiller's fellow pupils in the Karlschule of Stuttgart; her sister Charlotte became his wife; she herself was through the whole latter part of his life an intimate friend of his, and her book, *Schillers Leben*

(2 vols., 1830), is one of the most vivid and trustworthy pictures of him. In the field of pure imagination she also gained reputation by her romances, *Agnes von Lilien* (2 vols., 1798) and *Cordelia* (2 vols., 1840), the first of which was for a time considered a work of Goethe even by eminent critics. See *Litterarischer Nachlass der Frau Karoline v. Wolzogen* (1867). Revised by JULIUS GOEBEL.

Woman's Christian Temperance Union (in abbreviated form W. C. T. U.); an association formed for the purpose of unifying throughout the world the work of women in temperance and social reform. Its methods are preventive, educational, evangelistic, social, and legal; the time of prayer observed by its members is noontide; its badge is a knot of white ribbon; its watchwords are "Agitate! Organize." Its motto is "For God and home and every land."

The National Woman's Christian Temperance Union was organized in Cleveland, O., in 1874, and is the result of the great "women's crusade." It is now regularly organized in all the States of the Union, and in every Territory except Alaska. Its headquarters are in Chicago, Ill., where it has a temperance publishing-house which sends out about 135,000,000 pages annually, and has seven editors and 150 employees. This publishing-house is a stock company, and all its directors and stockholders are women, as is its business manager. The *Union Signal* is the organ of the society, and has an average circulation of 80,000. The Woman's National Temperance Hospital demonstrates the value of non-alcoholic medication. The Woman's Temperance Temple, which cost over \$1,000,000, has been built in Chicago. There are about 10,000 local unions with a membership and following, including the children's societies, of about half a million. The Woman's Christian Temperance Union has forty-four distinct departments of work, presided over by as many women experts in the national society and in nearly every State. All the States in the republic except three have laws requiring the study of scientific temperance in the public schools, and all these laws were secured by the Woman's Christian Temperance Union, as were also the laws forbidding the sale of tobacco to minors. Most industrial homes for girls were secured through the efforts of this society, also the refuges for erring women; laws raising the age of consent and providing for better protection for women and girls have been enacted by many legislatures through the influence of the department for the promotion of social purity, of which the president of the society, Miss Willard, was until 1895 superintendent.

The World's Woman's Christian Temperance Union was founded through the influence of the national society in 1883, and already has auxiliaries in more than forty countries and provinces. Its president is Frances E. Willard, and its vice-president at large, Lady Henry Somerset, of London. The white ribbon is the badge of all the Woman's Christian Temperance Union members, and is now a familiar emblem in every civilized country. A great petition is being circulated in all parts of the world against legalizing the sale of opium and alcoholics; 7,500,000 names have been secured, including endorsements of great societies, and the petition is to be presented to all the governments of the world by a commission of women appointed for that purpose.

FRANCES E. WILLARD.

Womb [*< O. Eng. wamb*]: the uterus, the chief of the female sexual organs, in which conception takes place and the embryonic organism is retained during the period of gestation, and developed from step to step of fetal growth until its birth as a living, independent individual. The womb (see Fig. 1 in article OVARIES) in healthy adult women is located in the abdominal cavity, in the median line of the pelvis: it has the bladder in front, the rectum behind; its position is one of slight anteversion—that is, its vertical axis is thrown slightly forward. It is a pear-shaped body, with base above, and measures about 3 to 3½ inches in length. It is chiefly muscular in structure; is hollow, having a small canal through its lower portion, the neck or *cervix uteri*, which widens into a triangular cavity within the body or broad base above. The length of this canal and cavity is usually 2½ to 3 inches. At the upper or basic end of the cavity the angles connect by small apertures with the Fallopian tubes, which bring the oöules from the ovaries to the uterus. The interior of the womb, both neck and body, is lined with mucous membrane, arranged in folds and rich in blood-vessels, and containing numerous glands. The substance of the organ comprises three distinct sets of muscular fibers—an external, middle, and internal layer—some of

which are transverse or circular, others longitudinal, and others oblique. These give the organ a powerful contractility. The organ is retained *in situ* by ligaments and the cellular tissue surrounding it. It has attachments to the bladder in front, to the rectum behind, to the pelvic bodies on either side by the broad ligaments—to the ovaries by the ovarian ligaments. When in pregnancy the womb increases to accommodate the developing infant, its muscular fibers take on increased growth, and, following the expulsion of the child and placenta, these fibers contract in the direction of the several coats, as stated, and prevent hemorrhage. By a slow process of involution or atrophy from disuse the womb gradually returns to its normal size. For details of its functions, see EMBRYOLOGY, OBSTETRICS, and OVARIES; for diseases to which it is liable, see STERILITY and UTERINE DISEASES.

Wombat: any marsupialian quadruped of the family PHASCOLOMYIDÆ (*q. v.*), of which only three species are known. The wombat is an animal of clumsy form and stout limbs, reaching a length of about 3 feet and a weight of 60 lb. The legs are short, but powerful, and the animals burrow readily. The general color is gray, lighter beneath. They are nocturnal in habits, feed on vegetables, and, as a rule, are easily tamed. The common wombat, *Phascolomys wombat*, is found in South Australia, New South Wales, and Van Diemen's Land. The broad-fronted wombat, *P. latifrons*, is a native of South Australia. F. A. L.

Women's Rights: those rights which are denied to women because of their sex, and to secure which organized effort is being made, namely, equal political rights with men, involving equal recognition in the laws and constitutions, in colleges, trades, and professions; equal honor in the Church and the state; the same code of morals in social life. Those who are laboring in behalf of woman's rights demand that there shall be no limitations to her sphere of action. Whatever she has the desire and capacity to do, she must be free to do. Men and women have the same sphere in the universe of possibilities, though as individuals they may have different duties in that sphere. Woman asks to be subject to the laws of her being, and not to male authority—the assumptions and superstitions of the past.

The Matriarchate.—During the early centuries woman reigned supreme, the arbiter of her own destiny, the protector of her children, the builder of all there was of home-life, of religion, and of government. The mother was all-sufficient; family descent and property were in her line; man's relations were promiscuous—no one knew or cared who his father might be. Down to a late period woman sat in the councils of peace and war, and even at the dawn of Christianity, as priestess, she took part in religious ceremonies. Her motherhood compelled the use of all her powers, and made her the great factor in civilization. This period was called the Matriarchate, or mother age. Traces of it can be found in early Egyptian, Aryan, German, and Persian history, all through the Middle Ages, and among some uncivilized tribes and nations to-day.

The Patriarchate.—The transition to the patriarchate, or father age, was marked by force, violence, slavery, and wars for conquest. As soon as man assumed authority, woman's position, not only in the home, but also in the Church and the state, was the subject of constant dispute, whether the right to the throne could be in the female line, or whether, as priestess, she could administer the ordinances. The Salic law of France prevailed in some countries, in others the more liberal policy of England. But all through the patriarchate women have retained some recognition in the laws and customs of continental Europe. The Roman civil law was in some points favorable to woman until touched by the icy fingers of the canon law, out of which grew the old common law of our Saxon fathers. Charles Kingsley said, "This will never be a good world for women until the last remnant of the canon law is swept from the face of the earth."

Under the common law of England the right of suffrage was a franchise attached to a freehold, and women as well as men were "freeholders." As far back as the time of William the Conqueror women were enrolled among the inhabitants as "householders" who were "burgesses" or voters. Down to the seventeenth century women voted for members of Parliament, and in earlier centuries sat in the councils of the state and Church as members. The right of women to the franchise was verified many times by the courts. Judge Charles B. Waite, of Chicago, says: "Of fourteen authors whom I have consulted, who have written treatises on the election laws of England, four only express

any doubt as to the common-law right of women to vote for members of Parliament." Women not only voted, but held important offices, as queen, queen regent, with power to declare war, high constable, keeper of the seal, member of Parliament, and other offices—some of which they hold today. They have always had some form of representation, as property-holders, in most European countries, the *feme sole* (widows and spinsters) voting in person, the *feme covert* (married women) voting by proxy, the husband casting one vote for himself and another for his wife. Thus the principle of woman suffrage has all along been recognized in most civilized nations.

Adverse Legislation in the United States.—The common law of England was brought to New England by the colonists of 1620. The word "male" was not found in any of the constitutions of the original thirteen States. Voters were designated as "persons," "freeholders," "inhabitants," "freemen," and, following English precedent, women voted. New York was the first State to narrow her constitution by inserting the word "male" (1778). Massachusetts followed (1780). The last States to make the change were Rhode Island (1842) and New Jersey (1844). If women had not exercised their right to vote during two hundred years, why was it necessary to introduce the word "male" at all? Many publicists still hold that they were disfranchised then only by implication. It is remarkable that a nation claiming to be a republic, based on universal suffrage, should be the first to deny representation to one-half the people on the ground of sex. Whether a majority of women voted or not when they had the right does not affect the question from a legal standpoint. Political rights are not lost by *non user*. In some of the Southern States Negro men do not vote, yet no one doubts their legal right.

Efforts made to secure Equal Suffrage.—From the foundation of governments there have been women in all countries who understood their political status. In more recent times Mercy Otis Warren and Abigail Smith Adams, of Massachusetts, and Hannah Lee Corbin, of Virginia, made their protests against the exclusion of women from representation in the new republic (1776). Madame Roland and Madame de Staël's political utterances in the French Revolution, Mary Wollstonecraft's *Vindication of the Rights of Women*, Frances Wright's lectures on *Political Equality*, both in England and America; and later Harriet Martineau's writings on *Political Economy* in England, Margaret Fuller's *Woman in the Nineteenth Century*, Judge Hurlburt's *Human Rights* in the U. S., Madame Anneke's influence in the German revolution, the novels of George Sand, Charlotte Brontë, Frederika Bremer, and Elizabeth Barrett Browning's *Aurora Leigh*—all prepared the way for the general uprising of women in all civilized countries.

The first organized effort made by women to recover their ancient rights was in the U. S. In 1848 Lucretia Mott and Elizabeth Cady Stanton called conventions in Seneca Falls and Rochester, N. Y. Strong resolutions and a "declaration of rights" were adopted, which were extensively noticed, denounced by the pulpit, and ridiculed by the press. These conventions were speedily followed by others in Ohio, Indiana, Massachusetts, and Pennsylvania, all making the same demands for political rights, for equal advantages of education, and for equal place and equal pay in the trades and professions. In 1850 a national committee was formed—Paulina Wright Davis, president; Lucy Stone, secretary; Wendell Phillips, treasurer—which called conventions in the different States until 1866, when the national association was organized.

Favorable Legislation.—New York was also the first State to legislate on the question. A bill introduced by Judge Hurlburt in 1837 for the property rights of married women aroused general discussion. John Savage, chief justice of the Supreme Court, and John C. Spencer, one of the revisers of the statute laws of the State, assisted in framing the bill, which became a law in 1848. While this bill was pending Ernestine L. Rose and others circulated petitions through the State. Pennsylvania enacted a similar law in the same year, and the other States soon followed. During all these early years *The New York Tribune*, edited by Horace Greeley, was the only metropolitan paper that gave the question a fair hearing.

Legislation thus far had been confined to the several States, but in 1866 national action was demanded. The civil war, the emancipation of the slaves, and the reconstruction of the Southern States involved prolonged discussions, resulting in the thirteenth, fourteenth, and fif-

teenth amendments to the Constitution, under which it was claimed that women, as well as the slaves, were enfranchised. This being the opinion of able jurists, the national association sent a petition with 80,000 signatures to Congress, on which Hon. William Loughridge, of Iowa, and Hon. Benjamin F. Butler, of Massachusetts, made a minority report, asserting woman's right to vote under the fourteenth amendment. With this view Virginia L. Minor, of Missouri, who tried to register and was denied, sued the inspectors, while Susan B. Anthony, of New York, who registered and voted, was arrested, tried, and fined. The result of this denial by Congress and the Supreme Court was the demand for a sixteenth amendment forbidding disfranchisement on the ground of sex. Washington thus became the center for national conventions, and congressional legislation the future demand. An amendment to the national Constitution adopted by the legislatures of three-fourths of the States is the most speedy way to secure woman's enfranchisement. The national association has held annual conventions in Washington from 1869 to 1895, with hearings before congressional committees, whose minority and majority reports with the arguments of the women have been published by Congress, franked by members, and sent broadcast throughout the Union.

While demanding national action, much liberal legislation has been secured in the States. Propositions to amend their constitutions have been submitted by nine different legislatures—Kansas, 1867; Michigan, 1874; Colorado and Minnesota, 1877; Nebraska, 1882; Oregon, 1884; Rhode Island, 1886; Washington, 1889; South Dakota, 1890; and in Kansas again 1894—all of which were lost. During these years school suffrage has been granted by the legislatures of twenty-five States, municipal suffrage in Kansas (1887), and full suffrage in Wyoming (1869); and by popular vote full suffrage in Colorado (1893) and in Utah (1895).

In 1894 a constitutional convention was held in New York which aroused deep interest throughout the State and among a class of women who hitherto had taken no part in the movement. The result of their efforts was a petition containing 625,000 names asking for an amendment to the Constitution, striking the word "male" from Section I., Article 2, and thereby securing to women the right to vote on equal terms with men. The majority of the members not having thought on the subject, knew nothing of its merits, and a considerable number of women who were opposed to the movement protested against the enfranchisement of their sex, and did what they could to prevent it. The amendment was lost by a vote of 97 to 58.

Agitation in Great Britain.—Soon after the agitation began in the U. S. it started in England. *The New York Tribune*, containing a full report of the first convention in Massachusetts (1850), fell into the hands of Mrs. Taylor, the future wife of John Stuart Mill, and inspired her able essay in the *Westminster Review* on the enfranchisement of woman. This roused Mr. Mill to thought on the question. In 1867 in the House of Commons he moved an amendment to the Household Suffrage Bill to strike out the word "man" and substitute "person." He presented petitions from distinguished men and women, made an able argument, and secured 81 votes. Though the word "man" was retained in the Reform Acts of 1867-68, English women claimed their right to vote under them. In Manchester alone 5,345 women householders tried to register, but the courts decided against them. In 1869, by a motion of Jacob Bright, the ancient right of women householders to vote at municipal elections was restored. In 1882 Dr. Cameron carried a similar measure for the women of Scotland. In 1870 William E. Forster carried an educational bill which empowered women householders to vote at school board elections and to act as members of school boards. In 1883 the Married Women's Property Bill was passed, the result of the untiring efforts of Mr. and Mrs. Jacob Bright. In 1888 the County Council Franchise Bill became a law, which extended the suffrage to another large class of women. Since 1866 the agitation has been sustained by a central committee in London, with auxiliaries throughout the three kingdoms. Mammoth meetings have been held and petitions circulated. The largest (1874) contained 445,564 signatures. Women now (1895) in Great Britain vote for all officers except members of Parliament, and many women are elected on school boards and as poor-law guardians. Throughout Ireland they vote for poor-law guardians, in the seaport towns for harbor boards, and in the city of Belfast for municipal officers.

Political Rights enjoyed in other Countries.—In the provinces of Canada, Cape of Good Hope, Australia, the presidencies of Madras, Bombay, and other British colonies, women householders vote at all municipal elections. In the Isle of Man women gained full suffrage in 1881, in New Zealand in 1893, and in South Australia in 1895. In Russia women who are heads of families vote for all elective officers and on all local questions. In Asiatic Russia, wherever there is a Russian colony, the *mir* or self-governing village obtains and women householders vote. In Finland, Sweden, and Denmark they vote for all officers except members of parliament. In Norway women have school suffrage. In Austria-Hungary they vote (by proxy) at all elections, including those for members of provincial and imperial parliaments. In Italy widows vote (by proxy) for members of parliament. In Croatia and Dalmatia women vote at all elections in person. In France the women teachers elect women on the boards of education. At every change of dynasty in France there have been propositions to extend political rights to women. Though many able advocates, such as Condorcet, Legouvé, and Dumas, have pressed their claims they have been persistently ignored.

Thus far the discussion has been confined to woman's political status, because on that depends the recognition of all her civil rights. With the suffrage all the opportunities of life are available. Colleges and universities closed to girls were open to boys because they were prospective heirs in the Government, while all of woman's disabilities grew out of her disfranchisement. Her position in the industrial world was essentially changed by the introduction of machinery, emancipating her from the dependence of home life and giving a monied value to her labor. This taste of financial freedom gave women new confidence, and they began to establish themselves in business of their own as milliners, dressmakers, merchants, manufacturers, bankers, farmers, horticulturists, and owners of vessels. In addition to the higher position in the industrial world, women soon fitted themselves for a place in the professions by the study of art, science, literature, philosophy, and political economy in seminaries founded for girls and in colleges opened for coeducation. They are now teachers in the public schools, professors in colleges, public lecturers on civil and parliamentary law, popular lyceum speakers, and most efficient organizers in the charities and the churches.

In 1876, the year of the Centennial celebration in the U. S., the supporters of suffrage reform were especially active. A protest against eulging the Centennial a celebration of the people while one-half were denied all representation was issued by the Washington convention of that year and presented to Congress. The national association issued a declaration of rights, which was presented before a great assembly in Independence Square.

The first International Council of Women, held in Washington, D. C., 1888, was called and conducted by the National Suffrage Association—Elizabeth Cady Stanton, president—at a cost of \$13,000. This brought together women from every civilized country engaged in every variety of public work. The convocation continued through eight days. An international council was organized to meet once in five years, and a national council to meet once in three years. The most remarkable feature of the World's Columbian Exposition in Chicago (1893) was the responsible position assigned to women in its administration. Congress appointed a "board of lady managers" and made an appropriation of \$300,000, to be used at their discretion in the different departments of woman's exhibits; women were also appointed on the general committees, and served with men as judges of awards. Of all the great assemblies in the Art Palace (1893) the most wonderful was the "congress of representative women," to which all civilized nations sent delegates, and in which all questions involving the interests of domestic as well as public life were freely discussed during eight consecutive days. The many rights already conceded herald the dawn of a new civilization in which woman, as the chief factor in the development of the race, must be crowned with new dignity, honor, and power in the government. We have passed through the matriarchate, and are now approaching the close of the patriarchate, gathering our forces for another step in progress, which will bring us to the amphiarcliate, the combined rule of man and woman.

ELIZABETH CADY STANTON, SUSAN B. ANTHONY.

Wonders, SEVEN: See SEVEN WONDERS OF THE WORLD.

Wood [M. Eng. *woode*, *wude* < O. Eng. *wudu*, *wiodu*; O. II. Germ. *witu*; Icel. *víðr*]; the hard and compact or tough and fibrous parts of higher plants, chiefly composed of fibrous and vascular tissue. It is found in the stems and roots, while those woody fibers which are obtained from the inner bark of dicotyledonous plants or from the midrib and veins of the leaves of monocotyledons, and which are so valuable in the arts, are not, strictly speaking, wood. Annual plants usually contain little woody fiber; they are chiefly composed of parenchymatous tissue, which also forms the great part of many herbaceous perennials and of all plants in a very young state. Wood is valuable not only as timber and fuel, being in many parts of the world the chief, if not the only, fuel, but to the woody fiber we are also indebted for cordage, many textile fabrics, etc., and, reduced to pulp, it is used for the manufacture of paper. A kind of factitious or artificial wood used for making ornamental articles was invented in France, and is known under the name of *bois duré*. It is formed of sawdust heated to a high temperature and subjected to a very great pressure. Its compactness and hardness exceed those of wood itself. See FIBER; FORESTRY; FUEL; HISTOLOGY, VEGETABLE; PRESERVATION OF TIMBER, and TIMBER AND TIMBER TREES.

Revised by CHARLES E. BESSEY.

Wood, or à Wood, ANTHONY: antiquarian; b. at Oxford, England, Dec. 17, 1632; studied at Merton College, Oxford; took his degree 1652; devoted most of his life to the collection of data illustrative of the history of Oxford University. D. at Oxford, Nov. 29, 1695. He was the author of *Historia et Antiquitates Universitatis Oxoniensis* (2 vols. folio, 1674), being a translation from Wood's original *History and Antiquities of the University of Oxford*, which appeared in 5 vols., 1786-96, and of *Athene Oxonienses: an Exact History of all the Writers and Bishops who have had their Education in the Most Ancient and Famous University of Oxford, 1500-1695, with the Fasti or Annals of the said University* (2 vols. folio, 1691-92). For his strictures on the Earl of Clarendon, Wood was expelled from the university and his book burned shortly after its publication. A second edition, with 500 new *Lives*, was edited by Tonson (2 vols., 1721), and a third edition was carefully superintended, with extensive *Additions and a Continuation*, by Rev. Philip Bliss, D. C. L., fellow of St. John's College, Oxford (4 vols., 1813-20). A fourth edition was projected by the short-lived Eccelesiastical History Society, and for it Dr. Bliss wrote vol. 1, embracing the *Life of Wood* (1848), but the project was not further carried out, though abundant materials were left by the editor to the Bodleian Library. Wood's *Life and Times, described by Himself*, first published 1730, was edited by Andrew Clark for the Oxford Historical Society, and published at Oxford (5 vols., 1891-95). His *State of the City of Oxford* (1773), by the same editor, appeared (3 vols., 1889-95) under the same auspices.

Revised by S. M. JACKSON.

Wood, DE VOLSON, A. M.: engineer; b. at Smyrna, N. Y., June 1, 1832; graduated at the State Normal School, Albany, 1853; taught mathematics in that institution 1854-55; graduated at the Rensselaer Polytechnic Institute, Troy, 1857; was Professor of Civil Engineering in the University of Michigan 1857-72; from 1872 to 1885 Professor of Mathematics and Mechanics in the Stevens Institute of Technology, Hoboken, N. J.; since 1885 has been Professor of Engineering in the same institution; inventor of a steam-pump, a steam or pneumatic rock-drill, air-compressor, etc.; brought out revised editions of Mahan's *Civil Engineering* and of Magnus's *Lessons in Elementary Mechanics*; furnished many articles on engineering and on mathematical subjects to the *Journal of the Franklin Institute* and other periodicals; and is author of *A New System of Alligation* and of treatises on *The Resistance of Materials, Bridges and Roofs, Elements of Analytical Mechanics, Elementary Mechanics, Co-ordinate Geometry, Trigonometry, Thermodynamics, Reaction Motors*, etc.

Wood, ELEAZER DERBY: soldier; b. in New York in 1783; graduated at the U. S. Military Academy Oct. 30, 1806, and appointed a second lieutenant in the Corps of Engineers; assisted in the construction of Castle Williams, Governor's Island, N. Y., and of Fort Norfolk, Va. During the war with Great Britain he served with Gen. Harrison's Northwestern army during the memorable siege of Fort Meigs, where he conducted the defense, and was engaged in the sortie of May 5, 1813; was in command of the artillery at the battle of the Thames Oct. 5. Transferred to the Northern army in 1814, he was engaged in all the events of that campaign, including the capture of Fort Erie July 3, the battle of Chippewa July 5, and that of Niagara, or Lundy's Lane, July 25. In the repulse of the assault on Fort Erie Aug. 15, Col. Wood led the Twenty-first regiment of infantry, and in the sortie of Sept. 13, 1814, he fell almost at the outset at the head of a column of which he was in command. For distinguished services in the defense of Fort Meigs he was breveted major, and lieutenant-colonel for gallantry in the battle of Niagara. His commanding general (Brown) erected a monument to his memory at West Point.

Wood, ELLEN (Price), better known as Mrs. HENRY WOOD: novelist; b. at Worcester, England, Jan. 17, 1814; lived many years in France; contributed to many periodicals. She became editor of the *Argosy* magazine in 1867; published upward of thirty popular novels, among which are *East Lynne* (1861); *The Channings* (1862); *The Shadow of Ashlydyat* and *Verner's Pride* (1863); *Johnny Ludlow stories* (1874, 1880); *Count Netherleigh* (1881); and *About Ourselves* (1883). D. Feb. 10, 1887.

Wood, GEORGE BACON, M. D., LL. D.: physician and author; b. at Greenwich, N. J., Mar. 13, 1797; graduated at the University of Pennsylvania 1815, and at its medical school in 1818; was Professor of Chemistry in the Philadelphia College of Pharmacy 1822-31, and of *Materia Medica* 1831-35; professor of the same branch in the University of Pennsylvania 1835-50, and of Theory and Practice of Medicine 1850-60; was physician in the Pennsylvania Hospital 1835-59; became president of the American Philosophical Society 1859; was long president of the College of Physicians of Philadelphia, and in 1865 endowed an auxiliary faculty of medicine in the University of Pennsylvania. He was the author of *A Treatise on the Practice of Medicine* (2 vols., 1847; 5th ed. 1858); *Therapeutics and Pharmacology* (2 vols., 1856; 3d ed. 1868); and *Lectures and Addresses on Medical Subjects* (1859). With Dr. Franklin Baeffe he prepared *The Dispensatory of the United States* (Philadelphia, 1833; 13th ed. 1870). D. in Philadelphia, Mar. 30, 1879. Revised by S. T. ARMSTRONG.

Wood, Mrs. HENRY: See WOOD, ELLEN (Price).

Wood, Gen. Sir HENRY EVELYN: soldier; b. at Cressing, England, Feb. 9, 1838; entered the navy 1852; about 1856 entered the army in which he served with distinction in the Indian mutiny, the Ashantee, Zulu, and Transvaal wars; commanded the second brigade in the Egyptian expedition of 1882; commander-in-chief of the Egyptian army Dec., 1882; commanded the line of communication in the Nile expedition 1884-85; since 1886 has held home appointments and was appointed quartermaster-general to the forces in 1893. See the *Life* by Charles Williams (1892).

Wood, HORATIO C., M. D., LL. D. (Yale): physician and author; b. in Philadelphia, Pa., Jan. 13, 1841; graduated in medicine at the University of Pennsylvania 1862, and became Professor of Medical Botany and afterward of Therapeutics; also Clinical Professor of Diseases of the Nervous System in that institution. He is the author of numerous papers on myriapods, *Scorpionida*, *Phalangida*, botany of the coal periods, and on fresh-water Algae in the *Proceedings* and the *Transactions* of the Academy of Natural Sciences of Philadelphia, of the American Philosophical Society, and of the Essex Institute; also of *The Fresh-water Algae of North America* in the *Smithsonian Contributions to Knowledge* (1873), of numerous original physiological and clinical investigations upon Indian hemp, nitrite of amyl, *Veratrum viride*, hyoscyne, ergot, chorea, the pneumogastric nerves, etc., in the *Proceedings* of the American Philosophical Society, and in the medical journals of the U. S., England, Germany, and France; gained various prizes for original research, among them the Boylston prize by his *Essay on Thermic Fever or Sunstroke* (Philadelphia, 1872), and has published *A Treatise on Physiological Therapeutics* (1874; 9th ed. 1894); *A Study of Fever* (1875) in the Smith-

sonian *Miscellaneous Collections*; also *Nervous Diseases and their Diagnosis* (Philadelphia, 1887); has been chief editor of the *United States Dispensatory*, 15th, 16th, and 17th editions. Revised by S. T. ARMSTRONG.

Wood, JOHN GEORGE, F. L. S.: writer on natural history; b. in London, England, in 1827; educated at Ashbourne grammar school; became Jackson scholar at Merton College, Oxford; graduated 1848; was attached for two years to the anatomical museum at Christ Church, Oxford; took orders in the Church of England 1852; became chaplain to the Boatman's floating chapel, Oxford; was assistant chaplain to St. Bartholomew's Hospital, London, 1856-62; was examiner for the natural history university prize at Oxford 1855-57, and became in 1868 precentor of Canterbury diocesan choral union; was author or editor of numerous popular works on all the branches of natural history, many of them written for children; was editor of *The Boy's Own Magazine* and *Every Boy's Magazine*, and contributor to several prominent periodicals. His most important works are *The Illustrated Natural History* (3 vols., 1859-63; new ed. 1865-66), with 1,500 original illustrations; *The Natural History of Man* (2 vols., 1868-70), richly illustrated; *A Popular Natural History* (1866); *Homes without Hands, being a Description of the Habitations of Animals* (1864-65); *Bible Animals* (1869); *The Modern Playmate: a Book of Games, etc.* (1870); *Man and Beasts, Here and Hereafter* (2 vols., 1874); *Horse and Man* (1886). D. at Coventry, Mar. 4, 1889. Revised by F. A. LUCAS.

Wood, THOMAS JEFFERSON: soldier; b. at Munfordsville, Ky., Sept. 25, 1823; graduated at U. S. Military Academy July 1, 1845; served in the Mexican war and on frontier duty in Texas 1849-55. Promoted to be major Mar. 16, lieutenant-colonel May 9, 1861, he was employed in organizing and mustering Indiana volunteers until Oct. 11, when appointed a brigadier-general of volunteers, and Nov. 12 attained the colonelcy of the Second U. S. Cavalry; commanded a division of the army of Gen. Buell in the second day's fight (Apr. 7, 1862) at Shiloh and at siege of Corinth; of the Army of the Ohio at Perryville; of the Army of the Cumberland at Murfreesboro, where wounded, and at Chickamauga; of the Fourth Corps at Missionary Ridge and march to Knoxville, and in the numerous battles in Sherman's Georgia campaign in 1864 from Dalton to Lovejoy's Station, Sept. 2, where severely wounded; took part in opposing Gen. Hood's advance into Tennessee; succeeded to the command of the Fourth Corps, which he led in the battle of Nashville and pursuit of Hood to the Tennessee river. For gallant conduct at Chickamauga he was breveted brigadier-general, and for Nashville major-general. He was placed on the retired list June 9, 1868, with rank of major-general, but by act of Congress of 1875 he was reduced to brigadier-general. Revised by JAMES MERCUR.

Wood, THOMAS WATERMAN: painter; b. in Montpelier, Vt., Nov. 12, 1823; studied painting with Chester Harding, and at a later time went to Europe for several years. In 1867 he took up his residence in New York. He was president of the American Water-color Society from 1878-87. The National Academy of Design received him as an associate in 1867, as an academician in 1871. He was elected vice-president in 1878 and president in 1889. Three of his pictures, *The Contraband*, *The Recruit*, and *The Veteran*, belong to the Metropolitan Museum of Art.

Woodbine: a name given in Europe to the honeysuckle, *Lonicera periclymenum*, and in the U. S. to the Virginia creeper. See HONEYSUCKLE and AMPELOPIS.

Woodbridge: township; Middlesex co., N. J.; on Staten Island Sound, and the Cent. of N. J. and the Penn. railways; 10 miles N. E. of New Brunswick, the county-seat, and 25 miles S. W. of New York, with which it has regular steamboat connection (for location, see map of New Jersey, ref. 3-D). It contains several villages, and has 5 churches, high school, public library, 3 weekly newspapers, large deposits of fire-clay, and fire-brick, tile, and drain-pipe works. Pop. (1880) 4,699; (1890) 4,665; (1895) 5,802.

EDITOR OF "SUN."

Woodbridge, WILLIAM: U. S. Senator; b. in Norwich, Conn., Aug. 20, 1780. His father was one of the earliest emigrants to the Northwest Territory, removing to Marietta, O., in 1791. The son received his earliest education in Connecticut; studied law at Litchfield, and was admitted to the bar in Ohio in 1806; in 1807 was elected to the Assembly; was prosecuting attorney for his county 1808-14, during

which period he was also a member of the State Senate; in 1814 received from President Madison the appointment of secretary of the Territory of Michigan, and removed to Detroit; in 1819 was elected the first delegate from Michigan to Congress; judge of the Supreme Court of Michigan Territory 1828-32; in 1835 was a member of the convention called to form a State constitution; in 1837 was elected to the State Senate of Michigan; in 1839 was chosen Governor of the State; was Senator in Congress 1841-47. For many years before his death he lived at Detroit. D. Oct. 20, 1861.

Woodbury: town (named in 1674); Litchfield co., Conn.: on the Pomperaug river, and the N. Y., N. H. and Hart. Railroad; 12 miles W. of Waterbury, 25 miles N. W. of New Haven (for location, see map of Connecticut, ref. 9-E). It contains the villages of Woodbury, North Woodbury, Hotchkissville, and Minortown; has a savings-bank, Parker Academy, a weekly newspaper, and manufactures of woollen goods, cutlery, powder-flasks, and shot-pouches. In 1894 it had a grand list of \$898,938. Pop. (1880) 2,149; (1890) 1,815. EDITOR OF "REPORTER."

Woodbury: city (chartered in 1871); capital of Gloucester co., N. J.; on the Del. River and the West. Jersey rail-ways; 8 miles S. of Philadelphia (for location, see map of New Jersey, ref. 6-B). It contains 6 churches, 3 public schools, a widely known private school, public library with 5,000 volumes, and 2 national banks with combined capital of \$200,000, and has a monthly and 3 weekly periodicals. The city has gas and electric-light plants, water-works, and manufactories of chemicals, glass, and pianos. It is connected with Philadelphia by steam and trolley lines, and is an important shipping-point for fruit, berries, and vegetables. Pop. (1880) 2,298; (1890) 3,911; (1895) State census, 3,853.

EDITOR OF "GLOUCESTER COUNTY DEMOCRAT."

Woodbury, DANIEL PHINEAS: soldier and engineer; b. at New London, N. H., Dec. 16, 1812; graduated at U. S. Military Academy July 1, 1836, appointed second lieutenant of artillery. Soon after transferred to the engineers, he was promoted captain 1853 and major 1861. At the outbreak of the civil war, he was assigned to duty under Gen. John G. Barnard, and became henceforth associated in the arduous duties involved in providing for the defense of the capital and in the engineering organization of the Army of the Potomac. As commander of the brigade of engineers he had immediate control of a large portion of the engineering operations in the siege of Yorktown and subsequent operations before Richmond. In the memorable "Seven Days," and more especially in the engineering works by which the army was able to cross the White Oak Swamp and move to the James river, Gen. Woodbury rendered conspicuous services. At the unfortunate battle of Fredericksburg his personal gallantry in throwing bridges across the Rappahannock won him the brevet of brigadier-general. Detailed for the important command at Key West Mar. 16, 1863, he fell a victim to the yellow fever Aug. 15, 1864.

Woodbury, GEORGE EDWARD: author; b. at Beverly, Mass., May 12, 1855; graduated at Harvard College in 1877; was Professor of English Literature in the Nebraska State University in 1877-78 and 1880-82, and was appointed to a similar position in Columbia College, New York, in 1892. Besides many papers in reviews and magazines, he has written a *History of Wood Engraving* (1883); *Life of Edgar Allan Poe* (1885); and *The North Shore Watch and other Poems* (1890). In 1894 he published an edition of Shelley, and in 1895 an edition of Poe, in collaboration with E. C. Stedman.

HENRY A. BEERS.

Woodbury, LEVI: jurist; b. at Francistown, N. H., Dec. 22, 1789; graduated at Dartmouth College with the highest honors of the class in 1809; was admitted to the bar, and began the practice of the law in his native town in 1812. He was an earnest Democrat, and zealously supported the war against Great Britain. In 1816 he was appointed a judge of the Supreme Court of the State; in 1823 was elected Governor; in 1825 was elected Speaker of the House of Representatives of the State, and to the Senate of the U. S.; in May, 1831, was appointed Secretary of the Navy, and in 1834 Secretary of the Treasury, by President Jackson, and remained in the last-named office till the close of President Van Buren's administration in 1841, when he was again elected to the Senate of the U. S. In 1845 he declined the mission to England, and was appointed a justice of the Supreme Court of the U. S., and held that office until his

death, which occurred at Portsmouth, N. H., Sept. 4, 1851. At the time of his death he was the candidate for the presidency upon whom all factions of his party had agreed.

Wood-carving: sculpture in wood. Many kinds of wood afford excellent material for sculpture. Some hard and close-grained woods, such as box, holly, mahogany, pear, linden, and those of several Oriental trees, are fit for the most minute and delicate carving, whether in relief or in the round. Except on a small scale it is not necessary to seek for woods having an exceptionally fine grain. It is often found that the grain adds a charm to the work—not merely the lines of the veining, as in the case of ivory, but even the open pores as they are cut across at different angles. Thus of all woods oak has been the most employed since the tenth century for all kinds of sculpture, and there is no wood so fit for it and so beautiful, as is shown in the stalls and confessionals of hundreds of churches throughout Europe; but oak, with all its tenacity, its beautiful grain, and the patina it takes from time and wear is a very open-grained wood. Chestnut is excellent, and is much used for coarser work. Walnut has been much used, especially for carved furniture and the like, and in the south of Europe. Sycamore wood, the use of which for large pieces of sculpture is traditional in Europe from the earliest times, seems to have been but little employed in the Middle Ages. The wood of the ancient acacia of some varieties is recognized as having been employed in important sculptures of the earliest times. It is to be remembered that the beauty of the wood when finished was less thought of because sculpture in wood, like that of stone, was generally covered with painting and often in parts gilded. Wood-carving in monumental tombs, in church fittings, and in elaborate furniture was indeed painted in bright colors down to the seventeenth century.

Wood that is to be used for artistical carving should receive a special treatment fitting it for its purpose and adding to its durability. One expedient much used in ancient times was smoking in wood smoke. This, of course, was not used until the wood was well seasoned. It is a custom, still observed in the few cases where delicate carving is to be done, to glue pieces of paper upon the ends of the piece of wood and covering the end grain; such wood may then be thoroughly dried even in hot rooms, without checking, the drying out of the sap taking place equally along the whole length of the wood and not rapidly at the ends. Most workmen of the best class have secrets for the preparation of wood; but the cost of fine work has become so great in modern times that it is very rare that a cabinet or a similar piece of furniture is undertaken with every precaution for the highest excellence of material and artistic completeness.

The soft wood of the common coniferous trees lends itself well to carving on a large scale, and is particularly good for out-of-door work which is to be painted. These woods might equally well be used even where the surface is not to be painted, as may be seen in the curved and pierced panels of Japanese temples and dwelling-houses. Some of those panels are 3 inches or more thick, and are carved in animal and vegetable forms and with legendary subjects, even involving the suggestion of landscape with mountains and clouds, the carving being carried deep into the wood so that parts of it are pierced through. The domestic architecture of India includes a great deal of effective wood-carving, the pieces being often very large and covered with minute flower and leaf sculpture. In this Indian work carving is used in excess, all parts being equally covered with it. It is frequently painted in rich colors, but apparently rather for ornament than for preservation.

The earliest piece of wood-carving which we know is also perhaps the earliest piece of sculpture known. This is the celebrated Egyptian statue called the Sheikh-el-Beled or "village chief," so named by the natives when first discovered—the life-size statue of a short and stout man, apparently of sycamore wood, and dating from an epoch about 4,000 years B. C. A few other large pieces of Egyptian sculpture in wood are preserved, especially in the Boulak Museum, now removed to Gizeh. Wood-carving of the Greeks is not known, but it is certain that many of the sacred statues, regarded with great veneration throughout classical antiquity, were of wood. The type of the earliest stone statues seems to be that of the primitive wooden ones, and the term *xoanon* has been applied to the lost wooden prototype and the earliest stone copy alike. Classical Roman sculpture in wood has also perished. There is, in fact, little hope of finding well-preserved wooden articles in tombs or

otherwise buried in a climate and soil less dry than those of Egypt. The doors of the Church of St. Sabina at Rome have been thought to date from the fifth or sixth century, but this theory is now abandoned.

It is with the later Middle Ages that the finest wood-carving is associated. The stalls and other fittings of the choir in the Church of Ratzeburg, near Lubeck, those in Notre Dame de la Roche, near Paris, those of the Cathedral of Auch, and especially those of the Cathedral of Amiens, are specimens of the most admirable detailed carving of men and animals, foliage and the like, all combined in a semi-architectural design of great dignity and importance. The stalls were often crowned by high Gothic canopies, with tracery, gables, and pinnacles. The bishop's chair and the reading-desk are parts upon which a great deal of detail was lavished. The carving of the arms of the stalls, the *miserere-cordes* or *misereres* under the seats and frequently of the ends of the benches, is often rich and varied, with incidents and character studies of wonderful vigor and truth of interpretation.

Larger carvings were used for the wooden structural parts of churches and other buildings. Of these almost nothing remains except the English open timber roofs; and the ends of the hammer-beams in Westminster Hall, carved into angels holding shields, are good instances of the kind of work which was put upon such architectural members.

The portable furniture of the same epoch, French, German, Italian, and English, though but few pieces remain, gives us an excellent example of elaborate carving used for the adornment of the simplest and most natural forms. The furniture-makers of the Middle Ages used only very simple methods of putting together the parts of their benches and tables, but decorated the members by skillful cutting away of the wood in picturesque curves where comparative thickness was not needed, and by carving of leafage and animals wherever their forms could be introduced as part of the general design. (See FURNITURE.) Wood-carving was used also for images of the sacred personages of Christian theology, both small and portable, and of large size in connection with the altar, the rood screen, etc.

The mediæval forms of church fittings were retained after the close of the epoch of Gothic architecture. The churches of the Renaissance and of the seventeenth century were fitted up with stalls, thrones, singing-desks, and the like, as elaborate as those of the Middle Ages, but of a different style. In the Church of Sta. Maria in Organo, in Verona, is an elaborate candelabrum, 15 feet high, for the Pascal candle; a reading-desk arranged with a double-revolving support for the service-book, and mounted on a pillar which rests upon a large base serving as a cupboard for the storage of sacred articles; and choir-stalls of great beauty. All these are of walnut, and although much of the decoration is *intarsiatura*, or inlaying of one wood in another (see INLAYING), many parts of the structure are elaborately carved. This is ascribed to Fra Giovanni da Verona, and is certainly of the years from 1480 to 1510. The stalls of Sta. Maria Gloriosa dei Frari at Venice are of the same epoch, though they retain a Gothic feeling in some of their details; those of the Church of S. Zaccaria and of S. Stefano, both in Venice, St. Francis of Assisi, and of the Cathedral of Sienna contain wood-carving of the time of the Renaissance. In like manner the Cathedral of Notre Dame in Paris contains in the choir some beautiful wood-carving of the time of Louis XIV. The churches of Belgium contain high wainscoting and partitions of oak of the sixteenth and seventeenth centuries, decorated with twisted columns with elaborately carved capitals and bases. In connection with these, confessionals, which structures were not treated as separate compositions in the Middle Ages, were made a part of the general design and often the most prominent feature in it. The pulpits in some of the churches in Belgium are of excessive richness, with statues and groups representing biblical scenes, the carving being not confined to the decoration of the surfaces of the structure, but free of it and occupying a large span on the floor. These extraordinary pulpits are of the eighteenth century, and represent a low ebb of taste in spite of their extreme richness and the evident skill of the workmen.

In all the times and places of a free use of wood-carving, the art grows to be familiar and the mechanical process easy and rapid beyond the conception of those who have only seen it done to order in an inartistic and commercial community. Thus in cities of France, where old traditions still partly remain undisturbed, very interesting and spirited

carving in oak is done at a price surprisingly low, and yet done by men who are well-to-do citizens earning a good living. Some of these men have also a considerable knowledge of certain styles of art, and can do "Louis XIII." or "Louis XV." work without special study or preparation. In all this work it is noticeable how simply it is done; how few cuts, how few minutes have gone to the shaping of a leaf or a bunch of leaves. At present and especially in the U. S. the demand is generally restricted to very delicate and highly finished work. Moreover, there are fewer competent wood-carvers in a great city like New York than there are in many a French town of one-twentieth its size. RUSSELL STURGIS.

Woodchat: the *Lanius rutilus*, a shrike of the Old World which has a very wide geographical range. In South Africa it is called "magistrate bird," from its habit of impaling and hanging its victims. In some systematic treatises it is named *Enneoctonus rufus*, the "red nine-killer," from the belief that it kills nine victims before it begins to eat.

Woodchuck, or Ground-hog: the *Arctomys monax*, a large rodent mammal of North America, quite common in the eastern portions. It is about 18 inches long, and has a grizzled reddish-brown fur, which has a limited industrial use. The creature is very prolific, eats clover, young cabbages, and beans, hibernates in cold weather, and is sometimes used for food. It digs a deep burrow. See SCIRRIDÆ. Revised by F. A. Lucas.

Woodcock: either of two different game-birds of the snipe family. The European woodcock (*Scolopax rusticola*, Linn.) ranges over the Eastern continent from Japan to the British isles, and attains a length of 14 inches, while the American bird (*Philohela minor*, Gray), which attains only 11 inches, is found abundantly in the Northern U. S. and in Canada. The plumage is a warm brown with gray and black markings. The eye is placed high up toward the hinder part of the head. Both are highly prized by epicures for the delicacy of their flesh. The food of the woodcock consists mostly of worms, which it obtains with extraordinary skill, thrusting its beak as far as the nostrils into the soft, moist earth. A tame woodcock has been seen to probe large turfs with its bill, and to draw out a worm at every thrust of the long slender beak. It is thought that the sense of smell enables the bird to discover the worms beneath the surface. It moves about chiefly on misty days, and is said by experienced woodcock-shooters to prefer the northern side of a hill to the southern. It is a very silent bird, seldom uttering a cry except when first starting for its feeding-places, and hardly ever crying when flushed. The flight of the woodcock is wonderfully swift, although the wings do not appear to move very fast. Revised by F. A. Lucas.

Wood-duck, or Summer-duck: the *Aix sponsa*, one of the most beautiful members of the family of *Anatidæ*, whose only congener is the still more beautiful mandarin duck (*Aix galericulata*) of China. Both of these have the bill shorter than the head, high at the base, where the upper lateral angle runs back much behind the lower edge, the nail very large and hooked, the lamella broad and distant, the nostrils very large and open, the wing-coverts nearly as long as the feathers, and the tail truncate at the tip. The wood-duck has the head green, glossed with purple, with a line from the upper corner of the bill, one from behind the eye, and two bars on the side of the head confluent with the chin, and upper part of throat white, the jugulum and tail at sides purple, the under parts white, the sides yellowish, banded with black, and subterminally with white, the speculum bluish green, the primaries silver white at tip, and the back uniform with various reflections. It is about 19 or 20 inches long. (*Baird*.) The species ranges over most of North America—in the warmer regions as a permanent resident, and in the northern as a summer migrant. It builds its nest generally in a hollow tree. Its eggs are smaller than a hen's, and have surfaces like polished ivory. It is generally seen in pairs, and rarely in flocks of more than three or four. It feeds chiefly on acorns, the seeds of wild oats, and insects. The flesh is tolerably good food.

Wood-engraving: the art of carving a smooth flat surface of wood in very low relief, so that a figure or pattern is left raised above the background no more than is sufficient to enable the whole to be used as a stamp or type for printing in ink upon paper. All other processes which might be called wood-engraving have disappeared, if they ever existed, and the use of the term is limited as above.

In the modern practice of Europe and America the wood is always boxwood, and it is cut across the grain, so that the engraver has end-grain to work upon; but in Europe before the seventh century, and in China and Japan, the wood is used in planks cut in the usual way. A drawing being made upon the surface of the wood, or transferred to that surface by photographic process, as in recent times, the engraver cuts away the parts left white and leaves the darks. If, now, the engraver is asked to follow exactly lines that are drawn for him, no discretion being left to him, he requires mere technical skill and neatness of hand. This seems to have been the case in the famous wood-engravings of the sixteenth century, those by Albert Dürer and others, mentioned below, and also generally in China and in Japan. When, however, the drawing has been made partly in tints, as in washes of India-ink and touches of white, the engraver has not a black line to leave standing while he cuts away around it, but a certain artistic effect to reproduce. Thus as the drawing offers him a surface of gray, darker in one part than in another, it is his duty to produce a similar effect by certain black lines or spots printed on white paper. He is compelled then to cut out such parts as in his judgment will leave the surface of the block such that ink printed from it on paper will produce the tint or the gradation needed. This is, of course, true artistic work. The artist is indeed a copyist or reproducer, but his duty is to copy in one art, viz., engraving, an effect produced by a very different art, viz., drawing with a lead pencil and camel's-hair brush. Such wood-engraving as this is recognized as a very admirable fine art, and prints taken from the blocks engraved in this way are valuable works of art, and are loved and bought at high prices and carefully preserved.

One important distinction is to be observed: the easiest and simplest way for a wood-engraver to work is to cut narrow grooves and little pits in the surface, which grooves and pits will come out white on a black ground when the impression is taken in ink on paper: the most difficult and the slowest way is to leave lines and points standing while he cuts away from around them. The latter must be the process used by the mere mechanical workman who follows the lines set down for him, because this is the only way of reproducing those lines on the paper; but the artist working freely will choose the former. A wood-engraver of ability, working as he pleases, will then consider his wooden surface as a solid black space, out of which he is to get his work of art, made up of different grays and blacks and whites. He will work then *in the white line*, as it is called, very much as a student would draw in white chalk on a blackboard, making a careful drawing of a statue or bas-relief, putting in the lights, and leaving the black or gray ground for the darks. This is the peculiarity of the work of Thomas Bewick, W. J. Linton, Timothy Cole, Gustav Kruell, and the other able men belonging to the school of which those artists are chiefs.

The Art in China and Japan.—It is generally thought that the Chinese were the first to use wooden blocks with figures in relief for printing. The device is so obvious, however, that any one who might wish for a stamp to use instead of a signature would be apt to employ it. It seems probable that the first artistic use of it was Oriental, and Oriental scholars generally assume that such artistic work was done in China as early as the eighth or ninth century of our era. It spread at a very early date to Japan and Corea and perhaps to other Eastern nations. Fine and artistic prints evidently made from wood blocks are known, the dates of which are fixed with some certainty as early as the fourteenth century A. D., but books printed from engraved blocks of wood are known to be much earlier. These block books of Chinese make, the syllabic characters of which are engraved with great care and delicacy, date from the tenth century A. D.; but these contain no illustrations. Japanese and Chinese wood-engraving of later dates is known to us by many excellent examples. Much of it is in outline, and the prints have been taken in black ink on white or nearly white paper, so that they appear like early European prints from wood blocks to have been intended for coloring by hand. The Japanese at an early date discovered a remarkable means to artistic effect in the free use of rather large patches of solid black. These black patches were, however, not the monotonous glossy silhouettes that they would be in European art. The peculiar paper used for the impressions and perhaps something in the grain of the wood caused the black surface to be filled with in-

nute striations, and gave it great diversity. What is called local color in black and white drawing or printing—that is, the representation of the strength of natural colors by darker and lighter modifications of black and white—is treated with great freedom in these woodcuts. Thus in a picture where the murder of the hero by spears is the chief subject, his blood in large patches is given in solid black, whereas in other prints of the same period black is kept for ceremonial caps and the glossy hair of the personages, the lower parts of the horses' legs, their manes and tails—in other words, for those parts which might easily be really black or very dark in nature. It is in color-printing, however, that the most extraordinary results have been reached in the Chinese and Japanese use of this art. It is late in its development, seeming not to have been in use before 1700 A. D., and is evidently imitated from the hand coloring of outline prints. The color is laid upon the block with great care and skill by hand, the gradations and breaking of the color being done upon the block and printed off at once upon the paper. Such prints resemble water-color drawings. They are of extraordinary merit, both expressional and decorative, and such prints when fine have been in eager demand in Europe and the U. S., though scarcely known to the West before 1875, the finest examples much more recently.

In Europe.—Wood-engraving in the West begins in the fifteenth century. Cuts dated 1423 and 1418 have been thought the earliest artistic work, but a still earlier date has probably been established by Henri de Laborde. It is generally held that the first European wood-engraving was in Block Books (*q. v.*), which would have preceded the purely artistic compositions made for separate printing; but Léon de Laborde has given excellent reasons for his belief that the earliest relief engraving for artistic purposes was done upon metal. It is certain, however, that block books exist which are as early as the beginning of the fifteenth century. Rude illustrations appear in these at a very early date, and the next step to be taken would seem to be obvious and inevitable. Before the close of the fifteenth century woodcuts had been engraved in Italy, the prints from which exist in abundance and are of great beauty. They are generally in pure outline and of small size. They illustrate such books as early editions of Dante, the *Letters of St. Jerome* (1497), *Ovid's Metamorphoses* (1497), a translation of Vegetius's *Art of War* (1496), and the celebrated *Hyperboreia* of Francisco Colonna (1499). By the middle of the sixteenth century wood-engravings of an elaborate kind were being produced in Germany and France as well as in Italy. Some of these are very large. The engravings in Albert Dürer's *Apocalypse*, which were published early in the sixteenth century, those of the *Life of the Virgin*, and those of the *Greater Passion*, as it is called, are all large, the prints of the last-named series about 11 by 15 inches. Prints as large appear in books of this period. Artists such as Lucas Cranach, Hans Schaufelin, and Hans Burgkmaier made the drawings for them, and it is often claimed for them, but probably without sufficient reason, that these artists engraved the blocks themselves.

The large prints from wood-engravings published in the sixteenth century were commonly, but not always, parts of books. Sometimes the title-page of a book not otherwise illustrated would be adorned with a rich border and ornamental lettering and coats-of-arms. Sometimes a frontispiece would be inserted opposite the title-page. The *printer's mark*—that is, the device or emblem of the printer and publisher—was often a decorative composition or a figure-subject with an ornamental border and a motto, and this print would come upon the title-page or at the close of the volume or elsewhere. Often, however, the book would be full of illustrations either of the full size of the page or inserted in the text. Thus the *Schatzbehälter*, a book of devotion printed in Nuremberg in 1491 and containing ninety-five large pictures of Bible history, each about 7 by 10 inches actual size of print, was followed by a number of such books which succeeded each other all through the sixteenth century. In like manner the celebrated Vergil translated into German rhyming verse and published at Strassburg in 1502 has some pictures the full size of the page and others in the text, which among them tell the whole story of the *Aeneid* pictorially, and similar fantastic illustrations of ancient story and of history as understood in the Middle Ages were used in many books published throughout the century. These pictures were clearly intended for painting by hand. Many volumes remain to us in which all or a part of the

illustrations have been so painted, this having been done at the time or very soon after. Sometimes they have been colored very skillfully and with great elaboration, like original paintings, and touched with gold, the black outline wholly disappearing. Of all this early and facsimile engraving the most refined and delicate is perhaps that done by Hans Lützelburger, of Basel, who engraved Holbein's drawings of the *Dance of Death*, published in 1538 and frequently thereafter.

In the sixteenth and seventeenth centuries color was used in a very guarded way by the printers of woodcuts in Italy and elsewhere. Two blocks or more were used, each block for a different shade. The resulting prints were called *chiaroscuro prints*, and these form a special branch of the art and study of wood-engraving. Some of these were very large. Thus John Baptist Jackson, an Englishman, published in 1742 a print after Titian's *Presentation of the Virgin in the Temple*, which print on three sheets of paper is exactly 4 feet long, one of the great *Marriage of Cana* by Paul Veronese, which is made up of two parts each 17 by 23 inches, and many others; these being in three tints of brown or gray, the white paper showing through freely, and the colors being mingled with each other and with the white by the usual hatchings and dottings.

THOMAS BEWICK (*q. v.*) is the first engraver who made the engraving itself a fine art, as explained above. He used the white line with freedom and with great intelligence. The first collection of his prints is in the *Select Fables*, published 1784, but those contained in the *General History of Quadrupeds* (1790) are more important and have never been excelled in their penial merits. The engravers of the nineteenth century have not generally used the white line freely. Luke Clenell, a pupil of Bewick, is the chief of those in the early part of the century. Other able engravers, such as William Harvey, Robert Branson, and John Thompson, though admirable artists in their way, scarcely ever used the freer and more artistic process. Of engravers of the latter half of the nineteenth century Stephane Panemaker, a Belgian, has done wonderful work. Edward Evans is an English artist with great delicacy of touch, but generally producing rather mechanical drawings in a mechanical way. William J. Linton is probably the greatest wood-engraver since Bewick's death, at once artist and technician. Henry Marsh, in his illustrations to Harris's *Insects Injurious to Vegetation* (Boston, 1862), has produced artistic and individual engraving worthy of Bewick. Of the engravers who have done such admirable work for *The Century* and *Harper's Magazine*, Cole and Krull have been named above. William Kingsley should also be mentioned.

See W. J. Linton, *Wood Engraving: a Manual of Instruction* (London, 1884); John Jackson, *A Treatise on Wood Engraving, Historical and Practical* (London, 1837; also an enlarged edition 1861); Henri de Laborde, *La Gravure, Précis Élémentaire* (Paris, 1882); Alfred de Lostalot, *Les Procédés de la Gravure* (Paris); Firmin Didot, *Essai Typographique et Bibliographique sur l'Histoire de la Gravure sur Bois* (Paris, 1863). RUSSELL STURGIS.

Woodfall, HENRY SAMPSON: editor; b. in London, England, 1739; was son of the proprietor of the London *Public Advertiser*, and succeeded to the management of that paper, which he edited from 1760 to 1793, including the period during which the celebrated *Letters of Junius* (see JUNIUS, LETTERS OF) appeared in that paper (1769-71); was prosecuted and tried for their publication June, 1770; printed the standard edition of *Junius* in 1772, and became master of Stationers' Hall 1797. D. at Chelsea, Dec. 12, 1805. He probably never knew the secret of Junius, though an argument to the contrary has been alleged by the advocates of the Franciscan theory from the fact that he was a schoolfellow of Philip Francis.—His son GEORGE, b. about 1780, succeeded to the business; brought out a famous edition of the Bible (4to, 1804) in which only one erratum has been detected, and employed Dr. John Mason Good to edit the *Letters of Junius* (3 vols., 1812), whence that edition is usually called *Woodfall's Junius*, and is supposed to derive peculiar authority from the name of its publisher. In fact, however, the only real *Woodfall's Junius* is the edition of 1772, and Good's edition of 1812 is the most misleading of all from the fact that it includes a multitude of anonymous letters under different signatures culled from the columns of the *Public Advertiser* by Dr. Good, and attributed by him to Junius without any warrant.

Woodford, STEWART LYNDON, LL. D.: lawyer and soldier; b. in New York city, Sept. 3, 1835; graduated at Columbia College in 1854, and began the practice of law in his native city in 1857. He was assistant U. S. attorney at New York from Apr., 1861, to Aug., 1862, when he resigned and served three years in the U. S. army. He was appointed chief of staff to Maj.-Gen. Gilmore, commanding the department of the South; served in the Army of the Potomac; was military commandant of Charleston, S. C., was military governor of Savannah, Ga., and was breveted brigadier-general for service in the field and assigned to duty as of brevet rank. He was elected Lieutenant-Governor of New York in 1866, and in 1870 was the Republican candidate for Governor, but was defeated by John T. Hoffman. In 1872 he was sent to Congress from the third district of Brooklyn, but resigned in 1873, and in 1875 canvassed Ohio in joint debate with Thomas Ewing in behalf of a sound metallic currency. From Jan., 1877, to Mar., 1883, he was U. S. attorney for New York. He is a trustee of Adelphi Academy, Brooklyn, and of Cornell University. He has published several college and commencement literary addresses, and sundry pamphlets on legal, literary, and political subjects. He has practiced law in New York except when in the army.

Wood Grouse: See CAPERCAILZIE.

Woodhouselee: See TYTLER, ALEXANDER FRASER.

Wood Ibis: See IBIS.

Woodland: city; capital of Yolo co., Cal.; on the South Pac. Co.'s railway; 20 miles N. of Sacramento, 86 miles N. E. of San Francisco (for location, see map of California, ref. 6-C). It contains a public high school, Academy of the Holy Rosary, and Hesperian College (Christian, organized in 1861), and has 4 State banks with combined capital of \$1,468,600, 2 daily and 3 weekly newspapers, and large interests in wheat, barley, and fruit-growing, wine-making, wool-growing, and stock-raising. Pop. (1880) 2,257; (1890) 3,069.

Wood-louse: any one of various isopod crustaceans, of the genera *Porcellio*, *Oniscus*, *Armadillo*, etc. They are otherwise called slaters, sow-bugs and pill-bugs. They inhabit moist places, rotten wood, cellars, etc., and are often found under stones.

Wood-naphtha: See METHYL ALCOHOL.

Wood-oil: a fine aromatic drying oil used in making varnish, in preventing insect ravages, in making lithographic ink, and in medicine as a cure for gonorrhœa. It comes from Burma, and is produced by the *Dipterocarpus turbinatus* and other trees.

Woodpecker: a popular name for the birds of the family *Picidae*, or, more strictly, of the sub-family *Picinae*, given on account of their habit of cutting, or pecking, into trees either in search of food or to build their nests. They have the outer (fourth) toe turned backward, bill compressed at the point to form a chisel, tail-feathers more or less stiff, strong, and pointed, except in the little birds of the genus *Picumnus* (chiefly South American), where they are soft and rounded. The claws are strong, scales of the feet well developed, both features connected with their climbing habits. The salivary glands are large, and the tongue usually very long, extensible, and barbed at the tip. Aside from these, the woodpeckers are mostly of moderate size, ranging from the great Mexican *Campophilus imperialis*, which is 22 inches long, to the little downy *Picus pubescens* of 6 inches. Though not, as a rule, bright-colored birds, many species have a plumage which is striking from its sharp contrasts of black and white, heightened by the red, crescent-shaped nape-mark. Some species have conspicuous crests, and others, like the flickers of North America *Colaptes auratus* and *C. cafer*, have considerable red or yellow about them; but this is so blended as not to be glaring. Woodpeckers live largely on ants, grubs, and other insects, as well as on fruit and vegetable food. The tongues of the majority of species form effective spears for impaling wood-boring grubs, whose burrows are cut into by the strong bill. In other species, like the flicker, the tongue is used for probing ant-hills, or picking these insects from the ground, being plentifully besmeared with sticky saliva. The sapsuckers, *Sphyrapicus*, have comparatively short and brushy tongues. (See SAP-SUCKER.) The California woodpecker, *Melanerpes formicivorus*, stores up acorns in holes cut into dead branches, and scores may be seen imbedded in one limb. A woodpecker's eggs are six to nine in number, white, glossy, and translucent.

There are between 250 and 300 species of woodpeckers, distributed over the greater portion of the globe, save Madagascar and the Australian region, except Celebes and Flores. About half this number are American, and twenty-two species and thirteen sub-species occur in the U. S. One of these, the ivory-billed woodpecker, *Campopitulus principalis*, is in some danger of being exterminated, being limited to the wilder parts of Florida in the East, although still found sparingly in some parts of the Southwest. F. A. LUCAS.

Wood-rat: See RAT.

Woodrow, JAMES, Ph. D., M. D., D. D., LL. D.; educator; b. at Carlisle, England, May 30, 1828; was educated at Jefferson College, Canonsburg, Pa., Lawrence Scientific School, and Heidelberg; Professor of Natural Science in Oglethorpe University, Ga., 1853-61, where he privately pursued a full theological course, and was ordained into the Presbyterian Church South in 1860; Perkins Professor of Natural Science in connection with Revelation in the Presbyterian Theological Seminary, Columbia, S. C., 1861-84, when he was removed for views expressed in a public address on *Evolution*; reinstated in 1885, and ceased to act in 1886; Professor of Science in South Carolina College 1869-72; in South Carolina University 1880-91; and since 1891 president of South Carolina College. Dr. Woodrow has been editor of *The Southern Presbyterian Review* 1861-85, of *The Southern Presbyterian* since 1865; and has published many review articles, such as *Geology and its Assaults* (1862); *An Examination of Certain Recent Assaults on Physical Science* (1873); and *A Further Examination* (1874). C. K. HOYR.

Woodruff, the *Asperula odorata*, a favorite herb of the European peasants, belonging to the family *Rubiaceae*. It has, when dry, a pleasant odor, somewhat like that of the Tonquin bean or sweet clover. The Germans put it into their May-drink (*Maitrank*) and into home-made beer. In America *Galium triflorum*, a related plant with a similar smell, is used as a substitute.

Wood-rush: See LUZULA.

Woods, LEONARD, D. D.: professor of theology; b. at Princeton, Mass., June 19, 1774; graduated at Harvard 1796; studied theology; was ordained pastor of the Congregational church at West Newbury 1798; took an active part in the Unitarian controversy, vindicating "orthodox Calvinism" against Drs. Ware, Buckminster, and Channing; was prominent in the organization and management of tract, education, temperance, and foreign missions societies; was Professor of Theology in Andover Seminary from its establishment in 1807 until 1846, and emeritus professor from that time until his death Aug. 24, 1854. Among his works were *Letters to Unitarians* (Andover, 1820); *Reply to Dr. Ware's Letters to Trinitarians* (1821); *Lectures on the Inspiration of the Scriptures* (1829); *Letters to Rev. N. W. Taylor* (1830); *Memoirs of American Missionaries* (1833); *An Examination of the Doctrine of Perfection, etc.* (1841); *Reply to Mr. Mahan on the Doctrine of Perfection* (1841); and *Lectures on Swedenborgianism* (1846). A collective edition of his *Works* appeared at Andover (5 vols., 1849-50; 4th ed. 1860). Revised by G. P. FISHER.

Woods, WILLIAM BURNHAM: soldier and jurist; b. at Newark, O., Aug. 3, 1824; educated at Western Reserve College and at Yale, where he graduated 1845; was admitted to the Ohio bar in 1847; was elected mayor of Newark, O., in 1856 and 1857; served two terms in the Ohio House of Representatives as a Democrat, and became Speaker of the body; in Sept., 1861, was commissioned lieutenant-colonel of Seventy-sixth Ohio Infantry; was engaged in many battles during the civil war, and became brigadier-general and brevet major-general; removed to Alabama after the war, and became a chancellor of that State in 1867, and U. S. circuit judge in 1869; in 1877 removed to Atlanta, Ga., and on Dec. 21, 1880, was commissioned associate justice of U. S. Supreme Court. D. at Washington, D. C., May 14, 1887.

Wood's Halfpence: copper currency coined in Ireland by William Wood in accordance with a grant made in 1722, giving him a share of the profits from the difference between the nominal and bullion value of the coins. A portion of these profits also went to the king's mistress, the Duchess of Kendal. Swift attacked the system in his famous *Drapier's Letters*, with the effect of stirring the public indignation and causing the cancellation of the patent.

Woods Holl (formerly *Wood's Hole*): village; Falmouth town, Barnstable co., Mass.; on Buzzard's Bay, Vineyard

Sound, and at the terminus of the Woods Holl Branch of the Old Colony Division of the N. Y., N. H. and Hart. Railroad; 7 miles N. W. of Cottage City, on Martha's Vineyard, and 72 miles S. E. of Boston (for location, see map of Massachusetts, ref. 5-1). It has long been noted as a harbor of refuge for shipping, and contains one of the most important stations of the U. S. fish commission for the propagation of cod, scup, sea-bass, lobsters, and other food-fishes. The lower floor of the main building contains fish-hatching jars and tanks, while the upper floors are devoted to the scientific study of all problems connected with the fisheries. Opposite the main building is a thoroughly equipped marine biological laboratory, supplied with tanks of running seawater, and having a technical library and a lecture-room. In 1895 there were fifteen instructors and 188 students and investigators at the station. The U. S. Government owns a plot of land with a shore-line of over one-third of a mile. Pop. of village (1880) 508; (1890) not reported. J. S. K.

Wood-sorrel: See OXALIS.

Wood-spirit, or Wood-naphtha: See METHYL ALCOHOL.

Woodstock: port of entry; capital of Carleton County, New Brunswick; on Canadian Pacific Railway; on the river St. John, which is navigable at high and medium stages of water (see map of Quebec, ref. 5-C). It is 12 miles E. of Houlton, Me., and is in a fertile region. Red hematite iron ore, charged with manganese, and making a prized variety of steel, was formerly mined here, but the mine is abandoned. Pop. 3,000.

Woodstock: port of entry and railway center; capital of Oxford County, Ontario, Canada; 28 miles E. N. E. of London, and on the river Thames and Cedar creek, which affords water-power (see map of Ontario, ref. 5-C). It is well built, and situated in a healthful and fertile region. It has a large trade in wheat and flour. Pop. (1891) 8,610.

Woodstock: town (incorporated as a part of Massachusetts in 1690, annexed to Connecticut in 1749); Windham co., Conn.; 5 miles N. W. of Putnam, 41 miles N. E. of Hartford (for location, see map of Connecticut, ref. 7-K). It contains the villages of Woodstock, North Woodstock, South Woodstock, East Woodstock, West Woodstock, and Woodstock Valley; has an academy and a public library; and is principally engaged in agriculture and the manufacture of cotton twine. Pop. (1880) 2,639; (1890) 2,309.

Woodstock: city; capital of McHenry co., Ill.; on the Chi. and N. W. Railway; 32 miles E. of Rockford, 51 miles N. of Chicago (for location, see map of Illinois, ref. 1-P). It is in an agricultural and dairying region; contains 6 churches, city-hall that cost \$30,000, water-works plant that cost \$21,000, the Todd Seminary for boys, public library, pickling and canning works, several mills, a State bank with capital of \$25,000, and a private bank; and has 3 weekly newspapers. Pop. (1880) 1,475; (1890) 1,683; (1895) estimated, 2,200. EDITOR OF "SENTINEL."

Woodstock: town; capital of Windsor co., Vt.; on the Ottaquechee river, and the Woodstock Railway; 40 miles S. of Montpelier (for location, see map of Vermont, ref. 7-C). It is in an agricultural region; contains the villages of Woodstock, South Woodstock, West Woodstock, and Taftsville; and has 6 churches, high school, the Norman Williams Public Library (founded in 1885), a national bank with capital of \$300,000, a savings-bank, 3 hotels, 2 weekly newspapers, and manufactories of butter and cheese, carriages and sleighs, lumber, soap, hay-rakes, and doors, sash, and blinds. Pop. (1880) 2,815; (1890) 2,545; Woodstock village (1880) 1,266; (1890) 1,218; (1895) estimated, 1,240.

EDITOR OF "VERMONT STANDARD."

Woodstock: town (laid out in 1762); capital of Shenandoah co., Va.; on the north branch of the Shenandoah river, and on the Balt. and Ohio Railroad; 100 miles W. of Washington, D. C., 160 miles N. W. of Richmond (for location, see map of Virginia, ref. 4-G). It is in an agricultural and stock-raising region, and has eight churches, separate public schools for white and colored children, several private schools, a number of manufactories, a State bank with capital of \$41,500, and a weekly newspaper. Pop. (1880) 1,000; (1890) 1,068; (1895) estimated, 1,200.

EDITOR OF "SHENANDOAH HERALD."

Woodstown: borough; Salem co., N. J.; 10 miles N. E. of Salem, 25 miles S. of Philadelphia (for location, see map of New Jersey, ref. 6-13). It is in an agricultural and marl region, and has a public library (founded in 1858), a

Friends' academy, a national bank with capital of \$75,000, extensive canneries, manufactories of shirts and agricultural implements, and a weekly paper. Pop. (1880) 490; (1890) 1,556; (1895) 1,470. EDITOR OF "MONITOR-REGISTER."

Wood-swallows, or Swift Shrikes: a group of birds slightly resembling swallows in habits and appearance, but belonging to the sub-family *Artamidae*. In the East Indies and Australia they abound. The *Artamus sordidus*, an Australian species, has the habit of forming clusters like those formed by honey-bees on their hives, the whole flock clinging together, and sometimes forming a mass as large as a bushel basket. They eat insects and seeds, and are somewhat migratory in their habits, arriving in and leaving Van Diemen's Land at regular intervals, and making a partial migration on the Australian continent. Some individuals, however, remain in the same country throughout the year, as they find abundance of food without repairing to another climate. Revised by F. A. LUCAS.

Wood-thrush: See THRUSH.

Woodward, BEARNARD BOLINGBROKE, F. S. A.: archaeologist and historian; son of Samuel Woodward (1789-1838), author; b. at Norwich, England, May 2, 1816; studied theology in the Independent College at Highbury, near London; took his degree of B. A. at London University 1841; was settled in 1843 as minister of a Congregational church at Wortwell, Norfolk; assisted the printer John Childs in some of his large undertakings, especially in preparing a new edition of James Barclay's *Universal English Dictionary* (1848); settled in London as a professional man of letters 1849; wrote a *History of Wales* (2 vols., 1850-52); completed a *History of the United States of North America to the End of the Administration of President Polk* (3 vols., 1855), which had been begun by William Henry Bartlett; was coeditor (with John Morris and W. Hughes) of Mauder's *Treasury of Knowledge* (1859); wrote several admirable works for the young, including *First Lessons on the English Reformation* (1857); was appointed librarian in ordinary to Queen Victoria and keeper of the prints and drawings at Windsor Castle 1860; edited a *History of Hampshire* (1859-62); founded the *Fine Arts Quarterly Review* (1863); translated Eliséé Reclus's *The Earth and The Ocean, Atmosphere, and Life*; and was actively engaged upon his chief work, *The Encyclopædia of Chronology* (completed by W. L. R. Cates, 1872), when he died at London, Oct. 12, 1869. Revised by HENRY A. BEERS.

Woodward, JOSEPH JANVIER, M. D.: surgeon; b. in Philadelphia, Oct. 30, 1833; was educated in the Central High School of that city; studied medicine in the University of Pennsylvania, and graduated in 1853. He practiced medicine in Philadelphia until 1861, when he was appointed assistant surgeon in the regular army, and in 1876 he was made surgeon of the army with rank of colonel. He early attracted attention by his treatises on the use of the microscope in the practice of medicine, and subsequently he was regarded as one of the leading authorities on medical microscopy. He invented an instrument by which myopia or other conditions of the eye can be determined with mathematical accuracy. Among his published works were *Remarks on Croup and Diphtheria; Typho-Malarial Fever; Photographic Micrometry; Application of Photography to Micrometry, with Special Reference to the Micrometry of the Blood in Criminal Cases; Outlines of the Chief Camp Diseases of the United States Armies* (Philadelphia, 1863); and *The Medical and Surgical History of the War of the Rebellion* (2 vols., Washington, 1870-79). D. in Philadelphia, Aug. 18, 1884. Revised by S. T. ARMSTRONG.

Woodward, ROBERT SIMPSON, Ph. D.: physicist and mathematician; b. at Rochester, Mich., July 21, 1849; educated at University of Michigan; assistant engineer U. S. lake survey 1872-82; astronomer U. S. transit of Venus commission 1882-84; astronomer U. S. Geological Survey 1884-90; assistant U. S. Coast and Geodetic Survey 1890-93; Professor of Mechanics, Columbia College, New York, from 1893; chairman of section of astronomy and mathematics of the American Association for the Advancement of Science 1889. Prof. Woodward's chief contributions to science have been in the field of precise mensuration, geodesy, the physics of the earth, physical astronomy, and pure mathematics. Among his published papers are *Results of Experiments to Determine the Variation in Lengths of Certain Bars at the Temperature of Melting Ice* (*Am. Jour. Science*, 1883); *On the Free Cooling of a*

Homogeneous Sphere (*Ann. Mathematics*, 1887); *On the Conditioned Cooling and Cubical Contraction of a Homogeneous Sphere* (*Ann. Mathematics*, 1887); *On the Form and Position of the Sea Level* (*Bull. U. S. Geol. Survey*, No. 48, 1888); *On the Diffusion of Heat in Homogeneous Rectangular Masses, with special reference to Bars used as Standards of Length* (*Ann. Mathematics*, 1888); *The Mathematical Theories of the Earth* (*Am. Jour. Science* and elsewhere, 1889); *The Ice Bar and Taped Base Apparatus, and Results of Measures made with them on the Holton and St. Albans Bases* (*Rept. U. S. Coast and Geodetic Survey for 1892*); *Mechanical Interpretation of the Variations of Latitudes* (*Astron. Jour.*, 1895). G. K. G.

Woodwaxen, or Woadwaxen: See DYERS' BROOM.

Woodworth, SAMUEL: poet; b. at Scituate, Mass., Jan. 13, 1785; served an apprenticeship as a printer in the office of Russell's *Columbian Centinel*; edited and printed a short-lived weekly paper at New Haven, Conn., 1807; settled in New York 1809; conducted during the war of 1812-15 a weekly paper, *The War*, and a monthly Swedenborgian magazine, *The Halcyon Luminary*, both unsuccessful; wrote a romantic history of the war entitled *The Champions of Freedom* (2 vols., 1816); published a small volume of poems 1818, and another 1826; was one of the founders of the *New York Mirror* 1823-24; edited the *Parthenon* 1827, and wrote a number of dramatic pieces. D. in New York, Dec. 9, 1842. His *Poetical Works* appeared in 2 vols. (1861), with a *Memoir* by George P. Morris. He is chiefly remembered by his song, *The Old Oaken Bucket*.

Woody Nightshade: See BITTER-SWEET.

Wool, JOHN ELLIS: soldier; b. at Newburg, N. Y., Feb. 20, 1784; after engaging in the book business for a time in Troy, the destruction of his stock by fire led to his turning his attention to the study of law, which he abandoned in Apr., 1812, to accept a commission in the army as captain of the Thirteenth Infantry. He distinguished himself in the war of 1812, and in 1816 was appointed inspector-general with the rank of colonel, which position he retained until June 25, 1841, when appointed a brigadier-general, to which rank he had been breveted in 1826. In the war with Mexico he superintended the organization of Western volunteers, and after dispatching some 12,000 to the seat of war, conducted himself a force of 3,000 on the march from San Antonio to Saltillo, a distance of 900 miles, where he joined the army of Gen. Taylor as second in command. At Buena Vista, before the arrival of Taylor, he was in command during the early part of the day, and had made the disposition of the troops for the battle, which was approved of by Taylor on his arrival. After Taylor's return to the States, Wool remained in command of the army of occupation until the close of the war. For his services at Buena Vista he was breveted major-general Feb. 23, 1847, and in 1854 Congress passed a joint resolution of thanks and presented him with a sword for his Mexican services. The State of New York also presented him with a sword. Returning East in July, 1848, he commanded the eastern military division until 1853, the department of the East 1853-54, that of the Pacific 1854-57, when again in command of the Eastern department until 1860. In Aug., 1861, he was placed in command at Fort Monroe, Va., and in May, 1862, occupied Norfolk and Portsmouth. He was promoted to be major-general May 16, 1862; was in June placed in command of the middle military department, including the Eighth Army-corps; transferred to New York Jan., 1863, he commanded the department of the East until July 15, when relieved, and Aug. 1, 1863, was placed on the retired list. D. at Troy, N. Y., Nov. 10, 1869.

Wool and Woolen Manufactures [*wool* is O. Eng. *wull*; Ger. *wulle*; Goth. *wulla*; cf. Lat. *lana*, Gr. *λῆνος*, Lith. *vilna*, O. Bulg. *vlina*]; strictly, the covering or fleece of the sheep, and the processes by which it is converted into textile and other fabrics. The term wool, however, has been extended to include the hair of the angora, cashmere, and other goats, the hairy fleece of the alpaca, vicuña, and other species of the llama, the soft down from the belly of the camel, several kinds of fur which are spun and woven, and even cow's hair, which is made up into a cheap quality of woolen goods. Wool proper may be distinguished from all these varieties of hair, as well as from all vegetable fibers, by the corrugated character of its fibers and by its property of felting, which is due to the epithelial scales which overlap each other along the course of its fibers, and which, under certain conditions, from their corrugation, interlock with

each other and form a felted fabric. (See FELT.) The average number of these epithelial scales or serrations per linear inch varies greatly in different breeds of wool. The larger numbers improve the elasticity and the felting property in like proportion. East India wool has 1,000 scales per inch; common domestic, 1,400; Leicester, 1,400; merino, 2,000; Saxony, 2,200. The average size of the fiber varies, and almost inversely to the above proportion. East India measures $\frac{1}{100}$ th of an inch; common domestic, $\frac{1}{110}$ th; merino, $\frac{1}{130}$ th; Saxony, $\frac{1}{200}$ th. Hair possesses very little of this felting property, but by long beating and rubbing develops it to some extent. The primitive sheep was covered with long hair, the rudiments of the present fleece being an underwool or down. This hair was bred out, and the wool was left. If sheep are neglected now, or become very old, they will revert to this habit by growing hairs among their wool. Sheep formed a large part of the wealth of the Oriental nations, particularly of those which were more or less nomadic in their habits; and as these were kept very largely for food, though shorn every year, it is remarkable that in the absence of any special efforts to improve the character of their wool it should have retained its good qualities to such an extent as to enable those nations with their rude processes to have produced fabrics of such delicate and exquisitely fine texture as issued from their looms.

The first attempts to improve the breeds of sheep with special reference to the production of a finer quality of wool were made by the Romans about the second century B. C. Their Tarentine sheep produced a long and finely stapled wool, and their fleeces were very heavy, but the color was either brown or black, and the sheep was so delicate in constitution that they were reared with difficulty, and were kept covered even in the mild climate of Italy. Columella relates in his *De re rustica* that his uncle, Marcus Columella, who was a wealthy agriculturist in Spain, transported some white African rams of great size and beauty to his estate in Bætica, and by continually crossing them with his Tarentine ewes and their progeny succeeded in producing a breed of white fine-wooled sheep of vigorous and hardy constitution and yielding a heavy fleece. This cross is supposed by many to have been the original of the Spanish merino sheep, which, with its various modifications and crossings, has been the parent of most of the fine-wooled sheep of Europe and America. It was renewed by Pedro IV. of Castile in the middle of the fourteenth century, and probably from Africa, and again with Barbary rams in the sixteenth century by Cardinal Ximenez. Its transportation to France and careful improvement there have led to the production of the French merino, one of the finest of the long-wool breeds. Its introduction into Germany, and modification by crossing and by climatic influences, have produced the fine Saxon wools, adapted to the making of the best broadcloths; and the French sheep of Naz, which yields a more silky wool of great luster, though now a distinct breed, bears traces of its early merino origin. In the U. S. the Spanish merino, introduced by Delessert, Livingston, Col. Humphreys, and William Jarvis between 1801 and 1812, has exerted a wide influence, and, together with the Saxony sheep, the sheep of Naz, and the French merino, constitutes to this day the largest proportion of those flocks which are bred mainly for their wool. The Australian and Cape Colony wools are also largely indebted to the merino sheep for their good qualities. The greatly increased demand for mutton has led to the breeding of sheep which have larger food-producing value, and with which the wool is an incidental rather than the principal product. The Leicester, Cotswold, South Down, Hampshire Down, and Oxford Down among the English sheep are the best of this class, while the undistinguished breeds of South America have some of the same characteristics. The large flocks of the Western States and the Pacific coast are American merinos. These all yield a portion of medium and coarse wools, and while the best grades are valuable for the worsted manufacture, the coarser are equally in demand for carpets, friezes, and the lower grades of goods for men's wear.

Wool is divided primarily into pulled and clipped or fleece wools, the former being pulled by the roots from the pelt or skin of the dead animal, and the latter clipped or shorn from the living one. The clipped or fleece wools form the greater part of the wool in market, and these are again divided into long and short staple, or combing and clothing wools. The clothing wools are used mainly for broadcloths and the thicker woolen cloths; the finer combing wools for soft and thin fabrics for women's wear; the medium for

worsted goods, delaines, alpacas, mohairs, etc.; and the coarser for carpets, blankets, and coarse goods generally. The quantity of wool grown has increased very rapidly during the nineteenth century, especially in Europe, America, Australia, and Southern Africa. The increase in quantity in Europe and America has been largely due to improved methods of breeding and feeding the sheep, which caused them to mature earlier and to yield larger and more uniform fleeces. Horned Dorsets are the most prized for the production of hot-house or winter lambs. The increase in the consumption of wool in Great Britain has been enormous, and the production has increased. In 1801 the wool-clip of the United Kingdom amounted to 94,000,000 lb. and the imports of unmanufactured wool to 8,000,000 lb. more. In 1828 the production was about 112,000,000 lb., and the imports in round numbers 30,000,000. In 1873 the production was 165,000,000 lb., and the imports 324,000,000, of which 123,000,000 was re-exported. In 1883 the production was 128,000,000 lb., and the imports 508,000,000, of which 277,000,000 was re-exported. In 1892 the production was 153,000,000 lb., and the imports 762,000,000, of which 332,000,000 was re-exported. Large quantities of shoddy, wool extract, and mungo were also consumed. The wool production of France has increased almost as rapidly as that of Great Britain, though mainly in the finer descriptions of wool; but it is now decreasing. France imports also considerable quantities of fine wools from other countries. The Australian colony of New South Wales alone exported in 1893 344,982,876 lb. of wool. Australasia produces the best wool in the world for fine combing purposes. In the U. S. the demands for wool for home manufactures have immensely increased the production, while the amount imported was nearly 55,000,000 lb. in 1875, 67,768,778 lb. in 1885, and 172,435,838 lb. for the year ending June 30, 1893. Importation consists of the merino wools of Australia, the Leicester and other combing wools of high luster for worsted goods, from Canada and Great Britain, and the coarse long-stapled wools from Asia, Russia, and South America for carpets, etc. In 1810 the wool produced in the U. S. was estimated at 13,000,000 lb.; 1880, 264,000,000 lb.; 1890, 309,474,856 lb.; 1891, 307,101,507 lb. These figures are those of James Lynch, continued by Mr. Truitt. In 1840 the average weight of the fleece, as estimated by the Department of Agriculture, was 1.9 lb.; 1850, 2.4 lb.; 1860, 2.7 lb.; 1870, 3.5 lb.; 1880, 4.8 lb.; 1891, 5.5 lb. The scoured wool produced by the growth of 1891 was rated at 139,326,703 lb. The Department of Agriculture estimated the growth for 1891 at 285,000,000 lb.; the imports at 129,303,648 lb.; total consumption after deducting exports, 411,373,603 lb. The percentage of imports was 30.2 per cent., and in 1890 it was 27.6 per cent. The percentage has varied from 21.7 per cent. in 1840 to 44.9 per cent. in 1872, the highest point ever reached. It dropped to 15.6 per cent. in 1879, the lowest point. It was 29.9 per cent. in 1886. The consumption of wool *per capita* in the U. S. was 4.49 lb. in 1840. It increased steadily, and was 8.52 lb. in 1880 and 9.07 lb. in 1890. The world's supply was 955,000,000 lb. in 1860 and 2,456,773,600 lb. in 1890. The latter quantity was distributed as follows:

United Kingdom.....	147,475,000 lb.
Continent of Europe.....	639,917,000 "
North America.....	319,100,000 "
Australasia.....	550,000,000 "
Southern Africa.....	128,681,600 "
River Plate country.....	376,700,000 "
Other countries.....	294,800,000 "
	2,456,773,600 lb.

The principal European markets for wool are at London and Antwerp. At London periodical auction sales of British colonial wools are held, and are attended by buyers from all manufacturing countries. At Antwerp the bulk of the wools from the important River Plate country is disposed of.

Woolen Manufactures.—The manufacture of wool into fabrics for clothing is one of the oldest industries. At a very early date the primitive man, or rather the primitive woman, discovered that the coarse wool of the sheep, the first of domesticated animals, could be spun into long threads, woven, and then, by rubbing with clay and beating in water, thickened or fulled till it furnished a satisfactory substitute for the pelts of the sheep, which had till then formed the clothing of man. From these rude garments the transition to those of finer and more skillful workmanship, such, for instance, as are shown on ancient Egyptian monuments, was gradual, and must have required long periods of development. The production of dyed garments, of shawls, and

of carpets, often of elaborate patterns and requiring protracted labor, was attempted at a very early period, and the manufacture of tent and curtain cloths, of tapestry hangings embroidered with needlework, and of those vestments of lamb's wool and the rich imperial robes of Tyrian purple came somewhat later. Some of the Persian, Greek, and Roman cloths, robes, and shawls must have been very beautiful; but in the ages which followed the downfall of the Western Roman empire the art of manufacturing them, like most of the fine arts, was nearly lost; the says and serges of the Middle Ages were made from coarse and harsh wools. The rough friezes, made of still coarser wool in Friesland, were still more objectionable, and the manufacture, such as it was, existed mainly in Florence, in Flanders, in England, and in France. After the thirteenth or fourteenth century silks, satins, and velvets became the favorite and distinguishing clothing of the wealthy. Until after the period of the Reformation the manufacture of woollen goods was almost entirely domestic; the large spinning-wheel and the reel had indeed taken the place of the distaff; and the hand-loom, gradually improved, of the rude contrivances of the Oriental weavers. Among the thousands engaged in this domestic manufacture, some possessed greater manual skill and higher ingenuity than others, and consequently their cloths were more in demand; and the assembling of their looms and spinning-wheels in a single building gave them some advantages. The dyeing and fulling of the cloths was a separate business, and for this a water-power was required, and so fulling-mills sprang up wherever there were considerable quantities of cloths made. The use of the teasel for combing out a nap on the fulling cloths dates from an unknown antiquity. There were frands in those days—stretching of the goods and the extravagant use of flocks. *Flocks* are shorn fibers or the nap cut from the face of one piece of cloth, then fulling into the back of another piece. If judiciously used, they improve the fabric, as they not only increase the bulk, but retard the whole felting process, and thus render the cloth firmer. From the end of the thirteenth to the end of the seventeenth century this domestic manufacture of worsteds, baizes, kerseys, serges, friezes, broadcloths, and other cloths was carried on very extensively in England, and considerable quantities of each were exported. The English cloths were mainly of coarse qualities, and inferior to some of those made on the Continent, the Spanish and Flemish fine wools enabling them to make finer and more desirable goods. In the eighteenth century the manufacture of both worsteds and woolens began to be concentrated in Yorkshire, and Leeds, Stroud, Chippenham, and Huddersfield gradually became the seats of the woollen goods manufacture; while Bradford, Halifax, Norwich, and their vicinities absorbed the manufacture of worsted goods and carpets. But, though large quantities of goods were made and sold, their quality was far from uniform, and there was no improvement in the processes of manufacture until the invention of the carding-machine, which first came into use for wool in England about 1753, and the SPINNING-JENNY (*q. v.*). The gradual introduction of these machines, and the application of steam both as a motor and for dyeing and dressing purposes, greatly improved the character of the English and French cloths, but until the introduction of the power-loom (which, though invented in 1785, did not come into general use till about 1800) and the Jacquard loom (invented in 1811), the woollen and worsted manufactures had not received their greatest impulse in Great Britain. The French manufacturers were moving meanwhile in a somewhat different direction. With their fine and soft wools they directed their attention very largely to the production of fabrics for women's wear, and with their admirable taste and delicacy of workmanship soon achieved great success. The French merino goods, introduced by Pallotat at Rheims in 1801, have never been surpassed by any all-wool product in softness, durability, and beauty. Other goods, both of wool and worsted, pure and in combination with silk, cotton, and linen, have been produced in vast quantities in England and France. The broadcloths of the highest grade made in France are of better quality than any others, except some of the west of England goods; but the practice of adulterating these, as well as cassimeres, satinets, and indeed almost every description of the heavier wool goods, with shoddy or the ground and picked fibers of old woollen rags, first undertaken in 1813 at Batley, England, but not largely used till 1840, has done much to impair the value and durability of the lower and medium priced goods. This practice has

been carried to a greater excess in Great Britain and Belgium than elsewhere. The modern *shoddy* is fiber of yarns or threads picked and broken into the semblance of wool. *Mungo* is the fiber of felted rags thus picked. Both these articles, being mixed with wool, are carded and spun; they are never fullled or carried into the fabric like flocks.

In the U. S. the manufacture of woollen goods was almost entirely domestic as late as 1790, and though there had been fulling-mills from the first settlement of the colonies, there was no woollen-factory in successful operation before 1794, when one was established in Byfield parish, Newbury, Mass. An attempt had been made at Hartford in 1788. In 1794 the first carding-machine for wool was put in operation in Pittsfield, Mass. Between that time and 1801 four or five were started. Gray-mixed broadcloth of good quality was made at Pittsfield in 1804, and President Madison's inaugural suit of black broadcloth was made there in 1808. In 1809 a woollen-mill was erected by Dr. Capron at Oriskany, Oneida co., N. Y., and in 1812 what was then considered a large manufactory of fine cloths was established at Middletown, Conn., which made 30 or 40 yards of broadcloth a day. In the same year were produced what are known as the helicoidal shears, a cutting-machine with spiral blades on a cylinder acting against a straight steel blade, and shearing the nap of the cloth evenly and perfectly. This was first adopted in France. To the inventors of the U. S. the world is indebted for the original and best processes for making felted goods, carpetings, hat-bodies, etc.; the knitting-frame, and later the various knitting-machines, the burring-machine, the Crompton and Knowles power-loom for weaving fancy cassimeres, which, with their successive improvements, are now far superior to any other loom for this purpose; the still more wonderful automatic Bigelow carpet-loom; the best processes for making a mixed mousseline delaine; Crompton's improvement of Noble's wool-comb; and the Smith moquette carpet-loom. The woollen-manufacturers in the U. S. have had great difficulties to contend with. In addition to the high price of labor as compared with European countries, and the lack for many years of native wool of those qualities best adapted to their use, they have been unduly affected by high and low tariffs, and their goods systematically depreciated by the importers and free-traders; but they have at length reached a position in which they can supply more than three-fourths of the woollen and worsted goods consumed at home, and, except in a few classes of goods, produce those of quality equal to those of their European rivals.

From 1790 to 1810 there was a large domestic manufacture in proportion to the population, and the greater part of the men and all the boys were clothed in homespun, while the women wore for everyday use linsey-woolsey, a fabric composed of linen and wool. In 1810 the value of this domestic manufacture was estimated at \$25,608,788. But after this date the domestic production fell off rapidly, and at first the factory-made goods did not supply their place. In 1820 the total value of woollen goods reported was \$4,413,068; in 1830, \$14,528,166; in 1840, \$20,696,999; in 1850, \$49,636,881; in 1860, \$80,734,060; in 1870, \$217,668,826. In 1876, owing to the depression of business, there was a slight falling off in production, and a still larger one in importation. The value of the woollen goods produced in 1880 was \$267,252,913; in 1890 it had risen to \$337,768,524, of which \$137,930,014 was in woollen goods proper, \$72,194,642 in worsted goods, \$8,958,205 in felted goods and hats, \$39,769,441 in carpets, and \$55,457,642 in hosiery and knit goods. Massachusetts has from the first maintained the leading position in these manufactures, her production of all-wool goods, carpetings, worsted, and mixed goods of cotton, linen, or silk and wool, amounting in 1890 to \$72,681,408, or more than one-fourth of the whole production of the country. Pennsylvania, New York, Connecticut, and Rhode Island are the other largest producers, though nearly every State has some woollen manufactures. The value of importations in 1821 was \$7,238,954; in 1831, \$13,197,364; in 1840, \$10,808,485; in 1850, \$19,620,619; in 1860, \$43,141,988; in 1870, \$37,064,001; in 1880, \$35,356,992; in 1890, \$56,582,432; in 1891, \$41,060,080.

