II. Finally there is the second large group of poisons in which marked tissue changes are not found at the portal of entrance or within the body, but in which profound nervous symptoms are observed. The symptoms vary infinitely with the part of the nervous system affected, with the peculiar activity of the poison (physiological action), and with the individual susceptibility of the person affected. Excitement, cramps or convulsions, delirium, rapid pulse, and increased rapidity of the breathing may mark one group of cases, while another presents depression, sleep, stupor, or coma, with depression of the general organic functions; but all grades of severity and shades of demarcation exist to distinguish the individual poisons.

Diagnosis of Poisoning.—This must be made by taking the sum of the evidence of all kinds. A thorough discussion of this intricate subject in all its medico-legal relations is obviously impossible within the limits of this essay, but the following are the essential points to be borne in mind: In the first place, the diagnosis of poisoning can not be made with infallible certainty from the symptoms alone, for there are no symptoms absolutely distinctive of any single poison. Neither does the mere fact, taken by itself, of the presence of a poisonous substance in the stomach, the excreta, or even the tissues of the dead body, necessarily prove that the illness or death was occasioned by the poison. On the other hand, neither does the absence of characteristic symptoms or lesions, or failure to detect the presence of poison, prove that the case is *not* one of poisoning. Presumptive evidence of poisoning is afforded by the following circumstances: (1) Sudden onset of the symptoms in a previously healthy individual, especially shortly after taking food, drink, or medicine. Still stronger is the presumption where several persons, so partaking, are similarly and simultaneously attacked. (2) Correspondence of the symptoms with those known to be produced by some poison. (3) Finding of a poison in the stomach, excreta, or tissues of the dead body. Proof of the presence of a poison may be obtained by chemical tests, physiological experiments upon animals with the

suspect matters, etc. But as regard chemical testing, which is very properly regarded as the means of getting most certain proof, it is important to know that in a body dead from poisoning it is rarely, if for many reasons, utterly fail to detect any trace of the poison. Thus, for one for some poisons to decompose, but yet be fatal, and with others because the poison may have wholly disappeared by reason of volatility, or by being volatilized, excited, or decomposed during life, before the analysis is begun, to such an extent as to be altogether within the power of chemical means to detect. Hence, in judicial cases it is not always necessary to demonstrate, quantitatively, a trace of the poison in the person of the poisoned individual, or of other corroborative circumstances. Examples are the finding of charred clothing and corrosion of the lips in a case of cupric sulphuric acid poisoning; proof of possession of the suspected poison by the administrator; finding of motive for the poisoning; proof of administration by direct or circumstantial evidence. From the more or less perfect chain afforded thus by the evidence from the symptoms, the results of analysis, and corroborative circumstances, the diagnosis of poisoning is made with a greater or less certainty.

Treatment of Poisoning.—The aim here is to prevent absorption or local injury by combined attempts at body removal of the poison and chemical neutralization of its poisonous property, and then to combat the effects by general medical means. With inoculated poisons, as in bites from venomous reptiles or rabid animals, the part should be instantly washed, and then thoroughly sucked out by the mouth or a sucking-glass. At the same time, where practicable, a ligature should be tied tightly around the limb near the wound and between it and the heart. Then in dangerous cases the wound should be thoroughly cauterized with a red-hot iron, or powerful caustics. In the use of these care must be taken not to injure any large artery or important organ. Where the poison is swallowed, the stomach should be evacuated with the least possible delay, and, if there be one, the antidote to the poison should be immediately given. For emptying the stomach the means are emetics and the stomach-pump. This should be done even though the drug itself had already caused some vomiting and had been in the stomach for some time, for the vomiting is only rarely complete enough to insure removal of all of the poison swallowed, and absorption may be so slow that some of the substance may still remain in the stomach after a long interval. Of emetics, the best is the chloride of apomorphia, because it is prompt, thorough, un-irritating, and, most important of all, because it will act if only put under the skin. One-fifteenth of a grain in solution in a little water should be injected under the skin by the hypodermic syringe, or double the quantity given by the mouth. Other useful ones are the following: *Cupric sulphate* (blue vitriol), in the dose of 2 or 3 grains, repeated if necessary; *zinc sulphate* (white vitriol), dose from 15 to 20 grains; *common ground mustard*, a dessert-spoonful diffused through a tumblerful of water; powdered *alum*, a teaspoonful, taken dry, mixed with sugar, in molasses, or in water. *Ipecac* is a safe and un-irritating emetic, but is rather slow. Dose, 20 or 30 grains of the powder, or from 1 to 2 table-spoonfuls of the sirup or wine. These doses are for an adult, and must be duly reduced for children. In all cases where an emetic is given, its action should be assisted by free drinking of nauseous potions, as warm water, warm salt water, or warm chamomile tea. The stomach-pump is invaluable where emetics fail to thoroughly empty the stomach, but in corrosive poisoning the stomach-pump should not be used for fear of perforating the corroded or softened walls of the stomach. When employed, water is to be repeatedly pumped into the stomach and then out again. In irritant poisoning, after evacuation of the stomach, copious draughts of bland and viscid fluids should be taken to soothe the walls of the alimentary canal from the action of the poison. Such are mucilages, oils, flaxseed tea, milk, white of egg, barley-water, etc. As regards antidotes, the special substances to be used will be mentioned in connection with each poison. In general, antidotes act by chemically transforming the poison, while still in the stomach, into a comparatively innocuous compound. Thus *free acids* *alkalies* are to be given, and, *vice versa*, for *alkalies* *acids*, whereby a salt is formed devoid of the caustic effect of either of its components. For the irritant *acids*, *albumen*, as white of egg, is given to form the comparatively insoluble, and therefore inert, albuminate of the acid. In poisoning by vegetable alkalies the *acids* are given.

(tannic acid), or a vegetable infusion containing the same, such as strong green tea, infusion of galls, of cinchona, of blackberry-root, logwood, rhatany, etc. Here a rather insoluble tannate of the alkaloid is formed. But yet the efficacy of antidotes is generally small; they can not reach such of the poison as has been already absorbed, and with irritant poisons they generally come too late. Effects of the poison necessarily vary greatly. In all cases, besides such local treatment as may be necessary, the special tendency to death should be recognized and intelligently combated by appropriate means.

Detection of poisons in medico-legal questions requires the most careful application of all chemical tests as well as of physiological experiments. The materials removed must be sealed or locked by the examiner to prevent any possible suspicion of tampering. All known tests must be tried, and in metallic poisoning the metal should be obtained from the tissues if possible. All vessels employed and the reagents must be absolutely clean and free of contamination.

SYSTEMATIC TOXICOLOGY.

Systematic toxicology is concerned with the classification and study of individual poisons. The best classification is that based upon the symptoms, and we may distinguish the (a) irritant or corrosive poisons, which act locally; (b) parenchyma poisons, which cause little local trouble at the portal of entrance, but decided inflammatory and degenerative changes in the organs of the body, principally the glands; (c) the blood-poisons, whose symptoms result from chemical or morphological changes in the blood; and (d) nerve-poisons, which produce marked symptoms, but little or no discoverable anatomical change.

1. *Corrosive Poisons*.—These produce a local death or necrosis of tissue, and reactive inflammation beneath and around. The extent and depth of the process depend upon the individual poison and its concentration. The most common poisons of this group are the acids and alkalis. They may act on the surface of the body, causing most painful destruction of the skin and deeper tissues, or internally with production of intense gastro-enteritis and collapse. The treatment consists in the neutralization of the poison and in the application of bland liquids to protect the inflamed surface. In the case of acids weak alkalis, such as magnesia, chalk, soap, dilute ammonia solutions, lime from the plastering of the wall, and the like may be used; in the case of alkaline poisoning, dilute vinegar or acetic acid, or lemon juice is generally at hand. After the poison has been neutralized, mucilaginous drinks, milk, the white of eggs beaten up with milk or water, and the like are given; and remedies administered to quiet irritation. The results of external application of corrosives are treated like burns, by soothing and protective applications. Among the individual poisons of this group *sulphuric acid* (oil of vitriol) is probably the commonest, and most serious. It is frequently thrown in the face with criminal intent, or accidentally applied or swallowed. Linear scars of a yellowish-brown color on the face, radiating from the mouth if the poison is swallowed, are the characteristic indication. The clothing is charred where the acid has come in contact with it. When the poison reaches the digestive tract the most intense gastro-enteritis is set up. *Nitric acid* is less intense. It produces yellowish areas of corrosion and internally violent gastro-enteritis. *Oxalic acid* and the soluble oxalates (salt of lemon and others) cause marked irritation of the mucous membrane, and also nervous symptoms from action on the brain. The ordinary alkalis are not antidotal, as the oxalates are soluble. Lime forms an insoluble oxalate, and is therefore the most useful antidote. *Hydrochloric acid* and *hydrofluoric acid* act similarly to the others of this group, as does also *carbolic acid*; but the latter occasions specific nervous symptoms as well. Of the alkaline poisons *caustic potash* and *soda* are common forms, because of their use as lye. Concentrated *ammonia* is another common form. The symptoms are of the same irritative nature as in the case of acids. *Chlorine*, *bromine*, *nitric oxide*, and other substances in vapor form act as violent irritant poisons of the respiratory tract.

II. *Parenchyma Poisons*.—There are innumerable examples of this group, but only a few of the more common can be referred to here. In concentrated form most of them cause irritation of the stomach and intestines, but the more specific action is due to their solution and absorption by the blood, and the subsequent action on the organs. The symptoms in the several cases are so varied as to require separate description.

Arsenic is a very common poison of the accidental and homicidal kind. Arsenic is used as a coloring-matter or for other commercial purposes in the forms of Scheele's green, Schweinfurth green, Brunswick green, Paris green, orpiment (yellow arsenic), and realgar (red arsenic). Green, yellow, and red wall-papers, carpets, and other house-finishings may be colored with these, and the dust very often occasions slow arsenic-poisoning. Fowler's solution (containing arsenite of potassium) is very poisonous. It is often prescribed by physicians in concentrated form, and over-doses may be used by careless persons. See ARSENIUS OXIDE.

Acute arsenical poisoning is generally manifested in the form of violent gastro-enteritis with pain in the abdomen, vomiting, purging of a watery character, cramps in the legs, and finally collapse with the attendant symptoms of this condition. The symptoms in such cases soon resemble those of Asiatic cholera, and the diagnosis may be extremely difficult. In other cases the abdominal symptoms are almost absent, and collapse alone or delirium and coma with convulsions may lead to rapid death. In either form the course of the case is rapid and generally fatal. The fatal dose of arsenic may be placed at from 0.1 to 0.15 gramme.

Arsenic may act as an external poison when brought into contact with the skin or mucous surfaces in concentrated form or as solid arsenious acid. In this case the lesions of a violent caustic are present, but absorption of the poison does not take place to any large extent.

The treatment of acute arsenical poisoning consists in the administration of emetics, in careful washing out of the stomach, and subsequently the administration of an antidote. The best is a freshly prepared hydroxide of iron made by adding magnesia to a solution of sulphate of iron.

Chronic arsenical poisoning is exceedingly common, more so, perhaps, than is generally supposed. In these cases the source of poison is most frequently wall-paper, colored lampshades, clothing, tapestries, etc., and the poison enters through the stomach or respiratory tract. Chronic catarrh of the stomach, persistent cough, sneezing, throat troubles, and conjunctivitis may be present. In more serious or protracted poisoning, paralysis, general deterioration of health, or pigmentation of the skin are noted.

Phosphorus-poisoning is due in all cases to the common yellow phosphorus, the red being wholly insoluble and inactive. The common sources from which this poison is derived are phosphorus matches, rat-poisons, and the phosphorated oil of the chemists. In chronic cases, mainly workmen in match-factories are affected. The symptoms of acute phosphorus-poisoning are usually those of a severe gastro-enteritis, with eructation of gases having a phosphorecent odor, and a luminous character when seen in the dark, and of vomiting of materials presenting similar characters. Enlargement of the liver, a jaundiced hue of the skin, and the appearance of leucine and tyrosin in the urine are among the more distinctive symptoms. Later, loss of consciousness, collapse, coma, and convulsions may be present. Amounts over 0.15 gramme are usually fatal.

The treatment of acute phosphorus-poisoning consists in the removal from the stomach of every trace of the poison, and the administration of ozonized oil of turpentine, of solutions of ozone in water, or of permanganate of potash. In chronic phosphorus-poisoning, catarrhal conditions of the respiratory and digestive tract are noted, but more characteristic is a form of necrosis of the lower jaw-bone, which is not uncommon among workmen in match-manufactories.

Lead is perhaps the most common of all mineral poisons. Acute cases are mainly due to ingestion of acetate of lead, the carbonate, oxide, or chromate; and manifests itself as an intense gastro-enteritis, with white vomiting and dejections of a black color. In more subacute cases, where small quantities of poison are repeatedly inhaled or swallowed, lead colic is apt to occur. In this condition there is intense constipation, with twisting pains in the abdomen, a certain amount of cachexia, and a blue line on the gums at the junction of the teeth.

Acute lead-poisoning may occur in persons exposed to the odors of fresh paint, and is very often met with in painters and others engaged in occupations in which lead is used. In these, however, the subacute form (lead colic) is more common than the truly acute.

In still more chronic cases, cramps of the limbs, paralysis (particularly of the forearms), and marked cerebral disturb-

ances may be developed. Disturbances of sight, chronic Bright's disease, and gout are results of protracted lead-poisoning. Cases of very chronic and insidious lead-poisoning may occur from obscure causes, such as the drinking of water conducted in lead pipes, the use of cosmetics containing lead, and eating canned food contaminated by the lead of the solder. Water containing saline materials is not apt to be contaminated by the lead pipe, because of the precipitation of an insoluble incrustation in the pipe. Pure spring water, however, is more dangerous. In acute cases the treatment consists in emptying the stomach, and the administration of a soluble sulphate, which precipitates an insoluble sulphate of lead. Epsom salt answers this purpose, and acts as a purge as well. In more chronic cases the same purge may be employed, and iodide of potash is useful to eliminate the lead from the system.

Mercury-poisoning is similar to lead-poisoning in its varieties and symptoms. Very acute poisoning, with violent gastro-enteritis, results from the ingestion of the corrosive sublimate. Non-corrosive or irritating preparations may produce no local disturbance, but occasion soreness of the mouth, sponginess of the gums, and free flow of saliva with swelling of the salivary glands (mercurial salivation). In very chronic cases, particularly where small particles of vapor or dust containing mercurial compounds are inhaled, nervous symptoms are common, such as tremor, headache, and cerebral disturbances. The fatal dose of corrosive sublimate is not definitely determined; 0.5 gramme has proved fatal, and 1 gramme has been recovered from.

Treatment in acute poisoning (as by the bichloride) demands the administration of egg-albumen, milk, or other albuminous materials. In chronic cases, iodide of potash is given to eliminate the mercury, and if ptyalism is present, atropine and opium are useful.

In addition to these there are a number of other less important forms of mineral poisoning, such as those by antimony, copper, zinc, iron, silver, and chromium. Among the vegetables belonging to this group ergot takes the principal rank, for the symptoms of which see ERGOTISM; but it may be said at this place that there are two forms: that in which acute poisoning occurs, and in which gastro-intestinal symptoms, with sleepiness, delirium, and coma, play a part, and chronic poisoning, which is apt to affect large communities of people, particularly during periods of famine, and which may occasion a form of gangrene or irregular nervous disturbances.

III. *Blood-poisons*.—The number of these is very great, but none of them is of such great importance as to merit extended discussion. Carbonic oxide gas, bisulphide of carbon, sulphuretted hydrogen are among these. Somewhat more important are the various cyanogen compounds, such as prussic acid, cyanide of potash, oil of bitter almond, and ferrocyanide of potash. These may lead to rapid death in the course of a very few minutes, with loss of consciousness, intensely disturbed respiration, and great weakness of the pulse. When the poison is taken in less quantity, preliminary dizziness, nausea, ringing in the ears, and other mild symptoms may precede more serious disturbances. Chlorate of potash, nitrobenzol, aniline, and nitroglycerin are analogous in action. Among the vegetables the poison mushroom *Amanita phalloides* and certain others less well-known act similarly upon the blood.

IV. *Nerve-poisons*.—Finally, there is the great group of poisons which act through the nervous system, and which for the most part cause no definite and recognizable changes of structure. Many sub-classifications have been attempted, but the actions of the individual poisons are so varied in some directions and so similar in others that it is best to attempt no subdivisions.

Opium and its principal alkaloid, *morphine*, are perhaps the most common of all poisons used for suicidal and homicidal purposes. The better qualities of opium contain from 12 to 20 per cent. of morphine as well as other alkaloids. Some of the preparations of opium are specially apt to be taken by accident or design, such as the tincture (laudanum), the extract, and the solution of morphine. Purgative contains so little opium that it is dangerous only for children. The fatal doses can not easily be estimated, as idiosyncrasy plays a more prominent part in the action of this drug than of any other. Children bear it very badly. From 0.2 to 0.4 gramme of morphine and from 2.0 to 4.0 grammes of opium may be taken as surely fatal doses. Habit will develop tolerance for these or even greater quantities in some persons.

Acute opium-poisoning is marked by a preliminary stage of mild or considerable cerebral excitement, in which, as a rule, pleasant emotional stimulation predominates. Later, drowsiness, sleep, and complete unconsciousness follow in order. In the first stage the pulse is excited, and the skin dry and warm; in the second the pulse is weak and irregular, the skin grows cold and moist, and with growing stupor the muscular power and reflexes are completely lost. The pupil is more and more contracted, until just before death, when paralytic dilatation may occur. The respirations become slower and slower, until the individual breathes but once a minute, or even less frequently. The skin becomes livid, and the patient dies gradually and quietly of failure of the respiratory power. In some persons the primary stage of stimulation may alone occur, and wild delirium or convulsions may be the only symptoms.

Treatment.—The stomach must be promptly emptied, and repeatedly washed with water. Tannic acid may be given as an antidote, but permanganate of potassium has been found decidedly useful. Cerebral stimulants should be given to combat stupor, such as coffee, atropine, or strychnine. The patient must be kept awake by cold douching or other means, and electrical stimulation of the respiratory muscles or artificial respiration should be practiced. Forced artificial respiration will save many cases apparently dead.

Chronic Opium-poisoning.—Opium eating and smoking are scourges of the East, but the consumption of opium or morphine is a common habit in Western countries as well. In the East the results are comparatively trivial. Among Europeans and Americans there is gradual deterioration of health, more and more craving for the drug, and intellectual deterioration. Eventually death ensues from exhaustion and disturbance of the gastro-intestinal tract.

The treatment can only be carried on with satisfaction in institutions where abstinence can be enforced. Regulation of the general health and tonics must be used as adjuvants in the treatment.

Chloral.—This substance is in frequent use as a hypnotic, and has often been taken as a poison. The symptoms in acute cases are those of deep sleep, without a previous stage of excitement such as opium produces. The patient may pass into deep coma, and sudden heart failure is not rare. The treatment consists in the rapid removal from the stomach, and in the administration of strychnine, atropine, and other stimulants. Chronic chloral-poisoning leads to symptoms not unlike those of chronic alcoholism in some persons; more characteristic, however, are certain eruptions in the skin, weakness of the heart, with rapidity of its action, and emaciation of the individual.

Chloroform and *ether* are the well-known anesthetics. In overdoses these act as narcotic poisons, and sometimes chronic poisoning is acquired as a habit. The symptoms in the case of etherization or chloroformization may be divided into two stages, like those of opium-poisoning. In the first the patient is excited, the heart is accelerated, the respiration is rapid, and the face flushed. In the second consciousness becomes more and more disturbed, until the patient is wholly insensible, the muscles are relaxed, and the reflexes are wanting. If pushed too far absolute paralysis of the vital functions may occur, and the patient dies of failure of respiration or of the heart's action. If these substances are taken into the stomach they act as local excitants and irritants. Certain persons acquire the habit of inhaling or of drinking ether and chloroform, but such are comparatively rare.

Alcohol is perhaps the commonest of all poisons, and may manifest itself as an acute or chronic intoxicant. The details are given under the headings INTOXICATION and ISMBRIETY (qq. v.).

Atropine, the alkaloid of belladonna, in overdose produces delirium, flushing of the skin, dryness of the mouth, dilatation of the pupil, and sometimes convulsions. Wide differences exist in different persons with regard to the tolerance for this drug. The smallest dose which has proved lethal is 0.095 gramme in a child of three years, and 0.195 gramme in an adult. The treatment consists in the removal of the poison from the stomach, the administration of tannic acid as an antidote, and of morphine to combat the symptoms.

Cocaine is derived from the *Erythroxylon coca*. The symptoms produced by overdoses are rapidity of the heart, cold sweat, nausea, and vomiting, followed by vertigo, unconsciousness, and delirium. The pupils are dilated. Death occurs in collapse. The fatal dose may be placed at 1 gramme.

Morphine may be used as an antidote in the earlier stages, while stimulants will be required in the later stages. Chronic cocaine-poisoning presents many of the symptoms seen in chronic opium-poisoning, and the treatment is the same.

Strychnine is the alkaloid of the *Strychnos nux-vomica*. In toxic doses it produces intense excitement of the spinal cord and general nervous system, leading to cramps and convulsive seizures resembling those of tetanus. The slightest irritation, as by a breath of wind, may throw the patient into a violent convulsion, in which the body is bent backward, resting upon the heels and head. The patient as a rule remains conscious until shortly before death, when cyanosis may be present from tetanic arrest of respiration, and coma may be developed. The fatal dose for adults is from 0.03 to 0.1 gramme. The treatment consists in rapid evacuation of the stomach and the administration of chloral and opium.

There are many other vegetable substances which act upon the nervous system in similar manner, and some of these, like aconitine, nicotine, and curari, are intensely toxic. The more important, however, have been named.

Animal Poisons.—There are a number of animal poisons, such as the venom of serpents, tarantulas, etc., which are properly considered in this place. The action of these is rather complex. There is, in the first place, decided local irritation at the point of the sting or bite, leading to swelling, redness, and œdema, and, in severe cases, it may be to gangrene. Then the poison after its access to the blood may occasion serious destruction of that fluid, with the production of such symptoms as jaundice, cyanosis, hæmoglobinuria (the blood coloring-matter appearing in the urine), and finally hæmorrhage into the tissues or from the free surfaces; and, finally, there are general symptoms, due on the one hand to the blood-poisoning and on the other hand to direct action upon the nerve-centers. Among these general symptoms are dyspnoea, vertigo, extreme prostration, loss of power of the muscles, slowing of the pulse, with weakening of the heart's action, and finally collapse. Death may occur rapidly, or after a period of prolonged prostration. The treatment of such poisoning consists, in the first place, in the application of a tight band on that side of the point of injury toward the body, so as to shut off rapid absorption; in the second place, the destruction, by the knife or cauterizing agents, of the area of inoculation; and, in the third place, of the administration of remedies, such as ammonia, alcohol, or strychnine, to support the system. The poisons in question are albuminous substances, which may be extracted from the liquid secretion of the poison glands by glycerin and other agents, and even dried and preserved.

Putrefactive Poisons.—Many instances have been recorded in technical literature, as well as in the public prints, of poisoning of families or communities of persons by food which has undergone some change of a putrefactive character. The foods most apt to give rise to such poisoning are meat, sausage, and cheese. The poisons in these cases are spoken of as ptomaines, and numerous forms have been described. The actions of these are as dissimilar one from another as are those of the various vegetable alkaloids, and there is a strong resemblance in action of some of these ptomaines to certain of the vegetable alkaloids. Not only this, but there is a close relation in chemical reaction of some of them, so that it becomes a matter of the greatest medico-legal interest to determine the minute differences between these animal poisons and the vegetable alkaloids. See Vaughan and Novy, *Ptomaines and Leucomaines*.

WILLIAM PEPPER.

Toxiglossa [Mod. Lat.; Gr. *τοξικόν*, pertaining to an arrow, hence poison + *γλῶσσα*, tongue]; a group of molluscs, including the cone-shells, the angur-shells (*Terebridae*), etc., in which there is frequently a poison apparatus in connection with the lingual ribbon.

Toxodontia [Mod. Lat., plur. of *Toxodon*: Gr. *τόξον*, bow + *ὀδούς*, *ὀδώντος*, tooth]; a sub-order of extinct mammals whose remains have been found in South America. They were most nearly related to the perissodactyle ungulates, but differed in several characters, and especially the teeth, showing affinities with the *Proboscidea* and *Rodentia*. The molars of the upper jaw were broad, and extended severally into an externo-anterior angle; those of the lower jaw were narrow, and continuous in a uniform row; the incisors were diversiform in shape as well as the mode of insertion and number; the feet are mostly unknown; the hind feet, however, had the astragalus at its anterior face inclined

obliquely inward, and articulating in front only with the navicular, and the calcaneum had an extensive upward-extended surface for the articulation of the fibula, and a large lateral process articulating in front with the astragalus. Two families—the *Toxodontide* and *Typhotheriide*—represent the sub-order.

Revised by F. A. LUCAS.

Toxodontide: a family of placental mammals of the order *Toxodontia*, which formerly flourished in South America, and which were especially distinguished by their teeth, which consisted of large incisors, very small canines, and strongly curved molars, all with persistent roots. Only one genus, *Toxodon*, is known. It was composed of large-sized mammals which lived in South America during the later Tertiary epoch. The remains first obtained of *Toxodon platensis* were found by Darwin during his sojourn in the Banda Oriental, near the Sarandis, a tributary of the Rio Negro, about 120 miles N. W. of Montevideo, and were known to the natives as giants' bones. Revised by E. A. BIRGE.

Toxotidae [Mod. Lat., named from *Toxotes*, the typical genus, from Gr. *τοξότης*, Bowman, archer, deriv. of *τόξον*, bow]; a family of fishes of the order *Teleostei* and sub-order *Acanthopteri*, remarkable for the power of "shooting" water at insects, etc., to insure their capture. The family is represented by but two known species—*Toxotes jaculator* (see ARCHER-FISH for illustration) and *Toxotes microlepis*—in the East Indian and Polynesian seas. These (or at least the former) catch insects and other small animals which rest on aquatic plants or those growing on the banks near their quarters, by protruding their mouth into a tubular form and shooting drops of water, and it is said they can hit insects thus at a distance of 3 feet and more. This habit is a source of amusement to the natives, and the fishes are kept to give evidence of their skill and industry. They attain a length of about 6 or 7 inches.

Revised by E. A. BIRGE.

Toy, CRAWFORD HOWELL, D. D., LL. D.: educator; b. at Norfolk, Va., Mar. 23, 1836; graduated at the University of Virginia 1856; attended the University of Berlin 1866-68; was Professor of Hebrew in Southern Baptist Theological Seminary 1869-79; since 1880 Professor of Hebrew and other Oriental languages and Dexter lecturer on biblical literature in Harvard University; translated and edited the volume on Samuel in Lange's *Commentary on the Bible*; edited Prof. Murray's *Origin of the Psalms* (1880). He is author of *The Religion of Israel* (Boston, 1882; 3d ed. 1884); *Quotations in the New Testament* (New York, 1884); and *Judaism and Christianity, a Sketch of the Progress of Thought from Old Testament to New Testament* (Boston, 1890).

Revised by S. M. JACKSON.

Toynbee, ARNOLD: philanthropist; son of Joseph Toynbee, a well-known aural surgeon; b. in London, Aug. 23, 1852; spent two years at a military college, but left and entered Oxford, and after taking his degree proceeded to London. Having a keen sympathy with the laboring classes, he took up his residence in Whitechapel, and devoted himself to improving the condition of the poor, addressing audiences of workmen, and taking part in religious work. His health was undermined by his incessant labors, and the strain incidental to the delivery of two lectures against Henry George's *Progress and Poverty* was the immediate cause of his death in 1883. From the inspiration of his example arose Toynbee Hall, founded in 1884, as the outcome of a scheme, framed by members of Oxford and Cambridge Universities, to provide education and the means of recreation for the people of the poorer districts of London, and to consider and support plans calculated to promote their welfare. It is a center of social life and organized effort to elevate the masses by educational work, loan exhibitions of pictures, etc. There is a regular force of fifteen residents, besides a body of associates, men and women, who come at intervals to take charge of classes and clubs. In connection with Toynbee Hall are Wadham House and Balliol House, where students and workers reside. Similar institutions, called college settlements, have been founded in the U. S. See UNIVERSITY SETTLEMENTS. R. A. ROBERTS.

Tracadie [Miacae *Tracadiesh*, or Heron island]; town of Gloucester County, New Brunswick; near the mouth of Tracadie river, and on the Gulf of St. Lawrence; 20 miles S. of Shippigan (for location, see map of New Brunswick and Quebec, ref. 3-1). It has good fisheries of herring, salmon, and cod. Here are about twenty lepers, formerly more numerous, and the disease is said to have been introduced from

Mitylene in 1758. Tracadie contains a Trappist monastery and a convent of Sisters of Charity. Pop. about 1,200, mostly Acedian. M. W. H.

Trachea [Mod. Lat., from Lat. *trachia* = Gr. *τραχεία*, liter., the rough one (scil. *ἀρτηρία*, artery, windpipe); the tube which in all air-breathing vertebrates carries the air from the oral cavity to the lungs. It begins on the floor of the throat and extends backward until it divides into two parts

Human trachea dividing below into the bronchi. At its upper end the laryngeal cartilages.

(*bronchi*) connected with the right and left lungs. In its wall are numerous incomplete rings of cartilage; these being to prevent collapse and at the same time, by reason of their incompleteness, to allow the œsophagus to compress them during the swallowing of food. The term trachea has also been applied to the air-tubes which penetrate the body in insects and spiders. These have also a ringed appearance, due to a corrugation of the lining membrane, and not, as was formerly thought, to the presence of a spiral filament. See ENTOMOLOGY. J. S. KINGSLEY.

Tracheata [Mod. Lat., from TRACHEA (*q. v.*):] a group of ARTHROPODA (*q. v.*) recognized by many authors, embracing those forms which respire by air-tubes which penetrate the body. Under this head are included the insects ARACHNIDA and MYRIAPODA (*qq. v.*). The later discoveries go to show that this division is unnatural, and that there are at least two distinct kinds of trachea in the group.

Tracheids: See HISTOLOGY, VEGETABLE.

Tracheotomy [Mod. Lat. *trachea* = Gr. *τραχεία* + *τομή*, cut]: opening of the trachea by incision or puncture for the free ingress and egress of air when respiration is labored or suffocation is imminent from laryngeal obstruction. Older writers treat the subject under the title bronchotomy. The operation is chiefly demanded when the larynx is obstructed by the membrane of croup or diphtheria, is the seat of acute œdema or dropsy, is closed by the impaction of foreign bodies, or is contracted by previous inflammation or ulceration. It may also be performed to permit the escape of foreign bodies accidentally passing the larynx and entering the trachea and bronchial tubes. When goiter of great size compresses the upper part of the trachea, tracheotomy affords relief. Older writers advocate opening the trachea before employing artificial respiration in cases of asphyxia by noxious vapors or drowning, but this is seldom done. The air-passage may be opened at either of three points. Laryngotomy, the operation highest up and involving least danger, is preferable when membranous or other obstruction does not exist below the larynx; it consists in opening through the crico-thyroid membrane. Incision a little lower, cutting the cricoid cartilage and one ring of the trachea, is termed laryngo-tracheotomy, while incision of one or more rings of the trachea below the thyroid gland is strictly tracheotomy. The operations are most easily performed on thin, long-necked children; infants with short

necks and corpulent persons present difficulty. The incision is always longitudinal, and in the median line over the elected point of opening, the cutting being cautious and progressive; at every step vessels should be pushed to one side rather than cut, as bleeding delays the operation, and the entrance of blood into the air-passage endangers life by causing asphyxia by clot, or at a later period by exciting broncho-pneumonia. When the trachea is fully exposed, it is firmly held with a sharp hook or tenaculum and incised, and a tracheotomy tube or cannula, provided with a fenestrated, hollow

Tracheotomy tube

pilot-trocar as a guide, is inserted, the guide being removed as soon as the tube is in place. The cannula is usually of silver or rubber, curved so as to descend in the air-passage. An inner tube is provided, slightly longer than the outer one. Mucus or membrane obstructing the end may be removed by withdrawing and cleansing the inner tube. The tube is retained in the wound by means of a tape around the neck, and should be worn until all danger from the original disease is past and the larynx is again free. Tracheotomy is performed more frequently than formerly, and with increasing success. It should not be left till too late; should be carefully performed at a point below all obstruction; the tube should be of large size, adequate to admit air freely; an attendant should be constantly at hand to keep the tube open; the patient should breathe a pure but warm and moist atmosphere, and should be supported by abundant but easily assimilated food and by tonics.

Revised by JOHN ASHURBAST, Jr.

Trachinidæ [Mod. Lat., named from *Trachinus*, the typical genus, from Gr. *τραχύς*, rough, rugged]: a family of marine teleost fishes containing the forms known in England as weevers and kindred types. The body is elongated, narrowed from shoulders to tail, and compressed; the scales very small; lateral line high up and continuous; the head terminates in a conical snout; eyes lateral, but separated by a narrow interval, and far forward; the operculum has a strong acute spine arising from its upper surface and pointing backward; villiform teeth are developed in bands on the jaws and palate; the branchial apertures are continuous below; branchiostegal rays in six pairs; the dorsal is represented by two fins, the first short and sustained by a few diverging spines, the second elongated and with branched rays; the anal is very long, and composed of articulated rays; the caudal distinct; the pectorals large, and composed of branched rays; the ventrals are approximated to each other and jugular, and have each a spine and five rays; pyloric appendages are developed in small number (about six); the vertebral column has the normal number of abdominal, but an increased number of caudal vertebrae (A. 10-11 + C. 25-31). The family is composed of a few species, chiefly found in the European seas (where are three) and along the western African coast, but one occurs along the coast of Chili. By most authors these species have been combined in one genus (*Trachinus*), but they have been distributed among three by Bleeker. They are considerably feared by fishermen and others on account of the formidable opercular spines, with which they can inflict severe wounds. These spines are generally cut off when the fishes are caught, and thus they are exposed for sale. The species are of inconsiderable economic importance. For illustration, see GREAT WEAVER. Revised by F. A. LUCAS.

Trachoma: See GRANULAR LIDS.

Trachypteridæ [Mod. Lat., named from *Trachypterus*, the typical genus; Gr. *τραχύς*, rough + *πτερόν*, fin]: a family of teleost fishes of the order *Telosteophtali* and sub-order *Acanthopteri*. The body is very long and exceedingly compressed, and gradually diminishes in height from head to tail; the skin is naked; the lateral line is low and continuous; the head is oblong and compressed; the eyes lateral, and in anterior half of head; the opercular bones unarmed, senseless, and with radiating striae; the mouth has a small cleft; the teeth are feeble; branchial apertures confluent below; branchiostegal rays in six pairs; dorsal fin very long, extending the whole length of the back, divided into a very short elevated portion and a

remaining continuous fin, all the rays of both of which are flexible spines; anal wanting; caudal undeveloped, or composed of an enlarged upward-directed upper and a rudimentary lower portion; pectorals small; ventrals thoracic or absent; there are five gills, and also well-developed pseudobranchia, "situated in a pouch formed by a fold of the mucous membrane (*Trachypterus*);" pyloric appendages are developed in large number; the skeleton has comparatively little consistency; the vertebrae are very numerous. This family is composed of large-sized, extremely compressed, and thin fishes, which are inhabitants of the deep or open seas, and rarely stranded on shore or otherwise caught. They are probably widely distributed; specimens have been observed from time to time in many parts of the European seas, as well as in the Bermudian archipelago, the Australasian seas, the East Indian seas, and on the west coast of North and South America. The large species have doubtless in part given rise to the belief in a sea-serpent, and been mistaken for such, as they well might from a distance on account of their size, some species of *Regalecus* attaining the length of 20 feet. Nearly twenty species of the family are known.

Revised by F. A. LUCAS.

Trachystomata [Mod. Lat.; Gr. *τραχύς*, rough + *στόμα*, mouth]: a group of amphibians by some considered as a sub-order of *Gradientia* or *Urodela*, and by others (e. g. Cope) as an independent order. It has been constituted for the reception of the family *Sirenidae*, and is characterized by the absence of the basioccipital, supratermporal, supraoccipital, and vomer; there are no maxillary or palatine arches. The frontals and premaxillaries are distinct, as are also the propodial bones and caudal vertebrae. There are but two species in the group, *Siren lacertina* and *Pseudobranchius striatus*, both from the southern parts of the U. S.

F. A. LUCAS.

Trachyte [from Gr. *τραχύς*, rough, rugged]: aphanitic or glassy rock, usually porphyritic, having chemical composition similar to that of syenite. Constituent minerals are potash-feldspar (sanidine), some lime-soda-feldspar, and one or more ferromagnesian minerals—biotite, hornblende, angite—besides others in small amount. Abundant alkalis lead to the crystallization of sodalite and nephelinite, when the rock grades into PNOXOLITE (*q. v.*). When quartz is present in small amount the rock is quartz-trachyte; with increasing quartz it passes into RHYOLITE (*q. v.*) and pantellerite. Trachytes may be rough and porous, or compact and dense, or glassy, dense vesicular, or pumiceous. Non-porphyrific trachytic glass, or trachytic obsidian, is distinguishable from rhyolitic obsidian, the more common kind, only by its chemical composition. Trachytes are usually light-colored rocks, but may be any shade of gray to black. Many rocks formerly called trachyte are andesites, being rich in calcium and in lime-soda-feldspar. The name *trachyte* was introduced by Italy in 1823 for light-colored, porous, and rough lavas of the Auvergne with glassy feldspars. Afterward it was applied to any rough lava with prominent glassy feldspars. Modern petrographic usage restricts it to the definition given above. Trachytes are much rarer rocks in the U. S. than andesites. They occur in Montana, Wyoming, South Dakota, and Colorado, and are better known in Italy, France, and Germany.

J. P. IDDINGS.

Tractarianism: the Anglican doctrinal and religious system promulgated in the Oxford *Tracts for the Times*; the principles of the movement known as the *Oxford Movement* and afterward as the *Catholic* or *Anglo-Catholic Revival*. In the first quarter of the nineteenth century the distinctive principles of the Church of England were maintained with little zeal, and public worship and church edifices evidenced laxity and neglect. The old High Church party still existed, but inactive and in the background. Evangelicalism dominated, but had spent much of its force. Constant attacks were made on the doctrines and liturgy of the Church, theological teachings were imported from Germany, and unfavorable political changes seemed imminent. The first marked sign of a reaction was the appearance of John Keble's *Christian Year* and its phenomenal popularity. Keble was a strong Tory and High Churchman and a brilliant scholar, but very modest and retiring. Richard Hurrell Froude, Keble's pupil, and of a more aggressive disposition, brought under Keble's influence John Henry Newman, till then known as an Evangelical. In 1833 the changes connected with the Reform Bill threatened the Church. The Government had suppressed ten bishoprics in Ireland, and disestablishment and alterations of the Prayer-book

were feared. In view of the agitation against the Church, Keble preached July 14 a university sermon, which was published under the title *National Apostasy*, and was regarded by Newman as the start of the movement. In the same month a meeting to begin an agitation in defense of the Church was held at the parsonage of Hugh James Rose, editor of *The British Magazine*. Addresses presented to the Archbishop of Canterbury in 1834, one signed by 7,000 clergy and the other by 230,000 heads of families, counteracted the movement toward disestablishment. The publication of the *Tracts for the Times*, prepared by different authors and far-reaching in their influence, began Sept. 9, 1833. The first sixty-six tracts were short papers, some original, but mostly extracts from eminent Anglican writers, especially of the seventeenth century, and from Ante-Nicene fathers. The opening paper struck the key-note. To restore the vigor and authority of the Church it was necessary to reaffirm her divine institution and historical continuity, and so the doctrine first emphasized was that of the apostolic succession. In the course of 1834-35 Dr. Edward Bouverie Pusey, a man of influential position, massive learning, and quiet solidity of character, joined in the preparation of the tracts, which now became carefully digested theological essays or catenae of authorities, and of considerable length. The teaching of the tracts seemed novel and strange to many. The Anglican understanding of the Catholic Church as one historical body with an organism perpetuated by the apostolic succession, and with a doctrinal system inherited from the past and defined by councils accepted both in the East and West, of which body the Anglican Church was a living part with her own authoritative usages and formularies, was a conception strange alike to Roman Catholics, who considered the historical Church as contemptuous with the papal obedience, and to dissenting Protestants and the general public, practically ignorant both of Church history and of the actual existence of the great Greek Church, ancient, orthodox, and non-Roman. The points especially insisted on by the Tractarians in addition to apostolic succession (the grace of the sacraments, and therefore belief in baptismal regeneration, the real presence in the holy Eucharist, and the power of the keys in absolution) were therefore regarded by many as Romish. Tractarian strictness in fasting and favor shown to clerical celibacy were viewed in the same light. During the publication of the tracts Newman was the most prominent figure in the movement. His wonderful powers as a preacher and writer and his immense personal influence over the Oxford undergraduates made him especially influential and prominent. As the movement progressed differences began to appear among its adherents. Some laid aside former feelings against Rome and began to respect and even admire her. Some began to have misgivings as to the Catholicity of the Anglican Church. William G. Ward occasioned many complaints by anti-Anglican and pro-Roman articles in *The British Critic* and by his book, *Ideal of a Christian Church* (1844). After several occurrences which had intensified feeling against the Tractarians, *Tract No. XC.*, the last of the series, appeared in 1841. It dealt with the Thirty-nine Articles from the Tractarian point of view. The Articles had, at the time of the Reformation, been accepted by Catholics unfavorable to Protestantism as well as by the others, but were afterward considered distinctively Protestant and even Calvinistic. When Newman, therefore, undertook in this tract to show that they were capable of being understood in a Catholic sense, his treatment was taxed as dishonest and tending to Romanism. The tract was condemned by the hebdomadal board of the university, which refused to wait for his defense. After this and other troubles Newman in 1845 entered the Church of Rome. In this step he was followed by others, a number seceding soon after him and others at various dates. These defections were held by those unfavorable to the movement to demonstrate its Romish character. On the other hand, the statement has been made that "one large parish church would hold them all" (i. e. all the converts from Anglicanism to Romanism since Newman). Other leaders of the movement, including the two greatest, Keble and Pusey, remained steadfast Anglicans. Both approved of *Tract No. XC.*, and its positions have since been widely accepted by Anglicans.

The movement, at the time apparently much injured, survived its losses and became vigorous again. As Pusey was now its most prominent figure it was for a number of years termed Puseyism. One very valuable outcome of the

movement, begun as far back as 1836, was the series of translations entitled *Library of the Fathers of the Holy Catholic Church anterior to the Division of the East and West*.

In its new stage, since 1845, the Anglo-Catholic revival has assumed a more and more practical character in the institution of guilds, religious sisterhoods and brotherhoods, and parochial missions, improvement of church music, introduction or revival of hymns and popular devotions, restoration and building of churches. Since 1848-50 there has been also a revival of ritual, grounding itself especially on the ornaments rubric of the present English Prayer-book as re-enacted in 1662, directing the retention and use of the ornaments of the second year of Edward VI. Those most prominent in this revival were called Ritualists, and met not only with popular opposition, but with litigation and special legislation, subjecting them to lay judges. A number of priests were even imprisoned for their ritual, and societies were formed to prosecute and to defend them. In a case in 1888-90 (appeal 1892), a bishop (Dr. King, of Lincoln) was tried before the Archbishop of Canterbury, a case important as reviving such exercise of authority. But the general result, whatever the action of these courts, has been the extension of the ritual impugned.

All the principal phases of the Tractarian and Anglo-Catholic movement have reproduced themselves in the Episcopal Church of the U. S.

BIBLIOGRAPHY.—Newman, *Apologia pro Vita mea* (London, 1864 and 1888); *Letters and Correspondence of J. H. Newman* during his life in the English Church, edited by Anne Mozley (2 vols., London, 1890); a *Memoir of the Rev. John Keble*, by Sir J. T. Coleridge (Oxford, 1869); T. Mozley, *Reminiscences, chiefly of Oriel College and the Orford Movement* (2 vols., Boston, 1882); Dean R. W. Church, *The Orford Movement* (London, 1891); *Life and Letters of Dean Church*, ed. by Mary C. Church (London, 1894); Canon Henry Parry Liddon, *Life of E. B. Pusey* (posthumous, 4 vols.; three have appeared; London, 1893-94); Wilfrid Ward, *William George Ward and the Orford Movement* (London, 1889); W. G. Ward and the Catholic Revival (London, 1893).

LEIGHTON HOSKINS.

Tract Societies [*tract* is from Lat. *tractatus*, a touching, handling, treating, treatise, deriv. of *tracta re*, handle, treat]; societies for the publication and circulation of religious literature, other than the Scriptures, which are distributed by organizations called BIBLE SOCIETIES (*q. v.*).

The word tract, though commonly applied to small, unbound pamphlets, includes also, by derivation and early usage, any treatise or bound volume for general circulation, of whatever size. Long before the invention of printing, the importance of multiplying copies of the best religious writings was recognized, for the sake of both preserving and diffusing them, and the early Reformers made great use of them, the timely invention of printing opening the way for a rapid growth of this method of doing good.

European Societies.—In the eighteenth century the friends of religion began to associate themselves for greater efficiency in this work, three societies having been organized before 1701 by members of the Church of England—one "for the propagation of the gospel in New England and America," another "for foreign parts," and the third for "promoting Christian knowledge." In 1750 was formed the first tract society in which different denominations united—the Society for Promoting Religious Knowledge among the Poor. In 1793 the Religious Tract and Book Society of Scotland was formed. In May, 1799, the Religious Tract Society was organized in London, and has since become the largest and most efficient tract society in the world. The first year its entire receipts were £2,340; now (1895) its annual income is about £175,000, and its grants £29,000. It has issued a total of over 18,000 different publications, large and small. Its publications at home and abroad are in 212 languages, and amount to a total of 3,000,000,000 copies. Besides this great and undenominational society, each religious denomination in Great Britain has a publication board of its own; and the opponents of religion have adopted the same means of disseminating their views. There are also tract societies in which Christians of all denominations unite, at Paris, Lausanne, Toulouse, Brussels, Geneva, and some other points on the continent of Europe; also at various foreign missionary centers.

Societies in the U. S.—In the U. S., where common school education and a free press have formed an eminently reading community, tracts and volumes on religion appeared

early and in great numbers, and societies for printing and circulating them were at length formed—the Methodist Book Concern in 1789; the Massachusetts Society for Promoting Christian Knowledge, at Boston, in 1803; and other societies in Boston, New Haven, Middlebury, Vt., New York, Albany, Philadelphia, Baltimore, and Hartford. Prominent among these was the New York Religious Tract Society, organized in 1812, and afterward continued in the American Tract Society, New York; and the New England Tract Society, organized in 1814, which in 1823 changed its name to the American Tract Society, and in 1825 became a branch of the national society of the same name, then instituted. In the present American Tract Society Christians of all denominations in the U. S., and most of the local tract associations then existing, united to publish and circulate whatever would best "diffuse a knowledge of our Lord Jesus Christ as the Redeemer of sinners, and promote the interests of vital godliness and sound morality"—with only this restriction, that it should be "calculated to receive the approbation of all evangelical Christians." Such men, of twenty different denominations, have always been found among its officers, its laborers, and its warm friends and supporters. For the first two years only brief tracts were published, for adults and for children. The issue of volumes, however, was intended from the first, and in the third year volumes began to appear. In the fourth year monthly tract distribution began to be practiced by many churches and church unions. In the eighth year was begun an attempt to supply every family in the Southern and Western States with one or more volumes. The next step was the organization of a system of colportage, in 1811, to carry the Gospel to the doors of neglected, scattered thousands—at least one-third of the entire population of the U. S.—who would never seek it and whom churches did not reach. Each colporteur was to visit every family in his district, induce them to purchase or accept Christian books or tracts, and by his teachings and prayers do as far as possible the work of a Christian pastor. At one time over 600 men were so employed during the whole or a portion of the year.

Another notable point in the progress of the society is found in the establishment of its periodicals. The first three were *The American Messenger*, the *Amerikanischer Botschafter*, and *The Child's Paper*. To these have since been added the *Deutscher Volksfreund* (or *German People's Friend*), an eight-page illustrated weekly; *The Morning Light*, a small illustrated paper for beginners; *Apple of Gold*, a weekly for the youngest readers; and *Light and Life*, a series of monthly tracts. The aggregate circulation of these papers is about 2,500,000 yearly. The distribution of tracts in foreign languages forms a large and very important branch of the society's work. Its home presses print in more than thirty foreign tongues for the millions of immigrants that swarm into the U. S., and for many foreign missions.

Among results may be mentioned the printing of over 8,000 distinct publications, of which over 1,900 are volumes and the others tracts, handbills, wall-rolls, etc. Among the publications for home use are 1,560 in seventeen foreign languages—German, French, Spanish, Italian, Portuguese, Swedish, Welsh, Dutch, Danish, Bohemian, Polish, Armenian, Hebrew, German-Hebrew, Lithuanian, Finnish, and Hungarian—for immigrants, for many of whom scarcely any other Christian literature is provided. Of the periodicals 231,000,000 copies have been issued. Of the other home publications, over 31,000,000 volumes have been printed and over 3,150,000,000 pages of tracts, literature which has had an immense influence. Annual grants to the destitute are made to the amount of over \$30,000 worth of the society's home publications, forming a total of \$2,180,000. Besides large amounts thus transmitted by shipping to foreign nations, a total of over \$720,000 in money has been granted to aid the missionaries in heathen lands to print books which the society approves for their work; and thus 4,600 publications, including 800 volumes, have been printed by its help abroad, in 151 languages.

Since the organization of the system of colportage the society has circulated 15,000,000 volumes, and its agents have made over 14,000,000 family visits. The total amount received in donations and legacies, and expended in the charities of the society, is over \$6,000,000; and the same amount to above \$13,000,000.

Besides these undenominational societies, each of the leading denominations in the U. S. has its own board of publication.

WILLIAM W. RAY.

Tracy: city; Lyon co., Minn.; on the Chi. and N. W. Railway; 165 miles S. W. of St. Paul (for location, see map of Minnesota, ref. 10-B). It is in a noted wheat and corn belt, and contains 7 churches, a public school with twelve departments, electric lights, water-works, a State bank with capital of \$35,000, a private bank, and 2 weekly newspapers. Pop. (1880) 322; (1890) 1,400; (1895) 1,687.

EDITOR OF "REPUBLICAN."

Tracy, trā'see', ANTOINE LOUIS CLAUDE DESTUTT, Count de (commonly called Destutt de Tracy): philosopher; b. near Moulins, France, July 20, 1754; was educated for the army; was a member of the States-General in 1789; joined the revolutionary party; served in the army under Lafayette; was, nevertheless, arrested, but was released after the fall of Robespierre; was made a senator under the empire, but voted for the deposition of Napoleon; opposed the reactionary measures of the restoration. D. at Auteuil, Mar. 9, 1836. He was a commander of the Legion of Honor, and a member of the French Academy. He published *Grammaire générale* (1803); *Logique* (1805; often reprinted); *Traité de la volonté et de ses effets* (1815); *Éléments d'idéologie* (4 vols., 1817-18), containing a full representation of his philosophical system; *Essai sur le génie et les ouvrages de Montesquieu* (1828). As a philosopher he was a follower of Condillac and a representative of the sensualistic school, whose principles he, in common with the other members of the society of ideologists at Auteuil, pushed to their last consequences.

Tracy, trā'si, BENJAMIN FRANKLIN; lawyer and statesman; b. at Owego, N. Y., Apr. 5, 1830; educated in the common schools and Owego Academy; admitted to the bar 1851; district attorney for Tioga County 1853-56; member of the State Assembly 1861; appointed by the Governor in the spring of 1862 to recruit for the Union army; personally recruited the 109th and 137th Regiments; accepted the colonelcy of the former; participated in the battles of the Wilderness and Spottsylvania; on account of ill health was obliged to go North to recuperate; on recovery became colonel of the 127th Colored Troops, and commanded the military post at Elmira; obtained the rank of brevet brigadier-general; resumed practice of law at the close of the war in New York city; U. S. district attorney for eastern district of New York 1866-73; associate justice New York State court of appeals 1881-83; appointed by President Harrison Secretary of the Navy, Mar. 5, 1889. On the expiration of his term he resumed the practice of law in New York.

C. H. THURBER.

Tracy City: village; Grundy co., Tenn.; on the Nash., Chat. and St. L. Railway; 20 miles S. by N. of Cowan (for location, see map of Tennessee, ref. 7-G). It is on the summit of the Cumberland Mountains, in a coal-mining and coking region, and has railway car and repair shops, foundry, steam sawmill, and a weekly newspaper. Pop. (1880) estimated, 1,200; (1890) 1,936.

Trade-mark: a mark by which one's trade or wares are known in business. The rules of law governing this subject have been developed during the nineteenth century. Lord Chancellor Hardwicke declared in 1842 that while every trader had his distinctive mark or stamp, he knew of no precedent for enjoining one trader from using another's mark, and he thought such a precedent would be mischievous. Such a precedent was established, however, by Lord Eldon in 1803 (*Hogg v. Kirby*, 8 Ves. 215), and was followed by a very rapid growth of this branch of the law.

STATUTES AND TREATIES.—Trade-marks have become the subject of modern legislation and international conventions. In Great Britain the principal statutes are the Merchandise Marks Acts of 1887 and of 1891 (50 and 51 Vict., c. 28, and 54 and 55 Vict., c. 15). The earliest legislation by the U. S. Congress on this subject was enacted in 1870 as a part of an act to revise the statutes relating to patents and copyrights. Its constitutionality was soon attacked and the Supreme Court decided against its validity, holding that a trade-mark is neither an invention, a discovery, nor a writing, and hence was not within Art. I., § 8, cl. 8, of the U. S. Constitution; also that the statute in question was not a regulation of commerce with foreign nations, or among the several States, or with the Indian tribes (see Art. I., § 8, cl. 3), but was a regulation applicable to all trade. (*U. S. v. Steffens*, 100 U. S. 82.) The court declared that the property in trade-marks, like the great body of the rights of person and of property, rests on the laws of the States. At present there is an abundance of State legislation on this subject. Later acts of Congress are

limited to trade-marks used in commerce with foreign nations or with Indian tribes, and are therefore constitutional. (See Act of Mar. 3, 1881, 21 U. S. Statutes at Large, ch. 128.) Section first of the last-named act provides that owners of trade-marks used in commerce with foreign nations, or with Indian tribes, provided such owners shall be domiciled in the U. S., or located in any foreign country, or tribes which by treaty, convention, or law, afford similar privileges to citizens, may obtain registration of such trade-marks by recording in the Patent Office the prescribed statement and by paying \$25 to the U. S. treasury. The reciprocal privileges referred to above have been secured by special treaties, one of the latest of which is the treaty with Denmark of June 15, 1892, or by the International Convention for the Protection of Industrial Rights, adopted at Paris Mar. 20, 1883, to which the U. S. became a party July 3, 1887, and which was re proclaimed June 22, 1892. 27 U. S. Statutes at Large, Treaties, p. 119.

Its Nature and Purpose.—These were set forth with clearness and precision by Justice Strong in a leading case in the U. S. Supreme Court. The office of a trade-mark is to point out distinctively the origin or ownership of the article to which it is affixed. This may in many cases be done by a name, a mark, or device, well known, but not previously applied to the same article. But though it is not necessary that the word adopted as a trade-mark should be a new creation, never before known or used, there are some limits to the right of selection. This will be manifest when it is considered that, in all cases where rights to the exclusive use of a trade-mark are invaded, it is invariably held that the essence of the wrong consists in the sale of the goods of one manufacturer or vendor as those of another, and that it is only when this false representation is made, or the necessary tendency of defendant's acts is to deceive the public, that the party who appeals to a court of equity can have relief. Hence the trade-mark must either by itself or by association point distinctively to the origin or ownership of the article to which it is applied. The first appropriator of a name or device which points to his ownership, or which, by being associated with articles of trade, has acquired an understood reference to the originator or manufacturer of the articles, is injured whenever another adopts the same name or device for similar articles, because such adoption is in effect representing falsely that the productions of the latter are those of the former. Thus the custom and advantages to which the enterprise and skill of the first appropriator had given him a just right are abstracted for another's use, and this is done by deceiving the public, by inducing the public to purchase the goods and manufactures of one person supposing them to be those of another. The trade-mark must therefore be distinctive in its original signification pointing to the origin of the article, or it must have become such by association. There are two rules which are not to be overlooked: No one can claim protection for the exclusive use of a trade-mark which would practically give him a monopoly in the sale of any goods other than those produced or made by himself. If he could, the public would be injured rather than protected, for competition would be destroyed. Nor can a generic name, or a name merely descriptive of an article of trade, of its qualities, ingredients, or characteristics be employed as a trade-mark, and the exclusive use of it be entitled to legal protection. *Canal Co. v. Clark*, 13 Wallace 311.

It will be observed that the foregoing decision bases the protection of trade-marks on the power of the courts to prevent fraud. Such is deemed to be the correct view in the U. S. (*Chadwick v. Covell*, 151 Mass. 190.) The later English cases, however, place emphasis on the property element in a trade-mark, and no longer conceive of the wrong to be redressed "as a species of fraud, but as being to an incorporeal franchise what trespass is to the possession or right to possession of the corporeal subjects of property." Pollock, *Torts*, p. 264.

The right to use a trade-mark is not confined to a manufacturer or producer of goods. One who exercises skill and fidelity in the selection of goods, or who bleaches goods, or is a shipper, a commission merchant, a seller or a carrier, may acquire the right to a trade-mark which serves to distinguish his vendible commodities from those of others—to authenticate them as the signature authenticates a letter.

When Acquired.—It is sometimes said that a trade-mark must have been used for a considerable period before its adopter will be protected. The better view appears to be, however, that as soon as the mark is adopted and used as a

trade-mark in connection with vendible articles, the right to protection is complete. *Cope v. Evans*, L. R. 18 Eq. 143; *Shaver v. Shaver*, 51 Ia. 208.

Examples.—As stated above, a name or device which is generic or descriptive of the article, its qualities, ingredients, or characteristics can not be monopolized as a trade-mark. Accordingly, the courts have refused to protect the use of such terms as Cherry Pectoral, Toffe Tulu, Rye and Rock, Straight Cut, Cresylic Ointment, Iron Bitters, Ferro-phosphorated Elixir of Calisaya Bark; while they have protected Cottolene, Bromo-caffine, Lacto-peptine, Sirup of Figs, and others. The decision in such cases often turns on a question of fact. Is the term, claimed as a trade-mark, either originally descriptive of the article, or had it, before its adoption as a trade-mark, become incorporated into the language so as to be descriptive of the article? If either of these questions is answered in the affirmative, the term can not be protected as a trade-mark. (*Chemical Co. v. Meyer*, 139 U. S. 540; *Kearly v. Brooklyn Chemical Works*, 142 N. Y. 467.) On the other hand, if the term is employed in an arbitrary or fanciful manner, the person first adopting and using it in connection with his wares will be protected. The word "Ideal," therefore, applied to fountains has been held a valid trade-mark, so La Favorita applied to flour, so Falstaff and Phil. Sheridan applied to cigars, and Roger Williams applied to cotton cloth.

Devices, symbols, or pictures may be used as trade-marks. For example, a star, an elk's head, a picture of a boy doubled up with cramps, a peculiar grouping of letters, an arbitrary combination of numerals such as 3214, may be used to individualize the goods made or dealt in by a particular person, and become a valid trade-mark. Letters or numerals, however, can not be monopolized to indicate quality.

Ordinarily a geographical name can not be turned into a trade-mark. If it is used in an arbitrary or fanciful sense, it may be protected, as in the case of Vienna bread, or Columbia Hotel; and in Britain, certainly, it will be upheld if it has acquired a secondary signification in connection with a particular manufacture, as in the case of Glenfield starch. (*Wotherspoon v. Currie*, Law Reports, 5 House of Lords 508.) The name of a mine or of a mineral spring may become a valid trade-mark for its product, where the one asking for protection is the exclusive owner of the spring or mine. "Carlsbad salts," "Clysmie water," "Hunyadi Janos," "Apolinaris" and "Congress water" are examples.

How Lost and Transferred.—The owner of a trade-mark may lose his right to it by abandoning it, that is, intentionally discontinuing its use. It is incumbent on one alleging abandonment to show by clear and unmistakable evidence that the right has been relinquished. If the owner is guilty of laches in proceeding against persons infringing his trade-mark, he may lose his right to an account for his profits, but does not lose his right to an injunction. *McLean v. Fleming*, 96 U. S. 245.

A trade-mark is a subject of commerce and may therefore be sold and transferred, unless such disposition of it works a fraud upon the public. If it is personal, that is, if it owes its value to the personal skill of a particular individual, it can not be transferred, as it is inseparable from that which gives it its value. Oftentimes a trade-mark is an incident of a particular business. In such cases a sale or devolution of the business carries with it the trade-mark without any express mention of it. Upon the dissolution of a partnership each partner has the right to use a firm trade-mark unless he has vested the others with an exclusive right to this firm asset. (*Merry v. Hoopes*, 111 N. Y. 415.) The treatises upon this subject are numerous. Among the best are Barclay, *Law of France relating to Trade-marks*; Sebastian, *Law of Trade-marks* (London, 1890); and Browne, *Law of Trade-marks* (Boston, 1885). FRANCIS M. BERDICK.

Tradescant, JONAS: traveler and naturalist; b. in Holland about 1570; traveled through various countries of Europe, Asia Minor, and North Africa, making a collection of objects of natural history; was in 1608 settled in Kent, England; subsequently established a botanic garden at South Lambeth, where he added largely to his collection of curiosities; was the means of acclimatizing several useful plants in England; was employed by several of the nobility to lay out their gardens, and in 1629 was appointed gardener to Charles I., D. at Lambeth in 1638.—His son JONAS, b. at Meopham, Kent, in 1608, added largely to the collection by his travels, in the course of which he visited Virginia, and published in 1656 a descriptive catalogue

under the title, *Museum Tradescantianum, or a Collection of Rarities preserved at South Lambeth, near London*. D. Apr. 22, 1662. The museum was given by the younger Tradescant to the antiquary Elias Ashmole, and became the nucleus of the celebrated Ashmolean Museum, presented to the University of Oxford 1682. Revised by C. E. BERRY.

Trade Schools: See SCHOOLS.

Trades-unions: societies of workmen organized chiefly to assist members in contest with employers to secure rights and privileges. They are a natural evolution of the ancient guild into more definite, better organized, and larger societies than the guilds were.

Origin of Trades-unions.—They made their appearance about the middle of the eighteenth century, by which time more temporary combinations of workmen to resist employers' exactions and to raise wages crystallized into permanent local societies which were virtually trades-unions. They were at first confined each to its own trade. Each town then separated its union from every other, and isolated societies were the only unions. These were at first supported by voluntary contributions, but as each union hardened into permanency and began to have regular needs, a specified tax was laid upon members and a treasury was established. Later the features of benefit societies were added to attract new members, but the union still retained its primal object as a fighting organization to resist injuries and to secure privileges, the usual objects of every organization in history from the church and the state down to the family and partnership. Trades-unions differ in no way from other combinations of men for self-protection and self-aggrandizement.

In their benefit society features unions agreed to give help to members out of work, for sickness, or other legitimate cause, to pay burial expenses for members and their wives, and sometimes to give superannuation allowances, insurances against accident, and the like. By such provisions unions secured more members and larger funds. But these objects were not the chief purpose of the unions. That was and continues to be the adjustment of relations between men and masters in a way favorable to the men, and the points for which the men are combined were in general always the same, namely, higher wages, shorter hours, provisions against physical dangers connected with work, and equalization of work among different bodies of workmen so as to prevent over-supply in one and scarcity of work in another.

English Trades-unions.—It was in England that trades-unions took their rise. The reason of this rise in England rather than elsewhere was because there the wages system consequent on the development of the factory first came into general use. Then for the first time laborers were grouped in large bodies, and this grouping tended naturally to associations for mutual help and protection. The old industrial body had been slack, personal, intermittent, and had called into existence temporary coalitions of workmen for specific purposes which dissolved themselves as soon as those purposes were accomplished. But with the advent of the factory system, with its regular wage payments and promotion of stable habits, workmen began to improve their condition. With the increase of production their average wealth increased, and this turned their occasional coalitions into permanent institutions. English law for centuries bore hard upon all labor combinations and punished them as conspiracies. The common law from time immemorial and many express statutes down to 1825 made them criminal. Workmen were forbidden even to discuss wages rates, hours of labor, contracts between employers and employed, or to try to induce their fellows to join them in efforts to increase wages. In fact they were absolutely forbidden to work out their own interests in any reasonable way down to 1825. Between 1776 and 1814, however, the inventions of Hargreaves, Arkwright, and Watt brought about a vast increase of production, which was succeeded as always by increase of wages. Workmen were gathered into cities and began to consult together. The result was an accession of force which, though against the law, made it possible for them to combine and discuss. Parliament at last began to listen and statutes were passed recognizing the legality of combinations of workmen. In 1815 the ten-hour movement started, which won its victory in 1847. In 1867 special factory laws protecting children and women were passed; in 1875 laws to improve laborers' houses and preventing payment of arrears in commodities were made, and to-day labor finds in Great Britain,

protected, and favored on all sides, with political parties bidding against each other for its support and vote.

Labor Representation in Parliament.—In 1874 the first labor member of Parliament, Thomas Burt, was elected in England. He was president of the Northumberland Miners' Association. In 1885 the labor interests elected ten members; in 1886 thirteen members. In 1892 seventeen were returned, among whom was Sir Charles Dilke. Up to 1886 these members were all representatives of unions of skilled laborers. They stood rather for defensive than aggressive measures. In the elections of 1895 the labor party received a severe blow in the defeat of most of its candidates.

Trades-unionism since 1886.—Since 1886 the development of trades-unions in Great Britain has been most important. A great step was taken in the organization of unskilled labor, which dates from the London dock strike of 1889. Joseph Arch had organized rural laborers between 1870 and 1875. Benjamin Tillet and Thomas Mann organized the dock workmen, and by a strike succeeded in raising their wages to sixpence an hour. This has been followed by the so-called new unionism, a movement to organize unskilled labor everywhere in the United Kingdom. This unionism is aggressive, and elected four members to the House of Commons in Aug., 1892. It goes for the eight-hour day, for "one man, one vote," payment of members of Parliament and election expenses by Government, simplification of procedure in law courts, better factory acts, and other valuable measures. The British unions extend to every department of industry, and are now the fourth estate of the realm. In 1883 Great Britain had 195 unions of 253,088 members, and funds amounting to £431,495 sterling. In 1886 the membership had increased to 800,000, and in 1893 was 1,507,026, or 3.98 per cent. of the entire population.

Continental Nations.—In Germany trades-unions of a type differing from the British began to appear in 1868, laws against combinations of workmen having been repealed in 1866. General unions were first formed, and afterward local unions under the direction of the general unions. They originated with the professional classes, and in 1869 had 267 societies in 145 towns with 30,000 members, diminished to 20,000 in 1872, but have since increased. They tend much to theories, unlike British unions, which are for business only. They easily become socialistic, get into politics, and begin to decay because they gain so little of practical benefit to their members. In 1875 France had seventy unions forbidden to meddle with politics. Switzerland and Belgium have many unions in a flourishing condition. Italy has had them since 1865, but they are still subject to some legal disabilities. Poorer countries have none, and all continental trades-unions are more interested in views than in gains of wages or shorter hours as a rule, and are therefore ineffective. Fifteen national organizations, with over 52,000 members, were represented at the International Typographical Congress held at Berne, Switzerland, in 1892. It was resolved to create an international strike and traveling benefit fund, and to agitate for uniform wages and less hours. The next international congress was appointed for 1897.

Trades-unions in the United States.—Colonial history shows no labor-unions among its scattered populations. Unions rise in cities, and not till 1840 did the U. S. possess a city of a population of 500,000. Local labor-unions arose, however, from 1800 to 1825. Notably the New York Society of Journeymen Shipwrights, organized Apr. 3, 1803; the House-carpenters of the City of New York, in 1806; the New York Typographical Society, 1818—with Thurlow Weed for a member. In Boston the Columbian Society of Shipwrights and Calkers of Boston and Charlestown was given a charter in 1823 "to have and use a common seal, to make its own by-laws, manage and apply its funds, promote invention and improvements in its arts, assist mechanics with loans of money, and relieve unfortunate mechanics and their families."

Local labor-unions multiplied between 1815 and the beginning of the civil war (1861). These local unions also began to extend to men of the same trades in other cities as the railway developed increased ease of intercourse, and finally the idea of a general national union began to be mooted, though with indifferent success. In these movements the best men among the most skillful laborers took the lead. Boston, New York, and Philadelphia were most prominent in the struggles of labor during those years. In 1820 George Henry Evans and his brother Frederick arrived in New York from England, and soon began to influence laborers with their ideas of land reform, holding that men

should have only the use of land, and rent should be abolished. They published *The Workingmen's Advocate* between 1825 and 1829, probably the first labor paper published in the U. S. The General Trades-union, established in New York in 1833, was the first central labor-union in the U. S. Its objects were "to guard against encroachments by aristocracy, to preserve natural and political rights, to elevate moral and intellectual conditions, and to establish the honor and safety of industrial vocations." The right of laborers to combine for protection was asserted, and the position that general trades-unions would diminish the number of strikes and lockouts was maintained. One rule was that "no trade or art should strike for higher wages without the sanction of the convention."

In 1831 Stephen Simpson published in Philadelphia *The Workingmen's Manual*, with the motto "Governments were instituted for the happiness of the many and not the benefit of the few," and to show that "labor is the source of wealth and industry the arbiter of its distribution." The writer had no notion of the economic laws which determine distribution, giving to each his own with small regard to civil laws or society resolutions. Seth Luther published *An Address to Workingmen* in 1832 of greater value, in which he recounted the miseries of workmen of that day. They worked from twelve to fifteen hours per day, beginning often at half-past four. Children eleven years of age and women were treated with incredible brutality, beaten, and maimed, and mangled. Wages were low, from 65 to 71 cents per day. The press was hostile, and employers everywhere denounced trades-unions and combined to suppress them; \$20,000 was raised among Boston merchants for that purpose, so ignorant were they of their usefulness.

A workingman's convention in 1830 nominated Ezekiel Williams for Governor and gave him 3,000 votes. Their party was later called Locofocos and joined the Democrats, who favored them more than did the Whigs. Their work and principles show an advanced stage of social thought, though mixed with many uneconomic ideas, such as the abolition of "wages slavery," the inalienability of homes, abolition of laws to collect debts, and the natural right of man to the soil. Other notions, as the abolition of imprisonment for debt, equal rights of women, abolition of slavery, general bankrupt laws, were more reasonable, and some of them have taken their places on the statute-book.

The New England Association of Tanners, Mechanics, and other Workingmen was formed in 1831, and met in Boston Sept. 6, 1832. The labor movement began to enlist much sympathy now among literary people—William Ellery Channing, Robert Rantoul, Horace Mann, and the like—who laid stress on education. Their sympathy was grateful, their help very small, since what was needed was not words but more things and greater production. Poverty could only be abolished by wealth, and poverty was the disease to be cured.

Dates of Organizations.—In 1850 the Typographical Union appeared, and in 1852 used first the prefix National, then International. At first New York, New Jersey, Pennsylvania, Maryland, and Kentucky were represented in it; now it extends through all the States and some Territories. At first opposed by employers, it is now welcomed and supported by most and endured by all. Labor organizations were formed by the hatters in 1854, iron workers in 1858, machinists in 1859, and others organized later till twenty-six trades had national unions in 1860, and many have been added since. International unions were formed by cigar-makers (1864), engineers (1864), masons (1865). Unions were also formed by conductors (1868), wool-hatters (1869), furniture-workers (1873), locomotive firemen (1869), horseshoers (1875), granite-cutters (1877), coal-miners (1885), bakers (1886), carpenters, plasterers, tailors, glass-workers, boiler-makers, bookkeepers, bottle-blowers, plumbers, piano-makers, switchmen, spinners, stereotypers, lithographers, and finally messenger-boys. At length women also caught the spirit, and organized their various callings, till now the unions are everywhere.

In 1872 eight-hour leagues began to be formed, and they are now very extensive. Already many trades have secured the nine-hour and some the eight-hour work-day. In the U. S. trades-unions, though numerous, were local and confined to their own special trades until Mar. 3, 1859, when the National Union of Machinists and Blacksmiths was called together in order to make a more extended organization. It met in Philadelphia and took into consideration a long list of workmen's "wrongs," such as "the payment of

wages in orders," the taking on of too many apprentices, and the peremptory dismissal of workmen. It recognized, however, the real identity of interests between employers and employed.

The success of this meeting led one of the moulders, W. H. Silvis, to call another for permanent organization. The same Mr. Silvis also called to order the first national union of all trades-unions on Feb. 22, 1861. During the civil war the National Labor-union fell into abeyance, but was revived in 1867, though with little enthusiasm at first. It pushed forward the homestead law, however, and in June, 1868, it succeeded in getting the eight-hour labor-day adopted by Congress as the standard time of Government employees. It adopted a platform, reciting a long list of grievances entailed upon labor by the existing scheme of society, and so deployed into politics, with the usual result of such departures from the proper field. The National Labor-union fell into neglect during the years from 1870 to 1873, and threatened to disappear. A general convention was called at Cleveland, O., on July 15, 1873, to prevent this, under the new name of an Industrial Brotherhood, which passed the usual denunciatory resolutions, and called a second meeting on Apr. 14, 1874, at Rochester, N. Y. But, entering the domain of politics with a very radical programme, this organization perished as the previous one had, and was dead in 1875 from mere "neglect and indifference." Trades-unions properly so called still flourished, but the National Union, to effect by law that amelioration of the laborers' condition which could be accomplished only by an increase of production, fell to pieces for want of a sufficiently practicable purpose.

Knights of Labor.—On Dec. 9, 1869, the Garment Cutters' Union of Philadelphia dissolved itself, and divided its money among its members. On the 28th of the same month some of the ex-members of that body met and formed the first association of the Knights of Labor. To save its members from the temptations of the saloon this body resolved to combine reasonable pleasure with business, and had refreshments served at its meetings. The trades-unions had become social, and like most social institutions began to succeed, since a social trend is always better than a political one. The order was made secret, and care was taken to avoid the admission of unfit persons as members. In July, 1870, this organization was opened to others beside garment cutters, and soon began to assume wide relations. It was simply an evolution of the ordinary trades-unions to an extraordinary extension, and carried with it, therefore, that relation to practical business affairs which the more ambitious national brotherhoods had lost in politics. Its secrecy and the consequent limitation of its members gave it an unusual interest to workmen. One of its expressed objects was to harmonize labor and capital. It discountenanced strikes, idleness, and frivolity, and was to labor for the prime object of securing to every man the fruits of his toil. It arose out of the irrational readiness of the trades-unionists to strike all round for the grievance of one man without considering the injuries which the strike might work to all. The unions thought only of the workman; the Knights of Labor began to consider the community. It really marked a step in advance over all previous organizations in the field of thought, inasmuch as it displayed a consciousness of social duties belonging to the mechanic apart from any mere quarrel with his employer, duties which might lead him to waive his own wrongs in deference to the greater evils to be suffered by society in case he insisted upon his contention.

This organization also sought to occupy a higher intellectual plane than any before it. It set to work to compile facts about the classes belonging to it, to learn their work, wages, and mode of living, to keep a record of the number of its employed and non-employed, to encourage men to know the laws of the land, and to learn to read and write at least their own names. The second branch of the Knights of Labor was organized on July 18, 1872, and by Jan., 1876, it had over 100 societies from all kinds of trades, extending as far W. as Wyoming. In 1877 it took part in the great strike on the Baltimore and Ohio Railroad and the Pennsylvania Railroad to resist a 10 per cent. reduction of wages, which resulted in losses of \$5,000,000. Four hundred and fifty-six assemblies were in existence in 1877, and in June, 1878, a national body of Knights of Labor was organized. It adopted the platform of the deceased Industrial Brotherhood at Reading, Pa. Laborers still remained under the common misconception that "the development of aggregated wealth" threatened to increase the poverty of the masses

and their degradation, which is much like saying that plenty of rain is the cause of drought, or a big crop in a tobacco-field tends to sterilize a corn-field. In 1881 the knights discarded the rule of secrecy.

Many of their ideas are good, as that "Politics are always too late, coming only after the evil is done—that they must be superseded by education." They would have spoken better if they had said "Education is too slow; we must devote ourselves to production and increasing our own wealth—the rest will come." The establishment of labor bureaus in different States occupied the knights' attention with such success as to create such bureaus in twenty-eight States, and finally the U. S. bureau of labor was established in 1884, a really signal step in advance for the civilization of the U. S. In 1888 the Department of Labor was further created at Washington, and at last there was begun a reasonable governmental attention to the main interest for which government exists at all, and that is the increase of the means of living among the people. The eight-hour problem is now the main consideration of trades-unions. The alien-labor law, long seriously contended for, is already in force.

The American Federation of Labor.—This organization originated in Nov., 1887. In 1891 it claimed to have 4,453 local unions under its control, included in seventy-four general unions, under Samuel Gompers, president. Its general objects are the same with other unions, namely, short hours, higher wages, protection of laborers in factories and on active duty, prevention of unprepared and useless strikes, prevention of the labor of children under fourteen years of age, passage of laws to improve the laborers' condition, equalization of men's and women's wages for the same work, and the like. Between it and the Knights of Labor there is more or less antagonism, arising from their attempting to cover much the same ground as universal organizations. The knights desire a centralized system, while the Federation of Labor wishes to leave the different trades-unions in a position like that of the separate commonwealths in the U. S., each with its own government. In most matters the two organizations aim at similar results, but with different machineries. Neither of them has as yet attempted the organization of unskilled labor in the U. S., where the difficulties would be enormous owing to differences of nationalities in the laboring classes and the constant influx of laborers from all countries. Many of these importations, unfortunately, are far below the level of organization as yet.

Benefits of Trades-unions.—George Howells enumerates the benefits of trades-unions to workmen as follows: (1) Discipline arising from subjection to rules and laws. (2) Unity, which gives strength. (3) Social restraint, inducing sobriety. (4) Thrift, arising from frequent discussions of ways and means. (5) Emulation among members, who ridicule drones and botchers. (6) Educational effects springing out of discussions of important subjects and political issues. Mr. Howells, however, fails here to include the benefits for which the unions chiefly exist, namely, to raise wages and shorten working hours.

Trade Winds: See WINDS.

Traducianism [from Lat. *tradux*, *tractus*, a vine-layer trained for propagation, deriv. of *traducere*, lead across, lead along, train, propagate]: the theory that the human soul is derived from the souls of the parents, as the body is from their bodies. Tertullian, Athanasius, Gregory Nazianzen, and the Lutheran theologians are Traducians, generally holding that the parents are the divinely appointed means of a divine act of creation. Augustine leans toward this view, although careful not to commit himself to it. During the Middle Ages, however, creationism, or the theory that each soul is a separate creation and joined to the body just after its conception, was the orthodox view, and is the prevalent view in the Roman and Protestant Churches.

Trafalgar: See CAPE TRAFALGAR.

Tragacanth [from Lat. *tragacanthum*, deriv. of *tragacantha* = Gr. *τραγάκανθα*, a shrub producing tragacanth; *τράγος*, goat + *ἀκανθα*, thorn]: a gummy exudation from several shrubs of the genus *Astragalus* found in Asia Minor and neighboring lands. The dried gum is slightly translucent, resembling horn in appearance. It is hard, but difficult to pulverize; has no smell, and but very little taste. It does not dissolve in water, but absorbs it, swelling up and forming an adhesive paste. Upon adding an additional quantity of water to this paste, a uniform mixture is formed from which, however, the greater part of the gum is granulated.

ally deposited. It is insoluble in alcohol. Tragacanth appears to consist of two distinct constituents, of which only one is soluble in water. This is very similar to gum arabic, but differs from it in a few chemical properties. The insoluble portion, which is perhaps identical with *bassarine* ($C_{11}H_{16}O_6$), and is termed *tragacanthine*, is colored blue by iodine, but the coloration is probably owing to the presence of a small proportion of starch. The analysis of tragacanth gives gum, 53.3; tragacanthine and insoluble starch, 33.1; water, 11.1; the ash forming 2.5 per cent. Gum tragacanth is used in calico-printing, and also to some extent medicinally.

Trag'edy [from O. Fr. *tragedie* < Lat. *tragœdia* = Gr. *τραγῳδία*, deriv. of *τραγῳδός*, tragic poet or singer, liter., goat-singer; *τράγος*, goat + *ἄλδευ*, *ἔδευ*, sing, the tragedy originating in a rustic festival]: that variety of the drama which represents the fatal solution of a tragic situation or the final catastrophe in the lives of characters doomed for some cause to misfortune or evil. This definition, however, like all definitions of the forms of art, must be regarded as empirical and incomplete. The most famous and in many ways the most interesting definition of tragedy is that given by Aristotle in his *Poetics* (ch. vi., Butcher's trans.): "Tragedy is an imitation of an action that is serious, complete, and of a certain magnitude; in language embellished with each kind of artistic ornament, the several kinds being found in separate parts of the play; in the form of action, not a narrative; through pity and fear effecting the proper purgation of these passions." Here, as throughout the *Poetics*, Aristotle uses "imitation" not of mere realistic picturing of fact, but of creative reproduction of fact, similar to the original production of it in nature. The process of purgation is undoubtedly a medical analogy, and implies an effect of tragedy on the spectator similar to the effect of medicines according to homœopathic theory.

Historically, tragedy is purely an invention of the Greek genius, and the name is actually given to no dramatic work that either is not Greek or was not composed directly or indirectly under the influence of Greek models. The drama, of course, is found among many peoples that have felt little or not at all the intellectual influence of Greece, e. g. India (compare the dramas of KALIDASA, *q. v.*), China, and Japan. But no dramatic work of these peoples, however violent its incidents, is generally accepted as a tragedy. In the Occident, also, in modern times, tragedies have been composed only where some knowledge of the Greek drama or its Latin imitation was generally diffused.

The origin of tragedy is to be found in the Greek lyric dithyramb in honor of the god Dionysus. This is first mentioned by Archilochus, though it must have existed long before him, particularly in Thrace, where Dionysus was particularly celebrated. Originally probably monodic (that is, sung by a single voice), this lyric form was late in the seventh century B. C. employed by Arion of Lesbos for the choral celebrations of Dionysus introduced by him at Corinth. Arion, furthermore, constituted his choruses of satyrs (*τράγοι*, *τραγικός χορός*), after a fashion already familiar in the Peloponnesus. In this form the choral dithyramb came to Athens during the reign of Pisistratus in the sixth century, and was made a feature of the new festival of Dionysus—the Great Dionysia—celebrated in the spring toward the end of March. In 534 B. C. the poet Thespis made an important innovation by appearing as a reciter of verses, in colloquy with this chorus of satyrs. It now became possible to relate an action, the chorus by its songs showing the emotion produced by it. The action, however, could not as yet be represented. Nevertheless immense possibilities were already opened to the new literary form. Early in the fifth century we find Phrynichus employing it to bring before an Athenian audience the capture of Miletus by the Persians and the battle of Salamis. The glory of finally constituting tragedy belongs, however, to Æschylus, who, by introducing two reciters or actors, made possible a real reproduction of the events described. This innovation made feasible the representation of all kinds of tragic themes; but Æschylus wisely turned for his material in the main to the great store of heroic legends of the Greeks, many of which had already been employed in the epos. Athenian audiences, therefore, were delighted by the visible portrayal of heroic personages familiar to them, personages involved, too, in those very actions with which they were associated by long tradition. As a consequence, the vogue of tragedy in the fifth century B. C. became very great, and

a multitude of poets entered the annual competitions for popular favor. Of these, the most famous are Sophocles, who gave still greater variety to the representation by the use of a third actor; and Euripides, whose innovations in style and in the choral parts of the drama were felt by conservative contemporaries, like Aristophanes, to have robbed tragedy of what was highest and noblest in it.

The rise of Attic comedy, as well as the decay of tragedy itself, prevented the production of tragedies in Greece from being important after the fifth century B. C. The dramas of the three great poets remained, however, objects of admiration and of eager literary study. Thus it naturally happened that when the Romans, in the end of the third century B. C., turned to Greek literature for models for their own, they adopted tragedy among the first literary forms. Both by direct translations and by imitations the Roman playwrights sought to familiarize their fellow countrymen with what they believed to be the noblest achievement of the dramatic art. Livius Andronicus, Æneius, Ennius, Pacuvius, and Accius, all rendered noteworthy services to this end during the third and second centuries B. C. And yet with all their efforts these writers do not seem to have been able to make tragedy really popular at Rome, or so to establish the form and style of it that their successors should have safe models to follow. To judge by the fragments and other indications, the tragedies of the first century B. C. had lost most of their inner meaning and become empty rhetoric or trivial vulgarity. In the first century of the Roman empire, however, there was a kind of purely literary revival of the writing of tragedies, though public audiences seem by this time quite to have ceased to be interested in them. In cultivated circles, however, the *Thyestes* of L. Varius, the *Medea* of Ovid, and the nine tragedies of L. Annæus Seneca, the younger, which last alone survive entire, as well as others by less eminent writers, enjoyed a considerable reputation. This was really the last effort of Roman tragedy. Toward the end of the same century, to be sure, Curvatus Maternus essayed the form, but with no durable success, and after the first century the writing of tragedies practically ceased in the Roman world. The gladiatorial shows were the only tragic spectacles enjoyed by Roman audiences, and in the theaters only comedy in its various forms was given.

We come now to a long gap in the history of tragedy. In the last centuries of the Roman empire there was a steady decline in the condition of the theater, and after the Germanic invasions of the fifth and sixth centuries actors became one of the most scandalously degenerate classes of society. Nothing could exceed the contempt and reprobatation with which the Church spoke of the *histriones*, *mimi*, *scurre*, *thymelici*, etc., during the whole mediæval period. The very names comedy and tragedy ceased to have a determinate meaning attached to them. The former was applied to any poem with a painful beginning and a happy ending; the latter to poems in which the case was reversed. Isidore of Seville puts Horace, Persius, and Juvenal among the *comici*, while others classed the epics of Lucan and Statius among tragedies. Dante was still under the influence of these confusions, and called his great poem *Commedia*, because its style, not being Latin, was not properly that of tragedy; and because, beginning with hell and ending with paradise, the work conformed to the supposed principles of comedy.

As the mediæval period drew to a close, a new form of the drama rapidly developed itself, at first quite without the influence of ancient tragedy or comedy. This was the *mystery-play*, which was followed later by the *miracle-play* and the *morality*. All these forms arose from the necessities and observances of the Church; and through them the world became familiarized with a pathetic drama unregulated by the laws that had obtained among the classical playwrights from Æschylus down. In its unity of time and place were unknown, the subordination of character to action was unthought of, and the limitation of the number of the actors was impossible. Vivid pictorial effects and psychological analysis were the chief means of success. From these traditions of the mediæval drama it has been impossible for modern dramatists, however much imbued with the classical spirit, to break away.

The revival of tragedy proper connects itself with the larger revival of the study of antiquity, which is called the Renaissance. During the whole mediæval period, to be sure, there had been considerable familiarity with the comedies of Terence, and the Saxon nun Hrotsuitha (tenth century)

had attempted to imitate them. We find also occasional traces of a knowledge of the tragedies of Seneca, and these were destined to have an important part in the revival of tragedy. Indeed, this revival may be said to date from the *Commentaries* on Seneca's tragedies composed by the learned English Dominican Nicholas Treveth (about 1260-1330), at the request of Cardinal Niccolò Albertini da Prato, Bishop of Ostia and Velletri (d. 1321), one of the most influential men at the papal court at Avignon. Treveth's *Commentaries*, both from his own reputation and from that of his patron, were speedily known all over Europe, and greatly increased the interest in Seneca. In Italy particularly, where so many causes were at work to turn men back to classical antiquity, and where during the fourteenth century the powerful influence of Petrarch and Boccaccio definitely established the ideal of humanism, the step was speedily taken from admiration to imitation. Early in this century a learned circle in Padua, of which the judge Lovato was the leading spirit, gave itself to the study of Seneca, and from one of the group—the statesman, historian, and poet, Albertino Mussato—proceeded what may fairly be called the first tragedy of the modern world. The title of this is *Eccerinis*, and it is the dramatized history in Latin of the famous tyrant Ezzelino da Romano, composed in order to inspire the Paduans in their struggle against Can Grande della Scala. In form, however, the piece follows Seneca as nearly as Mussato knew how. The meters are various and imitate Seneca's, and even the chorus is present. It was largely for this play that in 1315 Mussato received from the Paduans the poet's laurel crown. The example of Mussato was not left unfollowed in Italy, though the choice of a subject from Italian history remained peculiar. Early in the fifteenth century we find Antonio Loschi (1365-1441), of Vicenza, Gregorio Corraro (1410-64), and the Florentine Leonardo Dati winning great applause by their Latin plays after the style of Seneca. From the first we have the *Achilleis*; from the second, *Progne* (about 1428); from the third, *Hiempsal* (about 1441). On the whole, however, the humanists found comedy more congenial than tragedy, and their Latin imitations of Terence and Plautus were both more numerous and more interesting than their tragedies.

Through the efforts of these men the understanding of tragedy in the ancient sense had been restored to the world. And yet their works were works of the closet, or at best designed for mere recitation. Not one of them was ever actually played on a public stage. Here the popular religious drama still held undisputed sway. Furthermore, they were in Latin, and not till tragedies had been written in a modern tongue could modern tragedy be said to have been born. As is well known, the secular drama in the vulgar tongue began in Italy with comedy, or a near approach to it. The *Orfeo* of Poliziano, though it contains pathetic situations, is idyllic rather than tragic in its general character. It was not till 1524 that a regular tragedy in Italian, meant for actual production, was written. This was the piece *La Sofonisba* of Giangiorgio Trissino, which has the glory of being the first tragedy in a modern language.

Tragedy passed to the remaining countries of Europe with the other Renaissance influences that proceeded from Italy. By the end of the fifteenth century the Italians had so completely revived both Latin and Greek that a large body of the ancient drama had become accessible. Not only Seneca, but also Æschylus, Sophocles, Euripides, and Aristophanes were now known. Aristotle's remarks on the drama in the *Poetics* had been studied in the light of the very plays on which he based them. And yet it is interesting to see how long the example of Seneca remained preponderant. In France, about 1540, Buchanan had Latin plays of the Seneca type, *Jephthah* and *John the Baptist*, played at the Collège de Guienne at Bordeaux. And, though the *Electra* of Sophocles and the *Heccuba* of Euripides were translated into French by Lazare de Baif about the same time, the first original French tragedy, the *Utopolâtre* of Jodelle, acted in 1552, shows much more reading of Seneca on the author's part than of the Greeks. In England the importance of Seneca for the development of tragedy is no less marked, and the first English tragedy, *Gorboduc*, by Sackville and Norton, acted in 1562, shows practically no influence of the Greek dramatists. All is Seneca.

In this manner tragedy was reintroduced and established in the modern world. And yet it must be noted that the greatest modern tragedies are the result of a fusion of the antique type with dramatic traditions of medieval origin. In France alone did classicism so triumph as to make play-

wrights attempt accurately to conform to what they supposed to be the rules of the ancient drama. During the seventeenth and eighteenth centuries theunities that Aristotle was believed to have found in Greek tragedy were held to be the law of perfection. Yet even in Corneille and Racine the skilled observer can detect abundant traces of the mystery-play and the morality. In England and Spain, on the other hand, theunities were never really accepted; the limited scope, the subordinated personalities, the dramatic machinery of ancient tragedy were freely disregarded. In Shakespeare and the other Elizabethans, in Calderón, Lope de Vega, and the dramatists of the Siglo de Oro, we have the ample material of the mediæval drama frankly fused with the classical tradition. Hence the superiority of the work of these poets.

A. R. MARSH.

Trag'opan [Mod. Lat., from Lat. *tra gopan* = Gr. *τραγῶπιον*, a fabulous Ethiopian bird]; any bird of the genus *Cerionis*, family *Phasianidae*. *Cerionis* is nearly related to the genus *Gallus*. The males, however, instead of a comb, have a crest of soft feathers and a pair of soft horn-like appendages, protractile and retractile at will, above the eyes, as well as wattles in front on the throat; the tail is large, depressed, and rounded at its posterior margin; the tarsi are armed, in the male, with short conic spurs. The species are mostly confined to the pine forests of the Himalaya Mountains and neighboring chains of Asia. They are generally solitary in their habits, dwell in the inmost recesses of their native forests, and are difficult of approach. They average about the size of the domestic poultry, or perhaps are a little larger. They feed upon grain, insects, worms, etc., and indeed resemble in this and many other respects the common gallinaceous birds. Revised by P. A. LUCAS.

Tragu'ida [Mod. Lat., named from *Tragus*, the typical genus, dimin. of Gr. *τράγος*, goat]; a family of placental mammals of the order *Ungulata* and sub-order *Artiodactyla*, containing the smallest living representatives of the order. In external appearance they suggest a small deer, but are peculiar in the arching of the back behind and the projection of the buttocks backward; the neck is rather short; the head slender and with a pointed snout; the ears moderate; no horns are developed in either sex; the tail is moderately short; the legs are slender; the feet provided with lateral hoofs; the teeth are in the normal ruminant number (M. 3, P. M. 3, C. 4, I. 3 × 2), and form the chief distinctive feature, consisting of the interruption of the incisorial series at the symphysis and the enlargement and expansion of the middle incisors toward their crowns, and the development of the canines of the upper jaw as tusks in the males; the stomach is tripartite, the psalterium being incompletely developed; the placenta is diffuse; the outer metatarsals are developed. The family is now peculiar to Asia and Africa. It is specially interesting as exhibiting an intermediate condition in the development of the stomach and some other parts between the typical ruminant ungulates and the omnivorous or hog-like forms.

Revised by P. A. LUCAS.

Trailing Arbutus. See *EPHEDRA*.

Trail, CATHERINE PAIR (*Strickland*); author; sister of AGNES STRICKLAND (q. v.) and Mrs. SUSANNA M. (q. v.).

Kent, England, Jan. 9, 1802; educated at her home; removed to Canada in 1833 with Lieut. Thomas Traill, whom she had married the preceding year. She settled at Douro, Ontario, and subsequently resided in Peterborough, but for many years has made her home at Lakefield, Ontario. She began to write when fifteen years of age, and has devoted much of her time to literary work ever since. Among her works are *The Backwoods of Canada* (London, 1835); *Canadian Crusoes* (New York, 1852); *Rambblings in the Canadian Forests* (1854); *Afar in the Forest* (London, 1869); *Studies of Plant Life* (Ottawa, 1884); *Pearls and Pebbles* (1895). N. M.

Traill, ROBERT, D. D.: b. at Lisburn, Ireland, July 15, 1793; graduated at Trinity College, Dublin, about 1817; took orders in the Church of England 1820; became parish minister of Scull, County Cork, 1830, and fell a victim to his incessant labors to relieve his parishioners during the great Irish famine, dying of an epidemic fever in 1847. He is the author of a superior English translation of Josephus's *Jewish War* (London, 1846-47, with Isaac Taylor's notes and Tipping's illustrations of Palestinian scenery; later ed. rep. Boston, 1868). Revised by S. M. JACKSON.

Traill, THOMAS STEWART, M. D.: b. at Kirkwall, Orkney islands, in 1782; graduated at the University of Edinburgh 1801; became a physician, and was Professor of Medical Jurisprudence in that university from 1832 to his death July 30, 1862. He was editor of the eighth edition of the *Encyclopedia Britannica* (22 vols., 1853-61), for which he wrote more than 400 articles; wrote for scientific periodicals, and was author of *Lectures on Medical Jurisprudence* (2d ed. 1840; Philadelphia, 1841) and other works.

Train, GEORGE FRANCIS: author; b. in Boston, Mass., Mar. 24, 1830; entered upon mercantile business there, and subsequently in Australia; in 1860 went to England, and attempted to introduce street-railways into Liverpool and London, but was met by legal opposition. Subsequently he traveled extensively, wrote considerably, spoke much in public, and developed singular idiosyncrasies. For many years he declined to speak to anyone, using pencil and paper as his only medium for conversation. One of his peculiarities is a special fondness for children, with whom he surrounds himself in his daily visits to Madison Square, New York, which city has long been his place of residence. Among his publications are *An American Merchant in Europe, Asia, and Australia*, and *Young America Abroad* (New York, 1857); *Spread-eaglesism*, consisting of some of his public speeches (1859; London, 1860); *Young America on Slavery* (1860); *Union Speeches delivered in England* (4 vols., Philadelphia and London, 1862); *Downfall of England* (1863); *Irish Independence* (1865); *Championship of Woman* (Leavenworth, Kan., 1868).

Trajan (Marcus Ulpius Trajanus): Roman emperor A. D. 98-117; b. at Italia, near Seville, Spain, Sept. 18, A. D. 52, of Roman descent; was educated in the camp of his father, and distinguished himself so much in the Parthian and German wars that, although not of Italian birth, he was adopted by Nerva in 97, and in January of the following year succeeded him on the throne. Trajan's reign is considered, next to that of Augustus, the most brilliant period of the history of imperial Rome. By two campaigns (101-102 and 104-106) Dacia, the region between the Theiss and the Pruth, comprising the present Transylvania, Moldavia, and Wallachia, was conquered and made a Roman province. Of less permanent importance were the conquests in Armenia and Mesopotamia, made in the wars with the Parthians. Although most eminent as a general, Trajan was a vigorous and capable ruler, and the probity of his administration gave rise to the phrase with which a new emperor was first saluted—*Augusto felicior, melior Trajano* (more fortunate than Augustus, better than Trajan). Cities were founded, colonies settled, fortresses and harbors constructed, and numerous roads, canals, bridges, etc., were built throughout the empire. In Rome the Forum Trajani was constructed, containing the famous column in its center. Large sums were employed in the education of freeborn Roman children. Libraries, among which was the celebrated Ulpia Bibliotheca, were founded, and the Latin literature experienced its afterbloom in Tacitus, the younger Pliny, and Juvenal. Pliny's correspondence with Trajan when governor of Bithynia gives a valuable picture of the provincial government, and throws light on the condition and treatment of the Christians, whose relation to the empire was at this time becoming a question of considerable importance. Trajan died at Selinus, in Cilicia, in Aug., 117.

Revised by CHARLES H. HASKINS.

Trajan's Wall: a fortification in the Dobruja, Roumania, nearly 50 miles long, extending from Tchernavoda on the Danube to Kustendji on the Black Sea. It is a double and in some places a triple earthwork on the south side of a natural fosse, consisting of a narrow marshy valley. It is even now a strong line of defense. It was constructed in 377 by Trajan, a general of Valens, to prevent the Visigoths, who had crossed the Danube, from advancing farther southward. E. A. G.

Trajectory: See GUNNERY.

Tralee': town; in County Kerry, Ireland; on the Lee, 1 mile from its mouth; 207 miles by rail S. W. of Dublin (see map of Ireland, ref. 12-B). It is well built, and has some trade in agricultural produce. It has ceased to be of importance as a port since ships began to discharge at Fenit, 5 miles distant. Tralee returned a member to Parliament until 1885. Pop. (1891) 9,318.

Tramps: See VAGRANTS AND VAGRANCY.

Tramways: See RAILWAYS AND STREET-RAILWAYS.

Trance [from O. Fr. *transe*, extreme fear, swoon, trance, deriv. of *transir*, pass over, fall into a swoon < Lat. *transi re*; *trans*, across + *ire*, go]; a state of abeyance of most of the vital functions, resembling in some cases a profound sleep, in others closely simulating actual death. Some cases of so-called trance are clearly cataleptic, and all are associated with abnormal nervous conditions or perverted nerve-functions. Trance sometimes follows extreme religious excitement. In some cases of real or pretended trance the patient can speak, and even address public audiences, the condition being assumed at will. But in the more profound trance all sensibility and power of motion is lost, and in some no sign of breathing or of heart-beat is apparent. This condition has been known to last for months or even years. See CATALEPSY AND HYPNOTISM.

Revised by J. M. BALDWIN.

Trani, traan'è: town; in the province of Bari delle Puglie, Southern Italy; on the Adriatic; about 27 miles N. W. of the town of Bari (see map of Italy, ref. 6-G). A few traces of an old castellated wall, with towers and bastions, remain. The port is well sheltered except on the N. W., and during the flourishing period of Italian mediæval commerce with the East, Trani was a very important center of maritime trade. The cathedral, Byzantine in its architecture, was begun in the twelfth century and consecrated in the thirteenth; the tower is one of the boldest in Italy. The law school established here by Charles V. had a wide reputation. In 1799 the city was sacked and burned by the French. It is a place of considerable industry and commerce, the exports being chiefly oil, wine, and fruits, especially almonds from the vicinity. A fine calcareous building-stone, known as *pietra viva*, and found near Trani, is exported. Pop. 25,000. Revised by M. W. HARRINGTON.

Tranquebar' [Tamil *Tarangambadi*, or city of the waves]; town of Tanjore, Madras, British India; on the Coromandel coast, in the delta of the Cavery; in lat. 11° 2' N.; on a small bay which forms a good harbor (see map of S. India, ref. 6-F). It is surrounded by walls, defended by forts, and well built. Pop., with an indigenous suburb, 6,200. The town, with adjacent district, very productive of rice, cocoanuts, and fruits, was originally a Danish possession, but in 1845 was sold to Great Britain. It has declined in importance, partly because of this change and partly because of the advantage given to the rival port, Negapatam, through the construction of the South Indian Railway to it. Tranquebar is a healthful place, has a mild and agreeable climate, and was long a favorite watering-place.

Revised by M. W. HARRINGTON.

Tranquillus Suetonius: See SÜETONIUS TRANQUILLUS.

Transbaikalia [i. e. across the Baikal; Rus. *Sabaikal'*]; province of Eastern Siberia, bordering on Mongolia, and S. and E. of Lake Baikal; between the parallels 49° 8' and 56° 31' N., and the meridians 101° 28' and 121° 30' E. Area, 238,868 sq. miles, or nearly that of Texas. The eastern part is mountainous; the western is a high plateau with many lakes and marshes. The waters belong to the basins of Lake Baikal, the Lena, and the Amur. The climate is continental, rigorous, and dry. This is the central part of the Nerthinsk mineral region, and is rich in gold, silver, copper, tin, lead, coal, asphalt, and salt. It was rich in forests, but these are rapidly disappearing. Agriculture does not prosper, but stock-raising is profitable. The collection of

pelts is a regular pursuit, and the skins obtained include those of the fox, bear, ermine, and sable. The last two are especially fine, but these animals are fast being exterminated. Pop. (1890) 545,338, mostly Russians, but about 150,000 are Buriats, Tunguses, and Chinese.

M. W. H.

Transcaspien District: province of Russia in Asia; part of the government of Turkestan; E. of the Caspian Sea, S. of Uralsk, W. of Khiva and Bokhara, and N. of Afghanistan and Persia. Area, 214,237 sq. miles, or a third larger than the Caspian Sea. The country is largely steppe and desert. It is traversed by the Transcaspien Railway, and has many caravan routes. The district was formed in 1881, and Merv was added to it in 1884. Pop. (1890) 276,709, of whom 210,000 are Turkomans, 44,000 Kirghiz, 7,000 Russians (not including the troops), the remainder Persians, Afghans, Bokhars, Armenians, and Jews.

M. W. H.

Transcauca'sia [Lat. *trans*, across, beyond + *Caucasus*]: the name given generally to that part of Asiatic Russia which lies S. of the Caucasian Mountains; between the Black Sea and the Caspian. It includes the provinces of Baku, Daghestan, Elizabethpol, Erivan, Kars, Kutais, Tiflis, and Zakataly, making altogether an area of 91,346 sq. miles, with a population of 5,011,555 in 1890.

M. W. H.

Transcendent'alism: a term used to describe the doctrine of the New England school of philosophy, initiated by Ralph Waldo Emerson and A. Bronson Alcott, which, however, owed its origin to the study of Plato and the Neo-Platonists rather than of Kant, although the latter, through Coleridge, exercised some influence. Kant called transcendental all those cognitions or elements of cognitions which are not derived *a posteriori* by experience, but underlie all experience as its necessary *a priori* conditions, and which consequently transcend the whole sphere of experience. Transcendental are all those primary, original, and *a priori* principles of knowledge which, as necessary and universal truths, underlie all contingent and particular truths derived from experience; and in this sense of the word transcendental is the opposite of empirical.