Processes.—The variety of goods wholly or in part made of wool, and of those wholly or in part of worsted, is so great that the processes to which each is subjected in its manufacture can only be named in the most general way. The distinction between the woollen and worsted goods begins in the character of the wool used; for all heavy wool goods a more or less fine, short-stapled, and readily felting

wool is required; for goods wholly or in part of worsted the wool must be strong in fiber, of long staple (fibers $2\frac{1}{2}$ to 5 or 6 inches in length, although shorter wool can be combed), not very fine, and either naturally or by the combing process freed from the noil or short fiber, which is afterward mixed with wool, carded, and spun for felted goods. The wool, which is usually purchased in bales, is first sorted and scoured. The sorter arranges the parts of each fleece according to fineness, length of staple, and silkiness of texture; and the scouring is accomplished by throwing the wool into large tanks filled with water and an abundance of soap, keeping it at a high temperature by means of steam, and continually moving it by means of rakes or stirring-sticks driven by machinery. When thoroughly cleansed it is drawn out through rollers to squeeze out the water, and then dried by revolving fans or other means. By this scouring and washing not only is the dirt and soil removed from the fleeces, but the yolk or suint—a peculiar fatty secretion of the sheep most abundant in the merino breeds—is also discharged. The British manufacturers extract these matters from the water by a chemical process, and make *dé-gras*, a low form of grease, from the product. Similar processes for extracting the fat are now being introduced into the U. S. The wool is next dyed (if it is necessary to dye it in the wool). The next process is willing, or, in the case of Western and South American wools, burring. The object of this is to remove seeds and burs which have become entangled in the wool. The American burring-machines of various kinds do this very perfectly and in combination with the carding-machine. Picking, teasing, or moating is the next process, and is performed by a machine which tears open the matted portions and separates the wool into small tufts. Either before or immediately after this process the wool is oiled, oleic acid or olein being now generally used for this purpose, instead of olive oil, and sometimes a mixture of olein and paraffin oil; these oils are much more readily removed from the yarn or tissues by a brief scouring with carbonate of soda and pure water than the olive oil, and there is much less danger of spontaneous combustion than from the use of the vegetable oils. The wool is now ready for the carding and slubbing processes, which, though formerly separate, are now continuous by the use of a patent feeder and condenser. Their office is to convert the wool into rolls, which are drawn out before they are spun. The spinning is the next process, and herein is another difference between woollen and worsted yarns, the yarns for woollen cloths being but slightly twisted, so as to leave them more free for felting, but those for the warp twisted more than those for the weft, as they have to bear more strain; while the worsted yarns are hard-spun and made into a much stronger thread. The slight twisting and comparative lack of strength in woollen yarn renders it more difficult to weave it on a power-loom than the worsted, cotton, silk, or linen yarns. The yarn, when spun, is reeled, and, if to be made into cloth, warped, beamed, sized, and otherwise prepared for weaving. The weaving is generally done on an ordinary power-loom for broadcloths, flannels, cassimeres, satinets, blankets, etc.; on a Crompton chain-loom for fancy cassimeres, yarns of different colors being introduced; or on the Earnshaw needle-loom, where the goods are made with two faces or different colors are used. Broadcloths, and indeed most woollen goods, are next scoured to remove the oil, and then, if thought necessary, dyed again, and tented or stretched upon hooks to dry. Burling, or picking off irregular threads, hairs, and dirt, succeeds this, and then, for the cloths, come the fulling process and the teasing or raising the nap, which is sheared evenly by the helicoidal shears. It is next steamed or scalded to prevent its spotting unevenly from the rain, and pressed between polished iron plates in a powerful hydraulic press, or, as is more common now, in a rotary or calendaring press. The flannels, blankets, etc., do not go through these last processes. The knit goods are made from the yarn on knitting-machines, and finished by hand. Delaines have usually cotton warp, and are woven on cotton looms, and printed, like calicoes, from rollers. Merinos, Tibets, empress and Henrietta cloths, alpacaes, with many other kinds of dress goods, are made from worsted yarns. Carpets are made from coarser wools, and do not go through so many preliminary processes before spinning; they are woven on the Bigelow carpet-looms, or some modification of them. The worsted wools are combed on a combing-machine with teeth heated by indirect application of steam, to make the fibers straight and

parallel, and the noil or shorter fiber is combed out. The other processes before the spinning are much the same as already described. But the spinning of worsted and woollen yarns is entirely different. Woollen is drawn finer by the draft of the mule carriage after the roving passes through rollers. Worsted is drawn between rollers as a cotton thread. The front pair of rollers runs faster than the back pair, and thus the size is reduced. Then the thread is twisted by the revolutions of the spindle. The yarns are hard-twisted, and for some purposes, as for alpacaes, mohairs, and lustered goods, the lustered wools and the hair or wool or the alpaca and vicuna and of the angora goat are used. The weaving and dyeing of these goods are watched with great care. The cow's hair, camel's hair, and calf's hair goods are of cheaper grades, and in quality belong rather to the woollen than the worsted trade. Most of them contain a considerable proportion of the lower grades of wool, woollen waste, and shoddy. Revised by W. B. WERDEN.

Woollet, WILLIAM; engraver; b. at Maidstone, England, Aug. 15, 1735. His father apprenticed him to an engraver named John Tinney, and he also studied in the St. Martin's Lane Academy. Woollet carried landscape-engraving to an unsurpassed degree of excellence; his success with historical subjects was also great. Among his plates (123 in number) are those of West's *Death of Wolfe* and *Battle off Cape La Hogue*, and those after Van Dyck, Claude Lorraine, Villemont, Zuccarelli, and Richard Wilson. Woollet belonged to the St. Martin's Lane Academy and the Incorporated Society of Artists elected him in 1766. He was also appointed engraver to the king Nov. 27, 1775. He had the habit of firing off a cannon from his roof when he had finished an important plate. D. May 23, 1785, in London. See Louis Fagan's *Catalogue Raisonné of the Engraved Works of William Woollet* (London, 1885). W. J. S.

Woolner, THOMAS; sculptor and poet; b. at Huddleigh, Suffolkshire, England, Dec. 17, 1826. He was a pupil of the sculptor William Behnes, and exhibited his first work at the academy in 1843. Genre works occupied his attention during his youth, such as *Titania with her Indian Boy*, a bas-relief *Feeding the Hungry*, and *The Rainbow*. He also produced busts of Carlyle and Tennyson. In 1849 he was active in the association called PRERAPHAELITES (*q. v.*). In 1853 or 1854 he went to Australia, and after his return in 1857 he produced the remarkable bust of Tennyson which was set up in Westminster Abbey after the poet's death. At about this time he produced the medallion portrait of Tennyson, an engraving of which forms the frontispiece of the Moxon edition of Tennyson's poems published in 1857. From this time on he was actively employed and produced many notable works. In 1871 he was made associate of the Royal Academy, in 1874 an academician, in 1877 Professor of Sculpture in the Royal Academy, an office which he resigned in a few years. D. in London, Oct. 7, 1892. His poem *My Beautiful Lady*, which first appeared in the periodical issued by the Preraphaelites, was published as a volume in 1863 and has been through several editions. He also published volumes of poems under the titles *Pygmalion* (1881), *Silenus* (1884), and *Tiresias* (1886).

Woolrych, HUMPHREY WILLIAM; b. in England in 1795; entered Oxford with the intention of taking orders in the Church, but upon graduation took up the study of law and was called to the bar at the Inner Temple in 1821; became eminent as a barrister on the western circuit and the home circuit, and in 1855 was made serjeant-at-law. D. in London, July 2, 1871. He was a prolific writer, and was the author of a *Life of Sir Edward Coke* (1826); *Series of the Lord Chancellors, Keepers of the Seal, etc.* (1826); *Memoirs of the Life of Lord Jeffrey* (1827); and *Lives of Eminent Serjeants-at-Law* (1869); and of a number of legal treatises, of which those on the *Law of Ways* (1836), the *Law of Misdemeanor*, and on the *Law of Sewers, including the Drainage Acts*, have a present value. F. STURGES ALLEN.

Woolsey, SARAH CHAUNCEY; author; b. at Cleveland, O., about 1845; a niece of Theodore D. Woolsey, and a favorite writer for children under the pseudonym of Susan Coolidge. She resided a number of years at New Haven, Conn., and subsequently at Newport, R. I. Among her books are *The New Year's Bargain* (1871); *What Katy Did* (1872); *Verses* (1880); *A Guernsey Lily* (1881); *A Little Country Girl* (1885); and *A Short History of the City of Philadelphia* (1887). She edited *The Diary and Letters of Mrs. Delaney* (1878) and *The Diary and Letters of Frances Burney, Madame d'Arbly* (1880). HENRY A. BEERS.

Woolsey, THEODORE DWIGHT, D. D., LL. D.: educator; b. in New York, Oct. 31, 1801; graduated at Yale College 1820; read law in the office of Charles Chauncey, Esq., in Philadelphia; studied theology at Princeton; was a tutor in Yale College 1823-25; licensed to preach in 1825; studied Arabic, Greek, and modern languages abroad 1827-30; elected Professor of Greek in Yale College in 1831; elected president in 1846, resigned this office in 1871; resided in New Haven, and for a time lectured in the law school, and was busily occupied in researches and studies chiefly in political science; was ordained at the time of his inauguration, and frequently preached in the college chapel and elsewhere with great acceptance; edited the *Alextis* of Euripides (1833), the *Antigone* of Sophocles (1835), the *Electra* of Sophocles (1837), the *Prometheus* of Æschylus (1837), the *Gorgias* of Plato (1842); published his inaugural discourse on *College Education* (1846); an *Historical Discourse upon Yale College* (1850); *An Introduction to the Study of International Law* (12mo, Boston, 1860; 4th ed. New York, 1874); *An Essay on Divorce and Divorce Legislation* (New York, 1869); a volume of sermons entitled *The Religion of the Present and the Future* (New York, 1871). After the death of Prof. Francis Lieber (1872) President Woolsey re-edited, with notes, his work on *Civil Liberty and Self-Government* (Philadelphia, 8vo, 1874), also his *Manual of Political Ethics* (2 vols. Philadelphia, 1874). President Woolsey was for several years one of the regents of the Smithsonian Institution, and was a member and the chairman of the American division of the committee for the revision of the New Testament. He published a work on *Political Science* in 1877, in two vols., and a book on *Communism and Socialism* in 1879. D. in New Haven, Conn., July 1, 1889.

Woolsey, THEODORE SALISBURY, A. M., LL. B.: professor of international law; b. in New Haven, Oct. 22, 1852; son of Theodore Dwight Woolsey; educated at Yale University (A. B. 1872, LL. B. 1876, M. A. 1877); traveled for two years in Europe and Asia; studied for two winters in Germany; in 1877 became instructor in public law in Yale College; in 1878 Professor of International Law in the same institution; editor of Pomeroy's *International Law* (1886) and the sixth edition of Woolsey's *International Law* (1891); associate editor *Johnson's Universal Cyclopedia*, in charge of the department of public law and intercourse of nations (1892-95).

Woolson, CONSTANCE FENIMORE: novelist; b. at Claremont, N. H., Mar. 5, 1838. Her mother was a niece of James Fenimore Cooper. She was taken, when a child, to Cleveland, O., and was educated there and at the school of Madame Chegaray in New York city. She resided at Cleveland till 1869, spending her summers on the island of Mackinac. From 1873 to 1879 she lived in the South, chiefly in Florida and in the mountain districts of Virginia, Georgia, and the Carolinas. In 1879 she went to Europe and resided principally in Italy till her death, which occurred at Venice, Jan. 24, 1894. The scenes of her stories were commonly in the South and in the region of the Great Lakes. Besides tales, sketches, and poems in the magazines, which remain in part uncollected, she is the author of the following books: *Castle Nowhere* (1875); *Rodman the Keeper* (1880); *Anne* (1882); *For the Major* (1883); *East Angels* (1886); *Jupiter Lights* (1889); and *Horace Chase* (1894). H. A. B.

Woolsorter's Disease: See ANTHRAX.

Woolston, THOMAS: deist; b. at Northampton, England, in 1669; studied at Sidney-Sussex College, Cambridge; took his degree about 1688; became a fellow of Sidney-Sussex; took orders in the Church of England; made a careful study of the works of Origen; wrote *The Old Apology for the Truth of the Christian Religion against the Jews and Gentiles revived* (1705), in which he maintained, ostensibly in the interest of Christianity, that many seemingly historical portions of the Bible, including the Pentateuch, are to be interpreted allegorically, Moses and his miracles being merely types of Christ; was deprived of his fellowship 1721 on account of the scandal occasioned by his writings; published *The Moderator between an Infidel and an Apostate: or the Controversy between the Author of the Discourse of the Grounds and Reasons of the Christian Religion* [Anthony Collins]; and his *reverend ecclesiastical opponents; set in a clear light* (1725) and *Six Discourses on the Miracles of our Saviour* (1727-29), addressed to six bishops, in which he maintained the allegorical character of those miracles. Woolston was in consequence indicted for blasphemy at the instance of the attor-

ney-general, tried, and convicted at the Guildhall, London, Nov., 1729, fined £100, imprisoned for a year in the King's Bench prison, and failing to provide security for not repeating the offense, spent the rest of his life within the rules of that prison, dying Jan. 21, 1731. He was probably somewhat deranged. See his collected works with *Life* (5 vols., London, 1733). Revised by S. M. JACKSON.

Wool-tree: See ERIODENDRON.

Woolwich, wŏol'ich: town; county of Kent, England; on the southern bank of the Thames; 9 miles below London Bridge (see map of England, ref. 12-K). It extends for a distance of 2 miles along the river. This is also the seat of the chief arsenal of England, covering over 100 acres, and contains all the different kinds of workshops in which cannons, bombs, shells, etc., are made. It has the Royal Military Academy and extensive barracks. (See MILITARY ACADEMIES.) Woolwich is now a part of London. Pop. (1891) 40,848, and of the parliamentary borough, returning one member, 98,976.

Woonsock'et: city; Providence co., R. I.; on the Blackstone river, and the N. Y. and New Eng. (now New Eng.) and Prov. and Worcester Div. of the N. Y., N. H. and Hartford railways; 16 miles N. by W. of Providence and 37 miles S. W. of Boston (for location, see map of Rhode Island, ref. 7-N.). It is a consolidation of what were isolated factory villages; hence its streets are irregular, but not without beauty. A century ago the region now called Woonsocket was a wilderness. The village then called Woonsocket, and which contained the post-office, bank, tavern, etc., of the locality, has not only relinquished these institutions, but is now not even included within the limits of the city to which it gave its name. The present Woonsocket was set off as a town from Cumberland in 1867, enlarged by the addition of a part of Smithfield in 1871, and incorporated as a city June 13, 1888. The river is here crossed by a magnificent bridge whose construction cost \$300,000. Woonsocket has three parks and a fair-ground, and a soldiers' monument gives name to the principal square. The leading industries are cotton, woolen, and rubber manufactures, with an aggregate capital of \$4,500,000, and giving employment (1895) to 5,646 persons; besides these there are several machine-shops, a sewing-machine, wringing-machine, shuttle, reed, harness, and bobbin factory, and extensive gas and electric plants. The water-works has a daily capacity of 3,000,000 gal. The city contains 6 national banks, with an aggregate capital of \$850,000, and 4 savings institutions with deposits of about \$8,000,000. Woonsocket has 18 school-houses, with 75 teachers and 2,500 pupils, besides 1,800 who attend the parochial schools and 45 in a kindergarten. There are 3 Roman Catholic churches, 2 Episcopalian, while the Baptists, Methodists, Congregationalists, Presbyterians, Universalists, and Second Adventists have one each. The Friends meeting-house is just outside the city limits, on a site which has been owned by them for more than a century. The city also has a free public library of about 13,850 volumes, one weekly and 3 daily newspapers, 2 opera-houses, and 3 hotels. The assessed valuation in 1894 was \$13,862,150, its rate of taxation \$0.0135, and its net debt, including water bonds, \$1,371,426. Pop. (1880) 16,050; (1890) 20,830; (1895) 24,468. ERASTUS RICHARDSON.

Woorari, or Woorara: See CURARI.

Wooster: city (founded in 1808); capital of Wayne co., O.; on the Balt. and Ohio and the Penn. railways; 25 miles W. of Massilon, 52 miles S. S. W. of Cleveland (for location, see map of Ohio, ref. 3-G). It is in an agricultural region; has 12 churches, high school, 5 ward schools, city-hall, court-house, water-works, electric lights, 2 national banks with combined capital of \$175,000, and a daily, a quarterly, 5 weekly, and 2 monthly periodicals; and has manufactories of pianos, engines, boilers, mill-gearing, flour, furniture, harness, paving-brick, carriages and wagons, and door, sash, and blinds. Wooster is the seat of the Ohio agricultural experiment station, and of WOOSTER UNIVERSITY, a coeducational institution of learning under the control of the Ohio Synod of the Presbyterian Church. The university was founded in 1866 and opened in 1870; its buildings, of brick, cost \$190,000, and its endowment is \$262,000. There are collegiate, preparatory, post-graduate, and music departments, besides a medical department located at Cleveland. The instructors number (1895) 69; students, 850; and collegiate alumni, 765. Pop. (1880) 5,880; (1890) 5,901; (1895) estimated, 7,500. EDITOR OF "REPUBLICAN."

Wooster, DAVID; soldier; b. at Stratford, Conn., Mar. 2, 1710; graduated at Yale College 1738; commanded a sloop-of-war in the expedition against Louisburg 1745; went to Europe in charge of a cartel-ship; visited England; was presented at court and made a captain in Pepperell's regiment; was appointed colonel of the Third Connecticut Regiment 1755; served as brigadier-general in the northern campaigns of 1758-60; was one of the originators of Arnold's expedition for the capture of Ticonderoga Apr., 1775; was appointed brigadier-general June 22, 1775; succeeded to the command in Canada on the death of Montgomery; became major-general of State militia 1776; mortally wounded in the defense of Danbury against Tryon, dying there May 2, 1777. A monument was erected by the State in 1854.

Worcester, wōos'ter, or **Worcestershire** [*Worcester* is O. Eng. *Wircworceaster*, liter., camp of the Huiccii; Lat. *Huicci*, name of a people in Britain + *castra*, camp]: an inland county of England, on both sides of the Severn and its affluent, the Avon. Area, 751 sq. miles. The surface is undulating and well wooded; the elm grows luxuriantly, and has received the name of the weed of Worcestershire; fruit-trees also succeed well. Wheat, hops, vegetables, and pears are extensively cultivated. Coal and iron abound, and about one-third of the inhabitants are engaged in mining. Among the different manufactures which are carried on are those of carpets at Kidderminster, the most remarkable, glass and iron wares at Dudley and Stourbridge, gloves, porcelain, needles, and fish-hooks. Pop. (1891) 413,760.

Worcester: city of England; capital of Worcestershire; on the Severn; 27 miles by rail S. W. of Birmingham (see map of England, ref. 10-G). The principal feature is the cathedral, which, founded in 679, was rebuilt after 1084 and restored since 1857. It is principally Early English and decorated in style. It is 410 feet long, 126 feet wide, and 60-67 feet high. Tanning, currying, dressing, and staining of leather, glove-making, the manufacture of porcelain, vinegar, sauce, and chemicals are the principal branches of industry, and several of them—as, for instance, those of sauce, china, and gloves—enjoy a great reputation. Worcester returns one member to Parliament. Pop. (1891) 42,905.

Worcester: city; capital of Worcester co., Mass.; on the Blackstone river, and the Boston and Albany, the Boston and Maine, the Fitchburg, the N. Y. and N. Eng., the N. Y., N. H. and Hart., and the Wor. and Shrew. railways; 44 miles W. of Boston (for location, see map of Massachusetts, ref. 3-G). The settlement, begun in a valley, has spread over and beyond adjacent hills, and the natural advantages for beauty, health, and convenience are unsurpassed.

Plan and Government.—The principal business thoroughfares are Main Street, running generally from N. to S., about 3 miles, and having most of the largest and finest business blocks and trades-houses extending for half its length; and Front Street, running E. from the common to the Union railway station, one-third of a mile. The city is well supplied with pure water, and there is an extensive sewerage system. An extensive electric-railway system accommodates all parts of the city and communicates with some of the adjoining towns. There are 11 public parks, aggregating 360 acres. The city is divided into 8 wards, the boundary-lines of which diverge from the center like the spokes of a wheel. The government is vested in a mayor, 9 aldermen, and a common council of 24 members. The total appropriation for city maintenance in 1895 was \$1,116,990. The property valuation in 1894 was \$86,397,576, the net debt \$2,535,719; tax-rate, \$15.20 per \$1,000. There are 7 banks for discount and a safe deposit and trust company with a capital of \$2,450,000, and 5 savings-banks with deposits of over \$26,000,000.

Churches, Schools, etc.—Worcester possesses few striking specimens of architecture; Mechanics' Hall building and the stone court-house are the only ones of classic pretensions. Other important buildings are the Armory, the new U. S. building, the Oread Institute, the Worcester Academy buildings, Holy Cross College, and CLARK UNIVERSITY (*q. v.*). There are 73 church organizations and 64 edifices. Of these, 16 are Orthodox Congregational, 3 Unitarian, 10 Baptist, 11 Methodist Episcopal, 10 Roman Catholic, and 4 Protestant Episcopal. The schools of Worcester are noted for their excellence. The number of pupils registered in 1894 was 17,604; average attendance, 13,099; teachers employed, 471; appropriation for school maintenance in 1895, \$415,000.

450

There are 2 high schools—the Classical and the English. Six parochial schools are maintained by the Roman Catholic Church, three of which are French, with a total of 3,000 pupils. There are also several excellent private schools. The higher educational institutions are the Roman Catholic College of the Holy Cross, founded in 1843, the Polytechnic Institute for practical training (see WORCESTER POLYTECHNIC INSTITUTE), the State Normal School, the Worcester Academy, and Clark University. The Free Public Library, with a circulating department and a reading-room, has a total of 100,000 volumes. The library of the American Antiquarian Society contains 100,000 volumes. Various smaller libraries with the above make a total of 305,000 volumes for public use. There is an active and prosperous Mechanics' Association, whose hall is one of the finest in the U. S. The Agricultural and the Horticultural Societies, the Worcester County Musical Association, the Natural History Society, and The Worcester Society of Antiquity are prominent organizations. There is a flourishing board of trade. The principal social clubs are the Worcester, the Commonwealth, the Hancock, and the new South End. The Y. M. C. A. and the Y. W. C. A. own each a fine building. Four daily papers and several weekly and other periodicals are published.

Charitable and Benevolent Institutions.—The City Hospital for general medical and surgical cases and the Washburn Memorial Hospital for the treatment of women and children are well endowed. There is also a Homœopathic Hospital and several private ones. Two State hospitals for the insane are located here. The State Odd Fellows' Home was opened in 1892, and there are homes for aged men and women, orphan asylums, and many other charitable establishments. The county jail is the only penal institution.

Manufactures.—Worcester produces a greater variety of manufactured articles than any other city in the U. S. The wire-mills of the Washburn & Moen Company are the largest in the world, employing 4,000 persons. Loom manufacture comes next in importance. One-third of the envelopes used in the U. S. are made here. The boot and shoe industry is extensively carried on. Every kind of machine used in a woolen or cotton mill is made here. There are nearly 1,100 manufacturing establishments, with \$26,000,000 capital, employing 22,000 persons, who receive nearly \$12,000,000 per annum in wages. Material to the value of \$21,000,000 is used in manufacturing, and the total output has a value of \$39,000,000.

History.—Worcester was first settled in 1675 under the name of Quinsigamond Plantations. The pioneers were soon driven away by the Indians, and their buildings destroyed. A second settlement in 1684 met the same fate after a few years. In 1713 the third and permanent settlement was made. The first church was organized in 1719, and the town was incorporated in 1722. In 1775 ISAIAH THOMAS (*q. v.*) removed his press from Boston to Worcester, and during 1790-1800 carried on the most extensive publishing business in the U. S. From the steps of the old South church the Declaration of Independence was read for the first time in Massachusetts. The opening of the Blackstone Canal in 1828, and of the railways which superseded it, caused the town to grow rapidly, and it was incorporated as a city in 1848. From its central situation in the State, in its richest agricultural section, Worcester has long been known as the "Heart of the Commonwealth." Pop. (1880) 58,291; (1890) 84,655; (1895) 98,767.

FRANKLIN P. RICE.

Worcester, EDWARD SOMERSET, Second Marquis of; b. at Raglan Castle, England, about 1601, was the eldest son of Henry Somerset, Lord Herbert of Chepstow, created in 1642 first Marquis of Somerset; spent some years in foreign travel; married in 1628; devoted himself to mathematical and mechanical researches at Raglan Castle; entered the military service of Charles I. in 1641, along with his father, raising and commanding a body of troops; was known from 1642 by the courtesy title of Lord Herbert; is alleged to have been created Earl of Glamorgan by Charles I. Apr. 1, 1644; was sent to Ireland as a secret agent of the king to treat with the Irish Roman Catholics 1645; was imprisoned on the discovery of his errand, and at first disowned by the king; was released, and succeeded his father in 1646, and went into voluntary exile in France Mar., 1648; returned to England 1652; was imprisoned in the Tower 1652-55; drew up while in the Tower a little work entitled *A Century of the Names and Scantlings of such Inventions as at*

present I can call to mind to have Tried and Perfected, etc. (1663), in which he describes a steam-engine as "an admirable and most forcible way to drive up water by fire," and spent a large sum of money upon the erection of water-works at Vauxhall. D. Apr. 3, 1667. A well-written account of his *Life, Times, and Scientific Labors* (1865), including a reprint of the *Century of Inventions*, was issued by Mr. Henry Dircks, who also published *Worcesteriana* (1865), consisting of notices of 180 works relating to the marquis or his connections.

Worcester, JOSEPH EMERSON; lexicographer; b. at Bedford, N. H., Aug. 24, 1784; graduated at Yale College 1814; taught school at Salem, Mass.; studied theology two years at Andover Seminary; settled at Cambridge, Mass., 1819, and devoted himself thenceforth to the preparation of a series of valuable text-books and of his dictionary, for which purpose he visited Europe 1830-31. D. at Cambridge, Oct. 27, 1865. Among his works were a *Geographical Dictionary, or Universal Gazetteer* (2 vols., Andover, 1817); *Elements of Geography, Ancient and Modern* (1819; several editions); *Sketches of the Earth and its Inhabitants* (2 vols., 1823); *Elements of History, Ancient and Modern* (1826); *Elements of Ancient Classical and Scripture Geography* (1828); *The American Almanac* (1831-43); a revised edition of Todd's *Johnson's Dictionary* (1828); an abridgment of Webster's *Dictionary* (1829); a *Comprehensive Pronouncing and Explanatory Dictionary of the English Language* (1830); a *Universal and Critical Dictionary* (1846); and his great work, *A Dictionary of the English Language* (Boston, 1860, with 1,000 illustrations).

Worcester, NOAH, D. D.; clergyman; b. at Hollis, N. H., Nov. 25, 1758; received only a common-school education; served three years as fifer and fife-major in the Continental army 1775-77, being present at Bunker Hill and at Bennington; was licensed to preach 1786; was pastor of the Congregational church at Thornton 1787-1809; removed to Salisbury, N. H., 1810, supplying there the pulpit of his brother Thomas until 1813, when he settled at Brighton, Mass.; edited the *Christian Disciple* 1813-19, and a quarterly magazine, the *Friend of Peace*, 1819-29; founded the Massachusetts Peace Society in Jan., 1816; was its secretary until 1828; published *Solemn Reasons for Declining to adopt the Baptist Theory and Practice* (Charlestown, 1809); *Bible News, or Sacred Truths relating to the Living God, His Only Son and Holy Spirit* (Concord, 1810), which was censured by the Hopkinton Association as unsound on the doctrine of the Trinity; *Impartial Review of Testimonies in Favor of the Divinity of the Son of God* (1810), and other controversial treatises against the Trinitarians; *A Solemn Review of the Custom of War* (1814; 11th Amer. ed. 1833); *The Atoning Sacrifice a Display of Love, not of Wrath* (Cambridge, 1829); *The Causes and Evils of Contentions among Christians* (Boston, 1831); and *Last Thoughts on Important Subjects* (Cambridge, 1833). D. at Brighton, Oct. 31, 1837. A *Memoir* (1844) was issued by Rev. Henry Ware, Jr., D. D. Revised by G. P. FISHER.

Worcester Polytechnic Institute; a school of engineering at Worcester, Mass.; founded by John Boynton, of Templeton, Mass., in 1865, by a gift of over \$100,000. This was soon followed by a gift from the Hon. Ichabod Washburn, of a large and very well equipped machine-shop for the training of students pursuing the course in mechanical engineering, and a handsome endowment for the maintenance of the same. Further gifts were received from others, including the Commonwealth of Massachusetts, by means of which extensive buildings were erected, and the annual income of the institute from all sources was made to exceed \$60,000. The buildings occupy a prominent and beautiful location in the city of Worcester, the grounds belonging to the institute including about 11 acres. They are adjacent to a beautiful park in a part of which the right to erect buildings in the future belongs to the corporation of the institute. The principal buildings are Boynton Hall, the Washburn machine-shops, the Salisbury laboratories of physics and chemistry, the large and completely equipped Engineering laboratory built by funds appropriated by the commonwealth, the Power laboratory, magnetic laboratory, etc. There is also an extensive hydraulic laboratory about 4½ miles distant from the other buildings, where there is water-power of 80 horse-power and a completely equipped testing plant, including turbine wheels, a large Venturi and other meters, weirs, water-rans, and other apparatus. There are five courses of study, i. e. civil engineering,

mechanical engineering, electrical engineering, chemistry, and general science. The institute confers the degree of Bachelor of Science. There are (1895) about 33 instructors and 225 students. Its graduates are almost entirely employed in the various branches of engineering, a few having become teachers and college professors. One of the distinctive characteristics of the school is the thorough practical training which it gives in the Washburn shops to students of mechanical engineering. The constructive idea is dominant. From the beginning every student works on some part of a machine which he afterward assembles, and the whole is subjected to the actual tests of practical use. In this way the invention, design, construction, test, and use of machinery are systematically taught. The extensive laboratories of physics, electricity, chemistry, and engineering are managed in harmony with the same general principle. T. C. MENDENHALL.

Word [O. Eng. *word*; O. H. Germ (> Germ.) *wort*; Icel. *orð*; Goth. *waitrd* < Teuton. *word-* < Indo-Eur. *uǵdhom* > Lat. *verbum*, word; Lith. *vardas*, name]; the smallest detachable portion of a sentence, i. e. the smallest sentence-segment which, when abstracted, still suggests its possible sentence functions. The term has two senses: (1) *particular word*, the single concrete utterance in an actual sentence, e. g. *book*, in *give me the book*; (2) *general word*, or the psychical word-picture generalized out of, and serving as substrate to, all the concrete occurrences of identical or similar forms, e. g. Eng. *book* vs. Fr. *livre*. In both these senses the real word may be different from our naming of it, e. g. in *I'd go if I could*, the second and fourth real particular words are 'd and 'f, their names are *would* and *if*; the real general Eng. word "u" is named *and*. See ABLAUT.

Sentences as Words.—Actual language consists always of sentences. The real particular word exists only as an organic part of an actual sentence, and the real general or psychical word only as implicitly capable of filling one or more places in any appropriate sentence type. In primitive language (whether individual or racial) the sentence is an undivided whole, and words and sentences are identical ("incorporating" languages). Individual parts may have a clearly felt force, but the native mind does not recognize their sentence function when abstracted; e. g. Massachusetts (Indian) *wut-oppesitugussun-nooveht-anuk-quoh*, lit., he-came-to-a-state-of-rest-on-bended-knees-doing-reverence-to-him; Acedian *in-bat*, he-opened, *in-nin-bat*, he-opened-it, *in-sub-sabe*, he-built-a-building; Basque *didac*, I-have-it-for-you, *dizud*, you-have-it-for-me. Purely pronominal sentences often remain incorporating (i. e. single words) even in highly developed inflectional and agglutinative languages, e. g. Arab. *agfala*, he caused to kill; Congo *wamvondisa*, he caused him to kill. Word-order in Japanese is the same as if the whole sentence were still one compound word. In all languages a large class of emotive (and volitive) sentences must always remain sentence-words, because the emotive psychical states, and hence the sentences expressing them, do not admit of sub-organization, e. g. *psshaw! horrors! shoo!*

Sentence-members as Words.—Speakers of every language in time develop a limited number of *sentence-types* or generalized psychical pictures of sentence-structure. Every actual sentence must thereafter approximately embody one of these types, and consist of *sentence-members* conforming to the general structure-picture, e. g. *the boy—runs, the rain—felt in torrents* are both sentences of the "simple declarative" type having as members a subject and predicate; *the man—who saw him—told me* is of the complex declarative type, etc. As fast as these psychical types succeed in reshaping language, sentence-members take the place of sentences as words (polysynthetic languages), e. g. Magyar *kesem*, my-knife; Lhotá *Nagá öyán*, village, *níyán*, your-village, *yántzú*, large-village, *kyóntzúyán*, all-villages, *yándra*, small-village, *yánthamo*, another-village; *áná tsó*, I will-eat, *áná tsolám*, I will-eat-again, *áná tsótem*, I will-eat-first, etc.

Significant Sentence-portions ("Phrases") as Words; "Stems" and "Inflection."—Sentence-members are in turn capable of sub-organization into what we may call significant portions. One significant portion may indeed constitute a whole member, e. g. (*the-boy*)—*walks*, but more often thoughts and feelings and our linguistic expression of them are complex, e. g. *the shepherd—strokes + the dog's + back + with-his-hand, the boy—went-away + without-getting + what-he-came-for*. Here *stroke-s, with-his-hand, what-he-*

came-for, etc., are significant sentence-portions within the larger sentence-members. As the speaker comes to regard these portions as *separable* components of the sentence, and unconsciously reshapes his language accordingly, words begin to coincide normally with sentence-portions (inflectional languages), e. g. Gr. ὄρνιθα πέτρα βάλλει, lit., the-bird with-a-stone he-hits; Lat. dorsum cum manu remulcel pastor, the-shepherd stroke-s the-dog's back with-his-hand; Eng. John's ship ran aground = the-ship-of-John did-run on-the-ground.

In this stage of language different particular words associate themselves as "forms" under one general word, e. g. I, me, we, us are forms of I; am, was, etc., are forms of be, etc. Usually the different forms of a word come to closely resemble each other (see ANALOGY), and then their common portion comes to be felt as a "stem" whose variations are felt as "inflections." Stem and inflections may be completely fused (e. g. Arab. aylala, Eng. men) or completely analyzable (Gr. ἐ-λύ-θη-ν, I-did-get-released, lit., did-released-get-1), but if detached retain no sentence function.

Sentence-elements as Words; "Roots," "Affixes."—Sentence-portions having resembling significance (whether different words or forms of the same word) constantly tend to form association groups, and in the end (see ANALOGY) to acquire resembling forms, with constant variations for the expression of like variations in meaning, relation, or function. The constant part then becomes a "root" (e. g. sorrow in sorrow and sorry, str-ug in strong and strength)*. When the variation in form is not completely fused with the root, it then becomes an affix (either prefix, suffix, or infix), e. g. -y in sorry, etc. As fast as this analysis succeeds in expressing itself in the sentence-structure, roots, or both roots and affixes, become detachable as words. Three stages of development arise: (1) Either the significant root (or stem) alone or the root and affix together constitute a word, but the affix alone does not (agglutinative languages), e. g. Sanskr. sarva- or sarva-s, all; in Congo tua-ki-vangidi, lit., we it male, vangidi alone is a word, or tua-ki-vangidi is one word, but neither tua nor ki nor tuaki are words; Eng. home-ward, etc. (2) Both significant root and relational root are words (analytic languages). (3) Significant, relational, and mechanical roots are all words (isolating or root languages). Examples: he gives food to you (all significant and the relational to are words, but the mechanical s is not); Jap. tsuki ga hikaru, the moon shines, kono kodomo wa yokunakatta, this boy was not good (all significant and the relationals [nominative particles] ga and wa are words, but mechanicals -na-, not, -katta, was, are not words); Eng. the moon is bright, this boy was not good (all elements words).

"Cognates," "Derivates"; *Compound Words*.—Words felt as having a common root are called cognates. If the root is felt to be practically identical in form with one of a group of cognates, this is regarded as a *primate* (or *primitive*) to which the rest are *derivates* (or *derivatives*). Logically, derivation implies some change or addition to the concept expressed by a word.

Paulful, church-sleeple, pickpocket, foretell, forget-me-not, etc., are examples of compound words. In English nearly all parts of speech are freely compoundable with each other, as in the examples above (noun + adj., noun + noun, verb + noun, adv. + verb, verb + pron. + adv.). Compounds may be (1) copulative, with both members on an equal footing, e. g. The THOMPSON-HUTCHINSON Co.; (2) determinative, with one (in Eng. the former) member serving as a modifier of the other, e. g. wind-mill, ill-gotten; (3) secondary adjective, e. g. a THREE-FOOT rule, uphill work, etc. As a rule, logical derivation (see above) and fusion of meaning subsists between the members of a compound, but this makes them one word only as it makes them fill the place of one word in sentence-structure. With exactly the same juxtaposition and fusion (or lack of fusion) of meaning, groups that must be compounds in one language can not be so in another, e. g. Sanskrit copulatives would not be compounds in an uninflectional language; Germ. steinbrücke is a compound, but Eng. stone bridge is not, because stein by itself can not suggest adjective function, but stone can; Chin. min li = Gr. δημοκρατία, lit., people-power, but the former is not a compound, because min alone suggests adjective function.

ROBERT J. KELLOGG.

Worde, wawrd, WYKIN, de; printer; b. probably at Worth, Belgium, about 1455; was an assistant to Caxton in his first

* Root is used here to include the narrower term stem.

English press at Westminster, and after his master's death (1491) succeeded to the business; made many improvements in the art; introduced Roman letters and many fonts of different sizes, which he sold to other printers; was the first to adopt title-pages and to employ Greek characters; enjoyed the patronage of the Queen-dowager Margaret, and was an intimate friend of Richard Pynson. He had printed 408 works, many of them being school-books; all remarkable for neatness and elegance. The best specimens of his press are Higden's *Polyconicon* (1495) and Stephen Hawes's *Pastime of Pleasure* (1517). D. after 1535.

Worden, JOHN LORIMER; rear-admiral U. S. navy; b. in Westchester co., N. Y., Mar. 12, 1818; entered the navy as midshipman Jan. 10, 1834; commanded the Monitor in her famous fight with the Merrimack Mar. 9, 1862, and the Montauk in the attacks on Fort McAllister of Jan. 27 and Feb. 1, 1863, and in the first Fort Sumter fight of Apr. 7, 1863. By his heroic conduct in the engagement with the Merrimack, Worden gained a worldwide reputation. Toward the close of that action a shell, exploding against the pilot-house of the Monitor, fractured one of the great iron logs of which it was composed, and filled his eyes with powder, so that for a long time he was blind. He was promoted captain Feb. 3, 1863; was on duty at New York connected with the iron-clads 1863-66; commanded the Pensacola in the Pacific squadron 1866-67; was promoted to the rank of commodore May 27, 1868; superintendent of the Naval Academy 1870-74; commissioned rear-admiral Nov. 20, 1872; commander-in-chief of the European squadron Feb. 3, 1875, to Dec. 23, 1877; served as member of the examining board and president of the retiring board; retired at his own request Dec. 23, 1886.

Wordsworth, CHARLES, D. C. L.; bishop; son of Rev. Dr. Christopher Wordsworth (1774-1846); b. at Bocking, Essex, England, Aug. 22, 1806; educated at Harrow School and at Christ Church, Oxford; took his degree 1830, gaining a studentship and two chancellor's medals; took orders in the Church of England; was a tutor at Cambridge 1830-33, having among his pupils W. E. Gladstone and Cardinal Manning; was second master of Winchester College 1835-46, and first warden of Trinity College, Glenalmond, Perthshire, Scotland, 1846-54; contributed largely to the establishment of that institution on a firm basis, and built the college chapel (costing £8,800) at his own expense; became bishop of the united dioceses of St. Andrews, Dunkeld, and Dunblane 1853; distinguished himself by his efforts to procure "a united Church for the United Kingdom," and by his vindications of the Anglican doctrines, and was one of the "New Testament Company for the revision of the authorized version of the Bible." D. in London, Dec. 5, 1892. He was the author of numerous theological and critical treatises, including *Shakespeare's Knowledge and Use of the Bible* (London, 1864; 3d ed. 1880), and of a Greek grammar in extensive use, *Græce Grammatica Rudimenta* (1839; 19th ed. 1868). See his autobiography to 1856, *Annals* (2 vols., 1891-93; vol. iii. promised). Revised by S. M. JACKSON.

Wordsworth, CHRISTOPHER, D. D.; clergyman and author; youngest brother of William Wordsworth; b. at Cockermonth, Cumberland, England, June 9, 1774; studied with his brother at Hawkes-head School, Lancashire, also at Trinity College, Cambridge; took his degree 1796; was elected a fellow of Trinity 1798; took orders in the Church of England; became chaplain to the Bishop of Norwich, subsequently Archbishop of Canterbury, 1802; rector of Ashby, Norfolk, 1804; dean of Bocking, Essex, 1808; rector of St. Mary's, Lambeth, and of Sundridge, Kent, 1815; exchanged the two last-named livings for the rectory of Buxted, Sussex, 1820; was master of Trinity College, Cambridge, 1820-41; and was instrumental in adding the new quadrangle or "court" to that famous seat of learning. D. at Buxted, Feb. 2, 1846. He was the author of *Ecclesiastical Biography* (London, 6 vols., 1810; 4th ed. 4 vols., 1853); *Who Wrote Eikon Basilikè?* (1824-25, 2 parts), maintaining the authenticity of that work; *King Charles I. the Author of Ieon Basilike further Proved* (Cambridge, 1828); and *Christian Institutes, selected from the Writings of the Most Eminent Divines of the English Church* (4 vols., London, 1837). Revised by S. M. JACKSON.

Wordsworth, CHRISTOPHER, D. D.; Bishop of Lincoln; son of Christopher Wordsworth and nephew of the poet; b. at Bocking, Essex, England, Oct. 30, 1807; educated at Trinity College, Cambridge; graduated 1830, having twice gained the chancellor's medal for English poems, and having also taken the Browne medals (1828) for the best Latin ode and

Greek epigram; became a fellow 1830; took orders in the Church of England 1833; traveled in Greece 1832-33; prepared *Athens and Attica* (London, 1836; 4th ed. 1869), *Inscriptiones Pompeianae* (1837), and *Greece* (1839; 4th ed. 1867); was head master of Harrow School from Apr., 1836, until Nov., 1844, when he was made canon of Westminster Abbey by Sir Robert Peel; became vicar of Stanford-in-the-Vale, Berkshire, and rural dean 1850; archdeacon of Westminster 1865; was consecrated Bishop of Lincoln Feb. 24, 1869, and took part in the "Old Catholic" congress at Cologne Sept., 1872. D. at Lincoln, Mar. 20, 1885. Among his works are *Theophilus Anglicanus* (1843; later ed. under the title *Elements of Instruction concerning the Church, and the Anglican Branch of it*, 10th ed. 1879); *A Diary in France mainly on Topics concerning Education and the Church* (1845); *On the Canon of the Scriptures of the Old and New Testaments and on the Apocrypha* (1848; 6th ed. 1867); and *Lectures on the Apocalypse* (1849; 3d ed. 1852), being the Hulne lectures for 1847 and 1848 respectively; *Memoirs of William Wordsworth* (2 vols., 1851); *St. Hippolytus and the Church of Rome* (1853; 2d ed. 1880); *The Inspiration of the Bible* (1861; 8th ed. 1875); a volume of hymns, *The Holy Year* (1862; 5th ed. 1868); and *A Journal of a Tour in Italy* (2 vols., 1863); edited *The Correspondence of Richard Bentley* (2 vols., 1842), the works of *Theocritus* (1844), the Greek text of the *Apocalypse* (1849) and of the *New Testament* (4 parts, 1856-60; 2d ed. 1872—his chief work), and *The Holy Bible, with Notes and Introductions* (5 vols., 1864-70)—both these works show rare patristic learning—and was a prominent contributor to Smith's *Dictionary of the Bible*. See his *Life*, by J. H. Overton and E. Wordsworth (1888).
Revised by S. M. JACKSON.

Wordsworth, WILLIAM: poet; b. at Cocker mouth, Cumberland, England, Apr. 7, 1770; the second son of John Wordsworth, attorney-at-law, and his wife Anne Cookson of Penrith. His mother died in 1778 and his father in 1783, leaving William and his brothers ill provided for. John Wordsworth had been agent to the Earl of Lonsdale, who borrowed all his fortune and refused to repay it. The future poet was brought up by his maternal grandparents at Penrith, and went to school at Hawkshead. In Oct., 1787, he proceeded as an undergraduate to St. John's College, Cambridge. In his second vacation he and his friend Jones took the "unprecedented course" of taking a walking-tour in Switzerland, an experience long afterward described in *The Prelude*. Wordsworth took his B. A. degree in Jan., 1791, and left Cambridge; later in the same year he paid a visit of more than a year to France. With very limited resources, and still uncertain of his genius, Wordsworth lingered in England without a profession. At length, toward the end of 1794, he was relieved from the absolute necessity of working by a legacy from a young friend, Raisley Calvert. In 1795 his admirable sister joined him, and they settled at Racedown, in Dorset. His earliest publications, *The Evening Walk* and *Descriptive Sketches*, written in the old-fashioned style of the preceding century, had appeared in 1792; he was now determined to be a poet, but his style came to him slowly. Coleridge became his friend in 1797, and in July of that year the Wordsworths removed to Alfoxden, in Somersetshire, to be near Coleridge at Nether Stoway. Here the greater part of the *Lyrical Ballads*, published at Bristol in 1798, was composed. On the appearance of this volume the Wordsworths immediately left for Germany, and spent the winter at Goslar. Here Wordsworth wrote some of the finest and most characteristic of his poems, and here *The Prelude* was planned and begun. Returning to England in the spring of 1799, the poet and his sister determined to settle in their own ancestral country, whose lakes and mountains had left an indelible stamp on the whole surface of Wordsworth's imagination. He settled in a cottage at Townend, Grasmere, "the lovely cottage in the guardian nook." From this time forward the life of Wordsworth, although to be prolonged for more than half a century, was to be almost without external incident. In 1800 he issued a new edition of the *Lyrical Ballads*, with a second volume of unpublished and mature poems. In 1802 he married Miss Mary Hutchinson, of Penrith, a lady of refined character and devoted amiability. His tours now take importance in his career because they stimulated him to direct poetic production. In 1802 the Wordsworths went to France, in 1803 to Scotland; the *Diary* of Miss Wordsworth on the latter occasion is a valuable document which was first published three-quarters of a century later. In 1803 Wordsworth formed the acquaintance

of Sir George Beaumont, the painter, who was visiting Coleridge at Greta Hall. The baronet, who lived till 1827, became one of Wordsworth's few intimate friends. Beaumont presented to him a piece of land at Applethwaite, near Keswick, hoping to persuade him to move there, but the poet clung to Grasmere. On the birth of his fourth child in 1808, Wordsworth left his cottage and moved to Allan Bank, and then, in 1811, to the parsonage of Grasmere, where he lived for two years. In the spring of 1813 Lord Lonsdale appointed the poet distributor of stamps for the county of Westmoreland, and Wordsworth moved into the more commodious residence of Rydal Mount, near Ambleside. A more lucrative local post he afterward declined. The remainder of his life was spent at this house of Rydal. In 1814 Wordsworth published the long and elaborate poem of *The Excursion*, in which his poetical philosophy was for the first time put strenuously before the public. This didactic epic was received at first with scant respect, and even with open ridicule, but it soon became accepted as one of the masterpieces of English poetry. In 1815 appeared a collection of Wordsworth's lyrical poems, arranged upon a new plan, and in two essays, prefixed and appended to this volume, he developed his theory of poetic art. A second tour had been taken in Scotland in 1814, and had, as usual, stimulated the poet to write. But his finest gift, that of solemn and penetrative melody, was now about to leave him for ever, and after 1820, if not after 1816, he can scarcely be held to have added to what is exquisite in English literature, although he continued to be earnest, forcible, and sometimes stately in his verse. In 1815 he published the romantic narrative of *The White Doe of Rylstone*; in 1819 *Peter Bell* and *The Waggoner*, two juvenile studies in somewhat affected excess of simplicity; in 1820 the series of sonnets entitled *The River Duddon*; in 1822 a first draft of those *Ecclesiastical Sonnets* which long entertained his middle life; in 1825 a rather barren volume named *Yarrow Revisited*. In 1842 he rearranged his *Poems chiefly of Early and Later Years*. The serenity of his life was troubled in 1832 by his sister's mental decay, and in 1834 by the death of Coleridge. But he was now enjoying a tardy celebrity; the University of Oxford conferred upon him in 1839 the degree of D. C. L., in 1842 he received a pension of £300 a year from the civil list, and in Mar., 1843, succeeded Southey as poet-laureate. His only remaining work of importance was the *Two Letters*, on the railway projected between Kendal and Windermere, against which scheme he eloquently protested in 1844. In 1847 he lost his favorite daughter, Dora Quillinan. Wordsworth died of pleurisy, at Rydal Mount, Apr. 23, 1850, and was buried among the dalesmen in Grasmere churchyard. His great poem *The Prelude* was published posthumously in 1850, and *The Recluse* not till 1888. *A Life of Wordsworth*, by Dr. Christopher Wordsworth, in 2 vols., was issued in 1851, and a new edition of his poems, in 6 vols., in 1865. In 1876 the Rev. A. B. Grosart published the prose works, in 3 vols. Mr. F. W. H. Myers's sympathetic memoir dates from 1881. In 1882 Prof. W. Knight began to issue an elaborate edition of the poetical works, of which the eighth and last volume appeared in 1886.
EDMUND GOSSE.

Work [O. Eng. *weorc, worc*; O. H. Germ. *were* (> Mod. Germ. *werk*); Icel. *verk*; Goth. *gawairki*; Gr. *εργον*, work]; a term used in mechanics to express the effect produced by a force in causing a definite change of position of a body. In the case of gravity the work done is estimated by the product of the weight of a body and the vertical distance moved through by its center of gravity—that is, if W is the weight and h the vertical distance, the work done is Wh . Hence it appears that the work done depends upon the initial and final positions only. For instance, the work done in raising a body through a vertical height is the same as that expended in drawing the body up an inclined plane of the same height, provided the effect of friction is neglected.

In general, the work done by a force P is expressed by $\int P \cos \theta ds$, where θ is the angle between the force and the infinitesimal line (of length ds) along which the point of application moves. Hence if X, Y, Z are the components of P parallel to rectangular axes, since we have

$$P \cos \theta = X \frac{dx}{ds} + Y \frac{dy}{ds} + Z \frac{dz}{ds},$$

we get the work done equal to

$$\int (Xdx + Ydy + Zdz).$$

Workhouse: See PAUPERISM.

Workington: town; county of Cumberland, England; on the Derwent, near its mouth; 7 miles N. of Whitehaven (see map of England, ref. 4-E). It has a good harbor lined with convenient quays, furnished with a breakwater, and provided with docks. Breweries, distilleries, and factories for the manufacture of sailcloth, cordage, and chemicals are in operation, and large quantities of coal from the rich collieries of the vicinity are exported. A Sheffield steel-foundry was transferred here in 1883. Pop. (1891) 23,522.

Worksop: town; county of Nottingham, England; on the Ryton; 16 miles E. S. E. of Sheffield (see map of England, ref. 7-I). Malting, brass and iron founding, and manufactures of agricultural implements are carried on. Pop. (1891) 12,734.

World: the earth from the standpoint of habitability and other material human interests. To the part of the earth habitable by man the Germans have given the name of *Oekonom*. Judging of what is habitable by what is and has been inhabited, this area may be defined as follows: In the Antarctic the entire continent and the adjoining islands are excluded. In the Arctic regions the boundary is irregular. It includes all Norway and Siberia, including Nova Zembla and the New Siberian Archipelago, but not Wrangel island. In North America it includes all the continent, but excludes the most of the American Arctic Archipelago. It has its greatest extension N. on Smith Sound (lat. 80° N.). It includes the entire western coast of Greenland S. of this point, but on the east coast does not reach so high N. by several degrees of latitude. Southern Spitzbergen has been occasionally occupied by Europeans throughout the winter, and the southern part of this archipelago should probably be included in the habitable area. Besides the polar caps the districts absolutely excluded are small and unimportant, consisting of limited areas on high mountains. Several large cities are at elevations of about 7,000 feet above sea-level. Quito is at 9,250 feet, Leadville at 10,200 feet, and Lassa at 14,580 feet. Many hamlets and isolated dwellings are at higher elevations, especially in Central Asia and on the Andes. With toleration created by habit, life can be comfortably supported at 14,000 feet elevation, but at 20,000 feet it is supported with difficulty, and at 4 miles may be set the limit of habitability in altitude.

The habitable parts of the earth's surface have very varied capacity for supporting life. In the worst of the deserts it is almost, though probably never quite, *nil*. On rich alluvial plains, especially in temperate regions because of their freedom from malarial disease, this capacity reaches its maximum, the average per square mile in Belgium being 550 (1893), in the province of Shantung, China, 557 (official estimate 1882), and for Rampur, a small protected native state in Northern British India, 561 (1891). The average density of population for the entire British possessions throughout the world is thirty-five per square mile, and this is probably a fair average for the entire habitable land area, although its extreme capacity is probably five to ten times as great. This capacity has been greatly increased in the nineteenth century by the advance in civilization. The mastery of steam and electricity accomplished in this time by civilized man has added so greatly to his powers as to make of him almost a new species, and has increased manifold his power to wring his sustenance from nature. It has also powerfully protected him from the agents of destruction, as, for instance, preventing famines by speedy and effective interchange of foods.

One of the most noteworthy and one of the most recent features of man's conquest of the world is seen in the manner in which he has bound it together into one organic whole. Such is the effect of the extraordinary growth of the postal system since 1870. Similar in effect is the system of maritime exchanges now so general and so enormous in volume that a failure of crops in any country is felt throughout the markets of the world. An even better illustration is found in the system of submarine cables. (See map herewith.) The telegraph proved effective by Morse in 1844, and soon covering with a network of wires the land area of the civilized world, was in 1866 extended by Field under the Atlantic Ocean, connecting Europe and America. Since that time these threads of copper, rubber, and steel have bound together the severed masses of land in all directions so effectively that an event in Australia at noon can be read in the New York newspapers at the breakfast table of the same day.

The geographic conquest of the habitable world is nearly complete. The commercial conquest goes hand in hand with the geographic. Eventually must come the economic conquest—that is, the conquest of the earth's surface as a source of sustenance, the utilization of its agricultural and piscicultural capacity to its limit. This is not of such pressing and immediate importance. Congestion of population can yet be at once relieved by emigration, but the economic conquest may be the most important problem a century hence. See also EARTH, GEOLOGY, CLIMATE, etc.

MARK W. HARRINGTON.

World's Columbian Exposition: See COLUMBIAN EXPOSITION, WORLD'S.

Worms, or Vermes [O. Eng. *wyrm*; Germ. *wurm*; Goth. *waúrms*; cf. Lat. *vermis*, Gr. *βόμος*, wood-worm]: a division of the animal kingdom, including a varied assortment of forms without many features in common. As a rule, they have elongate, cylindrical, or flattened bodies, and are without appendages. The present tendency is to restrict the group by removing from it the PLATHELMINTHES, TUNICATA, and ENTEROPNEUSTA (qq. v.), and as thus limited they may be defined as having, with few exceptions, bilaterally symmetrical bodies, with a digestive tract with two openings (mouth and anus) and a circulatory (blood-vascular) system. A body-cavity (coelom) is usually present, and the nervous system, variously developed, always has a principal center (brain) above the throat. Excretory organs (nephridia) are usually present, and serve to carry waste products from the coelom or from the tissues generally to the exterior. The branch *Vermes* is usually divided into the following classes: *Nemertines*, *Nemathelminthes*, *Amelida*, *Rotifera*, *Chaetognatha*, and *Prosopygia*, to which reference should be made for further details. See also PALEONTOLOGY. J. S. K.

Worms, Germ. pron. vŕrms: town of Hesse-Darmstadt, on the Rhine; 20 miles N. W. of Heidelberg (see map of German Empire, ref. 6-D). It is one of the oldest cities of Germany. It existed before the time of the Romans, was the residence of Charlemagne, and the seat of the famous diet before which Luther was summoned in 1521. In 1689 it was taken and sacked by the French, and only the cathedral (see illustration in ARCHITECTURE), a fine structure, built 996-1016, of red sandstone in Byzantine style, and a few houses, escaped destruction. It was soon rebuilt, but it never recovered its former prosperity. It manufactures leather, tobacco, and soap, and in its vicinity is produced the celebrated Rhemish wine called *Liebfrauenmilch*. (For the Concordat of Worms, see CONCORDAT.) Pop. (1895) 28,629.

Wormseed: the name given in the U. S. to the fruit of *Chenopodium ambrosioides*, a wild herbaceous plant, native in the U. S., and most commonly met with in the Southern States. The plant possesses a peculiar aromatic but disagreeable smell. Wormseed is found in commerce in the form of very minute grains, which have the characteristic odor of the plant. When distilled, they yield a volatile oil (*oleum chenopodii*). In Europe the term wormseed (*Semen cinæ*, *Semen santonici*, *Semen-contra*) is given to the small unexpanded flowers of *Artemisia vahliana*, *A. sieberi*, and *A. inculta*. The first (Levant wormseed) is indigenous in Persia and Asia Minor; the second (African or Barbary wormseed) is found in Persia, Barbary, and Arabia; the third is said to furnish the East Indian wormseed. These varieties contain a volatile oil, an active principle (santonin or santonin acid; see SANTONIN), resin, with extractive matters, and other ordinary constituents of plants. The oil is prepared by distilling wormseed with water, and forms a yellow or brownish-yellow liquid, possessing the peculiar disagreeable odor and aromatic burning taste of the plant. Wormseed is employed in medicine as a vermifuge, but lately santonin has been generally used in its place. In the U. S. the seeds and oil of *Chenopodium ambrosioides* are most generally employed as an anthelmintic remedy.

Revised by H. A. HARE.

Wormwood [corrupted under influence of *wood* from M. Eng. *wermode* < O. Eng. *wermōd*; Germ. *wermuth*, whence the Fr. has *wormout*]: the leaves and flower-tops of the *Artemisia absinthium*, a perennial plant indigenous in Europe, but naturalized in the U. S. It possesses a strong, peculiar odor and a very bitter unpleasant taste, which are imparted to its aqueous and alcoholic infusions. The dried plant furnishes by distillation a dark-greenish oil (*oleum absinthii*, C₁₀H₁₆O), which is isomeric with ordinary camphor,

has a specific gravity of 0.932, and possesses the odor and taste of the plant. The bitter principle of wormwood (*absinthin*, $C_{20}H_{26}O_4$) forms a yellow, pulverulent mass, is neutral to test-papers, and has the odor and taste of wormwood. The remaining constituents of wormwood are chlorophyll, albumen, fibrin, lignin, starch, and saline matters. It is occasionally employed externally in medicine as an antiseptic and discentient, and was formerly used also as a tonic. The volatile oil of wormwood, upon which its active qualities depend, possesses narcotic properties, and if given in large dose produces epileptiform convulsions, and even death; when mixed with oil of anise, fennel, etc., and dissolved in alcohol, it forms the well-known *liqueur absinthie* (*q. v.*).

Wormum, RALPH NICHOLSON; writer on fine art; b. at Thornton, Northumberland, England, Dec. 29, 1812; educated at University College, London; became a portrait-painter in London; became lecturer on art to the Government schools of design 1848; librarian to those schools 1852, and keeper and secretary of the National Gallery 1855; author of *A Sketch of the History of Painting* (1846; 4th ed. 1861); *Analysis of Ornament* (1856); *The Epochs of Painting, a Biographical and Critical Essay on Painting and Painters of All Times* (1864); and *a Life of Holbein* (1867); edited the *Lectures on Painting* by the Royal Academicians Barry, Fuseli, and Opie (1848). D. at Hampstead, Sept. 15, 1877.

Worsaae, FORSIV, JENS JACOB ASMUSSEN; archaeologist; b. at Veile, Jutland, Denmark, Mar. 14, 1821; studied theology and law at Copenhagen, Scandinavian history and archaeology; traveled in Great Britain and Ireland, France, Germany, and Italy, and was appointed Professor of Northern Archaeology at the University of Copenhagen in 1854; director of the Museum of National Antiquities in 1861; and Minister of Public Education 1874-75. His principal works are *Danmarks Oldtid* (Copenhagen, 1843; translated into English by W. J. Thoms as *The Primal Antiquities of Denmark*, 1849); *Minder om de Danske og Nordmændene i England, Skotland og Irland* (1851; translated into English as *An Account of the Danes and Norwegians in England, Scotland, and Ireland* (1852); *Den Danske Erobring af England og Normandie* (1863); *Om Danmarks tidligste Bebyggelse* (Concerning the Earliest Settlement of Denmark (1861); *Nordens Forhistorie* (The Primitive History of the North, 1881) etc. One work is translated into French—*La Colonisation de la Russie et du Nord Scandinave, etc.* (1875). D. at Holbæk, Zealand, Aug. 15, 1885.

Revised by D. K. DOBGE.

Worship [*M. Eng. worscheipe, wurdscipe* < *O. Eng. weorðscipe*, honorableness, honor; *weorð*, worth, honor + *-scipe*, -ship]; the chief act of religion, and its natural expression. It is performed in various ways, from fetishism, the lowest form of human worship (see FETTER), to the highest adoration of him who is the Supreme Spirit.

The objects of worship are God, angels, spirits of ancestors, saints, powers and objects of nature such as the sun, moon, and stars, relics, pictures, idols, etc. Of the natural objects the sun enjoyed the greatest favor. The worship of Apollo, so popular among the Greeks, was really sun-worship. Among the Phœnicians the sun was the center of their cultus, so with the Sabæans; so with the Incas in Peru; and with many other tribes more or less advanced in civilization. The Schoolmen emphasized the distinction between *latría* (service), rendered only to God, and *idolatria*, rendered to images. (See IDOLATRY.) Later distinctions have been added—viz., *dulia*, to saints and angels—*hyperdulia*, to the Virgin Mary.

Every pagan worship centers in sacrifices. (See PAGANISM.) They are offered to propitiate the divine favor and under a sense of guilt, or in thanksgiving, or to secure mercy and favor, or sometimes to serve as food or drink for the gods. Human sacrifices are offered under the notion that the most precious gift will buy the largest favor. As fire is deemed purifying, mysterious, and sacred, the highest sacrifice is by burning. Similarly, in the Old Testament, sacrifice appears at first as an expression of faith in a present God, as an act of propitiation and thanksgiving, and a pledge of a covenant. Blood is the life; therefore the best sacrifices are bloody. The offerings were of "clean" domestic animals, grain, fruits, wine, oil, etc., offered on altars of stone and earth or metal, in sacred places, under trees, groves, on "high-places"; later in the tabernacle and the temple. Sacred times were sabbaths, new

moons, the feasts of the Passover, Pentecost, Atonement, Tabernacles, Trumpets, Jubilee, Dedication, and Purim. (See FEAST.) In the completed temple-service to sacrifice were added prayer, praise, instrumental and vocal music, instruction, purification; also circumcision, vows, tithes, etc. The synagogue-service, in which prayer took the place of the sacrifices of the temple, consisted of (1) prayer, with written forms; (2) reading of Scripture in three parts—(a) Shema (three extracts from Numbers and Deuteronomy); (b) the Law; (c) Prophets; (3) expounding the Scriptures. Services were held Saturday, Monday, and Thursday, morning, noon, and evening, and were conducted by the "elders," ministers or "angels," and deacons. See SYNAGOGUE.

The early Christians organized their services on the synagogue model. They met in private houses, or solitary places, or hired halls at any convenient and safe time. No stress was laid at first on a particular order. They read from the Old Testament, explaining the passage in free discourse, in which at first all could join. They listened to the exhortation of some eye-witness of the Gospel history, or to some letter written by an apostle. Individual gifts were used under the promptings of the Spirit, according to mutual regard and utility. Singing and prayer followed. Then the love-feast (see AGAPE) and the covenant supper were solemnized, the kiss of fraternal love was given, and the voluntary offerings were made. By the end of the second century the service was divided into the *missa catechumenorum*, called "Scripture reading"—in which were psalmody, Scripture lessons, the sermon, and some of the prayers—and the *missa fidelium*, called "prayers." In the latter the prayers, which were all offered at the altar, were for consecration, for the whole Church, for the peace of the world, and all orders of men. There were also the Eucharist, hymns, thanksgivings, and doxologies. (See MASS.) By the third century Christian temples were frequent, and sometimes splendid. They were divided into the porch, nave—where the pulpit stood—and the sacristy. (See CHURCH.) In the fourth century triumphant Christianity built magnificent churches or appropriated public buildings (see BASILICA), and adorned its clergy with peculiar costumes, kindled lights on the altars, used incense, and gave more attention to artistic music and responses. The agape was separated from the Lord's Supper and became a feast. With the union of Church and state the liturgical tendencies were rapidly developed, forms were multiplied, and the ministers came to be held as a peculiar class. See CLERGY.

The public worship of the Church includes—(1) Prayer (see PRAYER), in the vernacular or some sacred though often unfamiliar tongue, written and formal or unstudied, standing or kneeling, rarely prostrate, with uncovered heads, with or without responses. (2) Reading of Scripture. (3) Preaching, exposition, exhortation, etc. (4) Singing, in the words of Scripture or human compositions, with or without instrumental accompaniment, by the congregation, or later by choirs. (See HYMNOLOGY.) "Hymns are prayers in the festive dress of poetry," tendered with music on account of the strong influence it exerts on the emotions. (5) Confession of faith. (6) Voluntary offerings; and (7) sacraments, which universally are two in number, baptism, the initiatory rite, and the Lord's Supper, the rite of witnessing and edification. The latter was celebrated every day, or every Lord's Day, or at longer intervals. In the Greek and Roman Catholic Churches five sacraments are added to them, but they form no proper part of worship. (See SACRAMENT.) Christian worship is held on the Lord's Day, or on daily or on yearly festivals or fasts which commemorate special events.

The liturgical class emphasize the sacrificial side of worship—others, especially the Reformed Churches, the didactic side. A multiplicity of ceremonies is commended, on the ground that they give expression to varied sentiments—that they enliven and increase devotion and piety by moving the senses, and lead the illiterate more easily to a knowledge of the mysteries of religion. It is condemned on the ground that it diverts the attention from the simple principles of worship, and that, as worship is a divine ordinance, nothing is to be allowed except that which is divinely ordained.

Worship implies the ascription of divine perfections to its object, the possession of such perfections giving the only claim for such homage. In the fourth century the worship of saints was developed from the veneration of martyrs. The worship of the Virgin Mary has gradually greatly increased from early days until it forms the distinctive feature

of the modern Roman Catholic Church. The use of images (i. e. statues and pictures) was allowed by the Council of Nice (787), and the adoration of relics by the Council of Trent (1545). See the article **IMAGE-WORSHIP**.

Revised by S. M. JACKSON.

Worsley, PHILIP STANHOPE: poet and translator; b. in Kent, England, about 1832; educated at Cholmeley School, Highgate, and at Corpus Christi College, Oxford, where he was elected scholar 1854, and subsequently fellow; took orders in the Church of England; gained the Newdigate prize for his poem, *The Temple of Janus* (1857); contributed poems to *Blackwood*; published a volume of *Poems and Translations* (1863); *The Odyssey of Homer, translated into English Verse in the Gregorian Stanza* (Edinburgh, 2 vols., 1861-62); and *The Iliad of Homer, translated into English Verse in the Spenserian Stanza* (vol. i., 1865), both of which have taken a high place among the versions of Homer. D. at Freshwater Bay, Isle of Wight, May 8, 1866.

Revised by H. A. BEERS.

Worsted: See **WOOL AND WOOLEN MANUFACTURES**.

Wörth, rört: village of Alsace, with 1,014 inhabitants in 1890; at the junction of the Sulzbach and the Sauerbach (see map of France, ref. 3-1). It is noted as the point where the first decisive encounter took place between the French and German armies Aug. 6, 1870. The principal point in the French position was Fröschweiler, a village on the road between Wörth and Reichshofen. See **FRANCO-GERMAN WAR**.

Worth, WILLIAM JENKINS: soldier; b. at Hudson, N. Y., Mar. 1, 1794; fought in the war of 1812, and rose to the rank of captain in 1815. Appointed colonel of the Eighth Infantry July, 1838, he commanded the northern department during the insurrectionary movement on the Canada border 1838-39. In 1840 he was ordered to Florida, and in 1841 placed in command of the army there. During this and the next year the hostile Seminoles were subdued, and the greater part of them removed to the Indian Territory. For gallantry and highly distinguished services in Florida he was breveted brigadier-general Mar. 1, 1842, and retained in command of the department of Florida until 1846, when again called to the field by the outbreak of the war with Mexico. In the battle of Monterey his command stormed the heights commanding the Bishop's Palace, and carried the palace itself. He further distinguished himself at Cerro Gordo, Churubusco, Molino del Rey, Chapultepec, and in the storming of the city of Mexico. For his services at Monterey, Congress presented him with a sword of honor, and similar testimonials were bestowed upon him by his native State and county, and by the State of Louisiana. D. at San Antonio, Tex., May 7, 1849. A handsome memorial monument was erected by the city of New York at the junction of Broadway and Fifth Avenue, beneath which rest his remains.

Worthen, WILLIAM EZRA: civil engineer; b. at Amesbury, Mass., Mar. 14, 1819; graduated at Harvard College 1838, and prior to 1849 was engaged in hydraulic surveys and constructions in Massachusetts. In 1850 he began work in New York city as an architect and engineer, designed the floating grain-docks for the Erie Railway at Jersey City, the dam over the Mohawk river at Cohoes, many large buildings, and the water-works of several cities. He built the first pumping-engine at High Bridge, New York city, and acted as consulting engineer for several cities and important commissions. He is the author of papers on hydraulic and sanitary subjects, and in 1887 he was president of the American Society of Civil Engineers. He has published *Cyclopaedia of Drawing* (New York, 1857); *First Lessons in Mechanics* (1862); and *Rudimentary Drawing for Schools* (1863).

MANSFIELD MERRIMAN.

Worthing: town; county of Sussex, England; on the English Channel; 10 miles W. of Brighton and 56 miles S. S. W. of London (see map of England, ref. 14-J). It is a fashionable watering-place and winter resort; it has a beautiful promenade along the shore, and a pier 320 yards long. Fruit-growing under glass is extensively carried on. Pop. (1891) 16,606.

Worthington: town (laid out in 1853); Greene co., Ind.; at the junction of the White and Eel rivers, and on the Evans, and Terre Haute and the Pitts., Cin., Chi. and St. L. railways; 46 miles N. E. of Vincennes, 71 miles S. W. of Indianapolis (for location, see map of Indiana, ref. 9-C). It is an important shipping-point for corn, wheat, and live stock, and has 4 churches, public high school, 2 private banks,

2 weekly newspapers, and flour, woolen, planing, and saw mills. Pop. (1880) 1,185; (1890) 1,448; (1895) estimated, 2,100.

EDITOR OF "SEMI-WEEKLY TIMES."

Worthington: village; capital of Nobles co., Minn.; on the Burl., Cedar Rap. and North, and the Chi., Minn., St. P. and Om. railways; 39 miles S. W. of Windsor, 92 miles N. E. of Sioux City, Ia. (for location, see map of Minnesota, ref. 11-B). It is in an agricultural and stock-raising region, near Lake Okabena, and has a public hall, public library, flour-mill, elevator, a State bank with capital of \$50,000, a private bank, and a daily and three weekly newspapers. Pop. (1880) 636; (1890) 1,164; (1895) 1,918.

EDITOR OF "ADVANCE."

Wotton, Sir HENRY: diplomatist and author; b. at Boc-ton or Boughton Malherbe, Kent, Mar. 30, 1568; educated at Winchester School, at New College and Queen's College, Oxford; spent several years (1589-97) on the Continent, and became well acquainted with Italian literature, science, and art; was for some time secretary to Robert Devereux, Earl of Essex, whom he accompanied to Spain and Ireland, and at whose fall (1600) he took the precaution to revisit Italy, whence he was dispatched by Ferdinand I., Grand Duke of Tuscany, to warn King James of a plot against his life 1602; made his way to Scotland in disguise via Norway, under the assumed name of "Ottavio Baldi"; delivered his message to that monarch at Stirling, gaining his favor; returned to Florence; went to England on the accession of James, by whom he was knighted, and sent as ambassador to Venice (1604); was in the diplomatic service almost continuously for twenty years, chiefly at Venice; returned to England with broken fortunes 1624, and became provost of Eton College in 1625. D. at Eton in Dec., 1639. His *Poems* have been many times reprinted, usually in connection with those of Raleigh, but he is best known by his miscellaneous remains, entitled *Reliquiae Wottonianae* (1651), edited by his friend Izaak Walton, who prefixed a *Life*. Other of his works were *The Elements of Architecture* (1624) and *The State of Christendom* (1657).

Wotton, WILLIAM, D. D.: linguist and author; b. at Wrentham, Suffolk, England, Aug. 13, 1666; was able at five years of age to translate chapters and psalms from the Hebrew, Greek, and Latin into English—attainments which were minutely described by his father in a pamphlet published the following year (1672); was admitted to Catherine Hall, Cambridge, in his tenth year, when Dr. John Eachard, master of the college, certified (Apr. 1, 1676) that his classical attainments were equal to those of Hammond or Grotius; graduated as bachelor of arts at twelve years of age (1679), at which time he was acquainted with twelve languages, and was able to repeat an entire sermon after a single hearing; became fellow of St. John's College, Cambridge, 1685; took orders in the Church of England, and was presented with the sinecure living of Llandrillo, Denbighshire, 1691; became chaplain to the Earl of Nottingham, who gave him the rectory of Middleton Keynes, Buckinghamshire, 1693; was made prebendary of Salisbury 1705; retired to his Welsh living 1714, and was able soon afterward to preach in Welsh; author of *Reflections upon Ancient and Modern Learning* (London, 1694; 3d ed. 1705); *The History of Rome from the Death of Antoninus Pius to the Death of Severus Alexander* (1701); *Miscellaneous Discourses relating to the Traditions and Usages of the Scribes and Pharisees* (2 vols., 1710), translated from the Mishna; and editor of the *Laws of Howel the Good* (1730), in Welsh and Latin, with a glossary. D. at Buxted, Essex, Feb. 13, 1726.

Revised by S. M. JACKSON.

Wounds [O. Eng. *wund*; Germ. *wunde*; cf. Goth. *winnan*, suffer pain]; injuries classified according to their nature as (1) punctured wounds, made with pointed instruments; (2) incised wounds, produced by cutting instruments or sharp edges; (3) lacerated wounds, in which the borders of the wound are irregular, ragged, and torn, and the result of great force, injuries by dull instruments, or tearing; (4) contused wounds, which are accompanied by much bruising; (5) poisoned wounds, in which either an animal venom or virus, or some impure, poisonous, or irritating matter has gained entrance to the injured tissues and contaminated the blood; and (6) gunshot wounds, which as a rule are penetrating and may be lacerated, but differ from other wounds, owing to the character of the missile, the shock they give to the part and to the nervous system, and the grave complications to which they are liable. Contusions are also classed with wounds, but the contusion is not

properly a wound, since there is no actual solution of continuity of the flesh, unless it be an abrasion of the skin. The tissues at the seat of a contusion are often seriously injured, many minute blood-vessels are ruptured, and the escaped blood, settling in the tissues, causes an ecchymosis, a black or blue-black mottling of the part. As the blood is decomposed and slowly absorbed this color changes to blackish green, greenish yellow, dark leather-color and lighter shades, till it disappears. In other contusions there is subcutaneous laceration of tissues, or such shock to their vitality that they speedily disintegrate, and the devitalized part sloughs in a mass or becomes the seat of ulcers. Punctured wounds are relatively the most serious class, for they are often poisoned by the entrance, if not of venom or virus, of foreign matter, as rust, dust, splinters, clothing, etc., which cause suppuration at the bottom of the deep puncture, and lead to grave inflammation, erysipelas, and contamination of the blood by retained unhealthy fluids. The punctured wound is to be well washed, cleansed of all blood-clots and dirt, and if deep, or in the vicinity of dense fibrous tissue, as in the hand or foot, or near joints, must sometimes be freely cut and converted into an incised wound. Incised wounds heal in several ways. They heal most promptly and simply when perfectly smooth, clean cut, free from clotted blood, and in the flesh of persons in perfect health. Thus a clean cut whose borders do not gape or separate may, if instantly closed and sealed from the air by plaster or collodion, heal in a few hours, and approximately warrant the designation immediate union, or union by first intention. More often a day or two is required; the wound, being cleansed of clots or foreign matter, is exposed for a moment to the air, and closed either by adhesive plaster or stitches of silk, catgut, silkworm gut, or silver wire. The opposed surfaces are glazed over by a film of lymph, containing cells supposed to be identical with the white blood-corpuscles, and this, filling the interspace, agglutinates the walls of the wound and organizes a firm scar or cicatrix of fibrous tissue. Such speedy healing is termed union by adhesion, or primary union. When a wound has been lacerated, or a considerable area of tissue has been removed, the deficit has to be made up by a slower process of new tissue-growth; new cells develop one by one, in superimposed strata, until the level of the surface is reached, when the skin begins to heal and shoot over the raw area. This is the process of healing by granulation, or by second intention, far slower than the others, and, if the wound be large, a severe tax upon the strength and health of the patient. In lacerated wounds the more ragged points, if left, will be destroyed by sloughing before the wound can begin to heal, and the delay often converts the wound into a suppurating, weak, indolent ulcer; therefore it is better, in some cases, to remove the irregularities and convert the injuries into incised wounds, either straight or irregular, which can be brought together and heal. When an incised wound has failed of union by adhesion, its walls become covered with granulations, when they may sometimes be approximated and soon unite, constituting the process of union by secondary adhesion or by third intention. In granulation the growth of tissue may become exuberant and rise above the surrounding healing parts, or even the healthy intact surface. Such excess of granulation is popularly termed proud flesh. It must be reduced by use of astringents or compression, or destroyed by caustics, and the site stimulated to a healthier action. Poisoned wounds, as a rule, should be laid freely open by incision, treated by disinfectant lotions, and the general strength of the patient sustained by diet, tonics, and stimulants. Contusions are usually best treated by soothing lotions, as lead-water and laudanum, which may be applied cold or warm, as most agreeable to the patient. The healing of a wound is facilitated by pure air, regular hours for sleep, plain but nutritious diet, and abstinence from alcohol.

Revised by JOHN ASHURST, JR.

Wouverman, wov'ver-mān, PHILIPS; painter; b. at Haarlem, Netherlands, 1619; was baptized May 24. He was pupil of his father, Paulus Joosten Wouverman, a painter of whom no work has been identified. He studied landscape under Wynants. His work also shows the influence of Andries Both and Pieter van Laer. In 1640 he entered the guild of painters of Haarlem, of which he was elected dean for 1645-46. Wouverman's pictures are chiefly landscapes with figures of men and animals. He was especially fond of introducing horses, and painted hunting scenes

or fighting cavalry. He is supposed never to have left his native Haarlem, but the character of some of his landscapes would seem to contradict this supposition. Wouverman was a prolific painter, and his works are to be found in most collections. D. at Haarlem, May 19, 1668. Pieter and Jan Wouverman were younger brothers of Philips, and also painted landscapes. See portrait and biography of Wouverman, *Historic Gallery of Portraits* (vol. iii). W. J. S.

Wrack, or **Sea-wrack**: names applied to many seaweeds, especially to the *Fucaceæ*, useful as manures and as sources of iodine; also to wrack-grass, eel-grass, or grass-wrack, *Zostera marina*, a naiadaceous plant useful as manure, and extensively used for packing glass and pottery.

Wrangel, wraŋ'el, FERDINAND, Baron, von; explorer; b. in Esthonia, Dec. 29, 1796; was educated in the naval academy of St. Petersburg; accompanied Capt. Golownin on his journey around the world 1817-19; commanded an expedition to the Polar Sea Nov. 2, 1820-Aug. 15, 1824; made a second voyage around the world 1825-27; was governor of the Russian possessions in North America 1829-34, and received on his return various high positions in the naval department, and was made an admiral. D. at Dorpat, June 6, 1870. His account of his polar expedition was published in Russian (2 vols., St. Petersburg, 1841), but an extract from his diaries appeared in German in 1839, and was translated into English by Mrs. Sabine in 1840—*Wrangell's Expedition to the Polar Sea in 1820-23*. See von Engelhardt, *Ferdinand von Wrangel und seine Reise* (Leipzig, 1885).

Wrangel, FRIEDRICH HEINRICH ERNST, Count von; general; b. at Stettin, Pomerania, Apr. 13, 1784; served in the Napoleonic wars, and rose rapidly in the service, attaining the rank of major-general in 1823. In the Danish war of 1848 he commanded the troops of the German Confederation, and in the same year he put down the insurrection in Berlin. In 1856 he was made general field-marshal. On the outbreak of the Danish war in Jan., 1864, he held the chief command of the allied Prussian and Austrian troops; but in the following May gave up the direction of the campaign to Prince Frederick Charles. D. in Berlin, Nov. 1, 1877.

Wrangel, KARL GUSTAF, Count; soldier; b. Dec. 13, 1613, at Skokloster, the family estate, on Lake Mälär, near Upsala, Sweden; received a military education, and fought in the Thirty Years' war under Gustavus Adolphus, Bernhard of Saxe-Weimar, Banér, and Torstensson. In 1644, after the death of Admiral Fleming, he received the command of the Swedish fleet which was destined to join the Dutch fleet and carry the Swedish army from the Danish peninsula to the islands, defeated the Danes off the island of Femern Oct. 11, and shut them up in the Bay of Kiel. In 1646 he was made commander-in-chief of the Swedish force in Germany; joined Turenne, and defeated the Austro-Bavarian forces repeatedly. Under Charles X. he commanded in the campaigns in Poland (1655) and in Denmark (1657-59), and in 1674 led the army of 16,000 men which suddenly invaded the country of the Elector of Brandenburg, who was a member of the coalition against Louis XIV. and was engaged with his whole force in the Rhine countries. But Wrangel's health failed, the elector hastened back with astonishing rapidity, and the Swedes were defeated at Rathenow and Fehrbellin, and driven out of Brandenburg. D. in the island of Rügen, June 24, 1676.

Wrangler [so called from the public disputations in which candidates for degrees were formerly required to take part; from deriv. of *wring* < O. Eng. *wringan*, *wrang*]: one of the first class of honorem of the mathematical tripos in the University of Cambridge, England. The number of these is not limited. The first of them is called the senior wrangler. See **TRIPOS**.

Wrasse [cf. Welsh *gwrachen* in *gwrachen y môr*, wrasse]: a name commonly applied in Great Britain to sea-fishes of the genus *Labrus*, family *Labridæ*. They have spiny fins, large thin scales, and the form, generally speaking, somewhat perch-like, with the back more straight. The mouth is protrusible, with thick, fleshy lips, folded so as to appear double. The dorsal fin is long and single; the spines of its anterior portion are surmounted with short membranous filaments, while those of the posterior portion have short and split rays. It generally frequents deep rocky gullies where the water is tolerably tranquil, and takes bait freely. The colors are generally very brilliant, but fade quickly when the fish is taken out of the water. The species are numerous,

not large, and mostly inferior as food. The bullan wrasse or oldwife (*L. maculatus*) is one of the most common kinds. It attains a length of about 18 inches and a weight of more than 3 lb. It is bluish green, paler on the belly, all the scales margined more or less broadly with orange red, the blue prevailing in some specimens and the orange in others. It feeds on crustaceans, molluscs, and marine worms. See FISHERIES.

Wrath, Cape: See CAPE WRATH.

Wratislaw, ALBERT HENRY: author and divine; b. in England about 1822 of Bohemian parentage; educated at Christ's College, Cambridge; graduated in 1844; became head master of Felstead Grammar School in 1849, and of that at Bury St. Edmund's in 1857. In 1879 he resigned his position as head master, and became vicar of Manorbier, near Tenby, in Pembrokeshire, but resigned on account of ill health in 1887. Besides a number of school-books and religious treatises, he published many volumes of poems and prose translated from the Czech and other Slavonic languages, and thus became the principal promoter of knowledge of this important branch of studies in England. His more important works are *Lyra Czecho-Slovanská* (Boh. poems transl., 1849); *The Queen's Court MSS., with other Ancient Bohemian Poems* (1852); from the collection discovered in 1817 at Králové Dvůr, Kömginhof; *Barabbas the Scape-goat* (sermons, 1859); *Notes and Dissertations on Scripture* (1863); *Adventures of Baron Wratislaw of Mitrovicz in his Captivity in Constantinople and Diary of an Embassy from King George (Podiebrad) of Bohemia to Louis XI. of France in 1464* (both trans. from Czech); *Life, Legend, and Canonization of St. John Nepomuk* (1873); *Lectures on Bohemian Literature* (1878); *Life of John Hus* (1882); *Sixty Folk-tales from Slavonic Sources* (1889).

Revised by HERMANN SCHOENFELD.

Wraxall, Sir NATHANIEL WILLIAM, Bart.: statesman and author; b. at Bristol, England, Apr. 8, 1751; was employed in civil and military service in India 1769-72; traveled for several years in Europe; was confidential agent of Caroline Matilda, Queen of Denmark, in her negotiations with her brother, George III., 1774-75; entered Parliament 1780; was created a baronet 1813; was imprisoned three months in 1815 for a libel on Count Woronzow, Russian envoy to England, in an autobiography published in that year. He was the author of several amusing volumes of anecdotal history, including *Memoirs of the Kings of France of the House of Valois* (2 vols., 1777); *History of France from Henry III. to Louis XIV.* (3 vols., 1795); *Memoirs of the Courts of Berlin, Dresden, Warsaw, and Vienna 1777-79* (2 vols., 1799); *Historical Memoirs of My Own Time, 1772-84* (2 vols., 1815; 3d ed., revised, 3 vols., 1818); and *Posthumous Memoirs of his Own Time, 1784-90* (3 vols., 1836; 3d ed. 1845; new ed. of whole work, 5 vols., 1884). D. at Dover, Nov. 7, 1831.

Wray, JOHN: See RAY.

Wreck [doublet of *wrack*, ruin, also seaweed < O. Eng. *wreac*, distress, exile (or Scand. *rek*, anything driven ashore), from same root as O. Eng. *wreacan*, punish, drive > Eng. *wreak*; Germ. *rächen*; Goth. *wrikan*, punish; probably akin to Gr. *εἰργεω*, constrain, Sanskr. *vij-*; akin is Eng. *wretch*]; at common law, vessels or parts of vessels or goods cast by the sea upon the land, within the limits of a county and there left. It is said by many writers that at early common law wreck belonged to the king, without regard to the claims of the owner; and that the statutes of Henry I., of Henry II., and Edward I. modified this rule by permitting the owner to recover his property provided a person or animal escaped from the wreck alive. Such was not the view of Lord Coke, who agrees with Bracton that the king shall have wreck as he shall have great fish, because none claims the property; that wreck is estray on the sea coming to land, as estray of beasts is on the land coming within any privileged place; and the law gives in both cases a year and a day to claim them. Whether wrecked property was forfeited by the owner to the crown or its grantees because no live animal came ashore was carefully considered by Lord Mansfield in *Hamilton vs. Davis*, 5 Burrows, 2732 (A. D. 1771). He declared no case had been produced on the argument to prove such forfeiture. In Great Britain the general superintendence of all matters relating to wreck is now confided by statute to the Board of Trade. In the U. S. common-law wrecks are matters of State jurisdiction generally, although the licensing of vessels to engage in

wrecking, the disposition of property wrecked on certain coasts, and the control of the life-saving service are proper subjects for federal legislation. (See U. S. Revised Statutes, §§ 4239, 4240, 4241, 5358.) A fair sample of State legislation upon this subject is found in the New York Town Law of 1890 (ch. 569, §§ 137-150).

The term is also applied, in the law of marine insurance, to a ship so injured at sea as to become unavailing, or unable to pursue her voyage without repairs exceeding the half of her value. See FLOTSAM, JETSAM, and LIGAN.

FRANCIS M. BURDICK.

Wrede, vrä'de, KARL PHILIPP, Prince: Bavarian field-marshal; b. at Heidelberg, Apr. 29, 1767; studied jurisprudence at the university there, and in 1792 became assessor to the higher court. In the following year he was chosen commissioner for the Palatinate to the Austrian army. After serving in this capacity for five years, he raised a corps of troops with which he joined the Austrian forces, and fought in the campaigns of 1799 and 1800. On the return of peace he organized the Bavarian army, and when war broke out anew fought on the side of the French against his former allies, the Austrians. In the campaign that ended at Austerlitz he distinguished himself in several battles, but more particularly in the campaign of 1809 and in his pacification of the Tyrol. Napoleon rewarded him with the rank of field-marshal, and made him a count of the empire. In the retreat from Moscow he commanded the Bavarian forces; but with the change in Napoleon's fortunes Bavaria returned to the side of his enemies, signing a treaty with the allies on Oct. 8, 1813, and in the ensuing campaigns Wrede was again fighting against the French. At the head of some 40,000 men he tried to cut off Napoleon's retreat at Hanau (Oct. 30-31), but was defeated. In the campaign of 1814, however, he was successful, and after the war was made field-marshal and prince by the Bavarian Government. He was afterward active in Bavarian politics, and held several important diplomatic positions. D. at Ellingen, in Bavaria, Dec. 12, 1838.

F. M. COLBY.

Wren [O. Eng. *wrenna*, *wrænna*]: any member of the family *Troglodytidae*, a group of song birds having ten primaries, a slender bill, and scutellate tarsi. They vary in appearance and habits, but the plumage is generally more or less brown with fine dark bars, and the birds pass much of their time on or near the ground, some being partial to marshes, where they build large round nests among the rushes. Others nest in bushes, hollow stumps, or holes in branches. The eggs are six or eight in number, usually white with fine reddish spots, and two or three broods are raised in a season. None is found in Africa, and only fifteen species in Europe and Asia, while nearly 150 species occur in America, their headquarters being in the tropics. Fourteen species with nine sub-species dwell in the limits of the U. S. The common European species, *Troglodytes parvulus*, is, next to the kinglet, the smallest bird in Europe; its nearest relative in the U. S. is the winter wren, *T. hiemalis*, a little bird found over the greater portion of North America. It is shy, with short wings and a shorter tail; dark brown above, whitish below, barred with blackish. The house wren, *Troglodytes aedon*, is another common species, often nesting in boxes. The cactus wren, *Campylorhynchus brunneicapillus*, of the southwest, is a large species, 8 inches long, and a representative of numerous Central and South American forms. See the article NESTS OF BIRDS.

F. A. LUCAS.

Wren, CHRISTOPHER, Sir: architect; b. at East Knoyle, Wiltshire, England, 1622. He entered Wadham College, Oxford, graduated 1650 and was made fellow of All Souls College, Oxford, in 1653, and Savilian Professor of Astronomy 1660. At Oxford he made a great reputation as a geometer. In view of his mathematical reputation he was much consulted in matters of building. Architecture, which had been little regarded in the reign of Charles I., scarcely existed during the civil wars and under the Commonwealth. Immediately after the restoration of Charles II. Wren served on a commission for the repair and partial rebuilding of old St. Paul's, the Gothic cathedral of London. The next year (1664) he began his first building, the chapel of Pembroke College at Cambridge, which his uncle Matthew Wren, Bishop of Ely, intended to be a memorial of his release from the Tower, where he had been imprisoned for eighteen years. The next year he began the Sheldonian theater at Oxford. The building is intended to imitate a Roman theater, at

least in its general proportions, and the ceiling was made flat, perhaps to suggest the awning stretched over the unroofed ancient building. The library of Trinity College at Cambridge was begun in 1665, though not finished for many years. In 1665 Wren went to France, where he made the acquaintance of Bernini and François Mansart. The Great Fire in London in Sept., 1666, gave him at this time a singular opportunity for impressing his ideas of architecture upon a whole community. The Cathedral of St. Paul was entirely ruined, and it was proposed now, as it had been before the fire, to rebuild the church in what the architects of the seventeenth century supposed to be the Gothic style. Wren's first design showed a large dome surrounded by small ones arranged almost in a ring; another small dome covered a vestibule, into which access was given through a portico of columns. This design, combining many Byzantine features with a Roman exterior in one order and kept down to the dimensions of the model, about 450 feet in length, would have resulted in a noble church of the second class, and one of the most interesting buildings in Europe. The design was abandoned, however, when in 1675 the first stone was laid and the larger and longer church now existing was begun. Previous to this, and probably in consideration of his services as adviser and engineer in the matter of laying out the rebuilt city of London, he had been knighted. In 1681 he was made president of the Royal Society, in 1697 the choir of the cathedral was open for service, in 1710 the last stone was put in place. During all these years Wren was engaged upon public and private buildings, of which he undertook more than by any possibility one man could design or direct. It is hardly an exaggeration to say that every important building, at least in the south of England or in the vicinity of London, from 1666 until about 1710, was put in his hands. He built Winchester Palace, which is now used as a barrack, a large additional structure to Wolsey's Palace at Hampton Court, and Chelsea Hospital, and began the great hospital at Greenwich. He built the town-hall at Windsor, Marlborough House and Buckingham House in London, the Royal Exchange, the Custom-house, the Ashmolean Museum at Oxford, Queen's College chapel at the same place; and at Cambridge, Trinity College Library, as well as Pembroke College chapel, named above. His most notable work, however, is the great series of churches in London and elsewhere which Wren carried out during his forty-five years of active practice. Of these may be named St. Michael's, Cornhill; St. Bride's, Fleet Street; St. Mary-le-Bon, with its remarkable and much admired steeple; St. Stephen's, Walbrook, with an interesting vaulted interior and a large cupola; St. Lawrence, Jewry, whose interior is a noble and beautiful hall about 70 feet in clear span and over 80 feet long with a flat ceiling 40 feet above the floor—all these in London. Another much admired London church is St. James's, Piccadilly, of which the elaborate vaulted roof, praised by writers on architecture for its proportions, is in reality a piece of carpenter work with sham vaults, and even with this the supports below the gallery are very large square piers used as pedestals for the columns above. Wren was never very careful about such constructional matters as these.

Wren sat in Parliament for many years during his later life. Throughout the reigns of James II., William III., and Anne he was kept constantly busy in public duties of many kinds. The actual work of his office had to be done by his assistants, and attempts have been made to distinguish in the architectural work under Wren's name the designs of these different artists. Wren died in 1723 and was buried under the choir of St. Paul's Cathedral. In the choir above was placed the tablet, now removed to another part of the church, which bears the well-known inscription, "Si monumentum requiris circumspecte." See *Biographies* by James Elmes and by Miss Phillimore.

RUSSELL STURGIS.

Wrestling: an athletic sport in which each of the two contestants endeavors to throw his opponent to the ground. It is one of the oldest as well as the most universal of athletic exercises. It flourished most among the ancients, and was a prominent feature of the Olympian games. Among the Greeks, the competitors trained for months prior to the competition, and the victor was feted, processions formed in his honor, special privileges were conferred upon him, and in some of the cities his statue was placed in one of the temples. Most famous among the ancient wrestlers was Milo of Croton, six times the winner at the wrestling competitions

at both Olympian and Isthmian games. Among the earliest Jewish records are references to wrestling long before the era of history, and sculpture takes us back still further into the antiquity of this particular form of sport. Homer's account of the match between Ajax and Ulysses (*Iliad*, 23-710) is probably the most perfect account that remains to us of these ancient competitions. Pausanias states that Theseus made the first wrestling rules. During the Homeric age the wrestlers were naked with the exception of the loin cloth. This custom continued until the fifteenth Olympiad. In the time of Solon oiling and dusting were practiced, and there seems to have been some especial significance attached to the dusting process, since we read that dust brought from certain localities was much more highly prized by the wrestlers than that from others. In Argos flute music for a time accompanied the wrestling. There were two distinct types of wrestling among the ancients, one where the competitors stood and struggled for a fall, and the other, in which the competition might still go on after the competitor was upon the ground, until a specified part of the body was on the ground. Falling on the face did not constitute a fall. If a man was thrown three times from the standing position he was beaten. Wrestling for boys was introduced at the Olympian games and at Athens, Elisinia, and Thesea. The old Greek rules forbade striking and kicking, but allowed breaking of fingers, throttling, etc. Wrestling competitions were popular in the olden times in the British isles, and contests were held annually in London on St. James's Day, at which time we find a ram was offered for the prize. Another prize commonly offered in Old England was a cock.

In later times some distinct kinds of wrestling have been developed, in both Great Britain and the U. S. One of the best known of the English styles, is that practiced in Cumberland and Westmoreland, and is known under this combined name. Here the competitors usually dressed in close-fitting and becoming costumes. The rules compelled them to stand chest to chest, each placing his chin on his opponent's right shoulder, and grasping him around the body, each placing his left hand above the right of his antagonist. If either party breaks his hold, though not on the ground, the one so letting go is the loser. If either touch the ground with any part of the body except the feet, he shall be deemed the loser.

Another famous style is that of the Cornish and Devonshire men. The greatest rivalry exists between Cornwall and Devon. Here kicking was formerly allowed, and heavy-soled shoes, sometimes with thin steel plating inserted within the leather, were worn, so that the injuries resulting from the game were serious. The judging is exceedingly difficult, and the amount of quarreling resulting therefrom has brought the Cornish and Devonshire wrestling into disfavor. It is required that both hips and one shoulder, or both shoulders and one hip (or sometimes both shoulders and both hips) reach the ground simultaneously, and this before any other portion (as the arm or knee) of either thrower or thrown reaches it.

The Lancashire style is the roughest of all the English wrestling. It allows catching by the legs, wrestling on the ground, and other equally objectionable features. The wrestlers combat in stockinged feet, and are not allowed to scratch, strike, or maim. A fall is constituted by both shoulders touching the ground.

The Scotch style is largely modeled after that of the Lancashire.

In the French style the wrestlers are allowed to take hold from the head to the waist. Tripping is prohibited. Competitors are not allowed to strike, scratch, or to clasp hands, although they may grasp their own wrists or other portions of their own bodies. They may not wrestle bare-footed, but in the stocking. If one of the wrestlers falls on his knee, shoulder, or side, he must begin again. The one whose shoulders first touch the ground is the loser, providing both shoulders are on the ground at the same time.

The German style is a struggle on the ground. The wrestlers can catch hold of the legs, or indeed anywhere below the waist. This wrestling starts with the men standing erect, but is usually finished by a competition on the ground, an effort being made to turn the fallen man so that his shoulders may rest upon the ground.

The Græco-Roman is not much favored. Like some of the previous styles it allows only of the clasping of the body above the waist, and does not permit of wrestling upon the ground.

The much more popular style is the catch-as-catch-can. Here also brutal playing is barred by the rules, and yet there is always more or less savage work that is really unsportsmanlike. The competitor may twist a head or a foot to the extremes of safety, but it is always within the power of the sufferer to relieve himself from the punishment by admitting a fall. In this, as in the Græco-Roman style, a fall is lost when both shoulders touch the ground.

See J. P. Mahaffy's *Old Greek Education, Fencing, Boxing, and Wrestling*, in the Badminton Library (London and New York); and Strutt's *Sports and Pastimes of the English People*.
E. HITCHCOCK, Jr.

Wrexham: town; in Denbighshire, North Wales; 12 miles S. W. of Chester (see map of England, ref. 8-F). It has a fine church of the fifteenth century with a finely decorated tower 135 feet high, rich coal and lead mines in the vicinity, and extensive breweries, iron-works, and paper-mills. Pop. (1891) 12,552.

Wright, CARROLL DAVIDSON, M. A.: statistician; b. at Dunbarton, N. H., July 25, 1840; received an academic education; began the study of law 1860; enlisted as a private in the Fourteenth Regiment, New Hampshire Volunteers, 1862, and became in December, 1864, colonel of the regiment; 1865 returned to the study of law in Boston, and was admitted to the bar in New Hampshire in the same year. In 1871 he was elected to the State Senate of Massachusetts and served two terms. In 1873 he became chief of the bureau of statistics of labor of Massachusetts, which position he held until Sept., 1888. In this position he developed a system of labor statistics which became the model for all similar work. In 1875 and 1885 he had charge of the census of Massachusetts, and in the latter year was appointed U. S. commissioner of labor. He has lectured on statistical and social subjects before several universities. In 1895 he was appointed Professor of Political Science in the Catholic University of America, Washington, D. C. He has published *Annual Reports of the Massachusetts Bureau of Statistics of Labor* (15 vols., Boston, 1873-88); *Census of Massachusetts* (3 vols., 1876-77); *The Statistics of Boston* (1882); *The Factory System of the United States* (Washington, 1882); *The Census of Massachusetts* (4 vols., Boston, 1887-88); *Reports of the United States Commissioner of Labor, including Industrial Depressions* (Washington, 1886); *Cowivet Labor* (1886); *Strikes and Lockouts* (1887); *Working Women in Large Cities* (1888); *Railroad Labor* (1889); *Marriage and Divorce* (1889); *Cost of Production of Iron, Steel, etc.* (1890); *Cost of Production of Textiles and Glass* (1892); and *The Industrial Evolution of the United States* (Meadville, Pa., 1895); besides numerous pamphlets.
C. H. THURBER.

Wright, ELIZUR: journalist; b. at South Canaan, Conn., Feb. 12, 1804; graduated at Yale College 1826; taught in the Lawrence Academy at Groton, Mass., 1827-28; was Professor of Mathematics and Natural Philosophy in Western Reserve College 1829-33; became secretary of the American Anti-Slavery Society 1833; edited the paper *Human Rights* 1834-35 and the *Quarterly Anti-Slavery Magazine* 1837-38; removed to Boston 1838; became editor of the *Massachusetts Abolitionist* Apr., 1839, of the *Daily Chronotype* 1845, and of its successor, the *Boston Commonwealth*, 1850; he also edited for short periods the *Boston Daily Chronicle* and the *American Railway Times*; was commissioner of insurance for Massachusetts 1858-66; translated La Fontaine's *Fables* (2 vols., Boston, 1841; 2d ed., New York, 1859); wrote an introduction to Whittier's *Bullads and other Poems* (London, 1844); *Savings Bank Life Insurance with Illustrative Tables* (1872); *The Politics and Mysteries of Life Insurance* (1873); contributed to the *Atlantic Monthly*, and published several anti-slavery pamphlets. D. at Medford, Mass., Nov. 22, 1885.

Wright, FANNY: See D'ARUSMONT, FRANCES.

Wright, GEORGE FREDERICK, D. D., LL. D.: theologian and geologist; b. at Whitehall, N. Y., June 22, 1838; graduated at Oberlin College 1859, and at Oberlin Theological Seminary 1862; served in the Union army in the civil war (1860); became pastor at Bakersville, Vt., 1862, and at Andover, Mass., 1872. He was made Professor of New Testament Literature in Oberlin Theological Seminary in 1881. In 1881 he was assistant geologist on the Pennsylvania survey, and since 1884 has been connected with the U. S. survey in the division of glacial geology. He has published *The Glacial Boundary in Ohio*, etc. (Cleveland, 1884); also *The Logic of Christian Evidences* (Andover, 1880); *Studies in Science*

and Religion (1882); *The Relation of Death to Probation* (1882); *The Divine Authority of the Bible* (Boston, 1884); *Man and the Glacial Period* (1892).
G. P. F.

Wright, HORATIO GOUVERNEUR: soldier; b. at Clinton, Conn., Mar. 6, 1820; graduated at U. S. Military Academy, and commissioned second lieutenant in the Corps of Engineers July 1, 1841. In 1856 he was called to Washington, and served as assistant to the chief of engineers until the outbreak of the civil war in 1861. At the first battle of Bull Run he was chief engineer of Heintzelman's division. He was commissioned a brigadier-general of volunteers Sept. 14, 1861, and commanded a brigade of the land forces of the Port Royal expedition. In Feb., 1862, he set out from Port Royal with a brigade of volunteers, and by the middle of March had occupied Fernandina, Jacksonville, St. Augustine, and retaken possession of Fort Marion and Fort Clinch. Promoted major-general of volunteers in July, 1862, he commanded the department of the Ohio until Mar., 1863. He led a division in the battle of Gettysburg, and in the spirited assault on Rappahannock Station (Nov. 7, 1863). After the Mine Run affair on May 9, 1864, he succeeded to the command of the Sixth Corps; was present with the army of the Potomac at every engagement up to July, 1864, when summoned from the front of Petersburg with his corps to the defense of Washington, then threatened by the Confederates under Gen. Early. Wright pursued the latter and defeated him at Snicker's Gap. In the ensuing campaign of the Army of the Shenandoah under Sheridan he led his corps at Opequan and Fisher's Hill, and was in command of the army at Cedar Creek. Mustered out of volunteer service in Sept., 1866, he returned to duty with the Corps of Engineers, in which he had attained a lieutenant-colonelcy Nov., 1865. For gallantry at Spotsylvania he was breveted colonel; brigadier-general for Cold Harbor; and major-general for capture of Petersburg. He was a member of the board of engineers for fortifications 1867-79; was promoted colonel Corps of Engineers Mar., 1879, and on June 30, 1879, brigadier-general and chief of engineers, which position he occupied until he was retired Mar. 6, 1884.

Revised by JAMES MERCUR.

Wright, JOSEPH, called Wright of Derby; painter; b. at Derby, England, Sept. 3, 1734; studied portrait-painting under Thomas Hudson; resided in Italy 1773-75; settled in Derby 1777, remaining there through life, occupied chiefly with portraits, but painting also historical and figure pieces; was especially fond of representing the effects of firelight, which he had carefully studied in Italy during an eruption of Vesuvius; exhibited at Covent Garden in 1785 a collection of twenty-four of his pictures, the most striking of which was the *Destruction of the Floating Batteries off Gibraltar*. D. at Derby, Aug. 29, 1797. See the *Life* by Benrose (1885).

Wright, ROBERT EMMET: b. at Allentown, Pa., in 1810; became a distinguished member of the Pennsylvania bar, practicing in his native place. He published *Pennsylvania State Reports, etc.* (14 vols., 1861-66); edited William Graydon's *Forum of Conveyancing* (1845) and Samuel Roberts's *Digest of Select British Statutes, etc.* (1847); prepared digests of the laws of Pennsylvania on constables' duties, on aldermen and justices of the peace, and of several different periods of adjudged cases; besides writing essays and addresses on legal and political topics, and editing several legal works.

Revised by P. STURGES ALEX.

Wright, SILAS: statesman; b. at Amherst, Mass., May 24, 1795; graduated at Middlebury College, Vermont, 1815; studied law; was admitted to the bar 1819; settled at Canton, St. Lawrence co., N. Y.; was elected to the State Senate as a Democrat 1823; distinguished himself as an opponent of the policy of Gov. De Witt Clinton; developed in a report to the Senate in 1827 the financial policy with which he was identified throughout his political career; was commissioned brigadier-general of State militia 1827; was a member of Congress 1827-29; was comptroller of New York 1829-33, and U. S. Senator 1833-44; supported Clay's Compromise Bill and defended the removal of the deposits from the U. S. Bank by President Jackson 1833; opposed the recharter of the U. S. Bank and the distribution of the surplus Federal revenues among the States; was chosen Governor of New York in the exciting campaign of 1844; took decided ground against the anti-rent rioters, declaring Delaware County in a state of insurrection; repeatedly declined appointments to foreign missions, as well as an offer of a seat in the cabinet or on the Supreme bench by President

Tyler, and of the secretaryship of the Treasury by President Polk 1845; was defeated as a candidate for re-election 1846, and retired to his farm at Canton, where he died Aug. 27, 1847. Biographies were published by Jabez D. Hammond (1848) and John S. Jenkins (1852).

Wright, THOMAS; philologist and antiquarian; b. on the Welsh border, near Ludlow, Shropshire, England, Aug. 21, 1810; entered Trinity College, Cambridge; graduated 1834; settled in London as a professional man of letters 1835; was one of the founders of the Camden Society (1838), the Percy and Shakspeare societies (1840), and the British Archaeological Association (1843), editing its *Journal* and other publications until 1850, when he withdrew in consequence of the divisions which led to the foundation of the Society of Antiquaries, of which he became a fellow; was a prominent contributor to the *Archæologia*; rendered services to M. Guizot's French record committee, which procured him while still young (1842) the honor of an election as corresponding member of the Institute (Académie des Inscriptions et Belles-Lettres); was the originator in England of the annual archaeological congresses (1844), and successfully conducted the excavations upon several Roman sites in Britain, especially those which brought to light the remarkable ruins of the Roman Uriconium at Wroxeter, Shropshire. He wrote or edited above eighty volumes, nearly all connected with British history, philology, or archaeology, and was selected by the Emperor Napoleon III. to translate his *History of Julius Cesar* (2 vols., 1865-66). He edited many of the literary relics of the Middle Ages in English, Anglo-Norman, French, and Latin—*Feudal Manuals of English History* (1872); *The Anglo-Latin Satirical Poets* (1872); and *The Works of James Gilray* (1873), etc. Among his numerous original works are *The History of Ludlow and its Neighborhood* (2 parts, 1841-43; new ed. 1852); *Biographia Literaria* (2 vols., 1842-46), comprising the Anglo-Saxon and Anglo-Norman periods of Great Britain and Ireland; *The Archaeological Album* (1845); *A History of Ireland* (3 vols., 1848-52); *The Cell, the Roman, and the Saxon* (1852; 3d ed. 1875); *The Wanderings of an Antiquary* (1854); *A Dictionary of Obsolete and Provincial English* (2 vols., 1857); *Essays on Archaeological Subjects* (2 vols., 1861); *A History of Domestic Manners in England during the Middle Ages* (1862); *A History of Caricature and Grotesque in Literature* (1865); *Woman-kind in Western Europe* (1869); and *Uriconium, an Historical Account of the Ancient Roman City* (1872). D. at Chelsea, Dec. 23, 1877. Revised by HENRY A. BEERS.

Wright, WILLIAM, Ph. D., LL. D.: Orientalist; b. in Bengal, India, Jan. 17, 1830; educated at the Universities of St. Andrews and Halle; was appointed Professor of Arabic in University College, London, 1855, in Trinity College, Dublin, 1856, and in the University of Cambridge 1870; became employed in the MS. department of the British Museum in 1861, and became assistant keeper 1869. He edited in Arabic the *Travels of Ibn Jubair* (Leyden, 1852); Al-Makkari's *Analectes* (1855); *Opuscula Arabica* (1859); and El-Mubarrad's *Kamil* (Leipzig, 11 parts, 1864-82); issued *The Book of Jonah in Four Oriental Versions—Chaldee, Syriac, Ethiopic, and Arabic—with Glossaries* (London, 1857); a revised translation of Caspari's *Grammar of the Arabic Language* (2 vols., 1859-62; new ed. 1875); *Ancient Syriac Documents relative to the Earliest Establishment of Christianity in Edessa, etc.* (1864); *Contributions to the Apocryphal Literature of the New Testament, collected and edited from Syriac MSS. in the British Museum, with an English Translation and Notes* (1865); *The Homilies of Aphraates, "the Persian Sage"* (in Syriac, 1869); *An Arabic Reading-book* (1870); *The Apocryphal Acts of the Apostles* (Syriac and English, 2 vols., 1871); *A Catalogue of the Syriac MSS. in the British Museum* (3 vols., 1870-72); *Oriental Series of Fac-similes of Ancient Manuscripts* (1876); *The Chronicle of Joshua the Stylite* (1882); *The Book of Kalilah and Dimnah* (1883); and *The Empire of the Hittites* (1884). D. in Cambridge, May 22, 1889.

Wright, WILLIAM ALDIS; author and editor; b. in England about 1836; educated at and became librarian of Trinity College, Cambridge; was the principal contributor in biblical geography and biography to Dr. Smith's *Dictionary of the Bible* (3 vols., 1860-63), and corrected the proofs of that important work and made the abridgment (1865); edited with notes and glossarial indexes Bacon's *Essays* (1862) and his *Advancement of Learning* (1869); was co-

editor with William George Clark of *The Cambridge Shakspeare* (9 vols., 1863-66), and the Globe edition of Shakspeare's *Complete Works* (1 vol., 1864); and edited *The Bible Word-book* (1866), Chaucer's *Clerke's Tale*, the *Metrical Chronicle* of Robert of Gloucester and other works.

Wrightsville: borough; York co., Pa.; on the Susquehanna river, the Susquehanna and Tidewater Canal, and the Penn. Railroad; 11 miles N. E. of York, the county-seat, and 31 miles S. E. of Harrisburg (for location, see map of Pennsylvania, ref. 6-G). It has 6 churches, 8 graded schools, a national bank with capital of \$150,000, a weekly newspaper, several saw and planing mills, lime-kilns, foundry, blast furnace, and tobacco, cigar and furniture factories. Pop. (1880) 1,776; (1890) 1,912; (1895) estimated, 2,500.

G. S. TINSLEY, BOROUGH SOLICITOR.

Writ: in law, a formal instrument, issued by or under authority of a court, commanding the person to whom it is addressed to do a certain act therein specified. It is written in the form of a mandate from the highest authority in the state—the king in Great Britain, the President, people, or commonwealth in the U. S.—attested by the chief judge of the court, sealed and signed by the clerk, and may be issued either at the commencement of an action or proceeding, or during its progress, to the sheriff or to some other person, for the purpose of procuring various acts to be done in connection with such action or proceeding. Anciently, actions in the courts of law were commenced by a species of writs termed "original," which were issued by officers of the chancery, and were considered as the direct mandates of the king, stating the nature of the claim, and laying the jurisdiction of the judge to try the case; but they were long ago abolished, and all writs became "judicial"—that is, were in the nature of process from the court in which the suit was brought or was pending. In the common-law practice the number of writs was very great; a separate one was adapted to every special proceeding and to almost every important stage in an action, and each had its appropriate name. Among the most familiar were the writs of "*capias*" and of "summons" for commencing legal actions, the writ of "*subpoena*" for summoning the defendants in an equity suit and for compelling the attendance of witnesses (see *SUBPOENA*), the writs of "error" and of "*certiorari*" for the review of judgments and other judicial decisions, and the writ of "*habeas corpus*" for the production of a person imprisoned in order that the cause of his detention might be inquired into. (See *HABEAS CORPUS*.) A large part of the common-law writs have been abolished by statute both in the U. S. and in Great Britain, especially those for which some other simpler and more direct substitute could be made. Some of the more common and important, however, have been retained in those States which adhere to the ancient system of practice. In those States which have adopted code procedures writs have been almost wholly abrogated in civil actions, and simple orders of a court or a judge, or notices, have been substituted in their places. In these States, however, a few important writs belonging to the criminal practice, together with the writs of *habeas corpus* and of *certiorari*, and some others of less importance, are still used, though in a somewhat modified form. See *PROCESS, PROCEDURE, CAPIAS, CERTIORARI*, etc.

Revised by F. STURGES ALLEN.

Writer's Cramp: See *NEUROSI*.

Writers to the Signet, or Clerks to the Signet: a legal body, constituting an incorporation by immemorial custom, of lawyers having much the same general duties and privileges in the Supreme Courts in Scotland that ATTORNEYS and SOLICITORS (*qq. v.*) have in England. They are said to have anciently been clerks in the office of the Secretary of State, by whom writs passing the signet were prepared. When the College of Justice (that is, the supreme civil court of Scotland, composed of the lords of council and session and of the members and officers of court) was established the writers to the signet exercised about the same functions as they do to-day, and they are recognized as members of that college. Formerly they alone had the privilege of preparing such summonses as could not pass the signet without a bill, but this privilege is now essentially modified. All crown writs, however, including charters, precepts, and writs from the sovereign or Prince of Scotland must be prepared by them. Admission to the body is by apprenticeship for a period of five years, except for those holding university degrees in law or the arts, and for some other specially excepted classes of men.

F. STURGES ALLEN.

Writing [O. Eng. *writan*, write, liter., scratch, score; O. Sax. *writan*, write, tear; O. H. Germ. *wizan* > Germ. *reissen*, tear; Icel. *rita*, write; Goth. *writs*, stroke, dash, letter]: the art of conveying ideas by means of signs inscribed on some material. It may be either ideographic or phonetic, and is distinguished from the pictorial—that is, from illustrations intelligible independently of language (though not from numerals) by the fact that it must represent words, either by a sign for a word, or by signs for the more or less accurate or simple vocal word-elements. This distinction does not exclude the hieroglyphic or the cuneiform determinatives from writing proper, though their strict office lies outside of representing vocables. In fact, they are less common in the older Egyptian than the later, and thus belong among the conveniences, like capitals, punctuation, etc. Writing, as representing words, primarily represents sounds; but to say nothing of those words which are coined and written and understood (book-words), though scarce ever pronounced, the sounds of many words written in ancient symbols are wholly lost, though the meaning is retained. *Ideographic writing* is that in which a single character stands for a word, as in Chinese: *phonetic writing*, that in which the vocal elements are more or less approximately represented by separate characters; *alphabetic*, when the characters are letters, as in most Western languages; *syllabic*, when the character stands for a syllable, as in the ancient Babylonian and Assyrian, the Cypriote and the Ethiopic, and the modern Japanese. In all systems writing is an imperfect representation of the sound, the ideograph generally failing to give the inflection necessary to the word-meaning, besides standing for different words in different connections. Phonetic writing fails in representing the finer shades of sound or accent even in such uniform systems as the German, Spanish and Italian, and the pointed Hebrew; and it requires a large element of the conventional in French, and especially in English; while in the Semitic languages generally the omission of vowels, and treating them as mere supplementary modifications of the vocal effort represented by the consonants, is, if possible, a greater defect in the system of signs than any of the others mentioned. Writing thus never has been, nor can be, a perfect representation of sounds, i. e. of the spoken language proper, since different readers may give to it a variety of renderings, so as almost to change the main thought; yet, by its introduction of pauses and other distinctions, it is a positive addition to oral language as a means of communicating ideas, to say nothing of its peculiar province of recording them. Writing doubtless descended through various inventive steps from signs purely pictorial; but it must be one of the oldest of the arts. The descent of nearly all the civilized alphabets from the Phœnician shows a general spread and adaptation, rather than repeated independent invention; and of some alphabets, as the Mæso-Gothic and the Armenian, we have almost the exact time of their beginning—the one, third or fourth century A. D., the other, the fifth. The Cypriote syllabary, which seems to go back at least to 900 B. C., bears very strong marks of invention for a considerable portion of it, but obscurity as yet covers its origin. In the U. S. the generation is scarce passed that saw the pictorial communications called the "Indian newspaper," not yet advanced to be writing, and our own times the invention of syllabic and alphabetic writing proper by native American Indians, of which specimens may be seen in the publications of the American Bible Society. These, by the by, are almost the only original syllabic systems of which the original specimens are on a flexible writing material, the syllabic systems of Western Asia being on stone or pottery, and the Ethiopic, etc., on parchment and paper, being rather alphabetic characters with syllabic attachments than syllabic characters proper. The alphabetic system is that of most countries of the world, and, although certain excellent scholars assert that the Chinese language does not admit of the use of an alphabet, yet the Japanese can do so, and there are powerful societies and individuals who are doing their best to induce all the Japanese to use Roman letters. The languages of the Pacific isles and of most of the tribes of Africa are expressed in the same alphabet, and the signs of the times foreshadow that the alphabetic system, as it is the best, will be the only one. The learned of Europe and America use the Roman alphabet, with modifications, for a host of Oriental languages, the only obstacle to the nearly universal use of this method being the love which Semitic scholars show for too complicated a system and fonts of type.

The facts above stated, with the additional ones that spoken language itself changes, and that ignorance is almost as strong a factor as learning in bringing this about, together with changes of fashion (such as any type-founder's book of specimens exhibits), account for a multitude of variations in the appearance of the written page, producing what are commonly called different alphabets, though in the same language, as Roman, Old English, etc., along with a multitude of other matters of which the palæographer has to take account, but, of course, with caution, especially to distinguish that which is sporadic from that which forms the general course of change, with the added caution that great changes are often sudden, and a reaction sets in later. The oldest Phœnician letters are more like the modern Roman and Greek than those of many intervening ages. The earliest printed Greek type had far fewer ligatures than the fonts of thirty years later, and the latter had far fewer than those of 150 years later. In several languages the scribes of later time often affect an antiquated form, so that it takes a long and close inspection to see that the writing is really much later than it seems at first sight. A Greek manuscript in the Philadelphia Library is usually taken at first sight to be several centuries older than it is, and for some centuries older than the author himself of the work. For generations it was supposed that the "lapidary" style of Greek inscriptions was older than the "uncial," but that is now found to be true only as a general proposition. The cursive Greek writing had long been thought to be scarce older than the ninth century A. D., but the potsherds of Egypt, the Rainer papyri from the Fayyûm in Egypt, and some inscriptions on pottery in the Césnola collection in New York, show that the cursive writing was used almost if not quite as long ago as the date of our oldest uncial manuscripts. Almost, but not quite, the same may be said of the more cursive forms of Syriac writing, as compared with the ancient Estranghela alphabet. And, on the other hand, a Syriac manuscript of the twelfth century, in the library of the Union Theological Seminary, New York, contains a treatise which the scribe begins in imitation of the oldest Estranghela writing, but gradually forgets himself, and finishes in his own contemporary Nestorian. Among Latin manuscripts, the famous Codex Amiatinus, at Florence, after having been long esteemed by the best judges as the work of an Italian scribe, then of a Swiss or German, has been demonstrated to have been written in England. As was said by Bentley (1662-1742), "it is not every one knoweth the age of a manuscript"; but now we have better helps for the diligent. The discoveries in the Fayyûm of so many Greek, Latin, Syriac, Arabic, and other manuscripts, with data to fix their age, most of which are in Vienna, but some in the British Museum, now furnish a wealth of material for students of the original, and more and more continually for the students of facsimiles published—far better data than have been accessible before. The discovery and bringing to England of the library of the Nitrian convent of S. Maria Deipara made Syriac palæography a rather more certain science than that of the Greek or Latin; although the general age and nationality of the Latin scribes had been pretty well known, and manuscripts of the Latin Bible and its parts are more numerous than any other class of ancient manuscripts.

In general, the most ancient alphabetic writing was made from right to left; then boustrophedon, and then from left to right. The most ancient syllabic writing, on the other hand, generally reads from left to right, though there are exceptions. It is claimed by high authorities that the scribes of the Syriac (which reads from right to left) wrote perpendicularly, holding the sheet sidewise; but it is doubtful whether that method was more than sporadic. With respect to writing materials—the stylus for wax tablets, palm-leaves, and lead, the reed pen for papyrus, parchment, leather, and cotton paper, the brush for illumination and for writing like the Chinese—such particulars belong rather to the making of books. But it is proved that the Syrians sometimes, if not often, used the quill. See ALPHABET, INSCRIPTIONS, and PALÆOGRAPHY. ISAAC H. HALL.

Writing-machines: all contrivances for recording, either for mechanical purposes or for preserving language written or spoken, as well as to aid in writing. Of the former class are all the various means for permanently recording the pressure of steam, the force and direction of the wind, meteorological phenomena, the investigations of the astronomer, etc. Examples of this class are the steam-engine

indicator, the meteorograph, and the delicate recording apparatus now used in large observatories. In the second class are what are termed TYPEWRITERS (*q. v.*). To this class belong the marking, recording, and printing devices described in the article TELEGRAPH. (See also TELEOGRAPH.) Several machines have been invented for the use of the blind, among which is Johnson's, which enables a blind person to impress characters in rows and lines so as to be read by the sense of touch.

Attempts have been made to record the spoken word by automatic means, as in the PHONAUTOGRAPH and PHONOGRAPH (*qq. v.*). One of these is the machine invented by M. H. Duppinger, a Frenchman, which is about the size of the hand, and is put in connection with the vocal organs, recording their movements on a moving band of paper in dots and dashes. The person using it repeats the words of a speaker after him inaudibly, and this lip-language is afterward written out.

A stenographic machine has been invented in France which has a keyboard of twelve black and twelve white keys on a plane, arranged in three groups of four black and four white keys. The keys, operated like a piano, produce indications in ink on a roll of paper, the black keys giving long marks and the white ones simple dots. These keys may be simultaneously struck, so that the combinations may give several letters or words for every movement of the operator's fingers. It is said that six months' practice will enable one to follow a speaker. A similar machine, the steno-phonotype reporter, was invented by J. C. Zachos, of New York. In this the types are placed on two shuttles, two or more of which may be simultaneously placed in position. The impression is given by a plunger or platen common to all the bars.

Wryneck [named from its habit of twisting the neck in a serpentine manner]: any bird of the genus *Iynx*, forming the sub-family *Iynxiine*. The wrynecks are closely related to the woodpeckers, from which they differ principally in the soft tail-feathers and mottled buff, brown, and gray plumage. The group is confined to Europe, Asia, and Africa, the best-known species being *Iynx torquilla*, a form common to all three countries, though occurring in Europe only as a migrant. It is easily tamed. It lives mostly on ants and caterpillars. F. A. L.

Wulfenite: mineral *molybdate of lead*, O_4MoPb , named after the mineralogist Wulfen, who first distinguished the mineral in 1781 at Carinthian localities, where it had been mistaken by Klaproth for calcium tungstate; called also *yellow lead ore*. It occurs in tetragonal crystals, also granular massive; has about the hardness of calcite; yellow or orange in color, sometimes red (containing then *vanadic acid*); also green and brown; and has a resinous to adamantine luster. It is found in several American localities, notably in very fine crystals at Phoenixville, Pa.

Wulfstan, or **Wolstan**: prelate; b. in Worcestershire, England, about 1007; educated in the monastic school at Evesham, and afterward in the seminary at Peterborough; became a monk and prior of the monastery at Worcester; was appointed Bishop of Worcester in 1062, on the promotion of Aldred to the archbishopric of York; offered a vigorous resistance to the efforts of that prelate and of his successor to appropriate the estates of the see of Worcester; paid successful court to William the Conqueror; had the diocese of Worcester transferred to the jurisdiction of the Archbishop of Canterbury; enjoyed the favor of William Rufus; defended the city of Worcester against the rebels led by Roger de Montgomery, and rebuilt Worcester Cathedral. He was the last of the Anglo-Saxon prelates. D. at Worcester in 1095. There are two accounts of him by William of Malmesbury—one in his work, *De Gestis Pontificum*, the other a separate *Life* in 3 books, printed in Wharton's *Anglia Sacra* (2 vols., 1691). He has been supposed, though not on sufficient evidence, to be the author of the concluding portion (from 1034) of the *Anglo-Saxon Chronicle*.—Another WULFSTAN, b. about 950, Archbishop of York in 1003, was the supposed author of the Saxon *Sermones Lupi Episcopi*, published at Oxford by Elstob in 1701.

Wurnser, *Wörmser*, DAGOBERT SIEGMUND, Count von: soldier; b. at Strassburg, in Alsace, May 7, 1724; entered first the French, afterward the Austrian army; fought in the Seven Years' war and the Bavarian succession war, and was afterward appointed military commander in Galicia, and made a general of cavalry (1787). In the wars between Austria and the French republic he achieved some successes

on the Rhine, and in 1796 he was sent to Italy with reinforcements to supersede Beaulieu as commander-in-chief. Advancing from Trent toward Mantua, which was besieged by Bonaparte, he marched his army in two columns, one on each side of the Lago di Garda, but Bonaparte at once raised the siege, fell with his whole force on the western column at Lonato, and beat it back into the Tyrol, and then attacked the other under Wurnser himself, defeated him at Castiglione Aug. 5, and compelled him to retreat into the Tyrol. At the head of a new re-enforcement he advanced toward Mantua a second time, through the valley of the Brenta, but Bonaparte, who in the meantime had penetrated into the Tyrol, now took him in the rear, beat him at Roveredo Sept. 4, Bassano Sept. 8, and under the walls of Mantua Sept. 13, and shut him up in the fortress. Alvinczy, who was sent to his rescue, was defeated at Arcola Nov. 15, and Rivoli Jan. 14, 1797, and on Feb. 2 Wurnser capitulated. Retiring to Vienna, he was appointed military commander of Hungary, but died before entering his new position Aug. 22, 1797.

Württemberg (official German spelling **Württemberg**, *zürt*'tem-bärch): kingdom in the southwest part of the German empire; third in area, fourth in population; area, 7,529 sq. miles. It is bounded on the N., W., and S. by Bavaria and Baden, on the E. by Bavaria, and is separated from Switzerland by Lake Constance on its southern frontier. It shuts in six small enclaves of Hohenzollern and Baden, while it owns seven exclaves within these two states and Hesse. The larger part of it belongs to the western South German table-land, traversed by the Schwarzwald (Black Forest) and the Suabian Jura, or the Rauhe Alp; the rest is rather hilly than mountainous. The average elevation is 1,640 feet; the lowest point is situated 437 feet above the level of the sea. The country is well watered. A minor part (30 per cent.) of it belongs to the basin of the Danube; the rest (70 per cent.) to that of the Rhine. The Danube traverses the southern part of the country for a distance of 65 miles, and receives the Iller above Ulm. The Neckar, which rises in the southeastern part of the country, where the Schwarzwald and the Rauhe Alp meet, flows northward to the Rhine for a distance of 186 miles. The Tauber, a tributary of the Main, flows through the northern part of the country. All these, and some minor streams, are navigable. Of the artificial waterways, the Wilhelm Canal is the most important, making the Neckar navigable from Cannstadt to Heilbronn. Lakes are numerous. The climate in the Black Forest is severe but healthful; in the other parts of the country moderate and invigorating. The soil is, on the whole, good and well cultivated; in Middle and Lower Suabia are the most fertile districts. Only 4 per cent. is untillable ground; 45 per cent. is arable soil and garden-land; vineyards, 1; meadows and pasture, 19; forests, 31 per cent.

Industries.—Agriculture is flourishing. Of cereals, spelt, oats, maize, rape, rye, wheat, hemp, and flax are raised in abundance, together with leguminous plants and tobacco (13,360 cwt. annually), hops, chicory, etc. The garden, fruit, and vine cultivation is famous. Cattle-breeding is extensively carried on; there are about 100,000 horses, 1,000,000 horned cattle, the exportation of which to France and Switzerland is considerable, 550,000 sheep, 292,000 swine, 55,000 goats, and 120,000 bee-hives. Several Government stud-farms improve the race of horses. Mining, which is chiefly in the hands of the state administration, is almost confined to the production of iron and salt, the latter in five great Government salt-works. The manufacturing industry, owing to the copious water-power, is important and steadily progressing. Noteworthy are the flax-spinning and weaving establishments; the wool, cotton, linen, and lace manufactures; the silk industry, which is the most considerable in Germany; the paper-factories, producing 58,000 cwt., valued at \$1,500,000; the manufactures of iron goods and other metalware, especially represented by the machine-factories of Stuttgart and Esslingen; the tile-works and manufactures of earthenware, glass, and chemicals; the dye-works, the tanneries, the sugar-refineries; the manufactures of tobacco, woodenware, etc. Since Württemberg joined the German Zollverein, in 1834, commerce has steadily increased; it exports especially cattle, grain, wool, timber, salt, fruits, hops, cloth and woollens, linen, leather and paper, Black Forest clocks, gold and silverware, and chemical products. The imports are less considerable, and consist mostly of coal, cotton, porcelain,

faience, and drugs. Würtemberg's book-trade ranks next to that of Berlin and Leipzig. The most important commercial places are Heilbronn, Cannstadt, Ulm, Friedrichshafen, Stuttgart, Reutlingen, and Tuttlingen. In 1892 1,054 miles of railway were in operation, all belonging to the state, except 10 miles.

Education.—Education is compulsory, and there is an elementary school for every group of thirty families. The University of Tübingen enjoys a worldwide fame; there are also a Polytechnic Institute, an art school, an architectural school, a music-conservatory, a veterinary school at Stuttgart, an agricultural academy at Hohenheim, a military school at Ludwigsburg, 85 real-schools of various grades, 64 Latin schools, 11 gymnasia, and 4 lycées, besides 3 Roman Catholic and 5 Evangelical seminaries and numerous industrial schools, as well as many charitable institutions.

Population.—This belongs in the southern part to the Allemannic, in the central to the Suabian, and in the north-eastern part to the Frankish race. There were in 1895 2,081,151 inhabitants. Six towns have each a population exceeding 20,000. According to creed, 69.3 per cent. are Protestants, 29.8 per cent. Roman Catholics, 0.36 per cent. other Christians, 0.57 per cent. Jews.

Government and Finances.—The Government is a constitutional monarchy with 4 votes in the federal council and 17 in the imperial diet. The crown is hereditary, and the female line is not excluded. The constitution dates from Sept. 25, 1819, amended in 1868 and 1874. The representation consists of two chambers. The first chamber, that of the peers (*Standesherrn*), has 45 members, of whom 36 are members by birthright, and 9 are chosen for life by the king. The second chamber (*Abgeordnetenhaus*) has 93 members, chosen for six years—13 by the nobility, 6 by the Protestant and 3 by the Roman Catholic clergy, 1 by the university, 7 by the cities, and 63 by the rural communities. For the members of this chamber all men above twenty-five years of age who pay taxes or in any way contribute to the public burdens can vote and are eligible. The troops form under the terms of the convention of 1870 the Thirteenth German Army-corps, consisting of 24,120 men, 4,190 horses, and 64 cannons in peace (1896-97); 69,934 men and 120 cannons on the war footing. For administrative purposes the country is divided into four circles (*Kreise*)—the Neckar, Schwarzwald, Danube, and Jagst. With regard to finances, the budget for the fiscal year 1896-97 was 70,900,447 marks as revenue, 71,744,325 marks as expenditure. The state debt in 1896 was 468,051,325 marks, of which 432,147,739 marks are railway obligations. The administration of justice is carried on by a supreme court (*Oberlandesgericht*) at Stuttgart and eight courts of first rank (*Landgerichte*).

History.—In ancient times Würtemberg was occupied by the Suevi, a Germanic race. About 84 A. D. it came under Roman authority, and out of the Roman colonies grew up the cities. About the beginning of the third century the Allemanni drove the Romans beyond the Danube and the Rhine, but they in turn were conquered by the Franks under Clovis in the battle of Tolbiacum (Zülpich) in 496. About 900, under the German emperors of the Carolingian dynasty, the duchy of Suabia was formed. The family of the Counts of Würtemberg first appeared in the eleventh century, and grew very rapidly in power and importance. Eberhard V., surnamed "im Bart" (1457-96), one of the most energetic and illustrious Counts of Würtemberg, was made a duke by Emperor Maximilian I. in 1495. Though Würtemberg tried to remain neutral during the earlier part of the Thirty Years' war, it suffered severely from the opposed armies; in 1633 it entered into an alliance with Sweden against Austria, and was devastated by the imperial troops; of 400,000 people, only 50,000 were left after that disastrous war. A similar fate befell it when Louis XIV. began an unprovoked war and sent Melac to ravage all the country along the Rhine. The destructive invasion of the French (1688-92), followed by the disastrous reign of Duke Eberhard Ludwig and his mistresses (1693-1733) nearly ruined the country, which invoked the intervention of Prussia and England in vain. In 1796 it became involved in a war with France, and was compelled to cede Mömpelgard (Montbéliard), but in 1803 Duke Frederick II. obtained as a compensation the electoral dignity and extensive territories, which were formed into a particular division of the state and called Neu-Würtemberg. On Oct. 5, 1805, an alliance was concluded with Napoleon I., and on Jan. 1, 1806, the elector was made a king by Napoleon, and his territory greatly enlarged. The kingdom became a member of the Rhenish confederacy, and on

May 14, 1809, Ulm, Mergentheim, and other cities were added to it, but it had to furnish an army of 16,000 men for the ill-fated campaign to Russia (1812). By the treaty of Pulkava (Nov. 2, 1813) Würtemberg broke its alliance with France and joined the other German princes against Napoleon, having all its new and old possessions guaranteed by the allies. King William (1816-64) granted the constitution of Sept. 25, 1819. His successor, Carl, married to a daughter of Nicholas I. of Russia, sided with Austria in the war of 1866, and his army was defeated (July 24) at Tauberbischofsheim. On Aug. 13 peace was concluded with Prussia. Würtemberg paid a war indemnity of 8,000,000 florins, and formed an offensive and defensive alliance with Prussia, agreeing to reorganize its army after the Prussian model. On Nov. 25, 1870, it joined the other German states in the formation of the German empire, and had its important share in the victory over France. Charles I. died without children Oct. 6, 1891, and William II., grandson of Charles's uncle on his father's side, succeeded to the throne.

BIBLIOGRAPHY.—*Das Königreich Würtemberg. Eine Beschreibung von Land, Volk und Staat*, Royal Statist. Office (3 vols., Stuttgart, 1882-86); Bitzer, *Regierung und Stände in Würtemberg* (Stuttgart, 1882); Stälin, *Geschichte Würtembergs* (Gotha, 1882). HERMANN SCHOENFELD.

Wurtz, HENRI, CHARLES ADOLPHE; chemist; b. at Strassburg, Germany, Nov. 26, 1817; studied medicine and chemistry in his native city; settled at Paris in 1843; was appointed Professor of Medical Chemistry at the Institute in 1854, and received in 1865 the biennial prize of 20,000 francs; he was made dean of the faculty of medicine 1866; became Professor of Organic Chemistry at the Sorbonne 1874; was appointed senator 1881; was first secretary of the Chemical Society of Paris, which he aided in founding, was three times its president; was vice-president of the Academy of Sciences 1880, and president 1881; was awarded the Copley medal by the Royal Society of London 1881. Besides contributions to the *Annales de Chimie et Physique* and the *Répertoire de Chimie pure*, of which he was editor from 1858 until it was merged into the *Bulletin* of the Chemical Society, he published *Traité élémentaire de Chimie médicale* (3 vols., 1864-65); *Leçons élémentaires de Chimie moderne* (1866-68); *Dictionnaire de Chimie pure et appliquée* (5 vols., 1868-78; 2 vols. of appendix); *Théorie atomique* (1879); *Traité de Chimie Biologique* (1885). His works translated into English include *Chemical Philosophy according to Modern Theories* (1867); *Theory from the Age of Lavoisier* (1869); and *Elements of Modern Chemistry* (1880). D. in Paris, May 12, 1884. Revised by IRA REMSEN.

Wurtz, HENRY, Ph. D.; chemist; b. at Easton, Pa., June 5, 1828; graduated at Princeton 1848; studied at the Lawrence Scientific School at Cambridge, Mass., and also privately; became in 1850 assistant in charge of the laboratory of the Yale (now Sheffield) Scientific School at New Haven, Conn.; was State chemist of New Jersey 1854-56, being also engaged on the geological survey of that State; was subsequently Professor of Chemistry in Queen's University, Kingston, Canada, professor in the National Medical College at Washington, D. C., 1858-59, and chemical examiner in the U. S. patent-office 1858-61; removed to New York; edited the *American Gas-Light Journal* 1871-75; in 1888 entered the employ of Thomas A. Edison as chemist; has made several important discoveries in chemistry, among which are the use of sodium in the amalgamation of the ores of precious metals, the determination of alkalis in silicates by fusion with chloride of calcium (presented to the American Association 1850), and, above all, the discovery of the geometrical laws of the condensation of chemical molecules, first published in 1876. Prof. Wurtz has published more than sixty scientific papers. He is also the originator of the dynamic theory of metamorphic heat in geology, communicated to the American Association for the Advancement of Science in 1866. Of this, Mallet's theory of vulcanicity is only an extreme case.

Würzburg, würtz-boorch; town of Bavaria; 60 miles S. E. of Frankfurt; on the Main, which here is crossed by a splendid stone bridge of eight arches (see map of German Empire, ref. 5-E). It was formerly the capital of the bishopric of Würzburg, which (until 1803, when it was secularized and its territory conferred on the Elector of Bavaria) formed an independent and very wealthy ecclesiastical principality of Germany. The episcopal palace, built in 1720, is one of the most magnificent royal residences of Europe. The cathedral, built in the eleventh century, is an elegant

edifice. The university, with which are connected a magnificent hospital and a library of about 200,000 volumes, enjoys a great reputation, especially for its medical department. It had 1,330 students in 1892-93. Besides its university the city has many other good educational institutions, and manufactures of leather, tobacco, cloth, woolen fabrics, and surgical and mathematical instruments. The vicinity produces very fine wine. Pop. (1890) 61,039.

Wyandot Indians: See IROQUOIS INDIANS.

Wyandotte: city (incorporated in 1867); Wayne co. Mich.; on the Detroit river, and the Lake Shore and Mich. S., and the Mich. Cent. railways; 12 miles S. of Detroit (for location, see map of Michigan, ref. 8-K). It has a public library, high school, two State banks with combined capital of \$100,000, a weekly newspaper, and extensive rolling-mills and blast furnaces, several sawmills, shipyard, large soda-ash works, rope and mat factory, stave and hoop works, trunk-factory, etc. Pop. (1880) 3,631; (1890) 3,817; (1894) state census, 4,209.

EDITOR OF "HERALD."

Wyant, ALEXANDER H.: landscape-painter; b. at Port Washington, O., Jan. 11, 1836; pupil of Hans Gude in Karlsruhe; settled in New York; National Academician 1869; member of the Society of American Artists 1878; member of the American Water-color Society; received honorable mention at the Paris Exposition of 1889. His works are notable for unity of effect and good qualities of color. D. in New York, Nov. 29, 1892.

W. A. C.

Wyatt, Sir MATTHEW DIGBY, F. S. A.: architect and writer on art; b. at Bowle, Wiltshire, England, in 1820; was associated as secretary with those members of the Society of Arts who originated the project of the Universal Exposition held at London in 1851; superintended the fine arts department and the decorations of the Crystal Palace at Sydenham 1852-54; became surveyor to the East India Company Dec., 1855; was architect to the Council of India; was prominently connected with the British Universal Exposition of 1862; received her Majesty's gold medal for architectural excellence 1866; was knighted Jan. 14, 1869, and was Slade Professor of Fine Arts at Cambridge for the first term of three years, 1869-72. Author, among other works, of *Geometrical Mosaics of the Middle Ages* (1848); *Industrial Arts of the Nineteenth Century* (2 vols., 1854); *Metal-Work and its Artistic Design* (1852); *Notices of Sculpture in Ivory, etc.* (1856); *Art-Treasures in the United Kingdom* (1857); *What Illuminating Was—What it Should Be* (1861); and *An Architect's Note-Book in Spain* (1872). D. in London, May 21, 1877.

Revised by RUSSELL STURGIS.

Wyatt, Sir THOMAS: sonneteer and diplomatist; b. at Allington Castle, Kent, in 1503; son of Sir Henry (d. 1538), a prominent friend of Henry VII.; educated both at Oxford and at St. John's College, Cambridge; took his degree 1518; made the tour of Europe; married Eleanor, daughter of Lord Cobham; became a gentleman of the king's bed-chamber; gained a high reputation at court by his poems, his skill at arms, in music, and in repartee, and his knowledge of continental languages; and was sent by Henry VIII. on several diplomatic missions. D. at Sherborne, Oct. 11, 1542. He left a considerable number of poems, largely love sonnets in the Italian manner, which were published together with those of his friend the Earl of Surrey 1557, and frequently reprinted. Among recent editions of his *Poems*, those of Gilfillan (1858) and of Robert Bell (1860) are the best. The best edition of his *Complete Works* is that of Rev. Dr. George F. Nott, along with those of Surrey (2 vols., 1815-16), with notes and a glossary.

Revised by H. A. BEERS.

Wyatt, Sir THOMAS, called THE YOUNGER: b. at Allington, Kent, about 1521; married at the age of sixteen; succeeded to his father's titles and estate 1542; led for some time a life of reckless dissipation; raised a body of soldiers at his own expense and took part in the siege of Landreecis 1544; commanded the English forces at Boulogne 1545, and was subsequently second in command there under Surrey, remaining there until that place was surrendered to the French 1550; lived in retirement at Allington until the accession of Mary, when he was involved with the Duke of Suffolk in a conspiracy against her in favor of Lady Jane Grey; assembled a body of Kentish men under pretext of resisting Mary's marriage with Philip II.; marched upon London, but was captured, tried, and condemned to death Mar. 15, behaving with little self-control and implicating the Princess Elizabeth and others in his confessions. He

was executed on Tower Hill, Apr. 11, 1554. His ill-judged movement proved fatal to Lady Jane Grey, who had been some months in prison, and was brought to the block a week after the attempt upon the city.

Wych-elm: See WITCH-ELM.

Wycherley, wick'er-lée, WILLIAM: dramatist; eldest son of a Shropshire gentleman of good family; b. at Clive, near Shrewsbury, England, about 1640; educated at Angoulême, France, where he became a Roman Catholic; returned to England 1660; studied at Queen's College, Oxford, where he conformed to the Church of England; produced with success in 1672 his play, *Love in a Wood, or St. James's Park*, which procured him the patronage of the Duchess of Cleveland, who introduced him at court; was favored by the Duke of Buckingham and by the king, who afforded him employment at court; brought out three other plays, *The Gentleman Dancing-Master* (1673), *The Country Wife* (1675), and *The Plain-Dealer* (1677), the last two founded in some degree upon Molière's *L'École des Femmes* and *Le Misanthrope*; married clandestinely, about 1680, the Countess-dowager of Drogheda, who soon died, leaving him her fortune, which, however, was disputed at law by her relatives. Having lost favor at court he was several years a prisoner for debt in the Fleet until after the accession of James II., by whom his debts were paid and a pension of £200 settled upon him; succeeded to his paternal estates soon after, and published dull volumes of *Poems* (1704), corrected by Pope, D. in London, Jan. 1, 1715. His *Posthumous Works* (1728) were published by Theobald, and his collected *Plays* (1712) were edited by Leigh Hunt in 1840, in connection with those of Congreve, Vanbrugh, and Farquhar. Wycherley's comedies were in prose, and were vigorous but very coarse. See Macaulay's *Comic Dramatists of the Restoration*.

Revised by H. A. BEERS.

Wyclif, Wickliffe, or Wielif, sometimes de Wyclif, JOHN: reformer; b. at Ipswel (now Hipswell), near Richmond, Yorkshire, England, probably some years earlier than 1324; was a scholar of Baliol College, Oxford, afterward a fellow, and sometime between 1356 and 1361 master of the college. He is supposed to have published in 1356 his first work, *The Last Age of the Church*, in which he argued that the millennium was past, that the world was then under the reign of Satan and of Antichrist, and that the day of judgment was near at hand; was soon led to identify the papacy with Antichrist; about 1360 vigorously attacked the mendicant orders of preachers, whom he accused of profligacy, of false doctrine, and of undermining the influence of the regular clergy. In 1361 he accepted the college living of Fillingham, in the diocese of Lincoln, but exchanged it for the poorer living of Ludgershall 1369. In 1370 he took his degree of D. D., but he had begun to read lectures on divinity at Oxford about 1363. He was appointed chaplain to King Edward III., and wrote against the papal demand for arrears of tribute from the English crown 1365. In 1374 he was appointed by the crown to the living of Lutterworth. In August of the same year was one of six commissioners sent by Edward III. to Bruges to confer with the papal delegates upon questions of ecclesiastical authority in England; remained abroad nearly two years; was during his absence presented by the king with a prebend in the collegiate church of Westbury, Gloucestershire (Nov., 1375), but refused it. In 1376 his vigorous attacks on the papal pretensions caused great excitement in England, and he was accused of heresy by Archbishop Courtney, and summoned before a convocation of the clergy at St. Paul's, London; was attended thither (Feb. 19, 1377) by the two most powerful subjects of the kingdom, John of Gaunt and Henry Percy, the earl-marshal, whose defense of Wyclif gave rise to a popular tumult in which the Savoy Palace, the residence of the former prince, was attacked; was directly accused of heresy in five bulls issued by Pope Gregory VI. May, 1377, by virtue of which he was cited before a clerical synod at Lambeth early in 1378; was saved from active persecution by the intervention in his behalf of the Princess of Wales, and especially by the breaking out in that year of the great papal schism; was consequently allowed to depart with an admonition to refrain from preaching the obnoxious doctrines. He was not fighting these battles alone; on the contrary, he was supported by the chancellor and many of the officers of Oxford University, and by a great part of the nation; and in order to deepen the impression of the movement he began about this time to send out many disciples, who under the name of poor priests preached his doctrines

in all parts of the kingdom; and further he prepared, with the assistance of his pupils, a version of the entire Bible into English (1382), which was rapidly disseminated among the people. Up to this time his teaching related mainly to the religious life, to the sins of monks, and to the independence of the English people from papal domination, especially pecuniary; but in 1381 he made a more decisive break with the Roman Church, for he lectured at Oxford against transubstantiation. In so doing he braved fiercer opposition and could no longer count upon royal protection. He was condemned by a synod of twelve doctors; was summoned before a clerical convocation at Oxford 1382, when he defended his opinions, presenting two confessions of faith in which they were reaffirmed, but in a conciliatory manner; was debarred by royal command from lecturing further at Oxford; retired to his living at Lutterworth, where he continued preaching and writing controversial and expository treatises until his death, which ensued two days after suffering a stroke of paralysis (Dec. 28) while celebrating mass. D. Dec. 31, 1384. His doctrines had many supporters in England (known as Lollards or Wycliffites) for two generations, and being carried to Bohemia by the members of the suite of Queen Anne, gave rise there to the formidable Hussite movement. His opinions coincided in great part with those of Luther and Calvin, and he is justly called "the morning-star of the Reformation." The Council of Constance, as a preliminary to the martyrdom of John Hus and Jerome of Prague, examined and condemned forty-five articles of the doctrines of Wyclif (May 5, 1415), formally declared him a heretic, and ordered his bones to be removed from consecrated ground and cast upon a dunghill. This sentence was not executed until thirteen years later, when, on the demand of the anti-pope Clement VIII., his remains were burned and the ashes thrown into the Swift, a tributary of the Avon. Wyclif's writings were very numerous, more than 200 pieces being ascribed to him, chiefly brief tracts. Few of them were printed until recently, and many are still unpublished. His translation of the Bible was first edited by Rev. Josiah Forshall and Sir Frederick Madden for the University of Oxford (4 vols., 1850). His *Last Age of the Church* (Dublin, 1840) was edited by James Henthorne Todd, D. D., who also issued his *Apology for Lollard Doctrines* (1842) and his *Three Treatises* (1851). A collection of his English Tracts and Treatises, with *Selections and Translations from his Latin Works* (1845), was edited for the Wycliffe Society by Robert Vaughan, D. D., who was the author of the best biography of the Reformer up to that time (2 vols., 1828; new ed. 1853). His *Select English Works* (including numerous sermons) were edited by Thomas Arnold (3 vols., Oxford, 1869-71); his *English Works, hitherto unprinted*, by F. D. Matthew (London, 1880). In 1882 the Wyclif Society was founded by F. J. Furnivall, to take away the reproach that the most important of Wyclif's Latin writings should still be unprinted. These writings are very numerous, and are found in foreign libraries, particularly in Vienna. The explanation of this anomaly is the dissemination of Wyclif's writings among the Hussites after they had been put under the ban in England. The society issued its first volume in 1884. It was then hoped to present the Latin writings complete in twenty volumes in ten years' time, but the nineteenth volume appeared in 1895, and the end is only in sight. Until the Latin writings are published, no complete study of Wyclif's theology can be made. The best biography of Wyclif is by G. V. Lechler (2 vols., Leipzig, 1873; Eng. trans. of vol. i, London, 2 vols., 1878; new ed. with summary of Lechler's vol. ii., 1884, 1 vol.). A good book is Lewis Sergeant, *John Wyclif* (London and New York, 1893). See also W. W. Shirley, *Catalogue of the Original Works of John Wyclif* (Oxford, 1865). For the connection between Wyclif and Hus, see J. Loserth, *Wyclif and Hus* (Eng. trans., London, 1884).

SAMUEL MACAULEY JACKSON.

Wye: river of England and Wales, a tributary of the Severn. It rises on Plumlimmon, near the head water of the Severn, and flows for 150 miles through or adjoining Montgomery, Radnor, and Brecknock, in Wales, and Hereford, Monmouth, and Gloucester, in England, reaching the Severn below Chepstow. The part dividing Monmouth and Gloucester is famed for its beauty.

Wylie, JAMES AITKEN, LL.D.: clergyman and author; b. at Kirremuir, Forfarshire, Scotland, Aug. 9, 1808; educated at Marischal College, Aberdeen, 1822-25, at the University of St. Andrews 1826, and in Original Secession Hall, Edinburgh 1827-30; was minister of the Original Secession

congregation at Dollar 1831-46; associate editor with Hugh Miller of the *Witness*, Edinburgh, 1846-56; editor of the *Free Church Record* 1853-60; professor (of the distinctive principles of the Roman Catholic and Protestant theologies) to the Protestant Institute of Scotland, in Edinburgh, from 1860 till his death there May 1, 1890. He wrote mostly upon the subjects connected with his professorship and on the fulfillment of biblical prophecy. Of his many books may be mentioned *Modern Judea compared with Ancient Prophecy* (London, 1841); *A Journey over the Region of Fulfilled Prophecy* (Edinburgh, 1845; 2d ed. under title *Ruins of Bible Lands*, 1857; 14th ed. 1881); *A Pilgrimage from the Alps to the Tiber, or the Influence of Romanism on Trade, Justice, and Knowledge* (1855); *Wanderings and Musings in the Vallies of the Waldenses* (1858); *The Tercentenary of the Scottish Reformation* (1860); *The Awakening of Italy and the Crisis of Rome* (1866); *The Road to Rome via Oxford, or Ritualism identical with Romanism* (1868); *Daybreak in Spain, a Sketch of Spain and its New Reformation* (1870); *The History of Protestantism* (3 vols., 1874-77); *The Jesuits; their Moral Maxims and Plots against Kings, Nations, and Churches* (1881); *History of the Scottish Nation* (2 vols., 1886); *The Papacy* (1889).

SAMUEL MACAULEY JACKSON.

Wylie, ROBERT: genre-painter; b. in the Isle of Man in 1839. He was taken to the U. S. when a child, and studied at the Pennsylvania Academy, Philadelphia; he was sent by the trustees of the academy to France to study in 1863. He took up his residence at the little village of Pont-Aven in Brittany, and was the founder of a colony of painters there. He received a second-class medal at the Salon of 1872, and after his death his works were exhibited in Paris, where they attracted much attention. D. at Pont-Aven in 1877. One of his most important works, *Death of a Vendean Chief*, painted in 1876-77, is in the Metropolitan Museum, New York.

WILLIAM A. COFFIN.

Wyman, JEFFRIES, M. D.: anatomist; b. at Chelmsford, Mass., Aug. 11, 1814; graduated at Harvard 1833, and at the Harvard Medical School 1837; became demonstrator of anatomy and curator of the Lowell Institute 1839; delivered a course of lectures there in 1840; spent two years studying medicine in the hospitals of Paris and natural history in the Jardin des Plantes; was Professor of Anatomy in the Hampden-Sidney Medical College at Richmond, Va., 1843-47, and thereafter until his death Hersey Professor of Anatomy in Harvard University. He soon began the formation of the Museum of Comparative Anatomy, to the increase of which he devoted most of his energies for many years, making extensive journeys; delivered before the Lowell Institute in 1849 a second course of *Lectures on Comparative Anatomy and Physiology* (1849); became Professor of Comparative Anatomy in the Lawrence Scientific School at Cambridge; was successively secretary of the Boston Society of Natural History, its curator in different departments, and its president 1856-70; was president of the American Association for the Advancement of Science 1857; became curator of the Peabody Museum of Archaeology at Cambridge 1866, and laid the foundation of its remarkable collections; published over sixty papers in the scientific journals and in the *Transactions or Proceedings* of the numerous societies to which he belonged; made the first anatomical investigation of the gorilla, and gave it its scientific name. In conjunction with Dr. Savage he investigated the question of spontaneous generation with great carefulness and impartiality; made curious researches in regard to the action of light and other forms of force in embryology, and especially in teratology; exposed the spuriousness of the famous skeleton called the *Hydrarchus Sillimani*, alleged to be that of an extinct sea-serpent, and discovered in Florida and elsewhere prehistoric human remains in fresh-water shell-heaps. D. at Bethlehem, N. H., Sept. 4, 1874.

Wymore: city; Gage co., Neb.; on the Big Blue river, and the Chi., Burl. and Quin. Railroad; 62 miles S. of Lincoln, the State capital (for location, see map of Nebraska, ref. 10-G). It is an important grain and stock shipping-point, and has three weekly newspapers, and railway-shops and roundhouses. Pop. (1890) 2,536.

EDITOR OF "REPORTER."

Wynants, or Wijnants, JAN: landscape-painter; b. at Haarlem, Netherlands, somewhere about 1600 or later. He lived at Haarlem until 1660 or 1665, and afterward established himself at Amsterdam, where he is supposed to have died after 1679. Wouwerman inserted figures in Wynants's

landscapes while the latter lived at Haarlem; A. van de Velde or Jan Lingelbach while he was at Amsterdam. His works are dated from 1641 to 1679. He is well represented in foreign galleries, especially at Amsterdam, Munich, and St. Petersburg, the National Gallery of London, and in the collections of Sir R. Wallace, Lord Northbrook, and the Earl of Ellesmere. W. J. S.

Wynkin de Worde: See WORDE.

Wynne, EDWARD: b. in England in 1734; became an eminent lawyer, and was author of *Eunomus, or Dialogues concerning the Law and Constitution of England; with an Essay on Dialogue* (4 vols., 1767; 5th ed. 2 vols., 1822). This work was at first published anonymously, and is generally cited as *Eunomus* simply. Some shorter and less known and rare works by him which were privately printed were also published anonymously. D. at Chelsea, near London, in 1784.

Revised by F. STURGES ALLEN.

Wyntoun, ANDREW OF: rhyming chronicler; b. in Scotland about the middle of the fourteenth century; became a canon regular of the priory of St. Andrews, and was chosen prior of St. Serf's Inch (or Island), Lochleven, before 1395. D. after 1420. He wrote *The Orygynale Cronykil of Scotland*, in rhyme, five books of which relate to ancient history and geography. The part devoted to Scottish history was first edited, with notes and a glossary, by David Macpherson (London, 2 vols., 1795). See the complete edition by Laing, *Historians of Scotland Series* (3 vols., 1872-79).

Revised by H. A. BEERS.

Wyo'ming [= Amer. Ind. (Del.), liter., Great Plains]: one of the U. S. of North America (Western group); the thirty-first State admitted to the Union; capital, Cheyenne.

Location and Area.—It is situated between lat. 41° and 45° N. and lon. 104° and 111° W.; bounded N. by Montana, E. by South Dakota and Nebraska, S. by Colorado and Utah, W. by Utah, Idaho, and Montana; length from E. to W., 355 miles; width from N. to S., 276 miles; area, 99,015 sq. miles, of which about 315 are water surface.

Physical Features.—The general appearance of the State is mountainous, with valleys, foothills, and rolling plains. The mean elevation is 6,000 feet, extremes ranging from 3,400 to 14,000 feet. The continental divide or main range of the Rocky Mountains enters the State about midway on the southern boundary, and extends in a N. W. direction through the State into Montana and Idaho. Wind River Mountains, snow-capped the year around, and with altitude of from 10,000 to 12,000 feet, are the culminating crest of the main range of the Rocky Mountains in the northwest,

between the Sierra Madre Mountains and Green river is designated the "Red Desert." The highest peaks in the State are Fremont's Peak, in the Wind River range, elevation 13,790 feet; Grand Teton Peak, of the Teton range, 13,690 feet; Mt. Sheridan, of the Yellowstone range, 13,691 feet; and Atlantic Peak, of the Wind River range, 12,700 feet. Mt. Washburn, Elk, Laramie Mountains, and Index, Wyoming, and Gros Ventre Peaks all exceed an elevation of 10,000 feet. The most important rivers are the North Platte, rising in Colorado and flowing N. into Wyoming, through the southeastern part of the State and then into Nebraska; Green river, flowing S. in the western part into Utah; Snake river, rising in the southern part of Yellowstone Park and flowing S. E. into Idaho, eventually joining the Columbia; the Yellowstone, Big Horn, and Powder rivers flowing N. into Montana; and the Cheyenne and Belle Fourche, flowing E. into South Dakota. Yellowstone Lake, situated in the YELLOWSTONE NATIONAL PARK (*q. v.*), in the northwestern corner of the State, is the largest body of water in Wyoming, being 22 miles long and 15 wide. Jackson's, Shoshone, Lewis, and Madison Lakes lie S. and S. E. of Yellowstone Lake and N. W. of the Wind River range. Fremont and Boulder Lakes lie near the base of Fremont's Peak, where the Green river, one of the largest tributaries of the Colorado, rises.

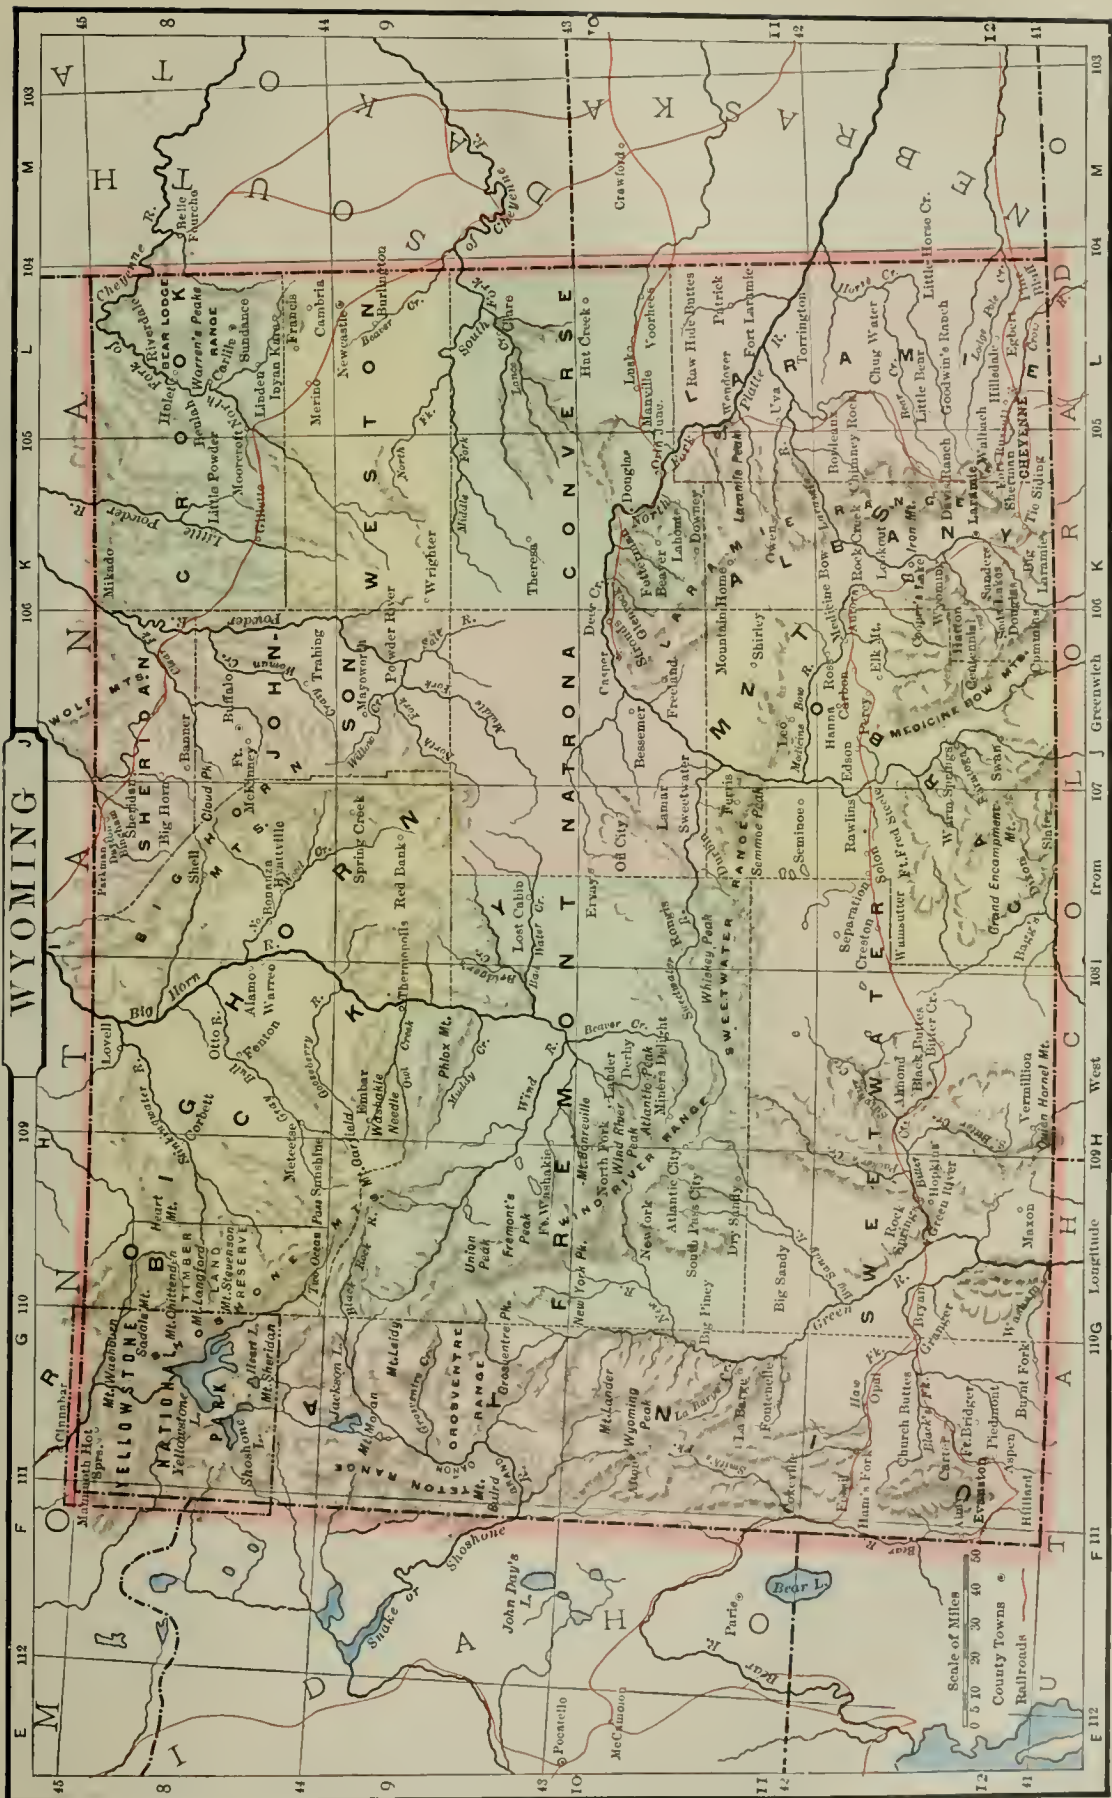

Geology.—The earliest geological explorations in Wyoming were made by Prof. F. V. Hayden. The State is an interesting field for geological research. Though not as yet extensively explored, Wyoming has been found to contain Tertiary, Carboniferous, Cretaceous, Eozoic, Silurian, Triassic, Jurassic, Devonian, and Volcanic formations. The mineral deposits include a large percentage of coal, iron, gold, silver, graphite, asbestos, gypsum, bismuth, arsenic, alum, sulphur, copper, and red oxide of iron. Building-stones of high commercial value are also found, comprising sandstone, limestone, granite, and marble. They have not as yet been extensively worked, but at Rawlins, on the line of the Union Pacific Railway, there has been opened a large quarry of superior gray sandstone. North of Cheyenne are shipping quarries of excellent stone, ranging in color from light gray to dark red. Iron ores have been found in every county, but mining is not developed. The largest known deposits are at Hartville, Laramie County, where the ore is found associated in many instances with copper. At Rawlins, Carbon County, deposits of red oxide of iron are mined for use as mineral paint and as flux for the reduction of silver ores. Gold and silver are mined at Atlantic, in the Sweetwater region, in the Seminoe, Sierra Madre, and Big Horn Mountains, and in the Silver Crown district W. of Cheyenne. The total valuation of the gold and silver product in 1890 was \$14,572. Soda is found in Carbon, Albany, and Natrona Counties, and is mined principally near Laramie, where the deposit is 12 feet thick. Petroleum has been found in many localities, and recent development has placed Wyoming oils on the market. The most extensive development has been in Fremont and Natrona Counties, where many wells have been bored and plugged, awaiting transportation facilities. Oil from the Salt Creek field, in Natrona County, is refined at and shipped from Casper. It is estimated that Wyoming has 20,000 sq. miles underlain with coal. The first utilization of this product was by the Union Pacific Railway in 1868, when it mined 650 tons at Carbon in a single month. The total production in 1893 was 2,439,311 short tons, valued at \$3,290,904, of which 2,280,685 tons were loaded at the mines for shipment. The coal-producing counties, with their production in 1893, are: Sweetwater, 1,337,206 short tons; Carbon, 395,059; Weston, 310,906; Uinta, 292,374; Converse, 56,320; Sheridan, 35,920; and Johnson, 10,126. The variety is lignite of a high order, containing from 50 to 55 per cent. of fixed carbon, and being equal to many of the bituminous grades.

Soil and Productions.—The soil of the uplands and plateaus of Wyoming is a light sandy loam, and of the valleys a black loam, in some instances alkaline, but yielding bountifully when reduced by water. About 10,000,000 acres are suitable for agricultural purposes by irrigation, 22,000,000 acres are mountainous, 18,000,000 acres consist of high table-lands, and approximately 30,000,000 acres are covered with grasses and suitable for grazing. The native and cultivated grasses of Wyoming are highly nutritious, and by reason of the dry climate cure naturally, thus retaining their nutritive properties. Below the timber-line, which in Wyoming varies from 9,000 to 11,000 feet, the mountains are covered with a thick growth

Seal of Wyoming.

and are paralleled on the W. by the Teton and Gros Ventre ranges. The Shoshone Mountains, with a general elevation of from 10,000 to 11,000 feet, lie N. of the Wind River range, and the Big Horn Mountains extend from the middle of the northern boundary S. to nearly the geographical center of the State. The Rattle Snake Mountains, together with the Casper and Seminoe ranges, are S. of the Big Horn range, while the Black Hills, which constitute the eastern foothills of the Rocky Mountains, occupy part of the eastern section, extending from South Dakota in a S. W. direction. The Medicine Bow and Sierra Madre ranges are in the southern part and extend into Colorado. The Sweetwater range lies on the southern side of Sweetwater river. The vast plain

of pine, spruce, and hemlock trees of large size, more dense on the western than on the eastern slope; the foothills have some pine, spruce, aspen, walnut, elm, ash, box-elder, and red cedar; and along the rivers and creek bottoms are found two species of cottonwood and thickets of willows. Many hundreds of flowering plants, mosses, and lichens are indigenous to the State.

By the aid of irrigation, abundant crops of tame grasses, such as alfalfa (lucerne), red clover, bluestem, reedtop, and timothy are grown. The agricultural productions include wheat, oats, barley, rye, buckwheat, and Indian corn. Potatoes are an important crop, of superior quality, and yielding liberally. Other roots and vegetables are sugar-beets and the ordinary farm products of lower altitudes. Hardy fruits and berries thrive, and in the mountains raspberries, strawberries, currants, gooseberries, choke-cherries, and buffalo-berries are native.

The following summary from the U. S. census reports of 1880 and 1890 shows the extent of farming operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.*
Total number of farms.....	457	3,125	583.8
Total acreage of farms.....	124,433	1,830,432	1,371.0
Value of farms, with buildings and fences.....	\$835,835	\$14,460,880	1,630.0

* Increase.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	2,257	67,710 bush.	\$44,012
Wheat.....	5,082	99,607 "	62,752
Oats.....	16,677	506,981 "	243,351
Potatoes.....	2,554	383,100 "	229,860
Hay.....	224,765	361,872 tons	3,618,720
Totals.....	251,335		\$4,198,695

On Jan. 1, 1895, the farm animals comprised 82,524 horses, value \$1,589,457; 1,505 mules, value \$50,618; 18,706 milch cows, value \$397,503; 767,193 oxen and other cattle, value \$10,562,332; 1,222,538 sheep, value \$2,004,107; and 15,834 swine, value \$102,417; total head, 2,108,300; total value, \$14,706,434.

Fauna.—About thirty species of mammals, including the grizzly, black, brown, and cinnamon bear, wolf, coyote, mountain lion, wild cat, wolverene, otter, beaver, porcupine, mink, skunk, little ermine, elk, moose, white and black tailed deer, mountain sheep, cotton-tail and jack-rabbit, squirrel, prairie dog, gopher, and muskrat are found. The buffalo, formerly common in Wyoming, is only found in the Yellowstone National Park, where it is protected. About 125 species of birds, including several birds of prey, many song-birds, and game birds of the duck and grouse family, are also found. Of the fifty or more species of fishes there are mountain trout (which is native in many of the mountain streams), several kinds of suckers, catfish, bass, pickerel, sunfish, pike, etc. For the propagation of food-fishes a State fish-hatchery is maintained at Laramie, and also two branch hatcheries, one at Sheridan and the other at Sundance, in the northern part of the State. There are stringent laws for the protection and propagation of game and fish.

Climate.—The average mean temperature for the year in the State is about 44°, ranging lower in the mountains and higher in the valleys, according to the elevation. The atmosphere is pure and rarefied, and cloudless days predominate. In the southern part of the State high winds sometimes prevail during the spring and autumn, but cyclones and tornadoes are unknown, and thunder-storms infrequent. In Dec., 1894, at Cheyenne, the wind attained a velocity of 72 miles per hour, which was the highest for the year, and the highest ever recorded. The average annual velocity is 11.81 miles per hour. The thermometer during the winter months sometimes records very low temperature, but the dryness of the atmosphere tends to ameliorate the effects of the intense cold, and the storms of winter are not generally more violent and destructive than those of lower altitudes. Occasionally, when accompanied by high winds and low temperature, the air becomes so filled with particles of frost and dry snow as to endanger life; but such storms are unusual and of short duration. Generally speaking, the cli-

mate of Wyoming is dry, mild, pleasant and healthful. The following tables give extremes and average of temperature and of rainfall by months for 1894:

MONTHS.	TEMPERATURE.			RAINFALL.		
	Highest.	Lowest.	Average.	Highest.	Lowest.	Total.
January.....	59° F.	17° F.	25° F.	0.15 in.	Trace.	0.20 in.
February.....	50	13	20	0.23	0.04 in.	0.72
March.....	63	4	33	0.36	0.02	0.93
April.....	73	16	44	0.58	0.01	1.21
May.....	82	27	54	0.38	Trace.	1.24
June.....	86	40	61	0.33	0.04 in.	0.64
July.....	94	46	68	1.14	0.03	3.35
August.....	89	14	67	1.61	0.05	2.17
September.....	85	32	56	0.44	0.02	1.23
October.....	73	21	49	0.16	0.01	0.18
November.....	68	3	41	0.14	0.01	0.08
December.....	58	13	28	0.18	0.01	0.70
Annual average.....			45.5			12.98

Divisions.—For administrative purposes the State is divided into thirteen counties, of which one is unorganized (1895), as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	* Ref.	Pop. 1880.	Pop. 1890.	COUNTY-TOWNS.	Pop. 1890.
Albany.....	12-K	4,026	8,865	Laramie.....	6,388

Totals.....		20,789	60,705		

* Reference for location of counties, see map of Wyoming.
 † Unorganized, 1895.
 ‡ Unorganized, 1880.

Principal Cities and Towns, with Population in 1890.—Cheyenne, 11,690; Laramie, 6,388; Rock Springs, 3,406; Rawlins, 2,235; Evanston, 1,995; Newcastle, 1,715; Carbon, 1,140; and Buffalo, 1,087.

Population and Races.—In 1870, 9,118; 1880, 20,789; 1890, 60,705 (native, 45,792; foreign, 14,913; male, 39,343; female, 21,362; white, 59,275; colored, 1,430, including 922 persons of African descent). Within the limits of Fremont County is the Shoshone Indian reservation, containing 1,520,000 acres of excellent land. It is occupied by the Shoshone and Arapahoe Indians, numbering about 2,000. The Shoshone Indian agency and Fort Washackie military reservation are located on this tract. Fort D. A. Russell military reservation is 3 miles N. W. of Cheyenne. Federal troops are also stationed at Rock Springs, in Sweetwater County, but other military reservations in Wyoming have been abandoned.

Industries and Business Interests.—The most important industries of Wyoming are coal-mining, stock-raising, and banking. The coal-mining industry is largely controlled by the Union Pacific Railway Company. Probably stock-raising in its various departments absorbs the attention of more of the people than any other industry. In 1890 there were 190 manufacturing establishments, employing 1,144 persons, paying in wages \$878,646, using materials that cost \$1,084,432, and having an output valued at \$2,367,601.

Finance.—The total taxable valuation of property in 1894 was \$29,198,041; bonded indebtedness, \$320,000; receipts, \$237,626; expenditures, \$196,381; tax rate, 5.85 mills. Wyoming had \$546,567 invested in public buildings. The constitution provides that the annual levy for State purposes shall not exceed 4 mills on every dollar, excepting for charitable and educational purposes; and the county levy shall not exceed 12 mills, excepting for State revenue and public debt. The State can not create an indebtedness exceeding 1 per cent. of its assessed valuation, and no county an indebtedness exceeding 2 per cent. of it. The total number of real estate mortgages in 1890 was 3,028, representing \$4,767,065, or a per capita indebtedness of \$82.

Banking.—In 1895 there were 11 national banks with a total capital of \$1,060,000, 3 State banks with a capital of \$52,000, and 4 private banks with a capital of \$137,900;

total banking capital, \$1,249,900; total deposits in all banks, \$3,294,913.07; total loans and discounts, \$3,376,211.39.

Means of Communication.—Wyoming has no shipping, the rivers and lakes not being navigable, and internal trade is conducted by railways or horse-power. From railway terminals to interior towns a considerable tonnage is transported by means of cattle, mule, or horse equipment. The total railway mileage is 1,157.34 miles, of which the Union Pacific Railway had 533.77, and the Grand Island and Northern, 236.59. The railways are practically without branch lines or feeders.

Churches.—The census of 1890 gave the following statistics of the religious bodies:

DENOMINATIONS.	Organiza-tions.	Churches and halls.	Members.	Value of church property.
Roman Catholic	67	67	7,185	\$173,450
Latter-day Saints	8	6	1,336	11,700
Methodist Episcopal	13	11	773	48,700
Protestant Episcopal	16	19	594
Lutheran, General Council	5	..	580
Presb. in the U. S. of America	6	6	364	52,250
Congregational	7	6	339	44,550
Baptist	9	9	262	27,855
Lutheran, General Synod	3	3	141	6,100
African Methodist Episcopal	3	3	139	4,000
Disciples of Christ	2	1	48

Schools.—The number of pupils of school age enrolled in 1894 was 10,310; number of schools taught, 379; number of school buildings, 257; cost of buildings, \$381,914; outstanding bonded school district indebtedness, \$199,223; number of teachers, male 96, female 311; average monthly compensation of male teachers \$66.70, female \$49.15; amount expended for support of public schools during the year, \$240,023. A Congregational college is located at Big Horn, Sheridan County, and the State University and Agricultural College, at Laramie, Albany County. The State University is maintained from the proceeds of a State levy, and the Agricultural College is supported from the proceeds of an appropriation by the Federal Government. Public buildings are located in Wyoming by vote of the people, and in compliance with this provision of the constitution an agricultural college has been located at Lander, Fremont County, but is not yet (1895) constructed.

Post-offices and Periodicals.—In Jan., 1895, there were 258 post-offices, of which 8 were presidential (1 second-class, 7 third-class) and 250 fourth-class. Of the total offices 39 were money-order offices and one was a limited money-order office. There were 38 newspapers and periodicals, comprising 5 daily, 1 semi-weekly, and 32 weekly publications.

Charitable, Reformatory, and Penal Institutions.—Wyoming maintains a State penitentiary at Laramie, an Insane Asylum at Evanston, a State Hospital at Rock Springs, and a Soldiers' and Sailors' Home at Cheyenne. The blind, deaf mute, feeble-minded, and juvenile delinquents of the State are sent to the Colorado institutions for such unfortunates, as the number does not justify special arrangements for their care in Wyoming. The poor farm is at Lander, but is not in operation, and paupers are supported by the several counties. A new penitentiary is (1895) in course of construction at Rawlins. All of the above institutions are supported by special tax levy, and are under the general control of a State Board of Charities and Reform, consisting of the Governor, Secretary of State, auditor, treasurer, and superintendent of public instruction.

Political Organization.—The legislative department is composed of a State Senate, whose members are elected for four years, and a House of Representatives, whose members are elected for two years. Each county is entitled to at least one member in each body, and additional members are allotted according to population. The Legislature meets on the second Tuesday in January of odd years, and sessions are limited to forty days. The compensation of members, excepting officers, is \$5 per day. The elective State officers are the Governor, Secretary of State, auditor, treasurer, and superintendent of public instruction, all elected for four years. Appointive State officers are the attorney-general, engineer, adjutant-general, mine inspector, fish commissioner, examiner, veterinarian, and librarian, whose terms vary from two to six years. All State officers have fixed salaries and fees received by them go to the State. The courts comprise the Supreme and district courts, and justices of the peace. The Supreme Court consists of three justices, elected for eight years, the senior member by rotation becoming the chief jus-

stice. There are four judicial districts, the judges of which are elected for six years. Justices of the peace are elected for two years. Under the constitution the right of citizens to vote and hold office can not be abridged on account of sex, and male and female citizens enjoy equally all civil, political, and religious rights and privileges. Before voting, electors must have resided in the State one year and within the county sixty days, and be able to read the constitution, unless prevented by physical disability. The Australian ballot system is used.

History.—On July 25, 1868, Congress authorized the segregation of a part of the Territories of Dakota, Utah, and Idaho, and the organization of the territory so segregated into the Territory of Wyoming. The territorial form of government was maintained until July 10, 1890, when Wyoming was admitted into the Union. Probably the oldest white settlement is at Fort Laramie, on the Platte river, in the eastern part of the State, where a fur-trading post was established in 1834, rebuilt by the American Fur Company in 1836, and sold to the U. S. and garrisoned in 1849. It was for years an important base of military operations against the Indians, but is now abandoned. Fort Bridger, probably the second settlement, was established in the southwestern part of the State some time in 1842. Although the early settlers experienced the usual frontier contests with the Indians, in which many lives were sacrificed, there have been no serious outbreaks since the Custer massacre by the Sioux of Dakota in 1876, and the Meeker massacre by the Utes of Colorado in 1878.

GOVERNORS OF WYOMING.

Territorial.	Term.	State.	Term.
John A. Campbell	1869-75	Francis E. Warren *	1890
John M. Thayer	1875-78	Amos W. Barber	1890-93
John W. Hoyt	1878-82	John E. Osborne	1893-95
William Hale	1882-85	William A. Richards	1895-
Francis E. Warren	1885-86		
George W. Baxter	1886		
Thomas Moonlight	1886-89		
Francis E. Warren	1889-90		

* Elected U. S. Senator while Governor.

AUTHORITIES.—Bancroft, *History of Wyoming*; the reports of Prof. F. V. Hayden, U. S. geologist; Ralph, *Our Great West*; the reports of Gov. Warren, and the annual reports of State officers.

Wyoming: town (settled in 1837); Stark co., Ill.; on the Burlington Route and the Rock Id. and Peoria railways; 6 miles S. E. of Toulon, 30 miles N. by W. of Peoria (for location, see map of Illinois, ref. 4-D). It has 5 churches, 2 graded schools, 2 flour-mills, 3 grain elevators, a private bank, 2 weekly newspapers, and several large machine-shops, and is principally engaged in mining and agriculture. Pop. (1880) 1,086; (1890) 1,116; (1895) estimated, 1,500.

EDITOR OF "POST-HERALD."

Wyoming: village; Springfield town, Hamilton co., O.; on the Cin., Ham. and Dayton Railroad; 12 miles N. by E. of Cincinnati (for location, see map of Ohio, ref. 7-C). It is principally a residential place, has several churches, graded school, and public library (founded in 1882), and does its banking in Cincinnati. Pop. (1880) 840; (1890) 1,454.

Wyoming: borough; Luzerne co., Pa.; on the Susquehanna river, and the Del., Lack. and West. Railroad; 3 miles S. W. of Pittston, 5 miles N. by E. of Wilkesbarre, the county-seat (for location, see map of Pennsylvania, ref. 3-1). It takes its name from the valley in which it is situated, and is chiefly notable because of the massacre within its limits. (See WYOMING VALLEY.) It is engaged in farming, mining, and manufacturing; does its banking in Pittston; and has a monument, commemorating the massacre, about half a mile S. of the actual scene, a public high school, and a weekly newspaper. Pop. (1880) 1,147; (1890) 1,794; (1895) estimated, 3,000.

HARRY HAKES, M. D.

Wyoming Valley: a fertile valley in Luzerne co., Pa.; traversed by the north branch of Susquehanna river. It was settled in 1762 by people from Connecticut, which colony claimed this region by virtue of its ancient charter, notwithstanding the protest of the government of Pennsylvania. In the following year the settlers were either driven away or slain by the Delawares, but other Connecticut colonists went there in 1769, and for several years were embroiled in a contest with other citizens, who recognized the government of Pennsylvania. In 1771, the British Government having confirmed the Connecticut claim, peace was restored, but in 1775 a force of Pennsylvanians attacked the settlements

without success. During the Revolutionary war a large number of Tories from New York settled in the valley, which, from its seclusion, could not well be protected from hostile arms. The greater proportion of the able-bodied men were on duty with Gen. Washington when on June 30, 1778, a body of 400 British troops and 700 Seneca Indians, with some Tories, invaded the valley. On July 3 the battle of Wyoming was fought between this force and a body of some 300 settlers, chiefly boys and old men, who were driven into a fort, and after a desperate resistance, in the course of which about two-thirds of their number were killed by the Tories and Indians, not even the prisoners being spared, were forced to capitulate, but the terms of the capitulation were not observed, and the greater part of the inhabitants were soon compelled by the Indians to flee from the valley. In 1782 Congress decided the dispute as to jurisdiction in favor of Pennsylvania; but when the authorities attempted to eject the Connecticut people from the property they had acquired in the valley, they again took up arms, and the contest lasted until 1788, when the Pennsylvania Legislature confirmed the titles of the residents; but for some twenty-five years there was much litigation in regard to the conflicting claims. This long series of contests was known as the "Pennymite wars," the settlers calling their opponents "Pennymites." The valley includes parts of the townships of Pittston, Jenkins, Plains, Wilkesbarre, Hanover, Plymouth, Kingston, and Exeter, but the Connecticut colony occupied a large tract in Luzerne and several other counties. The picture of the massacre of Wyoming given by Campbell in his *Gertrude of Wyoming* is greatly exaggerated in respect to the cruelties practiced by the Indians. Above Kingston, opposite Wilkesbarre, stands a granite obelisk which commemorates the slain in the contest of July 3, 1778. See Charles Miner's *Hist. of Wyoming* (1845); George Peck, *Wyoming, its History and Incidents*, etc. (1858).

Revised by F. M. COLBY.

Wyss, JOHANN RUDOLF: author; b. at Berne, Switzerland, Mar. 13, 1781; studied philosophy at various German universities; was appointed professor in the academy of his native city in 1806, later chief librarian also. D. there Mar. 31, 1830. He published *Vorlesungen über das höchste Gut* (2 vols., 1811); *Idyllen, Volkssagen, Legenden und Erzählungen aus der Schweiz* (3 vols., 1815-22); and *Reise im Berner Oberland* (1808); edited the series entitled *Alpenrose* (20 vols., 1811-30). His *Der Schweizerische Robinson* (The Swiss Family Robinson, 2 vols., 1812-13), was translated into many languages.

Revised by J. GOEDEL.

Wythe, GEORGE: signer of the Declaration of Independence; b. at Elizabeth City, Va., in 1726; educated at William and Mary College; inherited a large fortune by the death of both of his parents before reaching mature age, and led for some time a life of extravagance, but when thirty years of age devoted himself to legal studies; was admitted to the bar 1757; soon became eminent as a lawyer; was chosen to the house of burgesses as the representative of William and Mary College 1758; drew up in 1764 a remonstrance addressed to the British Parliament against the Stamp Act; was elected to the Continental Congress Aug., 1775; signed the Declaration of Independence; was appointed Nov., 1776, along with Jefferson (who had been his

pupil), to revise the laws of Virginia; was chosen speaker of the House of Delegates and appointed judge of the high court of chancery 1777; became sole chancellor on the reorganization of that court 1786, filling that post twenty years; was Professor of Law at William and Mary College 1779-89; emancipated his slaves toward the close of his life, and furnished them with the means of subsistence. D. by accidental poisoning at Richmond, June 8, 1806. Author of *Decisions of Cases in Virginia by the High Court of Chancery* (1795; 2d ed., with *Memoir*, by B. B. Minor, 1852).

Wytheville: town (founded in 1835); capital of Wythe co., Va.; on the Norfolk and West. Railroad; 80 miles W. of Roanoke, 131 miles W. of Lynchburg (for location, see map of Virginia, ref. 7-10). It is a popular summer resort, in a lumbering, mining, and stock-raising region, and contains 13 churches, Trinity Hall Female College (Lutheran), Wytheville Seminary (Protestant Episcopal), 2 State banks with combined capital of \$150,000, 4 weekly newspapers, and manufactories of woolen goods, iron, and wood work. Pop. (1880) 1,885; (1890) 2,570; (1892) 3,144.

EDITOR OF "SOUTHWEST VIRGINIA ENTERPRISE."

Wytttenbach, rit ten-bāakh, DANIEL: Greek scholar; b. at Berne, Switzerland, Aug. 7, 1746; studied at Marburg; went thence, in 1768, to Göttingen to enjoy the instruction of Heyne, at that time the most celebrated classical philologist of Germany. Before this Wytttenbach had begun to read through all the Greek authors in chronological order down to the later philosophers and rhetoricians. In 1769 he attracted the attention of the famous Ruhnken by his *Epistola Critica super nonnullis locis Juliani imperatoris*; visited Leyden (1770) to attend the lectures of Valckenær and Ruhnken. Through their influence he obtained the chair of philosophy and literature at the college of the Remonstrants in Amsterdam; was transferred in 1779 to the Athenaeum of that city, and in 1799 was called to Leyden as the successor of Ruhnken. Among his writings are *Præcepta Philosophiæ Logicæ* (1781); *Selecta principum Græcæ Historicorum* (1793); but his great work, upon which he bestowed the labor of nearly thirty years and upon which his enduring fame rests, was his exhaustive critical and exegetical edition of Plutarch's *Moralia* (text, commentary, and index; new ed. in 12 vols., 1834). His *Vita Ruhnkenii* (1799, pp. 240, edited with copious notes by Bergman, 1824) is a biographical masterpiece. His *Opuscula* (2 vols.) were published shortly after his death Jan. 17, 1820. See G. L. Mahne, *Vita D. Wytttenbachi* (1823).

ALFRED GUDEMAN.

Wytttenbach, THOMAS: Reformer; b. at Biel, canton of Berne, Switzerland, 1472; studied theology at Basel and Tübingen, and was appointed preacher in his native city in 1507. In 1519 he began to preach against the sale of indulgences, the mass, and the celibacy of the priests, and in 1524 he, together with seven other priests from the vicinity, married. Although he had gained many adherents among the citizens, the Roman Catholic party, the council of Berne, and the Bishop of Basel were nevertheless powerful enough to drive him from his office and expose him to poverty and many persecutions. He continued, however, to preach according to his convictions, and two years after his death, which took place in 1526, Biel accepted the Reformation.

Revised by S. M. JACKSON.

X

: the twenty-fourth letter of the English alphabet.

Form.—The form is the same as that of the twenty-first letter of the Roman alphabet, representing the twenty-fourth letter of the so-called Western Greek alphabet. In this alphabet it was the first of the signs added to the original body

of twenty-three letters, and had the value *ks*. In the Eastern or Ionic alphabet it held the twenty-fifth place, being preceded by *phi*, and had the value *ch*. In form it is probably an old variant of tau (Τ, τ, X), just as the next letter of the Western alphabet Ψ (*ch*) was a variant of *upsilon*.

Name.—The name *eks* has displaced the earlier *iks* (*ix*) = O. Fr. *ix* = Lat. *ix* (*ix*), on the analogy of *ef*, *el*, *em*, *en*, *es*.

Sound.—Generally a double consonant: (1) *ks*, in *tax*, *axle*, *erile*; (2) *gz* before an accented vowel, as in *examine*, *example*, *exist*, *exhort*; (3) *ksh* (*kš*), as in *anxious*, *luxury*; (4) *gz* (*gž*), in *luxurious*, *luxurious*; (5) *z* initially, as in *Xerxes*, *Xenophon*, *rebec*.

Sources.—Chief sources are: (1) Teutonic *hs* < Indo-Europ. *ks*; *ox* < O. Eng. *oxa*; Germ. *oehse*, Sansk. *uksan-*; six < O. Eng. *sier*; Germ. *sechs*, Lat. *sex*; *wax* (verb) < O. Eng. *wearan*; Germ. *wachsen*, Gr. *αἰξάνω*, Sanskr. *vaks-*; *next* < O. Eng. *næxt*; Germ. *nächst*; *are* < O. Eng. *ar*; Germ. *axl*, Gr. *ἀξίλη*; *flax* < O. Eng. *flæx*; Germ. *flachs*. (2) Union of *c* + *s* in English by syncope: *serton* < M. Eng. *scerestein*; *proxy* < M. Eng. *prokecyge*. (3) Loan-words from Latin: *noxious* (*noxius*), *text* (*textus*), *tax* (*larus*), *juxtaposition* (*juxta*), *fix* (*fixus*), *extra* (*extra*), *explode*, *exist*, etc. (4) From Greek: *climax*, *calyx*, *exodus*, *larynx*, *onyx*, *elixir* (via Arabic), etc.