Revised by W. T. HARRIS.

Transformer: in electricity, an instrument for converting an alternating current from a higher to a lower potential, or *vice versa*. A step-down transformer converts a small current at a high potential to a large current at a low potential; a step-up transformer converts a large current of low potential to a small current at high potential. The energy obtained from a transformer is equal to that put in, less the losses due to heating. Step-down transformers are commonly used in the ordinary systems of alternating-current distribution for the supply of incandescent lamps at constant potential. The alternating-current transformer is a modification of the old-fashioned induction coil (see **INDUCTION COIL**), and consists essentially of a primary and a secondary coil of wire embracing the same magnetic circuit.

FIG. 1.—Typical representation of a transformer.

The simplest form of such a transformer is shown in Fig. 1. The primary coil, commonly spoken of merely as the "primary," consists usually of many turns of fine wire. This is connected to a supply of alternating current commonly at 1,000 or 2,000 volts. The current which flows in the primary is small, being opposed by the counter-electromotive force of self-induction, which is large on account of the fact that the primary turns are many and embrace an iron coil. The secondary usually consists of fewer turns of larger wire, capable of carrying a larger current than the primary, which is, however, at a correspondingly lower potential. The primary current sets up lines of magnetic force which thread the secondary circuit and induce an electromotive force in the secondary, inasmuch as the magnetization keeps changing with the primary current and the lines of force are reversed with each alternation. It is then the function of the magnetic circuit to convey through the secondary coils the lines of force set up by the primary current. The magnetic circuit is usually a completely closed one made of soft, well-laminated iron. This is not always so, however, and a transformer may be constructed with only a partial magnetic circuit, as typically shown in the upper diagram of Fig. 2. Such is technically known as an "open-magnetic-circuit" transformer in contradistinction to the

"closed-magnetic-circuit," as shown in Fig. 1. The open-magnetic-circuit transformer possesses the advantage of smaller losses at no load, due to diminished hysteresis (see

FIG. 2.

MAGNETISM OF IRON); and although little used in the U. S., it is commonly used in Great Britain, notably in the case of the "hedgehog" transformer of Mr. Swinburne. Step-down transformers are used to supply incandescent lamps arranged in parallel, as typically shown in Fig. 2. Although Fig. 1 shows the general arrangement of the parts of a transformer, it must not be supposed that the form there shown is the design of the practical transformer in commercial use.

Lines of Force due to the Secondary Current.—We have thus far considered the lines of force passing through the magnetic circuit, due to the primary current; now the secondary current will likewise tend to set up lines of force which will be opposite in direction to those set up by the primary. (See **The Direction of the Induced Current** under **ELECTRICITY**.) These lines will accordingly meet and oppose each other,

FIG. 3.—Transformer

and in a transformer as Fig. 1 there will be a tendency for them to leak across between *a* and *b*. This magnetic leakage,

FIG. 4.—Transformer plates and arrangement of coils.

and in a transformer as Fig. 1 there will be a tendency for them to leak across between *a* and *b*. This magnetic leakage,

as it is called, diminishes the effect in the secondary circuit, and likewise interferes with the regulation for constant potential which is necessary for the supply of the incandescent lamps. A commercial form, avoiding to a large extent magnetic leakage and possessing mechanical advantages, is shown in Fig. 3. The primary and secondary coils are compactly arranged and the magnetic circuit built up of plates of soft iron bolted securely together. The shape of the

loads; in reality it decreases slightly with the load on account of the magnetic leakages, already referred to, and the fall in potential due to the resistance of the conductors. The primary mains are usually supplied both day and night. The lamps in the secondary may be turned on and off individually or altogether. This is the common system of supply, but a system of sub-stations is sometimes used. Here each house no longer has its own transformer, but one large transformer is used for each district or group of houses, thus entailing less first cost for transformers and a higher efficiency; for, as the output of the transformer is increased the size and cost do not increase in proportion; and, furthermore, greater efficiency is thus obtained. Although this fact is noticeably true for small transformers, it is, however, not so marked with larger ones, say those of 30 or 40 kilowatts capacity. The energy which is lost in a transformer appears as heat which must be radiated from the surface, and with large transformers the effect of rise of temperature, due to the smaller surface in proportion to the output, must be considered. In a closely settled district where a complicated network is necessary, a system of distribution, as shown in Fig. 6, may be used, in which a complete system of secondary wires is supplied from the secondaries of a number of transformers placed at suitable points.

Alternating-current measurements are necessarily complicated, inasmuch as we have to deal with quantities rapidly varying from instant to instant. In experimental investigations these instantaneous values are commonly ascertained, and are of particular importance in certain lines of research. The value of a quantity varying periodically is sometimes expressed in terms of the maximum value which the quantity attains in each period. These maximum values become more significant when the quantity varies harmonically or nearly so, as is ordinarily the case with alternating currents. For a current differing widely from a sine or harmonic function, the maximum value indicates little as to the magnitude of the current in the usual sense of the term. When a current is of periodically varying value, it is most commonly the case that we wish to know, not the value of the current from instant to instant nor its value when at a maximum, but the value of an equivalent unvarying current, by which we mean a current equivalent in heating and dynamic effects. This value of the alternating current is called its *virtual* value. It is the one commercially used in connection with transformers, being given by most measuring instruments. The virtual value of a quantity is equal to the square root of the mean square of the instan-

FIG. 5.

transformer plate is shown in Fig. 4: the dotted line indicates the magnetic circuit—that is, the path of the lines of force. The lamination prevents loss due to Foucault currents induced in the iron.

The common form of transformer distribution for lighting purposes is shown in Fig. 5. The primary mains are supplied with a potential of, say, 1,000 volts by a constant potential alternating-current generator placed in some central station. Each house to be lighted has installed in it an

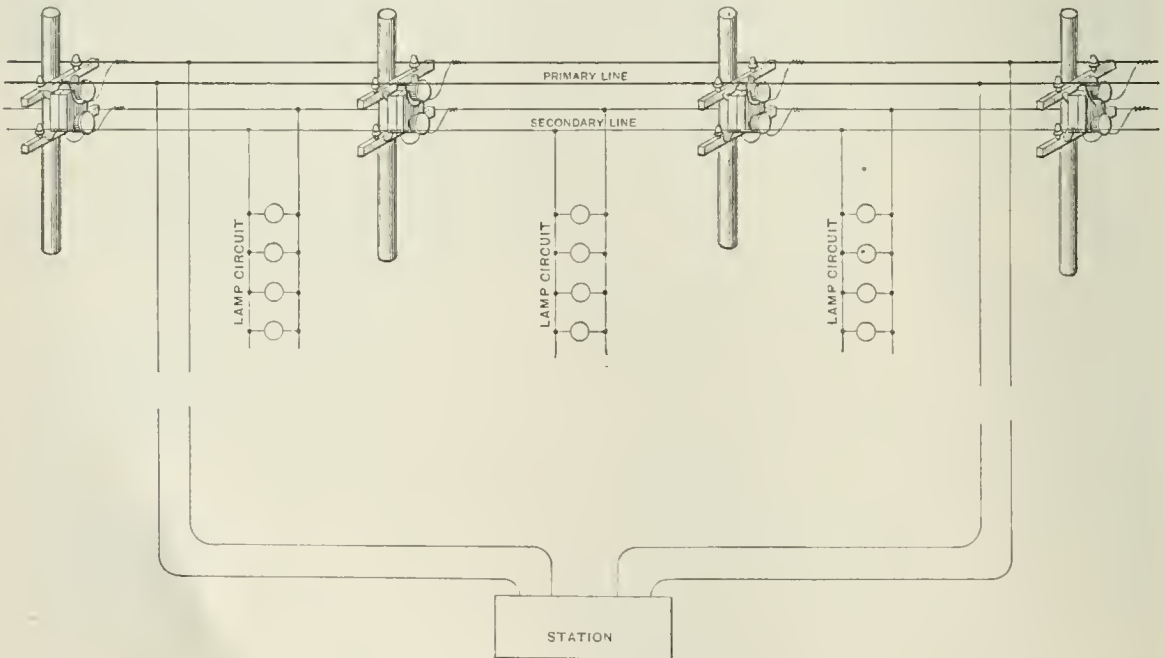

FIG. 6.

individual transformer which supplies incandescent lamps at 50 or 100 volts. This potential should be constant at all

instantaneous value; and, for an harmonically varying quantity, that is, proportional to a sine or cosine of the variable,

is equal to the maximum value divided by $\sqrt{2}$; or the virtual value is equal to 0.707 times the maximum.

The calculation of the efficiency of the transformer consists either in the measurement of the power supplied to the primary and the power obtained from the secondary, or in a determination of the several losses. The efficiency is the ratio of the secondary output to the power supplied to the primary—that is, efficiency = $W_2 \div W_1$.

The losses in a transformer are as follows: The iron losses, due to hysteresis and Foucault currents; the loss in the primary, due to the heating of the primary conductor; and the loss in the secondary, due to the heating in the secondary conductor. The loss due to the heating of a conductor equals the product of the resistance and the square of the current; hence the copper losses in the primary and secondary circuits are $R_1 I_1^2$ and $R_2 I_2^2$, respectively. The secondary power, W_2 , utilized in operating incandescent lamps, is equal to the product of the secondary current and the difference of potential at the secondary terminals, inasmuch as the load is non-inductive and the current is in phase with the electromotive force—that is, $W_2 = E_2 I_2$. The power put into a transformer is equal to the power taken out and made use of in the secondary load plus the several losses, thus:

$$W_1 = W_2 + \text{iron losses} + R_1 I_1^2 + R_2 I_2^2.$$

The primary power is also equal to the product of current, electromotive force, and the power factor; thus $W_1 = E_1 I_1 \times$ power factor. The power factor is equal to the cosine of the angle by which the current lags behind the electromotive force.

The action of a transformer may best be investigated by a determination of the values, from instant to instant, of the currents and electromotive forces. For these determinations the method of instantaneous contact is used, em-

opposite in phase to that of the primary. The efficiency may be obtained by computing the primary and secondary

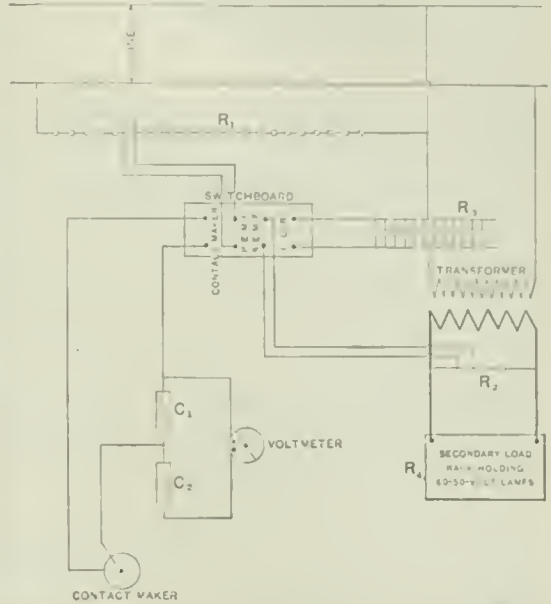

FIG. 8.—Connections for transformer test by method of instantaneous contact.

power from the instantaneous values of current and electromotive force. The results of a test upon a transformer possessing exceptionally high efficiency and good regulation are shown in Fig. 10.

FIG. 9.—Transformer curves by method of instantaneous contact.

The theory of the transformer may be analytically developed from the two equations for primary and secondary electromotive forces:

$$E_1 = R_1 I_1 + L_1 \frac{dI_1}{dt} + M \frac{dI_2}{dt};$$

$$0 = R_2 I_2 + L_2 \frac{dI_2}{dt} + M \frac{dI_1}{dt}.$$

These express the relation that the electromotive force in a circuit is equal to the electromotive force to overcome resistance, the counter electromotive force of self-induction and the back electromotive force of mutual induction. The coefficients of mutual induction, M , and primary and secondary self-induction, L_1 and L_2 , are:

$$M = \frac{4\pi S_1 S_2 A \mu}{l};$$

$$L_1 = \frac{4\pi S_1^2 A \mu}{l};$$

$$L_2 = \frac{4\pi S_2^2 A \mu}{l}.$$

FIG. 7.—Bedell-Ryan revolving contact maker

ploying a contact-maker (see Fig. 7) which closes a circuit once in each revolution of the armature of the generator, and thus enables measurements to be made at any desired phase of the alternation. (Methods of measurement are described in vol. ii. of Nichols's *Laboratory Manual of Physics and Applied Mechanics*.) The connections for a transformer test by this method are shown in Fig. 8. Curves thus obtained are shown in Fig. 9, which indicates in a complete manner the action of a transformer. (The curves here given were taken from a hedgehog transformer.) The primary current lags considerably behind the primary electromotive force. The secondary electromotive force is almost exactly

Here S_1, S_2 denote primary and secondary turns; A, l , and μ denote area, length, and permeability of the magnetic circuit. The ratio of transformation is equal to the ratio of the number of primary and secondary turns. It is by this

FIG. 10.—Efficiency and regulation curves.

ratio that the potential is transformed up or down—that is, the primary and secondary electromotive forces have the same ratio as the number of turns. Space will not here permit the development of analytical theory. The results of analysis may, however, be well shown by a diagram in which relative magnitudes and phase relations are shown graphically.

FIG. 11.—Transformer diagram.

Such a transformer diagram is shown in Fig. 11 (Bedell and Crehore). Each line is drawn to represent the magnitude of some quantity. The diagram is supposed to revolve with uniform velocity in a counter-clockwise direction. The value of a quantity at any instant is found by projecting upon any fixed line of reference the line which represents it. The primary current is represented by OA . Ninety degrees behind this is OB , the electromotive force induced by the primary current in the secondary circuit, equal to $M\omega I_1$ (where $\omega = 2\pi n$, n being the frequency or number of complete alternations per second). The secondary current OD lags by the angle θ_2 due to the secondary self-induction. The electromotive forces in the secondary are OB induced by the primary current CB due to self-induction, and OC the resultant pressure at the terminals. The secondary current induces the back electromotive force, OF , ninety degrees behind it in the primary. The primary electromotive force, OK , is equal to the geometrical sum of three parts: OG to overcome the back electromotive force, OF ; OH to overcome resistance; and IJ to overcome the self-induction of the primary itself. Evidently the secondary current is about opposite in phase to the primary electromotive force. The magnitudes of the various quantities are indicated by the lines representing them. The angular positions of the lines represent the phase relations of the corresponding quantities. A transformer diagram of this sort can be constructed for a particular transformer under given conditions, and the complete action of the transformer is thus shown by purely graphical methods. FREDERICK BEDELL.

Transfusion of Blood [*transfusion* is from Lat. *transfu'sio*, deriv. of *transfundere*, *transfu sum*, pour over; *trans*, across, over + *fundere*, pour]: a surgical operation in which blood from a strong and healthy person, or from one of the lower animals, is injected into the veins of a feeble or anæmic patient. It is especially employed after severe puerperal hæmorrhage, great care being taken to exclude bubbles of air or clots, either of which is likely to prove fatal. The blood, either defibrinated or not, is usually introduced by means of a suitable syringe. This operation, though long known and at present recognized as a legitimate one, is not as yet very common; but it may be considered as established that in well-selected cases, and when performed with proper skill, transfusion is an extremely useful and successful operation. The transfusion of warm saline solutions is almost if not equally useful and does not have the dangers of blood transfusion. Subcutaneous injection of saline solutions and rectal injections of water are scarcely less efficacious and prompt in action than transfusion in cases of hæmorrhage. Revised by W. PEPPER.

Transit [from Lat. *transitus*, a crossing, going over, deriv. of *transire*, *transitum*, cross; *trans*, across, over + *ire*, go]: the passage of a planet over the disk of the sun, or, in a broader sense, the passage of any celestial body over an arbitrary point of reference.

The transit instrument is an astronomical instrument used to determine the time of a star's passage over a fixed great circle of the heavens, usually the meridian or the prime vertical. In the latter case the instrument is called a prime vertical transit. Roemer seems to have first used a transit instrument for the determination of right ascensions in 1675, and fourteen years after that he used it in the meridian for the determination of local time. A very excellent form of the most modern construction is shown in Fig. 1,

FIG. 1.

where tt represents a telescope of 3 inches aperture and 40 inches focus, which rotates around a horizontal axis aa' , and is composed of the frusta of two similar cones firmly secured to the hollow brass cube, $ee'e'$, at their larger bases. The axis, aa' , is also composed of the frusta of two similar cones terminating in two faces of the cube $ee'e'$ at right angles to the other two faces. This axis terminates in two pivots, pp' , $1\frac{1}{2}$ inches in diameter, made of cast steel, which rest upon V-shaped bearings firmly supported by the cast-iron piers, uu' , which are firmly bolted to a base plate at b , which in turn rests upon three points, $mm'm'$, of which the point, m , is capable of a slight lateral motion by means of the screw, s . The telescope is made conical in order to give

it the greatest rigidity of form; it is of brass, and may be elevated to any desired angle by turning it on its axis.

The light from a lamp enters through an aperture in one end of the axis p' and strikes a diagonal reflector, the tint of the reflected light of which is controlled by the milled head, i , operating colored glasses, and the reflector is so inclined as to reflect the light downward into the field of view; this is necessary to render visible a reticule of fine

FIG. 2.

lines composed of spider's web, placed in the focus of the object-glass at f . At night these lines are quite invisible without artificial illumination. The simplest form of this reticule of lines is shown in Fig. 2, where s is a star entering the field between two horizontal lines. The vertical line c is supposed to coincide with the plane in which the instrument rotates: $a b d e$ are four additional lines symmetrically placed, and the time at which the star s is bisected by each of them, as at s' , is noted. The mean of these observed times is more nearly correct than the time obtained from the transit across a single wire, c , would be. Five or seven wires are usually employed when the times are noted by eye and ear; this number is increased when the times are noted with a chronograph.

To determine the local time, the instrument is set up in the meridian and accurately leveled. The error of the time-piece is found by noting the difference between the observed and true times of transit of stars across the meridian. It is assumed that the horizontal axis is approximately level, and that the reticule has been so adjusted as to make the telescope axis pass through the middle wire, and that the system of wires is perpendicular to the horizon.

Transit Circle.—The mural circle was formerly a companion to the transit instrument in a fixed observatory; but by attaching a large circle to the horizontal axis of the transit instrument the results formerly obtained by two instruments and two observers are now more accurately obtained by this single instrument, called the transit or meridian circle; the declination of a star being obtained from the circle reading, while its right ascension is obtained at the same time by observing its transit.

Fig. 3 shows the transit circle of the Harvard College

FIG. 3.

Observatory, built in 1870 by Troughton and Simms. The telescope has an aperture of $8\frac{1}{4}$ inches and a focal length of

9 ft. 4 in. The telescope pivots rest on iron castings imbedded in the solid marble block $a a$. Two circles 3 feet in diameter, graduated on silver to five minutes of arc, are attached to the axis, and move with the telescope. Four microscopes, $k k k k$, provided with micrometers, read to tenths of a second of arc the distance of the last five-minute division on the circle beyond which the telescope has been moved to bring a star into the position s of Fig. 4 from the center of the microscopes. The microscopes are secured to a circular frame, which in turn is attached to the iron casting which supports the bearings for the pivots. A similar arrangement exists with regard to the circle on the other side of the telescope from the one shown in the drawing. Counterpoises at $e e$, working upon the levers, $f f$, diminish the amount of the friction of the pivots against their bearings. Glass cases cover both the circles. For the purpose of easily finding an object, the small finding-circles at x were provided, but in practice it is found more convenient to use a long arm attached to the axis, which describes the arc indicated in the lower part of the figure v . A lantern at l throws its light by a system of reflectors upon the circle. The framework at A is used for putting the striding-level in position. The instrument differs from the usual form of transit circles in supporting the circles above the piers, in its system of counterpoises, and in the placing of the circles so near to the floor that they may be read without the inconvenience of using steps. These improvements are due to the late Prof. Joseph Winlock, as also the using of collimators having apertures of the same diameter as the observing telescope.

Fig. 4 represents the reticule of this instrument. It consists of a system of twenty-five vertical lines, fifteen of which are double and arranged as shown in the figure. A

FIG. 4.

diagonal double line, $a a'$, makes an angle of 85° with the vertical system. Fractional parts of a horizontal line, $d d'$, extend far enough into the field to enable the observer to bring the star s between the lines $a a'$ and $d d'$ when the star enters the field. Since $a a'$ would intersect $d d'$ at the center c , the star s transits the line $a a'$ at some point s' between a and c , and by noting the time when the star is at s' , it becomes a matter of simple trigonometry to compute the vertical distance of s' from the line $d d'$, and consequently from the assumed center of the field. The reading of the large graduated circle gives us the observed zenith distance of this central line $d d'$ in space, and we are thus enabled, without any micrometrical measurements, to obtain the exact observed altitude by adding to the reading of the circle the computed vertical distance $a s'$ with its proper sign. For a full discussion of the transit instrument, see W. Chauvenet, *Manual of Spherical and Practical Astronomy*; *United States Coast Survey Reports* (1866, appendix No. 9; 1868, appendix No. 10), by Prof. C. A. Schott. For discussions of transit circle, see W. Chauvenet (as above); *Washington Astronomical Observations for 1865*.

Transits of Venus and Mercury: The term "transit" means the apparent passage of a planet as a dark object across the disk of the sun. This can take place only with the two planets Mercury and Venus, whose orbits lie within that of the earth. Transits of Mercury occur at intervals of a few years; never more than thirteen, nor less than three. They have no special astronomical significance, but owing to their interest they are industriously observed when they do occur. The times of occurrence for some time to come are given in the article MERCURY. Transits of Venus are among the rarest phenomena of astronomy, as only two occur in a period of more than a century. They were formerly believed to afford the most accurate method of determining the solar parallax. (See SOLAR PARALLAX.) For this reason the whole astronomical world devoted great attention to the observation of those which occurred in 1761, 1769, 1874, and 1882, and the leading nations sent expeditions to distant points of the earth's surface to make the necessary

observations. On the whole, however, they have been a comparative failure, so far as the determination of the sun's parallax is concerned. The last transit occurred in 1882; no other will be seen until the year 2004. Further information respecting them is contained in the article VENUS.

Translation, Motion of: See MOTION.

Transleithania, (trăns-lî-tă'ni-ă): the common name for that part of the Austrian-Hungarian monarchy which lies to the E. of the river Leitha, an affluent of the Danube. It comprises Hungary proper, Transylvania, Croatia, and Slavonia, or the Hungarian crown-lands. It has never become generally used, and corresponds closely to the present kingdom of Hungary as distinguished from Austria proper.

Transmigration [from Lat. *transmigra'tio*, deriv. of *transmigra're*, transmigrate; *trans*, over, across + *migra're*, remove, migrate]: the doctrine of the repeated existence of the soul in different forms of matter, its form in each successive existence being determined by its merits and demerits in the preceding ones. Buddha, replacing the idea of soul with the wholly different idea of KARMA (q. v.), denied the entire theory of transmigration. It has, however, extensive sway among the ignorant masses of his followers, in spite of his negative teaching. The most striking fact in connection with this doctrine is its wide prevalence. The ancient civilization of Egypt seems largely to have grown out of this faith. The swarming millions of India also, through the chief periods of their history, have, under its spell, suffered their lives, wrought their great works of government, architecture, philosophy, and poetry, meditated, aspired, and exhaled their souls. Ruder forms of it are reported among innumerable barbaric tribes. It played an important part in the speculations of the early Fathers of the Christian Church, and has often cropped out in the works of later theologians. Men of the profoundest metaphysical genius, like Scotus Erigena and Leibnitz, have affirmed it, and sought to give it a logical or scientific basis. And even amidst the predominance of skeptical and materialistic influences in Europe and America at the present time, there are many individuals with independent minds who earnestly believe the dogma, for to a large class of minds the doctrine has transcendent attraction as well as plausibility.

An Oriental Doctrine.—Another striking fact connected with this subject is that it seems to be an ineradicable growth of the Oriental world, but appears in the Western world rather as an exotic form of thought. The pantheistic tendency which possessed and overwhelmed the Brahmanic mind, shaping and tingeing all its views, opened the whole range of sentient existences to an indiscriminate sympathy, and made the idea of transmigration natural, and more pleasing than repugnant. Furthermore, the Brahmanic sages are a distinct class of men whose lives are absorbed in introspective reveries calculated to stimulate the imagination and arouse to keen consciousness all the latent possibilities of human experience, thus furnishing the most favorable conditions for such a belief as that of transmigration. Accordingly, the doctrine has held the mind, sentiment, and civilization of the East through every period of its history as with an irrevocable spell. On the contrary, in the Western world, the characteristic tendencies are all different. Pantheistic theories are rarely held, and the dreams and emotions which those theories are fitted to feed are foreign. An impassable barrier is imagined separating humanity from every other form of being. Speculative reason, imagination, and affection are chiefly employed in scientific studies and social pursuits, or personal schemes external rather than internal. This absorption in material affairs engenders in the spirit an arid atmosphere of doubt and denial, in which no efflorescence of poetic and mystic faiths can flourish. Thus while outward utilities abound, hard negations spread abroad, and living, personal apprehension of God, providence, and the immortality of the soul dies out either in open infidelity or in a mere verbal acceptance of the established creed of society.

Its Grounds.—The grounds on which this belief rests are chiefly the following: (1) The strong resemblances, both physical and psychical, connecting human beings with the whole family of lower creatures. They have all the senses in common with us, together with the rudiments of intelligence and will. They all seem created after one plan, as if their varieties were the modulations of a single type. We recognize kindred forms of experience and modes of expres-

sion in ourselves and in them. Now the man seems a travesty of the hog, the parrot, the ape, the hawk, or the shark; now they seem travesties of him. As we gaze at the ruminating ox, couched on the grass, notice the slow rhythm of his jaw and the dreaminess of his soft eyes, it is not difficult to fancy him some ancient Brâhman transmigrated to this form, and patiently awaiting his release. Nor is it incongruous with our reason or moral feeling to suppose that the cruel monsters of humanity may in a succeeding birth find the fit penalty for their degradation and crime in the horrid life of a crocodile or a boa-constrictor. (2) The conception of a series of connected lives furnishes a plausible explanation for many mysteries in our present experience. Reference is made to all that class of phenomena covered by the Platonic doctrine of Reminiscence. Faces previously unseen, and localities unvisited, awaken in us a feeling of familiarity with them. Thoughts and emotions not hitherto entertained come to us as if we had welcomed and dismissed them a thousand times. Many an experience, apparently novel and untried, makes us start as though the chambers of the soul had often before echoed to its shadowy footsteps. The supposition of forgotten lives preceding the present, portions of which reverberate and gleam through the veils of thought and sense, seems to throw light on this department of experience. (3) Much more weighty, however, than the foregoing considerations is the philosophical argument drawn from the nature of the soul. Consciousness being in its very essence the *feeling of itself*, the conscious soul can never feel itself annihilated, even in thought. It only loses the knowledge of its being when it lapses into unconsciousness, as in sleep or trance. The soul may indeed *think* its own annihilation, but can not realize the thought in *feeling*, since the fainter emotional reflex upon the idea of its destruction is instantly contradicted and overborne by the more massive and vivid sense of its persistent being in immediate consciousness. This incessant self-assertion of consciousness at once suggests the idea of its being independent of the changing body in which it is shrined. Then the conception naturally follows that the soul, as it has once appeared in human form, may reappear indefinitely in any of the higher or lower forms which compose the hierarchy of the universe. The eternity of the soul, past and future, once accepted by the mind, leads directly to the construction of the whole scheme of the metempsychosis—an everlasting succession of births and deaths, disembodiments and re-embodiments, with their laws of personality and fortunes of time and space weaving the boundless web of destiny and playing the endless drama of providence. (4) But the strongest support of the theory of transmigration is the happy solution it seems to give to the problem of the distressing inequality and injustice which appear so predominant in the experience of the world. To the superficial observer of human life, the whole scene of struggle, sin and sorrow, nobleness and joy, triumph and defeat, is a tangled maze of inconsistencies, a painful combination of discords. But if we believe that every soul, from that of the lowest insect to that of the highest archangel, composes an affiliated member of the infinite family of God, and is eternal in its conscious essence, perishable only as to its evanescent disguises of incarnation; that every act of every creature is followed by its legitimate reactions; that these actions and reactions constitute a law of retribution absolutely perfect; that these souls, with all their doings and sufferings, are inter-connected with one another and with the whole, all whose relationships co-penetrate and co-operate, with mutual influences whose reports are infallible, and with lines of sequence that never break—then the bewildering maze becomes a vindicated plan, the horrible disorder a divine harmony. But the theory of the transmigration of souls remains, to the average modern mind of the Western world, a mere fancy, although it has a deep metaphysical basis, a strong poetic charm, and a high ethical and religious quality. See METEMPYSCHOSIS, PESSIMISM, and BRAHMANISM.

See Alger's *History of Doctrine of a Future Life*, part 5, ch. ii., for full treatment of the subject of metempsychosis; also Leibnitz, *Monadologie*; Hardy's *Manual of Buddhism*, ch. v.; Edward D. Walker, *Reincarnation: a Study of Forgotten Truth* (New York).

WILLIAM R. ALGER.

Transpiration: the process of exhaling a gas or liquid, as in botany the exhalation of watery vapor from the surface of leaves. The transpiration of gases and liquids is their motion through capillary tubes under pressure. See GAS and PHYSIOLOGY, VEGETABLE.

Transportation [from Lat. *transportatio*, deriv. of *transportare*, carry across, transport; *trans*, across, beyond + *porta re*, carry]: the act of conveying persons or goods and the like from one place to another. In connection with this subject we have to consider the history of the physical means employed—roadways and waterways, natural or artificial, sail and steam, wagon-road or railway—and the social and economic problems which arise out of the services rendered, including the question of the relation of the various transportation agencies to the government.

Transportation by Water.—For a long time in the world's history most of the transportation was by water. There was little internal commerce. Each village or manor lived chiefly within itself, and supplied its own rude wants. Most of the trade was in foreign products. The merchant vessels of the Phœnicians and other commercial nations many centuries before the Christian era, though rude in comparison with modern appliances, represented the highest mechanical and engineering art of the age, and the work done by these ships, both in discovery and in transportation, was of a remarkable character. On land there were no means of transportation to compare with them in efficiency. The earliest roads worthy of the name were built for purposes of war rather than of trade. As conquest preceded commerce, so the question of moving armies was in early days more important than the question of moving goods or travelers.

By Roads.—The first important system of roads was developed by Rome. In their first beginnings the Roman roads were military in their purpose and character. They were intended as means of holding the provinces in subjection, rather than as means of exchanging goods with them. But as the power of Rome became more securely established the warlike purpose partly gave place to the peaceful one, and during the days of the empire there was a system of roads through Europe better than existed for many centuries afterward. In fact, down to the present day, in certain parts of Europe the best roads are the remains of the old Roman system.

With the downfall of the empire and the establishment of the feudal system there was again a period of commercial isolation. Trade by sea began to revive as early as the eleventh century, but it was not until the fourteenth century that the efforts of merchants in the towns were sufficient to give security and importance to inland traffic, nor was it until the establishment of the French national power in the seventeenth century that any power was strong enough to resume the work of the Roman empire in road-building. It was Colbert, the great financial minister of Louis XIV., who conceived the idea of the French national system of roads and waterways, which his successors have continued to develop. There is a system of national highways, chiefly radiating from Paris, under the direct control of the department of roads and bridges. These are now supplemented by a system of departmental roads, bearing the same relation to each department or district that the national roads bear to France as a whole, while between them there are the local or communal roads, which are laid out and constructed in the same haphazard way as those in the U. S. The long lines of river in comparatively level country have enabled the French engineers to devise, at comparatively slight expense, an internal system of navigable water routes in connection with the roads, so that France is, on the whole, less dependent on her railways than is any other civilized country.

In England there was no such system of national or departmental roads. Down to the beginning of the eighteenth century the English road system was in the hands of local authorities, and, as is always the case under such conditions, it was imperfectly cared for. The establishment of national highways in England was due to private rather than to Government enterprise. Turnpikes—so called from the bar or pike which can be turned to bar the road at points for the collection of toll—were first established at the beginning of the eighteenth century. They were usually built by trusts; that is, by bodies of semi-public officials who were authorized to borrow money for the purpose of constructing the road, and charge tolls, which should not only pay interest on the money thus borrowed, but ultimately, if possible, extinguish the principal. The English canals were built by private companies. The first important one was constructed in 1760. The next forty years was a period of great activity in canal-building, the Duke of Bridgewater being the most active promoter of these enterprises.

The U. S. was much later in developing a road and canal

system than England or France. This was due rather to the poverty of the country than to any lack of interest in the subject. The early roads were in the hands of local authorities—townships in New England, or counties elsewhere. In 1790 the first turnpike in the U. S. was built. The system developed first in Pennsylvania, but appears to have been carried further in New York. Some States gave subsidies to turnpikes, but on the whole they were built by private companies as a purely commercial enterprise. The one great public road of the U. S. was the national pike, or Cumberland Road, running from Washington by way of Wheeling, Columbus, and Vandalia, to the Mississippi river. It was built in sections, from 1808 to 1837. It was intended by its promoters as part of a large national system. Among the most prominent exponents of this idea were Gallatin in 1808, and Calhoun in 1818. Gallatin, as Secretary of the Treasury, urged the necessity of a comprehensive road system on economic grounds. Calhoun, as Secretary of War, argued in favor of the same proposal on military grounds also. Ultimately, however, the plan of national aid to roads was taken up—not by Democratic leaders like Gallatin and Calhoun, but by the Whig party. This party approved of internal highways on principle, as tending to bind the different parts of the country closer together, and to extend the influence of the central government. With the overwhelming victory of the Democratic party under the leadership of President Jackson the project of a national road system failed completely.

By Canals.—Canal-building in the U. S. was, for the most part, not in the hands either of private companies or of the national Government, but of the several States. By far the most important work of this kind was the Erie Canal, first projected in 1792, but actually built during the years 1817 to 1825. It proved so successful that it was enlarged in 1836, and for half a century, at least, was the most important internal transportation route in the U. S. The next best canal system was that of the State of Pennsylvania, which was useful and profitable until the development of railways, but afterward fell into comparative disuse. Some of the coal canals were also very successful, but the other canal routes were, as a rule, ill judged, if not ruinous. An important exception must of course be made in favor of those comparatively short ship-canal which virtually formed part either of the lake route or of the Mississippi system.

By Railways and Steamships.—The use of steam as a motive power revolutionized all transportation—inland and foreign alike. There were several reasons for this, of which the most obvious is not the most important. The obvious effect of the use of steam was quicker transportation. Its still more important effect was that its application to other forms of business created a greater amount of goods to transport.

When each village or each plantation lived within itself expensive roads were impossible, because the amount of traffic was too small to pay interest on a costly rail or water route, no matter how efficient it might be. But with the development of the factory system there came a chance for handling more traffic. The factories made goods on a large scale at very much lower prices than were admissible before. The difference between the old price and the new could be paid to any transportation agency which would lay down the goods in a market otherwise inaccessible. There thus grew up a demand for a means of placing factory products in distant towns and villages, and these in return were given the opportunity to send farm products to feed the larger towns in which the factories had collected. The amount of such traffic between town and country was now limited only by the question of price. Railways and steamships were developed as a means of doing an enormous business at low rates.

The two inventions were almost simultaneous, that of the steamship being slightly the earlier. The practical usefulness of this invention dates from the early years of the nineteenth century. As early as 1820 or 1830 it was extensively employed on inland waters and in the coasting trade. It was not until 1838 that a systematic effort was made to use it permanently on ocean routes. The first efforts of the British steamship lines, aided and backed by the Government, were connected with political and military considerations quite as much as with purely commercial ones. But by the year 1850 the commercial success of the new method was assured, and then there began the hard fight for supremacy between steam and sail. The owners of the sailing-

vessels made determined efforts to hold their own by increase in size, by greater care both in construction and management, and, above all, by a study of the prevailing winds, due primarily to Lieut. Maury, which enabled sailing-vessels to reach their destination faster by somewhat circuitous routes than by the old direct ones. But, in spite of these, each new invention gave steam a new advantage. The substitution of iron for wood as a material in ship-building helped the steamer more than the sailing-vessel. The substitution of the screw for the side-wheel was an important step in economy of propulsion, especially in head winds and rough water. The introduction of compound engines, and afterward of the triple or quadruple expansion, marked a further step in the same direction. Even the increase in size of the vessels gave steamers a new advantage. It increased the consumption of fuel somewhat, but it increased the carrying capacity far more. With each year the percentage of the world's steam tonnage becomes larger, and its sailing tonnage relatively, if not absolutely, smaller. Since 1880, besides these general improvements in construction and economy, there has been a further tendency to systematize ocean traffic by the division of labor among different classes of boats. Formerly each boat was built for general purposes, and took all the traffic that it could get. To-day there are ocean passenger-steamers, built for high speed and on fine lines, and endeavoring to make their passages in the shortest possible time; freight-steamers, running on regular lines, but built with a view to economy in coal rather than economy in time, and attracting freight by their regularity and convenience rather than by their speed or their appointments; and, finally, ocean tramps, or still cheaper steamers, running like sailing-vessels, wherever they can get a cargo. In this competition the sailing-vessel has the advantage of cheapness in motive power, but the steamer can be so much more rapidly utilized that it often more than makes up for this disadvantage.

For history of railway development and of the various devices connected with it, see RAILWAYS. This article is concerned rather with the social and economic effects—with the relation between the progress of invention on the one hand, and the growth of business on the other. Of the kind of use which would be made of the railway none of the early inventors had any idea. When the first charters were granted in Great Britain or Germany it was assumed that the company would own the road, and that private individuals would furnish the vehicles if not the motive power. Railway charges under this view were to be like tolls on a canal or turnpike. Nor has the legislation of the present day everywhere outgrown this view. Equally erroneous was the old view of the kind of service which railways would probably render. It was supposed that they would carry passengers rather than freight. It was predicted in 1830 or 1840 that passengers would very soon be carried at 100 miles an hour. On the other hand it was not supposed that railways could carry freight so cheaply as they now do, least of all that they could do it in competition with water routes. Some early charters actually tried to prohibit such carriage of freight. In 1856 there was an agitation in New York State to prohibit the New York Central Railroad from carrying freight in competition with the Erie Canal. But each decade was marked by a lowering of rates and an increase in freight traffic which usually made the reduced charges profitable. This reduction, which was comparatively slow until 1870, was much more rapid after the introduction of steel rails in place of iron. It was not the direct saving in expense which produced economy. It was rather the capacity of doing more work. The use of steel rails instead of iron made it possible to carry larger train-loads. With the increase in train-loads, as with the increase in size of steamships, the direct expense of running a train was slightly increased, but the amount which such a train could carry increased enormously. In the year 1870 a freight-car weighed 10 tons and carried 10 tons. In the year 1890 a standard freight-car weighed from 12 to 13 tons and could carry 25 tons. Two-thirds of the total weight of the train is profitable under the new conditions instead of one-half. A similar change took place in the size of locomotives. The new locomotives cost perhaps one-fourth more than the old to run, but they do from two to three times the work. In order to utilize this increased capacity, both of the cars and of the traffic, a system of rates was made to develop traffic. It was seen that in certain lines of business little or no movement could be obtained at high rates, while a great deal of business could be had if the rates were made lower.

This was the case with cheap articles like coal, stone, lumber, or even food products, especially if these articles were carried for long distances. Thus classification was introduced by which some goods paid more than others for the same weight, while the mileage system, which would make rates proportionate to the distance, was largely, if not wholly, abandoned. The effect of this change has been a reduction of rates at almost every point, combined with vastly increased efficiency of the railway system. It has also contributed to the further development of improvements in construction and economy. In the U. S., instead of cheap railways built to carry a small amount of traffic at two or three cents a ton per mile, there are being substituted more expensive roads carrying much larger traffic at one cent, half a cent, or, in certain exceptional cases, a quarter of a cent a ton per mile. Each increase of traffic makes it possible to introduce improvements in construction. Each improvement in construction renders it profitable to do an increased business at lower rates, and each lowering of rates enables the shippers to increase the volume of traffic furnished.

Yet all this reduction increases rather than diminishes the possibility of extortion on the part of the railway managers (see INTERSTATE COMMERCE), and renders the question of the organization of transportation service and its relation to the Government even more important.

Service rendered by Transportation Agencies.—This may be divided into two main heads: first, the transmission of intelligence; second, the transportation of persons and property. The former work has been kept in large measure in the hands of the government. There are obvious reasons for this. As a mere matter of military strength the government must have under its own control the means of transmitting intelligence as quickly as private individuals, if not more quickly. The establishment of political power of any kind has been usually followed by an assumption of the postal service. It was so with the Hanseatic League of free towns in the Middle Ages. It was so with the renewed national life of France in the seventeenth century, just described. In England for a time the postal service was left to some extent in private hands, but the results of this were not satisfactory either to the Government or to the public. It was made a Government monopoly by the legislation of 1649 and 1651, although it continued to be farmed out to some extent until the next century. The usefulness of the British post-office dates from the year 1784, the establishment of low postal rates from 1840. (See POSTAL SERVICE.) The U. S. postal service was a Government monopoly from the outset, and now there is scarcely a civilized country of which the same thing can not be said. The disadvantages in economy due to government administration are more than counterbalanced by the general public considerations already alluded to. The only questions at issue between the advocates and opponents of government activity are connected with the parcels post or express business and the telegraph. In Great Britain the telegraph was controlled by private companies until 1870, and the British parcels business is handled by the railways and private companies, and by the Government since 1883. But on the continent of Europe both of these matters are managed by the Government. In the U. S. the parcels business is done by private companies. The Government is willing to do a certain amount of such business, but under the conditions of Government efficiency it seems impossible for it to handle the great bulk of such traffic in competition with private companies. The rates would probably be higher, the responsibility would certainly be less. The only method of organizing a Government parcels post on a large scale would probably be to prohibit the express companies from doing business of that kind, and for such a measure the public is by no means ready. Neither the higher rates, the lessened responsibility, nor the extension of official patronage would be a desirable result. While the Government, in virtue of long-standing custom, can prevent private persons from carrying letters, it would find it impossible to prevent them from carrying parcels.

The question of the telegraph presents much greater room for doubt. In the first place there is great public dissatisfaction with existing conditions. The telegraph business of the U. S. is almost entirely in the hands of one company, and, rightly or wrongly, it is believed that the rates charged by this company are unnecessarily high. They are on an average higher than those of most countries of Europe, and in connection with this the amount of general use of the telegraph in the U. S. is less than in two or three other

countries where the government manages the telegraph lines. Add to this that the Government telegraph in Great Britain has given great satisfaction, and there are strong reasons for the popular demand for the change. On the other hand, it is urged by the opponents of a government telegraph that the rates in the U. S. are not really higher than those of Europe, if we take distance into account, and that, though distance itself is not an important direct factor in telegraph rates, the sparseness of population which is connected with this fact of long distance is overwhelmingly important. They can also show that, in spite of the abuses charged against the Western Union Company, the capitalization of the telegraph lines of the U. S. per mile of line, per mile of wire, or per office is not high as compared with that of Great Britain; that the expenditures of the British Government on telegraph lines have been extravagant, and that the economy of operation of the British Government has been questionable; in short, that most of the economic objections against various forms of state activity may be urged in this case also.

Railway Ownership.—This question involves wider interests, and has given rise to more conflicting arguments, than that of the post-office or even the telegraph.

In the early stages of railway development governments were more concerned to encourage railways than to control them. Each nation saw how important it was to have railways. Few, even among the most far-sighted statesmen, perceived that the power connected with railway ownership might one day become dangerous to large public interests. All were anxious to have railways, and were ready to give such help as was necessary to that end. Sometimes the state built the roads, sometimes it gave money to private companies. Partial state ownership or an extensive subsidy system was the general rule. Great Britain was the only exception. There was so much capital in Great Britain seeking investment that no such encouragement was needed. In Ireland, where capital was scarcer and more timid, the British Government did not scruple to grant subsidies. In the U. S. the national Government from 1850 to 1857 gave large grants of land, and after a few years' interruption renewed the same policy on a still larger scale in 1862, also giving to two large railway systems, the Union and Central Pacific, a cash subsidy of \$25,000 per mile. (See *SUBSIDIES*.) Equally extravagant cash payments were made by States and municipalities in the years preceding the crisis of 1873. There are no adequate data on the subject for the U. S. as a whole, but the records of so conservative a State as Massachusetts show that public assistance to the amount of something like \$30,000,000 was given to the railways of that State, usually to the ones that did not pay, and sometimes to those that were not built, at least for many years after the payment of the subsidy. Much of the most burdensome part of the local debt of the U. S. is due to grants of this kind, whether in the form of subscriptions to capital stock or to bonds in aid of new roads. France went further than the U. S. The Government systematically defrayed about half of the original cost of the French railways. It laid out the road, did the grading, the tunneling, the bridge construction, and everything to the level of the line itself, leaving to the companies only the expense of track, buildings, and equipment. In addition to this the French Government granted to a few large companies a monopoly in their several districts, and this monopoly has proved so strong that no subsequent efforts have been able to break it.

In other countries of Europe the state actually built and operated the railroads to a greater or less extent. In Belgium this policy was pursued at the outset. The state built the best lines, leaving the private companies to occupy less advantageous fields of traffic. Somewhat later the states of South Germany pursued a policy like that of Belgium. Prussia at first did just the converse. It allowed the best lines to be built by private companies, with more or less aid and encouragement from the state; it then built and operated on its own account, as a military or political necessity, those lines which private enterprise was unwilling to undertake. Austria vacillated between the German and the French policy, building some roads on Government account which it afterward sold to private companies below their true value. In Scandinavia and in Hungary the roads were generally owned and operated by the Government. In Russia, in Italy, in Switzerland, and in Spain private enterprise was the rule down to 1870. In one sense all the roads of continental Europe are government property because they will, by the terms of their charters, revert to the state

about the middle of the twentieth century. Such is the theory, but it is not of much importance in practice.

After the year 1870 there was a strong movement among the nations in favor of increase of government control, if not actual ownership. This was due to several causes. In the first place the wars of 1859, 1866, and 1870 had awakened in Europe a feeling of national life and a desire to have a strong government, with widely extended activity. In the second place, certain abuses of railway power had developed themselves which led people to think that the government might do better. Every day also it became clearer that in the management of railway enterprises monopoly was the rule and combination the exception, and it was thought that the management of any such powerful monopoly should be in the hands of the government itself. In those countries like the U. S., where there were practically no government lines, the agitation in favor of national ownership was fruitless. There was some talk on the subject in connection with the Granger movement, but the only practical results of that movement lay in the direction of legislative control instead of actual ownership. (See *INTERSTATE COMMERCE*.) But in those countries where there was already a state railway system in existence the government, besides building new roads of its own, bought many of the old roads from private companies. This movement was first felt in Belgium, where the Government, in the years from 1870 to 1885, purchased most of the private lines and made close traffic arrangements with the roads, so that it now owns, in round numbers, three-quarters of the railways in the kingdom, and has considerable control over the policy of the remainder. The same movement was felt in Germany a little later. It seems to have been Bismarck's desire that the German empire, as such, should own and manage its railways. But this project, though urged more or less seriously from 1871 to 1877, met with opposition from the states of Southern Germany, which already controlled their railway systems and were jealous of encroachments by the imperial power. Defeated in his plan of organizing a German state railway system, Bismarck was forced to content himself with the extension of the Prussian state railways, and in this project he succeeded. In 1878 out of 11,000 miles of railway in Prussia, 6,000 were owned and managed by private companies, 2,000 owned by private companies but managed by the state, and only 3,000 miles owned by the state itself. In the years 1879 to 1881 the Government gradually acquired nearly all the railway lines previously managed by private companies. On May 1, 1894, out of 27,589 km., or 17,105 miles, of railway in Prussia only a few hundred miles were in private hands. There was little or no compulsion connected with the purchases. The prices paid were so high as to make it worth while for the stockholders to sell, the stockholders of the Berlin-Hamburg line obtaining Government securities which gave them a guaranteed income of over 16 per cent. on the par value of their shares. Austria followed the example of Prussia, but less completely, because the Austrian Government was not financially strong enough to conduct its operations on so rapid a scale. During this period Italy also moved in the direction of state railway management. Even in France there was a movement, under the leadership of Gambetta, to establish a strong national system of roads, partly as a means of military training for Government officials, partly as a check to the irresponsible activity of private lines. In those countries which had had few railways until 1870, most of the lines were owned or at least managed by the state from the very outset. Such has been the case in the extreme east of Europe, in many parts of South America, and, above all, in Australia. It has been to a considerable extent true of British India also.

About the year 1881 a counter-reaction against state ownership began to make itself felt in some quarters. This was noticeably the case in France, where, by a convention of 1883-84, the state system was confined to a relatively unimportant district in the southwest. The Government went so far as to abandon the idea of a line of its own to Paris, and in so doing it gave up all prospect of becoming a controlling power in the railway system of the republic. Still more important were the developments in Italy. In 1876 the triumph of state railway management there had seemed as fully assured as in Germany, and much more so than in Austria. But the financial burdens of the change were great, and the results of state management not wholly satisfactory. It was considered better to lease the Government roads to private companies for the time being, and to appoint a commission to consider what should be the per-

manent arrangement. This commission sat from 1878 to 1881, and its conclusions, based as they are on practical experience, form perhaps the strongest argument against government management of railways. The conclusions of the commission were: 1. That the state can not be expected to make lower rates than private companies. The theory that government railways can foster industrial development does not work in practice. The state is much more likely to tax industry than to foster it, and when anything of the sort is attempted, the state is more arbitrary than a private company and less subject to any outside control. 2. State management is, on the whole, more costly than private management. 3. The political dangers connected with state management are very great. So far from finding that the power of railway rings is checked by putting the roads into public hands, the commission believes that the power of such rings is increased. Politics corrupt the railways, and the railways corrupt politics. Rates are made to influence elections rather than to meet the necessities of traffic or of sound finance. On the basis of these conclusions the commission urged the Italian Government to give the railways into the hands of private companies for operation.

On the other hand, it should be said that the feeling in favor of state ownership in Germany and Austria shows no signs of abating; that Switzerland is gradually being drawn into a policy of nationalization of its railway lines; and that neither British India nor Australia shows any tendency in the direction of private ownership. In the U. S. the platforms of the Farmers' Alliance and the People's Party declare in favor of Government railway ownership, though it may be questioned how far those who have framed the platforms would be ready to meet the financial burdens involved in any such change.

It is extremely difficult to compare, with any degree of fairness, the results of the two systems of railway ownership, state and private. Such figures as can be given serve more than anything else to show the difficulties of the subject, and to indicate that the question is one whose solution depends largely upon national character.

The countries which have, on the whole, developed their railway systems most rapidly are Great Britain and the U. S. Care must be taken to avoid laying too much stress on this fact, which is quite as likely to be due to the exceptional wealth of these two countries as to any difference in system. If we compare Germany and France we find that Germany, with state-owned roads, has larger mileage and traffic than France, with subsidized roads. But the French roads are, as already stated, in the hands of a strong guaranteed monopoly. In general, it seems to be the rule that railway development is fastest under free competition, next fastest under government monopoly, and slowest under private monopoly. In the facilities furnished, the results of competition, though imperfect, show a still more marked superiority. The miles run by trains in the U. S. in the year 1891 amounted to over 830,000,000, or 13 miles for every inhabitant. In Great Britain the figures for the same period show an average of about 8 miles, in Germany barely 4 miles, and in France a little less than in Germany. In other words, the amount of railway service offered is vastly greater under competing private lines than under a monopoly, even though it be in the hands of the government. Equally marked is the difference in speed. Much the fastest trains are run in Great Britain and the U. S., a great many of them in the former country, a few of equal merit in the latter. Until recently France came next, though at a long interval, with Germany a bad fourth. Since the accession of William II. there have been efforts at increased speed, but the one fast train between Berlin and Hamburg, of which so much is said, does not surpass in speed the best English or American trains, and there is nothing else in Germany which even approaches them. With regard to rates, the matter is much more even. The average charges for freight and passengers on the railway systems of leading countries in 1887 were as follows:

COUNTRY.	Per passenger per mile, cents.	Per ton per mile, cents.
United States.....	2 16	0 94
Great Britain.....	About 2	Less than 2
France.....	1 39	1 77
Prussia.....	1 32	1 43
Austria.....	1 54	1 85
Russia.....	0 80	1 00
India.....	0 54	1 36

The question of high or low rates, as will be seen from this table, depends not so much upon the form of ownership as upon the character of the traffic. In a dense population and with small train service, like that of India, passenger rates will be relatively low. With a comparatively small population and high demand for train service, passenger rates will be relatively high. The U. S. pays more per passenger mile than any other country in the list, because a saving of time is of more importance to a large part of the people than a saving of money. If the people of the U. S. were willing to have the relatively small train service of continental Europe or of India, they could have the passenger rates of continental Europe or of India also. If a man is making only 20 cents a day, he can afford to wait the whole day to save 20 cents. If he is making \$2 a day he can afford to pay \$1 to have a train go at the time it suits him. This is in large measure the explanation of the differences in the table. On the other hand, the differences in freight rates are largely influenced by distance hauled and by character of the traffic. In the U. S. or Russia, where there are long-distance shipments of grain or other similar commodities, the freight rates will be low, independently of railway management. In Great Britain, for the converse reason, freight rates must be high. Here again we may say with some qualification that the lowest rates will be found under competition, the next lowest under government monopoly, and the highest under private monopoly.

With regard to abuses of power in the matter of rates, there is little to be said in favor of one system against the other. Wherever there is competition there is a tendency to make special rates and give secret rebates to those who least need or least deserve it. This was one of the controlling facts which drove Belgium and Prussia to extend their government railway systems. The government could not control the acts of its own agents when those agents were working in competition with private lines. In the years preceding 1870 the very worst abuses of the rate-making power were found in the government lines. The question whether special rates can be avoided depends largely upon the extent to which a monopoly can be secured by the railway companies. Whether that monopoly is in the hands of the government or of private companies does not appear to make any very great difference. In either case the advantage, such as it is, is obtained at a sacrifice of development and cheapness. The leveling process results in leveling up, not in leveling down.

There is no greater mistake than to suppose that because government represents the people, therefore if government owns the roads the people will get lower rates. Most of the advocates of state railway ownership in the U. S. think that there is a large fund of profit which now is divided among stockholders, but which would go to the shippers if the nation owned the railroads. Now, in the first place, there is no such large fund of profit. Railways in the U. S. barely pay interest on their investment. Even if we make all allowance for water in stock, it is not likely that the net earnings of railways are equal to 4 per cent. of the capital actually invested. If it be said that there is a fund of legitimate profits of which the community might get the benefit under a state railway system, we may reply that there is reason to believe that those legitimate profits would be larger rather than smaller under national control. Whatever may be said about the unrighteous stock issues of roads in the U. S. it is certain that, quality for quality, the capitalization of these roads is less than that of any similar railway system in the world. The effective or net capitalization of the railways of the U. S. is about \$50,000 a mile. Australia, with a vastly inferior system, has an average capitalization of about \$40,000, as nearly as can be ascertained. Germany and Austria, with systems approximately equal to those of the U. S., superior in construction, but inferior in usefulness, are capitalized at nearly \$100,000. Whatever waste or abuse may have been incident to private management, it is certain that the capital accounts of foreign railways show an even greater waste, due to the inefficiency inseparable from government contracts.

The important thing for each country is to get the management of its transportation industries into the hands of the most far-sighted and competent men. If a country like Germany has such traditions that the best administrative talent is to be found in the Government service, it is probable that a state railway system, even with the inevitable evils of monopoly, is on the whole the best. If, on the other

hand, the best administrative talent is found in private rather than public business, which is noticeably the case in the U. S., a change from private to public management would be attended with all the evils noted by the Italian commission, and would prove a burden instead of a relief to the business interests of the country. See COMMERCE, RAILWAYS, and STREET-RAILWAYS. A. T. HADLEY.

Transportation: as a punishment for crime, the transfer of a convict to a limited part of a kingdom, under pains and penalties for leaving the limits before the expiration of the term of transportation, and with or without other forms of punishment being added. This form of punishment was unknown at the common law in England, although in the case of a criminal's taking sanctuary and confessing his crime he was allowed to leave the kingdom, taking an oath of abjuration, which bound him never to return. Sanctuary and abjuration were abolished by the act of 1 James I., c. 25, and 20 James I., c. 18. The earliest case of transportation seems to have occurred in the reign of Charles II., when transportation was made a condition of pardons granted to persons convicted of capital crimes. This practice was subsequently greatly extended by legislation, and especially by the act of 1768; and transportation was first legalized as a direct punishment, by sentence of the court, by the act of 4 Geo. I., c. 11. During the eighteenth century and the early part of the nineteenth an immense number of acts were passed by which various terms of transportation, with alternative terms of imprisonment, and power, in some cases alternative and in others cumulative, to order whipping, were provided for the punishment of particular offenses. This legislation was utterly lacking in uniformity and was guided by no principle, and the statutes themselves contained so many capricious variations as to be incapable of any systematic classification on principles. A statute providing for punishment by transportation might and generally did contain the following provisions:

- (1) A maximum term of transportation.
- (2) Intermediate terms of transportation.
- (3) A minimum term of transportation.
- (4) A maximum alternative term of imprisonment with or without hard labor.
- (5) A minimum alternative term of imprisonment.
- (6) Power to inflict whipping, publicly or privately, and once or more than once.
- (7) Power to inflict solitary confinement during a certain part of the term of imprisonment.

And these seven varieties of punishment were combined in all imaginable ways. In making these provisions a very wide, and yet capriciously restricted, discretion was left to the judge, and in the great majority of cases the judge could inflict as little punishment as he chose. In a few cases only was the punishment prescribed absolutely; in many cases a greater or less minimum of punishment was of necessity inflicted.

This condition of affairs continued until in 1816 an act (9 and 10 Vic., c. 24, § 1) was passed which provided that in all cases where any court was empowered to pass a sentence of more than seven years' transportation it should have power to pass instead sentence of transportation for any term not exceeding seven years, or sentence of imprisonment with or without hard labor for any term not exceeding two years.

The places to which criminals were sent from Great Britain under sentence of transportation were some of her colonies, most notably those in Australia, and the great extent to which this form of punishment was carried was made possible only by the fact of her possessing them. The criminal population in this manner became concentrated in small districts, and there they married, and by the natural increase and the numbers constantly added by newly transported convicts, this population was increasing with great rapidity, and extending throughout the colonies to which they had been transported. Meanwhile the colonies themselves were rapidly becoming more thickly settled by colonists of the better class, and their power and resources enormously developed, and they began to make objection to any further practice of transportation to their territory. Principally owing to these objections the punishment of transportation was gradually abolished between 1853 and 1864, and penal servitude or imprisonment and hard labor on public works was substituted for it. The punishment of penal servitude consists in keeping the offender in confinement, and compelling him to labor in the manner and under the discipline

appointed by the acts relating to penal servitude. Imprisonment at hard labor consists of the detention of the offender in prison so that he shall be prevented from having any communication with other prisoners, and in forcing him to work at the treadwheel, shot-drill, crank, capstan, stone-breaking, or some other description of labor lawfully substituted therefor. The Penal Servitude Acts authorized the carrying out of the sentence in any part of the kingdom, and under these acts criminals were kept in confinement at Bermuda till 1862 and at Gibraltar till 1875. The difference between the two punishments is thus rather nominal than real, and the provisions of the act which regulated transportation are still in force as regards prisoners under sentence of penal servitude. Actual transportation, however, was practically discontinued.

The usual minimum term of transportation, when that punishment was commonly inflicted, was seven years, but imprisonment might in many cases be alternatively inflicted for three, four, or in some cases seven years. When penal servitude was substituted for transportation the punishment of imprisonment at hard labor had been made more severe and shorter than it had been, and in nearly every instance two years was the maximum term of imprisonment at hard labor permissible to be inflicted. At first the minimum term of penal servitude was three years; in 1864 it was raised to five years, and in 1891 it was again reduced to three years.

The use of transportation has been practiced more or less by other nations than the British, but its use has never obtained among British colonies nor to anything like the extent to which it was carried in Great Britain, except in the case of Russia, which still uses the territory of Siberia as a place of transportation of criminals of certain classes. See SIBERIA.

See the articles on PUNISHMENT and PRISON DISCIPLINE, etc.; also Sir James Stephen's *History of the Criminal Law of England*, and *Digest of the Criminal Law*.

F. STURGES ALLEN.

Transposition [from Lat. *transponere*, *transpono*, set over, remove, transfer; *trans*, across, over + *ponere*, put]; in music, the act of removing a composition into a key different from that in which it is written. By this is not meant a change of mode also. A piece of music written in a major key, for instance, can not be transposed into the corresponding minor (as from C major to C minor), unless its construction has been such as to make such a transfer possible. A composition in any major key may be transposed into any other major key; and the same rule applies to compositions in minor keys. Transposition is not simply the moving of all the notes of a piece one or more degrees higher or lower, for such a change would at once destroy or impair its distinctive character. If the scale consisted of a series of regular and equal degrees this might readily be done, and a composition would suffer no injury by being moved from any key to any other. But as the scale is not a regular but an irregular series of sounds, consisting of five whole tones and two semitones arranged in a fixed and invariable order, and as all music is now written on such a scale, and no other, it follows that we can not transfer a composition without injury into a new key until we have brought the scale of that key into conformity with that in which the piece is written. A composition in C major, for instance, if carried three degrees higher—i. e. into the scale of F—would be false on every fourth degree of that scale, because one of the semitones in the series differs in its position from the normal pattern in C. To rectify this we lower the fourth (or B) by placing at the clef a flat on that degree; and by thus changing every B into B \flat we correct the scale, and transposition from C to F requires nothing more than a change of the places of the notes. Again, if we would transpose from C to G, we shall find a defect of an opposite kind on the seventh degree of the G scale, which must be corrected by changing every F into F \sharp . On the same principle we proceed in transposition into any other key, correcting by sharps or flats the deviations of any desired key from the model scales of C major or A minor. See KEY.

Revised by DUDLEY BUCK.

Transubstantiation [from Late Lat. *transubstantiatio*, deriv. of *transubstantiare*, transubstantiate; *trans*, over, across + *substantia*, substance]; a scholastic term signifying the change of the substance of the natural elements of bread and wine into the very body and blood of Christ in the Eucharist, while the visible form and the appearance of

bread and wine remain. According to the teaching of the Roman Catholic Church, this miracle takes place in the Mass whenever the priest pronounces the words of institution: "This is my body," "This is my blood." The doctrine was more or less clearly suggested by several Greek and Latin fathers (under different terms, such as *transitio*, *transmutatio*); it was controverted in the Middle Ages by Bertram (Ratramnus) and Berengar, but defended by Paschasius Radbertus (831), Lanfranc, and the chief Schoolmen, confirmed by the Lateran Council (1215) and the Council of Trent (Oct. 11, 1551), and learnedly defended by Bellarmine, Bossuet, Möhler, Perrone, and Cardinal Wiseman (in a dissertation on John vi.). The Church teaches not only that Christ is present in the blessed Eucharist, but that he is present by transubstantiation. The very words of consecration, as given in the Gospels, seem to prove this doctrine. The teaching of the Church is conformable to the literal interpretation of these words. See Cardinal Wiseman's *Lectures on the Holy Eucharist*. Revised by J. J. KEANE.

Transvaal Republic: See SOUTH AFRICAN REPUBLIC.

Transylvania (Hung. *Erdély*; Germ. *Siebenbürgen*): the southeast part of the kingdom of Hungary. Area, 21,518 sq. miles. There are fifteen counties; pop. (1890) 2,247,049, of whom about 55 per cent. are Roumanian, 29 per cent. Magyars and Szeklers, 10 per cent. Germans, and nearly 50,000 gypsies. The country is hilly and mountainous, with a mean elevation of 1,444 feet, with the Carpathians on the E. and the bold Transylvanian Alps on the S. The drainage is into the Danube, chiefly westward by the Maros and Körös to the Theiss, but the Aluta and some lesser streams make the traverse of the Transylvanian Alps southward directly to the Danube. Of the soil, 37 per cent. is in forests, 23 in plowed land, and 17 in meadows and gardens. The chief crops are maize, wheat, oats, fruits, tobacco, flax, and hemp. Wine is made in large quantities, especially in the Maros basin. The climate is mild and agreeable in the lower lands. The horses number 188,000, and the breed is excellent. Cattle are reared in large numbers, and the breeding of sheep and swine is general. Mining has been a very important industry, and Transylvania used to be called the gold mine of Europe. Gold has been obtained from time immemorial, and is produced in considerable quantities from both mines and placers. Silver and iron are also mined. Manufactures and other industries are not well developed, and are declining because of the recent political and Slavic tendencies which are driving out the Germans. Trade is largely with Roumania, and is in the hands of Armenians and Greeks. About 12 per cent. of the population is Roman Catholic, 27 per cent. Greek Catholic, 32 per cent. Greek Oriental, 10 per cent. Lutheran, and 14 per cent. Calvinist. There is a university at Klausenburg, and there are many secondary schools.

Transylvania was a part of Dacia, acquired by Trajan and colonized by Dalmatians, Gauls, and people from Roman Asia Minor. When the Roman empire was in decay this region was especially exposed, and was occupied by race after race of the invaders—latest by the Magyars. In the twelfth century colonists were again introduced, this time from the basin of the Rhine (Teuton), and there called Saxon. The Saxons built the most of the existing cities. After the defeat of the Hungarians by the Turks at Mohács in 1526 Transylvania was independent till 1690. After that it became a grand duchy and crown-land of Austria, and so remained till 1867, when it became, politically and administratively, an integral part of the kingdom of Hungary. See Gerard, *The Land beyond the Forest: Facts, Figures, and Fancies from Transylvania* (2 vols., 1888).

MARK W. HARRINGTON.

Trap, or Trap-rock [*trap*: Germ. *trapp*, from Swed. *trapp*, deriv. of *trappa*, a stair, stairs; so called from the stair-like arrangement often observable in these rocks]: a name indiscriminately applied to any dark-colored mass of igneous rock, regardless of its composition. On account of its lack of definiteness it is passing out of use as a geological and petrographical term. To a very great extent the name has been applied to basaltic masses. See BASALT, BUILDING-STONE, and ROCKS. J. P. I.

Trapani, tra-pa'ñ-nēē (anc. *Drepanum*): a town on a scythe-shaped peninsula of the extreme point of the west coast of Sicily; lat. 38° 3' N., lon. 12° 30' E. (see map of Italy, ref. 9-E). The churches, the municipal palace, the Giudecca, etc., are worthy of notice, and contain interesting artistic objects. The celebrated sanctuary of the Madonna

of Trapani (finished 1332) is outside the town. The harbor is convenient for the coasting trade, and it has been made much more safe of access for foreign vessels by the erection of a mole and of lighthouses. About 3,000 vessels enter this port annually, the trade being chiefly in fish, coral, sponges, wine, oil, fruits, cotton, semolino, etc. Among other local industries are works in marble, alabaster, coral, and shell. The art of cutting cameos in shell is said to have been revived here. Here in 249 B. C. the Carthaginians defeated the Romans in a famous naval battle. Charles V. made this place a great military station for the defense of this coast against the Saracens, and it was at this time called *Inveltisima*. Pop. of commune (1893) 47,000.

Revised by M. W. HARRINGTON.

Trapezuntios, GEORGIOS: Italian humanist; b. in Candia, 1395. He fled before the Turkish invaders and reached Venice in 1430, and was employed by Francesco Barbaro as a copyist. He learned Latin under Guarino and Vittorino da Feltre, and acquired so great a proficiency in that language that he became a celebrated teacher of Latin literature and rhetoric. He taught in a number of Italian cities—Venice, Padua, Florence, and Rome. Befriended by Pope Nicholas V., he translated Eusebius, Cyril, the *Homilies* of Chrysostom, Plato's *Laws*, and Aristotle's *Zoology* and *Rhetoric*, and the *Almagest* of Ptolemy, translations characterized by an incredible negligence, wanton omissions and changes in *majorem dei gloriam*. He was engaged in unseemly quarrels with most of the great humanists of the fifteenth century, and is withal one of the most typical, albeit disgusting, figures of the Renaissance. He died in abject poverty in Rome, Aug. 12, 1484. Cf. G. Voigt, *Wiederbelebung des klassischen Alterthums*, ii., pp. 138-144. ALFRED GUDEMAN.

Trappists: a monastic order of the Roman Catholic Church deriving their name from La Trappe, an abbey of the Cistercian order, situated in the department of Orne, Normandy, and founded in the middle of the twelfth century. Here Armand Jean le Bouthillier de Rancé, who was consecrated abbot on July 13, 1664, introduced those severe reforms which made the Trappists one of the most austere orders of the Roman Catholic Church. He was at first opposed both by other Cistercian monasteries and by the monks themselves, whose practices had become so disorderly, by neglect of the ecclesiastical authorities and by other unfortunate circumstances, that they were generally called the "brigands of La Trappe." But after some years' persevering exertions he saw his rules adopted not only in La Trappe, but also in Tamié, a Cistercian monastery near Faverges, in Upper Savoy. Twelve hours of the day were given to religious exercises, and several hours to hard labor. Vegetables and water formed the fare; meat, wine, etc., were forbidden, and conversation between the monks themselves or with outsiders was avoided. The whole life tended to concentrate the mind on the sole idea of death. During the Revolution the order was suppressed in France, and it possessed at that time only two monasteries outside of France—one in Germany and one in Tuscany. In 1817, however, La Trappe was reopened, and in the meantime a Trappist colony had settled in 1803 at Pigeon Hill, near Conewago, Pa., whence they removed in 1805 to Kentucky, and finally, in 1813, to Tracadie in Nova Scotia. A second colony settled in 1848 at Gethsemane, Ky., and a third at New Melleray, near Dubuque, Ia. In France the order was dissolved in 1830, though the law of dissolution was not enforced; in Italy it was suppressed in 1870, and in Germany in 1874. See Marsollier and Maupeau, *Vie de l'Abbé de la Trappe*; Chateaubriand, *Vie de Rancé* (Paris, 1844); *Histoire religieuse et littéraire de l'Abbaye de la Trappe* (Paris, 1824); Gaillardin, *Les Trappistes ou l'Ordre de Cîteaux au XIX^e. Siècle, Histoire de la Trappe depuis sa Fondation*, etc. (Paris, 1844). Revised by J. J. KEANE.

Trasime'nus, Lacus: See PERUGIA, LAKE OF.

Tras-os-Montes [Portug., liter., beyond-the-mountains]: province of Portugal; bounded N. and E. by Spain, S. by the river Douro, and W. by the province of Minho. Area, 4,307 sq. miles. Pop. about 400,000. It is mountainous, and of a rather rugged and wild character, but its valleys are very fertile, and produce, besides more wheat than is demanded for home consumption, excellent fruits, and the famous port wines, whose cultivation is confined to one district, called Alto Douro. The mineral wealth is great, but entirely unused; the mulberry is extensively grown, and silk-culture carried on with success.

Travancore': a feudatory state of the British-Indian empire, on the southwestern end of the Indian peninsula; area, 6,730 sq. miles; pop. (1891) 2,557,736, chiefly Hindus, containing, however, the unusually large number of 500,000 native Christians, 300,000 of them Nestorians, as well as remnants of ancient Jewish colonies. A most turbulent sect are the Moplahs, Mohammedans who inhabit the N. of the state. Owing to a large outlay of state money on public irrigation, works, and roads, the condition of the laboring and agricultural classes has been improved; roads connect the harbors of Quilon and Trivandrum with the interior. The British-Indian penal code, altered to suit the characteristics of the people, has become part of the law of the state. The revenues are quite large and are economically used, the expenditures being less than the income. The palace expenditure is very moderate, the greater part of the revenues being devoted to public works, to religious institutions, to education, and to judicial and police establishments. The state pays to the Indian Government an annual subsidy of £80,000. Besides coffee and pepper, the production of which is on the increase, cardamoms, areca, and coconuts are among the chief products. The capital is Trivandrum, on the Malabar coast. Revised by M. W. HARRINGTON.

Travelers. Legal Rights of: Many of these are stated in the articles on CARRIERS, COMMON; INNKEEPER; HIGHWAYS; NEGLIGENCE, and ROAD, LAW OF THE. The liability of the state, or of its subdivisions, for damages caused to travelers by defective highways is purely statutory; no such liability existed at common law. As a rule, statutes of this character receive a close construction. (See INTERPRETATION.) It is generally held that they require only the traveled portion of country roads to be free from defects, not the entire surface of the street as in cities. Moreover, the liability does not extend to every one lawfully upon the highway, but to such persons only as are using it for the ordinary and proper purposes of travel. Accordingly, children who use the highway as a playground on their way home from school, or who are coasting for pleasure and not for transit; persons who are loafing by the way as distinguished from those who have stopped temporarily for a purpose incidental to their use of the road as travelers; those who are racing horses, and those who have not reached the traveled portion of the highway, have been judicially denied the statutory rights of travelers. *Brown vs. Skowhegan*, 82 Me. 273.

Tickets.—Travelers may be required by carriers to provide themselves with tickets before taking passage, and to produce them whenever required, as the only evidence receivable by the carrier's servants of the payment of fare. They may be limited in point of time to the day on which they are issued, or to a through trip, or to an excursion-train. (*Elmore vs. Sands*, 51 N. Y. 512.) At times, tickets are formal written contracts by whose terms the purchaser is bound, whether he knows them or not. (*Pomsea vs. Cunard Steamship Co.*, 153 Mass. 553.) In the case cited the ticket consisted of a sheet of paper of large quarto size, the face and back of which were covered with written and printed matter. Other tickets do not purport on their face to be formal contracts, although they may contain provisions which if known to both parties would make them such. In these cases the provisions are not binding on the traveler unless he know of them, or unless the carrier did what was reasonably sufficient to give the purchaser notice of them. (*Richardson, etc., Co. vs. Rowntree* [1894], Appeal Cases 217.) Still others appear to be mere checks or tokens. These do not constitute the contract between the traveler and the carrier. That consists of the offer made by the carrier and its acceptance by the traveler; and the offer may include the public advertisements of the carrier, the general customs of carriers, the usages of the particular carrier so far as notified to the traveler, the special representations by the carrier or his authorized agents, and the language of the ticket which has been brought properly to the traveler's attention. (*Logan vs. Railway*, 77 Mo. 663; *Frank vs. Ingalls*, 41 Ohio State 560.) The traveler may demand a seat before surrendering

his ticket, and upon giving it up or tendering it may take a seat temporarily in a drawing-room car if none is provided for him in a common coach. (*Thorpe vs. N. Y. C. Ry.*, 76 N. Y. 402.) If a seat can not be provided for him, he may retain his ticket, refuse to pay his fare, leave the train, and sue for damages, or he may, and he usually does, accept such accommodations as are afforded him, and surrender his ticket. FRANCIS M. BURDICK.

Traveling Sidewalk: a pathway or platform, with or without seats and covering, moving in a continuous manner with a uniform speed and utilized as a means of transportation. The idea is not a new one, even as at present developed, but was conceived about 1870. Such a device was suggested for use in the Paris Exposition of 1889, and has been the subject of numerous patents in the U. S. and in Europe, but it remained for a U. S. company to bring it first into practical use in 1892.

The essential features required in a sidewalk of this nature are, first, that it shall be continuous and in the form of a loop or belt railway, and, second, that one or more intermediate platforms or steps between the first platform and the fast-moving platform, on which the seats are usually furnished, shall be moved at such a low rate of speed as to enable the passenger to step readily from the first platform to the next and faster-moving platform and from that to the third and so on to the seated platform, the differences in speed between each two adjoining platforms or steps being the same. Experience has fixed this difference at from 2½ to 3 miles an hour. The most simple form of such a sidewalk is, of course, one in which separate cars or trucks move on separate tracks, each having its own motive power and each moving at its own proper speed; but as the first platforms are merely steps, and as the difficulty of maintaining

FIG. 1.—View of traveling sidewalk, Jackson Park, Chicago, 1893.

with different motive power the proper relative motions between the platforms or steps is very great, a simpler means is requisite. The system was not fully developed until electricity had made practical the economical, compact, and direct application of power by means of trolley wires and motors attached directly to the trucks, and mechanism had been devised for moving one or more step platforms by the same trucks that furnished the propelling power for the fast-moving platform.

A third and perhaps in many respects the most important feature is a flexible rail to move on the tops of the peripheries of the wheels. These devices and improvements were first put to a practical use on an experimental road constructed under patents issued to Max E. Schmidt and J. L. Silsbee, in the Columbian Exposition-grounds in Chicago. The mechanical and practical success of this device led to its adoption and use on the Long Pier in 1893 and 1894, in the same grounds, where a road in the form of a loop 4,300 feet in length was erected. The radius of the curves on this road was 64 ft. 9 in. at the minimum and 80 feet at the maximum. The gauge was 45 inches and the rails were 10 lb. T-rails. There were 351 cars and the same number of platforms. Of these cars, 12 were motor-cars, carrying each two 15-horse-power motors. It will thus be seen that 560 horse-power was used in starting this road. In running it the

average horse-power expended was 130. There were seats for 5,600 persons on the road, and over 1,000,000 people were carried without an accident during the four months that the road was in operation. The total weight of the movable platforms on this road was 450 tons, and the weight of 5,600 passengers would be, on the average, 392 tons, so that the power required as compared with the number of people carried is very small.

Fig. 2 illustrates the methods of construction of this road. The slow-moving platform which is attached to the

Fig. 2.—End view, showing both platforms: A, track-rails; B, wheels; J, hand-post; K, boxes; M, transverse frame of slow-moving platform; P, fast platform; S, slow platform; X, traveling flexible rail; Y, castings with slots for flexible rail.

trucks may be supposed to move at the rate of 3 miles an hour. The fast-moving platform which rests on the flexible steel rails, that rest in their turn on the peripheries of the wheel, is by the forward motion of the wheels of necessity carried forward twice as fast as the forward motion of the axles of the wheels themselves. If, therefore, the speed of 3 miles an hour be given to the slow platform, the fast platform will of necessity move at the rate of 6 miles an hour. The possible extension of this system is shown in Fig. 3; in

Fig. 3.—Section showing a slow-moving platform. C, and several successively faster-moving platforms. E. The latter are borne on the flexible rails, F; the former on a frame with boxes at B. The long axle, A, is supported at the right by the wheels P.

this, with the same differential speed of 3 miles an hour, the platforms may be given speeds of 3, 6, 9, and 12 respectively.

The points in favor of the adoption of a road of this kind for any place where a large number of people are to be carried, like the congested parts of great cities, exhibition-grounds, parks, etc., are as follows: First, the small expense per capita involved as compared with any other known means of transportation; second, the possibility that the slow speed of the trucks gives of adopting every precaution, like rubber tires, paper wheels, and other light constructions, so that all noise is prevented; third, the great flexibility of the road, which adapts itself to all curves, ascents, and descents; fourth, the facility of heating the train in consequence of the continuity of the system; and fifth, the continuity of the motion, which without great speed, but with great safety and without any waste of time for stops, permits a net running time from one point to another that compares favorably with (and in numbers carried vastly exceeds in its possibilities) any modern urban method of transportation.

In its application to city work it must of necessity be either elevated above the normal street level or sunk below the same, for, as will be evident, grade crossings are not admissible. This system has obtained the indorsement of nearly every engineer of note in the world, and will undoubtedly come into general use.

JOSEPH L. SILSBEE.

Traverse City: city (chartered in 1895); capital of Grand Traverse co., Mich.; on Grand Traverse Bay, and the Chi, and W. Mich., the Gr. Rap. and Ind., and the Manistee and N. E. railways; 70 miles N. E. of Manistee, and 145 miles N. of Grand Rapids (for location, see map of Michigan, ref. 4-11). It is the center of a rich agricultural and fruit-growing region, has a good harbor, and is connected by steamboats with the principal ports on Lake Michigan. The principal industries are connected with the lumber interest. There are 2 electric-light plants, Northern Michigan Asylum for the Insane, a national bank with capital of \$50,000, a State bank with capital of \$100,000, a library, and a daily, a monthly, and 3 weekly periodicals. Pop. (1880) 1,897; (1890) 4,353; (1894) State census, 7,386.

EDITOR OF "TRAVERSE BAY EAGLE."

Traverse-table: in surveying, a table from which the latitude and departure of any course can be found by inspection. It is a rough table of the sines and the cosines of arcs, computed to each quarter of a degree from 0 to 90°, and for every radius from 1 to 100. In the ordinary traverse-table the computation is carried out only to two places of decimals.

Travnik: town; capital of the district of Travnik, Bosnia; on the Laskva (see map of Turkey, ref. 2-A). Ill built and unhealthy, its chief importance is due to its manufacture of sword-blades. Pop. (1885) 5,933. E. A. G.

Trawling [from O. Fr. *troller*, whence Eng. *troll*]: a method of fishing by means of a trawl, or small bag-shaped net, dragged along the bottom of the sea behind a boat. The name *trawling* is also given to a system of fishing for cod, halibut, and other large fish, by means of a great number of hooks set at intervals along a stout line which lies upon the sea-bottom. From time to time this trawl or ground-line is underm by men in a boat, and the fish are removed. See FISHERIES.

Trayastrinsha: See DEVALOKA.

Treacle: See MOLASSES.

Treason [M. Eng. *tresun*, *traison*, from O. Fr. *traïson* < Lat. *traditio*, a giving up, betraying, deriv. of *tradere*, *traditum*, give over, deliver, betray; *trans*, over + *da-re*, give]: a crime of indefinite and variable limits against the sovereignty of the people or the person of the supreme ruler. The Romans call this crime *perduellio*, and afterward *crimen majestatis*—that is, either hostility to one's own country, such as joining its enemies in war would imply, or afterward hostile attack on the emperor, or, as the latter term denoted, the act of invading the sovereignty of the people. In the expression *tradere majestatem*, to injure the sovereignty of the people or of the state, is found the origin of the term *lèse-majesté*, used by the French to denote treason. The English definition of treason or high treason has included, especially, compassing or imagining the death of the reigning sovereign or his (or her) eldest son and heir; violation of the queen or the king's eldest daughter, being unmarried, or his eldest son's wife; levying war against the sovereign within the realm by a subject; giving aid and comfort in or outside of the realm to the sovereign's enemies; counterfeiting the great or privy seal; importing "false money, counterfeit to the king's money," besides other offenses which at any time of excitement it seemed best to comprehend under the same term. The folly of such legislation led to the simple definition of the U. S. Constitution that "treason shall consist only in levying war against the U. S. or in adhering to their enemies, giving them aid and comfort." It is implied that the crime can be committed only by one owing allegiance to the U. S.

The States of the Union, to some extent at least, have admitted into their codes a crime of treason against themselves similar to that committed against the U. S. But as treason against a State must always be treason against the U. S., and as war against so limited a sovereignty as that of one of the States is hardly an act deserving the name of war, such treason is as little deserving of the name as it is likely to be frequent. If an invading force from a foreign country should land on the territory of a State and be joined by one of its citizens, he would be amenable to the laws of the U. S.; if it were joined by a man from one of the other States, the same would be true, but in this case the State could not try him for treason, as he is in no sense its subject. A general law against seditious or armed assemblages would answer all purposes equally well, and could not come into conflict by any possibility with the

laws and judicial arrangements of the Union. On the other hand, if a man were acquitted of treason against a State, he would still be liable to indictment for treason against the U. S. for the same offense.

The law of treason with the growth of monarchy included various offenses against the person of the monarch or his rights or appurtenances, and with the growth of arbitrary power stretched its penalties over various crimes or even peccadilloes that lay outside of its original limits. See on this, and the restrictions which a free government admits into its definition, Lieber's *Civil Liberty*, ch. viii.

Revised by THEODORE S. WOOLSEY.

Treasure-trove [*treasure* + O. Fr. *trove* > Fr. *trouvé*, found]: in common law, accidentally found gold or silver coin, plate, or bullion which had been hidden in the earth or in some secret spot so long ago that its existence was forgotten and its owner unknown. Such property technically belonged to the crown, unless the owner were found. In the U. S. the term is not much used.

Treasury of the United States: a department of the executive Government of the U. S., having control over the collection, management, and disbursement of the public revenue, and presided over by a secretary, who is, next to the Secretary of State, the most important officer of the cabinet. The present office dates from the law of Sept. 2, 1789, drawn up with such precision and comprehensiveness by Alexander Hamilton, the first secretary, that few changes have since been made in its language. The subordinate officers consist of three assistant secretaries, a treasurer, three comptrollers, six auditors, a register, commissioners of customs and of internal revenue, a solicitor, a director of the mint, and a large number of employees. There are eighteen bureaus, among which are those of the mint, statistics, the coast survey, the life-saving service, and the light-house board. Most of the heads of bureaus, etc., are independent of their nominal head, and many of them are appointed by the President.

Treat, ROBERT: Governor of Connecticut; b. in England in 1622; emigrated to New England, with his father Richard, in company with Sir Richard Saltonstall; was one of the first settlers of Wethersfield, Conn.; settled in 1639 at Milford, where he was a deputy 1653-59, and an assistant 1659-61; was one of the founders of Newark, N. J., and a deputy to the first assembly 1667-72; returned to Milford 1672; became a major of Connecticut troops 1673; marched to Springfield (1675) to the relief of that place against the Indians; drove them from before the town, subsequently routed them at Hadley; participated in the great Indian battle at the Narragansett Fort on Dec. 19, 1675; was Lieutenant-Governor 1676-83, and 1698-1708, and Governor 1683-98 not including the two years under Andros. D. at Milford, July 12, 1710.—His son SAMUEL, b. at Milford in 1648, graduated at Harvard 1669, and was minister of Eastham on Cape Cod, Mass., from 1672 to his death Mar. 18, 1717. He acquired the language of the Nauset Indians, in which he published a "confession of faith," and was successful in the conversion of those Indians; preached the "election sermon" at Plymouth in 1678 and at Milford in 1713.

Treaties [M. Eng. *treater*, from Fr. *traité* < Lat. *tractatus*, treatise, deriv. of *tractare*, discuss, treat]: compacts or agreements made by two or more nations or sovereigns. States, like individuals, may make contracts. These rest for their fulfillment upon the good faith of the contracting parties. State contracts may be made with private persons—a government bond, for instance—or with other states. These latter are called treaties. A treaty, then, is an engagement between states to do, or to refrain from doing, something which is lawful. Treaties may be considered under the following heads:

I. *The Conditions of a Treaty's Validity*.—1. A state must have capacity to contract. This is lacking to the individual States which compose the United States, being denied them by its Constitution, but may belong to the members of a more loosely organized confederation. It may be lacking, in whole or in part, in the case of a protected state, according to the terms of its dependence. It is lacking also in its fullest extent in the case of a state like Belgium which, under its status of neutrality, has no right of making war save in self-defense, and is thereby debarred from such treaties as alliances which imply the ability to wage war. Yet for most purposes the capacity of Belgium is complete. Such questions of capacity the international status, the history, and constitution of a state will decide.

2. The agents negotiating a treaty must be properly authorized, to make their agreement a valid one. This, again, is a constitutional question which each state must answer for itself. The duty may devolve upon the sovereign or executive head of a country, upon its minister of foreign affairs, or upon agents representing these. For a certain class of state contracts of a military nature, truces, cartels for the exchange of prisoners, and capitulations, for example, the high military and naval officers are competent, and such agreements do not need ratification. Under ancient usage even an unauthorized person might make a treaty, subject, however, to ratification. This was a *sponsio*. A noted case of this kind, referred to by the publicists, was when the consul Postumius (b. c. 321) saved his army by a peace with the Samnites which the Roman senate declared void. Upon this failure of the consideration, good faith demanded that the army should be surrendered to the Samnites, but this did not follow.

3. A third requisite to the validity of a treaty is *freedom of consent* on the part of the negotiators. Duress or intimidation, false representation, bribery, applied to the treaty agent and instrumental in deciding the terms of agreement, will invalidate it. But a mere mistake as to the value of a consideration will not matter. Thus before the thorough exploration of the Mississippi river, the right of free navigation from British territory upon its whole course, a valueless concession, was agreed upon by treaty in return for valuable fishery privileges. Of course force applied to the nation not the mere agent is valid, as when a cession of territory is the result of a war. Or a sovereign in captivity may be of sufficient value to his country to entitle the captor to something in exchange. Where the existence of a nation is at stake it is held that no agents are competent to transfer it by treaty, and yet the partition of Poland has been an accepted fact for a century.

4. Again, treaties are void which involve a violation of accepted principles of international law, which contain stipulations whose execution has become impossible, or which conflict with prior obligations to a third power. For instance, an agreement to engage in the slave-trade or to assert joint control over a portion of the high seas would be invalid.

II. *Forms of Treaties*.—Here the essential fact is the expression of an agreement, no particular form being indispensable. This might be verbal, but in point of fact is always written and signed. The language employed was anciently Latin, then French, as that became the language of diplomacy; but when two states using the same tongue negotiate naturally that will be used. A distinction of small importance is made between treaties and conventions, the former having generally a wider political scope, while the latter relate to some minor specific object. For instance, the Treaty of Washington of 1871, arranging for a settlement of the Abbama claims and the fishery question, was followed by the convention of 1873 settling the place where the sessions called for by its twelfth article should be held.

III. *Ratification of Treaties*.—The general rule may be laid down that ratification of a treaty is expected and necessary to make it valid. Under a Constitution like that of the U. S., where the power of making treaties belongs to the President, while the Senate must confirm or veto (by a two-thirds vote), knowledge of this fact is presumed and notice that ratification is necessary is not required. But also where negotiation and ratification lie in the same hands, the latter is essential and may be withheld if desired. Here we may touch on the question whether, in forms of government where the executive is authorized to conclude a treaty, he is bound by the action of his negotiator, provided the latter proceeded according to instructions. It was formerly held that, if the agent who made the treaty proceeded according to his *full power* but not according to secret instructions, the principal was bound by his action, since the full power, being known to the other party, was the motive in consideration of which he consented to treat. But at present it is held by the best authorities that the principal may withhold his ratification, in certain circumstances, even when the negotiator has followed his private instructions. The refusal is justified in cases like these (see Wheaton, iii., ch. ii., §§ 256-263): (1) "On the ground of the impossibility, physical or moral, of fulfilling the stipulations"; (2) "on the ground of mutual error of the parties respecting a matter of fact, which, if it had been known in its true circumstances, would have prevented the conclusion of the treaty"; (3) on the ground of "a change of circumstances on which

the validity of the treaty is made to depend, either by an express stipulation or by the nature of the treaty itself." To which may be added the case where the treaty would involve injury to a third party; or if such representations have been made as to the powers of the negotiator as to make a failure of ratification an act of bad faith.

Ratification should cover the entire treaty. The U. S. Senate in at least two instances has been complained of for loose practice in this regard, in ratifying the main body of a treaty while amending or dropping a particular article, whereas the whole should have been sent back for revision.

Reference may be made here to another point under our usage. In the U. S. if the payment of a sum of money forms one of the conditions of a treaty a majority of the House of Representatives must concur. In this way it would be possible, in certain cases, to defeat the action of the Senate; but to do this, except in extreme cases, would oppose the spirit of the Constitution, which evidently intended to invest the President and Senate finally and absolutely with the treaty-making power. A similar conflict might take place when in Great Britain the king's ministers had made similar agreements with foreign powers; for, as money is voted for particular purposes and not in a lump, the Parliament might refuse to sanction a payment to which the treaty had pledged the country. A question has been discussed as to the extent of power lodged in the hands of the President and Senate by the U. S. Constitution, as it respects the cession by treaty of land belonging to a State. Very high authorities on constitutional law have taken ground which would sanction the idea that the treaty-making power is practically omnipotent. But surely no treaty could alter the relations of the general Government to the States; and as to cessions of land, the better opinion seems to be that while treaty can determine boundaries and so take away from a State what was *supposed* to be its territory, it can not dispose without its consent of territory admitted to belong to a State, unless in the extreme case of conquest, when treaty simply admits the fact of actual transfer of territory to the jurisdiction of another power, and declares this to be inevitable. After the exchange of ratifications a treaty dates back to the time of its signature, so that captures made between these two moments are invalid.

IV. *Interpretation of Treaties.*—Without going at length into this topic the following brief rules of interpretation are given as covering the main ground:

The ordinary meaning of words prevails, but technical language has its technical sense.

Words involving an absurdity should be otherwise construed or else be held void.

Where grants, privileges, or favors are inserted they should be strictly interpreted. For it was the duty of the party for whose benefit they were inserted to make them clear and unmistakable. Obscure expressions may be explained by clearer ones, or interpreted in accordance with the general spirit of the treaty.

Special stipulations are preferred to general ones. If an agreement is inconsistent with an earlier treaty between the same parties, the earlier is superseded by it; but if opposed to treaty provisions made by either with a third power, it is void.

V. *How Treaties may Differ.*—An examination of the collection of its treaties made by every state will show their immense range and variety. Some important ones are led up to by a preliminary treaty and qualified by a subsequent one. Some are common to two states only, while others, like the Act of the Congress of Vienna in 1815, or the Treaty of Paris in 1856, are signed by a number of powers, or receive their subsequent accession. Some make a single commercial or administrative arrangement, like the maintenance of consuls, of a postal service or of copyright privileges, while others cede territory or settle a question of national existence. Some are perpetual in nature or in terms, others are made for a certain number of years, or are terminable at will. Some are of a private nature, to arrange a marriage alliance for instance, while most are of a public character. They may reiterate and enforce a prior treaty or a national right or an accepted principle of international law. On the other hand, they may attempt to introduce some new usage, as was the case in the armed neutrality of the Baltic powers in 1780 and 1800, and in the Declaration of Paris of 1856. Of special classes of treaties the most common are alliances and treaties of guaranty.

Alliances.—An offensive alliance is an anomaly, except when made with reference to a particular war. A defensive

alliance was made in 1778 between France and the American confederated colonies during the Revolution. A modern example is the Triple Alliance of Germany, Austria, and Italy. An alliance both offensive and defensive binds states together in the strongest way possible short of confederation. It is for the state whose aid is called for to determine whether the circumstances contemplated by the treaty (the *casus fœderis*) have arrived. If only a certain limited aid is promised in case of war, the enemy of either must choose whether in view of this to regard both states as belligerents or only the one.

Treaties of Guaranty.—The thing guaranteed may be a particular status, as of neutrality; or the integrity of another treaty or of specific rights under it; or the protection of certain property or territory, as when by treaty of 1778 with France the U. S. guaranteed the French possessions in North America. So likewise by treaty of 1846 with New Granada, the U. S. guaranteed the neutrality of the Isthmus of Panama, free transit across it, and the rights of sovereignty and property of New Granada in it. Under the latter the U. S. has intervened by force to protect the Panama railway. Both of these guarantees were reciprocal in terms.

Here, again, the guarantor must decide whether the occasion contemplated by the treaty has arrived. The guarantor of a money payment differs from a surety in that the latter is bound to make the payment in lieu of the principal, while the former merely uses his influence and offices to secure it. The guaranty of a political status may involve the duty of intervention.

VI. *Execution of a Treaty.*—With this object, hostages were formerly given, but not by present usage, except in military conventions, the last instance being in 1748 to secure the treaty of Aix-la-Chapelle. Solemn oaths to observe a treaty are also out of date. Pledges are still in use. Thus certain French fortresses were left in German hands after 1871, for several years, to secure the carrying out of the terms of the treaty of peace, an enormous money indemnity being one of them. Lastly may be mentioned the guaranty of a treaty by a third power.

VII. *Termination of Treaties.*—When a treaty is made to secure a definite object and that object is attained, the treaty has no longer any reason for existence. Many treaties are of this class, to settle a boundary, to arrange for the arbitration of a special difficulty, to satisfy certain claims. So also when a treaty is made for a specified term or is made for an indefinite term with mutual right of abrogation, or, as is the case with numerous treaties, is made for a term but with a provision for their continuance beyond their limit and until notice of termination is given. Where an evident impossibility of execution appears, there is at least a suspension of the treaty. States may also, unfortunately, terminate a treaty or portions of it by simple repudiation, coupled with a willingness to take the consequences, even war. Though a clear violation of international law, for the fact that a treaty is burdensome is no reason for its violation, such repudiation is practically possible. An excuse for such conduct will of course be given which may or may not be valid. Thus the U. S. formally declared that it should no longer consider the two treaties with France of 1778 as in force, on the ground that France had violated several of their provisions. A treaty is an entire contract, and if one article is violated, the injured party may consider the whole void or may, if it prefers, insist on the enforcement of the remaining articles.

The Effect of War upon Treaties.—That a large class of treaties are terminated by war is beyond question. Such are treaties of peace, of commerce, of alliance, of all in fact where friendship is an essential basis. On the other hand, many treaties are by nature or in terms perpetual, like the recognition of our independence within certain boundaries by Great Britain, or the Fishery Treaty of 1818 agreeing that the inhabitants of the U. S. "shall have forever . . . the liberty to take fish" on certain coasts. Moreover, all those treaties which contemplate a state of war must survive, for otherwise they would be useless. Such are treaties laying down the rules of blockade, contraband, convoy, visitation, capture, and so on. Upon a third class of treaties the effect of war must be held doubtful, the special circumstances of each case being considered.

Kent says that "as a general rule the obligations of treaties are dissipated by hostilities." Halleck says, *inter alia*, that "treaties of commerce and navigation are generally either suspended or extinguished by a war between the parties" to them. Of course they must be suspended at least,

or war could not exist. Calvo says that "as for postal and custom-house arrangements, conventions relating to navigation and commerce, agreements relative to private interests, they are generally regarded as suspended until the cessation of hostilities." As commercial, postal, and similar conventions are often limited in time by their express terms, it seems safe to say that such arrangements, and others, like them, liable to be changed in these particulars in a few years of peace, ought to be regarded as broken off by war, which brings with it new feelings and interests. We add from Calvo that opinions agree "in favor of admitting the *definitive rupture* of conventional obligations entered into expressly in view of a state of peace, of such as have it for their special object to favor the relations of good harmony between nation and nation, such as treaties of friendship, of alliance, and other acts of the same nature, having a political character." A distinction was made by some of the older writers between the effects of a new war arising from a cause independent of a treaty, which they thought would not affect the provisions of a treaty, and a war growing out of the breach of a treaty by which its provisions would be annulled. Hence, in a given treaty, if one of the articles had been broken, and a war arose out of the breach, the rest of the treaty would be unaffected. It is easy to see that this distinction would complicate affairs between parties wishing to make peace. The practical rule suggested by these doubts is that, as silence may be misinterpreted, it is best always to make mention of the old treaties by way of renewing and confirming them. It is said by Dr. Twiss that Great Britain "in practice admits of no exception to the rule that all treaties, as such, are put an end to by a subsequent war between the contending parties." In conformity with this rule, or to prevent doubt, the Peace of Westphalia and the Treaty of Utrecht were renewed a number of times over when the parties to them after war made new treaties with one another. It may be added to what has been said, that private rights, resulting from rules of admitted justice, are not extinguished by a war; and so a debt due by one nation to another, where the same rules of right prevail as are acknowledged in municipal law, survives a war. An interesting discussion arose between Great Britain and the U. S. after the war of 1812 whether the colonies, after the recognition of their independence, retained the rights of fishery on British coasts, as a matter of course, which they had had while dependencies of Great Britain. John Quincy Adams and others contended that they retained these rights, and in the discussion the question of the effect of war on treaties came up. It seems that the British side of the question had the soundest arguments in its favor. The U. S. placed itself on the footing of an independent nation, and had no more rights than others; nay, even if it had been obliged to submit again to the British crown, this right of fishery might have been taken away.

VIII. *Treaties of Peace*.—The only rational object of war is to secure a state of justice involving reparation and security for the future. Treaties of peace, being appeals to force, do not always bring the adversaries to just terms, but, whatever their result, they are the most important acts of treaty-making powers; they often form epochs in national or in continental history. To name only one or two: the Peace of Westphalia, those of Nymwegen, Ryswick, and Utrecht-Baden, the treaties of Paris and of Hubertsburg in 1763, the Peace of Paris and that of Versailles in 1783, the two treaties of Paris in 1814 and 1815 respectively, the Peace of Zurich in 1859 and of Prague in 1866, and the Peace of Paris in 1856 (on account especially of its international character), indicate memorable changes of relative strength, or mark a new policy, or bring in a new dynasty, or are in some way the eras of some kind of progress. They are the hands of a clock, but the war was the moving force.

Treaties of peace are subject to the same rules of interpretation with others made by the constitutional power in the state. Only two additional points remain to be considered: (a) When do treaties go into effect? They bind the parties, as we have seen, when they are signed or when they are ratified. They bind individuals when they receive news that such treaties have been made. In the interval between ratification and knowledge of the peace by military officers or by cruisers, injuries must be made good by the country to which the party committing the injury belongs. Captures made after a peace, but without knowledge of it, have been held to subject the capturing officer to civil damages, for which he would have a right to demand compensation

from his government. Captures, again, made before the time for the termination of hostilities, but with knowledge that peace has been concluded, are held to be invalid and subject to restoration. (b) The effect of peace is to put an end not only to a war, but also to all complaints relating to the subject for which war was undertaken. It is an oblivion or amnesty of all past difficulties. A new war can be undertaken for similar causes of complaint, but not for the same. They are forgotten and forgiven, whether mentioned in the treaty or passed over in silence. In regard to the state in which the war leaves the parties, if the treaty makes no mention of this point, the principle of *uti possidetis* is admitted. Territory stays in the actual occupant's hands unless passed over by express agreement, and a strong place must be restored without injury to its works. When a part of a country is yielded up at peace to the enemy, the former sovereign is neither bound to make compensation to those who suffer by the change of jurisdiction, nor to secure the new sovereign against resistance from the inhabitants to his authority. All he does is to renounce his own sovereignty and jurisdiction. The cession of Formosa by China to Japan is an instance.

The value of a study of treaties can hardly be overestimated. Quite outside of their statement of the actual relations existing between states, they show the abolition of old usages, the introduction of new ones, and foreshadow the better principles of the future. They mark the growth of international law, while binding only their principals. They furnish an important object lesson to outsiders. Founded upon a mutual sense of moral obligation, they furnish a stable basis upon which the law governing the relations of states is created, so that the collection of its treaties which every nation will make is the fundamental text-book of principle and of illustration for the international lawyer.

Revised by T. S. WOOLSEY.

NOTABLE TREATIES.

The following summary of the chief international agreements made between the leading nations is limited to the mention of only the more famous treaties since the year 843, which is taken as the starting-point, because the contract of Verdun, formed in that year, may be regarded as the basis of the international relations of modern Europe.

843. *Contract of Verdun*: the treaty that concluded the war between Lothar, Louis the German, and Charles the Bald over their respective shares of the imperial dominions on the death of their father, Louis the Pious. Lothar claimed the whole inheritance, but was defeated at Fontenay, and though he retained the title of emperor was obliged to content himself with Italy and a narrow strip of land between the dominions of his brothers, extending to the North Sea. This land was afterward called Lotharingia or Lorraine. Charles the Bald governed the western portion of the empire of Charlemagne, comprising chiefly Gallie-Roman inhabitants and corresponding roughly to the limits of modern France, while Louis the German held the eastern portion, peopled by German-speaking inhabitants. In this breaking up of the restored Roman empire the modern nations of France and Germany have their origin. See map of Europe under the Carlovingians in article EUROPE.

911. *Treaty of St.-Clair-sur-Epte*: concluded the war between the invading Norsemen under Rollo or Rolf and the French king Charles the Simple. The latter's daughter was given in marriage to Rollo, who agreed to become a Christian, and was invested with a part of Neustria, which was afterward known as Normandy.

1122. *Concordat of Worms*: an agreement between the emperor and the pope, closing the long strife known as the war of investitures. Neither obtained by it all that he had been striving for. The emperor renounced his right to confer the ring and crozier as symbols of ecclesiastical office, but retained the right of granting church and other property by the symbol of temporal authority. He also retained the right to be present in person or by proxy at ecclesiastical elections, provided that he abstained from bribery or compulsion. Though a compromise, it was in effect a victory for the Church, which obtained much of what Gregory VII. had striven for and Henry IV. had opposed.