BENJ. IDE WHEELER.

Xalapa: another spelling of JALAPA (*q. v.*).

Xalisco: See JALISCO.

Xanthin, or **Xanthine** [from Gr. *ξανθός*, yellow]: a name given to the yellow principle contained in flowers, to a yellow coloring-matter found in madder, and to a compound found in some rare urinary calculi, and as a normal constituent of urine in very small quantity.

I. R.

Xanthophyll [Gr. *ξανθός*, yellow + *φύλλον*, leaf]: a modified form or product of transformation of *chlorophyll*, the green coloring-matter of leaves. Little is known about it chemically as yet, more than the fact that by some chemical change in the leaf, generally before separation from the tree, the green matter is changed into other compounds, sometimes yellow and sometimes red, this being the first stage of decay, the final product being brown.

Xanthoproteic Acid [*xanthoproteic* is deriv. of *xanthoprotein*; Gr. *ξανθός*, yellow + *protein*]: an acid formed by the action of nitric acid on albuminoid substances. When the fingers are wetted with nitric acid they become stained of a deep and indelible yellow, which becomes orange-red on the subsequent application of an alkali. This phenomenon was investigated by Mulder, who found that the action of the nitric acid was upon the *albuminoid* matter of the skin, and he isolated the yellow substance, to which he gave the above name. He attributed to it the composition $C_{24}H_{26}N_4O_{14}$. White of egg and other albuminoid matters give the same compound. The stain produced upon wood by nitric acid is due to a similar compound formed with albuminoid matter in the wood. The indelibility of the stain on the fingers is due to the fact that this substance is soluble only in acids and alkalies so concentrated as to destroy all organized substances, and which hence can not be applied to the skin with safety. Boiling potash solution dissolves xanthoproteic acid with a deep red color; hence the darkening of the stain by alkalies. From this solution xanthoproteates of other bases may be precipitated.

Xanthorhamnine [Gr. *ξανθός*, yellow + *ράμος*, buckthorn (whence Mod. Lat. *Rhamninus*): a yellow coloring-matter, contained in the ripe Persian or Turkey berries and in Avignon grains. It appears to be formed by the decomposition of *chrysothamnine* ($C_{23}H_{22}O_{11}$), which is present in

the unripe berries. Its extraction is effected by boiling the ground berries with alcohol, allowing the decoction to stand until the various impurities present settle, then allowing the xanthorhamnine to crystallize, and afterward purifying it by recrystallization from alcohol. It is also obtained upon boiling chrysothamnine with water. It forms yellow crystals, which are easily soluble in water and in alcohol, but do not dissolve in ether. It probably has the composition $C_{23}H_{22}O_{14}$, although, according to some authorities, it is identical with *quercitrine*, $C_{33}H_{30}O_{17}$. When treated with dilute acids, xanthorhamnine yields glucose ($C_6H_{12}O_6$) and *rhamnetine* ($C_{11}H_{10}O_6$). It forms precipitates with several metallic salts, and imparts a yellow color to fabrics mordanted with alumina, and a black color to those mordanted with iron salts.

Revised by IRA REMSEN.

Xanthoxylum: a genus of plants of the family *RUTACEÆ* (*q. v.*) containing the PRICKLY-ASH (*q. v.*). See also SATINWOOD.

Xanthus: city of Lycia. See LYCIA.

Xantippe: See SOCRATES.

Xaraes: See CHARAES.

Xauxa: See JAUJA.

Xavier, FRANCISCO, de: See FRANCIS XAVIER.

Xebec [from Span. *jabeque*, *xebegue*, Fr. *chebec*, of doubtful source]: a small, three-masted vessel, carrying lateen and also sometimes square sails. It is sharp fore and aft, has low sides and a high, cambered deck. The xebec is a fast sailer and was the favorite vessel of the Mediterranean pirates. It is still employed in commerce along the southern and eastern Mediterranean.

E. A. G.

Xenia, zee'ni-ā: city (incorporated in 1808); capital of Greene co., O.; on the Shawnee creek, and the Cin., Ham. and Dayton, and the Pitts., Cin., Chi. and St. L. railways; 55 miles S. W. of Columbus, 65 miles N. E. of Cincinnati (for location, see map of Ohio, ref. 6-D). It is in the Miami valley, 3 miles from Little Miami river and 12 from Big Miami river; is laid out with broad macadamized streets; and is principally engaged in the manufacture of cordage, paper, shoes, pumps, carriages, machinery, and powder, and in marble and granite work. In the center of the city is a park containing the county court-house, and opposite the park is the municipal building. There are 16 churches, of which the Baptists and Methodists have 4 each, the United Presbyterians 3, and the Protestant Episcopal Church, the German Reformed, the Lutheran, the Presbyterian, and the Roman Catholic 1 each; 3 new public-school buildings, a business college, and a parochial school. A city workhouse and the county jail are within the corporate limits, and about 2 miles from the city is a county infirmary with a large farm. In 1894 the city receipts were \$73,902; expenditures, \$55,943; the net debt was \$133,511; and the property valuation, \$387,012. It has 5 hotels, 2 national banks with combined capital of \$200,000, a monthly, 5 weekly, and 2 daily periodicals. It is the seat of the Ohio Soldiers' and Sailors' Orphans Home, which has 917 children, 31 teachers, and 39 matrons; and of the United Presbyterian Theological Seminary, which has an endowment of \$119,000, and (1894) 4 professors and 44 students. In the suburbs is Wilberforce University, a coeducational institution for colored students, which has an endowment of \$128,000, literary, scientific, theological, law, and industrial departments, a training-school for nurses, and (1894) 18 professors, 250 students, and 5,500 volumes in its libraries. Pop. (1880) 7,026; (1890) 7,301; (1895) estimated, 8,500.

M. C. KINNEY.

Xenocrates, ze-nok'raā-tēz (in Gr. *Ξενοκράτης*): philosopher; b. at Chaleeion in 396 B. C.; became a pupil of Plato, and gained his favor by his earnestness and energy, though the master was well aware of his slowness of comprehension and lack of elegance in manners. He accompanied Plato to Syracuse, and went after his death, together with Aristotle, to Asia Minor. Afterward he returned to Athens, and succeeded Speusippus as chief of the Academy (in 339 B. C.), which position he occupied till his death, 314

B. C. He was highly respected by the Athenians for the integrity of his character, and was repeatedly sent as an ambassador to foreign princes—Philip of Macedon, Antipater, etc. Aristotle respected him for his insight and knowledge, but of his works none has come down to us.—To be distinguished from him is XENOCRATES the physician, a native of Aphrodisias in Cilicia. A little essay by him, *Περὶ τῆς ἀπὸ τῶν Ἐνύδρων Τροφῆς* (*De Alimento ex Aquatilibus*), is very interesting on account of the picture it gives of the state of natural history at that time. It has been edited by De Ancora (1794), by Franz (1774), by Coray (1814), by Matthäi (1808), and by Ideler in his *Physici et Medici Græci minores* (Berlin, 1841). Revised by J. R. S. STERRETT.

Xenophanes (zen-of-än-ēēs) of Colophon: founder of the Eleatic school of philosophy; flourished in the second half of the sixth century B. C., and brought to Elea (Velia), in Lower Italy, his philosophic doctrines and his poetic art. His epic poems have for their themes *The Founding of Colophon* and the *Colonization of Elea*, but his reputation rested on his didactic poem *On Nature* (*Περὶ φύσεως*), and on his *Satires* (*Σίλλοι*), in which he attacked the doctrines of other philosophers and poets. He was a zealous upholder of monotheism, and accused Homer and Hesiod of ascribing to the gods actions that were a shame to men. The fragments of his elegies show a high moral standard, and have the true poetic ring. They are contained in Bergk's *Græci Poetæ Lyrici*. For his philosophy, see ELEATIC SCHOOL. B. L. GILDERSLEEVE.

Xenophon: Greek historian and moralist; the son of Gryllus, an Athenian of wealth and position; b., according to one account, in 444 B. C., according to another and more probable reckoning about ten years later. Early in life Xenophon was attracted by Socrates, and remained to the last an enthusiastic adherent of the great teacher. But the fascination of the master yielded to the seductions of a military career, and Xenophon took service under Cyrus the Younger in the campaign against his brother Artaxerxes. When Cyrus fell in the battle of Cunaxa, 401, and the Greek generals were assassinated, Xenophon conducted, or intimated that he virtually conducted, the retreat of the Ten Thousand through the enemy's country to the Black Sea, and thence to the Hellespont. This was a military performance that Isocrates chose to represent as a mere promenade, that, according to Xenophon, was an achievement that demanded rare skill, rare tact, readiness of resource, and every phase of fortitude and bravery. Unfortunately, as to Xenophon's part in this famous feat we have no testimony except the historian's own plausible narrative.

The survivors of the expedition joined the army of the Lacedæmonians, who were at that time engaged in operations against the Persians; and Xenophon himself took service with the enemies of his country, and fought at Coroneia (394) against the Thebans, who were allies of Athens. As a natural consequence he was found guilty of high treason, and his property confiscated. The Lacedæmonians indemnified him for the loss of his possessions by presenting him with an estate near Scillus, in Elis, where he lived the life of a country gentleman until he was dislodged after the battle of Leuctra in 371, and was forced to take refuge in Corinth. A turn in politics having united Athens and Sparta against Thebes, Xenophon was recalled from banishment, and of his two sons who had entered the Athenian cavalry, the elder, Gryllus, died a soldier's death at Mantinea (362). A few years later Xenophon died at Corinth.

Apart from his lack of patriotism, Xenophon united in his person many of the best elements of a Greek gentleman (*καλὸς κἀγαθός*). As a writer, he was held up to subsequent generations as the model of a simple style, and was called "The Attic Bee," by reason of the sweetness of his Atticism. Modern scholarship has made many deductions from the antique estimate, and closer criticism has shown that in the long absence from Attica the *condottiere* Xenophon had lost much of the purity of Attic speech. His thesaurus includes poetical and dialectical words, and his syntax is not always constructed on Attic lines, and these faults, which enhance the human interest of Xenophon's style, have served to bring him into increasing disrepute with exacting Atticists.

The following works make up the body of Xenophon's authorship: *The Anabasis of Cyrus* (*Κύρου ἀνάβασις*), in seven books, deals with the expedition, the "going up" of Cyrus the Younger against the Great King, and the subsequent retreat of the Ten Thousand. It is the most famous military narrative in literature. *The Cyropædia* (*Κύρου παιδεία*) in eight

books, is an historical romance, in which the author has undertaken to incorporate many of his notions about education and administration. Cyrus the Elder, who is the hero of the story, is an ideal, and the picture is drawn without much regard to historical accuracy. The close of the eighth book, depicting the decline of the Persians, in any case an afterthought, is commonly deemed spurious. *The Hellenica* (*Ἑλληνικά*), in seven books, takes up the history of Greece from 411, where the narrative of Thucydides stops, and carries it on to the battle of Mantinea in 362. The earlier books, i. and ii., seem to have been intended simply as a continuation of Thucydides. The latter part shows more life and movement, but here also there is a certain diversity of style, and critics have been busy in detecting tokens of different periods and different hands. In the *Agésilæus* (*Ἀγησίλαος*), an encomium of the great Spartan *condottiere*, whole sections of the *Hellenica* have been incorporated, and the genuineness of the work has been seriously questioned. *Hiero* (*Ἱέρων*), a dialogue between Hiero and Simonides, is intended as a lesson on the miseries of a tyrant's life. *The Memorabilia*, or *Memoirs of Socrates*, in four books (*Ἀπομνημονεύματα Σωκράτους*), is the work to which Xenophon owes his name as a philosopher. In it he speaks in his own person, and repels the various charges brought by the Sophists against his master, whose character is unfolded in a series of dialogues. It is not unlikely that in one sense he may be truer to the historical Socrates than was Plato, but the deeper significance of the great teacher was not comprehended by the practical unphilosophic soul of Xenophon. *The Symposium* (*Συμπόσιον*) is a sequel of the *Memorabilia*, and exhibits Socrates in the joyous environment of a banquet. The piece has an interest, has a grace of its own, but it has nothing of the depth, or the poetry, or the ideality of the Platonic *Banquet*. Which preceded is still a moot point, and will probably always be. *The Oeconomicus* (*Οἰκονομικός*) is also, as it were, another book of the *Memorabilia*, and records in the form of a dialogue the views of Socrates on household economy and agriculture. In this work the figure of Socrates merely serves the purpose of ventilating the views of Xenophon himself. *The Apology* (*Defense*) of Socrates (*Ἀπολογία Σωκράτους*) is a poor thing, and is commonly considered a late fabrication. *The Lacedæmonian Constitution* (*Λακεδαιμονίαν πολιτεία*) is designed to commend the organization of the Spartan state, and was pronounced spurious even in antiquity. *The Athenian Constitution* (*Ἀθηναίων πολιτεία*) is clearly by an older hand, and is one of the very earliest pieces of Attic prose extant. It has been attributed to various members of the oligarchical party of the time of the Peloponnesian war. The work *On Revenues* (*Πίρροι*) deals with the finances of Athens. The Xenophontean authorship is not assured. The list of writings attributed to Xenophon is completed by the *Hipparchicus*, a manual of instruction for a cavalry commander, a treatise on *Horsemanship* (*περὶ ἵππικῆς*), and one on *Hunting* (*Κυνηγετικός*). The genuineness of the last-mentioned tract is much disputed, on account of the unequal style and the excessive floridity of some of its parts. The seven Xenophontean letters are undoubtedly spurious. The bibliography of Xenophon is so vast that only select lists can be given.

EDITIONS.—Of the entire works by Schneider and his associates (6 vols., 1791–1849); the Gotha ed. by Bornemann, Kühner, Breitenbach (4 vols., 1828), by Sauppe (5 vols., 1865). Noteworthy text editions by L. Dindorf, by Schenkl, and by Keller. Among the innumerable editions of the *Anabasis* may be mentioned the German editions of Krüger, Kühner, Hertlein, and Rehdantz, the American editions of Crosby, Goodwin-White, Kelsey-Zenos. Kühner's standard edition of the *Memorabilia* has been translated with additions by Anthon. Holden's English editions of the *Cyropædia*, the *Oeconomicus*, and the *Hiero* are highly serviceable for English and American students. The *Hellenica* has been edited by Breitenbach, and also by Büchschütz, and the latter edition translated by Manatt and by Bennett in the White-Seymour series. There is an American edition (1894) of the first two books by Blake, based on the best authorities. The *Symposium* has been edited by Hug, who has also made special contributions to the textual criticism of Xenophon. The English translation of Xenophon's works by H. G. Dakyns, in 2 vols. (New York, 1890–93), is destined to supersede all others. Of especial interest is Prof. Morgan's translation of Xenophon's *Art of Horsemanship* (Boston, 1893), with a valuable commentary. Sauppe's *Lexilogus Xenophontæus* (1865) is an indispensable auxiliary in the study of Xenophon. B. L. GILDERSLEEVE.

Xenotime [from Gr. *ξενότιμος*, honoring guests or strangers; *ξένος*, stranger + *τιμή*, honor]: a native phosphate of yttrium. It crystallizes in octahedrons and prisms; its hardness is between fluor-spar and apatite; density about 4.5. Its color is yellowish brown.

Xeres: See JEREZ DE LA FRONTERA.

Xerez, *kā-rāth*, FRANCISCO, de: b. at Seville, Spain, about 1500; was secretary to Pizarro during his conquest of Peru, of which he wrote from Caxamarca a narrative addressed to Charles V., *Verdadera Relación de la Conquista del Pirú y de la Provincia del Cuzco llamada la Nueva Castilla, etc.* (Salamanca, 1547), which is sometimes appended to Oviedo's *Natural History of the Indies*. An Italian translation was given by Rainasio, and a French by Ternaux-Compan.

Xerxes, *zērks'ēz* (in Gr. *Ξέρξης*): King of Persia 486-465 B. C.; b. about 519 B. C.; the oldest son of Darius Hystaspes and Atossa, the daughter of Cyrus; succeeded to the throne on the death of his father in preference to his three elder brothers, sons of Darius by his first wife, a daughter of Gobryas. Herodotus calls him cowardly, cruel, and incompetent, but the facts related of him do not seem to warrant this judgment. In the picture which Herodotus gives of the war between the Greeks and the Persians, the part Xerxes plays is by no means a very prominent one. After suppressing a revolt in Egypt he began his preparations for the war against the Greeks. They lasted for four years, and resulted in the largest military armament the world had ever seen. The Egyptians and Phœnicians furnished the fleet, 1,207 triremes and 3,000 smaller vessels, manned with about 500,000 men; and in order to preserve this fleet from the fate which overtook Mardonius's in 492 B. C. at Mt. Athos, a canal was dug from Strymonic to the Singitic Gulf—a work which cost the labor of several thousand workmen for nearly three years. The army was composed of contingents from all the countries between China and Sahara, and between the Black and the Arabian Sea; forty-six nations were represented in the camp of Xerxes at Cratilla in Cappadocia, each with its own peculiar equipment and method of war. Immense stores of provisions were accumulated at regular stations along the whole line of march from Cratilla to Athens, and a bridge was thrown across the Hellespont from Abydos to Sestos. A storm destroyed the bridge, and Xerxes ordered the engineers who had built it to be put to death. A new bridge was constructed, and for seven days and nights one continuous line of soldiery marched across it. The entire number engaged in the expedition, including the naval force, the women, children, slaves, and other attendants, has been estimated at 5,000,000 persons. The figure has been rejected by some as fabulous. Like an avalanche this host rolled down over Greece. There was some impediment at Thermopylae, Artemisium, etc., but Xerxes barely heard of it. Athens was burned, and on Sept. 23, 480 B. C., he sat on his throne of gold, raised on a promontory of Mt. Egaleos, to witness the battle of Salamis. After the loss of this battle the great king fled, panic-stricken, first to Sardis, and thence to Susa, where he buried himself in dissipation, voluptuousness, and court intrigues. In 465 he was assassinated by Artabanus. Revised by J. R. S. STERRETT.

Ximenes de Cisneros, *kheē-mā nās-dā-thēs-nā rōs*, FRANCISCO: primate of Spain; b. at Torrelaguna, New Castile, Spain, in 1436 or 1437; was educated at the University of Salamanca, where he graduated in both civil and canon law 1456; became a priest; went to Rome, where he practiced as an advocate in the consistorial courts 1459-65, acquiring a great reputation for political ability; obtained from the pope a bull nominating him to the first benefice of a specified value which should become vacant in the archbishopric of Toledo; took possession in 1473 of the living of archpriest of Uceda, near his native village, against the will of the Archbishop of Toledo, who regarded the papal bull as a violation of his rights, and on declining to surrender the living was imprisoned six years in Uceda and Santoreaz; was released and given possession of his benefice 1480; exchanged it for a chaplaincy near Sigüenza, where he studied Hebrew and Chaldee, and acted as vicar to the bishop of the diocese; resigned his preferments in the Church and entered the Franciscan convent of San Juan de los Reyes in Toledo 1482; distinguished himself by his austerities; acquired a high reputation for sanctity, and was in great request at the confessional; retired to the secluded mountain-convent of Our Lady of Castañar, where he built with his own hands a cell in which he passed his time in prayer and meditation;

was appointed superior of the convent of Saucedá; was appointed confessor to Queen Isabella 1492, retaining his monastic habits and residence; was appointed provincial of his order in Castile 1494, and made his visits of inspection on foot, subsisting on alms; was nominated high chancellor of Castile, Archbishop of Toledo, and primate of Spain 1495; refused for six months to accept that dignity, yielding only to the express commands of the pope; retained the austere simplicity of his former mode of life, dispensing the vast revenues of his see chiefly in charities; effected a vigorous reform among the Spanish clergy; founded the University of Alcalá 1498; insisted that the conquered Moors of Granada should receive Christian baptism during the residence of the court at Granada 1499, thus giving rise to the rebellion in the Alpujarras 1500; began in 1502 the printing at his own expense, at Alcalá de Henares, of the famous Complutensian Polyglot Bible (from *Complutum*, the Latin name of Alcalá); was the director of most of the public acts of Isabella down to her death in 1504; was mediator between Ferdinand and the Archduke Philip in their rival claims upon the regency of Castile; became president of the Castilian council of regency on the death of Philip 1506; was appointed by Pope Julius cardinal and inquisitor-general of Castile 1507; led an expedition against the pirates of Oran on the Barbary coast 1509, securing to Spain an important territorial acquisition; became regent of the kingdom on Ferdinand's death 1516; effected the proclamation of Charles V. against the rival pretensions of the partisans of the insane queen Joanna; reduced the little kingdom of Navarre to quietude; made preparation against the Barbary corsairs; extended the Inquisition throughout the Spanish dominions, but modified its severity; surrendered the regency on the arrival of the young king in Spain in September, and was allowed to retire to his diocese. D. at Roa, on the Douro, Nov. 8, 1517. See his biographies by Gomez de Castro, and by Hefele, *Der Cardinal Ximenes* (Tübingen, 1844; translated into English 1860).

Revised by J. J. KEANE.

Ximenes de Quesada: See QUESADA, GONZALO XIMENEZ, DE.

Xingú, or **Chingú**, *zhēn-goo'*: a river of Brazil; one of the principal southern tributaries of the Amazon, which it joins near lon. 52° W. It rises on the plateau of Matto Grosso, has a general southerly course, and is much obstructed by rapids and falls except near its mouth, where it is broad and lake-like. Length over 900 miles; navigable for steamers 110 miles, and above there are long navigable spaces between the rapids. In 1885 von den Steinen explored the whole course of the river, descending it in bark canoes. He found the region about the head waters inhabited by a great number of petty Indian tribes, belonging to nearly every linguistic stock known in Brazil. H. H. S.

Xiphoid Cartilage: See ENSIFORM CARTILAGE.

Xiphosura [Gr. *ξίφος*, sword + *οὐρά*, tail]: an order of arthropods, including of living animals only the king crabs or HORSESHOE CRABS (*q. v.*), of which five species only are known. In geological time the group was better developed, *Belinurus prestrichia*, etc., dating from the Carboniferous, *Limulus* from the Cretaceous.

Xisuthrus *zī'soo-thrūs*, or **Xysuthrus** (Gr. *Ξισουθρος*): the name given by Berossus to the hero of the Deluge in the Babylonian version of the story. It is supposed to come from the Assyrian form *Khasis-adra*. See DELUGE, and Smith's *Chaldean Account of Genesis* and Lenormant's *The Beginnings of History*. D. G. LYON.

Xorullo: another spelling of JORULLO (*q. v.*).

X-rays: See the Appendix.

Xylene, or **Xylol** [from Gr. *ξύλον*, wood]: one of the series of coal-tar hydrocarbons, a homologue of benzol or benzene: composition C_8H_{10} . There are three isomeric varieties of xylene, all of which occur in coal-tar. All three have been made artificially from BENZENE (*q. v.*) and from TOLUENE (*q. v.*), and they have thus been shown to be dimethyl derivatives of benzene. Xylene is a colorless liquid of little odor, boiling at about 140°. IRA REMSEN.

Xyloidine [Gr. *ξύλον*, wood]: an explosive substance discovered by Braconnet in 1832, prepared by dissolving starch in nitric acid; by the addition of water a white explosive compound is precipitated.

: the twenty-fifth letter of the English alphabet.

Form.—Its form is that of the twenty-second letter of the Roman alphabet. It was simply the Greek letter *upsilon*, Υ , which was introduced late in the first century B. C. to aid in the transliteration of the numerous Greek loan-words and

proper names which were establishing themselves in Latin use. The necessity for the new symbol lay in the peculiar pronunciation of the Greek *upsilon* (= \bar{u} , or French *u*). Prior to the adoption of the letter, the sound had been rudely indicated by the Roman *V* (*u*); thus *cupressus*, *turannus*, *Agyptus*. The letter *Y* is therefore in its origin the same as *V* and *U*; cf. also *W*.

Name.—The English name *wy* (phonet. *wad*) is the regular modern resultant of a *M. Eng.* *wī*. This name appears in *O. Fr.* as *wī* or *guī*, which is undoubtedly of Teutonic origin. It was probably the name assigned to the Greek *upsilon* when adopted into the Gothic alphabet, and was an approximate imitation of its sound (\bar{u}) at that time.

Sound.—As a vowel-sign it stands for \bar{i} (*ai*), as in *my*, *cry*, *type*, *cycle*, *hyphen*, *tyrant*, *hybrid*, *cyclops*, *hyacinth*, or for \bar{e} , as in *hymn*, *syllable*, *syntax*, *myth*, *cytic*, *physics*, *beauty*, *happy*, *physician*. As a consonant, used only at the beginning of a syllable, it represents the consonant of \bar{e} ; as in *yet*, *you*, *yolk*.

Source.—As a consonant it is limited almost entirely to genuine Teutonic words where it represents: (a) *O. Eng.* \bar{j} (= *y*) < Teutonic \bar{j} < Indo-Europ. \bar{j} or \bar{j} ; as in *yoke* < *O. Eng.* $\bar{j}eoc$: *Germ.* *joch*, *Lat.* *jugum*; *young* < *O. Eng.* $\bar{j}eong$: *Germ.* *jung*, *Lat.* *juvenis*, *Sanskrit.* *yuvagā*; *year* < *O. Eng.* $\bar{j}ear$: *Germ.* *jahr*, *Gr.* $\bar{j}ēra$; *ye* < *O. Eng.* $\bar{j}ē$: *Goth.* *jus*, *Sanskrit.* *yásmān*; *yea* < *O. Eng.* $\bar{j}ēa$: *Germ.* *ja*, *Gr.* $\bar{j}ē$; *yon* < *O. Eng.* $\bar{j}eon$, cf. *Germ.* *jener*. (b) *O. Eng.* \bar{j} , voiced palatal spirant before palatal vowels < Indo-Europ. \bar{gh} ; as in *yard* < *O. Eng.* $\bar{j}eard$: *Germ.* *garten*, *Lat.* *hortus*, *Gr.* $\bar{x}ōrtos$; *yellow* < *O. Eng.* $\bar{j}eolo$: *Germ.* *gelb*, *Gr.* $\bar{x}λωρός$; *yield* < *O. Eng.* $\bar{j}ieldan$: *Germ.* *gellen*; *yarn* < *O. Eng.* $\bar{j}earn$: *Germ.* *garn*; *yesterday* < *O. Eng.* $\bar{j}iēstra$: *Germ.* *gestern*, *Lat.* *hesternus*, *Gr.* $\bar{x}θés$.

As a vowel *y* is chiefly used in Greek loan-words to replace *upsilon*; as in *cycle* ($\bar{k}ύκλος$), *syn-tax* ($\bar{σ}ύνταξις$), *type* ($\bar{τ}ύπος$). It also stands in genuine English words for *O. Eng.* \bar{i} , as in *twenty* < *O. Eng.* $\bar{twēnti}$; *holy* < *O. Eng.* $\bar{hūli}$, and as the final component of a diphthong represents *O. Eng.* \bar{j} , as in *day* < *O. Eng.* \bar{daz} , *gray* < *O. Eng.* $\bar{j}rāz$.

BENJ. IDE WHEELER.

Yachts and Yachting [*yacht* is from *O. Dutch* *yacht* > *Dutch* *jagt*, liter., chase, deriv. of *jagen*, hunt, chase]: a yacht is a vessel of any size, propelled by sail, steam, or other motive power, and used exclusively for pleasure purposes. The name was first applied to small vessels of exceptional speed and handiness compared with the war and trading vessels of the day, and thus specially adapted for chasing smugglers and pirates.

The use of large and elegant pleasure craft specially devoted to royalty may be traced back to a very remote period; but yachting in its true sense began no earlier than the seventeenth century, while its establishment as a recognized sport falls within the nineteenth century. Mention is made of a small yacht, called the *Rat of Wight*, built at Cowes, Isle of Wight, in 1588, and in 1604 a small vessel was built for Henry of Wales; but it is not until the reign of Charles II. that a definite record of the building and use of yachts is found. Through the early part of the seventeenth century the small *jagt* was found in Dutch waters, in model very similar to the Dutch craft of to-day, and the vessel was introduced into England some time prior to 1660. In the diary of Samuel Pepys, secretary to the admiralty, under date of July 15, 1660, is found mention of the king, Charles II., going to inspect a "Dutch pleasure-boat"; and for the next five years the same diary alludes to the building of various small vessels for the king, and of races sailed on the Thames between them and different Dutch

craft. The word *yacht*, in its present form and meaning, was prior to that time incorporated into the English language, and at a later date into French, German, and other continental languages.

No hard line of demarkation can be drawn between the small sail-boat or launch and the yacht; while at the other extreme are found the larger class of steam-yachts which differ but little in model and build from passenger steamers, but which are yachts by virtue of their use. The sailing yacht, as distinguished from the larger boats and from canoes, may be defined as a craft of from 20 to 100 feet water-line length, wholly or partly decked, and with standing spars and rigging. The steam, naphtha, or electric yacht, as distinguished from the simple launch, is a craft of from 50 feet water-line length upward, completely decked, and with permanent cabins. The upper limit of length in private steam-yachts is about 250 feet water-line and 1,000 tons displacement.

VARIETIES OF SAILING YACHTS.—Sailing yachts may be divided into three types, according to the shape of the hull: (1) the keel yacht, with a deep body of which the keel is an integral part; (2) the fin-keel, with a very shoal body to which is attached a deep fixed fin, usually a plate of metal, with the ballast in the form of a cigar-shaped mass of lead attached to the lower side; and (3) the centerboard yacht, also with a shoal body, but relying for lateral resistance on a movable plane of wood or metal so pivoted in a vertical plane as to drop through the keel and below the bottom of the vessel. Almost every variety of rig is used on yachts, and although there is not of necessity a close connection between model and rig, it is frequently the case that certain rigs have been so closely associated with certain types of hull that the name of the rig is applied to both, as in the case of the catboat, the sloop, the cutter, and the lugger.

Catboat.—The simplest form of yacht is the centerboard catboat, the hull being wide, shallow, and usually lightly

FIG. 1.—American catboat with centerboard.

built, with no overhang at the ends, a wide rectangular rudder hung outside the transom, a large centerboard, and with but one sail set on a gaff and boom, the mast being stepped as far forward as possible. These boats, ranging in length from 12 to 40 feet, are used in all the waters of the U. S. for racing, pleasure-sailing, fishing, and general service; and, though easily capsizable, their light draught and speed make them adaptable to the shoal waters which abound.

Sloop.—The sloop rig, the boom and gaff mainsail with the addition of a large jib, is used on the same type of hull as the cat rig, but on larger as well as the smaller sizes, up to yachts of 70 feet water-line. It is mainly used on the shoal centerboard type, the cutter rig having been adopted with the introduction of the keel yacht. In its simplest

form, with a pole-mast and only a jib and a mainsail, as used on the older racing-boats, it is known as the "jib-and-mainsail" rig, but on decked yachts a topmast, a pole-mast in the smaller, and a housing topmast in the larger, serves to carry a top-sail and jib-top-sail.

FIG. 2.—Catboat.

Ketch.—The ketch rig is similar to the yawl, but the mainmast is farther forward and the mizzenmast is stepped forward of the rudder-head, giving a much larger mizzen in proportion to the mainsail than in the yawl. This rig was used in the third Valkyrie in her ocean passage in 1895.

FIG. 3.—Yawl rig with lug mizzen.

The lug rig has a yard on the head of the sail, slung by a single halyard made fast near the middle, instead of a gaff with jaws which slide on the mast. In the true lug the fore end of the yard and the upper fore angle of the sail project forward of the mast. The rig is used on yachts of all types, being the favorite racing rig for the smaller yachts in Great Britain; but it is chiefly associated with the fast smugglers of the early part of the nineteenth century, the lugger having two or three masts with very long yards.

FIG. 4.—Ketch rig.

The sharpie is a shoal draught vessel, extensively used in the U. S. for oystering as well as for pleasure-sailing. The bottom is flat, the sides slightly flared outward at the deck, the stem straight, and the stern is carried out into a long counter with a round end. The centerboard is long rather than deep, and the rudder is of the balance variety, there being no rudder-post or scag. The rig is pe-

culiar to the boat and shares the name with it; there are two masts, each long and flexible and carrying a leg-o'-mutton sail extended by a long sprit running across from the mast to the clew, instead of a boom on the foot. The foremast is stepped in the bows and the mainmast just abaft the middle of the boat.

Yawl.—The yawl rig is similar to the sloop or cutter except that it has a short main boom and a second and much smaller mast (stepped just abaft the rudder-head), on which is carried a mizzen-sail, sometimes a leg-o'-mutton and sometimes a lug sail. The rig is specially adapted for cruising.

Cat-yawl.—The cat-yawl or double-cat rig, the latter name being peculiar to the Great Lakes of North America, has the larger mast stepped in the bows, as in a catboat, but a mizzen is also carried, as in a yawl, though there is no bowsprit or jib.

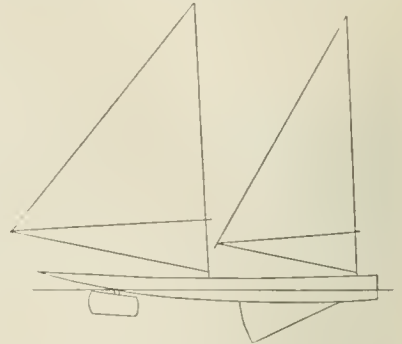

FIG. 5.—Sharpie.

FIG. 6.—Modern schooner rig.

Schooner.—The schooner rig is used on yachts of from 60 feet upward; it has two masts, the fore and main, the latter carrying the larger sail; the bowsprit and head sails are rigged like those of a cutter. The barkentine and brigantine rigs are no longer seen on sailing yachts.

Ice-yacht or Ice-boat.—This is not properly a vessel, but a machine for sailing on ice. It consists of a light framework of wood resting on three large skates or runners, the after one movable and fitted with a tiller for steering. A mast is stepped in the center of the framework, on which one or two sails are carried, the sloop rig being the most common, though the cat rig is sometimes used. Under favorable conditions the boats are capable of very high speed, and they are used throughout the Northern U. S. for racing in winter. The main member

FIG. 7.—Hudson river ice-yacht (with plan).

The main member

of the boat is a long stick of timber forming keel and bowsprit in one piece. At right angles to it, and forward of the middle, is the runner plank, on which it rests and is securely bolted. The frame is stiffened by four wire-rope stays which connect the four ends. Under each end of the run-

FIG. 8.—Malay racing "kolek." Crew suspended by lines from masthead.

ner plank is an oak shoe with a sharp steel runner. The crew, usually two, lie in a small oval box near the after end of the keel.

Early Yachts and Yacht Clubs.—The first yacht club, the "Water Club of the Harbour of Cork" (Ireland), was founded in 1720. The beginning thus made at Cork was not followed by a regular growth of yachting, and the sport had made little progress up to 1812, when the "Yacht Club" was founded at Cowes, Isle of Wight. In 1815 the club was reorganized, and after the prince regent became a member, 1817, it was renamed the "Royal Yacht Club," continuing under this name until 1833, when William IV. altered the name to the "Royal Yacht Squadron," under which it still exists. The yachts of 1800 to 1830 were of all sizes, rigs, and models, following closely after the faster types of fishing-boats, smugglers, and revenue cutters, and rigged as sloops, cutters, yawls, ketches, brigs, and schooners. They were built primarily for cruising, and such racing as they did was merely incidental, all sizes and rigs being classed together, with only the crudest attempts to compensate for difference in size by time allowance. After the peace of 1815, with the waters of the globe thoroughly explored, with the American continent fully colonized, with buccaneering and privateering abolished and the great powers exhausted by a long and expensive series of naval wars, there was little of their old occupation afloat for the descendants of Drake and Frobisher and Raleigh, and the new sport of yachting soon became exceedingly popular. Up to 1840 yacht building and racing were carried on in an irregular and unsystematic manner, but the love of the sport was spreading rapidly in British waters, and a number of clubs were formed.

The first yacht club in the U. S. was the New York Yacht Club, founded in 1844, mainly through the efforts of Col. John C. Stevens and his brother Edwin.

For over a century no attempt was made to allow time to the smaller craft. It was only with the formation of yacht clubs and the general popularity of yacht-racing, subsequent to 1815, that this difference in size was first appreciated and attempts made to measure and allow for it. The first measurement was naturally based on the tonnage of the yachts, as ascertained by the old custom-house rule described in the article *TONNAGE (q. v.)*, and though modified in various ways from time to time, this same tonnage rule held sway over British yachts down to 1887. This rule did not take into account the actual depth of a vessel, but rated all vessels of the same length and breadth at the same tonnage.

About 1820 the dimensions of a yacht of about 80 tons measurement were 55 feet water-line, 18 feet beam, and 10 feet draught. The model was marked by a long straight keel, but slightly deeper aft than forward, stem-piece and stern-post but slightly raked, a round and full midship section, and a very full bow and disproportionately fine after-body, the center of buoyancy being placed forward of the mid-length of the water-line.

The first improvements on this model were the deepening of the midship section, giving a larger vessel on the same nominal tonnage an easier form to propel, and a larger and

much more effective lateral plane to hold the vessel to windward. The loss on the score of stability, which was one marked result of the change, was met by substituting iron ballast for the stone previously used. The quarter century from 1820 to 1845 was marked by the building of a number of cutters and schooners of this general type, and by a very general interest in yacht-racing.

The Wave-line Theory of Scott Russell.—It was about 1840 that John Scott Russell first pointed out the faults of the bluff bow, the errors of the "cod's-head and mackerel's-tail" theory, then followed by all builders, and the advantages of a new method devised by himself, in which the proportions of length between the fore and after bodies were reversed, the bow being made long and fine and the run shorter and quite full in the water-lines. In 1848 a yacht (the *Musquito*) was built on the Thames which was remarkable as being constructed of iron in place of wood, and as having a very fine bow and relatively full after-body. In many features of design and construction the *Musquito* was far ahead of her time, but yachtsmen were slow to appreciate her true merits.

The British Cutter and the Cutter Rig.—The great variety of rigs prevalent in the early days disappeared prior to 1850, leaving two principal rigs, the schooner and the cutter. The schooner rig was found only on the largest yachts, the cutter being the popular rig.

The mast was comparatively short and strongly stayed by several shrouds to a side, a stout forestay, leading from masthead to stemhead, and by masthead runners. The topmast was very long, and so fitted as to be readily housed or even struck entirely and stowed on deck, while the heavy round bowsprit was similarly fitted to house or run in on deck in bad weather. The mainsail was not laced to the boom, but was loose on the foot, confined only at the tack and clew, and there were two headsails—a jib, set on its own luff, so that it could be readily taken in and replaced by a smaller one, the bowsprit being at the same time fidded in, and a fore-staysail running on the forestay.

The cutter rig was essentially a seagoing one, its principles being those of a ship applied in the simplest form. In fair weather a very large spread of sail could be set on the long topmast and bowsprit, and with the big yard-topsail; but this area could be rapidly and conveniently reduced as the wind increased, the topsail taken in, the topmast housed, the bowsprit run in to carry a smaller jib, and the mainsail reefed, until in extreme weather the yacht, with topmast lashed on deck and bowsprit run in, was under only a small storm-trysail set in place of the mainsail, with a diminutive storm-jib or the corner of the staysail.

American Yachting—The Centerboard Type and Sloop Rig.—The establishment of yachting in the U. S. dates from about 1840-45, the prevailing model being very similar to that of the British yachts. The conditions, however, were very different from those governing British yachting. The waters of the North Atlantic coast were essentially dif-

FIG. 9.—British keel yacht with "cutter" rig, 1880.

FIG. 10.—American centerboard sloop (1860 to 1880) with midship half-section.

ferent from the English Channel, there being a large available area of calm, landlocked, and readily accessible water about New York, the cradle of the sport, and also about the ports of Long Island Sound. The physical geography of New York harbor was, from 1840 to 1880, one of the

controlling factors in the development of the American yacht.

While in Great Britain the tonnage rule placed a premium on great depth, and local conditions in the form of deep and rough waters also favored it, about New York and Boston, where the rule exerted no influence, the local conditions all tended to produce a shoal vessel.

Though originally of British origin, the centerboard had received little attention from British yachtsmen from the days when its progenitor, the Dutch leeboard, was seen on the *jagts* of the *Merry Monarch*. It was, however, well known in the U. S. in the coasting and river vessels, and its adoption by yachtsmen came as a matter of course as soon as the fact was appreciated that the very shoal craft could not go to windward with keel alone. Aided by a large centerboard, though at the expense of valuable room in the cabin, it was found possible to build very large and fast craft on a limited draught, the great sloop *Maria*, built for Commodore John C. Stevens in 1847, having a draught of but 5 ft. 2 in. on a water-line of 92 feet and a beam of 26 ft. 6 in.

The Sloop Rig.—Even before the days of yachting the single-masted rig was found in two different forms—the cutter of the English Channel, already described, a strictly seagoing rig, and the sloop, the product of the local conditions prevailing on the narrow inland waters of Holland.

This rig, brought over by the early Dutch settlers, had

been developed to a high degree of perfection in the passenger-packets and freight-boats of the Hudson river and Long Island Sound before the days of yachting, the vessels being also of Dutch model, shoal, wide, and bluff in the bows, first with leeboards and afterward with centerboards. As yachts increased in number subsequent to 1845, a national type

Fig. 11.—American centerboard yacht with "sloop" rig, 1880.

was developed, based on the working sloop. Keel boats were few in number; the cutter rig was unknown; there was little difference in model between the largest and the smallest yachts, but those over 50 feet were, as a rule, rigged as schooners, while the smaller ones were sloops.

In the U. S. the fastest yachts of the day were produced by George Steers, the son of an English shipwright, a young builder of remarkable ability, who turned out the finest pilot-boats, yachts, and war-ships of his time. The early Steers yachts and pilot-boats, up to 1846, were all of the "cod's-head" type, but in the pilot-boat *Mary Taylor*, built in 1848, he made a notable departure from the conventional model in the direction of a fine bow. In 1851, in conjunction with Col. Stevens, he planned a new yacht, the famous *America*, with the object of visiting England on the occasion of the World's Fair at the Crystal Palace in 1851.

This yacht was a keel schooner of 170 tons, 90 feet water-line, 23 feet beam, and 11 feet draught. Her general construction, rig, and fittings were similar to the pilot-schooners of the day; she had a deep outside keel of oak, and was ballasted by iron stowed on the inner skin. The passage across the Atlantic was safely made, and on Aug. 22, 1851, the *America* sailed as one of a fleet of 17 yachts—8 schooners and 9 cutters—2 schooners and 1 cutter being larger than she and the rest smaller. The course was around the Isle of Wight, the wind being light and variable. The *America* came in ahead of all her rivals. The race was sailed without time allowance, and the prize was a silver tankard of the value of 100 guineas. Contrary to a widespread belief, this cup, long known as the "Queen's Cup," was not given by Queen Victoria, but by the Royal Yacht Squadron. The cup, by common consent of the five owners of the *America*, remained in the possession of Col. Stevens, and was held by him until 1857, when it was dedicated by

the five original owners of the yacht to the purposes of a perpetual challenge cup for international competition, being

Fig. 12.—*America's* first arrival off Cowes, 1851, from painting by Dutton.

first intrusted to the care of the New York Yacht Club to hold under certain specified conditions until won by a foreign challenger.

The victory of the *America* gave a new impetus to yacht building and racing, and the defeat of their crack yachts set the British yachtsmen at work to imitate her two prominent features—the hollow bow and flat sails. Old yachts were altered and new ones built on both sides of the Atlantic to conform to the new theories.

The tonnage rule was never adopted by the yachtsmen of the U. S., but many different rules were tried from 1850 onward, based on displacement, on length taken in various ways, on sail area, and other factors of advantage real or imaginary. From 1850 to 1880 the development was almost exclusively under a length rule, producing a wide and shoal boat; and the length on deck was taken, wholly or in part, instead of the length on water-line, thus producing a craft with square ends and no overhang. The progress of British yachting during this period was far more varied and interesting. The adoption, through the *America* and *Musquito*, of finer bows and better general form was followed by a further contraction of beam, to save tonnage, to offset which an outside shoe of cast iron was added below the keel, in addition to the heavy weight of shot carried in the weather bilge. To such a dangerous extreme was this latter practice carried that in 1856 it was rigidly prohibited by a rule which has been in existence ever since in Great Britain, forbidding the shifting of any weights during a race. This restriction stopped for a time the process of decreasing the beam a little in each successive yacht to gain more size on the same nominal tonnage, the narrow yachts having insufficient stability when deprived of the weight to windward. The inventive powers of owners and builders soon disposed of this difficulty by using a heavier iron shoe, and filling every inch of space between the floors and keelson with lead accurately moulded to fit. About 1870 a great change was made in the placing of a very large proportion of the ballast in a lead keel outside the oak keel.

The extent of this change is shown by a comparison of the racing-yawl *Florida*, built in 1873, with the cutter *Galatea*, built in 1885. The *Florida*, of 125 tons, yacht measurement, was 85 ft. 9 in. on the water-line, 19 ft. 4 in. beam, and 11 ft. 9 in. in draught, with 54 tons of ballast, of which but 8 tons were on the keel; the *Galatea*, of 90 tons measurement, was 86 feet on the water-line, 15 feet beam, and 13 ft. 3 in. draught, her ballast, 78 tons, being all carried at the lowest possible point, in her trough keel, the hull being of iron.

For a long time yacht-builders were, as a rule, men of large practical experience but little technical education, planning their yachts by ways of their own, and knowing little of the accepted methods of the trained naval architect. It was about 1870 that they began to feel the first competition from young men of thorough technical education, who, giving no thought to the business of yacht-building, devoted themselves seriously to the work of producing designs on paper from which yachts could be built with some reasonable certainty of good performance. The work of such men as Watson, Richardson, Beaver-Webb, Clayton, Paton, all of whom

are distinctively designers, received recognition in Great Britain prior to 1880; and from that time onward all yachts have been built from plans carefully worked out on paper after a recognized method, whether by a professional designer or by one who combines the two occupations of designing and building.

The first yacht built from a design in the U. S. was the iron cutter *Vindex*, designed by A. Cary Smith in 1871. In spite, however, of the success of the *Vindex*, and of other yachts designed by Smith, it was not until 1884 that the old method of building from a wooden model carved out by the builder was finally abandoned. Though the *Vindex* was a very successful yacht, her building had no effect on the national type. The visit of the *America* in 1851 was returned in 1870 and 1871 by the English schooners *Cambria* and *Livonia*, each of which sailed at New York and was defeated in the attempt to regain the *America's* cup; and then all interest on the part of yachtsmen of the U. S. in the progress of the sport across the sea ceased entirely, and the development of the national type proceeded independently on the lines already indicated.

In the fall of 1880 James Coats, of Paisley, a wealthy Clyde yachtsman, sent to New York on the deck of a steamer a very successful 10-ton cutter, the *Madge*, the work of the young Scotch designer, George L. Watson, in every respect a perfect craft of the type. A number of matches were made with representative sloops as nearly as possible of the same size, and seven races were sailed off New York and Newport, in which *Madge* scored six victories, being once defeated by the famous Boston sloop *Shadow*, the deepest yacht of her type, and the most successful. The other sloops, *Schemer*, *Wave*, and *Mistral*, were badly defeated by the little Scotch boat.

The victory of the *Madge* proved the merits of her type in many points, if not her all-around superiority; in particular were her rigging, sails, and the handling of her Scotch crew superior to those of her opponents. In 1881 was built the cutter *Oriva*, of 50 feet water-line, and next year the *Bedouin*, of 70 feet, and the *Wenonah*, of 60 feet, all built by Piegrass from designs by Mr. John Harvey, the English designer. These three yachts were wider by 1 to 2 feet than the British cutters of the day. Several cutters were imported from England, and, with those built in the U. S., gave battle to the sloops, through 1882, 1883, 1884, the result being that while certain faults, notably the lack of beam, were plainly apparent in the cutters, the superiority of the cutter rig, of the lead keel, and of other important features was conceded very practically by the process of rebuilding and rigging the sloops; while many new yachts of wide beam but much greater depth, and with a centerboard working through a lead keel, were built under the general name of "compromise sloops."

Modern International Races.—This process of reconstruction and modification found its most successful embodiment in 1885, in which year a challenge was received by the New York Yacht Club for the *America's* cup, on behalf of the British cutter *Genesta*, of 80 tons, 81 feet water-line, a fast and fitting representative of the extreme cutter type. Of the two yachts built to defend the cup, the successful one, both in the preliminary trial races, and the final races with the *Genesta*, was the *Puritan*, a centerboard yacht with a deep outside keel of lead and a cutter rig modified in mechanical details, the cotton mainsail being laced to the boom, and the bowsprit being permanently fitted. The *Puritan's* designer, Edward Burgess, of Boston, was practically an amateur, though an old and experienced yachtsman, she being the first yacht of any size which he produced after adopting the profession of yacht-designer. In 1886 there came a new challenge from the *Galatea*, a sister ship to the *Genesta*, and she was in turn defeated by an enlarged *Puritan*, the *Mayflower*, also designed by Burgess. In the periodic discussions over the tonnage rule which at intervals disturbed British yachtsmen, the suggestion was made about 1880 by Dixon Kemp, a designer and yachting writer, that length combined with the sail area should be employed in place of the rule which was producing narrower and deeper yachts each year. In 1882 this rule was adopted in a primitive form by the Seawanhaka Corinthian Yacht Club of New York, and in 1883 it was remodeled into what has since been known as the "Seawanhaka rule," the length on the water-line being added to the square root of the sail area, and the sum divided by 2. At the same time the New York Yacht Club adopted the rule in a slightly different form. The Seawanhaka rule has since been

adopted by nearly every North American yacht club. The movement for the adoption of the length and sail-area rule had been gaining strength in Great Britain for some years previous to the defeat of the *Genesta* and *Galatea*, and in the winter following the victory of the *Mayflower* over the *Galatea* the change was made, the old tonnage rule being finally abandoned, and what has been since called the "rating rule" adopted. By this rule the length and sail area are multiplied together, and the product divided by 6000, the quotient being the "rating" of the yacht ($\frac{L \times SA}{6000} = R$). This particular form of the rule was adopted merely to conform in a measure to the established custom, British yachtsmen having for two generations been accustomed to a cubic form of measurement rather than to a lined form, as used in the U. S.

This change of rule gave new liberty to the designer, leaving beam entirely untaxed, and he was not slow to appreciate the situation. Between 1886 and 1890 there grew up a fine fleet of yachts, of excellent design, light and elaborate construction, and great speed. The first large yacht built under the new rule, the *Thistle*, designed by Mr. Watson to challenge for the *America's* cup in 1887, though very successful against the older cutters at home, was badly defeated by a new champion, the *Volunteer*, a still deeper centerboard yacht built of steel from Burgess's design.

FIG. 13.—Keel yacht (1890) with midship half-section.

The influence of the three years' racing for the *America's* cup was strongly felt on both sides; in the U. S. the keel cutter came to the front very rapidly in the smaller classes, and some very exciting races were sailed in 1889-90 in the 30 feet and 40 feet classes. These yachts were of considerable beam and even more draught than the old cutters, with very large sail plans, rigged as cutters save that the mainsail was laced to the boom, the sails being all of cotton instead of hemp, and the bowsprit was a fixture. In the larger classes the deep centerboard yacht was still successful, for the reason that yachtsmen were reluctant to take the extreme draught essential to a perfect keel yacht; but in the classes up to 53 feet water-line the keel yachts were almost uniformly successful against both the old sloops which had been remodeled and the more modern "compromise" sloops.

The year 1891 was marked by the production in the U. S. of two noted yachts, both designed by N. G. Herreshoff. The first of these, the *Gloriana*, was a keel cutter of 45 feet water-line, 13 feet beam, and 10 feet draught, with a sail plan of 4,000 sq. feet by the Seawanhaka measurement, a very large rig. While of the general form of the yachts of the day, she carried to an extreme degree two details of modern designing. The water-line was excessively round and full at both ends, with no suspicion of hollow at the bows, giving a large area of water-line plane and corresponding stability, the hull below the water being boldly cut away into a hollow S-section. In consonance with this form below water, the topsides were carried out by the prolongation of the under water-lines until they reached their natural limits by converging at bow and stern, giving very long and full overhangs at each end.

The "wave-line" theory of Scott Russell, in 1840, called for excessively fine water-lines in the bow, involving a great amount of deadwood and wetted surface that was detrimental to speed. The true application of Scott Russell's theory was first developed by John Hyslop about 1875, his proposition being that the true wave form demanded not that the water-lines of a vessel should be of any one form, but that the growth of the bulk, from the bow to the midship section, and its decrease then to the stern, should follow a certain distinct rate of progression, the "curve of areas" of the transverse sections, representing this growth and decrease of bulk, being a curve of versed sines in the fore-body and a trochoid in the after-body. So far from conflicting with the elaborate investigations and deductions of Scott Russell, the discovery of Hyslop served to complete and perfect them and to make them for the first time of practical application in designing. It is remarkable that

this "wave-form" theory was discovered simultaneously by Hyslop, working in New York, and a Norwegian naval architect, Colin Archer, living in Laurvig, Norway; they were unknown to each other and worked on original and distinct methods to the same end.

By this new theory, accepted by all yacht-designers, the form of the water-lines could be materially modified, provided the volume of the immersed body at any point was properly proportioned. In the early yachts the full round water-lines were carried down to the full depth of the keel, making a bow that was excessively bulky. In the *Gloriana* only the load water-line was full, the hull being cut away excessively below, so as to preserve the fineness of bulk demanded by theory. Apart from the special features of the full water-line and long ends, the yacht was a masterpiece of light construction, on the composite system, with a beautiful outfit of sails, and a rig that included many new me-

FIG. 14.—Fin-keel yacht (1891-95) with lead bulb and balance rudder, with midship half-section.

chanical devices invented by the clever designer, who also sailed her in many of her races. The fame of her success was emphasized by her peculiar features, and she will always stand in yachting history as a remarkable craft.

In the fall of the same year Herreshoff designed and built a small experimental craft, in which the tendencies already noted—toward a very hollow section and reduced lateral plane—were carried to an extreme degree, the hull being that of a canoe about 39 feet over all, 25 feet water-line, 7 feet beam, and but 2 feet immersed depth. To this shoal hull was attached a fin of steel plate about $\frac{3}{4}$ inch thick, the lower edge of the fin carrying a cigar-shaped bulb of lead. The *Dilemma*, as she was called, was a great success, and in 1892 she was followed by others of her type from the Herreshoff shops—the firm being both designers and builders—several of them going to British waters and racing with hardly a defeat.

The interest in racing being still maintained, the models of each successive year showed a closer approach to the fin-keel type in the larger classes, and when a challenger came in 1893 for the America's cup, two of the four large yachts built for the defense, of 87 feet water-line, were fin keels, one, the *Pilgrim*, an extreme fin, drawing 22 feet, the other, the *Jubilee*, having a shoaler fin but 13 feet extreme draught, but with a centerboard working through the fin. The successful yacht, both in the trial and cup races, was the *Vigilant*, designed by Herreshoff, of 87 feet water-line, 126 feet over all, 26 feet beam, and 13 feet draught, with a very hollow section and a deep keel that was virtually a fin, to which was added a centerboard weighing 4 tons. The frames of the yacht were of steel, and the plating of an alloy—Tobin bronze. Opposed to her was the *Valkyrie II.*, designed by Watson, a keel cutter of composite build, of the same length, but under 23 feet beam, and drawing 17 feet of water. The result of her racing in the U. S. was the same as in previous years—she was defeated by the *Vigilant* in three races.

The season of 1894 was a most interesting one. The *Valkyrie II.* was sailed home and thoroughly refitted with a larger rig and more ballast, and the *Vigilant*, purchased by George J. Gould, was sent across to take part in the British racing. After only two trials the *Valkyrie II.* came to an untimely end, being sunk by collision with the *Satanita* in the Mudhook regatta on the Clyde on July 4. The *Britannia*, *Vigilant*, and *Satanita* sailed out the season with the result that the first named scored a wonderful success, winning 12 out of 17 races from the *Vigilant*.

Again, in 1895, came another challenge from the owner of *Valkyrie II.*, the Earl of Dunraven, and a still larger yacht (*Valkyrie III.*) was designed for him by Watson, her length on water-line being 90 feet, beam 26 feet, and draught 20 feet. This time but one yacht was built to meet her, the *Defender*, designed and built by N. G. Herreshoff, of 90 feet water-line, 23 feet beam, and 19 feet draught. While nominally keel cutters in model, both possessed the extreme draught and the small area of midship section characteristic of the fin-keel type. The races were most unsatisfactory; in the first *Defender* won, in the second

Valkyrie was disqualified as the result of a foul, and Lord Dunraven declined to sail the third.

Yak [from Tibetan *gyag* or *gyak*]: the *Bos grunniens*, a bovine animal of Tibet. It is about the size of a small ox, very hairy, and has a long sweeping tail. The legs and neck are short, horns small and half hidden in the long hair; the shoulders bear a great mass of hair which suggests a hump. The wild yak is much less shaggy than the domesticated variety, and of a nearly uniform deep brown or blackish color. The domesticated animals are generally black or white, or black and white, the latter most commonly. Its hair is not coarse, though long and thick; and though the creature, when wild and disturbed or wounded, may prove terribly fierce, yet it can be easily tamed and domesticated. Its hair protects it from the cold of the great mountain-heights which it loves to frequent. It is a sure-footed animal, climbing over rocks with the agility of a chamois. It is found only in the plateau region between the Altai and Himalaya Mountains, ranging upward to an altitude of 20,000 feet. The Tibetans frequently keep large domesticated flocks of yaks, and the milk is much prized. It is very rich and yellow, and has a strong but pleasant odor. The yak does not low like an ox, but has a peculiar sharp, quick, deep voice, very similar to the grunt of a boar. It is sometimes hunted by large dogs. Sportsmen declare that its flesh is superior to venison. The Tibetans frequently use its skin for clothing, and often take long journeys on yaks.

Revised by F. A. LUCAS.

Yako'nan Indians: a family comprising four tribes of North American Indians, whose name is a corruption of that of the leading tribe, the Yaquina, or Yakwina. This family was based by Ilale upon a single tribe, then numbering 600 or 700, who lived on the coast, N. of the Nsiet-shawus (probably the Ntsi-ya'mis, a village of the Ku-ite, or Lower Umpqua), from whom they differed merely in language. Ilale calls the tribe Iakon, or Yakones, or Southern Killamuks. The Siuslaw language has usually been assumed to be distinct from all others, but there is unquestioned evidence of relationship between the Yaquina, Alsea, Siuslaw, and Ku-ite, or Lower Umpqua, the four tribes that constitute the Yakonan family. The Yaquina tribe must have been of importance in early days, as it occupied fifty-six villages on both sides of Yaquina river, from the site of Elk City, 30 miles down to the Pacific Ocean. The Alsea formerly occupied twenty villages along both sides of Alsea river and on the adjacent coast. Most of the Alsea are with the Yakwina on the Siletz reservation, Oregon; but a few of them are on the Grande Ronde reservation, in the same State. The Siuslaw used to inhabit thirty-four villages along Siuslaw river. The Ku-ite, or Lower Umpqua, had twenty-one villages along both sides of Umpqua river, from its mouth up the stream for about 30 miles. Above the Ku-ite villages on the Umpqua river were the Upper Umpqua villages, occupied by Athapascan Indians. See INDIANS OF NORTH AMERICA.

J. OWEN DORSEY.

Yakutsk', or **Jakutsk**: Russian province (*Oblast*) of East Siberia, embracing almost the entire basin of the immense Lena river; bounded W. by the Yeniseisk, N. by the Arctic Ocean, S. by Irkutsk, the Transbaikal and the Amur provinces, and E. by the narrow strip of the maritime district of Ochotsk, which separates it from the Pacific. The immense province with an area of 1,533,397 sq. miles (nearly one-third of Siberia) has a population of 280,000, mostly Yakuts, Yukagirs, and Tunguses who live as hunters and fishers, partly still as nomads with large herds of cattle and horses. The Russians, mostly exiles or descendants of exiles, living in about twenty villages, number some 2,000 soldiers and 4,100 artisans, merchants, and officials. The south-

eastern part of the province is a high plateau, an immense desert of forests and of marshes frozen several hundred feet deep; but the wealth of the forests in fur-bearing animals and of the rivers in fish is unbounded. In the southwest gold-mining is growing. H. S.

Yakutsk: capital of the province of Yakutsk, Siberia; on the Lena, in lat. 62° 2' N., and 129° 44' E. lon.; founded in 1632 as a Cossack station (see map of Asia, ref. 2-11). It is the seat of a governor and the provincial authorities. The place has straight, unpaved streets, wooden houses, a cloister, a cathedral, 3 churches, a pro-gymnasium for boys and one for girls, and 2 primary schools. It is the center for the North Siberian trade in furs, mammoth-bones, reindeer-hides, tallow, and fish, which are exported for groceries and manufactured goods. The great fair, frequented by the natives all over the province, takes place from June 22 to Aug. 13 (new style), with an estimate of returns amounting to \$2,250,000. Pop. 5,698. H. S.

Yale, ELIHU, F. R. S.: philanthropist; b. in or near Boston, Mass., Apr. 5, 1648; son of Thomas Yale, one of the original settlers of New Haven, Conn., 1638, who soon after removed to Massachusetts and in 1651 returned to England, followed in 1652 by the rest of his family. Elihu went to India to engage in trade about 1670; was governor or president of the East India Company's settlement at Madras 1687-92; amassed a fortune; returned to England 1699. He never went back to New England, but he became interested in the "Collegiate School" at Saybrook, Conn.; favored it instead of bestowing a charity upon a college at Oxford as he had intended to do, and at different times—1715, 1718, 1721—sent over books and goods valued at more than £600 sterling. The largest remittance—1718—was in response to a hint to the effect that by making further donations he might have the college building, then in process of erection at New Haven, named after him. In 1745 the name Yale College was extended to the whole institution. Yale died in London, July 8, 1721, and was buried at Wrexham, North Wales, the ancient seat of his family.

Yale University (formerly **Yale College**): an institution of learning chartered as "the collegiate school of Connecticut" by the General Assembly of the colony of Connecticut Oct., 1701. From the first settlement of New Haven (1638) it had been intended to set up a college there, and it was in execution of this design that the minister of New Haven, James Pierpont, in concert with nine other Congregational ministers, most of whom were of the Connecticut seaboard, effected in Sept., 1701, the foundation of the collegiate school. The ten ministers made trustees by the charter were empowered to set up and carry on the school where they should see fit, and to perpetuate their own body. By an additional act (1723) the rector or head master of the school was made a trustee *ex officio*. The school was formally established at Saybrook in Nov., 1701, though the classes until 1707 were taught at Killingworth (now Clinton), an adjoining town, where Abraham Pierson, the first rector, was pastor. After long dissatisfaction and amid much opposition the school was permanently settled in New Haven in 1716, and in 1718 its name was changed to Yale College in recognition of a large gift from ELIHU YALE (*q. v.*), of London. In 1745 the present charter was granted by the General Assembly, confirming the trustees in all their powers under the title of "the president and fellows of Yale College in New Haven." Down to the period of the Revolution the college received from the colonial Government stated or occasional grants of funds, without which it could hardly have survived. In 1792 the Governor, Lieutenant-Governor, and six senior Senators of the State were made, *ex officio*, members of the corporation, the State making at the same time a grant valued at \$30,000 to the college funds. The constitution of Connecticut, adopted in 1818, expressly confirms the charter of Yale College. In 1871 the Assembly, with the assent of the corporation, substituted for the six Senators six graduates of the college, who were chosen, as their successors (one vacancy occurring annually) are also chosen, by the votes of a plurality of graduates of the first degree of five years' standing. In Jan., 1887, the use of the title Yale University was authorized by the General Assembly. For the first 100 years instruction was given chiefly by the rector or president, assisted by two or three tutors chosen from among the recent graduates and serving for brief periods. A professor of divinity (or college pastor) was appointed in 1755, and in 1770 a professor of mathematics, though the chair was not permanently occupied till 1794. It was not until the nine-

teenth century that the system of permanent professors, assisted still by temporary instructors, was fully established. There are over 200 instructors, nearly one-half of whom are permanent officers. The presidents from the foundation of the institution have been Abraham Pierson (1701-07), Samuel Andrew (1707-19), Timothy Cutler (1719-22), Elisha Williams (1726-39), Thomas Clap (1740-66), Naphtali Daggett (1766-77), Ezra Stiles (1777-95), Timothy Dwight (1795-1817), Jeremiah Day (1817-46), Theodore D. Woolsey (1846-71), Noah Porter (1871-86), Timothy Dwight, elected in 1886. The president is the presiding officer of the board of trustees and of every board of instruction. He has no required duties of teaching. There are four departments of instruction grouped under the name of Yale University, viz., the departments of philosophy and the arts, of theology, of law, and of medicine, the first of these including the academical department (the original Yale College, around which all the others have been developed), the Sheffield Scientific School, the School of the Fine Arts, the musical department, and the courses of graduate (or advanced non-professional) instruction. Degrees in arts were first given in 1702, in medicine in 1814, in law in 1843, in philosophy in 1852, in theology in 1867, in fine arts in 1891, and in music in 1894. The whole number of graduates is (1895) 16,737, of whom about 7,800 are deceased. The annual commencement is held on the last Wednesday in June, and the college year begins thirteen weeks later. The number of students enrolled on the annual catalogue for 1894-95 was 2,350, of whom 1,812 were undergraduates or candidates for the first degree in arts or philosophy (1,150 in the academical department and 662 in the Sheffield Scientific School).

The course of study in the academical department, now known as Yale College, extends through four years, and leads to the degree of bachelor of arts. The requirements for admission are mainly in Greek, Latin, and mathematics, and the first two years of the course are given largely to further drill in these branches; while the studies of the last two years take a wider range, the most of the time in these two years being given to advanced courses in subjects in which the student has already made some progress, and which he chooses from among a larger number offered to his option. The annual charge for tuition and incidental expenses is \$155. Beneficiary funds help to meet this charge for those who need such relief to the extent of over \$20,000 yearly. Nearly \$10,000 is also disbursed yearly to graduate and undergraduate students in premiums for the encouragement of scholarship. The permanent funds of the department (exclusive of real estate, buildings, and apparatus devoted to academical uses) are about \$1,500,000. The oldest college buildings occupy a square (about 850 feet by 400) in the center of the city, and on the west side of the public green, but the growth of the college has caused the erection of buildings for this department on adjoining squares also. There are nine dormitories, built from 1752 to 1894, and accommodating about 700 persons. There are also on the central square a chapel, a library, an art school, a building for the use of the Young Men's Christian Association, and six other buildings used as halls, recitation-rooms, and offices. The buildings form a quadrangle inclosing an open space. A very fine gymnasium, for the use of all the students of the university, was erected in 1893 immediately to the N. W. of the college square. There is a well laid-out athletic field about a mile and a half W. of the university buildings.

The Sheffield Scientific School, begun in 1847 as a school of applied chemistry, was gradually expanded until in 1860 it received its first considerable endowment from Joseph E. Sheffield, of New Haven, who afterward largely added to his original gift. The school provides for advanced and special students in the mathematical, physical, and natural sciences, and also for undergraduates who wish a training leading chiefly in this direction. It has five buildings, situated two squares N. of the college square. The State Legislature appropriated to the school in 1863 the national grant of 1862 for the benefit of agriculture and the mechanic arts, the income from which amounts to \$6,530 annually, besides the additional appropriations by Congress. In 1893 the Legislature passed an act taking this appropriation away from the Sheffield School, but this led to litigation. The course of instruction leading to the degree of bachelor of philosophy occupies three years. The degrees of civil and mechanical engineer are given to bachelors of philosophy after a higher course of two years, and the degree of doctor of philosophy after a three years' course. The charge for tuition is \$150 a year. The degree of Ph. D. is also given

to bachelors of arts who have pursued advanced studies at the university for two years, and the degree of M. A. is given for one year's similar study at the university or elsewhere under the direction of the faculty. Women are admitted to the courses for the degrees of Ph. D. and to the School of Fine Arts, but not to other departments.

The School of the Fine Arts was founded in 1864 by Augustus R. Street, of New Haven, who erected a building on the college square for its use and otherwise endowed it. Instruction is provided in drawing, painting, sculpture, architecture, and copper-plate etching. The degree of bachelor of fine arts is conferred on students who have fulfilled the requirements of an advanced course. The annual fees are \$100.

The theological department was founded in 1822 in connection with the Congregational denomination, and provides a three years' course of study. There is also a graduate course of one year. There is no charge for instruction or for room-rent in the buildings belonging to the school. It is open on equal terms to students of every Christian denomination. It possesses two dormitories, a library building, and a chapel, situated immediately N. of the college square.

The law department, begun as a private school soon after 1800, was not recognized as part of the college until 1824. It now offers a three years' course for the degree of LL. B., and also advanced courses with appropriate degrees at the end of one and two years. Special courses of one and two years are also provided for persons desiring acquaintance with law as a preparation for business life, or with political and legal systems and the rules by which they are governed. The annual tuition fees are \$100. For many years the school found quarters in the county court-house. In 1895 it occupied a building erected for it on the north side of the public green.

The medical department was organized in 1813, and in 1814 received a grant of \$30,000 from the State. It was originally conducted under a charter obtained in 1810, which placed the school under the joint control of Yale College and the Connecticut Medical Society. In 1884 the medical society withdrew from the control. The requirements for a degree include attendance on three yearly courses of lectures. The building of the school is situated about a block and a half to the S. W. of the college square. Students in the medical department have the advantage of clinical instruction, etc., at the New Haven Hospital. The annual lecture-fee is \$140.

The University Library, which is open to students in all departments, contains about 175,000 volumes and many thousands of unbound pamphlets. In the same building is a separate library of about 30,000 volumes, supported by the undergraduates and devoted to general literature. There are also special libraries belonging to the theological, law, medical, and scientific schools. The total number of volumes in the several libraries of the university is about 225,000.

The Peabody Museum of Natural History, devoted chiefly to zoölogy, geology, and mineralogy, was established by a gift of \$150,000 from George Peabody, of London, in 1866. One wing of the proposed museum has been erected, directly W. of the college square.

The university possesses an excellent observatory situated about a mile and a half from the college grounds. It was built from funds given by Hon. Oliver F. Winchester, and largely endowed by Prof. Elias Loomis. F. B. DEXTER.

Revised by BERNARD C. STEINER.

Yam [from Span. *ñame*, *ñame*: Portug. *inhame*, from Afr. *nyame*]: the tuberous root of species of *Dioscorea*, climbing vines of the family *Dioscoreaceæ*. Yams are extensively grown in all warm countries as food. Some of the wild sorts are nauseous and even poisonous. Yams are successfully grown in the southern parts of the U. S., and the Chinese yam (*D. batatas*, or properly *D. divaricata*) thrives in the northern parts, but its great roots, though often of excellent quality, have a tendency to bury themselves so deeply in the earth that they can only be reached at considerable trouble. The air-potato is a *Dioscorea* (*D. bulbifera*) which bears large edible tubers in the axils of the leaves. The term yam is also applied to various forms of the sweet potato. See FOOD.

Revised by L. H. BAILEY.

Yama: a Hindu deity, represented in the earliest legends as the first man who died, and the guide to the land of spirits of the spirits of other mortals. At a later date he is represented as presiding over the spirits of the just who

dwelt in the upper sky or the heaven called Yama. (See DEVALOKA.) In the Purānas he appears as the judge and punisher of the dead, awarding heaven or hell according to the balance of merit or demerit shown on the books kept by Chitragupta, his recorder. Death is his messenger. Two hideous dogs, each with four eyes, guard the approaches to his abode. In painting and sculpture he is generally represented as seated on a buffalo; he is four-armed and of austere aspect. In one hand he holds a mace and in another a noose. His eyes are inflamed and bloodshot and his teeth are like those of a tiger. His twin-sister is Yamī. In Buddhism Yama becomes the monarch of hell. (See NARAKA.) Originally, it is said, he was a king of Vaisālī, who having expressed a wish, while engaged in a bloody war, to be the ruler of hell, had his wish granted. He was reborn as Yama, along with his eighteen officers and his whole army of 80,000 men, who now serve under him as assistant judges, jailers, and executioners. By way of punishment for past offenses, however, a demon three times a day pours boiling copper into their mouths and squeezes it down their throats, causing them intense suffering. When Yama's sins have been expiated he will be reborn as Buddha under the name of the Universal King. His sister Yamī controls all the female culprits. See MONIER-WILLIAMS'S *Brahmanism and Hinduism* (Oxford and New York, 1891) and Eitel's *Handbook of Chinese Buddhism* (Hongkong, 1870).

R. L.

Yamaehi'che: post-village; St. Maurice County, Quebec, Canada; on Yamaehiche river, and Canadian Pacific Railway (see map of Quebec, ref. 4-B); near the St. Lawrence; 15 miles W. S. W. of Three Rivers. It has an academy, a convent, trade in grain and lumber, and some manufactures. Pop. (1891) about 2,700.

J. M. H.

Yamagata, yā'mā' gaa'tā. ARITOMO, Marquis: Japanese soldier and statesman; b. 1838, in the province of Choshū; entered the army and took a leading part in the suppression of the shogunate; was appointed second vice-minister of war in the new government, and in 1869 was sent on a military mission to Russia and France. In 1876 he was in command of an army ready to embark for Korea to avenge an insult to the Japanese flag, but the trouble was patched up. As a strict disciplinarian he took a leading part in abolishing the custom of wearing swords, since 1876 reserved for the services. (See SAMURAI.) He added to his reputation by the ability he showed in the Satsuma rebellion campaign of 1876-77. In 1878 he was appointed commander of the imperial guard and head of the general military staff. Since then he has served as Minister of the Interior, as Prime Minister (1889-91), and as Minister of Justice (1891-93). In 1884 he was created a count in the new order of nobility. When the war with China broke out in 1894, he was given command of the First Army-corps, and by his brilliant and effective strategy expelled the Chinese from the Korean peninsula in a few weeks, receiving a marquise in recognition of his services, 1895. His policy all along has been in favor of a thorough assimilation of European methods. He is noted for his indomitable resolution, ardent patriotism, and strict integrity; and as a general is considered the ablest strategist in the empire.

J. M. DIXON.

Yamaguchi, yā'mā' goo'chō: the most important town in the province of Suwo, Southwestern Japan; situated in a plain surrounded by mountains, about 15 miles from the sea. It was formerly the castle-town and residence of the powerful Mori family, lords of Choshū, and is now the seat of the local government. Ito, Inouye, Yamagata, and others of the leading men of the new era were born in this city or the vicinity. It possesses a higher middle school established and endowed by the former lord. In the sixteenth century the Christian Church here, founded by Xavier in 1550, was strongly organized, and was finally crushed after a hard struggle. Pop. (1894) 14,418. Until 1860 Hagi, 20 miles to the N., was the capital of the province.

J. M. DIXON.

Yamaji, yā'mā' jō', MOROHART, viscount: Japanese soldier, and perhaps the most popular hero of the China-Korean campaign of 1894-95; b. in the province of Tosa, Shikoku, about 1840. When a boy he lost an eye through an accident, and now goes by the name of the One-eyed Dragon. He served with distinction in the Satsuma campaign of 1877, and in due time became lieutenant-general and a peer. When the Japanese forces invested Port Arthur, Nov., 1894, the conduct of the attack was intrusted to him by Gen. Oyama, his superior, and he carried it out with wonderful pluck and vigor. He was advanced from baron to viscount in the distribution of honors in 1895.

J. M. DIXON.

Yamas'ka River: a river of the province of Quebec, Dominion of Canada; rises in Brome Lake, Brome County, and flows westerly as far as West Farnham, Missisquoi County, from which point its course is northerly until it empties into Lake St. Peter, an expansion of the St. Lawrence. The length of the Yamaska river is about 100 miles, and it flows through a fertile country. The towns on its many branches are Granby, Waterloo, Cowansville, Farnham, and St. Hyacinthe.

Revised by J. M. HARPER.

Yamato, *yāma'tō*: the "home" province of the Japanese empire, having NARA (*q. v.*) as its chief town. The name was once applied to the whole empire, as it still is in poetry. The "Yamato" language is Japanese free of all Chinese admixture, and is used in poetry and the compositions of literary women. The phrase *Yamato-Damashii* is employed to signify the chivalrous and cultured spirit of old Japan, and has often been used by the conservative party, jealous of the intrusion of a mean, commercial spirit. The Yamato school of painting corresponds to the *Tosa* (see *TOSA-RIU*), which is a development of it, and has been of great service in preserving a record of the costumes, manners, and ceremonies of old Japan.

J. M. D.

Yam'bu, Yanbu, or Yembo: town in El Hedjaz, Arabia; nearly 100 miles W. S. W. from Medina, of which it is the port (see map of Persia and Arabia, ref. 6-C). It has a good though exposed harbor, and is important as one of the principal stations of pilgrims to the holy places of Arabia. Pop. about 5,000.

E. A. G.

Yanan (*yaa'nān*) **Indians** [in their language *Yana* means people]: a family of North American Indians, represented by a single tribe, the Yana, chiefly known to the settlers by the name *Noje* or *Nozi*. They formerly occupied the territory from Round Mountain, near Pitt river, Shasta County, to Deer creek, Tehama County, Cal. The western boundary from Redding southward was on an average 10 miles to the E. of the Sacramento river, both banks of that river being held at that time by the Wintun, with whom the Yana were in frequent warfare. The Yana have a tradition that they came to California from the Far East. They are said to differ markedly in physical traits from all California tribes, and their language seems unrelated to any other. They are reduced to two little groups, one at Redding, and the other in their original country, at Round Mountain, Cal. In 1884 they numbered thirty-five persons.

J. O. D.

Yana (*yaa'nān*) **River:** a river of Siberia, 1,000 miles long, with its tributaries Adiga, Dulgalak, Shemanova, and Butakai, and one of the most considerable Arctic rivers in the Yakutsk province. It rises on the north side of the Tukan Mountains between 61° and 62° N. lat., where also the Indjghirka (950 miles) and Kolyma (1,000 miles) have their origin, flows N. and N. E., and empties into the Arctic Ocean by several mouths in lat. 72° N.

H. S.

Yang and Yin: in Chinese cosmogony, the positive and negative essences evolved by the *T'ai-k'i* or Ultimate principle of Being, by the action and interaction of which all things are produced. Yang is the male or masculine essence, Yin is the female or feminine; Yang is light, Yin is darkness; Yang is heaven, Yin is earth.

Yang-tse-Kiang (literally, the Yang-tse river): the name by which the principal river of China is known to foreigners. See CHINA.

Yanina: another spelling of JANINA (*q. v.*).

Yankee Doodle: a national air of the U. S.; originally known under the title of *The Yankee's Return from Camp*. It is reported to have been a popular tune in England during the Commonwealth, at which time its doggerel words originated. Others say that it was the tune originally set to the old English song, *Lydia Locket lost her pocket*, and that the words now used were composed in 1755 by Dr. Schuckburgh, a British surgeon who served under Gen. Amherst during the French and Indian war in North America, and who took this means of ridiculing the colonial militia. Still other accounts of its origin are given. It was introduced by Samuel Arnold into his opera *Two to One* (London, 1784). See Helen K. Johnson, *Our Familiar Songs* (New York, 1881).

Yankton: city; capital of Yankton co., S. D.; on the Missouri river, and the Chi. and N. W., the Chi., Mil. and St. P., and the Great North. railways; 61 miles N. W. of Sioux City, Ia., and 140 miles N. W. of Omaha, Neb. (for location, see map of South Dakota, ref. 8-G). It is in an

agricultural region, and is connected by steamboat and stage lines with the principal ports on the Missouri river and the military posts and Indian agencies on the upper Missouri. It has 8 churches, Yankton College (Congregational), the Academy of the Sacred Heart, the State Insane Asylum (cost \$300,000), 2 national banks with combined capital of \$100,000, an incorporated bank with capital of \$25,000, a State bank with capital of \$8,250, a daily, a monthly, and 6 weekly periodicals, and 12 artesian wells. The city has a pork-packing establishment, woolen-mill, several breweries, and Portland-cement works with capacity of 300 barrels per day, and a large trade with the interior in general supplies. Pop. (1883) 3,431; (1890) 3,670; (1895) 3,814.

PUBLISHERS OF "PRESS AND DAKOTAN."

Yankton Indians: See SIOUX INDIANS.

Yantic River: a stream which unites at Norwich, Conn., with the Shetucket river, about 3 miles below the junction of that stream with the Quinebaug river. These three rivers form the Thames. The Yantic affords large and well-utilized water-power.

Yapoek: See CHEIRONECTES.

Yapurá: See JAPURÁ.

Yaquina Head: See CAPE FOULWEATHER.

Yard [M. Eng. *yard* < O. Eng. *gierd*, *gyrd*, rod, stick, measure, yard; O. H. Germ. *garta* (> Mod. Germ. *gerte*, switch, rod; Goth. *gards*, goad. Cf. Lat. *hasta*, spear); the fundamental British statutory unit of length. Its prototype, for an account of which see WEIGHTS AND MEASURES, is in actual use at the Standard Office, London.

Yarkand: Chinese city of Eastern Turkestan; lat. 38° 22' N., lon. 77° 15' E., about 130 miles S. E. of Kashgar; on a canal derived from the river Yarkand (see map of China, ref. 3-A). It is surrounded by an earthen wall and defended by bastions at the angles. The citadel is outside the walls. Caravans from India arrive at Yarkand, carrying with them the manufactures of Manchester, and through Russian Turkestan lines of commerce connect it with the Caspian Sea and Moscow. Its manufactures of silks, cottons, linen, and woollens are important. The city is well built; the houses are mostly of stone; the streets are very narrow, frequently intersected by canals; the bazaars, caravanserais, and mosques are numerous. The population was estimated at 35,000 to 40,000 by Roborovsky in 1891.

Yarmouth, *yaarmūth*: town; in the counties of Norfolk and Suffolk, England; 122 miles N. N. E. of London (see map of England, ref. 9-M). It stands on a tongue of land between the North Sea and the Yare, along the bank of which runs a quay nearly 2 miles long. It is the principal seat of the English herring-fisheries on the east coast, and a considerable deep-sea fishing is also carried on, the produce of which is daily carried to London. Silk goods, ropes, sails, and iron are manufactured, and coasting vessels are built here. The church of St. Nicholas, founded by Herbert de Losinga early in the twelfth century and restored 1847-84, is one of the largest parish churches in England. Yarmouth returns one member to Parliament. Pop. (1891) 49,318.

R. A. R.

Yarmouth: town and port of entry; Yarmouth County, Nova Scotia, Canada; on the seacoast at the entrance of the Bay of Fundy, and on the Dominion Atlantic Railway; 90 miles S. of St. John, N. B., and 205 miles S. W. of Halifax (for location, see map of Quebec, ref. 3-A). It is principally engaged in shipping, fishing, and manufacturing, and has a semi-weekly and two weekly newspapers. Pop. (1881) 3,485; (1891) 6,989.

Yarmouth: town (incorporated in 1849); Cumberland co., Me.; on Casco Bay, the Royals river, and the Grand Trunk Railway; 11 miles N. by E. of Portland (for location, see map of Maine, ref. 10-C). It contains the villages of Yarmouth, North Yarmouth, Yarmouthville, and Cousen's Island, and has four churches, high school, academy, public library, granite quarries, foundry, and cotton and paper mills. Pop. (1880) 2,021; (1890) 2,098.

Yarmouth: town (incorporated 1633); Barnstable co., Mass.; on the N. Y., N. H. and Hart. Railroad; 75 miles S. E. of Boston (for location, see map of Massachusetts, ref. 5-K). It extends across the peninsula from Cape Cod Bay to Nantucket Sound; contains the villages of Yarmouth, Yarmouthport, South Yarmouth, West Yarmouth, and Yarmouth Farms; and has 5 churches, high school, 9 district schools, public library, a national bank with capital of

\$350,000, and a weekly newspaper (both in Yarmouthport). It is principally engaged in agriculture, cranberry-culture, and navigation, and in 1894 had an assessed valuation of \$1,970,777. Pop. (1880) 2,173; (1890) 1,760; (1895) 1,655.

Yarmuk [from Talmudic *Yarmokh*, whence Gr. *Ἰερμοῦξ*, whence Lat. *Hieromax* (mod. *Sheriat-el-Mandhur*): a river of Eastern Palestine. It has a strong current, is about 130 feet wide, and empties into the Jordan 5 miles S. of the Sea of Galilee. It is not mentioned in the Bible; but with its tributaries drains the ancient Bashan and Iturea, the modern Hauran, and Djolan. It is full of fish, and is lined with oleanders. On its banks near Gadara, called by Pliny in his natural history "Gadara, before which the river Hieromix flows" (*Gadara Hieromice prefluente*), about 8 miles from Jordan, are hot sulphur springs mentioned by Eusebius and Jerome. EDWIN A. GROSVENOR.

Yaroslav, *yā-rō-slaav'*, or **Yaroslavl**: government of Great Russia; originally an independent principality, but annexed by Moscow in the thirteenth century. Area, 13,751 sq. miles. The surface is level, and is irrigated by the Volga and its tributaries, the Mologa and the Sheksma, in the west, where ponds and marshes abound, the chief being Lake Nero near Rostov, from which the Weksa flows. Considerable traffic is carried on by way of the Volga and the above-named tributaries which connect it by two canals with the Neva. Timber and fuel are exported, the fir and pine forests covering one-third of the area; only 27 per cent. of the total area is under cultivation, but market-gardening is extensively carried on. Yaroslav is, however, one of the chief manufacturing governments in the empire: cotton and linen, chemicals, machines and metallic wares, flour, spirits, and tobacco are abundantly produced. The villages carry on domestic trades in great variety. The entire commerce of the government amounts to 1,600,000 tons annually, one-half being carried by the two railway lines—Rybinsk-St. Petersburg and Yaroslav-Moscow-Vologda. Pop. (1886) 1,071,518. HERMANN SCHOENFELD.

Yaroslav: capital of the government of Yaroslav, Russia; at the confluence of the Kotorost and the Volga; 173 miles N. E. of Moscow (see map of Russia, ref. 6-E). It is the seat of the civil governor and an archbishop, and had a population of 80,336 (with suburbs) in 1891. The right bank of the Volga is bordered by a beautiful quay for nearly 2 miles; the suburbs are on the left bank. The city has 66 churches, the Uspenskij Cathedral (begun in 1215) and several very old churches, a theological seminary, 3 monasteries, a lyceum with a law faculty, and 3 gymnasia. There are many factories for linen and cotton goods, bell-foundries, silk-factories, and a very active traffic with Moscow and St. Petersburg. The village Velikojje Seló with 3,849 inhabitants in the district of Yaroslav is the center of linen manufacturing which is famous all over Russia. It produces goods valued at 6,000,000 rubles annually. The town of Jaroslav in Austrian Galicia, on the Cracow-Lemberg Railway, must not be confounded with Russian Yaroslav. II. S.

Yarra-Yarra: river of Australia, in the colony of Victoria; passes Melbourne and enters Hobson's Bay, the northern point of Port Phillip, 3 miles below. It has a bar at its mouth, with originally but 9 feet of water at high tide; but improvements have deepened the passage until vessels drawing 16 feet can go up to the city. Above Melbourne it is not navigable. Revised by M. W. HARRINGTON.

Yarrell, WILLIAM, F. L. S.: naturalist; b. at Westminster, England, in June, 1784; formed an important collection of British fishes; was one of the originators, and long a vice-president, of the Zoological Society, and communicated over eighty papers to various societies with which he was connected. He published *The History of British Fishes, illustrated by 400 Woodcuts* (2 vols., 1835-36), of which the third edition was accompanied by a *Memoir of the Author* by Sir John Richardson (2 vols., 1859; *Supplement*, 1860), and *The History of British Birds with 520 Wood Engravings* (3 vols., 1839-43; 4th ed. 1881-85). D. at Yarmouth, Sept. 1, 1856. Revised by F. A. LUCAS.

Yarriba: See YORUBA.

Yarrow, or **Milfoil** [*yarrow* is M. Eng. *yarowe*, *yarwe* < O. Eng. *garwea*, *garawa*; < O. H. Germ. *garawa*, *garba* > Mod. Germ. *garbe*; *milfoil* is viâ O. Fr. from Lat. *millefolium*; *mil'le*, thousand + *fol'ium*, leaf] of the *Achillea millefolium*, a European plant of the family *Compositæ*, nearly allied to ecamomile, wormwood, and tansy; found as a com-

mon weed in Great Britain and the U. S. It produces leaves and flowers which have a bitter, astringent taste and an aromatic odor, and yields a blue volatile oil. It was formerly much used as a vulnerary, and in Sweden is employed by brewers as a substitute for hops.

Yarrow: a river of Scotland. It rises at Yarrow Clough, near Loch Skene, flows N. E. 25 miles through Lochs Lowes and St. Mary, and falls near Selkirk into the Ettrick, a tributary of the Tweed. On its banks are the ruins of the famous Castle of Newark, and Bowhill, the family-seat of the Dukes of Buccleuch. Its current is rapid, and it affords many picturesque views, which are commemorated in three well-known poems of Wordsworth.

Yarumal: a town in the northern part of the department of Antioquia, Colombia; in a valley of the Central Cordillera; 7,470 feet above the sea-level; 320 miles N. W. of Bogotá (see map of South America, ref. 2-B). It is the center of a rich grazing district, and in the vicinity are important gold-washings in which many of the inhabitants are employed. Pop. (1892) 10,000. II. H. S.

Yassy: another spelling of JASSY (*q. v.*).

Yates, EDMUND HODGSON: journalist and novelist; b. in Edinburgh, Scotland, July 3, 1831; son of an actor; was educated at Highgate and Düsseldorf; was for many years connected with the London post-office, but resigned in 1872 in order to devote himself exclusively to literature; made a lecturing tour in the U. S. (1872-73); was for some time the London representative of the New York *Herald*, and established with Grenville Murray, in 1874, the *World* "a journal for men and women," which proved a most extraordinary success. He was the author of a great number of successful novels and works of a miscellaneous kind—*Broken to Harness* (1861); *Land at Last* (1866); *Black Sheep* (1866-67); *Wrecked in Port* (1869); *Castaway* (1872); *A Silent Witness* (1875); and two volumes of *Recollections and Experiences* (1884). For a libel on Lord Lonsdale he was imprisoned for two months in 1884. D. in London, May 20, 1894. Revised by H. A. BEERS.

Yates, RICHARD: politician; b. at Warsaw, Ky., Jan. 18, 1818; became a resident of Springfield, Ill.; graduated at Illinois College, Jacksonville, 1838; studied law and practiced at Springfield; served in the Illinois Legislature 1842-49; and in 1850 was elected to Congress on the Whig ticket; was Governor of Illinois 1860 and 1862; took an active part in raising troops for the Union army; appointed U. S. Grant mustering officer for the State and subsequently colonel of the Twenty-first Illinois Regiment; served as U. S. Senator from Illinois from 1865 to 1871. D. in St. Louis, Mo., Nov. 27, 1873.

Yates, ROBERT: jurist; b. at Schenectady, N. Y., Mar. 17, 1738; educated in New York city, where he was admitted to the bar 1760; settled at Albany; was a member of the committee of public safety 1775, of the provincial congress 1775-77, and chairman of the committee on military operations 1776; served on the committee that drafted the first constitution of the State 1776; was appointed a judge of the Supreme Court of New York the same year; chief justice 1790-98; was a member of the national convention which formed the Federal Constitution of 1787, but opposed the adoption of the Constitution in the State Convention; took notes of its proceedings, which were printed by his widow (1839); retired from the bench 1798, and was appointed a commissioner to settle disputed land titles in the "Military Tract" with the States of Massachusetts and Connecticut, and also to settle claims of New York against Vermont. D. at Albany, Sept. 9, 1801.

Yates Center: city (founded in 1875); capital of Woodson co., Kan.; on the Atch., Top. and S. Fé. and the Mo. Pac. railways; 60 miles W. of Fort Scott (for location, see map of Kansas, ref. 7-I). It is in an agricultural and stock-raising region, and has 6 churches, graded public school, a private bank, and 4 weekly papers. Pop. (1880) 350; (1890) 1,305; (1895) State census, 1,599. EDITOR OF "NEWS."

Yaupon: a small evergreen tree, *Ilex cassine*. See HOLLY.

Yavari: another spelling of JAVARY (*q. v.*).

Yawning [M. Eng. *yanien*, *ganien*, *gonien* < O. Eng. *ganian* (collat. form *ginian*), yawn < O. H. Germ. *ginōn* > Germ. *gähnen*; Ice. *gína*; cf. Lat. *hia're*, Gr. *χαίρειν*, O. Bulg. *zjati*, yawn]; an act consisting of a deep inspiration, accompanied by an involuntary opening of the jaws to the fullest extent. It differs from sighing in these points

—that it is entirely involuntary, and that it is evidence of mental weariness or *ennui*. Its exciting cause is imperfect aëration of the blood, and it is sometimes a symptom of certain brain diseases, in which the encephalon is weakened in its functions of carrying on the operations of the organism. Yawning is performed by certain animals, as the dog, probably from similar causes.

Yaws [from Afr. *yaw*, raspberry, which the tumors sometimes resemble]: a contagious disease (*Frambesia*) of Africa, Malaysia, the Piji islands, the West Indies, etc. It has several varieties. It closely resembles the *Sibbens* of Scotland and the *Scherlievo* of Illyria. Some have considered it a form of leprosy, but it is more probably syphilis.

Yazoo City: city; capital of Yazoo co., Miss.; on the Yazoo river, and the Illinois Cent. Railroad; 45 miles N. W. of Jackson, the State capital, and 60 miles N. E. of Vicksburg (for location, see map of Mississippi, ref. 6-F). It is in a rich cotton and corn growing region, handles about 75,000 bales of cotton annually, and has a large cottonseed-oil plant, several lumber-manufacturing plants, water, sewerage, and electric-light systems, a national bank with capital of \$50,000, a State bank with capital of \$185,000, and 2 weekly newspapers. Pop. (1880) 2,542; (1890) 3,286; (1895) estimated, 6,500.

EDITOR OF "SENTINEL."

Yazoo Fraud: the name popularly applied to the sale by Georgia in 1795 of the greater portion of her western territory. In 1789 the State of Georgia sold to certain companies lands estimated at 13,500,000 acres for about \$200,000. Certain difficulties both as to the Indian title and the currency in which the purchasers were entitled to pay having arisen, the Legislature repealed the act. These sales, therefore, seem to have been practically inoperative; but in 1795, under a reorganization of the purchasers, the State of Georgia sold to four companies—known in history as the Yazoo Companies—for \$500,000 about 35,000,000 acres of western lands. This sale naturally excited the apprehension of the Federal Government, to whose notice it was brought by a message of President Washington; but in Georgia it aroused especial indignation, for there was strong evidence of legislative corruption. The members of the Legislature of 1796 came pledged to repudiate the whole transaction. All acts authorizing the sale were repealed, the purchase-money paid was ordered to be returned, and the records of the transaction were publicly burned. In 1802 Georgia ceded all this western territory to the U. S., and the Federal Government subsequently recommended that the claimants be compensated in land or money. The popular feeling, however, against the transaction prevented any action by Congress. The claimants finally sought their remedy in the U. S. courts, and the case was carried by appeal to the Supreme Court of the U. S. In *Fletcher vs. Peck*, Chief Justice Marshall in 1810 held that the original sale by the State of Georgia must be sustained; that the allegation of corruption on the part of the Legislature could not be entertained by the court; that purchasers from the land companies were innocent holders without notice; that the repealing act of the Georgia Legislature could not divest them of the rights thus acquired. Consequently, in 1814 Congress appropriated \$5,000,000, to be raised by the sales of the lands, to quiet and extinguish all the Yazoo claims.

Revised by F. M. COLBY.

Yazoo River [the name signifies "River of death" in the Choctaw language, alluding to the malarial diseases which prevailed upon its shores]: a navigable stream of Mississippi. It originates in the Yazoo Pass, Coldwater river, Beaver Dam river, and other bayous and sloughs springing from the east bank of Mississippi river. These join the Tallahatchie, a navigable stream from the N. E., at Polkville, Miss., where the Yockeney also comes in from the E., but the united stream is generally called the Tallahatchie down to the junction with the Yalabusha, which is also navigable. The Yazoo proper below this point is 290 miles long, deep, serpentine and sluggish, and navigable the year round. It joins the Mississippi 12 miles above Vicksburg.

Revised by I. C. RUSSELL.

Yberá, or Iberá, Laguna: See CORRIENTES.

Yberville: another spelling of Iberville. See IBERVILLE, D.

Yca: another form of ICA (*q. v.*).

Year [M. Eng. *yer* < O. Eng. *yēar*; O. H. Germ. *jār* (> Mod. Germ. *jahr*); Icel. *ár* < Teuton. *yēr-* < Indo-Eur. *iēr-, iōr-* > Gr. *ἔπος*, season, *ἔπος*, year; Zend. *yāre*]: a full

round of the seasons. While this, the original conception of the year, remains unaltered, as defining the principal year still used in astronomy, circumstances have led to a number of different years which we may regard as branching off from the main conception. When a system of astronomy was first formed it was seen that the solar year was determined by the apparent revolution of the sun around the earth, which we now know to be due to a real revolution of the earth around the sun. But this revolution may be reckoned in various slightly different ways, according as we refer the motion of the earth to the equinox, or to the earth's perihelion. Again, the year was found to be approximately twelve months, and thus various years were formed from the length of twelve months of different kinds.

On the subject of the years practically used in chronology information will be found in the article CHRONOLOGY (*q. v.*). The present article is limited to a brief statement of the characteristics of the principal years.

First of all, there is the solar, tropical, or equinoctial year, defined as the mean interval between two returns of the sun to the vernal equinox. The length of this year is 365 days 5 hours 48 minutes 46 seconds, and it diminishes about half a second in a century owing to a change in the annual precession of the equinoxes. Since the apparent motion of the sun or the real motion of the earth, relative to the equinox, determines the changes of the seasons, we may regard this year as the principal one for the practical purposes of life. It is also the principal year for astronomical purposes, because it corresponds to one revolution of the earth in longitude.

In consequence of precession the equinoxes are in constant motion from E. toward W. among the stars. Hence the return of the sun (or earth) to the equinox takes place in a somewhat shorter space than its return to a line drawn toward the same star. The former period is a little less than 365½ days; the latter a little greater. The mean interval between the return of the sun to the same star is called a sidereal year, and its length is 365 days 6 hours 9 minutes 9.5 seconds. The anomalistic year is the interval between two returns of the earth to its perihelion; it has no special importance in ordinary life.

The years which have branched off, as it were, from the solar year are, principally, our "common year" of 365 days, and leap-year, or bissextile year, of 366 days. The Julian year is one-fourth the length of four consecutive years of the Julian calendar, or 365¼ days.

A "lunar year" of twelve lunar months, or 354 days nearly, was sometimes used by nations whose religions feasts were regulated by the moon, notably by the Mohammedans.

Different peoples have differed widely as to the place among the seasons of the beginning of the year. The Roman year, before the time of Julius Caesar, began on Mar. 1. The civil year of the Jews began at the autumnal equinox, though their sacred year began at the vernal. The Greek year, before the time of Meton, began at the winter solstice; afterward at the summer solstice. The Egyptians, Persians, and other Eastern peoples began, like the Jews, at the autumnal equinox. The Mohammedan year, being a lunar year, has no determinate epoch, but continually goes backward among the seasons. Sept. 1 was the beginning of the year in the Eastern empire, and the same was true in Russia before the time of Peter the Great. In France, under the Merovingian kings, the year began Mar. 1; under the Carolingians, Mar. 25; under the Capetians, at Easter; and after 1564 on Jan. 1. The ancient northern nations of Europe placed the beginning of the year at the winter solstice. In England the year began on Mar. 25 previously to the adoption of the Gregorian calendar, which took place in 1532. The same usage prevailed in the British American colonies from Nova Scotia to Georgia, and was abandoned at the same time. For the Church year, see CALENDAR (*Ecclesiastical Calendar*). S. NEWCOMB.

Year and a Day: a complete calendar year. The day was added because the common law recognized no parts of a day, and therefore treated the last day of any period as ending at the very moment of its beginning. In accordance with this rule an INFANT (*q. v.*) attained full age at the beginning of the last day of his twenty-first year. The period of a full year, or of "a year and a day," was adopted as an arbitrary limit in many cases. By the feudal law the heir of the tenant was required to claim within that period, or he lost his land. The same limitation was imposed upon the claim of a tenant against his disseisor; and upon that

of the owner of an estray, or of the owner of wrecked property, or upon the issuing of an execution on a judgment. In order to make felonious killing murder, the common law required that the injured party should die within a year and a day after the mortal injury was inflicted. The reason assigned for this rule was that if the person alleged to have been murdered die after that time it can not be discerned, as the law presumes, whether he died of the injury or a natural death; and in a case involving life a rule of law ought to be certain. This rule has no application to a civil action for damages sustained by the widow and next of kin of one whose death was negligently caused by the defendant.

FRANCIS M. BURDICK.

Year-books: the oldest English law reports extant, so called because published annually, and termed by old writers "books of the years and terms." They are valuable and interesting from an antiquarian and historical point of view, and to some extent to the practicing lawyer, though seldom resorted to as guides for modern decisions. Instances, however, may be found in which they are consulted. (See the cases of *Lumley vs. Gye*, 2 Ellis & Blackburn, 216; *Curtis vs. Hubbard*, 4 Hill (New York), 437; *Althorff vs. Wolfe*, 22 New York Reports, 366, 367.) Until recently the year-books, as generally known to the legal profession, consisted of an edition in the Norman French published by Sergeant Maynard (1678-80), beginning with the reign of Edward I. and coming down to the time of Henry VIII. The collection was an imperfect one, a number of the early reports still remaining in a manuscript form; but the reports for a number of the years have now been carefully edited and published in English.

Revised by F. STURGES ALLEN.

Yeast: See FERMENTATION.

Yeast-plants: the *Saccharomycetaceæ*; much degraded and simplified sac-fungi, found abundantly in fermenting fluids. They are usually reduced to single, rounded cells, although under favorable conditions they may form several—or many—celled threads. They increase by pullulation from the end or side of the cell, the outgrowth eventually separating as a new cell. This process may take place with much rapidity, as in case of ordinary bakers' yeast. Occasionally the cell becomes an ascus and forms four ascospores. The family is now placed in the order *Discomycetes*, near to the *Gymnoascaceæ*. It includes the single genus *Saccharomyces*, with about twenty-five species. One of the most common is that used by bakers and brewers, *S. cerevisiæ*. See FERMENTATION, FUNGI, and VEGETABLE KINGDOM.

CHARLES E. BESSEY.

Yedo: See TOKIO.

Yeisk: another spelling of JEISK (*q. v.*).

Yekaterinboorg, Yekaterinodar, Yekaterinoslav, Yelets: another spelling of EKATERINBURG, EKATERINODAR, EKATERINOSLAF, ELETZ (*qq. v.*).

Yelk: See YOLK.

Yellow-bird: the common name given in the U. S. to two varieties of birds, the American goldfinch (*Spinus tristis*) and the yellow warbler or summer yellow-bird (*Dendroica aestiva*).

Yellow-eyed Grass: the common name of the *Xyridaceæ*; a family of monocotyledons chiefly consisting of the *Xyris*, a genus of biennial or perennial rush-like plants with two-edged, sword-shaped leaves. More than fifty species have been described, and fifteen are found in the Northern U. S., chiefly in sandy swamps and pine-barrens.

Yellow Fever: a disease so called because of the peculiar yellow tinge of the skin characterizing it, and for the same reason technically designated *typhus icterode*, *icterus* being the classical name of "yellow jaundice." It is not a form of typhus fever, but resembles it in the prostration, blood-disorganization, and softening of internal organs which are features in both. Yellow fever prevails chiefly in tropical and warm climates. When occurring in temperate or cold zones, it has been imported in the course of commercial travel. It is indigenous chiefly in the West Indies, upper coasts of South America, and the borders of the Gulf of Mexico. It occurs in isolated, sporadic cases at all seasons in seaports, to which it has been transported in ships. Rigid quarantine of all ships coming from yellow-fever localities, and their fumigation before disembarking passengers and cargo, have averted the epidemics formerly so frequent. It is generally conceded that there is a specific morbid ele-

ment, a portable *fomes* or infectious agent, which propagates this disease. This *materies morbi*, when imported and let loose, will prove innocuous unless the weather be warm or mild and the air moist. It rarely develops when the mercury is below 70° F., and frost or freezing weather effectually terminates its career. Insalubrious, damp, low, and filthy localities are more likely to be its points of successful lodgment. By the intercourse of business and personal visits it may be carried from the infected localities to other points, which in turn become foci of contagion. But there is no general atmospheric contamination, no infection, no contagion necessary, except as the air vitiated by the breath, vomit, and stools of the patient is inspired. The question of the direct contagiousness of yellow fever is still an open one. Opinion and what evidence there is upon this point would indicate that the disease is not directly transmitted from the sick to the well. Some intermediate development of the infectious agent in the soil or air seems to be necessary before it passes from one to another person. Yellow fever is not now regarded, as formerly, a fever of malarial origin, allied to intermittent and remittent. It prevails on the coasts and in large cities, sparing the contiguous country, which is often swampy and afflicted severely by malaria. The Negroes of the South, although susceptible to malaria, enjoy a relative immunity from yellow fever. Quinine and other anti-malarial remedies do not control it, or especially relieve it beyond their general tonic effect. In some cases, for two or three days or more, there will be general lassitude, loss of appetite, and sense of debility. In graver cases the attack may be precipitate and speedily fatal; reversely, there are "walking cases," in which, with jaundice and even mental disturbance, the muscular power is retained. There is usually an initial chill, headache, pains in the back and limbs, and slight increase of temperature. Exceptionally, the thermometer in the mouth or axilla will register a high degree, as in other fevers—103°, 104°, 105° F.—but more often the body-heat is but little elevated, and in some cases is lowered. After a few days, two or three, the temperature subsides and the symptoms abate. The patient may consider himself well, and indeed in abortive cases the disease terminates at this point. In most instances, however, a recrudescence follows after a day or two, and the graver symptoms of the disease, black vomit and delirium with general prostration, supervene. The pulse is but little accelerated. The stomach is irritable at an early date. The mind may be mildly or actively delirious. The skin grows yellow, and, when vomiting causes exhaustion and wasting, is often shriveled. The blood has become seriously impaired by the morbid poison, and its decomposed and watery elements tend to transude the coats of the vessels. Hence, with the effects of vomiting, vessels in the congested stomach are unloaded, and the already disorganized blood, being further perverted by the action of gastric juice, presents a coffee-ground, or again a tar-like, appearance, known as black vomit. This is regarded as a critical or even fatal sign; and with reason, since it is an evidence of serious destruction of red blood-cells. Exhaustion and collapse are the result of such conditions unless stimulating and sustaining treatment is assiduously adhered to. The average duration is a week. There is no specific treatment, but the bichloride of mercury has appeared to exercise some beneficial action. No depressing remedies should be employed. Cold and evaporating lotions to the head may prevent brain symptoms; ice, effervescing waters or champagne in small quantity, and other remedies for composing the stomach are valuable. Ammonium carbonate may help to oxygenate the blood. But quiet, discreet nursing, warm drinks, and blanketing, and, later, abundant nutrition, are found to be the most successful means of cure. The mortality varies with the character of the epidemic, the class of persons it has attacked, their hygienic surroundings, and the discretion with which cases are treated; it may be as low as 5 or as high as 75 per cent. See FILTH DISEASES.

Revised by WILLIAM PEPPER.

Yellow Fibrous Tissue: See ELASTIC TISSUE.

Yellow-hammer: the *Emberiza citrinella*, a very common and handsome bunting of Europe and western Asia. In Italy it is fattened and eaten. In the U. S. the name is sometimes applied to the flicker, or golden-winged woodpecker, *Colaptes auratus*.

Revised by F. A. LUCAS.

Yellowlegs: the *Totanus flavipes*, a North American snipe found all along the Atlantic coast of the U. S. It is a fine game-bird, and is esteemed by epicures.

Yellow Metal : See BRASS.

Yellow River (in Chinese *Huang-Ho* : sometimes formerly spelled *Whang-ho* and *Hoang-ko*) : one of the principal rivers of CHINA (*q. v.*) ; sometimes called "China's Sorrow," from its unruliness, and the destruction and loss of life caused by its frequent change of course and the bursting of its banks. Its principal affluent is the Wei. See SHENSI.

Yellows : See CHLOROSIS.

Yellow Sea (in Chinese *Huang-hai* ; formerly sometimes written *Whang-hai* and *Hoang-hai*) : those waters of the Pacific Ocean which border on the Chinese provinces of Cheli-kiang, Kiang-su, Shantung, and Chih-li, and are discolored by the large amount of yellowish mud which the Hwang-ho and the Yang-tse-Kiang carry with them to the ocean. It is rather shallow and its depth is steadily diminishing.

Yellow Springs : village ; Greene co., O. ; on the Pitts., Cin., Chi. and St. L. Railway ; 9 miles S. by W. of Springfield (for location, see map of Ohio, ref. 6-D). It derives its name from several mineral springs which have made it popular as a summer resort, and is the seat of ANTIOCH COLLEGE (*q. v.*). Pop. (1880) 1,377 ; (1890) 1,375.

Yellowstone National Park : a reserved tract situated in the northwest corner of the State of Wyoming, with a strip of country less than 2 miles in width lying on the N. in Montana and a still narrower strip extending westward into Idaho. Its boundaries as determined by act of Congress setting apart the park are ill defined. That portion of the park which is most frequented by travelers lies S. of the 45th parallel of N. lat. and between the 110th and 111th meridians. It is a rugged country, embracing a little more than 3,300 sq. miles. For a long time it had remained an inaccessible land which had defied all efforts of explorers to cross it. Occasionally a venturesome mountaineer or trapper entered the country, but not until 1870 was there any trustworthy account of a journey through the central portion. Up to that time it remained the largest tract of unexplored country in the Rocky Mountains. In the summer of 1870 H. D. Washburne, surveyor-general of Montana, accompanied by Lieut. G. C. Doane, traversed the region and published the first detailed account of its marvels and scientific curiosities. In the following year Dr. Ferdinand V. Hayden, U. S. geologist, accompanied by a corps of scientific assistants, among whom were several topographical engineers and a photographer, visited the region. Upon his earnest solicitation Congress passed a law dedicating the park and defining its boundaries as a public park or pleasure-ground for the benefit and enjoyment of the people. The act was approved Mar. 1, 1872.

The central portion of the park is a broad volcanic plateau between 7,000 and 8,500 feet above sea-level, with an average elevation of 8,000 feet. Surrounding it on all sides are mountain ranges with prominent peaks and ridges rising from 2,000 to 4,000 feet above the general level of the inclosed table-land. The Gallatin Range shuts in the park on the N. and N. W. Electric Peak, in the extreme northwest corner of the park, forms the culminating point in the range, and attains an elevation of over 11,000 feet above sea-level. It affords one of the most extended views to be found in this part of the country, not only over the park but the broad valley of the Yellowstone. The range is one of great beauty, of diversified form, and picturesque scenery. Sedimentary rocks from the Cambrian to the top of the Cretaceous are represented. Large masses of eruptive rocks have penetrated through sedimentary strata.

South of the park the Tetons rise grandly above the surrounding country, and form the highest peaks in the northern Rocky Mountains. East of the Tetons across the broad valley of the upper Snake, generally known as Jackson Basin, lies the Wind River Range. Only northern outlying spurs of both these ranges extend into the park.

Along the east side the Absarokas stretch for 80 miles, a bold unbroken barrier to western progress. They are made up of volcanic rocks, the highest peaks and crags attaining elevations ranging from 10,000 to 11,000 feet above sea-level. At the northeast corner of the park an irregular mass of mountains unites the Absarokas with the Snowy Range. The latter incloses the park on the north, and is an exceptionally rough, broken country, with elevated mountain masses formed of Archaean crystalline schists and Tertiary lavas. These ranges are all geologically older than the relatively depressed region which they inclose, designated as the Park Plateau. This plateau is by no means a level

country, but is accidented by broad shallow basins, and deeply scored by narrow gorges and cañons. The plateau represents a vast pile of lavas, in places 2,000 feet in depth, resting against and in part concealing the flanks of encircling mountains. Out of this plateau rise two prominent peaks, Mt. Washburne and Mt. Sheridan, from both of which have poured forth enormous masses of lavas. Across the plateau from the S. E. to the N. W. stretches the Continental Divide, separating the waters of the Atlantic from those of the Pacific. Several large bodies of water, notably Yellowstone, Shoshone, Lewis, and Heart Lakes, form such characteristic features on both sides of this divide that the southern end of the plateau has received the appellation of the lake region of the park. Hundreds of smaller lakes occupy irregular depressions either in lava flows or in shallow basins of glacial origin. Numerous streams coming down from the high mountains supply large quantities of water to these lakes and ponds. The Yellowstone and the Snake carry off the greater part of these waters, the former draining more than one-half the area of the park, and the latter the entire western side of the divide. The Yellowstone river, the longest branch of the Missouri, finds its source in Yellowstone Lake ; the Snake, in Shoshone Lake. A volcanic ridge about 250 feet in height separates the two lakes. Bechler river drains the Pitchstone Plateau, a part of the Park Plateau lying W. of the main Snake. The Firehole and Gibbon unite to form the Madison, which carries off the greater part of the water upon the western side of the park, ultimately running into the Missouri. The Gardiner drains the eastern slopes of the Gallatin Range and adds its water to the Yellowstone, joining the latter near the northern line of the park.

Flora and Fauna.—About 85 per cent. of the park is forest clad : the bare portions are mainly areas above timber-line, steep slopes, and wet marshy bottoms. The forest is essentially coniferous. A few groves of aspen (*Populus tremuloides*) add brilliancy to the autumnal foliage, but are insignificant in number. Over two-thirds of the trees are black pines (*Pinus murrayana*). On moist ground and where the snows remain late in the season this species gives way to the balsam (*Abies subalpina*) and the spruce (*Pinus engelmanni*). In a few localities the red fir (*Pseudotsuga douglassii*) is conspicuous by its height and vigor. The black pine rarely attains any great size, trees more than 2 or 3 feet in diameter being exceptional, while over considerable areas they are so diminutive as to be locally known as lodge-pole pine. The young forest is made up of graceful trees, but the maturer growth is not specially attractive. The charm of the forest is found in the natural groupings and park-like arrangement of the trees in the open country, many of those on the mountain slopes being of exquisite beauty. For grandeur these forests are not to be compared with those of the Sierra Nevada or Cascade Ranges. In the pine timber over much of the plateau there is little vegetation other than a low but luxuriant growth of blueberry (*Vaccinium myrtillus*).

From middle July to late September flowering plants everywhere abound, except in the forest. A peculiar flora is found in the region of the geysers and hot springs, due to the exceptional heat and moisture or to peculiarities of alkaline soil.

With the exception of the Rocky Mountain goat, all the larger game of the Rocky Mountains roam in the park. Elk, deer, and bear abound, antelope are found in the open valleys, sheep in the high country, and moose in the more marshy bottoms. A few small herds of buffalo roam over the park, grazing most of the time in out-of-the-way places. Since their protection by the Government, they are rapidly increasing.

Yellowstone Lake and Cañon.—Yellowstone Lake is a grand sheet of water, measuring 20 miles in length, with a breadth across its broadest expansion of 15 miles. It has an elevation of 7,741 feet above sea-level, and is the largest lake at so high an altitude in North America. Only a few lakes in the world at this altitude surpass it in size. It embraces an area of about 140 sq. miles, and it requires a ride of nearly 100 miles along the shore to complete the circuit.

After leaving the lake the Yellowstone river winds across Hayden valley, and then suddenly enters the cañon, a deep, narrow gorge cut in the plateau. The upper falls of the Yellowstone measure 110 feet, and a quarter of a mile below, the river plunges over the rocks in one bound for 310 feet. The cañon of the Yellowstone far excels in beauty all other marvelous sights in the park. From the lower

falls for 3 miles down the river the abrupt walls on both sides of the cañon, nearly 1,000 feet in depth, present a brilliancy and mingling of color beyond description. The cañon varies in width from a quarter to three-quarters of a mile. From the brink to the water's edge the walls are a mass of decomposed lava, presenting varied tints of orange and red, the result of steam and acid vapors upon the rhyolite. A number of small hot springs may still be seen in action in the bottom of the cañon only a short distance above the river. Numerous other deep gorges penetrate the lavas, carrying the waters of the plateau to the lower valleys. Geologically speaking, all these gorges are of recent origin. In most of them may be found waterfalls of great beauty; among them may be mentioned Tower, Undine, Osprey, Gibbon, Mystic, and Terrace falls.

Geysers and Hot Springs.—The natural objects that have made the Yellowstone region famous are mainly connected with its unequalled manifestations of thermal activity. Eruptions of lava ceased long ago; nevertheless over the Park Plateau evidences of internal heat are everywhere to be seen. Surface waters in percolating downward have become heated by relatively small quantities of steam rising through fissures from deep-seated hot rocks. Geysers and hot springs return these meteoric waters to the surface. (See THERMAL SPRINGS.) Geysers, mud-volcanoes, thermal springs, solfataras and steam-vents remain as active evidences of the dying out of volcanic energy. Innumerable localities of hot springs indicate the wide distribution of underground heat over the park. Large areas of decomposed lavas and extinct solfataras show the former existence of still greater thermal activity. The number of hot springs scattered over the park is nearly 4,000. If to these be added the fumaroles and fissures from which issue in the aggregate enormous volumes of steam, the number of active vents would be more than doubled. In the four principal geyser basins frequented by tourists (Norris, Midway, Upper and Lower Geyser Basin) eighty-four geysers are known to have been active since the days of the earliest exploration. To these may be added the geysers of the Shoshone Basin on the shores of Shoshone Lake, the Union Geyser, only a short distance from the lake, ranking among the finest in the park. In the neighborhood of Yellowstone and Heart Lakes are found a number of other geysers. Probably there are 100 geysers within the park.

All the thermal waters of the park may be classed under three heads: First, calcareous waters carrying calcium carbonate in solution; second, siliceous alkaline waters, rich in dissolved silica; third, siliceous acid waters, usually carrying free acid in solution.

Only at the mammoth Hot Springs do calcareous waters present an important feature. These springs lie in the extreme northern end of the park, just N. of the plateau. The waters reach the surface through Jurassic and Cretaceous limestones, and are strongly charged with calcium carbonate, which is rapidly deposited as travertine. The travertine covers an area of about 2 sq. miles, occupying a narrow valley lying between Sepulchre and Terrace Mountains. A continuous deposit extends from Gardiner river up to the top of Terrace Mountain, a vertical distance of 1,300 feet. The brilliant white travertine with its abrupt terraces presents the appearance of a glacier occupying a narrow mountain gorge. A series of terraces extend all the way from the river to the top of the mountain. The hotel terrace is the broadest of these level areas, and contains 83 acres. There is considerable range in temperature of the waters, the hottest springs reaching 165° F.

The siliceous waters are found mostly on the volcanic plateau issuing through cracks and fissures in the rhyolitic lavas from which they derive their mineral contents.

Acid waters occur in the Norris Basin, Crater Hills, Highland Springs, and on the slopes between Mt. Washburne and the Grand Cañon of the Yellowstone. They may be recognized by the efflorescent deposits of alum and salts of iron, and in general have an astringent taste. They are of less general interest than the alkaline siliceous waters, as it is only with the latter that the geysers are associated. Alkaline waters deposit mainly silica as siliceous sinter. It occurs as a surface incrustation of amorphous silica, and is usually spoken of as geysersite. It is white in color and covers large areas in all the geyser basins.

Geyser Basins.—The Norris Basin is situated 22 miles from the Mammoth Hot Springs. There are fourteen geysers in the basin, but none of them so impressive as those in the other basins.

The Lower Basin is 20 miles S. of the Norris Basin, and is the largest of all the geyser areas. It is roughly rectangular in shape, and contains innumerable hot springs and seventeen geysers, the largest of which is the Great Fountain. This is a typical geyser in every way.

On the west bank of the Firehole river, about 3 miles from the hotel in the Lower Basin, is Midway Basin. It is much the smallest of all the geyser areas, but contains the grandest geyser and the most picturesque hot lake to be found in the park. Excelsior Geyser is the most powerful geyser in the park. It throws into the air an enormous column of water 250 feet in height, measuring nearly 20 feet in diameter at the base, breaking into a fan-shaped body above. It rises from the center of a seething caldron of boiling water, the level of which lies about 20 feet below the surface of the sinter plain. At every eruption the amount of water thrown out reaches many thousand barrels. Frequently large blocks of sinter are hurled violently into the air by the force of the explosion. Prismatic Lake is unsurpassed for brilliancy of color and for the exquisite beauty of its rim.

From the Excelsior to the head of the Upper Geyser Basin, geysers and hot springs line the Firehole river. The Upper Basin is about 2½ miles long by 1½ miles wide, and contains the greatest number and, with the exception of the Excelsior, the grandest geysers in the park. There are over forty, of which nine are of the very first order. The Giant, Giantess, Grand, Splendid, Grotto, Castle, Bee-hive, Oblong, and Old Faithful are all within a short distance of each other. Old Faithful was so named on account of its great regularity; for over twenty years it has been playing at intervals averaging sixty-five minutes. All the larger geysers throw columns of water varying from 70 to 250 feet.

Government of the Park.—The Yellowstone Park is under the supervision of the Secretary of the Interior, who is authorized to make all necessary rules and regulations for its government and protection. The superintendent is an army officer, with headquarters at the Mammoth Hot Springs. Nobody is allowed to reside permanently in the park without special permit. All shooting is strictly prohibited, and the capture and trapping of game is forbidden. Fishing for pleasure and for food while in the park is permitted, but is strictly prohibited for commercial purposes. Every precaution is taken to prevent forest fires. There are several hotels in the park, and these are connected by good roads, maintained by the Government. ARNOLD HAGUE.

Yellow-wood: the valuable yellow timber of *Flindersia* (formerly *Oxleya oxleyana*, a noble cedrelaceous tree of Eastern Australia. Also the wood of *Cladrastis tinctoria* (once called *Virgilia*), a beautiful leguminous tree, a native of Tennessee and Kentucky. L. H. B.

Yambu: See YAMBU.

Ye'men [Arab. *Yaman*, liter., on the right hand, south (to one facing east), hence the land south of Syria. The ancient mistranslation, as *Arabia Felix* (Gr. εὐδαίμων), arises from the further meaning of lucky, fortunate, in the Arabic word]; a vilayet or province of the Ottoman empire in Arabia. It is bounded N. by Hedjaz, W. by the Red Sea, S. by the British protectorate of Aden. Its indefinite eastern boundaries are Hadramaut and the great Arabian desert. The coast-line is about 500 miles in length, and the total area between 70,000 and 80,000 sq. miles. It consists in part of a maritime lowland belt from 10 to 30 miles broad, mostly sandy and sterile, but in places tropically fertile, in part of table-land some 4,000 feet above the sea, and between these two of a chain of heavily wooded mountains running N. and S., with peaks from 6,000 to 8,000 feet high. Among these mountains are well-watered valleys and terraced slopes of great fertility. The population is variously estimated by conjecture at from 500,000 to 2,500,000. About 100 miles from the coast is the nominal capital, SANAA (*q. v.*), whose hereditary imam, a subject of the Ottoman empire, shares dominion with numerous chieftains more or less independent and powerful. The former capital, Hodeida, a most unhealthy city, is the principal port of the vilayet. Other ports are Mocha, famous for its coffee, but now almost abandoned, and Loheia, Zebid, 15 miles from the sea, the seat of an influential Sunnite college, is the most important manufacturing town, supplying large quantities of colored cotton fabrics. In the highlands are the towns of Beit el-Fakih, an entrepôt of coffee, Taif, Dhama, Mareb, Khamir, Saadeh, and Abu Arish. The principal exports are coffee, skins, senna, indigo, gums, dates, tamarinds, and ivory.

The history of Yemen goes back to remote antiquity. The earliest inhabitants are supposed to have belonged to the Hamitic race. Descendants of the Semitic Sheba (Gen. x. 28) came afterward. From their amalgamation arose the celebrated Himyaritic kingdom about 700 B. C. The high civilization of this kingdom is attested by hundreds of inscriptions, coins, and works of art. Various attempts at conversion of the country to Christianity, as by Theophilus, a missionary sent by Constantius II. in 356, had small permanent result. The king Abu Novas, who reigned toward the end of the fifth century, professed Judaism and massacred the Christians. In consequence he was conquered by the Negus of Abyssinia (525), whom Justin I. had instigated to revenge his coreligionists. The Persians replaced the Abyssinians in 575, and the whole province submitted to Mohammed and Islam in 628. The Ottomans have exercised a precarious authority over Yemen since 1538. EDWIN A. GROSVENOR.

Yenikale, or **Jenikale**, yen-ě-kaa-lā, **Straits of** (anc. *Cimmerius Bosphorus*); the body of water connecting the Sea of Azof with the Black Sea. It is 19 miles long, about 3 miles wide where narrowest, and very shallow. The southern part is called Strait of Kerteh. E. A. G.

Yenisei, yen-ě-sā-ě: the longest of the great rivers of Siberia, watering the immense Yeniseisk province through its whole length. It rises in the N. W. of Mongolia in several branches, the chief of which is the Ulukhera to the W. of Lake Kossogol, separated from it by the Khangai Mountains. Below Krasnoyarsk it receives a great tributary, the Kan, and farther N. the Angara, the Podkamennaja ("stony"), and the Nishnaja Tunguska, and empties into the Arctic in a deep estuary, the Yenisei indentation or the Liman of Seventy islands, ice-bound almost all the year round. Its total course is more than 3,000 miles long, and is navigable from Minusinsk, though there is a series of rapids in the middle course between Krasnoyarsk and Yeniseisk. HERMANN SCHOENFELD.

Yeniseisk, yen-ě-sā-isk: one of the two great governments of Eastern Siberia (see **SIBERIA**) on both sides of the Yenisei river, extending from the Chinese frontier to the Arctic Ocean. Area, 987,186 sq. miles. It is very sparsely inhabited in the north by the Yuraks of Samoyede race and the Yakuts, in the south by Ostjaks, Tunguses, and Tartars. The northern part is mostly a frozen swamp or a desert plain; the southern part is very mountainous. The Sayans Mountains, connected with the Altai, which form the frontier between Russia and China, are very rich in gold, silver, iron, and all kinds of metals and minerals. The very common salt lakes yield about 50,000 cwt. of salt every year. Fishing in the great streams and lakes and hunting are the chief occupations of the half-savage natives. The Russian inhabitants are partly exiles, among whom there are nearly 50,000 so-called "settled" exiles, but mostly voluntary settlers, and are chiefly engaged in agriculture, cattle-raising, and the fur-trade. The total population of the government in 1890 was 458,572. Minusinsk is the granary of the province, and from it the gold-fields of the Yeniseisk Taiga are provided with grain and cattle by boats. The enormous government is divided into six districts. The capital is Krasnoyarsk, with 17,155 inhabitants; but perhaps more important is the town of Yeniseisk (see map of Asia, ref. 2-F), which has given its name to the government, being the chief entrepôt for the gold mines. At its fair in August the larger part of the Siberian fur-trade is concentrated. The town has a public library and a natural history museum created by exiles. Pop. (1888) 7,382. HERMANN SCHOENFELD.

Yeomanry Cavalry: a body of British volunteers, not reckoned as militia, and liable to duty only in Great Britain. They are organized by counties under the lords-lieutenants, and can be called out to assist the civil power or to serve against an invader; while serving they are on the same footing as regular soldiers. The yeomanry were first organized in 1797, and originally comprised infantry, but are now composed entirely of cavalry. In 1894-95 they numbered 11,790.

Yeomen of the Guard: properly "His (or Her) Majesty's Body-guard of the Yeomen of the Guard," a body of 100 veteran soldiers, commanded by a captain (a nobleman), a lieutenant, an ensign, an adjutant, and four exons (probably a form of the word exempt), all old soldiers, besides non-commissioned officers. They were instituted in 1485 by Henry VII., and are employed on special occasions as a body-guard of the sovereign.

Yes'digerd III.: Persian king; the last of the dynasty of the SASSANIDE (*q. v.*); b. in 617; ascended the throne in 632. In 634 he repulsed the Mussulmans under Abou Obeida, but was defeated in the three days' battle of Cadesiah (636), after which his capital, Ctesiphon, was taken and destroyed. Again defeated at the decisive battle of Nehavend (641), all Persia was subdued by the caliph. Yes'digerd maintained a hopeless resistance till 651, when he was assassinated by a perfidious host. E. A. G.

Yesso: See **YEZO**.

Yew [M. Eng. *ew* < O. Eng. *ēow*, *īw*; O. H. Germ. *īwa* (> Mod. Germ. *eibe*); Icel. *ýr*. Fr. *if*, Span. *īva*, *yew*, are of Teuton. source]: the common name of evergreen coniferous trees of the genus *Taxus*, and sometimes extended to others of the family *Taxaceæ*, now generally included in *Conifera*. Thus *Torreya* (*q. v.*) is called stinking yew, etc. The common yew-tree (*T. baccata*) of Europe is often planted in churchyards, and like the cypress and willow, has a funereal character well supported by its gloomy appearance. Its leaves and seeds are poisonous. Its tough wood was once in great repute for bows. It is very hard, elastic, and durable. The tree is slow-growing and is famous for its longevity. Of its varieties the Irish yew is the finest. *T. canadensis* is a prostrate American sort, very common northward.

Yezd, or **Jesd**: town: in Central Persia (see map of Persia and Arabia, ref. 3-1). It is situated in a small oasis, watered by the river Mehris, and produces excellent fruits and vegetables. Grain has to be brought from Isfahan. Though the town appears a mass of ruins, it manufactures arms and silk and velvet stuffs, and has well-stocked bazaars. It is the junction of the main Persian caravan routes. Among its inhabitants are Parsees and numerous Jews. Pop. about 40,000. E. A. G.

Yezidees: See **DEVIL-WORSHIPERS**.

Yezo, yā-zō, less correctly **Yesso**, and known by the Japanese as **Hokkaido**: the most northerly of the great islands of Japan, and until recently treated as a colony; extending from the Straits of Tsugaru on the S. to the Soya Strait on the N., i. e. between parallels 41½° and 45½° N. lat. and 139½° and 146° E. lon. Its area, with small adjacent islands, is 30,276 sq. miles. The surface of the country is broken and mountainous, and a large portion remains imperfectly explored. The highest summit, forming the center of the river system, is Mt. Tokachi, 8,200 feet in height. The chief river is the Ishikari, flowing W. into the Japan Sea, a stream abounding in salmon. About the year 1600 A. D. the southwestern peninsula began to be settled by Japanese, and the town of MATSUMAYE (*q. v.*) remained the center of rule until the year 1868. HAKODATE (*q. v.*), however, with its magnificent harbor, is the most important town on the island. It was thinly settled, and the new rulers of Japan, fearing Russian aggression, undertook a comprehensive colonization scheme. A special department, the Kaitakushi, was founded, and a number of Americans, with Gen. Horace Capron at their head, were in 1871 engaged as advisers. Making SAPPORO (*q. v.*) its headquarters, the department spent large sums on internal improvements, but as no adequate returns followed this expenditure, and few colonists were attracted, the Kaitakushi was dissolved in 1881, and the island divided into prefectures like the rest of Japan. Military colonists were settled all around Sapporo; a penal settlement was established close to Poronai; Mororan on Volcano Bay, with its landlocked harbor, became a naval station, and considerable progress was made in opening up the island. But the interior still remains for the most part covered with primeval forest, inhabited by deer and bears. For six months of the year the island is under ice and snow, the depth of the snow ranging from 2 feet in Hakodate to 6 or 8 feet on the N. and W. of the island. The summers though short are hot, and insect life abounds in the shape of mosquitoes and gadflies. The chief Aino villages are found on the southeast coast, the west coast immediately N. of Matsumaye being settled by a Japanese fishing population. Pop. (1894) 339,455, of whom about 14,000 are Aino or AINOS (*q. v.*). J. M. DIXON.

Yg'drasil [from Icel. *Yggdra Syll*; (apparently) *Yggr*, a name of Odin + *syll*, sill, support]: in Scandinavian mythology, the greatest and most sublime of all trees, the ash, whose branches spread over all the world and aspire above heaven itself. It is the symbol of the universe. Beneath one of its roots is the fountain of wisdom and beneath

another is the meeting-place of the gods. Odin once hung nine days and nine nights in this tree sacrificing himself to himself. It is believed that Ygdrasil is the origin of the Christmas-tree. See SCANDINAVIAN MYTHOLOGY. See also Anderson's *Norse Mythology*. RASMUS B. ANDERSON.

Yncas: another spelling of INCAS (*q. v.*)

Yoga Philosophy: one of the six orthodox systems of India. (See NYĀYA, VĀJESHIKA, MĪMĀNSĀ, VEDĀNTA, SĀNKHYA.) Since ancient times, the belief has passed current in India that by the practice of asceticism or self-castigation a man could acquire supernatural powers, by which he could change at will the ordinary course of nature. Indeed, this idea has possessed the Indic Aryans as have few others; and they have accepted it quite as a matter of course. The Sanskrit word for asceticism is *tapas*, literally, heat, then pain, torment, and so self-torment; and it occurs as early even as in the younger hymns of the Rġveda, and then more frequently in the Yajurveda and the Atharvaveda; while the word and the thing are in full vogue in the literature of the next period, the Brāhmaṇas and Upanishads. Here, indeed, *tapas* is often treated as a cosmogonic potency, by means of which the creator of the world produces things and living beings. This is the best proof we could have of the fact that even in these ancient times the power ascribed to *tapas* was hardly less than that claimed for it in the later or classical Sanskrit literature. Here the belief finds most extravagant expression; even the gods fall a-trembling with horror and fear before the power of the ascetic (*tāpasa*), who is depicted as an omnipotent magician. Originally, the Indic *tapas* consisted doubtless merely in continence, fasting, and mortification. Later the religious needs of the people were no longer to be satisfied by the performance of endless ceremonies and by innumerable outward observances; and these changes are duly reflected in the system of *tapas*, whose principal features came to be meditation and intent contemplation. This spiritual *tapas* gets the name of *yoga*, and comes into the foreground; while the word *tapas* continues to mean as before, simply bodily mortification, and *tapas* itself is relegated to the subordinate position of an auxiliary, or of a means for the intensification of *yoga* proper. We may note in passing that Buddhism rejected *tapas* altogether, but laid great weight upon the intent contemplations. Naturally the ideas proper to the words *tapas* and *yoga* were not in the sequel always sharply distinguished. The word *yoga*, as meaning the closing of the senses to the outer world and the introversion and concentration of the mind, does not occur until considerably later than *tapas*; but it does indeed occur with tolerable frequency in the Upanishads, which are of the middle class as respects their age; and in the Māitri Upanishad (at vi. 18), we find almost completely developed the technique prescribed for the practice of *yoga* by the later system.

The establishment of the Yoga philosophy is ascribed to Patañjali, but his work was in part simply the reduction to fixed literary form of views that had long prevailed in India. This reduction the writer of this article would refer to the second century before Christ, being persuaded of the correctness of the Indic tradition which identifies the philosopher Patañjali with the grammarian of the same name who flourished about 143 B. C. (See SANSKRIT LITERATURE.) His doctrines are contained in the compendium called Yoga-sūtra; and doubtless this is older than any of the compendiums of the five other systems. And this is to be inferred from the fact (until now unnoticed) that the Yoga-sūtra is the only one among the philosophical Sūtras which develops its system without entering into polemics against the other systems. Since now the oldest two of the other five, namely, the Mīmāṃsā-sūtra and the Vedānta-sūtra, date from the beginning of the vulgar era, or from a time not long anterior (see VEDĀNTA), and since the Yoga-sūtra antedates them, it is clear that the time of the great grammarian is an extremely probable one for the composition of the Yoga-sūtra. And this consideration greatly strengthens the probability of the correctness of the native identification.

The basis of the Yoga system is the Sāṅkhya philosophy. (See SĀNKHYA.) Indeed Patañjali has appropriated Sāṅkhya doctrines to such an extent that his system is generally and justly designated in Indic literature as a branch of the Sāṅkhya. All of the most important Sāṅkhya doctrines, except the denial of a God, are transferred to the Yoga system; to wit, the Sāṅkhyan theory of cognition, the Sāṅkhyan cosmology, physiology, and psychology, and the Sān-

khyan theory that the deliverance of the soul from the round of existences is to be attained only by direct recognition of the absolute difference of *spirit* from matter. (The belief in the metempsychosis and in karma belongs, of course, to Aryan India in general.) The admission of the doctrine of a personal God into the Yoga system became in later times a fact of decided importance in determining the character of the system. But its original insertion by Patañjali, to judge from the Yoga-sūtra, was made in a way so loose-jointed as not to involve any essential modification of the contents and aim of the Sāṅkhyan system as a whole. Indeed, we may make the downright assertion that the Yoga-sūtras, i., 23-27, and ii., 1 and 45, which treat of God, are quite out of connection with the remaining portions of the compendium, and even in contradiction with the fundamental principles of the system. The ultimate end of human strivings is, according to the Yoga-sūtra, not union with God or a merging into God, but rather, as in the Sāṅkhya, simply the complete isolation (*kāivalya*) of the soul from matter, and the bringing about of an absolutely unconscious condition after the mundane existence. The statement is sometimes found in works on the history of Indic thought that the Yoga system is purely theistic, and that it assumes a primeval spirit from which the individual spirits originate, and the like. But this is completely erroneous. The individual souls are as truly without beginning and eternal as is the "particular soul" (*puruṣa-viśeṣa*), called "God." It is probable that Patañjali, by his very superficial erasure of atheism, simply intended to render the originally non-Brahmanical Sāṅkhya system more acceptable to his countrymen.

In this connection we must add that there is a large number of Upanishads which treat of *yoga*, and which are all much posterior to the oldest Upanishads, and probably even to the Yoga-sūtra also. They are those which Prof. Weber, in his *History of Indian Literature*, designates as the second class of Atharvan Upanishads. They have for their subject the sinking of the soul in contemplation of the Atman (that is the divine soul); and are, for the rest, somewhat affected by Vedāntic views. The conception of a personal God is well developed in them; and the like is true in still larger measure in the third and most recent class of Upanishads, the sectarian Upanishads, which substitute one of the forms of Viṣṇu or Śhiva for the Atman, while still following in essentials the Yoga doctrine.

There is one other important matter, besides that of the admission of a personal God, in which the Yoga is distinguished from the Sāṅkhya, to wit, the doctrine of *yoga*, from which the system receives its name. Patañjali treats this subject systematically; describes the means for attaining to this condition of concentration of thought or absorption, and the means for intensifying it to the highest degree, and the supernatural powers which are the reward of the practice of *yoga*. The practice of *yoga* has eight component parts (*yogaṅga*): (1) Self-control and the repression of all sensual impulses (*yama*); (2) the keeping of prescribed observances (*niyama*); (3) the remaining in certain bodily postures (*āsana*); (4) artificial restraint or regulation of the breath (*prāṇāyāma*); (5) the diversion of the senses from the objects of sense (*pratyāhāra*); (6) the composing of one's self, or attainment of self-composure (*dhāraṇā*); (7) meditation (*dhyaṇa*); and (8) intent or profound contemplation (*samādhi*). The belief prevails even to this day in Brahmanical India that by the successful practice of *yoga* one can attain the supernatural powers (*siddhi, āṣṭvarya*). The Yogins, i. e. the ascetics who practice *yoga*, do not, it is true, give any public proof of their possession of supernatural powers; but this is easily explained by the fact that it is an essential condition of their attainment that the Yogin be absolutely indifferent to the world of sense, and hence have no motive for exhibiting the miraculous powers. These are eight in number: (1) The power of making one's self infinitesimally small, or invisible (*anīman*); (2, 3) the power of making one's self exceedingly light (*laghīman*), or heavy (*garīman*); (4) the power of reaching anything whatsoever, for example, the moon, with the tips of one's fingers (*prāp-ti*); (5) irresistible power of will (*prākāmya*); (6) "lordship" (*īṣṭva*) over all beings; (7) the power of changing the course of nature (*vaṣiṭva*); (8) the power of transporting one's self to any place soever by mere exercise of the will (*yatrakāmā-vasūṣiṭva*).

But the acquisition of the supernatural powers is not the only fruit of the practice of *yoga*, according to Patañjali; this practice is also the most successful means of overcom-

ing the hindrances to the attainment of the "redeeming knowledge" which springs from our own natural disposition. When concentration is so intensified that it is no longer possible for the thoughts to wander, nor for the faulty tendencies of the organ of thought to work themselves out, then comes the "knowledge of the absolute difference of spirit from matter" in the form of an "intuitive perception" (*pratibhā*). Such "knowledge" is tantamount to salvation; and in this way, accordingly, *yoga* is also the most certain means of attaining supreme deliverance or salvation.

There is an excellent commentary to the *Yoga-sūtra* by Vyāsa (of the seventh century after Christ), and this in turn was annotated by Vāchaspatimītra (twelfth century); and by Vijnānabhikṣu (after 1550) in his *Yogavārttika*. There is also a commentary on the *Sūtra*, entitled *Rājamārtanda*, and ascribed to King Bhoja (about 1000 A. D.). Of Vyāsa's commentary there are various Hindu editions with Vāchaspatimītra's sub-commentary. The *Yogavārttika* was published at Benares in 1884. An edition and English version of the *Yoga-sūtra* with Bhoja's commentary was published by Rājendralāla Mitra in the *Bibliotheca Indica* (Calcutta, 1883).

RICHARD GARBE.

Translated by CHARLES R. LANMAN.

Yokohama, *yō kō'haa'mā*: an important town and seaport of Japan; on the west shore of the Bay of Tokio; about 18 miles S. of the capital, with which it is connected by rail (see map of Japan, ref. 6-E). The town sprang up almost by accident at the time of the opening of the country, the original treaty-port being KANAGAWA (*q. v.*), on the north shore of a small bay, now closed in. Impatient of the obstructions placed in the way of their securing ground for their warehouses, foreign merchants established themselves at the small fishing-village of Yokohama (lit., cross-beach), 2 miles distant by water. The town divides itself into three parts: (1) the "native town," (2) the foreign settlement where the foreign business houses are, and (3) the Bluff, a well-wooded hill to the south of the settlement. The native town and the settlement are built on flat ground, at one time mostly a marsh or swamp. Most of the foreign private residences are on the Bluff. There is a good roadstead; a harbor, suitable for the accommodation of the largest vessels, is now in course of construction, and a graving-dock is also to be constructed. Yokohama is the chief port of foreign entry in Japan; during the year 1892 the tonnage of the vessels entering the port amounted to 1,910,191 tons (exclusive of junks). It is also the chief silk emporium; in the year 1892 2,800,000 lb. went to Europe and 4,400,000 to America. As a tea emporium it is yielding to Hiogo; 29,301,969 lb. were exported in 1892. The chief imports are cotton yarns, sugar, kerosene, woollens, bar iron, wire nails. Yokohama is on the main line of railway between Tokio and Kioto. The foreign consuls-general are established here, and several of the legations. In Dec., 1894, the native population numbered 160,439, the houses occupied by them 29,774. The foreign population, not Asiatic, numbers about 1,600, of whom one-half are British; until the war with China in 1894-95 the Chinese population numbered about 3,400.

J. M. DIXON.

Yokosūka, *yō-kos'kaū*: a town of Japan; on the west shore of the bay of Tokio; about 12 miles S. of Yokohama (see map of Japan, ref. 6-E). Here is situated a great naval arsenal, with the best dry docks in the empire, and large ship-building yards from which armored vessels have been launched. The harbor is landlocked; there is hourly communication by sea with Yokohama. A branch line from KAMAKURA (*q. v.*) connects it by rail with that seaport and the capital. About a mile off is the grave of the English pilot, Will Adams, who, arriving in the country in 1600, remained in the service of the shōgun, prospered, and died in 1620. Pop. (1894) 20,443.

J. M. DIXON.

Yolk, or **Yelk** [M. Eng. *yolke, yelke* < O. Eng. *geoloca, geoleca*, deriv. of *geolu*, yellow; Germ. *gelb*]; the food material stored up in the eggs of various animals. In contrast to the active protoplasm it is often termed deutoplasm. It consists of an albuminoid oily substance divided into globules, granules, or plaques, usually suspended in a network of protoplasm. In many eggs it is white or colorless and this is true of the yolk in the early stages of the formation of the eggs of birds. In these latter, however, it later assumes the yellow color to which the name is due. In other cases it may be red, green, purple, etc. Yolk is coagulated by heat and by various chemicals. Under the influence of protoplasm it is altered into protoplasm, and utilized in the

building up of the embryo. The amount and distribution of the yolk varies greatly in different eggs, and the early features of the development of the embryo are greatly modified according to these conditions.

J. S. K.

Yonge, *yūng*, CHARLOTTE MARY: novelist and miscellaneous writer; b. at Otterbourne, Hampshire, England, 1823; has published more than thirty novels, usually characterized by "High Church" religious tendencies, several works of history and biography, chiefly for the young, and some miscellaneous works, in all more than 100 volumes, not including those edited or translated. The most popular of her novels were *The Heir of Redclyffe* (2 vols., 1853; 17th ed., illustrated, 1868) and *Daisy Chain, or Aspirations* (2 vols., 1856; 9th ed., illustrated, 1868). The profits of the former were largely devoted to fitting out for Bishop Selwyn of New Zealand the missionary schooner Southern Cross, and those of the latter work, amounting to £2,000, were devoted to the erection of a missionary college at Auckland, New Zealand. Among her historical and miscellaneous books are *The Kings of England* (1848; 7th ed. 1862); *Landmarks of History, Ancient, Middle Ages, and Modern* (3 vols., 1852-57); *Camros from English History* (1868); *Stories of English History* (1874); *The Book of Golden Deeds* (1864); *The Book of Worthies* (1869); *The History of Christian Names* (2 vols., 1863); *The Story of English Missionary Workers* (1871); *The Life of John Coleridge Patteson, Missionary Bishop of the Melanesian Islands* (2 vols., 1873); *A Modern Telemachus* (1886); and *The Victorian Half Century* (1887). She was joint author, with Miss Elizabeth M. Sewell, of *Historical Extracts* (1868), and was the editor of *The Monthly Packet*. An illustrated edition of her more popular works was issued in 1888-89 (35 volumes).

Revised by H. A. BEERS.

Yonkers: city (officially named in 1788, incorporated as a village in 1855, chartered as a city in 1872); Westchester co., N. Y.; on the Hudson and Bronx rivers, and the N. Y. Cent. and Hud. River Railroad; 18 miles N. of the New York city-hall (for location, see map of New York, ref. 8-J). It has a frontage of more than 4 miles on the Hudson river, extends eastward for 6½ miles along the Bronx river, and is built on a series of terraces which rise from the Hudson to a height of 425 feet above tide-water. The city is noted for its beautiful residences and for its manufacturing interests. Among the notable buildings are the city-hall, formerly the Philipse Manor, built in 1752, and used for municipal purposes since 1868; the Leake and Watts Orphan Home; the Hebrew Home for the Aged and Infirm; and "Greystone," which was the suburban residence of Samuel J. Tilden. There are 25 churches, viz.: Methodist Episcopal, 5; Roman Catholic, 4; Presbyterian, 4; Baptist, 3; Protestant Episcopal, 4; Reformed, 2; Congregational, 1; German Lutheran, 1; and Jewish, 1. Public organizations include a Young Men's Christian Association, a Women's Christian Temperance Union, and the Woman's Institute for aiding self-supporting women. A public library is installed in the High School building, and near the city-hall is a soldiers' monument. The principal industries are the manufacture of carpets and hats (each having two large plants), elevators, refined sugar, maltine, tools, chemicals, and insulated goods, and the handling of grain, for which there is a large elevator. In 1895 there were 2 national banks with combined capital of \$250,000, 2 savings-banks, and 2 daily and 4 weekly newspapers. Pop. (1880) 18,892; (1890) 32,933; (1895) estimated, 35,000. EDWIN A. OLIVER, of "THE STATESMAN."

Yonne, *yon*: department of Northeastern France; on both sides of the river Yonne; area, 2,868 sq. miles. The soil is very fertile, producing wheat, many vegetables, and excellent wine. There are fine forests and pastures. Iron, ocher, marble, and lithographic stones are produced, and different kinds of manufactures carried on. Pop. (1891) 344,688. Capital, Auxerre.

Yoritomo, *yō re'tō'mō*: the personal name of Minamoto Yoritomo, one of the great warriors and statesmen of Japan; b. in 1146 A. D. When the Minamoto party was overthrown, Yoritomo, who was then an infant, was spared in the great massacre which followed. In 1180 he eluded the vigilance of his guardians, took up arms, and finally succeeded in 1185 in overthrowing the powerful Taira party. He was appointed shōgun in 1192, and became the real master of Japan, organizing the military feudalism which, superseding an officialdom after the Chinese model, lasted till 1868. Kamekura, 12 miles W. of Yokohama, became the seat of his government. D. in 1199.

J. M. DIXON.

York, or Yorkshire: largest county of England, extending along the North Sea from the mouth of the Tees in the north to the estuary of the Humber in the south, bounded by Westmoreland and Durham on the N., by Lancashire on the W., by Cheshire, Derbyshire, and Notts on the S., and Lincoln on the S. E. Area, 6,067 sq. miles. It is divided into three ridings—North, East, and West—each with its own lord-lieutenant, magistracy, and constabulary. Certain subdivisions of the county are known as shires, such as Hallamshire, Richmondshire, Allertonshire, etc. The surface is greatly diversified, but the soil is mostly fertile, and has been rendered still more productive by a most careful cultivation. The northern part is mountainous, and contains the highest mountains of England. Here are excellent pastures, rich mines of alum and lead, and extensive quarries of marble. The central part is a broad valley stretching from N. to S. and well suited for agriculture; wheat of superior quality is raised here. Extensive coalbeds are found in several places, and a manufacturing industry of the greatest importance is carried on in Leeds, Sheffield, and other large towns of the county. Pop. (1891) 3,208,812. Capital, York.

York (Lat. *Eboracum*): capital of Yorkshire, at the confluence of the Ouse and the Foss; 188 miles N. of London by rail (see map of England, ref. 6-1). It is one of the oldest and—on account of its monuments—most interesting cities of England. It is surrounded with walls, 2½ miles in circuit, dating mainly from the reign of Edward III., and is generally closely built, with narrow streets and curious, old-fashioned houses. Its cathedral, built from the eleventh to the fourteenth century, is one of the finest specimens of Gothic architecture in the world. It is built in the form of a cross, 524 feet long, 250 feet broad across the transepts, with a square, massive tower, 216 feet high, rising over the crossing, and two elegant towers, 201 feet high, flanking the western front. Many of its other churches and public buildings are also fine edifices. The castle, in which the assize courts are still held, dates from the reign of Edward I. The manufactures and trade of York are not important. It is the seat of the Archbishop of York, whose residence is at Bishopthorpe, a short distance from the city, while the old archiepiscopal palace, N. of the cathedral and built in the twelfth century, is used as a library. In the time of the Romans, York was the seat of the general government for the whole province of Britannia; Septimius Severus and Constantius Chlorus died here, and here Constantine the Great was proclaimed emperor. In the Saxon period it was the capital of Northumbria, and afterward of Deira, and in connection with the Scots and the Danes it offered a fierce resistance to William the Conqueror, who after taking it razed it to the ground. It was only partially rebuilt, and suffered much by fire in 1137. York returns two members to Parliament. Pop. (1891) 66,984. R. A. R.

York: town and port of entry; York co., Me.; on York river and Cape Neddick harbors, and the Boston and Maine Railroad; 9 miles N. E. of Portsmouth, N. H., 45 miles S. by W. of Portland, and 99 miles S. W. of Augusta (for location, see map of Maine, ref. 12-B). It is in an agricultural region, is a summer resort of considerable note, and has a public high school, 15 schools, 9 churches, a national bank with capital of \$60,000, and a weekly newspaper. It contains the villages of York, York Corner, York Beach, and Cape Neddick, and in 1894 had an assessed valuation of \$1,622,132. The town was formed from a portion of the territory granted by the Plymouth Council to Sir Ferdinando Gorges and John Mason in 1622. On Mar. 1, 1640, Gorges incorporated the territory of 21 sq. miles and its inhabitants into a body politic, which he named Gorgeana. This was the first grant of incorporation for a city in America. In 1649, on the death of Charles I., the inhabitants of Gorgeana city, Kitterytown, Wells, and the Isles of Shoals formed themselves into a confederacy, and in 1652 Massachusetts assumed control of the colony, revoked the city charter of Gorgeana, changed the name of the place to York, and incorporated it as a town, with limits about as at present. Pop. (1880) 2,463; (1890) 2,444; (1895) estimated, 2,600. EDITOR OF "COURANT."

York: city; capital of York co., Neb.; on the Burlington Route, the Fr., Elk, and Mo. Val., and the St. Jos. and Gr. Ind. railways; 50 miles W. of Lincoln, the State capital (for location, see map of Nebraska, ref. 10-G). It is in an agricultural region; contains York College (United Brethren), the school of the Holy Family (Roman Catholic, con-

ducted by the Ursuline Sisters), high school, several lower public schools, and 3 national banks with combined capital of \$150,000; and has a monthly, a daily, and 4 weekly periodicals. Pop. (1880) 1,529; (1890) 3,405; (1895) estimated, 5,200. EDITOR OF "TIMES."

York: city; capital of York co., Pa.; on the Codorus creek, and the North, Cent., the Penn., the York South., and the Balt. and Harris. (E. extension) railways; 28 miles S. E. of Harrisburg, 96 miles W. of Philadelphia (for location, see map of Pennsylvania, ref. 6-G). It is laid out in quadrangles designed to be 480 feet wide by 520 feet long, and has a slightly undulating surface and excellent drainage. There are three public parks, Center (containing 13 acres), Highland, and Farquhar. Local and suburban travel is accommodated by electric railway. The public buildings include the courthouse, county prison, almshouse, city hospital, alms hospital, U. S. Government building, Children's Home, four market-buildings, an opera-house, a Masonic Temple, and several public halls. The city has an abundant water-supply, gas and electric-lighting plants, and a thoroughly equipped fire department.

There are 44 churches, viz.: Lutheran, 9; Reformed, 5; Methodist Episcopal, 5; Presbyterian, 4; Baptist, 3; Evangelical, 3; Roman Catholic, 2; United Brethren, 5; Quaker, 1; Protestant Episcopal, 1 (begun in 1769); Moravian, 1; German Baptist, 1; Winebrennerian, 1; and Hebrew, 3. The public-school system comprises 11 school-houses (valued at \$201,000), 78 teachers, and 3,800 pupils, and the annual cost is \$60,000. The Collegiate Institute has an endowment of \$150,000, and property valued at \$100,000. York Academy was founded in 1787. There are 3 parochial schools, 2 Roman Catholic, and 1 Lutheran, with property aggregating \$10,000 in value. A free circulating library is maintained by St. John's church.

Business Interests.—In 1890 the census showed that 350 manufacturing establishments reported. These had a combined capital of \$3,842,453, and employed 4,120 persons, to whom \$1,609,456 was paid in wages. Materials were used that cost \$3,170,840, and the total output was valued at \$5,968,223. The principal industries were the manufacture of agricultural implements, passenger and freight railway cars, turbine water-wheels, rolled metals, ice machines and refrigerators, safes, electric-power machinery, wagons and carriages, wall-paper, iron, flour, candy, chains, crackers, carpets, cigars, and wire-cloth. There are 6 national banks with combined capital of \$1,450,000, a State bank with capital of \$100,000, 2 trust companies with capital of \$233,000, and a private bank.

History.—The borough was laid out in 1740; the first court of general quarter sessions was held in 1749; Congress sat here in 1777-78; the borough was created in 1787, and the city in 1887. Pop. (1880) 13,940; (1890) 20,793; (1895) estimated, 25,000. C. J. WOOD.

YORK, CARDINAL: See STUART, HENRY BENEDICT MARIA CLEMENT.

YORK, DUKES OF: a title often conferred upon younger sons of the Kings of England, some of whom have come to the throne through the decease of their elder brothers. The first duke was Edmund Plantagenet, fourth son of Edward III., and from him were descended the princes who, after the many vicissitudes of the Wars of the Roses, became kings under the titles of Edward IV., V., and Richard III. The title was held by Henry VIII. and Charles I. during the lifetime of their elder brothers, and by James II. until his accession to the throne. It was bestowed by the old Pretender upon his second son, Henry Benedict, known as Cardinal York, the last of his family, and was held successively by George I.'s brother, Ernest Augustus (d. 1728), by Edward Augustus (1739-67), brother of George III., and by the latter's second son, Frederick Augustus (1763-1827), who figured in the wars against Napoleon, and in 1795 was made commander-in-chief of the British army, but showed little capacity as a general. The title was revived in 1892, when it was conferred upon Prince George, second son of the Prince of Wales and heir to the throne by the death of the Duke of Clarence, his elder brother, Jan. 14, 1892.

York and Lancaster, Wars of: See ROSES, WAR OF THE.

Yorke: See HARDWICKE, EARLS OF.

York River: the tidal estuary of Mattaponi and Pamunkey rivers, which unite at West Point, Va., whence it extends eastward 40 miles to Chesapeake Bay. On York Spit, at its entrance, stands a lighthouse.

Yorkshire: See YORK.

Yorktown: capital of York co., Va. (for location of county, see map of Virginia, ref. 7-1); on York river, notable from the two sieges which it has sustained. Pop. (1890) 221. On Aug. 1, 1781, Lord Cornwallis posted himself here with a force of something more than 8,000 men, supported by several frigates and other vessels which were anchored in York river, fortifying his position by strong redoubts and batteries on the land-side, and by a line of batteries along the river; also strongly fortifying Gloucester Point on the opposite side of the stream. In the latter part of September the combined American and French forces under Washington and Lafayette, numbering about 16,000 men, invested Yorktown. On Oct. 9 the first parallel was established, and fire was opened, by which several of the British guns were dismantled, and on the following evening a frigate and three large transports were destroyed. On the 11th the second parallel was opened, and as the besiegers were annoyed by an enfilading fire from two redoubts, a successful attack was made upon them on the night of the 14th, and the captured works were included in the parallel. A large French fleet under Count de Grasse in the meanwhile prevented Cornwallis from receiving the re-enforcements which were sent to him by Sir Henry Clinton from New York. On the 16th he made an ineffectual sortie, and on the next day offered to capitulate. The terms having been agreed upon, on the 19th he surrendered his whole force, consisting of 7,247 regular troops, 840 sailors, with 235 guns. The entire British loss in killed, wounded, and missing was about 550; that of the Americans and French, about 300. This surrender virtually brought the war of the Revolution to a close.—The second siege of Yorktown was during the civil war. Gen. Magruder, with between 10,000 and 15,000 Confederates, had taken possession of the place early in the spring of 1862, and Gen. McClellan, advancing up the Peninsula with about 53,000 men reached Magruder's defensive line on Apr. 5, and thinking it too strong to be carried by assault, began his preparations for a siege. The Confederates were soon largely re-enforced by Gen. Johnston, who took the command, having in all about 53,000 men; the Union army was also largely re-enforced, reaching finally a strength of nearly 100,000 men. The besieging works were completed, and fire was to have been opened May 6, but two days previously Johnston secretly evacuated the works, carrying away everything worth taking, except the heavy guns.

Revised by JAMES MERCUR.

Yorkville: town; capital of York co., S. C.; on the Chester and Lenoir, and the Ohio River and Charleston railroads; 22½ miles N. of Chester, 84 miles N. of Columbia (for location, see map of South Carolina, ref. 4-D). It is in an agricultural and magnetic iron-mining region, and has 7 churches, 2 academies for males, public graded school, a State bank with capital of \$30,000, water-works, buggy, spoke, handle, saddle and harness factories, and a semi-weekly, a weekly, and a monthly periodical. Pop. (1880) 1,330; (1890) 1,553.

PROPRIETORS OF "ENQUIRER."

York von Wartenburg, -vår'ten-boörch, HANS DAVID LUDWIG, Comdt: field-marshal; b. at Potsdam, Prussia, Sept. 26, 1759; entered the army in 1772; was cashiered in 1779 for insubordination; served in the Dutch army in India 1783-84; re-entered the Prussian service as a captain, and was made a major-general in 1807, and governor of the province of Prussia in 1811. During the Russian campaign of 1812 he commanded the Prussian auxiliary corps in Napoleon's army, and concluded (Dec. 30, 1812) a convention with the Russians, according to which his corps remained neutral during the retreat. The Prussian king was compelled to denounce this convention for some time, but when Prussia soon after declared war against Napoleon, York's conduct was highly praised. He fought with great distinction in the campaigns of 1813-14, was made a count and field-marshal, and died at Kleinöls, near Breslau, Oct. 4, 1830.

Yoruba, yō-rōō'baá', or **Yarriba**: a region comprising about 19,000 sq. miles mostly undulating plain, in Northwest Africa, W. of the Niger river, and N. of the Bay of Benin. It was a powerful native kingdom until about 1825, and extended almost to the Bay of Benin, while to the E. and N. E. it reached the Niger. Much of the territory was lost in wars with the Fulbe of Gandu, and the complete disintegration of the kingdom resulted in splitting the country into independent districts, each under its own chief, and these political divisions still exist. Yoruba is one of the most

densely peopled parts of Africa. The population is estimated at 3,000,000, and there are a number of towns, of which Ibadan and Ojo are the most important, each containing from 50,000 to 80,000 inhabitants. The people are mostly of pure Negro blood, speaking a variety of dialects of their common language, most of them professing the Mohammedan faith, though in the southern part of the country Christianity has gained a firm foothold through the efforts of fifteen missionary stations. In no part of barbarous Africa is agriculture more highly developed, and in the early morning the roads leading to the towns are thronged with farmers carrying all kinds of farm-produce to market. Cloth-making and leather, iron, and other manufactures are far advanced, and in most respects Yoruba is completely self-sustaining and one of the most prosperous parts of Africa. The chief export is palm oil, and this trade has brought the natives into relations with the British at Lagos, who write of Yoruba as an appendage of their colony, though the influence of Great Britain has not yet (1895) been officially extended over the country.

C. C. ADAMS.

Yosemite (yō-sen'i-te) **Valley**: a region of remarkable scenic attraction, situated in the Sierra Nevada of California, about 150 miles in a direct line a little S. of E. of San Francisco. It was discovered in 1851, having been first visited by a party of settlers in the vicinity of the mining-camp of Mariposa while in pursuit of a band of Indians who had made themselves troublesome to the whites, and who were ascertained to have a stronghold in the mountains. The word *Yosemite* means "a full-grown grizzly bear," and was not the aboriginal name of the valley itself, but that of a noted chief.

The Yosemite valley is about midway between the east and west bases of the Sierra, which is here not far from 70 miles in width. It is a level area, about 6 miles in length, and from half a mile to a mile in width, and is sunk nearly a mile in depth below the general level of the adjacent region. It has very much the character of a gorge or trough hollowed in the mountains in a direction nearly at right angles to their general trend. The river Merced, which heads in the Sierra some 15 miles higher up than the head of the valley, runs through the Yosemite with many graceful windings. Two branches of the main Merced also enter the valley near its head: one, the Tenaya Fork, which rises in a beautiful mountain-lake of the same name, comes in from the N. E.; the other, the Hliouette, enters from the S.

In entering the Yosemite by the roads which approach it from the lower ends, the visitor notices that he has before him a valley of a different type of form from those he has before been accustomed to see. He passes from a V-shaped gorge or cañon, into one which may be fairly called U-shaped, since its walls rise almost vertically from its floor. This change of form is strikingly impressed on the visitor as he approaches what may be called the gateway of the Yosemite. Here he sees before him, on the north side of the valley, the mass of rock called El Capitan, and, exactly opposite, the Bridal Veil and Cathedral Rocks. At this point the distance across the valley is only a mile, measured from the summit of the Bridal Veil Rock to that of El Capitan, and at the base of these cliffs there is only just room for the river to pass. El Capitan is an immense block of granite projecting squarely out into the valley, and presenting two almost vertical faces which meet in a sharp edge 3,300 feet in perpendicular elevation. The sides or walls of this mass are smooth, and entirely destitute of vegetation. The most striking face of the larger Cathedral Rock is turned up the valley, but on the side facing the entrance there is a feature of great beauty—namely, the Bridal Veil Falls, made by the creek of the same name, which, as it enters the valley, descends in a vertical sheet of 630 feet perpendicular, striking there a pile of *débris*, down which it rushes in a series of cascades, with a vertical descent of nearly 300 feet more, the total height of the fall being 900 feet. When the stream is neither too full nor too low, the mass of water in its fall vibrates with the varying pressure of the wind, blowing in the daytime up the valley, fluttering and waving in a manner to justify the poetic name it now bears. There is also a charming fall, the Virgin's Tears, in a recess of the rocks opposite the Bridal Veil, and just below El Capitan. This is over 1,000 feet high. It runs, however, but a short time during the early summer months.

Passing up the valley after entering between the Cathedral Rocks and El Capitan, the level area or river bottom increases to nearly half a mile in width. This area is broken

up into small meadows, gay with flowers in the early summer, and sandier regions on which grow numerous pitch-pines (*P. ponderosa*) and some oaks, cedar, and firs. The walls of the valley continue lofty and broken into the most picturesque forms. Of these the Three Brothers and the Sentinel Rock are the most conspicuous. Nearly opposite the Sentinel Rock is one of the most attractive features of the Yosemite—namely, the fall made by Yosemite creek down the wall on the north side of the valley. There is first a vertical fall of 1,500 feet, then a descent of 626 feet in a series of cascades, and finally one plunge of 400 feet on to a low talus of rocks at the foot of the precipice.

At the head of the valley are the falls of the Merced river. There are two of them, with beautiful intervening rapids. The lower one is called the Vernal Fall, and is about 400 feet in vertical height. The upper, the Nevada Fall, is about 600 feet in elevation.

The dome-shaped masses of granite which characterize the vicinity of the Yosemite are also extremely grand. The North Dome, on the north side of the valley, lends itself to beautiful combinations of scenery, as seen from various points a little above the Yosemite Falls. The Sentinel Dome, on the opposite side, is not visible from the valley itself, but it affords a magnificent view from its summit of the valley and its surroundings, and especially of the High Sierras. A projecting cliff, called Glacier Point, a little lower than this, and just on the edge of the valley, is also much visited for the sake of the view which it offers of the whole region. The rock thus named is the highest point in the immediate vicinity of the Yosemite, rising to an elevation of 4,737 feet above the general level of the valley. The Half Dome fronts the valley of the Tenaya Fork of the Merced with a very steep slope, crowned by a vertical wall of fully 1,600 feet in elevation, forming a mass of imposing magnitude.

The Yosemite valley was given by Congress to the State of California in 1864, to be "held for public use, resort, and recreation," and to be "inalienable for all time." It is managed by commissioners appointed by the Governor. Wagon-roads have been made into the valley from its lower end and leading up the Merced river. These, however, have been built and are owned by private parties, and the same is true of the various excellent trails which have been built to afford access to Glacier Point, Union Point, and other elevations commanding remarkable views. The San Joaquin Valley and Yosemite Railroad, 22 miles long, extending from Berenda station, on the Central Pacific Railroad, to Raymond, where it connects with stage-line to Yosemite valley, was opened in 1886.

Revised by I. C. RUSSELL.

Youatt, WILLIAM: b. in England in 1777; was for many years professor in the Royal Veterinarian College, and proprietor and coeditor of *The Veterinarian*, established in 1828. He was the author of *The Horse* (1831), a standard work, of which two American editions have been published; *Sheep, their Breeds, Management, and Diseases* (1832); *Cattle, etc.* (1834); *The Dog* (1842); *The Pig* (1860); and *The Complete Grazier* (1864). D. in London, Jan. 9, 1847. Prof. Youatt's works are highly esteemed by stock-raisers in Great Britain and the U. S.

Youghal, yaw'äl: town; county of Cork, Ireland; on the estuary of the Blackwater, 27 miles by rail E. of Cork (see map of Ireland, ref. 13-E). It has a good harbor, admitting vessels of 400 to 500 tons, and a large export trade in agricultural produce. Here, according to local tradition, the first potatoes were planted by Sir Walter Raleigh, whose house is still preserved. Pop. (1891) 4,317.

Youmans, EDWARD LIVINGSTON, M. D.: scientist; b. at Coeymans, N. Y., June 3, 1821; studied chemistry, physics, and medicine, although, on account of a disease of the eyes which made him blind at times for many years, he could pursue his studies only by the aid of his sister, ELIZA ANNE YOU-MANS, known by her educational publications. Besides delivering scientific lectures before popular audiences during a period of fifteen years, he published *A Chemical Chart* (1850); *Class-book of Chemistry* (1852); *Alcohol and the Constitution of Man* (1854); *Chemical Atlas* (1856); *Hand-book of Household Science* (1857); *Correlation and Conservation of Forces* (1864); *The Culture demanded by Modern Life* (1867). In 1871 he founded the International Scientific Series (New York, London, Paris, Leipzig, St. Petersburg, and Milan), of which seventy-two volumes have appeared, and in 1872 he founded the *Popular Science Monthly*. D. in New York city, Jan. 18, 1887.

Revised by W. J. YOU-MANS.

Youmans, WILLIAM JAY, M. D.: editor; brother of Edward L. Youmans; b. at Milton, Saratoga co., N. Y., Oct. 14, 1838; studied chemistry in his brother's laboratory at Saratoga, N. Y.; spent one year under Prof. Joy in the laboratory of Columbia College, New York; took a special course of one year in the Sheffield Scientific School, New Haven, Conn.; took a full course in medicine at the University of the City of New York, graduating 1863; pursued the study of anatomy and physiology under Prof. Huxley in the Jermyn Street School of Mines, London; practiced medicine for three years in Minnesota; assistant editor *Popular Science Monthly* 1872-87, sole editor since; for many years has prepared the articles on chemistry, metallurgy, and physiology for Appletons' *Annual Cyclo-pædia*; edited Huxley's *Lessons in Elementary Physiology*, to which he added a second part on *Elementary Hygiene* (New York, 1867); revised and rewrote his brother's *Class-book of Chemistry* (New York, rev. ed. 1889); published *Pioneers of Science in America* (New York, 1895).

Young, ARTHUR: writer on agriculture; b. at Whitehall, London, England, Sept. 11, 1741; was in early life engaged in mercantile business at Lynn, which he abandoned for the pursuit of scientific agriculture; spent most of his life at Bradfield Hall, Suffolk; managed a large farm at Stamford Hall, Essex, 1765-70; traveled through most of the counties of England and Ireland in quest of information on the current methods of farming; made a careful tour through France for a similar purpose; wrote for the *Museum Rusticum* and for William Nicholson's *Journal of Natural Philosophy* (1792, seq.); edited the *Universal Museum*; was for some time parliamentary reporter for the *Morning Post* (1765, seq.); was engaged in practical husbandry from 1779; conducted through forty-five volumes the *Annals of Agriculture*, established by him in 1784 at Bury St. Edmund's, and issued at London after 1808, a publication to which George III. sometimes contributed under the name of Ralph Robinson; corresponded with Washington on agriculture, and was secretary to the board of agriculture from 1793 to his death, at London, Apr. 20, 1820. Among his many works may be specified the *Farmer's Letters to the People of England* (1768); *A Six Weeks' Tour through the Southern Counties of England and Wales* (1768); *A Six Months' Tour through the North of England* (4 vols., 1770); *The Farmers' Guide* (2 vols., 1770); *Rural Economy* (1770); *A Course of Experimental Agriculture* (2 vols., 1770); *The Farmer's Tour through the East of England* (4 vols., 1771); *The Farmer's Kalendar* (1771; 215th ed. revised by J. C. Morton, 1862); *Political Arithmetic* (2 parts, 1774-79; translated into several foreign languages); *A Tour in Ireland* (2 vols., 1780); *Travels, etc., with a View of Ascertaining the Cultivation, Wealth, Resources, and National Prosperity of the Kingdom of France* (Bury St. Edmund's, 2 vols., 1792-94; in French, Paris, 3 vols., 1794); *The Example of France a Warning to Great Britain* (1793); *An Essay on Manures* (1804); *The Progressive Value of Money as marked by the Price of Agricultural Products* (1812); and *The Rise of Prices in Europe, etc.* (1815). By order of the French Directory a collective edition of his agricultural works was published in French under the title *Le Cultivateur Anglais, etc.* (20 vols., 1800-01). Arthur Young was perhaps the most eminent of writers on agriculture, and his fame may be expected to increase for centuries to come. An edition of the *Travels in France with Life*, by Matilda Betham-Edwards, appeared in 1890, and an edition of the *Tour in Ireland*, by A. W. Hutton, with bibliography by J. P. Anderson, in 1892.

Revised by L. R. BAILEY.

Young, BRIGHAM: Mormon; b. at Whitingham, Vt., June 1, 1801; the son of a farmer; was educated in the Baptist Church, and trained as a painter and glazier, but joined in 1832 the Mormons at Kirtland, O., and started in 1835 on his first missionary journey. He was very successful as a preacher, and made many converts, being possessed of a peculiar but very impressive eloquence, and at the same time rose to the highest dignities and acquired an almost boundless influence within the sect by his energy and shrewdness, and by the power of his personality. After the death of Joseph Smith in 1844, he was chosen president of the church by the apostles, and in 1846 he led the host of the Mormons from Nauvoo across the prairies to Great Salt Lake valley, where he founded Salt Lake City in 1847. In Mar., 1849, a convention was held in that city, a constitution was framed, and a State was organized under the name of *Deseret*, which in the "reformed Egyptian" language is

said to mean the "Land of the Honey-bee." Congress refused to admit the new State, and organized the Territory of Utah, Brigham Young being appointed Governor. Conflicts soon arose with the Federal Government (see *UTAH*), but the U. S. officers were expelled from the Territory, and Brigham Young declared his intention to continue as Governor. In spite of the forcible measures which the Government took from time to time, he continued to wield an almost unlimited power as president of the church. On Aug. 29, 1852, he introduced polygamy as an institution, as the celestial law of marriage, and he carried it through in spite of considerable resistance from a division of the church itself. In 1871 he was indicted for polygamy, but was not convicted. D. at Salt Lake City, Aug. 29, 1877.

Young, CHARLES AUGUSTUS, Ph. D., LL. D.: astronomer; b. at Hanover, N. H., Dec. 15, 1834; graduated at Dartmouth College 1853; was assistant teacher in Phillips Academy, Andover, Mass., 1854-55; studied theology in Andover Seminary 1855-56; was Professor of Mathematics and Natural Philosophy in Western Reserve College, Ohio, 1856-66; was called in the latter year to the professorship of Natural Philosophy and Astronomy at Dartmouth, a chair which had been filled by both his father and his grandfather, Prof. Ebenezer Adams; and in 1877 to the chair of Astronomy at the College of New Jersey, at Princeton. Prof. Young was the discoverer, associated with Harkness, of the spectrum of the corona in 1869, in 1870 of the reversal of the solar spectrum by the lower strata of the sun's atmosphere, and in 1872 of the presence of sulphur, cerium, and strontium in the sun by observations upon the spectrum of the chromosphere, made at Sherman, Wyo., at an elevation of 8,000 feet. He was chosen an associate fellow of the American Academy of Arts and Sciences at Boston in 1871, a member of the National Academy of Sciences in 1872, and in that year was also elected a foreign associate of the Royal Astronomical Society of Great Britain. Prof. Young is the author of numerous published papers on science, of *The Sun* in the International Scientific Series (New York, 1882), and of *A Text-book of General Astronomy* (Boston, 1888).

Revised by SIMON NEWCOMB.

Young, EDWARD: poet; b. at Upham, Hampshire, England, in 1684; educated at Winchester School and at Corpus Christi College, Oxford; obtained a law fellowship at All Souls' College, Oxford; took there the degree of doctor of laws 1719; took orders in the Church of England 1727; was appointed a royal chaplain 1728; became rector of Welwyn, Hertfordshire, 1730; married a daughter of the Earl of Litchfield 1731; and was appointed clerk of the closet to the princess-dowager of Wales 1761. D. at Welwyn Apr. 12, 1765. He published, among other things, a number of tragedies—*Busiris* (1719), *The Revenge* (1721), etc.; a collection of satires, *The Love of Fame* (1725-28), and many other poems and miscellaneous writings; but is best remembered by his gloomy and didactic religious blank-verse poem *Night Thoughts* (1742-46), once very popular and still extensively quoted. His collected works in 4 vols. were published in 1762.

Revised by H. A. BEERS.

Young, JAMES, LL. D., F. R. S.: b. at Glasgow, Scotland, July 14, 1811; was in early life a joiner; attended the chemical lectures of Prof. Thomas Graham at the Andersonian Institution; was his assistant, first in Glasgow and afterward at University College, London, 1832-38; was employed in a scientific capacity in Muspratt's chemical works at Newton 1838-42, and in Tennant's works at Manchester 1842-46; analyzed about 1847 the petroleum found in a spring in a coal mine in Derbyshire; obtained from it a lubricating oil for machinery and a lighter oil for burning in lamps; was led thereby to undertake the slow distillation of coal by a process for which he took out a patent, thus created a new and important industry, permanently cheapening the price of light; established coal-oil works at Bathgate, and subsequently at Addiewell, Scotland; acquired a large fortune, and contributed indirectly to the rise of the vast petroleum industry in the U. S.; gave £10,000 for the endowment of the chair of Chemistry in the Andersonian Institution, Glasgow; erected a bronze statue to Prof. Graham at Glasgow, and sent out at his own expense in 1872 an expedition to Central Africa in search of his intimate friend, Dr. Livingstone. D. May 13, 1883.

Young, JOHN RUSSELL: journalist; b. at Downingtown, Pa., 1841; educated at high school, New Orleans; was compositor, reporter, and news-editor and, 1861-64, war correspondent on the Philadelphia Press. Attracting the atten-

tion of Horace Greeley, he was offered a position on *The New York Tribune*, which he accepted in 1865, and became managing editor. He started the *New York Standard* in 1869, joined the *Herald* staff in 1872, and traveled as special correspondent of that paper with Gen. Grant around the world, about which journey he wrote a book. He was U. S. envoy extraordinary and minister plenipotentiary to China in 1882-85. He resides (1895) in Philadelphia, and is president of the Union League Club of that city.

Young Men's Christian Associations: societies of young men, with a basis of specific Christian principles, working by methods consistent with the same for the physical, social, mental, and spiritual improvement (a) of their membership and (b) of young men in general.

Various societies of young men more or less akin to these associations have existed at different times since early in the seventeenth century. Some in England and also in the U. S. acquired a degree of importance, but they were generally short-lived. In a few instances organizations claiming an existence prior to or independent of the London movement subsequently became affiliated with it. This was true of the German *Christliche Jünglingsvereine*.

In 1841 George Williams, a devout and active young Christian, then in his twenty-fourth year, removed from a provincial town to the English metropolis and became a clerk in a large dry-goods house. He soon began a quiet but earnest effort among his companions, nearly all of whom were irreligious, and many very profligate. Numbers were led into the Christian life, the good influence spread to other houses, and June 6, 1844, an organization was effected under the name of Young Men's Christian Association. To the meetings for prayer and Bible study were soon added the library and reading-room and courses of lectures; a secretary was employed, and branches were formed both in the metropolitan districts and in other cities of Great Britain. Christian travelers brought into contact with the London association scattered the seed in other countries; especially was this done in connection with the Industrial Exposition of 1851, soon after which these societies began to spring up not only in Europe, but also in America and Australia. The total number of associations in the world is now 5,289, distributed as indicated in the following.

GREAT BRITAIN AND IRELAND.—Twenty years after the founding of the London society the associations in the United Kingdom numbered 160. The first conference of British associations was held in 1858; the first association building was erected in 1866; the first district union was formed in 1867; the first traveling secretary was appointed in 1868. A national union for England and Wales was formed in 1882. Scotland and Ireland have also each a general organization, the first formed in 1874, the latter in 1884. Twenty-four representatives from these three autonomous executives, twelve from the first named and six from each of the other two, constitute the British committee, which supervises all general matters in the United Kingdom and represents the associations in their foreign relations. A British conference is held annually. Each national union is subdivided into district unions. More rapid progress has been made since the general organization was effected, as is indicated by the following comparative figures:

ENGLAND, IRELAND, AND WALES.	1883.	1893.
Number of associations.....	188	405
Active membership.....	17,618	33,563
Associations owning buildings.....	19	80
Valuation of buildings.....	£153,637	£397,695
Annual current expenses.....	£31,013	£72,565
Reading rooms and libraries.....	27	552
Gymnasiums.....	9	91
General secretaries.....	45	63
Weekly religious meetings.....	493	848

Scotland has 246 associations, with a membership of 25,500. Twenty-five associations own the premises they occupy. A traveling secretary was placed in the field in 1880.

THE CONTINENT OF EUROPE.—Between the years 1806 and 1841 a number of *Christliche Jünglingsvereine* came into existence in Germany. They were little more than bands of young men united for prayer, Bible study, and mutual encouragement in the Christian life, and usually if not always in connection with an individual church. Later, under the influence of the London movement, and especially after the first world's conference (Paris, 1855), new organizations sprang up in the various countries, and all accepting the

Paris "Basis" became affiliated through the *Conférence Universelle*. A large number of the European societies are still very limited as to both methods and appliances, resembling the earlier *Jünglingsverein*. In the chief centers, however, such as Paris, Berlin, Geneva, Stockholm, etc., a broad and progressive work has been established, and this is gradually influencing the work throughout the Continent.

Germany.—Previous to 1841 the *Christliche Jünglingsvereine* had been organized in perhaps a score of German towns. The number increased, and in 1848 the first district union (*Westdeutscher Bund*) was formed with Elberfeld as its center. The eighth of these unions was formed in 1890. In 1883 a new and broader form of organization (*Christliche Vereine Junger Männer*), resembling the American associations, was started in Berlin. This has since spread to other cities, and its methods have been adopted by many of the older societies. The German associations were united in a national alliance in 1882. There are 1,180 organizations with a membership of 64,362; forty own buildings.

Switzerland.—The Swiss associations form two independent unions, the German and the French. Each union is divided into cantonal organizations, and these into districts, and again into groups. The national gathering of the German union is biennial, that of the French triennial. Excepting a few of the *Christliche Jünglingsvereine*, the Swiss associations do not date earlier than 1850, and increased but slowly for the first decade. The two unions aggregate 399 associations with 7,200 members; there are seven buildings and ten employed secretaries.

France.—At the close of 1852 perhaps a dozen associations existed in the south of France. The first world's conference, meeting in Paris in 1855, gave a new impetus to the French societies, and they increased in number and strength. The present national alliance was formed in 1867. In 1893 the Paris association entered its new building, adapted to the advanced methods of work. Several other cities are also aggressive centers. The French associations number 128, divided into seven groups. A national traveling secretary was placed in the field in 1893.

Holland.—An association was formed in Amsterdam in 1851. Two years later the seven societies then in existence were federated in the *Neederlandsche Jongelings-Verbond*. In 1861 a traveling agent was appointed. Besides the 195 associations with a membership of 5,500 in this federation, there are three independent or denominational alliances, which aggregate 550 societies and 12,000 members.

Belgium.—The first association was formed in Brussels in 1853. The first general conference met in 1859, when the eight societies represented formed a Belgian alliance. The Belgian associations number 35, with 851 members.

Sweden.—An attempt was made to establish associations in Sweden in 1852, and again in 1876, the latter effort being for a time successful; but the existing movement began with the organization of the Stockholm association, in 1884, after the model of those at Paris and Berlin. At a conference held in 1888 a Swedish alliance was formed, and a national committee constituted. There were at this time twenty associations and 600 members. Later in the same year the meeting of the world's conference in Stockholm greatly promoted the Swedish work. The number of associations has increased to 52, with a membership of 4,560.

Norway and Denmark.—A Norwegian student brought in contact with the associations in Germany on returning formed an organization in Stavanger in 1868, and the year following, another in Christiania. In 1880 representatives from twelve societies met and formed a national alliance. Since 1889 a traveling secretary has been employed. The national conference meets triennially. There are also annual district meetings. The associations number 185, with 11,000 members. They own twelve buildings valued at 450,000 francs, and employ three secretaries. In 1890 the associations of Norway and Denmark united in a Dano-Norwegian alliance. The Danish associations, which date from 1878, number 135, and have a membership of 4,000.

Italy.—Between 1850 and 1853 a number of associations were organized in the Vaudois valleys, and in the latter year they met and formed a general organization. An association in Venice has recently celebrated its twenty-fifth anniversary. Most of the present organizations, however, date from 1880 and later. In 1887 representatives from thirty associations met in Florence and formed a national alliance. The 5 groups aggregate 50 organizations, with 1,500 members.

Other European States.—At Budapest, in *Hungary*, an

association was formed in 1850. Six have since been added, the total membership being 270. St. Petersburg, *Russia*, has maintained an association since 1868. The whole number of organizations, including the Finland group, is 17 with 1,070 members. *Spain* has 7 small associations, the first organized in 1871. The first association in *Austria* was formed at Vienna in 1873. A second has been organized in the same city, and there are 9 in Bohemia, 4 in Moravia, 1 in Styria, with a total membership of 430. There is a single association in *Turkey*, at Constantinople, 1 at Samokov, in Bulgaria, 1 in the island of Malta, and 1 at Gibraltar.

ASIA.—The association not being a pioneer agency, and only following the Church, is confined to Christian countries and mission lands. In the latter it is brought in only as desired by the missionaries and as auxiliary to their work. There are some forty associations scattered among the mission stations of Syria, Persia, and Asia Minor. Eight or ten organizations are also connected with the various missions in China.

India.—Associations were first formed in Trivandrum (1870) and Bombay (1875). Model associations have been organized at several centers, a national committee has been formed, and annual conferences are held. There are 78 associations and nearly 4,000 members, largely Indian young men. In the island of *Ceylon* there are 17 associations, the first having been formed in Colombo in 1882.

Japan.—An association was started in Tokio in 1880, and others soon followed. The work was greatly promoted by the visit in 1884 of an agent of the world's committee, and the subsequent residence in Tokio of a secretary of the American committee. Since 1889 a summer school has been held, with an average attendance of 500. A national union was formed in 1893. The Tokio association has a fine building that cost \$50,000. The general secretary and the entire directory are Japanese laymen. There are 35 associations affiliated with the Tokio movement, including fifteen in Government schools.

AFRICA.—An association has been in active existence at Cape Town since 1855. There are some 20 organizations in South Africa, five own buildings, one has a paid secretary. There are also 3 associations in Egypt, 2 in Madagascar, and 1 each in Algeria, Morocco, and Guinea.

OCEANICA.—Associations were formed at Sydney, in Australia, and Auckland, New Zealand, in 1855. The associations in this group number 23, with 4,500 members. Four own buildings and employ secretaries. An intercolonial organization and an annual conference are maintained. At Honolulu, Hawaii, an association was formed among the foreign young men in 1869. It has a good building and a paid secretary. A number of organizations exist among the natives and one each among the Chinese and the Japanese. There is also an association among the lepers on Molokai, for which a building has recently been erected.

AMERICA.—Although young men's religious societies existed in North America more than 200 years ago, the Young Men's Christian Associations are a direct outgrowth from the London movement of 1844. With the exception of less than a score of societies in South America and the West Indies, the associations of the continent—embracing those of the U. S., Canada, and Mexico—form one affiliated body under supervision of the American international committee. The English-speaking peoples have always led in the work of these societies, and nowhere has there been such rapid development and breadth of scope as in North America.

The first American associations were organized in Dec., 1851, at Montreal and Boston; some 24 were added during the next two years, and by the end of the decade the number had reached 200. The first convention met in Buffalo, N. Y., June 7, 1854, 19 of the then 39 associations sending delegates. Its action resulted in a confederation, with a central committee and an annual convention, this form of affiliation continuing until the civil war. The war greatly depleted the membership, and such organizations as survived were chiefly employed in aiding their fellows in the army. At a special convention of the associations in the Northern States, held in New York, Nov., 1861, the U. S. Christian Commission was formed—an organization which, receiving the support of the general public, sent 5,000 Christian helpers to the camps and hospitals, and distributed over \$5,000,000 in money and stores. With the close of the war the reorganized work grew rapidly; errors and crudities disappeared with riper experience, and advanced ideas and better methods prevailed. The prejudices inci-

dent to a new movement also died out, and the associations were acknowledged to be "the Church at work interdenominationally, and, through its laymen, by and for young men." The evangelical test of active membership, a definite and all-round work, the ownership of carefully planned buildings, the employment of trained officers, systematic effort for special classes of men, a strong central committee for general supervision, with similar supervisory organization for individual States and Provinces, and great emphasis on the Bible and personal work were among the features adopted, developed, specialized, each contributing to the marvelous growth and efficiency of the following decades.

The General Work.—The American international convention is held biennially, every association being entitled to representation on the basis of its active membership. A central board, incorporated as the "international committee," is elected by the convention, one-third every two years, its headquarters and a working quorum being located in New York. The committee's executive force includes a general secretary, with twenty-five field, department, and office secretaries. It has also eight secretaries in foreign mission lands.

State and provincial organizations supplement in their several fields the work of the international committee. Called into existence by the Albany convention of 1866, there are now 36, embracing 50 States and Provinces; their executive committees number 750 members, with 60 traveling and office secretaries. Thirty conventions are held annually, attended by from 5,000 to 7,000 delegates. A well-organized State is divided into a number of districts, each with its committee, an annual conference, and corresponding members in non-association sections. The annual expenditures of the international and State committees aggregate \$200,000.

The Local Work.—The local association has absolute autonomy, except that to affiliate with the American international convention there must be constitutional provision restricting active (voting and office-bearing) membership to men in communion with an evangelical church. A typical American association may be thus described: (1) Membership—(a) *active*, Christian young men who constitute the working force; (b) *associate*, young men of good moral character. There are 1,430 associations and 250,000 members, over one-half being associates. Thousands of non-members in every city also come in contact with the helpful agencies of the organization. (2) An incorporated board of management, officers, and system of committees. The members of these boards and committees number 37,000. (3) A paid secretary, as executive officer, and fitted for the position by Christian and business character, tact, and technical training. His chief province is to supervise and develop. Often one or more assistants are required. There are 1,200 of these officers in local fields. An international and many State conferences are held by them annually for the discussion of methods. Two well-equipped training-schools are also in operation, at Springfield, Mass., and at Chicago, Ill. (4) A specially constructed building, with focal reception-room, reading-room, library, parlor, recreation-room, offices, educational class-rooms, gymnasium, including bowling-alley, baths, and dressing-rooms, rooms for boys' department, kitchen, and janitor's quarters. There are 305 buildings, many of them elegant and complete in their appointments, the total value of real estate being over \$17,000,000. (5) Organized departments: (a) *Business*, general supervision, membership; (b) *Religious*—Bible and workers' training-classes, evangelistic and devotional meetings, work in behalf of personal purity, temperance, etc., systematic invitation work, distribution of religious literature, and a specially emphasized personal work. There is also a worldwide observance of an annual week of prayer in November. (c) *Educational*—library and reading-rooms, evening classes in commercial, industrial, scientific, literary, political and social-economic subjects, literary societies, and lectures. (d) *Physical*—gymnasium, athletic games, cycling, boating, swimming, etc., with instructors qualified to make physical examinations and prescribe and direct safe and beneficial exercise. Athletics are conducted in connection with an international athletic league. Emphasis is given to an all-round work, and on a scientific basis, as against specialties, and the associations lead all other organizations in the line of physical culture. (e) *Social*—a pleasant resort with companionable supervision, music, recreative games, social gatherings and entertainments, combining the attractions and the restraining influences of a Christian home. (f) *Information and relief*—

employment bureau, boarding-house register, savings fund, medical club, visitation of the sick. (g) A work more or less complete along all these lines for boys.