1183. *Treaty of Constance*: between the Emperor Frederick Barbarossa and the Lombard cities. In the peace of Venice (1177), formed in the year after the battle of Legnano, he had acknowledged the independence of the cities and submitted to the pope. In the definitive treaty of Constance the cities recognized his overlordship, but they

secured local self-government, together with the right to fortify themselves and levy armies. With this peace a new power appears in the political system of Europe, that of the free cities, and the attempt to re-establish the ancient despotism of the Roman empire failed.

1360. *Peace of Bretigny*: a treaty that interrupted the Hundred Years' war between France and England. Edward III. renounced his claims to Normandy, Maine, Anjou, etc., and to the French crown, but his sovereignty over the south and west of France and over a part of Northern Picardy was recognized.

1397. *Union of Calmar*: the treaty by which the northern powers, Denmark, Sweden, and Norway, were united under the rule of Queen Margaret of Denmark. Its object was forever to put an end to wars and dissensions between the three northern states, and it was enacted that they should henceforth be ruled over by one sovereign, who was to govern with due regard to the laws and customs of each. If the reigning king or queen died without children a joint sovereign should be elected by the senators and deputies of the three realms. National jealousies, however, asserted themselves, and Sweden, who had long been a reluctant member, finally broke up the union in 1523 through the efforts of her national chief Gustavus Vasa.

1420. *Treaty of Troyes*: interrupted the Hundred Years' war between France and England on terms most favorable to the latter. The English king, Henry V., to whom the French princess Catharine was given in marriage, was made heir to the French throne at the death of the insane king Charles VI., and in the meanwhile was to act as regent.

1435. *Treaty of Arras*: a compact between Burgundy and France, in which the former abandoned the English alliance and acknowledged Charles VII. as king of France on condition of receiving Auxerre and Macon and the towns on the Somme. This weakened the power of the English in France and led the way to their final expulsion.

1466. *Treaty of Thorn*: the instrument by which the Polish conquest of West Prussia was recognized and the rule of the Teutonic Knights was confined to East Prussia.

1482. *Treaty of Arras*: settled the dispute between Louis XI. of France and Maximilian of Austria in favor of the former, who retained the towns on the Somme, and by the betrothal of the dauphin to the daughter of Maximilian was to secure Franche Comté and other territories.

1493. *Bull of Pope Alexander VI.*: arranged the conflicting claims of Spain and Portugal to newly discovered lands. Assuming the authority to apportion the countries of the earth, he fixed a line of demarkation running N. and S. through a point 100 leagues W. of the Azores. All to the E. of this line was assigned to Portugal, all to the W. to Spain.

1494. *Convention of Tordesillas*: between Spain and Portugal, substituted for the line fixed by the papal bull of 1493 one passing through a point 370 leagues W. of the Azores. See TORDESILLAS, CONVENTION OF.

1508. *League of Cambray*: a union formed by treaty between Louis XII. of France and the Emperor Maximilian, which the pope, Ferdinand of Spain, and others were invited to join, for the purpose of crushing Venice and partitioning her territories. War resulted, but the object of the league was not attained, owing to dissensions among the allies, some of whom finally withdrew and joined the Venetians.

1526. *Treaty of Madrid*: formed between the Emperor Charles V. of Germany and Francis I. of France, who had been defeated at the battle of Pavia and was then a prisoner. By it the latter gave up his claims to Genoa, Milan, Naples, Flanders, and Artois, agreed to cede Burgundy to the emperor, and consented to other humiliating conditions. Professing to have signed under constraint, he broke the treaty as soon as he regained his liberty.

1529. *Treaty of Cambray*, known as the *Ladies' Peace*: also between Francis I. and Charles V.; renewed the chief provisions of the Treaty of Madrid except that relating to Burgundy, which Francis was allowed to retain. It pressed too severely on France and the war was renewed.

1544. *Treaty of Crespy*: concluded the fourth and last war between Francis I. and Charles V. with a mutual cession of conquests made since the Truce of Nice in 1538. It left the two contestants in approximately the same condition as before the first war, Charles renouncing his claim to Burgundy, Francis to Naples, Flanders, and Artois.

1552. *Treaty of Passau*: between Charles V. and Maurice of Saxony. The former promised to convoke a Diet to consider the questions at issue, and in the meanwhile granted the Protestants religious toleration.

1555. *Religious Peace of Augsburg*: concluded at the Diet promised by Charles in the preliminary Treaty of Passau; granted toleration to Lutherans, but not to Calvinists; gave each prince the right to choose between the Roman Catholic faith and the Augsburg Confession, and to expel those of his subjects who differed from him in religion. By the *Reservatum Ecclesiasticum*, it was provided that any Catholic ecclesiastic on turning Protestant should forfeit his goods and rights that he had enjoyed by virtue of his ecclesiastical office. This was the source of constant trouble, and led ultimately to the THIRTY YEARS' WAR (q. v.).

1576. *Pacification of Ghent*: a union of the seventeen provinces of the Netherlands for mutual defense against the Spaniards. Foreigners were to be driven from the provinces and a meeting of the States-General was to be called to regulate matters of common interest.

1579. *Union of Utrecht*: the union of the seven northern provinces of the Netherlands in defense of their political rights and their religious freedom. It laid the foundation of the Dutch Republic, whose independence of Spain was virtually recognized by the treaty of 1609.

1648. *Peace of Westphalia*: consisting of the treaties of Münster and Osnabrück; concluded the THIRTY YEARS' WAR (q. v.), and adjusted the relations of most of the European powers. The provisions of this important peace may be divided into three classes: those making territorial changes, those affecting religion, and those bearing upon the internal constitution of the German empire. I. Territorial arrangements. Sweden acquired Hither Pomerania, the island of Rügen, the archbishopric of Bremen, the bishopric of Verden, the town and port of Wismar, parts of Further Pomerania, etc. These were to continue parts of the empire, of which the King of Sweden was to be a member with three votes in the Diet. Sweden further received a money indemnity. In general she attained much of what Oxenstjerna had striven for, and she ranked for a time, as the leading northern power. France secured the bishoprics of Metz, Toul, and Verdun, the town of Pignerol, Austrian Alsace, the right to garrison Philippsburg, and some minor accessions of territory. Her territorial gains, however, were of less importance than the prestige arising from the strengthening of her friends and the weakening of her enemies by the provisions of the treaty. The aggrandizing policy of Richelieu and Mazarin had completely succeeded, and France stood forth as the first power of Europe. The seed of future strife existed in a clause of the treaty, binding the King of France to permit the bishoprics of Basel and Strassburg, the ten imperial towns in Alsace, and all estates holding immediately of the empire to remain "in that liberty and possession of immediacy toward the empire which they had formerly enjoyed." Brandenburg was compensated for territory ceded to Sweden, by the bishoprics of Minden, Halberstadt, and Kammin, and the archbishopric of Magdeburg. Mecklenburg and Brunswick-Lüneburg were also compensated by territorial accessions, and the house of Hesse-Cassel gained important rights and a money indemnity. The Lower Palatinate, with the right of reversion to the Upper, was restored to the family of the unfortunate Elector Frederick V., and an eighth electorate was created in its favor, Bavaria retaining the old electoral dignity and the Upper Palatinate. Switzerland, long independent in fact, was acknowledged to be so of right. The independence of Holland was also formally recognized. II. Religious provisions. Toleration was extended to Calvinists as well as Lutherans. The possession of ecclesiastical property and rights was determined by the status of the parties in 1624. A benefice held by a Protestant or Catholic in Jan., 1624, should forever belong to the same religion, but in the Palatinate, Würtemberg, and Baden 1618 was taken as the normal year. Thus the *Reservatum Ecclesiasticum* of the Peace of Augsburg was superseded. The holder of an ecclesiastical benefice on changing his religion was to vacate his benefice without restoring its former fruits. If a prince changed his religion he could not alter the existing Church, but could enjoy only his own domestic worship. Even if an entire community followed their sovereign in the new faith the old state of things in Church and school must continue. Those subjects of a sovereign differing in faith from their own who had not enjoyed the right of worship in 1624 could be compelled to emigrate, but must receive notice several years beforehand. III. Provisions affecting the constitution of the empire. The weakening of the imperial authority which had resulted from the war was legalized. The emperor was thenceforth of less importance in the political

system than the Diet, which alone could make the laws, declare war, and conclude treaties. The separate states of the empire were free to make alliances with one another or with foreign states, subject only to the condition that such alliances be not prejudicial to the empire or the emperor.

The chief features of the Peace of Westphalia are the following: It established the equality of the Calvinists, Lutherans, and Catholics in Germany. It made the states of the empire almost independent of the emperor, thus preventing the attainment of national unity, and preparing for the rise of Prussia as a great Protestant power and the rival of Austria. It further gave to Sweden and France the right of continual interference in the internal affairs of the empire. Its adjustment of European affairs was of course not permanent, but it is the basis of almost all European treaties down to the time of the French Revolution, and it marks the end of the period of religious wars between European nations, whose points at issue were thenceforth to be mainly political.

1659. *Peace of the Pyrenees*: brought to a close the long war between France and Spain, confirming the former power in the possession of Roussillon, granting her Artois with places in Flanders, Hainault, and Luxemburg, and a portion of Cerdagne, and restoring Lorraine to the Duke of Lorraine. The Prince of Condé was pardoned and reinstated in his dignities. A special contract arranged the marriage of Louis XIV. to the Infanta Maria Theresa, who was to renounce her claims to the crown of Spain in consideration of a dowry of 500,000 crowns.

1660. *Treaty of Oliva*: between the King of Poland and his allies and the King of Sweden. By it Poland gave up to Sweden Esthonia and Livonia, and renounced suzerainty over the duchy of Prussia in favor of the Elector of Brandenburg.

1660. *Treaty of Copenhagen*: between Denmark and Sweden, secured to the latter power Schonen, Blekingen, Halland, Hveen, and Bohus, and restored to Denmark Bornholm and Drontheim in Norway.

1667. *Treaty of Breda*: between England and Holland: restored the conquests made during the war and secured in the interest of the latter power a modification of the English Navigation Acts.

1668. *Triple Alliance*: between England, Holland, and Sweden to defend Spain against Louis XIV. It was successful and peace was formed in the same year between Spain and France, but within two years from its formation Louis succeeded in detaching Sweden from the alliance and winning over the English king Charles II., so that France was free to avenge herself on Holland.

1668. *Treaty of Aix-la-Chapelle*: between France and Spain, the former retaining a chain of strong fortresses on the northern frontier, but restoring Franche-Comté to Spain.

1668. *Treaty of Lisbon*: between Spain and Portugal through the mediation of England. Spain recognized the independence of Portugal.

1678. *Peace of Nymwegen*: ended the Dutch war. Treaties were formed between Holland and France, France and Spain, and in the following year between France and the other parties to the war. Holland recovered all the territory that she had lost to France, but the latter power acquired Franche-Comté from Spain.

1697. *Peace of Ryswick*: brought to a close the war between France under Louis XIV. and the principal states of Europe, sometimes called the War of the Palatinate or the War of Orleans; comprised the mutual restoration by France and England of the conquests made during the war, the recognition by the former power of William of Orange as the lawful King of England, and the relinquishment by France of a large part of the districts which she had seized from Spain and the emperor through the courts of "reunion" established by Louis after the peace of Nymwegen, but Alsace lost all connection with the empire and became an integral part of France.

1699. *Peace of Carlowitz*: between Turkey on the one hand and the Emperor of Germany, the King of Poland, and the republic of Venice on the other. It was agreed that Transylvania should remain an Austrian province, that the southern bank of the Danube should separate Hungary from the sultan's dominions, and that Venice should hold a part of Dalmatia and her acquisitions in Greece, except Lepanto.

1713-14. *Treaties of Utrecht, Rastadt, and Baden*: concluded between the states that had taken part in the war of the Spanish Succession (see SUCCESSION WARS); comprised nine treaties formed at Utrecht and one between France and the empire at Rastadt, which was subsequently finished

with some modifications at Baden. Among the important features of these treaties were the stipulation that the crowns of France and Spain should be forever separate, the cession or restoration by France to Great Britain of Hudson Bay, St. Kitts, Nova Scotia, Newfoundland, etc., the cession by Spain to Great Britain of Gibraltar and Minorca, the transfer of Naples, Sardinia, Milan, and the Spanish Netherlands to Austria, and the confirmation of the Duke of Savoy in the possession of Sicily. A notorious clause of the treaty between Great Britain and Spain granted a company of British merchants the exclusive right to supply Spanish America with Negro slaves.

1717. *Triple Alliance*: between Great Britain, France, and Holland, in which these powers engaged to maintain the treaty of Utrecht, and in which France promised to give no aid to the Pretender to the throne of Great Britain.

1718-19. *Quadruple Alliance*: between Great Britain, France, Holland, and the emperor against the aggressions of Spain, which finally was obliged to give way and acceded to the alliance in 1720. Spain gave up all claim to the Netherlands and the Spanish part of Italy, and the emperor in return acknowledged Philip V. as rightful King of Spain. The emperor exchanged Sardinia for Sicily with the Duke of Savoy.

1718. *Peace of Passarowitz*: between the sultan and the emperor, granted the latter the portion of Hungary previously held by Turkey and extensive territories in Serbia and Wallachia.

1721. *Peace of Nystadt*: between Sweden and Russia, granting the latter Esthonia, Livonia, Ingermanland, and part of Carelia, in return for parts of Finland which had been conquered. By it Russia succeeded to the position among the northern powers formerly held by Sweden.

1738. *Treaty of Vienna*: between France and Germany. France received Lorraine and agreed to the Pragmatic Sanction of Charles VI., naming Maria Theresa as his successor to a great part of the Austrian dominions. Austria ceded Naples and Sicily to a younger branch of the Spanish reigning family and received in exchange Parma and Piacenza. Tuscany was bestowed on the Duke of Lorraine.

1742. *Peace of Breslau*, subsequently confirmed by the *Peace of Berlin* and the *Peace of Dresden*: between Frederick II. of Prussia and Maria Theresa of Austria, secured Silesia to Prussia. By the Peace of Dresden Frederick acknowledged Maria Theresa's husband as emperor.

1748. *Peace of Aix-la-Chapelle*: between Great Britain, France, and Holland; Austria, Spain, Sardinia, Genoa, and Modena being accessories; ended the war of the Austrian Succession with the mutual restoration of conquests, but Frederick II. of Prussia kept Silesia.

1761. *The Family Compact*: between the Bourbon rulers of France and Spain, binding them in a close offensive and defensive alliance to which none but members of the Bourbon family should be parties.

1763. *Peace of Paris*: terminated the Seven Years' war, known in the American colonies as the French and Indian or Old French war. Its chief provisions related to the possessions of France and Great Britain in North America, where the latter power gained Canada and secured all lands E. of the Mississippi with the exception of New Orleans, but restored some of her conquests in the East and West Indies and in Africa to France.

1763. *Peace of Huhertsburg*: the treaty by which Prussia ended the Seven Years' war, retaining all that had been recognized as hers in the treaties of Breslau, Berlin, and Dresden.

1772. *First Partition of Poland*: carried out by treaties between Russia, Austria, and Prussia, giving as a reason for their action their insecurity against the internal dissensions of their neighbor.

1774. *Peace of Kutschuk-Kainardji*: between Russia and Turkey; restored Bessarabia, Wallachia, and Moldavia to the latter power, which engaged to protect the Christian inhabitants of these principalities in their religion. Russia obtained freedom of navigation in Turkish waters and arranged for a minister resident at Constantinople. To this treaty Russia afterward appended as granting her a protectorate over the Christian subjects of the Porte.

1783. *Treaty of Paris*: the treaty in which Great Britain acknowledged the independence of the North American colonies and granted them important fishing privileges in the British dominions in America.

1783. *Treaty of Versailles*: signed at the same time as the above between Great Britain, France, and Spain; was a mutual restitution of conquests.

1792. *Peace of Jassy*: between Russia and Turkey; made the left bank of the Dniester the boundary between their respective territories.

1792. *First Coalition against France*: comprised ultimately all the powers except Sweden, Switzerland, Denmark, Tuscany, Venice, and Genoa.

1793-95. *Second and Third Partitions of Poland*: carried out by treaties between Russia, Prussia, and Austria. See the article *POLAND*.

1795. *Peace of Basel*: between France and Prussia, the latter withdrawing from the first coalition. It gave up the left bank of the Rhine to France.

1795. Treaty between the U. S. and Great Britain, known as the *Jay Treaty*. See the article *JAY, JOHN*.

1797. *Treaty of Tolentino*: between the French republic and the pope. The latter surrendered to France Avignon, the Venaisin, and the legations of Ferrara, Bologna, and Romagna, renounced the coalition, and agreed to pay an excessive indemnity and to give up 100 works of art, etc.

1797. *Treaty of Campo Formio*: between Napoleon and the Emperor of Germany. Austria had been humbled in the Italian campaigns and was forced to consent to an unfavorable peace. See the article *NAPOLEON I.*

1798. *Second Coalition against France*: initiated by Russia; afterward comprised England, Austria, Naples, Portugal, and Turkey. It was formed for the purpose of checking French aggressions, and was at first successful, but its power was broken by the French victories of Hohenlinden and Marengo, and it fell to pieces after the Treaty of Lunéville.

1801. *Treaty of Lunéville*: between France and Germany; renewed several of the most important provisions of the Treaty of Campo Formio. See *NAPOLEON I.*

1802. *Peace of Amiens*: between Great Britain on the one hand and France, Spain, and the Batavian republic on the other. It was hardly more than a truce, war being renewed in 1803. See *NAPOLEON I.*

1803. *Treaty between France and the U. S. touching the purchase of Louisiana*. See *UNITED STATES (History)*.

1805. *Peace of Pressburg*: between Austria and France. The former gave up to France the Austrian spoils of the old republic of Venice, acknowledged the French seizures in Italy, and recognized the kingdom of Italy established by Napoleon. The terms were most humiliating to Austria, and in the following year occurred the formation of the Confederation of the Rhine, and the disruption of the ancient Holy Roman Empire. The Hapsburg ruler was thenceforth merely Emperor of Austria.

1807. *Treaties of Tilsit*: concluded between France, Prussia, and Russia after Napoleon had successively humbled the last two powers in the campaigns of 1806-07. Prussia gave up all her territory W. of the Elbe and almost all that she had gained by the partitions of Poland, the latter territory to constitute the grand duchy of Warsaw, which was to be dependent upon France; submitted to the occupation of her remaining territory by a French army; was forced to limit her own army to 42,000 men, and to conclude an offensive alliance against Great Britain. She lost about half her territory and was reduced to a condition of virtual vassalage to France. Russia also entered into an offensive alliance with France against Great Britain, promising to make common cause with the former if the latter persisted in her maritime policy. See *NAPOLEON I.*

1809. *Treaty of Schönbrunn or Vienna*: between France and Austria, preceded by the armistice of Znaim, closing the campaign which had resulted in the French victory of Wagram. Austria lost extensive territories, with a population of about 4,500,000.

1812. *Peace of Bucharest*: between Russia and Turkey; secured Bessarabia to the former, making the Pruth the boundary between the territories of the two powers. The navigation of the Danube was to be free to both nations.

1814. *First Peace of Paris*: between France and the principal European powers; formed after the defeat of Napoleon at Leipzig and the invasion of France by the allies. It cut down the limits of France to what they had been in 1792, and provided for the meeting of a European congress.

1814. *Treaty of Ghent*: between the U. S. and Great Britain; brought to a close the war of 1812, leaving matters substantially as they were before the war. No mention was made of the right of search and the impressment of U. S. seamen by the British, though these were the especial grievances that had provoked the U. S. to declare war. See *UNITED STATES (History)*.

1815. *Congress of Vienna*: held according to the provision of the first Peace of Paris, and attended by the principal European powers. See *VIENNA, CONGRESS OF*.

1815. *Second Peace of Paris*: concluded between France and the allies after the defeat of Napoleon at Waterloo. France was reduced nearly to her limits of 1790, and was obliged to submit for a time to the occupation of her territory by a foreign army.

1815. *Holy Alliance*: an agreement formed at Paris between the monarchs of Russia, Austria, and Prussia, who were afterward joined by other European powers. Its avowed objects were of a vague and general nature, but in its operations it proved to be a league of sovereigns against peoples. See the article *HOLY ALLIANCE*.

1818. *Congress of Aix-la-Chapelle*: attended by the representatives of Great Britain, Russia, Prussia, and France to settle the affairs of Europe pursuant to the principles of the *HOLY ALLIANCE (q. v.)*. See *AIX-LA-CHAPELLE, CONGRESS OF*.

1820. *Congress of Troppau*: a meeting of the members of the Holy Alliance to take action against the revolutionists in Italy. See *TROPPAU*.

1821. *Congress of Laibach*: a continuation of the Congress of Troppau; decided upon intervention in Italy. See *LAIBACH*.

1822. *Congress of Verona*: the fourth and last meeting of the members of the Holy Alliance to suppress the revolutionary spirit. It was here decided to interfere in Spain. See *VERONA, CONGRESS OF*.

1827. *Treaty of London*: between Great Britain, Russia, and France, to put an end to the war between Turkey and Greece. When the Turks persisted in hostilities the allies destroyed their fleet at Navarino and effected the liberation of Greece, but with narrower limits than she afterward obtained.

1829. *Treaty of Adrianople*: between Russia and Turkey after the war of 1828-29. Russia restored her conquests, but secured a money indemnity and the possession of the islands at the mouth of the Danube and the ports of Anapa and Poti on the eastern shore of the Black Sea. The hospodars of the principalities were to hold office for life, and the opportunities for Russian interference in behalf of the Porte's Christian subjects were greatly increased.

1833. *Convention of Unkiar-Skelessi*: an agreement between Russia and Turkey, which, if carried out, would have reduced the latter to the position of vassalage. It was opposed by the other powers.

1840. *Quadruple Treaty of London*: between Great Britain, Austria, Prussia, and Russia on the one hand and Turkey on the other; formed to settle the dispute between the sultan and his rebellious vassal, Mehemet Ali of Egypt, who for a time seemed likely to receive aid from France. Mehemet was checked in his aggressions, and limited to the pashalik of Egypt, which was made hereditary in his family. France afterward joined the alliance.

1842. *Treaty of Nanking*: concluded the so-called "Opium war" between Great Britain and China, securing to the former a money indemnity, the possession of the island of Hongkong, and the opening of five ports to British trade and residence, a privilege later extended by supplementary treaty to all foreigners. This is one of the most important treaties of modern times.

1842. *Ashburton Treaty*: signed at Washington to define the northeastern boundary between the U. S. and British North America. It also contained provisions concerning the suppression of the slave-trade and the surrendering of fugitives from justice.

1848. *Treaty of Guadalupe-Hidalgo*: between the U. S. and Mexico. It ceded to the former country New Mexico, Texas, and Upper California, but all other conquests by the U. S. were to be given up to Mexico and the sum of \$15,000,000 paid her.

1854. *Treaty between the U. S. and Japan*: negotiated by Commodore M. C. Perry; secured humane treatment for U. S. sailors shipwrecked on the coasts of Japan, and the right to appoint a consular agent to look after their interests. It led the way to the establishment of commercial intercourse. Important trading privileges were secured by the U. S. and Great Britain in 1858, and subsequent treaties have added to these and extended them to other nations.

1856. *Treaty of Paris*: after the Crimean war, between Russia, France, Great Britain, Austria, Sardinia, and Turkey, Prussia also being invited to participate. The Black Sea was neutralized and thrown open to commerce. The Danube was also thrown open to commerce, and the limits

of Bessarabia were altered with the design of taking from Russia the control of the mouths of the Danube. While Wallachia and Moldavia were confirmed in their privileges by the Porte, no exclusive protectorate was granted to any of the contracting powers.

1858. *Treaties of Tientsin*: concluded between China and each of the four nations, Great Britain, France, Russia, and the U. S. The affair of the Jorcha Arrow had caused war between Great Britain and China, and in the treaty of peace the former secured a money indemnity. The chief features of the four treaties are the increase of the number of ports open to foreign trade, the guarantee of protection to both native and foreign Christians in the practice and propagation of their religion, the opening of the country to foreign travel, and the sanctioning of the residence of foreign ambassadors at Peking.

1859. *Peace of Zurich*: the settlements of the points in dispute between France and the kingdom of Sardinia on the one hand and Austria on the other, after the war of 1859, preliminaries of peace having already been signed earlier in the same year at Villafranca. Austria retained Venetia, but ceded to France nearly all of Lombardy, which was transferred to Sardinia. Austria and France promised to favor the establishment of an Italian confederation under the presidency of the pope, and Venetia, while still owning the supremacy of Austria, was to be a member of this confederation. In return for Lombardy, and for the aid given by France in the war, Sardinia ceded to her Savoy and the arondissement of Nice. This peace and the events which resulted from it put an end to the arrangements respecting Italy made by the Congress of Vienna, and prepared for the unification of Italy under the house of Savoy.

1864. *Peace of Vienna*: between Austria, Prussia, and Denmark, concluded the war that arose out of the Schleswig-Holstein question. The Danish king renounced his rights over Lauenburg, Schleswig, and Holstein in favor of Prussia and Austria.

1865. *Convention of Gaslein*: a compact between Prussia and Austria, arranging for the control of the three duchies gained from Denmark by the war of 1864. Prussia was to control Schleswig, and on the payment of a stipulated sum to Austria the Prussian king was to acquire possession of Lauenburg, while the government of Holstein was committed to Austria. Prussia, however, was to have the command and police of the port of Kiel in Holstein, with the right to maintain two military routes and to construct a canal through the duchy. The arrangement was merely provisional, and did not affect the rights of the two powers to both duchies; but it brought Prussia somewhat nearer to the realization of her object, namely, the annexation of the duchies.

1866. *Peace of Prague*: concluded the war of 1866 between Prussia and Austria. The latter power recognized the dissolution of the German Confederation and the establishment of the North German Confederation under the leadership of Prussia; renounced all rights over Schleswig and Holstein in favor of Prussia; agreed to the union of Lombardy and Venetia with the kingdom of Italy, and agreed to pay to Prussia an indemnity of 20,000,000 thalers.

1871. *Treaty of Frankfurt*: between France and Germany after the war of 1870-71, preliminaries having been signed at Versailles earlier in the same year. France ceded Alsace and part of Lorraine to Germany and paid an indemnity of 5,000,000,000 francs. A district containing over 1,500,000 inhabitants was thereby annexed to Germany.

1871. *Treaty of Washington*: between the U. S. and Great Britain to settle questions pending between the two countries. To adjust the so-called Alabama claims it was agreed to submit them to a tribunal of arbitration to meet at Geneva and consist of members appointed by each of the parties and by three neutral nations. (See ALABAMA CLAIMS.) With regard to difficulties concerning the fishing privileges of U. S. vessels on the coasts of British America, the treaty adjusted the points at issue on the basis of the Reciprocity Treaty of 1854, giving to the persons of each nation the right of fishing on the coasts of the other. There was a mutual concession of important privileges, such as the privilege of transit without payment of duties, and of transportation from one place to another in the territory of one nation across the territory of the other, and the opening of Lake Michigan, the lower course of the St. Lawrence river, and certain rivers in Alaska to the people of both nations. It was further agreed to submit the question respecting the running of the boundary-line on the Pacific to the German

emperor, whose decision, rendered in the following year, was in favor of the U. S.—that is, accepted the line run through the Canal de Haro, leaving the island of San Juan and its group in the territory of the U. S.

1878. *Treaty of San Stefano*: the preliminary treaty of peace at the close of the Russo-Turkish War (q. v.). The final settlement was reached at the Congress of Berlin.

1878. *Congress of Berlin*: a congress of the chief European powers to settle the questions that grew out of the Russo-Turkish war. See BERLIN, CONGRESS OF.

1879. *Treaty of defensive alliance between Austria and Germany*: Its text was first published in 1888, when the signatory powers were alarmed by the attitude of Russia. It provided that if Russia attacked either party the other was bound to come to the latter's aid, and that if either party should be attacked by some other power than Russia, the other party should remain neutral. In 1882 Italy was reported to have entered this alliance, thus forming the *Dreibund* or TRIPLE ALLIANCE (q. v.).

1895. *Treaty of Shimonoseki*: concluded the war between China and Japan on terms most advantageous to the latter power, which secured the island of Formosa, the Pescadores, the acknowledgment of the independence of Korea (the original cause of the war), important commercial privileges, and a money indemnity of about \$160,000,000. In addition to these benefits Japan was granted possession of the Liaoning peninsula on the mainland from Port Arthur northward as far as the fortieth parallel of latitude, but the protest of Russia, indorsed by France and Germany, induced Japan to withdraw her claims to any portion of the mainland, on the understanding that she should be compensated by an increase in the amount of the money indemnity. F. M. COLBY.

Trebia: the ancient *Trebia*, a river of Northern Italy. It rises in the Ligurian Apennines 15 miles N. E. of Genoa, flows northward, and joins the Po 3 miles above Piacenza. On its banks the Romans under Sempronius were defeated by Hannibal in 218 B. C. and the French under Macdonald by Suwaroff June 17-20, 1799.

Trebellius Pollio: See AUGUSTAN HISTORY.

Trebizond, or **Tarabozan** (Gr. Τραπεζοῦς, gen. Τραπεζοῦντος; Lat. *Trapezus*; Turk. *Trabizon* or *Türabizon*): town; in Asia Minor, in the vilayet of Trebizond; on the southeastern coast of the Black Sea (see map of Turkey, ref. 4-1). It is beautifully situated on a slope, facing the water; is surrounded with walls, and fortified. It is the Turkish terminus of the main route to Armenia and Persia, but the trade formerly centering here is being rapidly diverted to Batoum. Regular lines of steamers connect Trebizond with the Danube and Constantinople. The imports are mainly manufactured European goods. The exports are wool, mohair, skins, wax, gum, resin, gall-nuts, tobacco, oil, opium, fruit, shawls, and carpets, brought overland by camel caravans; also timber and box-wood. Trebizond, founded by a colony from Sinope, was a flourishing city in the time of Xenophon, and gave a memorable reception to the TEX THOUSAND (q. v.). Trajan made it the capital of Pontus-Cappadocia. In 1204 Alexius Comnenus founded the empire of Trebizond, which lasted till its overthrow by Sultan Mohammed II. in 1461. Population (1889) 45,000, of whom 29,000 were Ottomans, 10,000 Greeks, and 5,000 Armenians. E. A. GROSVENOR.

Tredegar, tred'gair: town; in Monmouthshire, England; 7 miles E. N. E. of Merthyr Tydvil (see map of England, ref. 12-F). It is in a coal district, and is the seat of great iron and steel works. Pop. (1891) 17,484.

Tredgold, THOMAS: engineer; b. at Brandon, near Durham, England, Aug. 22, 1788; was for some years a journeyman carpenter; was for ten years (1813-23) employed in London in an architect's office, extending his studies to embrace chemistry, geology, mechanics, and engineering, and for the last six years of his life practiced with great success as a civil engineer, contributing meanwhile scientific articles to *The Philosophical Magazine*, *The Annals of Philosophy*, and the *Encyclopædia Britannica*. He was the author of *The Elementary Principles of Carpentry* (1820); *A Practical Essay on the Strength of Iron and other Metals* (1821); *Description of Iron Suspension Bridges* (1826); and *The Steam-engine* (1827), which was subsequently edited by W. S. B. Woodhouse (2 vols., 1838-40), with 125 plates in 8 folio, and in an enlarged edition (3 vols., 1850-53). D. in London, Jan. 28, 1829.

Trediakov'skii, VASILII KIRILOVICH: author; b. in Astrakhan, Russia, 1703. After a stay of some years in foreign countries he settled in St. Petersburg, where he was made secretary of the Academy of Science. He was a prolific writer, but his verse was so bad that Catherine II. in her games used to punish her courtiers by making them learn lines of it, and his name has remained proverbial in Russia as that of the pretentious, talentless poet who made his way by cringing for court favor. As a prose writer he was of more importance, for some of his critical works, and especially his *Method of Russian Versification*, were of considerable value. He also translated Boileau's *Art Poétique*, Rollin, Fénelon, etc. D. Aug. 18, 1769. A. C. COOLIDGE.

Tree [O. Eng. *trēo*; Icel. *trē*; Goth. *triu* < Tenton. *trewo*; Russ. *drevo*; Welsh, *derw*, oak; Gr. *δρῦς*, oak; Sanskr. *dru*, tree]; a woody plant with a single trunk rising to more than the height of a man. There are all gradations between shrubs and trees. Some woody-stemmed plants are properly called trees, although of dwarf stature, the branches being elevated upon a single trunk; some, which branch or divide from the ground or near it into a cluster of trunks, reach such a height and magnitude that they must be called trees rather than shrubs. Most common trees increase in thickness by the addition each year of a cylinder of wood around the wood of the preceding years. They are therefore said to be *exogenous* in growth. The seedling stem, almost as soon as it is formed, is traversed longitudinally by some woody threads (fibro-vascular bundles), which are so arranged as to surround a central portion that remains destitute of woody matter; and these increase in size and number until they form a cylindrical layer of wood (in cross-section a ring) between the soft central core, the pith, and an outer more or less soft portion, the bark. When this layer of wood in the seedling stem or other shoot of the season is completely formed, no additions are made to its inner portion, but new wood may continue to be formed on its outer surface, between it and the bark, all through the season. When, after a suspension of growth consequent upon the diminution of temperature in all climates which have a winter, or of moisture where vegetation is arrested or checked by dryness, a second season of growth supervenes, a new layer of wood is formed upon or external to the old one, and so on year after year. Consequently the section of an exogenous tree-trunk exhibits concentric layers—in all ordinary cases one for each year of its age—the oldest next the pith, the youngest next the bark. As the tree has made annual increments of growth in length as well as in diameter, a cross-section at the base of the trunk exhibits a number of annual layers equal to the whole age of the tree, while one at the summit has only a single layer, interposed between the pith and the bark. Radiating plates—in the cross-section lines more or less conspicuous—traverse this layer of wood from the pith to the bark, dividing it into wedges; these are continued through the succeeding layers, and new ones are interposed between them as the wedges widen; these are the *medullary rays* or *silver grain*. The bark of an exogenous tree is always clearly distinguishable from the wood, and for the most part is readily separable from it, the demarcation between the two being a thin zone of undifferentiated cells, called the *cambium*. From this cambium are developed on the one side additions to the wood—on the other to the bark. While the wood, once formed, remains unaltered except as changing from sapwood to heart-wood, the bark is subject to distension from within, from the increasing size of the woody cylinder. The older and outer bark is consequently sooner or later fissured and riven as well as worn and weathered by exposure to the elements.

The port or character of the tree depends much upon its mode of branching, and this primarily upon the arrangement of leaves upon the twigs; for the branches of the spray proceed from lateral buds, of which there is usually a single one in the axil of each leaf. Accordingly, when the leaves are opposite, so will be the branches of the spray, while alternate leaves originate alternate branchlets; but this symmetry, however evident in the branchlets, is usually more or less obscured in the larger branches by the non-development of some of the buds and the destruction of many branchlets. When the main trunk persists and leads throughout, not being rivaled or supplanted by any of the branches, the tree is said to have an excurrent trunk; when the main trunk is lost in or replaced by the main branches, it is said to be deliquescent.

Palm-trees are the more common but not the exclusive representatives of the type of arboreal vegetation in which the stems do not increase in thickness exogenously. They rise by a simple columnar trunk, not tapering as it ascends, terminated with a crown of large and long-stalked leaves, which are either pinnate or plume-like, as in date-palms, or palmate, as in palmetto. This simple and mainly cylindrical trunk comes from their whole vegetation being the development of a single terminal bud. Such axillary buds as they develop form the inflorescence, and therefore do not result in permanent branches. Nevertheless, a few palms branch habitually and normally after a certain age. The doug-palm of Upper Egypt and Nubia is the best-known example. In contrast with the wood of exogenous trees, that of palms and their relatives has no concentric layers surrounding a central pith, and no proper bark. The wood is made up of separate fibro-vascular bundles, longitudinally traversing and separately imbedded in the cellular and softer fundamental tissue which is represented in the exogenous stem by the central pith and the radiating medullary rays. When these wood-bundles can be traced, they are found to have their upper termination in leaf-stalks, their lower in the circumference or rind, in their course describing more or less of an arch or long curvature. The central portion of the trunk contains fewer of the woody bundles; toward the circumference they are more crowded. Consequently, the denser wood is at the circumference, the softer at the center. The center sometimes remains pithy, as it were, and sparsely traversed by threads of wood, but in many palm-stems nearly the whole becomes so closely packed with woody bundles as to form a very compact and hard wood. On account of this structure such trees have been called *endogenous*, "inside growing," but the term is inaccurate, and is becoming obsolete in this sense. Exogenous trunks increase indefinitely in diameter; palm trunks soon become incapable of further enlargement, except in height. They are accordingly cylindrical up to the crown of leaves, and in place of a bark, distinct, separable, and of different layers, they are invested by an inseparable, more homogeneous, and permanent rind, which, along with the more solidified wood of the circumference, restricts and limits distension. Some such trunks, however, notably those of dragon-trees and yuccas (of the lily family), continue distensible, and therefore continue to increase in diameter; they also branch when old, usually only after blossoming, which takes place from a terminal bud, thus arresting the vegetative growth, which is resumed from axillary buds. Such stems therefore fork at each flowering or other arrest of the terminal bud, and so in time form a branched head, in some respects imitating that of an ordinary exogenous tree.

Trees as to climate and distribution can hardly be here treated of, but it must be stated that arboreal growth, of any ordinary type, supposes and requires a considerable amount of moisture, and accordingly of rainfall, either through the year or through a growing season. An ordinary tree expands a large extent of evaporating surface, chiefly in its foliage. Leaves dry up and perish if not supplied with moisture to replace that which is evaporated or transpired. Therefore, not only are rainless districts treeless (except as water is supplied by irrigation), but regions of scanty and precarious summer rain are sparsely wooded or without forest, according to the amount of aridity or length of the dry season; or their arboreseent vegetation meets the exigency and stress by some special adaptation. Broad-leaved evergreens abound where rains fall throughout the year, and especially where winter is unknown. Narrow-leaved or needle-leaved evergreen trees are chiefly in cooler or cold climates, well supplied with moisture through the year or through the season of activity. Trees with expanded foliage survive the rainless hot season of the drier tropical and sub-tropical regions only by dropping their leaves, upon which the stress first comes, and thereby reducing the evaporating surface to a minimum. Those which retain their foliage are such as have some peculiar provision—by fleshiness with thick epidermis in the case of succulent foliage, or by firm coriaceous texture, superficially or throughout, to which, especially in Australia, is sometimes added a vertical instead of horizontal position of the leaves, which thus present their edges instead of one face to the high sun. This prevails among the Australian acacias and myrtaceous trees, which compose the larger part of the arboreal vegetation. In climates in which vegetable growth and action are arrested by winter, the trees are nearly all deciduous, except

the coniferous evergreens, the leaves of which are peculiarly organized for resisting cold, and individually expose a small surface to the elements.

Duration of Trees.—An exogenous tree, renewing annually its twigs and foliage above, its growth of roots beneath, and zone of new wood and bark connecting the two, has no definite limits to its existence. Its actual duration depends upon external circumstances, and upon some inherent liabilities which may practically result in a certain average of life in any particular species, which, however, certain favored individuals may be expected to overpass. Increase of size, height, or spread of branches, and other inevitable consequences of age, however, bring increasing, and at length inevitable, disadvantages and liabilities, so that practically, although most trees, like most men, die an accidental death, the longest survivors may be said to die of old age in the sense in which the oldest of the human race do—that is, of the diseases or accidents which the younger generally resist or recover from, but to which the older succumb in consequence of the disadvantages of age. Suffice it to say, however, that exogenous trees are known, by the actual counting of their layers, throughout or in great part, to have attained the age of from 1,200 to fully 2,000 years; it is probable that some extant trees are considerably older. The tallest trees known rise little less than 500 feet (*Eucalyptus*, in Australia). The largest in girth are trees of *Eucalyptus*, up to 81 feet; giant redwoods in California, up to 91, and possibly 100 feet; baobab-trees of Senegal, some of which have reached the latter circumference, but they are low trees of rapid growth even when old, and probably of no extreme age; and, finally, there is a Mexican *Taxodium* or bald cypress, a slow-growing tree, which measures 112 feet in circumference. If this does not consist of two or more original trunks which have grown into one—of which there are no external indications—it is probably the oldest existing tree known.

Trees like palms, which do not continue to increase in girth, are more strictly and inherently limited in their duration; perhaps they never live more than 200 or 300 years. When such a trunk has a soft living rind, capable of unlimited expansion, and also produces branches, perhaps it may live as long as an exogenous tree. Dragon-trees (*Dracæna*) are examples of this. The celebrated great dragon-tree of Orotava, Teneriffe (now destroyed by a series of storms, but which was in full vigor when Humboldt visited it), was probably as old as any of the existing redwoods of California.

Revised by CHARLES E. BESSEY.

Tree, HERBERT BEERBOHM: actor; b. in London in 1853; educated in Germany and England; entered the office of his father, a grain-merchant in London, in 1870, but became devoted to amateur acting, and made his *début* at the Globe theater, London, as Grimaldi in 1878. In Mar., 1884, he made a hit as the timid curate in *The Private Secretary* at the Prince of Wales's. In 1887 he became lessee of the Comedy theater, and later of the Haymarket theater, where he has produced a number of very successful plays, among which are *The Pompadour*, *Hyppatia*, *A Woman of No Importance*, and *John-a-Dreams*. In 1894-95 he paid a visit to the U. S. He is remarkable for the very different styles of the parts which he has assumed. He has written several papers on the actor's art, and in 1893 he lectured at the Royal Institution on the imaginative faculty.

Tree-duck: any one of ten or a dozen species of ducks of the genus *Dendrocygna*, deriving their name from their arboreal habits. They are readily distinguished by their long legs and the length of the hind toe. They nest in holes in trees, often at some distance from the water, to which they carry their newly hatched young. They are chiefly confined to the tropics, but two species, *Dendrocygna fulva* and *D. autumnalis*, occur in the U. S. F. A. L.

Tree-ferns: large ferns having a tree-like form and size, with much the habit of the palms. Tree-ferns formed an important part of the vegetation of the coal-measures. At present they are mostly tropical or insular, but are abundant in Tasmania, New Zealand, and parts of Australia and in the Himalayas. A few species yield a useful starchy pith resembling sago. See FERNWORTS and PLANTS, FOSSIL.

Tree-frogs, or Tree-toads: those species of tailless batrachians (order *Salientia*) which are adapted for life among trees, and which are provided with terminally dilated toes. This character of dilatation of the tips of the toes, although regarded by some authors as of systematic importance, is of mere teleological significance, and is not co-ordinated with

true morphological characteristics. The tree-frogs and tree-toads are now mostly to be found in the families *Hyllidæ*, *Cystignathidæ*, *Engystomidæ*, *Dendrobatidæ*, and *Ranidæ*. The North American species, however, all belong to

The squirrel tree-toad.

the family *HYLLIDÆ* (q. v.). The *Hyla squirella*, which is about 1½ inches in length, is of a brownish or light ash color. It is a southern species. Revised by F. A. LUGAS.

Trefoil: See CLOVER.

Tregelles, tre-gelz, SAMUEL PRIDEAUX, LL. D.; New Testament critic and author; b. at Wodehouse Place, near Falmouth, England, Jan. 30, 1813, of Quaker parentage; educated at Falmouth Classical School; was for some years in the iron-works at Neath Abbey, Glamorganshire, 1828-34; was in 1835-36 a private tutor at Falmouth; shortly after devoted himself to the task of preparing a critical edition of the text of the New Testament from the most ancient MSS. and versions, and pursued that object through life; studied the Oriental languages; was long associated with the Plymouth Brethren, though he never joined that organization, and died in the communion of the Church of England. He was stricken with paralysis in 1861, and again in 1870. The second stroke so crippled him that he could not take part in the revision of the New Testament to which the Convention of Canterbury invited him. In the pursuit of his scheme he visited the principal libraries of Europe for the purpose of collating MSS. He published the first specimen in 1837, and the first part, the Revelation, 1844; then his great work in parts, *The Greek New Testament, edited from Ancient Authorities, with the Latin Version of Jerome, from the Codex Amiatinus* (1857, seq.); the 6th part completed the text, 1872; the 7th and last part, containing the prolegomena, addenda, and corrigenda, edited by F. J. A. Hort and A. W. Streane, 1879. By this labor he put himself in the line of illustrious scholars who have brought the text of the Greek New Testament to its present perfection. In recognition of this service he received a pension of £100 in 1862, which was doubled after 1870. He was an active philanthropist as well as scholar. D. at Plymouth, Apr. 24, 1875. Besides his New Testament, he published many books. His chief publications were: *Passages in the Book of Revelation connected with the Old Testament Scriptures* (1836); *The Englishman's Greek Concordance to the New Testament* (1839); *The Englishman's Hebrew and Chaldee Concordance to the Old Testament* (2 vols., 1843); *Hebrew Reading Lessons* (1845); *Heads of Hebrew Grammar* (1852); *Gesenius's Hebrew and Chaldee Lexicon* (1847); *The Prophetic Visions of the Book of Daniel* (1847; 5th ed. 1861); *The Book of Revelation Translated from the Ancient Greek Text* (1848); *On the Original Language of St. Matthew's Gospel* (1850); *The Jansenists* (1851); *Historic Evidence of the Authorship and Transmission of the Books of the New Testament* (1852); *Account of the Printed Text of the Greek New Testament* (1854); *Codex Zacynthius, Greek Palimpsest Fragments of the Gospel of St. Luke obtained in the Island of Zante* (folio, 1861), the fourth volume of the 10th ed. of Horne's *Introduction* (1856). Revised by S. M. JACKSON.

Treitschke, tritsh ke, HEINRICH GOTTHARDT, von: historian; b. in Dresden, Saxony, Sept. 15, 1834; studied history and political economy in various German universities; was privat docent at Leipzig 1858-63; appointed professor in the University of Freiburg im Breisgau 1863-66. As an ardent

adherent of Prussia he resigned in 1866, and removed to Berlin, where he edited the *Preussischen Jahrbücher*. He was called to the chair of History at Heidelberg in 1867, and to that in the University of Berlin in 1874. In the meanwhile (1871) he was elected to the Reichstag, where he continued as a member of the liberal party till 1888. He succeeded Prof. von Ranke, who died in 1886, as Prussian historiographer. He published *Zehn Jahre Deutscher Kämpfe 1865-74* (1874); *Der Sozialismus und seine Gegner* (1875); *Der Sozialismus und der Meuchelmord* (1878); *Deutsche Geschichte im 19ten Jahrhundert* (1879-85); *Zwei Kaiser* (1888); and several other works. D. Apr. 28, 1896.

Trelawney, EDWARD JOHN: author and soldier of fortune; descended from an old Cornish family, and b. Mar. 10, 1792. He is known especially as the author of a novel, in great part autobiographical, entitled *Adventures of a Younger Son* (1830), and *Recollections of Shelley and Byron* (1858), reissued in 1878 as *Records of Byron, Shelley, and the Author*. At the age of eleven he was sent to sea, and after many adventures and some experience in privateering he settled in London and wrote for the magazines. He made the acquaintance of Byron and Shelley at Pisa in 1821, and was present with Byron and Leigh Hunt at the burning of Shelley's body. In 1823 he joined Byron in Greece, and fought in the Greek war of liberation as aide-de-camp to the partisan leader Odysseus. He afterward returned to London, and was prominent in Lady Blessington's circle. D. at Sompting, Sussex, Aug. 13, 1881. His body was cremated, and the ashes interred near Shelley's at Rome. His portrait is preserved in Millais's painting, *The Northwest Passage*. H. A. BEERS.

Release, WILLIAM, D. Sc.: botanist; b. at Mt. Vernon, N. Y., Feb. 22, 1857; educated in Cornell and Harvard Universities; instructor in botany in Cornell University 1880; Professor of Botany in University of Wisconsin 1881-85; director of Shaw School of Botany, Washington University, St. Louis, 1885-; director of Missouri Botanical Garden 1889-; has published an English translation of Poulson's *Botanical Microchemistry* (1883); *The Botanical Works of the Late George Engelmann* (1887, with Asa Gray); an English translation of Salomonsen's *Bacteriological Technique* (1889); *Annual Reports of the Missouri Botanical Garden* (1890-91-92-93); and many papers in various journals and the proceedings of societies. CHARLES E. BESSEY.

Trematoda [Mod. Lat., from Gr. *τρηματώδης*, full of holes, deriv. of *τρήμα*, *τρήματος*, hole]: a group of parasitic flatworms (see PLATHELMINTHES) in which parasitism has produced but slight degeneration. The body is usually flattened, lacks cilia and all traces of segmentation; the mouth is anterior and communicates with a digestive tract which forks after a short extent. Upon the lower surface are one, two, or more suckers for adhesion to the host, and sometimes these are re-enforced by hooks. Like all flatworms they lack a body-cavity and distinct circulatory organs, while the excretory system is well developed. Most species have the sexes separate. The group is usually subdivided into the Monogenea, in which the egg develops directly into the adult form without the intervention of an asexual form, and the Digenea, in which there is an alternation of generations, one or more asexual forms being introduced in the life cycle. Correlated with this is a difference in their habits of parasitism. Thus the Monogenea inhabit a single host and usually attach themselves to the external surface of the body. The Digenea, on the other hand, have more than one host, one being usually an invertebrate, the adult living in some vertebrate. Among these last are found some of the most dangerous parasites, especially that group known popularly as flukes (*Distoma*). Some of these cause serious distempers among domestic animals and eight occur in man. The history of a few flukes has been followed, and reveals a wonderfully complex series of alternation of generations. See Leuckart, *Die menschlichen Parasiten* (1867); Cobbold, *Entozoa*; Thomas, *Quar. Jour. Micros. Science* (1883). J. S. KINGSLEY.

Tremblay, FRANÇOIS LECLERC, du: See JOSEPH.

Trembles: See MILK-SICKNESS.

Tremont: town; Hancock co., Me.; on the Atlantic Ocean; 25 miles S. of Ellsworth, and 25 miles E. by S. of Castine (for location, see map of Maine, ref. 9-F). It was formerly a part of the town of Mt. Desert, from which it was set off and incorporated in 1848 under the name of Mansel, subsequently changed to its present name. It contains the

villages of Tremont, Southwest Harbor, Seal Cove, West Tremont, Sea Wall, Tremont Center, and Mansel, and has 5 churches, public high school, public library, 11 hotels, and a savings-bank. Pop. (1880) 2,011; (1890) 2,036.

Tremont: borough; Schuylkill co., Pa.; on the Phila. and Reading Railroad; 13 miles W. of Pottsville, the county-seat, and 50 miles N. W. of Reading (for location, see map of Pennsylvania, ref. 5-II). It is in an agricultural and mining region, and contains 8 churches, graded schools, improved water-works, electric lights, a private bank, and 2 weekly newspapers. Pop. (1880) 1,785; (1890) 2,064; (1895) estimated, 2,000. EDITOR OF "WEST SCHUYLKILL PRESS."

Tremulous Poplar: See ASPEN.

Trench, RICHARD CHENEVIX, D. D.: archbishop and author; b. in Dublin, Ireland, Sept. 9, 1807; educated at Trinity College, Cambridge, and graduated in 1829; spent some years in travel; took orders in the Church of England 1833; was curate at Hadleigh, Suffolk, 1833-35; incumbent of Curdridge 1835-40; curate to Archdeacon (afterward Bishop) Samuel Wilberforce at Alverstoke 1840-44; rector of Itchenstoke 1844-45; was appointed examining chaplain to the Bishop of Oxford (Dr. Wilberforce) 1845; was Hulsean lecturer 1845-46, and select preacher at Cambridge 1843 and 1856; Professor of Theology at King's College, London, 1846-58; Dean of Westminster 1856-63, and was ordained Archbishop of Dublin, as successor to Dr. Whately, Jan. 1, 1864; resigned 1884. In the field of philology he achieved distinction, and his paper on the *Deficiencies in our English Dictionaries* gave the first impulse to the great *New English Dictionary* edited by Dr. James A. H. Murray. D. in London, Mar. 28, 1886. He was the author of many works, including *Poems from Eastern Sources* (1842); *Elegiac Poems* (1846); *Poems, collected and arranged anew* (1865); *Notes on the Parables of our Lord* (1841; 15th ed. 1884); *Notes on the Miracles of our Lord* (1846; 13th ed. 1886); *Exposition of the Sermon on the Mount, from St. Augustine* (1844); 2 vols. of Hulsean lectures, *The Fitness of Holy Scripture for unfolding the Spiritual Life of Men* (1845); *Christ the Desire of all Nations* (1850); *On the Study of Words* (1851; 15th ed. 1874); *On the Lessons in Proverbs* (1853); *Synonymes of the New Testament* (1854; 2d series 1863; 8th ed. recast, 1 vol., 1876); *English, Past and Present* (1855; 11th ed. 1881); *Cadron, his Life and Genius* (New York, 1856); *Some Deficiencies in our English Dictionaries* (1857); *The Authorized Version of the New Testament, in Connection with some Recent Proposals for its Revision* (1858); *Select Glossary of English Words used formerly in Senses different from their Present* (1859); *Commentary on the Epistles to the Seven Churches in Asia* (1861); *Studies on the Gospels* (1867); *Lectures on Mediæval Church History* (1877; 2d ed. 1879); edited several volumes of poetry, and *Remains of the Late Mrs. Richard Trench* (1862), his mother. See his *Letters and Memorials* (2 vols., 1886). Revised by S. M. JACKSON.

Trenchard, STEPHEN DECATUR: naval officer; b. in New York, July 10, 1818; entered the navy as a midshipman Oct. 23, 1834, serving in the Seminole war in Florida; became lieutenant in 1847, and was on the Saratoga in the war with Mexico; commander in 1862, captain in 1866, commodore in 1871, rear-admiral in 1875; commanded the Rhode Island in both the Fort Fisher fights; retired in 1880. D. in New York, Nov. 15, 1883.

Trendelenburg, FRIEDRICH ADOLF: classical philologist and philosopher; b. at Eutin, near Lübeck, Germany, Nov. 30, 1802; studied at Kiel; appointed professor extraordinary at Berlin 1833; ordinary 1837; member of Academy of Sciences in 1846. D. in Berlin, Jan. 24, 1872. Trendelenburg's claim to distinction as a thinker rests on his acute criticism of the formal logic of Kant and the dialectical method of Hegel. In his own system he took motion as a starting-point, from which he deduced all other philosophical conceptions, including time and space. The foundation of his teaching is Platonic and Aristotelian. His most noteworthy works are *Elementa Logices Aristotelicæ* (8th ed. 1878); an edition of Aristotle's *De Anima* (2d ed. by Chr. Belger, 1875); *Historische Beiträge zur Philosophie* (3 vols., 1846-67), in which the *History of the Doctrine of Categories* and the essays on *Kant, Spinoza, Leibnitz*, and *Herbart* are especially valuable; and *Naturrecht auf dem Grunde der Ethik* (2d ed. 1868). See II. Bonitz, *Zur Erinnerung an Trendelenburg* (Berlin, 1872); E. Bratuschek, *Adolf Trendelenburg* (1873). ALFRED GUDEMAN.

Trent: a river of England. It rises in Biddulph Moor in Staffordshire, at an elevation of about 600 feet above the level of the sea, flows in a southeasterly direction, and forms the Humber after joining the Ouse, about 15 miles W. of Hull. Its length is about 150 miles, and it is navigable for about two-thirds of its course.

Trent: a tributary of Lake Ontario, rising in Rice Lake, Northumberland County, Ontario, and draining a large system of northern lakes and rivers; partly navigable. The Trent itself affords good water-power, and large quantities of lumber are floated upon it. It is 150 miles long, has a basin of 4,000 sq. miles, and discharges its waters into the Bay of Quinté at Trenton. M. W. 11.

Trent (anc. *Tridentum*): town of Austria, in the southern part of Tyrol; on the Adige (see map of Austria-Hungary, ref. 7-A); beautifully situated and well-built, and traversed by canals. Its cathedral, begun in 1212, is a magnificent edifice of white marble; the palace, in which the famous council held its sittings, and several other buildings are also remarkable. It manufactures leather, glass, sugar, tobacco, bells, cards, and silks, and carries on an important transit trade between Italy and Germany. Pop. (1890) 21,486.

Revised by M. W. HARRINGTON.

Trent Affair: the seizure of the Confederates *Slide* and Mason on board the British steamer *Trent* in 1861, and the resulting international complications. See *SLIDELL, JOHN*.

Trent, Council of (*Concilium Tridentinum*): the nineteenth œcumenical council of the Catholic Church, held at Trent in Tyrol.

Occasion of the Council.—Its convocation was owing to two motives: (1) the desire to stay the spread of Protestantism, and (2) to bring about a much-needed reform within the Church. For several years the project of the council had been discussed between the papal and the imperial authorities without much headway, the former being anxious to convoke the council in some Italian city, like Mantua or Vicenza. The imperial view obtained, and a compromise was effected which resulted in the calling of the council by Paul III. for Nov. 1, 1542, at Trent, an imperial free city under a prince bishop. It was finally opened Dec. 13, 1545, by the papal legates, the cardinals del Monte, Cervini, and Pole, in the presence of four archbishops, twenty-two bishops, five generals of orders, theologians, ambassadors, etc. The Protestants were invited to attend, and such was the sincere desire of the emperor and the King of the Romans, but they refused.

Procedure.—It was decided to take up in each session matters of dogma and discipline, and this, too, was a compromise, the pope desiring doctrinal questions to be first decided, and the emperor leaning toward a speedy reform of practical abuses. The subject-matter was proposed by the papal legates, who presided, and was then divided among private congregations, in which the *pro* and the *con* were argued at length by learned and experienced men. Afterward the private congregations met as a body or general congregation, and the final session was usually a formal confirmation of what had already been settled. The doings of each of the twenty-five sessions are divided into *decrees*, i. e. statements of Catholic doctrine or resolutions concerning disciplinary reform, and *canons*, or condemnations of heretical teaching.

History of the Council.—The first eight sessions were held at Trent, but in Mar., 1547, owing to the prevalence of the pest, it was transferred to Bologna, where the ninth and tenth sessions were held in spite of the absence of the bishops subject to the emperor, and of the latter's protestations, Sept. 17, 1549. It was therefore indefinitely prorogued. Julius III., Mar. 14, 1550, issued another call to the bishops to assemble at Trent, and May 1, 1551, the twelfth session was held. Neither the emperor nor the King of France desired to look on it as a continuation of the original council because of the susceptibilities of their Protestant subjects. The victories of Maurice of Saxony and his near presence at Innsbruck decided the fathers to suspend the council Apr. 28, 1552. It was again convoked by Pius IV., Jan. 18, 1562, and closed its work Dec. 4, 1563. Nine cardinals, 3 patriarchs, 33 archbishops, 237 bishops, 8 abbots, 8 generals of orders, and 150 theologians and canonists had taken part. Of the bishops, 187 were Italian. Queen Elizabeth was twice asked to take part, but refused. Mary, Queen of Scots, excused herself by the lamentable condition of the Church in her kingdom. Cardinal Pole and Thomas Goldwell, Bishop

of St. Asaph, represented England, and three Irish bishops, Thomas O'Herlaghy, of Ross, Eugene O'Hart, of Achonry, and Donald Mcougail, of Raphoe, represented Ireland.

Work of the Council.—The direct results of the council were visible in doctrinal statements and resolutions for reform. The rule of faith, the nature of original sin, the nature and office of grace (justification), the doctrine of the sacraments in general and particular, the Mass, orders, marriage, the censorship of books, the Catholic practices and traditional beliefs, the invocation of saints, purgatory, the veneration of relics and images, were all treated in the council with great wisdom, moderation, and exactness. The reforms were thorough and extended to the entire Church in the intention and provision of the fathers. Its results were a great relief to the conscience and intelligence of Catholics, and inaugurated at once a counter-reformation, personified in men like St. Charles Borromeo and St. Francis de Sales. It united Catholics throughout the world, and put an end to the mental wavering and indecision of a great many, while it pointed out the evil and the false in the non-Catholic teachings. Altogether it marks a complete awakening in the Church, and is the starting-point of the modern ecclesiastical law, discipline, administration, and to a large extent of the theological formation itself, so much so that it can be said that no council since that of Nice has had a more profound influence. The council was acknowledged in most Catholic countries: in those whose civil authorities, like France, refused to accept its decrees, provincial councils and public opinion made it the ecclesiastical law and binding. Its doctrinal and disciplinary regulations are binding in the entire Catholic Church, though in some countries the decree *Tametsi* on the necessary presence of the parish priest and two witnesses for the validity of the marriage contract has never been proclaimed, this especial promulgation having been ordered by the council before the decree can obtain the character of a law in any given territory. See *TRIDENTINE PROFESSION OF FAITH*.

LITERATURE.—The acts of the council are best found in Le Plat, *Monumenta ad historiam Concilii Tridentini* (7 vols., Louvain, 1781-87). The original acts and debates, as prepared by the secretary, Angelo Massarelli, are in the Vatican Library, and were published in part, but unsatisfactorily, by Theiner, *Acta Gemina SS. Œcum. Concilii Tridentini* (2 vols., Leipzig, 1875). Döllinger, Calenzio, and Siekel have published diaries, correspondence, and other information concerning the council. The original and authentic edition of the *Canones et Decreta Concilii Tridentini* is of 1564 (Rome). The history of the council has been written by Paolo Sarpi (Pietro Sove Polano) and Sforza Pallavicino, the former a Venetian Servite, the latter a Jesuit and a cardinal. The work of Sarpi appeared at London in 1619; that of Pallavicino in Rome 1652, and after many editions, *ibid.*, with notes of Zaccaria 1833. The work of Sarpi is written with great art, and he dissimulates much of his own feelings by indirect methods. Bossuet declared it the work of an enemy and not of an historian of the council. Pallavicino wrote his history out of the original acts preserved in the Vatican, and in many places has successfully exposed the inaccuracies and evil animus of Fra Paolo, who was for the rest an able, learned, many-sided writer, but proud, and bitterly opposed to the court of Rome. The Catechism of the Council of Trent, the diocesan seminaries, the new editions of the liturgical books and of the Vulgate, etc., are the outcome of the council, which committed to the care of the pope a number of projects left over at the closing. On Sarpi and Pallavicino, see Brischar, *Burtheilung der Controversen Sarpis und Pallavicinos* (Tübingen, 1843); Ranke, *History of the Popes* (vol. iii., app. 2); L. Maynier, *Études critiques sur le Concile de Trente* (Paris, 1874). Other literature in Hergenroether, *Kirchen-Geschichte*, iii., 231, *seq.*, and Kraus, *Kirchen-Geschichte*, p. 567. The second edition of Hefele's *History of the Councils* (German) will contain the history of that of Trent. Cardinal Hergenroether undertook it (vol. ix., 2d ed.), but did not get beyond the preparatory period. J. J. KLANE.

Trente-et-Un: See *ROUGE-ET-NOIR*.

Trenton: port of entry of Hastings and Northumberland Counties, Ontario, Canada: on the Bay of Quinté, on both sides of the Trent, and on Grand Trunk and Central Ontario railways; 101 miles E. of Toronto (see map of Ontario, pp. 4-1). Immense quantities of timber are rafted down the river and shipped at this place, and it has large manufactures. Pop. (1891) 4,364.

Trenton: city; capital of Grundy co., Mo.; on the Weldon fork of the Grand river, and the Chi., Rock Is. and Pac. and the Quincy, Om. and Kan. City railways; 85 miles N. E. of St. Joseph, 101 miles N. E. of Kansas City (for location, see map of Missouri, ref. 2-F). It is in an agricultural and stock-raising region, and has 6 churches for white people and 2 for colored, a public school with 22 rooms and over 1,500 enrolled pupils, Avalon College (United Brethren, chartered 1881), the Jewett Norris library with endowment of \$15,000, a national bank with capital of \$75,000, a State bank with capital of \$75,000, 3 daily and 3 weekly newspapers, 3 flour-mills, 2 cigar-factories, 2 coal-shafts from which 35,000 tons of coal were taken in 1894, butter and cheese factory, gas and electric light plants, water-works, and street-railway. Trenton was founded in 1841, was chartered as a town sixteen years later, and became incorporated as a city with enlarged territory in 1893. Pop. (1880) 3,212; (1890) 5,039; (1895) estimated, 7,000.

EDITOR OF "REPUBLICAN."

Trenton: city; capital of New Jersey and of Mercer County; on the Delaware river, at the head of steamboat and sloop navigation; on the Delaware and Raritan Canal, and on the Penn. and the Phila. and Reading railways; 33 miles N. E. of Philadelphia, 59 miles S. W. of New York (for location, see map of New Jersey, ref. 4-C). Two iron bridges span the Delaware, connecting the city with its suburb, Morrisville, and the fertile farm-land of Bucks co., Pa. Trenton surrounds an apex in the course of the Delaware, is closely built through eleven wards, and has many wide streets lined with handsome residences. Cadwalader Park and its residential plot, Cadwalader Place, Monument Park, Tenth Ward Park, and Spring Lake Park are the breathing-places. The city has an excellent sewerage system, good water-supply, paid fire and police departments, and an economical administration of local affairs.

State Capitol, Trenton, N. J.

Public Buildings.—There are a public library (other than the State Library in the Capitol), large opera-house, Y. M. C. A. building, three hospitals (the Mercer, City, and St. Francis), county court-house, Union Industrial Home, the State School for Deaf Mutes, State prison, arsenal, and U. S. Government building. In Ewing, on the environs of Trenton, are the State Asylum for Insane, the Industrial School for Girls, and the Odd Fellows' Home. The Widow's and Single Woman's Home, near the State-house, was formerly the barracks used during the French and Indian war.

Churches and Schools.—Trenton is the seat of a Protestant Episcopal and of a Roman Catholic bishopric. There are 48 churches and places of worship, including 10 Methodist Episcopal, 8 Roman Catholic, 7 Presbyterian, 6 Baptist, 5 Protestant Episcopal, 3 Lutheran, 2 African Methodist Episcopal, 2 synagogues, a church of the Messiah, and a Hicksite and an Orthodox meeting-place of Friends. The public schools embrace a high school and a score of subordinate schools. The first public school to be founded in the State was located at Trenton. Besides the common schools, the city contains the State Normal and Model Schools with over 1,000 scholars, 3 business colleges, 7 parochial schools and the Franciscan Convent of Minor Conventuals, the Union Industrial Home (formerly Children's Home), and a dozen private schools.

Business Interests.—An energetic board of health and a board of trade advance the city's interests. The First National, the Trenton Banking Company, the Mechanics' National, each with a capital of \$500,000, and the Broad Street Bank are large financial institutions. Other important organizations are the Trenton Saving Fund Society, the Trenton Trust and Safe Deposit Company, and the Real Estate Title Company. Trenton is pre-eminently a manufacturing city. Thirty potteries making all classes of ware from drain-pipe to Belleek china, two tile companies, and several brick-yards comprise an industry which gives the northeast portion of the city (old Millham) the name Staffordshire of America. Iron and steel works, woolen-mills, flouring-mills, rubber and oil-cloth works, and a large brewery are other representative establishments. Here also are located the great wire-works of the Roeblings, famous as the builders of the East river bridge between New York and Brooklyn.

History.—Trenton's site attracted settlers as early as 1679, when the place was called "Ye Halls of ye De La Ware." It took its name from the rifts of rock in front of the town. Mahlon Stacy and other members of the Society of Friends purchased land, and Stacy built on the Assanpink in 1680 the second flour-mill in West Jersey. About 1715 Judge Trent bought a large plantation, and the place came to be called Trent Town (Trenton). A royal charter created Trenton a borough town about the middle of the eighteenth century, but the plan was soon abandoned. The Legislature frequently met here before Trenton became the State capital (1790). In 1792 the town was incorporated. The Continental Congress once met here after the Revolutionary war, and a project to have Trenton made the capital of the U. S. was defeated by State jealousies. Trenton is best known to history as the place where that battle was fought which perhaps turned the tide of the Revolution. On the morning of Dec. 25, 1776, Washington, with about 2,500 men, crossed the Delaware from Pennsylvania about 8 miles above Trenton, and after a forced march surprised Col. Rall, the Hessian commander, and captured his entire force. This event was followed by the battle of Princeton Jan. 3, 1777. A shaft costing \$75,000, standing in Monument Park at the old Five Points, commemorates the event. A statue of Washington in the posture of directing his forces at Trenton surmounts the shaft. Pop. (1880) 29,910; (1890) 57,458; (1895) 62,518. The great increase between 1880 and 1890 was due to the annexation of the township of Millham and Chambersburg borough (eighth, ninth, tenth, and eleventh wards).

FRANCIS BAZLEY LEE.

Trenton: city; capital of Gibson co., Tenn.; on the Mobile and Ohio Railroad; 32 miles N. by W. of Jackson, and 59 miles S. of Columbus, Ky. (for location, see map of Tennessee, ref. 6-B). It is in an agricultural region, and has 8 churches, Peabody High School, Laneview Academy, electric lights, 2 State banks (combined capital \$83,000), 3 weekly papers, an extensive cotton-mill, 2 large roller flour-mills, cottonseed-oil mills, several foundries, and a box-factory. Pop. (1880) 1,383; (1890) 1,693; (1895) estimated, 3,000.

EDITOR OF "GIBSON COUNTY DEMOCRAT."

Trenton Falls: a series of falls and rapids in Trenton township, Oneida co., N. Y.; on the West Canada creek, a branch of the Mohawk river; on the N. Y. Cent. and Hud. Riv. and the Rome, Water, and Ogdens. railways; 17 miles N. by W. of Utica (for location, see map of New York, ref. 4-II). The stream flows through a ravine or chasm in the Trenton limestone from 70 to 200 feet deep, and the water has a descent of 312 feet in a distance of 2 miles by several falls, the most notable of which are Sherman's, 35 feet; High, 80 feet; Milldam, 15 feet; and Prospect, 20 feet. The surrounding scenery is remarkably wild, and the clearly defined stratification of the rocks affords an interesting study. The locality has many other attractions, such as the Alhambra amphitheater and the Rocky Heart, and is a place of popular resort.

Trenton Group: a division of the rocks deposited during the Lower Silurian period, and named from Trenton, N. Y., where they were first studied. The terrane is composed principally of limestone, and forms the surface over large areas in the U. S. and Southern Canada. In New York it is about 100 feet thick, and increases to 2,000 in Pennsylvania, but becomes thinner southward along the Appalachians. It has also a broad development in the upper Mississippi valley, where the average thickness is 300 feet. The subdivisive or stages usually recognized are the Trenton,

Utica, and Cincinnati. Invertebrate marine fossils abound. It is from the Trenton limestone in Ohio that most of the petroleum of that State is obtained. ISRAEL C. RUSSELL.

Trepang: See BÊCHE-DE-MER and HOLOTHURIANS.

Trephining, or Trepanning [*trephining* is from Fr. *tréphine*, a trephine, an arbitrary deriv. of *trépan*, trepan; *trepanning* is from O. Fr. *trepanner*, to trepan, deriv. of *trépan*, a trepan < Late Lat. *trépanum*, from Gr. *τρήπανον*,

FIG. 1.—The trephine.

has entered the skull, although sometimes employed in other parts to

FIG. 2.—The ancient trepan.

As soon as the inner table of the skull is cut through, the button of bone is pried out or removed by forceps, and the edges of the circular opening are cleared of all splinters of bone. The depressed bone is then elevated by means of a lever, clots are washed out, or the abscess is incised, etc., care being taken never to cut into the great venous sinuses. Trephining is more often performed for the relief of cerebral abscess or tumor than formerly, since modern diagnosis of the site of brain lesions is more definite. But for the relief of depressed bone in fractures of the skull it is less often resorted to. Hey's saw, or "rongeur" forceps, obviates the necessity of trephining in many cases. By these instruments the points and angles of bone may be removed, and a place of entrance for the lever or "elevator" secured, without the loss of sound bone, which the trephine involves.

Revised by JOHN ASHURST, Jr.

Trescott, WILLIAM HENRY: diplomatist; b. in Charleston, S. C., Nov. 10, 1822; graduated at the College of Charleston 1840; admitted to the bar 1843; U. S. secretary of legation in London 1852-53, and Assistant-Secretary of State of the U. S. 1857-60; elected to State Legislature, South Carolina, 1862, 1864, 1866; in 1877 appointed counsel for the U. S. on the fishery commission at Halifax, N. S.; in 1880 one of the plenipotentiaries to China to revise the treaties with that country; in 1881 continued and concluded the negotiations with the Colombian minister, and the protocol in reference to the rights of the U. S. on the Isthmus of Panama; in same year became special envoy extraordinary and minister plenipotentiary of U. S. to Chili, Peru, and Bolivia; in 1882 plenipotentiary with Gen. Grant to negotiate a commercial treaty with Mexico; removed to Washington, D. C., to continue the practice of law; author of several works, including *The Diplomatic History of the Administrations of Washington and Adams* (Boston, 1857).

Trespass [from O. Fr. *trespas*, deriv. of *trespasser*, pass over, transgress, die; *tres-* (< Lat. *trans*, over, beyond) + *passer*, pass]; in law, a species of tort, consisting in an unlawful act done to the person or property of another by means of direct violence, actual or constructive. The essential feature of this delict in legal contemplation is the direct violence, which may be actual, as in the case of an assault and battery, or constructive, as in the case of an unauthorized entry upon the land of another, and doing thereby mere nominal damage. This notion was expressed in the common-law pleading by the necessary allegation that the act was committed *vi et armis*. The amount of force used, the intent, and the extent of the injury done are immaterial elements in constituting the tort, and only affect the damages recovered. Trespasses are separated into three classes—to person, to personal property, and to real property. The principal trespasses to the person are ASSAULT AND BATTERY and FALSE IMPRISONMENT (*q. v.*). Trespass to personal property may consist either in forcible direct injury to the chattel, or in taking and carrying it away from the custody of its owner. Trespass to real property is an unlawful entry upon the land of another—in the old legal language, "the breaking and entering another's close." The damages may be aggravated by wrongful acts done on the land, but such acts do not form the gist of this species of tort. The commission of a legal act in an illegal manner may be a trespass, as the abuse or wrongful execution of process by an officer, and the like. It is a general doctrine of the law that if one begins to do a legal act in a proper manner, and then in its further prosecution is guilty of wrongs which amount to a trespass, he thereby becomes a trespasser from the beginning (*ab initio*). The remedy in all cases of this tort is the recovery of compensatory damages by the injured party; and if the wrong was willful, malicious, and without excusing circumstances, exemplary or punitive damages may be added by the jury.

The term "trespass" is also the name of the common-law form of action which must be used to recover damages from the wrongdoer when the delict complained of is a trespass.

Revised by F. M. BURDICK.

Trevelyan, Sir CHARLES EDWARD: statesman; b. in England, Apr. 2, 1807; entered the civil service of the East India Company; was employed in important posts; made to the viceregal government at Calcutta elaborate reports on various subjects, one of which led to the abolition of some oppressive imposts; secured the aid of the government to the promotion of European literature and science among the natives of India; in 1840 was appointed assistant secretary to the treasury; was knighted in 1848 for services in connection with the Irish famine; was instrumental in the revision of the civil establishment and in throwing open the civil service to competition. As finance minister in India, 1862-65, he made reforms in the system of accounts, and cooperated in the immense extension given at that time to public works; on his return resumed his efforts to secure the abolition of the system of purchasing commissions in the army, which system he had long opposed; was created a baronet 1874, and took a leading part in several important charities. Among other works he wrote *Education of the People of Ireland* (1838); *The Irish Crisis* (1848); *The Purchase System in the British Army* (2d ed. 1867); *The British Army in 1868* (1869); *Christianity and Hinduism* (1881). D. in London, England, June 19, 1886.

Trevelyan, Sir GEORGE OTTO: statesman and author; son of Sir Charles Edward; b. July 20, 1838, at Rothley Temple, Leicestershire, England; educated at Harrow School and Trinity College, Cambridge; entered the East Indian civil service; returned from India, and was elected to Parliament from Tynemouth as a Liberal 1865; became civil lord of the admiralty under Mr. Gladstone's second administration Dec., 1868, but resigned office July, 1870, being opposed to the Government Education Bill. He was secretary for Scotland 1885-86, and held that office again from 1892 to 1895. Among his writings are *Letters of a Competition Wallah*, republished from *Macmillan's Magazine* (1861); *Cawnpore* (1865); *The Ladies in Parliament, and other Pieces* (1869); *The Life of Lord Macaulay* (2 vols., 1876; 2d ed. 1877); *The Early History of Charles James Fox* (1880).

Treves, trevz (Germ. *Trier*): town of Rhenish Prussia, 69 miles by rail S. W. of Coblenz; on the right bank of the Moselle, beautifully situated among the vine-clad hills of that river (see map of German Empire, ref. 6-7). It has a cathedral, chiefly of the eleventh century, containing among

its relies the famous HOLY COAT OF TREVES (*q. v.*); a church dedicated to the Virgin dating from the thirteenth century (Liebfrauen Kirche), and other ecclesiastical buildings; a library containing 100,000 volumes, a hospital, manufactures of woolsens, cottons, and linens, and a large trade in timber, grain, and wine. The Moselle is here crossed by an eight-arched bridge, 623 feet long. Treves is the most ancient city of Germany (a fabulous Latin inscription on the wall of the Rothe Haus says it was built *before Rome*). The Emperor Augustus established here a Roman colony under the name of *Augusta Trevirorum*. In later days it was the residence of the Emperors Constantius, Constantine, Julian, Valentinian, Gratian, and Theodorus, and if not—as Ravenna was a little time afterward—the head of the Western world, at least the head of all the lands beyond the Alps. Almost annihilated during the subsequent barbarian invasions, it rose under the archbishops of Treves to nearly its earlier splendor. It is now a decayed town, but one of high antiquarian interest from its numerous Roman remains. Pop. (1890) 36,166.

Revised by M. W. HARRINGTON.

Treviso, trā-vee'sō (anc. *Taurisium*, or *Tarvisium*): town; province of Treviso, Italy; on the Sile; 17 miles N. of Venice by rail, in a very fertile region (see map of Italy, ref. 2-1). It is an agricultural town, and a center for the silk industry, besides manufacturing hardware, paper, and other articles. The cathedral is an imposing building, the five cupolas producing a grand effect, and in its interior, as well as in that of the Church of S. Niccolò di Bari, pictures and sculpture of much merit are preserved. Treviso has a public library, a theater, a chamber of commerce, and several educational institutions. Pop. of commune (1893) 35,200.

Trevithick, RICHARD: inventor; b. at Illogan, Cornwall, England, Apr. 13, 1771; was brought up to the business of a mechanical engineer in the Cornish mines; constructed several steam-engines, introducing various improvements, one of which was the introduction of wrought-iron cylindrical boilers (see RAILWAYS), but, his engine having blown up, popular prejudice was aroused and the practical use of the invention postponed for many years. Trevithick devoted himself anew to engineering work in the Cornish mines, continually inventing and making improvements in machinery; sent to Peru in 1814 nine of his small high-pressure condensing engines, for use in some mines in which he acquired an interest; went thither himself in 1816 as directing engineer; returned to England 1827; resumed operations as an engineer: made various inventions and mechanical improvements of widely different kinds, including warming apparatus, iron stowage-tanks, iron buoys, a gun-carriage for single-decked ships, a furnace for purifying silver ores, an hydraulic engine, a salt-water distilling apparatus, and floating docks, some of which were patented by him. D. at Dartford, Kent, Apr. 22, 1833.

Trevor, GEORGE, D. D.: clergyman and author; b. in England in 1809; graduated at Oxford 1836; chaplain on the Madras establishment 1836-45; became chaplain to the high sheriff of Yorkshire, rector of All Saints, York, and canon of York minster 1847; was elected chaplain of the parish church at Sheffield 1850, but was refused induction by the vicar, a proceeding which led to suits in chancery and in the court of queen's bench, in which he was successful; became rector of Burton Pidsea 1868, was the most active promoter of the revival of the house of convocation for the archdiocese of York, in which body he was actuary of the lower house and synodal secretary to the two houses, and was in 1871 collated to the rectory of Beeford-with-Lisset, near Hull. He published a number of works, including *Christ in his Passion* (1847); *Sermons on Doctrines and Means of Grace* (1851); *Origin, Constitution, and Form of Proceedings in the Convocation of the Two Provinces of Canterbury and York* (1852); *The Catholic Doctrine of the Sacrifice and Participation of the Holy Eucharist* (1869); *India, its Natives and Missions* (1862); *Russia, Ancient and Modern* (1862); *Egypt from the Conquest of Alexander to Napoleon* (1866); and *Rome from the Fall of the Western Empire* (1869). D. June 18, 1888.

Trevor, Sir JOHN: politician; b. at Brynkinalt, Denbighshire, Wales, about 1633; was a cousin of Chancellor Jeffreys, by whom he was favored in his professional career; was elected to Parliament 1679; chosen Speaker of the new House of Commons May, 1685; became master of the rolls Oct. 20, 1685; sworn of the privy council July 6, 1688; was dismissed from office by William and Mary; was an energetic opponent of the Government in the Convention Parli-

ment 1689, but soon made his peace with the court, with the consent of which he was unanimously elected Speaker Mar. 20, 1690; was intrusted by the Government with the task of conciliating political opponents by means of promises and rewards; made first commissioner of the great seal May 14, 1690; restored to the office of master of the rolls Jan., 1693; reported by a parliamentary committee guilty of bribery Mar. 12, 1695, and by vote of the House, to which he himself as presiding officer had to put the question, was declared guilty of a high crime and misdemeanor; resigned the speakership, and was a few days later formally expelled. He retained, however, the position of master of the rolls for the rest of his life, more than twenty-two years, and seems to have filled that office without reproach, his decisions being still quoted with respect. D. May 20, 1717, and was buried in the Rolls' Chapel.—He must not be confounded with his cousin and contemporary, Sir JOHN TREVOR (1626-72), who was envoy to France and Secretary of State under Charles II., and son-in-law to the celebrated Hampden.

Triacanthidae [Mod. Lat., named from *Triacanthus*, the typical genus; Gr. τρεῖς, *três*, three + ἄκανθα, *thorn*, spine]; a family of teleost fishes of the order *Plectognathi* and sub-order *Scleroderma*, and the most fish-like of the order. The skin covered with small, rough, closely adherent scales; the head compressed and conical in profile; the eyes lateral; the opercular bones comparatively well developed; the mouth small and terminal; the upper jaw has its elements very imperfectly united; teeth are developed on the jaws in variable form; the branchial apertures are narrow slits in front of the pectoral fins; the branchiostegal rays are completely concealed; the dorsal fins are two in number—(1) spinous, with from four to six spines, and (2) an oblong soft one; ventral fins represented mostly by a pair of strong spines articulated with a long and compressed pelvic bone; the air-bladder is closed and simple. The family is composed of three well-marked genera—(1) *Triacanthus*, confined to the Indian and Australian seas; (2) *Triacanthodes*, of which a single species only has been found in Japan; and (3) *Hollardia*, one species of which has been found in Cuba.

Revised by E. A. BIRGE.

Triad [from Gr. τριάς, *triádos*, the number three, a three of anything, trio]; in music, a chord consisting of a bass or root, with a third or fifth. See HARMONY and MUSIC.

Trial [from O. Fr. *trial*, deriv. of *trier*, try < Lat. **tritare*, frequentative of *terere*, rub]; the formal judicial examination and decision of the issues, whether of law or fact, pending between the parties to an action, preliminary to the judgment which finally determines the rights and liabilities of the litigants. For convenience, forensic trials in the U. S. may be divided into three generic classes—the trial of (1) legal actions, (2) equity suits, (3) admiralty causes.

Legal Actions.—Though formerly all legal actions were ordinarily tried before a jury, recent legislation, both in England and the U. S., has provided that by the consent of the parties, and in some cases without their consent, the jury may be dispensed with and the issues submitted to the court or to a referee; but since the only difference between the proceedings before a court or referee and those before a jury is that in a jury trial there are certain additional details, viz., the selection of the jurors, the judge's charge to them, and their verdict, these three modes of trial (before a jury, judge, or referee) may be described together.

The first step in the proceeding, after a cause has been called and is ready for trial, is (in a jury trial) the drawing and impaneling of a jury, the members of which must be taken, as a general rule, from men who have their domicile within the county where the court sits. From all the names of the jurors, written upon slips of paper and deposited in a box, the clerk draws at random the names of twelve who are to act in the particular case. As each one is announced, either party may challenge the person and proceed to ascertain whether for any reason he is incompetent to sit as a juror in that cause, the qualifications for jury duty being usually fixed by statute and referring to residence, political status, prejudice or liability to bias, mental condition, property, etc.; and a stricter rule of qualification is applied in criminal than civil cases. Besides such challenges for cause, in criminal trials the accused, and in many States the prosecution, are allowed a certain number of peremptory challenges; that is, they may exclude a certain number of the jurors drawn without giving any reason therefor; and a smaller number of peremptory challenges are in some States allowed to the parties to a civil action.

When the twelve men have been obtained they are sworn by the clerk to render a true verdict according to law and the evidence given; and this brings the proceedings to their second stage, which consists of the production of the proofs in the presence of the jury. The counsel for the party holding the affirmative, who is almost always the plaintiff, briefly explains the nature of his client's claim, and examines his witnesses, who are then cross-examined by his opponent, and sometimes re-examined directly. The opposite party then proceeds in the same manner to state and prove his version of the case. At the close of the plaintiff's evidence the defendant may move for a non-suit; and if in the opinion of the court no cause for action has been shown, even assuming the truth of all the facts stated by the witnesses, the motion will be granted and the case at once dismissed. On the other hand, a verdict may be directed for the plaintiff if his right to it clearly appears from uncontradicted proof, but this seldom happens, there being usually a conflict of evidence which must be submitted to the judgment of a jury. The court entirely regulates the admission of evidence, and either party may except to its rulings of what facts are competent and what are not competent, to be proved, and what questions are proper and what improper, and the points of law thus raised are examined upon appeal.

When the evidence is all in, the counsel address the jury on behalf of their respective clients. The order of these addresses varies in the different States, but, as a general rule, the party holding the affirmative closes and sometimes also opens the argument, though in some States the right of closing in criminal cases is given to the accused. Next comes the judge's charge to the jury. This charge is in many States restricted by statute to a simple statement of the legal rules, and in several of them it must be in writing; but at common law the judge may comment upon the facts, and, as it has been held, may even express an opinion, provided the jury is left free to decide. Either party may request particular instructions to be given, and may except to the charge, or a portion thereof, or to a refusal to charge as requested, such exceptions presenting questions of law for review by the appellate court.

After they have been charged, the jury retire to a private room to determine upon their verdict, which must be unanimous. After the jurors have retired to consider their verdict, they are not allowed to separate till it is found and delivered in open court, except in some cases after the finding of a sealed verdict. When they have agreed, they return into court, announce their verdict, and it is recorded by the clerk in his minutes. If they can not agree upon a verdict the court may, in most cases, at least, dismiss them after a reasonable time. If at any time in the trial of a cause it becomes necessary to discharge a jury because of the serious illness or the insanity of one of its members, or because the jury can not agree upon a verdict, the discharge has been held, in the majority of cases, not to constitute a bar to a second prosecution. When the trial is before the court or a referee, instead of a verdict, a written find is filed by the judge or referee containing his conclusions of fact and of law.

The general rules of evidence are the same in criminal as civil cases, i. e. the best evidence must be given. The court decides as to the admissibility of evidence, but it is the peculiar province of the jury to pass upon the weight of evidence and the creditability of witnesses. See EVIDENCE.

Equity Suits.—The original practice in chancery was for witnesses to be examined privately, without the presence of counsel, by an examiner or one or more commissioners appointed by the court. The examination was conducted by means of written interrogatories and cross-interrogatories, prepared by the counsel for the respective parties, or by the court itself, and the testimony was kept secret till all the witnesses had been examined. The reading of the depositions thus obtained, and of the pleadings, together with the arguments of counsel, constituted the trial, and the chancellor then gave his decision as suited his convenience. The great objection to this practice was that till publication of the testimony each party was left in ignorance of what facts his opponent would attempt to establish, so that, although it is still retained by a few States, in most of them the methods and proceedings in the trial of an equity suit have been made the same as those in a legal action before a judge or referee. The testimony of witnesses is reduced to writing, and an accurate transcript of all proceedings preserved by means of official stenographers, who are now generally em-

ployed in the superior courts both of the U. S. and of England.

Admiralty Causes.—The usual practice in the trial of civil causes in admiralty is very much like that which originally prevailed in equity, the evidence being taken by the clerk, and the court merely hearing the case summed up; but in some States of the U. S. the testimony is taken in open court. The common-law rules of evidence do not apply. In admiralty, trial by jury is not a right unless expressly given by statute; but when it is so given, and in criminal cases within the jurisdiction of admiralty, the same forms are employed as in a jury trial in legal actions. In the U. S. the federal courts alone have jurisdiction of admiralty cases. See the articles on PROCEDURE, PRACTICE, ADMIRALTY, EQUITY, COURTS, and JURISPRUDENCE; and also the treatises on practice by Chitty and Daniell, and John W. Smith's *Elementary View of the Proceedings in an Action at Law*; Stephen's *History of the Criminal Law of England*.
Revised by F. STURGES ALLEN.

Triangle [via O. Fr. from Lat. *triangulum*, triangle, liter., neut. of *triangulus*, three-cornered; *tres*, three + *angulus*, angle, corner]: a surface bounded by three sides, and consequently having three angles. A triangle may be *plane*, *spherical*, or *spheroidal*.

Plane Triangles.—A plane triangle is a plane surface bounded by three straight lines. These lines are called *sides*, and the points at which the sides meet are called *vertices* of the triangle. Plane triangles may be classified either with respect to their sides or with respect to their angles. When classified with respect to their sides, we have—(1) *scalene* triangles, in which no two sides are equal; and (2) *isosceles* triangles, in which two of the sides are equal; the *equilateral* triangle is a particular case of the isosceles triangle in which all of the sides are equal. When classified with respect to angles, we have—(1) *right-angled* triangles, which have one right angle; and (2) *oblique-angled* triangles, in which all of the angles are oblique; triangles of the latter class may be *acute-angled* triangles, all of whose angles are acute, or *obtuse-angled* triangles, each of which has one obtuse angle. The sides and the angles of a triangle are called *elements*; the side on which it is supposed to stand is termed the *base*; and the vertex of the opposite angle is then called a *vertex* of the triangle; the distance from the vertex to the base is the *altitude* of the triangle. The area of a triangle is equal to the product of its base by half its altitude.

Spherical Triangles.—A spherical triangle is a spherical surface bounded by arcs of three great circles. These arcs are called *sides*, and the points at which the sides meet are *vertices*. The dihedral angles between the planes of the sides are the angles of the triangles. In most cases of practice the sides of the triangles considered are supposed to be less than semicircles. Spherical triangles are classified in the same manner as plane triangles, and corresponding parts receive corresponding names. There is, however, this difference: a spherical triangle may have two right angles, or it may have three right angles; it may even have three obtuse angles. In addition to the terms common to both plane and spherical triangles, we may add the following, peculiar to the latter class: Two spherical triangles are *polar* when the vertices of each are poles of the sides of the other; in this case any element of either is the supplement of the opposite element of the other. A *quadrantal* triangle is one in which one side at least is a *quadrant*. The following are some of the properties of spherical triangles: (1) The greater of two sides lies opposite the greater of the two opposite angles, and conversely; if two sides are equal, their opposite angles are equal, and conversely. (2) Any side is less than the sum of the other two, and greater than their difference. (3) The sum of the three angles may have any value between two right angles and six right angles. (4) The difference of any two sides is less than two right angles, and the sum of the three sides is less than four right angles. (5) The sum of any two angles is greater than the supplement of the third. (6) If the sum of any two sides is equal to two quadrants, the sum of their opposite angles is equal to two right angles, and conversely. (7) If the angles are all acute, each of the sides is less than a quadrant; if the angles are all obtuse, each of the sides is greater than a quadrant; if the angles are all right angles, each side is a quadrant. (8) The area of a spherical triangle is equal to its spherical excess multiplied by the square of the radius of the sphere; the spherical excess is found by

subtracting 180° from the sum of the three angles; the area of the trirectangular triangle is equal to one-half of a great circle. See TRIGONOMETRY. Revised by S. NEWCOMB.

Triangle of Forces: a modification of the parallelogram or polygon of forces from which it may be stated that "if three forces in one plane be in equilibrium about a point, and if on that plane any three mutually intersecting lines be drawn parallel to the directions of the three forces, a triangle will be formed, the lengths of whose sides will be proportional to the magnitude of the forces."

Triangular Numbers: See FIGURATE NUMBERS.

Triangulation: the operation of determining the relative positions of points by means of measured base-lines and angles. A precise triangulation is essential for the accuracy of a survey covering a large area. The base-line, which is rarely more than 10 miles long, is measured with great precision by a special apparatus. This is connected through a series of triangles with the stations whose positions are to be determined, and all the angles being carefully measured, the data are at hand for computing the distances, directions, and differences of latitude and longitude.

Although the determination of distances by triangles was known to the ancients, it was not until 1617 that the possibility of an extended accurate triangulation from a short measured base was demonstrated. This was done in 1617 by Snellius, who measured such a base at Speyer in Germany. Many triangulations were made during the seventeenth and eighteenth centuries for the purpose of measuring the length of a degree and the size of the earth; those made in Lapland in 1736 and in Peru in 1740 decided that the shape of the earth was that of an oblate spheroid. Near the end of the eighteenth century a triangulation in France and Spain was undertaken for the purpose of finding an accurate value of the length of the earth's quadrant in order that the meter might be made one $\frac{1}{10,000,000}$ th part of this length. During the nineteenth century triangulations have been carried on in all civilized countries for the location of stations for topographical surveys, and also incidentally for the determination of the figure of the earth. Central Europe is covered with a network of triangles, while many long series exist in India and the U. S.

Besides the measurement of base-lines and of angles, triangulation involves the astronomical operations for finding the azimuths of lines and the latitudes and longitudes of stations. These being observed at a few points, those of the others are computed from the angles and distances. See COAST AND GEODETIC SURVEY, and GEODESY.

MANSFIELD MERRIMAN.

Triassic Period: the division of geologic time following the Carboniferous and preceding the Jurassic. The name originated in Germany, and records the fact that German formations of that date were grouped in three series. These are the Bunter sandstone below, the Muschelkalk, and the Keuper marls above. Modern usage adds the overlying Rhetie clays and sandstones. Formations of this age are extensively developed in Europe and Asia, and are less confidently correlated in Africa, New Zealand, and Australia. The Newark sandstone of the eastern part of the U. S. is probably Triassic, and the red beds of the Rocky Mountain region are with much doubt referred to the same period. On account of the difficulty of classifying the American Mesozoic formations according to European standards, and especially the difficulty of distinguishing Triassic formations from Jurassic, the U. S. Geological Survey, in the publication of its atlas of the U. S., substitutes a single period, the Jura-Trias, for the Triassic and Jurassic periods of the European chronology. See JURA-TRIAS PERIOD, and for the flora of this period, PLANTS, FOSSIL. G. K. GILBERT.

Tribe [Lat. *tribus*]: originally a third part of the Roman people—one of the three tribes that founded the city of Rome; hence in historical literature a name for a subdivision of a nation or stock not yet organized as a civil state; hence, further, in sociology and ethnology a name for any union of hordes or clans which is a subdivision of a folk.

Clan, Tribe, and Nation.—No ethnographic term has been more often used in the pages of historians, travelers, and missionaries than "tribe," and none has been used more unintelligently. As a rule, it is almost impossible to determine whether a writer means by "tribe" a horde, a village, a clan or gens, or a nation. A horde is an aggregation of four or five to twenty or thirty simple families—each family consisting of father, mother, and children. The horde is found

only among the lowest savages, such as the Australian Black-fellows, the Bushmen of South Africa, the Fuegians at the southern extremity of South America, and the Arctic Highlanders of Northern Greenland, or as a degenerate form in civil communities. It has no political organization. A totem-kin (see TOTEMISM), clan, or gens, is a group of real or nominal kindred, claiming descent from a common ancestor, and tracing relationship through mother names (metronymic) or through father names (patronymic), but never through both, and usually forbidding marriages between men and women of the same gentile name. A phratry is a union or brotherhood of clans which is not an independent tribe, but only a subdivision of one. A tribe is a union of hordes under the leadership of a chief for common defense or common aggression, or it is a similar union of clans or of phratries. A tribe always claims a certain territorial region as its domain. A nation, in the ethnic as distinguished from the civic sense of the word, is a federation of tribes which speak dialects of a common language, which have a common culture, and which are crossed by the same clan lines. The nation is essentially a political organization; the tribe is essentially a military organization; the phratry is a religious organization; the clan or gens is a juridical organization; the family is an economic organization.

Savage and Barbarous Tribes.—The lowest Australian hordes are loosely united in tribes that number 200 or 300 each. In the more advanced Australian tribes hordes and tribes are crossed by elaborate totemistic kinships.

The North American Indians afford the finest examples of metronymic tribal organization. The Seneca tribe of the Iroquois, for example, was constituted of eight totem-kins, namely, Wolf, Bear, Turtle, Beaver, Deer, Snipe, Heron, Hawk. The Cayuga tribe was constituted of the same eight totem-kins, with the exception of the Eel in place of the Heron. The Onondagas had the same totem-kins as the Cayugas, except the Ball in place of the Hawk. The Oneidas had the Wolf, Bear, and Turtle totem-kins, and the Mohawks had the same as the Oneidas. These five tribes, mistakenly called the Five Nations by historians, were the famous Iroquois confederation, or nation. Each totem-kin religiously maintained the following rights and obligations, namely: The right to elect its sachem and chiefs—women shared in the election; the right of deposing its sachem and chiefs; the obligation not to marry in the totem-kin; mutual rights of inheritance of the property of deceased members; reciprocal obligations of help, defense, and redress of injuries; the right of bestowing names upon its members; rights in a common burial-place. The totem-kin regulated its affairs through a council. The affairs of the tribe were governed by a council of chiefs. As a rule, each tribe occupied more than one village. A similar organization, but patronymic in its relationships, may be studied at the present time among the Wyandottes and among the Omahas.

In patronymic society, where the wife follows the residence of the husband, the clan may become easily identified with a local group, and there is always a probability, therefore, that the hasty observer of patronymic communities has confounded the village with the clan or with the tribe. The local group, nevertheless, upon examination may turn out to be a subdivision of a clan or a cluster of clans, or even a cluster of tribes. All of these forms may be studied among the Semites of the Arabian desert, among the Ostyaks inhabiting the dreary northern country along the banks of the Obi and its tributaries, and elsewhere in Asia and in Africa.

Historical Tribes.—Tribes that history represents as descended from an eponymous ancestor were seldom so in fact. More often they were confederations compacted by war. W. Robertson Smith's studies (*Kinship in Arabia*) have shown how artificial were the Arabian and Hebrew genealogies. Artificial, too, was the division of the Hebrews into twelve tribes, of the Athenians into ten tribes. The clans of the Hebrew tribes are designated in the English translation of the Old Testament as "houses" (e. g. Numbers i. 2, 4; Joshua xxii. 14). The organization of the Grecian φυλή and of the Roman tribe, of the Grecian φράτρα and of the Roman curia, of the Grecian γένος and of the Roman gens, were, in essential respects, like those of the tribe, phratry, and clan among uncivilized peoples to-day. The tribal organization of the ancient Irish, as revealed in the Brehon laws, was not less elaborate. The Tuath or Cíneal was the tribe, occupying a defined territory, and paying homage to its flath or chief, sometimes called a king. The Sept was the true clan or gens, though the name *clann* was often applied to the Tuath. The Fine was a sub-

clan closely resembling the compound patriarchal family, or "house," that still survives in Slavonic communities. The tribal organization of the Germanic stock has never been satisfactorily made out. The one thing certain is that the so-called seven great tribes—namely, the Swabians, Frisians, Saxons, Alemanni, Franks, Thuringians, and Bavarians—were not tribes, but nations. Each was subdivided into tribes, which, in turn, were subdivided into clans.

Tribal and Civil Divisions.—The substitution of territorial subdivisions for tribal lines, and therewith the transition from gentile to civil societies, was brought about, after tribes had settled down to a permanent agricultural life, by the intrusion of men whose ties of kinship had been broken, and whom it was necessary to include in the military and tax-paying population. The transition was marked in the Athenian commonwealth by the institution of the local tribe. The subdivision of the local tribe into demes roughly followed the subdivision of the tribe into gentes. It is probable that English counties correspond roughly to Saxon tribal domains and hamlets to clan settlements. See SOCIOLOGY.

LITERATURE.—Henry Sumner Maine, *Ancient Law* (London, 1861) and *The Early History of Institutions* (London, 1875); Lewis H. Morgan, *Systems of Consanguinity and Affinity of the Human Family* (Washington, 1871) and *Ancient Society* (New York, 1877); W. Robertson Smith, *Kinship in Arabia* (London, 1885); Laurence Ginnell, *The Breton Laws* (London, 1894); Frederic Seebohm, *The Tribal System in Wales* (London, 1895); and the writings of J. W. Powell and J. Owen Dorsey in the Reports of the Bureau of Ethnology (Washington).

FRANKLIN H. GIDDINGS.

Tribonianus: b. at Side, Paphlagonia; quaestor, consul, and master of the offices to Justinian, who in 528 appointed him one of the ten commissioners to form the first *Code*, in 530 as president of the sixteen lawyers commissioned to compile the *Digest* or *Pandects*, and in 532 one of the three to edit the *Institutes*. He is described as a learned and highly gifted man, but avaricious and of low moral standing. It is hardly possible to form any estimate of the services of Tribonianus as distinct from those of the other commissioners. He had the superintendence of the *Digest*, and may have taken the chief part not only in gathering and sifting the materials, but also in forming the plan. D. about 545.

Revised by M. WARREN.

Tribune [from O. Fr. *tribun*; Lat. *tribunus*, tribune; liter., chief of a tribe; deriv. of *tribus*, tribe]: a person holding any one of several different Roman offices.

1. The military tribunes (*tribuni militum*) were officers standing directly under the commander-in-chief and above the centurions. There were six such tribunes in each legion. They were originally appointed by the king, and, in the republic, by the consuls. In the later republic a portion—ultimately the twenty-four tribunes of the four older legions—were annually elected by the people in the assembly of the tribes (*comitia tributa*). Under the kings there was also a special tribune of cavalry (*tribunus celerum*), an officer who reappeared in the republic when a dictatorship was proclaimed, as master of the horse (*magister equitum*).

2. **Consular Tribunes.**—During the conflict between the orders, when the plebeians were agitating for admission to higher offices, the election of consuls was discontinued for a series of years (444 to 367 B. C.). In their stead were annually elected from three to six military tribunes (an office which plebeians had long been capable of filling) with consular powers (*consulari imperio*).

3. The plebeian tribunes (*tribuni plebis*) were the defenders of their order against the patrician magistrates, and its leaders in its long struggle for civil and political equality. When this struggle ended with the complete triumph of the plebeians and their admission to all the higher offices, the tribunate, endeared to the people by service to liberty, continued to exist, representing, however, not the interests of the plebeians only but those of the whole people.