The following are statistics of the associations in North America, and relate exclusively to work for young men: Religious—610 associations report 27,710 Bible class sessions, with a total attendance of 282,176; 448 report 13,910 Bible training-class sessions, with a total attendance of 119,950; 1,093 report 67,612 religious meetings, with a total attendance of 2,913,770. Secular—639 associations report an average daily attendance at rooms of 71,965; 840 report reading-rooms; 676 report libraries, containing 500,000 volumes, and valued at \$422,536; 349 report educational classes, with 22,800 different students and 955 teachers; 230 report literary societies, with a total average attendance of 5,200; 568 report 5,062 lectures, etc.; 897 report 4,292 social entertainments; 493 report gymnasiums, 316 other means of physical culture. For current expenses 1,030 associations expend \$2,250,240. Careful management and the amount of volunteer labor afforded yield large returns for the financial investment.

Work among Special Classes.—At first a work among merchants' clerks, with only moral and religious aims and few attractive appliances, the organization has so grown and widened in scope that, with its present equipment and versatile and flexible methods, it is able to touch young men of every class and on all sides of their nature. This is shown in the physical department with its broadly adaptive recreative, hygienic, and educative features, and in the evening classes, aggregating seventy-five lines of study, including the rapidly developing industrial work which is interesting large numbers of young mechanics. It is still more forcibly illustrated in the evolution of such strikingly dissimilar departments as the college and the railway work.

Work among College Students.—The present movement began in 1877, at which date there were a few college associations, but little activity or uniformity in methods, and no intercollegiate relations. Under the new international supervision the organizations have increased to more than 500, including the leading state and denominational schools, and, with a membership of over 33,000, form the largest college fraternity in the world. The associations are strongly knit together by a system of correspondence, visitation, and conferences, and are working with a definite and thoroughly outlined plan. Many convenient buildings are being erected for their use, and the larger societies employ a general secretary. Several men also give their time to this department in connection with the international and State committees. Summer schools are held for the study of the Bible, missions, and association methods, and through series of presidential and deputation conferences men are trained for leadership and visitation work. The student class in large cities is affiliated through an intercollegiate organization connected with the city association.

Among important outgrowths of this work are: (1) The summer schools, or Bible conferences, beginning in 1885, and spreading from Northfield over many lands. (2) The student volunteer movement, through which many have pledged themselves to foreign mission work, and more than 700 are already on the field. (3) The foreign work of the American committee, placing experienced secretaries at strategic centers to establish model associations and train native Christians for association work. Eight men have been sent out for this purpose to Japan, India, China, and South America. (4) The spread of affiliated Christian work to the colleges of other lands; the attendance of students from foreign universities at Northfield, and several tours of visitation abroad by college secretaries of the American committee have contributed to the establishment of the intercollegiate movement in Great Britain and to more or less progress toward organization in Germany, Switzerland, France, Scandinavia, India, Japan, and South Africa. The introduction of the English Bible as a department of study in colleges, the drawing of more students into distinctively religious callings, an impetus to Bible study, and a greatly increased religious activity among college students are among the direct local results.

Work for Railway Men.—Originating in 1872 and passing slowly through the experimental period, this work has developed into over 100 organizations at railway centers, with nearly 25,000 members, 126 employed officers, 3,000 men on working committees, and an annual current expenditure of \$215,000. Nearly 40 buildings are either owned by them or set apart for their use. The corporations

contribute generously both to building funds and current expenses, and in every way promote and encourage the work. Ordinary methods, which are all well represented, are supplemented by certain distinctive agencies—rest-room and baths (day and night), lunch-counter, instruction in "first aid," emergency hospital, visits to sick and injured, and railway library. Membership tickets are reciprocal. Three international secretaries give their entire time to the supervision and extension of the department.

Associations of German-speaking young men have been formed in several cities having a large German population. There are in all 12 such associations and 8 well-equipped buildings. An agent for work among colored young men was placed in the field in 1879, since which 49 associations have been established, 29 being in colleges. The total membership is 2,800. The first association among the American Indians was organized by the Dakotas in 1877. The number has increased to 40, 4 of which are in Indian schools. An educated Sioux is the international secretary of the department. Work is also carried on among lumbermen, sailors, and soldiers, etc.; also among destitute young men in the large cities and the male inmates of hospitals, prisons, and reformatories. The associations are alert to enter any field where they can be helpful to young men; as far as practicable men are reached through members of the association of the same class or employment.

THE WORLD'S COMMITTEE.—The first world's conference was held in Paris in 1855, at which was adopted the basis on which the associations of all lands have since affiliated: "The Young Men's Christian Associations seek to unite those young men who, regarding Jesus Christ as their God and Saviour, according to the Holy Scriptures, desire to be his disciples, in their doctrine and in their life, and to associate their efforts for the extension of his kingdom among young men." Similar conferences have since been held, triennially as a rule, in the capitals of Europe. In 1878 there was constituted a "central international committee," composed of representatives from all the affiliating national organizations, and with its executive quorum resident in Geneva, Switzerland.

The thirteenth world's conference was held in London in June, 1894, coincident with the fiftieth anniversary of the association of that city, the pioneer organization. Two thousand delegates were present, representing twenty-six nationalities. Among the civic and religious functions were an official reception at the Guildhall; public services at St. Paul's Cathedral and Westminster Abbey, with sermons by the Bishops of London and Ripon; a reception at Royal Albert Hall; and an excursion to Windsor. George Williams, the founder, was knighted by the Queen, and voted the freedom of the city by the London council. Commemorative services were held in nearly 1,500 Anglican and Nonconformist churches of Great Britain.

HENRY S. NINDE.

Young People's Society of Christian Endeavor: See CHRISTIAN ENDEAVOR.

Youngstown: city; capital of Mahoning co., O.; on the Mahoning river, and the Erie, the Lake S. and Mich. S., the Penn., the Pitts. and Lake Erie, and the Pitts. and West. railways; 67 miles S. E. of Cleveland, and the same distance N. W. of Pittsburg, Pa. (for location, see map of Ohio, ref. 3-J). The business portion of the city lies in a valley on the north side, and the residential streets extend up and beyond the surrounding hills on both sides of the river. The most attractive residence thoroughfare is Wick Avenue. Two public parks are (1895) in process of development; one, Wick Park, a natural grove of 48 acres in the northern part of the city, presented by the Wick family; the other, Mill Creek Park, comprising 460 acres, and containing Mill Creek, with the valley, bluffs, and ravines on both

sides, from its mouth to Mahoning Falls, a distance of more than 3 miles. The city derives its supply of water from the river, and has good sewerage, gas and electric-light plants, and an electric street-railway traversing the business section, extending from the suburb of Brier Hill on the W. to Haselton on the E., and making the circuit of the north and south sides. For manufacturing purposes, coal from near Pittsburg is used, and for domestic purposes, natural gas from Allegheny and Washington cos., Pa. The notable buildings are the county court-house, city hospital, Public Library, Y. M. C. A. building (cost \$90,000), jail, opera-house, and hotels.

Youngstown has 42 churches, viz.: Methodist Episcopal, 10; Presbyterian, 5; Roman Catholic, 5; Baptist, 4; Lutheran, 4; Protestant Episcopal, 3; Congregational, 2; Disciple, 2; Reformed, 2; Swedish, 2; Hebrew, 2; and Evangelical, 1. There are 26 public-school buildings, with over 100 teachers and 6,000 pupils, the Rayen High School with large endowment, 5 Roman Catholic parochial schools, 3 Lutheran parochial schools, several business colleges, private and free kindergartens, and classes for self-supporting women maintained by the Women's Industrial and Educational Union.

In 1894 the municipal receipts were \$234,368; disbursements, \$200,828; the assessed valuation was \$13,314,710; net debt, \$429,096; value of water-works, owned by the city, \$750,000. In 1895 there were 5 national banks with combined capital of \$1,429,000, and a savings-bank with capital of \$90,000. The total deposits were \$3,900,000; loans, \$4,700,000.

In 1890 the census showed that 245 manufacturing establishments reported. These had a combined capital of \$7,542,742, and employed 5,843 persons, to whom \$3,607,659 was paid in wages. The total output was valued at \$14,667,260. The city has large wholesale and retail mercantile establishments foundries, machine-shops, lumber-yards, flour-mills, bridge, ear, tube, and boiler-works. Its principal industry is the manufacture of iron. The annual capacity of 5 blast furnaces is over 320,000 tons, and of 6 rolling, puddling, and finishing plants, 981,000 tons. In 1895 there were 86 incorporated companies in the city, with aggregate capital of \$14,377,900.

The site of the present city and township of Youngstown was purchased from the Connecticut Land Company in 1800 by John Young, who settled there in 1799. The first rolling-mill (the second in the State) was erected in 1845-46, and the first furnace in 1846. Pop. (1880) 15,435; (1890) 33,220; (1895) estimated, 43,000.

SARAH J. PETERSON.

Young Women's Christian Associations: organizations devoted to the physical, social, intellectual, and spiritual development of young women. The first of these associations was founded in London, England, in 1855. In the U. S. they were the outgrowth of the Ladies' Christian Union established in New York in 1858. The object of this organization was to further the welfare of women, especially of young women dependent on their own efforts for support. To attain this it was designed to form an association on the model of the Young Men's Christian Association, and an attempt was made in Boston in 1859, but the opposition of members of the clergy, who feared that the creation of this new field of activity would withdraw the energy of young people from church work, discouraged the originators of the plan, and nothing was done until 1866, when a Young Women's Christian Association was founded in Boston—the first association organized under that name. By 1871 there were in the U. S. three organizations bearing that name and twenty-seven with other names, mostly Women's Christian Associations, all doing kindred work. In that year, in order to give mutual encouragement and promote harmony of action, there was instituted the practice of holding biennial conferences which have met regularly since that date. The conference of 1879, at which delegates from Canada and Europe were present, adopted the name of International Conference, which has since been changed to the International Board of Women's and Young Women's Christian Associations; but this body has merely a deliberative character and exercises no control over the individual associations. It admits as members all organizations for improving the condition of women, especially those who are self-supporting.

There is also a distinct organization of Young Women's Christian Associations that originated in the colleges. In Nov., 1872, the first college Young Women's Christian As-

sociation was organized in the State Normal University, Normal, Ill., and by 1885 there were about one hundred associations in various colleges in the U. S., under nine state organizations. A national organization was formed in 1886, and in 1889, on the union with Canadian associations, this was merged into the International Association of Young Women's Christian Associations, which holds biennial meetings and extends its membership to any association in either city or college which does a work for and by young women, and whose voting and office-holding membership is composed of women who are members of Protestant Evangelical churches. Young Women's Christian Associations have been established in several European countries, and in 1892 a world's committee was organized with its headquarters in London. In the latter city, in 1894, the membership of the associations was estimated at 14,000.

While at first the work of the organizations was modeled on that of the Young Men's Christian Associations, it was soon found that among women the requirements were more varied. A valuable and important feature of their work is the maintenance of boarding-homes for young women. In addition to these, the city associations have gymnasiums, educational classes, entertainments, lectures, employment bureaus, and other means for promoting the intellectual and social interests of their members. Since their foundation they have increased steadily in number. In 1895 there were about eighty associations represented in the International Board of Women's and Young Women's Christian Associations, and their membership was estimated at 23,000. In the International Association of Young Women's Christian Associations in 1895 there were 61 city associations, 280 college associations, and the total membership was over 24,000.

Ypres, *ce'p'r*: town; province of West Flanders, Belgium; on the Yperlee; 30 miles S. S. W. of Bruges by rail (see map of Holland and Belgium, ref. 10-B). It was in the fourteenth century one of the leading manufacturing centers of Europe, and had about 200,000 inhabitants. A splendid monument of that time is the cloth-hall, a large structure in Gothic style, built in the thirteenth and fourteenth centuries, and now occupied by different public establishments. In the sixteenth century Ypres began to decline, and its present manufactures, though very varied, comprising linen, woolen, cotton, and silk, lace, and ribbons, oil, soap, salt, and leather, are comparatively of little consequence. Its former fortifications are now dismantled and transformed into promenades. Pop. (1891) 16,505.

Ypsilan'ti: city (site of Indian trading-post in 1807, located in 1824, chartered as a city in 1858); Washtenaw co., Mich.; on the Huron river, and the Lake S. and Mich. S. and the Mich. Cent. railways; 8 miles S. E. of Ann Arbor, 30 miles W. by S. of Detroit (for location, see map of Michigan, ref. 8-I). The city is laid out chiefly in regular squares, is on both sides of the river, and owns the water-works and electric-light plant. A peculiarity of the water system is the use of an elevated tank with capacity of 250,000 gal., instead of the usual stand-pipe. The tower is of stone and the tank of steel. There are 10 churches and places of worship, State normal school, St. John's Academy, 4 public schools, business college, a national bank with capital of \$75,000, a State bank with capital of \$50,000, and 3 weekly newspapers. The manufactures include underwear, paper, tags and labels, flour-mill machinery, agricultural implements, pumps, and sash, doors, and blinds. In 1895 the city had an assessed valuation of \$2,420,000, and a bonded debt of \$148,500, all of which, excepting \$19,500, was for its water-works and lighting-plant. Pop. (1880) 4,984; (1890) 6,129; (1894) State census, 6,111. EDITOR OF "SENTINEL."

Ypsilanti: name of an illustrious Greek family of princely rank, descendants of the Comneni of Trebizond and prominent as champions of the emancipation of Greece. (1) **ALEXANDER**: statesman; b. at Constantinople 1725; hospodar of Wallachia 1774-82, and again 1796-98, and of Moldavia 1784-92. Executed, for treason, at Constantinople in 1805.—(2) **CONSTANTINOS**: statesman and writer; son of (1); b. at Constantinople, 1760; hospodar of Moldavia 1799-1801, and of Wallachia from 1802 to 1806, when he was removed on account of his Russian proclivities. Soon reinstated, he was forced to flee to Russia in 1808, and died at Kiev in 1816. He was an able linguist and prolific writer. He left eight children.—(3) **ALEXANDER**: revolutionist; son of (2); b. at Constantinople, Dec. 12, 1792; served in the Russian army and lost his right hand at the battle of Dresden (1813); was made adjutant to Alexander I. and major-

general in 1817. In 1820 he was chosen chief of the *hetaria*, a secret association, the object of which was the liberation of the Greeks from the Ottomans. He invaded Moldavia with a force of Greek and Russian volunteers, but was entirely defeated at the battle of Dragashan (June 19, 1821). Escaping to Austria, he was arrested by the Austrian authorities, and confined for six years in the fortress of Munkács. D. in Vienna, Jan. 31, 1828.—(4) **DEMETRIUS**: revolutionist; son of (2); b. at Constantinople, Dec. 25, 1793; served in the Russian army; joined the Greeks in the Moree in 1821, and distinguished himself at the capture of Tripolitza, the defense of Argos, and the battle of Lerna against Ibrahim Pasha. In 1828 he was appointed commander in chief of the Greek army, but disagreement with the president Capodistrias caused his resignation in 1831. D. in Vienna, Jan. 3, 1832. EDWIN A. GROSVENOR.

Yquitos: another spelling of *IQUITOS* (*q. v.*).

Yreka, *wi-ree'ka'u*: city (founded in 1851); capital of Siskiyou co., Cal.; on the Yreka creek, and the Yreka Railroad; 25 miles S. of the Oregon State line, 360 miles N. of San Francisco (for location, see map of California, ref. 2-B). It is in an agricultural, fruit and stock raising, and lumbering region, and has 3 churches, high school, grammar school, a State bank with capital of \$100,000, and 2 weekly newspapers. Pop. (1880) 1,059; (1890) 1,100; (1895) estimated, 1,500. EDITOR OF "JOURNAL."

Yriarte, Span. pron. *ÿ-ree-ãrr'tã*, **CHARLES ÉMILE**: writer; b. at Paris, Dec. 5, 1832, of a family of Spanish descent. He studied architecture at the École des Beaux Arts, and in 1856 became inspector of the imperial asylums, and a little later of the Opéra at Paris. Attracted, however, by the freer life of the journalist, he went in 1859 as correspondent of the *Monde Illustré* to the Spanish war in Morocco. In 1860-61 he followed the war in Italy in the same capacity. Returning to Paris in 1862, he became editor-in-chief of the journal. In 1871 he resigned this position and for several years devoted himself to travel and the study of the history of art. In 1881 he was appointed inspector of the École des Beaux Arts. Yriarte's literary works fall into several very distinct groups. First, we have a series of impressions of war and of society in and out of Paris. Here belong *La société espagnole* (1862); *Sous la tente: souvenirs du Maroc* (1862); *Paris grotesque, les célébrités de la rue 1815-63* (1864); *Les cercles de Paris 1828-64* (1865); *Portraits parisiens* (1865); *Nouveaux portraits parisiens* (1869); *Portraits cosmopolites* (1870); *Tableaux de la guerre* (1870); *Les Prussiens à Paris et le 18 Mars* (1871); *Campagne de France 1870-71* (1871); *La Bosnie et l'Herzégovine pendant l'insurrection* (1875). In the second place, we have a series of studies of life and society in Italy during the Renaissance: *La vie d'une patricienne de Venise au XVI^e siècle* (1874); crowned by the French Academy; *Un condottiere au XV^e siècle: Rimini* (1882); *Françoise de Rimini* (1882); *Matteo Crivelli* (1885); *César Borgia* (2 vols., 1888); *Adour des Borgia, les monuments, les portraits* (1890). In the third place stand several contributions to the history of art: *Goya, sa vie et son œuvre* (1867); *La sculpture italienne au XI^e siècle* (1885); *J. F. Millet* (1885). Closely allied to these last are the magnificent illustrated works: *Venise: l'histoire, l'art, l'industrie, la ville et la vie* (1877); *Les bords de l'Adriatique et le Monténégro* (1877); *Florence et l'histoire des Médicis* (1880). Last we may mention the historical sketches *Les princes d'Orléans* (1872); *La bataille de Dorking* (1872); *Le Partisan* (1873). Over his own name and the pseudonyms Junior, Marquis de Villemer, etc., Yriarte has written much for the *Figaro* and other Parisian journals. A. R. MARSH.

Yriarte, or **Triarte**, **JUAN**, de: Spanish scholar; b. Dec. 15, 1702, at Orotava on the island of Teneriffe; d. in Madrid, Aug. 23, 1771. After studying the ancient languages at Paris and jurisprudence at Madrid, he obtained a position in the royal library at the latter place. In 1732 he became chief librarian. In 1742 he was appointed also official translator for the ministry of Foreign Affairs. His most important literary work had to do with the library in which he worked, and particularly valuable was his *Códices grieci manuscripti*, of which, however, but one volume ever appeared (Madrid, 1769). As *pareyga* he wrote many epigrams and proverbs in both Latin and Spanish, narrative poems in Latin, etc. All were published in his *Obras sueltas* (4 vols., Madrid, 1774). Selections from his poems and letters are printed in volumes lxii. and lxvii. of *Rivadeneira's Biblioteca de Autores Españoles*. A. R. MARSH.

Yriarte, or **Iriarte**, TOMAS, de: Spanish poet and dramatist; nephew of Juan de Yriarte; b. at Orotava (Teneriffe), Sept. 18, 1750; d. in Madrid, Sept. 17, 1791. He went in early childhood to Madrid, and was there educated under the eye of his learned uncle. As a mere boy he began to write verses, and when only eighteen he had completed the comedy *Haer que hacemos*, published in 1770 under the name Tirso Ymarea. In 1771 he was given the office left vacant by his uncle's death, and in 1776 he became also archivist of the ministry of War. In 1780 appeared his excellent didactic poem *La música*, which attracted attention outside of Spain. In 1782 he published his *Fábulas literarias*, which still remain the best poetical fables in the Spanish tongue. He also has the distinction of having written the first regular comedies in Spanish, the best specimens being *El señorito mimado* (1778) and *La señorita mal criada* (1788). He translated into Spanish several French plays, Horace's *Ars poetica* (1777), and four books of Vergil's *Æneid*. Having become involved in literary animosities, he was toward the end of his life charged with leaning toward the recent French philosophy. For this cause he was summoned before the Inquisition in 1786, but no harm ensued. The first collection of his *Obras*, edited by himself, appeared in 6 vols., Madrid, 1787. More complete is the edition in 8 vols., 1805. His poems are printed in vol. lxxii. of Rivadeneyra's *Biblioteca de Autores Españoles*.

Ysaye, cē-zā', EUGÈNE: violinist; b. in Liège, Belgium, July 16, 1858; studied in the Conservatory of Liège till 1874, then received private lessons from Wieniawski at Brussels. He made concert tours over Europe with great success. In 1884 he was decorated Knight of the Royal Oak by the King of Holland; in 1886 was appointed high professor in the Royal Conservatory of Brussels; went to London for the first time in 1889, and in the autumn of 1894 visited the U. S., playing with immense success everywhere.

D. E. HERVEY.

Ysleta, cēs-lā'tā: city; El Paso co., Tex.; on the Rio Grande river; and the South. Pac. and the Tex. and Pac. railways; 12 miles E. of El Paso, the county-seat (for location, see map of Texas, ref. 3-A). It is in the heart of the fertile Rio Grande valley, has large agricultural and fruit-growing interests, and does its banking in El Paso. Coronado's expedition of 1540 discovered a settlement of Pueblo Indians here, established a colony, and built a church. Descendants of these Pueblos still occupy part of the city, which is believed to be the oldest in the State. Pop. (1880) 1,453, nearly all Mexicans and Indians; (1890) 1,528, about one-third citizens of the U. S. G. W. WAHL, CITY CLERK.

Yssel, ū'sel, or **Ijssel**: a branch of the Rhine, separating from it near Arnhem in the Netherlands. It receives the Old Yssel, which comes from Rhenish Prussia, and enters the Zuyder-Zee after a course of 80 miles.

Yttrium [Mod. Lat.; so named because first detected in gadolinite found at Ytterby, in Sweden]: a rare metal belonging to the cerium group; atomic weight (Cleve) 89.6, or, according to Bunsen and Bahr, 92.5, symbol Y. Cleve prepared the metal by the electrolysis of the double chloride of yttrium and sodium, and also by fusing this salt with sodium. It was thus obtained as a dark-gray powder with a metallic luster under the burnisher. It decomposes cold water slowly and boiling water more quickly. It is most easily recognized by the spark spectrum of the chloride (YCl₃), which contains a large number of bright lines. Of these, two groups near the sodium line toward the red are characteristic.

Yttrium oxide (Y₂O₃), or yttria, is obtained as a yellowish-white powder by igniting the oxalate or hydroxide. It is not directly soluble in water, but dissolves slowly in nitric, hydrochloric, and sulphuric acids, forming sweetish salts—namely, Y(NO₃)₃ + 6H₂O, YCl₃ + 6H₂O, and Y₂(SO₄)₃ + 8H₂O respectively. Pure yttrium and erbium salts were prepared by Bunsen and Bahr, who first decomposed the mineral gadolinite by heating it with strong hydrochloric acid and then precipitated the chlorides of the contained metals with oxalic acid. By further treatment they separated out the salts of cerium, lanthanum, etc., and formed oxides, nitrates, and oxalates alternately.

Yttrium occurs as a silicate and as yttria in gadolinite, a mineral with a vitreous luster, usually found in masses of a black or greenish-black color; as a phosphate in XENOTIME (*q. v.*); and as a fluoride in yttröerite, a mineral found near Fahlun, Sweden; at Amity, Orange co., N. Y.; and at Paris, Me.

R. A. ROBERTS.

Yuba River: a river of California, rising by three forks, (the North, Middle, and South), which flow through deep, cañon-like gorges in the Sierra Nevada. The united stream joins Feather river at a point just below Yuba City.

Yucatan, yoo-kā-taan': a peninsula of Southeastern Mexico, projecting northward between the Gulf of Mexico and the Caribbean Sea, and separated from the western extremity of Cuba by a channel about 140 miles wide. It embraces the two states of CAMPEACHY (*q. v.*), occupying about one-fourth of the peninsula in the southwest, and Yucatan. The latter has an area of 28,180 sq. miles and an estimated population (1893) of 365,810. Unlike the main body of Mexico, Yucatan is not mountainous except in the southern part, which is physically a portion of Central America. The surface is generally rolling or hilly. There is comparatively little heavy forest except in the southern mountains or on swampy flats adjoining the coast. Though rains are abundant in their season, many districts are almost without running water. For this reason much of the land is unfitted for ordinary agriculture; but it is well adapted for grazing and for the cultivation of sisal hemp, which is now the staple product and export. The mines are unimportant. The climate is warm and somewhat insalubrious. The civilized population is gathered in the northern part. Merida, the capital, and its seaport, Progreso, are the most important towns. The southern districts are still held by Indians, who are only nominally subject to the Mexican Government. Yucatan was the first portion of Mexico visited by the Spaniards 1517-19. (See CORDOVA, FRANCISCO HERNANDEZ, de, and GRIJALVA.) It was crossed by Cortés on his way to Honduras (1525), and was partly conquered by Montejo 1527-49. The Indian inhabitants of the Maya race (see INDIANS OF CENTRAL AMERICA) had attained a considerable degree of civilization, and their skill in architecture is still shown by the ruined cities of UXMAL, CHICHEN, etc. (*qq. v.*). They resisted the Spaniards bravely, but eventually the northern tribes were subdued and their descendants form a large portion of the inhabitants. The Maya language is still in general use in the interior, and is spoken even in Merida. Yucatan was attached to New Spain or Mexico, and followed its revolutions more or less willingly until 1839, when it seceded and formed an independent state. It was reunited to Mexico in 1843. In 1847 the Indian population revolted, holding a large part of the peninsula for several years and even threatening Merida. See Fancourt, *The History of Yucatan* (1854); Baqueiro, *Ensayo histórico sobre las revoluciones de Yucatán* (3 vols., 1871-72); the works of Stephens, Brasseur de Bourbourg, and Le Plongeon; also see CENTRAL AMERICAN ANTIQUITIES. HERBERT H. SMITH.

Yucatecs: inhabitants of Yucatan; a name often given to the Mayas (see INDIANS OF CENTRAL AMERICA).

Yucca [Mod. Lat., from *Yuca*, the native (San Domingan) name]: the aboriginal and also the botanical name of a genus of peculiar liliaceous plants, species of which have the English names of bear-grass, dagger-weed, Spanish bayonet, etc., natives of North America from New Jersey and from Iowa to Yucatan, but most abundant between the 25th and 35th degrees of N. lat. From fifteen to twenty species are well characterized (by Dr. Engelmann and Dr. Trelease), with many varieties, and various doubtful forms are in cultivation. The stems of the more northern species are subterranean, so that the tuft of bayonet or dagger shaped leaves is next the ground; of the more southern, arborescent, and palm-like in some species, forming a trunk 10 to 20 feet high, crowned by a dense tuft of prickly-pointed leaves. In *Y. filamentosa* and some other species delicate threads separate from the edges of the needle-pointed leaf, whence the popular appellation, Adam's needle and thread. The framework of the leaves affords a valuable fiber, which is used for cordage by the Mexicans. The root-stocks are replete with mucilaginous and saponaceous matter, which, under the name of "amole," serves as a substitute for soap in many a Mexican household, is also used by the Negroes of the Southern U. S., and gives the common name of soap-plant to *Y. glauca* (*Y. angustifolia* of the books), which abounds between the Mississippi and the Rocky Mountains. A stalk rising from the center of the crown of foliage bears an ample panicle of large and white lily-like blossoms, showy at all hours, but most so at evening, when the blossoms fully spread. The fruit is dry and capsular in some species, fleshy and baccate in others. The latter are edible and savory. That of *Y. aloifolia*, the "Spanish bayonet," is eaten by the Negroes of the coast of South Carolina and

Georgia under the name of banana, which it somewhat resembles in appearance; that of *Y. baccata* of Arizona, etc., is largely consumed when fresh by whites and Indians, and is cured by the latter for winter provisions. Several species are planted for ornament, and are much prized in landscape gardening.

Revised by C. E. BESSEY.

Yuchee Indians: See UCHEAN INDIANS.

Yu'kian Indians: a family of North American Indians. *Yuki*, the name of one of the tribes, is of Wintun origin, signifying *stranger* or *enemy*, secondarily *bad* or *thieving*. The principal tribes are the Yuki, whose prairie home was the territory now known as Round valley, Mendocino co., Cal.; the Chumaia, in Eden valley and on Middle Eel river; the Tatu, or Huchnom, in upper Potter valley; the Ashochimi, or Wappo, whose ancient range extended from the geysers to the Calistoga Hot Springs and in Knight's valley; and the Napa, in upper Napa valley.

The physical appearance of the Yuki is not pleasing. They have disproportionately large heads, small bodies, and rather protuberant abdomens; their eyes are small, but keen and restless; their noses stout, short, and straight, with expanded nares. They have heavy shocks of bristly hair, which they cut short, and their complexion varies from yellowish buff to almost black. The women tattoo the cheeks, nose, mouth, and chin with pitch-pine soot and a sharp-pointed bone. Stephen Powers describes this tribe in 1877 as "a truculent, sullen, thievish, revengeful, and every way bad, but brave race." The Tatu, on the contrary, were regarded as remarkably timid. The Ashochimi are of finer physique than the Yuki, having less angularity and coarseness of feature, more prominent chins, and brighter eyes.

Before being confined to a reservation these tribes built conical lodges of poles, bark, and puncheons on elevated ground. The dwellings of the Tatu, or Huchnom, were sometimes oblong and very large, with sleeping room for thirty or forty persons. Their ceremonial lodge or tribal assembly-hall is a dome-shaped structure covered with thatch and earth, and is capable of containing probably 200 persons. In this lodge the Yuki perform their annual green-corn dance, engaged in by both men and women. The Tatu observe an open-air acorn dance, in which both sexes also participate. The men of all the tribes of this family are fearless hunters, entrapping even grizzly bears in snares made of wild flax, then killing them with sharp, fire-hardened sticks.

The Ashochimi cremate their dead, casting the ashes, which are believed to contain the spirit, to the wind. The Tatu bury their dead usually with the head to the N., while the Yuki Indians inter the corpse in a sitting posture. The Yuki recognize a Supreme Being, the creator of the world, and its first inhabitant, but it is probable that this belief is the result of Christian contact. Both the Ashochimi and Tatu regard the owl and the hawk as potent and malignant spirits, which they conciliate by offerings and by wearing mantles of their feathers. Snakes are also an object of superstitious belief and awe. Like most primitive peoples, the Yuki have a deluge legend.

AUTHORITIES.—Stephen Powers, *Tribes of California* (Contr. N. A. Eth., iii., Washington, 1877); H. H. Bancroft, *History of California* (vols. i.–viii., San Francisco, 1884–90). See INDIANS OF NORTH AMERICA. J. W. POWELL.

Yukon River: one of the great rivers of the world. Of the streams of North America it is second in drainage area, and probably second in volume. Its length is about 2,000 miles, and its hydrographic basin, one-half of which lies in Alaska, approximately 440,000 sq. miles in extent.

The position of its source has been variously reported by explorers, and is not yet definitely determined. The main valley leads to Lake Teslin, in Northwestern Canada, lat. 60°, lon. 132°. On its head waters there are numerous large lakes, in the midst of grand scenery, some of which are clear, while others are turbid with glacial mud. The tributaries from the N. traverse a forested and moss-covered region, and are mostly clear and limpid; while the larger branches from the S. flow from glaciers on high mountains, and are turbid and heavy with silt throughout the year. The Yukon is an intensely muddy stream, except near its source, and is building an immense delta where it enters Bering Sea. The head of the delta, or where the river first divides, is more than 100 miles from the sea; and its seaward margin measures about 70 miles. The delta has not been surveyed. For this reason, and also because of the shallowness of the sea near where the river discharges,

oceangoing vessels do not approach it. The transfer of goods intended for the Yukon trade, to river steamboats is made at St. Michael's, 70 miles to the N.

The Yukon river has been ascended by small, stern-wheeled steamboats as far as Selkirk House, 1,500 miles, but this is not the head of navigation. Several of the tributaries of the main stream are also navigable. The Porcupine, which comes in from the N. E., and joins the Yukon near Ford Yukon, under the Arctic Circle, has been ascended by steamboats 150 miles. Other tributaries, several of which are larger than the Porcupine, have not been explored. The season of navigation is usually from the middle of June to the middle of October.

The climate of the lower Yukon is exceedingly humid, but grows drier on ascending the river. E. of the 141st meridian, the eastern boundary of Alaska, the summers are dry and hot, and the winters intensely cold, with a light snowfall. The delta of the Yukon is treeless, and forms a part of the tundra that fringes the coast of Bering Sea and the Arctic Ocean. About 70 miles from the sea spruce forests begin and continue all along the river and its many branches to near its head waters. As the climate becomes drier toward the interior of the country, the forests on the uplands are less dense. In Eastern Alaska and adjacent portions of Canada the hills are grass-covered and separated by belts of spruce, cottonwood, willow, and other trees, which grow along the streams.

The river is solidly frozen in winter. In spring, thawing begins first on its head waters, and great floods occur on account of the ice gorges that are formed. On the banks of the river layers of ice are exposed in many places, beneath the moss that covers the ground in the forests, solid ice of unknown thickness may frequently be found even on hot summer days. The Yukon is a highway of travel for the natives. The Eskimos use skin boats, *kyaks*, and the Indians hire-bark canoes. In winter long journeys are made on sleds drawn by dog-teams.

Gold is found in the river gravels of the upper Yukon, and along many of its branches. The center of this industry is now on Forty-mile creek, just within the eastern boundary of Alaska. About 1,000 miners were at work in that region in the summer of 1894. The gold is obtained by washing the gravel in sluices.

See Dall, *Alaska and its Resources* (1870) and Report in Eleventh U. S. Census. ISRAEL C. RUSSELL.

Yule [M. Eng. *yol* < O. Eng. *gōol*: Icel. *jól*: Swed. *jul*: cf. O. Eng. *gōola*, December or January, Icel. *Ylir*, a winter month, and Goth. *jiuleis*, November or December]: the old Teutonic name of Christmas, or, properly speaking, of the religious festival of the winter solstice. Though the nature of the festival has been completely transformed by Christianity, and though the mode of celebrating has also been much changed, in the greenery with which we still deck our houses and temples of worship, and in the Christmas-trees laden with gifts, we still have relics of the symbols by which our heathen forefathers signified their faith in the power of the returning sun to clothe the earth again with green and hang new fruit on the trees.

Yule, Col. Sir HENRY. K. C. S. I., C. B.: Anglo-Indian official and scholar; b. at Inveresk, Midlothian, Scotland, May 1, 1820, and educated at the Edinburgh High School. In 1837 he entered the East India Company's Military School at Addiscombe, and at the end of 1858 was appointed to the engineer service. After the usual period of instruction at Chatham he was sent to India, and was there employed on public works in different parts of the country, until 1862, when he retired and went to reside in Italy. D. Dec. 30, 1889. His principal works are *Mission to the Court of Ava* (1858); an edition of the *Mirabilia Descripta* of Friar Jordanus (1863); *Cathay and the Way Thither* (1866); the *Book of Ser Marco Polo* (2 vols., 1871; new ed. 1875); *Glossary of Anglo-Indian Terms*, begun in concert with his friend Burnell (1886); and the *Diary of William Hodges* (3 vols., 1889), besides many papers in the *Journal of the Royal Asiatic Society*, etc.

Yuma: city; capital of Yuma co., Ariz.; on the Colorado river, and the South. Pac. Co.'s railway; 150 miles W. by S. of Phoenix and 250 miles S. E. of Los Angeles, Cal. (for location, see map of Arizona, ref. 13–4). It is principally engaged in mining, agriculture, fruit-growing, and general trade, and has 2 public-school buildings and 2 weekly newspapers. Pop. (1880) 1,200; (1890) 1,773.

EDITOR OF "ARIZONA SENTINEL."

Yuman Indians [*Yuma*, the name commonly applied to the Cuchan tribe, is said to mean "sons of the river"]; a family or linguistic stock of North American Indians. The tribes composing it occupied an area extending from the Cataract Cañon of Colorado river, Northern Arizona, to the southern extremity of Lower California, including the greater portion of the lower Colorado and Gila river drainage in Western, Central, and Southwestern Arizona, the larger part of California S. of lat. 35°, and a small area in Western Sonora, Mexico. The divisions of the stock are:

Cochimi. The most populous of the Lower California groups, embracing a number of small tribes, formerly between lat. 26° and 31°, principally about Loreto Mission. In the eighteenth century they numbered probably 7,000 or 8,000 in about sixty settlements. Only a few now survive.

Cocopa. This tribe, including seven bands of indeterminate status, in early historic times held the valley of Colorado river from its mouth almost to the Gila junction, as well as the mountains of Northern Lower California. They are of more peaceable character than the Cuchan and Mohave, but like them are agriculturists, their principal products being corn, wheat, pumpkins, and melons. Population about 500, mostly in Mexican territory.

Comeya. A term formerly of indefinite application, being used collectively to designate the tribes from San Diego for 100 miles inland, and even to Colorado river, thus including the Diegueños, but now applied to a group of six insignificant tribes about New River on both sides of the California and Lower California boundary. The name is now obsolete, the Indians apparently being classed officially as "Yuma."

Cuchan, more commonly called Yuma; a tribe north of the Cocopa, on both sides of Colorado river from 50 miles above its mouth to 60 miles above the Gila confluence. Physically the Cuchan are much superior to the Cocopa, though perhaps inferior to the Mohave. They are peaceable yet brave, and excepting the Tulkepaia division are agriculturists, raising crops similar to those of the Cocopa. The Tulkepaia, numbering 240, are now under the San Carlos agency, Southeastern Arizona. There are also 760 "Tonto Apache" under the San Carlos agency, part of whom belong to this tribe. The population of the "Yuma" (mainly Cuchan) of Yuma reservation, California, is 1,208.

Diegueño (so named from San Diego mission, established in their midst in 1769). The name has no ethnic significance, being a collective term for several small tribes (at least one of which belonged to the Comeya) formerly in a number of *rancherías* in Southern California. They are now classed as Mission Indians under the Mission Tule agency. Population about 410.

Havesupai, also called Avesupai, Cosnino, Supai, etc. An isolated tribe, numbering 224 souls, who make their home in the gorge of Cataract creek, a side cañon of Colorado river, Northwestern Arizona. They bear closer linguistic affinity to the Walapai than to any other Yuman tribe, though in everything save language they resemble more closely the Pueblo tribes than their kindred.

Maricopa (formerly called Cocomariocopa). The priscaean habit of this tribe was the Gila and the western bank of the Colorado, near their confluence in Southwestern Arizona and Southeastern California; but for mutual protection they joined the PIMAN INDIANS (*q. v.*), with whom they have resided in historic times on the Gila and Salado between lon. 112° and 113°. They are an agricultural tribe, their principal product being wheat, which is raised by irrigation. Their customs are similar to those of the Pima, with whom they intermarry, but they retain their native language. Population, 300 in 1891.

Mohave, or *Mojave* (from *hamok*, three, and *habi*, big rock or mountain, hence "three mountains," in allusion to the rocky buttes or The Needles, on the eastern side of Colorado river, about lat. 31°-41', Western Arizona, which, so far as known, was their earliest habitat). This is the largest of the Yuman tribes. Physically the Mohaves are among the finest specimens of the North American Indian. They live in commodious, well-made houses of thatch and earth supported by posts, each house being supplemented by a large wickup or ramada. So far as known the tribe has fourteen clans, one of them being an adopted band of Maricopa. They are now mainly under the Colorado river agency, California, where they numbered 1,991 in 1891.

Yavapai (from *e-nyu'e-va*, sun + *pai*, people); also, but improperly, called Yampai. These are the Nijora (Pima for captive) of the early Spanish missionaries, and the so-called Apache-Mohave (i. e. wild Mohave) of the present time. The

Yavapai are strictly Mohave who left the main tribe in the Colorado river valley, and occupied the range of country between Bill Williams Fork and the Rio Santa Maria as far as the Castle Dome Mountains near the Gila. When they were removed to the Camp Verde agency in 1873 they claimed the Rio Verde country and the Black Mesa from the Rio Salado northward to Bill Williams Mountains. Since 1875 they have been under the San Carlos agency, where they numbered 557 in 1891. They have intermarried extensively with the Apache.

Pericu. This linguistic division of indefinite status included a number of small tribes formerly in Lower California from La Paz, about lat. 24°, to Cape St. Lucas. So far as known there are no survivors.

Seri (also Ceri). This is a small semi-nomadic tribe occupying an area on the coast of Sonora, Mexico, about lat. 29°, and the adjacent island of Tiburon in the Gulf of California. They subsist chiefly on fish, turtles, and waterfowl, generally eaten raw, using pelican skins as clothing and bedding. They are of fine physique, and are noted as runners. In the seventeenth century they gained an unenviable reputation for ferocity and cruelty, and while a part of the tribe were subdued by the Mexicans and surrounding Piman tribes in 1770, the remnant retain their savage character. They are probably the most primitive and bloodthirsty Indians remaining in North America. Their principal inland settlements in early days were about El Populo and the present Hermosillo, but these localities have long been abandoned. In 1852 they were said to number 500 on Tiburon island; in 1894 they were visited by McGee, when for the first time extensive collections and photographs were made among them, and found to number about 75 warriors with some 200 women and children. The Seri have been classed as Yuman on meager linguistic evidence, but the latest researches indicate that they probably form a distinct family.

Tonto (Spanish "foolish," "stupid"). A name inappropriately and indiscriminately applied (1) to the Tulkepaia or "Apache-Yuma," on San Carlos reservation; (2) to an Athapasean tribe commonly known as the Coyotero Apache; (3) to the Pinal or Pinaleno of the same stock; (4) to a body of Indians mostly Yavapai men and Pinal women who have intermarried. The term is applied more particularly to the last-mentioned class, who, before their removal to the Rio Verde reservation and afterward to the San Carlos agency, made their home in Tonto Basin and the Pinal Mountains in Eastern Central Arizona. They speak a Yuman-Apache jargon, and number 750.

Waikuru. A collective term applied to the tribes of Lower California, formerly between the Cochimi on the N. and the Pericu on the S., or from lat. 24° to 26°. They spoke four dialects—Cora (distinct from the Piman Cora), Uehiti, Aripe, and Callejue, none of which probably now exist in their native purity.

Walapai (also Hualapai, Wolapai, from a term said to signify "pine people"). This tribe originally occupied the middle Colorado river, above the Mohave territory, from the great bend eastward into Walapai, Yavapai, and Sacramento valleys. The southern boundary of their range was the Cerbat and Aquarius Mountains. They are physically inferior to the Mohave. Population, 700.

Missions were established among the Lower California tribes by the Jesuits in the seventeenth and eighteenth centuries, when the native population of the peninsula was estimated at about 12,000. In 1769 the first mission of Northern California was founded at San Diego, and in 1780 two missions were established among the Cuchan near the present Fort Yuma, but the latter were destroyed and the missionaries killed by the Indians the following year.

During the mission period the Yuman stock doubtless numbered at least 20,000 souls. The present population within the limits of the U. S. is 6,400, and a few are still to be found in the California peninsula. See INDIANS OF NORTH AMERICA.

J. W. POWELL.

Yuncan Antiquities: The Yuncas or Chimus inhabited the coast of Peru, and were a different stock from the Kechuas of the interior. (See INDIANS OF SOUTH AMERICA.) They were conquered by the Kechuas about a century before the arrival of Pizarro, but they did not owe their culture to that people, having independently reached a comparatively close approximation to a civilized condition. (See INCAN ANTIQUITIES.) One of the most celebrated localities is Pachacamac, 20 miles S. of Lima, on the river Lurin. It was the capital and sacred city of the natives before their conquest by the Incas. The ruins consist of walls and terraces covering 8 or 10 acres. The material is usually large adobe or sun-burned bricks, and many of the structures are still in a fair state of preservation. A remarkable feature is the presence of the true rounded arch, probably the only correct example of this architectural element to be found in America. It is not confined to Pachacamac, but occurs in other Yuncan ruins along the coast. In this, in the use of undressed stones laid in a mortar of tenacious clay, in the extensive use of adobes, and in the style of mural ornamentation, the Yuncan method of building shows differences from the Incan which are readily recognized. They were, however, able to handle stone to advantage, as is testified by the remains of the Castle of Cañete in the valley of Guareco and elsewhere.

In the vicinity of Lima there are many ruins attributable to this people. One of the most extensive are those of Caxamarquilla, about 15 miles from Lima, in a side valley of the river Rimac. They cover an area of about 3 miles square, and are a complicated mass of adobe walls, streets, narrow passages, subterranean chambers, and mounds. Much more extensive are the remains of the city called El Gran Chimú, on the plain of that name, not far from Truxillo. They cover the ground with a wilderness of walls, inclosures, mounds, and passage-ways, over an area 12 to 15 miles long and 5 to 6 wide. Several miles of the massive wall of defense which once protected the inhabitants are still standing. The truncated pyramids which supported the foundation of these structures were of imposing size, measuring, one 162 feet square, another 210 by 240 feet, a third 172 by 152 feet, and in height from 40 to 50 feet. Most of them are built of rubble, that is, of tenacious clay mixed with broken stones, so as to form an indurated mass, which in that dry climate becomes almost as hard as mortar. Not far from Chimú is the great pyramid of Moche, sometimes called the Temple of the Sun. Its base covers an area of more than 7 acres, and its height is upward of 200 feet. It is constructed throughout of large adobes built around a central core, and eased externally with others laid flat upon the sides. Near by is another pyramid of smaller size and similar construction. The purposes of these laborious structures is not known, but it is conjectured that they were the supports of religious edifices which have now wholly disappeared.

From the pottery, ornaments of metal, and domestic utensils which have been exhumed in this vicinity the inference is fair that the Yuncas were as highly developed in their culture as any other of the Peruvian peoples. See E. G. Squier, *Travels in Peru* (1877); de Nadaillac, *Ancient America* (1882); Rivero and Tschudi, *Peruvian Antiquities* (Vienna, 1851).

D. G. BRANTOX.

Yun-ho (literally, transport river), or **Yun-liang-ho** (grain-transport river): the names by which the Grand Canal of China is known to the Chinese; so called because originally intended, and for centuries used, for conveying the tribute rice and other grains to Peking. See GRAND CANAL.

Yunnan, yün'naan' (literally, south of the clouds, in allusion to the great banks of clouds which hang over the highlands of Sze-chuen on the north): a southwestern province of China, bounded on the N. by the province of Sze-chuen, E. by Kwei-chow and Kwangsi, S. by Burma and the Laos, and W. by Burma; area, 107,969 sq. miles; population, 11,721,576. Capital, Yunnan-foo, situated on the north shore of Lake Chin, one of the two great lakes of the province (see map of China, ref. 7-F). It is described by Baron von Riechthofen as consisting for the most part of an extensive plateau containing extensive valley-plains at altitudes of 5,000 to 6,000 feet, overtopped by ridges which separate them and rise to a nearly uniform level. In these valley-plains most of the great cities are situated. He also mentions some very elevated mountain ranges, situated in the northwest, whose snow-covered summits tower high up above the plateau. Yunnan is rich in minerals. Coal occurs on the borders of

the plateau; gold is washed on many of the rivers; silver is also found, and has been worked to some extent; spelter is plentiful, and is extensively worked. Tin is extensively mined in the southeastern portion of the province, and iron is widely distributed. The most important, however, is copper, which is found in great abundance. Yunnan is the chief source of supply for the empire. Lead is also of frequent occurrence. Among the other products of the province are medicines and opium, and the famous Puh-wih tea, which is said by natives to be more refreshing than any other kind.

R. L.

Yupanqui, yoo-pñan'keō, called **Yupanqui Pachacuti**, or **Pachacuti Yupanqui**: the ninth and one of the greatest of the Inca sovereigns of Peru; second son of the Inca Viracocha; b. about 1380. It is related that Ureo, his elder brother and heir to the throne, was incompetent and was either forced to resign or was killed at a critical moment, when Cuzco was threatened by the powerful Chanca tribe. Yupanqui assumed the government (about 1400), defeated the Chancas in a great battle, and annexed their territory. Subsequently he continued his conquests during a long reign, and at his death (about 1440) the Inca empire embraced nearly all of the territory now included in Peru. Yupanqui is a favorite hero of Quechua tradition, and many institutions are traced to him.

H. H. S.

Yusuf-ben-Ayub-Salah-ed-Din: See SALAH-DIN.

Yusuf-ben-Taxfin': second prince of the Almoravide dynasty; b. at Velad Sahara in 1006; gained great military renown. Crossing to Spain as the ally of the Moorish king against Alphonso VI. of Castile, he powerfully contributed to the victory of Zalaca near Badajoz (1086). Dissensions arising among the Mussulmans, he gradually became master of the kingdoms of Malaga, Granada, Murcia, Cordova, Seville, Almeria, Badajoz, and Valencia. Though so powerful, he was content with the title of emir. His son Ali was acknowledged in 1103 as successor to both his Moorish and Spanish possessions. D. in 1106.

E. A. G.

Yverdon, ev'vār'dōn' (ancient *Eburodunum*): town; canton of Vaud, Switzerland; at the mouth of the Thièle, in Lake Neuchâtel; 20 miles by rail N. of Lausanne (see map of Switzerland, ref. 5-B). It was the seat of the celebrated institute of Pestalozzi (1805-25); has a library with Roman antiquities, a school for deaf mutes, and a gymnasium. Pop. (1888) 6,330.

Yves d'Évreux, ev'vay'v-rō', PIERRE: missionary and author; b. at Évreux, in Normandy, about 1577. He entered the Capuchin order in 1595, and was superior of the four missionary orders sent with a French colony to Maranhão, Brazil, in 1612. He returned about 1614, and shortly after wrote an account of the mission intended as a continuation of the work of CLAUDE D'ABBEVILLE (*q. v.*). The printer who had charge of this was bribed, for political reasons, to destroy it; but some of the sheets, including all except the preface and a few chapters, were saved. From these a new edition was prepared in 1615, with the title *Suite de l'histoire des choses plus mémorables advenues en Maragnan ses années 1613 et 1614*. From the single known copy, in the Bibliothèque Nationale of Paris, a modern edition, with notes, was published by Ferdinand Denis in 1864. Yves d'Évreux was alive in 1620, but the date of his death is unknown.

H. H. S.

Yvetot, ev'tōt': town; department of Seine-Inférieure, France; 24 miles N. W. of Rouen by rail (see map of France, ref. 2-E). It manufactures cotton and linen fabrics, silk, and velvet, and trades in corn and wine. The lords of Yvetot were clothed with the title of king in the fifteenth and sixteenth centuries, and this has given rise to many humorous references in French literature, notably a song of Beranger. Pop. (1891) 7,007.

Yvon, ev'vōn', ADOLPHE: historical and portrait painter; b. at Eschwiller, Moselle, France, Feb. 1, 1817; pupil of Paul Delaroche; received a first-class medal at the Salon of 1848, second-class medals at the Paris Expositions of 1855 and 1867, and a medal of honor at the Salon of 1857; became an officer of the Legion of Honor 1867; Professor of Drawing in the École des Beaux-Arts, Paris. In 1855 he was sent by the Government to the Crimea to paint pictures of the war. Six large battle pictures by him are in the Versailles Museum.

WILLIAM A. COFFIN.

Y'ylang-Y'ylang: another spelling of IHLANG-IHLANG (*q. v.*).

Yzabal, or **Ysabal**: See IZABAL.

: the twenty-sixth letter of the English alphabet.

Form.—It has the form of the final letter of the Roman alphabet, which was simply the Greek letter *zēta*, introduced at the same time as *Y*, late in the first century B. C., to aid in transliterating the numerous Greek loan-words and proper names which were establishing themselves in Latin usage. The older Latin alphabet of twenty-one letters had no symbol for the voiced sibilant *z*.

Name.—The English name, *zee* (phonet. zī), is a late invention adapted to the sound and following the analogy of *bee*, *cee*, *dee*, *gee*, *pee*, *tee*. An older name is *zed* or *ized*, often written *izzard*; cf. the proverb "from a to izzard." This represents O. Fr. *zède*, Lat. *zeta*, or an *et zède*—i. e. "and *z*"—which was pronounced *zede*, and regularly became *ized* in English.

Sounds.—(1) The voiced dental sibilant *z* in *zone*, *zephyr*, *mazy*. The same sound is frequently expressed by *s*, as in *lose*, *nose*, *reason*. (2) The voiced dental wide sibilant *zh* (ž) in *azure*, *seizure*, a sound correlative to the voiceless *sh* (š) of *sugar*, *sure*, *censure*. The sound *zh* is frequently expressed also by *s*, as in *pleasure*, *leisure*.

Sources.—The chief sources of the sound *z*, whether denoted by *s* or *z*, are the following: (1) O. Eng. *s*, which became voiced to *z* when unaccented and in contact with voiced sounds. As Teutonic *z* had become *r* in O. Eng., *z* is not found there. English words beginning with *z* are therefore all foreign. Cf. *freeze* < O. Eng. *frēosan*; Germ. *frieren*, *frost*, Lat. *prūna*; *sneeze* < O. Eng. *snēosan*, akin to Germ. *niesen*; *choose* < O. Eng. *cōosan*; Germ. *kiesen*, Lat. *gustare*; *weasel* < O. Eng. *wesle*; Germ. *wiesel*; *wise* < O. Eng. *wis*; Germ. *weise*. Illustrations of the contrast *s* : *z* are found in *grass*; *graze*, *brass*; *brazen*, *use* (noun); *use* (verb) < M. Eng. *usen*, *house* (noun); *house* (verb), *abuse* (noun); *abuse* (verb); also in *cabs*, *tucks*, *maps*, versus *luds*, *pigs*, *cubs*. As is seen in *use*, *abuse*, as well as in *reason*, *misery*, etc., the change *s* > *z* affects the French as well as the native element. (2) In loan-words from various sources: *zeal*, from Fr. *zèle*, from Gr. *ζῆλος*, *zodiac* (Fr.-Lat.-Gr.), *zenith* (Span.-Arab.) BENJ. IDE WHEELER.

Zaandam, zaän-daam', or **Saardam**: town; province of North Holland, Netherlands; on the Zaan; 5 miles N. W. of Amsterdam by rail (see map of Holland and Belgium, ref. 4-E). It has numerous flour, oil, and saw mills, extensive paper manufactures, and a little ship-building. The house in which Peter the Great lived while he worked here as an artisan is still preserved. Pop. (1890) 15,604.

Zabism: See SABISM.

Zacatecas, thaā-kā-tā-kāas: an interior state of Mexico; bounded N. by Coahuila, E. by San Luis Potosí, S. by Jalisco, and Aguas Calientes, and W. by Jalisco and Durango. Area, 25,229 sq. miles. The western part, lying on the slope of the Sierra Madre, is mountainous; the eastern part is included in the plateau, with valleys southward which are below 3,000 feet, and therefore in the *tierra caliente*, or hot land. The climate is temperate on the plateau, but somewhat dry; in the northern part of the state large areas are arid and desert-like, but they are interspersed with tracts of excellent pasture, which support large herds of cattle and sheep. The southern districts are generally very fertile, and are especially fitted for the cultivation of cereals; this is one of the great maize-producing states. The mountain-lands are partly covered with oak and pine forests. In its silver mines Zacatecas stands pre-eminent among the Mexican states. It is estimated that the production since 1548 has exceeded \$810,000,000, and though some of the older deposits have been worked out, others are discovered to take their places. A few veins yield a small percentage of gold. Copper, lead, quicksilver, etc., occur, and are mined on a considerable scale. Zacatecas was conquered from the Chichimec Indians about the middle of the sixteenth century, and its mines were famous almost from the first. Pop. (1893) estimated, 485,640. H. H. S.

Zacatecas: a city of Mexico; capital of the state of Zacatecas; in a high valley between spurs of the Sierra Madre; over 8,000 feet above sea-level; 439 miles by the Mexican Central Railroad N. W. of Mexico city (see map of Mexico, ref. 6-F). It was founded as a mining-town about 1548; its silver lodes were for some time the most famous in New Spain, but they are now surpassed by others in the state and elsewhere. About 15,000 miners and ore-workers are employed in the vicinity; reduction is generally by the *patio* process. The climate is cold and subject to sudden changes, though not insalubrious; the water-supply is scanty and poor, and the narrow valley leaves so little room for growth that many of the streets climb the mountain-sides like staircases. Carriages are almost unknown. The city, however, is very picturesque, resembling a Moorish town. It has a cathedral (commenced in 1612, completed in 1752) noted for its quaint carvings; the magnificent silver font for which it was formerly famous was confiscated under the Juarez law. On the Bufa hill near the city is a celebrated chapel and resort of pilgrims; and at Guadalupe, 6 miles distant, is one of the most beautiful chapels in Mexico, with a handsome park. Pop. of Zacatecas (1892) about 60,000. H. H. S.

Zach, tsākh. FRANZ, BARON, von; astronomer; b. at Presburg, Hungary, June 4, 1754. He was director of the observatory of Seeberg, near Gotha, 1787-1806; he published *Monatliche Correspondenz zur Beförderung der Erd- und Himmelskunde* (28 vols., Gotha, 1800-13), afterward continued in Italy under the title of *Correspondance astronomique*, which are, together, the most important astronomical periodicals before the *Astronomische Nachrichten*. D. in Paris, Sept. 2, 1832. He also wrote *Tabule Motuum Solis nova et correctæ* (Gotha, 1792); *Supplementa ad Tabulas Motuum Solis* (Gotha, 1804); *L'Attraction des Montagnes et ses Effets sur les Fils à Plomb* (Avignon, 2 vols., 1814); and other works. Revised by SIMON NEWCOMB.

Zachari'as: pope 741-752. By his personal influence with several of the Lombard kings he obtained the restoration of certain cities and lands formerly subject to the Roman Church. He also prevented for a time the extinction of the exarchate by the Lombards. He sanctioned the deposition of Childeric III., the last of the Merovingians, and the consecration of Peppin in his place, thereby putting an end to the weak and incapable line which had outlived its usefulness. He continued to St. Boniface the direction and sympathy which his predecessors had given. He was very charitable, generous, and mild, "a man of great faith, courage, and self-reliance," a benefactor of the clergy, and a lover of letters. See art. *Zachary* in *Dictionary of Christian Biography*. J. J. KEANE.

Zacynthus: See ZANTE.

Zadkiel: the pseudonym of William Lilly, the astrologer (1602-81), and of one Richard James Morrison (b. 1794), who from 1830 until his death in 1874 published an astrological almanac, forecasting the weather and the principal events of the coming year.

Zadok: See SADDUCEES.

Zaffre, or **Zaffer**: See COBALT.

Zagazig, zāū-gāā-zeeg': town; in Lower Egypt. Connected with Alexandria, Cairo, Ismailia, and Suez by rail, it has become the entrepôt of Northwestern Egypt, and is rapidly growing. Near by are the ruins of ancient BUBASTIS (q. v.). Pop. about 20,000. E. A. G.

Zagros Mountains: a range of mountains lying between ancient Media and Assyria.

Zaleszczyki, zāā-lesh-chik'ēē: town; in Eastern Galicia, Austria; on the left bank of the Dniester, which at this point separates Galicia from the Bukovina (see map of Austria-Hungary, ref. 5-E). It is situated in a fertile plain, has a beautiful castle, a large sugar-factory, and considerable trade in grain and wood, carried on in several annual fairs. Pop. (1890) 3,750, mostly Ruthenians; the district has 73,598 inhabitants. H. S.

Zalen'cus (in Gr. *Záλευκος*): the lawgiver of the Epizephyrian Locrians in Magna Græcia; flourished in the middle of the seventh century B. C. His code is said to have been the first collection of written laws which the Greeks ever possessed. Of his personal life and of his legislation nothing is known but loose tradition, and from this it would seem that his laws were severe. Adultery was punished by the loss of both eyes; the use of unmixed wine and journeys to foreign countries were forbidden; any one who wished to propose a new law or the abolishment of an old was compelled to step forward in the assembly with a rope around his neck, and if his proposition was rejected he was immediately strangled.

Zalin'ski, EDMUND LOUIS: soldier and artilleryist; b. at Kurnik, province of Posen, Prussian Poland, Dec. 13, 1848; came to the U. S. as a child; was educated in the schools of Seneca Falls and Syracuse, N. Y., and on Feb. 23, 1865, was appointed second lieutenant Second New York Artillery. Mustered out Sept. 29, 1865; appointed second lieutenant in the Fifth U. S. Artillery Feb. 23, 1866, first lieutenant Jan. 1, 1867, and captain Dec. 9, 1887. He served in garrison with his company at various military posts, at the artillery school at Fort Monroe, and as Professor of Military Science and Tactics at the Massachusetts Institute of Technology. Retired from active service owing to disability Feb. 3, 1894, he accepted a position as foreign agent of the Bethlehem Iron Company. Author of *Ordnance Notes on Telescopic Sights for Cannon, Deflection of Projectiles by Wind*, and various articles on submarine warfare and the pneumatic torpedo-gun. He was so intimately connected with the construction and introduction of the latter weapon that it is popularly known as the "Zalinski dynamite-gun."

JAMES MERCUR.

Zalus'ki, JÓSEF ANDRZEJ: bishop and scholar; b. in Poland, 1702. He was for three years ambassador to Rome to Pope Clement XII., and later became Bishop of Kiev. Being violently opposed to the Dissidents who enjoyed the protection of Russia and Prussia, he was, at the instance of the Russian ambassador Repnin, banished to Kaluga and confined there till 1773. D. Jan. 9, 1774. Zaluski's principal merit is his reawakening of Polish literature just at the period of the political downfall of Poland. Though a great scholar, he was not a great writer, but spent his entire fortune on the collection of a library of 230,000 volumes, which he bequeathed to the Polish nation. After the third partition of Poland, however, it was transferred to St. Petersburg, where it became the nucleus of the great Imperial Public Library. Zaluski's *Biblioteka historyków*, written at Kaluga from memory (ed. Muczowski, Cracow, 1832), and *Specimen historiae Poloniae criticae* (Dantzig, 1733) are of considerable bibliographical and historical value.

H. S.

Zama, zā-mā: town of Nnmidia, near the Carthaginian frontier; was very strong in the time of the Punic wars, and selected by King Juba as his residence and the depository of his treasures. Here was fought, in 202 B. C., the famous battle in which Publius Cornelius Scipio defeated Hannibal, thereby bringing the second Punic war to an end.

Revised by G. L. HENDRICKSON.

Zamacois, Span. pron. thā-mā-kō'es, EDUARDO; genre-painter; b. at Bilbao, Spain, in 1842; pupil of Federico de Madrazo in Madrid and of Meissonier in Paris; medals at the Paris Exposition 1867 and Munich 1870. D. in Madrid, Jan. 14, 1871. His pictures are among the best of their kind in modern art, characterized by excellent drawing, felicity of expression, and good color. *The Education of a Prince* (1870) is one of his most celebrated works, and *The King's Favorite* (1867), is a fine example.

W. A. C.

Zambesi, zām-bee'zē: the fourth river in size in Africa. Its most western head waters rise a little E. of Benguela, Portuguese West Africa, and the Zambesi proper flows S. and E. two-thirds of the way across the continent, emptying into the Indian Ocean by a widespread delta, in about 18° 30' S. lat. The country it drains is one-fifth as large as the U. S. exclusive of Alaska. From its sources nearly to its mouth it passes through one of the largest pastoral regions of Africa. It was long supposed that the Zambesi could not be made available for commerce from the sea because no channel of its delta was known through which ocean steamers might meet river craft. In 1889, however, Mr. Rankin brought to notice the Chinde branch of the delta, through which, he had discovered, navigable communication with the sea might be attained. This dis-

covery at once stimulated enterprise on the river. Steamboats are superseding the small trading canoes formerly in use, and the town of Chinde has been built in the delta as the port of the river. Above the delta there are 600 miles of steam navigation on the Zambesi and its northern tributary, the Loangwa, interrupted by one stretch of 30 miles of land portage around cataracts. Coal has been discovered near the north bank of the middle Zambesi, and promising gold-fields N. of the river and within easy reach of it. On the upper Zambesi are the famous VICTORIA FALLS (*q. v.*). The total length of the river is between 1,500 and 1,600 miles.

C. C. ADAMS.

Za'nia [Mod. Lat., from Lat. *za'mia* = Gr. *ζαμία*, *ζημία*, hurt, damage, loss]: a genus of cycadaceous plants, partly tree-like and partly stemless. The genus has a wide geographical range. *Z. integrifolia*, the COONIE (*q. v.*) of Florida, *Z. tenuis* and *Z. furfuracea* of the Bahamas, *Z. cycadis* of South Africa, *Z. pumila* in the West Indies, and other species furnish starchy food from their stems, and known in commerce as arrowroot and sago, though in strictness it is neither.

Revised by C. C. BESSEY.

Zamojski, zā-moi'skōē: a famous Polish family of old nobility and great wealth. The Austrian branch was raised to the rank of Austrian imperial counts by Leopold II. in 1791.—JAN ZAMOJSKI, b. Apr. 1, 1541, at Skoków, palatinate of Chelm. In the diets after the death of King Sigismund Augustus in 1572 he brought about an extension of the elective franchises of the nobles, so that every one who served personally in the army, with his own equipment and at his own expense, was also entitled to participate in the election of the king. He was especially instrumental in the election of Henry of Anjou (later King Henry III. of France), and when Henry left Poland, after a few months, succeeded in establishing Stephen Bathori, Prince of Transylvania, on the throne in 1576. Between this excellent king and the king-maker there existed perfect harmony, and Zamojski was made commander-in-chief of the Polish army and grand chancellor of the Polish crown, and in 1583 married the king's niece, Griseldis. On the death of Bathori (1586) Zamojski secured the throne to Sigismund III., and defeated the party of Prince Maximilian of Austria at Pitschen (Upper Silesia); but owing to Sigismund's weakness and suspicion he was soon superseded by incompetent favorites. D. June 3, 1605, at Zamosc (*q. v.*). He wrote *De Senatu Romano* (Venice, 1563); *Testamentum Joannis Zamori* (Mentz, 1606), etc. His biography was written by Zurkowski (Lemberg, 1860).—ANDRZEJ ZAMOJSKI, b. in 1716 at Zdiezun, government of Plock; entered the Saxon military service; returned to Poland in 1754 as major-general; became a senator, commander-in-chief, and finally, in 1764, grand chancellor. But in 1765 Zamojski resigned his offices and retired to his estates. Here he introduced many reforms, and even abolished serfdom, which raised a bitter enmity against him among other noblemen. On the invitation of the diet of 1776 he drew up a code of law, comprising an elaborate regulation of the rights and duties of the third estate, *Zbór praw sądowych* (3 vols., Warsaw, 1778); this, though rejected by the diet of 1780, was adopted by the constitution of May 3, 1791. D. at Zamosc, Feb. 10, 1792.

Revised by HERMANN SCHOENFELD.

Zamo'ra: an interior state in the western part of Venezuela; surrounded by Lara, Carabobo, Miranda, Bolivar, and Los Andes (or Zulia). Owing to the frequent changes in this and other Venezuelan states, it is impossible to compute the area with accuracy; in 1892 it was estimated at 25,212 sq. miles, with a population of 249,018. The north-western part is included in the Venezuelan Andes, the remainder is a plain, part of the *llanos* district, but interspersed with patches of forest and watered by numerous streams; these flow to the Apure on the southern boundary, and through it to the Orinoco. The only important industries are agriculture in the mountain districts, where the famous Barinas tobacco is raised, and stock-raising on the plains. Owing to lack of communications the development of the state has been slow. Capital and largest town, Guanare.

H. H. S.

Zamora: capital of the province of Zamora, Spain; 182 miles N. W. of Madrid; on the Douro, which here is crossed by a splendid bridge (see map of Spain, ref. 14-D). It contains a Romanesque cathedral completed about 1174, many fine churches, palaces, monasteries, hospitals, barracks, and other public buildings; but these edifices, like the dilapidated walls which surround the city, are now only monuments of a

splendor long gone by. Its manufactures of serges, linens, leather, hats, brandy, and liquors are not important, but its trade in wine and grain is brisk. Pop. (1887) 15,292.

Revised by M. W. HARRINGTON.

Zamose, *zau'mōsts* (Russ. *Samostje*): district town and fortress in Poland, government of Lublin; 154 miles S. E. of Warsaw, on the Wieprz (see map of Russia, ref. 8-B); founded by Jan Zamojski, after his victory over Archduke Maximilian of Austria in 1588. He established here a high-grade academy with a valuable library, which flourished for over two centuries, until it was suppressed by the Russians. The city remained in the possession of the family of Zamojski until 1820, when it was bought by the Russian Government. Pop. 9,235 (5,720 Jews); of the district (1890) 100,972, including 12,320 Jews. Revised by H. SCHOENFELD.

Zamouse: See NIARE.

Zampieri: See DOMENICHINO.

Zanele: See MESSANA.

Zane, EBENEZER: pioneer; b. in Berkeley co., Va., Oct. 7, 1747; was of Danish descent; settled on the present site of Wheeling 1770, making the first permanent establishment on the Ohio river; built there a blockhouse called Fort Henry, from which he repulsed several assaults made by the Indians during the Revolution; was a disbursing officer under Lord Dunmore; held several other civil and military posts, gaining the rank of colonel, and became owner of the land on which the city of Zanesville, O., now stands. D. at Wheeling in 1811.

ZanePta, GIACOMO: poet; b. at Chiampo (district of Vicenza), Italy, in 1820. After studying for the priesthood at the seminary of Vicenza he became Professor of Philosophy and Italian Literature in the same institution. In 1855 he was given a similar position in the lyceum of Santa Caterina (now Marco Foscarini) at Venice. In 1856 he became director of the gymnasial lyceum at Vicenza; in 1862 director of the similar institution at Padua. In 1866 he was appointed Professor of Italian Literature in the University of Padua, and in 1871-72 rector of the university. He was obliged by failing health to retire from active service in 1872. He had in the latter part of his life obtained great fame as a lyric poet. Distinguished for beauty of style and mastery of form, he held a peculiar position among Italian poets through attempting to show a moral and religious meaning in both the scientific and the patriotic movements of his time. D. at Vicenza, May 17, 1888. His noted poem *La conchiglia fossile*, as well as others in the same vein—*Scienza e natura*, *L'industria*, *Il lavoro*—were among the first efforts within the Church in Italy to reconcile the new with the old order of things. His first volume of poems, *Versi*, appeared in 1868. This has been followed by *Poesie* (1877) and *Nuove poesie* (1878), as well as by the poetic tales *Il piccolo Calabrese* (1870); *Il pettirosso* (1881); *L'astichello* (1881); and *Edrige: racconto* (1881). In prose he published *Scritti vari* (1877); *Parallele letterarie* (1884); and *Delta letteratura italiana nell'ultimo secolo* (1885). We may mention also various contributions to the *Atti dell'Istituto Veneto* and other learned journals.

A. R. MARSH.

Zanesville: city; capital of Muskingum co., O.; on the Muskingum river at the point where it receives the waters of the Licking, and on the Balt. and O., the Bellaire, Zanesville and Cincinnati, the Cin. and Musk. Val., the Cleveland, Akron and Columbus, the Clev., Canton and So., the Col., Sandusky and Hocking, and the Zanes. and Ohio Riv. railways; 78 miles from Marietta, where the Muskingum joins the Ohio river; 59 miles E. of Columbus, the State capital, and 137 miles S. by W. of Cleveland (for location, see map of Ohio, ref. 5-G). It is in a fertile agricultural country, on the edge of the great mineral region of Ohio, abounding in bituminous coal, limestone, potters' clay, and to some extent in iron ore, and possesses splendid water-power for manufacturing from the falls of the two rivers. The Muskingum is here crossed by four iron bridges and by two others, two of the former being railway bridges, and the Licking is spanned by three bridges, one of which is a railway bridge. The city is laid out regularly with wide streets, and the principal ones are paved with the paving-brick made here. Surrounded as the city is with high hills, there is very little room for parks. The two most worthy of mention are the Putnam and the McIntire. There are gas and electric-light plants, water-works, and an electric street-railway. The notable buildings include the court-house, faced with lime-

stone quarried in the neighborhood; the Soldiers' and Sailors' Memorial Hall, the Masonic and Odd Fellows' Halls, City Prison, Market-house, Work-house, and Opera-house.

Business Interests.—Zanesville early became a manufacturing and commercial point of considerable importance, and maintained a large export trade in flour, provisions, etc., to New Orleans and other markets in the Southwest until superseded by greater rivals in the new Northwest. In President Jackson's administration, about 1833, the National Road from Cumberland, Ind., was completed to Zanesville, and for twenty years, until the completion in 1853 of the Central Ohio Railroad, was the great highway from Baltimore and Washington to the "West." The manufacturing interests are numerous and varied, and include iron-works, 2 tiling-works (encaustic and mosaic), 4 large potteries, 2 foundry and machine shops, 4 glass-works, 5 pressed, paving, and common brick works, 4 planing-mills, 2 flouring-mills, 3 breweries, 2 tanneries, 1 woolen and 1 cotton mill, 3 marble-works, 2 furniture-factories, 2 stove-foundries, 1 coffin and casket factory, canning-works, ice-factory, soap-factory, bent-wood factory, and a tobacco-factory, and the large car-shops of the Baltimore and Ohio Railroad Company. These give employment to 5,000 persons.

Finance and Banking.—In 1894 the municipal receipts aggregated \$130,000; the total debt (including \$380,000 in water bonds) was \$681,554; and the assessed property valuation was \$8,893,808. There were 3 national banks with combined capital of \$550,000 and surplus of \$167,000, an independent bank, and 7 building and savings organizations.

Churches and Schools.—The churches comprise 6 Methodist, 4 Baptist, 4 Presbyterian, 2 Roman Catholic, 2 Lutheran, and 1 each Disciples, Congregational, Protestant Episcopal, Evangelical German, Hebrew, United Brethren, and Universalist. There are 17 public-school buildings, a high school, an academy for boys, Putnam Female Seminary, 2 Roman Catholic parochial schools, a Lutheran parochial school, and a Hebrew school. In 1894 there was a public-school enrollment of 3,700, and the cost of the system for the year was \$56,347. The library of the Zanesville Athenaeum (8,000 vols.), founded in 1827, is free to high-school pupils. In 1896 there were 4 daily, a semi-weekly, and 6 weekly newspapers.

History.—The original town was laid out in 1799 by Jonathan Zane and John McIntire, Virginians. They owned a section a mile square, and platted the lots in the southeast corner and called it Westbourn, a small part of the present city. The first regular mail carried in Ohio was from Marietta to Westbourn. In 1802 Postmaster-General Gideon Granger established a regular post-office here and called it Zanesville, whence the town took its name, but it was not incorporated until 1814. From 1810 to 1812 Zanesville was the State capital. Pop. (1890) 21,009; estimated (1896), 24,000.

JAMES T. IRVINE, JOURNALIST.

Zangnebar: See ZANZIBAR.

Zante, *zăn'te* [Lat. *Zacyn'thus* = Gr. *Zákynthos*): island; one of the largest of the Ionian group. Area, 277 sq. miles. It is of volcanic origin and earthquakes are frequent. The climate is delightful and the soil very fertile. The island produces currants, citrons, oranges, pomegranates, melons, olives, and wine, all of superior quality; carpets, linen and cotton goods, and gold ornaments are manufactured. In the village of Kery are naphtha wells, constantly worked since remote antiquity. Zante, the capital, is a finely situated and enterprising town, well provided with schools, churches, and public buildings. It has a good, though not deep, harbor protected by a mole, and carries on a large trade. Pop. (1889) of island, 44,070; of capital, 16,603.

EDWIN A. GROSVENOR.

Zanzibar', or **Zangnebar**: a sultanate of East Africa under British protection. It formerly consisted of coast islands and possessions on the mainland that were acquired by Imams of Muscat from the Portuguese and from native chiefs between 1698 and 1807. The long strip of coast extending for 3 degrees of latitude N. of the equator and nearly 11 S. of it, together with the adjacent islands, has been the field of enterprise of Arabs from Muscat for three centuries. Here they planted their colonies, extended trade, established Islam, and gradually pushed their influence into the interior until their ivory and slave traders were found all through the region of the great lakes and over a wide area of the upper Congo. The Sultans of Zanzibar, direct descendants of the Imams of Muscat, were until recently the paramount influence on the coast to the upper Congo. Zanzibar has been independent of Muscat since 1861.

The largest island and center of trade of the sultanate is Zanzibar (area, 625 sq. miles). Other important islands are Pemba, Mafia, and Lamu, the total extent of the islands pertaining to the sultanate being about 1,200 sq. miles. Until 1890 about 12,000 sq. miles of coast regions were under the direct government of the sultan, though in 1884-90 the Germans and British acquired inland territories extending to the large lakes among numerous tribes who had not actually come under the sultan's authority. The sultan at first leased to these two powers a long coast strip, but later they acquired this territory in perpetuity, and finally Great Britain assumed a protectorate over Zanzibar (1890), and the independent state created by the Muscat Arabs has ceased to exist.

The island of Zanzibar has a population of about 150,000, of whom about 80,000 live at the capital, including 10,000 Arabs and 5,000 East Indians, the remainder being an admixture of coast and inland tribes, whose language, kiswahili, embraces, like their blood, many different elements, and is the *lingua franca* over a large part of equatorial Africa. The Arabs, who are the ruling element throughout the sultanate, are almost exclusively tradespeople, except W. of Lake Tanganyika, where they made large plantations. They established large interior towns—Tabora, Ujiji, Nyangwe, Kassongo, and others—and often remain for a long time or permanently in the interior. The capital for their enterprises is largely supplied by the Indian merchants of Zanzibar and the coast towns, who receive an exorbitant rate of interest and usually contrive to keep the Arabs deeply in their debt.

The capital city, Zanzibar, is by far the largest center of trade in East Africa, and has been the starting-point of many of the most famous exploring expeditions. It was once the greatest slave-market, and is still the largest export ivory-market in the world. Most of the interior trade routes lead to Zanzibar or to a half dozen coast towns, N. and S., that are directly tributary to it and send their exports there for shipment. In 1893 the imports were valued at \$5,573,248, and the exports at \$4,869,890. The city was declared a free port in 1892. It is visited by about three merchant steamships a week. Pemba is famous for the production of cloves. The most important coast towns are Mombasa (pop. 12,000), now in the British domain, and Kilwa (10,000), Bagamoyo (10,000), Pangani, Saidani, Dar es Salaam, Lindi, Tanga, and Malindi, all in German East Africa. See GERMAN EAST AFRICA AND IBEA.

C. C. ADAMS.

Zapolya, zã-polyã: the name of a powerful Hungarian family of Slavonian origin which at one time maintained a protracted contest with the house of Hapsburg for the possession of the Hungarian crown. Stephen Zapolya, vojvoda of Transylvania, one of the generals of King Mathias Corvinus of Hungary, took a prominent part in the conquest of Austria and afterwards became its governor. After the king's death in 1490 he brought about the election of Wladislaw II. of the Jagellon family, but died in Jan., 1499, while preparing a great war against the Turks.—His son JOHANN ZAPOLYA, b. in 1487, was proclaimed King of Hungary in 1527 by one section of the nobles, while the other elected Ferdinand of Austria, against whom Zapolya maintained himself with the aid of the Turks in Transylvania and in Hungary beyond the Theiss. He died at Mühlentbach, July 22, 1540.—His son JOHANN ZAPOLYA II. (1540-71) introduced into Transylvania the Reformation, which was recognized in the Transylvanian diet by a state law as early as 1555. With the death of Johann II. the male line of the family of Zapolya became extinct. His daughter, Barbara Zapolya, became the wife of King Sigismund I. of Poland.

HERMANN SCHOENFELD.

Zapotees, tsã-põ-tek's, **Tzapotees**, or **Zapote'cos**: an important race of Indians in Southern Mexico. Before the Spanish conquest they were a powerful nation, occupying a region corresponding nearly to the modern state of Oaxaca, with portions of Guerrero. They resisted the Aztecs successfully, and only submitted to the Spaniards after several bloody campaigns 1522-27; two subsequent revolts were put down and they eventually gave up the struggle in 1551. The Zapotees were entirely distinct from the Aztecs by their language, but resembled them in many of their customs and in their method of computing numbers, calendar, etc. They were considerably advanced in civilization, building large towns of stone and mortar, using a cotton armor in warfare, and excelling in agriculture and many textile arts. Their religious system was elaborate, and they offered human

sacrifices to their idols. The ancient ruins of Mitla, etc., were supposed by them to be the tombs of their ancestors. The Zapotees still constitute a large part of the country population of Oaxaca, numbering about 260,000, or with the allied Mixtecs, etc. (Zapotec-Mixtec stock) nearly 700,000. Many of them speak only their own language and retain some of their ancient customs, but they are devout Roman Catholics, submissive to the whites, and excellent citizens. Some of them have attained wealth and positions of trust. A notable example was the Mexican reformer and president Juarez, who was a pure-blooded Zapotec.

H. H. S.

Zara, za'ra (Slav. *Zadar*): capital of the Austrian province of Dalmatia; on a narrow promontory jutting into the Adriatic; 130 miles S. E. of Trieste (see map of Austria-Hungary, ref. 10-E). It has a fine harbor and active commerce. In 1890 1,448 ships entered the harbor, with a tonnage of 376,674. It manufactures fine linen and silk, and the celebrated *maraschino* liquor of Zara from a peculiar bitter cherry, growing especially in the fields of Makarska, near Spalato. It is the seat of a Catholic archbishop and Greek bishop, and has a large college. The ancient cathedral in Roman-Lombard style, the San Donato church, and the *Porta di Terraferma*, are the most remarkable monuments. Pop. 14,500 (commune, 49,710).

H. S.

Zárate, thaar'ã-tã, AUGUSTIN, de: historian; b. in Spain about 1492. He was comptroller of Castile for fifteen years, and in 1543 went to Peru with the viceroy Blasco Núñez Vela with a special commission to examine the colonial finances. He witnessed many events of the civil wars, made a special study of the country and its history, and returned to Spain after the fall of Gonzalo Pizarro. In 1555 he published his *Historia del descubrimiento y conquista de la provincia del Perú*. This is one of the most valuable of the early works on Peruvian history, though somewhat biased and in parts inaccurate. There are many later editions in several languages. Zárate died about 1560.

H. H. S.

Zarathushtra: See ZOROASTER.

Zarneke, tsãrn'ke, FRIEDRICH: literary historian and philologist; b. in Zahrenstorf, near Brüel, in Mecklenburg-Schwerin, July 7, 1825. In 1848-50 he catalogued the famous Meusebach library at Alt-Geltow, near Potsdam, which was afterward purchased by the Prussian Government. In this work he attained a wide knowledge of mediæval literature. In 1850 he removed to Leipzig, where he established the *Litterarisches Centralblatt für Deutschland*, a weekly critical journal, which he edited until his death there Oct. 15, 1891. He was successively docent (1852), professor extraordinary (1853), and ordinary professor (1858). His great works were his edition of Brant's *Narrenschiff* (1854) and joint-editorship of Benecke's Middle High German lexicon (1863). Of his two great collections, his library became the property of Cornell University, Ithaca, N. Y., while his collections to illustrate Goethe's life and writings, the most extensive ever made, became the property of the city of Leipzig.

Zauschne'ria [Mod. Lat., named from M. Zauschner, a Bohemian botanist]: a perennial of the evening primrose family, with stem from 1 to 2 feet high and brilliant-colored flowers strongly resembling those of the fuchsia. It is a native of California. It blooms late in the summer and during the autumn, succeeds best in dry and sandy soil, and in the northern U. S. must be protected during winter.

Zavala, thaav'ãã, JOAQUIN: general and politician; b. in Nicaragua about 1839. He was a prominent army officer; was elected president of Nicaragua in 1879, and held the position during a peaceful and prosperous term until 1883. Subsequently he was minister to Washington. He led the revolt by which Sacaiza was deposed in May, 1893; was declared provisional president July 17, but was deposed by another revolution within two weeks.

H. H. S.

Ze'a (or *Zia*, Gr. *Κέα*, Lat. *Ce'a*, *C'ia*): island in the Ægean Sea; one of the Cyclades; 12 miles E. from Cape Sardinia. It is healthful, fertile, and well cultivated, producing cotton, wine, and figs. Pop. (1889) 3,863. E. A. G.

Zea, thã'ã, FRANCISCO ANTONIO: naturalist and statesman; b. at Medellín, New Granada (Colombia), Oct. 21, 1770. He studied at the College of Popayan, and subsequently was associated with Mutis in botanical explorations. In 1795 he was arrested and sent to Spain on a charge of circulating republican pamphlets; he was acquitted in 1799, but forbidden to return to New Granada. For many years he continued his botanical studies in Europe; but his republican principles were unshaken, and eventually, in 1815,

he joined Bolivar in Jamaica, passing with him to Venezuela. The congress of Angostura (1819) elected him vice-president of Colombia, but in the succeeding year he went to Europe as special envoy of the republic to England and France. D. at Bath, England, Nov. 28, 1822. Zea has been called, not inaptly, the "Franklin of Colombia." Besides various scientific papers, he published a *Historia de Colombia* (1821).

Zealand: Dutch province. (See ZEELAND.) Also a Danish island (Sjælland). See SEELAND.

Zealots [from Gr. *ζηλότης*, deriv. of *ζῆλος*, zeal; cf. *ζεῖν*, boil]: a fanatical Jewish sect which struggled desperately against the Romans from about 6 A. D., when Judas the Gaulonite headed a revolt, till the fall of Jerusalem, in the year 70. Beginning as intense Jews, they became robbers and murderers of their political opponents, and after Felix had cruelly endeavored to suppress them by crucifying all he could catch of them they armed themselves with short daggers (*sicae*) and continued their murderous work on a larger scale. Hence they are known as the Sicarii. They kept alive the hatred of the Romans, which flamed out in the Jewish war, and they contributed much to the horrors of the siege of Jerusalem. Their literary memorial is the *Assumptio Moysis*. See Josephus, *War*, iv., and Schürer, *Jewish People*, *passim*.

Zeballos, thā-baal yōs, PEDRO, de (often written *Ceballos*; in full, *Zeballos Cortés y Calderón*): general and administrator; b. at Cadiz, Spain, June 29, 1715. He entered the army as captain of cavalry in 1738, distinguished himself in Italy and elsewhere, and became lieutenant-general in 1755. In 1766 he was sent to the Rio de la Plata as governor of Buenos Ayres, taking out a considerable re-enforcement of troops. War having broken out with Portugal and England in 1762, Zeballos laid siege to the Portuguese post of Colonia de Sacramento, near the mouth of the Uruguay, forcing its surrender Nov. 2, 1762; twenty-six English ships were captured in the harbor. Zeballos was relieved in Aug., 1766, and returned to Spain. In 1776 he was appointed viceroy of the newly created viceroyalty of La Plata. On his way out he took Santa Catharina from the Portuguese (Feb., 1777), and retook and destroyed Colonia de Sacramento, which had reverted to Portugal. He governed wisely until relieved in 1778. D. at Cordova, Spain, Dec. 26, 1778. HERBERT H. SMITH.

Zebid (*Sabea Regia* of Ptolemy): town in Yemen, Arabia; on the Zebid; 60 miles N. of Mocha. It is the seat of a Sunnite college, and manufactures colored cotton fabrics. In consequence of inundations and of the obstruction of its harbor by silt, its prosperity and trade have greatly diminished. Pop. about 5,000. E. A. G.

Zebō'im [from Heb. *Tsēbō'im*; cf. *tsēbū'im*, gazelles, and *tsēbō'im*, hyenas]: (1) one of the five "cities of the plain" (*Gen. x. 19, xiv. 2*; Hosea xi. 8)—Sodom, Gomorrah, Zoar, Admah, and Zeboim—all of which, except Zoar (See ZOAR), were destroyed (*Gen. xix. 28, 29*; Deut. xxix. 23). (2) A place of unknown locality. The name is differently spelled from (1). It is mentioned only in Neh. xi. 34. (3) A valley in Benjamin near Gibeah (1 Sam. xiii. 18), perhaps identical with the "valley of the hyenas" near Jericho. S. M. J.

Zebra [= Portug. *zebra*, from African name]: any one of the striped wild asses of Africa, but more particularly the mountain or true zebra (*Equus zebra*), a species found in the mountainous regions of South Africa, and in danger of extermination. It is about 4 feet high at the shoulders, of a creamy white color, cross-striped with black on the head, trunk, and legs, except on the belly and inside of thighs; the tail is tufted and blackish at the end. A closely related species (*E. grevyi*) occurs in Northeast Africa. Burchell's zebra (*E. burchelli*) is a commoner animal, occupying the central regions of Africa, readily distinguished from the true zebra by its larger size and the absence or faintness of the cross stripes on the lower part of the legs. It is known as DAUW (*q. v.*) by the Dutch colonists. The quagga (*E. quagga*) has no bands on the hinder portion of the body nor on the legs. The name *quagga* is also employed for Burchell's zebra. Although so conspicuously marked, the zebra is said to readily escape detection when lying down, as the stripes of the legs then blend with those of the body, the general effect being that of flecks of shadow on a light ground. Zebras are very wild and untamable, although occasionally broken to harness. F. A. LUCAS.

Zebra Wolf: See TASMANIAN WOLF.

Zebra-wood: a beautiful striped wood; used for veneering; is produced in Guiana by *Connarus guianensis* (or *Omphalobium lambertii*), a large tree of the family *Connaraceae*, and in the West Indies by *Eugenia fragrans* of the family *Myrtaceae*. L. H. B.

Zebu: book-name for the common domesticated ox of India, found also in China and East Africa, the name not being used in India. It differs from the common ox of Europe and America in having one, or more rarely two, humps of fat on the shoulders, and in having 18 caudal vertebrae, while our cattle have 21. The Brahman cow goes with young 300 days, the common cow 270. Hence the zebu is assigned to another species, *Bos indicus*. Nevertheless it breeds freely with the common cattle. The zebu is of several breeds, varying much in size. The beef is of fair quality, and the hump is prized. Zebus are trained to draw carriages, to plow, and to serve as beasts of burden. To this stock belong the Brahminy or sacred bulls of Shiva.

Revised by F. A. LUCAS.

Zebú, or **Cebú**, Span. pron. thā-boo': one of the Visaya group of the Philippine islands; in the Malay Archipelago, E. of Negros; in lat. 9° 20' N., lon. 113° E., and forms, together with the islands of Matan and Bohol, a province with about 430,000 inhabitants. The capital, Zebú, is a large and well-built town, with 34,000 inhabitants, a fine cathedral, a handsome episcopal palace, and a good trade in the products of the islands. It is an open port.

Zeb'ulon [from Heb. *Zebulūn*, *Zēbūlūn*, *Zībūlūn*, liter., habitation, deriv. of *zēbāl*, habitation]: the tenth of the twelve sons of Jacob, the sixth and last by Leah. His personal history is a blank. In the exodus from Egypt the tribe of Zebulon marched in the van, next after Judah and Issachar, just ahead of the six wagons which carried the hangings, planks, and pillars of the tabernacle. The territory of the tribe in Palestine was bounded on the E. by the southern half of the Lake of Galilee, beginning just above the site of Tiberias, and included Nazareth and Rimmon, but especially the very fertile plain of *Buttauf* (10 miles from E. to W. and 5 from N. to S.), on whose northern edge, according to Robinson, stood Cana of Galilee (*Josh. xix. 10-16*). It disobeyed the divine command, and did not drive the Philistines from its territory, but brought them under tribute (*Jud. i. 30*). It answered the rallying-cry of Gideon (*Judges vi. 35*), and joined in the crowning of King David (1 Chron. xii. 33, 40). It ceased to exist as a tribe when Tiglath-Pileser carried the principal people of it into captivity (2 Kings xv. 29). But in its territory Jesus preached the most of the time (*Matt. iv. 12-16*), fulfilling Isa. ix. 1, 2.

Revised by S. M. JACKSON.

Zechari'ah [from Heb. *Zēkharyāh*, liter., whom Jehovah remembers]: the eleventh in order of the twelve minor prophets in the Old Testament. In its text the book is formally divided into five discourses. The first (i. 1-6) is dated the eighth month of B. C. 520 (*ver. 1*). The second (i. 7-vi. 15) is an account of a series of eight visions seen the twenty-fourth day of the eleventh month of the same year (i. 7)—that is, the latter part of Feb., B. C. 519. The third discourse (vii.-viii.) is dated two years later, the fourth day of the ninth month, and is perhaps a summary of several prophecies. There is, of course, no doubt that these three discourses belong to the time when Zerubbabel and Jeshua were building the second temple. The fourth discourse (ix.-xi.) is not formally dated, but is entitled *The Burden of the Word of Jehovah in the Land of Hadrach*. The fifth is without date, entitled *The Burden of the Word of Jehovah upon Israel* (xii.-xiv.). The fourth and fifth discourses differ linguistically from the first three. They present a situation in which Northern Israel is yet in existence, separate from Judah, as a political power, and in which Assyria is the great national enemy (ix. 10, 13, x. 6, 7, 10-11, xi. 14, etc.). The details of the fourth discourse fit a time in the later years of Uzziah (2 Kings xv. 17, *seq.*), and those of the fifth discourse fit the time after the death of Uzziah and just before the accession of Ahaz (2 Kings xv. 37; *Zech. xiv. 5*, etc.).

On this showing the opinions of scholars are divided. Many insist upon the unity of the book, whether they can reasonably account for the differences or not. Others regard the last two discourses as some generations later than the first three, and consider the allusions to Ephraim and Assyria as allegorical. Far more simple and probable, however, is the theory that the fourth and fifth discourses are genuine earlier prophecies (perhaps by the Zechariah of

2 Chron. xxvi. 5 or of 2 Chron. xxix. 13 [cf. Isa. viii. 2], or by the two), which have been appended to the book of the prophecies of the post-exilian Zechariah. The witness named in Isa. viii. 2 was the son of Jeberechiah, and the prophet named in Zech. i. 1 was the son of Berechiah, a mere variant of the other.

As to the personal history of the post-exilian prophet Zechariah, we only know that he was active, along with his colleague Haggai, in encouraging the leaders of the Jews in the work of temple-building (Ezra v. 1, vi. 14). Perhaps we should infer from Matt. xxiii. 35, Luke xi. 51 that he met later a tragic death at the hands of the people to whom he prophesied, though many think this reference to be to the earlier prophet of the days of Joash of Judah (2 Chron. xxiv. 20-22). That he was a priest is to be inferred from Neh. xii. 16.

It is probable that there existed, early in the Christian era, copies of the major and minor prophets, bound up together, some of them having Jeremiah for the first book in the volume and some having Isaiah for the first; and that it was a frequent thing to call the whole volume by the name of the book that was placed first. This affords the best explanation of the fact that Zech. xi. 12-13 is quoted as from Jeremiah in Matt. xxvii. 9-10. This is altogether parallel with the citing of a passage from Malachi as from Isaiah (Mark i. 2, Rev. Ver.).

Of commentaries on Zechariah, one of the fullest is that by Charles H. H. Wright, *Zechariah and his Prophecies* (1879). See also that by the Ven. T. T. Powrie, D. D., in the *Cambridge Bible for Schools*. W. J. BEECHER.

Zedekiah: See JEWS (*Kingdom of Judah*).

Zedoary [: Fr. *zédouaire* : Ital. *zedoaria*, from Arab. *zedwār*]: the warm aromatic root (rhizome) of certain East Indian plants of the family *Zingiberaceæ*. The long zedoary is from *Curcuma zerumbet*. Round zedoary is from *Curcuma zedoaria* and *Kaempferia rotunda*. Zedoary, like cassimuniar, galangale, and zerumbet, considerably resembles ginger, but the latter is so much superior to them all as to have crowded them entirely out of general commerce.

Revised by L. H. BAILEY.

Zee'land, or Zealand: province of the Netherlands; bounded S. by Belgium and W. by the North Sea; consists of the islands of Walcheren, Beveland, Tholen, Duiveland, and Schouwen; between the mouths of the Maas and the Scheldt. Area, 690 sq. miles. The ground is very low, and must be protected against inundation by dikes, but the soil is very fertile. Large crops of wheat, oats, potatoes, beans, madder, and tobacco are raised, and cattle, sheep, and pigs are extensively reared. The fisheries are valuable and the manufacturing industry is considerable. Pop. (1893) 204,561. Middelburg is the capital. The other important towns are Flushing, Zierikzee, and Goes.

Revised by M. W. HARRINGTON.

Zeilah, zā'lāh: an African port on the southwest side of the Gulf of Aden (Somali coast); ceded to Egypt by Turkey in 1875 (see map of Africa, ref. 4-11). Since 1890 the whole north coast of Somali Land has been under British protection, and the two ports of Zeilah and Berbera are now held by the British, and are of much importance as gateways for the growing commerce of Northern Somali Land, a considerable part of which is fertile and populous. Though Zeilah is inferior to Berbera in position and advantages, it has greatly improved since the advent of the British made trade safe in the surrounding region. Pop. about 16,000.

Revised by C. C. ADAMS.

Zeisberger, tsis'bärg-er, DAVID: Moravian missionary; b. at Zauchtenthal, Moravia, Apr. 11, 1721; in 1740 emigrated to Georgia. After studying Indian languages at Bethlehem, Pa., he began in 1743 his missionary work among the Indians, which he continued with unabated energy for more than sixty years. In 1771 he established a mission on the Muskingum river in Ohio, but ten years later the settlements of Christian Indians were broken up by Wyandot warriors. When, in 1796, Congress granted to the Moravian Indians the tract of land in Ohio which they had formerly occupied, Zeisberger was able to return to the place with a considerable number of converts and built the town of Goshen, where he died Nov. 17, 1808. He published a spelling-book (Philadelphia, 1776); a collection of hymns (1803); *Sermons to Children* (1803); and a *Harmony of the Four Gospels* (1821), in Delaware. A *Dictionary in German and Delaware* was published in 1887 (Cambridge) and *Essay*

toward an Onondaga Grammar in 1888 (Philadelphia). See de Schweinitz, *Life and Times of David Zeisberger* (Philadelphia, 1870), and *Diary of David Zeisberger 1781-98* (Cincinnati, 1888).

Zeititz, tsits: town; in the Prussian province of Saxony, in the circuit of Merseburg; on the White Elster, right affluent of the Saale; station of three state railways, 22 miles S. W. of Leipzig (see map of German Empire, ref. 4-F). The river is here crossed by four bridges, two of iron, one of stone, one of wood. The upper and the lower town are connected by a cable line. Zeititz has numerous manufactures of cottons and wooleus, carriages, machinery, pianos, vinegar, sugar, spirits, cigars, and extensive wood-carving; dyeing and calico-printing are carried on. Considerable lignite deposits in the vicinity are utilized by mineral-oil factories. The city has four old churches, a gymnasium in the ancient Franciscan cloister with a library of 20,000 volumes, and other educational and charitable institutions. The bishopric Zeititz was founded by Otto I. in 968 for the conversion of the pagan WENDS (*q. v.*). Pop. (1890) 21,680. HERMANN SCHOENFELD.

* **Zelâ**: See RABAT.

Zelaya, thā-l'yaā, JOSÉ SANTOS: general and politician; b. at Managua, Nicaragua, about 1845. He was educated in England, joined the Nicaraguan army, was commissioned general in 1885, and was a man of wealth and a leader of the liberal party. In Apr.-June, 1893, he joined Zavala in the revolt by which President Sacaça was overthrown; but Zavala having been made provisional president, Zelaya revolted and forced him to resign at the end of July. A convention was then called which promulgated a new constitution, and under this Gen. Zelaya was elected president, with practically dictatorial powers, Sept. 17, 1893. In 1894 he occupied the Mosquito territory, and in May, 1895, the port of Corinto was held for a few days by a British force, in security for payment of indemnity claimed on account of the murder of a British subject; Nicaragua agreed to make the payment, and the force was withdrawn. II. 11. S.

Zelle: See CELLE.

Zeller, tseler, EDUARD: philosopher and theologian; b. at Kleinbottwar, a village of Württemberg, Jan. 22, 1814; studied theology and philosophy at Tübingen under Baur and Strauss (whose life he subsequently wrote), at Berlin under Marheinecke, Neander, and Gans; privat docent at Tübingen in 1840, where he founded the *Theologische Jahrbücher*, which was continued till 1857, and formed the principal organ of the so-called Tübingen school of theology; called to Berne in 1847, to Marburg in 1849, to Heidelberg in 1862, and finally to Berlin in 1872. He resigned in 1894, retiring to Stuttgart. His *Philosophie der Griechen* (5 vols.; translated into English, French, and Italian) is a masterpiece of classical scholarship. A compendium of this large work, for the use of younger students, was published in a third edition in 1889. ALFRED GÜDEMAN.

Zeller, Fr. pron. zellār, JULES SYLVAIX: historian; b. in Paris, Apr. 23, 1820; studied in his native city, and subsequently in Germany; taught history in the lycées of Bordeaux, Rennes, Strassburg, and Aix, and was appointed Professor of History at the Normal School of Paris in 1858, and of the École Polytechnique in 1869. He wrote *Ulrich de Huttin* (1849); *Histoire de l'Italie* (1852; 3d ed. 1875); *Épisodes dramatiques de l'Histoire d'Italie* (1855); *L'Année historique* (4 vols., 1860-63); *Les Empereurs romains* (1863); *Histoire d'Allemagne* (1872, et seq.); and other works. Revised by A. G. CANFIELD.

Zena'na [= Hind. *zenāna*, *zanāna* = Pers. *zanāna*, deriv. of *zan*, woman; Gr. *γυνή*, woman; Eng. *queen*]: that portion of the house of a high caste family of India which is devoted entirely to the use of the women and girls. Like the portion which belongs to the gentlemen, the *zenana*, or inner portion, is in the shape of a hollow square, with an open court in the center—the men's building toward the street, the women's back of it. The house is usually from two to three stories high, with verandas on each story running round the inner part opening on to the open court in the center. In the *zenana* there will sometimes be from fifty to a hundred ladies, or even more, all belonging to one family, yet all of them wives of different individuals. They have no common parlor or sitting-room elegantly furnished, like the ladies of the Turkish harem, but each one has her own little room, where she lives all her life and brings up her children, though she is permitted to go into any room

to visit the other women in the zenana, and the work-rooms and open court in the center of the building are free to them all. But she must never go out into the outer portion of the building, that which belongs to the gentlemen, as it is considered the greatest disgrace to be seen by any other man besides her own husband. Therefore, too, no man can enter the zenana, except that late at night he may go to his wife's room, after every woman has retired to her own apartment.

The lower rooms of the building are used as cooking-rooms and cow-sheds. When the birth of a child is expected, the poor mother is not allowed even the poor comforts of her own room, but is brought down and made to share the cow-shed with the cow, simply a strip of matting being placed between them, and here she has to remain for twenty-eight days. All this time she is considered polluted, and no one must speak to her but the low-caste coolie-woman who has acted as midwife. She must never have a doctor, no matter how great may be her sufferings. The little girls are married when they are six or seven years old, and most generally are mothers before they are quite eleven years of age. The son always lives in his father's house, and his little bride is taken there, so that often there are five or six generations living in one house. If the quarters become too straitened, another hollow square is built on, or another story is added to the buildings; some of the larger buildings have three or four of these inner courts, all belonging to the one zenana. Revised by R. LILLEY.

Zend-Avesta: See AVESTA.

Zenick: See SURICATE.

Zenith [from O. Fr. *cenith*, from Span. *zenit*, O. Span. *zenith*, from Arab. *sent* in *sent urras*, zenith, liter., way of the head]; the point in the celestial sphere directly over the head of the observer; the opposite of the *nadir*.

Zenith Telescope: an astronomical instrument for measuring small differences between the zenith distances of two stars passing the meridian on opposite sides of the zenith: the one north, the other south. It was designed by Capt. Andrew Talcott, U. S. Engineers, about the year 1834, and the method of determining the latitude, in which it is principally used, is hence known as *Talcott's method*. The principle of the method, however, is two centuries old, having been conceived and published by the Danish astronomer, Horreboe. The results obtained with this portable instrument rival in accuracy those of the instruments of a fixed observatory. The figure represents a zenith telescope of the Coast Survey, having an aperture of about $3\frac{1}{2}$ inches, a focal length of about 45 inches, and a magnifying power varying between 120 and 160. The tube rotates around a horizontal axis, Q, and is counter poised by a weight at O. A striding-level at S indicates the deviation of this axis from horizontality. The essential parts of the instrument consist of the sensitive level, L, and the micrometer, E. The level is

Zenith telescope.

connected with the telescope, so that the inclination of its line of collimation may be known. The graduated semicircle K is attached to the tube, and by means of the vernier H, which is attached by an arm to the movable level L, zenith distances can be read to within $30'$. The micrometer-screw is used for measuring apparent differences of zenith distance when the telescope is pointed alternately from the first star to the second star of a pair which culminate at opposite zenith distances, differing from each other

by less than the diameter of the field of view of the telescope. The value of one revolution of the screw is about $45'$, and the value of one division of the level L is about three-fourths of a second.

In recent times the instrument has acquired new importance from its use in measuring the minute changes of latitude to which all places on the earth's surface are now known to be subject. Revised by SIMON NEWCOMB.

Zenkoji, zen'kō jō', or Nagano: town of Central Japan; on the through railway from Tokio to the west coast; the capital of the province of Shinshu. It is finely situated close to the swift Nagano river, and at the foot of lofty mountains. Its Buddhist temple is one of the most famous in Japan, and resorted to by thousands of pilgrims; it is dedicated to Amida and his two followers, Kwannon and Daiseishi; the sacred group of their images is a treasured relic. The greatest feast is held on July 31. In 1847 a desolating earthquake visited the city and neighborhood, ruining 15,000 acres of arable land, blocking up the river, and causing the death of 30,000 persons. Zenkoji has considerable trade in woven goods and agricultural implements. Pop. (1894) 28,751. J. M. DIXON.

Zē'no: emperor of the Eastern empire (474-491); was an Isaurian by birth; married in 469 Ariadne, a daughter of the Emperor Leo I. On the death of Leo I, the succession was fixed on Leo II, a son of Zeno and Ariadne, but as Leo II, died in the same year as Leo I, in 474, Zeno came into possession of the crown. His reign was disturbed by contests with his rivals and by several revolts. The Goths were especially troublesome, but the emperor finally got rid of them by commissioning their chief, Theodoric, to conquer Italy and expel the usurper Odoacer. An important event of his reign was his issuance of the *Henoticon* or decree of union (482) designed to put an end to the Monophysite controversy. It reaffirmed the doctrines of the Nicene Creed, and renewed the condemnation of Nestorius and Eutyches, but was ambiguously worded on the main point at issue, i. e. the duality of natures in Christ. D. in 491.

Zeno, APOSTOLO: dramatist and historian; b. at Venice, Dec. 11, 1668; devoted himself to literature, and acquired great fame by his dramatic compositions; founded in 1710 the celebrated periodical, *Giornale dei Letterati d'Italia*; went in 1718 to Vienna as court-poet and historiographer; returned in 1729 to Venice, and died there Nov. 11, 1750. His dramatic works were published in 10 vols. at Venice in 1744. Among his other works are *Dissertazioni storico-critiche* (2 vols., 1752-53), and *Epistole* (6 vols., 1785).

Revised by A. G. CANFIELD.

Zeno'bia: Queen of Palmyra. The daughter of a Syrian chieftain, she married Odenathus, who from a private station became Prince of Palmyra, and virtual master of the East, and who, because of his brilliant campaigns against the Persians, was declared Augustus and coregent of the empire by Gallienus. In 267 Odenathus was murdered by his nephew Maonius. Thereupon Zenobia assumed the title of Queen of the East, asserted her independence of Rome, defeated the Roman general Heracianus, and extended her authority over Syria, parts of Asia Minor, Mesopotamia, and Egypt. Aurelian marched against her in 272. He won the two pitched battles of Antioch and Emesa, where she commanded in person, and then besieged Palmyra, which she defended with desperation. Finally, Zenobia fled from her capital to seek the assistance of the Persians, but was captured on the Euphrates. Her subsequent history is involved in obscurity. The commonly received account represents her as a captive, laden with jewels and silver chains, and walking before Aurelian's chariot on his triumphal entry into Rome in 273; then as living as a Roman matron in a villa near Tibur, and marrying her daughters to Roman patricians. Another account says that she starved herself to death after her capture. Her son received a principality near the Armenian frontier. Zenobia was a woman of extraordinary beauty and accomplishments. She spoke Greek, Latin, Syriac, and Coptic. She was brave and wise in battle, judicious in the council chamber, and economical and shrewd in administration. She is perhaps the only woman in the East "whose superior genius broke through the servile indolence imposed on her sex by the climate and manners of Asia." EDWIN A. GROSVENOR.

Zeno of Elea: philosopher; b. about the beginning of the fifth century B. C. at Elea; a friend and disciple of Parmenides, whose doctrines he supported by indirect demon-

stration (*reductio ad absurdum*); is reported to have been adopted as a son by Parmenides, who was twenty-five years his senior. Aristotle names him as the father of dialectics, from the circumstance that his arguments in favor of the Eleatic doctrine of Being were based upon the self-refutation of its opposite. This negative dialectic established the truth of Being as One, by showing the contradiction inherent in the hypotheses (a) of motion, (b) of multiplicity, (c) of sense-perception: "The flying arrow is at rest, because at every moment it is only in one place"; "Achilles can not overtake the tortoise, because as often as he reaches the place occupied by the tortoise the previous moment, the latter has left it"; "Motion can not begin, because a body can not arrive at a given place before it has passed through an infinite number of intermediate spaces." Aristotle in his *Physics* (vi.) pointed out the fallacy in his arguments against the reality of motion. In Plato's *Parmenides* a writing of Zeno's is referred to as containing a prolix argument to prove that Being is One, but this writing has been lost. Strabo reports him to have participated in the ethico-political efforts of Parmenides, and we are told by Diogenes Laertius that, being unsuccessful in that, he was taken by Nearchus the tyrant and put to a cruel death. Zeller's *Pre-Socratic Philosophy*, vol. i., gives what is known of him and his doctrines. WILLIAM T. HARRIS.

Zeno Ridolfo: See **SCHADOW**, **RUDOLPH**.

Zenos, **ANDREW CONSTANTINIDES**, D. D.: educator; b. at Constantinople, Turkey, Aug. 13, 1855; was educated at Robert College, Constantinople, Princeton College and Seminary; pastor of the Presbyterian church at Brandt, Pa., 1881-83; Professor of the Greek Language and Literature in Lake Forest University 1883-88; of New Testament Literature and Exegesis in Hartford Theological Seminary 1888-91; of Biblical and Ecclesiastical History in McCormick Seminary 1891-94, and since 1894 Professor of Biblical Theology. Dr. Zenos has published an edition of Xenophon's *Anabasis* (Boston, 1888) and a translation of *Socrates's Ecclesiastical History*, in vol. ii. of the Nicene and Post-Nicene Fathers (New York, 1890). C. K. HOYT.

Zeno the Stoic: b. about 350 B. C.; son of a Phœnician merchant residing in Cittium, a Greek city on the island of Cyprus; was occupied in commerce until near his thirtieth year, when a shipwreck caused him to visit Athens, where he read the works of Xenophon and Plato, and conceived a great admiration for their master, Socrates, and accordingly became a disciple of Crates the Cynic, who imitated the external peculiarities of Socrates. Becoming satiated with this phase of the Socratic school, he resorted to Stilpo the Megarian, who initiated him into the dialectics by which the nugatoriness of sense-perception is exhibited. He afterward joined Xenocrates and Polemon of the first Academic school, and about the year 310 B. C. founded his own school in the *Στοὰ ποικίλη* (porch adorned with paintings by Polygnotus), whence the name "Stoic" arose. He taught fifty-eight years, according to Apollonius, dying about 258 B. C., by his own hand. Diogenes Laertius (vii.) mentions a number of works attributed to him, but none of them have been preserved. His doctrines were considered by the ancients to be not so much new in substance as new in terminology. He combined the ethics of the Cynic school with the physics of Pythagoras and Heraclitus, and introduced a modified logic. See **STOICS**. WILLIAM T. HARRIS.

Zé'olite [from Gr. ζέω, to boil + λίθος, stone]: the name of a large group of minerals which swell up under the blow-pipe, whence the name. They are generally hydrated double silicates in which the principal bases are sodium or aluminum and calcium; are decomposed by acids, sometimes with gelatinization; and are mostly crystalline or sub-crystalline. They are often deposited in cavities in plutonic rocks, and have been found infiltrating ancient walls built by man. They are formed from watery solutions.

Zephani'ah [from Heb. *Tsephanyáh*, liter., whom Jehovah hid, i. e. defended]: the ninth in order of the minor Hebrew prophets; was great-great-grandson to Hezekiah, perhaps the king of that name, and prophesied under Josiah 638-608 B. C. (Zeph. i. 1). The book, like Joel and Obadiah, is a monograph on "the day of Jehovah" (i. 7-11, 14-18, iii. 8, 11, 16, 19, 20), containing a threat of judgment (i.), an exhortation to repentance (ii. 1-iii. 8), and a promise of salvation (iii. 9-20). It probably belongs to the early reign of Josiah, after the partial reformation of the later years of Manasseh. W. J. B.

Zerafshan': one of the gold-bearing rivers of Bokhara; the main stream of the Russian district of Zerafshan, which was formed in 1868, enlarged in 1870, and now comprises an area of 1,756 sq. miles. It rises under the name of Masja at the foot of an immense glacier of the Alai range, and passes through the Lake of Iskander. In its upper course it is a wild mountain stream; during its middle course it irrigates extensive rice and cotton fields, orchards and mulberry plantations, for which purpose it is led into numerous canals above Samarkand to the city of Bokhara. A little to the E. of Samarkand it sends out a northern branch, which after several miles of fertilization is absorbed in the sand; the southern branch, which is connected with the Amu by irrigating canals, has recently lost itself also among the steadily extending sand wastes; consequently the country is being more and more depopulated, about 100,000 Tajiks (of Persian origin) and Uzbeks (of Turkish origin) having removed since the Russian dominion over the country. Since the capture of Tashkent by the Russians in 1865 and of Samarkand in May, 1868, and through the command of the upper Zerafshan, the whole country has been practically under Russian sway, and has belonged to Russian Turkestan since the annexation of Merv in 1884.

Revised by HERMANN SCHOENFELD.

Zeram: See **CERAM**.

Zerbst, tserbst: district town; in the duchy of Anhalt, Germany; formerly capital of the principality of Anhalt-Zerbst; on the Nuthe; 11 miles N. W. of Dessau, on the Magdeburg-Leipzig railway line (see map of German Empire, ref. 4-F). It has manufactures of gold and silver ware, machinery, carriages, chemicals, soap, spirits, and beer; market-gardening is extensively cultivated. The beautiful castle (built 1681-1750) was the residence of the ruling family till 1793; it now contains the ducal archives with documents dating back to 941. There are five churches, a gymnasium, a quaint old town-hall which contains a parchment Bible of 1541 with paintings by Lukas Cranach and others. Zerbst is an ancient town, which became part of the Brandenburg bishopric in 949. Pop. (1890) 16,181.

HERMANN SCHOENFELD.

Zero [from Fr. *zéro*, from Ital. *zero*, *zifro*, from Amb. *zifru*, *zafrau*, empty, cipher, zero]: in physics, the point in space or time which serves as the origin or base of measurements. Thus upon a linear scale there is always a zero reading from which the count is made.

It follows that the zero is always arbitrary and relative, although in some cases it takes on a semblance of absolute character. An example is the so-called *absolute scale* of temperature (see articles **THERMOMETER** and **THERMOMETRY**), which is defined as follows: Suppose a cylinder to contain a perfect gas. If the volumes of the gas at the temperatures of melting ice and of boiling water respectively be noted and the same be indicated by lines upon the cylinder at proper distances from the closed end, and if the intervening space be divided into one hundred parts, each of these will be a degree of the centigrade scale. The division may, however, be carried downward, in which case it will be found that the 273d division below that corresponding to the ice-point coincides with the bottom of the cylinder. The point - 273 C. is therefore called the *absolute zero*.

Familiar examples of purely arbitrary zeros are that of the Fahrenheit thermometer, the various meridians from which longitude is counted, the zero of the daily counting of time, etc. The choice of such points of reference is sometimes dictated by considerations of symmetry, sometimes by practical convenience; the most important consideration being that the zero should be capable of definition in a simple and unmistakable manner. E. L. N.

Zerrahn, CARL: orchestral conductor; b. at Malchow, Mecklenburg, Germany, July 28, 1826; removed to the U. S. in 1848 as flutist in the Germania Orchestra, a body of young musicians, the majority of whom had left their native land on account of the revolution of 1848. Zerrahn was appointed conductor of the Boston Handel and Haydn Society in 1854, a position which he still retains. Until 1882 he was conductor of the Harvard symphony concerts. He is conductor of the annual festivals at Worcester, Mass., and his influence has been widely felt throughout New England as a promoter of choral and orchestral societies. D. B.

Zerub'babel [from Heb. *Zerubbâbel*, either from *zrûb-hâbhel*, scattered to Babylon, or from *zrû'a bâbel*, born at Babylon]: the prince of the tribe of Judah and civil (Joshua

being the sacerdotal head of the first Jewish colony returning from the captivity in Babylon by permission of Cyrus, 536 B. C. (Ezra ii. 2, 64), under whom the second temple was built.

Zetland Islands: See SHETLAND ISLANDS.

Zet'terstedt, JOHAN WILHELM: naturalist; b. in the circle of Östergötland, Sweden, May 20, 1785; studied natural history, especially botany, and subsequently also entomology, at the University of Lund; began to lecture there in 1810; was appointed professor in 1839; retired in 1853. He visited Öland in 1811 and 1817, Gotland in 1819 and 1841, and made extensive travels in Lappland in 1821, 1832, and 1840. Besides reports of his travels and minor essays, he published *De Plantis rarioribus Romanorum* (1808); *Dissertatio de Fecundatione Plantarum* (3 vols., Lund, 1810-12); *Orthoptera Suecica* (Lund, 1821); *Fauna Insectorum Lapponica* (Hamburg, 1828); *Monographia Scatophagorum Scandinaviae* (Paris, 1835); *Insecta Lapponica* (Leipzig, 1838-40); *Diptera Scandinaviae* (14 vols., Lund, 1842-60). D. at Lund, Dec. 23, 1874.

Zettinie: See CETTINJE.

Zengiodon'tia [Mod. Lat.; Gr. ζέγγιον, strap or loop of a yoke + ὀδούς, ὀδόντος, tooth]: a group of extinct mutilate mammals, generally regarded as a sub-order of the order Cete, but sometimes raised to independent ordinal rank. The distinctive characters were as follows: The skull was much more like the ordinary mammalian type than it is in either of the existing sub-orders; the intermaxillaries were expanded forward, normally interposed between the supra-maxillaries, and formed the terminal as well as anterior portion of the lateral margins of the upper jaw; the nasal apertures opened more or less anteriorly, and never so far backward as in the Denticete or Mysticete; the olfactory organs must consequently have been moderately developed; the lower jaw had the rami connected by suture at the symphysis; the teeth approached to the normal mammalian type, the dental formula being $I. \frac{3}{3} C. \frac{1}{1} PM + M \frac{5-6}{5-6}$, and those of the supramaxillary were mostly two or three rooted; the roots were so large and connected by the crowns in some of the species to such an extent as to have produced the resemblance to a yoke to which the ordinal name alludes. The fore limbs were modified into short paddles; no traces of hind limbs have as yet been found. The representatives of the order existed during the Tertiary epoch, and ranged from the Eocene to the Pliocene. They are supposed to have been derived from the same common progenitors as the seals, but this supposition remains to be verified. Some of the species attained a gigantic size; e. g. *Zengiodon cetoides* of the Jackson beds (Middle Eocene) of the U. S., of which remains found indicate a length of over 70 feet, while others were little larger than porpoises. They were prevalent in ancient times almost if not quite as extensively as the living cetacean types, remains having been found in North and South America, as well as Europe and Asia. They have been differentiated into two families—*Zengiodontidae* and *Cynorhidae*. Revised by F. A. Lucas.

Zeus (in Gr. Ζεύς): the chief god of the Grecian mythology. He is fundamentally the god of the light of day; he reigns in heaven the king of gods, and sits enthroned in ether on high mountains, where he gathers the clouds and sends forth the rain and the storm. He is the son of Cronus and Rhea. Cronus had been warned by the Titans that he would be robbed of throne and virility alike by his children. He therefore swallowed his children as they were born. But when Rhea was delivered of Zeus, she followed the advice of GAIA (*q. v.*) and substituted a stone for the child, who was secretly reared in a cave on Mt. Ida in Crete by a nymph, Amalthea, while the Corybantes and Curetes eluded their weapons in order to prevent the cries of the infant god from reaching the ears of Cronus. At the end of one year Zeus was powerful enough to attack his father, to whom, at the suggestion of Metis (wisdom), he gave an emetic, and thus caused him to vomit forth the elder brothers and sisters of Zeus. With the help of the Hundred-handed and the Cyclopes the youthful gods overcame the Titans, and Zeus unmanned and deposed his father Cronus. The Titans were banished to the abyss of Tartarus, and Zeus apportioned out the empire of the universe, reserving to himself the realm of heaven, while he gave the empire of the sea to Poseidon, and that of the lower world to Hades. By the machinations of Gaia the GIANTS (*q. v.*) were created in order to avenge her children the Titans, and to dethrone the new gods. But,

chiefly owing to the personal prowess of Zeus, the Giants were overcome, and the new order of things was firmly established.

Zeus is the father of gods and heroes. His first wife was Metis, who foretold to him that the child in her womb would dethrone him. Zeus therefore swallowed her, and himself shortly thereafter gave birth to the child of Metis, Athene, who sprang full-armed from her father's head, which had been cloven by Hephaestus. The second wife of Zeus was Themis (right), who bore to him the Hours (seasons) and the Fates. His third wife was his own sister Hera, who bore to him Ares, Hebe, Ilithyia (and Heplæstus). By other goddesses and mortal maidens he became the father of a numerous and important progeny: by Mnemosyne, of the Muses; by his sister Demeter, of Persephone; by Dione, of Aphrodite; by Leto, of Apollo and Artemis; by Eurynome, of the Graces; by the Argive Niobe, of Argus and Pelægus; by Maia, of Hermes; by Taygete, of Lacedæmon; by Electra, of Dardanns; by Semele, of Dionysus; by Europa, of Minos, Sarpedon, and Rhadamanthus; by Io, of Epaphus; by Danaë, of Perseus; by Leda, of Pollux and Helen; by Alcimene, of Heracles, etc.

In addition to being the god of the storm-cloud, Zeus, because of his prowess in the wars with Titans and Giants, is the god of physical vigor, and therefore he was the patron of the Olympic games. He was furthermore the god of prophecy, though he spake his oracles chiefly through the mouth of Apollo. He also presided over purifications and atonements, and over the life of the family and of the state. His accompanying attributes are the scepter, the thunder-bolt, and the eagle. The chief seats of his worship were Dodona and Olympia, though he was worshiped at a great number of other places. For the temple of Zeus at Olympia Phidias made a statue of the god in gold and ivory that was renowned throughout antiquity.

For a masterly analysis of the functions and character of Zeus, see Preller's *Griechische Mythologie* (edited by Carl Robert, Berlin, 1887), and for an account of Zeus in art, see Baumeister's *Denkmäler*, s. v. Zeus. J. R. S. STERRETT.

Zeus'is: painter; of whom many anecdotes are told by Lucian and Cicero, and especially by Pliny in his *Natural History*. His birthplace is stated as Heraclea, but which city of that name is not known. The date of his birth is uncertain; it is only known that he was painting and already famous in 424 B. C., and very probable that his career was in the years 450-400 or thereabout. There is no painter of antiquity of whom more or stranger anecdotes are told, but a real knowledge of what his art was like is not possible to moderns.

RUSSELL STURGIS.

Zhitoueer: another spelling of JI TOMIR (*q. v.*).

Zhukov'skiĭ, VASILĪ ANDREEVICH: poet; b. in the government of Tula, Russia, Jan. 29, 1783; d. Apr. 12, 1852. His mother was a Turkish captive, and he was brought up largely by and among women, which may have helped to give his character the softness which distinguished it. He served in the campaign of 1812 against Napoleon, later lived for a time in Dorpat; in 1816 was given an imperial pension, and in 1826, on the accession of Nicholas I., was made the tutor of the future emperor, Alexander II. The last ten years of his life were spent in Germany. As an original poet Zhukov'skiĭ does not rank very high, though his ballad *Ludmilla* (an imitation of Bürger's *Lenore*) was the first national effort of its kind. His *The Minstrel in the Russian Camp* also had a great success at the time, and others of his attempts have merit. His importance is as a translator, for it was he who by first making known to his countrymen the romantic writings of England and Germany led the way for the romantic school in Russia. He translated with great success poems of Gray, Byron, Moore, Scott, Goethe, Schiller, Ruckert, etc., also *Don Quixote* and the *Odyssey* (from a German prose rendering). The sixth edition of his works appeared in 1859. Some of his own pieces have been put into English verse in *Specimens of the Russian Poets* by John Bowring (2 vols., 1821-23).

Ziegenbalg, tsë'gen-baalch, BARTHOLOMEW: first Protestant missionary to India; b. at Pullnitz, Saxony, June 24, 1683. After a gymnasium course at Görlitz he formed the acquaintance of Spener and Baron von Arnstein, through

whom he entered the University of Halle in 1703. Responding with another Halle student, Henry Plutschau, to the call of Frederick IV. of Denmark for missionaries to the Danish possessions in India, he embarked at Copenhagen Nov. 29, 1705, and reached Tranquebar, in Southern India, July 9, 1706. Although opposed by the authorities, being imprisoned for four months, he laid the foundation of an extensive mission work, learning the Tamil language, compiling a grammar and two lexicons, and within two years after his arrival beginning the translation of the Bible. The New Testament was completed in 1711. The Pentateuch, Joshua, and Judges were also translated. On his return in 1715 he met with a warm reception in both Germany and England, where the Society for the Propagation of the Gospel gave him its encouragement. Returning to Tranquebar in 1716, he died Feb. 23 (o. s.), 1719. See Germann, *Ziegenbalg u. Plutschau* (Erlangen, 1868); Plitt, *Kurze Geschichte der lutherischen Mission* (Erlangen, 1871). For his journals, letters, and contemporaneous and nearly contemporaneous accounts, see the *Halle Reports*, edited by G. A. Francke.

H. E. JACOBS.

Ziegler, tseech'ler, ERNST, M. D.: pathologist; b. at Messen, Switzerland, Mar. 17, 1849; studied at Berne and at Würzburg, where he graduated M. D. 1872; subsequently received the appointment of assistant in the anatomico-pathological institute of the university; in 1878 was made assistant in the pathological institute of the University of Freiburg, subsequently Extraordinary Professor of Pathology in that institution; in 1881 was Professor of Pathological Anatomy and General Pathology in the University of Zurich, and in 1882 accepted the same chair in the University of Tübingen. His most important work is *Lehrbuch der pathologischen Anatomie*, which has passed through a number of editions.

S. T. ARMSTRONG.

Ziem, zeem, FÉLIX: marine and landscape painter; b. at Beaune (Côte-d'Or), France, Feb. 25, 1821; studied at the Dijon Art School; received a third-class medal at the Salon of 1851, a first-class medal in 1852, and a third-class medal at the Paris Exposition of 1855; became an officer of the Legion of Honor 1878. Most of his pictures represent scenes in Venice, and as he is a most prolific painter he has a wide reputation. His *View of Venice*, painted in 1852, is in the Luxembourg Gallery, Paris. *Inundation of Piazza San Marco, Venice*, is in the Wolfe collection, Metropolitan Museum, New York. Studio in Paris. WILLIAM A. COFFIN.

Ziemer, tseem'er, HERMANN: classical philologist; b. at Neustettin, in Pomerania, May 12, 1845; studied at the University of Berlin; teacher in gymnasium at Stargard 1870-73; professor in the gymnasium at Colberg since 1873. Author of *Psychologische Erklärung syntaktischer Erscheinungen* (1867); *Das psychologische Moment in der Bildung syntaktischer Sprachformen* (1879); *Junggrammatische Streifzüge im Gebiete der Syntax* (1882; 2d ed. 1883); *Vergl. Syntax der indogerm. Comparison* (1884); also various articles and reports in journals. His work is characterized by much freshness and vigor, and has served to advance the science of comparative syntax rather by its suggestiveness and its sympathy with new endeavors than by its precision.

B. I. W.

Zierikzee, zee rik-zā: town; province of Zeeland, Netherlands; on the island of Schouwen (see map of Holland and Belgium, ref. 7-D). It has a good harbor, extensive ship-building, shipping, and fishing, and a large trade in agricultural products. Its walls, behind which its citizens made an obstinate resistance to the Spaniards in 1576, are now transformed into promenades. Pop. (1890) 7,060.

Revised by M. W. HARRINGTON.

Ziethen, or **Zieten**, tsee'ten, HANS JOACHIM, von: general; b. on his paternal estate of Wustrau, Prussian province of Brandenburg, May 14, 1699; received a military education, and entered a regiment of dragoons as lieutenant in 1726, but became entangled in the difficulties of one of his comrades, and was cashiered. In 1730, however, he was reinstated in the army as lieutenant in a regiment of hussars just then forming, and served in the campaign against France in 1735. Soon after the outbreak of the first Silesian war he became lieutenant-colonel, and early in the second Silesian war was made major-general. In 1745 he made his famous march to Jägerndorf through the Austrian lines, and distinguished himself at Hohenfriedberg and at Hennersdorf. Shortly after the peace some disagreement arose between him and the king, and a reconciliation did

not take place until 1755, but in the Seven Years' war he took a most brilliant part, as commander of the cavalry, in the battles of Prague, Kolin, Leuthen, Liegnitz, and Torgau, rendering especially valuable service in the last-named battle, which he decided in favor of the Prussians by storming the heights of Siptitz, and after the peace he retired to his estates as the most popular and one of the most celebrated of the generals of Frederick the Great, though he had many peculiarities approaching closely to the ridiculous. D. at Berlin, Jan. 26, 1786. His *Life* has been written by Hahn (5th ed. 1878) and by Count Lippe-Weissenfeld (2d ed. 1886).

Revised by F. M. COLBY.

Zikr: See DERVISHES.

Zileh (anc. *Zela*): town; in the vilayet of Sivas, Asiatic Turkey. Here Mithridates defeated the Romans (67 B. C.). Here Cæsar conquered Pharnaces (47 B. C.) and sent the famous dispatch, "*Veni, vidi, vici.*" The present town is lifeless and decaying, though still maintaining the annual fair in November, which was formerly frequented by 50,000 or 60,000 persons. Pop. 5,000.

EDWIN A. GROSVENOR.

Ziller, tsiller, TUISKON: educator; one of the foremost exponents of the Herbartian pedagogy; b. in Wasungen, Saxe-Meiningen, Germany, Dec. 22, 1817; became in 1864 professor in the University of Leipzig, where he founded a pedagogical seminary modeled after that of Herbart at Königsberg. His most influential work, *Grundlegung zur Lehre vom erziehenden Unterrichts* (Basis of the Doctrine of Instruction as a Moral Force), appeared in 1865, and from its appearance dates the beginning of popular interest in Herbart. Ziller's other important works are *Einführung in die allgemeine Pädagogik* (1856); *Die Regierung der Kinder* (1857); *Allgemeine Pädagogik* (2d ed. 1884); *Allgemeine philosophische Ethik* (1880). De Garmo characterizes Ziller's work as follows: "It deserves respect as the most thoroughgoing attempt ever made to answer the question, How may instruction in the common school become an instrument for the development of moral character?" See De Garmo, *Herbart and the Herbartians* (New York, 1895). D. in Leipzig, Apr. 20, 1882.

C. H. THURBER.

Zillerthal, tsil'er-thäl: one of the principal valleys of the Tyrol, 50 miles long, inclosed by lofty glaciers and opening N. into the valley of the Inn. Rearing of cattle and manufactures of gloves and essences of herbs are the principal occupations. In 1837 399 persons, who had left the Roman Catholic Church, were compelled to leave their homes and emigrated to Prussia. Pop. 14,000.

Zimmermann, tsim' mer-män, JOHANN GEORG, von: physician and philosophical writer; b. at Brugg, canton of Berne, Switzerland, Dec. 8, 1728; studied medicine at Göttingen; began to practice at Brugg in 1751; was appointed court physician at Hanover in 1768. D. Oct. 7, 1795. He had a great reputation; was invited to the court of Catherine II.; attended Frederick the Great in his last illness; published *Vom Nationalstolze* (Zurich, 1758); *On Solitude* (*Ueber die Einsamkeit*, Zurich, 1755; 2d ed., Leipzig, 4 vols., 1784-85), which made his name celebrated throughout the whole of Europe; *Von der Erfahrung in der Arzneikunst* (Leipzig, 2 vols., 1764), which was translated into several foreign languages; *Ueber Friedrich den Grossen und meine Ueherredung mit ihm kurz vor seinem Tode* (1788); and *Fragmente über Friedrich den Grossen* (3 vols., 1790), which implicated him in some very bitter controversies. A collection of some of his letters was published at Aarau in 1830. See also *Zimmermanns Krankengeschichte* (1786), by Wichmann.

Revised by S. T. ARMSTRONG.

Zinc, sometimes called **Spelter** [*zinc* = Fr., from Germ. *zink*; with *spelter*, cf. Germ. and Dutch *spialter*, and Dutch *spialter*, pewter, whence Eng. *pewter*]; one of the metallic elements, very abundantly distributed, comparable in this respect to lead. It was not known in metallic form to the ancients, though they knew how to make alloys of it with copper (common brass) by adding zinc ores to melted copper. Zinc being one of those metals, however, which must be procured by a process of *distillation*, was doubtless beyond the skill of the metallurgists of old. It was first, and for a long time, brought into Europe from the East, and it is not much more than 100 years since zinc was first smelted in Europe. The ores of zinc are not numerous, there being only six mineral species which furnish all the zinc and zinc-white of commerce. These are BLENDE, CALAMINE, WILLEMITE, SMITHSONITE, FRANKLINITE, and ZINKITE (*qq. v.*), including sulphide, silicates, carbonate, and oxide. The sul-

plide and carbonate are first roasted to expel sulphur and carbonic acid. Calamine also contains water, which must be expelled by roasting. The ores, thus prepared, are distilled, in admixture with carbon, in retorts, or furnaces of special construction, the zinc-vapor generally carrying with it some lead, sulphur, and arsenic. Most commercial zinc, when required pure, must be redistilled. That which is made from calamine, or from the willemite, franklinite, and red zinkite of New Jersey, is free from arsenic, and generally quite pure. When made from blende it sometimes contains calcium, and more rarely traces of indium.

The metal zinc is one of much hardness, with a bluish color, with a brilliant luster when freshly cut, but soon taking a tarnish, from the formation of a film of suboxide or carbonate, which protects it quite strongly from further oxidation, so that it is an extremely durable metal, resisting both air and water very persistently. When cast, it is highly crystalline in structure, and somewhat brittle, though at the same time sectile; but by heating to a temperature somewhat below 300° F., it may be rolled into very thin plates, passing into a modification which is quite malleable, so that sheets as thin as tin-foil may be obtained. The best way to obtain it pure is by electrolysis. At a temperature but little higher than that mentioned still another allotropic modification appears, which is very brittle and fragile, and in a mortar heated to 400° F., or a little higher, the metal may be crushed to powder. It melts at about 780° F., and boils at about 1900° F., yielding a vapor which takes fire in the air and burns with a dazzling light to zinc oxide. (See ZINC-WHITE.) The relations of zinc to acids and other solvent liquids are highly interesting. When chemically pure it dissolves readily in nitric acid, but not so in dilute sulphuric and hydrochloric. Even ordinary commercial zinc, containing lead, iron, etc., may be almost absolutely protected from the latter two acids by the thinnest film of mercury, which in voltaic batteries is used, therefore, for this purpose. On contact, however, with most other metals, and other substances capable of conducting electricity, voltaic circuits are set up, and the zinc dissolves, hydrogen being evolved from the surface of the other metal. Hence, through the formation of such circuits with its metallic impurities, commercial zinc is readily soluble in acids, and even in solutions of neutral salts. These same relations explain the well-known protective action of zinc upon iron or copper, even in sea-water (as in the case of sheathing of ships). The film of hydrogen formed upon the surface of the other metal prevents all oxidizing action thereon. Zinc is largely used for coating iron and copper, exerting a protecting influence, both as a mere coating or impervious varnish, and through its voltaic relations. (See ZINCKING OF METALS.) Zinc dissolves also in alkalis, whose compounds with its oxide are soluble, in a manner similar to that above described, its relations to other metals in such alkaline liquids being altogether similar to those in acid and saline solutions.

ALLOYS OF ZINC.—Almost all the other common metals, except *lead* and *bismuth*, alloy readily with zinc, forming alloys that generally partake of the hardness of the zinc, and, when the latter is in excess, of its brittleness also. Under **BRASS** will be found some mention of the highly important alloys with *copper*, these being by far the most valuable of zinc alloys. With *lead*, zinc will not unite unless through intermediation of some other metal, such as *tin*, which alloys with both; with *lead* and *bismuth* also, equal quantities of each of the three metals, a fusible alloy is obtained which melts in boiling water. **Bronze**, which properly consists of tin and copper, is often alloyed with zinc, and triple alloys of these three metals are used for journal-boxes and some other purposes. An alloy with eleven times its weight of tin is beaten into leaves and used as a spurious substitute for silver-leaf. *Amalgams* of zinc have little interest except in connection with voltaic batteries.

COMPOUNDS OF ZINC.—Zinc forms a number of compounds which are useful in the arts. For the *oxide*, see ZINC-WHITE. The *sulphide* of zinc is found constituting two mineral species, identical in composition, but differing in crystalline form—*blende* or *sphalerite*, which is of the regular system, and *wurtzite* (named after the French chemist, Adolphe Wurtz), which is hexagonal. Hydrous *silicate* of zinc is found in nature as calamine. It is used as a pigment for producing a brilliant green in glazed pottery.

Zinc-vitriol, *White Vitriol*, or *Zinc-sulphate*.—This is a familiar commercial compound, also occurring in nature as *goslarite*. For commercial use it is prepared by roasting

and then lixiviating blende, or by dissolving metallic zinc in dilute sulphuric acid, and crystallizing. Its composition is $ZnSO_4 \cdot 7H_2O$. Crystals right-rhombic, efflorescing in the air, with loss of part of their crystal-water. At 212° F. they lose $6H_2O$, the seventh equivalent requiring a much higher temperature. White vitriol dissolves in 2.33 times its weight of cold water, and less than its weight of boiling water. It has an acrid metallic taste, and is very powerfully emetic in its effect when swallowed in any quantity. It is used in medicine, both directly and as a material for preparation of other medicinal zinc compounds.

Zinc Chloride ($ZnCl_2$), *Butter of Zinc*.—Zinc combines powerfully with chlorine, thin foil taking fire therein spontaneously. The substance formed is whitish, translucent, of the consistence of wax, melts at a low temperature, and sublimes at a red heat, condensing in white needles. It is highly deliquescent, and soluble in water and alcohol. The aqueous solution has several uses in the arts. It is used for "burnettizing" wood (see PRESERVATION OF TIMBER) and as a disinfecting agent.

Revised by IRA REMSEN.

Zincking of Metals: the plating of metals with a thin layer of zinc, by which they are protected from the oxidizing action of the air. Iron is the metal oftenest coated, but copper is also sometimes treated in the same manner. In the preparation of zincked iron (so-called "galvanized iron") the metal is first cleansed by immersion in a warm bath of equal parts of sulphuric or hydrochloric acid and water, after which it is cleaned by rubbing with emery; it is next dipped in a bath of equal parts of saturated solutions of chloride of zinc and chloride of ammonium, then into a metallic bath consisting of 640 parts by weight of zinc, 106 parts of mercury, and about $\frac{1}{2}$ part of sodium, where it is allowed to remain until it acquires the temperature of the melted metal (680° F.). In order to avoid the partial solution of the iron by the action of the molten zinc, it is advisable to add pieces of wrought iron to the bath, so that it may previously become partially saturated. Iron castings are treated by a somewhat similar process: they are first cleaned by rubbing with sand, then heated, and immersed while still hot in a concentrated solution of chloride of zinc containing sulphate or chloride of ammonium, after which they are dipped in a bath of molten zinc, the surface of which is kept free from oxide by means of a little sal-ammoniac. The protective action of the zinc coating obtained as above described is said to exceed that of the tin upon ordinary tinned iron; increased strength is also imparted to the iron by the zinc, and its welding properties are not impaired. Copper objects can be zincked by immersion in a concentrated and boiling solution of chloride of ammonium, in which granulated or powdered zinc has been placed, or by simply dipping them in a boiling solution of chloride of zinc. Zincked iron is extensively employed for telegraph wires, roofing purposes, water-coolers, etc.

Zinco'graphy [*zinc* + Gr. *γράφειν*, write, engrave]: the art of producing impressions of prints and other designs on zinc, from which a facsimile on paper can be made. It is very analogous to LITHOGRAPHY (*q. v.*); the term is applied to the processes of *anastatic printing* (*anastasis*, resuscitation), *zinc-printing*, *paniconography*, and *photozinco'graphy*. In *anastatic* printing, first used in Germany in 1840, a printed sheet is moistened with water containing nitric acid, which affects only the parts where there is no printing, being repelled from the letters by virtue of the oily matter in them. The sheet is then pressed on a prepared zinc plate, whereby a typographical surface is produced, from which impressions can be printed on paper. *Zinc-printing* consists in first etching designs in the metal with the needle, cleaning them with acid, and covering the entire plate with a layer of fusible metal, which is afterward removed by planing until the etched lines appear at the surface; the plate is then dipped in an acid bath, when the surface of the plate will be dissolved, but not the fusible metal which fills the lines; in this way a relief-drawing, suitable for the printing of maps, plans, etc., can be obtained. In the process of *paniconography*, crayon drawings, proofs of wood or copper plates, etc., are transferred to a zinc plate, a damp inked roller is passed over it to deepen the impression, and powdered rosin then spread on it, which adheres only to the parts that were moistened by the ink. Upon now placing the plate in a bath consisting of diluted nitric acid, the unprotected surface is etched, and a relief surface formed which can be used for printing. *Photo-zinco'graphy* is accomplished by first preparing a photograph, then trans-

ferring it to zinc, from which copies can be multiplied as from a lithographic stone; it is based upon the fact that bichromates render gelatin insoluble when a mixture of the two is exposed to the action of light. The paper used is prepared with a solution of bichromate of potassium and gelatin, and exposed together with the negative of a drawing or other design to the light, the outline of the same being thus obtained in insoluble lines. On then covering it with printer's ink and wetting it at the back, the soluble portion swells up, and allows of the removal of the ink from this part, but not from the insoluble lines. A copy of the object photographed is thus produced in ink, which can be easily transferred to zinc. See PHOTO-ENGRAVING.

Zinc-white: a commercial product used largely as a pigment, formerly made by the combustion of metallic zinc and collection of the fumes, but of late years obtained directly from zinc ores by a process which combines the reduction of the zinc from the ore to a metallic vapor, and the subsequent burning of this vapor in the same apparatus. The general plan of the apparatus used consists in a perforated hearth, with a closed ash-pit below, upon which hearth is spread the charge of mixed ore and anthracite coal. The latter is kindled, and air blown in through the ash-pit. The products of combustion, containing an excess of air with vapor of metallic zinc, undergo another combustion after leaving the charge, forming fumes of zinc oxide, which, after cooling, are caught by being forced through very long bags of some textile fabric, through which the gases gradually filter, leaving the finely divided oxide within. Zinc-white is extensively used as a substitute for white lead in painting woodwork. Revised by IRA REMSEN.

Zinder: a fertile district in the northwest corner of the Mohammedan sultanate of Bornu, a little S. of the domain of the Tuareg nomads of the Sahara. Its chief town, Zinder, on the main trade-route through the Northern Sudan, is surrounded with walls and ditches, which also inclose many gardens and orchards. It carries on a considerable trade. Pop. of the town, estimated, 10,000. C. C. A.

Zinkite: a native zinc oxide. It is very rare in Europe, but found in abundance at Franklin Furnace and Sterling Hill, near Ogdensburg, N. J. It is of a deep-red color, occasionally with a yellowish tint; is brittle, and in thin scales is translucent.

Zin'nia [Mod. Lat., named from Dr. J. G. Zinn (1727-59), professor at Göttingen]: a genus of showy American, chiefly Mexican, herbs of the composite family, much cultivated in flower-borders. The finest are varieties of *Z. elegans*, a Mexican plant. *Z. pauciflora* (often called *Z. multiflora*) grows abundantly in parts of the Southern U. S., where it was doubtless introduced from farther south.

Zinzendorf, tsin'tsen-dörf, NICHOLAS LEWIS, von, Count: leader of the Moravians; b. at Dresden, May 26, 1700. He attended the Pedagogium at Halle under A. H. Francke 1710-16, and against his own inclinations was a law student at Wittenberg 1716-19, devoting two years to travel in order to complete his education. Whithersoever he went he found himself more interested in religious than in the higher social circles that were open to him. From 1721 to 1727 he occupied a civil office in reluctant compliance with the ambitious projects of his relatives. In 1722 he settled a colony of Moravian refugees on the Berthelsdorf estate in Lusatia, which he had purchased. This colony (Herrnhut) became a center of attraction to persons of Pietistic antecedents. This interest growing, in 1727 he fully identified himself with it, and became the great organizer of the Moravian Church. Zinzendorf's original conception was not that of a separate denomination, but a union of all the followers of Christ and advocates of a religion of the heart within the bounds of the various confessions. Hence he continued to claim his loyalty to the unaltered Augsburg Confession and Luther's Catechism, and to affirm that he still remained a Lutheran. Ordained a minister at Tübingen in 1734, he was consecrated a bishop by the Bohemian bishops Jablonsky and Nitschmann in 1737. Banished from Saxony in 1736, he lived in Germany, Holland, England, St. Thomas, Pennsylvania, again in England, various parts of Germany, and in Silesia, everywhere active in preaching the Gospel. While in Pennsylvania (1741-42) his work was around Bethlehem and Germantown as centers. He pressed forward missionary activity among the North American Indians, and aimed at the bringing of the various churches into a union by means of numerous conferences. He

acted as pastor of the Lutheran church in Philadelphia, and used the title of inspector-general. The sentence of banishment being removed in 1749, he returned to Herrnhut, where he died May 9, 1760. Zinzendorf's sermons preached in Pennsylvania were published at Büdingen in 1744. His chief claim to literary recognition rests upon his 2,000 hymns, a number of which are in common use in English translations of John Wesley and others. See *Life*, by Spangenberg (8 vols., 1772-75; condensed translation by Samuel Jackson, London, 1838), and *Zinzendorf im Verhältniss z. Philosophie u. Kirchenthum seiner Zeit*, by B. Becker (Leipzig, 1886). For additional literature, see extensive bibliography appended to Becker's article in the *Herzog-Plitt-Hauck, Real-Encyclopädie*. HENRY E. JACOBS.

Zion, or Sion [*Zion* is from Heb. *Tsiyōn*, liter., sunny place, sunny mountain; *Sion* = Lat. = Gr. *Σίων*, from Heb.]: an eminence in Palestine, on which a part of Jerusalem is built. It rises 2,540 feet above the level of the sea. W. and S. it faces the valley of Hinnom with a steep precipice 300 feet high. On the northern slope stands that part of Jerusalem which was called the "city of David" or the "upper city"; hence Jerusalem was often called the "daughter of Zion." See JERUSALEM.

Zipaquirá, thee-pñ-kee-rah' (often written *Cipaquirá*): a town of the department of Cundinamarca, Colombia; on a high plain, about 25 miles N. of Bogotá. The name means dwelling of the Zipas, and this was in fact a residence of the Zipas, or ancient kings of the Chibcha Indians. It is now important for its manufactures, and especially for a rich bed of salt found in the vicinity. This is worked by the national Government, and two-thirds of the salt used in Colombia is obtained from it. Beds of coal and iron occur in the same region. Zipaquirá has an active trade, the agricultural products of Cundinamarca and Santander being exchanged here for salt. Pop. about 11,000. H. H. S.

Zircon [= Fr., from Arab. *zarkūn*, einnabar, vermilion, from Pers. *zargūn*, gold-colored, whence Eng. *jargon* or *jargoon*, a kind of zircon]: a silicate of zirconium, occurring in crystals, generally four-sided prisms terminated by four-sided pyramids, and also in grains of a white, red, brown, yellow, green, or reddish-orange color, the last being sometimes called hyacinth or jacinth. It is found in the sands of rivers of Ceylon, in the sienite of Norway, at Strontian in Argyleshire, Scotland, and in streams of the Croghan Kinshela Mountains in Ireland.

Zirconium [Mod. Lat., from Eng. *zircon*]: an element having characters approaching those of a metal, found principally in the mineral called Zircon (*q. v.*). Its chemical relations are very close and parallel to the important element silicon, which gives to its study great interest. Like silicon and carbon, which also belong to the same natural group, it assumes different allotropic forms, widely varying in their physical characters. The amorphous allotrope of zirconium was obtained in 1824 by Berzelius by a method similar to that which yields amorphous silicon, by the action of an alkaline metal on the *zircon fluoride of potassium*, F_2ZrK_2 . It assumes a graphite-like luster under the burnisher. It is unchanged by ignition apart from the air, but in air burns to zirconia. *Adamantoid zirconium* was obtained by Troost by fusing potassium zircon fluoride in a crucible with an excess of metallic aluminium and dissolving the latter metal out of the fused mass with hydrochloric acid. It resembles metallic antimony in appearance, and is very brittle and hard. It is incombustible except by Hare's blowpipe, and soluble with difficulty in acids, except hydrofluoric and nitro-hydrochloric. *Zirconia* is the anhydrous oxide of zirconium, ZrO_2 . It is made from zircon. In many respects zirconium oxide is analogous to silicon dioxide. It forms salts with bases, and these resemble the silicates in composition. Revised by IRA REMSEN.

Zirknitz, tsirk'nits (or **Czirkniec**), **Lake of:** a body of water in a deep valley in Carniola, Austria, between Laibach and Trieste, famous on account of the occasional disappearance of its waters. It is 6 miles long, 3 miles broad, and 15 to 50 feet deep. At intervals—generally in August, though not regularly—its waters are entirely drawn off through a number of fissures in its bottom, and a harvest of hay or even of buckwheat, is gathered in its bed. After the lapse of four or six weeks, or when the wet season sets in, the water pours into the lake from a number of other fissures; but while it generally takes from twenty-two to twenty-five days to empty the lake, it takes often only twenty-four hours to fill it.

Zis'ka, Joux: leader of the Hussites; b. at Trocznow, Bohemia, in 1360; was educated at the court of Prague, and fought with the Teutonic Knights against the Lithuanians and Poles, in Hungary against the Turks, and on the English side in the wars between England and France. He had embraced the doctrines of Huss, and was conspicuous in the great commotion which was caused by the execution of Huss and Jerome. He was present on the famous July 30, 1419, when the thirteen Roman Catholic magistrates of Prague were thrown out of the windows and massacred. The outburst spread rapidly over the whole country, negotiations from the side of Wenceslas and his successor, Sigismund, failed, and under the leadership of Ziska the Hussites formed a fortified camp on the top of Mt. Tabor. They were in possession of the city of Prague, though not of the castle, and in order to defend it against the Emperor Sigismund, who approached with an army of 30,000 men, Ziska took up a position on the hill of Witkow, just outside the city. He had only 4,000 men, but such was the fanatical enthusiasm with which the Hussites fought that the emperor was unable to remove them, and had to retire with an immense loss after a most sanguinary struggle. July 14, 1420; the hill has since that day borne the name of Ziska Hill. In the autumn of the same year Ziska conquered the castle of Prague, but in the next year became blind. While a boy he had lost one eye, and now, while besieging the castle of Raby, also lost the other. But he continued, nevertheless, to command. Such was his knowledge of his country that from the descriptions of his lieutenants he was able to make his dispositions and conduct the battle. In 1422 the emperor returned with another great army, and on Jan. 18 the battle took place at Deutsch-Brod. The emperor was completely routed, and, unable to raise a third army, he now began to negotiate. He was willing to grant liberty of conscience, to make Ziska governor of Bohemia, etc.; but before the negotiations could be brought to a close Ziska died at Przbislaw, Oct. 11, 1424. He was buried at Czaaslau, but in 1623 his tomb was disturbed and his bones removed on an imperial order from Vienna. See Tomek, *Johann Zizka* (1882).

Zither: an instrument of very ancient origin; in its primitive form supposed to be identical with the *psaltery* mentioned in the Bible, and known among the Greeks by the name of *kithara*. In its modern shape it consists of a shallow box, somewhat in the form of a lyre, upon which are strung some thirty strings. These are technically divided into 5 melody-strings, 12 accompaniment-strings, and 13 bass-strings. The melody-strings lie straight across the zither, and are tuned thus:

The two A-strings are of steel, the D of brass, the G of steel wound with silver wire, the C of brass with copper wire. The other strings are partly of gut and partly of silk wound with silver wire, and are placed beside these over a lower cross-piece of wood called the tail-piece. In playing the zither the thumbs of both hands are used, also the first, second, and third fingers. The thumb of the right hand is provided with a partially opened ring with which to strike the melody-strings. This is to the zither what the bow is to the violin. The real home of the zither seems to be Austria and the Tyrol, where it may almost be called a national instrument.

Zittau, tsit'tow (Slav. *Žitava*): the most populous city in the circuit (*Kreishauptmannschaft*) of Bautzen, kingdom of Saxony; close to the Bohemian and Silesian frontier; on the left bank of the Maudau; station of the Saxon Railway and of the Prussian railway Görlitz-Zittau (see map of German Empire, ref. 5-11). The inhabitants are mostly Protestants, and carry on a brisk commerce and extensive industries in cotton, linen, and cloth, which are manufactured in the factories of the town and by the weavers of the surrounding villages. The transit traffic to Bohemia is very considerable. In the suburbs and near villages there are numerous mills of all kinds, iron-foundries, machine-shops, brickworks, and earthenware factories. The great lignite deposits in the neighborhood occupy about 1,000 laborers. Thirty-seven villages, with more than 70,000 inhabitants, mostly weavers, and rich forests extending to Bohemia, belong to the city commune. Zittau has seven churches, a gymnasium (founded 1586), with which is connected a real-school and a commercial school, an important city library with an historical museum, and several industrial schools. Pop. (1890) 25,394.

HERMANN SCHOENFELD.

Zlatust, zlá-toost': town; in the government of Ufa, Russia; on the Ai, left tributary of the Ufa (Volga-Kama Basin); in the Ural Mountains; terminus of the Ufa railway-line and starting-point of the Transiberian line (see map of Russia, ref. 7-1). It is the center of a rich mining district, and manufactures guns, sword-blades, and various articles of steel, which are noted. In the vicinity there are rich iron and gold mines, partly worked by a numerous German colony. There is also a brisk trade in agricultural produce and cattle. Pop. (1891) 21,105. H. S.

Znaim, formerly **Znaym** (Slav. *Znojmo*): town; in Southern Moravia, Austria; a fertile region on a mountain on the left bank of the Thaya (see map of Austria-Hungary, ref. 4-1'). It has four suburbs and 14,515 inhabitants (about 90 per cent. Germans), with tanneries and manufactures of leather goods, earthenware, saltpeter, and vinegar, and important trade in grain and fruits. Important buildings are the St. Nicolas church, of Gothic architecture, built in 1348 by Charles IV.; the pagan temple, the oldest architectural monument in Moravia (tenth century); the Thaya viaduct of the Vienna-Teschen Railway; and a monument to the German-American author Charles Sealsfield (Carl Postl). Several higher schools, large hospitals, and barracks are in the city. Pop. of district (1890) 96,785. H. S.

Zoan: See TANIS.

Zoantharia: See HEXACORALLIA.

Zoar {from Heb. *Tsō'ar*, liter., smallness. Cf. Gen. xix 20): the only one that was spared of the five "cities of the plain." Originally it was called *Bela* (Heb., "swallowed, devoured," Gen. xiv. 2), Jerome says, because, according to Hebrew tradition, it was destroyed for the third time by an earthquake (*Com. in Isaiam*, xv., 5). The four cities that perished were Sodom, Gomorrah, Admah, and Zeboim.

Zöckler, OTTO, Ph. D., D. D.: theologian; b. at Grünberg, Hesse, May 27, 1833; educated at Giessen, Erlangen, and Berlin (1851-56); became privat docent at Giessen (1857); professor extraordinary there 1863; Ordinary Professor of Theology at Greifswald 1866. His numerous writings include commentaries upon Chronicles, Job, Proverbs, Ecclesiastes, Song, and Daniel, in *Lange*; Acts, Galatians, and Thessalonians, and on the Apocrypha in the *Kurzgefasster Kommentar* (1886, seq.), edited by him in conjunction with H. J. Strack; and contributions in the *Handbuch der Theologischen Wissenschaften*, which he edits alone. All his works display great industry and extensive information. Besides these may be mentioned *Kritische Geschichte der Askese* (Frankfort-on-the-Main, 1863); *Hieronymus* (1864); *Das Kreuz Christi* (Bielefeld, 1875; Eng. trans., *The Cross of Christ*, London, 1877); *Geschichte der Beziehungen zwischen Theologie und Naturwissenschaft* (2 vols., 1877-79); *Gottes Zeugen im Reich der Natur* (2 vols., 1881); *Biblische und Kirchengeschichtliche Studien* (5 parts, Munich, 1893). SAMUEL MACAULEY JACKSON.

Zo'diac [viā O. Fr., from Lat. *zodi'acus* = Gr. *ζωδιακός* (sc. *κύκλος*, circle), circle of animals, zodiac, liter., masc. adj., pertaining to animals, deriv. of *ζῷδιον*, dimin. of *ζῷον*, animal]; an imaginary zone or belt in the heavens, extending from 9° N. to 9° S. of the ecliptic, and comprising that region of the heavens within which the apparent motions of the sun, moon, and all the greater planets are confined. It is divided into twelve equal parts, called "signs," which are designated by the names of the constellations Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, and Pisces, which are supposed to have been invented in Egypt, and refer to the division of the seasons and the agriculture of that country. See SIGS and CONSTELLATION.

Zodi'acal Light: a faint illumination of the sky in the region of the zodiac visible in the evenings of winter and spring after the end of twilight, and in summer and autumn before daybreak in the morning. It can be well seen only when the sky is perfectly clear, and the moon below the horizon. When seen in the evening it appears as a faint column of light, rising from the W. and inclining toward the S., which can sometimes be traced nearly to the meridian. Atmospheric vapors obscure the view of it near the horizon; it attains its greatest visible breadth and brilliancy at an elevation of perhaps 15° or 20°, where it may be as bright as the Milky Way. It differs from the Milky Way, however, in its extremely soft appearance. Under a very clear atmosphere, near the equator, it may sometimes be seen by keen eyes as an arch of light extending all the way across

the heavens, near the ecliptic. Whether the central line of the arch coincides accurately with the ecliptic does not seem to have been well determined. In northern latitudes it always appears N. of the ecliptic, but this may be due in part to the absorption of the light by the atmosphere. Connected with this light is said to be the mysterious phenomenon known as the *Gegenschwein*, consisting in a faint glow at that point of the heavens which is directly opposite the sun.

No complete and satisfactory explanation of the zodiacal light has yet been given. The best opinion is that it is caused by a mass of nebulous gases, or finely divided matter, surrounding the sun near the plane of the ecliptic, and extending out a little beyond the earth's orbit. The general aspect of the light shows that its form must be somewhat that of a lens, having the sun in its center. If this view be correct, the illumination is due to reflected sunlight. If such were the case the spectrum of the light should not differ from the solar spectrum except in intensity. The careful observations of Prof. Wright, of Yale, seem to show that such is the case. The phenomenon, however, is one on which there is still a want of accurate observations at elevated stations under the equator. S. NEWCOMB.

Zoe'a [Gr. ζῶν, animal]: a name given to one of the stages in the development of crabs, under the impression that it was an adult. At present the term is used to indicate one of the free-swimming stages, the constant characters of which are a large carapax usually armed with spines projecting from the back, sides, and front; a well-developed abdomen, which is divided into segments, but which lacks appendages, and a usually forked caudal lobe. Under the carapax are seven pairs of appendages, the posterior six segments and the corresponding appendages of the adult cephalothorax being rudimentary or not developed. The zoea varies greatly in size and in the development of the spines, etc., but only in rare instances is it larger than a pea. This stage is usually succeeded by one known as the megalops. J. S. K.

Zoetrope: See STROBOSCOPE and VITASCOPE.

Zola, ÉMILE: novelist; b. at Paris, Apr. 2, 1840; passed his youth in Southern France, but finished his studies at Paris at the Lycée Saint-Louis; became a clerk in the publishing-house of Hachette, using his leisure for writing for the newspapers and composing novels. He showed the character of his talent in the *Contes à Ninon* (1864), *La Confession de Claude* (1865), *Thérèse Raquin* (1867), and *Madeleine Féral* (1868), which exhibit a violent realism marked by a materialistic conception of life, the prominence of the physiological element, the choice of vice and disease as objects of observation, and a brutal frankness, and often a great power of statement. This realism, which he called naturalism, he defended with great acrimony in critical articles collected in the volumes *Mes Haines* (1866); *Le Roman expérimental* (1880); *Documents littéraires* (1881); *Les Romanciers naturalistes* (1881); *Une Campagne* (1882), etc. It was exemplified especially in the series of twenty novels under the general title *Les Rougon-Macquart, histoire naturelle et sociale d'une famille sous le second Empire* (1871-93). Some of the novels of this series have enjoyed a very wide sale and popularity: *L'Assommoir* (1878); *Nana* (1880); *Pol-Bouillon* (1882); *Germinal* (1885); *La Terre* (1888); *La Débâcle* (1892). He has had much influence upon younger writers, but since 1888 there has been a perceptible recoil against his school. Since completing the *Rougon-Macquart* series he has published *Lourdes* (1894). A. G. CANFIELD.

Zollverein, tsöl vār-in [= Germ.; zoll, toll, tax + vereîn, union]: a union of the German states, according to which all custom duties along the internal frontiers of the states belonging to the union were abolished, and the revenues proceeding from the custom duties levied along the external frontiers of the union were partitioned among the members according to population. Prussia was the first to propose such a customs union, but at first only the minor states would enter it. By 1834 eighteen states had become members, and others joined from time to time till in the period from 1854 to 1865 all states had entered it except Transylvania, Austria, the two duchies of Mecklenburg, Liechtenstein, Schleswig-Holstein, and the Hanse towns. It proved eminently beneficial by throwing down vexatious and mischievous barriers to communication, and by reducing the cost of collecting the revenues. Upon the formation of the German empire in 1871, there was no longer any reason for the separate existence of the Zollverein.

Zom'bar, or **Sombor**: royal free town of Hungary, in the Serbian woiwodina; capital of the county of Bács; on a wide plain near the Francis Canal, which connects the Theiss with the Danube, and is a station of the Szegedin-Esseg line of the Hungarian state railway (see map of Austria-Hungary, ref. 8-11). The city has extensive silk manufactures and a large trade in corn and cattle. Pop. (1890) 26,435. Revised by H. SCHOENFELD.

Zona Libre: See TAMAUPLIPAS.

Zona'ras, IOANNES: historian; b. in Constantinople in the first half of the eleventh century. He was commander of the imperial body-guard and private secretary to Alexius I. Comnenos. In consequence of domestic afflictions he became a monk, and withdrew to Mt. Athos, where he died at the age of eighty-eight or eighty-nine, in 1118. In his retirement he composed many works, some of which still exist, both printed and in manuscript. The most important are his *Chronikon* or *Annales*, a history of the world from the creation to 1118, edited by Du Cange (Paris, 1686) and by Dindorf (Leipzig, 1868-75), and his *Lexikon*, edited by Tittman (Leipzig, 1808). E. A. G.

Zoological Geography, or Zoögeography: that branch of geography which treats of the distribution of animals and of the division of the earth's surface into areas characterized by the presence of distinctive species or groups of animals. These associations of species are termed faunas. While it is not to be expected, nor necessary, that all the species occurring within a given area should be restricted to it alone, a sufficient number of species, genera, or families, should be peculiar to the region to give it a distinctive character. While a fauna is the sum total of animal life in any given division, all animals are not of the same importance in the definition of zoölogical regions, or life areas, as they have aptly been called. Fresh-water fishes have been regarded as among the best animals for this purpose, because, in the nature of things, they are less liable to be dispersed by accidental causes. It may be said against the choice of fresh-water fishes that they define great drainage areas rather than zoölogical areas, and also that it is becoming more and more evident that terrestrial and aquatic life must be studied independently, as their areas of distribution are not the same.

Mammals have been accorded first rank in determining faunal areas of terrestrial life, and zoögeographers have relied largely upon them to characterize their divisions, checking them by other animals.

The causes of the distribution of animals are many, the prime factor being, of course, the past geological history of the globe, including, as it does, those changes which have affected the continuity, extent, and elevation of former and existing land areas. The question of continuity is most important, since it practically controls the dispersal of land animals over large areas—a fact well illustrated by New Zealand and the islands of Polynesia, where there are no indigenous mammals save bats, whose power of flight has caused them to be very widely distributed. Next in order comes temperature, which is the most important controlling agent in the distribution of life over existing areas. Its effect has long been recognized, and it is very obvious that it acts directly by limiting the range of many animals, and indirectly by its influence on vegetation.

That temperature acts in other and more subtle ways than these has long been acknowledged, especially by botanists, but no satisfactory explanation has been offered until recently, when Dr. Merriam enunciated two principal "laws of temperature control" for the northern hemisphere. These, deduced from a careful study of the fauna of North America, are as follows: "The northward distribution of animals and plants is determined by the total quantity of heat, the sum of effective temperatures. The southward distribution of species . . . is determined by the mean temperature of the hottest part of the year."

After temperature come other climatic factors, especially humidity, physical characters, contour and configuration of the land, all of which have a greater or less effect on the distribution of animals.

Humboldt and Buffon may be credited with having laid the foundations of zoögeography, for while other writers had remarked certain peculiarities of distribution, they were the first to make any general deductions on the subject. Humboldt drew attention to the effects of heat and cold on the dispersal of animals, and mapped out zones of animal life. Buffon knew "that the inhabitants of the

tropical and southern portions of the Old and New Worlds were entirely different from each other; that those of the northern portions of the two were to a considerable extent identical; and that the confluence of the two was most apparent toward the proximate portions of America and Asia." Although Buffon recognized these facts, Swainson was perhaps the first to divide the earth into zoological regions, proposing five "ranges," practically corresponding to the main continental masses. Since his time various divisions have been proposed, authorities differing very considerably, not only in respect to the number and importance of the various zoological regions, but in the matter of their boundaries, although a comparison will show certain general agreements in regard to many of the principal divisions. These differences are partly due to a lack of positive knowledge respecting the actual distribution of animals, and partly to the class or to the combinations of animals selected to define the regions, there being a natural tendency on the part of each zoogeographer to consider as distinctive those groups of animals to which he has paid the most attention. The difficulty of establishing zoological regions is enhanced by the fact that their boundaries are not sharply defined, since there will be more or less overlapping of species, forming what have been termed transitional zones.

Among the more important contributions to zoogeography are those of Selater, Wallace, Allen, and Gill. The first, basing his divisions on birds, makes six regions, which have been widely accepted by European zoologists and were adopted by Wallace, who divided them into sub-regions.

Dr. Allen's system differs radically from those of Selater and Wallace in that he insists on the distribution of life in circumpolar zones "which conform with the climate zones, though not always with the parallels of the geographer." He also carries his subdivisions a step further, recognizing three grades of zoological regions, termed in the order of their importance realms, regions, and provinces. The realms are eight in number: 1. The Arctic, including that part of the globe N. of the isotherm of 32° F., a boundary which is practically coincident with the northern limit of trees. 2. North temperate. This extends southward in North America to the isotherm of 68° or between 68° and 70° F. This line begins on the Atlantic coast just below the northern boundary of Florida, and runs W. along the Gulf coast to Southern Texas and thence to the Pacific, following approximately the Mexican border. In the Old World the southern boundary of the north temperate realm is pretty nearly the same as that of the Palaearctic region of other writers. In both hemispheres there is a considerable tract of debatable territory. 3. American tropical realm, bounded on the N. and S. by the isotherms of 70° F. The southern boundary leaves the Atlantic coast about lat. 30° S. and bends to the N. until it nearly or quite reaches the tropic of Capricorn in the northeastern corner of the Argentine Republic; thence it turns southward and runs to the base of the Andes, follows them N. to Ecuador, and crosses, bending southward again so as to include a strip of Northern Peru. This very nearly coincides with the southern boundary of the Brazilian region of Wallace. 4. South American temperate realm. This includes all South America and the adjacent islands below the line just described. 5. Indo-African realm, including all Africa S. of a strip along the Mediterranean, and intertropical Asia, including the adjacent islands S. to New Guinea and W. to the Moluccas. 6. Australian realm, comprising Australia, Tasmania, New Zealand, New Guinea, and the Moluccas and Polynesia. 7. Lemurian realm, consisting only of Madagascar and the Mascarene islands. 8. Antarctic realm, mainly oceanic, but comprising also Tierra del Fuego and the Falkland islands.

The following arrangement is in the main that of Wallace, but certain emendations have been made by Dr. Gill, notably the recognition of the temperate South American, New Zealand, and Polynesian regions. The number and boundaries of these divisions will undoubtedly need to be modified as we obtain a better knowledge of the distribution of animals.

1. *The North American or Nearctic realm* embraces North America from its northern boundaries, where it is fused into the European, southward into Northern Mexico, projecting into that country to a considerable distance, and ceasing near the southwestern borders of the U. S. on the lowlands. It has representatives of 26 families and about 750 species of mammals, exclusive of the marine types; 60

families and about 760 species of birds; 25 families and about 250 species of reptiles; 14 families and about 100 species of amphibians; 17 families and about 650 species of fresh-water fishes; and 1 family and 6 or 7 species of marsipobranchiates. Of these several are peculiar to the region.

The realm has been variously subdivided into sub-regions by different authors, notably Agassiz, Baird, Verrill, Allen, Cope, and Merriam, each of whom has based his divisions primarily upon special classes, though availing himself of his knowledge of other vertebrates. The division made by Dr. Merriam is based on a larger amount of material than was available to other writers, as well as on a better knowledge of the laws of distribution. These regions are founded on the distribution of plants as well as of animals, and are three in number:

1. *The Boreal region* extends obliquely across the entire continent from New England and Newfoundland to Alaska and British Columbia, and from about lat. 45° N. to the Polar Sea, conforming in general direction to the trend of the northern shores of the continent. It recedes to about lat. 54° on the plains of the Saskatchewan, and gives off three long arms or chains of islands, which reach far south along the three great mountain systems of the U. S. Twenty genera of mammals are peculiar to this region, or do not extend beyond the transition zone which lies between it and the next division.

2. *The Austral region* covers nearly the whole of the U. S., except the mountains, and reaches northward considerably beyond the boundary on the Great Plains and Great Basin. It is invaded from the N. by the three boreal intrusions mentioned above. To the southward it occupies the great interior basin of Mexico and extends into the tropics along the highlands of the interior. It covers also the peninsula of Lower California, the southern border of which seems tinged with a tropical fauna. Twenty genera of mammals are confined to the austral region. This region is divided by temperature into three transcontinental zones, named transition, and upper and lower austral, and these in turn are subdivided into arid and humid divisions, the most important of which are the arid lower Sonoran, and humid austro-riparian, which together make up the lower austral zone.

3. *The Tropical region*, which occupies the remainder of North America, reaches the U. S. at two points—Florida and Texas. In the former it exists as a narrow belt encircling the southern half of the peninsula from Cape Malabar on the E. to Tampa Bay on the W. In Texas it crosses the lower Rio Grande from Mexico and extends N. to the neighborhood of the Nueces river. In Western Mexico the tropical region reaches Mazatlan. Fifty-three genera of mammals, the majority bats, are exclusively tropical.

11. *The European or Palaearctic realm* is the largest of all, and embraces the entire northern portion of the Old World. Its southern limits nearly coincide with the tropic of Cancer in the lowlands, and its isotherm projected therefrom in the more rugged countries. In Africa it extends into the Desert of Sahara, and in Asia it is limited by the Himalaya Mountains and their spurs. It possesses members of 31 families of terrestrial mammals, 55 of birds (according to Wallace), 25 of reptiles, 9 of amphibians (according to Günther), and 16 of fresh-water fishes. None of these families, however, are continuous over the entire area and at the same time peculiar to it. According to Wallace, there are four regions, or "sub-regions," which he contends are "in the present state of our knowledge at once the most natural and the only practicable ones." These are (1) the European, (2) the Mediterranean, (3) the Siberian, and (4) the Manchurian.

1. *The European region* coincides with the continent of Europe and its outlying islands northward, but is limited southward by the Pyrenees and the Alps, the Balkans, the Black Sea, and the Caucasus range. A few genera of vertebrates are peculiar to the region, among which are those including the chamois and the desman.

2. *The Mediterranean region* includes the countries bounded on the N. by the Pyrenees, the Alps, and the Caucasus Mountains, and on the S. by the great desert of Africa; it also embraces Asia Minor, Persia, and part of Afghanistan, as well as the northern part of Arabia. It is the richest of all the European regions in the number of species, and herein forms of North and South Europe meet on common ground, and a few African types have wandered into it. It has been subdivided into (a) "the Mediterranean sub-region" and (b) "the Persian sub-region."

3. The Siberian region includes the whole of Northern Asia from the Arctic Ocean southward to the borders of Persia and Afghanistan, the Himalaya Mountains, Northern China, and the Amoy river. A number of peculiar genera are present, but these are quite limited in their range, and none extends over the entire area. It is divisible into (a) "the Siberian sub-region" and (b) "the Tartarian sub-region."

4. The Manchurian region includes Manchuria, as well as the Chinese empire and the Japanese islands, and is characterized by quite a large number of peculiar species of the several classes of vertebrates, which, however, are mostly quite limited in their distribution, and few, if any, extend over even the greater part of the territory. It has been differentiated into (a) "the Manchurian sub-region" and (b) "the Japanese sub-region."

III. *The Indian or Oriental realm* is of less extent than either of the two preceding ones, but is nevertheless richer than either in the number of species. It extends from the Himalayan range southward to the Indian Ocean, and toward the southeast is limited by the narrow but deep strait which intervenes between Celebes island and its dependencies on the S. and Borneo on the N., and between the islands of Lumbok and Sumbawa on the one hand and Bali and Java on the other; it thus includes the peninsulas of Hither and Farther India and the Indo-Malayan Archipelago and Philippine islands. In it are found 33 families of terrestrial mammals, 71 families of birds, 25 families of reptiles, 9 of amphibians, and 15 of fresh-water fishes. Of these, 12 are peculiar. Four subdivisions are admitted by Wallace, but these will probably need revision. They are as follows:

1. The first or Hindustan region includes the Indian Peninsula from the Himalayas on the N. to the delta of the Ganges and its approximate isotherm on the S.; "and it probably reaches to about Kashmir in the N. W., and perhaps to the valley of the Indus farther S.; but the great desert tract to the E. of the Indus forms a transition to the south Palaëretic sub-region." Its zoological peculiarities consist rather in the development of the types than in the exclusive presence of any one.

2. The Ceylonese region—so called because its characteristics are exhibited in the highest degree in the island of Ceylon—includes not only that island, but also the southern portion of the Indian Peninsula to the confines of the first, or Hindustan, region. According to Wallace, "the main features of this division are—the appearance of numerous animals allied to forms only found again in the Himalayas or in the Malayan sub-region, the possession of several peculiar generic types, and an unusual number of peculiar species."

3. The Indo-Chinese or Himalayan region includes the peninsula of Farther India and Southern China, and extends from the Himalayas in the N. southward to the Malaccan peninsula. "Taking this sub-region as a whole," says Wallace, "we find it to be characterized by 3 genera of Mammalia [*Urva*, *Arctonyx*, and *Elurus*], without counting bats, and 44 genera of land-birds, which are altogether peculiar to it; and by 13 genera of Mammalia and 36 of birds, which it possesses in common with the Malayan sub-region." This region, according to some authors, admits of a further subdivision into three—(a) Southern and Central China, (b) Burma, Siam, and Cochin, and, as an appendage, (c) the Andaman and Nicobar islands.

4. The Indo-Malayan region includes all the islands of the Indo-Malayan Archipelago and the Philippine islands, as well as the Malayan Peninsula. The region is capable of subdivision into several others; Slater, e. g., has distinguished (a) the Malay Peninsula, (b) the Indian islands, and (c) the Philippine Archipelago. The last is remarkable for the exuberant development of the terrestrial gasteropods.

The Andaman and Nicobar islands have been combined by some naturalists, as already indicated, with the Indo-Chinese region, but by Wallace have been referred, one (the Andamans) to the Indo-Chinese, and the other (the Nicobars) to the Indo-Malayan.

IV. *The African or Ethiopian realm*, as the name indicates, includes the greater part of the African continent, but not all, it being limited on the N. by the Desert of Sahara, although on all other sides bounded by the ocean; but it also comprises, according to most recent authors, the island of Madagascar and the Mascarenes, as well as the peninsula of Arabia. It is distinguished especially in that it possesses the highest types, after man, of the order Primates, these being in all respects the most anthropoid. This region is also further distinguished by the restriction to it of as many

as 9 isolated families of mammals. The most marked, however, are the fishes, of which there are 14 families; of these, five are peculiar. This realm, like all the others, has been subdivided by Wallace into four regions, or, as he designates them, "sub-regions"—viz. (a) the East African, (b) the West African, (c) the South African, and (d) the Malagasy.

1. The East African sub-region, or that of Central or East Africa, includes "all the open country of tropical Africa S. of the Sahara, as well as an undefined southern margin of that great desert." It embraces Nubia and the country toward the S., as well as the entire width of the continent between about the 10th degree of S. lat. and the tropic of Capricorn. It is mostly distinguished by negative characters in contrast with the others.

2. The West African region comprises the western half of the continent at its greatest width, and is bounded on the N. by the Desert of Sahara, and on the E. and S. by the East African region, its southern bounds being nearly coincident, toward the coast, with the river Congo, but further inland with about the 10th degree of S. lat. Among the characteristic animals of the region are the gorilla, the chimpanzee, and two genera of *Lemurida* (*Prodielticus* and *Arctocebus*), constituting a peculiar section of the family Lemurida.

3. The South African region embraces the southern portion of the continent, and its limits toward the N. are nearly coequal with the tropic of Capricorn, except along and near the eastern coast, where it extends northward to the vicinity of Mozambique; on all other sides it is bounded by the ocean. To this region, so far as known, are limited several of the forms that are peculiar to Africa—viz. the *Proteida*, the *Chrysochlorida*, and the *Orycteropodida*. A large number of genera in various classes of animals are also peculiar to it.

4. The Malagasy region comprises the island of Madagascar, as well as the islands of Bourbon, Mauritius, Rodriguez, and the Seychelles. These, however, exhibit remarkable differences among themselves. (a) Madagascar is distinguished by the development of several peculiar types of mammals—e. g. *Daubentonidae*, *Cryptoproctida*, and *Centetida*;* birds and invertebrates of remarkable character further specialize it as an independent region. (b) The Mascarene islands include all the small ones enumerated, and several of them are remarkable for the large birds provided with imperfect wings which formerly existed on them, but which through the agency of man have now become extinct.

V. *The South American or Neotropical realm* extends from the N. near the northern boundaries of Mexico in the lowlands, and lower down in the highlands, to the irregular line which marks the northern boundary of the South American temperate realm and runs from lat. 30° S. on the east coast of South America to lat. 5° S. on the west coast. With it are also generally associated the West Indian islands. It has 30 families of mammals, 73 of birds, 35 of reptiles, 16 of amphibians, and 17 of fresh-water fishes. An unusual proportion of these are peculiar to the region, or nearly so. This realm has been subdivided into four regions.

1. The Mexican or Central American region extends from Northern Mexico near the coast, and from Central Mexico in the highlands, southward to about the Isthmus of Panama. It is distinguished by the intermixture of North and South American types; but quite a large number of species and not a few genera are peculiar to the region.

2. The Antillean, West Indian, or Caribbean region, as it has been variously called, includes most of the islands of the Caribbean Sea. On the whole, the types found on the several islands are most closely related to those of the Mexican region, and there are many species and quite a large number of genera peculiar to it. Undoubtedly the most noteworthy feature of this region is the great development of terrestrial gasteropods; these exhibit an extraordinary range of variation, both specific and generic. The larger islands (Cuba, Haiti, and Jamaica) are especially remarkable for the manifestation of this form of animal life. The region is susceptible of subdivision into several others well defined by differences in the combinations of land-shells. Cuba, Jamaica, Haiti, Porto Rico, etc., are all centers of peculiar combinations of species.

3. The Brazilian or Amazonian region embraces the most of tropical America, and its limits are coextensive with the Atlantic Ocean on the N., and generally also on

* An aberrant type of this family (*Solenodontina*) is represented in the West Indian islands.

the E., while toward the S. it extends into Uruguay, and toward the W. terminates in the highlands of the Andes. It is extremely rich in representatives of almost every class of terrestrial animals. It is the headquarters of the platyrrhine monkeys, the *Caridae*, the spiny rats, the ant-eaters, the sloths, the armadillos, and the opossums among the mammals; the toucans, the curassows, the tinamous, and many other families among the birds; and the *Polycentridæ* and *Gymnotidæ* among the fishes; the insects and terrestrial as well as fluviatile mollusks are also as a whole characteristic.

4. The Galapagos region includes the archipelago so named, with about fifteen islands situated on either side of the equator and distant about 600 miles westward from South America. Perhaps it is properly a mere faunal district of the Chilian region, and as such Wallace has considered it.

VI. *The South American temperate realm* coincides very nearly with Wallace's Chilian sub-region, its northern limit on the Atlantic coast being near the 30th parallel. On leaving the Atlantic coast, the northern boundary passes obliquely northwestward, rising in the region of the Chaco Desert to, or possibly a little beyond, the tropic of Capricorn. Again descending to about the 25th parallel, it turns abruptly northward and eastward, along the eastern border of the Andean chain, nearly to the 5th degree of S. lat., near which point it strikes the Pacific coast. It thus embraces a large part of the great Andean plateau, with the neighboring coast region to the westward, nearly all the La Plata plains, and the region thence southward to Tierra del Fuego, which belongs also to this realm.

Within its limits occur representatives of several peculiar groups; there are 18 families of terrestrial mammals, 2 of which (the *Chinchillidæ* and *Chlamydomorphidæ*) are almost confined to it; 42 families of birds, 3 of which (*Chionididæ*, *Thinocoridæ*, and *Rheidæ*) hardly occur farther N.; 15 families of reptiles; 11 families of amphibians; 5 families of fishes, two of which are shared with New Zealand and Tasmania, and scarcely extend into tropical America; and 1 family of Myzonts, also shared with New Zealand and Tasmania.

VII. *The Australian realm* is of all the most distinctly defined by its fauna. As here limited, it comprises Australia and the immediately outlying islands and the Austro-Malayan Archipelago; it is limited northward by Wallace's line or strait, which separates Lombok from Bali and Celebes from Borneo, including Papua or New Guinea and the Solomon islands to the eastward, and southward embraces Tasmania or Van Diemen's Land. It is especially distinguished by its numerous marsupial mammals, and by the almost complete restriction of the class to representatives of that order; the monotremes are also characteristic of the realm, and entirely confined to it. The class of birds likewise has a number of very characteristic types. The reptiles and amphibians are perhaps less noteworthy, although they present some interesting features of detail. The fresh-water fishes are, however, especially remarkable; while many of what may be called marine families are represented by fluviatile species, there are several that are peculiar to it or found elsewhere only in South America. Among the former is the family *Ceratodontidæ*, which in former geological epochs was extensively represented in other parts of the world, but is now peculiar to Australia. The articulates and mollusks also afford a large number of characteristic forms. The primary subdivisions of the realm are two:

1. The Australian region includes the continent of Australia and the island of Tasmania, as well as several smaller ones near the coast. This is especially the home of the existing types of marsupials, and all the surviving families, with the exception of *Didelphididæ*, are here best exemplified, and several of them are peculiar. To this region also the family *Ornithorhynchidæ* of the monotremes is restricted.

2. The Austro-Malayan or Papuan region includes the island of Papua or New Guinea, and likewise Celebes and the multitudinous islands lying toward the S. and between it and Papua, as well as the Solomon islands. Among the mammals there is one species of the genus *Sus* known, and one species of *Muridæ*, but all the others belong to the orders of marsupials and monotremes. Among the birds the most noteworthy forms are those of the family *Paradisidæ*, which are developed to the greatest extent in New Guinea.

Both of the above-specified regions of the Australian realm, but especially the Papuan one, are susceptible of subdivision into well-marked faunal districts; but for information respecting these reference must be made to Wallace's work, as well as to memoirs by Australian and other naturalists.

VIII. *The New Zealand or Ornithogean realm* comprises New Zealand only. It has 21 peculiar genera of birds, including the remarkable apteryx, which is by many considered as the type of an order. Moreover, the moas (*Dinornithidæ*) are only recently extinct, and these were restricted to New Zealand. Here also is found the only surviving genus, *Sphenodon* or *Hatteria*, of the order *Rhynchocephalia*, a group of reptiles whose fossil remains are widely distributed.

IX. *The Polynesian realm* includes all the islands of the tropical Pacific E. of New Guinea and the few small islands belonging to it. It is very largely distinguished by its negative characters, indigenous mammals being all but absent; there are something like 50 genera and 150 species of birds, including a considerable number of fruit pigeons and small parrots; and the gasteropod fauna is rather characteristic. This realm may perhaps be best considered as provisional, and its exact limits or relations to be determined in the future.

While much has been done in determining the zoological regions of the land, comparatively little has been done with those of the sea, because the data are much more meager, and the difficulties in the way of plotting the boundaries of the regions are much greater in the latter case than in the former. As stated by Dr. Gill, there is no relation between the marine faunas and those of the land, for while the geological changes which have affected the elevation of the land have to some extent influenced the character of the marine faunas, yet the two faunas have developed independently of each other. Prof. Dana, so early as 1853, divided marine life into three zones, these being subdivided into nine "regions" limited by isocrymes, or lines connecting points at which the surface temperature averaged the same "for the coldest consecutive thirty days of the year." Prof. Dana's arrangement was as follows:

I. Torrid or Coral Reef Zone.

Regions.	Isocrymal or temperature limits.
Supertorrid (Equatorial).....	80° to 80° F.
Torrid (North and South).....	80° to 74°
Sub-torrid (North and South).....	74° to 68°

II. Temperate Zone.

Warm Temperate (North and South).....	68° to 62° F.
Temperate (North and South).....	62° to 56°
Sub-temperate (North and South).....	56° to 50°
Cold Temperate (North and South).....	50° to 44°
Sub-frigid (North and South).....	44° to 35°

III. Frigid Zone.

Frigid (North and South).....	35° to 26° F.
-------------------------------	---------------

Three great divisions or "kingdoms" were admitted: "the American or Occidental, including East and West America; the Afro-European, including the coasts of Europe and Western Africa; and the Oriental, including the coasts of Eastern Africa, East Indies, Eastern and Southern Asia, and the Pacific. Besides these, there are the Arctic or Antarctic kingdoms, including the coasts of the frigid zones, and in some places, as Fuegia, those of the extreme temperate zone."

Dr. Gunther in 1880, treating of marine fishes, divided them into three categories—shore, pelagic, and deep-sea fishes. The distribution of the last two groups was not touched upon, but the shore fishes were distributed in zones, and the zones divided into districts, thus: I. The Arctic Ocean; II. The Northern Temperate Zone, subdivided into (A) the Temperate North Atlantic, comprising British, Mediterranean, and North American districts, and (B) the Temperate North Pacific, comprising Kamchatkan, Japanese, and Californian districts; III. The Equatorial Zone, subdivided into (A) the Tropical Atlantic, (B) the Tropical Indo-Pacific, and (C) the Pacific Coast of Tropical America, the last named comprising three districts—Central American, Galapagos, and Peruvian; IV. The Southern Temperate Zone, comprising four districts—Cape of Good Hope, South Australian, Chilian, and Patagonian; V. The Antarctic Ocean.

Dr. Gill in 1883 considered that the primary marine regions, or realms, were five in number: (1) The Arctalian, (2) the Pararctalian, (3) the Tropicidian, (4) the Notalian, and (5) the Antarctalian. The Arctalian or Arctic realm comprises the northern seas, extending southward approximately to the isocryme of 44° F., or about to Cape Cod on the eastern coast of North America and the Straits of Juan de Fuca on the west, but these boundaries are said to be provisional. The Pararctalian or North Temperate realm includes the various coast-lines between the isocrymes of 44° and 68°, the latter being the northern limit of reef-growing corals. The Tropicidian realm is the same as Dana's Torrid Zone, including the seas between the isocrymes of 68° N. and S. The Notalian or South Temperate realm extends from the isocrymes of 68° to 44° S. While differing from the Pararctalian there are nevertheless a number of genera common to the two which are absent from the intervening Tropicidian realm. The Antarctalian or Antarctic realm covers the antipodal ocean up to the isocryme of 44°, the only continental area included being part of Patagonia, from the Rio Negro on the east coast to lat. 50° S. on the west.

All the deep-sea fishes were relegated to a Bassalian realm with the qualification that the data on which it was based were insufficient, and that its limits would probably need to be better defined in the future. The statement was, however, made that "one of the characteristic features of the Bassalian animals appears to be their wide dispersion and range, . . . and they appear to be restricted less by latitude and longitude than by bathymetrical influences."

Subsequently to this came the publication of the Challenger Reports and the unsurpassed deep-sea work of the U. S. steamer Albatross, which, together with other less pretentious researches, furnished Dr. Goode with the material for papers presented by him in 1895. In these papers Dr. Goode shows that the ideas that the fauna of the deep sea is characterized by its uniformity and that the distribution is in horizontal zones are incorrect, and that instead of being limited by temperature a number of deep-sea faunal regions can be characterized as bounded in some instances by submarine plateaus. These regions are eleven in number, and the best defined of them are distinguished by the possession of not less than 25 per cent. of peculiar genera and 33 per cent. of peculiar species.

They are (1) the Boreal Atlantic; (2) Eastern Atlantic, or Lusitanian, with a Mediterranean sub-region; (3) Northwestern Atlantic, or Virginian, with a Caribbeo-Mexican sub-region; (4) Southwestern Atlantic, or Brazilian; (5) Boreal Pacific, or Aleutian; (6) Eastern Pacific, or Galapagean; (7) Northwestern Pacific, or Japanese; (8) Polynesian; (9) New Zealandian; (10) Antarctic; (11) Indian.

The fishes inhabiting the open ocean are termed oceanic fishes to distinguish them from the shore-frequenting or littoral species. They are divided into two general groups: 1. Pelagic fishes, or those which live near the surface; many of these descend to considerable depths and are called bathy-pelagic. 2. Bathybial fishes, or those which frequent the great depths of the ocean and are not found at less than 1,000 feet below the surface. A large number of species dwell at or near the bottom between the littoral and bathybial zones, often descending to considerable depths; they are mostly allied to littoral forms which have made their way down the continental slopes, and are termed hemi-bathybial or semi-littoral. They constitute more than half the inhabitants of the eleven bathybial regions, and many of the peculiarities of these divisions are due to the contingent of hemi-bathybial fishes, which in turn are related to those of the adjacent coast faunas.

It is still a moot question whether the intermediate depths of the ocean are or are not inhabited by fishes or invertebrates. Prof. Haeckel, of Jena, assuming that life occurs at all depths, has proposed an elaborate scheme of nomenclature for the various depths and for the animals assumed to dwell in them. Other naturalists, the most prominent among them being Alexander Agassiz and Victor Hensen, maintain, on the other hand, that life is limited to the strata directly adjacent to the surface and to the ocean bottom, and that the region between is practically lifeless, although no doubt many forms pass through these depths, at least from below upward, while many bathybial forms reside at the surface during the early stage of their lives.

The Plankton expeditions of the Germans and French, and the elaborate experiments of Prof. Agassiz with his trap-nets, tend to confirm these views, and indicate that

pelagic life is normally confined to the upper strata of the ocean, and that many forms which have been brought up in deep-sea nets and supposed to have come from great depths were really taken near the surface, and that pelagic life in the open ocean is confined, at most, to depths of 200 to 300 fathoms.