This office, according to the Roman tradition, was established in consequence of the first secession of the plebs (494 B. C.), and it is probable that the first plebeian tribunes were the *tribuni militum* who had led the plebs across the Anio. Later, ten tribunes were annually elected by the plebeians. Their "right of help" (*ius auxilii*) was made effective by giving them a general power of arrest (*ius prensionis*), from which the consuls themselves were not exempt, and, later, a power of fining (*multa dictio*). Their persons were invio-

lable; in the early republic he who offered violence to a tribune could be slain without trial. Their right of help, originally exercised in single cases of injustice and oppression, grew into a general right of prohibiting or "vetoing" any action of the magistrates or senate. They also summoned and presided over the councils of the plebs (*concilia tributa*), and when these councils became regular assemblies (*comitia*), with legislative and judicial powers, the tribunes exercised an initiative in legislation and in criminal prosecution—powers theoretically concurrent with those of the regular magistrates who presided over the centuriate assembly (*comitia centuriata*), but actually superior, since measures proposed by a consul or praetor could be vetoed by a tribune, while only a tribune could veto the act of a tribune. In the later republic, accordingly, the most important bills originated with the tribunes, and they regularly took the lead in the prosecution of political offenses. To the end of the republic the tribunes were always chosen from among the plebeians, patricians being legally ineligible; and they usually represented the popular as opposed to the aristocratic party—a fact which induced Sulla to limit their influence. During the social struggles which preceded the downfall of the republic, the powers of the tribunate (restored by Pompey) were utilized to support the dictatorial authority exercised by Pompey himself and other popular leaders; and the *potestas tribunicia* accorded to Augustus and his successors was one of the most important elements of the imperial power. Under the empire, tribunes were still elected, at first by the popular assembly and afterward by the senate, but the office was "an empty shadow and a name without honor" (*Pliny*). At first the tribunes interposed occasional vetoes—at the instance always of the emperor—later they were charged with minor judicial and administrative duties. The name of the office survived as late as the fifth century.

Medieval Tribunes.—The development of the Italian city-republics in the later Middle Ages, and the influence of ancient Roman traditions, occasioned a sporadic re-appearance of the title of tribune. It was usually connected, as in the case of Rienzi, with the leadership of the people against the feudal nobles.

MURROE SMITH.

Trichechidae, trī-kek i-dō, or **Manatīdæ** [*Trichechida* is Mod. Lat., named from *Tri chechus*, the typical genus; (irreg.) from Gr. *θρήξ*, *trichōs*, hair + *ἔχειν*, have; *Manatīda* is Mod. Lat., named from *Manatus*, another name for the genus, from Span. *manatí*, from the Haitian name]; a family of placenteriferous mammals of the order *Sirenia*, typified by the manatees of tropical and sub-tropical regions. The form is fish-like and elongate; the skin very thick and rugose; the head naked and depressed, and with a truncated snout; the eyes are very small; the nostrils are close together on the upper surface near the end of the snout, and are simple lunate fissures convex backward; the mouth is small; the molar teeth are typically nine (8-10) in each jaw, each provided with two large tuberculate and two smaller external transverse ridges; they have severally three roots, two on the outer and one on the inner side; incisor teeth wanting in the adult; the pectoral limbs are elongate, and oar-shaped, paddles mostly kept flexed at the elbows; rudimentary nails are developed; the tail is broad, depressed, and somewhat fan-shaped, having a convex border with a median notch or groove. The skull is noteworthy, as distinguishable from that of the other members of the order in that the intermaxillary bones have their branches not prolonged backward, and the anterior portions nearly or quite straight; the last or caudal vertebra (i. e. 5+2) are subcylindrical and destitute of transverse processes. Another peculiarity is the possession of only six cervical vertebrae, instead of seven, as in almost all other mammals; the missing one has been regarded by Murie and Chapman as the third. The manatees are found along the coasts of seas and rivers, and live upon the herbage that grows on or near the banks. (See MANATEE.) The name *Trichechida* is also used as a synonym of ODOBENIDÆ (q. v.), in which case the generic name *Trichechus* is considered equivalent to *Odobenus* (walrus) instead of *Manatus*. Revised by F. A. LUCAS.

Trichina [Mod. Lat., dimin. of Gr. *θρήξ*, *trichōs*, a hair]; a genus of parasitic nematode worms, the only species of which (*Trichina spiralis*) has acquired great prominence as, possibly, the most dangerous parasite of man. Its history is rather complicated. Besides man, it inhabits rats, swine, and some other animals. Usually, when found it is in the encysted stage, occurring in the voluntary muscles, enclosed in an ovoid or spindle-shaped capsule or cyst, secreted

partly by the parasite, partly formed by the host, in the walls of which are minute particles of carbonate of lime. Inside this capsule occurs the immature worm coiled in a spiral, to which the specific name alludes. The cysts are about $\frac{1}{8}$ th of an inch in length and $\frac{1}{10}$ th in diameter. The contained worm, when stretched out, is about $\frac{1}{2}$ th of an inch in length, cylindrical, and slender. In the cyst it exhibits but slight motion, but its vitality is very great, living worms having been found in man eighteen years after infection. When flesh containing encysted worms is taken into the alimentary canal the flesh and cysts are dissolved by the digestive fluids and the immature worms are set free. In the intestine they rapidly increase in size and attain sexual maturity, the male then measuring 1.5 mm. in length, the female 3 to 3.5 mm. The slender cylindrical body tapers to the anterior end, the posterior end being bluntly rounded. The greater size of the female is due in part to the number of eggs and embryos, a single female giving rise to 1,500 to 2,000 living young. These embryos are very minute, scarcely 0.1 mm. in length. They bore through the intestinal walls and rapidly make their way to the voluntary muscles, either by boring to them or by entering the blood or lymph vessels and by being carried by the circulating fluids. In the muscles they become encysted, as did their parents, and they can not become mature until freed of the cyst by the digestive juices of some animal.

This migration of the young from the intestine to the muscles produces serious and even fatal results in both man and other animals. When the parasites are comparatively few in number recovery usually follows, but when they are numerous severe illness—trichinosis—follows, characterized by many of the symptoms of lead-poisoning. First there are intestinal pains, vomiting, and diarrhœa, then pain in the limbs and muscles accompanied by dropsical swelling. Death may ensue in two days owing to the intestinal disturbances. More frequently it occurs in the fifth or sixth week. If the person survive that period the chances for recovery are increased. In bad cases of infection the number of worms is almost beyond belief, 90,000 having been found in a cubic inch of muscle in the shoulder of a man who died from trichinosis. With man the source of the infection is almost invariably from eating raw or imperfectly cooked pork in which are the encysted worms. It is only the lean meat which is dangerous, as rarely, if ever, are the *Trichina* found in the fat. The presence of the cysts in the pork can not be recognized by the naked eye. None of the processes—pickling, smoking, etc.—used for preserving pork serve to kill the parasites, and ham or bacon, unless thoroughly cooked, is as dangerous as fresh pork. In the U. S. cases of trichinosis are comparatively rare, one of the most serious being at Marshalltown, Ia., in 1891, which resulted in several deaths. The worst epidemics on record are those at Hedersleben (1865) and Emersleben (1884), Germany. In the first, in a village of 2,000 inhabitants, 337 were attacked and 101 deaths resulted. At Emersleben 361 cases were traced to one pig, and fifty-seven deaths followed.

A trichina encysted in human muscle (enlarged).

The question arises, how are the swine infected? There is considerable uncertainty upon this point. Examination has shown that pigs fed upon the house offal and the refuse from slaughter-houses are far more apt to be infected than those fed upon corn, and there is not a little evidence which goes to show that rats may play an important part in the process.

Doubtless the disease trichinosis has existed for ages, and probably the observation that the eating of pork was apt to be followed by serious results led to the Levitical prohibition of the flesh of swine as food. The worm was discovered by Richard Owen in 1835. Its connection with the disease was demonstrated in 1860, by Herbst, Zenker, Leuckart, Pagenstecher, and Virchow almost simultaneously. The literature of the subject is large. The most impor-

tant papers are Pagenstecher's *Die Trichinen* (Leipzig, 1865); Leuckart's *Untersuchungen über Trichina spiralis* (2d ed. Leipzig, 1866), and *Die menschlichen Parasiten* (Leipzig, 1863-66); also numerous papers in the reports of the State boards of health. J. S. KINGSLEY.

Trichin'asis, or Trichino'sis [Mod. Lat., derivs. of *Trichina*]: a disease induced by eating the trichinous flesh of swine. See TRICHINA.

Trichinop'oli: town of British India; capital of the district of Trichinopoly, in the province of Madras; on the Caveri, 56 miles from the sea (see map of S. India, ref. 7-F). It is a very hot place and poorly built, mostly consisting of mud huts, but it is the station of a division of the Madras army, and it has important manufactures of cutlery, jewelry, saddlery, and cheroots; an excellent tobacco is grown in the surrounding district. It is the seat of a Roman Catholic bishopric, and there are missions of several Protestant denominations. It is connected with Madras by rail. Pop. (1891) 90,609.

Trichin'ridæ [Mod. Lat., named from *Trichinurus*, the typical genus; Gr. *θρίξ, τριχός*, a hair + *ὄψα*, tail]: a family of fishes of the order *Telecephali* and sub-order *Acanthopteri*, related to the mackerels, but distinguished by the elongated form and the imperfectly developed anal fin. The body is more or less elongated and compressed, and terminates in a slender tail, which sometimes is filiform, but generally capped by a caudal fin; the skin is naked; the lateral line continuous; the head compressed; dorsal fin long, generally single and uninterrupted, sometimes divided into two, with the spinous portion longer than the soft; anal fin represented by numerous almost concealed spines; pectoral fins well developed; ventral fins obsolete, or represented by scale-like spines behind the pectoral region. The skeleton has very numerous vertebrae (e. g. A. 39-43 + C. 57-120). The family is composed of few genera, mostly restricted to the high or deep seas, and comprises three sub-families. (1) *Trichinurina*, in which the dorsal fin is undivided, the tail filiform and finless, and the pectorals extended (as usual) toward the upper angles, including the genera *Trichinurus* and *Eupleuragrammus*; (2) *Lepidopodina*, in which the dorsal is also entire, but the caudal fin is well developed, and the pectoral fins are produced toward the lower angles, with the genera *Lepidopus* and *Eroxymetopon*; and (3) *Aphanopodina*, in which the dorsal is divided. See Gill in *Proc. Acad. Nat. Sci.* (Philadelphia, 1863), pp. 224-229.

Revised by F. A. LUCAS.

Trichodon'tidæ [Mod. Lat., named from *Trichodon*, the typical genus; Gr. *θρίξ, τριχός*, a hair + *ὄδους, ὀδόντος*, tooth]: a family of fishes of the order *Telecephali* and sub-order *Acanthopteri*. The body is elongated and compressed, and regularly tapers from the head toward the tail; the skin is naked and smooth; the lateral line continuous; the head subquadrate and compressed; the preopercula each armed with five spines; the mouth has a very oblique and lateral cleft; branchiostegal rays five; dorsal fins two, oblong, and of nearly equal length, the first with rather numerous (fourteen) spines, the second with simple branched rays; anal fin very long; caudal separate; pectorals large, and with the lower rays not branched; ventral fins approximated and thoracic, and each with a spine and five rays. The family has been constituted for a single genus (*Trichodon*), which is confined to the western coast of North America.

Revised by F. A. LUCAS.

Trichome: See HAIRS and MORPHOLOGY, VEGETABLE.

Trichomycter'idæ [Mod. Lat., named from *Trichomycterus*, the typical genus; Gr. *θρίξ, τριχός*, a hair + *μυκτήρ*, nostril]: a family of eafishes, containing small species peculiar to South America. The form is long and slender, skin naked, lateral line imperfect, gill covers unarmed or furnished with small prickles; branchiostegal rays eight to twelve. The species range high up in streams on the slopes of the Andes, and many bear a striking resemblance to the loaches of the northern hemisphere. F. A. L.

Trichonot'idæ [Mod. Lat., named from *Trichonotus*, the typical genus; Gr. *θρίξ, τριχός*, a hair + *νότος*, back]: a family of acanthopterygian fishes containing a few small species peculiar to the East Indian Archipelago and the Australasian seas. The body is long; the scales cycloid and of moderate size; the lateral line continuous; the head depressed and pointed; the eyes directed upward; the opercula unarmed; the upper jaw is longest; teeth are developed in villiform bands on the jaws as well as palate; the branchial

apertures are very wide; branchiostegal rays seven; dorsal fin single, long, with articulated but not branched rays, and without a distinct spinous portion; anal fin long; ventrals jugular, each with a spine and five rays; no pyloric appendages; no air-bladder. Two genera have been recognized, *Trichonotus* and *Hemerocoetes*. F. A. LUCAS.

Trichop'tera [Mod. Lat.; Gr. *trichós*, hair + *ptéron*, wing]: that order of insects which contains the caddis-flies or case-flies. The adult insects closely resemble moths, even to the dense clothing of hairs upon the wings, but they differ from these latter in having rudimentary biting rather than sucking mouth-parts. The most interesting, however, are the larval stages. The larvae are aquatic, and to protect the soft body they build cases by cementing together with silken threads bits of bark, sand, shells, etc., so that a tube is formed in which the animal stays like a hermit-crab in its shell. Each species builds its own type of case. When the time for pupation comes the tube is closed by silken threads. Most of the caddis-flies feed on vegetable matter, but a few are known to be carnivorous. See Hagen, *Synopsis of Neuroptera* (Washington, 1861); McLachlan, *Monographic Revision of Trichoptera* (London, 1874-84). J. S. KINGSLEY.

Tri'color [from Fr. *tricolore*, three-colored; Lat. *tres*, three + *color*, color; cf. Fr. *drapeau tricolore*, three-colored flag, tricolor]; the French national flag, colored blue, white, and red in vertical divisions. It was first adopted during the First Revolution, and it is stated (though not generally believed) that the colors of the livery of Philippe, Duke of Orleans (Citizen Égalité), were selected for the national flag. In point of fact, many other national flags are tricolors.

Triconpis, tree-koo'pis, CHARILAO; statesman; son of Spiridion Triconpis; b. at Nauplia, Greece, July 23, 1832; educated in Paris and Athens; served in the Greek legation at London 1852-63; was elected deputy from Missolonghi to the Greek chamber in 1863; and was charged with the negotiations concerning the cession of the Ionian islands to Greece. He was made Minister of Foreign Affairs in 1866, and was Prime Minister in 1875, 1878-79, 1882-85, 1886-90, and 1892-95, in the last three changes of government being succeeded by his chief rival, Delyannis. D. at Cannes, Apr. 11, 1896. He was an able orator, a sound financier, and the leading statesman of modern Greece. E. A. G.

Triconpis, SPIRIDION; statesman and author; b. at Missolonghi, Greece, Apr. 20, 1788; studied in France and England; served in the army during the Revolution; was sent as ambassador to London and Paris several times during the reign of King Otho, and continued to participate very actively in public life till his death Feb. 24, 1873. He enjoyed a great reputation as an orator, poet, and historian. His principal work was *Ἱστορία τῆς Ἑλληνικῆς Ἐπανάστασεως* (History of the Greek Revolution, 1853-57).

Trident'ine Profession of Faith (Lat. *Professio Fidei Tridentina*), or the **Creed of Pius IV.**; a clear and concise summary of the doctrines of the Council of Trent, suggested by that council, prepared by a college of cardinals under the supervision of Pope Pius IV., and issued by him Nov. 13, 1564. It consists of twelve articles, including the Nicene Creed, and is put in the form of an individual profession and solemn oath (*profiteor, spondeo, voveo ac juro*). It is binding upon all Roman Catholic priests and public teachers in seminaries, colleges, and universities. It is also used for converts to the Roman Catholic Church, and hence called the Profession of Converts. (For converts from the Greek Church a modified formula was introduced by Pope Gregory XIII. in 1575.) The tenth article reads: "I acknowledge the holy Catholic Apostolic Roman Church as the mother and mistress of all churches, and I promise and swear true obedience to the Bishop of Rome as the successor of St. Peter, prince of the apostles and vicar of Jesus Christ." (See the Latin text in the two papal bulls of Nov. 13 and Dec. 9, 1564, and in Denzinger's *Enchiridion*, pp. 292-294.) A history of this creed was written by Mohrke, *Urkundliche Geschichte der Professio Fidei Tridentina* (Greifswald, 1822; Eng. trans. in Schaff's *Creeks*, ii., 96-99). See CREED and ORIGINAL SIX.

Trid'y'mite [Gr. *τρίδυμοι*, triplets, or trines, from the crystals being compounds of threes]: an allotropic modification of silica, discovered in 1868 by von Rath in a volcanic porphyry from Cerro San Cristoval in Mexico, and since identified elsewhere. It is hexagonal in crystallization, like quartz, but differs from the latter in possessing double refraction, like calcite, and in having a lower specific gravity (2-2).

Triest, tree-est', or **Trieste**, tree-est'ite (Slav. *Třst*, anc. *Tergestum*); city of the Austrian empire, and its most important port; on the Gulf of Triest, at the northeast extremity of the Adriatic Sea; 370 miles by rail S. S. W. of Vienna (see map of Austria-Hungary, ref. 8-C). The old town, which mostly consists of narrow and tortuous streets, is built on a steep acclivity, at the foot of which the new town extends along the harbor; between the two parts of the town runs the Corso, a broad, elegant thoroughfare, opening into large squares lined with magnificent edifices and ornamented with fountains and monuments. Ship-building is an important industry. White lead, candles, wax, soap, rosoglio, leather, spirits, and earthenware are extensively manufactured. It is from its commerce, however, that Triest principally derives its importance. Its harbor consisted originally of a safe but small inner port and a rather exposed roadstead; but in 1884 a new and excellent harbor was finished. By running out three piers, 700 feet long and from 250 to 275 feet broad, the old roadstead on the N. E. was transformed into three large inclosures of 85 acres of water-surface and nearly 2 miles of length of quays, protected by a pier 3,600 feet long running parallel with the shore at a distance of 1,000 feet. The value of the annual imports amounts to about \$66,000,000, and that of the exports to about \$62,000,000. The city has a naval and mercantile academy and a school of navigation, and is the headquarters of the Austrian Lloyds Steam-packet Company, which has magnificent docks and arsenals here. Among the principal exports are grain, rice, wine, oil, flax, hemp, tobacco, silk, iron, lead, copper, and liqueurs. Cotton, cotton goods, dried fruits, etc., are imported. The old town contains a cathedral built between the fifth and fourth centuries. Triest was acquired by Austria in 1382. Administratively is a small district of 37 sq. miles, including the city and vicinity, with a population (1890) of 158,344, mostly Italians. Pop. of city, 120,333.

Revised by M. W. HARRINGTON.

Trifo'rium, or **Blindstory**; a gallery in a mediæval church above the aisle and opening into the nave, choir, or high central part of the transept corresponding to the nave. The theory of the triforium is that it occupies the space under the sloping penthouse-roof of the aisle and above the vaulting. Such a gallery would be from 8 to 12 feet high at the inner side, where were the openings looking into the nave, etc., which openings formed a part of the architectural design of the interior, coming as they do above the great arches of the nave and below the clearstory windows. It is therefore to be distinguished from a great gallery like that of Notre Dame at Paris, or the Cathedral of Tournay in Belgium, which has its own vaulted ceiling and perhaps even a triforium proper above that vault. In some churches, especially in England, the triforium is built up with a solid wall on the inner side, so that the ornamental arcade serves no longer as an opening from which persons in the triforium could look into the church. In other instances, as in the Cathedral of Rheims, the triforium is a very narrow passage left between an outer solid wall and an open arcade on the inner side, in which case the space beneath the sloping roof of the aisle is shut out and becomes a mere garret. R. S.

Trigem'inus [from Lat. *trigeminus*, born three together; *tri*, *tres*, three + *ge'minus*, twin]: the fifth pair of cranial nerves, which take superficial origin from the side of the pons varolii by two roots, a larger sensory and a smaller motor; the sensory root bears the important Gasserian ganglion, situated at the apex of the temporal bone. The trigeminus, the great sensory nerve of the head, divides into three trunks, the *ophthalmic*, the *superior maxillary*, and the *inferior maxillary* divisions. The first two of these are entirely sensory, the third is a mixed nerve, being both sensory and motor. The ophthalmic nerve enters the orbit, the contents of which, including the eye, it supplies with sensory filaments, and finally is distributed to the forehead, brow, eyelids, and, to a limited extent, the nose. The superior maxillary nerve passes to the face, including the side of the nose, the cheeks and lips, and the upper teeth, and secondarily, through the connections of the sphenopalatine ganglion, the palate and the interior of the nasal cavity. The inferior maxillary nerve is a mixed nerve, and supplies motor filaments to the muscles of mastication and sensation to the lower teeth and the part of the face. One important branch, the lingual, is distributed to the tongue, and, in addition to supplying common sensation to that organ, very probably is also intimately related to the special

sense of taste. Each division of the trigeminus is connected with one or more special masses of nervous matter known as the ganglia of the nerve. With the ophthalmic nerve is connected the *lenticular ganglion*; with the superior maxillary, the *spheno-palatine*; and with the inferior maxillary, the *otic* and the *submarillary ganglia*. Those ganglia are of importance as affording points at which sensory, motor, and sympathetic fibers become intermingled, the nerves passing from the centers containing fibers of all three kinds. See FACIAL NERVES.

GEORGE A. PIERSOL.

Trig'lidæ [Mod. Lat., named from *Trigla*, the typical genus, from Gr. *τρίγλα*, mullet]: a family of acanthopterygian fishes, related to the *Collidæ*, including species popularly known as gurnards, sea-robins, flying fishes, etc. The elongate body may be covered with scales or with bony plates; the head is usually covered with rough, bony plates, some of which bear spines. The eyes are set high in the head; one of the suborbitals is very large, covering the cheek, and articulates with the preoperculum; the upper jaw is slightly protracted and longer; teeth villiform, on the jaws and generally the palate; branchiostegal apertures continuous below; branchiostegal rays in seven pairs; dorsal fins two, the first spiny; anal fin opposite the dorsal; pectorals more or less enlarged, and with their lower rays simple and generally isolated and distinct from the rest of the fin; ventral fins thoracic, separated by a wide area, and each with a spine and five soft rays; pyloric appendages developed in moderate number; an air-bladder is present. The family contains three distinct sub-families—viz.: (1) *Triglinæ*, in which the three lowermost rays of the pectorals are elongated, enlarged, and entirely free, and the scales are small, including the genera *Trigla*, *Prionotus*, etc.; (2) *Peristethinæ*, in which the two lowermost rays of the pectorals are enlarged and separate, and the scales large and plate-like, represented only by the genus *Peristethus* or *Peristedion*; and (3) *Dactylopterinæ*, in which the lowermost rays of the pectorals are mostly united with the others, the whole forming a very large wing-like fin, which enables the animal to skim over the water, and the scales are moderate and carinated, typified by the genus *Dactylopterus*. The family is represented on the eastern coast of North America by five species of *Prionotus* and one of *Dactylopterus*, and elsewhere, in almost every sea, by one or more generic forms.

Revised by F. A. LUCAS.

Trigonometry [from Gr. *τρίγωνον*, triangle + *μέτρον*, measure]: a branch of mathematics whose primary object is to explain the method of solving triangles; it also treats of the general relations of circular functions. It is divided into three great branches—*plane*, *spherical*, and *analytical*. *Plane trigonometry* treats of the relations between the sides and angles of plane triangles; *spherical trigonometry* treats of the relations between the sides and angles of spherical triangles; and *analytical trigonometry* treats of the general relations between trigonometric functions.

Measure of an Angle.—For the purposes of plane and spherical trigonometry, angles are expressed in *degrees*, *minutes*, and *seconds*, denoted by the symbols $^{\circ}$, $'$, $''$; and in analysis they are expressed in terms of the radius of the arcs which subtend the angles. In the former case the right angle is the *primary* unit; in the latter case the primary unit is the angle whose subtending arc is equal to its radius. In both cases the angle is expressed in terms of the subtending arc. To explain these methods of measurement, let A C D be a right angle; then

FIG. 1.

with C as a center, and with a radius C A equal to 1, describe an arc A P D intersecting the sides of the angle at A and D. Let the angle A C D be divided into 90 equal parts by radii; these will divide the arc A P D into 90 equal parts; the equal parts, both of the angle and the arc, are called *degrees*. If we draw any radius, as C P, the intercepted arc A P will contain as many degrees of the quadrant as the angle A C P does of the right angle. It is in this sense, and in this sense only, that we say an angle is measured by an arc. For convenience of expression, each degree is divided into 60 equal parts called *minutes*, and each minute is divided into 60 equal parts called *seconds*. Again, let the arc A P be equal in length to the radius C A; that is, to 1. If we take A C P as the unit angle, any other angle, as A C Q, will contain as many units as there are units in the quotient of the arc A Q by A P. Because the circumference whose

radius is 1 is equal to 2π , or 6.2832, the arc A P, in degrees, is equal to $6 \frac{2832}{360}$; that is, to 57.3' nearly, or, more exactly, to 206265". If the arc A Q contains 75.5', the linear measure of the angle A C Q is equal to 1.3 nearly; that is, it contains the unit angle 1.3 times.

Trigonometric Functions.—Angles are most readily compared by means of certain lines, whose values depend on the subtending arcs, and which are called *functions*. The nature of these lines will be most readily explained by the aid of a diagram. Let a circumference be described from C as a center, and with a radius C A equal to 1. Draw A L and M D, dividing the circumference into four quadrants, and call A L the *initial diameter*. Suppose every arc considered to begin at A, which is then called the *origin of arcs*, and to be estimated around in the direction A D L; let the point where the arc terminates be called its *extremity*. An arc beginning at A, and estimated around in the direction A M L, is said to be *negative*. The *complement* of an arc is the distance from its extremity around to D; it may be either positive or negative; thus E D is the complement of A E, and E' D is the complement of A E', the former being positive, and the latter negative. In addition, all distances estimated upward are regarded as positive, all distances downward as negative, all distances counted to the right as positive, and all to the left as negative. We have, then, the following definitions and conclusions:

FIG. 2.

(1) The *sine* of an arc is the perpendicular distance from the initial diameter to the extremity of the arc; thus F E is the sine of A E, F' E' is the sine of A E', F'' E'' the sine of A E'', and F''' E''' the sine of A E'''. Hence if an arc terminates in either the first or second quadrant—in which case it is said to lie in the corresponding quadrant—its sine is *plus*; if it lies in the third or fourth quadrant, its sine is *minus*.

FIG. 3.

(2) The *cosine* of an arc is the distance from the center to the foot of the sine; thus C F is the cosine of A E, and C F' is the cosine of A E'. If an arc lies in the first or in the fourth quadrant, its cosine is *plus*; if it lies in the second or in the third quadrant, its cosine is *minus*.

(3) The *tangent* of an arc is a portion of a tangent to the arc at the origin, which is included between the origin and the prolongation of the diameter through the extremity of the arc; thus A T is the tangent of A E and A E', and A T' is the tangent of A E' and A E''. If an arc lies in the first or in the third quadrant, its tangent is *plus*; if in the second or fourth, its tangent is *minus*.

(4) The *cotangent* of an arc is the tangent of its complement, the origin of the complement being taken at D; thus D K is the cotangent of A E and A E', and D K' is the cotangent of A E' and A E''. If the arc lies in the first or in the third quadrant, its cotangent is *plus*; if in the second or fourth, it is *minus*.

(5) The *secant* of an arc is the distance from the center to the extremity of the tangent; thus C T is the secant of A E, and C K' is the secant of A E'. The secant, being radial, is said to be positive when estimated from the center in the direction toward the extremity of the arc, and negative when estimated in the direction from the extremity. In the first and fourth quadrants the secant is *plus*; in the second and third it is *minus*.

(6) The *cosecant* of an arc is the secant of its complement; thus C K is the cosecant of A E, and C K' of A E'. In the first and second quadrants the cosecant is *plus*; in the third and fourth it is *minus*.

(7) The *versed sine* of an arc is the distance from the foot of the sine to the extremity of the arc; thus F A is the versed sine of A E, and T' A of A E'. The versed sine is always *plus*.

(8) The *co-versed sine* of an arc is the versed sine of its complement; thus G D is the versed sine of A E, and G' D of A E'. The co-versed sine is always *plus*.

The general relations between the circular functions of any arc from 0' to 360' are expressed by the following

equations, in which x denotes the arc, and this whether the arc is *plus* or *minus*:

$$\begin{aligned} \sin^2 x + \cos^2 x &= 1. & \tan x \cot x &= 1. \\ \text{ver. } \sin x &= 1 - \cos x. & \sec x &= \frac{1}{\cos x}. \\ \text{co-ver. } \sin x &= 1 - \sin x. & \text{cosec } x &= \frac{1}{\sin x}. \\ \tan x &= \frac{\sin x}{\cos x}. & \sec^2 x &= 1 + \tan^2 x. \\ \cot x &= \frac{\cos x}{\sin x}. & \text{cosec}^2 x &= 1 + \cot^2 x. \end{aligned}$$

ANALYTICAL TRIGONOMETRY.—Besides these formulas expressing the relation between the functions of a single arc are the following, which express more extended relations, are of continual use in analysis:

$$\begin{aligned} \sin(a \pm b) &= \sin a \cos b \pm \sin b \cos a. \\ \cos(a \pm b) &= \cos a \cos b \mp \sin a \sin b. \\ \tan(a \pm b) &= \frac{\tan a \pm \tan b}{1 \mp \tan a \tan b}. \\ \sin 2a &= 2 \sin a \cos a; \quad \cos 2a = \cos^2 a - \sin^2 a. \\ \sin \frac{1}{2} a &= \sqrt{\frac{1}{2}(1 - \cos a)}; \quad \cos \frac{1}{2} a = \sqrt{\frac{1}{2}(1 + \cos a)}. \\ \sin a \pm \sin b &= 2 \sin \frac{1}{2}(a \pm b) \cos \frac{1}{2}(a \mp b). \\ \cos a + \cos b &= 2 \cos \frac{1}{2}(a + b) \cos \frac{1}{2}(a - b). \\ \cos b - \cos a &= 2 \sin \frac{1}{2}(a - b) \sin \frac{1}{2}(a + b). \end{aligned}$$

PLANE TRIGONOMETRY.—Every plane triangle consists of six parts—three sides and three angles. When three of these parts are given, at least one of which is a side, the remaining parts may be computed. The operation of finding the unknown parts is called the *solution* of the triangle. The solution is made by means of formulas which express the relations between the parts of the triangle.

Solution of Right-angled Triangles.—The following formulas express all the essential relations between the sides and angles of a right-angled triangle. In them the right angle is denoted by A , the acute angles by B and C ; the hypotenuse is denoted by a , and the sides opposite B and C are represented by b and c . Because the angles B and C are complementary, either may be found when the other is known by simple subtraction; hence the formulas take account of only one of them. The symbols \sin^{-1} , \cos^{-1} , etc., are read, *The arc whose sine is*, *The arc whose cosine is*, etc.:

$$\begin{aligned} a &= \sqrt{b^2 + c^2} = \frac{b}{\sin B} = \frac{c}{\cos B}; \dots (1) \\ b &= \sqrt{a^2 - c^2} = a \sin B = c \tan B; \dots (2) \\ c &= \sqrt{a^2 - b^2} = a \cos B = b \cot B; \dots (3) \\ B &= \sin^{-1} \frac{b}{a} = \cos^{-1} \frac{c}{a} = \tan^{-1} \frac{b}{c}. \dots (4) \end{aligned}$$

In applying these formulas the multiplications and divisions are made by means of logarithms.

Solution of Oblique-angled Triangles.—The solution of every case of oblique triangles may be effected by means of the following formulas, in which A, B , and C denote the angles of a triangle, and a, b , and c the sides lying opposite to them, and $s = a + b + c$:

$$\begin{aligned} a : b : c :: \sin A : \sin B : \sin C; \dots (1) \\ a + b : a - b :: \tan \frac{1}{2}(A + B) : \tan \frac{1}{2}(A - B) \dots (2) \\ \sin \frac{1}{2} A &= \sqrt{\frac{(\frac{1}{2}s - b)(\frac{1}{2}s - c)}{bc}} \dots (3) \end{aligned}$$

The sine of an arc is equal to the sine of its supplement; hence, when an angle is determined by means of its sine, there may be two solutions. Whether there are two or one must be determined by a discussion of the particular case.

SPHERICAL TRIGONOMETRY.—Every spherical triangle contains six parts—three sides and three angles. When any three of these parts are given, the other three may be found.

Solution of Right-angled Spherical Triangles.—A right-angled spherical triangle may be solved when we have given any two parts besides the right angle, by two simple rules called Napier's rules for circular parts. If we denote the angles by A, B , and C , A being the right angle, and the opposite sides by a, b , and c , the sides about the right angle, the complement of the hypotenuse, and the complements of the angles B and C are called *circular parts*. Let these parts be arranged in order, as shown in Fig. 3; then each part will be *adjacent* to two other parts, or will be sep-

arated from two other parts called *opposite*. When so arranged, the parts are subject to the following rules: (1) *The sine of any part is equal to the rectangle of the tangents of the adjacent parts.* (2) *The sine of any part is equal to the rectangle of the cosines of the opposite parts.*

Solution of Quadrantal Spherical Triangles.—A quadrantal spherical triangle is one in which one of the sides is a *quadrant*. Such triangles may be solved by passing to the corresponding polar triangles, which will be right-angled. These triangles are then solved by Napier's rules for circular parts, and from the results we may find the corresponding parts of the given triangles by the reverse process of passing back to the given triangles.

Solution of Oblique Spherical Triangles.—Let A, B , and C denote the angles of an oblique spherical triangle, and let a, b , and c denote the opposite sides; also let $S = A + B + C$; and $s = a + b + c$; we shall then have the following formulas for solving oblique spherical triangles:

$$\begin{aligned} \frac{\sin A}{\sin a} &= \frac{\sin B}{\sin b} = \frac{\sin C}{\sin c} \\ \cos \frac{1}{2} A &= \sqrt{\frac{\sin \frac{1}{2} s \sin (\frac{1}{2} s - a)}{\sin b \sin c}} \\ \cos \frac{1}{2} a &= \sqrt{\frac{\cos (\frac{1}{2} S - C) \cos (\frac{1}{2} S - B)}{\sin B \sin C}} \\ \tan \frac{1}{2}(A + B) &= \cot \frac{1}{2} C \times \frac{\cos \frac{1}{2}(a - b)}{\cos \frac{1}{2}(a + b)} \\ \tan \frac{1}{2}(A - B) &= \cot \frac{1}{2} C \times \frac{\sin \frac{1}{2}(a - b)}{\sin \frac{1}{2}(a + b)} \\ \tan \frac{1}{2}(a + b) &= \tan \frac{1}{2} c \times \frac{\cos \frac{1}{2}(A - B)}{\cos \frac{1}{2}(A + B)} \\ \tan \frac{1}{2}(a - b) &= \tan \frac{1}{2} c \times \frac{\sin \frac{1}{2}(A - B)}{\sin \frac{1}{2}(A + B)} \end{aligned}$$

When any part is determined by means of its sine, there may be one or two solutions. Whether there are one or two can only be determined by a discussion of each particular case.

The solution of a spherical triangle may often be facilitated by the introduction of an auxiliary angle. Thus if two sides and their included angle be given, the third side may be found by the formula

$$\cos a = \frac{\cos b \sin(c + \phi)}{\sin \phi}, \text{ where } \cot \phi = \tan b \cos A.$$

In like manner, if two angles and their included sides be given, the remaining angle may be found by the formula

$$\cos A = \frac{\cos B \sin(C - \phi)}{\sin \phi}, \text{ where } \cot \phi = \tan B \cos a.$$

Formulas of this kind are particularly useful when it is desired to determine a single part without completing the solution of the triangle. Revised by S. NEWCOMB.

Trilinear Co-ordinates [*trilinear* is from Lat. *tri*, *tres*, three + *li* *nea*, line]: a system of co-ordinates in which the position of a point is determined by the ratios of its distances from three fixed lines. The equation of any right line in Cartesian co-ordinates may be put in the form

$$x \cos \phi + y \sin \phi - p = 0,$$

in which ϕ is the angle made by the lines with the axis of x , and p is length of a perpendicular upon it from the origin. If x' and y' be the co-ordinates of any point whatever, $x' \cos \phi + y' \sin \phi - p$ will express the length of a perpendicular from the point, or the *distance* of the point $x' y'$ from the line. Call this distance α . Let β and γ be in the same manner the distances of the point $x y$ from any two other arbitrarily chosen lines. We may imagine a system of *trilinear* co-ordinates in which the position of a point is defined by its distances from three fixed lines, and in which the position of any right line is defined by a homogeneous equation between these distances of the form

$$l\alpha + m\beta + n\gamma = 0.$$

See Ferrers, *Trilinear Co-ordinates*; Salmon, *Conic Sections*; Newcomb, *Analytic Geometry*; Clebsch, *Vorlesungen über Geometrie*, part I. (Leipzig). Revised by S. NEWCOMB.

Trillium [Mod. Lat: cf. Lat. *tris*, *tri*-, three, and *trili*-, triple-woven, triple, the parts being in three]; a genus of perennial herbaceous monocotyledonous plants, of the lily family, embracing a dozen species, all of which occur in

Eastern North America, the Himalaya region, and Japan. Each plant consists of a naked stem a foot or less high, sur-

Large flowered trillium (*Trillium grandiflorum*).

mounted by three ovate netted-veined leaves, a large flower, and a purple or red three-celled berry. *T. grandiflorum* bears a white flower, changing with age to rose color; *T. erectum*, a dark reddish-purple flower. The trilliums are cultivated in gardens, are highly valued for their beauty, and are commonly known as three-leaved nightshade, wake-robin, birth-root, or Indian balm. They have astringent, expectorant, and tonic qualities, and yield resin, tannic acid, and a volatile oil.

Revised by CHARLES E. BESSEY.

TriLOBITES [from Gr. *τρεῖς*, *τρι-*, three + *λόβός*, lobe]: a group of *Crustacea* which became extinct in Palaeozoic times. Their affinities have long been uncertain, but the discovery in 1893 of specimens with antennae places their position beyond a doubt. The body is divisible into three regions—a head with compound eyes, a thorax composed of a varying number of movable segments, and an abdomen (or pygidium) in which several segments firmly united to each other may be recognized. Until recently all knowledge of appendages was lacking, but at present the evidence goes to show that the head bore a pair of antennae and at least four pairs of leg-like appendages, the basal joints of which served for the mastication of food. In the thoracic region the feet were two-branched, and bore gills of peculiar character, while in the pygidial region the appendages were lamellate. The trilobites are among the most abundant fossils in the older rocks. They appear in the Cambrian and die out in the Carboniferous. The species are very numerous. Besides the various geological reports, see for structure, Walcott, *Bulletin Museum Comp. Zoology*, viii. (1881), papers in *American Journal of Science* (1893-94), and Bernard, *Quarterly Journal of the Geological Society* (London, 1894); for development, Barrande, *Système silurien du Centre de la Bohême*, vol. i. (1852).

J. S. KINGSLEY.

Trimble, ROBERT: jurist; b. in Berkeley co., Va., in 1777. His parents, in 1780, removed to Kentucky, where he received a scanty early education, but became a school-teacher; studied law under George Nicholas; was admitted to the bar 1803; settled at Paris, where he was chosen to the Legislature; became judge of the court of appeals 1808, chief justice of Kentucky 1810, U. S. district attorney 1813; was district judge of Kentucky 1816-26, and justice of the U. S. Supreme Court from 1826 to his death Aug. 25, 1828.

Trimeter: See METRES.

Trimūrti, *trī-moor-tē* [Sanskrit; literally, having three forms; *tri*, three + *mūrti*, body, form]: the Hindu triad or trinity, consisting of Brahma, Vishnu, and Śiva, considered as an inseparable unity, and as representing the creating, the preserving, and the destroying and regenerating principles of the deity respectively. They were produced by Brahma, the one self-existent spirit, from his own body—Brahma from the right, Vishnu from the left, and Śiva from the middle. When represented pictorially or in sculpture the Trimūrti has one body with three heads—that of Brahma in the middle, that of Vishnu at the right, and that of Śiva on the left.

Tricomalee': town of Ceylon; a seaport and naval station on the northeastern coast of the island (see map of S.

India, ref. 8-F). It has a large landlocked harbor, but the place is exceedingly hot and unhealthful. Its great renown in ancient time it owed to religious rather than to geographical considerations, as the seat of the temple of a thousand columns, to which pilgrims flocked from all parts of India. Pop. (1891) 11,411.

Revised by M. W. HARRINGTON.

Trinidad, Span. pron. *trē-nē-thaath'*: an island of the West Indies, belonging to Great Britain; near the north-eastern coast of Venezuela, and N. of the delta of the Orinoco. Area, 1,754 sq. miles. It is nearly square in form, with peninsular projections at the angles. These, with the peninsula of Paria and the delta, form the narrow passages called the Serpent's Mouth and Dragon's Mouth, noted for their dangerous currents; and they inclose the Gulf of Paria, between the island and the continent. Trinidad is generally classed as the southernmost of the Caribbean group; but by its structure, fauna, and flora, it belongs to South America, and in all probability was formerly united to it. A range of low mountains, a continuation of those of Paria, follows the northern coast, some of the peaks attaining an altitude of more than 3,000 feet. The remainder of the surface is hilly, or low, with tracts of swamp; a line of hills lines the southern coast. There are no true volcanoes, but some small crater-like cavities emit sulphuretted hydrogen, and sometimes, it is said, flames. The celebrated asphalt lake, called La Brea, is near the southwestern end; it covers about 100 acres, the asphalt bubbling up in the center but hardening around the margins, where it is extracted; it is largely exported for roofing and paving. The soil of Trinidad is fertile, and there are large tracts of forest, especially in the northern and eastern parts. The climate is warm, but generally healthful, and rains are abundant from May to October; during the winter months the ground is watered by heavy dews. Hurricanes are never felt. A large proportion of the inhabitants are Negroes, mixed races, and Hindu coolies. Of the latter Trinidad has more than any other West Indian island. They are imported under contract to work for five years, but often remain and acquire considerable wealth. The whites are of English, Scotch, or French descent, with many refugees from Venezuela. Most of the population is gathered in the western part of the island, where are the principal towns. Port of Spain, the capital, is the commercial center, and is connected with San Fernando by railway. Agriculture is the principal occupation, and the island has an unusually large number of peasant proprietors. The exports are sugar, cacao, asphalt, etc. By its position, Port of Spain controls much of the trade of Venezuela. Trinidad was discovered and named by Columbus in 1498. The Spaniards, after carrying off the Indian inhabitants as slaves, had only small establishments, later increased by French immigrants from Grenada. The British seized the island in 1797, and have since held it. With Tobago it forms the crown colony of Trinidad. Pop. (1891) 208,028. See Charles Kingsley, *At Last* (1871); Hart, *Trinidad* (1865); Wall and Sawkins, *Report on the Geology of Trinidad*. HERBERT H. SMITH.

Trinidad: a small rocky island of the Atlantic, in lat. 20° 31' S., lon. 29° 20' W.; about 700 miles E. of Brazil, whose claim to it is now acknowledged.

Trinidad: a city near the southern coast of Cuba; 3 miles by railway from its port of Casildas (see map of West Indies, ref. 4-C). It is beautifully situated on high land overlooking the sea. Owing to its mild and very equable climate it is a favorite resort for invalids. It is one of the oldest towns in the island, and was long the center of the coffee-trade, but has lost much of its commercial importance. Pop. (1887) with the district, 29,448. H. H. S.

Trinidad: capital of the department of Beni, Bolivia, on low land near the Mamoré (see map of South America, ref. 5-D). It was founded by the Jesuits, and was long the most celebrated mission town of the Madeira valley, having a population of over 20,000. The mission buildings remain, but the place is much decayed. Pop. (1885) 4,535. H. H. S.

Trinidad: city; capital of Las Animas co., Col.; on Las Animas river, and the Atch., Top. and S. Fé, the Denver and Rio Gr., and the U. Pac., Denver and Gulf railways; 200 miles S. of Denver, and 650 miles W. of Kansas City, Mo. (for location, see map of Colorado, ref. 6-E). It is in an agricultural, stock-raising, bituminous coal, and coking region, and contains 9 churches, 4 large public-school buildings, an academy, business college, parochial school, 2 national banks (combined capital \$200,000), 2 savings-banks (combined capital \$50,000), a loan and trust company (authorized capital

\$150,000), and 3 daily and 4 weekly papers. There are gas and electric light plants, extensive railway-shops, brewery, wool-scouring plant, and coking ovens. Pop. (1880) 2,226; (1890) 5,523. EDITOR OF "ADVERTISER."

Trinitarians: See REDEMPTIONISTS.

Trinitrocarboic Acid, Trinitrophenol, or Trinitrophenic Acid: See PICRIC ACID.

Trinity: See GOD.

Trinity: port of entry; capital of Trinity district, Newfoundland; on Trinity Bay; lat. of harbor, 48° 29' N., lon. 53° 24' W. It has an excellent harbor. In 1858 the first Atlantic cable was landed in Trinity Bay. The fisheries are the leading pursuit. Pop. about 2,000.

Trinity College: an institution of learning in Hartford, Conn., founded in 1823, and bearing until 1845 the name of Washington College. Its first president was Bishop Thomas Church Brownell, 1824-31. The college buildings, three in number, stood on a slight eminence, now the site of the State Capitol. In 1872 the campus was sold to the city of Hartford and a site of 78 acres was purchased, about a mile S. of the former location. Here has been erected a fine range of buildings, forming part of a new structure, which is intended to comprise three quadrangles, in all 1,950 feet by 370, with an aggregate area of 4 acres. It is in the early French secular Gothic style of architecture, and has an imposing effect. There are also, outside the limits reserved for these quadrangles, an observatory, a gymnasium and alumni hall, a hall of science, and a president's house. There is a valuable cabinet and a library of 36,000 volumes. The college offers four courses of study, leading to degrees in arts, science, and letters, with liberal provision for elective and special work; and there are numerous scholarships, in part competitive, for the assistance of deserving students, chiefly for those wishing to enter the ministry of the Protestant Episcopal Church. The Rev. Dr. George Williamson Smith has been president since 1883. SAMUEL HART.

Trinity College, Dublin: See DUBLIN, UNIVERSITY OF.

Trinity River: a river which rises in the northeast part of Trinity co., Cal., and after a course first to the S. W., and then to the N. W., falls into Klamath river, in Humboldt County. Its length is about 130 miles.

Trinity River: a river in Texas, formed by two branches, the Elm or East Fork and the West Fork, which rise in the northern part of the State, the latter in Archer County, and unite in Dallas County. Trinity river is a noble stream, flowing through a fertile, well-timbered country. At its lowest stage it is navigable to Liberty, about 22 miles from its mouth in Trinity Bay, and at high water small boats have ascended 500 miles. The length of the main stream is 550 miles.

Trinity Sunday: in the Roman Catholic, Anglican, and other Churches (but not the Greek Church), the Sunday next after Pentecost. It was established as a church festival, in honor of the Holy Trinity, by Pope John XXII. in 1320. It had previously been long celebrated in some Western dioceses, but not very generally before 1400.

Triodon'tidae [Mod. Lat., named from *Tri'odon*, the typical genus; Gr. *τρεις*, *τρι-*, three + *δδους*, *δδδντος*, tooth]: a family of fishes of the order *Plectognathi*, so named because the upper jaw is divided by a central suture while the under jaw is entire, thus forming three tooth-like pieces. The body is oblong, with a very dilatable abdomen, and with a slender conic tail; the lateral line well marked; the head oblong, with the snout rather long; the nostrils double; the mouth small; the gill openings narrow clefts in front of the pectoral fins; the branchiostegal rays entirely concealed; dorsal and anal fins very short and far behind; caudal distinct; pectorals narrow; ventrals wanting. An air-bladder is present. The skeleton is well ossified, and ribs are developed; the so-called pelvic bone is large, and serves to keep expanded the abdominal sac-like expansion, "the lower part of which is merely a flap of skin into which the air does not penetrate" (*Günther*). The family is especially interesting as serving to demonstrate the affinity of the gymnodonts with the scleroderms. But one species is known, the *Triodon bursarius* of the Indian Ocean and Archipelago.

Revised by F. A. LUCAS.

Trionych'idae [Mod. Lat., named from *Trionya*, the typical genus; Gr. *τρεις*, *τρι-*, three + *ὄνυξ*, *ὄνυχος*, claw]: a family of turtles containing the soft-shelled tortoises, and distinguished by the leathery and scaleless shell. "The

principal habitat of the members of this family is the muddy bottom of shallow waters. They bury themselves in the soft mud, leaving only the head, or a small part of it, exposed. They take breath from time to time, without moving the body, by raising up the long neck and head and carrying the leathery snout above water." They rarely emerge from the water to take to the land, and when on the land their locomotion is laborious and constrained. In the water, however, they are very active and quick in their movements. "They feed upon shells, especially upon *amodontas* and *paludians*." "They lay from twelve to twenty and more eggs, of a spherical form and above the size of a musketball, which they deposit on the shore by the water's edge. The shell of these eggs is thick, but very brittle." (*Agassiz, Contributions to the Natural History of the United States of America*.) Representatives of the family are found most abundantly in the tropical regions of Asia and Africa, but a number of species also extend through a considerable area in the U. S., and equally far northward in Asia.

Revised by F. A. LUCAS.

Tripe de Roche, treep de-rôsh [Fr. rock tripe]: a name applied by French Canadian *voyageurs* and hunters to several species of *Umbilicaria* and *Cyrophora*, tough and bitter lichens of the barren grounds of British North America. *Tripe de roche* is often used as food when other provisions are exhausted, and, though cathartic and unpalatable, it will sustain life. The genera have representatives growing upon rocks in many high arctic and alpine regions.

Tripit'aka [Sanskrit, three baskets; *tri*, three + *pitaka*, basket]: the sacred scriptures of the Buddhists; so called because made up of three collections called respectively *Sūtra*, or aphorisms; *Vinaya*, or discipline; and *Abhidharma* or *Abhidhamma*, metaphysics. (See PĀLI LITERATURE.) The name Tripitaka is also sometimes applied to the Chinese *San-tsang* (three storehouses; in Japanese *Sanzō*), which consists of translations, from the first century onward, of original Sanskrit texts, and of commentaries and other matter. A complete copy of this (in 2,200 vols., requiring 108 feet of shelf-room) is in the library of the India office, London. An edition in over 500 vols., printed from movable metal type, was issued in 1881-85 by one of the monasteries in Tokio.

Triple Alliance: (1) the league between England, Sweden, and the States-General (1668) for the protection of the Spanish Netherlands against Louis XIV. (2) The league of Great Britain, France, and the Netherlands against Spain and the Pretender in 1717. (3) The league of Austria, Great Britain, and Russia, concluded in 1795. (4) The *Dreibund*, or league of Germany, Austria, and Italy, formed for the purpose of mutual protection in case of attack by other powers. A dual alliance between Austria and Germany had been formed in 1879, and Italy was admitted as a third member in 1882. In spite of the opposition of the Italian republicans and Irredentists the alliance has been maintained, and in July, 1891, the Emperor of Germany publicly declared that it had been resumed for a period of six years.

Trip'oli [named from the city Tripoli]: one of the thirty-eight vilayets or provinces of Turkey, and, including Barca on the E., the only region in Africa now directly controlled by Turkey. It has over 700 miles of sea-frontage on the Mediterranean, adjoins Egypt and the Libyan waste on the E., includes Fezzan on the S., and has Tunis on its western frontier. Though about one-third larger than Texas, its population is only 800,000 to 1,000,000. Seventeen explorers have visited it since 1800, but they followed chiefly the main routes leading S. from the city of Tripoli, and many parts of the interior remain to be studied in their geological, ethnological, and other aspects. Its coast towns are the natural points of departure for caravans to the Western Sudan, because the coast-line on the deep indentation of the Gulf of Syrte shortens the journey to the Sudan about one-fourth. The routes S. across the desert are also better than those from Algeria, because mountains and sand-dunes oppose few difficulties and wells are comparatively abundant. The explorer Richfs urged Italy to acquire Tripoli, on the ground that the Western Sudan would easily fall to its possessor. In other respects Tripoli is much less favored than Tunis and Algeria. Lying farther S. the mean temperature is much higher and the climate is of continental rather than maritime character. Most of the region is poor and sandy, and the sands from the eastern and southern deserts, together with vast quantities blown in from

from the sea-border, have greatly restricted the areas where agriculture can flourish. Nine-tenths of the country has no population because it does not differ from the great sandy and rocky plateau, inhabited only in a few scattered oases, that extends from Alexandria to Tunis. The rainfall is small, and Tripoli has not a single perennial stream. Although thus pertaining to the region of the desert rather than to that of the littoral, Tripoli has a considerable number of small areas that are very fruitful, particularly along the slopes of the low mountains that nearly bisect it from E. to W. and from N. to S., and along the usually dry water-courses. The almond-tree, olive, and date flourish, and the vine is widely cultivated, though not for wine-making. The fauna, like the flora, is poorer in species and in numbers than in countries of the littoral farther west. Neither lions nor panthers are found in the mountains. crocodiles can not live where permanent rivers do not exist, and the elephants that once roamed over the country were long ago driven out by widespread deforestation. Foxes, hares, wolves, some varieties of monkeys, gazelles, and antelopes are the only game. There are a few varieties of reptiles, but not many birds, most of them being birds of passage, which are seen only for a few weeks in spring and autumn during their migrations. Camels and asses are the chief domestic animals, but a diminutive variety of cattle and also horses and dogs are found in small numbers. Fat-tailed sheep are raised to some extent, but goats are much more numerous. The population consists mainly of Arabs and Berbers. The Berbers, representing the ancient inhabitants, are probably more numerous, but there has been great admixture of these families. In many places the Berbers have adopted the language of their conquerors, and it is difficult to distinguish them from the Arabs. In other places, particularly in the oases, the two peoples live in distinct groups, having each its own name and social organization. The Berbers who have most successfully maintained their primitive character live among the mountains of Ghurian and Yefren. Here center the insurrections that, now and then, are a source of much trouble to the Turkish authorities. Thousands of slaves from the Sudan form an important element in the population. The Turks, though in absolute control of the country since 1835, form only a small minority. They hold themselves above the people they govern and are looked upon as strangers. Arabic, and not Turkish, is the official language. The Jews are a very old element in the population and suffer much ill treatment. The only port of importance is the capital, Tripoli, and the chief exports are esparto grass, ostrich feathers, and a little wheat. The total export and import trade with Europe amounts only to about \$6,000,000 a year. See Nachtigal's *Sahara and Sudan* (2 vols., Berlin, 1879-81); Barth's *Travels and Discoveries in North Africa* (5 vols., 1857-58) and *Wanderungen durch die Küstenländer des Mittelmeeres* (Berlin, 1849); Rohlf's *Land und Volk in Afrika* (Bremen, 1870); Vatonne's *Mission de Ghadâmès*; Duveyrier's *Exploration du Sahara, les Tuaregs du Nord* (1864); and Reclus's *Nouvelle Géographie Universelle* (vol. xi., Paris, 1876).

C. C. ADAMS.

Tripoli [Lat. *Tri'polis*, Gr. *Τρίπολις*, liter., three-town]: a port built on the site of three ancient towns on the African coast of the Mediterranean (see map of Africa, ref. 1-D). It is the capital of the Turkish province of Tripoli. The city is strongly fortified, has considerable trade with Europe and a large caravan trade with the Western Sudan, but it is far inferior, in commercial importance to several other cities on the southern shores of the Mediterranean. It presents a charming aspect from the sea, but first impressions are modified by a nearer view of dilapidated buildings, narrow and tortuous streets, and abounding dirt and refuse. It is most cosmopolitan in its architecture, the Arab style with its white, bare walls and courts surrounded by galleries predominating. Almost all the Government buildings resemble the Turkish structures of Stamboul, while the 3,000 Maltese residents, who form the Christian element, have many buildings of Italian aspect, and the water-front is lined with structures like those in the smaller commercial ports of Europe. Negro slaves have introduced in some quarters cabins like those in which they lived in the Sudan. Much has been done in recent years to improve the appearance and sanitary conditions of the city. The town nearly covers a small promontory jutting out into the sea, and behind it is a wide belt of plantations given chiefly to the raising of olives. The capital has a far larger trade with

the Sudan than any other Mediterranean port. Of late years its largest source of prosperity has been the export to Europe of esparto grass. The commercial value of the port is considerably impaired by the shallow waters of the roadstead, and the northern winds at times, particularly in the winter months, make it very dangerous to approach the city. Pop. about 40,000.

C. C. ADAMS.

Trip'oli (Arab, *Tarābulus*, anc. *Τρίπολις*, *Tri'polis*): seaport town of Syria; in the vilayet of Beyrout, about 40 miles N. N. E. from Beyrout (see map of Turkey, ref. 7-G). The ancient town consisted of three distinct quarters, each surrounded by its wall and inhabited by colonists from Aradus, Sidon, and Tyre respectively. It was hence called Tripolis, "the triple city," by the Greeks. Renowned for its commerce in antiquity, it was specially important during the crusades. It occupied a triangular promontory projecting into the Mediterranean, and inclosed on the E. by a wall 18 feet thick, which may still be traced, while the entire promontory is strewn with ruins. N. is the harbor, from which the modern town is about a mile distant, embowered in apricot, orange, and lemon orchards. El-Kadisha, "the sacred river," which rises among the grove of cedars on Lebanon, renders the vicinity fertile and unhealthful. Tripoli is the natural outlet of the interior cities Hama and Homs. It has a fine and safe harbor, and French, British, and Russian steamers touch here regularly. It exports raw silk, sponges, soap, olive oil, cotton, and fruits. Pop. 24,000, mainly Mussulmans.

E. A. GROSVENOR.

Tripolit'za: town; in Arcadia, Greece (see map of Greece, ref. 17-J). Founded by the Ottomans in 1770, its buildings were constructed from the *débris* of Pallantium, Tegea, and Mantinea. The capital of the Morea, it was taken by the Greek revolutionists (1821) and retaken by Ibrahim Pasha (1825), who razed it to the ground three years later. It is now an enterprising and prosperous place. Pop. (1889) 10,698.

E. A. G.

Trip'os: the system of honors examination at the University of Cambridge, England. The derivation of the name goes back to a very early period, when the student who was being examined sat on a three-legged stool. The examinations are held at the end of May or beginning of June in each year. The trip'os is usually taken at the end of the third year of residence at the university. There are the mathematical trip'os, classical trip'os, moral sciences trip'os, natural sciences trip'os, theological trip'os, law trip'os, historical trip'os, Semitic language trip'os, Indian language trip'os, mediæval and modern language trip'os. The one who obtains the highest place in the mathematical trip'os is called the senior wrangler.

C. H. THURBER.

Triptych [Gr. *τρίπτυχος*, consisting of three layers; *πίπτειν*, to fold]: a set of three tablets or panels hinged together. The use of the appliance is generally to hold either writing or painting in such a way that it is protected from injury. (See **DIPTYCH**.) Whenever it became necessary to increase the size of the tablets beyond that of an object easily carried in the hand, and especially when one leaf was made fast to a wall or desk, it must have been found better to divide the upper or covering leaf into two. This, then, became the type of folding tablet used for early devotional pictures—a stout panel which could be set upon an altar or secured to a wall, and two thinner leaves or doors, one hinged to each side of the larger leaf, the two meeting in the middle of it and exactly covering it. One picture being painted on the larger leaf, or a large one with a smaller one below, it was natural to paint also the inside of the two doors; next, when greater richness was required, the outside of the doors was painted. The famous altarpiece

Diagram of the *Last Judgment*, by Rogier van der Weyden.

of the brothers Van Eyck (see **EYCK**, JOHN VAN) was a double triptych; an upper and a lower back panel had each two doors, but, as each door was itself divided into two folds,

a word expressing division into five rather than three is needed to fully explain it. In like manner the *Last Judgment*, by Rogier van der Weyden, in the hospital at Beaune, in Burgundy, has a back panel of the shape of a smaller parallelogram above a larger one, with two small leaves above and two large ones below. The subject of the Judgment Day fills all the irregular-shaped surface offered when the leaves are opened wide; the outside has six different and separate pictures. These examples are, however, of late date, and show the triptych form giving way to the new requirements of an advanced art.

RUSSELL STURGIS.

Triqueti, trō'ke-tee', HENRI, Baron de; painter and sculptor; b. at Conflans, department of Loiret, France, in 1802; studied at the Academy of Art in Paris; exhibited in 1831 several pictures and a marble group, which attracted much attention, *Death of Charles the Bold*; devoted himself subsequently exclusively to sculpture; was for a long time engaged in the interior decoration of the Madeleine. Among his works are *Dante, Jesus feeding the Birds, Bacchus, The Holy Family*, and many busts. D. in Paris, May 11, 1874.

Revised by RUSSELL STURGIS.

Trirat'na [Sanskrit, three jewels; *tri*, three + *ratna*, a jewel]; the Buddhist triad or trinity, consisting of (1) Buddha, the founder of the system; (2) *Dharma*, the law or doctrine which he taught; and (3) the *Sangha*, or monastic order which he established. The two latter have been personified and deified by later Buddhists as the "Three Precious Ones," in whom the seeker after deliverance from individual existence and its sorrow and pain takes refuge. Hence they are also known as the "Three Refuges."

Trisection of Angle [*trisection* is from Lat. *tris*, three + *secare*, *sec'um*, cut]; a celebrated problem among the ancient geometers. It belongs to the same class of problems as the duplication of the cube and the insertion of two geometrical means between two given lines. Like them, it can not be solved by the methods of elementary geometry. It may, however, be solved by means of an auxiliary curve called a conchoid; it can also be solved in several ways by the principles of higher geometry.

S. N.

Trismegistus: See HERMES TRISMEGISTUS.

Trissino, GIANGIORGIO; grammarian and poet; b. at Vicenza, Italy, June 18, 1478. Exiled from Venice in 1508, he studied philosophy at Ferrara, and then went to Rome, where Leo X. received him. Desirous of reforming the Italian alphabet, he set forth his plans in the *Epistola a Clemente VII.* (1524), and published with it the *Canzone a Clemente VII.*, the *Sofonisba*, the *Ritratti*, and other works. The *Sofonisba*, an attempt to establish a tragic drama in the sixteenth century, was not very successful. As the ban had long been removed from him, he settled down in his home as a papal delegate (about 1526), still applying himself to his favorite scheme of improving the alphabet. The *Alfabeto*, the *Dubbi grammaticali*, the *Grammatichetta*, and the first portion of his *Poetica* and *Rime* appeared there after 1526, and were followed by the *Volgare Eloquio* (1529), a translation of Dante's *De Vulgari Eloquio*, which in this form appeared in print for the first time; the *Castellano*, a dialogue on the proper name for the Italian tongue; and the *Encomion*, a poem in Latin hexameters. During the remainder of his life he traveled about Italy not a little, and at the same time wrote the *Grammatices Introductionis Liber Primus* (1540); the *Italia liberata dai Goli* (1548); the *I. Simillimi*, a comedy; and the rest of the *Poetica*. The *Italia liberata dai Goli* is a noteworthy endeavor to revive the historic epic, and on it Trissino's fame came chiefly to rest. Indeed, it was for a time accepted throughout Europe as belonging to the same class of poems as the *Iliad* and the *Aeneid*. It is now, however, little read. Trissino died in Rome, Dec. 8, 1550.

J. D. M. FORD.

Tristan da Cunha, -daa-koon'yā: the largest of a group of islands in the Southern Atlantic, in lat. 37° 6' S., lon. 12° 19' W. Area about 40 sq. miles. It is mountainous, its center rising into a volcanic peak 7,640 feet high, but fertile, well provided with water, and healthful. It was discovered in 1506 by the Portuguese navigator Tristan da Cunha, and occupied by British troops from Cape Town during the captivity of Napoleon on St. Helena. Pop. (1895) 61. Property is held in common; there is no crime and no strong drink. The other islands are inaccessible and the three Nightingale islands, Nightingale, Stoltenhoff, and Middle Isle. These are frequented by large numbers of seals and sea-fowl.

Triton (Gr. Τρίτων): in Greek mythology, a marine deity, sometimes the son of Poseidon and Amphitrite, sometimes a subordinate sea-god, and sometimes even localized as the god of the Libyan Sea. In art he is represented as a young man with the body ending in a fish-tail, and with a trumpet of conch-shells with which at the command of Poseidon he bade the waves be still.

Revised by J. R. S. STERRETT.

Triton: a name given (1) to a gastropod mollusc; (2) to the aquatic salamanders, especially of Europe.

Tritone [from Gr. τρίτονος, of three tones; *τρι*, three + *τόνος*, tone. See TONE]: in music, the interval of the augmented fourth, which consists of three whole tones, or rather of two whole tones and two semitones, as C-E[♯], G-C[♯], an interval studiously avoided by the old musicians.

Triumph [via O. Fr. from Lat. *triumphus* < O. Lat. *trium pus*, deriv. of *trium pe*, an exclamation used in solemn processions of the Aryan brethren; cf. Gr. θρίαμβος]; in ancient Rome, a state pageant in which a victorious general or naval commander, preceded by the senate and by the spoils and prisoners, was drawn by four horses along the Sacred Way and followed by his army to the temple of Capitoline Jove, where solemn sacrifice was offered. In order to triumph, the general must be in possession of the highest magisterial power as dictator, consul, proconsul, praetor, or propraetor. The war, too, must be one against foreign foes, and must have been brought to a conclusion. There were also other conditions which were not uniformly observed. The triumphal procession was very brilliant, and sometimes lasted two or three days. It was customary to put to death some of the hostile chiefs during the triumphal march. There are in all about 350 recorded triumphs; the last seems to have been celebrated by Diocletian in 302 A. D.

Revised by CHARLES H. HASKINS.

Trium'virs, or **Tres'viri** [= Lat.; *tres* (gen. *trium*), three + *vir*, plur. of *vir*, man]; in ancient Rome, a board of three men. Besides certain permanent boards, the name was applied to various extraordinary commissions appointed to perform some special public duty. The coalition of Caesar, Pompey, and Crassus in B. C. 60 is often, though improperly, called the first triumvirate. The men who constituted it bore no official title, and exercised only an usurped power. The second triumvirate, which was that of Octavian, Mark Antony, and Lepidus, was officially recognized by the senate, and the three magistrates bore the name of *Tresviri reipublice constituendae* (triumvirs for arranging public affairs).

Revised by CHARLES H. HASKINS.

Triv'ium: name applied in the Middle Ages to the arts, grammar, rhetoric, and dialectic, which were taught in the cloister and cathedral schools. The trivium and quadrivium—music, arithmetic, geometry, and astronomy—made up the seven liberal arts. See West, *Alcuin and the Rise of the Christian Schools* (1892).

C. H. T.

Trochale Metres: verses whose fundamental foot is the trochee (τροχαῖος, running; called also choree, from χορείος, dancing). The measure is the dipody, resembling the ♪-bar of music in form and lively movement. The most common verse is the tetrameter catalectic, with diæresis between the two diameters. See METRES.

Trochil'idae [Mod. Lat., named from *Trochilus*, the typical genus, from Gr. τροχίλος, some kind of small bird; cf. *τρέχειν*, run]; a family of birds comprising the hummingbirds. See HUMMING-BIRD.

Troch'ophore [Gr. τροχός, wheel + φερῖν, to bear]: a term applied to the typical annelid larvæ in allusion to the circles of cilia (one to three or more) which surround the body, and which are the wheels referred to in the name. A trochophore stage is more or less clearly recognized in other worms and in molluscs.

Trochu, trō'shū', LOUIS JULES; soldier; b. at Le Palais, department of Morbihan, France, Mar. 12, 1815; made his military career chiefly as aide-de-camp and in the ministry of war. He was aide-de-camp to Marshal Bugeaud in Algeria, to Marshal Saint-Arnaud, and afterward to Gen. Canrobert, in the Crimea, and distinguished himself at the storming of the Malakoff as commander of the first brigade of the First French Corps. He was in command of a division at the battle of Solferino. On account of his scientific education he was generally considered as the future Minister of War, but by his pamphlet *L'armée française en 1857*, which ran through twenty editions in three years, and, revealing

the weaknesses of the French army, advocated the adoption of Prussian methods, he lost the favor of the Emperor Napoleon, and received no more offices of confidence. This circumstance, however, made him a favorite with the opposition, and when in 1870 the French army broke down, he was called to the imperial council and appointed governor of Paris Aug. 17. When the Revolution broke out in Paris after the disaster of Sedan, he was also made commander-in-chief of all the forces defending the capital, and president of the government of national defense, which position he held until the surrender of the city. He was chosen to the National Assembly in 1871, but retired to private life in 1873. Author of *Pour la Vérité et pour la Justice* (1873); *La Politique et le Siège de Paris* (1874); and *L'Armée française en 1879*. D. Oct. 7, 1896.

Troëzen, tree'zen, or **Troëze'ne** (Gr. Τροιζήν): one of the oldest cities of ancient Greece; in a fertile plain (Troëzenia) which occupied the southeastern part of Argolis. It was founded by Ionian settlers, and was under the authority of Argos at the time of the Trojan war; but although it subsequently, by the conquest of Peloponnesus by the Dorians, received a colony of Doric settlers and became a Doric city, it maintained its Ionian sympathies and traditions. It early grew into an important maritime place. It founded Halicarnassus and Myndus in Caria, and after the battle of Thermopyla its harbor was appointed the place of rendezvous for the Greek fleet. It received with the greatest kindness the Athenians who fled from Xerxes, and fought with five ships and 1,000 men in the battles of Artemisium, Salamis, Plataea, and Mycale. Up to the Peloponnesian war it was a firm ally of Athens, but after that time it sided with Lacedaemon, and subsequently it became a Macedonian possession. In the second century of the Christian era it was still a splendid city, as shown by the description Pausanias has given of its public buildings, of which some ruins are still found near the village of Danala.

Revised by J. R. S. STERRETT.

Trog'lo'dytes [from Lat. *Troglo'dyte* = Gr. Τρωγλοδίτης, the pygmies, cave-dwellers, liter., plur. of τρωγλοδίτης, cave-dweller; τράγλη, cave + δύνειν, enter]: with the ancient writers the name of races found in the Caucasus, in Moesia near the lower Danube, and elsewhere, but especially along the coasts of the Red Sea, both the Arabian and the African, which region was called *Regio Troglodytica*. Common to these tribes was their low grade of civilization. They lived in caves and depended on herds of cattle for their livelihood. The name is now applied to cave-dwellers generally. *Troglo'dytes* is the name both of a genus of wrens and of the genus containing the chimpanzee and gorilla.

Troglodyt'ida [Mod. Lat., named from *Troglo'dytes*, the typical genus. See TROGLODYTES]: a family of oscinine birds containing the wrens. They have a ten-primary wing, slender bill, inner toe united by at least half its basal joint to the middle toe, and scutellate tarsi. See WREN. F. A. L.

Trogon'ida [Mod. Lat., named from *Trogon*, the typical genus, from Gr. τρώγων, pres. partic. of τρώγειν, gnaw, chew]: a family of birds common to the tropical and subtropical regions of America, as well as Asia and Africa, distinguished from all others by having the second as well as the first toe turned backward. The bill is rather short,

stout, broad at the base, and rapidly narrowed forward, or less toothed; the wings are moderate and rounded; the legs are rather weak; the tarsi short; the tail is more or less elongated and graduated. The species are mostly showy birds of moderate size, which in great part live in the depths of the equatorial forests, often perched on the highest branches. They are believed to subsist to a large extent on fruits and berries, but also prey on insects. They nest in holes in trees, or those abandoned by woodpeckers. The most gorgeous species is the resplendent trogon, or quetzal (*Pharomacrus mocino*) of Guatemala, which is of a brilliant metallic green above and red below. The scapulars and upper tail coverts are long, the latter extending far beyond the tail feathers and often mistaken for them. About fifty species are known, thirty-five occurring in America, comprised in the genera *Prionoteles*, *Tennotrogon*, *Trogon*, *Leptuas*, and *Pharomacrus* (= *Calurus*): some dozen or more are found in Asia, and form the genus *Iarpactes* and its subdivisions; and two species in Africa have been isolated to form the peculiar genus *Hapaloderma*. The family is most nearly related to the *Momotidae*, *Alcedinidae* (kingfishers), *Cuculidae* (cuckoos), and allied forms.

Revised by F. A. LUCAS.

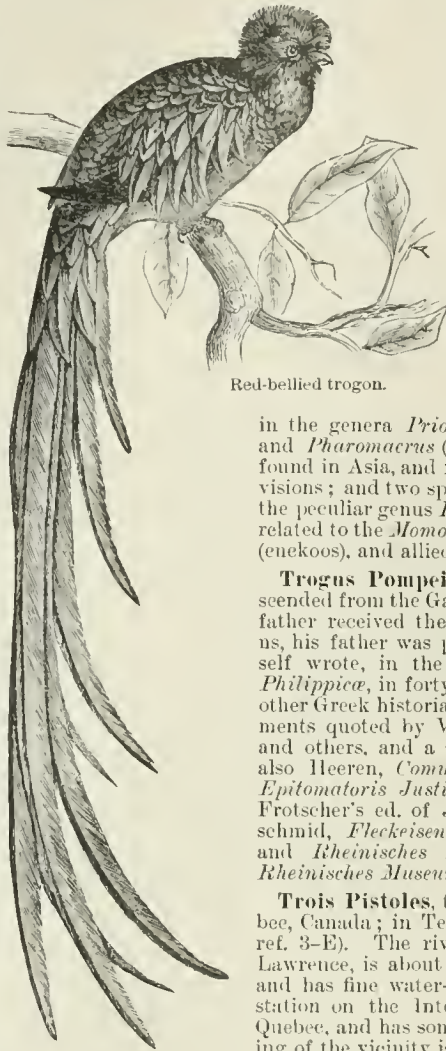

Trogus Pompeius, -pom-pee'yūs: a Latin author descended from the Gaulish tribe of the Vocontii. His grandfather received the citizenship of Rome from Cn. Pompeius, his father was private secretary to Caesar, and he himself wrote, in the time of Augustus, a work, *Historiæ Philippicæ*, in forty-four books, based upon Timagenes and other Greek historians, of which there exist a few brief fragments quoted by Vopiscus, Cassiodorus, Servius, Priscian, and others, and a series of excerpts by Justin (*g. v.*); see also Heeren, *Commentationes de Trogi Pompeii ejusque Epitomatoris Justinii Fontibus et Auctoritate*, printed in Frotscher's ed. of Justinus (Leipzig, 1827-30), A. v. Gutschmid, *Fleckeisens Jahrbücher*, supplement ii, p. 187; and *Rheinisches Museum*, 37, 548; also Wachsmuth, *Rheinisches Museum*, 46, 465. Revised by M. WARREN.

Trois Pistoles, trwā'pēs'tōl': river and town of Quebec, Canada; in Temiscouata County (see map of Quebec, ref. 3-E). The river is a right-hand affluent of the St. Lawrence, is about 50 miles long, discharges several lakes, and has fine water-powers. The town is at its mouth, a station on the Intercolonial Railway, 145 miles N. E. of Quebec, and has some trade in wood and stone. The fishing of the vicinity is excellent. Pop. 2,500. M. W. II.

Troja: See TROY.

Trolley: See ELECTRIC RAILWAYS.

Trollope, trol'up, ANTHONY: novelist; third son of Francis M. Trollope; b. in London, Apr. 24, 1815; educated at Winchester and Harrow; from 1834 to 1867 was connected with the British postal service, for which he made many voyages, and subsequently traveled extensively in the U. S., the West Indies, and Australia. In 1869 he was an unsuccessful candidate for Parliament, in the Liberal interest, for Beverley. He wrote several books of travel and many novels. Most of his later novels were originally published serially and simultaneously in British and American magazines. Among his books, which number about seventy, are *The Macdermots of Ballydoran* (1847); *The Kellys and the O'Kellys* (1848); *La Vendée* (1850); *The Warden* (1855); *Barchester Towers*, his first decided success (1857); *Doctor Thorne*, one of his best works (1858); *The Bertrams* (1859); *Castle Richmond* (1860); *Framley Parsonage* (1861); *Tales of all Countries*, stories which had appeared in various magazines (1861; 2d series 1863); *Orley Farm* (1862); *North America*, a book of travel (1862); *Rachel Ray* (1863); *The Belton Estate* (1864); *Hunting Sketches* (1864); *Can You Forgive Her?* (1865); *Clergymen of the Church of England* (1866); *The Claverings* (1867); *The Last Chronicles of Basset* (1867); *Phineas Finn, the Irish Member* (1869); *He Knew He was Right* (1869); *Sir Harry Hotspur of Humblethwaite* (1870); *The Vicar of Bullhampton* (1870); *Ralph the Heir* (1871); *The Golden Lion of Granpère* (1872); *Phineas Redux* (1873); *Australia and New Zealand*, a book of travel (1873); *The*

Red-bellied trogon.

Way we Live Now (1874); *The Prime Minister* (1875); a series of *Short Stories* (1876) published simultaneously in England and America; *The American Senator* (1877); *The Duke's Children* (1880); *Dr. Wortle's School* (1881); and a *Life of Cicero* (2 vols., 1881). D. in London, Dec. 6, 1882. An *Autobiography*, begun in 1875 and added to in 1879, was published in 1883. In this he described his methods of work, which were very systematic, and testified that for the last twenty years his books had yielded him nearly £70,000. Trollope's fiction is of the realistic type, honest in purpose, truthful, and solid, but often dull and creeping in style. He excelled in the portrayal of clerical characters and the humdrum life of rural parishes. See ENGLISH LITERATURE.

Revised by H. A. BEERS.

Trollope, Edward, D. D., F. S. A.: clergyman and author; b. Apr. 15, 1817, the younger son of a baronet; was educated at Eton and at Christ Church, Oxford; graduated in 1839; took holy orders; received successive preferments, becoming archdeacon of Stow and prebendary of Liddington in 1867, and bishop suffragan of Nottingham in 1877. Among his works on architecture, etc., are *Illustrations of Ancient Art* (1854); *Life of Pope Adrian IV.* (1856); *Introduction of Christianity into Lincolnshire* (1857); *Labyrinths, Ancient and Medieval* (1858); *Fens and Submarine Forests* (1859); *Monastic Gatehouses* (1860); *Life of Hereford, the Saxon Patriot* (1861); *Battle of Bosworth Field* (1862); *Shadows of the Past* (1863); *The Raising of the Royal Standard at Nottingham* (1864); *Spilshy and other Churches* (1865); *Norman Sculptures of Lincoln Cathedral* (1866); *Grantham and other Churches* (1867); *The Roman Ermine Street* (1868); *The Norman and Early English Styles of Gothic Architecture* (1869); *Boston and other Churches* (1870); *Church Spires* (1874); *Little Hugh of Lincoln* (1880).

Trollope, Frances (Milton): author; b. in Hampshire, England, about 1778. She was the daughter of Rev. William Milton, vicar of Heckfield, Hants, and in 1809 contracted an unhappy marriage with Thomas Anthony Trollope, a barrister. In 1829 she went to the U. S. and attempted to establish herself in some kind of business at Cincinnati; failing in this, she returned to England, where she published her *Domestic Manners of the Americans* (1831; new ed. New York, 1894), a broad and rather offensive caricature, which met with great favor in England. She followed up this success by writing a novel, *The Refugee in America* (1832), and entered upon a career of literary activity which lasted more than twenty years, the greater part of her works being novels. About 1844 she went to Italy, where her eldest son was residing, and where she passed the remainder of her life. Among her novels are *The Abbess* (1833); *Tremordyn Cliff*, one of her best (1835); *Life and Adventures of Jonathan Jefferson Whitelaw* (1836; republished in 1857 under the title *Lynch Law*); *The Widow Barnaby* (1839); *The Widow Married* (1840); *The Barnabys in America* (1843); *Father Eustace, a Tale of the Jesuits* (1846); *Petticoat Government* (1850); *Life and Adventures of a Clever Woman* (1851); and *Fashionable Life, or Paris and London*, her last work (1856). D. in Florence, Oct. 6, 1863. Revised by H. A. BEERS.

Trollope, Thomas Adolphus: eldest son of Frances M. Trollope; b. Apr. 29, 1810; educated at Winchester and Oxford; traveled on the Continent; published *A Summer in Brittany* (1840), *A Summer in Western France* (1841), and took up his residence in Florence. In 1873 he left Florence for Rome, where he acted as correspondent for the *London Standard*. In 1888 he returned to England and took up his residence in Devonshire. He was a constant contributor to English literary periodicals, and was the Italian correspondent of *The New York Tribune*. Most of his writings relate directly to Italian history, life, and manners. Among these are *La Beata* (1861); *Marietta* (1862); *Giulio Malatesta* (1863); *Beppo the Conscript* (1864); *History of the Commonwealth of Florence* (4 vols., 1865); *Gemma* (1866); *Leonora Casaloni* (1869); and *Life of Pius IX.* (2 vols., 1877). On subjects not Italian he published *Lindisfarne Chase* (1864); *Arthingdale Castle* (1867); *Dream Numbers* (1868); *The Garstons of Garstang Grange* (1869); *A Siren* (1870); *Durton Abbey* (1871); *Sketches from French History* (1878); and *What I Remember* (3 vols., 1887-89). D. at Clifton, Nov. 11, 1892. Revised by H. A. BEERS.

Trolls [= Icel.; cf. Eng. *droll* and Low Germ. *droll*, *troll*, *droll*]; a name often applied to the giants of Scandinavian mythology and to a similar class of beings in modern Scandinavian folk-lore. The trolls of folk-lore are very

powerful, and hostile to man. They are regarded as extremely stupid, and hence men usually defeated them in their attempts to capture fair maidens. Princesses taken into the subterranean mansions built of gold and silver easily deceive the credulous trolls, and so make their escape. RASMUS B. ANDERSON.

Trötsch, Baron Anton Friedreich, von, M. D.: aurist; b. at Schwabach, near Nuremberg, Germany, Apr. 3, 1829; educated at the gymnasiums of Bamberg, Augsburg, and Nuremberg; studied law at Erlangen 1847-48, after which he entered on a course of natural history at Munich; entered the University of Würzburg in 1849, graduating M. D. in 1853; then studied under von Gräfe in Berlin, Arlt in Prague, in Dublin under Wilde, in London under Toynbee, and in Paris in 1855-56. In the early part of the latter year he announced a new method of investigating the inner ear by means of a concave mirror and daylight, a procedure that revolutionized the treatment of aural diseases. In 1861, after five years of study at Würzburg, he qualified himself for the post of docent in aural medicine, and in 1864 he was promoted professor extraordinary in that department; in 1864 founded the *Archiv für Ohrenheilkunde*, the first special journal on ear diseases. The immense progress made in aural surgery since 1860 may be largely ascribed to the influence of his teachings. Among his classic works are *Die angewandte Anatomie des Ohres* (Würzburg, 1860); *Lehrbuch der Ohrenheilkunde* (Würzburg, 1862); and papers in Pitha and Billroth's *Handbook of Surgery* and in Gerhard's *Handbook of Children's Diseases*. D. at Würzburg, Jan. 9, 1890. S. T. ARMSTRONG.

Trombone [= Fr. = Ital., augmentative of *tromba*, trumpet]; a large brass wind instrument of the trumpet species, supposed to be the same as the sackbut of early writers. Its peculiarity consists in the facility of deepening the tones by means of sliding tubes, making it one of the most effective instruments in an orchestra. There are three kinds—alto, tenor, and bass.

Tromp, Maarten Harpertzoon, van: admiral; b. at Briel in 1597; entered the Dutch navy, and in 1624 was placed in command of a frigate. In 1637 he was made lieutenant-admiral, and in 1639 gained a European fame by his two great victories over the Spanish fleet off Gravelines and in the Downs. He was at first less successful in the war between England and Holland, and, having been defeated by Blake, he even lost his command for some time in 1652. He was soon reinstated, however, and defeated Blake completely in the Downs Dec. 10, 1652 (s. s.). In Feb., 1653, he fought against the combined fleet of Blake, Monk, and Deane, and, though somewhat worsted in the encounter, showed remarkable courage and skill and effected a successful retreat. He fought another indecisive battle in June. In July, 1653, he again attacked the English fleet. The battle lasted two days, but was finally lost by the Dutch; Tromp himself was killed Aug. 8 (s. s.), 1653. He is buried in the church of Delft, where a splendid monument has been erected to him.—His son, CORNELIS TROMP, b. in Rotterdam, Sept. 9, 1629, achieved almost an equal fame, held the highest positions in the Dutch navy, and served with great distinction for some time in Denmark. D. in Amsterdam, May 29, 1691.

Trompe: See BLOWING-MACHINES.

Tromsø: port of Northern Norway and one of the most northerly towns in the world; lat. 69° 38' N., lon. 18° 45' E.; on the eastern shore of an island of the same name in the Tromsø fiord (see map of Norway and Sweden, ref. 2-G). The town is well built, though of wood, and is in attractive surroundings. It has an ethnographic museum rich in material relating to the Lapps. The port is commodious, and is most frequented by Russians, who come for salt and smoked fish. The fishing industry is active, and is devoted to the herring, cod, hake, seal, and whale. The chief exports are fish, oil, pelts, nickel ore, and eider-down. The town was founded in 1794, but did not become important until the middle of the nineteenth century. Pop. (1891) 6,080 with the commune, but the rural population is very small.

MARK W. HARRINGTON.

Trona [Egypt. or N. Afr., perhaps connected with *natron*]; the mineralogical name of a native sodium carbonate, the most common native form of that salt. It has the composition when crystallized $\text{Na}_2\text{CO}_3 \cdot 2\text{H}_2\text{O}$, and is known by the name sodium sesqui-carbonate. It occurs as a natural deposit in Egypt, Africa, South America, and elsewhere.

Trondhjem, trond'yem, or **Drontheim**: the ancient *Nidaros*, the oldest town of Norway (founded 996); beautifully situated on the southern shore of Trondhjemsfjord, in lat. 63° 25' N.; 250 miles by rail N. of Christiania (see map of Norway and Sweden, ref. 7-D). Of its cathedral, which once was the largest church-building in Scandinavia, only the choir remains, in which the kings are crowned, but the restoration of the entire cathedral was undertaken by the Government in 1880. Its breweries and distilleries are extensive and celebrated. Much copper, salt and dried fish, oil, and timber are exported. Pop. (1891) 29,162.

Troopial [from Fr. *troupial*, deriv. of *troupe*, troop]: a name used for many of the orioles (*Icteridae*), and apparently first bestowed on the birds of the genus *Cassicus*, possibly from their associating in flocks or troops. Thus the BOBOLINK (*q. v.*) or rice-troopial, the cow-bunting or cow-troopial (*Molothrus pecoris*), and many others are occasionally called by this vague name. F. A. L.

Troost, GERARD, M. D.: geologist; b. at Bois-le-Duc, Holland, Mar. 15, 1776; educated at Amsterdam and Leyden; studied medicine and natural science; served in the army, both as a private soldier and afterward as a medical officer; was enabled by Louis Bonaparte, King of Holland, to devote himself to his favorite studies in Paris, where he translated Humboldt's *Aspects of Nature* into Dutch; embarked in 1809 on a scientific mission to the East Indies, but was taken by a French privateer and carried to Dunkirk; resided a year at Paris; proceeded to the U. S. 1810; settled in Philadelphia, where he was one of the founders and the first president of the Academy of Natural Sciences (1812-17); established at Cape Sable, Md., the first alum-factory in the U. S. 1814; was appointed Professor of Mineralogy in the Philadelphia Museum 1821; settled at New Harmony, Ind., with Owen and McClure 1825; became Professor of Chemistry and Mineralogy in the University of Nashville 1827, and was State geologist of Tennessee 1830-49. D. at Nashville, Aug. 14, 1850. His mineral and geological cabinets were the largest in the U. S. He was the author of geological reports upon Tennessee and upon the environs of Philadelphia (1826), and of numerous contributions to periodicals. Revised by G. K. GILBERT.

Trope [from Lat. *tro'pus* = Gr. *τρόπος*, turn, way, manner, style, trope, deriv. of *τρέπειν*, turn]: the application of a word or expression to some other than its normal or ordinary use, for the purpose of giving life or impressiveness to a statement. The three principal tropes are METAPHOR, METONYMY, and SYNECDOCHE (*q. v.*). B. I. W.

Trophy [from O. Fr. *trophee* < Lat. *trophæ'um*, *tropæ'um* = Gr. *τροπαῖον*, monument to commemorate a victory (or defeat of an enemy), liter., neut. of *τροπαῖος*, pertaining to turning or defeat, deriv. of *τροπή*, turning, rout, defeat, deriv. of *τρέπειν*, turn]: among the ancient Greeks a memorial erected on the battle-field by the victors on the spot where the enemy turned to flight or retreat. Originally, trophies were of wood or of simple armor affixed to a tree. It was equally unlawful to destroy or repair a trophy, since it was very justly considered unwise to perpetuate hostile feelings. In later times the Romans adopted the custom of erecting trophies. Revised by J. R. S. STERRETT.

Tropic-bird [so called because they are not commonly seen outside the tropics]: any member of the family *Phaethontidae*, order *Steganopodes*. There are three species,

Tropic-bird.

somewhat larger-bodied than a pigeon, having the plumage white with fine black markings above, pure white or rosy below; the bill is red or yellow, feet dark. The two central

tail-feathers are much longer than the others, and from their faint suggestion of a marlinspike these birds have been dubbed boatswain-birds by sailors. The two species of the Atlantic, *Phaethon aethereus* and *P. flavirostris*, occur occasionally on the southern coasts of the U. S. F. A. L.

Tropics: See SOLSTICE, CAPRICORN, and CANCER.

Troploug, tro'loo', RAYMOND THÉODORE: jurist; b. at St.-Gaudens, department of Haute-Garonne, France, Oct. 8, 1795; practiced as an advocate; held various judicial positions; was made a peer of France in 1846, president of the court of Paris in 1848, a senator and president of the court of cassation in 1852; and president of the Senate in 1854. D. Mar. 2, 1869. His principal work is *Code civil expliqué* (28 vols., 1833-58), parts of which—*Des Privilèges et Hypothèques* (4 vols.), *De la Vente* (2 vols.), *De la Prescription* (2 vols.), *Du Contrat de Mariage* (4 vols.), *Des Donations* (4 vols.)—have been published separately, and often reprinted. Revised by F. STURGES ALLEN.

Troppan, tro'p'pow: capital of Silesia, Austria; on the Oppa; 184 miles by rail N. E. of Vienna (see map of Austria-Hungary, ref. 3-G). It is fortified, contains many fine buildings, and is generally well built. Its manufactures comprise woolen and linen fabrics, soap, leather, beetroot sugar, and ironware, and its trade is very active. A congress of representatives of the five great powers was held here in Oct., 1820, to consider measures for the suppression of the revolutionary outbreaks in Italy. No action was taken, and the congress adjourned in November, resuming its session at Laibach in Jan., 1821. Pop. (1890) 22,867.

Trot: See GAITS.

Trotzendorf, VALENTINE (real name FRIEDLAND): educator; b. at Trotzendorf, Germany, Feb. 14, 1490; studied at Wittenberg, where he joined the Reformers and was a pupil of Melancthon; rector (1523-27, 1531-54) of the Latin School at Goldberg, which became under his direction one of the most famous classical schools of the age. He anticipated somewhat the monitorial system of Bell and Lancaster, and introduced a successful plan of student self-government. D. at Liegnitz, Apr. 26, 1556. See Barnard, *German Teachers and Educators*; Williams, *History of Modern Education*. C. H. THURBER.

Troubadours: See TROUVÈRES.

Troup, ROBERT, LL. D.: soldier and lawyer; b. in New York in 1757; graduated at Columbia College 1774; studied law under John Jay; entered the Revolutionary army as lieutenant 1776; became an aide to Gen. Woodhull; was taken prisoner at the battle of Long Island; confined in the prison-ship Jersey and the provost prison, New York; exchanged in 1777; became aide to Gen. Gates at Saratoga; was secretary to the board of war 1778-79; studied law at Princeton under Judge Patterson; was for several years U. S. district judge in New York and member of the Legislature; was an intimate friend of Hamilton, and during his later years resided at Geneva, N. Y., as agent of the great Pulteney estate; published occasional political pamphlets. D. in New York, Jan. 21, 1832.

Trous-de-loup: See FORTIFICATION (*Field Fortification*).

Trout [O. Eng. *trahht*, from Lat. *trācta* (> Fr. *truite*), from Gr. *τράκτης*, a sea-fish, liter., gnawer, deriv. of *τρώγειν*, gnaw]: a name given to several fishes, but originally applied to the trout of England and Northern Europe (*Salmo fario*), and properly used for members of the family *Salmonide* only. Trout are mainly restricted to fresh waters, where they reside the year around, not, like salmon, merely visiting fresh water to spawn; but some, like the sea-trout of Labrador (*Salvelinus stagnalis*), may have the same habits as the salmon, while others which thrive in landlocked waters visit the sea when opportunity offers. Trout are all naturally inhabitants of the northern hemisphere only, but some species have been introduced into such southern localities as New Zealand and Australia. They are active and powerful, and on this account, as well as for their beauty and fine flavor, are favorites with anglers. They reside in clear cold streams and lakes, and are among the most northern species of fresh-water fishes. They feed on small fishes, insects, and larvæ, those of the mosquito forming a considerable portion of their food in the lakes of Greenland.

The trout of Europe (*Salmo fario*) belongs to a group having teeth on the body of the vomer as well as on the anterior portion. The scales are quite small, about 120 along the lateral line; the body and head are usually thickly

marked with more or less irregular red and black spots, and the anterior edges of the dorsal, anal, and ventral fins are yellowish. The species reaches a length of 30 inches. The brook-trout (*Salvelinus fontinalis*) of the U. S. represents a genus in which there are no teeth on the body of the vomer.

The salmon-trout (*S. trutta*).

these fishes being termed charrs by English naturalists. The scales are minute, numbering something like 200 on the lateral line; there are numerous yellowish spots and many vermilion dots on the body, and the dorsal is marked with dark spots. The ventrals and anal are edged with white, preceded by a dark bar. This species has been known to attain a weight of 7 to 12 lb., but this is very unusual, the American trout averaging much smaller than the European. There are about a score of species in North America, to which the term trout is applied, but only eight belong to the genus *Salvelinus*. The salmon-trout of Europe is *Salmo trutta*, a species residing in salt water and ascending rivers. The salmon-trout or lake-trout of North America is *Salvelinus namaycush*, a large species restricted to fresh water. The rainbow trout (*Salmo iridens*) and Dolly Varden trout (*Salvelinus malma*) occur on the Pacific slope. In the southern parts of the U. S. the name is applied to the weakfish (*Cynoscion*) and to the black bass (*Micropterus*). See BULL-TROUT, CHARR, CUT-THROAT TROUT, DOLLY VARDEN, and NAMAYCUSH. F. A. LUCAS.

Trouvères, truu'vâr' [plur. of *trouvère* = Fr.: Prov. *troubador* (whence Fr. *troubadour*, whence Eng. *troubadour*), deriv. of *trobar*: Fr. *trouver*, find. The strict Mod. Fr. form should be *trouveur*, which is preferred by many scholars]; the courtly lyric poets of mediæval France, who must be sharply distinguished from the popular poets, the *jongleurs*, to whom was due the composition of the *chansons de geste* and of the earliest indigenous French lyric poetry. The beginning of courtly poetry in France proper is to be put about the middle of the twelfth century, and the inspiration to it was almost exclusively Provençal. The event which more than any other brought together Provence and France was the marriage of the famous Eleanor of Poitiers (later wife of Henry II. of England) to Louis VII. of France, in 1137. The granddaughter of the first of the *troubadours*, William VII. of Poitiers, this gay and brilliant woman carried with her to France the chivalrous practices and the amorous poetry of the south. Her court and later that of her daughter, the Countess Marie of Champagne, at Troyes, became centers from which the ideas and the poetical forms of the *troubadours* proper diffused themselves through Northern France.

The poetry of the *trouvères* falls into two decidedly distinct periods: the first, that of direct imitation of Provençal poetry, including the twelfth and thirteenth centuries; the second, that of modification and development of this earlier manner along original lines, reaching from the beginning of the fourteenth century down to the Renaissance (about 1550). The chief representatives of the first period are Christien de Troies, Conon de Béthune (d. 1224), Gace Brulé, Blondel de Nesle, Guy de Couci (d. 1203), Gautier d'Espinaux, Gontier de Soignies, and, perhaps most famous of all, Thibaut de Champagne, King of Navarre (d. 1253), whom Dante mentions in his *De vulgari eloquio* (i. 9; ii., 5, 6) among the exemplary poets of love. The second period was opened by Guillaume de Machaut, who introduced important musical innovations, and brought elaborate and artificial poetical forms, the *ballade*, the *chant royal*, the *rondeau* (*triolet*), the *lai* with twelve strophes, into favor. The new style was cultivated by Eustache Deschamps (d. about 1410), later by Froissart, Christine de Pisan, Charles d'Orléans, and others. It was finally superseded by the classical and Italianizing manner of which Ronsard and the Pléiade were the aggressive champions. See PROVENÇAL LITERATURE. A. R. MARSH.

Trover [from O. Fr. *trover* > Fr. *trouver*, find]: the common-law form of action by which damages are recovered

for the *conversion* of chattels. It was originally designed for the particular case of the defendant's *finding* a thing belonging to another, and appropriating it to his own use; whence the plaintiff's pleading necessarily contained an averment of the loss and finding—in law French, *trouver*. See CONVERSION.

Trowbridge; town; in Wiltshire, England; on the Biss; 12 miles by rail S. E. of Bath (see map of England, ref. 12 G). There is a fine Perpendicular church (1475) and a town-hall opened in 1889. Woolen cloth, cassimeres, kerseys, and tweeds are manufactured. Pop. (1891) 11,717.

Trowbridge, EDWARD; lawyer; b. at Newton, Mass., in 1709; graduated at Harvard 1728; became a lawyer of great eminence; was appointed attorney-general of Massachusetts 1749; was for several years a member of the council, but lost favor with the popular party in 1766 on account of lukewarmness in resisting British aggressions; became chief justice of the Supreme Court 1767; presided with great fairness at the trial of the British soldiers charged with the "Boston massacre" 1770, and resigned his office 1772 in consequence of the impending conflict with England, and remained in seclusion during the Revolution. D. at Cambridge, Mass., Apr. 2, 1793.

Trowbridge, JOHN; physicist; b. in Boston, Mass., Aug. 5, 1833; graduated at the Lawrence Scientific School of Harvard University in 1856, and continued as tutor there until 1869, when he became Assistant Professor of Physics in the Massachusetts Institute of Technology. In 1870 he returned to Harvard to establish the laboratory course of instruction in physics, out of which has been developed the Jefferson Physical Laboratory, which has become one of the largest and best-equipped laboratories of its kind in the U. S. He became Professor of Experimental Physics in 1880, and was in 1888 given the Rumford chair of the Application of Science to the Useful Arts, succeeding Dr. Wolcott Gibbs, who had been made emeritus. Prof. Trowbridge has devoted much time to original research, and his many investigations have been issued chiefly as *Contributions from the Physical Laboratory of Harvard College*. These have included the demonstration of the existence of platinum and carbon in the sun, and a study of the so-called oxygen lines in the solar spectrum. In electricity, to which he has devoted much attention, he is well known for his invention of the closed magnetic circuit transformer, which is in general commercial use in the alternate-current system of electric lighting; for his researches on the damping of electric waves on iron wires; and for his photographic studies of electrical oscillations, including a new determination of the velocity of electrical waves. The degree of S. D. was given to him by Harvard in 1873, and in 1878 he was elected to the National Academy of Sciences; also in 1884 he presided over the physical section of the American Association for the Advancement of Science. Besides his scientific papers he was one of the editors of the *Annals of Scientific Discovery for 1869* (Boston, 1870) and since 1879 has been an associate editor of *The American Journal of Science* in the department of physics. He is the author of *The New Physics* (New York, 1884) and *What is Electricity?* (1896). M. B.

Trowbridge, JOHN TOWNSEND; author; b. at Ogden, N. Y., Sept. 18, 1827; after teaching and working on a farm, settled in New York 1846 as a writer for periodicals; removed in 1847 to Boston, where he has since resided; became editor of *The Yankee Nation* 1850; wrote many popular tales for the young over the signature *Paul Croylan*; has been a prominent contributor to the *Atlantic* and other magazines; was editor of *Our Young Folks* (1870-73); has published many works of adventure, travel, and fiction, including *Father Brighthopes* (1853); *Neighbor Jackwood* (1857); *Cudjo's Carr* (1863); *The Drummer Boy* (1863); *The South* (1866); *The Vagabonds, and other Poems* (1869); *Lawrence's Adventures* (1870); *Coupon Bonds, and other Stories* (1871); *The Emigrant's Story, and Other Poems* (1875); *The Lost Earl, and other Poems* (1888); *The Sabinwood Box*; etc. Revised by H. A. BEERS.

Trowbridge, WILLIAM PITTIE, Ph. D., LL. D.; scientist and engineer; b. in Oakland co., Mich., May 25, 1828; graduated first in his class at the U. S. Military Academy 1848. Soon after his graduation, he was ordered back to the academy as assistant in the astronomical observatory, where he fully prepared himself for duty on the Cass Survey, to which, at his own request, he was ordered. In the survey he at first acted as assistant to Prof. Bessel, and the

primary triangulation of the coast of Maine, which in 1852 was placed under his immediate charge. In 1853 he was ordered to the Pacific coast to conduct a series of magnetic and tidal observations extending from San Diego to Puget Sound, a work which occupied three years. He was promoted to the rank of first lieutenant in 1854, and two years later accepted the professorship of mathematics in the University of Michigan, but in 1857 accepted a permanent office on the Coast Survey. Upon the breaking out of the civil war he was assigned to the duty of preparing minute descriptions of the harbors, inlets, and rivers of the Southern coast for the use of the navy. In 1862 he was ordered to execute a hydrographic survey of Narragansett Bay, where there was a design to erect a navy-yard, but the results of the survey were not favorable to the project. He was subsequently transferred to the War Department, and was during the remainder of the war in charge of the branch office of the engineer department in New York. He was Professor of Dynamic Engineering in the Sheffield Scientific School, Yale College, 1870-77; adjutant-general of Connecticut 1872-76; and in charge of the engineering department of the School of Mines, Columbia College, from 1877 to his death at New Haven, Conn., Aug. 12, 1892. He was elected to the National Academy of Sciences in 1878, and was a well-known contributor to the leading scientific journals, and author of *Steam Generators*, *Heat as a Source of Power* (1874), and other works. He is said to have been the first engineer to suggest the idea of the cantilever bridge.

Revised by C. H. TAUBER.

Troy, Troja, or Il'ium: the scene of the Homeric *Iliad*, and the metropolis of the Troad, the coast region extending from Cape Lectum on the Ægean to Dardanus and Abydus on the Hellespont. The Troad comprised a broad, undulating plain sloping from the foot of Mt. Ida to the sea, and traversed by the rivers Scamander and Simois. This plain was densely peopled by a mixed race of Pelasgians and Phrygians, and contained many cities (Achilles boasts of having destroyed eleven), of which, however, Troy was by far the most splendid and powerful. Troy was founded by Ilus, the son of Tros, the grandson of Dardanus, and developed rapidly and magnificently; legend tells how, under Laomedon, the son of Ilus, Poseidon himself built its walls. It had a fortified acropolis, called Pergamum, which overlooked the town proper, and contained the temples of the gods and the royal palaces. Under Priam, the son of Laomedon, it reached its highest splendor and experienced its downfall. Priam's son, Paris, carried off Helen, the wife of Menelaus, and in order to punish this outrage a Greek army landed in Troas, besieged Troy for ten years, and finally destroyed it, though the Trojan state, the kingdom of Troy, seems to have continued to exist for several centuries after the destruction of its capital. The exact site of the city is disputed. According to the Homeric description it was not situated in the plain, but stood on a hill between the Scamander and the Simois, which united in front of it. In ancient times it was generally believed that New Ilium, a city of little importance on the right bank of the Scamander, and of which some ruins are still extant near the present village of Hissarlik, occupied the same site as Old Ilium. When this New Ilium was founded is not known. It stood on a low spur of Mt. Ida, separating the basins of the Scamander and the Simois. In the time of Alexander the Great it existed, and by the partiality which Sulla showed for it, it even became prosperous. There were, however, even in antiquity, scholars who doubted the identity of the sites of New and Old Ilium; as, for instance, Strabo, who moved the site of Old Ilium several miles farther inland to a village called Ilium. In 1785 Lechevalier discovered at the village of Bunarbashi, on the left bank of the Mendereh, 5 miles S. of New Ilium, a hot and a cold spring which corresponded to those mentioned in the *Iliad*, and some ruins on the hill of Balidagh, beyond the springs, which he identified as the remains of the citadel of Pergamum. Although further excavations did not bring to light any marked traces of a great city, the views of Lechevalier were generally accepted by classical scholars. (See Lechevalier, *Voyage de la Troade*, 3 vols.) Later scholars have returned to the views of antiquity since the extensive excavations of Schliemann at Hissarlik (1871-73, 1876-1878, 1879, 1882). See Schliemann's *Ilios* (London, 1879), but better Schuchhardt's *Schliemann's Excavations* (London, 1891), pp. 17-92, and Perrot and Chipiez's *History of Art in Primitive Greece* (London, 1894), pp. 154-254.

Revised by J. R. S. STERRETT.

Troy: city; capital of Pike co., Ala.; on the Ala. Mid. and the Cent. of Ga. railways; 74 miles S. by E. of Montgomery, and 85 miles S. W. of Columbus (for location, see map of Alabama, ref. 6-E). It is an important cotton-trade center, and contains 2 private banks and a daily and 2 weekly newspapers. Pop. (1880) 2,294; (1890) 3,449.

Troy: city; capital of Lincoln co., Mo.; on the St. L. and Hannibal Railway; 15 miles W. of the Mississippi river, and 55 miles N. W. of St. Louis (for location, see map of Missouri, ref. 3-1). It is in a region containing coal, iron, glass-sand, and other mineral deposits, and rich farm lands, and has a high school, 2 State banks with combined capital of \$20,000, a weekly newspaper, flour-mill, and several tobacco-factories. Pop. (1880) 839; (1890) 1,350.

EDITOR OF "FREE PRESS."

Troy: city (chartered in 1816); capital of Rensselaer co., N. Y.; at the head of steamboat navigation on the Hudson river, and on the Del. and Hudson, the Fitchburg, the N. Y. C. and Hud. River, and several local railways; 6 miles N. of Albany, and 151 miles N. of New York (for location, see map of New York, ref. 5-K). It is at the junction of the Mohawk and Hudson rivers; is laid out regularly with streets generally 60 feet wide; and is surrounded by the municipalities of West Troy, Green Island, Cohoes, Waterford, and Lansingburg, whose people are largely employed in Troy and whose local enterprises are chiefly carried on by Troy capital. The city is noted for its extensive industries, which include laundry-drying and the manufacture of iron, steel, stoves, ear-wheels, ship-chains, cotton cloth, knit goods, and linen shirts, collars, and cuffs. In 1890 over 800 manufacturing establishments, representing over 100 industries, were reported. They had a combined capital of \$22,382,018, employed 25,092 persons, paid out \$9,502,580 for wages and \$13,061,278 for materials, and had an output of goods valued at \$29,064,935. Nearly \$5,000,000 was invested in the manufacture of iron and steel, and about \$4,000,000 in that of shirts, collars, and cuffs.

There are 68 churches and chapels, of which 12 are Methodist Episcopal, 12 Roman Catholics, 11 Presbyterian, 9 Protestant Episcopal, 6 Baptist, 4 Jewish, and 4 Lutheran. The public-school system comprises a high school and 18 grammar schools, and has property valued at nearly \$500,000. The most widely known educational institution is the Rensselaer Polytechnic Institute, which was founded in 1824 by Stephen Van Rensselaer, of Albany, and incorporated in 1826 under the name of the Rensselaer School. It was established as a school of practical science. Much of its early success was due to its first principal and senior professor, Amos Eaton, well known at that time as a scientific investigator and teacher. In 1832 its name was changed to Rensselaer Institute; in 1835 a department of civil engineering was opened; in 1850 the curriculum was completely reorganized; and in 1861 the Legislature sanctioned a change to its present name. Courses in natural science and civil engineering have been added since. In 1894 it had 17 instructors, 188 students, 5,000 volumes in its library, and nearly 900 living graduates.

The second institution of note is the Willard Female Seminary, founded by Emma Willard and enlarged in 1895 by a donation of \$150,000 by Russell Sage, and by a Gurley Memorial building and a Plumb Memorial building. Other advanced schools are the La Salle Institute and the St. Peter's Academy, both Roman Catholic.

The charitable and benevolent institutions include the Church Home (Protestant Episcopal), Day Home, Home for the Aged Poor, House of the Good Shepherd, Marshall Infirmary and Lunatic Asylum, Presbyterian Church Home, Troy Hospital, Troy Orphan Asylum, Troy Male Orphan Asylum (Roman Catholic), three houses of the Sisters of Charity, and a Woman's Association.

Troy has large business interests aside from its manufactures. Four-fifths of all the merchandise carried on the Erie and Champlain Canals enters into and is discharged from the canals at this point. The city has a daily line of passenger steamers to New York and daily lines of water transportation to the principal Atlantic coast cities. The U. S. Government has a building for post-office, court, and other Federal purposes; it was constructed at a cost of \$500,000. In 1895 there were 8 national banks with combined capital of nearly \$2,000,000, 2 savings-banks with aggregate deposits of over \$6,000,000, and a private bank. The city had an assessed valuation in 1894 of \$46,986,988 and a net debt of \$1,052,493.

The city was distinguished for its patriotism during the war of 1861-65, and the remains of three celebrated major-generals in the Union army, John E. Wool, George H. Thomas, and Joseph B. Carr, rest in its beautiful Oakwood Cemetery. The grave of Gen. Wool is marked by an obelisk whose shaft is 75 feet high. A soldier's monument, 90 feet high, is on Washington Square.

Pop. (1880) 56,747; (1890) 60,956; (1892) 64,986; (1895) estimated, 70,000; with environs, 130,000.

MARTIN I. TOWNSEND.

Troy; village; capital of Miami co., O.; on the Miami river, the Miami and Erie Canal, and the Cin., Ham. and Dayton and the Cleve., Cin., Chi. and St. L. railways; 80 miles N. by E. of Cincinnati (for location, see map of Ohio, ref. 5-C). It is in an agricultural region, and contains a public high school, a public-school library, 2 national banks with combined capital of \$300,000, a daily and 5 weekly newspapers, several iron-foundries, planing-mills, and bent-wood and buggy factories. Pop. (1880) 3,803; (1890) 4,494.

Troy; borough (founded in 1802, incorporated in 1845); Bradford co., Pa.; on the North. Cent. Railway; 25 miles S. of Elmira, N. Y. (for location, see map of Pennsylvania, ref. 2-G). It has public, high, and graded schools; Baptist, Methodist Episcopal, Presbyterian, Protestant Episcopal, Disciples, Roman Catholic, and Universalist churches; water-works, electric lights, farmers' club, with extensive fair-grounds, large creamery, 3 flour-mills, 2 tanneries, 2 foundries, 2 carriage-factories, 2 planing-mills, marble-works, engine-shops, furniture-factory, 2 hotels, 2 banks, and 2 weekly newspapers. It is the center of a noted butter-making region. Pop. (1880) 1,241; (1890) 1,307; (1895) estimated, 1,500.

EDITOR OF "GAZETTE."

Troyes, trwaa; capital of the department of Aube, France; on the Seine; 104 miles E. S. E. of Paris by rail (see map of France, ref. 4-G). The town has many splendid buildings, but is in general an old-fashioned place, partly in a state of decay, partly rebuilding. Its old ramparts have been changed into promenades, and of its many churches that of St. Urbain and the cathedral are remarkable. It has a library of 110,000 volumes, a museum, and a normal school and other educational institutions. Cotton fabrics, cloths, bombazines, calicoes, prints, lace, and hosiery are extensively manufactured; also wax, leather, paper, and sausages. Being the center of a fertile and well-cultivated district, its general trade is very active. It has given its name to an important treaty concluded here between Henry V. of England and Charles VI. of France in 1420. See TREATIES. Pop. (1896) 52,998. Revised by M. W. HARRINGTON.

Troyon, trwā yōn', CONSTANT; landscape and animal painter; b. at Sèvres, France, Aug. 25, 1810; d. in Paris, Feb. 21, 1865; pupil of Rocreaux and Poupart; studied later with Roqueplan, and began to exhibit landscapes about 1836. He visited Holland in 1847 and studied the works of the Dutch masters in the museums. He received a third-class medal at the Salon of 1838; second-class 1840; first-class 1846 and 1848, and at the Paris Exposition of 1855; Legion of Honor 1849. He introduced cattle in his landscapes after about 1848, and painted them, as well as sheep, with great knowledge and admirable simplicity. His pictures rank with those of his contemporaries Corot, Daubigny, Rousseau, Diaz, and Millet, among the finest works of the modern French school. He was a colorist of great strength, and his pictures are composed with nobility and grandeur of line. *Morning and Evening*, both large canvases, are in the Louvre, and so also is a fine example, *Return to the Farm*. One of his finest works is *The Valley of La Touque*, painted in 1853, which belongs to the Goldschmidt estate, Paris, and was exhibited at the Retrospective Exhibition in Paris in 1889. Many fine works by Troyon are in the U. S. In the Wolfe collection, Metropolitan Museum, are *Cow and Landscape and Cattle*.

WILLIAM A. COFFIN.

Troy Weight; See WEIGHTS AND MEASURES.

Trübner, NICOLAS; bookseller and bibliographer; b. at Heidelberg, Germany, June 12, 1817; settled in early life in England; became a bookseller and publisher in London 1852, in which capacity he rendered eminent service to American bibliography, as well as to Oriental and comparative philology, and was himself distinguished for linguistic attainments, especially in Sanskrit and Basque. He published a *Bibliographical Guide to American Literature* (1855; 2d ed. 1859); issued many elaborate sale-catalogues containing important bibliographical data; and edited Dr. Ludewig's

posthumous *Literature of American Aboriginal Languages* (1858). He was also a frequent contributor to periodicals. D. in London, England, Mar. 30, 1884.

Truce, or **Armistice** [*truce* < M. Eng. *truces*, plur. of *trewe*, pledge < O. Eng. *tréou*, truth, faith]; a temporary stoppage of hostilities contemplating a longer duration and a wider application than the brief cessation of hostilities at a particular place or for a particular purpose which is called a suspension of arms. A truce implies a return to a state of war, while a peace presupposes that the causes of war have been removed. The former, however, though limited usually in terms, as for a certain time or to secure a certain object, may actually outlast the latter. The cessation of hostile operations may apply to an individual only, through a flag of truce, a passport, or a safe conduct; or it may apply to the whole or a portion of the armies of the belligerent. A flag of truce, a white flag to which attention is called by the sound of a trumpet, is used to open negotiation for any cause during hostilities. There is no obligation to receive it, and in the midst of a battle it may be that injury is done to its bearers inadvertently; nevertheless by law and usage they are inviolable. Of course the flag of truce must not be employed to spy out an enemy's position or to delay a battle until reserves can be brought up; a belligerent can take measures to prevent such abuses.

A truce is *partial* if it relates to a particular district or military force, *general* if it relates to all the forces and the military operations of belligerents in their entire extent. The latter can only be made by the sovereign power of a state. A truce is binding from a certain declared date. If military operations are carried on in widely separated regions, the beginning of a truce may be set at different times for various places, to allow for spreading the news of it. But a force is bound by knowledge arriving prior to such time, and, on the other hand, if war has been carried on subsequent to the date set for the truce, but in ignorance of its existence, compensation for damage inflicted is not due, though property and prisoners captured during this interval must be restored.

Acts Lawful during a Truce.—The theory of a truce is that neither party shall be helped in his military operations by it; that such affairs shall be in the same position at its end as at its beginning. But this principle is not carried out so fully as to forbid those operations which could have been carried on without military interference had no truce existed. Thus in the case of a besieged town or fortress, nothing can be done during a truce by either party which the other, by his guns or his forces, was in a position to prevent, but fortifications not under fire could be built or strengthened, and supplies could be brought in by ways beyond the other's control. With regard to revictualing a besieged place, a truce should specify what rule is to be adopted. The allowance of a supply of provisions equal to the amount consumed during the truce would seem to be necessary to put the parties at its termination into the same relative position, for, if the reduction of a place was being attempted by starvation, to bar out provisions would be directly in line with the plan of campaign. Yet, on the other hand, provisions under such circumstances are really material of war; their introduction is unlawful if impossible but for the truce; and the policy of a truce is to be decided with this fact in view. In November of 1870 an armistice was proposed between the French army in Paris and the Germans besieging it, which turned on just this point. Bismarck declined to allow a supply of provisions for a time equal to the truce to be passed through the German lines, and so the negotiations fell through. No changes have been made in the rules governing truces of late years, the articles on this topic in Lieber's code, which governed the U. S. armies in 1863, and those of the Brussels conference in 1875 agreeing with what is here laid down.

Two or three minor rules remain to be mentioned. Violation of a truce by one party causes its immediate termination. So, too, if made for a definite time, and that time has expired, hostilities are resumed without further notice.

Finally, a truce is a form of treaty and to be similarly interpreted. See also INTERNATIONAL LAW AND TREATIES.

THEODORE S. WOOLSEY.

Truce of God (*treuga Dei*): in the Middle Ages, an institution which sprang up in France and Germany by which nobles and princes bound themselves to keep the peace, to abstain from unlawful wars, and to protect clerics, women, merchants, pilgrims, peasants, and other non-combatants.

In the council of Charroux in 989 the Church decreed a special peace to the unarmed clerk and laborer (*pax ecclesiarum*). This attempt to check violence extended throughout France during the opening years of the next century and was in part successful, but the task of maintaining a general peace was hopeless and the Church contented itself with limiting the feudal warfare. Accordingly, at the synod of Tulluges in 1027 it was decreed that warfare should be suspended from Saturday till Monday. This was afterward extended to the interval from Wednesday evening to Monday morning in every week and to nearly all the more important fasts, feasts, and holy seasons of the Church. England and Italy adopted the custom, which was confirmed by several church councils, among which were the second and third Lateran Councils (1139 and 1179). The final triumph of legal over feudal government did away with this institution and with the necessity for it.

Truckee': town; Nevada co., Cal.; on the Truckee river, and the South. Pac. Railroad; 120 miles N. E. of Sacramento, the State capital (for location of county, see map of California, ref. 5-E). It is the center of an extensive timber region, and is principally engaged in cutting and manufacturing lumber. Pop. (1880) 1,147; (1890) 1,350.

EDITOR OF "REPUBLICAN."

Trudel, FRANÇOIS XAVIER ANSELME, Q. C.: Canadian senator, and editor; b. at Ste. Anne de la Pêrade, Quebec, Apr. 29, 1838; educated at Nicolet College, and admitted to the bar in 1861. He was editor of *La Minerve*, Montreal, in 1860; is the founder, coproprietor, and editor of the daily newspaper *L'Étendard*, the monthly *La Revue Canadienne*, and the weekly *L'Ouvrier*. He represented Champlain in the Quebec Assembly 1871-73, and was appointed a Canadian senator in the latter year. He was one of the authors of the *Programme Catholique* in 1871, and has written largely on politics and other subjects.

NEIL MACDONALD.

Trueba y Quintana, troo-ā'baā-ee-kēen-taa'naā. ANTONIO, de la; novelist and poet; b. in the Basque village of Montellana, Spain, Dec. 24, 1821. Sent to Madrid to prepare for a mercantile life, he entered the university, and soon gave himself up entirely to literature. In 1862 Queen Isabella made him archivist of Biscay and *Poeta de la Reina*. The former office he lost through the revolution of 1868. D. in Madrid, Mar. 10, 1889. His poems, which are collected in the *Libro de los Cantares* (Madrid, 1852, etc.), are in the main concerned with his native district, and are marked by depth of feeling and mournfulness of tone. They are very popular in Spain. As a novelist he wrote many pleasant little tales of country life that have found ready appreciation. Among them are *Cuentos de color de rosa* (1859); *Cuentos campesinos* (2d ed. 1862); *Cuentos de vivos y muertos* (1866); *María Santa* (1874); *Cuentos de varios colores* (1874); *Narraciones populares* (1875); *Cuentos de madres é hijos* (1879); *Nuevos cuentos populares* (1880). In the *Cid Campeador*, the *Redentor moderno*, and a few other stories, he has essayed the historical novel. Among his later works are *Arte de hacer versos* (1881); *De flor en flor* (1882); *El gabán y la chaqueta* (1884). J. D. M. FORD.

True Cross, or **Holy Rood** [rood is O. Eng. *rōd*, cross; Germ. *ruhe*, staff]: the cross on which Jesus was crucified, alleged to have been discovered by Helena, mother of the Emperor Constantine, in Jerusalem, during her visit in 326, in a cave which now is covered by the Church of the Holy Sepulchre. The story as first told further stated that the three crosses were found lying together, but the true cross was known because it raised to life a dead man who was touched by it. The title on the cross of Jesus was found, and also the four nails. Two of them were used by Constantine in his bridle, and another in the head of his statue, while the fourth, dropped by Helena into the sea on her return voyage, calmed a storm which was then raging. The tale is told with variations upon each of the points mentioned. In itself it is one of the most remarkable legends in church history. That the location of the tomb of Jesus had been traditionally identified from the earliest times is not improbable; and that, in removing the structures which had been put upon it in order that Constantine might build a church in front of the holy sepulchre, a cave was found in which was wood which was honestly believed to have been that of the true cross, may be accepted as the basis of the story which afterward received many embellishments. It is incredible that Helena was an impostor, and there is no necessity for adding to Constantine's other crimes that of deliberately deceiving his aged and pious mother. But

honesty requires the acknowledgment that there is no contemporary proof that Helena had anything to do with the discovery, or that the cross was discovered in her time, for the earliest witness, the Bordeaux pilgrim to Jerusalem in 333, in his itinerary, only seven years after Helena's visit, says nothing about her in the discovery of the cross (*Itinerarum*, ed. Tobler, Geneva, 1879, p. 18); nor does Eusebius in his *Life of Constantine*, written in 338, wherein he expatiates upon Helena's visit to Jerusalem and her church-building (iii., xlii.-xlvii.), say anything about her discovery of the holy sepulchre, much less of the true cross. The first mention of the true cross is by Cyril of Jerusalem in his *Catechetical Lectures*, written in 348, who says, "the whole world has been filled with pieces of the wood of the cross" (iv., 10); "the holy wood of the cross bears witness, seen among us to this day and from this place, now almost filling the whole world, by means of those who in faith take portions from it" (x., 19); "the wood of the cross confutes [him if he denied the Passion], which was afterward distributed piecemeal from hence to all the world" (xiii., 4). But he makes no mention of Helena, nor gives any details of the discovery of the true cross. From Cyril, however, we do learn that the true cross was commonly believed to have been discovered, and that pieces of it were even then distributed. Chrysostom in 387, in his *Contra Judæos et Gentiles quod Christus sit Deus* (ed. Migne, *Pat. Gr.*, xviii., 826), speaks of the desire to possess portions of the true cross, and how they were encased in gold. Sulpicius Severus (*Sacred History*, ii., 34), writing in 395, is the first one to tell of the discovery of the true cross, and he connects it with Helena, and says that it was known because it restored a dead man to life. Ambrose, in a highly rhetorical and irrelevant passage in his oration on the death of Theodosius, delivered in 395, expatiates upon Helena's discovery of the true cross (*De Obitu Theodosii*, ed. Migne, *Patrologia Latina*, xvi., 1399-1402). The story having been thus started, it was repeated in different forms by later writers. Helena was without further question accepted as the discoverer, and the true cross was set up in the church Constantine built, which was dedicated 335. Part, however, she sent to Constantine, who directed that it be put in a statue he was erecting in Constantinople. The title was sent to Rome and there put in the basilica of Santa Croce in Gerusalemme, specially erected by Constantine in 331. It is still shown on Easter Sunday. Portions, generally mere splinters, were sold to persons of eminence or wealth. It is a common jibe that enough fragments of the true cross are shown as relics to make a dozen crosses. But as a matter of fact it is not so, but rather all of these pieces together would not make a piece of any size. On July 5, 1187, the true cross was carried by the crusaders to the battle-field of Hattin, in Syria, and there captured by the Saracens, and it has never been in Christian hands since, and "is doubtless long ago dust of the dust of Jerusalem." Some time in the eighth century the rather unhappily named festival of the Invention of the Holy Cross was introduced into the Roman Church. There is no such festival in the Greek Church. For a popular treatment which goes over the points, see W. C. Prime, *Holy Cross* (New York, 1877). SAMUEL MACAULEY JACKSON.

True Reformed Dutch Church: a body that withdrew from the Reformed Dutch Church in America in 1822, and was absorbed into the Christian Reformed Church in 1889. See REFORMED CHURCH IN AMERICA and PRESBYTERIAN CHURCH.

Truffle [from O. Fr. *truffe* (Fr. *truffe*) < Lat. *tuber*; Lat. *terre tuber* > Ital. *tartufo*, Fr. *truffe*, whence Germ.

French truffle (*Tuber melanosporum*).

kartoffel, potato]: any fungus of the genus *Tuber* and other closely allied genera (*Terfezia*, *Chyromyces*, *Hydnotrya*, etc.). Truffles belong to the order *Tuberoides*, and are nearly all subterranean in growth, and are from an inch to 6 inches in diameter. There are many species; the best known are *Tuber aestivum* and *T. melanosporum*, both of Europe. The truffle is one of the choicest of the edible fungi, and its cul-

ture has been attempted with some success. Some species are found to a limited extent in the U. S. See *FUSGI* and *VEGETABLE KINGDOM*.

CHARLES E. BESSEY.

Trujillo, or **Truxillo**, *troo-kheel-yō*: capital and largest town of the department of Libertad (formerly *intendencia* of Trujillo), Peru; about 3 miles from the coast, and connected by railway with the port of Sabaverry (see map of South America, ref. 4-B). It was founded by Pizarro in 1535, and was long the most important town in Northern Peru; it is now decadent, but controls the trade of the department. The surrounding region is a desert, but before the Conquest it was rendered very fertile by the elaborate Indian system of irrigation. Near Trujillo are the ruins of CHIMU (*q. v.*). Pop. (1889) about 11,000. H. H. S.

Trujillo: a town and port of the northern coast of Honduras, near lon. 86° W., on a bay which forms an excellent and secure harbor (see map of Central America, ref. 3-II). It was founded in 1525. The exports are hides, sarsaparilla, etc. It is the capital of a department of the same name. Pop. about 3,000. H. H. S.

Trullan Councils, or **Synods**: two ecclesiastical councils; the first convened in 680 by the Emperor Constantinus Pogonatus for the purpose of reconciling the MONOTHELITES (*q. v.*) with the orthodox Church; the second in 692 by the Emperor Justinianus II. in order to confirm and enforce the statutes of the fifth and sixth œcumenical councils, whence it is also called *Quinisextum*. (See *QUINISEXT COUNCIL*.) The epithet *Trullan* is derived, like that of Lateran, from the place in which the assembly sat—namely, a great hall in the imperial palace of Byzantium, surmounted by an oval dome, *τρούλλα*.

Revised by J. J. KEANE.

Trumansburg: village; Tompkins co., N. Y.; on the Lehigh Valley Railroad; 2 miles W. of Cayuga Lake, and 11 miles N. W. of Ithaca (for location, see map of the State of New York, ref. 5-F). It contains several flour-mills, foundries, and mower-factories, and has a private bank and two weekly newspapers. Pop. (1880) 1,376; (1890) 1,211.

Trumbull, BENJAMIN, D. D.: historian; b. at Hebron, Conn., Dec. 19, 1735; graduated at Yale College in 1759; was pastor of the North Haven Congregational church from 1760 to his death; served as a volunteer soldier, and also as a chaplain, in the war of the Revolution; wrote *A Plea in Vindication of the Connecticut Title to the Contested (Western) Lands* (1776), which influenced the decision of Congress upon the validity of the Susquehanna purchase; *A Complete History of Connecticut 1630-1763* (2 vols., Hartford, 1797-1818); and began a *General History of the United States of America* (vol. i., 1492-1765, Boston, 1810), which was incomplete at his death Feb. 2, 1820. He also published *Twelve Discourses on the Divine Origin of the Holy Scriptures* (Hartford, 1790).

Revised by G. P. FISHER.

Trumbull, HENRY CLAY, S. T. D.: author and editor; b. at Stonington, Conn., June 8, 1830; educated at Williston Seminary, East Hampton, Mass.; settled at Hartford, Conn., in 1851; was appointed State missionary of the American Sunday-school Union for Connecticut in 1858. Ordained as a Congregational clergyman in 1861, he served during the war as chaplain of the Tenth Connecticut Volunteers, and was taken prisoner before Fort Wagner in 1863; was appointed missionary secretary for New England of the American Sunday-school Union in 1865, and normal secretary in 1871; removed in 1875 to Philadelphia, where he became the editor and chief owner of *The Sunday-school Times*. In 1881 he visited the East, and discovered the long-lost site of Kadesh-barnea, on the southern border of Palestine. He has published many books, including *The Sabbath School Concert* (1861); *The Knightly Soldier* (Boston, 1865; rev. ed. 1892); *Childhood Conversion* (1868); *The Captured Scout of the Army of the James* (Boston, 1869); *The Model Superintendent* (New York, 1880); *Kadesh-Barnea* (1884); *Teaching and Teachers* (Philadelphia, 1884); *The Blood Covenant: a Primitive Rite and its Bearings on Scripture* (New York, 1885); *The Sunday School: its Origin, etc.* (1888); *Principles and Practice* (1889); *Friendship the Master Passion* (1891); and *Studies in Oriental Social Life* (1894). Five of his books have been republished in England.

Revised by G. P. FISHER.

Trumbull, JAMES HAMMOND, LL. D., LL. H. D.: philologist and historian; b. at Stonington, Conn., Dec. 20, 1821; entered the class of 1842, Yale College, but did not graduate; aided Rev. James H. Linsley in compiling catalogues of the mammalia, reptiles, fishes, and shells of Connecticut

1842-43; was assistant secretary of State of Connecticut 1847-52 and 1858-61; secretary 1861-65; corresponding secretary of the Connecticut Historical Society 1849-63; has been its president, and also librarian of the Watkinson Free Library in Hartford from 1863 to 1891; member of the National Academy of Science 1872; was an original member of the American Philological Association 1869, and its president 1874-75, and was appointed in 1873 lecturer in Yale College on the Indian languages of North America, a subject to which he has devoted much time since 1858. Editor of *The Colonial Records of Connecticut 1636-89* (3 vols., Hartford, 1850-59); Roger Williams's *Key into the Language of America* (Narragansett Club, vol. 1., Providence, R. I., 1866); Lechford's *Plain Dealing* (Boston, 1867); Pierson's *Some Helps for the Indians* (1873); of vols. i. and ii. of the *Collections of the Connecticut Historical Society*; and of *The Memorial History of Hartford County* (2 vols., Boston, 1886); author of *The Origin of McFingal* (1868); *The Composition of Indian Geographical Names* (1870); *The Best Method of Studying the Indian Languages* (1871); *Some Mistaken Notions of Algonkin Grammar* (1871); *Historical Notes on the Constitutions of Connecticut* (1872); *Notes on Early Algonkin Versions of The Lord's Prayer* (1873); *On the Algonkin Verb* (1876); *The True Blue Laws of Connecticut* (1876); *Indian Names of Places, etc., in Connecticut, etc., with Interpretations* (1881), and of many other contributions, historical or philological, to literary periodicals and the proceedings of learned societies. He has prepared a glossary to a large portion of Eliot's Indian Bible.

Revised by J. W. POWELL.

Trumbull, JOHN: lawyer and author; b. at Westbury (now Watertown), Conn., Apr. 24, 1750; was admitted to Yale College on account of extraordinary precocity at the age of seven years, but did not pursue the course until some years later, graduating 1767; wrote with Timothy Dwight a series of essays in the style of *The Spectator* (1769); was tutor at Yale 1771-73, during which time he published *The Progress of Dulness* (3 parts, 1772-73), a satire on methods of education; studied law; was admitted to the Connecticut bar Nov., 1773; continued his studies in the office of John Adams at Boston 1774-75; wrote for the political periodicals; settled as a lawyer at New Haven, Nov., 1774; published anonymously his poetical *Elegy on the Times* (1774), and in the following year, in Philadelphia, the first canto of his *McFingal*, a revolutionary satire, in Hudibrastic verse (completed in 4 cantos in 1782), of which more than thirty unauthorized editions were sold. He settled at Hartford, June, 1781; was associated with Humphreys, Barlow, and Hopkins in the production of *The Anarchiad* (1786-87); was State attorney for Hartford 1789-95, member of the Legislature 1792 and 1800, judge of the superior court 1801-19, and also judge of the court of errors 1808-19; was several years treasurer of Yale College; in 1825 removed to Detroit, Mich., where he died May 10, 1831. Editions of his *McFingal* appeared in 1856, 1860, and 1864, the latter with notes by Benson J. Lossing. His *Poetical Works* appeared at Hartford (2 vols., 1820).

Revised by H. A. BEAS.

Trumbull, JOHN: painter; son of Jonathan Trumbull, colonial Governor of Connecticut; b. at Lebanon, Conn., June 6, 1756; graduated at Harvard College in 1773; joined the army in 1775 as adjutant; accompanied the army to New York, and went as adjutant-general with Gates, who was appointed to the command of the Northern army; left the service in 1777, owing to his dissatisfaction in regard to the date of his commission; in 1780 went to Paris, thence to London, and studied painting with West; was suspected as a spy during the excitement caused by the execution of André, and imprisoned eight months; released through West's intercession, he returned to the U. S. in 1782, and remained till peace was concluded, then went back to England to resume his studies. His first historical work, *The Battle of Bunker Hill*, familiar through engravings, was exhibited in 1786, and was followed by *The Death of Montgomery before Quebec* and *The Sortie from Gibraltar*, both well known. In 1789 he returned to the U. S. with the purpose of commemorating on canvas the chief persons and events of the Revolution; among the likenesses taken were several of Washington. He returned to England as secretary to John Jay, and passed nearly ten years, from 1791 to 1804, in diplomatic service. Four years afterward he went once more and for the last time to England, and remained till 1815. The next seven years were devoted to painting four grand pictures for the rotunda of the Capitol at Wash-

ington—the *Declaration of Independence*, the *Surrender of Burgoyne*, the *Surrender of Cornwallis*, and the *Resignation of Washington at Annapolis*. About 1827 he disposed of his whole collection, fifty-seven pictures in all, to Yale College, in consideration of an annuity of \$1,000 for the rest of his life. Trumbull passed the last twenty-seven years of his life mainly in New York; was president of the American Academy of Fine Arts till 1825. D. in New York, Nov. 10, 1843, and was buried in New Haven. See his *Autobiography* (New York, 1841). Revised by RUSSELL STURGIS.

Trumbull, JONATHAN: statesman; b. at Lebanon, Conn., in 1710; graduated at Harvard College 1727; studied theology and was licensed to preach, but soon devoted himself to mercantile business, and ultimately to the law; was elected to the Assembly 1733; was its Speaker 1739; became an assistant 1740, to which office he was re-elected; was made judge of the county court and assistant judge of the superior court; was chosen Lieutenant-Governor 1766, thereby becoming *ex-officio* chief justice of the superior court; became Governor 1769; held that office throughout the Revolution, resigning in 1783; was an energetic supporter of the popular cause; was considered a leader of the Whigs of New England, and his advice was much valued by Washington. The popular epithet "Brother Jonathan," now applied as a personification of the U. S., is said to have originated from Washington's habit of addressing him by that familiar title when requesting his opinion. D. at Lebanon, Aug. 17, 1785. See the *Life* by Isaac W. Stuart (Boston, 1859).

Trumbull, JONATHAN: Governor of Connecticut; son of Gov. Jonathan Trumbull; b. at Lebanon, Conn., Mar. 26, 1740; graduated at Harvard 1759; was for several years before the Revolution a member of the Legislature and Speaker of the House; was paymaster in the army 1775-80; became in 1780 secretary and first aide-de-camp to Gen. Washington, and as such was a member of his family until the close of the war; was a member of Congress 1789-95; Speaker of the House of Representatives 1791-95; U. S. Senator 1795-96; Lieutenant-Governor of Connecticut 1796-98, and Governor from 1798 until his death, at Lebanon, Aug. 7, 1809.

Trumbull, LYMAN: lawyer and politician; b. at Colchester, Conn., Oct. 12, 1813; educated at Colchester Academy; taught an academy at Greenville, Ga., 1833-36; studied law in Georgia; was admitted to the bar 1837; settled at Belleville, Ill.; was elected to the Legislature 1840; was Secretary of State 1841-42, justice of the Supreme Court 1848-53; was a Democrat till repeal of the Missouri Compromise in 1854; elected member of Congress 1855, and U. S. Senator 1855-73; was prominent as a Republican during the civil war; became chairman of the judiciary committee 1861; voted against the impeachment of President Johnson in 1867. In 1872 he joined the Liberal Republican party; after that date supported the Democratic party, and in 1880 was Democratic candidate for Governor of Illinois. From 1863 he resided in Chicago, where he died June 25, 1896.

Trumpet [from O. Fr. *trompette*, dimin. of *trompe*, trump, trumpet, appar. from Low Lat. **trumpare*; Lat. *triumphare*, triumph, exult. See TRUMP;] in acoustics, any instrument used for the conveyance to the ear of articulate sound from a distance. In music a well-known wind instrument, usually consisting of a brass tube some 8 feet in length, expanding at the end into a bell-like shape. By means of slides and keys the capacity of the trumpet has been largely increased. See FOG-SIGNALS.

Trumpeter: a peculiar wading bird (*Prophya crepitans*) of South America. See AGAMI and PSOPHIDÆ.

Trumpeter: a breed of domestic pigeons, so called from the deep sound of their coo. The tarsi are heavily feathered, but the characteristic feature of the bird is the thick spreading crest which overlungs the eyes to such an extent that these birds can not care for their young until it is trimmed. The preferred colors are white and black. F. A. L.

Trumpet-fish: a name applied on the Atlantic coast of North America to the *Fistularia tabacaria* (family *Fistulariidae*), and on European coasts to *Centriscus scolopax* (family *Centriscida*, which, like the *Fistulariidae*, is of the order *Hemibranchi*). The first mentioned is without scales, and has a greatly elongated snout, with the mouth at the end of a bony tube. The forked tail has one or two long central filaments. The European trumpet-fish or BELLOWS-FISH (*q. v.*) has a large and very sharp dorsal spine, and a snout much like that of the foregoing. Revised by F. A. LUCAS.

Trumpet-flower: a popular name for various species of *Bignonia* and *Tecoma*, mostly shrubs and woody vines, though in tropical regions some of the species are large trees. They belong to the family *Bignoniaceæ*. The native

Trumpet-flower (*Tecoma radicans*).

species of the U. S. are *Bignonia capreolata*, *Tecoma radicans*, and *T. stans*. The first and second are fine climbers. *T. capensis* from South Africa, *T. grandiflora* from Japan, and other fine species are often cultivated.

Revised by CHARLES E. BESSEY.

Trumpet-wood: See CECROPIA.

Trunk-fish: any one of various fishes of the order *Plectognathi* and the sub-order *Ostracodermi*, forming the family *Ostraciontida*. They are so called on account of being incased in an angular case-like development of the integuments, which suggests the idea of a trunk. None of these

The trunk-fish.

fishes are in demand as an article of food, their flesh being small in quantity, and in some species even thought to have a poisonous effect. But the liver is very large and yields a considerable supply of oil. All the trunk-fishes are natives of the tropical seas. Revised by F. A. LUCAS.

Trunk-turtle: a name for the LYRE-TURTLE (*q. v.*).

Truro: town; in Cornwall, England; at the junction of the Allen and Kenwyn; 54 miles W. of Plymouth (see map of England, ref. 15-C). It is the center of a rich mining district, and exports large quantities of tin ore. The ancient bishopric of Truro was revived in 1876, and a new cathedral, which incorporates the old parish church of St. Mary's, was consecrated in 1887. Pop. (1891) 11,131.

Truro: a handsome town; capital of Colechester County, Nova Scotia; at the head of Cobequid Bay, and on the Intercolonial Railway; 61 miles N. of Halifax (see map of Quebec, etc., ref. 2-C). It contains a provincial normal school and has a daily and three weekly newspapers, and manufactures of woollens, boots and shoes, hats, furniture, pianos, organs, etc. Ship-building, fishing, agriculture, and mining are also carried on near Truro, which is a place of some wealth. Pop. (1891) 5,102.

Revised by M. W. HARRINGTON.

Truro, BARON (*Thomas Wilde*): jurist; b. in London, England, July 7, 1782; third son of an eminent solicitor;

was educated at St. Paul's school, articulated to his father for the study of law, and, after running away in disgust, devoted himself studiously to that profession; was admitted as an attorney in 1805; entered as a student of the Inner Temple in 1811, pursuing with great success the calling of special pleader until called to the bar Feb. 17, 1817. During the next three years he became prominent as a pleader at the bar, and attained distinction as junior counsel in the defense of Queen Caroline; was made serjeant-at-law in 1824 and king's serjeant in 1827. He entered politics as a Whig, and sat in Parliament 1831-32 and 1835-39. In Dec., 1839, or Feb., 1840, he became solicitor-general, and was knighted; June to Aug., 1841, was attorney-general; was prominent in a famous debate on parliamentary privilege; was again sent to Parliament in 1841, and in June, 1846, again became attorney-general, and chief justice of the common pleas July, 1846. On the formation of Lord John Russell's administration in 1850 he was made Lord Chancellor and Baron Truro of Bowe's Manor, Middlesex, but resigned in Feb., 1852. D. at Southgate, Middlesex, Nov. 11, 1855, after a protracted illness. He was during his whole life a progressive Liberal, of untiring industry, and was active in aiding many of the reforms which were accomplished during his time. F. STURGES ALLEN.

Truss [from O. Fr. *trousse, tourse*, truss < Low Lat. **tur'sus*: Lat. *thyr'sus* = Gr. *θύραος*, stalk, stem, staff; possibly akin to Lat. *fustis*, cudgel]; in surgery, a device worn to support a HERNIA (*q. v.*). It consists of a pad so arranged with a spring and straps that it may be retained in position without interfering with the patient's movements. In engineering a truss is a framed structure so arranged that the principal members take only stresses of tension or compression. A simple truss is one supported at its two ends, and it exerts only vertical pressures on the supporting walls or piers, while an arched truss exerts horizontal pressures also. A truss consists of an upper chord, a lower chord, and bracing, which connects them. In bridge trusses the two chords are often parallel, one being in tension and the other in compression, while the braces are alternately tensile and compressive under dead load. The economic depth of a truss of given length is such a depth that the quantity of material is a minimum. Various forms of trusses are described in the articles BRIDGES and ROOF. See also ARCH, CARPENTRY, MOMENT, and STRESSES.

MANSFIELD MERRIMAN.

Trusts [M. Eng. *trust, trost*; cf. Icel. *traust*, confidence, security; Germ. *tröst*, comfort; Goth. *traust*, convention, covenant. The ordinary meaning is confidence—hence intrusting of property, property intrusted, the organization which controls such property]; in law, peculiar species of ownership, whereby property, real or personal, is vested in certain persons for the use or benefit of others. The persons who hold the legal estate are the "trustees"; those for whose benefit the property is held or administered are known as the *cestuis que trustent*, or beneficiaries. Although trusts—whereby one person holds property on a trust or confidence which another person can enforce by legal proceedings—are of great antiquity, they are, in their present form and variety, essentially modern, dating back only to the Statute of Uses, passed in the twenty-seventh year of Henry VIII. (A. D. 1535). Prior to that statute the practice of conveying lands to one person to the "use" (*ad opus* or *ad usum*) of another, the former having a bare naked title without any rights of control or enjoyment in the lands conveyed, the latter having no legal estate or interest whatever, but being clothed with all the substantial rights and privileges of ownership, had become so common as to affect a large proportion of the land in the kingdom. The article on USES (*q. v.*) describes the inconveniences to which this practice gave rise and the successive efforts—usually all but futile—made by the legislature to restrain or destroy it. The most marked result of the Statute of Uses, which was the most radical as well as the latest of these legislative attempts, was to elevate the *use*, theretofore illegitimate and wholly without legal recognition, into a lawful estate, recognized and protected by the legal tribunals. There remained, however, within the exclusive cognizance of the equity tribunals certain of these uses which, by a narrow and technical construction of the statute referred to, escaped its operation. These were, 1, uses raised on terms of years or other personal estate; 2, uses charged upon other (precedent) uses; and 3, and most important of all, active uses, i. e. those with the performance of which some duty on the part of the trustee (*for office*

to uses) was connected. These three varieties of unexecuted uses (i. e. uses not covered by and "executed" by the statute), under the name of *trusts*, continued to be fostered and administered by the court of chancery upon substantially the same principles which it had applied to the regulation of uses before the statute. But while the leading principles of the jurisdiction of equity over trusts have long been established, its doctrines have, in very recent times, received enormous expansion, so that they constitute to-day by far the most important part of that jurisdiction.

In consequence of the fact above adverted to, that the *cestui que trust*, or beneficiary, is invested with the whole beneficial enjoyment of the trust estate, the trustee having the title vested in him only for the benefit of the *cestui que trust*, the latter is often spoken of as the "real owner," or, more commonly, as the "equitable owner," and his interest is described as an "equitable estate" in contradistinction to the "legal estate" of the trustee. But this language is in the highest degree improper and misleading. There is only one kind or species of "estate"—that, namely, which is recognized by the courts of law. The interest of the beneficiary of a trust is in no sense an estate or interest in the land or other property affected by the trust. He has, at the most, a right of action against the trustee in whom the "legal title," or estate, is vested. This right of action enables him by the aid of the equity tribunals to hold his trustee to a strict performance of the duties imposed upon him, and even, in certain cases, where the trust is only nominal, to compel the conveyance of the trust estate to himself, but until such conveyance the beneficiary has no right to deal directly with the estate. Not only is he without power to convey the property to another, but he can maintain no action at law for its protection, either against the trustee or a stranger, and he can bring no action of ejectment or trespass for a wrongful possession thereof. It has, however, been held from an early period that equity will recognize the right of the *cestui que trust* to assign his rights in the trust estate, so as to enable his assignee to enforce the trust as the beneficiary thereof; and such is the rule to-day, except where, as in New York, it has been modified by statute. See 1 N. Y. Rev. Stat. 780, § 63.

Jurisdiction of Equity over Trusts.—The jurisdiction of equity over the trustee is confined to the ascertainment and enforcement of the trust imposed upon him. There is no authority in the courts to alter the character of the trust, to enlarge or to reduce the powers of the trustee, nor, except in the case of charitable trusts (see below), to confer the benefits of the trust on any person other than the beneficiary designated by the act creating it. Ordinarily, therefore, the trustee of a trust for the life of another can not be empowered by the court to lease the estate for a longer period than such life, nor to sell or mortgage the estate, even where the interests of the estate or of the beneficiary clearly demand such action. In some jurisdictions, however, these rules have been modified by statute so as to give trustees or to authorize the equity tribunals to give them the power to lease, sell, or mortgage the trust estate in cases where it appears to be necessary for the protection of the trust estate, or to the best interest of the persons beneficially interested therein so to do. See, e. g., N. Y. Rev. Stat., vol. i., p. 730, sec. 65, as amended by Laws of 1886, ch. 257.

On the other hand, the power of the courts to enforce the performance of trusts is complete. They may remove a trustee and appoint another; may restrain him by injunction; may call him to account and hold him personally responsible for the results of his fraud or neglect, for improper investments, for profits made or which ought to have been made, and for interest; may avoid conveyances made to himself, and those made to third parties in breach of the trust; may follow the property into the hands of such third persons, as implied trustees, unless they are purchasers in good faith for a valuable consideration; may, in fact, do anything which will give equitable protection to the rights of the beneficiary. The office and function of the trustee are in the highest degree fiduciary and conscientious. He is bound to diligence and discretion in the performance of his duties as well as to the utmost measure of good faith.

Kinds of Trusts.—Ordinary private trusts, as usually classified, are of three kinds, *viz.*, *express, resulting, and constructive trusts*.

Express trusts arise from the direct and intentional act of the parties, evidenced by some declaration which is generally contained in a written instrument. The most common examples of this class are those created by the

settlements, by assignments for the benefit of creditors, by deeds of conveyance, and by wills. Such trusts may, in the absence of statute, be created by parol as well as by a written declaration, but it has been enacted by the Statute of Frauds that no trust over or concerning lands shall be created, assigned, or declared except by a deed or conveyance in writing, but that this provision shall not affect trusts created by will and those implied by law.

Resulting (or implied) trusts arise, in the absence of any express declaration, by implication from the acts of the parties. Where the circumstances attending an assignment or conveyance of property are such as to raise a presumption that a trust, although unexpressed, was intended, such a trust is said to "result" from the transaction. Trusts of this sort are not uncommon. They arise (a) where an intended trust can not take effect, either by reason of a failure to declare the beneficiary or because the intended trust, not being capable of execution as a charitable trust, is too indefinite to be carried into effect; (b) where an expressed trust fails to exhaust the entire property transferred to the trustees; (c) where the legal title is transferred, and a trust declared as to a part of the property, but no intention expressed as to the rest; and (d) where the purchase-money is paid by one person and the conveyance is taken in the name of another. In the first case (a) a trust results to the person who made the conveyance or, where the property is transferred by will, to the heir or personal representative, as the case may be, of the testator; that is to say, while the transfer to the grantee, devisee, or legatee holds good, and vests the legal title according to the intention of the parties, equity will compel such transferee to hold the property as a trustee for the donor or his lawful successors to the title; in the second and third cases (b and c) a trust results either to the donor (as in case a) or to the grantee, according to the apparent intention of the parties, as expressed in the instrument of transfer; in the last case (d) the person taking title is compelled to hold it as trustee for the one who paid the purchase-money. The only general exception to this rule is where the person who pays the consideration stands in the position of a husband or in *loco parentis* to the party to whom the property is conveyed. Where such relationship exists, a presumption arises that the payment was intended as a provision for the wife, or an advancement to the child, and no trust results, unless the presumption is rebutted.

A *constructive trust* is raised by a court of equity "wherever a person, clothed with a fiduciary character, gains some personal advantage by availing himself of his situation as trustee." The trust is in such cases said to arise by *construction*, without reference to any intention of the parties, either expressed or presumed. The power to raise or impose trusts by "construction," in order to obviate the effects of the fraudulent acquisition of property, constitutes a most salutary, important, and constantly growing exercise of equity jurisdiction. As it is impossible to enumerate here all of the cases in which this jurisdiction may be invoked, only a few of the most important and comprehensive rules will be given. (a) Where property is acquired by one person by the wrongful use of the property of another—as, e. g., where a trustee, executor, or agent misapplies money or other property which he holds in his fiduciary capacity to the purchase in his own name of other property—the dishonest agent or trustee will hold the property so acquired in trust for the person whose property was misapplied. (b) Where a person acquires for himself an interest in property in regard to which, by reason of his fiduciary position, he has a duty to perform for another, he will hold such interest in trust for the person to whom such duty was due. A good illustration of the application of this rule is found in the familiar doctrine that a person occupying a position of trust or responsibility toward another in regard to leasehold property—as a trustee, executor, guardian, mortgagee, tenant for life, cotenant, partner—can not take a renewal of the lease for his own benefit, but shall hold it, when taken, for the benefit of all parties interested in the old lease. (c) Where there is a valid contract for the sale of real estate "the vendor becomes in equity a trustee for the purchaser of the estate sold, and the beneficial ownership passes to the purchaser, the vendor having a right to the purchase-money," together with a charge or lien on the estate for the security of that purchase-money. This lien or charge, belonging to the class of interests known as "equitable liens," is sometimes also, although improperly, included among the constructive trusts.

Statutory Changes.—In many of the U. S. the law of

trusts, as developed by the equity tribunals, has been extensively modified by legislation. The New York statute may serve as a type of the law of trusts as thus modified. Implied, or resulting, and constructive trusts and all trusts of personal property are left substantially unaltered by this legislation. All express passive trusts of land and all express active trusts of land, except certain classes, are abolished. The express trusts which are permitted are the following: (1) to sell lands for the benefit of creditors; (2) to sell, mortgage, or lease land for the benefit of legatees or to satisfy any charge thereon; (3) to receive the rents and profits of land, and apply them to the use of any person during his life or for a shorter period; (4) to accumulate rents and profits of land for the benefit of minors during the continuance of their minority.

GEORGE W. KIRCHWEY.

CHARITABLE TRUSTS.—In the ordinary private trusts there must be both a known trustee and a certain, determinate beneficiary, although, if the trustee should die, resign, or refuse to accept, the court can supply the place by appointment. But property may be given in trust for specified objects where the beneficiaries are completely indeterminate—as, for example, a gift to aid in spreading the gospel or to relieve the poor—or where the beneficiaries constitute a known class, but the individuals are uncertain, as a gift to provide for the poor of a particular town or to support the scholars in a designated school. Dispositions of this form and nature, whether made by deed or by will, are termed "charitable trusts." They first appeared in the Roman empire after it became Christian, and were both legalized and fostered by several constitutions of Christian emperors. The researches of modern jurists have established the fact beyond a doubt that the English court of chancery at an early day, by virtue of its own intrinsic authority, assumed jurisdiction over, upheld, and enforced this species of trusts. In the 43d Elizabeth (A. D. 1601) a statute was passed known as the Statute of Charitable Uses, which regulated the whole subject of charitable gifts. It created a new and special jurisdiction of the chancellor, and contained an enumeration of lawful charitable objects. In determining what trusts should be upheld as charitable, the doctrine was firmly settled that all objects embraced within the spirit as well as the letter of the statutory enumeration are lawful. As the result of this principle, all trusts created for any one of the following general purposes are charitable: (1) The support, maintenance, or spread of the Christian religion; (2) the relief, aid, or support of the poor, the sick, or those in any manner disabled; (3) the foundation, erection, or support of institutions, organizations, societies, or other means of general beneficence, either for all needy persons or for particular classes, such as asylums, hospitals, dispensaries, reformatories, and the like; (4) the maintenance and promotion of education, learning, literature, science, or art by the establishment, erection, support, or aid of universities, colleges, schools, libraries, reading-rooms, museums, scientific lectures, societies, art schools or galleries, etc.; (5) any and all objects of interest or advantage to the public, as highways, parks, public gardens, water or gas supplies, and the like.

In administering charitable trusts the English court of chancery exhibited the utmost liberality in carrying out the designs of the donors and in sustaining the gifts. It even invented and applied a special doctrine, known as the principle of *cy pres* (as near to), in pursuance of which, when it was found impossible to carry out the design of the donor in the manner which he had indicated, the court would contrive and establish another scheme or mode, preserving the same general intent, and differing as little as possible in details from the original plan.

The statute of 43 Elizabeth has not been re-enacted in the U. S. In most of the States, however, the courts have adopted the general doctrines which had been formulated by the English chancery, so that charitable trusts as above described are recognized in their local jurisprudence and upheld by their judiciary. In other States the whole system has been rejected as inconsistent with the institutions of the U. S., and especially because it tends to create perpetuities, which are opposed to the policy of the laws. In New York, for example, it has, after some vacillation, been settled that charitable trusts were abrogated by the revised statutes, and that the only mode of establishing a charity is through the instrumentality of a corporation, which shall receive and administer the trust. This narrow and illiberal policy of the New York law has been subjected to much criticism, as tending to make charitable gifts

unnecessarily precarious, and thus frequently defeating the benevolent intentions of the donors of such gifts.

Revised by GEORGE W. KIACHWEY.

COMMERCIAL TRUSTS.—The great trade combinations which, under the denomination of trusts, have become such a marked feature of modern industry, especially in the U. S., owe their form and designation, though not their importance, either in law or in the industrial organization of society, to the trust proper, as developed in Anglo-Saxon jurisprudence. (See above.) The term is therefore not wholly a misnomer, though it becomes so when it is popularly applied to such combinations irrespective of their form and mode of creation, or when the term is employed in a peculiar and exclusive sense to describe the gigantic modern trusts created for industrial purposes. A commercial trust, whatever its magnitude, is neither more nor less a "trust" than any other vesting of property in one person to the use and benefit of another person, while, on the other hand, a trade combination may be equally effectual for the purposes of its creation, and equally obnoxious to public sentiment or to the law, if it is nothing more than an agreement between individuals to prevent competition or if it take on the form of a copartnership of corporations. Not every trade combination is a trust, nor is every trust an industrial monopoly. For the purposes of the present discussion, however, the whole subject of the legal status of all forms of capitalistic combination, whether trusts or not, may most conveniently be considered together.

Notwithstanding the fact that commercial trusts of the modern type had their origin in England before the middle of the nineteenth century, and that they were developed much later in America, by far the greater part of the law of the subject is to be found in the reports and statute-books of the U. S. and Canada. Indeed, in England these combinations of capital, directed either to general investment purposes or to the management and control of industry, have been regarded in the light of a normal development of industrial forces, like great corporations, and the attitude of the courts has been singularly liberal and free from the suspicion and hostility which have attended similar manifestations in North America.

The legality of the combinations under consideration may be considered from three different points of view: (1) Where the combination is of the normal type, the property of several individuals or corporations being vested in trustees, to be administered for the common benefit, it presents the question whether it constitutes a true trust within the scope and the terms of equity jurisdiction and entitled to protection and enforcement by the equity tribunals; (2) where, as has usually been the case, the parties to the combination are corporations or the stockholders of corporations, the question arises whether its organization constitutes an offense or, at least, an unauthorized and therefore unlawful act on the part of the persons of whom it is composed; (3) whatever be the form of the combination, and whether its constituent elements be corporations or private individuals, the question still remains whether the objects of the combination are consistent with the public welfare, and therefore lawful. These positions will be separately examined.

1. "*Trusts*" in Equity.—There is nothing in the form, the organization, or the methods of the modern industrial trust to render it obnoxious to law. It is in all essential particulars a trust of the normal, familiar type, such as are habitually enforced by the courts. In these external aspects it differs from ordinary trusts only in the magnitude of the interests involved. But neither the amount of property vested in the trustees, the extensive and secret powers of administration conferred upon them, nor the number and wide distribution of the beneficiaries of the trust affords any reason for refusing to recognize the title of the trustees or the right of the beneficiaries to protection against them. These principles are now undisputed, so far as the law of trusts, as that has been developed by the equity tribunals, is concerned. It is only in those jurisdictions where that law has been radically altered by legislation that any question can arise as to the validity of trusts of this description, and the jurisdiction of equity over them. Thus in New York and several other States it is provided by statute that express trusts of real property can be created only for certain enumerated purposes, not including such a use as is here under consideration. (See N. Y. Rev. Stat. 1, 727, secs. 45 and 55; see also above.) But this difficulty is successfully obviated by the method usually employed for the creation of such trusts. The property vested in the trustees, and forming the basis

of the trust, is not the real and personal property of the corporations forming the combination, and with which its business is to be carried on, but the shares of the stockholders of such corporations. These shares are always personal property, whether the corporate property which they represent be real or personal; and, as the restriction of the statute is confined to trusts of real property, its application in the case of corporate trusts is thus ingeniously excluded. When individuals or firms desire to join such a trust, they first become incorporated, and then enter as shareholders of the corporation thus formed. Of course the possession of the shares gives the trustees the actual control, though not the legal ownership, of the property, real as well as personal, of the several corporations composing the "trust."

It is true that equity may refuse to enforce a trust, notwithstanding its regularity and outward conformity to equitable principle, if its objects are unlawful and contrary to public policy. But as such a trust always comes into existence by virtue of an agreement, and as such agreement, if it be really illegal, can more conveniently be directly attacked in an action at law than by invoking the interposition of equity, there is seldom any motive for resorting to the latter course of proceeding. It should, moreover, be borne in mind that equity acts only upon the petition of the beneficiary, showing that the management of the property is wasteful or otherwise hostile to his interests; and, on the other hand, that if these facts are made to appear it is only where the performance of the trust would be manifestly illegal and *contra bonos mores* that the court will allow the trustee to continue to violate the terms thereof. Accordingly, in the litigation which has attended the development of these trust combinations their character as trusts has played little or no part, and those combinations that have been organized on the trust principle have been attacked and defended on precisely the same grounds as those which have taken on some other form. The field over which the battle of the trusts has been waged is covered by the two following points.

2. *Corporate Trusts.*—Corporations, being "artificial persons," created by the state for specific purposes and having only such powers as are conferred upon them for carrying those purposes into effect, have a very much more restricted range of activity than is permitted to the natural man. Many acts which the individual may lawfully perform are forbidden to the corporation. The former can retire from business, or turn his business over to some one else to be managed for him; the latter can not retire without dissolution, nor has it any power to delegate to another corporation or person the duties which its charter requires it to perform. A corporation which abandons the business for which it was organized and allows its property to be controlled and its operations to be carried on by a person or group of persons who have no direct relations to it, and who are not its agents, is acting *ultra vires* and in violation of its organic law, and thereby forfeits its right to exist at all. These principles suggest an obvious ground of attack on trust combinations made up of corporations, and it is upon this ground that the principal and most successful assault upon them has been made. But when the courts would have enforced this principle against the corporate trusts, so called, it was objected that the several corporations whose property and business was administered by the trust were not actually parties to it, and that the corporation, having a distinct legal personality and being capable of acting only by its duly appointed officers, could not be held responsible for the unauthorized, but yet lawful, acts of its individual stockholders in vesting their interests in the obnoxious trust. The courts, however, swept away this reasoning, plausible though it was, as sophistry, and laid down the principle that where the corporation acquiesces in the transfer of the corporate stock to such a trust, and in the real control and management of its interests by trustees, the act shall be deemed to be the act of the corporation, and the latter may be dealt with accordingly.

These principles once settled, the mode of attack is simple enough. Although the trust is, as we have seen above, impregnable against direct attack, it can be effectually undermined and destroyed by breaking down the several corporations from which it draws its strength. Although a stockholder or creditor of the corporation complains, it can be punished for its unlawful and unauthorized abuse of power, in the name and behalf of the people of the State, by a proceeding instituted by the attorney-general for the forfeiture of its charter. It was in this way that the Sugar Trust was broken up in New York, and the great Standard

Oil Trust in Ohio. In each case the attack was directed against one of the numerous corporations alleged to be a party to the trust, and the forfeiture of one charter, with the liability to a similar forfeiture in the case of all the other corporations concerned, operated effectually to dissolve the trust in each case. (*People of State of New York vs. North River Sugar Refining Company*, 121 New York Reports, 582; *State of Ohio vs. Standard Oil Company*, 49 Ohio State Reports, 137.) The principles of corporate liability were even more conspicuously violated in the organization of the Chicago Gas Trust, where a gigantic corporation, without express legislative sanction, assumed to control the operations of a multitude of lesser corporations by acquiring their capital stock. *People vs. Chicago Gas Trust Company*, 130 Illinois Reports, 268.

The principles upon which these cases were decided have been accepted as conclusive, excepting for purposes of academic discussion, by the parties concerned in the trust combinations as well as by the general public, and it is hard to see how they can be disputed. It is to be observed, however, that they are applicable only to the state of facts under examination in those cases—namely, where corporations, acting officially or by their stockholders, have transferred their property and concerns to trustees to be managed for them, or have in some other way exceeded their lawful powers. But this is only one—though it is certainly the easiest, as it has been the most popular—form of capitalistic combination. There are several other forms, of at least equal potency, with which the principles above discussed have nothing to do. Thus they do not touch the case of individuals, not corporations, forming trust combinations of precisely the character and type of those under consideration. They do not reflect upon the right of corporations or of individuals to enter into far-reaching agreements, regulating the rate and character of production and the prices to be charged for goods and services. They are not infringed by the consolidation of many corporations into one, or the acquisition by one gigantic corporation of all of the property and business engaged in a certain line of industry. The "trust," after it has been driven out of one form of organization, can easily take refuge in another and different form. Indeed, this is precisely what has occurred in the case of the trusts "destroyed" by the adverse decisions in New York, Ohio, and elsewhere. Of the large number of such combinations in existence at the date of those decisions, it is not known that a single one has gone out of operation as a result thereof. They have disappeared as corporate trusts, but they have promptly reappeared and are in full operation as great corporations or as combinations held together by contract. And yet the evils, real or imaginary, threatened by the corporate trusts are equally to be feared from the combinations of capital and industry which have generally succeeded them. How are these evils to be met? The question brings us to the third and most comprehensive ground of attack on such combinations.

3. "Trusts" as Monopolies.—Whether a given industrial combination be made up of individuals or of corporations, whether it be more or less closely held together by contract or be consolidated into a trust, if it constitutes or "tends to create" a monopoly, or if it is found to be a conspiracy in restraint of trade, it is obnoxious to law. This does not signify that it is liable to destruction at the instance of the State, nor that its promoters are subject to criminal prosecution, but only that the agreements and covenants on which it is based, being unlawful and contrary to public policy, will not be enforced by the courts, and that it will thus be reduced to a mere voluntary association without binding force upon its members. Where the monopoly is not based on agreement, but is exerted by a single corporation or individual who has gained control of the market, the rule here laid down has no application. As thus limited and defined, the rule against monopolies is one of the landmarks of the common law. But no rule of that law is more difficult of application. The crucial question as to whether a given combination is or is not a monopoly, as to whether a given agreement is or is not a conspiracy against the common weal, is well-nigh as broad as the rule itself, and the judicial attempts to answer it have thus far failed to develop any clear guiding principle. The common law relating to monopolies and the trade offenses of *engrossing, forestalling, and regrating* (by which were intended the buying of necessities of life in order to sell them again), founded, as they were, on economic ideas and industrial conditions which have long passed away, are wholly obsolete. Of the common-

law doctrine of the invalidity of agreements in restraint of trade and competition, there survives only the general principle that a restriction which is unlimited in respect both of time and place is unreasonable and therefore void. But where, as in New York, the courts lend their aid to enforce a contract made by a competing manufacturer to refrain for ninety-nine years from carrying on a certain business within the United States and Territories, excepting only in Montana and Nevada, especially where the contract in question is part of a general scheme on the part of the plaintiff to gain control of the entire business in the country, even that doctrine becomes too nebulous to serve as a guide. (*Diamond Match Company vs. Roeber*, 106 New York Reports, 473.) The only principle which has clearly emerged from the mass of conflicting decisions is that a contract restraining competition will be decreed to be unlawful if, in the opinion of the tribunals before which it is brought, it is unnecessary and unreasonable so far as the due protection of the parties is concerned, or is prejudicial to the public interest; and that an industrial enterprise will be deemed to be a monopoly when, in the judgment of the courts, it actually becomes a menace to the public welfare and is not justified or required by the existing conditions of trade and industry.

These principles solve the question as to the monopolistic and therefore unlawful character of trade combinations, so far as it is yet capable of solution. The tendency in most of the States has been to declare against such combinations; but in the great case against the Sugar Trust (above referred to) the New York Court of Appeals refused to follow the lower courts in declaring the combination to be essentially monopolistic and hostile to the welfare of the State. It is believed that, in the absence of legislation, this more temperate and conservative view will ultimately prevail.

Legislation.—The epidemic of trust legislation has produced so few conclusive results that it would be unprofitable to go much into detail concerning it. The popular agitation against trusts resulted in 1888 in legislative investigations by the U. S. House of Representatives, the New York Senate, and the Canadian Parliament, and these were followed, in 1889 and the years immediately succeeding, by a crop of hastily conceived and more or less stringent repressive acts. The act of Congress passed in 1890, and known as the National "Anti-Trust Act," is so indefinite in its terms and so inconclusive in character that it is generally regarded as an abortive and practically worthless measure in the campaign against monopoly. Moreover, it is by reason of the limitations of congressional authority confined to acts which come within the definition of interstate commerce. Anti-trust laws have also been enacted in Illinois, Michigan, and several other States in the West and South. In the eastern parts of the country the fulminations of social reformers and legislative committees have thus far (1895) produced but little result, though Maine has a comprehensive law, passed in 1889, and New York one of narrower scope and of doubtful utility, passed in 1893 (chap. 716). All of these statutes are penal in character, and declare all combinations or agreements regulating the supply or the price of "any article or commodity" to be criminal conspiracies, and prescribe penalties therefor. In addition to this the statutes usually declare such contracts or combinations to be null and void. Most of these statutes appear to be sufficiently explicit and drastic to produce the result intended by them, though there is considerable question as to the constitutionality of such legislation on account of its interference with vested property rights. There have been no decisions under these statutes as yet which have conclusively demonstrated their efficacy and legality. Probably it will not be difficult for the combinations at which they are aimed to adopt a form of organization which will avoid their operation. It will be remarked that this legislation does not affect any form of capitalistic organization which does not involve a contract or combination of several parties, and that a single corporation, owning and controlling all of the industries in a given territory or in a certain line of enterprise, is wholly outside its scope. Such an organization, therefore, would clearly seem to be lawful in the present state of the law, though it could doubtless be reached and partially controlled by legislation limiting the amount of the capital-stock which may be issued and of the property which may be held by industrial corporations.

Authorities.—The most comprehensive and practical treatise on the subject of trusts is that of Lewin (*The Law of Trusts*), though Perry on *Trusts*, the works of Story and

Pomeroy on *Equity Jurisprudence*, and the article on *Trusts and Trustees* in the American and English *Encyclopædia of Law* (vol. xxvii.) may also be consulted. There are also several treatises dealing particularly with charitable trusts, among them those by Dwight (Am.), Finlason (Eng.), and Tudor (Eng.). The literature dealing with commercial trusts is very large, but scattered, and usually of inferior quality. Even the law writers have too often substituted denunciation for exposition and reasoning. Spelling's *Trusts and Monopolies* contains the fullest discussion of the subject. See also *The Legality of "Trusts,"* by T. W. Dwight, 3 *Political Science Quarterly*, 592; several articles in vols. i., iv., and vii., of the *Harvard Law Review*; and the article **MONOPOLIES**. A very complete bibliography of commercial trusts, down to 1890, by William H. Winter, can be found in 7 *Railway and Corporation Law Journal*, 236.

GEORGE W. KIRCHWEY.

Trutch, SIR JOSEPH WILLIAM: statesman; b. at Bath, England, Jan. 18, 1826. He was educated at Exeter, studied civil engineering under Sir John Rennie, and removed to the Pacific coast in 1849. He practiced his profession in California and Oregon until 1856; removed to British Columbia in 1859, and till 1864 was employed in constructing public works for the colony. He was chief commissioner of lands and works and surveyor-general of British Columbia from 1864 until 1871, when the colony joined the Dominion; delegate to Ottawa in 1870 to arrange terms of union with Canada; and in 1871 to Ottawa and London to finally settle details of union. He was lieutenant-governor of British Columbia 1871-76; appointed resident agent of the Canadian Government in British Columbia in 1879, and was knighted in 1889.

NEIL MACDONALD.

Truth, SOJOURNER: See SOJOURNER TRUTH.

Truxillo: See TRUJILLO.

Truxton, THOMAS: naval officer; b. on Long Island, N. Y., Feb. 17, 1755; went to sea at the age of twelve years; was impressed into the British navy; became in 1776 lieutenant of the American privateer Congress; equipped and commanded in 1777 the Independence, with which he took valuable prizes; afterward commanded the Mars (20 guns) and other ships, and in 1781 the St. James (30 guns), with which he disabled a British ship of superior force after a severe engagement; was engaged in the East India trade for several years after the war. On the organization of the U. S. navy, 1798, he was selected as one of its six captains, and assigned to the frigate Constellation, with which he captured the French frigates *L'Insurgente*, Feb. 9, 1799, and *La Vengeance*, Feb. 1, 1800; was made commander of the West Indies squadron of ten vessels 1801, and appointed 1802 to the command of the naval expedition against Tripoli, but retired from the service, and after living on a farm in New Jersey removed to Philadelphia, where he was sheriff of the county 1819-21, and where he died May 5, 1822. He was the author of *Remarks, Instructions, and Examples relating to Latitude and Longitude, also the Variation of the Compass* (Philadelphia, 1794).

Trygon'ide [Mod. Lat., named from *Try'gon*, the typical genus, from Lat. *try'gon* = Gr. *τρύγων*, sting-ray]: a family of selachians, of the order *Raia*, typified by the sting-rays. The disk constituted by the union of the pectoral fins with the body is rhomboid or oval, and oblong or transversely expanded; the tail is thin and, toward its extremity, whip-like, but otherwise variously developed, being mostly very long, but sometimes very short; the skin is generally more or less armed with scattered spines or tubercles; the head is produced into a pointed snout or at least angulated in front; the mouth is moderate; the teeth mostly transversely elliptical, and ridged or cuspidate; on the back of the tail are generally one or more spines, which, in the typical forms, are compressed from before backward, and armed at their lateral edges with teeth or serrations directed downward, but these are sometimes wanting; there generally are only rudimentary dorsal and caudal fins, or none at all. The species are quite numerous, and disseminated in all seas except the extreme polar ones. They are to be feared on account of their spines.

See STING-RAY.

Revised by F. A. LUCAS.

Tryon, DWIGHT WILLIAM: landscape-painter; b. at Hartford, Conn., Aug. 13, 1849; pupil of Daubigny, Jacquesson de la Chevreuse and Guillemet, Paris; member of the Society of American Artists 1882; National Academician, 1891; member of the American Water-color Society. He won the

second Hallgarten prize, National Academy, 1887 and the Webb prize, Society of American Artists, 1889. His pictures are poetic in sentiment and fine in color; he paints very skillfully in water-color. His studio is in New York.

WILLIAM A. COFFIN.

Tryon, WILLIAM: colonial Governor; b. in Ireland about 1725; received a good education; became a distinguished officer in the British army; married Miss Wake, a relative of the Earl of Hillsborough, Secretary of State for the colonies, through whose influence he was appointed Lieutenant-Governor of North Carolina 1764; became Governor by the death of Gov. Dobbs July 20, 1765; suppressed the revolt of the Regulators, treating the prisoners with cruelty; erected at the cost of the province a magnificent residence at Newbern; was advanced to the governorship of New York July 3, 1771; became colonel 1772 and major-general 1777; was detested by the patriots for his many acts of rigor and severity, and especially for the destruction of Danbury, Fairfield, and Norwalk, Conn., by expeditions conducted by him in person; resigned his post Mar. 21, 1778, and returned to England, where he became a lieutenant-general 1782; was given the degree of LL. B. by King's (Columbia) College in 1774. D. in London, Feb. 27, 1788.

Tsad: another spelling of the name CHAD (*q. v.*).

Tsanpo: See DIHOXA.

Tsar: See CZAR.

Tsaritsyn', or **Zaritzin**: town; once an important fortress of Suratoff government, southeast Russia; at the great bend of the lower Volga, terminus of an important railway from the N. and of a short line to Kalach to the W. (see map of Russia, ref. 4-F). It is the center of the trade between Astrakhan and the North Caspian districts and Central Russia. It is especially the center for the naphtha, salt, and mustard trades. The town has become the gathering-place for the poor seeking work, and their quarters, especially in summer, contain much misery and filth. It has a large theater, a public library, two gymnasia, and a fine church in the architecture of the sixteenth century. Pop. (1890) 40,130.

MARK W. HARRINGTON.

Tsars'koye-Se'lo, or **Zarskoye-Selo**: town of Russia; 14 miles S. of St. Petersburg (see map of Russia, ref. 5-C). It contains two magnificent palaces which are used by the imperial family as summer residences. The park and pleasure-grounds of the palaces cover an area 18 miles in circumference, and the buildings contain many valuable collections. The cathedral of St. Sophia is a copy in miniature of the mosque in Constantinople. Pop. 16,838.

Revised by M. W. HARRINGTON.

Tschikows'ki, PIETER ILITSCH: composer; b. at Wotkinsk, Russia, Apr. 25, 1840; began the study of music in 1862 in the St. Petersburg Conservatory. His first composition was a cantata to Schiller's *Ode to Joy*. From 1866 to 1877 he was Professor of Harmony, Counterpoint, and Musical History in the Moscow Conservatory; after that he devoted himself entirely to composition. His works include several operas, symphonies, overtures, and other orchestral pieces, solos for piano and other solo instruments with and without orchestra, chamber music, and many vocal pieces sacred and secular. At the opening of the Carnegie Music Hall he visited New York and conducted several of his own compositions. D. in St. Petersburg, Nov. 5, 1893.

D. E. HERVEY.

Tschudi, choo'dé, ÆGIDIUS: historian; b. in Glarus, Switzerland, in 1505; studied at Basel, Vienna, and Paris; traveled much in his native country and Italy; held various important offices in Baden and Glarus; went in 1559 as ambassador to the Emperor Ferdinand I. in Augsburg; was banished in 1562 on account of his strong adherence to the Roman Catholic Church, but recalled in 1564. On his travels and in his various offices he made very comprehensive investigations with respect to the history of Switzerland, and the last years of his life he spent in preparing his rich materials for publication, but only *Die uralt wahrhaftig Alpisch Rhätia*, published in Latin and in German, appeared before his death. His principal work is the *Schweizerchronik*, covering the time down to 1470, published by I. R. Iselin in 2 vols. (Basel, 1734-36). In 1758 his *Beschreibung Gallia Comata*, appeared under Gallati's edit. D. at Glarus, Feb. 28, 1572.

Tschudi, JOHANN JAKOB, von: naturalist, traveler, and diplomatist; b. in Glarus, Switzerland, July 25, 1818. He

studied medicine and natural sciences at Neuchâtel, Leyden, and Paris. In 1838-43 he traveled in Peru, making a special study of the Quechua language and antiquities; subsequently he made an extended tour through Brazil, Bolivia, etc. The results of these expeditions were embodied in several works, including *Fauna Peruana* (1844-47); *Peruanische Reiseskizzen* (1846); *Reisen durch Südamerika* (1866-68); and *Organismus der Kechua-Sprache* (1884). With Rivero he wrote the *Antigüedades Peruanas* (1851). He was ambassador of Switzerland to Brazil (1860), and to Austria (1866-83). D. at Jakobsthal, Lower Austria, Oct. 8, 1889. H. H. S.

Tsêng (or **Tsüing**), MARQUIS, whose full name was *Tsêng K'i-tsêh*: Chinese diplomatist; b. in the province of Hunan in 1848; son of Tsêng Kwoh-fan (1807-72), who, though less known to Europeans than his son, was a statesman of wider fame in his own country, having won especial distinction as governor-general of the two Kiang provinces during the Tai-ping rebellion. The young Tsêng was his father's secretary at this time, and accompanied him in his successful campaign. In 1878 he was appointed minister to Great Britain and France, and afterward was sent as special ambassador to Russia to settle the Kulja difficulty, which he succeeded in doing in a satisfactory manner, obtaining the treaty of St. Petersburg, which restored Kulja to China. In 1886 he returned to China, where he was made a grand secretary and president of the admiralty board. D. in Peking, Apr. 12, 1890. F. M. COLBY.

Tset'se [S. African]: a dipterous insect, *Glossinia mortisans*, a little larger than the common fly. It abounds in some parts of South Africa, but is absent from large districts. Its bite is nearly always fatal to the ox, horse, and dog, though harmless to man, as well as to goats, asses, mules, and the wild beasts of the regions it inhabits.

Tsing-tu [Chinese, liter., pure land]: the Chinese name for SUKHĀVĀTĪ (*q. v.*), the heaven of Amitabha Buddha, and also of the Buddhist sect which reverences Amitabha and makes re-birth in his heaven their chief aim. In the mouths of the Japanese Tsing-tu becomes *Jōdō*. The SHINSHU (*q. v.*) is a Japanese development of the *Jōdō*.

Tsi-tsi-har, chee'chee'haar: the most northerly of the three provinces of Chinese Manchuria, known among the Chinese as the *Heh-lung-Kiang*, or Amur province; bounded N. by the Amur, E. and S. by the Sungari, a tributary of the Amur, and W. by the Nonni and Mongolia. Area, 195,000 sq. miles. It is cultivated chiefly in valleys of the Nonni and Sungari, pulse, maize, millet, tobacco, wheat, and the poppy being the chief crops. The rest of the country is mostly an uninhabited mountain wilderness. The inhabitants consist of Manchus, Korchin Mongols, Yakuts (of whom 6,600 families emigrated from Siberia, and settled in the valley of the Nonni in 1687), and Chinese, chiefly from the northern provinces. The chief cities are Tsi-tsi-har (on the Nonni, lat. 47° 21' N., lon. 124° E.), Mergen, and Hurunpir. The city of Tsi-tsi-har, built in 1692 by order of the emperor ruling in the period K'ang-hi in order to overawe the neighboring tribes, is surrounded with a stockade and a ditch. At Igun, in the northeastern part of the province, are a penal settlement and a large garrison. See S. Wells Williams, *Middle Kingdom* (New York, 1883).

T-Square: an instrument used in mechanical and architectural drawing. It consists of two arms, one of which is called the *stock* or *helve*, and the other the *blade*. The blade is attached to the stock at its middle point. The stock projects below the blade, forming a shoulder, which, when used, is pressed firmly against the edge of the drawing-board. To use the instrument the blade is first set so as to make the desired angle with the stock; the shoulder of the stock is then pressed firmly against the edge of the drawing-board and moved along that edge; the blade will remain parallel to its first position. In the simplest form of T-square the blade is firmly fixed at right angles with the stock.

Tsu'ga [a Japanese name]: a genus of coniferous trees related to the spruces and firs, and including the common hemlock (*T. canadensis*) of Eastern North America, the Californian hemlock spruce (*T. mertensiana*), and a few other species, one or two of which occur in Japan and the Himalayan region. They are distinguished from the spruces (*Picea*) by their flat, petioled leaves, and from the firs (*Abies*) by their pendulous cones, whose scales are persistent. See CONIFERS. CHARLES E. BESSEY.

Tsuga'ru: the ancient name of a district which lies in the extreme north of the main island of Japan, and gives its

name to the strait separating this from the island of Yezo. The family holding sway in the district also bore this name, their castle-town being at Hirotsaki (pop. 33,000), a garrison town, the barracks of which occupy the site of the old castle. The finely symmetrical mountain Iwaki San (4,500 feet) is known as Tsugaru Fuji from its resemblance to Fujiyama. The mottled green and red lacquer known as seaweed also takes its Japanese name from the district. J. M. DIXON.

Tsuru'ga: a town in Central Japan; on the west coast, about 50 miles N. of Kioto and 20 miles from Lake Biwa (see map of Japan, ref. 6-C). It is the terminus of a branch line of railway, leaving the trunk line at Nagahama, and possesses the best harbor on the northwest coast of Japan, a coast, however, singularly destitute of good harbors. The deep bay at the head of which the town is situated is much exposed, but is protected by a breakwater, and vessels of the largest draught can anchor in safety. Pop. (1892) 12,000. J. M. DIXON.

Tsu'shima: two islands in the sea of Japan, midway between the Korean peninsula and the island of Kinshin; separated from the former by the Broughton Channel, from the latter by Krusenstern Strait. Area, 361.69 sq. miles. Their distance from the harbor of Fusan, in Korea, is only 30 miles, and their military importance is fully recognized; they are known as the western gate of Japan. During the troubles of the restoration period of 1868-70 the Russians were a short time in occupation; since then the islands have been strongly fortified and well garrisoned. Though the climate is mild, the soil is not productive, and the inhabitants depend almost entirely on fishing for a livelihood. The chief town is Itsukubara, which has a fine harbor. Pop. (1895) 32,135. J. M. DIXON.

Tuamotu, twān-mō too, or **Pomotu**: a Polynesian archipelago belonging to the French, to the E. of the Society islands, extending N. W. and S. E. between 14° and 23° S. lat. and 136° and 149° W. lon., and passing to the S. E. into the Gambier and Mangareva groups. The islands are very numerous and comprise an area of 347 sq. miles, with a population of 4,775 in 1889. The islands are coral, often atolls, seldom have an area, individually, of more than 10 sq. miles, and the largest is Tureia or Papakina, with an area of 37 sq. miles. They are divided into three groups, northern, central, and southern, and the central has the greatest aggregate area and population. Navigation among them is difficult and dangerous. The climate is regular, moderate, and salubrious. The soil is poor, the vegetation not abundant, and the principal source of wealth is the pearl-oyster. The language and people of Tahiti have the supremacy, but the racial relations are with Raratongo. MARK W. HARRINGTON.

Tu'aregs (*Tawarek*): a race of Mohammedan nomads inhabiting a great part of the Sahara or great African desert, from Fezzan W. to the Atlantic. They are believed to be allied by race to the Berbers, and are fanatic, faithless, and predatory. Their hair is straight, their features are Caucasian rather than African, and their physical development is fine. They have a written alphabet, but no literature. The alphabet contains Hebrew, Greek, and Roman letters, with others. The Tuaregs are divided into large tribes, and greatly oppress the Tibbus (Tebu) their neighbors. Their number is estimated at 300,000. Revised by M. W. HARRINGTON.

Tuat': group of oases in the Western Sahara; to the S. of Oran, Algeria, on the Timbuctu route, in the French sphere of influence. They stretch over an area about 150 miles long by 40 broad, between the Tuareg country and that of the western dunes. The fertility of these oases depends on the waters of the Messand river and its tributaries, and, to a greater extent, on subterranean water. The climate is rigorous, but salubrious. The soil is a rich alluvium, very fertile and productive. The chief reliance for support is the date-palm, and the number of these trees in the Tuat has been estimated at from 3,500,000 (Deporter) to 4,300,000 (Pouyanne). Barley, wheat, sorghum, pomegranates, melons, and onions are also raised in considerable quantities. Pop. about 100,000, comprising Arabs, Negroes, Sherifs, black and white Berbers, and their intermixtures. M. W. H.

Tuatara: See HATTERIA.

Tuber [= Lat., swelling, hump, tumor, knob, truffle]: in plants, a thickened subterraneous portion of the stem, often bearing latent buds or eyes, and usually composed of cellular substance richly stored with starch or some other equivalent principle. Many of the tubers, like that of the common potato, are of great value as sources of human food.

Tubercula Quadrigemina: same as *Corpora Quadrigemina*. See BRAIN.

Tubercular Meningitis: See MENINGITIS.

Tuber'culin [from *tuberculo* + chemical suffix *-in*]: a dark-brown fluid obtained from the pure culture of the specific germ of tuberculosis, and first prepared by Prof. Robert Koch, of Berlin, in 1891, for the cure of the early stages of tuberculosis; hence known also as *Koch's lymph* and *Koch's specific*. The remedy acts curatively upon lower animals, especially guinea-pigs and rabbits, and many undoubted cures have followed its use in the human subject also; but it was quickly brought into discredit by the exaggerated accounts of its virtue which appeared in the public press, and by its injudicious use upon far-advanced cases. It was also found that the remedy contained some toxic substances which, although well tolerated by lower animals, proved highly poisonous to man in doses several hundred times smaller than could be safely given to a guinea-pig. Those, however, who appreciated the significance of its curative influence in the animal continued the use of tuberculin and increased the dose very gradually, and thousands of apparent cures are now on record by the best authorities both in Europe and America. The treatment was, however, tedious, and successful only in well-selected cases, and efforts were made at an early period for its purification, notably by Prof. E. Klebs in Germany and Dr. Hunter in England. In the meanwhile it was found that tuberculin, when given in larger doses, has a decided diagnostic value by its producing fever in tubercular animals and in man, whereas no such effect follows its application when the subject of such a trial is free from tuberculosis. This test is now largely applied to milk cows, and its benefits in thus preventing the use of the milk and flesh of tuberculous animals as food is of the greatest value in the prevention of human infection, as milk especially is now considered the usual mode by which the disease is communicated to man. Its diagnostic use for the early recognition of human tuberculosis is only a matter of time, and the test can be made perfectly safe. The efforts to purify tuberculin have also been successful, especially in the hands of Prof. E. Klebs, who separated the poisonous principles in the form of a toxalbumen and proved the curative effect of the purified remedy both in animals and in man; he also showed the absolute safety of it in doses many thousand times greater than could be given of the non-purified substance. This purified tuberculin Prof. Klebs called antiphthisin, and it as well as the original crude tuberculin are now being produced both in the U. S. and in Europe. All those who have so far employed it testify to its safety even in large doses, and to its curative value, the time required for treatment being very much shortened. This is confirmed by the present writer's experience of over a year in several hundred cases in which the remedy was employed.

KARL VON RUCK.

Tuberculo'sis [Mod. Lat., deriv. of *tuberculum*, small swelling, tubercle, dimin. of *tuber*, swelling, hump]: an infectious and somewhat contagious disease of man and many animals, which is caused by the growth and specific action of a micro-organism, the bacillus of tuberculosis. No disease has received a greater amount of study and none deserves more, for its ravages are so great that not less than one-seventh of all deaths are due to this cause; and, if the number of cases in which a small focus has existed and become latent or cured are added, it is not unlikely that the favorite saying of a great German physician is true, that "sooner or later everybody has a little tuberculosis."

The favorite seat of tuberculosis is in the lungs, but any tissue or organ of the body may be affected. Pulmonary tuberculosis or phthisis is, however, so much more frequent that it has received the greatest attention, and has been the basis of most studies of the causes and nature of the disease. From the earliest times it has been known that the lungs of persons dead of phthisis contain yellow masses; these were called tubercles (small nodules), and from them the technical name tuberculosis is derived. From 1790 to 1820 Stark, Baillie, Boyle, and the immortal Laënnec contributed to more accurate knowledge regarding the earlier stages of these yellow masses. It was established that at the earliest stage gray or milky tubercles will be found, and that these subsequently degenerate and become yellow. Gray tubercles may occur also in the membranes of the brain, in the pleura, pericardium, peritoneum, and in any of the solid organs; they may arise in the mucous surfaces, where they tend to degenerate with production of ulcerations.

Clearly as stages of tuberculosis can now be traced, the variety of the gross appearances presented made the pathology of this disease a ground for the bitterest conflicts, and not until the middle or later parts of the nineteenth century can anything like a settled view be said to have been established. This uncertainty and difference of opinion are largely due to the fact that associated and not necessarily specific changes in the affected organs frequently so mask or alter the appearances that it was only with the utmost difficulty that the characteristic were separated from the non-characteristic morbid changes. For example, in the lungs the growth of the tubercles may be unassociated with other changes, and the resulting condition is what is now called miliary tuberculosis; in another case the lung substance between the tubercle may be inflamed and solid, and the condition known as catarrhal or pneumonic phthisis results; while in still other cases nature's effort to cure the disease occasions an abundant growth of dense fibrous tissue, when the term "fibroid phthisis" is applied. The tendency in all parts of the body is for the tubercular masses to undergo cheesy change, and later to liquefy and form excavations. This is eminently true of the pulmonary forms.

Causes of Tuberculosis.—Two factors are to be considered—the individual susceptibility and the infection by the tubercle bacilli. **Susceptibility** to tuberculosis depends upon many causes. In the first place, animal families differ in this regard. The disease is rare among the cold-blooded animals, but common among many of the domesticated animals, particularly the ruminants. Of the greatest significance to man is the frequency of the disease in cattle, as has been shown at many large abattoirs and by the studies of veterinarians. Dogs, cats, and horses are less prone. The goat seems quite immune. Races of men differ largely in susceptibility in their natural state and under the influence of environment. In the U. S. the Negro seems specially susceptible.

The individual is affected unfavorably by heredity and by his surroundings, occupation, and the like. Heredity has always been looked upon, and justly, as a strong factor; but recent study indicates that in but very few cases is the disease itself transmitted directly from parent to offspring. There are a few undoubted cases on record, but these are certainly exceptional, and it seems unlikely that new investigations will show direct transmission to be frequent. The tendency to tuberculosis, the susceptibility, however, is regularly inherited, and especially from the maternal side. An individual with hereditary liability may increase this, or one without susceptibility may acquire it by the manner of life and surroundings. Any exposing occupation or ill-constructed residence, or other causes that deprave the system or occasion pulmonary troubles, bronchitis, and the like, make the individual prone to become infected. Certain occupations, such as mining, stone-cutting, grinding, hair-cutting or sewing, which expose the individual to the inhalation of dust, are notoriously liable to aid in the development of phthisis.

As a deduction from what has been said, and as experience proves, individuals strongly predisposed may escape the disease by the most careful attention to the care of health and the avoidance of the causes which specially increase susceptibility.

The Bacillus of Tuberculosis.—The history of the discovery of the infectiousness of tuberculosis is of very great interest. Villemin was the first to offer definite proof by showing that inoculation with tuberculous material produces the disease in the animal experimented upon. The final discovery of the bacillus itself was made by Koch and published in 1882. This is unquestionably one of the most brilliant contributions to human medicine and to science in general ever put forth. The bacillus (see BACTERIOLOGY) has been proved by all the tests regarded as decisive to be the specific cause of all forms of tuberculosis. Without this bacillus, tuberculosis can not arise.

Modes of Infection.—(1) As a rule, the bacillus enters the system by the inspired air, and in this way the disease is mainly contagious. The breath of phthisical patients does not contain the bacilli, but the sputa become dried on floors or the ground, and are then carried by the air to the lungs of susceptible individuals. Actual proof of the infectiousness of the dust in hospital wards or rooms where tubercular patients had lived was established by Cornet's experiments on guinea-pigs. (2) Intestinal tuberculosis is generally due to the swallowing of infected material. In the case of patients suffering with tuberculosis of the lungs, those who swallow

during sleep or at other times frequently causes tuberculosis of the bowels. The infection may, however, be conveyed by milk of tuberculous cows, by infected meat, or other food; and in particular the frequency of intestinal tuberculosis of children is attributable to this cause. (3) Some cases of tuberculosis result from direct inoculation, as in cases of tattooing, vaccination, or injuries to the hands of surgeons or dissectors. Another example is the tuberculosis of the genital organs, arising from sexual congress with an affected husband or wife. (4) Finally, direct transmission from the mother to her offspring during gestation, or from the father in procreation, is possible, but, in the human species at least, is very rare.

Varieties and Seats of Tuberculosis.—As has been said before, almost any structure of the body may be affected, and the appearances in the various situations vary widely in individual cases. Among the more common situations are the lungs, intestines, serous membranes, bones, and lymphatic glands. Since the discovery of the tubercle bacillus and the establishment of methods for its detection, a number of diseases have come to be recognized as tuberculous that were formerly not so regarded. Among these are scrofula (at least in many of its forms), certain bone diseases, lupus vulgaris, and other skin affections due to direct inoculation. *Scrofula* is of peculiar interest. In most cases this affects the lymphatic glands, which enlarge, caseate, and soften, discharging thick purulent material. The disease may remain local or may break into the blood-vessels with resulting general infection (general miliary tuberculosis). The glands affected are frequently those of the neck and those within the chest at the root of the lungs. In the former case the infection enters through the mucous membrane of the mouth, or nose, or through the lungs; in the latter through the lungs. It is to be noted that in many instances no local disease arises at the point of entrance of the bacilli, which simply pass through to the neighboring lymphatic glands, where they may lie dormant for a long time (latent tuberculosis), or occasion active disease of the glands. Many cases of general tuberculosis of obscure origin are traceable by careful search to such localized lesions of the glands or other parts which had remained latent before.

Symptoms.—These depend to the largest extent upon the organ or part involved, but there are certain general indications to be noted. The individual loses strength and flesh, he grows pale and worn in appearance, fever supervenes and becomes peculiarly irregular, coming on in the afternoon and subsiding in the morning; the patient perspires freely, and sometimes drenching night-sweats add seriously to his general weakness. Chills may be noted; and after a tedious illness, as a rule, the victim perishes of exhaustion and general intoxication. Individuals susceptible to the disease, especially to pulmonary tuberculosis, often present a characteristic appearance, in which the flattened chest, large bones, emaciated frame, straight black hair and dark eyes, and sallow complexion take a prominent part; but very often no doubt the appearances described as those of the "tuberculous diathesis" (or tendency) are in reality those of the beginning disease.

External tuberculosis, such as that of the skin (lupus), bones, and lymphatic glands, is, as a rule, less malignant than that of internal organs, and may be attended by few general symptoms.

Curability.—It is a widespread and not unnatural belief that tuberculosis is necessarily a fatal disease, but investigation proves the contrary. Very many persons become tuberculous and recover without having exhibited any decided symptoms, and in many more the disease is arrested before its ravages become extensive. Statistics of large series of *post-mortem* examinations, collected by various authorities, show that from 5 to 40 per cent. of all bodies examined show some evidence of past tuberculous disease which had become arrested. After, however, the disease has reached such extent that the symptoms are decided and the general health has materially suffered, the outlook is certainly grave. External tuberculosis is more hopeful than other forms.

Treatment.—Fresh air, change of climate, tonics, nutrients such as cod-liver oil, and the careful regulation of every detail of the life of the patient, constitute the reliable treatment. Special methods are useful according to the locality affected; and, in particular, surgical procedures are valuable in external tuberculosis. Specific remedies have been lauded by hundreds, but as yet none has been found. At the present day such antiseptics as creosote, guaiacol, and iodoform are in the ascendency. Koch, the discoverer

of the bacillus of tuberculosis, introduced a hopeful method of treatment a few years ago, which consists in the introduction by hypodermatic injection of tuberculin, a derivative from the growth of bacillus itself. This was supposed to exercise antitoxic action, but the claims made for it (more by others than by Koch himself) have not been substantiated. In external tuberculosis it would seem to have done good in a number of reported instances; in internal tuberculosis it is neither reliable nor safe in the form in which it is now obtained and used. As a diagnostic agent, in the detection of tuberculosis in animals, it has served a most useful purpose. In every case of tuberculosis of animals in which the remedy is injected an elevation of the body temperature of from one to several degrees occurs, and this does not occur excepting in tuberculous animals. WILLIAM PEPPER.

Tuberculosis (of animals), also known as **Consumption**: an infectious disease, caused by the tubercle bacillus of Koch and characterized by the development in various organs and tissues of small dense nodules (tubercles) which are prone to undergo softening and cheesy degeneration. This disease is most common in cattle and hogs, but it may occur in other domesticated animals. It is caused, in most cases, by contaminated atmosphere, in which the germs of tuberculosis, having been expelled from the body of a diseased animal, have become dry and mixed with the air as dust. Tubercle bacilli inhaled may lodge on the mucous membrane of the air-passages, and where numerous, or in the case of especially susceptible animals when few, will set up a local irritation at the point of lodgment or will be carried through the lymph-channels to the lymph-spaces or glands, and will there cause an irritation that is followed by the development of a tubercle—the characteristic lesion of the disease. The tubercle is at first a very small grayish mass of spherical shape, and is made up of a dense collection of cells. As the disease progresses the tubercles grow and multiply; they become confluent, their centers soften, and cheesy change takes place, leaving them yellowish, semi-solid, or soft. In many cases of tuberculosis of cattle a strong fibrous membrane forms around the tuberculous areas, and the part enclosed becomes soft and pus-like. A lesion of this nature is usually described as a tubercular abscess.

Tuberculosis may also be contracted by eating infected food, and this means of transmission frequently operates when calves or pigs are fed upon the milk of tuberculous cows, or when pigs are fed the refuse from slaughter-houses. Milk from tuberculous cows is recognized as an occasional, if not a frequent, cause of tuberculosis in people who consume it, and many cases of human disease have been traced to this source. Heating milk to 160° F. for fifteen minutes is sufficient to destroy the tubercle bacilli and render milk from tuberculous cows a safe food. The extent to which the cow must be diseased in order to render her milk infectious is a subject that has received much attention, and it is now well established that the milk is always dangerous when the udder is tuberculous. It is frequently dangerous in very advanced, generalized cases, and some experiments indicate that it may be dangerous in a low percentage of cases in which the disease is not very advanced and is confined to organs at a distance from the udder. It may be, however, that more careful investigation in these last cases would have shown that the udder was in fact diseased, and the infectiousness of the milk thus accounted for. The flesh of tuberculous animals is regarded as dangerous to the health of the consumer only when the disease has reached the lymphatic glands between the muscles or is generalized in the viscera. In all cases both the meat and milk can be rendered innocuous by cooking.

Tuberculosis is spread among cattle chiefly by bringing healthy animals in intimate contact with diseased ones, as when they are members of the same herd. The disease spreads more rapidly in the winter, when the cattle are confined in the stable, than in the summer, when they are at liberty in the pasture. The prevalent impression that tuberculosis is frequently inherited is erroneous, and may be traced to the fact that many of the offspring of tuberculous bulls and cows develop tuberculosis. This is due, however, to exposure after birth, and to the fact that a predisposition to, or tendency toward, tuberculosis can be inherited, and this renders the young animal prone to contract the disease when it is exposed to it.

Tuberculosis of cattle is, in many of its forms and stages, a very difficult disease to recognize during life. This great difficulty in diagnosis has made the extermination of the

disease, which is based upon the removal of sources of infection and the improvement of sanitary conditions, a matter of the greatest difficulty, for it is impossible by the ordinary methods to discover the tuberculous animals in a herd. The use of tuberculin or Koch's lymph as a diagnostic has become general, and has given very satisfactory results.

The tuberculin test, or the recognition of tuberculosis in the living animal by the use of tuberculin, is based upon the fact that when a small amount of tuberculin (0.2 c. c.) is injected beneath the skin of a tuberculous cow a reaction, or elevation of the temperature to the extent of distinct fever, is caused within from eight to sixteen hours, while in non-tuberculous animals no effect is produced. So far as known, this test is harmless to healthy animals, and has a curative tendency in many that are diseased. After tuberculosis has been recognized in this way, in a milk cow, even though the animal may appear to be in prime order, the milk should not be used in a raw condition, nor should the cow be allowed to associate with healthy animals.

LEONARD PEARSON.

Tu'berose {from Mod. Lat. specific name *tuberosa* (in *Polyanthes tuberosa*), liter., Lat. fem. adj., tuberous, deriv. of *tuber*, tuber}: the *Polyanthes tuberosa*, an amaryllidaceous plant, a native of Mexico, much cultivated in greenhouses, and in the open, for its beautiful and highly fragrant white flowers, which are extensively employed by perfumers. Some 24,000 lb. of tuberose flowers are yearly produced in the valley of the Var, in France, for perfumers' use. The common name is derived from the tuberous character of the plant, and is therefore *tuberosa*, not *tuberose*. The plant has "a solid pear-shaped tuber from the base of which proceed roots, and from the apex long, linear channeled leaves, and late in summer a stem 2 to 3 feet high, the upper part of which is crowded with short-pedicel flowers and the lower part bears a few short leaves. The flowers consist of a funnel-shaped slightly curved tube, with six nearly equal, spreading lobes often tinged with rose without and creamy white within."

Revised by L. H. BAILEY.

Tubina'res [in allusion to the character of the external nostrils]: an order of birds containing the albatrosses, petrels, and shearwaters, characterized by having the nostrils opening in a little, more or less complete tube, which forms a part of the beak. The bill is hooked, toes webbed, hind toe absent, or present as a single joint only. The wings are long, narrow, and pointed, the great length being due to the very elongate humerus, radius, and ulna. The order is usually divided into *Diomedidae*, albatrosses, *Procellariidae*, petrels and shearwaters, and *Pelecanoididae*, the diving petrels; but W. A. Forbes makes only two divisions, one *Oceanitidae*, containing the genera *Garrodia*, *Oceanites*, *Pelagodroma*, and *Fregatta*, the other *Procellariidae*, comprising all others.

F. A. Lucas.

Tübingen: an old but interesting town of Germany, in Württemberg; beautifully situated on the Neckar, 20 miles S. W. of Stuttgart (see map of German Empire, ref. 7-D). Its university, founded in 1477, has a botanical garden, a chemical laboratory, an observatory, and several fine museums and collections connected with it. Reuchlin and Meianthon were among its first professors, and in the beginning of the nineteenth century it developed a new school of theology. The manufacture of surgical and physical instruments and chemicals is carried on, also milling, dyeing, and book-printing. Pop. (1890) 13,273.

Tübingen School: the common title of three groups of theological and exegetical writers connected with the University of Tübingen in Germany. (1) The old Tübingen school, founded by Gottlob Christian Storr (professor 1775-1805), and whose best-known members were the brothers Johann Friedrich and Karl Christian Platt (professors

1792-1821 and 1804-1843, respectively), Ernest Gottlieb Bengel, grandson of the great Bengel (professor 1806-26), and Johann Christian Friedrich Steudel (professor 1815-37). This school based belief in the Bible upon the authority of Jesus. Its theology was the biblical supernaturalistic. Starting with the doctrine that the Bible was a revelation, it defended its position by an appeal to Scripture interpreted by a grammatical and historical exegesis in opposition to the current rationalism. (2) The modern or younger Tübingen school, founded by Ferdinand Christian Baur (professor 1826-60), and whose principal pupil was David Friedrich Strauss. It began with studies in the history of Christian doctrines, transforming the various systematical representations of the divine revelation into a simple historical evolution. It then subjected the documents of the Christian religion, the books of the New Testament, to a searching critical examination, attacking both their authenticity and their integrity. Finally, it undertook a reconstruction of the origin and development of Christianity, without admitting such ideas as revelation, inspiration, miracles, etc., as operating forces. Although Baur refused to acknowledge himself a pupil of Hegel, the fundamental principles of the school concerning the nature of religion and the progress of history were adopted from the philosophy of Hegel. (See R. W. Mackay, *The Tübingen School and its Antecedents*, London, 1863). (3) The Roman Catholic Tübingen school, founded by Johann Adam Möhler (professor 1828-35), which, although sincerely endeavoring to increase friendly relations between the Roman Catholic and Protestant communions, idealizes the Tridentine theology and somewhat caricatures the Protestant. See C. von Weizsäcker, *Lehrer und Unterricht an der evangelisch-theologischen Fakultät der Universität Tübingen von der Reformation bis zur Gegenwart beschrieben* (Tübingen, 1877).

Tubular Bridges: See BRIDGES.

Tubulariæ: See HYDROIDA.

Tuckahoe: the Indian name of a singular vegetable substance found under ground in the southern parts of the U. S., sometimes attaining the size, and having somewhat the appearance, of a loaf of bread, whence it is often called Indian loaf or Indian bread. Its methods of growth and reproduction are unknown. It has been thought by some observers to be a secondary product caused by the degeneration of the tissues of some flowering plant, the mass afterward becoming invaded by fungus mycelium. It was eaten by the Indians, and is said to be sometimes used, when boiled in milk, as a substitute for arrowroot.

Revised by CHARLES E. BESSEY.

Tucker, ABRAHAM: moralist; b. in London, Sept. 2, 1705; studied at Merton College, Oxford, and entered the Inner Temple, but retired to private life at Betchworth, near Dorking, where he died Nov. 20, 1774. After 1756 he devoted himself to the writing of *The Light of Nature Pursued* (7 vols., 1768-78), an unsystematic treatise of great originality on morals, metaphysics, and theology. It has been reprinted several times; standard edition by Sir Henry Mildmay (1805).

Tucker, GEORGE: author; b. in the Bermudas in 1775; emigrated about 1787 to Virginia, where he was educated under the superintendence of his relative, Judge St. George Tucker; graduated at William and Mary College 1797; became a lawyer; was a member of the Virginia Legislature; sat in Congress 1819-25, taking a high position as a debater and constitutional lawyer; was Professor of Moral Philosophy and Political Economy in the University of Virginia 1825-45, after which he lived in retirement, chiefly at Philadelphia. He was author of *Life of Thomas Jefferson* (2 vols., 1837); *The Theory of Money and Banks Investigated* (1839); *The Progress of the United States in Population and Wealth in Fifty Years, 1790-1840* (1843); *History of the United States to 1841* (4 vols., 1856-58); *Political Economy for the People* (1859); *Essays, Moral and Philosophical* (1860), and several other works; and contributed to numerous periodicals. D. at Sherwood, Albemarle co., Va., Apr. 10, 1861.

Tucker, NATHANIEL BEVERLEY: lawyer and author; son of St. George Tucker; b. at Matoax, Va., Sept. 6, 1781. He graduated at William and Mary College; was admitted to the bar, and was judge of the Missouri circuit court in 1815-30, and Professor of Law in William and Mary College from 1814 till his death, at Winchester, Va., Aug. 26, 1851. He published *Principles of Pleading* (1846); *George Bledsoe* (1836); *Gertrude*; *The Science of Government*, and other

Double tuberose (*Polyanthes tuberosa*).

works; but his most noteworthy book was *The Partisan Leader* (1836), an unfinished historical novel, the scene of which was laid in Virginia in 1849, thus forecasting the future by some dozen years. It was reprinted in 1861 as *A Key to the Disunion Conspiracy*, to prove that the project of secession had been long entertained in the Southern States.