F. A. LUCAS.

Zoö'ology [Gr. ζῷον, animal + λόγος, discourse, reason]: that part of biology which relates to animal life; the science which treats of the structure, development, classification, distribution, habits, and derivation of animals. Zoölogy properly includes the study of extinct animals as well as those now living on the earth, but the former branch of the science is considered by itself under the title PALEONTOLOGY (q. v.).

HISTORY.—The science of zoölogy begins with Aristotle (B. C. 384-322), whose works include the comparative anatomy of animals, together with the first-known classification. He mentions about 500 species of animals, and had dissected, studied, and described many forms which were not re-examined until recent times. His interest in the science was pre-eminently anatomical, although his influence at the Renaissance was chiefly systematic. No other ancient writer contributed much to the advancement of the science. The work of Pliny (23-79 A. D.) is distinguished by wide and entirely uncritical knowledge. It is a collection of mingled facts and fables about animals. Other ancient writers treated of human anatomy rather than zoölogy.

During the earlier Middle Ages no interest was shown in zoölogy for its own sake. In the fourteenth century a work appeared in various languages entitled *Physiologus*, treating chiefly of the natural history of Bible animals. It described about seventy species, including among them fabulous forms like the griffin and the phoenix.

The Arabian naturalists of the twelfth and thirteenth centuries translated Aristotle, and in some degree introduced him to the knowledge of the Western world. Among these may be mentioned Abd-el-Latif, Avicenna, Abd-ul-Faraj, and, in less degree, Averroes. At the revival of learning, zoölogy recommenced by the translation and commentary on Aristotle by Albertus Magnus (1193-1280). No advance in the science, however, was made either by him or by his contemporaries, whose interest did not lie in the direction of scientific study.

The zoölogy of modern times is divided into four periods—that of the encyclopedists, that of Linnaeus, that of Cuvier, and that of Darwin.

The Encyclopedists, 1500-1750.—The first new impetus to the study of zoölogy was given by the discovery of the Indies, East and West, and the animals which these discoveries brought to the notice of the Europeans. In the latter part of the sixteenth century A. Gesner published, in his *Historia Animalium*, the work from which modern zoölogy

may be dated. It described all the animals known to his time, with illustrations, many of them given to the world for the first time. The work of U. Aldrovandi is of a similar character, less critical, but still of great value in extending the knowledge of the new animals discovered in Asia and America. The Englishman Wotton (1492-1555), by his translation of Aristotle, revived the Aristotelian zoology, stripped of medieval fables, but his work had little influence as compared with those already cited. It began, however, the systematic work which led through Ray to Linnaeus.

The Linnaean Period, 1750-1800.—These encyclopaedic works gave the world that knowledge of facts which must precede the scientific handling of a subject, and prepared the way for Linnaeus, with whom modern scientific zoology and botany began. To the forces aiding in the accumulation of these facts must also be added the development of human anatomy and of microscopy in the fifteenth and sixteenth centuries.

Linnaeus (1707-78) first constructed a complete system in which all animals were to be enrolled. It was superficially constructed, indeed it was largely artificial, and yet the very fact of its completeness aided in making his work the point of departure for scientific zoology. His method was equally important. He introduced the binary system of nomenclature, which, although apparently a small thing, was in reality of the first importance in contributing to the clarification of knowledge in zoology, and he introduced also the diagnosis, as distinguished from the description, of the animal. In Linnaeus's method every animal was to receive its proper names—generic and specific—and was to be briefly characterized in terms which should distinguish it from all other members of the same genus, and each genus and other higher group was to be similarly characterized. In order properly to characterize a new animal, it had to be examined in all particulars, so as to find its diagnostic characters, and to determine its place in the system; and this study led to increasing knowledge of the characters of animals, and made necessary a continual revision and correction of the system itself as knowledge enlarged. With the work of Linnaeus the conception of the animal kingdom was developed for the first time, and zoology became an account of this kingdom rather than a mere description of individual animals. Linnaeus's *Systema Naturae* was published about the middle of the eighteenth century, and the next half century was mainly occupied with applying to the animal kingdom the principles which he had established, and widening the knowledge of the animal kingdom on lines which he had laid down. Among the distinguished zoologists of this period are Buffon, Bonnet, Fabricius, O. F. Müller, Lacépède, Trembley, Spallanzani, and C. F. Wolff.

The Cuvierian Period, 1800-60.—Important as were the ideas contributed to zoology by Linnaeus, they were not without danger to the science. Men forgot that "species" was merely a collective term, and ascribed to it a certain kind of real existence. They looked on the system as the structure into which newly discovered knowledge was to be fitted, not as the constantly changing expression of increasing knowledge. The Linnaean system, too, was especially deficient on the side of the higher classification, and the method included no criteria for grouping animals under the higher categories. A knowledge of comparative anatomy was needed in order to bring into view the points on which higher classification rests.

With the nineteenth century began a new development of zoology in the direction of comparative anatomy. The leader in this movement was George Cuvier (1769-1832), who possessed an extraordinary knowledge of the facts of comparative anatomy, based largely upon his own researches, and at the same time was able so to handle these facts as to establish three zoological principles of the first importance. The first of these was the law of the correlation of parts—the law that each organism is not a mere aggregate, but forms a complete whole, in which single parts can not be altered without changing all of the others; so that from the presence of certain characters the presence of others may also be inferred. This principal underlay his study of paleontology, which science he started, and his famous reconstructions of fossil animals. The second principle was that of subordination of characters—that certain characters are leading and others subordinate to these. From these he developed his third idea—that of types of structure in the animal kingdom. He conceived that under the principle of subordination of characters animals were built upon certain plans of structure, according to which

they might be arranged in great types or branches (*embranchements*). These were four in number—vertebrates, articulates, mollusks, and radiates. The animals in each branch were built on the same plan, and corresponding or homologous parts might be found in them. Animals in different branches were built on different plans, and showed no correspondence of structure, only likeness of function, analogy. Previous to Cuvier's establishment of the type theory the animal kingdom had been divided into classes of very unequal value, based on complexity of structure, and the idea was generally maintained, as by Lamarck, that the animal kingdom formed a series ranging from the highest and most complex to the lowest and most simple. The type theory was vigorously opposed by É. Geoffroy Saint-Hilaire, but unsuccessfully, and it dominated the zoology of the next half century.

The first half of the nineteenth century was devoted to working out and enlarging the ideas in anatomy and classification given to the zoological world by Cuvier, and a host of students developed the science both on the systematic side and in comparative anatomy. Embryology, founded by C. F. Wolff in the middle of the eighteenth century, began its real life with the work of Pander, von Baer (1792-1876), and other embryologists of the first part of the century, whose embryological work aided greatly to confirm the type theory as established by Cuvier. Histology originated with Bichat in the first years of the century. Of the host of distinguished men of this period only a very few may be named, an account of whom may be found under their respective names: Johannes Müller, perhaps the most influential comparative anatomist next to Cuvier, Ehrenberg, d'Orbigny, von Siebold, who corrected the Cuvierian types by the separation of the Protozoa, and Lenckart, who still further separated the Cuvierian types into seven divisions, substantially as indicated in the article ANATOMY, COMPARATIVE. In comparative anatomy no name is more distinguished than that of Richard Owen. In the U. S. the greatest name of this period is that of James D. Dana.

The Darwinian Period, 1860 to the Present.—The publication of *The Origin of Species* in 1859 by Charles Darwin worked a more rapid and complete change in zoology than in any other science—even the sister science of botany—(see EVOLUTION and DARWINISM), and under the stimulus afforded by the evolutionary conception of the animal kingdom, zoology has developed with great rapidity, has specialized in many different directions, and has claimed the labors of a host of men of the first ability. It is only possible here to sketch the directions in which zoology has moved, without attempting to name even the most important works and scientists.

The idea of descent gave for the first time a point from which all branches of the science could be viewed. The facts of systematic zoology, comparative anatomy, embryology, and the biological relations of animals could now be handled together for a common end, and their own interrelations could now be seen. As a result, all the older departments of the science have been developed with marvelous rapidity, and many new and formerly unsuspected directions of investigation have appeared.

Classification.—The number of species of animals known to science has increased with great rapidity. Linnaeus recognized about 6,000 species. In 1830 the number of known species was estimated at 50,000. Thirty years later, in 1860, J. Geoffroy Saint-Hilaire estimated the number at 140,000. In 1875 Pagenstecher gave 300,000 as the number then known. At the present time 400,000 to 500,000 would be a conservative estimate. Good authorities suppose that there are at least 1,000,000 species of insects, including those undescribed as well as those now known. The handling of this vast and rapidly increasing mass of material has called for a corresponding increase in the complexity and perfection of the methods of classification. At this place, however, only the changes in the higher classification can be noticed. As already stated, the type theory of Cuvier as modified by Lenckart and others, was the dominant theory of classification until the acceptance of the theory of evolution. The type theory is still practically dominant, although not interpreted to-day as it was by its adherents in the first half of the nineteenth century. The conception of descent which evolution introduced has not been used successfully as a basis of the wider classification, although many attempts have been made to do so. Our knowledge of the interrelationships of animals is still so incomplete and the relations are so complex that it has been impossible to

group the larger divisions of the animal kingdom on this basis. It is only in the past few years that there has been any marked tendency to break away from the seven types of animals established more than a half century ago by Leuckart, substantially as given in the article on ANATOMY, COMPARATIVE. The idea of plan of structure has been abandoned, although the name *type* or *branch* is still retained for the primary divisions of the animal kingdom. Recent classifications depart from older ones chiefly in the multiplication of new primary groups and in the redistributing of groups of doubtful affinities. The most important change is the establishment of groups higher in rank than that of type. The most generally accepted division of this sort is that of *series*, under which the animal kingdom is divided into two great groups, the *Protozoa*, or one-celled animals, and the *Metazoa* or many-celled animals. Less generally accepted is the division of *Metazoa* into *Acoelomata* or *Celenterata* and *Celomata*, or *Metazoa* devoid of a body-cavity and those possessing one. The most important modifications of the limits of the types or branches are as follows: (1) The old group *Vermes* has been abandoned and a number of groups have been substituted for it. Perhaps no two high authorities agree as yet in regard to the number, limits, or affinities of these groups. (2) The separation of *Bryozoa* and *Brachiopoda* from *Mollusca*, leaving, however, their affinities in doubt. (3) The sponges are placed in connection with the *Celenterata*, either as a group subordinate to that or correlative with it. (4) The division of *Arthropoda* into at least two branches. (5) The union of *Tunicata* and perhaps other groups with the *Vertebrata*.

Sciences relating to the Structure and Development of Animals.—*Morphology.*—A general account of the morphology of animals is given under ANATOMY, COMPARATIVE, and reference is made here only to the changes in the science accomplished by the introduction of the doctrine of evolution. Comparative anatomy, founded by Cuvier, had at first two aims: first, the description of the structure of animals, and second, the handling of these facts so as to work out the types of structure upon which animals were built. With the abandonment of the type theory this second purpose has been abandoned, and the science has been handled with a view to discovering the affinities between groups of animals, the origin of the structures possessed by the higher animals, and the lines of development by which they have reached their present condition. Carl Gegenbaur, whose anatomical work extends over the whole period from 1860 to the present time, has doubtless contributed more than any other one man to this philosophical handling of the subject.

Histology.—An account of the tissues of animals will be found under the heading HISTOLOGY.

Physiology.—While the study of the physiology of man and the higher animals, especially the mammals, has developed greatly within the last quarter century (see PHYSIOLOGY), the study of the physiology of the lower animals, especially the invertebrates, has been comparatively neglected. The doctrine of evolution, emphasizing the genetic affinities of animals, has diverted attention from the subjects of histology and physiology, which have contributed least to the working out of the questions arising from evolution.

Embryology.—The science of embryology, which had developed very slowly before *The Origin of Species* appeared, rose at once into a place of the first importance on the introduction of the idea of evolution. In the article EMBRYOLOGY an account is given of the development of the higher vertebrates, particularly the mammals. This field had been partially explored before 1860, although immense additions to our knowledge of embryology have been made since that time. The study of the embryology of the invertebrates, which is not discussed in that article, has been of even greater service in advancing our knowledge of zoology. This is especially true of the study of the larval forms of invertebrates, to which reference is made in the several articles on these groups. The nauplius larvæ of the *Crustacea* (see CRUSTACEA), the trochophore of the worms, the veliger larvæ of the mollusks, and the larvæ of the *Tunicatu* (see TUNICATA) have been of the first importance in determining the internal and external relationships of these groups. The results of the study of these developments led to the establishment of the so-called biogenetic law, first stated by Haeckel. This law asserts that the embryology of any group is a recapitulation of the history of its descent, and that from the study of the developmental changes of the individual there can be learned a summary of the developmental history of

(the group to which it belongs. This law, however, is subject to important modifications, since, first, many features of embryological development have been acquired by the larva and do not show the past history of the group to which it belongs; and, second, many stages of development which must have been present in the history of the group are not represented in the development of the individual. While these modifications were recognized by Haeckel, they are undoubtedly given more weight at the present time than formerly, and it is not thought that embryology offers such clear indications of phylogeny as was once believed. Since 1880 the science has developed in other directions, especially in the knowledge of the more minute facts of development, the study of the process of fertilization and of cell division in the egg, and the history and fate of each of the primary parts into which the cell segments. These studies have led in recent years to a rediscovery of the facts and methods of heredity. (See HEREDITY.) In these discussions the Hertwig brothers and Weismann have taken a leading part. Still more recently experimental methods have been introduced into embryology. In these, the egg or young embryo is exposed to changed or abnormal conditions, separated into its primary parts, etc., and the effect of these changes on development is noted. From this work important conclusions have followed as to the powers and capacities of the original cells of which the germ is composed. As leaders in this work the names of Driesch and Roux, in Europe, and of Loeb, Morgan, and Wilson, in the U. S., may be mentioned.

Sciences which deal with the Relation between Animals and their Surroundings.—The science of geographical distribution of animals (see ZOOLOGICAL GEOGRAPHY) has been entirely remodeled since 1860. Previous to that time the distribution of animals was regarded as a simple matter of fact. It is now interpreted in the light of the possibilities of distribution and the hindrances offered by mountain barriers, seas, etc., and has become an important constituent of zoological science. The study of the relations existing between individual animals and their immediate surroundings has led to the development of the doctrine of mimicry and other general questions related with the color of animals. (See EVOLUTION.) The study of variations is a department of zoology in which investigation has recently commenced. While the fact of variation has long been known and has been used as a factor in theoretical zoology, very little accurate study of the effects of variation has as yet been made. The first systematic work on the subject is that of Bateson.

Animal Biology.—The systematic and morphological sides of zoology found their best expression in the museum (see MUSEUM) and in the zoological gardens. Of the latter by far the largest is that at London, founded in 1828. In Paris is the Jardin des Plantes, founded in 1794, and in most of the capitals and larger cities of Europe smaller zoological gardens are maintained. In the U. S. there are such gardens at New York, at Philadelphia, and at Cincinnati, and less important ones elsewhere. Modern zoology has found it necessary to supplement the museum by stations where marine or fresh-water animals can be studied under their natural conditions, and numerous marine zoological laboratories or stations have been established since 1870. The oldest and the best known is that at Naples, founded in 1872 by Dr. A. Dohrn and supported mainly by the German Government. This has been followed by laboratories in all the chief countries of Europe. On the Adriatic there is the station of the University of Vienna at Trieste, on the Mediterranean the French Government station at Banyuls and one at Marseilles, and the Russian station at Villefranche. There is a station on the Atlantic in France, at Roscoff, under the direction of Prof. Lacaze-Duthiers. In Great Britain the chief station is at Plymouth, opened in 1888. There are others less important at Liverpool and at St. Andrews, near Edinburgh. In Holland there is a station at the Helder, opened in 1890. In Germany the only station is that of the laboratory of the University of Kiel. A Government station has recently been established in Heligoland. Germany has also at Plön, in Holstein, the first permanent fresh-water station ever established, although a second is being established at Havana, Ill., by the University of Illinois. Norway has two stations and Sweden has one. Russia has a station at Sebastopol and one on the White Sea near the convent Solovtsky, besides the station on the Mediterranean. Japan has a station at Musaki. In the U. S. the oldest station is the private laboratory of Prof. Alexander

Agassiz at Newport. The Johns Hopkins University has maintained a marine laboratory since 1877, but it has not been permanently located, frequently changing its place of work, although usually on the southern Atlantic coast of the U. S. or in the West Indies. There are marine laboratories also at Woods Holl, Mass., and Cold Spring Harbor, Long Island. The Leland Stanford Junior University maintains a marine laboratory near Monterey, Cal. These, however, are for instruction, both elementary and advanced, as well as for research, and they do not maintain a corps of observers throughout the year.

Zoological Journals.—*Zoologischer Anzeiger*, bi-weekly (established in 1879). This and the following two journals give summaries of important papers, with an account of current literature: *Zoologisches Centralblatt*, bi-weekly (1894); *Biologisches Centralblatt*, bi-weekly (1881). The following journals devoted to zoology and allied sciences are published in the U. S.: *American Naturalist* (1867); *Studies* from the Johns Hopkins Biological Laboratory (1879); *Journal of Morphology* (1887).
E. A. BIRGE.

Zoöphytes [from Gr. ζῳόφυτον; ζῳον, animal + φυτόν, a plant]: a name formerly in use for the fixed forms of the Coelenterates. See HYDROIDS, etc.

Zoöpraxiscopes: See STROBOSCOPE and VITASCOPE.

Zoöspores [Gr. ζῳον, animal + σπόρος, seed]: minute naked masses of protoplasm escaped from plant-cells, which move about in the water by means of one or more cilia. On account of their activity they are easily mistaken for animals, which fact has suggested their name. They are common in many of the lower orders of plants, where they serve as reproductive bodies. In most cases each zoöspore is provided with two cilia near one extremity; sometimes, however, there are four, and in some cases there are a great number—e. g. in *Vaucheria* they cover the whole surface.

CHARLES E. BESSEY.

Zorgite: See SELENIUM.

Zorilla [= Span., dimin. of *zorra*, fox]: a name given in Spanish America to certain skunks of the genus *Conepatus*, but transferred both as a popular and generic name to certain skunk-like *Mustelidae* of South Africa, for a long time confounded with the South American skunks. The typical species, *Zorilla striata*, is somewhat smaller than a cat, black, with a white spot on the forehead and each temple, and four white stripes on the back. The bushy tail is black and white.
F. A. L.

Zorndorf, tsörn'dörf: village of Prussia, province of Brandenburg; famous for the battle fought here on Aug. 25, 1758, between the Russians under Fermor and the Prussians under Frederick the Great; the Russians were defeated.

Zoroaster, zō-rō-ās'ter (Gr. Ζωροάστρης, Lat. *Zoroastres*, Pers. *Zardusht*, Avestan *Zarathushtra*): the prophet of ancient Iran, whose teachings are preserved in the *AVESTA* (q. v.). The era at which this religious leader flourished

has been open to discussion and controversy. Persian tradition is probably nearest the truth when it claims the sixth century before Christ as the period of his mission, although the writers of classical antiquity vary between b. c. 1000 and b. c. 6000 in giving his date. There is good authority for believing that the district of Atropatene in Western Iran was his native place, but the scene of his preaching and teaching was Bactria in Eastern Iran. King Vishtaspa of Bactria was his religious patron, but the consensus of scholarly opinion is rather against identifying this ruler with Hytaspes, the father of Darius, notwithstanding the identity of the names.

Regarding the life of Zoroaster, there is no doubt that he was an historical personage in spite of numerous legends that have gathered about his name. The tradition, moreover, is probably authentic that he began his ministry at the age of thirty, that he was forty-two when he converted King Vishtaspa, and that when seventy-seven years old he was slain, apparently in a storming of Balkh by the Turanians. He is commonly regarded as a Magian, a reformer of the old Iranian faith, and as the founder of a new creed. Dualism was one of its characteristic tenets (see ORMAZD), a belief in angels and archangels (*gazatas amesha spentas*) and in demons and fiends (*daevas, drujes*) was recognized; the doctrine of a bodily resurrection was taught; the practice of agriculture and husbandry enjoined; and the care of useful animals, as well as keeping pure the fire, water, and earth, was inculcated. The power of Zoroastrianism as the national religion of ancient Persia was first broken by the invasion of Alexander the Great, and although restored under the SASSANIDÆ (q. v.), it was overthrown by the rise of Mohammedanism. To-day the faith is professed by about 90,000 PARSEES (q. v.). See also PSALMS OF ZOROASTER.

A. V. WILLIAMS JACKSON.

Zorrilla y Moral, thōr-reel'yā-ee-mō-raal, JOSÉ: poet: b. at Valladolid, Spain, Feb. 21, 1817. After receiving his youthful education in the seminary for nobles at Madrid, he yielded to his father's wish that he should study jurisprudence, and passed two years at the universities of Toledo and Valladolid. Even as a boy, however, he had become an ardent admirer of Sir Walter Scott, Cooper, and Chateaubriand. After holding for a brief time a post in the magistracy at Valladolid, he set out for Madrid (1837). Shortly after his arrival there the brilliant Larra committed suicide, and at his funeral Zorrilla, unknown and unannounced, read some verses that set the whole town talking of him. His first collections of verse, published in 1837 and 1839, show too much the influence of his favorite authors, the French romanticists; but in the *Canos del trovador; colección de leyendas y tradiciones* (3 vols., Madrid, 1840-41) his peculiar and original qualities are more plainly to be seen. Here his aspiration to be the Spanish Lamartine, a romantic yet Christian poet, begins clearly to reveal itself. This volume was followed by *Flores perdidas* (1843); and in 1844 he had completed what is in some ways his best work, the strange religious drama *Don Juan Tenorio*, in two parts, in which this traditional villain is represented as saved at last through the intercession of his own victims. The piece contains obvious reminiscences of *Faust* and is in many ways fantastic; yet it has proved one of the most popular of modern Spanish plays. The poet, deriving little money from the sale of his works in Spain, was encouraged by the wide sale of Parisian editions to think that he could better his fortunes in the French capital. He undertook a long epic poem, *Granada, poema oriental*, two volumes of which appeared in Paris in 1853-54. The work was pecuniarily a failure, and has never been finished. In his discouragement Zorrilla determined now to go to Mexico (1854). He was received with enthusiasm, and, after Maximilian had established himself, the poet was put in charge of the court theater. Obligated to return to Spain in 1866, as he supposed temporarily, he there learned of Maximilian's fall and execution (June 19, 1867). There was nothing to do but work for a scanty livelihood with the pen. Finally, the Government gave him a sinecure literary mission to Italy; and when this also had been for some time withdrawn he was given a pension of 7,500 pesetas (1889) and made chronicler of his native province. Of his later works we may mention *Album de un loco* (1867); *Poema religioso* (1869); *Composiciones varias* (1877); *Leyenda del Cid* (1880); *Recuerdos del tiempo viejo* (3 vols., 1880-83); and a volume of lectures delivered at the Ateneo in Madrid, *Lecturas públicas* (1877). Several of his comedies,

inspired by the great playwrights of the seventeenth century, have had considerable success, notably *El Zapatero y el rey* and *A buen juez mejor testigo*. In 1889 Zorrilla was crowned poet in the Alhambra at Granada. D. at Madrid, Jan. 22, 1893. A. R. MARSH.

Zosimus: pope 417-418; first noted for his relations to Pelagianism, his restoration of the African priest Apiarius, and his adjudication on the question of the jurisdiction of Arles over Vienne. In the beginning of his pontificate he was deceived by the orthodox-sounding protestations of Cœlestius and Pelagius, so far as to desire judgment withheld by the African bishops until the personal guilt of the heretics should be proven. He was shortly undeceived as to the heretical notions of both, and condemned them in a letter known as *Epistola Tractaria*. Zosimus never subscribed to any Pelagian propositions, as he was certainly aware of their condemnation by his predecessor, Innocent I. St. Augustine positively says that his intervention was only in the nature of a suspension of judgment, or a *correctio clementissima suavis, non approbatio exiliosissima pravitatis*. See Hergenroether, *Kirchengeschichte*, vol. i., p. 424. JOHN J. KEANE.

Zosimus (in Gr. Ζώσιμος): a Greek historian of the fifth century, of whose personal life nothing is known, but whose work, a history of the Roman empire from Augustus to 410, is still extant, edited in 1837 by Bekker and in 1887 by Mendelssohn. Zosimus was a pagan, and attacks those Roman emperors who were Christians with great acrimony.

Zouaves, zoo-navz' [= Fr., from *Zouaoua*, name of a Kabyle tribe in Algeria]: According to Rullino, a body of Zouaves, or Zuaghi, tribesmen distinguished for bravery and skill, was in the service of the Sublime Porte in 1574. Prior to the French occupation of Algeria these Kabyle tribesmen were employed as mercenaries by the Barbary states. The French, after the conquest of Algiers, found themselves with a limited force in the midst of a hostile population, of whose manners and language they were ignorant. Gen. Clausel thereupon (1830) organized two battalions of Zouaves, designed at first to consist of natives only; but subsequently the officers, non-commissioned officers, and some of the privates were selected from French volunteers. The first volunteers of La Charte and some foreigners were also incorporated with them. The foreigners were subsequently organized into a foreign legion, and the Zouaves remaining consisted almost entirely of young Parisians and natives from the vicinity of Algiers. They were at once put into active service, and distinguished themselves by their bravery and dash in all the subsequent battles in Algeria.

Difficultly having been experienced in keeping up the mixed command, the natives were eventually organized into a separate corps known as Turcos, and the Zouaves became entirely or almost entirely French. Their organization was modified and their numbers increased by degrees; and service with them came to be regarded as the best possible school for ambitious officers of the French army. It was eagerly sought by many who subsequently rose to the highest rank and distinction. During the Crimean war the services and successes of the Zouaves were most conspicuous, and many innovations in modern drill tactics may be traced to methods introduced by them. The Zouaves served with distinction in the campaign in Mexico, and participated in the war of 1870-71. Their present organization consists of four regiments, each of four battalions of four companies. There are also in the French army four corresponding regiments of Turcos. In Algeria there are also *cadres* for ten battalions of Zouaves.

The *Pontifical* or *Papal Zouaves* were a body of volunteers, principally from the noble families of France, organized in 1860 by Baron Charette under the direction of Gen. Lamorieière for the defense of the temporal power of the pope. They fought with bravery in several actions, but were unpopular with the Italians, being regarded as foreign intruders. In 1870 they embarked for France, and returning to Tours were under Baron Charette as colonel recruited up to two battalions. Joining the army of Orleans, they fought with distinction at Orleans and Patay. They subsequently assisted the army of Versailles in suppressing the Commune. Their organization was dissolved after the entry of the army of Versailles into Paris.

During the civil war in the U. S. several regiments of Zouaves were organized, who wore uniforms similar to that of the French Zouaves; some of them served with marked distinction. JAMES MERCUR.

Zrinyi, or **Zrini**, zreen'yē, Count MIKLÓS: soldier and ruler; b. in 1508 of the illustrious Slovak family of the Counts of Brebir; became banus (governor) of Croatia, Dalmatia, and Slavonia in 1542; distinguished himself in the Austrian army against the Magyars under ZAPOLYA (*q. v.*) and the Turks under Sultan Suleiman II., and defended Croatia with great success for twelve years against the Osmons, whom he defeated at Sziget in 1562. When Suleiman in 1566 attacked Sziget from Belgrad, Zrinyi held the place with unparalleled bravery from Aug. 6 to Sept. 7 against a Turkish force of 65,000 men. Suleiman died on Sept. 4, and the final capture of the ruins cost the Turks 20,000 men. Zrinyi had the powder-magazines fired in the last moment, and thus destroyed the place, the enemy, and himself. His heroic death has been repeatedly dramatized, in the most classical way by Theodor Körner.—Zrinyi's great-grandson of the same name (1616-64), also a warrior, statesman, and banus of Croatia, wrote an epic *Szigeti veszedelm* (Fall of Sziget), in which he celebrated the great deeds of his ancestor in fifteen songs. This is the oldest Hungarian epic, and has recently been edited by K. Abafi, and partly translated by G. Steir. HERMANN SCHÖNFELD.

Zschokke, tshök ke, JOHANN HEINRICH DANIEL: author; b. at Magdeburg, Germany, Mar. 22, 1771; was educated in the gymnasium of his native city, but left it in 1788, and accompanied for some time a band of strolling actors as their play-writer. Shortly after, however, he went to the University of Frankfurt-on-the-Oder, where he pursued various lines of study—theology, philosophy, history, political economy, and belles-lettres—and began to give lectures in 1792. Meanwhile, his dramatic compositions, *Adalino* (1793), *Julius von Sassen* (1796), etc., attracted considerable attention; but in 1795 he wrote against certain religious edicts of the Prussian Government, and when he in 1796 applied for a professorship, he was rejected. Leaving Prussia immediately, he settled at Reichenau, canton of the Grisons, Switzerland, and took charge of a large educational institution. The institution prospered, and Zschokke was made a Swiss citizen. Soon he also began to take a most active and influential part in the politics of the country, acting, however, as a mediator rather than as a partisan. In 1798 he removed to Aarau, and was made chief of the department of public education, but in 1801, when the central Government in Berne attempted to restore the old federal constitution, he retired from public life and took up his residence at Biberstein. In 1803, however, he was recalled and made a member of the board of forests and mines, and from that time to his death, at Biberstein, June 27, 1848, he continued to hold various positions in the Government of the republic. His celebrity, however, and also his influence, rest chiefly on his literary activity. He edited *Der aufrichtige und wohlverfahrene Schweizerbote* (1804-07), *Miszellen für die neueste Weltkunde* (1807-13), and *Ueberslieferungen zur Geschichte unserer Zeit* (1817-23), which periodicals were much read; and his *Sämmtliche Werke*, relating to history, political economy, fiction, and devotion, comprise 40 vols. His most celebrated work is *Stunden der Andacht* (1806; twice translated into English, the last time in 1862 by Frederica Rowan, under the title *Meditations on Death and Eternity*). Of his historical works the most remarkable are *Geschichte vom Kampfe und Untergange der schweizerischen Berg- und Waldcantone* (1801); *Geschichte des bayerischen Volks und seiner Fürsten* (4 vols., 1813-18); *Des Schweizerlandes Geschichte für das Schweizervolk* (1822; translated into English by F. G. Shaw, New York, 1855). Of his novels (10 vols.) selections have been made and published in English (Philadelphia, 1845; New York, 1848, by Parko Godwin; and London, 1848). His autobiography, *Selbstschau* (1842), has also been translated into English (London, 1847). See the *Lives*, by Emile Zschokke (3d ed. 1876), and by Born (1886), and Keller's *Beiträge zur Politischen Thätigkeit H. Zschokkes, 1798-1801* (Aarau, 1887). Revised by JULIUS GOEBEL.

Zubly, JOHN JOACHIM, D. D.: clergyman; b. at St. Gall, Switzerland, Aug. 27, 1725; was ordained in 1744; came soon afterward to America; took charge of the Independent Presbyterian church at Savannah, Ga., 1760; preached in English and German, and occasionally in French; was active among the "Sons of Liberty" and as a member of the first provincial congress of Georgia 1775; was chosen to the Continental Congress the same year; opposed the Declaration of Independence, after which he suddenly went to Georgia, where he took sides with the crown and had to

conceal himself from popular resentment: was in that city during the siege of 1779; was banished from Savannah and went to South Carolina, but returned to his pulpit. D. at Savannah, July 23, 1781. He was a man of learning, and published a number of patriotic discourses.

Zuccaro, dzook'kã-rô, FEDERIGO: painter; b. at Sant' Angelo in Vado, Urbino, Italy, about 1542; a brother and pupil of Taddeo Zuccaro. He finished painting the frescoes in the Church of the Trinità del Monte in Rome begun by his brother. He was then called to Florence to finish the cupola in Santa Maria del Fiore begun by Vasari. In Rome the dome of the Paulina chapel, begun by Michelangelo, was confided to him, but having avenged himself by a picture of Calumny on some favorites of Pope Gregory XIII., who had insulted him, he had to fly from Rome. He then traveled in Flanders, Holland, and England, after which he went to Venice, where the senate invited him to paint a fresco in the Sala del Gran Consiglio beside those of the greatest masters. He painted in S. Francesco della Vigna in oil on marble a representation of the *Adoration of the Magi*. He was again called to Rome by the pope, who forgave his escapade and wished him to finish the work begun there. Philip II. then invited him to Madrid, where his work was not liked, and what he did was effaced, but he was handsomely compensated. On his return to Rome he was elected president of St. Luke's Academy. He built himself a palace on the Pincio, which he adorned with frescoes. He returned to Spain after this, but with no better success than the first time. Federigo was an architect and sculptor, and also a writer in prose and verse. D. at Ancona in 1609. W. J. STILLMAN.

Zug, Germ. pron. tzooch: the smallest canton of Switzerland, nearly in the center of the republic; area, 92 sq. miles (see map of Switzerland, ref. 4-G). The inhabitants speak the German language and belong to the Roman Catholic Church. The southern part is mountainous; rearing of cattle and dairy-farming are the principal occupations. The northern part, along the Lake of Zug, belongs to the Swiss plain, and is covered with grain-fields, orchards, and vineyards. Some manufactures of paper, silk, and cotton are carried on. Pop. (1894) 23,167. Capital, Zug.

Zuider Zee: another spelling of ZUYDER ZEE (*q. v.*).

Zuinglius: Latin form of ZWINGLI (*q. v.*).

Zulia, thoo'lee-ã, formerly *Maracaibo*: the north-westernmost state of Venezuela, surrounding Lake MARACAIBO (*q. v.*), and bordering on the Caribbean Sea, Falcon, Lara, Los Andes (or Zamora), and the republic of Colombia. The peninsula of Guajira is now separated as a territory. After being several times united to Falcon, Zulia was separated from it by the constitution of 1893. The western, southern, and eastern frontiers are mountainous, but Lake Maracaibo is bordered by low and often swampy lands; these and the mountain sides are covered in great part with luxuriant forest. Agriculture is almost the only industry, the chief products being coffee, cacao, and sugar. Area, 24,969 sq. miles. Pop. about 100,000. Capital, Maracaibo. H. H. S.

Zu'zuland [deriv. of *Zulu*, from *Zulu Ama-zulu*, *Zulu*, liter., people of heaven, deriv. of *zulu*, sky, heaven]: the country of the Zulus; bordering on the Indian Ocean, and formerly extending from Natal nearly to the Portuguese possessions in Southeast Africa, and inland to the mountain barrier of the South African republic. As a result of the fierce war (1879) between the Zulus and British, and of the territorial ambitions of the Boers, the country has been wrested from native control. Cetewayo was the last king of the independent native dynasty. He was crowned in 1873, and his word was law from the Tugela river to Dele-goa Bay. His army of 40,000 men was a standing menace to the neighboring territories. The war of 1879 resulted in his dethronement, and though the British decided to restore him, his power and spirit were broken. He died at Ekore, Feb. 8, 1884. All that the British have retained, about two-thirds of the country, is a protectorate under the administration of the governor of Natal. A district comprising about a third of the whole territory lying in West Central Zululand was seized (1884) by a party of Boers, who established an independent state; and when Zululand was declared British territory (1887) this section was handed over to the South African Republic. Most of the country is a productive table-land with a climate not injurious to Europeans. Area of British Zululand, 12,500 sq. miles. Pop. (1893) 163,447 natives and 857 whites. C. C. ADAMS.

Zumalacarreguy, thoo-maa-laa-kaar rô-gee, TOMAS: soldier; b. at Ormaiztegui, province of Guipuzcoa, Spain, Sept. 29, 1789; was a leader of the guerrillas during the Spanish war of independence 1808-14; served under Quesada 1822; was dismissed from the army as a Carlist 1832; on the outbreak of the Carlist insurrection 1833 was appointed by the pretender Don Carlos general-in-chief of his army, and conducted its operations with great skill and daring until he was mortally wounded at the siege of Bilbao, one of the principal cities of Spain, June 15, and died June 25, 1835.

Zumarraga, thoo-maar'na-gã, JUAN, de: a Franciscan; first Bishop of Mexico; b. at Durango, in Biscay, 1468. He was long guardian of the convent of Abrojo in Spain, and was named bishop of the new see of Mexico Dec. 12, 1527. Zumarraga has been deservedly praised for his zeal and piety, and under him the missions of Mexico were widely extended with excellent results. Soon after his arrival in Mexico, he instituted a careful search for Aztec manuscripts; these were gathered in great numbers, condemned as heretical books, and publicly burned in the square of the capital. Similar burnings took place in nearly every Mexican city, by the bishop's order; very few of the precious documents escaped destruction, and these were hidden away during centuries. Zumarraga died at Mexico, June 3, 1548, eight days after receiving the bull which raised his see to an archbishopric. H. H. S.

Zumpt, tsöompt, KARL GOTTLÖB: classical scholar; b. in Berlin, Germany, Mar. 20, 1792; studied classical languages and literature at Heidelberg and Berlin, and was appointed Professor Extraordinary of Roman Literature at the University of Berlin in 1827, and professor in 1838. D. at Carlsbad, June 25, 1849. He published editions of Curtius, Cicero's *De Officiis*, and (with Spalding) of Quintilian; wrote a Latin grammar (1818), which passed through many editions and was translated into English, but it is now no longer used; published numerous essays relating to classical antiquity, among which are *Annales Veterum Regum et Populorum, imprimis Romanorum* (1819; 3d edit. 1862); *Ueber den Stand der Bevölkerung und die Volksvermehrung im Altherthum* (1841); *Ueber die bauliche Einrichtung des römischen Wohnhauses* (1851); and a celebrated treatise, *Ueber den Bestand der philosophischen Schulen in Athen und die Succession der Scholiarchen* (1843). See A. W. Zumpt, *De C. Zumptii vita et studiis narratio*, Berlin, 1851.—His nephew, AUGUST WILHELM ZUMPT, b. at Königsberg, Dec. 4, 1815; studied classical philology at the University of Berlin; was appointed professor at the Friedrich-Wilhelm Gymnasium in Berlin in 1851, and wrote, besides other works, *Ueber die Entstehung und historische Entwicklung des Colonats* (1845); *Commentationes Epigraphicæ ad Antiquitates Romanas pertinentes* (2 vols., 1850-54); *Das Criminalrecht der römischen Republik* (2 vols., 1869). D. in Berlin, Apr. 22, 1877. See Padeletti, *August Wilhelm Zumpt*, Leipzig, 1878. Revised by A. GÜDEMAN.

Zungaria: See SUNGARIA.

Zuñian Indians: a family of American Indians, of Western Central New Mexico; first discovered by Fray Marcos de Niza in the year 1539, and named by him the people of Cibola or Cívola. This is but a corruption of *Shi'ui-na*, or *Shi'wo-na*, the Zuñian name for the country they then inhabited. As early as 1583, however, these Indians are referred to by Antonio de Espejo as the people of the "Province of Zuñi, and by the Spaniards called Cibola." This tribal name of Zuñi is said to have been derived from the Keresan Sun'yi-ga or Su'nyi, signifying "people of the long fingernails"—apparently referring to a custom of the native medicine-men.

Tribes and Pueblos.—At the time of the Spanish explorations in the sixteenth century the Zuñian Indians were divided into seven tribal communities, occupying as many distinct pueblos. This latter circumstance gave rise to the rumor of the "Seven Cities of Cibola," and, combined with the pre-eminence of the Zuñis in other ways, made them early the most widely known and respected of all the tribes of the arid region. They were regarded by nearly all tribes, from the north of Arizona and New Mexico to far into Old Mexico, as the leaders in the arts, in government, and especially in magic—as the "Fathers of the Pueblos."

Although greatly reduced in numbers, the Zuñians still maintain this septenary arrangement in their three farming pueblos as well as in the plan of their central or permanent pueblo of Zuñi. For example, the latter, although apparently but a single-terraced mass of piled-up houses, is really

divided into seven distinct portions or blocks by the courts and alleys which either separate or thread its parts. These divisions correspond both in distribution and in the native nomenclature to the original pueblo or town subdivisions of the Zuñians, and each (excepting the seventh or middle division) has its own distinct kiva or estufa of one of the six regions—that is, northern, western, eastern, southern, upper, and lower.

There are three summer, or farming, pueblos—Táiakwin ("place of planting"), K'ia'kwainakwin ("place of hot flowing waters"), and Heshotats'nakwin (the "built town of inscriptions"), so named from the petrographs on the older walls of the houses.

In Táiakwin, or the pueblo of Las Nutrias (until within very recent times), the clans pertaining to the north and west had their quarters together. In Ojo Caliente those pertaining to the south and east were harbored; while in He-sho-ta (tsi-na (at Ojo de los Pescados) those pertaining to the upper and lower regions were placed. Finally, the chief house-priests, although represented by subordinates at these outlying places, were supposed not to leave the main pueblo, even during summer; and during the colder season all the people returned from the farming towns and gathered about them there.

Habitat.—The original seven towns of the Zuñis—the "Seven Cities of Cibola"—and the more or less cultivated lands surrounding them occupied the whole Zuñi valley (3 to 10 miles in width), from the eastern boundary of Arizona to the Cañon Gateway of Zuñi, nearly 30 miles E. N. E. from this line.

This and the confluent valley of Ojos Calientes had been the abode of the Zuñis for nearly four centuries at the time of the discovery and conquest. Probably not more than a century previously to the latter events (in 1539-40) the now ruined towns farther E.—to beyond Ojo Pescado in the Upper Zuñi valley, and in tributary cañadas to the S.—had been occupied by the so-called Corn-tribes, or A'tá-akwe, division of the Zuñis; but at the time of the journey of the pioneer missionary, Fray Juan de Padilla, with Hernando de Alvarado, of Coronado's conquering army in 1540, these towns were already deserted and in ruins.

General Characteristics.—Two physical types of men and women occur side by side in the present tribe, notwithstanding generations of intermarriage. One of these may be regarded as the more distinctly Zuñian, since it is unrepresented among other tribes of Pueblo Indians save through Zuñian derivation, as in Laguna and Jemez. The other so closely resembles the Keresan type that it seems due to the absorption of Indians of the latter stock into the supposititious original Shiwian or strictly Zuñian family. Belonging to the distinctively Shiwian type are the majority of "summer clans" of the Zuñis—in the main one of which, the Macaw, the principal priestly offices (the masterships of the houses or regional kivas, as they are called), are hereditary. Although the men of this type do not often exceed 5 feet in height, the women generally seem like young girls beside them, except for their greater breadth of shoulder and general rotundity. All have very clear-cut features, with noses straight or more or less aquiline and thin; nares moderately broad, but not fleshy; lips thin, but curved, drooping at the corners; eyes straight, ebins prominent, and cheek-bones very pronounced; foreheads sloping, but broad and capacious, and ears of medium size or large. Their heads are as often long as brachycephalic. This is the more remarkable since the prevailing cranial form of the Pueblo Indian is short, and since even the long-headed class have in common with most Indians the flattened occiput resulting from the cradle-board of infancy. The hair of both sexes is abundant, long, fine, and often wavy. The men of this Shiwian or pure Zuñian type are more lithe and straighter limbed than those of the general Pueblo type, and their hands and feet are larger. They are also slightly lighter colored, but ruddier, and the women of the same type are both taller and much fairer than those of the Pueblo variety. Although this latter variety is quite distinctly Keresan, there is a greater prevalence of oblique eyes, giving them a mongoloid look, and they are not quite so dark as the Keresan women, whom they so much resemble. One in every 200 of the population is a typical albinoid, the skin being very fair, eyes blue or pinkish gray, and hair flaxen, golden, or light brown. And again, so-called hermaphrodites—monstrous, overdeveloped women (not counting men who are ceremonially relegated to their rank)—bear about a similar proportion to the population.

The Zuñis are intellectual and grave, yet deliberately, almost unemotionally, witty. They are intensely mythic-minded, and hence poetic and religious to an extreme degree. They are peace-loving and unusually self-restrained, and in disposition are perhaps the politest of North American aborigines, being exceedingly, because religiously, ceremonious even in ordinary intercourse. While unaggressive in both policy and tendency, yet they are intensely courageous and determined when defending their rights, which they guard with a jealousy more fanatical than patriotic.

Until the introduction of articles of civilization a few years ago the dress of the Zuñi consisted more purely of the primitive native fabrics and fashions of garment than that of any other Pueblo Indians excepting the Oraibe. The men wore the typical Pueblo pantalettes and plain, fairly close-fitting shirts, open at the armpit, all of cotton, either native or bought of the whites, as were their red or black silk or bandana head-sashes.

History.—Tradition seems to testify, and archaeological studies confirm the evidence, that the Zuñians in far-off times occupied the region of the Rio Colorado, and that at an even more remote period they had descended to this great valley from the northwest and west.

The ancestors of the present Zuñians gradually penetrated the valley of the Rio Zuñi, a division of them wandering away as far as the prehistoric Tañon territory, to return after a long time, differentiated from their people to an extent even still slightly perceptible, and imbued with customs so distinct that they were for a long time held off from the central body, which meanwhile settled mainly in the Zuñi valley. Here they built and occupied the Táiakwin or Las Nutrias towns to the N. and E. of Zuñi. Táiakwin itself they seem never to have permanently abandoned, and it is still held by their principal descendants as a farming village.

Another division of the tribe (the so-called Corn-grain people, partly derived from the southern branch, from the upper Colorado (Chiquito) built the long series of beautiful stone ruins beginning in Eastern Arizona, extending through valleys S. of Zuñi in New Mexico, and reaching as far E. as the double pueblo on Inscription rock or El Morro, including also the circular ruins at and above and below Los Ojos Pescados. The traces of their stone-paved reservoirs, their hand-tilling and irrigation operations, and the superior character of their works of art, quite justifies their name as the People of Corn or People of Great Harvests. For a long time they dwelt amicably apart from their central Zuñi brethren, joining them at last in a war waged upon a series of Keresan tribes in Ma-k'y'a-ta, or Ma'kyanawan. This latter pueblo group was the "Province of Marata" of Marcos de Niza and the Zuñi name of the American valley and Salt Lake region. At the time of Niza's visit this war was still a fresh incident, and had resulted in the subjugation of the Salinas, Keres, their absorption into the Corn and Zuñi tribes, and the gathering into one set of towns—the "Seven Cities" of all the tribes. Probably these events, which are historic as well as traditional, will account for the presence of a Keresan type of people among the Zuñis to-day.

In the spring of 1539 Estevan, the Negro companion of Fray Marcos de Niza, first discovered K'ia'kime, the most easterly of the seven cities, at the base of Táaiyalane or Thunder Mountain. The inhabitants of this town killed him, and the monk who followed fled for his life, but gained from neighboring Indians, and has left us, the first and most accurate account of the Zuñis ever until lately written. In the following year Coronado followed with his army and subdued the people of Ha'wikuh, the greater number of whom, with many of the neighboring villagers, fled to the top of their common Gibraltar, Táaiyalane, but soon after submitted. Between 1542 and 1580 Kwakina, the westernmost of the seven towns, was abandoned. Between 1598 and 1680 Hlampassawan and K'ia'nawe were also practically deserted in consequence of pressure from the predatory Apache and Navajo, and in 1672 Hawikuh was permanently abandoned for the same cause.

Meanwhile the Franciscans had established missions at five, if not six, of the towns, but the isolated Zuñis were restive under this religious pressure, and in 1630 killed their friars, Francisco Letrado and Martin de Avide, and fled again to their citadel on Thunder Mountain. At the outbreak of the great Pueblo rebellion of 1680-92 they were living in the three towns of Ha'lon, Ma'tsaki, and K'ia'kime, but with that uprising they again sought their mountain

refuge, and rebuilt there their sixfold citadel, adding a seventh group of buildings for the fugitive Keresans from Acoma. Here they continued to dwell until after the peace of de Vargas, when they descended and again occupied the three last-mentioned towns.

In 1704 the Zuñis of the central town killed three Spanish soldiers, and retreated for the third time to their rock of refuge, after descending from which they do not seem to have permanently occupied any save Ha'lona, the midmost of their towns—the site of the present Zuñi. Nevertheless, to escape espionage and to practice in the old divisional way their religious ceremonies, they built in the high mesas N. of Zuñi yet seven other towns called the "Peach" or "So'noli" villages (the peach having been introduced from Sonora in the beginning of the century), maintaining the planting and care of their orchards of this fruit as their excuse for dwelling as much as possible apart from the Spaniards at their central abode.

The Zuñis joined in the war with Mexico, and later under Gen. Kearny and his successors in that against the Navajos, but after this they continued to tend their sheep and cattle and till their corn-fields and irrigated patches of wheat at their three summer pueblos, indifferent toward the outside world, as had for centuries been their wont.

Population.—At the time of the Pueblo conquest by Coronado in 1540, the seven tribes of Zuñi or Cibola numbered about 4,000. Benavides in 1630 gave the population at 10,000 souls, this, of course, being a gross exaggeration. According to Vetancurt the tribe numbered 2,500 at the time of the Pueblo revolt of 1680, and judging from a partial count of the houses in the ruins of the pueblos occupied at that date, the estimate is doubtlessly approximately correct. In the eighteenth century the Zuñis had been reduced to about 2,000, while in 1890 they numbered 1,613. They are not rapidly decreasing.

Authorities.—See *Bandelier*, in *Reports, Bulletins, and Papers of the Archeological Institute of America*, 1881-92, and works cited therein; also his *Discovery of New Mexico by Fray Marcos of Nizza in Magazine of Western History* (Cleveland, O., Sept., 1886); and *An Outline of the Documentary History of the Zuñi Tribe* (in *Jour. Am. Eth. and Arch.*, iii., Boston, 1892); Ten Kate, *Somatomological Observations* (in *ibid.*); Hubert H. Bancroft, *History of Arizona and New Mexico* (San Francisco, 1889); Mindeloff, *Architecture of Cibola and Tusayan* (in Eighth Annual Report of the Bureau of Ethnology, 1886-87); Stevenson, *Religious Life of the Zuñi Child* (in Fifth Annual Report of the Bureau of Ethnology, 1883-84); Fewkes, *A few Summer Ceremonials at Zuñi Pueblo* (in *Jour. Am. Eth. and Arch.*, i., Boston, 1891); Gilman, *Zuñi Melodies* (in *ibid.*); Cushing, *Adventures in Zuñi* (in *Century Magazine*, Dec., 1882; Feb. and Apr., 1883); *ibid.*, *Zuñi Fetiches* (in Second Annual Report of the Bureau of Ethnology, 1880-81); *ibid.*, *Pueblo Pottery*, etc. (in Fourth Annual Report of the Bureau of Ethnology, 1882-83); *Manual Concepts* (in *Am. Anthropologist*). See INDIANS OF NORTH AMERICA and PUEBLO INDIANS. FRANK HAMILTON CUSHING.

Zuñiga: See ERCELLA Y ZUÑIGA.

Zuñi Mountains: a range of New Mexico; between the 35th and 36th parallels of N. lat.; intersected by the 108th meridian W. from Greenwich. Fort Wingate is at its northwestern end, and old Fort Wingate at its southeastern. Its length from N. W. to S. E. is 45 miles; its breadth is 20 miles. It rises 3,000 feet above the surrounding country, which has a general altitude of 6,500 feet; broadly arched at top, and is clothed with timber. The proportions and scenery of the range are not imposing, and it is overtopped by the neighboring volcanic peak of Mt. Taylor, but it is of great interest to the student of "mountain-building," on account of its simplicity of structure and its isolation. All about it the rocks lie in level strata; at its base they are bent upward, and they arch over its top in simple curves. At the southeast end erosion has removed the crest of the arch and exposed the crystalline rocks which underlie the stratified, but at the N. the continuity of the lower strata is unbroken, and they can be traced from side to side. The range is monographed by C. E. Dutton in the Sixth Annual Report of the United States Geological Survey. G. K. G.

Zuiz, tsóonts, LEOPOLD: b. at Detmold, principality of Lippe, Germany, of Jewish parentage, Aug. 10, 1794; studied philology at Berlin; was preacher at the synagogue of Berlin 1820-22; editor of the *Speuersche Zeitung* 1824-32;

preacher at the synagogue of Prague 1835-39; director of the normal seminary at Berlin 1839-50; became in 1845 member of the board of commissioners for the educational interests of the Jews in Prussia. His first work, *Etwas über die rabbinische Litteratur* (Berlin, 1818), attracted much attention; also his principal work, *Die gottesdienstlichen Vorträge der Juden* (1832); and several others of his writings, *Die Namen der Juden historisch entwickelt* (1836; 2d ed. by N. Brüll, 1892); *Die synagogale Poesie des Mittelalters* (2 parts, 1855-59; supplement, *Literaturgeschichte der synagogalen Poesie*, 1865-67), etc. A collected edition of his works was commenced in 1875, but never got beyond the first volume. D. in Berlin, Mar. 17, 1886.

Revised by S. M. JACKSON.

Zurbaran, thoor-bá-raan', FRANCISCO; painter; b. at Fuente de Cantos, in Estremadura, Spain, Nov. 7, 1598. He studied with Juan de Roelas at Seville when quite young, painting directly from nature, a habit that procured for him the appellation of the Spanish Caravaggio. At the age of twenty-one Zurbaran had already a great reputation and innumerable orders in Seville, where he lived and worked almost all his life. The great altarpiece in the chapel of St. Peter of the Cathedral of Seville is his first important work, completed in 1625. Soon after this he produced his picture for the College of St. Tomas, now in the museum of Seville, representing the Eternal Father above colossal figures of St. Thomas Aquinas and the four Fathers of the Church, with the Emperor Charles V. with his nobles kneeling in rapt devotion on one side, and on the other the archbishop with his Dominicans; also, the series representing incidents in the life of St. Peter Nolascó were produced in 1629. These are now to be seen partly in Seville Cathedral, partly in the museum of the Prado of Madrid, and some in the Academy of St. Fernando. The subjects from the life of St. Bonaventura for the church of that name are dispersed also, two being in the Louvre, one in the Gallery of Dresden, and another in Berlin. The king, Philip IV., had him come to Madrid to decorate his palace of Buenretiro with the *Labors of Hercules*. Zurbaran had the title of Painter of the King as early as 1633, as the signature on some of his pictures shows; but in 1650, through the intervention of his friend Velázquez, he removed to the capital, where he painted in his Majesty's service till he died in 1662. His work is to be seen in the museums of St. Petersburg, Pesth, Munich, Paris, and London, and in many private collections. W. J. S.

Zurich, zoo'rik (Germ. Zürich, tsü'rich); canton of Northeastern Switzerland, bordering on the Rhine and on Lake Zurich; area, 666 sq. miles. The inhabitants speak German and are Protestants. It consists of three elevated valleys, and contains excellent pastures. The soil is not very fertile. Grain and wine are produced, though dairy-farming and manufacturing are the principal occupations. Pop. (1894) 351,947. Capital, Zurich.

Zurich: capital of the canton of Zurich, Switzerland; 43 miles N. W. of Glarus; on the Limmat where it issues from the Lake of Zurich (see map of Switzerland, ref. 2-G). It is well and substantially built, though somewhat old-fashioned in its appearance. It has a university, a public library with more than 100,000 volumes, a botanical garden, several museums of natural history, and a federal polytechnic school to which pupils from all Europe gather. Its manufactures comprise silk, cotton, leather, ribbons, lace, etc., and are extensive. Pop. (1888) 28,235; with the suburbs (1893) 103,271.

Zurich, Lake of: lake of Switzerland; 23 miles long and 2½ miles broad; bounded by the cantons of Zurich, Schwytz, and St. Gall, and celebrated for the picturesque beauty of its scenery.

Zurita, thoo-ree-taa, GERONIMO; historian; b. at Saragossa, Spain, Dec. 4, 1512; son of the favorite physician of Ferdinand the Catholic; educated at Alcalá; became a magistrate and a member of the supreme council of Castile 1543; was employed in diplomatic service in Germany 1543-49; became chronicler of Aragon 1549; traveled through Spain, Sicily, and Italy in search of historical data, and was afterward private secretary to the king, D. in 1580. Author of *Anales de la Corona de Aragón* (6 vol., 1563-79).

Zut'phen: town; province of Gelderland, Netherlands; on the Yssel; 18 miles N. N. E. of Arnhem by rail (see map of Holland and Belgium, ref. 6-H). It is beautifully situated and well built, though an old city; its walls have

been transformed into promenades. It has tanneries, soap-works, oil and paper mills, spinning and weaving factories, carpet manufactories, and a large trade in wood, bark, and grain. Pop. (1890) 17,044.

Zuyder Zee, zī'der-zee' [= Dutch, *liter.*, South Sea]: a gulf of the North Sea, 80 miles long and 40 miles in greatest breadth. Several islands lie across its mouth, and the principal communication with the North Sea is between the Helder and the island of Texel. It receives the waters of the Rhine and of the Amstel, both delta-branches of the Rhine; at the entrance of the latter the city of Amsterdam is situated. In prehistoric times the Zuyder Zee was larger than at present, but in the eighth century considerable portions of it were dry and under cultivation. The great storm

of 860, followed by those of 1134 and 1164, caused it to be again inundated. It is quite shallow, and the difficulty of navigating the southern part caused the construction of the North Sea Canal and of the Holland Canal as approaches to Amsterdam. The portion shown shaded in the map has only an average depth of 10 feet. The project of draining this area of 487,500 acres has long been discussed, and in 1870 plans and estimates were prepared. A dike was proposed through the sea from Enkhuizen to the river Yssel, a distance of 28 miles. Along the southern edge of this dike a drainage reservoir was to be provided from which the water was to be lifted by steam-pumps. Canals for navigation and drainage were to be built through the reclaimed area, which was to be divided into drainage basins, or polders, along whose dikes railways were to be constructed. The work was estimated to cost about \$50,000,000, exclusive of interest, and to require from twelve to sixteen years for its completion. The doubt whether the cost of the work would be repaid by the proceeds of the sale of the reclaimed lands has been, however, so great that this drainage plan has not been undertaken.

MANSFIELD MERRIMAN.

Zvor'nik (*Isvornik*): fortified town; district of Tuzla, Bosnia; on the left bank of the Drina, an affluent of the Save (see map of Austria-Hungary, ref. 9-11). It is defended by a citadel, is the seat of a bishopric, and has considerable trade in wood and timber. There are lead mines in the vicinity. Opposite, on the right bank of the Drina, lies *Mali-Zvornik* (Little Zvornik), claimed by Serbia according to the treaty of Berlin, July 13, 1878, which established the Drina as the frontier between Austrian Bosnia and Serbia. Pop. 3,030. U. S.

Zweibrücken, tsvī-brük'en (French, *Deux-Ponts*): a town of the Bavarian Palatinate; 50 miles W. of Spire (see map of German Empire, ref. 6-C). It is finely situated at the confluence of the Schwarzbach with the Hornbach; is well built, and consists of the old town, the new town, and a new suburb. Its manufactures comprise velvet, silk-plush, cotton, leather, tobacco, and oil. The town is very old, and owes its name to the two wooden bridges across the Schwarzbach. Pop. (1890) 11,204. U. S.

Zwickau, tseik'ow: capital of the circle of its own name in the kingdom of Saxony; on the left bank of the Mulde, at the base of the Erzgebirge, central station of the Saxon state railways; situated in a beautiful valley (see map of German Empire, ref. 5-F). Among its six churches is St. Mary's, built (1453-1536) in Gothic style, with a tower 314 feet high and the largest bell in Saxony (115 cwt.). The gymnasium has a library of 20,000 volumes and many invaluable MSS. of the Reformation period; there is also a mining-school. The town has machine-shops, iron-foundries, and manufactures of chemicals, woolen goods, paper, oil, flour, porcelain and glass, etc. It lies in the center of a rich coal district, and in its vicinity are about 200 furnaces for the burning of coke. The production of coal amounts to about 2,500,000 tons annually, valued at 17,100,000 marks, and employs about 10,000 laborers. Zwickau is of Slavonic origin and is mentioned as early as 1030; it played a great rôle during the Reformation, the Thomas Münzer (Anabaptist) movement originating there. The circle (*Kreishauptmannschaft*) of Zwickau forms the southwestern portion of the kingdom, and is the richest and most industrial district in Saxony. Its population (1895) is 1,389,672; that of the city 50,391. HERMANN SCHOLNFELD.

Zwingli, Germ. pron. tseing'lee, ULRICH or HULDERICH: Reformer and patriot; b. in a lowly shepherd's cot at Wildhaus, Toggenburg (canton of St. Gall, Switzerland), of honorable and pious parents, Jan. 1, 1484 (seven weeks after Luther), studied at Wesen, Vienna, 1499-1501, and Basel 1502-06; was carried away with the enthusiasm for classical learning, and got an insight into the corruptions of the Church; was ordained priest by the Bishop of Constance, and elected pastor of Glarus 1506. He studied the Greek New Testament very carefully, and copied it with his own hand; preached against the mercenary service of his countrymen; in 1516 accepted a call to St. Mary's at Einsiedeln, and began to attack superstitious practices, but with the consent of his superiors; he even received for a while, as one of the most popular preachers, a pension from the papal nuncio in Switzerland which aided him in his studies and secured his political influence. In Dec., 1518, he was called to the cathedral at Zurich, where he labored till his death. He preached "Christ from the fountains" and "inserted the pure Christ into the hearts"; broke loose gradually from Romanism; introduced the Reformation in Zurich 1524, after some public disputations with the champions of the old system; led the Reform movement in the other German cantons of Switzerland; attended the conference at Berne 1528, which resulted in the abolition of the mass. He was invited to a personal conference with Luther and Melancthon at Marburg Sept. 1529, to adjust the only serious doctrinal difference between them on the Eucharistic Presence. He counseled energetic measures for the promotion of the Reform in his native land, but was defeated by the policy of hesitation which prevailed in Berne. He also entered into bold political combinations with Philip of Hesse for the triumph of the Protestant cause in Germany, and addressed the Emperor of Germany and the King of France with a confession of his faith. But he was cut down in the midst of his career. At the outbreak of the war between the Roman Catholic and Protestant cantons he accompanied the Zurich regiment as chaplain, according to Swiss custom, and was pierced by a lance in the disastrous battle at Kappel, Oct. 11, 1531, while stooping to comfort a dying soldier. His last audible words were, "What of that? They can indeed kill the body, but they can not kill the soul." His remains were burned, and the ashes scattered to the four winds. A plain monument in granite, erected in 1838, marks the spot where he died.

Zwingli was a bold reformer, an able scholar, an eloquent preacher, a patriotic republican, and far-sighted statesman. He lacked the genius and depth of Luther and Calvin, the learning of Melancthon and Peicolampadius, but he was their equal in honesty of purpose, integrity of character, heroic courage, and devotion to the cause of Reformation, and surpassed them in liberality. His prominent intellectual trait was clear, strong common sense. He loved music and poetry, but in public worship he favored puritanic simplicity, and removed all pictures from the churches to prevent the temptation to idolatry. In his theological views he was more radical than Luther, and departed further from the medieval traditions. He differed chiefly from Luther's view of the real presence of Christ's body and blood in the sacrament, and held this ordinance to be merely a commemora-

tion of the atoning death of Christ; but notwithstanding this difference he offered Luther with tears the hand of brotherhood at Marburg, which was refused. In some points he was ahead of his age, and held opinions which were then deemed dangerous and heretical. He had a milder view on original sin and guilt than the other Reformers, and believed that all infants dying before the age of responsibility, whether baptized or not, and all the nobler heathen who lived up to their standard of virtue and longed after the true religion, are saved by the grace of Christ, which may operate upon the heart without the ordinary means and visible signs. His principal works are a *Commentary on the True and False Religion* (1525); a sermon *On Providence* (preached at Marburg, 1529); his *Confession of Faith*, addressed to Charles V. at the Diet of Augsburg (1530); a similar *Exposition of Faith*, addressed to Francis I. of France (July, 1531, three months before his death). This last document is clear, bold, spirited, and full of hope for the triumph of the truth, warns the king against the slanderous misrepresentations of Protestant doctrines, and entreats him to give free course to the Gospel, and to forgive the boldness with which he dared to approach his Majesty. It is questionable whether he ever read the document. Zwingli represents only the first stage in the history of the Reformed Church. His work was completed after his death by his successor, Bullinger, at Zurich, and still more by Calvin at Geneva. The fourth centennial of his birth was extensively celebrated Jan. 1, 1884, in Reformed churches in Switzerland, Holland, and the U. S. In 1885 a life-size statue of Zwingli in bronze was erected with great popular enthusiasm before the Wasserkirche in Zurich. It represents him with uplifted face, with the sword in one hand and the Bible in the other.

LITERATURE.—*H. Zwingli Opera*, ed. Schuler and Schulthess (Zurich, 1828-42, 8 vols.); a popular edition of his works translated into literary German by Christoffel (Zurich, 1843, seq., 15 parts); *Biographies of Zwingli* by Myconius (1536; reprinted by Neander, *Vita quatuor Reformatorum*, Berlin, 1841); Hess (1811; trans. by Aiken, London, 1812); Hottinger (1843; trans. by Th. C. Porter, Harrisburg, 1856); Christoffel (Elberfeld, 1857; trans. by John Coehran, Edinburgh, 1858); and especially Mörkötter (*Ulrich Zwingli nach den Quellen*, Leipzig, 1867-69, 2 vols.); and R. Stäbelin, *Huldreich Zwingli* (Basel, 1895-96, 2 vols.). On the theological system of Zwingli, see Zeller, *Das theolog. System Zwinglis* (1853); Siegwart, *Ulrich Zwingli; der Charakter seiner Theologie* (1855); Spörri, *Zwingli-Studien* (1866); and especially A. Baur, *Zwingli's Theologie* (Halle, 1885-89, 2 vols.). Compare the seventh vol. of Schaff's *Church History*, which is devoted to the Swiss Reformation (New York, 1892). A large number of pamphlets and articles were called forth by the fourth centennial celebration, in 1884.

PHILIP SCHAFÉ,

Revised by S. M. JACKSON.

Zwolle: capital of the province of Overijssel, Netherlands; on the Zwart-Water; 50 miles E. by N. of Amsterdam (see map of Holland and Belgium, ref. 4-II). It is one of the handsomest cities of the kingdom, with broad and straight streets and many public squares. It is the seat of many educational and benevolent institutions, and has manufactures of oil, beer, spirits, linens, and iron goods. By canals it communicates with the Yssel and Vechte, and has a trade in grain, butter, cheese, cattle, fish, and oysters. Pop. (1893) 28,310. Revised by M. W. HARRINGTON.

Zygade'uns, or, less correctly, **Zygabenus**, EUTHYMIUS: a Byzantine theologian, "the last of the Greek commentators." He was monk of a convent dedicated to the Virgin Mary near Constantinople, and flourished under Alexius Comnenus (1081-1118 A. D.), at whose request he wrote his *Panoply against all Heresies*. His commentaries on the

Psalms and Gospels are still referred to by scholars. (See his works in Migne's *Pat. Græca*, cxxxviii.-cxxxix.) Other commentaries (on the Pauline and Catholic Epistles) and other works (including letters) are in manuscript in the Vatican.

Revised by S. M. JACKSON.

Zyga'ni'dæ [Mod. Lat., named from *Zyga'na*, the typical genus, from Gr. ζύγωνα, probably the hammer-headed shark]; a family of selachians of the order *Squali*, and containing the hammer-headed sharks. The body is moderately elongated and like that of the typical sharks; the head is depressed, transverse, and extended outward or sidewise to a greater or less extent; the mouth is inferior and convex forward; the teeth are moderate and in several rows (in all the known species nearly alike in both jaws, oblique and with a notch); the branchial apertures are five, of moderate size, and the last are above the pectoral fins; the spiracles are nullified in the adult; the dorsal fins are two, the first between the pectorals and ventrals, the second above the anal; the anal is normally developed; the caudal elongated, and with a well-developed lower lobe; the pectoral fins are moderate; the ventrals small. The family is anomalous by reason of the peculiar extension of the sides of the head. This extension is carried to its maximum in the *Eusphyra blachii* (*Zyga'na laticeps* of some authors), and is least developed in the *Reniceps tiburo*; in the former it is T-shaped and in the latter kidney-shaped. The common hammer-headed shark (*Sphy'na zyga'na* = *Zyga'na malleus*) exhibits an intermediate condition. At least five species are known, which by some are differentiated into three genera—*Eusphyra*, *Sphy'na*, and *Reniceps*. The *Sphy'na zyga'na* is not uncommon on the U. S. coasts, and the *Reniceps tiburo* is an occasional visitor. See also HAMMERHEAD.

Revised by F. A. LUCAS.

Zygotran'chia [Gr. ζυγόν, yoke + βράγchia, gills]: a group of simple gasteropod molluscs characterized by the possession of gills on either side. It includes the abalones, the keyhole limpets, etc. See GASTEROPODA.

Zygonen'ra [Gr. ζυγόν, yoke + νεῖρον, nerve]: a term employed by some zoölogists for a group including the pulmonate and opisthobranch molluscs in allusion to the fact that their nerves are not twisted, but have rather the appearance of a yoke. See GASTEROPODA.

Zyg'ophytes (*Zyggophyta*): lower plants characterized by the fact that two equal cells unite to form a resting spore (*zygospore*). The Pond Scums (*Zygnenaceæ*) and Black Moulds (*Mucoraceæ*) are common examples of Zygophytes. In the treatment of the lower plants in this cyclopædia the Zygophytes are not regarded as constituting a distinct group. Zygophytic reproduction occurs in the lower families of each order of the *Phycophyta*. See VEGETABLE KINGDOM.

CHARLES E. BESSEY.

Zygosporé: See DIATOMS.

Zy'lonite: a plastic material made by treating cellulose with nitric and sulphuric acids and mixing the resulting pulp with camphor, yielding a product similar to celluloid. It is also called xylonite and parkesine. Zylonite in its liquid state, collodion, was first used in surgery by Dr. J. Parker Maynard, of Boston, in 1848, and has since been employed as a dressing in cases where an air-tight covering for light wounds is required. In 1855 Alexander Parkes, of Birmingham, England, obtained a patent for a compound which he called parkesine—solidified or hardened collodion. This material was produced by using vegetable naphtha, alcohol, methyl, and other ethers as solvents for gun-cotton. Factories for the manufacture of zylonite were established in Great Britain, France, Germany, and in the U. S., but it has been superseded by CELLULOID (*q. v.*).

Zymotic Diseases: See INFECTIOUS DISEASES.

Zy'tomierz': a town of Russia. See JITOMIR.

APPENDIX.

Uitlanders, weët hān-ders (literally, outlanders or foreigners): the name given by the Boers of the Transvaal or SOUTH AFRICAN REPUBLIC (*q. v.*) to those whites who have lived in their country since the discovery of gold in 1886 in the De Kaap district of the Eastern Transvaal. The three other centers where Uitlanders are chiefly massed are north-east in the Zontpansburg district; south in the Klerksdorp district, close to the Vaal river, where there are nearly 5,000 Europeans; and southwest in the Witwatersrand district, which has far outstripped the others. The vast majority are English-speaking persons, while the Dutch outnumber the French and Germans. Of this foreign element, numbering about 75,000, at least two-thirds are adult males. The Boers, on the other hand, number (1897) only about 25,000 adult males in a total Boer population of about 125,000. See WITWATERSRAND. C. C. A.

Vitascope: an instrument for projecting a rapid succession of pictures in such manner as to cause the illusion of motion due to life. In its simpler forms this instrument has long been known. Its present perfection (1897) is an outcome of development in several departments of applied science, more especially photography and electricity. The physiological principle on which it depends is that a definite and measurable interval of time is required for the perception of a nerve impression; and however instantaneous this impression may be, time is required for the perception to vanish. The most obvious illustration of this is that a blow upon the human body produces the sensation of pain which may last for hours. About the middle of the nineteenth century Helmholtz measured the velocity of propagation of a nervous impression and found its average value to be less than 100 feet per second. Many hundreds of years ago it was observed that the apparent form of a body is greatly modified if its condition be changed from that of rest to rapid motion. The spokes of a rapidly revolving wheel when seen by continuous light are practically invisible, but if the wheel be revolved at the highest speed in the dark, and momentarily illuminated by a single spark from an electric influence machine or induction coil, every spoke is plainly visible.

Upon this principle an instrument called the STROBOSCOPE (*q. v.*) was invented in 1832. It consisted of a disk through which a series of equidistant narrow radial openings were cut near the circumference. If a moving body, such as a revolving wheel, be viewed through the slits of the stroboscope disk, the eye receives a succession of nearly instantaneous views like those due to the electric spark. Let us assume that the number of spokes of the wheel is the same as the number of slits in the disk, and that the speed of revolution is likewise the same for wheel and disk. Then every time a slit comes in front of the observer's eye a spoke comes into a corresponding position; and it can not be seen except when in this position. The wheel therefore appears at rest even though really in rapid motion. If the rate of revolution of the wheel slightly exceed that of the disk, or if the number of spokes slightly exceed the number of slits, the successive positions of the spokes will advance slightly in relation to those of the slits, and the wheel will appear to have a slow forward motion. By suitably varying the speed of revolution or the number of slits of the stroboscope while the style of construction and rate of motion of the wheel remains unchanged, it becomes thus possible to secure any desired rate of apparent forward or backward motion of the wheel.

In using such an instrument it is obvious that for satisfactory vision much depends upon the illumination of the wheel and the width of the slits. If, for example, the sum of all these widths be only one-tenth of the circumference of the disk, then nine-tenths of the light reflected from the wheel fails to reach the observer's eye, being interrupted by the opaque part of the disk, and indistinctness results from poor illumination. If an attempt to remedy this be made by widening the slits, we no longer obtain approximately instantaneous views of the wheel. In the effect upon the eye sharpness of definition is thus sacrificed to brightness. It is necessary therefore to regard judiciously the duration of the impression produced upon the brain through the medium of the retinal expansion of the optic nerve. Careful measurements by Plateau, Helmholtz, Nichols, and Ferry have shown that the duration of a luminous impres-

sion on the retina varies, under ordinary conditions of illumination, from one-tenth to one-fiftieth of a second. It is greatest after a very short exposure to violet light; it is least after exposure to intense yellow light. For ordinary white light the greater the brilliancy of a short exposure the more quickly does its effect upon the retina vanish. For good stroboscopic effects the object viewed must hence be brilliantly illuminated and the interval of time between two successive passages of a slit before the eye must not exceed one-fiftieth of a second. If these two conditions are fulfilled the visual impression is continuous and the illusion of motion is controllable.

The forms and names which have been given to this instrument are numerous. Instead of employing a disk it is easy to substitute a vertical hollow cylinder, pivoted axially and slitted in a direction parallel to the axis. Upon a strip of paper, whose length is equal to the circumference of the cylinder, pictures are constructed representing successive phases in the periodic motion of a living object. This strip is fixed against the inner wall of the cylinder just beneath the slits, the number of pictures being slightly greater or less than the number of slits if the illusion of horizontal progress is to be produced. The cylinder is made to spin upon its axis while the observer looks at the revolving strip through the slits which pass in front of his eyes. Whether the visual impression is sensibly continuous or perceptibly interrupted depends upon the speed of rotation, but the partial blending of successive impressions produces very strikingly the illusion of individual motion. The names *zoetrope* and *phenakistoscope* have been popularly applied to this form of stroboscope.

Prior to 1880 all pictures intended for the zoetrope were made by hand, and the accurate reproduction of the successive phases of rapid motion was quite impossible. A revolution in this art has been created by the rapid development of instantaneous photography. By the use of sensitive films of gelatin bromide of silver emulsion the time required for the action of ordinary daylight in producing a photograph has been reduced to a very small fraction of a second. Edward Muybridge in California first utilized these films for the photographic analysis of animal motion. A battery of cameras was arranged beside a race-track, each camera being provided with a spring shutter, which was controlled by a thread stretched across the track. A running horse thus broke each thread at the moment when he passed in front of the camera, and twenty or thirty pictures of him were taken in close succession within one or two seconds of time. From the negatives thus secured a series of positives could be readily obtained in proper order on a strip of sensitized paper. Such a strip when examined by means of the zoetrope furnished a reproduction of the horse's motion incomparably superior to anything previously attained.

Muybridge devised an instrument which he called a *zoopraxiscope* for the optical projection of his zoetrope photographs. The succession of positives was arranged in proper order upon a glass disk about 15 or 18 inches in diameter near its circumference. This disk was mounted conveniently for rapid revolution so that each picture should pass in front of the condenser of an optical lantern. About the same axis was fixed a stroboscope disk of zinc equal in size with the other, but so mounted as to give it rotation in the opposite direction. A projecting lens was placed at its focal distance in front of the glass disk so as to project upon the screen an enlarged image of the moving photograph. The visual effect was very striking, but the difficulties involved in the preparation of the disk pictures and in the manipulation of the zoopraxiscope prevented this instrument from attracting much popular notice. Artistically it was the forerunner of the instruments known as *kinetograph*, *vitascope*, *cinematograph*, etc.

In 1887 when Thomas A. Edison was busied with the work of improving the phonograph, he conceived the idea of associating with the phonograph an instrument embodying the well-known principle of the stroboscope, so that the reproduction of articulate sounds should be accompanied by the reproduction of the motion naturally associated with them. It was not until 1893 that his conception was successfully realized in the instrument which he named the *kinetoscope*. Instead of employing a battery of cameras as Muybridge had done to obtain a serial picture of the moving object,

Edison devised a special form of camera in which a long strip of sensitized film should be moved rapidly behind a lens, this being provided with a shutter so arranged as to alternately admit and cut off the light from the moving object. The mechanism is so adjusted that forty-six exposures per second are given, the film being stationary during the minute period of exposure, then quickly carried on far enough to bring a new surface of film into the proper position. The interval required for this shifting is about one-tenth of that allowed for exposure, so that the actual time of exposure is almost exactly one-fiftieth of a second. The average speed with which the film moves, including both shiftings and stoppages for exposure, is rather more than one foot per second, so that the whole length of film, about 50 feet, receives between seven and eight hundred successive impressions during its circuit of forty seconds. After this series of negatives has been appropriately developed the strip may be used as a transparency for the purpose of securing a corresponding series of positives. This strip is now ready for use in the kinetoscope. By means of an electric motor the strip of positives is made to move just as it did in the camera, passing under a magnifying lens through which the spectator looks. A revolving perforated disk, actuated by the motor, serves as a shutter, and an incandescent electric lamp appropriately placed thus illuminates each picture at the moment it comes under the eye. The area upon which each picture is formed does not exceed one square inch.

The kinetoscope, like the simple stroboscope, is adapted for only one observer at a time, the eye being close to the magnifying lens and the necessary illumination only moderate. To use the kinetoscope film for projection so as to be visible to a large audience, a source of intense light is found in the electric focusing lamp. At or near the focal point of the projecting lantern condenser the film is made to travel across the field just as in the kinetoscope. A water-cell in front of the condenser absorbs most of the heat and transmits most of the light from the arc lamp, and the small picture thus highly illuminated is protected from injury. A projecting lens of rather short focus throws a large image of each picture on the screen, and the rapid succession of these completes the illusion of lifelike motion.

The projecting apparatus just described has received the name "vitascope," a word of mixed Latin and Greek derivation which is not worthy of commendation. "Projecting kinetoscope" would be a less objectionable name. The "cinématograph," a French instrument by Lumière, differs from it only in matters of detail, but not at all in principle. The same remark applies to the "chronophotographic" projection apparatus of M. Demeny, of Paris, in which strips nearly 2 inches wide and more than 100 feet in length are employed. The combination of kinetoscope and phonograph has received the name of *kinetophone*.

W. LE CONTE STEVENS.

Witwatersrand (literally, White Water Range): the name given by the Boers of the South African Republic to the height of land S. and S. W. of their capital, Pretoria, which forms the water-parting between the head fountains of the Klip and Vaal rivers on the S. and the Limpopo on the N. The word *rand* is applied by the Boers to any slope down which river drainage flows. The Witwatersrand extends about 100 miles, nearly E. and W. in 26° S. lat., approximately. It has become famous, since 1886, as the greatest gold-producing region in the world. The area over which mining operations had been extended up to 1896 is not more than about 65 sq. miles; but in 1895 it yielded \$38,110,000, which was \$8,500,000 less than all the gold mines of the United States produced in the same year. The Rand rises above a bleak plateau that has little value for agriculture. The climate is mild and equable. Before gold was discovered, the herds of the Boers grazed over the district, and it was thought to be fit for nothing but pasturage. Gold-mining did not fairly open till 1887. The rocks forming this district are sandstones, quartzites, shales, and conglomerates that, at some time, were lifted above the general level to form the *rand*, which consists of the upturned edges of these rocks tilted at an angle of 25 to 45 degrees from the horizon. It is in the conglomerates, locally known as "baker reefs" from their resemblance to almond rock-candy, that most of the gold is found. The conglomerate dips rapidly beneath the surface and has been found by the diamond drill at a depth of 2,500 feet. The first mines were established along

the outcrop only, but shafts have now been driven (1897) that strike the conglomerate beds about 2,000 feet below the surface. The structure of the country as well as the evidence of the diamond drills have satisfied the experts that the reefs continue for a long distance at depth, and mining engineers are confident that they can mine to a depth of 5,000 feet. A peculiarity of the ore is that it is remarkably uniform in the quantity of the gold it contains. Various experts have made estimates of the total amount of precious metal that may be obtained from the district lying within 20 miles of Johannesburg. The most conservative estimates agree that the conglomerate will yield about \$3,500,000,000 down to the 5,000-foot level, or about ten times the value thus far of the total gold and silver product of the famous Comstock lode.

These marvelous deposits were not discovered until long after mining had been profitably carried on in four other districts. In 1889 the output was 369,557 oz., while in 1895 it was 2,277,635 oz., or over ten times as much as the four other districts put together. Above or near the gold-bearing conglomerates are extensive beds of coal, which have been only slightly developed, though the fuel required by the gold-mining industry is derived from them. Iron ores also abound. Many black workmen, as well as whites, are employed in the mines and reduction-works, the average weekly pay of the whites being \$26.25. The ore can be obtained and reduced only by the use of expensive machinery, and the Witwatersrand does not hold out the inducements to poor men that they once found in the placer diggings of California and Australia. This fact has been ignored by miners who have flocked to the district from all parts of the world, and there has been suffering in consequence, the supply of white labor exceeding the demand.

The development of the mines gave rise to JOHANNESBURG (*q. v.*), the most wonderful town of South Africa, situated close to the southern slope of the Witwatersrand and near its eastern end. In September, 1886, its site was nothing but a bleak plateau, 5,600 feet above sea-level. At that time the price of a few oxen would have purchased the entire site. The latest census (July, 1896) showed that 51,225 whites and 51,849 colored persons were then living within 3 miles of Market Square. Much of the city is most substantially built. In less than ten years many costly buildings, including churches, banks, theaters, clubs, and a Stock Exchange were erected on this part of the desert *veldt*. The city is connected by rail with Cape Town, which is nearly 1,000 miles distant, with Pretoria and Delagoa Bay on the Indian Ocean on the E. and with Natal on the S., and is thus becoming a very important railroad center. The city has been greatly handicapped by the unprogressive policy of its Boer rulers. The foreigners who built the city had developed the mines and filled the treasury of the republic with funds derived from the heavy taxes levied upon them; yet they were not admitted to citizenship, and had no voice in public affairs. Though the city has over 100,000 inhabitants, it has yet (1897) no adequate system of lighting, no sewerage system, and no general water-supply. It has had a board of health, but no municipal government, and no public schools except those conducted in the Dutch language. Its affairs have been controlled from Pretoria, the capital. This state of things led to the formation at Johannesburg of a National Union for the purpose of securing legislative and administrative reform. Petitions were presented, but failing to secure redress, and it being rumored that the Boers were about to attack the town, the central committee of the National Union constituted themselves into a provisional government pledged to reform; men were enlisted, an appeal for intervention was sent to the imperial commissioner, and a letter was sent to Dr. Jameson, administrator of the British South African Company in Matabeleland and Mashonaland on the N., asking his aid in the event of disturbances arising. He at once set out (Dec. 28, 1895) with several hundred men, before the National Union at Johannesburg was really in need of his assistance, and was defeated and captured by the Boers Jan. 1, 1896. The whole scheme (whatever its real nature was) collapsed, and nearly all its leaders were tried and punished by imprisonment or fine, or both. The Uitlanders still pressed for the rights of good government, however, and the Boers, impressed at last with the need of reforms as a means of maintaining the public peace, initiated several reforms (July-October, 1896), including provision for the education in their own tongue of the children of the Uitlanders.

C. C. ADAMS.

X-rays, or Röntgen- (or Roentgen-) rays: a special variety of radiation produced when a vacuum tube under pressure is subjected to the electrostatic discharge.

Historical.—When the discharge from an electrical machine or an induction coil passes through the air at ordinary pressures, we have an electric spark which follows a well-defined and narrow path, namely, the path of least resistance between the terminals of the machine. If a portion of the path of the discharge be through rarefied air, as, for example, between metal points inclosed in a glass tube from which the air has been partially exhausted, the spark undergoes changes of character; and when the pressure has been reduced to about 1 centimetre of mercury, the beautiful form of discharge known as the Geissler effect (see GEISSLER'S TUBES) begins to show itself. By means of mercurial air-pumps, CROOKES (*q. v.*) carried the exhaustion of the interior of the vacuum tube very much further; and he found that after passing through various striking modifications of appearance, the Geissler discharge ceased and was supplanted by other and new phenomena.

He noted, in the first place, that the discharge no longer passed in the form of a brush or radiant stream from electrode to electrode, but that a scarcely visible bundle of rays appeared to emanate from the cathode. To these the name *kathode rays* has since been applied. Those portions of the glass upon which this bundle of rays fall become finely fluorescent with a characteristic green light.

Crookes conceived these rays to consist of particles of electrified matter. He showed among other things that they were capable of being deflected by means of a magnet placed outside the tube; likewise that a metal screen mounted in their path cast a shadow upon the wall of the tube behind it. The form of apparatus by means of which this important property of the cathode rays is usually exhibited

consists of a tube (Fig. 1) in the form of a much elongated ovoid, within which is mounted a hinged screen of metal in the shape of a Maltese cross. This can be thrown down or set up in its place by simply tipping the tube. When the cross is erect and the electrode at the end of the tube is the cathode, a sharply defined shadow of the former is seen upon the rounded larger end of the tube.

In 1891 the German physicist HEINRICH HERTZ (*q. v.*) showed that, among other properties, the cathode rays have the power of penetrating many objects opaque to ordinary light, especially the metal aluminium. Following out Hertz's suggestion, his assistant, Dr. Lenard, of Bonn, constructed a vacuum tube with a window of aluminium, against which the cathode threw its bundle of rays. Owing to the transmitting power of that metal, already pointed out by Hertz, these rays were thus caused to leave the tube, and to enter the outer air. Lenard showed the cathode rays to be capable of affecting the photographic plate, and investigated their power of penetrating various substances.

The celebrated paper of RÖNTGEN (*q. v.*) in which he announced the discovery of the X-rays was read before the Physico-Medical Society of Würzburg, in Dec., 1895. In this brief paper he states the following points concerning the new phenomena, with admirable clearness and precision:

1. That the X-rays appear to emanate only from those portions of the glass of a vacuum tube which are rendered fluorescent by the action of the cathode rays.
 2. That their presence may be detected by their effect upon various fluorescent substances (see below).
 3. That objects placed between a fluorescent screen and the source of the rays may be made to cast a shadow upon the screen. That he (Röntgen) himself viewing the shadow of his hand in this manner, saw the shadow of the bones strongly cast and surrounded by the weaker shadow of the flesh.
 4. That the X-rays penetrate all kinds of matter, but in very different degrees, and apparently in inverse order to the density.
 5. That the X-rays affect the ordinary dry plates used in photography.
 6. That the retina of the eye is not sensitive to their action.
 7. That the X-rays are incapable of refraction, dispersion, or regular reflection.
 8. That, unlike the cathode rays, they can not be deflected by a magnet.
- Finally, he puts forth the hypothesis that the X-rays consist in a longitudinal vibration of the luminiferous ether.

These announcements by Röntgen attracted immediate attention, and his experiments were repeated with all imaginable variations throughout the world. His results, particularly as regards the penetrating power of the X-rays through the tissues of the human body, were fully confirmed.

Methods of producing X-rays.—The essential parts of an apparatus for the production of the X-rays are a vacuum tube, the contents of which have been pumped out to the proper degree of exhaustion by a mercurial air-pump, and some suitable device for sending the electrical discharge between the terminals of the tube. A suitable discharge for this purpose may be obtained (1) from an ordinary Ruhmkorff coil; (2) from a Tesla coil; (3) from an influence machine of either the Holtz or the Wimhurst pattern. When the first method is employed, the Ruhmkorff coil (see INDUCTION COIL) is arranged as shown in Fig. 2. The tube is usually introduced directly between the terminals of the secondary coil. The best results are obtained with coils capable of giving a spark of from 10 to 25 centimetres long in air; the usual length of spark employed is about 15 cm. Much depends upon the character of the interrupter used with the coil. Abruptness of breaking circuit seems to be the essential feature in the performance of the interrupter. Mechanical devices for making and breaking have been found to give better results in this respect than the "Neff's hammer" ordinarily used with induction coils.

Any vacuum tube with metal electrodes will produce X-rays when the proper pressure has been reached. Since, however, the principal use of the X-rays consists in obtaining shadow photographs by means of them and permitting the observer to inspect the shadows cast by them upon the screen of the fluoroscope, it is very desirable to have the rays issue as nearly as possible from a single point upon the surface of the vacuum tube. Various forms have been given to X-ray tubes in the attempt to secure these conditions. The X-rays appear to emanate from the surface of any body which is exposed to the rays which issue from the cathode of the vacuum tube. If the cathode be cup-shaped, as shown in the typical forms of tube depicted in Fig. 3, the rays will take the form of a cone; and if the apex of this cone is at the glass wall of the tube the X-rays will emanate only from that point upon the glass where the cathode rays strike. This would be the ideal form for an X-ray tube, but for the fact that the heat generated by the bombardment of the cathode rays is so great as to fuse the glass. The atmospheric pressure then blows in the wall of the tube and ruins it. To avoid this difficulty it is customary to gather the rays from the concave cathode upon an oblique plate of platinum, which acts as a mirror to reflect them outward through the wall of the tube. (See *a* and *c*, Fig. 3.) This platinum plate becomes red hot under the action of the cathode rays. It serves as a radiating center for the X-rays which are produced by the bombardment of the metal.

A vacuum tube provided with a concave cathode as just described is called a focus tube.

Effects produced by the X-rays.—Since the X-rays have no effect upon the human retina, we become cognizant of them only by indirect methods. Certain substances, such as the double cyanides of platinum and barium, of platinum

FIG. 1.—A Crookes' Tube, with cross.

FIG. 2.

FIG. 3.

and magnesium, and of platinum and potassium, the tungstate of calcium, the oxide of zinc, etc., fluoresce when the X-rays fall upon them. If a surface be strewn with one of these materials and be placed in the path of the rays it glows with a pale light as though the substance were faintly incandescent. Calcium tungstate and the cyanide of platinum and potassium appear to be the most sensitive.

If any object be interposed in the path between the vacuum tube whence the X-rays emanate and the fluorescent screen it will cast a shadow. This shadow differs materially, however, from that cast by ordinary light, because many substances which are opaque to the rays which promote vision are transparent to the X-rays, and *vice versa*. Wood, paper, and nearly all vegetable and animal fabrics, such as wool, leather, cotton, and silk, are transparent to the X-rays. Metals, glass, and many mineral substances are opaque. The tissues of the body all transmit these rays to some extent; the bones, however, are comparatively opaque.

The *fluoroscope* is an instrument based upon this property. It consists of a screen or a sheet of cardboard coated on one side with minute crystals of one of these substances, usually with tungstate of calcium. This is mounted at one end of a hood of opaque material, with an opening for the eyes of the observer at a distance of about 25 cm. from the screen. The usual form is shown in Fig. 4.

FIG. 4.

If we hold the fluoroscope to the eyes with the screen at a distance of from 20 to 40 cm. from a vacuum tube in which X-rays are being generated, the surface of the screen is uniformly illuminated. If any object be held between the screen and the tube we see the shadow of those portions of it which are opaque to the X-rays. If, for example, a pocket pincushion be held in the path of the rays the substance of the cushion itself will scarcely cast a shadow, whereas each pin will stand out strongly marked. A purse shows only the metal mountings and the coins within. If the hand be held between the fluoroscope and the X-ray tube the skeleton is sharply marked, whereas those portions which are not of bony structure scarcely cast any shadow.

Although the X-rays do not affect the retina they are capable of acting upon the photographic plate. It is possible, therefore, to take shadow photographs of objects placed between the plate and the tube. The process differs somewhat from that of ordinary photography, since the X-rays can not be brought to a focus by means of lenses.

The operation consists in wrapping the plate upon which the shadow photograph is to be made in black paper in order to protect it from light. It is then set up at a considerable distance from the tube and in such a position that the bundle of X-rays emanating from the tube will fall fully upon it. The object, the shadow of which is to be obtained, is interposed. If great sharpness of detail is required it is customary to place a diaphragm of heavy metal containing a hole about 1 cm. in diameter in front of the tube. In this way the X-rays producing the shadow come from a comparatively small region. Even without this precaution fairly sharp shadows may be obtained.* The varying transparency of different materials to the X-rays is well illustrated by means of Fig. 5, which is from a photograph taken by Prof. G. S. Moler. Several objects—namely, a bunch of keys, a lead-pencil with a metal cap, a chain, a small wheel with saw teeth, and a single metal link—were placed inside a pasteboard box. The chain was placed in a smaller cylindrical box (a pill-box) and the wheel and metal link in a similar one. An ordinary dry plate was wrapped in black paper and fastened to the cover of the box, and a pine board one inch thick was introduced be-

tween the box and the tube generating the X-rays. Upon developing the plate after exposure to the action of the rays the photograph shown in the figure was obtained. It will be seen that while the pine board was so nearly trans-

FIG. 5.

parent that no trace of its structure can be seen in the photograph, the pasteboard of which the pill-boxes were made was not entirely transparent. When seen edgewise this material cast a shadow appearing in the picture in form of dark circles surrounding the chain and the link and wheel. The core of the pencil was also partially opaque, whereas the wooden part is scarcely discernible.

Applications of the X-rays.—The chief interest in the phenomena discovered by Röntgen has centered around its application to the human body. The fact that these rays by virtue of their penetrating power enable one to gain a view of the internal organs of the body led to the hope that very important advantages might be gained for surgeons and medical practitioners. These applications are unquestionably being realized to a certain extent. The ability to learn by direct observation of the condition of bones after a fracture, to locate foreign substances, such as bullets, bits of glass, needles, etc., is of great value.

For the examination of the human subject the use of the fluoroscope is frequently to be preferred to the more tedious photographic method. By means of that instrument it is possible not only to inspect the condition of nearly all the bones of the human frame and to detect the presence of foreign substances, but even to observe the pulsations of the heart. It has been found, moreover, that prolonged exposure to the X-rays for the purpose of obtaining photographs has an injurious effect upon the skin. The results are similar to those of a severe burn, and in some cases the roots of the hair are destroyed, producing baldness.

Numerous industrial applications of the X-rays have been suggested, and some of these have already been put to use. The presence of mineral adulteration, such as plaster, soapstone, sand, etc., in articles of food, for example, can be immediately detected by means of the fluoroscope, and with the same instrument it is easy to detect imitation diamonds. The diamond is nearly transparent to the X-rays, whereas an imitation of the diamond in glass casts a strong shadow. To illustrate this point the writer made the photograph reproduced in Fig. 6. A ring of glass cut from a tube was laid upon the paper cover surrounding an ordinary dry plate. A diamond about as thick as the glass was laid within the ring. In the photograph obtained by a five-minute exposure the shadow of the glass ring is dense, whereas that of the diamond is scarcely perceptible.

Nature of the X-rays.—Röntgen was inclined to regard them as longitudinal vibrations of the luminiferous ether. Others are inclined to assume the X-rays to consist of a stream of material particles driven at high velocity from the excited surface. It seems probable, however, that they are identical in character with the radiation which produces light, and that they differ from the latter only in wavelength.

E. L. NICOLS.

* Various names, such as sciagraph, skotograph, radiograph, shadowgraph, kathodograph, etc., have been proposed for the photographs obtained by means of the X-rays.