H. A. BEERS.

Tucker, St. George, LL. D.: jurist; b. at Port Royal, Bermuda, June 29, 1752, but removed to Virginia in his early youth; graduated at William and Mary College 1772; studied law; was concerned in an expedition against Bermuda, where he aided in the capture of a fortification and of a large amount of stores 1776; was lieutenant-colonel at Yorktown, where he was severely wounded in the knee and rendered lame for life; married Mrs. Frances Bland Randolph, mother of John Randolph, 1778; became a member of the Virginia general court (legislature), professor at William and Mary College, commissioner to revise and digest the laws of Virginia, and a delegate to the convention at Annapolis, Md. (1786), which took the initiative in recommending the formation of a national constitution; was a judge of the State courts of Virginia nearly fifty years, judge of the court of appeals 1803-11, and of the U. S. district court of Eastern Virginia 1813-27, and was noted for wit, poetical talent, and legal attainments. D. at Edgewood, Nelson co., Va., in Nov., 1827. He was the author of *How far the Common Law of England is the Common Law of the United States; A Dissertation on Slavery, with a Proposal for its Gradual Abolition in Virginia* (Philadelphia, 1796); *Letter on the Alien and Sedition Laws* (1799); and edited *Blackstone's Commentaries, with Notes of Reference* (Philadelphia, 5 vols., 1803). See Lanman's *Biographical Annals*.
Revised by F. STURGES ALLEN.

Tucker, Samuel: b. at Marblehead, Mass., Nov. 1, 1747; bred to the sea; was a captain sailing from Boston to London before the Revolution; commissioned a captain in the new American navy May 15, 1777; commanded the frigate Boston, in which he conveyed John Adams, minister to France, to his destination, Feb., 1778; took several prizes 1779; aided in the defense of Charleston, S. C., but became a prisoner at its capture, May, 1780; was exchanged June, 1781; took command of the Thorn, with which he made many prizes; received the thanks of Congress at the close of the war; settled at Bristol, Me., 1792; was for several years a member of the legislatures of Massachusetts and Maine, and in 1812 captured by stratagem a British vessel which had greatly annoyed the shipping of Bristol. D. at Bremen, Me., Mar. 10, 1833. His *Life* was published by John H. Sheppard in 1868.

Tuckerman, Bayard: author; b. in New York, July 2, 1855. He graduated at Harvard in 1878, and has published *A History of English Prose Fiction* (1882); *Life of Lafayette* (1889); *Peter Stuyvesant* (1893); *William Jay and the Abolition of Slavery* (1893); and edited *The Diary of Philip Hone* (1889).

Tuckerman, Edward, M. A., LL. D.: botanist; b. in Boston, Mass., Dec. 7, 1817; educated in the Boston Latin School, Union College, and Harvard University; lecturer on history in Amherst College 1854-56; Professor of Botany there 1858-86. In 1868 he was elected to the National Academy of Sciences. His most important publications, many of which appeared in *The American Journal of Science and Arts* and the *Proceedings of the American Academy of Arts and Sciences*, relate to the lichens, viz.: *A Synopsis of the Lichens of New England, the other Northern States, and British America* (1848); *Genera Lichenum: an Arrangement of the North American Lichens* (1872); *A Synopsis of the North American Lichens*, part i. (1882); part ii. was published in a fragmentary state after his death (1888). In 1847 he began the publication of the *Lichenes Americae Septentrionalis Ericiccati*, which reached 150 species (1855). D. at Amherst, Mar. 15, 1886.
CHARLES E. BESSEY.

Tuckerman, Henry Theodore: author; b. in Boston, Mass., Apr. 20, 1813; studied in the public schools of that city; traveled in Europe in 1833 and 1837, and devoted himself to literature, criticism, and the study of art; settled in New York in 1845. Among his writings are *The Italian Sketch-book* (1835); *Isabel, or Sicily, a Pilgrimage* (1839); *Rambles and Reveries* (1841); *Thoughts on the Poets* (1846); *Artist Life*, being sketches of twenty-three American painters (1847); *Characteristics of Literature* (1849 and 1851); *The Optimist* (1850); *Life of Commodore Silas Talbot*

(1851); *Poems* (1851); *A Month in England* (1853); *Memoir of Horatio Greenough* (1853); *Leaves from the Diary of a Dreamer* (1853); *Essays, Biographical and Critical* (1857); *Essay on Washington, with a Paper on the Portraits of Washington* (1859); *America and her Commentators* (1864); *A Sheaf of Verse* (1864); *The Criterion* (1866); *Papers about Paris* (1867); *The Book of American Artists* (1867); and *Life of John P. Kennedy* (1871). D. in New York, Dec. 17, 1871.
Revised by H. A. BEERS.

Tuckerman, Joseph, D. D.: clergyman and philanthropist; b. in Boston, Mass., Jan. 18, 1778; graduated at Harvard 1798; was pastor of the Unitarian church at Chelsea, Mass., from Nov. 4, 1801, to Nov. 4, 1826; organized the Benevolent Fraternity of Churches for the support of a city mission called the Ministry at Large, to which he devoted himself and in which he was a pioneer; was the organizer of the first Seamen's Friend Society in the U. S. 1812, and visited England for the organization of charitable institutions. D. at Havana, Cuba, Apr. 20, 1840. He was the author of numerous sermons and *Reports*, of eleven tracts for seamen, of a *Prize Essay on the Wages paid to Females* (Philadelphia, 1830); *Gleanings of Truth, or Scenes from Real Life* (1835); and *The Principles and Results of the Ministry at Large in Boston* (1838). The Tuckerman Institute in Liverpool commemorates his philanthropic labors in England, which were fully described by Miss Mary Carpenter in a *Memoir of Dr. Tuckerman* (London, 1849).
Revised by J. W. CHADWICK.

Tuckerman, Samuel Parkman: organist and composer; b. in Boston, Mass., Feb. 11, 1819; received his first instruction from Charles Zeuner; from 1840 to 1849 was organist of St. Paul's church, Boston, going in the latter year to England to study the cathedral school of music. In 1853 took the Lambeth degree of Mus. Doc. and returned to Boston. He visited England again in 1856-60. He received the diploma of the St. Cecilia Academy, Rome, in 1852. For a short time he was organist of Trinity church, New York, succeeding Dr. Edward Hodges. D. at Newport, R. I., June 30, 1890. His compositions are entirely sacred and comprise anthems, services, and other church music; he also edited several collections of church music.
D. E. HERVEY.

Tucson: city; capital of Pima co., Ariz.; on the Santa Cruz river, and the South. Pac. Railroad; 86 miles S. E. of Maricopa, and 121 S. E. of Phoenix (for location, see map of Arizona, ref. 14-N). It is in an agricultural, stock-raising, and mining region, and contains the University of Arizona, a public high school, public library, 2 national banks with combined capital of \$100,000, 2 daily and 3 weekly newspapers, and works for the reduction of gold, silver, and copper ores. The city was the site of an Indian pueblo and was for several years the capital of the Territory. Pop. (1880) 7,007; (1890) 5,150.
EDITOR OF "ARIZONA CITIZEN."

Tucuman: an interior province of the Argentine Republic; bounded N. by Salta, S. E. by Santiago del Estero, and S. and W. by Catamarca. The authorities differ as to the area, but it is about 13,000 sq. miles. The surface is hilly, rising to mountains in the W., and the scenery is more varied and beautiful than that of any other province. The soil is very fertile, though requiring irrigation in parts; the climate is mild and salubrious. Though the smallest, Tucuman is the most thickly populated and one of the most prosperous of the Argentine provinces; it is called the garden of the republic. The most important industry is sugar-planting, which is protected by heavy import duties; most of the sugar and much of the rum consumed in the republic come from this province. Other products are wheat, maize, rice, tobacco, lumber, and fruits. The grazing industry is comparatively unimportant, and there are few mines, though the province is said to be rich in minerals. Pop. according to the census of May 10, 1895, was 215,693; it is rapidly increasing. Tucuman was the Tuema (region of cotton) of the Incas, who annexed it to their domains during the fifteenth century. The colonial government (*gobernación*) of Tucuman embraced, besides the modern province, most of Córdoba, Rioja, Catamarca, Santiago del Estero, Salta, and Jujuy; it was subject to the *audiencia* of Charcas (now Bolivia), attached to Peru until 1776, when it was transferred to the viceroyalty of La Plata. H. H. S.

Tucuman: a city; capital of the province of Tucuman, and the fifth town of the Argentine Republic in size and importance; beautifully situated on a plateau near the Sierra Aconquija, and a mile from the river Salí (see map of

South America, ref. 7-D). It is connected by railway with Rosario and Buenos Ayres, Jujuy, and other points, and controls most of the trade of the northern provinces. The town is surrounded by orange-groves, and there are nearly 300 sugar estates in the vicinity, with thirty central factories. It was founded in 1564 and removed to its present site in 1585. The streets are regular, but narrow; the principal square is shaded with orange-trees, and fronting it is the fine modern cathedral, with other public buildings. The town has a national college, libraries, large hospital, etc.; it is celebrated for its delightful climate. A congress of the Platine provinces (except Montevideo, Entre Rios, Corrientes, Santa Fé, and Paraguay) signed here the act of independence July 9, 1816: the building in which this congress met is carefully preserved in its original state. Pop. of the city (1895) 34,300. HERBERT H. SMITH.

Tuda: See DRAVIDIAN LANGUAGES and TODA.

Tudawa: See TODA.

Tu'dor: the family name of an English dynasty which occupied the throne from 1485 to 1603, when it became extinct upon the death of Queen Elizabeth. The family was descended from Owen ap Tudor, an obscure Welsh gentleman, who about 1423 married Catharine of France, widow of Henry V. of England. Their son, who was created Earl of Richmond, married Margaret, daughter and heiress of John Beaufort, Duke of Somerset, whose father was a son of John of Gaunt, Duke of Lancaster, but born out of wedlock. The Earl of Richmond was legitimated by act of Parliament, but was expressly excluded from the succession to the crown; but upon the failure of the real Lancastrian line, Henry, the second Earl of Richmond, was recognized by that party as their chief. He defeated Richard III. at the battle of Bosworth Field in 1485, and assumed the crown under the title of Henry VII., although without any legitimate right. He married Elizabeth, daughter of Edward IV., and thus united the pretensions of the rival houses of Lancaster and York. The sovereigns of the Tudor line were HENRY VII. (1485-1509), HENRY VIII. (1509-47), EDWARD VI. (1547-53), MARY (1553-58), and ELIZABETH (1558-1603), all of whom are treated under their respective names.

Tudor, WILLIAM: diplomat and editor; b. in Boston, Mass., Jan. 28, 1779; graduated at Harvard 1796; entered the counting-room of John Codman, an enterprising merchant, in whose employ he twice visited Europe (1800 and 1810); spent some time in literary pursuits at Paris, and traveled in Italy; went on a mercantile agency for the exportation of ice to the West Indies 1805; was one of the founders of the Boston Athenæum; was an active member of the Anthology Club, and editor of and a voluminous writer for its literary organ, *The Monthly Anthology* (10 vols., 1803-11); founded *The North American Review* May, 1815; conducted it as a bi-monthly, and wrote three-fourths of its contents until Dec., 1818, when it was changed to a quarterly and passed into other hands; published *Letters on the Eastern States* (1820), a volume of *Miscellanies* (1821), consisting of selections from his previous magazine articles, and a *Life of James Otis* (1823); was the originator of the Bunker Hill Monument (1823); was U. S. consul at Lima, Peru, 1823-27; became U. S. *chargé d'affaires* at Rio de Janeiro, Brazil, 1827, and wrote while there his last work, *Gebel Teir* (Boston, 1829), an ingenious allegory. D. at Rio de Janeiro, Mar. 9, 1830. Revised by H. A. BEERS.

Tuesday [M. Eng. *Twesday* < O. Eng. *Tiwesdag*: *Tiwes*, gen. of *Tiw* (See TYR), god of war + *dag*, day; cf. Germ. *Dienstag*; Icel. *Týsdagr*]; the third day of the week. The name originated as a translation of the *Dies Martis* (liter., Mars's day) of the later Roman pagans.

Tufa: See LIMESTONE.

Tufts, COTTON, M. D.: physician; b. at Medford, Mass., May 30, 1734; graduated at Harvard 1749; became a physician at Weymouth; wrote the instructions to the representatives of Weymouth to oppose the Stamp Act 1765; married a daughter of Col. John Quincy; was a representative of Weymouth in the general court, State counselor and senator for many years, member of the convention for ratifying the Federal Constitution; was one of the founders of the American Academy of Arts and Sciences and of the Massachusetts Medical Society, of which he was president 1787-95. D. at Weymouth, Mass., Dec. 8, 1815.

Tufts College: a coeducational institution at Medford, Mass.; founded in 1852 on land given by Charles Tufts and

through the munificence of several donors, among whom Sylvanus Packard gave the most. The college comprises four separate institutions, the College of Letters, the divinity school, Bromfield-Pearson (technical) school, and the medical school. Six courses of study are given in the College of Letters: (1) A course leading to the degree of A. B., equivalent to the regular classical course in New England colleges; (2) a second course, leading to the same degree, in which modern languages take the place of Greek as a condition of admission and during the course, with the option of beginning the study of Greek in the freshman year; (3) a course for the degree of Ph. B.; courses in (4) electrical, (5) civil, and (6) mechanical engineering. The divinity school, opened in 1867, fits students for the ministry in the Universalist denomination. The college buildings consist of a three-story building for recitations, etc., seven large dormitories, a library building, a beautiful stone chapel and a gymnasium, the gift of Mrs. Mary T. Goddard, a large natural history museum, the gift of Hon. P. T. Barnum, a divinity hall, the gift of Rev. Dr. A. A. Miner, a large brick building for the Bromfield-Pearson School, and a large structure for a chemical laboratory. The Bromfield-Pearson School was established in 1893, and the medical school the same year. The college is open to both sexes on equal terms in all its departments, and has an endowment fund of over \$1,250,000, 38 professors, 29 instructors, 3 lecturers 400 students, and a library of 30,000 volumes. The first president (1851-61) was Rev. Dr. Hosea Ballou; the next was Rev. Dr. Alonzo A. Miner (1862-75), who was succeeded by Rev. Dr. Elmer H. Capen, the present (1895) incumbent.

Tugaloo River, called also **Chattooga**: a river which rises in Jackson co., N. C., and, flowing S., forms for some distance the boundary between Georgia and South Carolina, and then unites with the Keowee to form the Savannah river.

Tuileries, Fr. pron. *tweidree'* [= Fr.; cf. *tuilerie*, tile-kiln, deriv. of *tuile*, tile < O. Fr. *teule*; Ital. *tegola*; Span. *teja* < Lat. *tegula*; as loan-word in Germ. *ziegel*]; a famous palace formerly existing in Paris, on the right bank of the Seine. The ground was originally occupied by tile-works, whence the name of the palace, and was bought by Francis I. in 1518. In 1564 Catherine de' Medici began the erection of the buildings after the plans of Philibert Delorme, who was succeeded as master-architect by Jean Bullant. This, the original palace, which was subsequently much altered, but of which no exact drawing has been preserved, consisted of the central pavilion, and the adjoining galleries, but not in their later form. Under Louis XIV. the older parts of the palace were heightened, and the spherical dome of the Pavillon de l'Horloge was transformed into a quadrangular one. Thus the front façade was completed, and at the same time the garden, occupying an area of 56 acres between the palace and the Place de la Concorde, was laid out by Le Nôtre. After the erection of the palace of Versailles the Tuileries was seldom used by the French kings until Louis XVI. in 1789 was compelled to remove the royal residence hither, and after that time the palace was the scene of some of the most stirring spectacles of the history of France. Napoleon I., Louis XVIII., Charles X., Louis Philippe, and Napoleon III. resided here, and the palace was stormed and ransacked by the people Aug. 10, 1792, July 28, 1830, and Feb. 26, 1848. In May, 1871, it was finally destroyed by fire by the communists. The long galleries of the Louvre, ending in the Pavillon de Flore and the Pavillon de Marsan which flanked the Tuileries, connected the two palaces, and the pavilions named, are sometimes considered as a part of the Tuileries, but they remain and have been restored. The ruins were removed finally in 1884.

Revised by RUSSELL STURGIS.

Tuke, DANIEL HACK, M. D., F. R. C. P., LL. D.: alienist; b. at York, England, in 1827; studied medicine at St. Bartholomew's Hospital College, London; became a member of the Royal College of Surgeons in 1852 and a fellow in 1857; graduated M. D. at the University of Heidelberg in 1853; after visiting the principal asylums for the insane in Europe became assistant medical officer and subsequently visiting physician to the York Retreat for the Insane; in 1871 removed to London. He was coeditor of *The Journal of Mental Science* from 1878-92. With Dr. J. C. Bucknill he wrote a *Manual of Psychological Medicine* which has passed through several editions since its appearance in 1857. Among his more important works are *Insanity in Ancient and Modern Life* (London, 1878); *Chapters in the History of the Insane in the British Isles* (London, 1882); *Insti-*

tions of the Influence of the Mind upon the Body in Health and Disease (London, 1884); *A Dictionary of Psychological Medicine* (London, 1892). D. in London, Mar. 5, 1895. S. T. ARMSTRONG.

Tuke, HENRY: b. at York, England, in 1756; was for thirty-four years, from 1780, a minister and distinguished writer of the Society of Friends. He wrote *The Faith of the People called Quakers in Our Lord and Saviour Jesus Christ, set forth in various Extracts from their Writings* (1801; 3d ed., enlarged, 1812); *The Principles of Religion as Professed by the Society of Christians usually called Quakers, written for the Instruction of their Youth and for the Information of Strangers* (London, 1805; 12th ed. 1852), an authoritative manual, translated into German, French, Danish, and Spanish; *Biographical Notices of Members of the Society of Friends* (2 vols., 1813-15), and other writings collected in his *Works* (4 vols., 1815), which were edited, with a biographical sketch, by Lindley Murray. D. at York in 1814.

Tula: government of European Russia, bordering N. on the government of Moscow; area, 11,954 sq. miles. The surface is level or slightly undulating, the climate temperate, and the soil fertile. One-sixth of the surface is covered with forest; the rest is under tillage; around the capital are extensive iron and coal mines. Grain, hemp, flax, mustard, turnips, potatoes, tobacco, and hops are grown; sheep, cattle, and horses are raised. Breweries, distilleries, and manufactures of ironware are numerous. Pop. (1890) 1,492,300.

Tula: town of European Russia; capital of the government of Tula; on the Upa; 110 miles by rail S. of Moscow (see map of Russia, ref. 7-E). It is well built and has a fine cathedral, many other churches, a theater, several museums, several technical schools, and other educational institutions. Locks; tea-urns, cutlery, bells, muskets, pistols, sword-blades, etc., are made to perfection in large quantities. The imperial manufactory of arms employs many men and women. The manufactures of hats, silks, leather, platinum-ware, jewelry, and ironware are very important. Its niello-work is famous. Pop. (1890) 66,111.

Revised by M. W. HARRINGTON.

Tula: a town of the state of Hidalgo, Mexico; on the Mexican Central Railway; at the junction of the Pachuca branch; 6,716 feet above the sea (see map of Mexico, ref. 7-G). It is supposed to be the ancient Toltec capital of Tollan, which, according to the Indian chronicles or legends, was founded in the seventh century. Extensive ruins about it have been studied by Charney and others, and are frequently visited by tourists. (See MEXICAN ANTIQUITIES.) Some of them appear to indicate communal buildings like those of Arizona. The quaint church and cloister of San José date from 1553. Pop. about 5,000. H. H. S.

Tulane University: an institution in New Orleans, La., organized on its present basis in 1884, having formerly been called the University of Louisiana. It is intended for the higher education of the white youth of Louisiana, and includes the medical department, law department, College of Arts and Sciences, College of Technology, the university department of philosophy and science, and the H. Sophie Newcomb Memorial College for Women. The donations of the founder, Paul Tulane, at the time of his death amounted to \$1,100,000. The medical department has since its foundation in 1834 matriculated 10,905 students and graduated 3,141 students. It has as its school of practical instruction the great Charity Hospital with its 700 beds and 6,000 patients annually. The law department teaches principally civil law, which forms the basis of Louisiana law. The line of demarcation between the university proper and the colleges is well defined and strictly observed. The courses of instruction are logical and progressive. The growth and expansion of the institution have been steady and rapid. The H. Sophie Newcomb Memorial College, resting upon a separate endowment of \$500,000, donated to Tulane University by Mrs. Josephine Louise Newcomb, bids fair to become a rival of the best Northern colleges for women. The separate departments of the university are in different parts of the city in buildings of the best architectural character, and with the fullest literary, scientific, and mechanical equipment. In 1894 it had 64 instructors, 1,296 students, and 60,000 volumes in its libraries, and William P. Johnston, LL. D., was president.

Tulare: city (founded in 1872); Tulare co., Cal.; on the South. Pac. Railroad; 250 miles S. E. of San Francisco (for location, see map of California, ref. 9-E). It is in an agri-

cultural and fruit-growing region, and contains 7 churches, public high school, grammar schools, public library (opened in 1878), 3 State banks with combined capital of \$108,100, railway round-houses and machine-shops, artesian wells, and a daily and 2 weekly newspapers. Pop. (1880) 447; (1890) 2,697. EDITOR OF "REGISTER."

Tulare or Tule Lake: a shallow lake in Kings co., Cal.; once the largest lake in the State. It formerly had no outlet, but at high water its surplus flowed through a slough into San Joaquin river. It received Kern, Tulare, and King's rivers, and other streams. In 1872 it covered an area of 500 sq. miles; in 1895 its area was reduced to about 220 sq. miles. This result is attributed largely to the cutting of timber on the mountains, the tapping of the watercourses by which the lake was replenished, and to the use of the waters of tributaries for irrigation. Revised by I. C. RUSSELL.

Tulasne, tū laan', LOUIS RENÉ: botanist; b. near Tours, France, Sept. 12, 1815; d. at Hyères, Dec. 22, 1885. CHARLES TULASNE: botanist; b. near Tours, Sept. 5, 1816; d. at Hyères, Aug. 21, 1884. The brothers Tulasne, as they were called, were intimately associated in botanical work throughout their lives. The first botanical work of the elder was with Saint-Hilaire in the preparation of his *Flora of Brazil* (1825-33); from 1842 to 1864 he was upon the staff of the Jardin des Plantes (Paris), but upon the failure of his health he removed with his brother (who had practiced medicine from 1843 to 1864) to Hyères, in Southern France. They published jointly and individually many papers, principally relating to the fungi, the younger brother usually supplying the illustrations. The most important are *Mémoire sur les Ustilaginées comparées aux Uredinées*, in *Annales des Sciences Naturelles* (1847), and a second *Mémoire* in same (1854); *Fungi hypogæi* (1851); *Selecta Fungorum Carpologia* (3 vols., 1861-65). CHARLES E. BESSEY.

Tuleha, tool'chaä: town of the Dobrudja, Roumania; on one of the arms of the delta of the Danube; 6 miles above the junction of the Sulina and St. George's arms (see map of Turkey, ref. 2-E). It has a good harbor, a citadel, and considerable trade in salt fish, wood, and grain. It is the ancient *Ægissus*. Pop. (1890) 17,250.

Tule [= Mex.], the *Scirpus lacustris* (variety *occidentalis*), a large club-rush or sedge (family *Cyperaceæ*) which grows to a height of 8 to 10 feet and covers large areas of marshy ground in some parts of California. The name is also applied to the similar plant *S. tatora*. This plant is found throughout the western parts of the U. S., but is not elsewhere of as large a size. The tule lands are very fertile when drained. It has been proposed to utilize the tule itself in the fabrication of matting, etc.

Tulip [from O. Fr. *tulipe*, *tulipan*, from Turk. *tulband*, *dulband*, turban, from Pers. *dulband*, turban, whence Eng. *turban*; so called from the shape of the flower]: the *Tulipa gesneriata* and other species, liliaceous herbs from Central Asia, now everywhere cultivated for their beautiful flowers. Of this species fully 1,000 varieties have been catalogued, but there are hundreds of unnamed varieties. Conrad Gesner brought the tulip from Turkey to Augsburg in 1559. Haarlem, in Holland, is, and long has been, the principal seat of the production of tulip-bulbs for the European and American markets. During the seventeenth century the value of tulip-bulbs increased largely in Holland, and in some instances they were sold for 2,500 florins, and even, according to some writers, as high as 4,600 florins. The Duc van Thol or sweet-scented tulips (*Tulipa suaveolens*) are smaller and earlier than common tulips with acuminate perianth segments.

Early tulip, Duc van Thol.

Revised by L. H. BAILEY.

Tulip-tree: the *Liriodendron tulipifera*, a beautiful and noble forest-tree of the U. S. belonging to the magnolia family. Its bark has active tonic powers, and its wood is valued in house-carpentry and carriage and furniture making. It is often incorrectly called poplar, and sometimes whitewood. It is a fine ornamental tree.

Tull, JETHRO: agriculturist; b. in Oxfordshire, England, about 1680; received a good education; studied law; was

admitted as a barrister and made the tour of Europe, after which he settled first on his paternal estate and afterward on Prosperous Farm in Berkshire, near Hungerford, and gave his attention to scientific agriculture; invented the drill-plow, and published a famous work entitled *New Horse-Hoeing Husbandry* (1733), which long enjoyed great authority in England. The essence of his system consisted in planting in rows and in pulverizing the soil around the plants, but he made the mistake of thinking manure unnecessary, and his own experiments consequently involved him in serious losses. Yet he so emphatically and truthfully expounded the importance of tillage that his work is generally considered to have marked an epoch in agriculture. D. Jan. 3, 1740. His work was edited by William Cobbett in 1822, with the addition of some scattered essays on similar subjects. Revised by L. H. BAILEY.

Tullaho'ma; village (incorporated in 1851); Coffee co., Tenn.; on the Nashv., Chat. and St. L. Railway; 69 miles S. E. of Nashville, and 81 N. W. of Chattanooga (for location, see map of Tennessee, ref. 7-F). It is on the Cumberland Mountain plateau, contains 7 churches for white people and 3 for colored, the Woolwine School (building cost \$30,000), public school, 2 national banks with combined capital of \$100,000, and a semi-weekly newspaper, and has 3 lumber-mills, flour-mills, and a hub, spoke, and handle factory. Its altitude and accessibility have made it a popular health resort. Pop. (1880) 1,080; (1890) 2,439; (1895) estimated, 3,000. EDITOR OF "GUARDIAN."

Tulle, tül; town; in the department of Corrèze, France; on the Corrèze; 61 miles by rail E. N. E. of Périgueux (see map of France, ref. 6-E). It is poorly built, but its paper-mills, sugar-refineries, tanneries, and wool-weaving factories are important, and its manufactures of arms employ between 1,500 and 3,000 men. The thin fabric called tulle takes its name from this place. Pop. (1891) 15,384.

Tullius, SERVIVS: See SERVIVS TULLIVS.

Tulloch, JOHN, D. D.: educator and author; b. near Tibbermuir, Perthshire, Scotland, June 1, 1823; educated at St. Andrews and Edinburgh; became in 1845 a minister of the Church of Scotland at Dundee; spent some time in Germany, familiarizing himself with speculative theology as there taught; became in 1849 parish minister of Kettins, Forfarshire, and in 1854 principal of St. Mary's College, St. Andrews, Primarius Professor of Theology, and in 1860 senior principal of the university. D. at Torquay, England, Feb. 13, 1886. He was the author of *Leaders of the Reformation* (Edinburgh, 1859); *English Puritanism and its Leaders* (1861); *Beginning Life* (London, 1862); *The Christ of the Gospels and the Christ of Modern Criticism—Lectures on Renan's Vie de Jésus* (1864); *Rational Theology and Christian Philosophy in England in the Seventeenth Century* (2 vols., Edinburgh, 1872); *Religion and Theology, a Sermon for the Time* (1875); a volume of Croall lectures on *The Christian Doctrine of Sin* (1876); *Pascal* (1878); *Modern Theories in Philosophy and Religion* (1884); *Movements in Religious Thought in Britain during the Nineteenth Century* (1885); and several volumes of sermons. In 1855 he entered the lists with 1,200 competitors and gained the second Burnett prize of £600 for an essay *On the Being and Attributes of God*, which was published under the title *Theism, the Witness of Reason and Nature to an All-wise and Beneficent Creator* (1855). He was confessedly one of the great leaders of liberal thought in Scotland; was a chaplain in ordinary to the Queen, and preached frequently before her at Balmoral, and in 1878 was elected moderator of the General Assembly. He visited the U. S. in 1874. See his memoir by Mrs. Oliphant (1888; 3d ed. 1889). Revised by S. M. JACKSON.

Tullus Hostilius: according to Roman legends, the third King of Rome (672-640 B. C.). During his reign the combat between the Horatii and Curiatii took place, in consequence of which Alba acknowledged the supremacy of Rome. Subsequently the Albans meditated treason, and when Tullus discovered their plans he razed the city and transferred the inhabitants to Rome.

Tully: See CICERO.

Tuman, or Mikiang: See KOREA.

Tumbes, toomb'ath: a town of the department of Piura, Peru; at the extreme northwestern end of the republic, near the entrance to the Gulf of Guayaquil and a little back from the coast. It is of very ancient origin, was conquered by the Incas in the fifteenth century, and was their prin-

pal frontier city in this direction. This was the first Peruvian city seen by the Spaniards, and here Pizarro landed and began his march of conquest. The place is now unimportant. Pop. about 2,000. H. H. S.

Tumble-weeds: the popular name of many species of herbaceous annual plants whose many branches curve upward so that the whole plant is globular in outline. When dead and dry they break off at the root and roll away before the wind, dropping their seeds here and there for many miles. They occur upon the prairies and great plains of North America, the pampas of South America, the steppes of Russia, and probably wherever similar conditions prevail. The most common tumble-weed of the prairies of the U. S. is *Amaranthus graveolens*, but upon the great plains *Cyclocoma atriplicifolium* and *Corispermum lysosopifolium* occur also. About 1890 another tumble-weed (*Salsola kali tragus*) appeared upon the Dakota prairies. It is a recently imported prickly weed, and is commonly known as the Russian thistle. Many common plants in dry soils become tumble-weeds, a dozen or more having been catalogued for the U. S. CHARLES E. BESSEY.

Tumors [= Lat., liter., swellings, deriv. of *tumere*, swell. Cf. TUMER]; in pathology, swellings abnormal to the body; but in the usual sense inflammatory swellings are excluded, and the term is limited to distinct and abnormal growths apparently causeless and without purpose. The structure of tumors is in all cases but a reproduction of normal tissue, more or less faithfully simulated. The structure of tumors differs from that of the tissues which they simulate, mainly in being of a less fully developed character, in being less regularly arranged, and in their tendency to undergo secondary degenerative changes. Tumors are in some cases characterized by malignancy, that is by a tendency to recur when removed and to spread throughout the system by portions being transferred from the original seat to other parts through the blood or lymphatic currents.

The classification of tumors may be based upon their shape, their structure, or their nature, whether malignant or benign. The most scientific is the structural classification, according to which there are fibrous, bony, fatty, lymphatic, cartilaginous, and other types, called respectively fibroma, osteoma, lipoma, lymphoma, chondroma, etc. In this manner practically every tissue and organ in the body has its counterpart in some tumor.

The malignant tumors are those which have always attracted the greatest attention. Of these there are two large groups—the *carcinomata*, or cancers, and the *sarcomata*. The former are composed of epithelial cells arranged for the most part somewhat after the manner of glands; the latter are composed of ill-developed connective tissue. The cancers grow where there is normally epithelium, as in the breast, stomach, or womb; the sarcomata, where there is mainly connective tissue, as about bones, in tendons, in the subcutaneous tissues, and the like.

The classification of tumors by their shape is the oldest and crudest. There are recognized in this classification polypoid, papillomatous, cystic, and other forms, but the nature of tumors taking the same shape may be widely different.

It has been one of the great difficulties in the work of pathologists to find a satisfactory explanation of the causation of tumors, and numerous theories have been advanced. Some held that the new growth depended upon a general blood disease or dyscrasia; others that local injury and irritation are the essential causes; others inclined to the view that some defective arrangement of tissue in fatal life buds to subsequent abnormal outgrowths; and most recently the parasitic theory has gained ground. The last refers tumors to the action of micro-organisms. In the case of certain growths in the lower animals and perhaps in man this theory has been substantiated; but the question is still very undecided. Doubtless each of the theories conveys part of the truth.

While tumors are most dangerous in proportion to their malignant characters, a purely local and benign growth may at times be most dangerous from the pressure or other mechanical effects it exercises. WILLIAM PEPPER.

Tunbridge, or Tonbridge; town; in the county of Kent, England; on the Medway; 29 miles S. E. of London (see map of England, ref. 13-K). It is noted for its manufacture of toys in Tunbridge ware, a kind of mosaic made of variegated woods. It has an important grammar school, founded in 1553, with an endowment of £7,500 a year. Pop. (1891) 10,123.

Tunbridge Wells: town; in the county of Kent, England; 5 miles S. of Tunbridge (see map of England, ref. 12-K). It is celebrated for its chalybeate springs, and has been resorted to as a watering-place since the beginning of the seventeenth century. It has a fine common, commanding beautiful views. Pop. (1891) 27,895.

Tundra [from Russ. = barren moss-plain]: a type of treeless, moss-covered plain, bordering the Arctic Ocean in Siberia and North America. The tundra in typical localities is a moderately undulating, swampy country, covered with a dense carpet of mosses, lichens, and a great variety of small but exceedingly bright and beautiful flowering plants, with a few species of ferns and rushes. The monotonous surface is dotted with innumerable lakelets which are surrounded with rich verdure during the short summers, and is sometimes broken by mountains and hills rising as islands from the sea-like expanse. The tundra, like other peat-bogs, is formed by the growth of vegetation above and its partial decay and accumulation below. The preservation of the vegetable matter is due to the fact that below the depth of about a foot the peaty soil is always frozen. As the thickness of the vegetable layer increases by growth above, the surface of the continually frozen layer rises. Under existing climatic conditions there seems to be no limit to the thickness that the accumulation may attain. Large rivers flow through the tundras, and in their banks a depth of from 100 to 300 feet of ice and frozen soil is sometimes exposed. The bones of extinct animals are frequently found in these deposits, and in Siberia the carcasses of the hairy mammoth and woolly rhinoceros have been found entire. In Alaska, on the border of Bering Sea, the tundra has a breadth of about 100 miles, but it increases in width along the shore of the Arctic Ocean, and in Asia is of still greater extent. The entire area occupied by these frozen bogs can not be less than 300,000 or 400,000 sq. miles. ISRAEL C. RUSSELL.

Tungsten [= Swed., *tung*, heavy + *sten*, stone, alluding to the high specific gravity of wolframite]: a rare metal related to molybdenum and uranium, whose atomic weight is 183.5 and symbol W. The chief sources are *wolframite*, a tungstate of iron and manganese (Fe,Mn)O.WO₃, which frequently accompanies native oxide of tin, and is found in Cornwall, England; Saxony; Bohemia; Wertschinsk, Russia; Limoges; Bolivia; Monroe and Trumbull, Conn.; and elsewhere; and *scheelite*, which is a tungstate of lime (Ca.WO₃). Tungsten is prepared by calcining a mixture of WO₃ and carbon in a covered crucible, or by reducing WO₃ in a current of hydrogen, or, again, by the reduction of the chloride in the vapor of sodium. In order to obtain the pure metal the pure yellow-colored WO₃ is ignited in a platinum or porcelain tube to redness in a current of pure dry hydrogen. The powder thus prepared has a gray metallic luster, and has a specific gravity of 19.429. Metallic tungsten does not oxidize in air at ordinary temperatures, but it burns at a red heat, being converted into WO₃. When thrown into chlorine at a temperature of about 250° it combines with this element. By the action of aqua regia readily, or nitric acid slowly, it is converted into tungstic acid (H₂WO₄), and when pulverulent it is oxidized and dissolved on boiling in a solution of the caustic alkalis or their carbonates. It forms a dioxide, WO₂, and a trioxide, WO₃. The latter, called tungstic anhydride, may be obtained as a straw-yellow, tasteless powder, insoluble in water or acids, but readily soluble in alkaline solutions by heating ammoniac tungstate in open vessels. Tungstic acid, obtained as a yellow powder by adding hydrochloric acid in excess to a boiling solution of tungstic oxide in an alkali, forms acid and normal salts, generally of a complex nature, and yielding a white, sparingly soluble hydrate of tungstic acid, H₂WO₄.H₂O, when mixed in the cold with excess of hydrochloric acid. Meta-tungstic acid, H₂W₄O₁₃ + 7H₂O, furnishes salts which are mostly soluble and crystallizable, and may be prepared by the action of tungstic acid on tungstates, or by removing part of the base by means of an acid. Tungsten yields several chlorides, oxychlorides, bromides, fluorides, sulphides, and phosphides; also silicotungstates and sulphotungstates. Its compounds are not poisonous. A class of compounds of WO₃, WO₂ and bases, called tungsten bronzes, are distinguished by their metallic luster and bright colors. They are used as bronze powder substitutes. A sodium compound, Na₂O.W₂O₇ + WO₃, has been made in the form of gold-like cubes, which conduct electricity like a metal.

Tungstate of sodium, prepared on a large scale in purifying certain tin ores, is used in place of sodium stannate

as a mordant, and also to prevent muslin from suddenly igniting when brought in contact with fire, a little phosphoric acid or sodium phosphate being added to it sometimes, to prevent its decomposition. Tungsten alloys with iron in almost all proportions, making it excessively hard. Steel containing 9 to 10 per cent. of tungsten possesses unusual hardness, but it has not proved a commercial success. An alloy of iron and other metals with 4 per cent. of tungsten, called sideraphite, is said to be very ductile and malleable and not readily acted on by acids. Revised by R. A. ROBERTS.

Tunguragua, *töon-goo-raa'gwäa*: an interior province of Ecuador, surrounded by Pichincha, Oriente, Chimborazo, Bolivar, and Leon. Area, 1,686 sq. miles. It is in the Andine region and is crossed by the Eastern Cordillera. The Tunguragua volcano, from which it takes its name, is 16,690 feet high and is noted for its violent eruptions; it is one of the most imposing peaks of the Andes. Pop. of the province (1889), estimated, 103,000. Capital, Ambato. U. S.

Tungus'es: a Mongolian tribe, inhabiting the regions of Siberia from the Yenisei eastward to the territory of the Chukchees and to Sakhalin; the Manchus are of Tungusian stock. The Tunguses have flat faces, olive complexion, no beards, straight black hair, and oblique eyes. They are nomads, and generally divided, according to the beast of burden which they principally employ, into reindeer, horse, and dog Tunguses. They are chiefly Shamanists, but Russian missionaries have labored with success among them. They number in Siberia 70,000, mostly in Transbaikalia and Yakutsk. Revised by M. W. HARRINGTON.

Tunicata [Mod. Lat., liter., neut. perf. part. of *tunicare*, to cover with a tunic, deriv. of *tunica*, tunic]: a group of marine animals of great interest to zoölogists on account of their relations to the VERTEBRATA (*q. v.*). Formerly they were regarded as molluscs, then transferred to the worms, and lastly, since 1867, associated with the vertebrates and usually, with these and a few other forms, constituting one of the great divisions of the animal kingdom, the branch or phylum CHORDATA (*q. v.*). The vertebrate affinities are best exhibited in the larvæ, which in general appear-

FIG. 1.—Tadpole larva of tunicate (based upon Seeliger), viewed as a transparent object: *a*, atrial opening; *ch*, notochord; *e*, endostyle; *ep*, epicardial process; *f*, fixing process; *g*, gill-openings into peribranchial chamber (dotted); *h*, heart; *i*, intestine; *m*, mouth; *n*, nervous cord; *s*, stomach; *sb*, sense vesicle; *sg*, subneural gland.

ance are tadpole-like. In the larva (Fig. 1) the dorsal mouth connects with a large pharynx, on either side of which are gill-slits through which the water used in respiration passes out to the exterior. On the ventral wall of the pharynx is a groove, the endostyle (so called because earlier regarded as a rod), the function of which seems to be to guide the food back to the opening of the œsophagus. The alimentary canal is folded on itself and opens in close proximity to the outlet of the gills. Below the pharynx and stomach is the heart; dorsal to them is the central nervous system. This has in front a vesicular enlargement in which are the sensory organs, visual and auditory in function. Behind, the body is prolonged into a tail, and in this is an axial structure, the notochord, which, like the structure with the same name in the vertebrates, arises from the entoderm. Gill-slits and notochord are peculiarly vertebrate structures. The tunicate tadpole resembles the vertebrates further in that the nervous system is not traversed by the alimentary canal, in the relative position of the various organs mentioned, and in other details. An important difference must be mentioned; in the true vertebrates the notochord extends forward far into the head; in the tunicates it is confined to the tail, a fact which has led to the name *Urochorda*, sometimes given to the group.

In the typical tunicate the larva, after a short free-swimming life, fastens itself to some solid support by means of a (varying) number of fixing processes on the anterior end of the body; and then begins the metamorphosis. The tail is absorbed and its various portions, including the notochord,

degenerate. At the same time the body shortens and changes shape, so that the mouth and the opening through which the gills and the alimentary canal communicate with the exterior (atrial opening) are brought close together; the number of gill-slits increases; and the long nervous cord of the tadpole is contracted to a ganglionic mass situated between oral and atrial openings. The outside of the body soon becomes smooth, and all characters pointing toward the vertebrates are so thoroughly obliterated that no one not knowing the life-history would ever suspect the tunicates of being man's degenerate cousins.

The class of *Tunicata* exhibits considerable variety of form and range of structure, and is divided into three orders: (1) *Larvacei* or *Copelata*; (2) *Ascidia*; (3) *Thaliacea*.

In the first, *Copelata*, are included a few minute marine forms, belonging to three or four genera (*Appendicularia*, etc.) which may be defined as Ascidian tadpoles with adult characters. They retain the tail of the larva above described,

FIG. 2.—Diagram of young tunicate, with nearly adult characters: letters as before, except *b*, central ganglion; *ch*, degenerating notochord surrounded by remains of tail; *t*, cast-off cellulose sheath of tail.

atrial chamber is developed, into which the gills and vent empty. The external opening of this atrium is usually near the mouth, but in the *Pyrosomes* it is at the opposite end of the body. Three sub-orders of *Ascidia* are recognized. Two of these are fixed to some support during adult life, the third embraces free-swimming forms. The *Monascidia* are either solitary, or when they form colonies the new individuals arise from root-like stolons, and each number of the colony has its own atrium. In the second sub-order, the *Synascidia*, we find only colonial species, the individuals being covered by a common envelope or mantle, and arranged, usually in a star-like manner, around a common atrium. In the free-swimming *Lucia* the individuals are colonial, the colonies taking the shape of a cylinder. The mouths are all turned to the exterior, and the atria empty into the central chamber of the colony. Here belong the *Pyrosomes* of tropical seas, celebrated for their phosphorescence. In the largest species the colony may reach a length of 15 inches.

The *Thaliacea* have barrel-shaped bodies, with the mouth at one end, the atrial opening at the other, and the similarity to a barrel is strengthened by the circular muscles which run round (incomplete rings in *Salpa*) the transparent body like hoops. The gill-slits also are less numerous than in the *Ascidia*, there being two rows in *Doliolum*, only two openings in *Salpa*. In these there is an alternation of generations, but only that of *Salpa* need be mentioned, it being especially interesting from the fact that it was the first instance known, and was discovered by the poet Chamisso. From each egg there develops a "solitary form" which is without sexual organs. In the body of this a stolon arises and

this structure being folded forward on the ventral side of the body. They have but a single gill-slit on either side, and yet, with these apparent characters of immaturity, they are adults and undergo no further change.

The *Ascidia*, after passing through the tadpole stage, lose the tail and develop adult characters. The body, typically, becomes more or less globular, the gill-slits increase in number, and by the development of a fold in the body-wall, an

becomes divided into distinct sacs, each of which contains an egg. This second generation remains attached to each other through life, constituting the "chain form." The contained eggs undergo their development and give rise, in turn, to the solitary condition.

The literature of the *Tunicata* must be sought in special papers. In Korschelt and Heider's *Embryologie* is a summary of the development of *Tunicata* and a list of the most important papers on them. Little is known of the American species, excepting those of New England, for which see Verrill in *Report of the U. S. Fish Commission for 1871-72* (1874).

J. S. KINGSLEY.

Tu'nis (Fr. *Tunisie*): a French protectorate in North Africa; bounded E. by Tripoli and the Mediterranean, W. by Algeria, N. by the Mediterranean, and S. by the Sahara; area, 45,716 sq. miles. The coast to the E. of the Gulf of Tunis is low and sandy; to the W. it is rocky and bald, forming lofty promontories, among which Cape Blanc is the northernmost point of Africa. The interior is traversed by nearly parallel chains of the Great and Little Atlas, whose average height is between 4,000 and 5,000 feet, and which form several elevated plateaus of great extent. A number of shallow salt-marshes in the southeast are below the level of the sea. The climate is dry and hot, and the soil produces large crops of wheat, maize, dhurra, and barley; cotton, indigo, saffron, and tobacco are also cultivated. Olive and date plantations are very numerous and very remunerative, and all South European fruits grow abundantly. Oxen, sheep, mules, and camels are the common domestic animals, and they are all of good breed. Salt and lead are produced, though mining, like agriculture, is very carelessly carried on. Some branches of manufacture, such as woolen fabrics, especially the well-known red caps, dyed skins, morocco leather, and coral, are extensively developed. Pop. 1,500,000, chiefly Berbers and Arabs.

Tunis occupies nearly the territory of ancient Carthage. With Sicily it formed the granary of Rome. On the dissolution of the Roman empire it became a province of the Greek empire, from which it was conquered by the caliphs of Bagdad. From the twelfth century to the sixteenth it formed an independent state, and became the terror of all the nations around the Mediterranean on account of its piracy, which did not cease until near the middle of the nineteenth century. In 1574 the country became dependent on Turkey. Oct. 25, 1871, the bey obtained an imperial firman which made him virtually independent; but of this independence he was deprived by the French, who landed an army in the country in 1881, and, under form of a treaty signed May 12, 1882, reduced him to a state of vassalage. The French resident is called *chargé d'affaires*, and practically administers the government of the country under the direction of the French foreign office and by means of a staff of French judges and officials of all kinds. In 1894 there was a revenue of \$4,646,200 and an expenditure of \$4,626,770. Tunis has 260 miles of railway from the capital to Goletta and to the Algerian frontier.

Revised by C. C. ADAMS.

Tunis: capital of the state of Tunis; near the Gulf of Tunis; surrounded by a double wall and defended by a citadel (see map of Africa, ref. 1-D). Its streets are narrow, unpaved, and filthy, but its houses, though only one story

The bey's palace, Tunis.

high and presenting no windows to the streets, are substantially built, and many are finely fitted up in oriental style.

Each house is erected in the form of a court, into the yard of which all the rooms open, and this yard is generally paved with marble and provided with a fountain, which is supplied with water from a large tank or cistern on the roof of the building. The palace of the bey and several of the mosques are fine edifices, and the bazaars are large and well stocked. Silk and woolen manufactures are extensively carried on; caps, shawls, burnouses, turbans, and mantles, soap, wax, olive oil, and leather are also manufactured and exported, and the transit trade between Europe and the interior of Africa is important. Pop. 135,000, of whom 20,000 are Europeans and 40,000 Jews. Revised by C. C. ADAMS.

Tunja, toon'zhā: capital of the department of Boyacá, Colombia; near the sources of the river Sogamoso; 75 miles N. N. E. of Bogotá, and 9,164 feet above the sea (see map of South America, ref. 2-B). It was founded in 1538 on the site of Hunsa, the ancient capital of the northern Chibchas; during the colonial and revolutionary period it was important, but it is now somewhat decadent. Near by is the battle-field of Boyacá (*q. v.*). Pop. about 8,000. H. H. S.

Tunkers: See DUNKERS.

Tunkhan'noek: borough; capital of Wyoming co., Pa.; on the Susquehanna river, and the Lehigh Valley and the Montrose railways; 28 miles S. by W. of Montrose, 32 miles N. by W. of Wilkes-barre (for location, see map of Pennsylvania, ref. 2-11). It is in an agricultural region, and has several planing-mills, iron-foundries, a national bank with capital of \$100,000, and three weekly newspapers. Pop. (1880) 1,116; (1890) 1,253.

Tunnels and Tunneling [from O. Fr. *tonnel*, tun, cask, pipe, tunnel for partridges (> Fr. *tonneau*, tun, cask), dimin. of *tonne*, tun, cask, pipe, from O. H. Germ. *tunna* > Germ. *tonne*]: Tunnels are subterranean passages constructed without removing the superincumbent earth. The construction of such subterranean passages is called tunneling. Similar works executed by excavating from the surface and refilling after the construction of the arches or other supports are properly "covered ways," although generally called tunnels, and are here included under that term. Mining tunnels which are not strictly through passages are called galleries, drifts, or adits.

The rock-hewn temples of Nubia and India and the tombs of Egypt, although constructed in the same manner, do not come under the definition of tunnels. Fergusson, however, says of the Turanian races, of which the Egyptians are the type, that "the existence of a tunnel is almost as

the Apennines. The tunnel of Posilipo, 2,200 feet in length, on the road from Naples to Pozznoli, was built about thirty-six years before the Christian era, and is still in use. The tunnel for the drainage of Lake Fucino (or Lake Celano), built about 52 A. D., was about $3\frac{1}{2}$ miles long. Numerous shafts were used in its construction, which extended over eleven years. Its modern reconstruction (see below) is one of the great works of the nineteenth century. In all these tunnels the rock was excavated with the chisel, gad, and pick, blasting being then unknown. In Egyptian quarries blocks are said to have been detached by cutting grooves around them with saws and tube-drills supplied with corundum or similar material. To these methods were added fires built in the face of the heading to heat the rock, which was then suddenly cooled, cracked, and disintegrated by the application of water. Drilling and blasting with gunpowder were first used in mining in 1613 in the Freiburg mines.

A tunnel is adopted for passage through a hill or mountain range when the cost of an open excavation is greater than that of a tunnel, including its protective masonry. This is usually the case when the depth of the cutting exceeds 50 or 60 feet. Tunnels are also built for the passage of rivers over which, for commercial or other reasons, bridges can not be placed; under populous cities where the surface can not be obstructed; and under lakes for procuring water-supplies.

Preliminary to the construction of a tunnel borings are necessary to ascertain the character of the ground to be passed through, and the depth at which water will be found. Upon the data thus obtained the exact situation of the tunnel is determined, and marked upon the ground with great precision and permanency. The small section of a tunnel limits the number of men that can work in it, and renders progress slow. For this reason access to it is sought at many points, where practicable, by means of shafts sunk from the surface to the level of the tunnel, from each of which two additional faces may be worked.

The operations of tunneling may vary according to the character of the ground. A "heading" is a small section which is carried in advance of the other workings, and facilitates their execution. In solid rock the work is slow, but very simple. In small tunnels (as single-track railway tunnels) a heading at the top of the section is enlarged to the full width of the tunnel, and the rest of the section, the "bench," is taken out by "bottoming." In the larger tunnels the same method may be followed, or a "bottom"

FIG. 1.—Timbering in soft ground.

certain an indication of their pre-existence as that of a tomb." The earliest tunnel known was made in Babylon to connect the royal palace with the temple of Belus on the opposite side of the Euphrates river. It was 15 feet wide, 12 feet high, and was arched with brick. There was a very ancient tunnel in Beotia, said to have been made to drain Lake Copais; and in the sixth century B. C. a tunnel was built in the island of Samos which was 8 feet wide, 8 feet high, and 4,245 feet in length. Few tunnels for passage are found before those of the Etruscans, and after them the Roman works. These are numerous, though generally of small dimensions, made for drainage, for water-works, and some as highway tunnels. One of the latter class, built by Vespasian, carried the Flaminian Way through the range of

heading is driven from which "break-ups" rise to the top, where a new heading is made and the work proceeds as before. If the rock be deficient in hardness and cohesion, temporary props of timber are used as the work proceeds, and walls and arches of masonry subsequently replace them. In blasting the holes are drilled by machine-drills operated by compressed air, water under pressure, or electricity, and the explosives used are generally some form of nitroglycerine. The charges are simultaneously fired by electricity. Ventilation is provided partly by the air used in the machine-drills, partly by fans or blowing-machines. Water, which sometimes accumulates in large quantity, is removed by pumps from the shafts, and by drains from the open ends of the tunnel when practicable. Tunnels in earth do

not require the drill or explosive, but need support at every step. Sometimes, as in the English system, the entire section of the tunnel is excavated before the masonry is begun. When a section (10 to 18 feet in length) of top heading is completed, a bench is cut in the top on one side to receive the timbers that carry the roof. Into this a "crown bar" is rolled and a corresponding bench on the other side receives a second crown bar, all of large, round timber. Lagging boards support the ground between them. Chambers in the sides of the heading are cut down to the floor, in which props are placed to support the crown bars. The heading is widened and the operation repeated until the whole arch section is excavated. A transverse sill is placed under the props, and the excavation continued by similar methods to the bottom of the tunnel. At other times small drifts or headings are made at the sides in which the side walls are built, and the arch section is then excavated as before, or other small headings superimposed upon the side drifts permit the building of the arch in sections, after the completion of which the interior mass is excavated. By the Belgian system the central heading is carried down to the floor of the tunnel, the excavation for the arch is made, and the arch is built before the side walls; the "bench" on each side of the central heading is excavated in short lengths, and the side walls built up under the arch. In more difficult cases, where the ground is very soft, a shield is used. In its modern form this is a short tube of steel or iron plates closed by a diaphragm containing openings or doors. The rear portion of the tube incloses the end of the finished section, and leaves a space between it and the diaphragm in which a new short section of tunnel may be built. The material in front is excavated through the doors in the diaphragm, and the shield is pushed forward by hydraulic or other power.

The earliest tunnel for transportation in the commercial sense was that of Malpas on the Languedoc Canal (now Canal du Midi), in France, constructed by Riquet in 1666-76. It is 767 feet long, 22 feet wide, and 27 feet high. The next French tunnel, that of Rive de Gier on the Givors Canal, was built in 1770; that of Torey on the Canal du Centre in 1787. The Tronquoy tunnel (St. Quentin Canal) was the first built in soft ground (sand), and the methods there followed are now known as the French or the German system. The tunnel of Riqueval, $\frac{3}{4}$ miles long, made in 1803 on the same canal, is the longest of the navigation tunnels, all of which are of good size. The Pouilly tunnel (1824) is over 2 miles in length. The Noireau tunnel, on a feeder of the St. Quentin Canal, is 5 feet wide and $7\frac{1}{2}$ miles long. The French canal tunnels which are on the main lines of transportation are now operated by steam or electricity. On the Riqueval tunnel a train of twenty or thirty barges (300 tons each) is taken through by a steam tow-boat working on a chain laid in the bottom of the canal.

The earliest English tunnels were also on canals, but of much smaller section than those of France. The first in point of time is the Harecastle, by James Brindley, on the Trent and Mersey Canal in 1766-77, 8,640 feet long, 12 feet high, and only 9 feet wide, passing a boat 7 feet wide propelled by "leggers," men lying on their backs and pushing with their feet against the sides and roof. Fifty years later it was supplemented and superseded by another tunnel 134 feet wide and 17 $\frac{1}{2}$ feet high. Many other canal tunnels were built up to 1826, when the canal system of England was for the time completed.

The tunnel on the Union Canal, built 1818-21, was the first constructed in the U. S. It was 456 feet long, 20 feet high, and 18 feet wide. The first railway tunnel was on the Allegheny Portage Railroad, by Solomon Roberts, in 1831-33. The earliest in which shafts were used was the Black Rock tunnel in 1836-37, by W. H. Wilson. The introduction of railways about 1830 and their rapid extension required the construction of many tunnels, often, in the earlier days, to avoid grades now of everyday occurrence which were then deemed unworkable. Of the older English tunnels the Kilsby, by Robert Stephenson, $1\frac{1}{2}$ miles long, was of very difficult and expensive construction by reason of quicksands saturated with water. The Box tunnel, by Brunel, $1\frac{1}{4}$ miles in length, encountered great quantities of water. The brickwork lining of the Sydenham tunnel was pressed out of shape repeatedly by the swelling of the London clay in which it lies, and the final form required to resist this pressure is nearly circular, with the brickwork about 3 feet thick.

In more recent times, owing to the extension of railways, tunnels are of such common occurrence that although many

of them are works of great length and difficult construction, it is impossible to refer to any but those of special interest. The three great rock tunnels of the world are the Mt. Cenis (Col de Fréjus), the St. Gotthard, and the Arlberg, to which may be added in the U. S. the Hoosac tunnel, all, except the single shaft of the latter, built without shafts. To these will soon be added the Simplon tunnel—the longest of all.

The first in order of time, usually known as the *Mont Cenis* tunnel, is in fact the tunnel of the Col de Fréjus. The Col de Fréjus is a depression in the crest of the Cottian Alps, about 16 miles S. W. from the summit of the Mt. Cenis pass, and rising to a height of about 9,500 feet above the sea, about a mile above the culminating point of the excavation. The material traversed for about 6 miles from the southern entrance was calcareous schist, followed about 1,000 feet of gypsum and dolomitic rock, then about the same distance of refractory quartzite, and finally $1\frac{1}{4}$ miles

FIG. 2.

of anthraciferous formation. The excavations consist of a straight gallery, A B (Fig. 2), through the mountain, and the two junction galleries, C D and E F, to connect with the railway to Bardonecchia, in Piedmont, on the southern and Modane, in Savoy, on the northern side. The straight gallery, A B, is 38,173 feet in length, the junction galleries, C D and E F, nearly 2,500 and 1,500 feet, respectively. The termini at A and B are left open for ventilation and convenience of access. The length of tunnel traversed by trains is 42,158 feet, or less than 30 yards short of 8 miles. The junction curves were made not only to avoid short curves on the connecting railways, but to leave the mountain more nearly at right angles to its stratification, slight movements of the mountain slope across the line of the tunnel having already been observed. The southern entrance is 4,236 feet above sea-level. From this point the grade ascends 8 feet in 18,325 feet to a summit-level 1,082 feet long; thence it descends by a uniform grade of 115 feet to the mile to the northern terminus, 3,801.4 feet above the sea, or 134 feet lower than the southern entrance. The width of the tunnel is 26 feet, its height is 19.68 feet at one end, 18.68 feet at the other. The total quantity of rock excavated was nearly 1,000,000 cubic yards. The lining is of stone masonry, from 28 to 40 inches thick. About 16,000,000 bricks were employed for subsidiary purposes, about 15,000 tons of hydraulic lime were used, and some 1,200 tons of gunpowder for blasting. From the beginning of the works in 1857 until the invention of the machine-drill by one of its engineers in 1861, progress by hand-labor was very slow. After 1861 in the southern division and 1863 in the northern, drills driven by compressed air were used. The air not only operated the drill, but on its escape from the machine ventilated and by expansion cooled the gallery. In 1863 the rate of progress, average of both ends, was 7 feet a day; but as experience was gained and the machines perfected, the rate increased to 11 $\frac{1}{2}$ feet in the last year. The temperature near the center of the tunnel is constant at about 85° F. Upon breaking through the last partition of rock between the headings a strong current of air poured through from the N., and this, as might be expected from the difference of elevation of the two extremities, is said to maintain itself constantly, greatly facilitating the ventilation. As early as 1832 a peasant mountaineer suggested a tunnel under the Col de Fréjus. In 1845 engineers were employed to plan the work. One of them, Maus, a Belgian, invented a drilling-machine which was perfected later by Bartlett, Sommeiller, Grandis, and Grandoni. Colladon proposed the use of compressed air to work the drills and supply ventilation.

The St. Gotthard Tunnel.—From remote ages until a very recent period most of the travel and a large proportion of the merchandise passing between Italy and her seaports on the one hand, and Switzerland, Northern France, Central and Western Germany, and Northern Europe on the other, were conveyed over Alpine passes having their northern termini in Switzerland. After the completion of the three great highways—the Simplon in 1806, the Splügen in 1822, and the St. Gotthard in 1824, they more or less ceased to be of this transit. On the completion of the Bernese Railway in 1867 and the opening of the Mt. Cenis tunnel in 1870 a

large proportion of this traffic was intercepted, and the construction of a direct and independent railway across the Alps was felt to be of vital necessity to Northern Italy and Switzerland, and of great interest to all the Western and Central German states. The Simplon and the Splügen passes were studied and rejected, the former because it would be tributary to French interests rather than to those of Germany and Switzerland, the latter because the route lay along the Austrian frontier and was therefore exposed to control by a hostile force. The St. Gothard line was free from these objections, the only serious obstacle being the tunnel, 9 miles long, involving a great expenditure and a long delay. In Oct., 1869, a treaty was concluded between Italy and Switzerland by which the principal points relating to location, construction, and connections were determined, and in Oct., 1871, Germany also signed the treaty. The three contracting powers were to contribute 85,000,000 francs—45,000,000 by Italy, 20,000,000 by Germany, and 20,000,000 by Switzerland. In Aug., 1872, a contract was made by the company with Louis Favre, of Geneva, for the execution of the tunnel within eight years from the date of acceptance of the contract by the Swiss Government, at a fixed price per lineal meter, amounting for the whole to 48,000,000 francs. The line of the tunnel runs from Airolo N. about 5° W., passes under the Kastelhorn (9,915 feet high), the St. Anna glacier, the village of Andermatt, the river Reuss at the Devil's Bridge, and comes out at Göschenen. The station at Airolo is 3,756 feet (1,145 meters) above the sea. The grade ascends at the rate of 1 per 1,000 24,280 feet (7,400 meters) to the summit-level, 590 feet (180 meters) long, thence descends by a grade of about 5½ feet per 1,000 (55 per cent.) to Göschenen. The total length of the tunnel is 9¼ miles. Although great difficulties were encountered in the execution of the St. Gothard tunnel, chiefly from the large quantities of water developed by the workings, the great advances in the art of tunneling since the completion of the Mont Cenis tunnel, and those made during the construction of this work enabled much more rapid progress to be made. The compressed air-drills were more perfect, as were also the installations for power from the torrents Reuss and Ticino, and the tunnel, begun in 1872, was completed in 1881. The excavated rock was removed and tools and materials brought in by a locomotive worked by compressed air instead of steam. Where the tunnel passed under the plain of Andermatt, 1,000 feet above, on a length of 200 feet, it passed through decomposed feldspar with alumina and gypsum, which not only swelled by absorbing water from the atmosphere, but was subjected to the immense pressure due to the height of the ground above. The masonry arches were twice crushed, and were finally made of cut granite 5 feet thick at the top and 10 feet at the sides. The difficulties of the company arose from its embarrassed pecuniary position, which was a consequence of the insufficient estimate and the excessive cost of the work, both due to the shortsightedness of the first chief engineer. In such a difficult country he had abandoned the bottom of the valley and placed his line high on the almost vertical flanks of the mountains inclosing the valley. His successor, Hellweg, suspended all work on the approaches and made a new study of the location. He kept the railway as nearly as possible in the bottom of the valley, and as in its upper portion the valley became too steep for the railway grade, elevation was gained by spiral tunnels, of which there are seven on the approaches north and south. The valleys of the Alps rise, as it were, by steps or terraces, facilitating and perhaps suggesting the use of spiral tunnels, which it is proposed to adopt also on the approaches of the Simplon tunnel.

The Arlberg Tunnel.—The province of Vorarlberg is separated from the rest of the Austrian Tyrol by the Arl Mountains, and was accessible therefrom only by a long detour outside of Austrian territory. To connect this province with the rest of the empire, and to make a more direct outlet for Austrian-Hungarian products to Switzerland and France, the Arlberg tunnel was constructed. After much discussion as to the location—eminent engineers advocating a rack railway with a shorter tunnel at a higher elevation—the location was fixed and the works begun in 1880. Its length is 6.38 miles. By reason of the improvements in the mechanical means of tunneling and carefully studied methods, the rate of progress was much more rapid than in the long tunnels which had preceded it, and it was opened in 1883. The estimated cost was less than 35,000,000 francs.

The rate of progress in the execution of these tunnels, although partly dependent upon the character of the rocks

encountered, is chiefly interesting as indicating the progress in the implements and processes of the art of tunneling. At Mt. Cenis (Fréjus) the daily advance with machine-drills was at first, in the argillo-calcareous rock, 6 ft. 8 in. a day; in the coal-bearing sandstones 3 ft. 4 in. a day; in the Triassic quartzites superimposed upon the sandstones, 2 feet a day. The average advance in both ends was about 8 feet a day, but in the last year the advance in the schist exceeded 14 feet a day. In the St. Gothard tunnel more improved air-drills were used, and locomotives hauled the cars used in construction. The quantity of water encountered was enormous—the headings were generally a foot deep with water. The material varied greatly in character, some of it being quite soft. The average progress was 14½ feet a day. At the Arlberg tunnel everything was carried on in the most systematic manner. Trains removing excavated rock and bringing in tools and materials were run by a time-table. The heading, 9.2 feet wide and 7.5 feet high, was in the bottom of the tunnel instead of in the top, as at St. Gothard, break-ups 160 feet apart connecting it with the top heading. The most improved drills were used—at one end the Ferroux, a percussion drill operated by compressed air, at the other the Brandt, a revolving drill worked under great pressure by hydraulic power. About 1,760,000 lb. of dynamite was used. In this, as in all these tunnels, hydraulic power for compressing air and other purposes was obtained from the neighboring mountain torrents. The average rate of the advance was 27½ feet a day, being more than three times as much as at Mt. Cenis, and nearly twice that of the St. Gothard tunnel, which it more nearly resembles in the character of the strata pierced.

The following table shows at a glance the characteristics of these three great tunnels:

NAME.	Begun.	Opened.	Time building.	Length, miles.	Ave. daily advance.
Mt. Cenis (Fréjus).....	1857	1871	13 yrs.	7¼*	8' 0 ft.
St. Gothard.....	1872	1881	9 yrs. 5 m.	9½	14' 6 ft.
Arlberg.....	1880	1884	3 yrs. 9 m.	6½	27' 8 ft.

* Length of straight gallery. The actual length of tunnel operated is very nearly 8 miles.

The *Simplon* tunnel, which connects the valley of the upper Rhône, in Switzerland, with that of the Diveria, about 16 miles from Domo d'Ossola, in Italy, will be 12¼ miles in length—the longest of the Alpine tunnels. The contract for its construction was made in Sept., 1893. The plans have been carefully studied and some new features introduced. Instead of one tunnel for two railway tracks there will be two smaller tunnels, distant from each other 58 feet, each for a single line of rails. The two headings will be driven at the bottom simultaneously, with numerous cross-headings oblique to the line of the tunnels. Only one of the main headings will be enlarged to full dimensions; the other will await the demands of traffic for a second tunnel. The second heading will, however, be used during construction for the return of the construction cars empty or with materials for the work, while those loaded with the *débris* of the excavations will go out through the enlarged tunnel. Air will also be driven in through the second heading and in much larger quantities than in earlier works. The temperature in the middle of the tunnel, estimated to be 104° F., will be cooled to 90° F. by sprays of water combined with a vigorous ventilation. Seventeen hundred cubic feet of air per second are to be provided, 212 cubic feet having been found satisfactory at Arlberg, where, however, the temperature did not exceed 67° F., and the length of the tunnel was but little more than half that of the Simplon tunnel.

The *Hoosac* tunnel, on the line of the Fitchburg Railroad in Massachusetts, passes through the Hoosac Mountains, a southern extension of the Green Mountains of Vermont. Its length is a little more than 4½ miles. It has one shaft 1,028 feet deep. Begun in 1856, it was seventeen years under construction, including several long suspensions due to discouragements and want of funds. The greater part of the rock penetrated is a micaceous schist of varying characteristics, some of it very hard. Progress was expedited in 1866 by the introduction of machine-drills worked by compressed air. Its cost, including interest, was about \$11,000,000.

Tunnel of Lake Fucino.—The Lake Fucino or Celano lies in a mountain basin in the Apennines, having no natural outlet. It is about 50 miles E. of Rome and 2,200 feet above sea-level. Its area has varied with its level. In 1816,

with a maximum depth of 75 feet, it covered 42,000 acres; in 1835, with a depth of 34 feet, but 33,000 acres were covered. To reclaim an area of fertile soil, to reduce the waters to a permanent level, and to improve the sanitary condition of the vicinity, a tunnel discharging into the river Liris (now Garigliano) was begun by the Emperor Claudius and completed eleven years later. Its length was about $3\frac{1}{2}$ miles, its cross-section variable, but nowhere less than 102 sq. feet, with a grade of 1 in 1,000. A large number of shafts, both vertical and inclined, were employed, and all the work was done with the chisel and similar tools. It fell into decay shortly after its completion. It was reconstructed by Prince Torlonia in 1854-76, at a cost for the entire drainage works of \$4,800,000, in such manner as to drain the lake entirely. The new tunnel underlies and replaces the old one, and is 2,200 feet longer. It has a section of 215 sq. feet, and is lined throughout with masonry.

The *Severn* tunnel on the Great Western Railway of England passes under the Severn river at a point where the rise and fall of tide is about 50 feet. The length of the tunnel is about $4\frac{1}{2}$ miles ($2\frac{1}{2}$ miles between shafts on opposite sides of the river), and a drainage tunnel 7 feet square and $\frac{1}{10}$ ths of a mile long leads from its lowest point to a pump-well 206 feet deep. It was constructed chiefly through the Permian sandstone on the one side and red marl on the other. Begun in 1873, it was not completed until 1885 owing to the very large eruptions of water. Twice the "big spring" was struck, discharging the second time over 30,000 gal. a minute, and in the same week an extraordinary tide overflowed the surrounding country and flowed down the shafts. After the arch was built the brickwork was crushed by the pressure of the water from the "big spring," which came from a very elevated source, and as a last resort the water was led away to a pump-well and permanent pumps established to pump it out. An interesting incident of this construction was the practical application of a method described in Jules Verne's story, *Twenty Thousand Leagues under the Sea*. When it became necessary, after the flooding of the works, to close an iron door in the tunnel 1,000 feet from the shaft, the head diver placed a Fleuss apparatus on his back and, without communication with the upper air, went into the tunnel to the door, which was rusted on its hinges, found a crowbar near by, and with much effort closed the door, and returned after having been about an hour and a half under the water. The attempt had previously been made in the ordinary diving-dress, but three strong men had been unable to drag after them a sufficient length of air-pipe to reach the point desired.

The *Mersey* tunnel connects Liverpool and Birkenhead. It is about a mile long, between large shafts containing elevators of great capacity, by which passengers between the two cities are brought from and taken to the surface. A drainage and ventilating tunnel under it was excavated at once to full size, in part by means of the Beaumont machine armed with rotary cutters, which cut away the rock to a fairly smooth, true cylindrical surface. The ventilation of the Mersey tunnel, which is superior to that of any other operated by steam, is accomplished by exhausting the foul air through the sub-tunnel by means of fans, fresh air being supplied to the main tunnel from the ends.

These two tunnels—the Mersey and the Severn—are literally "subaqueous," but, having been excavated through rock in the usual manner, they are not included in that class.

The Metropolitan and the Metropolitan District railways of London—the underground—are chiefly "covered ways," having been for the most part excavated from the surface and filled in and repaved after the construction of the arch. Three tunnels, however, aggregating about a mile in length, were made through very difficult ground. Built through the streets and under buildings in the most crowded parts of London, these works are models of ingenious and skillful construction, and are well worth study. The newer subways of London, as of Glasgow and elsewhere, are chiefly small tunnels in pairs built with shields and lined with iron segments. They are traversed by electric cars adapted to the size of the tunnel. This system of construction is well suited to the purpose for which it has there been used. By it the risk of disturbing buildings is reduced to a minimum.

The *Niagara* tunnel is the tail-race of the large water-power established on the New York side of the Niagara river to utilize a portion of the power of the falls. The buildings are erected near the river, above the falls and the rapids. Water is supplied to the turbines by a short open canal,

and escapes from the wheel-pits into the tunnel, by which it is discharged into the river below the falls. The tunnel is 7,600 feet in length, 19 feet wide, and 21 feet high, with a

FIG. 3.—Niagara water-power tunnel, map and section.

sectional area of 365 sq. feet. At the upper end it is about 150 feet lower than the water surface in the river above; its discharge is about 200 feet below that level. Its capacity is about 7,300 cubic feet of water each second. See WATER-POWER.

The valley in which the city of Mexico lies has no natural outlet for its waters, and formerly the plain around the city was covered with water in rainy seasons, except the causeways communicating with the capital. In 1607 Enrique Martinez, a Dutch engineer in the employ of the Spanish Government, proposed and afterward constructed the tunnel of Huehuetoca (now the cut of Xochitongo) for the drainage of the valley. It was built in a very short space of time,

though 4 miles long, and was arched throughout, but before the lining was completed and the bottom protected the walls were undermined in a great flood, and the tunnel fell in. The engineer was thrown into prison and kept there for three years. He was then released and ordered to make an open cutting in the place of his tunnel, in the execution of which he spent the remainder of his life. The construction of the cutting, however, extended over 120 years, and many lives were lost in its execution. The forced labor of the native Mexicans was so severe and the loss of life so great that it became a conspicuous cause of their hatred of Spanish rule. The excavation was not carried to the depth of the tunnel, and was of little use for the drainage of the valley. During the French occupation of Mexico plans were made for the drainage of the valley, and the project has been studied at various intervals since. In 1888 the plan was put in the way of execution. It consists chiefly of the tunnel of Tequixquia, 6 miles in length, and 27 miles of large canal. The twenty-four shafts of the tunnel are from 75 to 325 feet in depth. The tunnel has a section of about 150 sq. feet, and a proposed discharging capacity of about 450 cubic feet a second. The works have been carried out by English contractors under the direction of Mexican engineers.

In the construction of the great trans-Alpine tunnels an indispensable condition was the proximity of sufficient water-power to supply the mechanical force needed in their construction. For the tunnels on the trans-Andean line, connecting Buenos Ayres with Santiago, the power obtained from waterfalls was transmitted to the sites 2 and 4 miles away by electricity. The summit tunnel on this line is over 3 miles long, constructed for single track only, at an elevation of 10,460 feet above the sea.

The new (Croton) aqueduct tunnel of New York city, about 14 feet wide and as many high, has a length of 33 miles. It was worked partly from shafts nearly a mile apart, and partly from faces where the grade of the tunnel came above the natural surface. It is chiefly, though not entirely, through rock of variable hardness, and passes under the Harlem river in a perfectly dry rock 306 feet below the surface. Portions under dry head are lined with iron inside the brickwork. The work was generally not difficult, but one length of 110 feet occupied two years in its construction, and ranks with the most difficult works of the kind. The attempt was made to carry the conduit under the Harlem river in a tunnel 150 feet below the surface of the water. A pocket of very soft material was encountered, and to escape this, after several attempts to pass through it, the shafts were sunk over 150 feet lower.

The Howard Street tunnel, operated by the Baltimore and Ohio Railroad, lies under one of the principal streets of Baltimore. It has a length of 1.4 miles, of which about 1,200 feet was built as covered way. It passed through sand overlying clay, with a good deal of water in places. The side walls were first built in narrow drifts, the top was then taken out by the crown-bar system, and after the arch was turned the bench was removed. About 90 feet in length of side walls settled into the soft bottom and were pushed inward, deforming and rupturing the arch—all due to the want of an inverted arch between the walls. This portion was rebuilt, together with some other parts in which the crown of the arch had settled, the result probably of defective packing, and perhaps of other causes. The tunnel is lighted with electric (incandescent) lamps, and worked with electric engines capable of hauling the entire train, including the locomotive, the furnace doors and dampers of the latter being closed and steam shut off to avoid the escape of smoke and gases into the tunnel.

All mining drifts are really tunnels, but they will not be treated here except to mention the Sutro tunnel, $4\frac{1}{2}$ miles in length, constructed to drain the lower levels of the Comstock mine, in Nevada, which it reaches at 2,000 feet below the surface of the ground. The principal difficulty encountered was the crushing of the sustaining timber, 16 inches square, by the swelling of the clay in which a part of the tunnel was excavated. It became necessary to cut off the protuberant clay and renew the timbers over and over again. The great heat in the extreme end of the tunnel also ren-

dered the execution difficult, and required special precautions.

Subaqueous Tunnels.—The earliest and by far the most costly of these is the Thames tunnel, by Marc Isambart Brunel. Work upon a tunnel at this site (about 2 miles below London Bridge) was actually begun in 1807 by Trevelthick, but after a shaft had been sunk the work was abandoned in the following year. The existing tunnel, 1,200 feet long, with two passages 14 feet wide and 16 $\frac{1}{2}$ feet high, was commenced in 1825 and completed in 1843. It is now used by the East London Railway. The difficulties due to the influx of water and mud from the river were finally overcome by means of a shield invented by Brunel, which protected the whole face of the excavation, 38 feet wide and 22 $\frac{1}{2}$ feet high. Although entirely different in form and in detail from the modern shields used in tunneling, Brunel's shield contained the principle upon which they are made, that of supporting the face and the perimeter of the excavation during the construction of short lengths of lining.

In 1868-69 the Tower subway under the Thames was con-

FIG. 4.—Shield and lining, Tower subway, London.

structed by W. H. Barlow, by the aid of a shield similar in principle to that of Brunel, though more nearly resembling the modern shield. This subway was circular, 8 feet in outside diameter, and was lined with ribbed cast-iron plates, the earliest of this kind of construction, now so much in vogue. It lies entirely in the firm London clay.

A pair of small tunnels, 10 feet in diameter, for the City and South London Railway, a rapid-transit line, were opened in 1889. They are carried under the Thames at a considerable depth by means of an improved shield, designed by Mr. Greathead, the chief engineer. They are lined with cast-iron plates, and coated on the outside with cement grout injected by air-pressure through holes in the cast-iron rings into the annular space around the tube left by the somewhat larger shield. These methods have been imitated, not only in subaqueous works, as in Glasgow and elsewhere, but for tunneling lengthwise under city streets, because of the small risk incurred of damage to overhead and adjoining property and buildings.

In America the first important subaqueous tunnels were those constructed for supplying water to the cities on the Great Lakes.

The First Chicago Tunnel.—The city of Chicago, Ill., which obtained its supply of water from the shore of Lake Michigan, about half a mile N. of the mouth of Chicago river, by means of works constructed in 1852, found that the lake at the point of supply was contaminated by the sewage of the city: and as the nearest, the purest, and the most abundant source was immediately in front of the city, it was decided to construct a tunnel under the bottom of the lake to a point 2 miles out. There is a land-shaft at the western and a lake-shaft at the eastern extremity. The latter is protected by a crib, or hollow pentagonal breakwater, from storms, vessels, and ice. This is 58 feet on each side and 40 feet high. The horizontal diameter of the tunnel is 5 feet, and the vertical 2 inches greater. The work was begun at the land-shaft on Mar. 17, 1864. The main tunnel proper was lined with two shells of brickwork, in all about 9 inches thick, including cement joints. The upper arch was built on a ribbed center of boiler iron, which diminished the open space inside of the tunnel only $4\frac{1}{2}$ inches, and thus allowed the cars which conveyed away the earth to go up to the face of the excavation, usually kept from 10 to

20 feet ahead of the masonry. The excavation was generally through stiff blue clay, but with the irregularities of character peculiar to the drift. Sometimes sand-pockets, sometimes small bodies of quicksand, sometimes clay soft enough for a miner to run his arm into, and sometimes bowlders weighing several hundred pounds, were met. The greatest danger encountered was from inflammable and explosive gas. Early in the progress of the work several accidents occurred from this cause. Cavities containing gas were detected by sound, and bored into with a small auger. The gas was ignited as soon as it began to escape, and explosions were prevented.

The greatest progress made during any one week was 93 feet. Only once was a bowlder met so large as to require blasting. The ventilation of the tunnel was effected by means of tin pipes, through which the foul air was drawn out, and fresh air consequently drawn in through the main opening. The original estimate of the probable cost of the work was \$307,552; the actual cost, including all preliminary and other expenses of whatever nature chargeable to the lake tunnel up to Apr., 1867, was \$157,844.95. Later there was constructed another and larger tunnel from the same crib, parallel with the first, to the lake shore, and thence in a southwesterly direction about 4 miles farther to a point where new pumping-engines are in operation. Both tunnels have an estimated capacity of 150,000,000 U. S. gal. a day.

The Second Chicago Tunnel.—The enormous pollution by sewage of the lake water along the city's front and its extension into the lake nearly and at times quite as far as the 2-mile crib, as well as the rapid increase of the population and the consequent demand for a larger supply, determined the construction of another tunnel 8 feet in diameter, extending to a crib 4 miles from the shore. These works were begun in 1887. Difficulties occurred during the earlier construction from the pressure of a bed of plastic clay which was encountered in the roof of the tunnel at the same time that a water-bearing vein appeared at the bottom. A shield was built and put in place, but it was not strong enough. It was deformed by the pressure and finally abandoned. The mud and sand flowed in, and a conical hole or crater was formed over it in the lake bottom.

Two 6-foot tunnels were then substituted for the one of 8 feet diameter, and the line was diverted to pass around the place where the shield lay. Another shaft was sunk 2½ miles from shore, and work was carried on from it in both directions. Care was taken to keep the tunnel in the layer of hard clay, the soft clay being above and water-bearing sand below, and but little difficulty was experienced. The tunnel was completed to the 2½-mile crib on July, 1890, and to the 4-mile intake in Dec., 1892. At the shore end the tunnel is continued under the streets and blocks of the city 1½ miles, to the pumping-station.

The Cleveland water-works tunnel under Lake Erie was built during 1869-74; length between shafts, 6,606 feet; diameter, 5 feet; depth of the shore shaft, 67 feet; of the lake shaft, 90 feet; both shafts are 8 feet in diameter. The crib is pentagonal, about 95 feet across and 61 feet high. Great difficulties were encountered. The first was the bursting in of the clay at 1,300 feet from the shaft, and the exposure of a seam through which gas, water, and quicksand poured in large quantities, and were stopped only by building a brick bulkhead across the tunnel. Before this could be done 300 feet of tunnel was filled with sand. It became necessary to abandon this portion and to move the line of the tunnel. This was done by changing its direction about 20° and continuing in this line until 40 feet from the original line, then proceeding parallel to the original line.

When about 4,000 feet from shore, at a point 600 feet back from the heading, the water suddenly poured in through innumerable cracks in the brickwork over a length of 150 feet. The lake shaft was then completed, and work was begun at the outer end of the tunnel. After progressing some 380 feet the same soft clay was encountered and flowed in so fast that the end of the tunnel was bricked up until other preparations could be made for continuing it. For this purpose a shield was made of boiler iron strengthened with two cast-iron rings 4 inches by 4 inches in section. It was 6 feet long and 6 ft. 5 in. in diameter. Two horizontal shelves were put in extending to within 2 feet of the rear end of the shield, the friction on these being found sufficient to prevent the soft clay from flowing in too fast. The brickwork was built within the rear end of the shield in rings 16 inches long. Cracks appeared at every cross-joint

so long as the clay was soft, but it was necessary to use the shield for about 140 feet, after which the material was firmer. The shield was moved at first by screws, afterward by hydraulic presses of 135 tons capacity. The external pressure on the shield was about 4 tons to the square foot, and was too much for its strength. The cast-iron rings were broken and the shield flattened 5 inches. After leaving the soft clay the work progressed well until within 20 feet of the outer end of the slope section, when a mass of clay was blown into the tunnel with great force, followed by gas and water, and driving the men out of the tunnel. It was found that both tunnels were in communication and by means of increased pumping power both were soon emptied of water. The lake end, however, was full of gas, and being on an ascending grade it could only be blown out a few feet at a time. This, however, was done until it was clear. A few days later the connection was completed.

At 500 feet shoreward from the connection, near the large leak, transverse cracks were found; farther back the cracks were open and a portion of the masonry had settled 5 feet, breaking into short sections and going down bodily. The attempt was made to rebuild this portion, building up from the settled masonry, but cracks soon reappeared, and the cracked sections were cut off by bulkheads and a new tunnel built around them.

In 1871 it was proposed to construct a tunnel under the Detroit river to connect the Michigan Central Railway with the Great Western of Canada. A small drainage tunnel was driven as an experiment to a distance of 1,240 feet on the Michigan and more than 370 from the Canada shore. Great difficulties were encountered from the inflow of water and gas, the former under a head much greater than that due to the depth below the river. The cost far exceeded anticipations, and the work was finally abandoned.

In 1888 the Grand Trunk Railway undertook to make this connection at Sarina, and after careful study and preparation a single-track circular tunnel, lined with cast-iron segments, was begun and successfully completed, not without difficulty, but without serious accident or delay. The material was soft blue drift clay with pockets of sand and gravel, and under this the stratum of gas-bearing sand. The work was done with shields, one on each side of the river, and a comparatively light pressure of air was kept up, chiefly to prevent the inflow of gas. The length is 6,000 feet, of which 2,290 feet is under the river. The water is 40 feet deep and the least cover over the tunnel is 15 feet. It was completed and opened for traffic in 1892.

The Liverpool water-works tunnel under the Mersey, finished in 1892, is chiefly remarkable by reason of the great cost, difficulty, and delay incurred in its earlier stages, for want of proper engineering advice, and its rapid execution when the means were properly adapted to the end in view. The tunnel is 10 feet in diameter, lined with cast-iron plates, and has been built with a shield through clay, silt, and sand, all soft and full of water. As the first shield was not adapted to its work, great delay and expense were incurred, and very little progress was made. When the work was taken over by the corporation of Liverpool the shield was strengthened and slightly modified to fit it for its work, and the tunnel, of which but 183 feet had been built in twenty-eight months, was completed in four and a half months, the total length being 810 feet.

The change in the shield consisted in raising a low bulkhead in the rear of the diaphragm and a few inches higher than its lower edge, forming thus an air-seal which prevented the inflow of water so long as the air-pressure was kept in excess of the pressure of water. This idea is said to have been introduced into Sir B. Baker's design for the Humber tunnel shield in 1870, a tunnel which was not made;* it was applied to the compartments of the Hudson tunnel shield, and by the hanging plates in the Blackwall shield. It was patented in Belgium in 1880.

The Hudson River tunnel, to connect Jersey City with New York and permit the entry of railway trains to the heart of the metropolis, was begun in 1880, after seven or eight years of litigation. It was proposed to construct two oval single-track tunnels of brick, but, money failing, one was suspended, and work upon the other continued at intervals as money could be obtained until 1886, completing some 1,800 feet of tunnel. This work was executed through the soft river silt by the use of compressed air, and by lining

* Sir John Fowler's plan for the Humber tunnel was "built" by means of caissons with compressed air, as in sinking bridge foundations.

the excavation with thin plates of iron or steel, forming an air-tight surface, by means of which the compressed air supported the pressures of the exterior silt for a short time, enabling the brickwork to be built in 10-foot lengths inside the plates. A "pilot" tube was also used, 6 feet in diameter, of heavier plates, which was driven 20 feet to 40 feet ahead of the main excavation, and from the rear portion of which the thin lining-plates were supported by radial shores. The face maintained itself well under a well-regulated air-pressure, neither too great nor too small, for the short time it was exposed. In 1889 a loan was placed in London, under the terms of which the method of construction was changed. A shield was introduced and the tunnel was made circular, 18 feet in diameter, and lined with cast iron, in flanged segments, weighing about 8,000 lb. to the running foot of the tunnel. The rate of progress, which under the former system had averaged about 3 feet a day and had never exceeded 5 feet, was increased to 10 feet; but many expenses had been incurred in constructing and erecting the shield, closing leaks from the river preparatory to the erection of the shield, etc., and after building about 2,000 feet, and when only about 1,700 feet of the north tunnel remained to be built, the loan was exhausted and operations were suspended.

When in 1889 construction by means of a shield was decided upon, it was required to erect the shield at the end of the finished tunnel, 2,000 feet from the shore. To accomplish this a chamber had to be constructed large enough to permit the shield to be put together, much larger than the former tunnel, and this by a method which had been discarded as dangerous. In the construction of this chamber a fall occurred and the river broke in. When the break was closed and the chamber finished mechanics could not be procured who would work in compressed air, and the shield was put together and riveted or bolted up by common labor. By the break and the means taken to close it the silt in proximity to the site was disturbed and softened, and much trouble arose from this cause, aggravated by the great weight of the shield. As the work progressed, however, the silt became more firm, and no further difficulty was experienced up to the abandonment of the work.

The Hudson tunnel was the first of large size in which compressed air was used. It had previously been employed by Hersent, in constructing a small connecting tunnel at the Antwerp dock works.

diameter 25 feet, and for 821 feet 25 ft. 4 in. The whole length of iron-lined tunnel is 3,083 feet, of which 1,212 feet is under the water of the river, with in one place but 5 feet of cover (sand and gravel) over it; 1,382 feet at both ends is covered way, and 1,625 feet is open-walled trench. The entire length of the work is thus 6,090 feet.

The shield is a cylindrical shell 27 ft. 8 in. in diameter, and 19 ft. 6 in. long, with two diaphragms. The part in the rear of the first diaphragm is the tail of the shield. In front of this diaphragm is an inner skin or shell, strongly connected to the outer shell, from which it is distant 19 inches. The two skins are brought together to form the cutting edge. The space is divided horizontally by three platforms, forming four stages, from which the face of the work may be attacked. There are also three vertical partitions. The front part of the shield is thus divided into twelve compartments. Air-locks are formed in the space between the diaphragms, and in front of the front diaphragm, and some 6 feet back from the cutting edge, a vertical screen depends from the top of each compartment. The space between this hanging screen and the front diaphragm forms a safety-chamber for the men in case of a sudden irruption of water. The water will not rise in the inclosed space, being held back by the air, as in a diving-bell, and the men may keep their heads above water until relieved. The shield is pushed forward by hydraulic rams, placed in the annular space between the inner and outer shells, and they push against the cast-iron shell of the tunnel. Total pressure available, 2,800 tons. The material excavated is carried through the diaphragm by the shoots, which are also air-locks. The cast-iron segments forming the lining are erected inside the shield; the tail of the shield thus surrounds the last ring put in place. The segments are lifted into place by a hydraulic erector, such as was used in the Hudson tunnel. The air-locks in the shield are for exceptional occasions. A brick bulkhead across the tunnel contains large air-locks of the usual form.

No unexpected difficulties have been encountered (1895). Before reaching the river, while working without compressed air, the cutting edge of the shield at the bottom was damaged by contact with some hard body. A bottom heading was driven into the sand in front of the shield, timbered in the usual way, and a bed of concrete formed to fit the bottom of the shield, upon which it was slid forward until it reached the shaft, where the damage was repaired. In passing through the pure ballast (sand and gravel) the bottom of the river was first covered with a bed of clay 10 feet thick and 75 feet wide on each side. This to a large extent prevented the escape of the air, and also the run of the ballast. A similar plan is provided for the Hudson tunnel when work on it is resumed, there being but 7 or 8 feet of silt between the tunnel and the water in passing under the channel of North river, 62 feet deep. Additional quantities of air-pressure also were required at Blackwall when working in ballast to provide for that escaping to the river.

The East River Gas Tunnel, New York.—In view of the high price of real estate in New York, and the numerous objections to the establishment of gas-works in the heart of the city, the East River Gas Company established its works in Long Island City, and constructed a tunnel under the East river through which to convey its product to New York. The tunnel built in 1892-94 is circular, 10 ft. 2 in. in diameter, and 2,516 feet long. It passes under Blackwell's island and both channels of the river at a depth of 109 feet below high tide, and 41 feet under the deepest part of the river. The few borings made indicated that the tunnel would lie entirely in solid rock, but when the heading had advanced 360 feet from the New York shaft a stratum of decomposed rock was met, very soft, with streams of water between it and the adjoining hard rock. The water washed the soft material into the tunnel, forming large cavities overhead. At this juncture compressed air was introduced, and the soft stratum, 29 feet thick, was crossed by using steel roof-plates, after the manner of the first work on the Hudson tunnel, and lining with brickwork. About 80 feet beyond this section a large mass of soft black mud was encountered, and here a shield was introduced, and the lining was made of cast-iron segments, planed on all joints and placed to break joints. The brickwork which had been built across the preceding soft seam was not water-tight, and the iron lining was extended inside of it. About 380 feet of tunnel under the New York channel was lined with cast iron, and two seams, together 128 feet thick, under the Brooklyn channel were similarly protected. The rest of the tunnel was lined with brickwork.

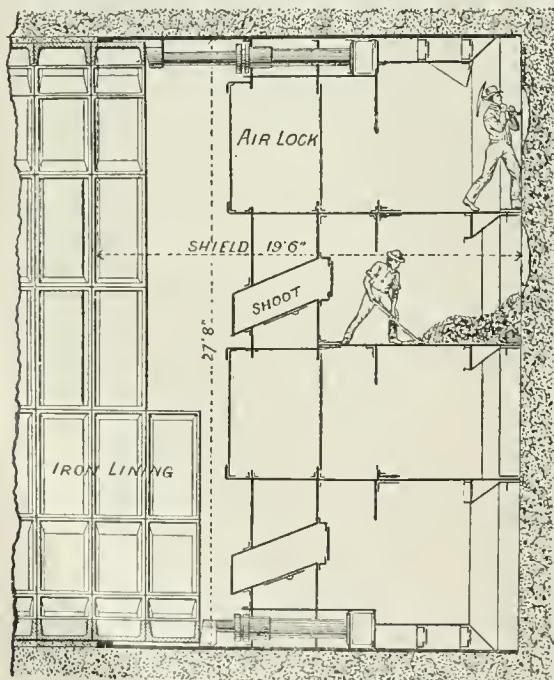

FIG. 5.—Section of shield, Blackwall tunnel, London.

The largest of the subaqueous tunnels is the Blackwall carriageway tunnel under the Thames, at London, which in 1895 was about half completed. The outside diameter of the iron-lined portion is 27 feet, and the cast-iron rings of the shell are 10 and 12 inches deep, making the interior di-

Special Cases in Tunneling.—The tunnel of Braye-en-Laonnais, in France, passed through a clay containing pyrites and lignites, overlaid by water-bearing sand which dipped at one point into the tunnel. The compressed air (27 to 28 lb. to the square inch) which was required to pass this point drove back the water and oxidized the pyrites. The heat of oxidation was sufficient to ignite the lignites, the gas from which entered the tunnel and asphyxiated seventeen men. Wells were sunk from the surface to furnish outlets for the gas, and by a rapid ventilation, using a great volume of compressed air, the tunnel was rendered safe for the workmen until the sand was passed and the air was taken off. The water in the sand returned and extinguished the fire, but the water leaking through the arch was warm for six months afterward.

The tunnel of Père-Ternère, in the Pyrenees, lies in a schistose rock inclined about 35°, the layers of which are separated by thin layers of fine green clay, as slippery as soap when moist. The top heading, 6½ by 6½ feet, was completed, and for 180 feet from the Spanish end the bottom of the heading had been sunk below the level of the springing line of the arch. After a long-continued rain the layers cut by the excavation began to slip into the tunnel, crushing the heavy timbering. Work was suspended and the case was studied. The movement continued. Finally, the arch was built in short lengths, 6 feet thick at the portal, 4 feet at the inner end of the disturbance. When the arch was completed, the bench being undisturbed, the right side wall was built in pits excavated in short lengths under the arch. It was made 5½ to 7 feet thick. The attempt was then made to drift for the left side wall, but the ground began to move as soon as the strata were cut, and the method was abandoned. Narrow cross-cuts the whole width of the tunnel were then made, 80 feet apart, and in them the invert and left wall were completed. Intermediate cross-cuts were made and built in and this method was continued until the masonry was completed.

The Boston subway for rapid transit is built of vertical steel beams connected by concrete arches with vertical axes, convex on the outside, to take the pressure of the outside earth. Steel beams, with brick or concrete arches, also form the roof. The tunnel is to be used by electric cars. The use of iron is not to be recommended in tunnels used by locomotives operated with steam.

The use of "lock bars," steel needles, or "poling-boards" is an improvement upon the crown-bar method. Steel beams, 2 or 3 inches deep, rolled of a shape to lock together, replace the heavy timbers of the older system. They are drawn forward by screws or hydraulic jacks, by twos or threes, and supported at intervals by wooden frames the shape of the outside of the arch, one end resting on the completed brickwork. Grout may be injected behind them as they are drawn forward, but the space they leave is so small that the settlements therefrom may be neglected, except in special cases. A tunnel built in London by this method, with but 5 feet cover, has caused no appreciable settlement of the surface.

FIG. 6.—Glasgow Harbor tunnel, interior.

Where shields are used they must be adapted to the character of the excavation. The London and Glasgow subways are generally in clay, with very little water, and the men worked in front of the shields. This method was also used in the Mersey water-works tunnel, where the material was

very soft and full of water. It was made practicable only by a very nice adjustment of the air-pressure, and there was a constant escape of air through the porous material. In the Hudson tunnel this method would not have been without risk, and the soft material was permitted to flow through the doors of the shield as it was pushed forward. The passage of air through the silt softened it and increased the risks of the work.

The boldest tunnel that has been projected is the Channel tunnel, designed to connect England with the continent of Europe, passing under the Straits of Dover, having a length between shafts of over 21 miles. The project was approved by such eminent engineers as Sir John Hawkshaw and Sir James Brunlees in England, and Thomé de Gamond and Alexandre Lavalley in France, but is for the present in suspense, powers to construct having been refused by Parliament at the suggestion of Gen. Sir Garnet (now Lord) Wolseley and other leading officers of the British army, as exposing their island to invasion from France.

Tunny [dimin. of O. Fr. *ton*, *thon* < Lat. *thunnus*, *thynnus* = Gr. *θύσνος*, *θύσνος*, tunny; cf. *θύβαλον*, to dart]: the largest member of the mackerel family (*Scombridae*), known on the coast of the U. S. as the horse-mackerel. It is a heavily built fish, tapering rapidly to the pointed head and slender base of tail. The dorsal and anal fins, as in the mackerel, are followed by six to nine finlets; it reaches a length of 9 or 10 feet, and a weight of 1,000 lb. The tunny occurs on both sides of the Atlantic and ranges to Tasmania, and has been the object of extensive fisheries in the Mediterranean from time immemorial. See FISHERIES. P. A. LECAS.

Tunstall: market-town of Staffordshire, England; in the parliamentary borough of Newcastle-under-Lyme (see map of England, ref. 8-6). It has several public buildings, including a town-hall (1884), market, and court-house, and has extensive manufactures of pottery, tiles, and iron. Pop. (1891) 15,730.

Tunstall, or Tonstall, Cuthbert, D. D., LL. D.: b. at Hatfield, Yorkshire, about 1475; entered Baliol College, Oxford, about 1491; removed thence to Cambridge, where he was chosen fellow of King's Hall, now Trinity College; studied at Padua, where he took the degree of Doctor of Laws; became vicar-general to Archbishop Warham and rector of Harrow-on-the-Hill 1511, prebendary of Lincoln 1514, archdeacon of Chester 1515, and master of the rolls 1516; was sent 1516-17 to Brussels with Sir Thomas More as joint ambassador to Charles I. of Spain (afterward Charles V.), with whom they concluded two treaties; made there the acquaintance of Erasmus; became prebendary of York 1519, prebendary and dean of Salisbury 1521, Bishop of London Oct., 1522, Lord Privy Seal May, 1523, ambassador to Spain 1525; accompanied Wolsey to France July, 1527; was a plenipotentiary to negotiate the Peace of Cambrai 1529; bought up Tyndale's New Testaments at Antwerp and burnt them in Cheapside 1529; became Bishop of Durham by papal bull Feb. 21, 1530; concurred in most of the ecclesiastical reforms of Henry VIII. and those of the first years of Edward VI., but was deprived of his bishopric and sent to the Tower on a charge of treason Oct., 1552; was restored by Mary, and conducted himself with great moderation during her reign, allowing no persecution within his diocese; was again deprived by order of Queen Elizabeth July, 1559, in consequence of having refused to take the oath of supremacy, and was committed to the custody of Dr. Parker, Archbishop of Canterbury. D. at Lambeth Palace, Nov. 18, 1559. He was described by Erasmus as "a man who outdid all his contemporaries in the learned languages"; was the inventor of a species of technical memory, and author of *De Laudem Matrimonii* (1518); *De Arte Supputandi* (Lut. Bat., 1522), one of the first books of arithmetic printed in England; *De Veritate Corporis et Sanguinis Domini Nostri Jesu Christi in Eucharistica, Libri II.* (Paris, 1554, 1559) an

elaborate defense of transubstantiation; *Compendium in X. Libros Ethicorum Aristotelis* (Paris, 1554); *Contra Impios Blasphematores Dei Prædestinationis Opus* (Antwerp, 1555); etc. Revised by S. M. JACKSON.

Tu'pac Ama'ru: an Inca or chief of the Peruvian Indians; b. in Cuzco about 1544. He was the youngest son of Manco Inca, who after his final struggle with the Spaniards had retired to the Vilcabamba Mountains and kept up a semblance of sovereignty until his death. By the death of his elder brother, Tupac Amaru became the legitimate sovereign of Peru, and was so recognized by the Indians, though he was a mere boy; he avoided the Spaniards, but was not hostile to them. The viceroy, TOLEDO (*q. v.*), regarded him as a possible inciter of insurrection, and, under pretense that he had been involved in the murder of a priest, sent an expedition against him. He was captured, taken to Cuzco, and beheaded there about Dec., 1571. At the execution he prevented a revolt by using his authority over the Indians, and it is related that thousands of them came at night to do reverence to his head. HERBERT H. SMITH.

Tupac Amaru II. (called the last of the Incas): revolutionist; b. at Tinta, near Cuzco, in 1742. His real name was José Gabriel Condoreanqui, and he was descended from the ancient Incas; he was a man of education and some wealth, and, in accordance with the colonial custom, was the recognized chief of several Indian villages, subject to the viceroy. His Indian name was assumed in 1771. At that time the system of forced labor practically held the poorer Indians in a condition of slavery. After vainly seeking redress he headed a rebellion in Nov., 1780. The Indians, who universally regarded him as their Inca, flocked in thousands to his standard. At one time he had a force of 80,000, and held all the country between Cuzco and Lake Titicaca; even the Indians of New Granada and Paraguay were in secret sympathy with him, and a complete overthrow of Spanish power was threatened. But his army was undisciplined and almost without arms, and after a gallant struggle he was defeated and captured Mar., 1781. By sentence of the judge Areche he was torn to pieces by horses at Cuzco, after witnessing the torture and death of his wife and nearly all his relations, May 15, 1781. His brother Diego held out for some time longer, and was pardoned on condition of disbanding his forces, but was subsequently tortured and killed. In the effort to extirpate the whole Inca race, Tupac Amaru's son, a child of ten years, was spared, but was sent a prisoner to Spain; his fate is unknown, though a person claiming to be him appeared in South America in 1828, and was given a pension. HERBERT H. SMITH.

Tupac Yupan'qui, or Tupac Inca Yupanqui: the most renowned of the Inca sovereigns of Peru; succeeded Pachacutec Yupanqui about 1440. His reign was marked by a long series of successful wars, by which he annexed the coast region to the Gulf of Guayaquil, Northern Chili, Chareas, or Bolivia, etc. Tribes as far S. as Tucuman tendered submission to him, and it is said that he sent out an expedition on rafts which discovered the Chincha islands. D. at Cuzco about 1478. H. H. S.

Tupaia: See TUPAIDE.

Tupaia'idæ [Mod. Lat., named from *Tupa'ia*, the typical genus, from a native name]: a family of mammals of the order *Insectivora* and sub-order *Animalivora*, peculiar to the East Indies and neighboring islands. In form they resemble the squirrels: the head, however, runs out in a pointed snout; the pelage is soft and abundant; the hind legs are notably larger than the front ones, and all have five well-developed toes; the tail is long. The family embraces mammals about the size of squirrels; like the squirrels, the tupaias live chiefly in trees; their resemblance to the squirrels has obtained for them in certain places the same name, the native word "tupaia" being applied to the animal in question and to true squirrels as well. The species are most abundant in the islands of Sumatra, Borneo, and Java. They are generally grouped in two genera, *Tupaia* and *Phloeocercus*. They are truly insectivorous. THEODORE GILL.

Tu'pelo: See GUM-TREE.

Tupelo: town; capital of Lee co., Miss.; on the Old Town creek, and the Kan. City, Mem. and Birm. and the Mobile and O. railways; 45 miles S. by W. of Corinth, and 50 miles E. of Oxford (for location, see map of Mississippi, ref. 4-II). It is in an agricultural region, and contains 8 churches, 2 public-school buildings, about 40 artesian wells, foundry and machine-shops, cotton-compress, steam-gin, 2 mills,

furniture and spoke factories, a national bank with capital of \$50,000, a State bank with capital of \$80,000, and 2 weekly newspapers. Pop. (1880) 1,008; (1890) 1,477; (1895) estimated, 2,000. EDITOR OF "JOURNAL."

Tupís, or Tupys, too-pee-z': a general name for numerous Indian tribes of Brazil. They form part of the great Tupi-Guarany race, which before the appearance of the whites occupied much of Brazil and Paraguay, as well as neighboring regions now included in Uruguay, the Argentine Republic, Bolivia, Peru, Venezuela, Colombia, and Guiana. Those of Paraguay were collectively called Guarany's, but they did not materially differ from the others. The Tupís were divided into a multitude of tribes which are known by different names, as Tupinambás, Tupiniquins, Caetés, etc. Nearly all of these were closely allied by language and customs; but they had no tribal connection, and were often at war with each other. They were scattered, generally along the coast and great rivers, frequently separated by tribes of other stocks. All were agriculturists and had fixed villages, but otherwise they were little advanced. They went naked, painting their bodies; the prisoners taken in war were sacrificed and eaten, at least by some tribes. Most of the Tupís received missionaries soon after the Conquest. Their tribal divisions have been lost, except in a few cases; but their descendants, mixed with Negro and white blood, form the bulk of the country population. Their language was adopted by the missionaries, and in modified form became the *lingua geral*, long the common tongue in the interior of Brazil. It is still spoken on the upper Xingú and Tapajós. HERBERT H. SMITH.

Tupper, Sir CHARLES, D. C. L.: statesman; b. at Amherst, Nova Scotia, July 2, 1821; graduated as a physician at Edinburgh in 1843. He was appointed governor of Dalhousie College, Halifax, by act of Parliament in 1862; was president of the Canadian Medical Association from its formation in 1867 until 1870; and is a director of the London board of the Bank of British Columbia. He represented Cumberland in the Nova Scotia Assembly 1855-67; same constituency in the Parliament of Canada 1867-84 and 1887-88; was a member of the executive council and provincial secretary of Nova Scotia in 1857-60 and 1863-67; and prime minister of that province 1864-67. He was president of the Privy Council of Canada 1870-72; Minister of Inland Revenue 1872-73; Minister of Customs in 1873; Minister of Public Works 1878-79; Minister of Railways and Canals 1879-84; and Minister of Finance from Jan. 27, 1887, until May 24, 1888, when he was appointed high commissioner for Canada in London. He was a delegate to Great Britain on public business from Nova Scotia 1858 and 1865; from the Dominion Government relative to the Nova Scotia difficulty in 1868; was leader of the delegation from Nova Scotia to the union conference at Charlottetown in 1864, to that at Quebec the same year, and to the final colonial conference in London to complete the terms of union 1866-67. He was appointed executive commissioner for Canada at the International Exhibition at Antwerp in 1885; of the Colonial and Indian Exhibition, London, 1886, of which he was appointed royal commissioner by the Queen; and was one of the British plenipotentiaries to the fisheries conference at Washington in 1887. He received the honorary degree of D. C. L. from Cambridge in 1886; was knighted in 1879, and made a baronet in 1888. In Apr., 1896, he succeeded Sir Mackenzie Bowell as premier of Canada, but held office only until July, when the liberals came into power with Wilfrid Laurier as premier. NEIL MACDONALD.

Tupper, Sir CHARLES HIBBERT, K. C. M. G.: cabinet minister; second son of Sir Charles Tupper; b. at Amherst, Nova Scotia, Aug. 3, 1855; educated at McGill and Harvard Universities, and admitted to the bar in 1878. He was first returned to the Dominion Parliament in 1882; re-elected in 1887 and 1891, and by acclamation after his appointment to office. He became a member of the Privy Council of Canada and was appointed Minister of Marine and Fisheries May 31, 1888; was appointed queen's counsel Aug. 2, 1890. He acted as British agent in the Bering Sea arbitration case between the Governments of the U. S. and Great Britain at Paris in 1893. He was gazetted K. C. M. G. in 1893. NEIL MACDONALD.

Tupper, MARTIN FARQUHAR: poet; b. in London, England, July 17, 1810; educated at the Charterhouse School and at Christ Church, Oxford, where he graduated 1831; studied law, and was called to the bar at Lincoln's Inn, but never practiced; published anonymously a volume of poems

(1832), and in 1838 issued the work by which he is best known, *Proverbial Philosophy* (second series, 1842; third, 1867). This had a prodigious circulation in England, and over 500,000 copies were sold in America. It was, notwithstanding, a very commonplace piece of work, and Tupper became a favorite butt for the ridicule of the critics and a proverb for platitudes and inanity. He wrote other volumes of prose and verse: *Hactenus, a Budget of Lyrics; Ballads for the Time; Stephen Langton, or the Days of King John; Probabilities, an Aid to Faith; My Life as an Author* (1886). In 1851 and 1876 he visited the U. S., and in 1875 wrote a drama in honor of the centenary of American independence. D. at Albury, Surrey, Nov. 29, 1889.—His three daughters published in 1864 a volume, *Poems by Three Sisters*, and contributed to Dr. Roger's *Lyræ Britannicæ*.
Revised by H. A. BEERS.

Tuquerres, too ker-res; town of the department of Cauca, Colombia; near the frontier of Ecuador; on a high plateau of the Andes, 10,200 feet above sea-level. It covers a wide area, but is composed mainly of thatched huts; the climate is cold (mean, 55° F.). It has a considerable trade, Pop. about 8,000. The quiescent volcano of Tuquerres, near here, rises to 13,350 feet, and is said to be composed almost entirely of sulphur.

Turanian Languages: See LANGUAGE.

Turbellaria [Mod. Lat., double dimin. of Lat. *turbo*, a whirling, whirlpool, or *turba*, crowd, tumult]: a group of flat-worms, PLATHELMINTHES (*q. v.*), which are so called from the fact that the motile cilia covering the body create small vortices in the water. Unlike the other flatworms (Trematodes and Cestodes), only a few of the group are parasitic, but most of them lead free lives, either in the ocean or in fresh water, a few living in moist earth. The body is usually flat and oval in outline. A mouth is always present, but its position varies; it may be in front, median, or behind the middle of the ventral surface. The alimentary tract is in some a solid rod of digestive cells, in others a cavity occurs, but a vent is never found. The character of the alimentary tract is, with other features, used as a basis of classification. In the *Polycladea* the digestive organs are many-branched, the terminal branches reaching to almost all parts of the body. In the *Tricladæ* there are but three primary branches to the digestive tract, one branch being anterior and median, the others paired and posterior. In the *Rhabdocalida* the tract is straight and rod-like, and either solid or hollow. The nervous system consists of a central portion or brain, usually anterior in position, from which nerves arise; and in many there are eyes near the brain. There is no body cavity, but delicate excretory tubules run through the body, the external openings varying in different groups. Circulatory organs are absent. There are a few Rhabdocalida in which reproduction by transverse division occurs, but in most species the sexual method is the only way of perpetuation of the species. The sexual organs are quite complicated. Some forms develop directly into the adult, while others pass through a larval stage.

The *Turbellaria* are the most primitive of the flatworms, and from a triclad form the passage to the Trematodes is easily made. By many the *Turbellaria* are regarded as nearly allied to the Ctenophores. See Graff, *Monographie der Turbellarien (i. Rhabdocaliden)*, 1882; *Organisation der Turbellaria Acota* (1891); Lang, *Die Polycladen des Golfes von Neapel* (1884).
J. S. KINGSLEY.

Turberville, GEORGE; poet; b. at Whitechurch, Dorsetshire, England, about 1530; was educated at Winchester School and at New College, Oxford, where he obtained a fellowship 1561; studied law at one of the inns of court, London; accompanied Sir Thomas Randolph to Russia as his secretary, and wrote three poetical epistles descriptive of that country, which were printed in Hakluyt's *Voyages* along with Randolph's narrative. He published *Epitaphes, Epigrams, Songs, and Sonets* (1565; enlarged in the edition of 1570, and several times reprinted in the nineteenth century); *Heroicall Epistles of the Learned Poet Publins Ovidius Naso, in English Verse* (1569); *The Booke of Fauconrie, or Hawking* (1575); *The Noble Art of Venerie, or Hunting* (1576); *Tragical Tales, translated out of the Italian* (1576); and left a MS. translation of Tasso's *Jerusalem Delivered*, now in the Bodleian Library. D. about 1600.
Revised by H. A. BEERS.

Turbine [= Fr. *turbine*, from Lat. *turbo*, *turbans*, anything that whirls around, wheel, top, whirlwind, deriv. of *turba* re, throw into confusion, disturb]: a water-wheel in

which the water enters and leaves at all points around the circumference, acting both by its impulse and reaction. Turbines are usually horizontal wheels turning upon a vertical axis, but some forms are vertical and revolve upon a horizontal axis.

The reaction wheel (see BARKER'S MILL) was an early form of the turbine, although an inefficient one. The first

FIG. 1.

real turbine, however, was invented in France by Fourneyron, who received a prize of 6,000 francs for the design in 1833. A modification of this, called the Boyden turbine, has been extensively used in the U. S. Fig. 1 shows a vertical section of the Boyden turbine with its shaft and penstock. The water approaches the wheel by the curved penstock, P, is given a rotary motion by the fixed guide, G, through which it enters the wheel, W. Fig. 2 is an enlarged horizontal section showing the guides, G, and the vanes, W, the latter being rigidly attached to the wheel. Under the action of the impulse and reaction of the water the entire outer annulus, W W, which constitutes the wheel proper, revolves and carries with it the shaft by means of the connecting arms, m. At R is seen a governor for regulating the speed.

FIG. 2.

The theoretic work of a turbine is the product of the weight of water which passes through it, and the height of fall from the head-race to the tail-race; in Fig. 1 this fall is designated by A B. The work actually utilized, however, is usually only from 70 to 80 per cent. of the theoretic work, the remainder being lost in friction, foam, and leakage. For example, if a wheel discharge 8,000 lb. of water per second with a fall of 11 feet, the work per second is 88,000 foot-pounds, and the theoretic horse-power is 160; if the wheel have an efficiency of 75 per cent. there will be utilized 120 horse-powers. With very carefully constructed wheels efficiencies of 90 per cent. have been obtained.

The turbines of Fourneyron and of Boyden are called outward-flow wheels, as the water enters the wheel upon its inner circumference and is discharged upon the outer circumference. Another very common type is that of the inward-flow wheel, where the water enters upon the outer and is discharged at the inner circumference. Fig. 3 shows a horizontal section of such a wheel, in which, as before, G denotes the guide-spaces where the water enters and W the wheel-vanes. After leaving the wheel the water drops vertically down to the tail-race, having surrendered to the wheel the greater part of its energy.

FIG. 3.

Turbines of inward and downward flow, having the wheel-vanes made as warped surfaces, are also very common. In these the water enters horizontally through fixed guides, but after entering the wheel the warped vanes give it a

downward direction. Fig. 4 shows a vertical section of one of these wheels, the arrows indicating the direction of motion of the water, while Fig. 5 shows a portion of a horizon-

FIG. 4.

tal section through the guides and vanes. This compound motion of the water is not generally employed except for small wheels.

Another class of turbines is that of downward or parallel flow, in which the water moves downward without approaching or receding from the axis. Fig. 6 is an outline diagram showing the method of arrangement of such a turbine: the fixed guides are marked *a a*, while the moving wheel is designated by *b b*, the latter being attached to the revolving shaft, *C*. It is seen that this wheel is placed some distance above the tail-race and that a draft-tube, *A*, connects them. By this device the fall due to the total head can be utilized,

FIG. 5.

provided that the wheel is not more than 30 feet above the tail-water, as the atmospheric pressure due to this distance is added to the static head actually above the wheel. Fig. 7 is an enlarged vertical section of one side of this wheel showing the positions of the guides and vanes, while Fig. 8 is a side view showing the edges of two of the guides with their corresponding vanes. This form of wheel is frequently called the Jonval turbine.

FIG. 6.

The regulation of the speed and power of a turbine is effected by a gate for shutting off the water, and also by a governor. The most common form of gate is an annular one which can be depressed around the entire circumference of the wheel. In Fig. 2 this annular gate fits into the annular space between the guides and vanes. In Fig. 4 the gate is marked by *M*, and at *E*, on the left-hand side, is seen one of the rods by which it is moved. In Fig. 3 each of the guide-openings has a gate which moves horizontally on a hinge. In the downward-flow turbine of Fig. 6 the gate is near the lower end of the draft-tube at *G*. In all cases, except that of Fig. 6, the efficiency of the turbine is materially less when the gate is partly closed than when it is fully opened, on account of the eddies and foam which result from the sudden change in cross-section.

FIG. 7.

In an outward-flow turbine the discharge increases when from any cause the speed increases, while in an inward-flow turbine the discharge decreases if the speed increases. The first form

hence requires a governor, and it is also frequently used for inward-flow wheels. Fig. 9 shows a governor of the centrifugal-ball type which is so connected with the main shaft and with the gate of the turbine that the latter is partially closed when the removal of a portion of the work causes an increase in speed. In the large Niagara turbines (see below) this method of control is so effective that the speed can not increase more than 4 per cent, when 25 per cent. of the work is suddenly taken off from the wheel.

FIG. 8.

The weight of the turbine and shaft may be supported by a suspension box at the top of the shaft, as seen in Fig. 1,

but a more common method is that of a wooden step at the bottom of the shaft, as shown in Fig. 4, where a pipe, *f*, is provided through which water is forced to prevent the heating of the bearing by friction. In Fig. 10 a form of step is shown where the shaft, *c*, revolves on a hemispherical seat, *b*, and lubrication is insured by oil which enters through the pipe, *h*, and passes out through *l*. In the large Niagara turbines there is a thrust-bearing at the top, but the weight of the wheel and shaft is supported, when in motion, by the upward pressure of the water on a disk in the upper part of the wheel-case.

FIG. 9.

An impulse turbine is one in which the spaces between the vanes are not filled with water, and the velocity of the water when entering the wheel is that due to the head. A reaction turbine is one in which the spaces between the vanes are entirely filled with water, which at the same time is under a certain degree of static pressure; the velocity of the water when entering the wheel is then usually much less than that due to the head. Most turbines are built on the reaction principle, but when the gate is partially closed the spaces between the vanes are not filled and they become impulse turbines.

FIG. 10.

For every turbine there is a certain velocity, called the advantageous velocity, which gives the highest efficiency and power. This advantageous velocity can be ascertained by trial, or it may be approximately computed theoretically when the angles which the guides and vanes make with the direction of motion are known. These angles are controlling factors in the design of turbines, and they are materially different for the two classes of impulse and reaction turbines. A common method is to arrange these angles so that the advantageous velocity shall be that due to half the total head of water.

The large turbines installed in 1894 and 1895 by the Cataract Construction Company, for the utilization of a portion of the power of Niagara Falls, are the most powerful ever built. Three turbines have been erected, each of 5,000 horse-power, and the entire plant is intended to include ten such turbines. Each turbine consists of two outward-flow wheels attached to the same shaft. Fig. 11 shows a vertical section of the lower wheel, the other being 11½ feet above it; the fixed guide spaces are marked *G*, while the wheel itself is marked *W*. The gate in this case, designated by *E*, is on the outside of the wheel. The water is brought to the turbine through a steel penstock, 7½ feet in diameter, and the mean head is 136 feet. The wheel itself is 63 inches in diameter, and, as shown in the figure, it is divided into three stages by two horizontal partitions. The advantageous speed is 250 revolutions a minute, and the discharge about

13,800 cubic feet a minute. These wheels are of the reaction type, the spaces between the vanes being full of water for nearly all positions of the gate. They were designed by

FIG. 11.

a Swiss firm, after an international competition in which engineers of five countries participated.

The theory of turbines is an extensive subject on which many volumes have been written. The fundamental principles of the theory are, first, that the water should enter the wheel without shock or foam; and, second, that it should leave the wheel with as small an absolute velocity as possible. The first requirement is fulfilled by giving proper angles to the guides and vanes at the circumference where the water enters; thus in Fig. 2, if ce represent the absolute velocity of the entering water and cb the velocity of the wheel, the line cf will represent the velocity of the water relative to the wheel, and its direction will determine the entrance angle of the vanes. The second requirement is fulfilled by making the vanes cut the exit circumference at a small angle. As usually built the loss of energy in a turbine due to the absolute velocity of the escaping water is about 6 per cent. In axle friction about 3 per cent. is lost, while the resistance of friction to the water in passing through the wheel, together with foam and leakage, gives a loss of from 5 to 15 per cent. On account of their small size, cheapness, efficiency, and adaptability to both high and low heads, turbines are used more extensively than all other forms of hydraulic motors.

A very full descriptive and theoretical discussion of turbines is given in Meissner's *Dre Hydraulik*, vol. ii. (Jena, 1878). See also Francis's *Lowell Hydraulic Experiments* (New York, 1884); Bodmer's *Hydraulic Motors, Turbines, and Water Pressure Engines* (London, 1889); and Merriman's *Treatise on Hydraulics* (New York, 1895). See HYDRAULICS and WATER-WHEELS. MANSFIELD MERRIMAN.

Turbot: a large flatfish, the *Psetta maxima*, of the North Sea and adjacent waters; highly esteemed as a food-fish. It is, next to the halibut, the largest flatfish of European waters, reaching a length of 3 feet and a weight of 30 or 40 lb. The general color is brown, with lighter shadings. The true turbot does not occur on the coasts of North America, but on the eastern side the name is bestowed on *Bothus maculatus* and in California on *Hyppossetta maculata*. Both are medium-sized flounders of indifferent flavor, and both are common. See FISHERIES. F. A. LUCAS.

Turdidae [Mod. Lat., from *Turdus*, the typical genus, from Lat. *turdus*, thrush]; a family of birds containing the thrushes and allied forms. They are oscines with ten primaries, having a "booted" tarsus—i. e. the front covering of the tarsus entire for the greater part of its length; the young in their first plumage are more or less spotted. The robin and wood-thrush of the U. S. and the blackbird and song-thrush of Europe are typical thrushes. F. A. L.

Turenne, tū'ren, HENRI DE LA TOUR D'AUVERGNE, Vicomte de; soldier; b. at Sedan, department of Ardennes, France, Sept. 11, 1611; a son of Henry, Duke of Bouillon, and Elizabeth, a sister of William I. of Nassau-Orange; was educated by his uncle, Maurice of Nassau, and entered the French army in 1630. During the Thirty Years' war he distinguished himself in subordinate positions in the campaigns in Germany and Italy; received an independent command in 1611; conquered Roussillon in 1612; was created a marshal of France in 1644, and contributed much to the conclusion of the Peace of Westphalia in 1648 by his successful campaigns in Germany and Flanders. In the wars of the Fronde he first sided with Condé, but having

been defeated at Bethel in 1650 and driven out of France, he became reconciled with the court; was appointed commander-in-chief of the royal troops; defeated Condé at Guen, and nearly destroyed his army at the Faubourg St. Antoine in 1652, the Spaniards at Arras 1654, and Condé and the Spaniards in the Dunes 1658; and was made a marshal-general in 1660. In the war of the Spanish Netherlands (1667) he conquered Flanders in a brilliant campaign in which the king, Louis XIV., accompanied him, and in the war with Holland (1672) his fame reached its culmination by his conquest and devastation of the Palatinate in 1671 and the victories at Sinzheim (1674) and Türkheim (1675). He was preparing for a last and decisive encounter with Montecuccoli, when he was killed by a cannon-ball during a reconnaissance near Sasbach, July 27, 1675. He is considered the greatest general France has produced, next to Napoleon. *Turenne* (general *Mémoires*, comprising the period from 1643 to 1678, published by Grinard in 2 vols. (1782). Deschamps, an officer of his staff, published some *Mémoires* in 1687 (new ed. 1756). His *Life* has been written by Ramsay (1733; trans. into English 1735), Raguenet (1738; new ed. 1877), Durny (5th ed. 1889), Hozier (1885). See also Neuber (Vienna, 1860), Roy (Paris, 1884), and Chappin (Brussels, 1888) for accounts of his military career. Revised by F. M. COLBY.

Turf: See HORSE-RACING.

Turgénev, too'gá-nyef': the name of several celebrated Russian authors. (1) ANDREI IVANOVICH, b. at Simbirsk in 1784; traveled in Germany, Italy, France, and Denmark to make investigations concerning the medieval history of Russia, and published *Historia Russia Monumenta* (2 vols., St. Petersburg, 1841-42), and a *Supplementum* (1848). D. at Moscow, Dec. 15, 1845.—(2) His brother, NIKOLAI IVANOVICH, b. in 1790; studied at Göttingen; was, with Baron von Stein, placed at the head of the administration of those German countries which in 1813 were reconquered from France; studied subsequently the state of the serfs in Russia; was implicated in the conspiracy of 1825 and condemned to death, but escaped, and lived afterward in Paris. D. in Paris, Nov. 1871. He wrote *La Russie et les Russes* (3 vols., Paris, 1847).

Turgénev, IVAN SERGEEVICH; novelist; b. in the city of Orel, Russia, Oct. 28 (Nov. 9), 1818. He was partly brought up at home, but completed his education at Berlin (1838). In 1852 for his *Letter on Gogol*, although it had been passed by the Moscow censor, he was arrested and banished for two years to his estate. From 1863 to his death he lived abroad, chiefly at Baden Baden and Paris. Still he made frequent visits to Russia, and suffered not a little from homesickness in spite of the fact that he was on intimate terms with Flaubert and many others of the French writers of his day. In his ideas he was a *Zapovednik*, or admirer of Western Europe, for which, and for his residence in a foreign country, he was violently attacked by ardent Slavophiles. Turgénev made his literary *début* with some verses (1841), but, though in the years that followed he wrote several pretty pieces, he does not rank high as a poet. His dramatic attempts, too, were failures. His earliest prose story, *Andrei Kolosov* (1843), did not attract great attention, but its successors were more fortunate. In 1847 appeared *Khor and Kalinych*, the first of his *Zapiski Okholnuka* (Tales of a Sportsman), which continued for four years and put him in the front rank of living authors. These were followed by other stories and sketches almost equally successful; in 1852 *Dimitri Rudin*, the first one long enough to be called a novel; in 1859 *Dvorianskoe Gnezdo* (A Nest of Noblemen, in some translations called *Lisa*); in 1862 *Nakanune* (On the Eve, in some translations called *Hélène*); in 1862 *Ottsy i Dety* (Fathers and Sons), perhaps his masterpiece; in 1867 *Dym* (Smoke); in 1877 *Nov* (New, in some translations *Virgin Soil*), and many smaller pieces, the last of which, his exquisite *Poems in Prose*, came out only just before his death, which occurred at Bougival, near Paris, Aug. 22 (Sept. 3), 1883. As a writer Turgénev is characterized by his keen realistic insight into the weaknesses of mankind, always showing, however, a lurking sympathy and tenderness. His characters are marvelously vivid and true to life, while his appreciation of the beauties of nature is profound. None of his stories is long. They lay, *patience*, unity, cohesion, and in both substance and style the mark of a great artist. They have been translated into many languages, into French largely by the author himself. A new English edition (7 vols.) by Mrs. Constance Garnett is being published. A. C. COLEMAN.

Turgot, tūr'gō : ANNE ROBERT JACQUES, Baron de l'Aulne; statesman and economist; b. in Paris, May 10, 1727; was educated for the Church, but gave up the ecclesiastical career in 1751; studied law and national economy; became noted as a liberal thinker and an advocate of religious toleration, and wrote several essays for the *Encyclopédie*. Early in his career he entered into relations with the physiocrats Quesnay and Gournay, whose views were in some points identical with his own, and whose influence had an important effect upon his economic policy. In 1761 he was appointed intendant—that is, governor—of the province of Limousin. His administration was eminently successful, and although his reforms were crippled by his egotism of the privileged classes and the stupidity of the unprivileged, they proved beneficial. In 1774 Louis XVI. appointed him Comptroller-General of France—that is, Minister of Finance—and he immediately went to work to save, if possible, the state from bankruptcy. His ideas were essentially the same as those subsequently adopted and carried out by the Revolution, and the courtiers, the nobility, the clergy, etc., raised a veritable storm around him. For some time, however, the king supported him faithfully. In 1775 a scarcity of grain occurred, which almost grew into a famine. The artificial barriers between the provinces of the realm, which trammelled the free trade in grain in the interior, Turgot abolished; he compelled the Parliament to acknowledge the measure, and the riots of the mob, excited by secret emissaries of the courtiers, were speedily suppressed by military power. But at this point the king failed him. Although he said that he himself and Turgot were the only two who loved France truly, yet he suddenly dismissed him in May, 1776. Turgot retired into private life, occupying himself with scientific researches. D. in Paris, Mar. 20, 1781. His *Œuvres complètes*, containing his essay on usury, on the best method of taxation, and *Réflexions sur la Formation et la Distribution des Richesses*, etc., were published by Dupont de Nemours in 9 vols. (1808-11), and often reprinted. His *Life* was written by Condorcet (1786) and Tissot (1862). See also A. Neymarek, *Turgot et ses Doctrines*, 1885. He is the author of the famous line on Franklin—*Eripuit celo fulmen sceptrumque tyrannis*. Revised by F. M. COLBY.

Tu'rin (Ital. *Torino*; Lat. *Augusta Taurinorum*): chief city of Piedmont, Northwest Italy; on the left bank of the Po; lat. 45° 4' N., lon. 7° 42' E.; elevation 784 feet above sea-level (see map of Italy, ref. 3-B). It is an industrial city, and makes silks, ribbons, lace, and bonnet-goods; also matches, leather, and tools. Its situation is picturesque. The town is so regularly laid out and built with so much uniformity as to be monotonous, but the constructions replacing the old ramparts and place of arms give some variety. The only building representing the architecture of the Middle Ages is the Madama Palace, a vast building flanked with towers, on Castello Place. The churches are very numerous, but not especially interesting. The city is especially rich in monuments raised in honor of celebrated Italians. The university is, next to that of Naples, the most frequented in Italy. Its library, now become national, has upward of 200,000 volumes and 3,000 MSS. The Egyptian museum of the Academy of Sciences is one of the best in the world, and the Academy of Fine Arts and the Royal Museum of Arms have fine collections. The climate of Turin is salubrious, but variable. The winter is cold and the spring inconstant. The mean annual temperature is 53°, and the mean annual rainfall 32 inches, with eighty-seven rainy days a year. It is the fourth city in size of Italy, is very modern in character, agreeable and full of business, rapidly growing, and affording charming sites for further expansion. Pop. of commune (1893) 335,900.

Turin owes its origin and name to a Celtic-Illyrian tribe, enemies of the Etruscans and faithful allies of Rome. Caesar established the colony from which the city grew, calling it *Colonia Julia*, afterward changed by Augustus to *Colonia Augusta Taurinorum*. Lying near the border of Italy, it has undergone many vicissitudes and had many different masters. It was the political capital of the duchy of Savoy, and later of the kingdom of Sardinia from the Napoleonic occupation to 1861; and from 1861 to 1865 capital of the kingdom of Italy. With the removal of the capital to Florence, and then in 1871 to Rome, it received a brief check to its prosperity, since overcome. MARK W. HARRINGTON.

Turkestan', or **Turkistan** [liter., country of the Turks; as *Turk* + Pers. *stan*, place, district, region]: a name of varying signification, political, linguistic, or geographic, but

always centering about the great interior basins of Asia, generally those of the Tarim river, of Lake Balkash, and of the Sea of Aral. The name is passing into disuse as a general term, but is still employed to designate Chinese and Russian Turkestan.

By Chinese Turkestan, sometimes Eastern Turkestan, is meant by Western geographers the basin of the Tarim, comprising all the southern part of the immense district called *Kansuh-Sin-kiang* by the Chinese. It is mostly a desert, very sparsely occupied, except in the extreme west in the vicinity of Kashgar, was in the path of the migration of nations, and has often changed masters. It was formerly called Little Bokhara by Europeans, Mogolistan during the empire of the Khans of Jagatai, and Kashgaria during the ephemeral domination of Yakub Beg (1878). When recovered by the Chinese it was given the name already mentioned, and meaning the "New Frontier of Kansuh."

The Russian general government of Turkestan was formed in 1867, and later modified so that it now consists of the three provinces of Syr-Darya, Ferghana, and Samarkand. Area, 257,134 sq. miles; pop. (1890) 2,670,035, of whom about 930,000 are Kirghiz, 800,000 Sarts, 400,000 Uzbeks, 353,000 Tajiks, 23,000 Russians (not including troops), and 1,000 Germans, Poles, etc. The capital is TASHKEND (*q. v.*), in Syr-Darya. The next cities in importance are Samarkand and Khojend. Less than 5 per cent. of Russian Turkestan is cultivable, and less than 3 per cent. is actually cultivated. The population is chiefly nomadic and pastoral. MARK W. HARRINGTON.

Turkey: a gallinaceous bird, domesticated in many civilized countries, but confined to North America until after

The turkey.

its discovery by Columbus. It was found in the forests from the Isthmus of Darien to Canada when the country was first settled, being then abundant even in New England. See MELEAGRIDDIE and POULTRY.

Turkey, or more properly the **Ottoman Empire**: an empire comprising large portions of Europe, Asia, and Africa, and having its political center and capital at Constantinople, a city on the Thracian Bosphorus. Politically, geographically, ethnographically, and ecclesiastically, the Ottoman empire is an incongruous bundle of heterogeneous elements. Its territorial possessions may be grouped as direct and indirect. The direct are under the immediate authority of the sultan, whether governed by the common law of the empire or enjoying certain concessions and hence called privileged. To the latter class belong the communities of the Mirdites, Mt. Athos, Zeitoun in Asia Minor, the Lebanon, and Crete. The indirect are vassal provinces, nominally part of the Ottoman empire, but either administered by some foreign power or practically independent. These are Bosnia and Herzegovina, placed by the treaty of Berlin (1879) under the military occupation and civil administration of Austria-Hungary; Cyprus, by secret treaty of June 4, 1878, between Great Britain and Turkey, assigned to

Great Britain to be occupied and administered by her so long as Russia holds Batoum, Ardahan, and Kars; Tunis, occupied by France in 1881; Egypt, since 1882 under the military occupation and control of Great Britain; Bulgaria, created by the treaty of Berlin a tributary principality; Eastern Roumelia, by treaty of Berlin made an autonomous province subject to the sultan, but by revolution (1886) united to Bulgaria. See BOSNIA, CYPRUS, TUNIS, EGYPT, and BULGARIA. This article deals only with the direct possessions which constitute the empire.

Turkey in Europe occupies the central portion of the Balkan peninsula. It lies between 42° 50' and 38° 56' N. lat. and 19° 20' and 29° 10' E. lon. It is bounded N. by Montenegro, Bosnia, Servia, Bulgaria, and the Black Sea, E. by the Black Sea and Bosphorus, S. by Greece, the Ægean Sea, the Dardanelles, and Marmora, W. by the Adriatic and Ionian Seas. It includes also the island of Thasos. Area, 67,810 sq. miles. Its situation is advantageous, possessing an extensive coast-line with many harbors. On the W. are the Gulfs of Drino, Durazzo, Avlona, and Arta; on the S. of Salonica, Cassandra, Monte Santo, Rendina, Kavala, Lagos, Enos, and Saros. It terminates toward the S. E. in the commanding peninsula inclosed by the Black Sea, the Bosphorus, and Marmora. The general surface is broken and mountainous. The mountain system is complicated. Two main ranges, one the Messora Dagh, which is a northern prolongation of the Pindus, and to which different names are applied, and the other, Despoto Dagh or Rhodope, emerge from the general confusion, proceed generally S. E., and divide the country into three sections of dissimilar shape but nearly equal area. These mountains sometimes attain a height of over 9,000 feet. The first section is Albania; the second, Macedonia, which comprises part of Thessaly; the third, Thrace. Albania is a mass of roughly parallel ranges, through which the rivers Boyana, Drin, Scoumbi, Loum, Vofoutza, Kalamas, and Arta force their way to the Adriatic and Ionian Seas. Here are also the large deep Lakes of Sentari, Oehrida, Janina, Prespa, and Kastoria. All this region is strategically commanded by the table-land of Janina, which is from 1,300 to 1,700 feet above the level of the sea. The ground is fertile only in a few localities, the climate rigorous and moist. Agriculture is in a most backward state, both from the poverty of the soil and from the aversion of the inhabitants to fixed pursuits. Oak, pine, box, and beech forests abound. In the second section, Macedonia, are the rivers Vi-stritza or Indji Kara Su and Vardar, emptying into the Gulf of Salonica, and the Strouma and Mesta or Kara Su, emptying into the Ægean. The Maritza, the largest river of Thrace, enters the Gulf of Enos. Macedonia and Thrace are fertile, but poorly cultivated. The forests have been almost destroyed. The climate corresponds with that of the same latitude and altitude in Southern Europe. Goats and sheep are exceedingly numerous, the latter furnishing the favorite food-supply. Buffaloes and even mules and asses are employed in cultivation rather than horses and oxen. Cattle and the live-stock generally are inferior. Great attention is paid to the bee and silkworm. Game is plentiful. The bear, wolf, stag, deer, and wild hog are found in Albania and Macedonia; the wolf and jackal in Thrace. Vultures, falcons, buzzards, hawks, and kites abound. Eagles are seen only in the mountains. Maize and the vine are extensively cultivated; also the fig, olive, and pomegranate in the south; wheat, rice, rye, barley, tobacco, cotton, hemp, and flax grow in the plains and low valleys; beans, peas, lentils, onions, cabbages, beets, and cucumbers are raised; the favorite fruit-tree is the plum. Rock-salt, copper, silver, and gold exist in certain localities, but mining is hardly undertaken. The numerous thermal and sulphurous springs are sometimes utilized for baths.

Turkey in Asia comprises the Sporades islands in the Ægean, Asia Minor, Crete, the vast basins of the Euphrates and Tigris, Syria, and the west coast of Arabia. Area, 686,370 sq. miles, or more than ten times that of the direct Ottoman possessions in Europe. This widespread territory, exclusive of Arabia, is included between 41° and 28° N. lat. and 25° and 48° E. lon. It is bounded N. by the Dardanelles, Marmora, Black Sea, and Russia, E. by Russia, Persia, and the Persian Gulf, S. by the Mediterranean and the Great Syrian Desert, W. by Africa, the Mediterranean, and Ægean. Turkish Arabia or El Hedjaz and Yemen is a strip of land nearly 1,000 miles long and of indefinite breadth, extending the entire length of Arabia along the Red Sea. Turkey in Asia comprises the many ancient

kingdoms and provinces of Asia Minor, Judæa, Syria, Mesopotamia, and Assyria. It includes the modern political divisions of Anatolia, Karamania, Armenia, Kurdistan, El Djezirah, Irak Arabi, and Syria. Its coast is long, sinuous, and abounding in gulfs with natural harbors. Syria is indented by many tiny bays. For further details of that country, see SYRIA. Asia Minor has on the S. the Gulfs of Iseanderun or Alexandretta, Adaha, and Maori, between which project the headlands of Anemour and Khelebloun; on the W. the Bays of Smyi, Kos, Mandelia, Scala Nova, Smyrna, and Edrimid, with the Capes Krio, Sancta Maria, Koraka, Karabouroun, Baba, and Koum Kahh, along which may still be seen the splendid ruins of the Dorian, Ionian, and Æolian Greek cities; in the Marmora, the Bays of Ariaki and Panormo on either side of Cyzeus, and of Moudania and Isnid; in the Black Sea, innumerable bays, but none of large dimensions, the most notable being those of Sinope, Samsoun, and Trebizond, with the Capes Karpch, Baba, Karenbeh, Iudjeh, Boztepeh, Tehalti, Yassoun, and Iros. The mountain system is even more irregular than in European Turkey. From the great plateau of Armenia, which spreads in every direction around Ararat (17,212 feet), its central point, the Anti-Taurus Mountains extend W. and the Taurus Mountains S. W. across Kurdistan to the Gulf of Iseanderun. Thence the latter range sends the Amanus chain S. into Syria and the Argæus chain S. W. toward the Anti-Taurus and over Asia Minor to the shores of the Ægean. Many of the peaks are over 10,000 feet in height and are covered with snow almost throughout the year. In the Amanus Mountains are the famous Cilician and Syrian Gates, the only passes to the Euphrates and Syria. The Anti-Taurus joins the range of the Bithynian Olympus, from which irregular spurs diverge southward. In addition, isolated peaks and disconnected ranges dot the face of Asia Minor. The most important mountains are Kuz Dagh (*Ida*), dominating the Troid; Manisa Dagh (*Sipylus*), commanding Smyrna and Phrygia; Boz Dagh (*Tmolus*), above Sardis; Tashlali Dagh (*Chimæra*); Ershishi Dagh (*Argæus*), 13,200 feet, an extinct volcano, like Sipylus; Kershish Dagh (*Olympus*). Kurdistan is a wild, mountainous region, sloping southward to El Djezirah (*Mesopotamia*) and Irak Arabi, which form a succession of deserts and steppe lands broken by hills to the Persian Gulf. In Arabia the coast belt owned by Turkey is bordered on the E. by lofty mountain ranges, which collect moisture and thus render it more fertile than the rest of the peninsula. In Asia Minor, from its physical formation, there are few great rivers, and all are winding. The principal are Kizil Irmak (*Halys*), nowhere over 200 feet wide, but over 500 miles long, though the direct distance from its source to its mouth is less than 160 miles; Yeshil Irmak (*Isis*); Muhallith Chaï (*Rhyndacus*); Khodja Chaï (*Granicus*); Menderch Chaï (*Scamander*); Buyonk Mender Chaï (*Alaxander*); Khodja Chaï (*Xanthus*); Keupri Su (*Eurymedon*); Seikbun Chaï (*Saros*); Djehan Chaï (*Pyramos*); Tersus Su (*Cydnus*). The most important in the empire are the Euphrates, 1,550 miles, and Tigris, 1,000 miles. Both rise in the plateau of Armenia and finally unite as the Shatt-el-Arab, which empties into the Persian Gulf. The lower course of these rivers was anciently exceedingly fertile, highly cultivated, densely populated, a center of civilization, the seat of the Chaldean and Babylonian empires. Assyria was W. of the Tigris. Lakes are numerous, some without known outlet, and very salt. The larger are Fouz Teholli, Igridi, Beishehr, and Ak Shehr, in the middle of Asia Minor; and Isnik and Aboulbonia, near the Gulf of Moudana. Lake Van, in Armenia, 80 miles by 40, area 1,550 sq. miles, is an inland sea. In a territory so extensive as Turkey in Asia, drawn out through so many degrees of latitude, every kind of soil and climate and the greatest variety of mineral, vegetable, and animal products must exist. Asia Minor is rich in copper, iron, coal, petroleum, lead, merschaum, and marble. Gold and silver are found in Kurdistan, bitumen and naphtha along the Tigris. The soil is generally fertile. Immense tracts are given up to pasturage. The plains of the interior are scantily wooded, but covered with wormwood, sage, and broom. Large forests, in which oak and fir predominate, spread inland from the Black Sea. Cypress and junipers abound in the Taurus; plane-trees grow everywhere. Wild grape-vines grow freely in the lowlands and on the western coasts. The vineyards furnish excellent wines. Garden vegetables and fruits of all sorts are abundant. Hemp, flax, cotton, wool, tobacco, indigo, saffron, and madder grow profusely. Ar-

menia produces wheat, and has chestnut and oak forests. Kurdistan is largely woodland. In El Djezireh trees are rare, but the lilac, jasmine, and vine grow in profusion. In Irak Arabi every kind of palm is found. There the soil is very fertile, but, on account of poor irrigation, the yield of barley and rice is small, though tobacco and cotton succeed better. The melons reach an enormous size, often weighing over 100 lb. Through Turkey in Asia the ox is rare, the buffalo being preferred both as source of food and as beast of labor. The camel likewise supplants the horse, but the horses, mules, and asses are large and strong. The sheep is the most common domestic animal, but its flesh and wool are poor except in the region of Angora, which is justly celebrated for its goats, sheep, rabbits, and cats. The bee and silkworm are reared, especially in Kurdistan, El Djezireh, and Irak Arabi. Game abounds. Flocks of wild sheep live in the Taurus. Partridges swarm near the Dardanelles and swans on the Kutchouk Mender (*Caystrus*). The stork is the bird most frequently seen and most typical of the country. Carnivorous beasts are the bear, leopard, wolf, hyæna, and jackal. Lions are found in the swamps bordering the Tigris and Euphrates. Locusts infest El Djezireh. Despite the almost boundless resources of Turkey in Asia, commerce is little developed, manufactures have terribly decreased during the last century, and the country has grown steadily poorer. This is largely the fault of an improvident and feeble government. Yet the system of administration has somewhat improved, property and life have become less insecure, and injustice is less prevalent than at any other period since the foundation of the Ottoman empire. The real reason for decline must be found in economic causes. Home manufactures in both Europe and Asia, as the muslins of Mosul and the woolen stuffs of Macedonia, have been crowded out by the introduction of machine-made and cheaper European goods. The Oriental is unable to appropriate the inventions and methods of the European, and is invariably worsted in the competition. Moreover, lack of roads, due to governmental indifference and to Oriental lack of enterprise, has largely hindered development of resources. The enormous cost of transport of agricultural articles, generally bulky and often perishable, paralyzes their production at a distance from the coast.

Turkey in Africa comprises Tripoli and Benghazi or Barca. It is mainly included between the Mediterranean and the Great Desert, though touching Egypt on the E. and Tunis and Algeria on the W. Its inland boundaries are indefinite. Area, 308,500 sq. miles; according to Turkish estimate, 398,840 sq. miles. The Gulf of Sidra (*Syrtis Major*) partly separates Tripoli and Barca. Ras Sem (*Phycus*) and Ras Tourba (*Zephyrium*) are the most northern capes. There are few good harbors. A belt of fertile land borders the coast. Farther S. are sandy plains and ranges of rocky mountains. The rivers are small, and, like the wells and watering-places, are often dry. Water is deficient, but wherever it is found the fruits, vegetables, and cereals are excellent and abundant, especially the date, olive, lemon, orange, mulberry, tobacco, wheat, and barley. Most of the inhabitants live in tents, and are nomads. Their flocks and herds and agriculture in a primitive way furnish their principal support. The population consists of Moors, Arabs, Kabyles, Ottomans, Negroes, Jews, and Europeans. The latter, mainly Maltese, and the Jews are the traders. The climate is healthful and not disagreeable, notwithstanding the heat. The temperature in winter rarely descends below 50° F., and in summer is ordinarily maintained at from 85 to 95°; when the wind blows from the desert, at from 104 to 113°. Tripoli, being less remote than the other Barbary states, is traversed by the chief caravan routes from the interior to Northern Africa. The caravans bring ostrich-feathers, gold-dust, ivory, dye-woods, skins, and cereals, and carry back cloth, silk, arms, iron, sugar, drugs, glass, coffee, dry-goods, and manufactured articles of all kinds. Barca includes ancient *Cyrenaica*, the remains of whose cities lie along the coast. See TRIPOLI.

Constitution and Government.—The Ottoman empire is an absolute monarchy. Succession is hereditary in the family of Osman, vested since 1617 in the person of its oldest male member. The ruler is the sultan or *padishah*. His person is inviolable; he is irresponsible. This absolutism is modified by essential conditions of the Mussulman faith and by certain customs which have the force of laws. Since the conquest of Egypt (1517) by Selim I, the sultan is caliph or spiritual head, not only of his own Mussulman subjects, but of the entire Mussulman world. He is repre-

sented in temporal affairs by the grand vizier, first appointed in 1327, and in spiritual affairs since 1523 by the Sheikh-ul-Islam. (See MURTI.) The state ministers are hardly more than state secretaries. Their departments at present are war; marine; interior; foreign affairs; justice and worship; finances, mines, forests, and civil list; *evcaf* (property of mosques and philanthropic institutions); public works; commerce, and agriculture; public instruction; artillery; presidency of the council of state. There is also the divan, a deliberative body; the council of state, charged with the elaboration of laws; and the senate, whose functions are honorary. The government is often styled the Porte, or Sublime Porte. A constitution, proclaimed by Abd-ul-Hamid II. (Dec., 1876), guaranteed equal rights to all subjects, and applied to them without distinction the name Ottoman, heretofore reserved to the Mussulmans. It conferred the privileges enjoyed in the most civilized countries, and instituted a representative chamber. Save for a brief season this constitution has been inoperative. Political legislation is called *kanun*, and is based on the codes of Mohammed II. and Suleiman I. The civil and religious legislation is that of the *shariat*, or sacred law of Islam. The *hatti sherif* (1839) and *hatti humayoun* (1856), imperial rescripts of Sultan Abd-ul-Medjid, proclaimed general reforms whereby non-Mussulman subjects were to be raised to full equality with Mussulmans. But the intolerance and inertia of the dominant race have rendered these rescripts generally a dead letter in almost all their provisions, such as acceptance of Christian testimony in trials, right of Christians to bear arms, and eligibility to all offices. Foreigners are not amenable to Ottoman law, but by virtue of the so-called capitulations are tried in their own courts. The slaves are the only legally subordinate class. There is no aristocracy. Manumitted slaves and persons of the humblest origin often attain the highest positions. For administrative purposes the empire was divided in 1868 into vilayets (governments), administered by a vali (governor-general), named by the sultan, and assisted by an administrative council. The vilayet is subdivided into sandjaks (provinces); the sandjak into casas (districts); the casa into nahieh (communes). The name, number, and size of the vilayets is often changed. According to the last apportionment (1889) there are seven vilayets in Europe—Adrianople, Salonica, Kossova, Monastir, Janina, Scutari in Albania, Constantinople with the two sandjaks of Bigha (Dardanelles) and Ismid in Asia; twenty-four vilayets in Asia—Hudavendighiar, Aidin, Archipelago, Crete, Konieh, Adana, Angora, Kastamuni, Sivas, Trebizond, Erzeroum, Van, Bitlis, Diarbekir, Mamuret-ul-Aziz, Dersim, Aleppo, Lebanon, Syria, Mosul, Mesopotamia, Bassora, Hedjaz, Yemen; two vilayets in Africa—Tripoli and Benghazi.

Army and Navy.—Military service is incumbent on every Mussulman subject twenty years of age—three years in the infantry or four in the cavalry or artillery (after five months of active service one may purchase exemption for the remainder of the period); then three or two years in the *shind* (reserve, eight in the *redif* (landwehr), six in the *mustafiz* (landsturm). In the navy—five in active service, three in the reserve, four in the landwehr. Non-Mussulmans pay the *haratch* (tax) of about 30 piasters and are not liable. The army is organized in seven *orbas* (corps d'armée), each commanded by a *mushir* (marshal). The headquarters are at Constantinople, Adrianople, Monastir, Erzringian, Damascus, Bagdad, and Sanaa. There are also three separate divisions, one each in Tripoli, the Hedjaz, and Crete. An *ordu* consists of divisions, brigades, regiments, battalions, and companies. There are sixty-six *nizam* (regular) infantry and forty-two cavalry regiments. The artillery is in a state of disorganization or attempted organization. The cannon are largely Krupp guns. The infantry are supposed to be armed with Mauser magazine-rifles, though few have been delivered to the troops. It is the endeavor to follow the German system in organization and tactics. No accurate statement exists or can be made of the number of soldiers. The real effective on either peace or war footing differs largely from the nominal force and the cadres are never full. The Government believes the army to number 250,000 in time of peace, and claims ability in case of war to put over 1,000,000 men into the field. Probably not half as many could be raised or officered and equipped. The large number constantly under arms during past years has been a main cause of the decrease in the Mussulman population and of its increasing poverty, as compared with the non-Mussulmans. The Ottoman soldier is

docile, patient, enduring, abstemious, content with little, and when behind fortifications almost unconquerable. But, since the foundation of the empire, he has seldom been victorious against Christians in the open field, except when far superior in number. On paper the navy is formidable—forty-one ironclads, almost all obtained in Great Britain, and 131 other vessels of all sorts; also sixteen in process of construction; nominally manned by 977 officers, 30,000 sailors, and 9,650 marines. Yet most of the ships are so superseded or unseaworthy, the crews are so incompetent and so deficient in discipline and experience, and the commanders so generally incapable, that the Ottoman navy hardly counts as a fighting power. Nevertheless in 1877-78 the fleet did excellent service in the transport of troops. See ARMY and SHIPS OF WAR.

Finance, Money, Weights and Measures.—In 1854 the empire contracted its first foreign loan; this was succeeded at short intervals by others, until in May, 1875, the total debt was 5,023,860,500 francs, or about \$1,000,000,000. Hardly more than half of this enormous sum had been received by the Government. In Oct., 1875, the Government, unable to pay the interest due, announced that during the next five years half the interest would be paid in cash and half in new bonds. The following year it declared that no further payment would be made till internal affairs became more settled. Until 1881 no part of the interest or sinking fund was paid. Then delegates of the foreign bondholders met at Constantinople and effected an arrangement which the Government embodied in the formal decree of Dec., 1881. The various loans, except bonds of the Roumelian Railway, were consolidated and grouped. A commission of delegates was authorized to administer the excise revenues of the empire entirely separate from all other revenue. The acknowledged debt is now over \$600,000,000. In this is not included \$155,361,000 due Russia as war indemnity, of which \$1,539,991.20 is to be paid annually without interest, and also \$1,539,991.20 as indemnity to Russian subjects. This payment is guaranteed by the revenues of the vilayet of Konieh. The revenue for 1889-90 was estimated by the budget committee as about \$81,400,000, and the expenditure as about \$94,160,000. Though the court and palace expenses have been reduced by the present sultan, they must still be very large. Any estimate as to their amount is mere conjecture. The piaster (¼ cent) is the unit of value. Forty paras make one piaster; 100 piasters make one lira or Turkish pound. Paper money (*kaimeh*) and copper are withdrawn from general circulation. Notes of the Imperial Ottoman Bank circulate at par. Common coins are pieces of 1, 2, 5 (*beshlik*), 10 (*onlik*), and 20 (*ardjildich*) piasters; gold coins are ½, 1, 2, 4, and 5 liras. The metallic currency (with exception of gold) is of different issues and alloys, and fluctuates in value. The decimal system of weights and measures was introduced in 1882 and declared obligatory in 1892, but the old names, as of *oke* and *arshine*, were retained, and much confusion has resulted.

Commerce.—A tax of 8 per cent. *ad valorem* is levied on all imports, except articles for embassies, consulates, schools, and churches, which are admitted free. The introduction of salt and tobacco is prohibited, they being Government monopolies. There is an export customs duty of 1 per cent. on native goods sent abroad, and of 8 per cent. between the different provinces of the empire. The repeated efforts of the empire to reform the customs tariff in its own interest have always encountered the determined opposition of the foreign powers.

YEARS.	Imports.	Exports.
1889-90	\$92,582,688	\$66,758,662
1890-91	100,822,876	56,489,168
1891-92	108,057,520	67,528,220

The value of the imports (1891-92) was: From Great Britain, \$41,884,972; Austria-Hungary, \$20,227,592; France, \$13,294,028; Russia, \$8,223,556; U. S., \$142,780. The chief imports were linen goods, piqué, sugar, woolen and cotton goods, cereals, cotton thread, medicines and dyes, coffee, rice, duck-cloth, petroleum, skins, animals, iron, cloths, cashmere, butter and cheese, manufactured iron, paper, timber, made clothing, dry goods, silk, bags—576 being manufactured articles, '03 animals, '132 raw materials, and '262 food articles. The value of the exports (1891-92) was: To Great Britain, \$30,197,288; France, \$19,830,800; Austria-Hungary, \$5,422,888; Russia, \$1,111,561; U. S., \$1,024,364. The chief exports were cereals, raisins, raw silk, opium, mohair,

nuts, coffee, wool, skins, figs, cotton, drugs and dyestuffs, minerals, animals, vegetables, dates, olive oil, carpets, seeds, sesame, fish—089 being manufactured articles, '024 animals, '308 raw materials, and '579 food articles.

Shipping and Navigation, Internal Communications.—The merchant marine consisted in 1891 of 980 sailing vessels, of 191,394 tons, and of eighty-nine steamers, of 71,358 gross tons. In 1893 9438,897 steamers and 151,377 sailing vessels, altogether 199,274 vessels, of 31,137,321 tons, entered or cleared from Ottoman ports. The mails are largely in the hands of foreigners. Great Britain, France, Germany, Austria-Hungary, and Russia have their own post-offices at Constantinople and in most of the seaboard cities. The Government has made many fruitless attempts to close these foreign offices and to bring the entire postal department under its own control. The number of Ottoman offices in 1889-90 was 1,142; receipts, 4,190,812 francs; expenses, 1,641,633 francs. Through the Ottoman mails passed 9,403,000 domestic letters and 48,000 postal cards, and 3,649,000 foreign letters and 66,000 postal cards; also 559,900 foreign letters and 12,000 postal cards in transit to foreign countries. Telegraphs: Length of wires, 31,969 miles; receipts (1888-89), 51,615,526 piasters; expenses, 17,669,044 piasters. Railways (Oct., 1894): 890 miles in Europe, 911 in Asia Minor, 122 in Syria; under construction, 317 miles in Europe, 273 in Asia Minor, and 243 in Syria.

Population.—No other country presents such variety of races and creeds; nowhere is it more difficult to obtain trustworthy statistics. Equally trustworthy authorities differ by 5,000,000 or 6,000,000 in their estimate of the number of the inhabitants. No reliable census has ever been taken. Mussulmans and non-Mussulmans are alike interested in avoiding enumeration, the former to escape conscription, the latter to escape the *haratch*, or capitation tax. The great majority of the subjects may be classed in seven main racial groups: Turkish, including the Ottomans, Yurooks, and Turcomans; Græco-Latin, including Greeks, Moldo-Wallachians, and Albanians; Slavic, including Bulgarians, Servians, and Kossacks; Georgian, including Circassians and Lazes; Hindu, represented by the gypsies; Persian, including Armenians and Kurds; Semitic, comprising Arabs, Jews, Chaldeans, Druses, Syrians, and Maronites. The population of the empire is estimated at about 10,000,000; that of Turkey in Europe, which is more accurately known, is about 4,780,000. In Europe the Ottomans, Albanians, and Greeks must be of nearly equal numbers, each about 1,300,000. The majority of the Albanians are Mussulmans. The Christian Albanians in the north, called Ghegs, are Roman Catholics, and use the Latin alphabet; those of the south, called Tosks, are members of the Greek Church, and use the Greek alphabet. Their dialects are very different, and they hate each other cordially. Macedonia is inhabited principally by Greeks, Bulgarians, Ottomans, Albanians, Moldo-Wallachians, and Servians. Thrace is peopled by a mixed multitude of Ottomans, Greeks, Bulgarians, Jews, Armenians, gypsies, Circassians, by members of other subject races, and foreigners. The Greeks predominate along the coast, not only in Europe and the islands, but in Asia, where they devote themselves to navigation, and, together with the Jews, Armenians, and foreigners, are the tradesmen and bankers. In Asia Minor there are about 9,000,000 Ottomans, double all the other inhabitants of that peninsula put together. The Yurooks are nomadic, and the Turcomans pastoral. Since the conquest of the Caucasus by Russia there has been a large immigration of Tartars and Circassians. The Armenians are scattered everywhere, though many still remain in their ancient country, Armenia. Northern and Central Kurdistan are occupied by 1,000,000 Kurds, ostensibly Mussulmans. They are a fierce people, never entirely subjugated in their mountain fastnesses, a perpetual trouble to their nominal masters, the Ottomans. Their neighbors, the Armenians, have always suffered greatly at their hands, as in the outrages of 1894-96. The 4,000,000 or 5,000,000 of Arabs in Syria, Irak Arabi, and Turkish Arabia are of two classes, sedentary and nomadic. The latter, the Bedouins, by far the more numerous, are the typical Arabs. Though of the same faith as the Ottomans, they are their inveterate foes, and, as far as possible, defy their authority. In case of war, the Porte can count upon only the 10,000,000 or 11,000,000 of Ottomans, on a possible million of Circassians, Tartars, Yurooks, Turcomans, Lazes, and Zebeks, and perhaps on the assistance of the Kurds and Albanians. The remaining 17,000,000 or 16,000,000 members of subject and non-Mussulman races

controlled by force are secretly hostile or at best indifferent. Pop. of different towns (estimated in 1889): In Albania—Scutari 36,000, Janina 20,000; in Macedonia—Salonica 122,000, Monastir 50,000; in Thrace—Constantinople 900,000, Adrianople 70,886; in Asia Minor—Smyrna 225,000, Broussa 75,000, Manisa 50,000, Kaisairieh 45,000, Trebizond 45,000, Adana 45,000, Konieh 40,795, Sivas 39,368, Angora 37,000, Marash 35,000, Kastambul 33,000; in Armenia—Erzeroum 60,000, Erzinghian 30,000, Van 30,000; in Kurdistan—Mosul 57,000, Kharput 35,000, Diarbekir 25,000; in Irak Arabi—Bagdad 180,000; in Syria—see SYRIA; in Arabia—Mecca 80,000, Medina 80,000, Sanaa 50,000; in Africa—Tripoli 30,000.

Religion and Education.—The state religion is Islam or MOHAMMEDANISM (*q. v.*), but other religions have always been tolerated and have enjoyed a certain degree of protection and freedom. Since the capture of Constantinople (1453) the Porte has preferred to deal with its non-Mussulman subjects as members of different religious communities rather than of distinct nationalities. So the religious chief of each church or sect is regarded by the Government as the civil head and representative of his coreligionists; its church organization has become to each subject people not only a religious institution, but a national center and the preserver of its national existence and language. The principal religious communities thus officially recognized by the Porte are: The Eastern Orthodox or GREEK CHURCH (*q. v.*), with its (Ecumenical) Patriarch of Constantinople and its Patriarchs of Antioch, Jerusalem, and Alexandria; the Armenian or Gregorian Church, the oldest national church in existence, with its Patriarchs of Constantinople, Sis, and Jerusalem; the Protestant Armenian community, with an official representative or *vekil*; the Jewish community, with a *khakham bashi* or grand rabbi. There are, moreover, a number of less prominent or less numerous religious groups, all recognized and represented. Education has made marked progress since about 1850, specially in the vicinity of the capital and large towns. This advance is due to the efforts of the Government, to the awakened sentiment of the people, and to the Protestant and Roman Catholic missionaries, whose work is largely educational. Formerly Mussulman education was entirely in the hands of the ulema and derived from the school attached to the mosque; that of the Christians was limited to such rudimentary branches as were taught in the school invariably connected with each Greek or Armenian Church. The imperial school of medicine, founded in 1826 by the Government, has been followed by a large number of colleges and of other high institutions, military, naval, polytechnic, etc., and of primary and secondary establishments. The subject nationalities have vied in founding many of various grades for their own children.

History.—The Ottomans are a Turkish tribe, originally from Khorassan. Numbering only 400 families, they were led by their chief, Ertogrul, into Asia Minor in 1231. The Seljuk sultan, Alaeddin I., grateful for aid chivalrously afforded him in battle, bestowed on Ertogrul some pasture-lands on the river Sangarius E. of the Bithynian Olympus. This insignificant territory, a few square miles in extent, was the nucleus of the Ottoman empire. There Ertogrul and his followers, hitherto pagans, embraced Islam. The sword played no part in their conversion, and their descendants have continued faithful and zealous Mussulmans. On the dissolution of the Seljuk empire, Othman, son of Ertogrul, was proclaimed *padishahi ali Othman*, Sultan or Emperor of the Ottomans, and his followers have ever since been called from his name Ottoman or Osmanli. His first official act was the erection of a mosque. His possessions slowly increased. At that time Asia Minor was broken up into twelve principal states, one of which consisted of the possessions of Othman, and into many minor fragments. The whole presented a ready field of conquest to whichever power was stronger or more ably governed than the rest. In Europe the Byzantine empire, which still held territories in Asia Minor, had never recovered from its conquest by the Latin crusaders, and the entire Balkan peninsula was divided between jealous and antagonistic petty states. Yet the rapid growth of the Ottoman empire was not due primarily to favoring circumstances, but to the pre-eminent abilities of its early sultans as warriors, statesmen, and organizers, and to the sober and austere virtues of their followers. The first seven sultans, OTHMAN I., ORKHAN, MURAD I., BAYAZID I., MOHAMMED I., MURAD II., and MOHAMMED II. (*qq. v.*), possessed the qualities requisite to the founding of states. Broussa was besieged and made the capital (1325). A code was formulated, the JANISSARIES (*q. v.*) and

sipahis (cavalry) organized, money coined, and red adopted as the national color before 1330. Tzyppe, the first Ottoman acquisition in Europe, was captured (1359); then Adrianople (1365). Gradually Asia Minor and the Balkan states were subdued. The frightful defeat of Bayazid I. at Angora by Tamerlane (1402), and the consequent eleven years' interregnum, threatened the very existence of the empire. Yet when Mohammed II. succeeded (1451), it had already become more strong and compact than before. The Seljuks, as fast as they were subdued, fused with the Ottomans. So did vast numbers of Christians, who became Moslems in the conquered European states. No distinction was made between the born Moslem and the convert. All, the original Ottoman, the Seljuk, and the convert from Judaism or Christianity, were considered equally Ottoman. The majority of grand viziers from 1359 to 1895 have been of Christian or Jewish origin. Duration was assured the empire by the capture of Constantinople (1453), which was at once made the capital. Under MOHAMMED II., BAYAZID II., SELIM I., and SULEYMAN I. (*qq. v.*) the empire steadily expanded, reaching its acme in the reign of the latter. The unsuccessful siege of Vienna (1529) and of Malta (1565) were its first real checks. Then Europe learned that the Ottomans were not invincible. Their empire in the sixteenth century was the most powerful in the world. It comprised all the European, Asiatic, and African countries situated on the Mediterranean, except Morocco, Spain, France, and Italy; all the coasts of the Black Sea, and nearly all of the Red Sea; Hungary and all the kingdoms S. of the lower Danube. Its possessions extended from 47° 30' to 12° N. lat., and from 3° W. lon. to 48° 30' E. lon. Austria and Venice paid tribute; the European powers rivaled each other in congratulating the Ottomans on every victory and in seeking their good will and favor. Yet already the empire was beginning its slow, apparently intermittent, but constant and inevitable decline. Prominent causes of this decline were the gradual abandonment of direct government by the sovereign, and his customary withdrawal into seclusion; the consequent increasing influence of the Harem (*q. v.*) in political and military affairs, and the demoralization of the janissaries, the Ottoman right arm in war; the progress made by the hostile Christian states in wealth and civilization, while the Ottomans deteriorated, or at best stood still; the fact that the last twenty-four sovereigns, with the exception of Murad IV., Mahmud II., and Abd-ul Hamid II., have each been inferior in ability to any one of the first ten sultans; above all, because the Ottoman empire from the first has resembled an armed camp, because it has always consumed and never produced, because it has lived on the countries which it conquered without conferring any benefits upon them. After the decline began, subsequent fruitless conquests, as of Cyprus (1570), Erivan (1635), and Crete (1669), and infrequent victories only varied the monotony of such irreparable disasters as Lepanto (1571), St. Gothard (1664), Vienna (1683), Zenta (1697), Peterwardein (1716), Belgrade (1717), Teshmhch (1770), Ismail (1790), Navarino (1827), and Plevna (1878). The whole humiliating history is best indicated by the successive treaties of Sivatork (1606), when the empire first receded; Carlovitch (1699), by which it was first dismembered; Passarovitch (1718), Kafardji (1774), Jassy (1792), Adrianople (1829), resulting in the first recognition of the independence of a hitherto subject people; San Stefano (1878), when Turkey submitted to the loss of several provinces; and Berlin (see BERLIN CONGRESS), when the last treaty was practically ratified by Europe. Even the treaties least unfavorable, Falkens (1711), Belgrade (1730), Bucharest (1812), and Paris (1856), after the Crimean war, contained no permanent or real advantage for the Ottomans. (See TREATIES.) The term "sick man of the East," commonly attributed to the Czar Nicolus, was used in reference to Turkey after the treaty of Carlovitch (1699). The empire is now protected by its relative weakness, which inspires no suspicion or dread, by the mutual jealousies of the European states, and by the antagonisms of its subject non-Mussulman races against each other, which prevent their union. See ABD-UL AZIZ, ABD-UL HAMID, ABD-UL MEDJID, MAHMUD, MOHAMMED, MURAD, MUSTAPHA, OTHMAN, SELIM, and SULEYMAN.

Turkey-buzzard: the *Cathartes aura*, the commonest of American vultures, resembling a turkey in size and appearance. It is 2½ feet in length and 6 feet in spread of wing; the general color is blackish, lighter on the wing coverts; head and upper part of neck bare and reddish. It ranges throughout the greater part of the U. S., except the most northern and eastern portions, and thence southward over nearly all of South America. It feeds on carrion and is remarkable for its sustained sailing flight. It must not be confounded with the smaller black vulture, or carrion crow, *Catharista atrata*. See also CATHARTIDÆ. F. A. LUCAS.

Turkey Red: See DYEING.

Turkey-stone, or Turkey Oil-stone: a siliceous rock of very fine grain used for sharpening cutting-tools; so-called because obtained from Asia Minor. See HONE.

Turkish Language: the most important member of the Ural-Altai or Ugro-Tartaric family of languages. It is spoken by the Osmanli or Ottoman Turks, regnant since 1453 in the Eastern Roman or Byzantine empire. There are really two Turkish languages: (1) That of the common people, a virtually unmixed language, spoken in its greatest purity by the Turkoman nomads, and practically covering the vast territory lying between the Danube and the western confines of China; and (2) the elevated language used in official life and in the higher flights of both prose and poetry. This elevated language has borrowed freely from both Arabic and Persian. All terms relating to religion, theology, politics, and law have been taken from the Arabic, while Persian literature, and the fact that the Turks first accepted Islam at the hands of the Persians, have caused another host of Persian words to be incorporated into Turkish. In order, therefore, to understand the elevated language, one must know well both Arabic and Persian. But it is with especial reference to the language of the common people, the practically unmixed language, that this article would give information, since its structure is fully preserved in the elevated language.

Originally, Turkish was written in an alphabet of its own, but this was abandoned long ago for the Arabic alphabet, to which were added several Persian letters, thus raising the number to thirty-three, or, if lam-êlif be counted in, to thirty-four. Most of these letters have one form when they stand alone, another form at the beginning, another in the middle, and still another at the end of a word. The alphabet is therefore virtually a fourfold one. The names, order, and value of these letters are as follows, it being noted that the right-hand column gives the nationality of the words in which the several letters are used.

Order.	Name.	Value.	In Turkish, Arabic, or Persian words.
1	êlif	a e i û u	t. a. p.
2	bê	b	t. a. p.
3	pê	p	t. a. p.
4	tê	t	t. a. p.
5	sê (tê)	s (Gr. θ) Eng. th	-. a. -.
6	jîn	Eng. j	t. a. p.
7	chîm	Eng. ch (church)	t. a. p.
8	ha	h (aspirated)	-. a. -.
9	khî	German ch	t. a. p.
10	dal	d	t. a. p.
11	zel (zal)	z	-. a. -.
12	rî (ra)	r	t. a. p.
13	zê (za)	z	t. a. p.
14	zhé	French j	-. a. p.
15	sin	s	t. a. p.

Order	Name	Value.	In Turkish, Arabic, or Persian words.
16	shin	sh	t. a. p.
17	sud	sharp s	t. a. p.
18	dad	z dh	-. a. -.
19	tî (ta)	d t	t. a. p.
20	zi (za)	hard z	-. a. -.
21	ayn	no equivalent (breathing)	-. a. -.
22	ghayn	hard g = gh	t. a. p.
23	fê	f	t. a. p.
24	kâf	palatal k	t. a. p.
25	kef (kyef)	k g n	t. a. p.
26	gyef-î 'udjemi	y	t. a. p.
27	saghyr noon	ñ (ng)	t. a. p.
28	lam	l	t. a. p.
29	mim	m	t. a. p.
30	noon	n	t. a. p.
31	vav	v w	t. a. p.
32	hê	h (t)	t. a. p.
33	yê	y	t. a. p.
34	lam-êlif	la	t. a. p.

All of these letters are consonants, though êlif, vav, hê, and yê are sometimes used as vowels. The vowels are indicated by seven vowel-signs or diacritical marks, which need not be explained here; these signs, however, are rarely employed, except in the case of a rare or foreign word. This fact adds immensely to the difficulty of learning to read Turkish. In fact, one can not read with ease until one knows and speaks the language. Turkish writing is therefore a kind of stenography. The Turks write from right to left, so that what with us is the end of a volume is with them the beginning. The numerals alone are written from left to right. They have no capital letters and make but little use of punctuation. The accent is usually on the last syllable of a word.

The Turkish language is in some respects the most remarkable of known tongues. It is conspicuous for the pronounced agglutinative character of its grammatical forms, for its law of vowel harmony, for the absolute regularity of its one declension and one conjugation, and for the extreme simplicity and transparency of its syntactical construction. Max Müller has said that "if a college of the most distinguished scholars had met for the purpose of constructing a language, nothing more regular or symmetrical could have come from their hands than we have here in this living tongue"; and again, "but no such society could have devised what the mind of man produced, left to itself in the steppes of Tartary, and guided only by its innate laws, or by an instinctive power as wonderful as any within the realm of nature."

Turkish illustrates most wonderfully the agglutinative stage of language. Under *agglutination* is meant the simple appending of fixed particles to a fixed root in order to modify in various ways the meaning of the root. Primitive languages made free use of agglutination, as may still be seen in Sanskrit, Greek, and Latin. The familiar *-mi, -si, -ti*, in

Sanskrit.	Greek.	Latin.
as-mi	ἐσ-μι (ἐμ-μι)	es-um
asi	ἐσ-σι	es
as-ti	ἐσ-τι	es-t

are illustrations of it. In modern languages, however, the tendency has been to reject agglutination and to obscure its particles or suffixes. Only the initiated can trace it, say, in English (*slays-th, kills-d*), which is as conspicuous for the neglect of agglutination as Turkish is for its employment. To illustrate agglutination in Turkish, take the fixed particles *lar, yû, dan*, which are the signs for the plural, for the possessive pronoun of the second person singular, and for the ablative case. Now take the word *at*, which means *horse*, append thereto these agglutinative particles in the order given above, and there results a word *at-lar-yû-dan* (*atlar-yûdan* = from thy horses). In what follows illustrations of agglutination will abound. These agglutinative particles are called *postpositions* in contradistinction from *prepositions*. The Turkish makes no use of any kind of *preposition*.

The second instance cited above to show the remarkable character of Turkish is the law of vowel harmony. In all the languages of the Turkic class the root is never obscured, but remains virtually unalterable, no matter what or how

many syllables (postpositions) are added to the end of the root to modify its meaning. The vowels of such modifying syllables are not fixed, but are regulated by a law of euphony, which requires the vowels of the postpositions to harmonize with the vowel immediately preceding the postposition. That is, if the root vowel be hard (a, o, u, y) or soft (e, i, ö, ü), the vowel of the postposition must be hard or soft to correspond therewith. Thus, for instance, the ending of the genitive singular may be either (1) *-yñ*, (2) *-uñ*, (3) *-iñ*, (4) *-üñ*, according as the end vowel of the word is (1) *a* or *y*, (2) *o* or *u*, (3) *e* or *i*, (4) *ö* or *ü*. In like manner the ending of the aor. act. 1st pers. sing. may be (1) *-dym*, (2) *-dum*, (3) *-dim*, (4) *-düm*, according as the end syllable of the verb-stem be (1) *a* or *y*, (2) *o* or *u*, (3) *e* or *i*, (4) *ö* or *ü*. Let the following serve as illustrations of the law of vowel harmony :

- (1) *at*, horse.
at-yñ, of the horse.
bak = see, *bak-dym*, I saw.
- (2) *dost*, friend.
dost-uñ, of the friend.
boz = spoil, *boz-dum*, I spoiled.
- (3) *ev*, house.
ev-iñ, of the house.
gel = come, *gel-dim*, I came.
- (4) *göz*, eye.
göz-üñ, of the eye.
büz = draw together, *büz-düm*, I drew together.

In a similar manner a number of postpositions have either the vowels *a* or *e* according as hard or soft vowels precede. Thus the ablative plural of (1) is *at-lar-dan*, but of (3) is *ev-ler-den*, while the negative of (1) is *bak-ma-dym* (I did not see), but of (3) is *gel-me-dim* (I did not come).

There is no definite article in Turkish, and no gender other than natural gender. Strictly speaking, there is no declension of the noun, the case-endings being really agglutinative suffixes or postpositions, which are appended to the unchanged stem (which is seen in the nominative and vocative cases), and thus form what we are accustomed to call the genitive, dative, locative, accusative, and ablative cases.

There is but one such declension, and one noun is here inflected, but as the vowels of the postpositions vary according to the law of vowel harmony, eight different nouns would have to be inflected to illustrate the declension fully.

Sing.

Nom.	<i>Adam</i> , the man.
Gen.	<i>Adam-yñ</i> , of the man.
Dat.	<i>Adam-a</i> , to the man.
Loc.	<i>Adam-da</i> , at (by) the man.
Acc.	<i>Adam-y</i> , the man.
Abl.	<i>Adam-dan</i> , from the man.
Voc.	<i>Adam</i> , man.

Plur.

Nom.	<i>Adam-lar</i> , the men.
Gen.	<i>Adam-lar-yñ</i> , of the men.
Dat.	<i>Adam-lar-a</i> , to the men.
Loc.	<i>Adam-lar-da</i> , at (by) the men.
Acc.	<i>Adam-lar-y</i> , the men.
Abl.	<i>Adam-lar-dan</i> , from the men.
Voc.	<i>Adam-lar</i> , men.

As in English, the adjective is indeclinable and stands before its noun. So *böyük bağh*, the large garden; *böyük bağhyñ*, of the large garden; *böyük bağhlar*, the large gardens; *böyük bağhlardan*, from the large gardens. As in German, French, Italian, etc., the numeral one (*bir*) is used for the indefinite article, as *bir kara taş*, a black stone. The comparative and superlative are formed by placing *daha* and *en* respectively before the positive, as

<i>küçük</i> , <i>daha küçük</i> , <i>en küçük</i> .
small, smaller, smallest.

But when two things are compared the simple ablative case with the positive of the adjective expresses the comparison, as *at eshekden epi dir*, a horse is better than a donkey. A superlative peculiar to Turkish is in common use, viz., if the adjective begins with a consonant, then the first two letters of the adjective plus some consonant serve to make a superlative prefix, as *kuru*, dry; *kup kuru*, very dry; *yash*, wet; *yam yash*, very wet; *bosh*, empty; *bom bosh*, quite empty; *mavi*, blue; *mas mavi*, very blue; *sary*, yellow; *sap sary*, quite yellow.

The verb, however, is the chief glory of Turkish; it is the most complete and most transparent in existence. Here, too, law reigns supreme, so that after one has mastered a

complete conjugation, no further difficulties are encountered, as there are no irregularities or exceptions. The root is always seen in the second person singular of the imperative, and it remains unchanged throughout, except that final *t* or *k* is changed under certain circumstances to *d* or *gh*. But that, too, is law. The verb not only has moods and tenses sufficient for expressing every shade of doubt, conjecture, hope, and supposition, but new verbal roots are created by adding to the original verb-stem certain postpositions which modify the original meaning of the verb-stem and create other moods that are inflected regularly. In this way a negative, a reflexive, a reciprocal, an interrogative, a causal, a necessitative, an impossible, and a conditional mood are created.

More description can give no idea of the glory of the Turkish verb. Max Müller gives a list of thirty-six present infinitives (to which belong just as many imperatives), but a still more astonishing list of present tenses might be furnished. In the verb *atmak*, to throw, for instance, there is a positive present in both the active and the passive voices (*at-arym*, I throw, *at-yl-yrym*, I am thrown); a negative present in both voices (*at-ma-m*, I do not throw, *at-yl-ma-m*, I am not thrown); an impossible present (*at-ama-m*, I can not throw, *at-yl-ama-m*, I can not be thrown), and so on through a positive, a negative, and an impossible reciprocal present; a positive, a negative, and an impossible reflexive present; a positive, a negative, and an impossible causative present; a positive, a negative, and an impossible reciprocal causative present; a positive, a negative, and an impossible reflexive causative present, etc., with a reciprocal interrogative, a reflexive interrogative, an interrogative causative, a conditional, a necessitative, an optative, and a dubitative present, each with its positive, negative, impossible, reflexive, reciprocal, causative, and other forms in both moods to the number of over 300. The same refinement runs through the other tenses, the aoristic imperfect, past habitual, pluperfect, future, and past future in most of the moods. Space utterly forbids anything like even a synopsis of the present tenses.

For a discussion of the various dialects belonging to the Turkic class of languages, see Max Müller, *Lectures on the Science of Language* (London, 1875). For a good short account of Turkish literature, see Lane-Poole, *The Story of Turkey*. For a more extended study of Turkish literature, see Redhouse, *History, System, and Varieties of Turkish Poetry* (Leipzig, 1879), and von Hammer-Purgstall, *Geschichte der Osmanischen Dichtkunst* (4 vols., Pesth, 1836-38). The chief grammars of Turkish in English are by Wells, *A Practical Grammar of the Turkish Language* (London, 1880); Redhouse, *A Simplified Grammar of the Turkish Language* (London, 1884); Tarring, *A Practical Elementary Turkish Grammar* (London, 1886). The best dictionary is still Redhouse's *Turkish and English Dictionary* (London, 1884-87). J. R. S. STERRETT.

Turkistan : See TURKESTAN.

Turk'omans : certain tribes of Turkish tongue scattered through Transcaasia, Turkestan, Persia, Khorassan, Western China, and Turkey in Asia. Their language is very similar to Osmanli Turkish, but physically they are much modified by Iranian intermixture. They are all zealous Sunnite Mohammedans, and are pastoral and nomadic.

Turks : in the broad sense, a race with definite and well-marked ethnic and linguistic characters which has played an important part in the history of Central Asia and Eastern Europe, and is now found scattered over a territory stretching from Yakutsk to Northern India and westward to the Mediterranean and Lithuania. It occupies but a part of this great territory, has extensively intermingled with Aryan and Mongol races, and comprises many different tribes divided into three general groups. The first or Oriental comprises the Yakuts, the Tartars of the Altai and of other parts of Siberia, and the Turks of China, otherwise called Daldes, Taranehi, Kashgarians, etc. The central group comprises the Kirghiz, the Uzbeks, the Tartars of Astrakhan, Lithuania, and the Crimea, and the Bashkirs with their Turko-Finnish mixtures. The western group includes the Turkomans, the Tartars of the Caucasus, the Tauridians of the Black Sea littoral, certain Tureo-Iranians of Persia, and the Osmanli Turks, generally called Turks *par excellence*, though perhaps the most distant from the pure Turkish characters by extensive Aryan intermixture. The purest types are believed to be in the Crimea and among the Turkomans of Khiva. Some of the tribes, like the Jats of

India, have lost their language though preserving other characters. More than twenty dialects are known which fall into groups corresponding fairly with the grouping of races already mentioned. The most of the Turkish races are Mohammedan and employ the Arabic alphabet, with some modifications; a few formerly used the Sogdianian or Syrian, and some now the Russian, Greek, or Armenian. They were originally nomads, are generally courageous and warlike, haters of tillage, and eaters of flesh. See Vambéry's works, especially his *Das Türkewolk* (1885), which is a complete monograph.

MARK W. HARRINGTON.

Turks Islands: a group of small islands (Grand Turk, Salt Cay, and some uninhabited islets); physically, the south-easternmost of the Bahama group, but politically, with the neighboring Catoes islands, attached to the British colony of Jamaica. All are low, and Grand Turk, the largest, is only 7 miles long by $1\frac{1}{2}$ miles wide. Several lagoons furnish an excellent quality of salt, and about 1,500,000 bush, are annually exported to the U. S. and British America. Total population of the Turks and Catoes islands (1891), 4,745, nearly all engaged in the salt industry. II, II, S.

Turpkins: See BROTHERS AND SISTERS OF THE FREE SPIRIT.

Turmeric: the root of *Curcuma longa* (family Zingiberaceae), a native of the East Indies and Cochinchina. It contains a volatile oil, a yellow coloring-matter (*curcumin*), starch, cellulose, gum, and a brownish dye. The root of *Curcuma speciosa*, a plant occurring in West Africa, also possesses the same physical and chemical properties. Turmeric is used in the dyeing of silk and wool, and is employed in pharmacy for coloring ointments, etc. The tincture of turmeric, or unsized paper stained with the aqueous or alcoholic solution (turmeric paper), is used in chemical operations as a test for the alkalis and for boric acid, which impart a reddish-brown color to the paper.

Turnbull, ROBERT, D. D.: clergyman and author; b. at Whiteburn, Scotland, Sept. 10, 1809; graduated at Glasgow University; was for some years a Baptist preacher in England and Scotland; in 1833 removed to the U. S., preaching at Danbury, Conn., 1833, at Detroit, Mich., 1835, at Hartford, Conn., 1837, at Boston, Mass., 1839; from 1845 to 1869 was pastor at the First Baptist church at Hartford, subsequently preached in several places, and was secretary of the Connecticut Baptist State convention; author of *Olympia Morata* (1842); *The Genius of Scotland* (New York, 1847); *The Genius of Italy* (1849); *Pulpit Orators of France and Switzerland* (1848); *Theophany, or the Manifestation of God in Christ* (Hartford, 1851); *Christ in History, or the Central Power* (Boston, 1856); and *Life Pictures* (New York, 1857); translated Vinet's *Vital Christianity* (1846); edited Sir William Hamilton's *Discussions on Philosophy and Literature* (New York, 1855); and for two years was joint editor of the *Christian Review*. D. at Hartford, Conn., Nov. 20, 1877.

Turnbull, ROBERT JAMES: political writer; b. at New Smyrna, Fla., in Jan., 1775, son of an English physician who married a Greek lady of Smyrna, and obtained, in connection with Lord Hillsborough, a grant from the British Government in 1772 for settling a Greek colony in Florida, but forfeited his rights by adhesion to the Revolutionary cause, and settled at Charleston, S. C. Robert was educated in England, studied law in Charleston and Philadelphia, and practiced at Charleston until 1810, when he devoted himself to the care of his residence on his large plantation; became a leader of the nullification party; was prominent in the free-trade conventions at Columbia and Charleston 1831, 1832, and at the South Carolina nullification convention of Nov., 1832, which adopted from his pen an address to the people. D. in Charleston, June 15, 1833. A fine monument was erected to his memory by his political associates. Author of *A Visit to the Philadelphia Prison* (London, 1797; trans. Paris, 1800) and *The Tribunal of Dornier Ressort* (1830); wrote much on politics for the *Charleston Mercury* 1827, and a collection of his articles from that paper, republished under the title of *The Crisis*, became the text-book of the nullification party.

Turnbull, WILLIAM: civil engineer; b. in Philadelphia, Pa., Oct. 9, 1800; graduated at the U. S. Military Academy July, 1819, when commissioned second lieutenant of artillery, but served on topographical duty until 1831, in which year he was transferred to the corps of topographical engineers with rank of captain; major 1838; was chief topographical

engineer in construction of the Potomac aqueduct 1832-43. This work, the piers of which are founded by coffer-dams on rock (covered by sometimes 20 feet of mud, from 30 to 40 feet below the water-surface, was one of the earliest of important works of American engineering—the earliest of its type. He was in charge of improvement of lake harbors 1844-46. In the war with Mexico he served as chief topographical engineer of Gen. Scott's army, from Vera Cruz to the city of Mexico, gaining the brevet of lieutenant-colonel for gallantry at Contreras and Churubusco, and colonel for Chapultepec. In 1848-49 he superintended the construction of the New Orleans system-locks; engaged in the study of the question of bridging the Susquehanna at Havre de Grace, and of the expediency of an additional canal around the Falls of the Ohio 1852; on lighthouse duty and on a large of the improvement of Cape Fear river, North Carolina, at the time of his death, at Wilmington, N. C., Dec. 9, 1857.—His son, CHARLES NESBIT, b. in Washington, D. C., Aug. 13, 1832, graduated at the U. S. Military Academy in 1854, and attained a captaincy in the corps of topographical engineers in 1862; was chief engineer of Gen. Sheridan's cavalry corps; also of the Eighth Army-corps; breveted colonel; resigned Dec. 31, 1865, and engaged in business in Boston, where he died Dec. 2, 1874.

Turnbull, WILLIAM BARCLAY: antiquarian; b. in Edinburgh, Scotland, in 1811; was called to the bar of Scotland 1832, to that of England 1856; was for several years secretary to the Scottish Society of Antiquaries; founded the Abbotsford Club 1833; was its secretary until 1841; edited for it many old MSS. and reprints of rare early publications, and was appointed, although a Roman Catholic, by Sir John Romilly in 1859 calenderer of the foreign correspondence at the state paper office, which post he resigned in 1861 in consequence of dissatisfaction with his method of presenting the religious transactions of the reigns of Edward VI. and Mary in the *Calendar* issued in February of that year. Among his other publications were *Legenda Catholica* (1840); *Audin's Life of Luther* (2 vols. 8vo, 1854); *The Poetical Works of Rev. Robert Southwell* (1856); *The Poetical Works of William Drummond of Hawthornden* (1856); and *The Complete Works of Rev. Richard Crashaw* (1858); *An Account of the Monastic Treasures confiscated at the Dissolution of the Various Houses in England* (1836); *The Miscellany of the Abbotsford Club* (1837); and *The Chronicles of Scotland* (3 vols., 1857-58), the latter forming part of the Rolls Series. D. Apr. 22, 1863.

Turnbull's Blue (*Ferrous ferricyanide*): a kind of Prussian blue, which when dry is of a blue color with a reddish luster. It is precipitated when potassium ferricyanide is added to a solution of a ferrous salt; formula, $Fe_3(CN)_{12} + 2H_2O$.

Turnèbe, tŭr'náb, ADRIEX (*Turnebus*): classical scholar; b. at Andelys, in Normandy, France, in 1512; called to the chair of Greek in the University of Paris in 1547, where Scaliger was for a short time one of his pupils; director of the royal printing establishment 1552-56. D. June 12, 1565. Turnèbe is one of the greatest of French Hellenists, distinguished alike for his erudition and his critical genius. He printed the *editio princeps* of Philo, Synesius, Demetrius Triclinius's scholia to Sophocles with a valuable preface; edited Æschylus, Aristotle's *Ethics*, Cicero's *De legibus*; wrote commentaries to Varro's *De Lingua Latina*, and to Horace; and published admirable translations of Arrian, Oppian, Theophrastus, and of several treatises of Plutarch. See his *Opera* (3 vols. fol., 1600). Most of his critical emendations, covering a wide field of classical authors, are collected in his justly famous *Adversaria*, thirty books. A. G.

Turner: village; Du Page co., Ill.; on the Burlington Route, the Chi. and N. W., and the Elgin, Jol. and East. railways; 30 miles W. of Chicago (for location, see map of Illinois, ref. 2 F). It is a manufacturing place, with rolling-mills, railway, machine, and carpenter shops, sash, door, and blind factories, creamery, pump-factory, office-furniture factory; and has 5 churches, 2 public-school buildings, a private bank, electric lights, and a monthly and 2 weekly periodicals. Pop. (1880) 1,001; (1890) 1,506; (1895) estimated, 2,700. EDITOR OF "DU PAGE COUNTY DEMOCRAT."

Turner, CHARLES TENNYSON: poet; b. at Somersby, Lincolnshire, July 4, 1808; third son of Dr. George Clayton Tennyson; educated at Louth Grammar School and Trinity College, Cambridge (1828-32), where he did admirably work in the classics, obtaining a Bell scholarship; became chap

of Grasby (Oct., 1835), where he passed the greater part of his life, beloved as pastor and highly esteemed for his good works; married (May 24, 1836) Louisa Sellwood, youngest sister of Lady Tennyson; assumed by royal license the name of Turner (1835), having inherited the Grasby living and Caistor house of his great-uncle, Rev. Samuel Turner. Besides *Poems by Two Brothers* (1827), which contained the juvenile verses of Charles and Alfred Tennyson, his works are *Sonnets and Fugitive Pieces* (1830); *Sonnets* (1864); *Small Tableaux* (1868); *Sonnets, Lyrics, and Translations* (1873); *Collected Sonnets, Old and New* (1880). D. at Cheltenham, Apr. 25, 1879.
EUGENE PARSONS.

Turner, CHARLES YARDLEY: genre and landscape painter; b. in Baltimore, Md., Nov. 25, 1850; pupil of the National Academy and of the Art Students' League in New York, and of Jean Paul Laurens, Munkaesy, and Bonnat in Paris; National Academician 1886; second Hallgarten prize, National Academy, 1884; honorable mention, Paris Exposition, 1889; member of the American Water-color Society. Studio in New York.
W. A. C.

Turner, JOSEPH MALLORD WILLIAM: landscape-painter; b. in London, Apr. 23, 1775. He was the son of a hair-dresser, and entered the schools of the Royal Academy in 1789; studied perspective with Thomas Malton, and architectural drawing with Girtin, and drew from nature in pencil and water-color. He was elected a Royal Academician in 1802, and soon afterward traveled in France, Italy, and Switzerland. In 1807 he began his *Liber Studiorum*; in 1819 visited Italy, to which country he returned in 1829 and 1840. He had a most successful artistic career, and received many honors. D. at Chelsea, London, Dec. 19, 1851. He left his pictures to the nation, the National Gallery in London thus acquiring over a hundred finished works. His work was enthusiastically championed by John Ruskin, who wrote eloquently about his methods and his faithful study of nature, and exalted him at the expense of Claude Lorraine, who was considered the greatest of all landscape-painters at the time when Turner began to be known. Ruskin's criticism, while sincere and earnest, is pernicious in its effects, and has had much to do with preventing the development of an intelligent appreciation of art in England. Turner was undoubtedly a man of great talent and singularly gifted as a colorist, his chief claim to rank high as an artist depending indeed on the fine color quality of many of his works, much more than upon any real truth to nature. In his later work he paid little attention to form, and occupied himself almost entirely in working out elaborate color schemes, for which almost any subject served his purpose.

In the National Gallery, in London, in Room VI., are a large number of oil-paintings by Turner, most of them coming from his bequest to the nation. Among these are *Calais Pier* (1803); *The Garden of the Hesperides* (1806); *Crossing the Brook* (1813); *Apuleia in Search of Apuleius* (1814); *Rome from the Vatican* (1819); *The Bay of Baia*, called also *Apollo and the Sibyl* (1822); *Dido building the Fleet* (1828); *Ulysses deriding Polyphemus* (1830); *The Fighting Temeraire* (1839); *Bacchus and Ariadne* (1840); *The Burial of Wilkie at Sea* (1842). In Room IV. are the two pictures, *Snow Storm, Steamer Signalling* (1842), and *Rain, Steam, and Speed on the Great Western Railway*, of about the same epoch, together with a number of water-color drawings, some of great importance. In Room III. are several large pictures, including two celebrated ones of *Venice* and *Lake Avernus*. In Room IX. are *The Sun rising in a Mist* and *Dido building Carthage*, which two pictures Turner left to the nation with the express proviso that they should be hung beside the two large pictures by Claude Lorraine, *Landscape with Figures* and *The Embarkation of the Queen of Sheba*. In the basement of the building is a very large collection of drawings, all framed and arranged like books upon shelves. Some of these are of great value.

Many of Turner's most important works are in private hands, generally in Great Britain, and a few are in the South Kensington Museum. In New York, the *Scene on the French Coast* (1831) and *Staffa* (1832) are in the Lenox Library; *Norham Castle* and the *Fountain of Indolence* are in the collection of Mrs. W. H. Vanderbilt; and the *Slave Ship* is owned by Thornton Lathrop, Boston.

Turner produced some remarkable engravings, the chief of which are the set known as *Liber Studiorum*. Eighty or more plates were prepared for this publication, of which seventy-one were published. Their general character is that of an etching in line, very carefully and skillfully made, as the

framework of the composition, the plate being then mezzotinted; but some few of the plates were engraved in different ways. Five or six pure mezzotints of great beauty also exist. Engravings after Turner's pictures and water-color drawings were made in great numbers, on a large and also on a very small scale. Among the important series of prints may be named the *England and Wales, the Yorkshire Series*, the *Harbours of England*, and the illustrations to Rogers's *Italy* (1830) and *Poems* (1834). See the *Lives* by Thornbury (1862), Hamerton (1878), and Monkhouse (1879).

WILLIAM A. COFFIN.

Turner, SAMUEL HULBEART, D. D.: clergyman and author; b. in Philadelphia, Pa., Jan. 23, 1790; graduated at the University of Pennsylvania 1807; was ordained deacon in the Protestant Episcopal Church 1811, and priest in 1814; was pastor of a church at Chestertown, Md., 1812-17; was elected Professor of Historic Theology in the General Episcopal Seminary, New York, Oct. 8, 1818; removed with that institution to New Haven, Conn., 1820, and returned with it in 1824 to New York, where it was combined with the New York Diocesan Seminary under the title of the General Theological Seminary, in which he was Professor of Biblical Learning and Interpretation of Scripture from Dec. 19, 1821, to his death, and also Professor of the Hebrew Language and Literature in Columbia College from 1831. He was the author of *Notes on the Epistle to the Romans* (New York, 1824); *Companion to the Book of Genesis* (1841); *Biographical Notices of Distinguished Jewish Rabbis* (1847); *Parallel References Illustrative of the New Testament* (1848); *Essay on our Lord's Discourse at Capernaum* (1851); *Thoughts on the Origin, Character, and Interpretation of Scripture Prophecy* (1852); *Teachings of the Master* (1858); *Spiritual Things compared with Spiritual* (1859); *The Gospels according to the Ammonian Sections and the Tables of Eusebius* (1861); an *Autobiography* (1862); and several volumes of sermons. He translated Jahn's *Introduction to the Old Testament* (1827), in which he was aided by Dr. W. R. Whittingham, and Planck's *Introduction to Sacred Philology and Interpretation* (1834); edited in Greek and English, with analytical and exegetical commentaries, the Epistles to the Hebrews (1852), to the Romans (1853), and to the Ephesians (1856). D. in New York, Dec. 21, 1861.

Revised by S. M. JACKSON.

Turner, SHARON: historian; b. in London, England, Sept. 24, 1768; became a successful attorney in London, but retired from the practice of his profession in 1829, and devoted the remainder of his life to literary pursuits, receiving a pension of £300 from the crown. D. in London, Feb. 13, 1847. The most valuable of his writings was the *History of the Anglo-Saxons* (4 vols., 1799-1805; 7th ed., 3 vols., 1853), which was long the standard authority. Besides other works in verse and prose, he also wrote *A History of England from the Norman Conquest to the Death of Elizabeth* (1814-23) and *The Sacred History of the World* (3 vols., 1832; 8th ed. 1848).

Turner, WILLIAM, M. D.: physician, clergyman, and naturalist; b. at Morpeth, Northumberland, England, about 1515; educated at Pembroke Hall, Cambridge, where he obtained a fellowship about 1531; studied medicine, botany, and theology; took orders in the Church of England; was imprisoned for preaching the doctrines of the Reformation; proceeded on his release to the Continent, and studied natural history at Zurich and Bologna; returned to England on the accession of Edward VI.; became physician to the Protector Somerset; prebendary of York 1550, dean of Wells 1550, and canon of Windsor; resided in Germany during the reign of Mary; was twice deprived of his deanery, and twice restored, 1553 and 1560, and at one time had a seat in Parliament. He was the author of *The Hunting and Fyndyng out of the Romish Fox*, by Will. Wraughton (Basel, 1543); *Arum precipuarum, quarum apud Plinium Aristotelem mentio fit, Historia* (Cologne, 1544); *The Rescuyng of the Romish Fox, etc.*, by Wyllyam Wraughton (Winchester, 1545); *The New Herball* (book i., London, 1551; i. and ii., Cologne, 1562; i. ii., and iii., 1568), the first scientific work on botany by an English writer. He published a collation of the English Bible with the Hebrew, Latin, and Greek, and wrote the account of British fishes in his friend Johann Gesner's *Historia Animalium*. D. in London, July 7, 1568.

Revised by S. M. JACKSON.

Turner, Sir WILLIAM, F. R. C. S., D. Sc., LL. D., D. C. L., F. R. S.: anatomist and naturalist; b. in Lancaster, England, in 1832; studied medicine in St. Bartholomew's Hospi-

tal, London, graduating M. B. in 1857; became a member of the Royal College of Surgeons, England, in 1853, and a fellow in 1893; was prosecutor in anatomy in the University of Edinburgh in 1851; and was elected Professor of Anatomy in that body in 1867. He has been coeditor of the *Journal of Anatomy and Physiology* 1866-94. Among his more important works are *An Introduction to Human Anatomy* (Edinburgh, 1875); *Lectures on the Comparative Anatomy of the Placenta* (Edinburgh, 1876); and *Atlas of Human Anatomy and Physiology*. S. T. ARMSTRONG.

Turner, WILLIAM WADDEN: philologist; b. in London, Oct. 23, 1810; removed to the U. S. 1818; was apprenticed to a printer in New York 1829; became distinguished for his attainments in modern and Oriental languages; was successively librarian to the University of New York and instructor in Hebrew in Union Theological Seminary 1842-52; assisted Dr. Isaac Nordheimer in the preparation of his Hebrew manuals; contributed to Bartlett's *Dictionary of Americanisms* (1848); translated von Raumer's *America and the Americans* (New York, 1845), and the greater part of Freund's *Latin-German Lexicon* for Prof. E. A. Andrews; superintended the publication of Dr. Stephen R. Riggs's *Dakota Grammar and Dictionary*, and other linguistic works issued by the Smithsonian Institution; contributed to Ludewig's *Literature of American Aboriginal Languages* (1858), to the *Transactions of the American Ethnological and Oriental societies*, *Iconographic Encyclopaedia*, the *Bibliotheca Sacra*, and other periodicals. He was for several years recording secretary of the National Institute for the Promotion of Science, and librarian of the U. S. patent office from 1852 to his death, in Washington, D. C., Nov. 29, 1859.

Turner's Falls: village; Montague town, Franklin co., Mass.; on the Connecticut river, and the N. Y., N. H. and Hart, and the Fitchburg railways; 3 miles S. E. of Greenfield, the county-seat (for location, see map of Massachusetts, ref. 1-E). A canal 3 miles long here cuts off a long bend in the river, and three falls provide an enormous water-power, which is utilized by extensive manufactories. The village has a public library, a national bank with capital of \$200,000, a savings-bank, a weekly and a monthly periodical, one of the largest cutlery-works in the world, 3 paper-mills, cotton-factory, foundry and machine-shops, and leather-factory. Pop. (1890) of town, 6,296; of village (1895), 4,202.

EDITOR OF "REPORTER."

Turnhout, (toorn'howt; town; province of Antwerp, Belgium; 25 miles E. of the city of Antwerp (see map of Holland and Belgium, ref. 8-F). It has large paper-mills, tanneries, dye-houses, and manufactures of cotton, flax, hemp, and lace. It was formerly a strong fortress, and in 1597 Maurice of Nassau, supported by a corps of English troops, engaged the Spaniards here, routed them, and captured the fortress. Pop. (1891) 18,747.

Turning: See LATHE.

Turnip [M. Eng. *turnep*; (perhaps) *turn*, implying something round + *nepe*, turnip (< O. Eng. *nāpe*, from Lat. *nāpis*, a kind of turnip); a biennial plant, abundant throughout the temperate zone, having a swollen fleshy root of great value as food both for man and more especially for cattle. It is of the same genus (*Brassica*) as mustard, and of the species *B. rapa*. It is found growing wild as a weed in Europe and Northern Asia, and is largely cultivated both as a field and as a garden crop, sometimes reaching 20 or 25 lb. Turnips, when grown in gardens, may be sown early; when raised in the field, they are sown much later, and thrive best in moist cloudy weather. Though turnip-culture is of comparatively recent origin in Great Britain, it has already taken rank there as a most important field-crop, being fed to sheep in the fields, inclosed within hurdles or movable fences. Though an agreeable article of diet for man, it has never assumed great importance in that respect, owing to the enormous proportion of water, 87 to 92 per cent., in its composition. The ruta-baga or Swedish turnip is closely allied to it, but is held by some botanists to be specifically distinct, *B. campestris*. Revised by L. H. BAILEY.

Turnip-fly: any one of several insects destructive to turnips. The most common is the small chrysomelean beetle called also turnip-flea (*Utica* or *Haltica nemorum*), from its prodigious leaping powers, a species having an oval body and wide head, long and strong hind legs, large black wings with two yellowish stripes, and claws notched and hooked to enable it to keep firm hold of the cruciferous vegetables

which constitute its food. It eats the leaves of the turnip as soon as they appear above ground in the spring, and lays its eggs on the under side of the leaves later in the season. The larva thus bred upon the plant are often extremely destructive to the turnip-root, in which they burrow. Other species are the *H. strigata*, or wavy-striped flea-beetle of the U. S.; the *Pontia abercana*, petcher or white butterfly; and the *Anthomyia radicum*, a dipterous insect of the family *Muscida*, of the same genus as the cabbage-fly and the beet-fly, and especially abundant and noxious in Great Britain, where the latter is considered as the turnip-fly proper. Revised by F. A. LUCAS.

Turnpike, or Turupike Road: a road, especially a highway, upon which turnpikes or toll-gates are established, and which are kept in repair by the tolls or fees collected from those who use the road.

In England the roads constituting the main lines of communication are, or formerly were for many years, chiefly turnpikes. Each parish, or township, or other particular district, is liable for the maintenance of all highways passing through its lands; but still many such roads are kept in repair, and were formerly built, under the authority of local acts of Parliament which vested their management for a certain number of years in trustees or commissioners who were empowered to erect toll-gates and levy tolls on those passing through as a means of raising a fund for defraying expenses of labor or improvement. The collection of such tolls, however, does not supersede other means for the maintenance of the roads. The turnpikes of England do not generally fall within the operation of the highway acts, and their construction and management are regulated primarily by the local acts relative to each particular trust, which (though temporary) were, until about the middle of the nineteenth century, continued by the legislature from time to time, as they were about to expire; and, secondly, are regulated by certain general acts, applicable (with very few exceptions) to all turnpike roads throughout the kingdom, that is, to all roads maintained by tolls and placed under the management of trustees or commissioners for a limited period of time. There were at one time in England many thousands of these turnpike trusts. In 1861 they numbered over 1,000, but in 1879 were reduced to a little over 200 by expiration of the trusts in accordance with the provisions of the Annual Turnpike Continuance Acts.

The first authorization in England for the erection of toll-gates was in 1346 under Edward III., and from that time the system spread throughout all England, Scotland, and Ireland, being regulated in each country by special laws. The first general turnpike act was that of 13 Geo. III., ch. 64, since which time numerous others have been passed, the effect of which has been to do away with turnpikes to a large extent, and place the roads and their maintenance under the charge of the county officers. The most important, as well as the earliest, of the general acts systematizing the turnpike laws now in force is that of 3 Geo. IV., ch. 126.

In Scotland there were formerly two main classes of roads, statute-labor roads and turnpike roads. The statute-labor roads were intended for local communication, and were maintained by personal services of tenants, cotters, etc., the services being later commutable to a money payment. Turnpike roads constituted the main lines of communication, and were maintained by tolls. These roads in Scotland, like those in England, were maintained by virtue of special acts, many of which were passed from time to time; but in 1878 an act was passed putting all the roads in each county under one system of management, abolishing statute labor, money commutation, and tolls, and substituting a rate upon land and heritages for the maintenance of the roads. This act was at first permissive, but became compulsory on June 1, 1886. Turnpike roads have also been abolished in Ireland.

England's various systems of maintaining roads were practically copied in her colonies. Thus in the U. S. many of the highroads for local communication in rural districts are maintained by the statute-labor system; in others they are maintained by some form of tax, usually a land tax. Where statute labor exists a provision is usually made for commutation into a money payment. Turnpike roads in the U. S. are constructed and maintained by corporations created either under general statutes or by special charters. The legislation of the several States upon this subject varies widely, but in general such corporations (which have pro-

tically the same general rights and duties as the commissioners or persons holding the turnpike trusts in England) stand in a position similar to railroad companies in regard to the exercise of the right of eminent domain, being considered so far public that they are authorized to take lands necessary for their own use, upon making adequate compensation to the owners thereof, and even to appropriate existing highways when necessary to carry into effect the rights and privileges granted by their charters. They are also given power to lay and collect tolls, and to erect gates to insure their payment, the rates of tolls, the distance between the gates, and various other details being frequently regulated by their charter. Owing to the importance of the franchise granted in bestowing a right to make and maintain a turnpike road, and the ease with which the rights of the parties concerned may be violated either by the turnpike company or the public, as the case may be, the rights and duties of the turnpike company and of the public are very strictly prescribed by the statutes or charters under which the turnpike companies or trusts are created. Turnpike roads are becoming less numerous, their construction and maintenance being assumed by, or imposed upon, municipal corporations.

Sometimes roads are constructed so that by taking a circuitous route a person traveling upon a turnpike may avoid passing through the toll-gates, and so avoid the payment of toll. These circuitous routes were called *shunpikes*, and they may be erected when public necessity demands it, but the laws are stringent against their being made with the intent and effect of depriving the turnpike company of its legal tolls.

In return for their franchises it is the duty of the turnpike companies to keep the road-bed and its appurtenances in good repair, and in such condition and manner as the statutes prescribe, at least so long as they do not surrender their charter by ceasing to demand payment of tolls. For a failure to comply with this requirement they may be held liable in an action for damages by a person injured through their negligence, and also to an action for such penalties or annulment of their charter as the law provides for. As concerns its use, a turnpike is in every respect a public highway, free to all, except that the legal toll must be paid as a condition of use; and the rules of law concerning the encroachment upon highways apply equally to turnpikes.

F. STURGES ALLEN.

Turnsol: another name for LITMUS (*q. v.*). See also ARCHIL.

Turnspit: a kind of dog, formerly employed for turning the spit upon which meat is roasted. The turnspit is a very intelligent dog, with a long body, short and often crooked legs, long and pendent ears, and a very large head. It has a dash of greyhound blood. Two or more dogs were kept, to relieve each other at the task, the dog standing in a kind of treadmill, his weight giving motion to the spit. The breed is apparently very old, as similar dogs are figured on the monuments of ancient Egypt.

Turnstone [so called from its habit of overturning stones in search of food]: of the *Streptilas interpres*, a wading bird of the family *Haematopodidae*, allied to the plovers, and common on the shores of the U. S. and in nearly all parts of the world. On the Pacific coast is found *S. melanopus*, the black turnstone.

Turpentine [from O. Fr. *turpentine* < Lat. *terebinthina*, *terbinthina* (sc. *resina*, gum), turpentine, liter., fem. of *terbinthinus*, of the terebinth or turpentine-tree, deriv. of *terbinthus*. See TEREBINTH]: any one of certain vegetable oleo-resins which exude from coniferous trees, also the resin obtained from the *Pistacia terebinthus*. They are obtained by making an excavation, having a capacity of about 3 pints, in the trunk of the tree, in which the exuded juice accumulates, which is collected, washed with warm water, and purified by straining through straw filters. The several varieties of turpentine are viscid solutions of resin in a volatile oil. American turpentine is chiefly procured from the *Pinus palustris* and the *Pinus taeda*, the principal supply coming from North and South Carolina and Georgia. French and German turpentine greatly resemble the American in most of their properties. Venice turpentine, which is obtained from the *Taxus europaea*, is a rosy, slightly greenish liquid having a rather unpleasant odor and taste. Canada turpentine is produced from the *Abies balsamea* (see BALSAM, CANADA), growing in Canada and the northern part of Maine. The remaining varieties of turpentine

are the Strassburg, the Hungarian, and the Chian, which differ somewhat in their properties, but are in most respects very similar compounds. The turpentine as a class form yellowish viscid liquids, possessing a strong aromatic odor, and a bitter, pungent taste, and are very inflammable. They consist of a volatile oil (or oils) and *colophony* (*rosin*). Upon distilling the crude product with water the volatile oil is separated, a brittle residue of rosin remaining.

Oil of turpentine (spirits of turpentine) (C₁₀H₁₆) is obtained by the distillation of crude turpentine, the different varieties of the crude product yielding oils that differ from one another. They all form colorless, mobile liquids of a peculiar disagreeable odor, are insoluble in water, but dissolve in alcohol, in ether, and in carbon disulphide. The oils of turpentine are solvents of many resins and oils, of caoutchouc, and of iodine, sulphur, and phosphorus. The chief differences exhibited by the various varieties are in specific gravity, boiling-point, and optical rotatory power. The ordinary turpentine oil of commerce has a specific gravity of 0.864 and a boiling-point of 320° F. French oil of turpentine consists essentially of a hydrocarbon termed *terebenthene* (C₁₀H₁₆), of specific gravity .8767 at zero centigrade, and boiling-point of 321° F. (*Ribán*). *Australene* is an analogous hydrocarbon obtained from the American oil. The oils of turpentine on standing slowly absorb oxygen, a portion of which is converted into ozone. Chlorine, bromine, and iodine are dissolved by them, disengagement of heat and combustion often occurring. Under the influence of heat and of acids turpentine oils assume various isomeric states; when heated to 464° F., *isoterebenthene* and *metaterebenthene* are formed; by the action of sulphuric acid *terebene* and *colophene* are produced. Two other isomers, *camphylene* and *terebylene*, have been prepared by treating artificial camphor with quicklime. Artificial camphors are the results of the combination of hydrochloric acid with oil of turpentine, so far two hydrochlorates, C₁₀H₁₆.HCl and C₁₀H₁₆.2HCl, having been obtained. The former, which is termed *hydrochlorate of camphene*, crystallizes in white prisms, which have an aromatic smell and taste greatly resembling that of ordinary camphor; the latter compound possesses the characteristic odor of the oil of thyme. (See THYME, OIL OF.) A numerous variety of seeds and fruits yield by distillation oils isomeric or polymeric with those of turpentine. These have received the generic name of *camphenes* or *terebenes*. Turpentine is sometimes applied externally in medicine in the shapes of salves and plasters; it is also taken internally in the form of pills. The oils of turpentine are extensively used in the preparation of varnishes, and to some extent in medicine as stimulants, diuretics, and anthelmintics.

Revised by IRA REMSEX.

Turpentine-tree: See TEREBINTH.

Turpeth, or Turbith [*turpeth* is viâ O. Fr. from Pers.; *turbith* = Fr. from Pers. *turbid*, a cathartic; *turbad*, a purgative root]: a medicinal cathartic root (that of the *Ipomœa turpethum*) from India and Australia. Spigatis found in it a substance he called *turpethine*, C₂₃H₃₆O₁₆, a yellowish resin which possessed purgative properties. It seems to be a glucoside.

Turpeth-mineral, also Turbith-mineral: an ancient name of what is now known as the basic sulphate of mercuric oxide, Hg₂SO₄. It is obtained by boiling with water the neutral mercuric sulphate, HgSO₄. It is a lemon-yellow powder, which is very slightly soluble in cold water. It was formerly used in medicine. Notwithstanding its name it is not a mineral substance, but is wholly artificial.

Turpil'ius, Sextus: a Roman comic poet contemporary with Terence, but outliving him by many years, dying at Sinuessa, 103 B. C. Like Terence he cultivated the *Fabula Palliata*, and six of the thirteen play-titles known to us agree with titles of Menander. In diction he falls far below the purity of Terence, to whom he is ranked next in merit in the canon of Volentius Sedigitus. The *Fragments*, 215 verses, are given in Ribbeck's *Com. Rom. Frag.*, pp. 85-111.

M. WARREN.

Turpin. Fr. pron. tür'pân', or Tyłpi'nus; archbishop of Rheims (d. Sept. 2, 800); the reputed author of a Latin chronicle relating the campaigns of Charlemagne against the Saracens in Spain. The book was declared authentic by Pope Calixtus II. in 1122, translated into French in 1206, printed in 1566 in Frankfort, and edited by Ciampi (Florence, 1822) and Reiffenberg (Brussels, 1836). The first part of the book was evidently written simply in order to

encourage pilgrimages to St. Jago di Compostella, and the rest bears the character of a romance written principally for the purpose of entertainment. Many interior features indicate that the work was produced in the twelfth century, perhaps by Pope Calixtus II. himself. See *Champi, De Vita Caroli Magni et Rolandi Historia, J. Turpinus vulgo tributa* (Florence, 1822), and Gaston Paris, *De Pseudo-Turpinio* (Paris, 1865).

Revised by S. M. JACKSON.

Turpin, EDMUND HART; organist and composer; b. at Nottingham, England, May 4, 1835; studied entirely in London; in 1859 he became organist at St. George's, Bloomsbury; is honorary secretary of the College of Organists; and has edited the London *Musical Standard* since 1880. He has conducted various societies and orchestras, and has composed a large quantity of church music of excellent character, with two cantatas—*A Song of Faith* (1867) and *Jerusalem*—several masses, a *Stabat Mater*, and many songs and organ pieces.

D. E. HERVEY.

Turquoise, or **Turquoise** [from Fr. *turquoise*, Turkish (adjective, feminine, turquoise, deriv. of *Ture*, Turk; named (as also *Turkey-stone*, as it was called in the sixteenth century) from Turkey, because derived from the East]: an aluminum hydrous phosphate, owing its blue color to a small amount of copper, always opaque and amorphous, and occurring in small seams in igneous and volcanic rocks. It has long been a favorite gem-stone from its peculiar delicate light-blue color; when greenish in tint it is much less prized. The principal localities for turquoise are at Nichapur, Persia, and in the Sinai Desert in Egypt. The stones from the latter are more liable to change color. Since 1890 very fine gems have been obtained in New Mexico, near Los Cerrillos, where extensive mines have been reopened that were worked by the ancient Mexicans. A single stone from these mines has been sold for \$4,000, and the product is one of much commercial importance. Turquoise occasionally loses its color and turns greenish, especially when exposed to fatty acids, as in washing with soap water. A natural imitation, known as *bone turquoise* or *adamolite*, is fossil bone similarly colored by copper. It is easily distinguished by its microscopic structure.

GEORGE F. KUNZ.

Turretin, Fr. pron. tür'tāin', or **Turretin**, François; theologian; b. at Geneva, Oct. 17, 1623; studied theology in his native city, in Holland, and in France under Spanheim, Morus, and Diodati; was appointed pastor at Geneva in 1647; removed to Leyden in 1650; returned to Geneva as Professor of Theology in 1653. Died there Sept. 28, 1687. His principal work is *Institutio Theologiae Elenctica* (Geneva, 1679-85; n. e. Edinburgh, 1847-48, 2 vols.), a standard treatise on the lines of the strictest Calvinism. His complete works were published in 4 vols., 1688. See his *Life* in Latin, by B. Pietet (Geneva, 1688).—His son, JEAN ALPHONSE TURRETIN, b. at Geneva, Aug. 13, 1671; studied theology; visited Holland, England, and France, and was appointed Professor of Ecclesiastical History in 1697 at Geneva, and of Systematic Theology in 1731. D. at Geneva, May 1, 1757. His complete works were published in 5 vols. in 1755, and contain *Pyrrhonismus Pontificus*, against Bossuet's *Histoire des Variations, Historia Ecclesiastica Compendium ab anno 1700, Cogitationes et Dissertationes Theologicae* (2 vols., 1737), etc. In his theology he tried to mitigate and modify the severe Calvinism, and practically he exerted himself much in order to promote a union between the Lutheran and the Reformed Churches. It was mainly due to him that the rule requiring every German pastor to subscribe to the Helvetic consensus was withdrawn; and when Frederick I. of Prussia asked the opinion of the German ministry concerning the union, it was Turretin who drew up the answer which makes a happy distinction between fundamental and non-fundamental differences, reducing the differences between the two great Protestant churches to the latter kind. See his *A Discourse concerning the Fundamental Articles in Religion*, which appeared in an English translation (London, 1720). The work was attacked by the Jesuit Francois de Pierre (Lyons, 1728), who urged that the Reformed churches, with such an explanation, had no further reason for remaining outside the Roman Church. See E. de Budé, *François et Alphonse Turretin* (2 vols., Lausanne, 1880).

Revised by S. M. JACKSON.

Turrets [M. Eng. *tourret*, from O. Fr. *tourrette*, dimin. of *tour*, tower < Lat. *turris*, tower]; in military usage, tower of metal, often revolving, designed both to protect the guns and gunners contained in them, and to afford these a suitable position for offensive operations. Since the civil war in

the U. S. they have become a recognized element in land and naval warfare. A patent was issued to Theodore R. Timby, of New York, in 1863, for "a revolving metallic tower, and for a revolving tower for a floating battery to be propelled by steam." This wholly original idea of a revolving battery found its earliest practical expression in the turrets of the monitors. (See *MONITOR AND SHIPS OF WAR*.) For each of the monitors built by Ericsson and his associates the inventor received a royalty. The great military value of the revolving battery once fully demonstrated by the crucial test of war, it was soon adopted by other nations, not only for naval purposes, but also for defensive works on land. "Revolving turrets," observes a high English authority, "if of adequate strength, are the best of all methods of protecting ordnance for coast-defense. They combine the security given by shields with more than the lateral range afforded by the barbette system, and the ease with which they can be turned gives special facilities for firing at moving objects, or for screening the gun-ports from an enemy's fire while loading the guns. The gunners are fully protected."

The Gruson turret (see Fig. 1) has the ellipsoidal form

FIG. 1.—The Gruson, a modification of the Timby turret.

in order to deflect a shot striking it. The turret is cast of chilled iron in separate pieces, which when put together are mutually supporting. They are comparatively cheap. Germany, Russia, Holland, Italy, Austria, and Belgium have adopted this type of defensive works. A two-gun turret is generally considered as equivalent to an open battery of six or eight guns.

The Dover Turret (England).—The Dover turret (Fig. 2), placed on the outer end of the pier at Dover, England, consists of a live ring and rollers of steel running on a path of steel laid on a massive cylinder of masonry. On

FIG. 2. Another modification of the Timby turret.

this live ring runs an iron framework weighing about 240 tons. The framework contains the gun-chamber, which is protected by three thicknesses of 7-inch armor, with two intermediate thicknesses of 2-inch plates and 6 inches of wood, weighing together about 460 tons. The weight of guns, carriages, and slides, added to the above makes a total running weight of about 895 tons. This throws upon each of the thirty-two rollers of the live ring a pressure due to about 28 tons. The outside diameter of turret is 37 feet; inside, 32 feet; interior height of gun-chamber, 8 ft. 8 in.; height of turret-armor, 9 feet; armament, two 80-ton guns. The turret is turned by a pinion, the vertical shaft shown, working into a large ring, with steel trundles secured to the framework, the power being given by a set of main engines capable of working up to 300 horse-power, and auxiliary engines of 45 or 50 horse-power. All engines and boilers are in the lower part of the battery, about 20 feet below the guns. The magazines are nearly at the same level as the engines.

S. B. LUCE.

Turret-ships: See *SHIPS OF WAR*.

Turtle: See *TUSTUDINATA*.

Turtle, or **Turtle-dove** [*turtle* is O. Fr. *turdus*, from Lat. *tur tur* (probably a name imitative of its noise, like any one of several small pigeons, especially those of the genus

Turtur. The *T. auritus*, or common European turtle, is a migratory bird, famed for its gentleness, its strong conjugal affection, and its loud but pleasant cooing note. The turtle or mourning dove of the U. S. is the *Zenaidura macroura*, whose gentle and mournful note is well known. It is 13 inches in total length, and has a remarkably long tail. Pigeons of the genus *Zen* are also reckoned as turtles. There are perhaps twenty species of turtle-dove. That mentioned in the Bible is *Turtur risorius*, an abundant Eastern species often kept in cages. Revised by F. A. LUCAS.

Turtle-fishery: the taking of turtles for commercial purposes. While turtles are used for food wherever they are sufficiently large or abundant, few species are the object of regular pursuit. Among marine species the green turtles (*Chelonia midas* and *virgata*) are taken for their flesh and the hawk's-bills (*Eretmochelys imbricata* and *squammata*) for their shells; the loggerhead (*Thalassochelys caretta*) is also taken, but forms indifferent or poor food. The diamond-back, or terrapin (*Malaclemmys palustris*) of the southeastern parts of the U. S. and the large species of *Emydidæ*, usually called sliders, are much sought for, as are also the soft-shelled turtles (*Trionychida*) of the southern parts of the U. S. and Mississippi valley. The Indians of the Amazon systematically hunt turtles for their flesh and eggs, the latter used for making oil, and the Japanese consume numbers of a species of *Trionyx* (*T. japonicus*). Marine turtles are taken on most suitable sandy shores in tropical or warm regions. The island of Ascension is an old and famous locality, as are the Bahamas and the Gulf of Mexico very generally, and the fishing extends as far N. as North Carolina, few, save stragglers, going beyond. The turtles are taken on land by watching on the nights when they come ashore to deposit their eggs, and quickly turning them on their backs. In the water they are sometimes caught by the primitive plan of diving and grasping the front of the shell with one hand and the hind part with the other, giving the animal such a twist that his struggles bring him to the surface. Another method much in vogue is to use a spear with a small round point, which is fastened to a line, though detachable from the shaft, the creatures being speared when asleep, or pursued when the conditions are favorable, as, for example, in smooth or shallow water. Nets are also employed to some extent. The turtles are usually kept until wanted for shipping in inclosures termed crawls, and travel very well if simply laid on their backs in a damp cool place. Fresh-water turtles are caught in nets and in traps on the principle of a lobster-pot, one end being attached to a stake and kept above water in order that the turtle may not drown. They are also scooped up in dredges or taken in the fall and winter after they have entered the mud to hibernate by probing for them with an iron rod. Turtle-culture has been practiced to some extent both in the U. S. and Japan, a suitable body of water being fenced in and, in necessary places, covered with netting to prevent crows and other enemies from destroying the eggs and young. These inclosures are perhaps more used in the U. S. for the keeping and feeding of small individuals until they reach a marketable age than for raising turtles from the eggs. In the States of the Eastern coast of the U. S. in 1890 there were taken 476,630 lb. of terrapin, worth \$70,141, and 1,287,256 lb. of turtle, valued at \$40,550, besides 1,153 lb. of tortoise-shell, amounting to \$2,884, and turtle eggs to the extent of \$994, the total, including the product of the Pacific States, reaching \$119,569. Florida claims the largest catch of the sea-turtles and Virginia leads in the number of terrapin caught, although Maryland's product stands first in value, owing to the large proportion of the valuable diamond-backs in her waters.

F. A. LUCAS.

Tusa'yan Indians: See CLIFF-DWELLINGS, PUEBLO INDIANS, and SHOSHONEAN INDIANS.

Tusealoo'sa: city; capital of Tuscaloosa co., Ala.; on the Black Warrior river, and the Ala. Gt. South. Railroad; 55 miles S. W. of Birmingham, 75 miles N. N. W. of Selma (for location, see map of Alabama, ref. 4-B). It is in a cotton-growing and coal-mining region, was formerly the State capital, and is noted for its educational institutions, which include the University of Alabama (post-office, University), University High School, Central Female College, Tuscaloosa Female College, and the Institute for Training Colored Ministers (Presbyterian). It is also the seat of the Alabama Insane Hospital. There are 2 national banks with combined capital of \$160,000, a private bank, and 2 daily and 3 weekly newspapers. Pop. (1880) 2,418; (1890) 4,215.

Tuscan Order: an order of architecture still simpler than the Roman Doric. (See ORDERS OF ARCHITECTURE and DORIC ORDER.) Its origin is probably to be found in the imitation of Greek designs by the Etrurians and other inhabitants of Italy before the time of the Roman domination. The Roman builders took this, with other features of Etruscan architecture, into use before importing Greek forms more directly. It may well be that the Roman Doric so called was a more decorated form of Tuscan.

R. S.

Tuscany [from Lat. *Tusca'nis*, Tuscan, Etruscan, deriv. of *Tusci*, another name for *Etrusci*, Tuscans, Etruscans]: a compartment of Italy, comprising the eight provinces of Arezzo, Florence, Grosseto, Leghorn, Lucca, Massa-Carrara, Pisa, and Sienna; now not recognized as a legal division. Area, 9,304 sq. miles. Pop. (1893) 2,296,011. It was formerly an independent grand duchy of Italy. Its territory corresponded nearly to that of the ancient Etruria, and after the fall of the Roman empire it formed at first part of the kingdom of the Goths, then of the kingdom of the Longobards, and then of the empire of Charlemagne. He gave it a somewhat more independent position, erecting it into a marquisate, and giving it away as a military fief. Guelf VI. sold his fief in 1160 to the German emperor Frederick I.; but as the connection with the German empire was somewhat loose from the very beginning, Tuscany was soon broken up into a number of independent republics, of which Florence, Pisa, and Sienna were the most important. Florence conquered Pisa and the greatest part of the Tuscan territory, but was conquered itself in 1532 by Charles V., who appointed Alessandro de' Medici Duke of Florence. In 1569 Cosmo I. united the whole of Tuscany into a grand duchy, and from that time to 1737, when it became extinct, the Medici family ruled the country, and made it one of the most prosperous and civilized in Europe. In 1737 it fell to Francis, Duke of Lorraine, who had married Maria Theresa and later became Emperor of Germany, and with exception of a few years, during which Napoleon first made it a part of the kingdom of Etruria, and then annexed it to France, it was ruled by the house of Lorraine until Aug. 16, 1859, when by an almost unanimous vote of the people it annexed itself to the kingdom of Sardinia. In 1861, by a similar process, it was annexed to the kingdom of Italy. From that time until 1871 Florence was the capital of the kingdom.

Revised by M. W. HARRINGTON.

Tuscara'ra or Tuskarora Indians: See IROQUOIAN INDIANS.

Tuscia: See ETRURIA.

Tuseo'la: city (founded in 1856); capital of Douglass co., Ill.; on the Chi. and E. Ill., the Ill. Cent., and the Ind., Decatur and W. railways; 150 miles S. of Chicago, and 150 miles E. of St. Louis (for location, see map of Illinois, ref. 6-F). It is in an agricultural region and the broom-corn belt of Illinois; contains several churches, 2 public-school buildings, a national bank with capital of \$60,000, a private bank, and 3 weekly newspapers; and is the largest broom-corn shipping-place in the U. S. Pop. (1880) 1,457; (1890) 1,897; (1895) estimated, 3,000. EDITOR OF "REVIEW."

Tuseulum: See FRASCATI.

Tuseum'bia: city; capital of Colbert co., Ala.; on the Tennessee river, and the Memphis and Charleston, the Louisv. and Nashv., and the Birmingham, Sheffield and Tenn. River railways; 125 miles N. W. of Birmingham, 175 miles N. W. of Montgomery, the State capital (for location, see map of Alabama, ref. 1-B). It is in an agricultural region, and contains a public school, several private schools, the Doshier Female Institute (chartered in 1870), an excellent spring-water supply, Baptist, Methodist Episcopal, Presbyterian, Protestant Episcopal, and Roman Catholic churches, a State bank with capital of \$25,000, flour and feed mill, plow-factory, and a weekly newspaper. Pop. (1880) 1,369; (1890) 2,491; (1895) estimated, 3,000. EDITOR OF "NORTH ALABAMIAN."

Tushita [Sanskrit, satisfaction or joy]: the heaven of "the perfectly contented ones"; the fourth of the six Buddhist deva-lokas or celestial spheres or abodes of the gods. Here dwell the Buddhissattvas, or beings whose essence has become intelligence, and who have only once more to pass through human existence before attaining to Buddhahip. Here dwelt Gautama, and it was from this heaven that he descended in the form of a white elephant to be born for the last time. Here also dwells Maitreya, the coming Buddha of the present age. In Tushita life lasts 4,000 years, but twenty-four hours are there equal to 400 years on earth.

Tuskegee: town; capital of Macon co., Ala.; on the Tuskegee Railroad: 40 miles N. by E. of Montgomery, 135 miles S. W. of Atlanta, Ga. (for location, see map of Alabama, ref. 5-E). It is in a cotton-growing region, is an attractive winter resort, and contains 2 cottonseed-oil mills, an incorporated bank with capital of \$50,000, a private bank, and a weekly newspaper. It is widely noted for its educational institutions, which comprise the Alabama Military Institute, the Alabama Conference Female College, the Alabama Normal School, school for colored people, and the Tuskegee Normal and Industrial Institute. The latter was founded in 1881 by Booker T. Washington, a graduate of the Hampton Normal and Industrial Institute, and in 1891 had 48 professors and instructors, all colored, 915 students, 1,810 acres of ground, and 31 buildings valued at \$200,000. The institution is exclusively for colored youth, is thoroughly equipped for advanced normal and industrial education, and nearly if not all of the work of laying out the grounds, erecting the buildings, and constructing the operating plants, was done by the students. From its opening till the 1894 commencement the institute received from all sources \$421,955, and the students paid in labor \$187,612, put over 500 acres under cultivation, and made over 500,000 bricks. Mr. Washington has been principal of the institute from its organization. Pop. of town (1880) 2,370; (1890) 1,803.

Tusser, THOMAS: successively a musician, schoolmaster, serving man, husbandman, grazier, and poet; b. at Rivenhall, Essex, England, about 1515; educated at Eton and at Cambridge. D. in London about Apr., 1580. He was the author of *Five Hundred Points of Good Husbandry, united to as many of Good Housewifery, etc.* (1573), in verse, with a metrical autobiography. His book is chiefly valuable for its picture of the manners and domestic life of English farmers. Revised by H. A. BEERS.

Tutmes: See THOTHMES.

Tuttle, DANIEL SYLVESTER, D. D.: bishop; b. at Windham, Greene co., N. Y., Jan. 26, 1837; graduated at Columbia College in 1857; studied theology in the General Theological Seminary in New York; entered holy orders, and in 1866 was elected Bishop of Montana, having jurisdiction in Idaho and Utah; was consecrated in 1867, his election to the missionary episcopate having taken place before he was of canonical age to be made a bishop. After nearly twenty years service in the far West he was chosen to succeed Dr. Charles Franklin Robertson as Bishop of Missouri. He has published missionary reports, episcopal addresses, sermons, and pastorals. Revised by W. S. PERRY.

Tuttle, HERBERT, A. M., LL. D.: historian; b. at Bennington, Vt., Nov. 29, 1846; A. B., University of Vermont, 1869; after graduation engaged for several years in journalism at Boston, afterward at Paris and Berlin, where he continued studies in history and public law; lecturer on international law, University of Michigan, 1879; received appointment to Cornell University 1881, where he held for a time the chair of politics and international law, and afterward became Professor of Modern European History. He was the author of *German Political Leaders* (New York and London, 1876); *History of Prussia to the Accession of Frederick the Great* (1884); *History of Prussia under Frederick the Great* (2 vols., New York, 1888); and many articles in magazines and reviews. D. at Binghamton, N. Y., June 21, 1894. C. H. TURNER.

Tuttle, JOSEPH FARRAND, D. D., LL. D.: clergyman and educator; b. at Bloomfield, N. J., Mar. 12, 1818; educated at Marietta College and Lane Theological Seminary; tutor in Marietta College 1843-44; pastor of the Presbyterian churches at Delaware, O., 1845-47, and at Rockaway, N. J., 1847-62; president of Wabash College 1862-92. Besides contributing frequently to several reviews, Dr. Tuttle has published a large number of important historical sermons, addresses, and pamphlets; *Life of William Tuttle; Way Lost and Found; Self-reliance; Revolutionary Fathers of Morris County, N. J.; The Western States of the Great Valley; Presbyterianism in the Frontiers; Our Half Century; The General Assembly's Jubilee; and Sixtieth Anniversary of Law*. C. K. HOYT.

Tutuila: one of the Samoan islands. See SAMOA.

Tuxpan: a town and port in the northern part of the state of Vera Cruz, Mexico; on the Tuxpan, 7 miles above its mouth (see map of Mexico, ref. 7-H). Vessels anchor in the roadstead, the bar only admitting small craft. Coasting steamers touch here regularly, and there is a thriving trade

in cabinet woods, dyewoods, honey, rubber, hides, etc. Tuxpan dates from before the Conquest and is connected with the legends of the Tlaltecs. Pop. 9,000. H. H. S.

Tver, (tvr, or Twer): government of European Russia; bounded S. by the government of Moscow; area, 25,225 sq. miles. The ground is elevated, but the surface level, covered with forests, and dotted with small lakes; the Volga and several of its affluents rise here. The climate is somewhat severe, and the soil is not very fertile. Rye and oats are produced, sufficient for home consumption; flax and hemp are cultivated. Cattle are neither numerous nor good, but the fisheries are remunerative. Pop. (1890) 1,791,000.

Tver: town of Russia, government of Tver; at the confluence of the Tvertsa and Volga, which latter here becomes navigable for steamers (see map of Russia, ref. 6-1). The town contains an imperial palace, a cathedral, a college, various schools, and barracks, and, situated as it is on the highway from Moscow to St. Petersburg, its trade is considerable. Nails and cotton goods are extensively manufactured. There are several chalybeate springs in the vicinity. Pop. (1890) 40,962.

Twachtman, JOHN HENRY: landscape-painter; b. in Cincinnati, O., Aug. 4, 1853; pupil of F. Duvencek and of the Munich Academy; member of the Society of American Artists 1879; Webb prize, 1888. His work may be properly classed as of the impressionist school, and is remarkable for luminousness and atmospheric quality. W. A. C.

Twatu'ia: the capital of Formosa (*q. v.*).

Tweed: next to the Tay the largest river of Scotland. It rises in the southwest corner of Peeblesshire, at an elevation of 1,500 feet above the sea, flows northeastward, eastward, and again northeastward, and enters the North Sea at Berwick after a course of 97 miles. It is tidal for 10 miles and forms a part of the border with England for 184 miles.

Tweed, WILLIAM MARCY: politician; b. in New York city, Apr. 3, 1823, of Scotch descent; the son of a poor chairmaker; when twenty-eight years old went into partnership with his brother in the chairmaking business; soon became prominent in local politics, and in 1853 was elected to Congress. For many years he was a member of the Tammany Society, of which he was chosen grand sachem in 1869, holding the office till 1871. From his appointment as deputy street commissioner in 1863 may be said to date the foundation of the famous Tammany Ring, of which he was the chief spirit. He became at once the virtual head of the department of streets, afterward the department of public works, and by extending enormously the expenditures for public improvements acquired vast political influence and began to accumulate a fortune. His position as president of the board of supervisors enabled him to increase the city's pay-roll to unprecedented dimensions, giving secure positions to an army of political friends. The ring gradually grew in power and influence till 1868, and at the opening of 1869 found itself master of nearly every department of the State government. In 1868 the ring's greatest scheme of robbery, the building of a new county court-house, was planned. The work was begun under the stipulation that the cost should not exceed \$250,000. Before 1871 over \$8,000,000 was pretended to have been expended on it and it was still unfinished. When by the charter of 1870 the power of auditing accounts was taken from the board of supervisors and vested in certain city offices then filled by Tweed and his friends, all restraints on the system of plundering by fraudulent bills was removed. Such bills, amounting to \$6,000,000, were passed by the board of audit at its first and only meeting. Of this amount over \$1,000,000 was traced to Tweed's private pocket. A secret account of the money thus paid was kept in the auditor's office under the title "County Liabilities." During the winter of 1870-71 a clerk employed in the auditor's office copied by stealth the items in this account and gave them to his patron, James O'Brien, an opponent of the Tammany Society. O'Brien subsequently gave the figures to *The New York Times*, and that journal published them in July, 1871. The excitement created thereby started an investigation which through the earnest efforts of Samuel J. Tilden and others resulted in the exposure of the frauds and the complete overthrow of the ring in the elections of Nov., 1871. Tweed was tried for grand larceny and forgery, and sentenced on Nov. 22, 1872, to twelve years' imprisonment in the penitentiary and to pay a heavy fine. On Dec. 1, 1875, he

escaped and fled to Spain, where he was captured and returned to the city Nov., 1876. Tweed was married in 1844 and had eight children. D. in Ludlow Street jail, New York, Apr. 12, 1878. See Bryce's *American Commonwealth*.

Twelve Tables, Law of the: See ROMAN LAW.

Twer: See TVER.

Tweten, AUGUST DETLEV CHRISTIAN, D. D.: theologian; b. at Glückstadt, Germany, Apr. 11, 1789; studied at Kiel and Berlin; Professor of Philosophy and Theology at Kiel from 1814; called to Berlin in 1835 to fill the theological chair of the great Schleiermacher, which position he occupied till his death Jan. 8, 1876, retaining his vigor and faithfully attending to his academic duties to the last. He was also member of the Oberkirchenrath of the Evangelical Church of Prussia from 1850 till 1874. He was a pupil and admirer of Schleiermacher, but more positive and orthodox. As a teacher and writer he was remarkably clear and accurate. He wrote *Die Logik* (Schleswig, 1825); *Vorlesungen über die Dogmatik der evangelisch-lutherischen Kirche nach dem Compendium des Herrn Dr. W. M. L. de Wette* (vol. i., Hamburg, 1826; 4th ed. 1838; vol. ii., part i., 1837, unfinished); *Matthias Flacius Illyricus* (Berlin, 1844); *Erinnerung an Frdr. Dau. Ernst Schleiermacher* (1869); and an introduction to Schleiermacher's *Ethik*, which he edited (1841). See his *Life*, by C. F. G. Heinrici (Berlin, 1889).

Revised by S. M. JACKSON.

Twichell, JOSEPH HOPKINS: clergyman; b. at Southington, Conn.; graduated at Yale College 1859; studied for the ministry at Union Theological Seminary and Andover Theological Seminary; was chaplain of a regiment in the civil war (1861-64); became minister of the Asylum Hill Congregational church, Hartford, Conn., in 1865. He has published a *Life of John Winthrop* (New York, 1891) and edited *Some Puritan Love Letters*, correspondence of John and Margaret Winthrop (New York, 1893). G. P. F.

Twick'enham: town; in Middlesex, England; on the Thames, opposite Richmond; 11 miles S. W. of London (see map of England, ref. 12-J). It has powder and oil mills, and contains many fine villas and summer residences. It was the home of Pope, who is remembered there by his grotto and a monument in the parish church. Among the other curiosities of the place are the Orleans House, where Louis Philippe lived while a refugee in England, and Strawberry Hill, the seat of Walpole. Twickenham is connected with Richmond by a handsome bridge. In 1894 a new lock, weir, and footbridge was opened. Pop. (1891) 16,026.

Twiggs, DAVID EMANUEL: soldier; b. in Richmond co., Ga., 1790; appointed captain in the Eighth Infantry in 1812, major Twenty-eighth Infantry Sept. 24, 1814, and served throughout the war with Great Britain; was retained in the peace organization of the army in 1815 as captain of the Seventh Infantry; transferred to First Infantry 1821, major May 14, 1825, lieutenant-colonel Fourth Infantry 1831, colonel Second Dragoons June, 1836. In the war with Mexico he served in command of the right wing of the army under Gen. Taylor at Palo Alto and Resaca de la Palma; was promoted brigadier-general June 30, 1846; was breveted major-general for gallantry at Monterey, and Congress presented him with a sword. Transferred to Gen. Scott's army he commanded a brigade before Vera Cruz, and during subsequent operations resulting in the capture of the city of Mexico was in command of the second division of regulars; military governor of Vera Cruz 1848. In Feb., 1861, being in command of the department of Texas, he surrendered his army to Gen. McCulloch of the Confederate service, together with all the Government stores, munitions, and material to the value of \$1,500,000, for which he was dismissed from the service of the U. S. Mar. 1. He was soon after appointed a major-general in the Confederate army and commanded for a while at New Orleans. D. at Augusta, Ga., Sept. 15, 1862.

Revised by JAMES MERCUR.

Twilight [*twi-* (< O. Eng. *twi-*, *twā*, two) + *light* (< O. Eng. *leoht*, light); cf. Germ. *zwei*light, twilight]: the glow in the morning and evening sky caused by the reflection of the light of the sun by the atmosphere after sunset and before sunrise. This very familiar phenomenon offers many interesting features to the observer who carefully watches it immediately after sunset under a clear, unobstructed sky. He can see what is equivalent to the shadow of the earth cast upon the sky. Suppose the observation to begin five

minutes after sunset. Then if one could in a moment ascend to the height of half a mile above the earth he should again catch a view of the setting sun. All that portion of the atmosphere above this point is therefore in full sunlight, while that below it is illuminated by the reflection from other portions. Ten minutes after sunset the line of demarkation will have risen to a height of 2 or 3 miles; all below that limit will be in the shadow of the earth. Now, looking toward the E., the shadow will be distinctly seen, the portion of the atmosphere near the horizon being in comparative darkness, while at the height of a few degrees will be seen the edge of the illumined portion shining by the red light of the setting sun. As the sun sinks farther and farther below the horizon, the illumined part will be seen to shrink away toward the W. Then no part of the air overhead is illuminated by direct sunlight; to see the sun one would have to ascend above the limits of the atmosphere. Yet later the only illumined portions of the atmosphere to which sight can extend are near the western horizon. The sun is then so far below the horizon that only the most distant parts of the atmosphere visible are illumined by its direct rays. Twilight is found to end entirely when the sun is between 15° and 18° below the horizon. The amount of depression varies with the place and the season, and has not been reduced to any satisfactory law. One conclusion from the observations of twilight is that the atmosphere ceases to reflect the rays of the sun at a height of about 45 miles. Did any part of the air higher than this reflect any light it would be visible when the sun was more than 18° below the horizon, and thus there would be a longer twilight than we actually have. S. NEWCOMB.

Twillingate: a port of entry; on the two Twillingate islands, off the northeast coast of Newfoundland, 190 miles by steamer from St. John's; lat. 49° 42' N., lon. 54° 44' W. The islands are connected by a bridge, and the harbor is not very good. The town is the capital of Twillingate and Fogo district, Newfoundland. The finest Newfoundland dogs come from this district. The name is apparently a corruption of Toulouguet, a cape in Brittany, near Brest. Pop. 2,800. M. W. H.

Twills: See TEXTILE-DESIGNING.

Twining, KINSLEY, D. D.: clergyman and editor; b. at West Point, N. Y., July 18, 1832; graduated at Yale College 1853, and at Yale Theological School 1856. He was pastor of Congregational churches at Hinsdale, Mass., 1857-63, at Cambridgeport, Mass., 1867-72, at Providence, R. I., 1872-76. In 1880 he became literary editor of *The Independent*, New York. G. P. F.

Twining, WILLIAM JOHNSON: soldier; b. in Indiana, Aug. 2, 1839; appointed a cadet from that State to the Military Academy at West Point, and was graduated in 1863, the fourth in a class of twenty-five. He was then appointed first lieutenant of engineers, and served in the civil war as assistant engineer of the department of the Cumberland and as chief engineer of the department of the Ohio, and was engaged in the invasion of Georgia, in the operations against Gen. Hood's army in Tennessee, in the battles at Franklin and Nashville, in the movement to the mouth of Cape Fear river, and in the operations in North Carolina in Feb., Mar., and Apr., 1865. Captain of engineers Dec. 28, 1868; major of engineers Oct. 16, 1877. He was breveted major and lieutenant-colonel of volunteers for gallant and meritorious services. After the civil war he served as Assistant Professor of Engineering at West Point 1865-67, as chief engineer of the department of Dakota, as commissioner for the survey of the U. S. boundary-line along the 49th parallel 1872-76, and as commissioner of the District of Columbia 1878-82. D. in Washington, D. C., Mar. 5, 1882.

Revised by JAMES MERCUR.

Twiss, SIR TRAVERS, F. R. S., D. C. L.: political and legal writer; b. in Westminster, Mar. 19, 1809; graduated at Oxford University; public examiner at Oxford in classics and mathematics 1835-39; called to the bar at Lincoln's Inn 1840; afterward admitted as advocate at Doctors' Commons; Professor of Political Economy at Oxford 1842-47, and afterward served in various other collegiate and public offices; created queen's counsel and bencher at Lincoln's Inn; made advocate-general 1867; knighted in 1867. He retired from his professorship of Civil Law at Oxford, and gave up the office of advocate-general in 1872, after which time he devoted himself chiefly to literary work. He drew up in 1884 for the King of Belgium a constitution for the

Congo Free State. D. Jan. 15, 1897. He was a man of remarkably wide attainments, and a brilliant but somewhat unreliable scholar. He published *Niebuhr's History of Rome, Epitomized*; *Levy's History* (editor); *The Oregon Question Examined in Respect to Facts and the Law of Nations* (in which he treats it as of little present weight); *View of the Progress of Political Economy in Europe since the Sixteenth Century*; *The Law of Nations considered as Independent Political Communities*; *Monumenta Juridica; the Black Book of the Admiralty* (editor); Henry de Bracton's *De Legibus et Consuetudinibus Angliæ* (editor); London, 1878-83); *Belligerent Right on the High Seas* (London, 1884). F. STURGES ALLEN.

Two Rivers: city; Manitowoc co., Wis.; at the entrance of the East Two and the West Two rivers into Lake Michigan, and on the Chi. and N. W. Railway; 6 miles N. E. of Manitowoc, the county-seat (for location, see map of Wisconsin, ref. 5-F). It has an extensive lumber and lake trade, and manufactures tubs, pails, chairs, wood type, and printers' cases, cabinets, etc. Pop. (1880) 2,652; (1890) 2,870; (1895) 3,593. EDITOR OF "CHRONICLE."

Tybee' Island: an island in Chatham co., Ga., lying off the entrance to Savannah river. The island is 6 miles long and 3 wide, and is separated from the other coast islands by Lazaretto creek. At its northeastern end stands Tybee lighthouse, 134 feet high, of brick, showing at a height of 150 feet above the sea a fixed white dioptric light of the first order, visible for 18 nautical miles; lat. 32° 1' 20" N., lon. 80° 50' 31" W. Tybee island has become historic as the site of the batteries by which Gen. Gillmore breached Fort Pulaski on Cockspur island Apr. 11, 1862. See BOMBARDMENT.

Tyche: anglicized form of the Greek name for FORTUNA (q. v.).

Tycho Brahe: See BRAHE.

Tycoon, or Taikun [literally, great prince]: the name by which the shogun of Japan was known to foreigners in the days of Japan's early intercourse with foreign nations. See SHOGUN.

Tydides: See DIOMEDES.

Tyler: city; capital of Smith co., Tex.; on the Int. and Gt. North, and the St. Louis S. W. (including the Tyler Southeastern) railways; 19 miles N. W. of Troup, 25 miles S. by E. of Mincola (for location, see map of Texas, ref. 3-I). It is in an agricultural region; is an important shipping-point for fruit and cotton; contains round-houses and machine-shops of the St. Louis S. W. Railway, a U. S. Government building (cost \$85,000), county buildings (cost \$75,000), city-hall (cost \$25,000), 3 national banks with combined capital of \$400,000, 6 churches, 2 public schools for white pupils and 1 for colored, 3 private schools for whites and 1 for colored, the Cotton-belt Hospital, public library, and 2 daily and 3 weekly newspapers; and has canning-factories, cotton-compress, fruit-tree nurseries, tile and pottery works, and iron rolling-mills. Pop. (1880) 2,423; (1890) 6,908.

Tyler, BENNET, D. D.: theologian; b. at Middlebury, Conn., July 10, 1783; graduated at Yale College 1804; studied theology; was pastor of the Congregational church at South Britain, Conn., 1808-22; president of Dartmouth College 1822-28; pastor of the Second Congregational church at Portland, Me., 1828-33; was the leader of the opposition to the theological views taught at Yale Theological Seminary known as the "New Divinity" (see TAYLOR, NATHANIEL WILLIAM, D. D.), and in 1834 became professor and Professor of Christian Theology at the new seminary founded at East Windsor, Conn., by the "Pastoral Union" of churches in Connecticut—a post he retained until his death at South Windsor, May 14, 1858. He was author of *A History of the New Haven Theology, in Letters to a Clergyman* (1837); *A Review of Day on the Will* (1837); *Memoir of Rev. Asahel Nettleton, D. D.* (Hartford, 1841); *The Sufferings of Christ confined to his Human Nature* (1845); *The Doctrine of Perseverance of the Saints: The New England Revivals* (1846); *Letters to Dr. Bushnell on Christian Nurture* (2 series, 1847-48); besides a number of sermons and controversial pamphlets. He also edited the *Remains of Dr. Nettleton* (1845). His posthumous *Lectures on Theology* (1853) was preceded by a *Memoir* from the pen of his son-in-law, Rev. Nahum Gale, D. D. Revised by G. P. FISHER.

Tyler, DANIEL: soldier; b. at Brooklyn, Conn., Jan. 7, 1799; graduated at the U. S. Military Academy July, 1819,

when commissioned second lieutenant light artillery; retained in the Fifth Infantry June 1, 1821; transferred to First Artillery June 12, 1821; served at the artillery school of practice 1824-27, on professional duty in France preparing a work on *Manœuvres of Artillery*, and in procuring drawings and designs upon which the U. S. artillery material and equipment were subsequently modeled; on ordnance duty 1830-34; resigned from the army May 31, 1834, and became a civil engineer, being president and constructing engineer of various railroads until the outbreak of the civil war. On Apr. 23, 1861 he was appointed colonel First Connecticut Volunteers, which regiment he led to Washington, and the next month was commissioned brigadier-general of Connecticut volunteers. He was in command of a division at the action of Blackburn's Ford, July 18, and in the battle of Bull Run, July 21. Mustered out Aug. 11, 1861, he was reappointed brigadier-general U. S. Volunteers Mar. 13, 1862. He was an active participant in the Mississippi campaign, and took part in the advance upon and siege of Corinth. Subsequently he served on a military commission appointed to investigate Gen. Buell's campaign in Kentucky and Tennessee. June 15-26, 1863, he was in command of the Federal forces at Harper's Ferry and Maryland Hills when the Confederate army had invaded Pennsylvania. He resigned his commission Apr. 6, 1864, and soon afterward took up his residence at Red Bank, N. J. He was somewhat interested in railways and manufacturing business. D. in New York, Nov. 30, 1882. Revised by JAMES MERCUR.

Tyler, JOSEPH: tenth President of the U. S.; b. in Charles City co., Va., Mar. 29, 1790; graduated at William and Mary College 1807; studied law; was admitted to the bar 1809; was a member of the State Legislature 1811-16 and 1823-25, and of Congress 1816-21; voted for the resolutions of censure on Gen. Jackson's conduct in Florida; opposed the U. S. Bank, the protective policy, and internal improvements by the national Government; was Governor of Virginia 1825-27, U. S. Senator 1827-36; opposed the administration of Adams and the Tariff Bill of 1828; made a three-days' speech against a protective and in favor of a revenue tariff 1832; condemned the nullification measures of South Carolina in that year, but opposed Jackson's proclamation and was the only Senator who voted against the "Force" Bill for the repression of that incipient secession; afterward voted for Clay's Compromise Bill, and his resolutions censuring President Jackson for the removal of the deposits 1835, as being an unwarrantable act, although at the same time believing the U. S. Bank unconstitutional; resigned his seat in the Senate Feb., 1836, in consequence of the vote of the Virginia Legislature instructing him to vote for expunging those resolutions from the Senate journal; took up his residence at Williamsburg; was regarded as a martyr to the Whig cause, and being in consequence supported in the campaign of 1836 for the vice-presidency by many Whigs, received forty-seven electoral votes; sat in the Virginia Legislature as a Whig 1839-40; was a member of the national Whig convention which met at Harrisburg, Pa., Dec. 4, 1839, by which he was nominated for the vice-presidency on the ticket headed by Gen. Harrison; was elected Vice-President Nov., 1840; inaugurated Mar. 4, 1841; succeeded to the presidency on the death of Gen. Harrison Apr. 4; retained in office the cabinet of his predecessor; issued an inaugural address Apr. 9, 1841; expressed in a message to Congress, which met in extra session May 31, 1841, his readiness to concur in any financial system not violative of the Constitution, and proposed through Mr. Ewing the outlines of a plan requiring the consent of the States to the establishment of branch banks within their limits; vetoed the bill substituted by Clay expressly striking out this requirement; vetoed a second bill called the Fiscal Corporation Bill, which claimed for Congress a similar power to establish corporations in the States; was abandoned by the members of his cabinet except Daniel Webster, who stated in a public letter that he saw no reason for his colleagues' deserting their offices; filled their places with States-rights Whigs who were opposed to the kind of bank demanded by Henry Clay; negotiated through Webster the Ashburton Treaty, fixing the Northeast boundary for 2,000 miles, and containing other important provisions (Aug. 9, 1842); made several changes in his cabinet in 1843; after two vetoes obtained the enactment of the tariff of 1842; asserted the independence of the Hawaiian islands, and caused through Caleb Cushing the first treaty to be negotiated with China; for four years conducted the whole

financial operations of the Union, Congress having repealed all laws providing for the public funds and refused to adopt the so-called "exchequer system" proposed by the President; suppressed Dorr's rebellion, and brought the exhausting war with the Florida Indians to a close; concluded through Upshur and Calhoun a treaty for the annexation of Texas (Apr. 12, 1844), and when this was rejected by the Senate effected his object by the passage of the joint resolutions of Mar. 1, 1845; was nominated for the presidency by a convention of States-rights Whigs held at Baltimore in May, 1844, but soon withdrew from the canvass after forcing the Democratic convention, which met the same day, to nominate James K. Polk, an advocate of his favorite measure, the annexation of Texas; was succeeded Mar. 4, 1845, by James K. Polk, and lived in retirement until Jan., 1861, when he presided over the peace convention, which he suggested as a means to preserve the Union; voted for secession in the Virginia State convention; was elected to the Provisional Congress of the Confederate States, and in Nov., 1861, to the House of Representatives of the Confederate States. He married in 1813 Leticia Christian, who died at Washington in 1842, and he contracted a second marriage, June 26, 1844, with Julia Gardiner, of New York. He died at Richmond, Jan. 18, 1862.

Revised by L. G. TYLER.

Tyler, LYON GARDINER, M. A., LL. D.: educator; b. at Sherwood Forest, Charles City co., Va., Aug., 1853; educated at the University of Virginia; Professor of Belles-lettres, William and Mary College, 1877-79; principal Memphis Institute 1879-83; began the practice of law in Richmond 1882; member of the Virginia House of Delegates 1887-88; became president William and Mary College 1888; author of *The Letters and Times of the Tylers* (2 vols., Richmond, 1883-84); *Parties and Patronage in the United States* (New York, 1890). He is the son of President John Tyler by his second wife, Julia Gardiner. C. H. T.

Tyler, MOSES COIT, LL. D., L. H. D.: educator; b. at Griswold, Conn., Aug. 2, 1835; graduated at Yale College 1857; studied theology there and at Andover, Mass.; pastor First Congregational church, Poughkeepsie, N. Y., 1860-62; resided in England 1863-67. In 1867 he was appointed to the chair of English at the University of Michigan, and in 1881 to that of American History at Cornell. In 1881 he was ordained deacon in the Protestant Episcopal church, and in 1883 priest. He is the author of *The Braunville Papers* (Boston, 1869), a volume of essays on physical culture; *A History of American Literature during the Colonial Time* (2 vols., New York, 1878); *A Manual of English Literature*, jointly with Henry Morley (New York, 1879); *Patrick Henry* (in the American Statesmen Series, Boston, 1887); *Three Men of Letters* (biographical and critical monographs on Berkeley, President Dwight, and Joel Barlow, New York, 1894); and *A Literary History of the American Revolution* (in press, 1895). During his early residence in England he was a frequent contributor to *The Independent* and especially to *The Nation*, and one of his articles in the latter on *American Reputations in England* was reprinted in a volume entitled *Essays from the Nation*. He has contributed important articles in more recent years to various other periodicals. H. A. BEERS.

Tyler, RANSOM HEBBARD: author and jurist; b. in Leyden, Mass., Nov. 18, 1813; removed to New York with his parents in early youth; studied law and was admitted to the bar, taking up the practice of law at Fulton, N. Y. He was elected and appointed to various local offices, including those of district attorney and county judge of Oswego County; traveled extensively abroad, and also devoted much time to literature. D. at Fulton, N. Y., Nov. 27, 1881. He edited the *Oswego Gazette*, and published *The Bible and Social Reform, or the Scriptures as a Means of Civilization* (1863); *American Ecclesiastical Law* (including the law of burial-grounds, 1866); *Commentaries on the Law of Infancy, including Guardianship and the Custody of Infants and the Law of Coverture, embracing Dower, Marriage, and Divorce* (1868); *Treatise on the Law of Boundaries and Fences*; *Treatise on the Law of Fixtures* (1877); *Treatise on the Law of Usury, Pawns or Pledges, and Maritime Loans* (1873); *Treatise on the Remedy by Ejectment and the Law of Adverse Enjoyment* (1871); besides many short articles in magazines. F. STURGES ALLEN.

Tyler, ROBERT OGDEN: soldier; b. in Greene co., N. Y., Dec. 22, 1831; graduated at the U. S. Military Academy July 1, 1853, when commissioned brevet second lieutenant

of artillery, reaching the grades of first lieutenant Sept. 1, 1856, and captain and quartermaster U. S. army May 17, 1861. After a year passed in garrison he joined Col. Steptoe's command, which marched from St. Louis to Washington Territory, 1854-55, Tyler taking post at San Francisco; engaged in the Yakima (1856) and the Spokane (1858) expeditions, participating in the actions of the Four Lakes, Spokane Plains, and Spokane river; transferred to Fort Ridgely, Minnesota, 1859, and New York harbor 1860; engaged in the civil war on the expedition for relief of Fort Sumter Apr., 1861; in reopening communications with Washington via Baltimore May, 1861; as dépôt quartermaster at Alexandria May-Sept., when appointed colonel Fourth Connecticut Volunteers, and in command of his regiment (known as the First Connecticut Heavy Artillery after Jan., 1862) in the defenses of Washington until the spring of 1862; in the Virginia Peninsular campaign in command of siege-batteries before Yorktown; in battles of Hanover Court-house, Gaines's Mill, and Malvern Hill. He was promoted brigadier-general of volunteers Nov. 29, 1862, and engaged in the battle of Fredericksburg, Dec. 13, in command of the artillery of Sumner's grand division; of the artillery reserve of the Army of the Potomac at Chancellorsville, Gettysburg, and subsequent operations, until Jan., 1864; of division of Twenty-second Army-corps, covering Washington and lines of communications of the Army of the Potomac, Jan.-May, 1864; of division of heavy artillery, Second Corps, in the Richmond campaign of 1864, from the Wilderness battles to Cold Harbor, where he was severely wounded June 1, and disabled for further duty in the field. He commanded various departments from Dec., 1864, to June, 1866, when he resumed quartermaster duty, in which department he became lieutenant-colonel and deputy quartermaster-general July, 1866, serving thereafter in San Francisco, New York, Boston, and elsewhere. He was breveted from major to major-general in the U. S. army for gallantry in action, D. in Boston, Mass., Dec. 1, 1874.

Revised by JAMES MERCUR.

Tyler, ROYALL: jurist and author; b. in Boston, Mass., July 18, 1757; graduated at Harvard 1776; studied law under John Adams; was for a short time during the war of the Revolution aide to Gen. Lincoln, which post he also filled during the Shays rebellion 1786; settled at Guilford, Vt., 1790; was judge of the Vermont Supreme Court 1794-1800, and chief justice 1800-06; published *Reports of Cases in the Supreme Court of Vermont* (New York, 2 vols., 1809-10). D. at Brattleboro, Vt., Aug. 16, 1826. He was one of the earliest American dramatists, enjoyed a high reputation as a wit, and was quite successful in the introduction in comedy of Yankee dialect and of humorous stories. Among his pieces were *The Contrast* (1790), produced Apr., 16, 1787, at the John Street theater, in New York, the first American comedy regularly presented by a company of professional actors; *May Day, or New York in an Uproar*, produced May, 1787; and *The Georgia Spec, or Land in the Moon*, produced 1797. He was a leading contributor of humorous verse and prose to Joseph Dennie's papers, *The Farmer's Weekly Museum* (Walpole, N. H., 1795-99) and *The Portfolio* (Philadelphia, 1801, seq.); wrote also for *The New England Galaxy*, *The Columbian Centinel*, *The Polyanthos*, and other literary journals, and was author of a Crusoe-like novel, *The Algerine Captive, or the Life and Adventures of Dr. Updike Underhill, Six Years a Prisoner among the Algerines* (Walpole, 2 vols., 1797); besides *Moral Tales for American Youths* (1800) and *The Yankee in London* (1809).

Revised by H. A. BEERS.

Tyler, SAMUEL, LL. D.: author and lawyer; b. in Prince George co., Md., Oct. 22, 1809; educated at Georgetown, D. C., where he paid especial attention to Greek; afterward studied at Middlebury College, Vermont, 1827; studied law; admitted to the bar at Frederick City in 1831; in 1850 appointed one of three commissioners to simplify the pleadings and practice in all the courts of the State, and prepared a *Report*, which contained a learned comparison of the common law and the civil law; resided for some years in Washington, D. C.; was connected as professor with the law department of the Columbian University; wrote chiefly on metaphysics, in which branch his labors received commendation from Sir William Hamilton and other competent critics. D. at Georgetown, D. C., Dec. 15, 1877. Author of *A Discourse on the Baconian Philosophy* (1844); *Burns as a Poet and as a Man* (1848); *The Progress of Philosophy in the Past and in the Future* (1859; 2d ed. 1868); and a

Memoir of Roger Brooke Tansy (1872); *Commentary on the Law of Partnership* (1877); and editor of *Gilbert's History of the Law of Chancery and Mitford's Chancery Pleading*.
Revised by F. STURGES ALLEN.

Tyler, WILLIAM SEYMOUR, D. D., LL. D.: educator; b. at Harford, Pa., Sept. 2, 1810; graduated at Amherst College 1830; taught classics in Amherst Academy 1830-31; was tutor in Amherst College 1832-34; studied theology at Andover Seminary; was in 1836 licensed to preach, but not ordained until many years later (1859), in consequence of his acceptance of the professorship of Greek and Latin at Amherst College; became Graves Professor of Greek (1847) on the division of the professorial chair; visited Europe and the East 1855, and Greece and Egypt 1869. He has published *The Germania and Agricola of Caius Cornelius Tacitus* (New York, 1847; enlarged eds. 1852 and 1878), with notes and a *Life*; *The Histories of Tacitus* (1849); *Prayer for Colleges* (1855; several eds.), a prize essay; *Memoir of Rev. Henry Lobbell, M. D., Missionary at Mosul* (Boston, 1859); *Plato's Apology and Crito* (1860); *The Theology of the Greek Poets* (1867); *The History of Amherst College* (Springfield, 1873); *Demosthenes de Corona* (Boston, 1874); *The Olynthiacs and Philippics of Demosthenes* (1875); and nine books of the *Iliad* (New York, 1886); besides numerous commemorative discourses, and contributions to reviews and eulogædæ, and to the *Transactions* of the American Philological Association.

Tyler, EDWARD BURNETT, D. C. L., LL. D., F. R. S.: anthropologist; b. at Camberwell, London, England, Oct. 2, 1832. He was educated at the Friends' School, Tottenham. In 1856 he went to Mexico in company with Henry Christy, and made an extended exploration of the antiquities, etc. The results of this journey were published with the title *Anahuac, or Mexico and the Mexicans* (1861), which has been much praised for the accuracy of its descriptions. Other important works by him are *Primitive Culture* (1871) and *Anthropology* (1881). In 1888 he was named Gifford lecturer at Aberdeen University, and in 1891 he was president of the Anthropological Society. H. H. S.

Tylpinus: see **TURPIN**.

Tym'panum [= Lat. = Gr. *τύμπανον*, drum, kettledrum, deriv. of *τύπαιν*, strike]: a sort of drum or hollow organ constituting the middle ear in man, containing air, and through its middle a small chain of bones—the malleus, or hammer-bone, the incus, or anvil, and the stapes, or stirrup. See **EAR**.

Tyn'dale, or Tindale, WILLIAM: translator of the New Testament; b. perhaps at Hunt's Court, North Nibley, or perhaps at Melksham Court, both in Gloucestershire, England, about 1484; studied at Magdalen Hall, Oxford, where he graduated B. A. 1512; removed to Cambridge, probably because Erasmus was there (1510-14); took holy orders; left Cambridge 1521; resided as a chaplain and tutor in the family of Sir John Welsh, of Little Sodbury, near Bristol, incurring danger by his advocacy of the doctrines of Luther, then recently proclaimed, on which account he was cited before the chancellor of the diocese of Worcester 1522; translated into English the *Enchiridion Militis, or Soldier's Manual*, of Erasmus; went to London 1523; made an unsuccessful application for admission into the household of Bishop Tunstall; was protected for some months in the family of Alderman Humphrey Monmouth, who gave him £10 per annum to prosecute his theological studies in Germany, on condition of praying at stated periods for the souls of the alderman's parents; went to Hamburg Jun., 1524; thence to Wittenberg; to Cologne, 1525. He engaged in the translation of the New Testament into English, with the aid of John Frith and William Roye, the printing of which at Cologne in the office of Peter Quentell (quarto, 1525) was interrupted by the vigilance of Cochleus; completed the printing at Worms in the office of Peter Schoeffer; issued in 1526 a new octavo edition of the whole work, which obtained a wide though secret circulation in England, being prohibited by an edict of Tunstall, Bishop of London, who bought up the remainder of the edition at Antwerp and burned them at Cheapside 1529; removed to Marburg, and published there his *Obedience of a Christian Man* (1528); had an interview with Coverdale at Hamburg, and issued a fifth edition of the Testament 1529; published his translation of the Pentateuch, "emprinted at Marlborough [Marburg] in the Land of Hesse," 1520; had a bitter controversy with Sir Thomas More, who in a witty and

abusive pamphlet denounced the translation and its author 1529; was treacherously invited to return to England in order to seize his person—an artifice to which his assistant, John Frith, fell a victim, being burned at the stake 1533; brought out a revised and corrected edition, the first to which he put his name, 1534; wrote several doctrinal treatises and introductions, expositions, and notes to various books of the Bible; resided during his later years at Antwerp; was arrested 1535 on a charge of heresy through the agency of an emissary of Henry VIII. acting in concert with the clergy and magistrates of Brussels; imprisoned in the castle of Vilvorde, Brabant, near Brussels; tried by virtue of a decree of Charles V., issued at Augsburg 1530, and the University of Louvain having urged his condemnation, with the eager approval of Henry VIII., he was convicted, after eighteen months' imprisonment, during which he translated from Joshua to 1 Chronicles, inclusive; these translations, along with his Pentateuch and Jonah, were published in Matthew's Bible (1537). He was strangled and burned at the stake at Vilvorde, Oct. 6, 1536. He met his fate with composure, his last words being a prayer, "Lord, open thou the King of England's eyes." The spot where he suffered is shown near the new penitentiary at Vilvorde. A monument to his memory was erected at Nibley Noll, Nov., 1866. His translation of the New Testament is the basis of the Authorized Version, and is executed with considerable accuracy and elegance, and also with independence; his translations from the Old Testament show clearly dependence upon Luther. His works were published London, 1573, and by the Parker Society (3 vols., 1848-50); his Pentateuch was reprinted by Rev. Jacob I. Mombert (New York, 1884); his New Testament has been several times reprinted. A beautiful edition, with a *Memoir of Tyndale's Life and Writings*, by George Offor, was published by S. Bagster (London, 1836), and reprinted at Andover, Mass., 1837; but the best *Life* is by R. Demais (London, 1871; rev. by R. Lovett, 1886). Revised by S. M. JACKSON.

Tyndall, JOHN: physicist; b. at Leighlin Bridge, near Carlow, Ireland, Aug. 21, 1820. He received a sound education in English and mathematics, and in 1839 became civil assistant to a division of the ordnance survey. He was a railway engineer at Manchester from 1844 to 1847, when he became a teacher of physics at Queenwood College, Hampshire, where Dr. Edward Frankland was resident chemist. In 1848 he and Frankland went to Germany, and attended Bunsen's and Knoblauch's lectures at Marburg. Tyndall worked in the laboratory in conjunction with Knoblauch, and made discoveries in magnetism, which he embodied in a paper published in *The Philosophical Magazine* in 1850. He graduated in 1851, presenting for his doctorate a thesis on screw surfaces, and afterward continued his studies under Magnus in Berlin. He returned to England, where he published the results of his experiments, which led to his being elected in 1852 a fellow of the Royal Society. In 1853, on the proposal of Faraday, he was elected Professor of Natural Philosophy at the Royal Institution, of which he was made superintendent in 1867. In 1856, with Prof. Huxley, he visited Switzerland, where he distinguished himself by being the first to climb the Weisshorn, and by his observations on the structure and motion of glaciers. Subsequently he reached the summit of the Matterhorn, crossing it from Breuil to Zermatt, and from 1856 until his death no year passed without a visit to the Alps. The results of this and later Swiss experiences he published in the *Philosophical Transactions, in Glaciers of the Alps* (1860), *Mountainering in 1861* (1862), and *Hours of Exercise in the Alps* (1871). In 1859 he began his important investigations on radiant heat, the results of which he described in his lectures at the Royal Institution in 1862, in *Heat considered as a Mode of Motion* (1863), and in the Rede lecture *On Radiation* (1865). Later he studied the acoustic properties of the atmosphere and the subject of spontaneous generation, discovering in 1869 a very precise method of determining the absence or presence of particles of dust in the air. Several of his results were embodied in his lecture *Dust and Disease* (1870). (See *The Nineteenth Century*, Jan., 1878.) In 1872 he visited the U. S. on a successful lecturing tour, the profits of which he placed in the hands of an American committee as a fund "in aid of students who devote themselves to original research." He received honorary degrees from the Universities of Cambridge and Edinburgh, and was made a D. C. L. by the University of Oxford, in spite of the protest of Dr. Huxley, Margaret Professor of Divinity, who alleged that Tyndall

had signalized himself by writing against and denying the credibility of miracles and the efficacy of prayer, etc. In 1874 he was president of the British Association in its meeting at Belfast, when his address excited a keen controversy, in consequence of its being the first clear and unmistakable utterance as to the aims of modern science, and its apparent assertion of materialistic opinions, as for instance in the statement that he found in matter "the promise and potency of every form and quality of life." In 1883 he retired from several appointments, and in 1887 was succeeded as professor at the Royal Institution by Lord Rayleigh. Toward the close of his life he took a somewhat prominent part in opposing Gladstone's scheme of Home Rule for Ireland. D. at Haslemere, Surrey, from an overdose of chloral accidentally administered by his wife, Dec. 4, 1893. Tyndall's eminence did not arise especially from his scientific discoveries, but rather from his force of character, his uncompromising love of truth, his unrivaled grasp of his materials, and his power as a brilliant and effective exponent of physical science, both in his public lectures and in his writings, which are remarkable for their literary merit. Besides the works previously mentioned, he published *Sound, a Course of Eight Lectures* (1867; 3d ed., enlarged, 1875); *Faraday as a Discoverer* (1868; 4th ed., 1884); *Natural Philosophy in Easy Lessons* (1869); *Nine Lectures on Light* (1870); *Researches on Diamagnetism and Magneto-crystalline Action* (1870); *Seven Lectures on Electrical Phenomena and Theories* (1870); *Essays on the Use and Limit of the Imagination in Science* (1871); *Fragments of Science for Unscientific People* (1871; 8th ed., 1892); *The Forms of Water in Clouds and Rivers, Ice and Glaciers* (1872, being vol. 1. of the International Scientific Series); *Contributions to Molecular Physics in the Domain of Radiant Heat* (1872); *Essays on the Floating Matter of the Air* (1881); and *New Fragments* (1892).

R. A. ROBERTS.

Tyne: river of Northern England; formed by the junction of the North and South Tyne. It flows eastward, and enters the North Sea after a course of 30 miles through the richest mining districts of England. Its chief tributaries are the Derwent and the Team. It is navigable 18 miles from the North Sea.

Tynemouth: town; in Northumberland, England; at the mouth of the Tyne; 9 miles E. of Newcastle (see map of England, ref. 3-H). Tynemouth is a well-built town, and is the chief watering-place of Northumberland. It has a pier half a mile long, completed in 1892, and a lighthouse situated on the cliffs above. The municipal and parliamentary borough, returning one member, includes North Shields (see SHIELDS) and several other townships. Pop. (1891) 46,267.

Tyng, STEPHEN HIGGINSON, D. D.: clergyman; b. at Newburyport, Mass., Mar. 1, 1800; son of Hon. Dudley Atkins (1760-1829), U. S. collector at that port and reporter of the Massachusetts Supreme Court, who assumed the name of Tyng on inheriting the estate of his relative, James Tyng, of Tyngsborough; graduated at Harvard 1817; was for some time engaged in mercantile pursuits; afterward studied theology; was ordained in the Protestant Episcopal Church 1821; was minister of St. George's, Georgetown, D. C., 1821-23, of a church in St. Anne's parish, Md., 1823-29; rector of St. Paul's, Philadelphia, 1829-33, of the Church of the Epiphany, Philadelphia, 1833-45, and from 1845 to May, 1878, of St. George's, New York; traveled in Europe; edited successively *The Episcopal Recorder*, *The Theological Repository*, and *The Protestant Churchman*; author of *Lectures on the Law and Gospel* (Philadelphia, 1832); *Recollections of England* (New York, 1847); *Forty Years' Experience in Sunday-Schools* (New York, 1860); *The Prayer-Book Illustrated by Scripture* (3 series, 1863-67); *The Child of Prayer, a Father's Memorial to the Rev. Dudley A. Tyng, A. M.* (1858), and other works, theological and biographical; published several volumes of sermons and many addresses; edited with introductions or prefatory memoirs various works by other hands; was a conspicuous advocate of temperance and other reforms, and had high fame for eloquence in the pulpit and on the platform. D. at Irvington, N. Y., Sept. 4, 1885.—His son, **DUDLEY ATKINS**, b. in Prince George's co., Md., Jan. 12, 1825; graduated at the University of Pennsylvania 1843; studied theology at Alexandria Seminary; took orders in the Protestant Episcopal Church 1846; was assistant to his father at St. George's church, New York; had charge of parishes at Columbus, O., Charlestown, Va., and Cincinnati, O., and was rector of the Church of the Epiphany, Philadelphia, from 1854 until shortly before his death, at

Brookfield, near Philadelphia, Apr. 19, 1858. He was a successful lecturer upon religious and social topics, and acquired a high reputation for ability and manliness, as well as philanthropy, by his course in preaching against slavery, which involved his dismissal from his pastorate. The hymn *Stand up for Jesus!* commemorates an incident of his deathbed. He published *Vital Truth and Deadly Error* (Philadelphia, 1852); *Children of the Kingdom, or Lectures on Family Worship* (1854), republished in England as *God in the Dwelling* (4th ed., 1859); and *Our Country's Troubles* (Philadelphia, 1856). His *Life*, as above indicated, was written by his father.—Another son, **THEODOCIS S. TYNG**, is a missionary at Osaka, Japan. Revised by W. S. PERRY.

Tyng, STEPHEN HIGGINSON, JR., D. D.: clergyman; son of Stephen H. Tyng, D. D.; b. at Philadelphia, Pa., June 28, 1839; graduated at Williams College 1858; studied at the Theological Seminary of Virginia; was ordained deacon May 8, 1861; assisted his father in the ministry of St. George's church, New York, 1861-63; was ordained priest Sept. 11, 1863; became rector of the Church of the Mediator, New York, 1863; entered the army as chaplain of the Twelfth New York Volunteers 1864; organized the parish of the Holy Trinity, New York, 1865, building on Forty-second street a church which in 1873-74 was replaced by a larger edifice; was tried in 1867 for preaching in a Methodist church in New Jersey, which was a violation of the canon law of his Church; edited 1864-70 a weekly religious journal, *The Working Church*; was noted for his cordial fellowship with evangelical churches of other denominations; took a prominent part in the revival movement of 1875 directed by Moody and Sankey, and in the summer of 1876, in combination with other clergymen, commenced out-door Sunday services for the people in a "gospel tent" erected near his church—an undertaking which proved very successful; published *The Square of Life* (New York, 1876); *He Will Come* (1877); and several volumes of sermons. He resigned the rectorship of Holy Trinity Church in 1881, and settled in Paris as manager of the interests of an insurance company.

Type [from Lat. *ty'pus*, figure, image, form, type = Gr. *τύπος*, liter., blow, impression, mark, deriv. of *τύπτειν*, strike]: in theology, an image or representation figuring a person or thing, which then is called its antitype: thus St. Peter describes baptism as the antitype of the ark of Noah (1 Pet., iii. 21). In this sense the word is used several times in the New Testament and by Jewish historians; and several of the Fathers, especially Augustine and Gregory the Great, are very ingenious in finding types by their interpretation of the Bible. In chemistry, types are formulas representing the composition and structure of other more complex compounds, which may then be derived from the simpler forms by substitution. They include the monovalent type HCl, the divalent type H₂O, the trivalent type H₃N, and the quadrivalent type H₄C.

Type: See PRINTING.

Type-founding: the process of casting or manufacturing type. From the discovery of printing to the middle of the sixteenth century printers cast their own type. After 1550 it became a business distinct from printing. Claude Garamond, of Paris, who began early in that century, is regarded as the father of letter-founders. He was followed by Le Bé, Sanlecque, Moreau, Fournier, Grandjean, Legrand, and others, who maintained the reputation of French type-

founding. Bodoni (1740-1813), of Italy, the Didots, of France, and Breitkopf (1719-94), of Leipzig, are other distinguished names in the subsequent history of type-making. Great Britain imported most of its type from Holland until about 1720, when William Caslon became famous as a letter-cutter. The Caslon foundry, established in 1718 in London, is still in existence, and contains the original punches which Caslon cut. Baskerville and Wilson were other notable Brit-

ish foundry. About 1735 Christopher Saur (or Sower) began printing at Germantown, Pa., and cast the type which he required, executing the second Bible printed in America, a quarto, in German, in 1743. Several unsuccessful attempts were subsequently made to establish type-foundries in America, among them one by Franklin. Binny & Ronaldson, of Edinburgh, began type-founding in Philadelphia in 1796, and, after a severe struggle and by State aid, were the first to establish a business, afterward known as the Johnson Foundry, and now carried on as the MacKellar, Smiths & Jordan branch of the American Type Founders' Company. The first type-founders of New York—Mappa, of 1793, and Robert Lothian, of 1806—were unsuccessful. Elihu White, who began in 1810, succeeded. He was followed in 1813 by the rival house of D. & G. Bruce, through whose efforts stereotyping

the U. S., and was slowly adopted, with modifications, by European foundrymen. This machine is represented in Fig. 8. It consists of a small melting-pot to hold the metal, which is kept fluid by a gas-jet or small furnace. In the interior of the pot is a forcing-pump and valve that expels the metal under the piston or plunger, and prevents its return to the mass in the pot.

The valve secures the full force exerted by the plunger, which transmits it to the molten metal under it, and forces it through a narrow channel leading from the bottom of the chamber in which the plunger works to the outside of the pot, where a nipple is inserted, with a small hole through it, communicating with the narrow channel. Against this nipple the mould in which the type is formed is pressed at the moment when the plunger descends to receive the molten metal that forms the type. The type-mould, of steel, is composed of two parts, each fitting the other with great exactness. Fig. 7 represents one-half of this mould, containing a letter just cast, which shows the nicks in the letter formed by a convex ridge in the other half-mould, and the jet of surplus metal attached to the bottom of the type. The face of the letter is shown without the matrix, Fig. 6, which is properly adjusted when in position, and the mould

FIG. 4.—1, counter; 2, hair-line; 3, serif; 4, stem, or body-mark; 5, neck, or beard; 6, shoulder; 7, pin-mark; 8, nick; 9, groove; 10, feet.

was introduced in the U. S. There is evidence that at the beginning of the sixteenth century the apparatus for type-founding was much the same as up to the middle of the nineteenth century. In devising a new font of type the first process is to make a model in steel for each letter. Instead of cutting out the interior of the letter, a tool, called the counter-punch, is cut on steel to form the hollow or counter of the letter. The counter-punch, after hardening, is then impressed in the end of a short bar of soft steel, which is known as the punch. Around this sunken counter the model letter is cut in high relief. The punch is hardened (then resembling Fig. 5), and is punched into a flat piece of cold-rolled copper like Fig. 6, which, after careful finishing, becomes the matrix, or mother-type. The letters at the bottom of the matrix indicate the size, double english, and

FIG. 5. Punch.

the number of nicks, in this case one nick. Every letter requires a separate punch and matrix. Matrixes may also be made by electrotyping from the face of the type or an engraving. The matrix is then fitted to the mould that forms the body of the letter. The hand-mould, used from the discovery of printing until recently, is composed of two parts, which fit exactly together. The external surface is of wood, the interior of steel. At the top is a shelving orifice, into which the metal is poured. The space within is of the size of the required body of the letter. The caster, holding the mould in the left hand, with a small ladle containing about a spoonful pours the metal into the orifice, then jerks up the mould higher than his head to expel air and condense the metal, lowers it, opens the mould, and casts out the type. The hand-mould is now seldom used, except to cast large metal or kerned type. The type, when first thrown out, has a piece of metal attached

FIG. 6. Matrix.

to its base, called the jet, partly represented at the bottom of the letter H in Fig. 7. In hand-dressing this jet is broken off by boys, the sides of the type are rubbed smooth on gritstone, and the type set up in long lines. They are then dressed and finished; a groove (Fig. 4, 9) is cut in the foot of the type to remove any bit of the jet remaining. After examination with a microscope for the detection of imperfect letters, the types are ready for use.

FIG. 7.—Half of machine mould (De Vinne).

but the types made by his machine were too light and porous. David Bruce, Jr., of New York, patented a more successful type-casting machine Mar. 17, 1838. Subsequently improved, it was put to general use in foundries in

FIG. 8.—Bruce's type-casting machine

closed. A mould is made for each body of type, and is immovable in the direction of its depth, but is made adjustable to suit the varying widths of different letters. Its immobility in one direction insures the same body for every type cast in each font. It is therefore only necessary to change the matrix for every character, instead of having a mould and matrix for the different letters. Half of the mould is attached to an oscillating arm, which carries the mould to and from the nipple in the melting-pot. The other half of the mould is attached to another arm, which is connected to the first arm, so that the two halves open and shut upon each other. The machine operates as follows: The plunger being raised in the chamber of the pump, and the chamber being supplied with metal through the valve, the mould is brought against the nipple; the valve closes to prevent the metal being forced back into the pot; the plunger descends and forces the metal through the narrow channel into the mould, the mould recedes, the halves separate, and the type is cast out. A blast of cold air is directed upon the mould to keep it cool. The types are hand-dressed as before. This machine is worked by turning a small crank-wheel. It may also be worked by steam. David Bruce, Jr., in 1868, introduced an apparatus adapted to the type-casting machine to receive the type as fast as cast, and break off the jet or stem of metal by a consecutive operation. The London Type-founding Company's machine is heated by gas, the mould is cooled by a stream of cold water, and the types when made travel into small chambers, where they are planed, smoothed, nicked, and grooved ready for use. Several machines were introduced at an early date into the U. S. to rub and dress type automatically. An important improvement is the type-casting machine of J. A.

T. Overend, of San Francisco, Cal., patented in 1875. A pump-cylinder is provided with a plunger, having a chamber in its lower end; a hole in the lower part of the cylinder allows the metal to flow in, and as the plunger closes this hole in descending, an opening in its upper part arrives opposite the discharge opening, and the liquid is forcibly ejected. A self-adjusting nozzle connects the pumps with the mould. Between the nozzle and the mould a carrier is interposed having several arms with holes. When the metal passes into the mould, it opens, and the carrier moves forward, holding the type by its stem, and places it on an inclined table. A clamp secures the type, and a sliding plate, breaking the type from its stem, forces it between rubbers, to smooth the rough edges, fitting the type for use. The stem left in the carrier is afterward forced out by a pin.

Many new forms of automatic type-casting machines have been invented since 1865. Ponceur Frères, of France, Hepburn, of England, and Küstermann, of Germany, have made marked improvements, but the machine most preferred in the U. S. is that of Henry Barth, of Cincinnati, patented Jan. 24, 1888. In this machine one-half of the mould and the matrix are fixed upright and made immovable; the other half rapidly slides to and fro on broad bearings, releasing the type that has been cast, and closing again before new metal is injected in the mould. It breaks off the jet, plows a groove between the feet, rubs off the feather edges, and delivers the finished types in lines in a channel ready for inspection.

The punch-cutting machine of L. B. Benton is a more recent improvement in type-founding. It is an adaptation of the pantograph. From one pattern letter any size of punch for book letter can be made without a special drawing for each size, and all the sizes will be in exact proportion. The success of the Linotype type-making and type-composing machine is largely due to the accuracy of the matrixes made by the Benton machine-punches.

Types can be cast by many machines quicker than they can be cooled. The ordinary performance of the caster by hand was 400 in an hour; by the Bruce machine, on ordinary sizes of book type, 100 in a minute; by the newer machines and on small sizes, 140 or more in a minute.

Revised by THEODORE L. DE VINNE.

Typesetting-machines: The simplest form of typesetting-machine merely sets the types provided by foundries; it does not make nor distribute the types. Nearly all the machines of this class are constructed with these features. The characters selected seldom exceed eighty-three in number. Italic, small capitals, and accents are excluded, because they are infrequent in ordinary composition; they add to the cost of the machine, and seriously diminish its performance. For each character a separate case or narrow channel of brass, about 2 feet long, is provided, in which the types are put side by side and in a nearly vertical position before the operator. The lower end of each case is connected with a lever that is moved whenever the operator touches its mated connection on the lettered keyboard. The lever so touched thrusts out the type desired into the general collecting channel. Another operator, called the justifier, takes the types in the channel and makes them up in lines of uniform length by the same methods practiced in hand typesetting. All the machine can do is to set types in a continuous line, which it does usually four or five times quicker than they can be set by hand. Spacing-out or justifying, making-up, and distribution must be done by hand, or upon machines of another kind. Of the many varieties of this form of machine but two are in practical use—the Empire and the MacMillan. A separate machine is required for the distribution of the type. Each character has cut upon its shank a distinct nick or groove, which permits its entrance only in its own channel during the operation of distribution. The MacMillan machine is also provided with a mated justifying apparatus.

In the Thorne machine the two distinct operations of setting and distributing are combined in one machine. An upright hollow, grooved cylinder of iron is divided in equal halves: the lower half contains in its grooved channels the type to be set; the upper half contains at its top the types to be distributed, which are separated and distributed down the grooved channels of the upper to those of the lower half of the cylinder. The operation of dislodging the types from this lower cylinder into a collecting channel is accomplished by peculiar devices, but the types set are arranged in a continuous line, and are spaced and justified by hand as in the Empire and MacMillan machines. The types can be set as fast as, often faster than, they can be justified.

The Mergenthaler or Linotype machine makes the type it uses, casting the letters selected by the operator, properly justified with spaces between words, in solid bars of the length

FIG. 1.—Thorne typesetting and distributing machine.

of line required. Brass matrixes are dislodged by the operator instead of types, and these are automatically arranged

FIG. 2.—Mergenthaler linotype machine.

over the mould that forms the line. When the line is full another automatic device thrusts wedges between the words and spaces out the line. At the same instant a jet of fluid

metal, kept fluid by gas jets under the machine, is injected and thrown out of the mould as soon as it is cool enough, without delaying the work of the operator. The brass matrices are also immediately returned to their proper receptacles for future re-use. The performance of the machine is limited only by the ability of the operator. It is largely used by the daily newspapers of the U. S. and to some extent in Great Britain. The Lanston machine also casts the types it uses, not in lines, but in isolated characters. Many other forms of typesetting and distributing machines, some of high merit, have been invented, but those here described are in most use in 1895.

The first patent for a typesetting and typemaking machine was granted in England, Mar. 24, 1822, to Dr. William Church, who claimed that his apparatus would cast and compose types at the rate of 75,000 characters in one hour. It never did practical work, but many of his devices were afterward accepted by other inventors. The first practical machine in the U. S. was that of Clay and Rosenberg (British patent of 1842), but it was not approved of by printers. This was quickly followed by the simpler American machine of Mithel, which was kept at work for many years. It failed, as did many of the early machines, for want of an equally good distributor. The names of some of the other prominent inventors are Mazzini, Goubert, Delcambre, Hattersley, Mackie, and Fraser—all holding British patents; Hirsinger, of Germany; Kliegel, of Hungary; Sørensen, of Denmark; Boulé, Caillard, Simencourt, Coulon, and Beaumont, of France; Gilmer, Ray, Felt, Huston, Paige, Rogers, Alden, and Dow, of the U. S. THEODORE L. DE VISSÉ.

Typewriters: machines carrying types with which writing is done resembling ordinary print. The increasing production of manuscript in modern times has greatly stimulated the development of these ingenious machines. Since about 1870 they have been brought from a state of crudity to a state of perfection which compares favorably with any other mechanical device. They are now considered almost indispensable in the U. S., and their use is rapidly increasing throughout the world.

The Earliest Typewriters.—The first recorded attempt to produce a writing-machine is that of Henry Mill, an English engineer, to whom, on Jan. 7, 1714, was granted a patent for "an artificial machine or motive for impressing or transcribing of letters, singularly or progressively, one after another in writing, whereby all writings whatsoever may be engrossed on paper or parchment so neat and exact as not to be distinguished from print." This machine, however, was not perfected, and no description of it exists.

The first typewriter invented in the U. S. was termed the "Typographer," patented in 1829 by William Austin Burt, of Detroit, Mich., also inventor of the solar compass. In design and construction it was an exceedingly crude device, although it would perform writing slowly. In 1833 a French patent was granted to Xavier Progin, of Marseilles, for a machine designed to print "almost as rapidly as one could write with an ordinary pen"; also to impress stereotype plates and to copy and stereotype music. In this device a circle of type-bars, operated by upright rods passing through the top plate, struck downward to a common center on a flat platen. It had no keyboard, and after printing each type-bar was pulled up again by the operator. The whole machine, regulated by suitable though crude mechanism, moved across the paper to provide for line and letter spacings. It was too slow and cumbersome to come into general use.

Much of the progress made in later years was due to the efforts of electricians to provide a means for printing by electricity letters or other symbols by which intelligence could be conveyed to distant places. A British patent issued to Alexander Bain and Thomas Wright, June 21, 1841, covered among other electrical contrivances a device which involves some of the principles of the modern typewriter. A series of type-bars arranged to print at a common center were moved by an electro-magnet attracting an armature on the connecting-rod until an armature on the type-bar itself came within the field of another electro-magnet located at the common center, which forced the type against an inked ribbon laid upon the surface of the paper upon which the printing was done. Another portion of the same patent described an ingenious machine with a type-wheel mounted upon a vertical shaft which was actuated by a clockwork attachment governed by an electric current. These inventors seem to have had no idea of making use of their device save

for the purposes of the electric telegraph, and as such methods of telegraphy were soon superseded their invention attracted little attention. It is also known that Sir Charles Wheatstone devised a writing-machine before 1851. This, with subsequent modifications constructed 1855-60, is described in the *Journal of the Society of Arts* for Sept. 21, 1891.

The Thurber Machine.—A typewriter practical in every way except as to speed was patented by Charles Thurber, of Worcester, Mass., on Aug. 26, 1843. In actual construction the only model ever made departed quite materially from the patent. A flat horizontal wheel carried on its periphery a number of upright rods, each having a type at the lower end and a finger-key at the upper. The proper rod was moved to the printing-point by revolving the wheel, and its depression, by the aid of a permanent guide, served to imprint the character upon the right spot on the paper beneath. The paper was placed around a cylinder which was moved lengthwise step by step by means of ratchet and pawl mechanism to produce the letters-spacing, while the revolution of the cylinder produced the proper spacing between lines. The inking was accomplished by passing the face of the type across an inked roller.

The Foucault Machine.—A machine for printing embossed characters for the use of the blind was patented in France by Pierre Foucault, a blind teacher of the Paris Institution for the Blind, on Jan. 19, 1849. The types in this machine were formed on the ends of a number of converging rods sliding in radial grooves to a common printing-point; the upper part of each rod contained a finger-key, and these finger-keys together formed a curved keyboard of two rows. Letter and line spacing devices were also included. When used for the blind the types were made to imprint their faces into the surface of the paper. The inventor also appears to have adopted the machine to ordinary printing by the use of carbonized paper.

Foucault's typewriter attracted great attention and was awarded a gold medal at the World's Fair in London, in 1851. Several of them were constructed and were for a long time used in the various institutions for the blind in different parts of Europe. They do not seem, however, to have come into very general use, or to have contributed anything to the development of the modern writing-machine.

Another typewriter, designed principally for the use of the blind, the invention of William Hughes, governor of the Manchester Blind Asylum, was also exhibited at the World's Fair in 1851, and received a gold medal. It is of very simple construction, much resembling some of the modern toy writing-machines in principle.

The Beach typewriter, the invention of A. Ely Beach, of New York, one of the editors of *The Scientific American*, marked a considerable advance in the development of a practical writing-machine. After constructing a machine in 1817 which contained some new features, and which worked fairly well, he was granted another patent (June 24, 1856) for a machine which consisted of a series of type-carrying levers arranged in the now familiar form of a circular basket, and all printing at a common center. It was mainly designed to print raised letters for the use of the blind, and was furnished with two sets of type-bars, one carrying depressed types striking the paper from below, while the other, carrying raised types, struck the paper from above, embossing on it the required character. Applied to ordinary typewriting, only one set of type-bars was employed. They struck upon a small table over which the ribbon of paper was conducted. The ink was furnished by an endless band of carbon paper or inked fabric. This machine did good work, but was slow in its operation. The method of printing was closely akin to that subsequently brought to a practical outcome by others, but it provided for the printing of characters only upon a narrow ribbon of paper, instead of on sheets.

Other Early Typewriters.—It is impossible to describe here in detail all the early attempts to perfect a writing-machine. Notable among them is the invention of O. T. Eddy, of Baltimore, Nov. 12, 1850, a cumbersome machine which used seventy-eight vertical type-bars with the types on their lower ends, and a flat horizontal platen whose lateral and longitudinal movements furnished line and letter spacing; the only one ever made, however, did not work. The Fairbanks machine, also of 1850, had a number of converging rods with types on one end, printing at a common center, and finger-keys on the other; it was designed

for printing on cotton fabrics, but proved impracticable. The typewriter invented by J. M. Jones, of Clyde, N. Y., and patented in 1852, and again in 1856, had types placed underneath the rim of a horizontal wheel, which was rotated and depressed by a lever so as to print on the paper held beneath. Suitable mechanism for line and (variable) letter spacing was provided in connection with a cylinder for paper. Another type-wheel machine was patented by J. H. Cooper, of Philadelphia, in 1856. In 1854 the Thomas typograph was patented; this was a small, cheap typewriter, suggestive of the modern toy machines.

The Francis Typewriter.—The invention of S. W. Francis, a physician of Newport, R. I., was patented Oct. 27, 1857. The types were arranged upon a series of hammers placed in a circle and moved to a common printing-point upon a small circular platen, which was supported from the framework, and which it was necessary to remove in order to insert a fresh sheet of paper. The key action resembled that of a piano. The depression of a key caused the type to rise toward a common center and print upon the paper through an inking-ribbon so arranged that it presented a fresh portion of its surface at each depression of the keys. The paper was held flat in a rectangular frame, moved by a drum containing a coiled spring, to which it was attached by a cord. At the end of a line the frame was drawn back, thus rewinding the spring and at the same time moving the paper forward a line-space. The machine was provided with a bell to indicate the end of the line (a device also employed in Beach's first machine). The machine printed clearly and with a speed exceeding that of the pen, but it occupied a space of about 2 feet square. Only one machine was constructed under the patent, and no attempt was ever made to put it on the market.

The Hansen Machine.—The writing-ball invented by Rasmus Johan Malling Hansen, a clergyman of Copenhagen, Denmark, is perhaps the best-known European invention of the kind; it is said to have been made and sold in continental Europe in considerable numbers. In the U. S. it is known only as a curiosity, although U. S. patents were issued upon it in 1872 and later, and it was exhibited at the Centennial Exhibition in Philadelphia in 1876, receiving a gold medal. The main feature of the machine, from which it took its name, is a hemispherical brass shell inverted over the paper-carrying and spacing mechanism. Fifty-four rods or pistons protrude through this shell, radiating in different directions from the center of the sphere, which is the common printing-point; each carries a type on the lower end and a finger-key on the upper. Different modifications of the paper-carrying device have been applied. The first designs provided for the use of an electrical mechanism to move the carriage. The machine was furnished with a bell to indicate end of line, scale to show locality of impressions, etc. The spacing mechanism was operated by a slight depression of the ball or hemisphere which followed the depression of the key. The machine was well made, weighed only about 8 lb., but was costly and too slow in operation, though it did good work.

The Sholes and Glidden Typewriter.—The first practical writing-machine was the invention of three men, residents of Milwaukee, Wis., working in conjunction: C. Latham Sholes, a printer and editor; Samuel W. Soule, also a printer, as well as a farmer and inventor; and Carlos Glidden, a gentleman of leisure. The first crude model, completed in Sept., 1867, was largely the work of Soule, who suggested the pivoted types set in a circle, and other minor details; Sholes contributed the letter-spacing device. It was a success in that it wrote accurately and with fair rapidity. Many letters were written with it and sent to friends, among others to James Densmore, of Meadville, Pa., who had sufficient enthusiasm to purchase an interest in the machine without even seeing it, by the payment of all the expenses already incurred. About this time both Soule and Glidden dropped out, leaving the enterprise wholly in the hands of Sholes and Densmore. The first patent upon the new machine was granted to the three associated inventors in June, 1868. It describes a machine with a circle of type-bars striking upward to a common printing-point. The keys resembled those of a piano, and moved the type-bars by means of cams or arms on the inner ends of the key-levers. The paper was held horizontally in a square sliding frame or carriage moving across the top of the machine and provided with lateral and transverse motions for line and letter spacing. An arm extending from the rear of the main frame supported a small platen at the common center. An

inked ribbon passed across this platen from spools situated on either side of it. The action of the type, therefore, served to carry the paper against the inked ribbon, so that the impression was upon the side of the paper opposite to the type. The motive-power for the carriage motion was provided by a falling weight unwinding a cord from a drum at the side of the machine. In July of the same year another patent was granted to Sholes, Soule, and Glidden for a machine substantially the same as the one just described, except that the connection between the key-levers and type-bars was made by means of connecting wires or rods. Urged on by Densmore, Sholes continued to make improvements, until in 1871 the machine had assumed a form differing in many particulars from the original model. A patent issued to Sholes in this year shows the use of a cylindrical platen which extended from front to rear and around which the paper was passed lengthwise. The letter-spacing was accomplished by a double ratchet on the axis of the cylinder, which was operated upon by a "twofold vibratory ratchet." This permitted the cylinder to turn the space of a letter only at a time. The shifting of the line was accomplished by a screw-cam upon the cylinder engaging the teeth of a rack placed beneath it upon the top of the frame. An extra wide notch in the ratchet-wheels marked the line on the cylinder where the edges of the paper overlapped one another. While the cylinder revolved past this point the screw-cam engaged the teeth of the rack and threw the cylinder, which turned loose upon its shaft, toward the rear of the machine a sufficient distance to make the line-spacing. The inking-ribbon passed across the type-basket in a direction parallel to the line of writing, as in the present Remington machine, but at right angles to the line of travel of the cylinder. Numerous models were turned out, but in the hands of practical users each proved to be in some respect defective, and broke down under the strain of constant usage. The machines which had been made so far were but crude products of the shop of an ordinary mechanic, and it was necessary to enlist the assistance of manufacturers able to make them on a large scale and supplied with sufficient capital to support the enterprise until there should be a market for them. Densmore made a contract with E. Remington & Sons, gun-manufacturers at Ilion, N. Y., and the improved machine has been called the Remington typewriter ever since.

The Remington Typewriter.—The ample resources and skillful workmen available at the great Remington factory were employed in the extensive improvement of the typewriter, and the first machines were ready for sale about the middle of 1874. The No. 1 Remington, the first typewriter to come into general use, was in general appearance not unlike a japanned box with a cover on the top, and with the keyboard projecting toward the operator at the bottom. The roller, around which the paper passed, ran from side to side, the key-levers were directly connected with the outer ends of the type-bars by means of connecting wires or rods, and the spacing was done by a crude rack and dog mechanism resembling in principle the device in later models. The carriage was returned by the action of a foot-treadle upon a pulley at the side of the machine—a form which was subsequently replaced by a side hand-lever, thus doing away with the necessity of a special table. The machine also contained one of the devices invented by Sholes at the time the machine was first brought to Ilion, in the form of a slotted disk forming a guide for each individual type-bar, a device which was long supposed to be essential to the preservation of alignment, but which later experience has shown to be a hindrance rather than a help.

The No. 1 Remington was exhibited at the Centennial Exhibition at Philadelphia in 1876, and attracted much attention, although it was slow to gain public favor. One great objection was that it wrote only capitals; but this was obviated by the joint efforts of two inventors, Lucien S. Crandall and Byron A. Brooks. Crandall devised and patented a method of carrying more than one type upon the type-bar. His original attempt was to simplify the machine and render it less complicated and expensive by reducing the number of parts. Six types were carried upon one type-bar. The swinging motion of the platen caused it to move to any one of three positions, each serving as a common center to a pair of the types. The oscillation of the keys served to determine which one of this pair should be brought to the printing-point. The device was ingenious, but it involved too much care in the manipulating of the machine to be deemed successful. Byron A. Brooks adapted Crandall's

idea to a type-bar carrying only two types, one a capital and the other its corresponding small letter. The change in the printing-center was accomplished by sliding the platen in a direction transverse to the line of writing by means of an extra key and corresponding mechanism. By properly adjusting the curve of the cylindrical platen to the distance between the types on the bar, and by sliding the platen a proper distance, it was possible to print either one of the two letters carried on the type-bar at will. This was devised a machine which could write both capitals and small letters without increasing the size of the key-board or adding to the number of the type-bars. The well-known Remington No. 2 typewriter embodies these inventions, and was placed on the market in 1878. One of the first machines of this model was exhibited at the Paris Exposition in that year, and was awarded a gold medal.

The sales increased materially, although still disappointingly slow, and the selling agency, after passing through several different hands, was finally undertaken, in 1882, by the firm of Wyckoff, Seamans & Benedict. Since then thousands of these typewriters have been sold, the machine has maintained a commanding position in the market, and in 1886 the firm assumed entire control also of its manufacture.

In 1886 the No. 3 Remington was put on the market, in response to a demand for a machine which would carry wider paper than the No. 2 (the latter writing a line only 6½ inches long). The position of the rack and spacing-dogs is reversed in this machine. Four new keys were also added to the keyboard, thus accommodating eight more characters than the No. 2. The No. 3 Remington writes a line 12 inches long, and can take paper 14 inches wide, and can be made to accommodate even a greater width by a few unimportant changes. In 1888, to meet the requirements of some European countries, the No. 5 Remington was introduced. This is intermediate between the No. 3 and No. 2, writing a line 7½ inches long, and taking paper as wide as 9½ inches. In general construction it resembles the No. 3. It has the same number of keys, the additional characters being utilized to provide for the accented letters, etc., required in many foreign languages. The No. 4 Remington is a single-case machine, closely resembling the No. 2 model in general appearance, but writing capitals only.

Improvements have been continually added to all of these models. In 1894 the No. 6 Remington was first offered for sale. In this new model important changes in the design of the paper carriage, spacing mechanism, and ribbon movement have been effected.

The Caligraph.—This is a machine which was devised under the direction of G. W. N. Yost, principally by a skilled German mechanic named Franz Wagner. His aim was to avoid a conflict with the Remington patents, but, failing in this, he secured a license under them to manufacture his proposed machine. The Caligraph was placed on the market in 1883. It does not employ a shift-key, using instead a separate type-bar for each letter, whether capital or lower-case. Hence it has a much larger keyboard, a greater number of longer type-bars, and consequently a much larger type-basket. The key-levers are of the third order (instead of the second, as in the case of the Remington), the fulcrums being in the front of the machine. The keys are ranged in six rows in an inclined plane, while the connecting wires by which they operate the type-bars are attached to the inner end, or end opposite the fulcrum. The arrangement of the keys is peculiar to the machine. The paper carriage has a platen cylinder with polygonal faces to adapt itself to the faces of the types. The motive-power of the carriage is furnished by a torsion-spring, which impels the carriage to move from right to left until the line is finished. The letter-spacing is effected by an oscillating dog or pawl which operates in a double sliding rack. The line-spacing is accomplished by a carriage-lever operated by hand, in a manner similar to the Remington mechanism for the same purpose. It is made in four styles: the No. 1, having forty-eight keys, printing only capital letters, punctuation-marks, and figures; the No. 2, which has seventy-two keys, and prints both upper and lower case letters; the No. 3, which differs from the No. 2 mainly in the addition of another row of keys, making the available characters seventy-eight; and the No. 4, which exhibits improvements in minor details of construction.

The Hammond typewriter, invented by James B. Hammond, is covered by patents taken out in 1880, 1881, 1882, and 1883. The applications for some of these were filed as

early as 1875. The machine is of the type-wheel variety, and presents radical differences in theory and construction when compared with other writing-machine inventions, except the "pterotype," invented by John Pratt, of Centre, Ala., and fully described in a paper read by him before the London Society of Arts in 1867. In the latter, of which only a very few were ever made, the types were arranged all on one plate, which was moved so as to bring the desired letter to the printing-point, when the impression was made by a hammer-blow on the paper, this being carried along in a square frame furnished with devices for line and letter spacing. Hammond's invention, which appears to have been a conception entirely independent of Pratt's, very strongly resembles it in principle. Hammond was finally successful in his efforts to control the motion of the type-wheel, a problem which Pratt failed to solve. The two inventors were placed in interference in the U. S. Patent-office, with additional complications arising from the presence of a third application upon a type-wheel machine by Lucien S. Crandall, whose device is described later on. By concessions on the part of Pratt, Hammond was enabled to proceed with his applications. The "Ideal" Hammond, first put on the market in 1884, has an almost semicircular keyboard, consisting of two banks of ebony keys. Each key controls the printing of three characters. The key-levers radiate from the center of a small turret-like casing, which contains the printing apparatus in the shape of a type-wheel, a small hard-rubber wheel made in two sectors of a circle, each containing forty-five characters disposed in three rows upon its outside periphery. This wheel turns freely in a horizontal direction. The depression of any key serves to throw forward the type-wheel a greater or less distance, bringing the proper type to the printing-point. The exact position of the type is determined by a small stop-arm oscillating on the shaft of the type-wheel, and engaging one of a series of thirty hardened steel index-pins, one for each key-lever. The lower end of each of these pins stands directly above its corresponding key-lever, and when a key is depressed the corresponding index-pin rises immediately, throwing its upper end into the path of the stop-arm, thus checking it, and consequently the type-wheel, at the exact point required. The type-wheel can readily be removed and another substituted for it. The paper-carriage runs directly behind the type-wheel turret. A pair of rubber-covered rollers hold the paper in a vertical position against the face of the type-wheel. An impression-hammer strikes from behind, carrying the paper forward upon the face of the type with sufficient force to cause an impression to be made. The spacing mechanism consists of an ingenious though very complicated set of levers, which also impel the hammer. An escapement wheel with pawls regulates the step-by-step motion of the letter-spacing. The inking is done by a narrow ribbon. When capitals or figures are required the use of the proper shift-key elevates the type-wheel, bringing another line of type into the printing line. The arrangement of the original (now termed the "Ideal") keyboard of the Hammond machine differs materially from that adopted by the Remington, to which almost all new machines conform. This led to the manufacture of a new model of the Hammond, which appeared in 1890, termed by the makers the "Universal Hammond." This machine differs from the first model only in adopting three banks of keys ranged according to the Remington Standard, with the space-key in the same position as in that machine. Still later, a light rubber shell containing the type-faces was substituted for the type-wheel. This was supported by a metal backing, giving rise to the name "anvil and shuttle" machine.

The Hall Typewriters.—Thomas Hall, of New York, secured a patent in 1867 on a machine upon which he had long been at work. Only a few of these typewriters were constructed; one, printing seventy-two characters in large and small letters, etc., was sent to the Paris Exposition of 1867, and another attracted great attention in the Government departments at Washington. The type-bars struck downward to a common center upon the surface of a flat platen, which slid into the bottom of the machine and worked from side to side to provide for spacing the letters, this being accomplished by an ingenious device which varied the space according to the width of the letter printed. Each type had a separate type-bar, which was also furnished with a peculiarly adjusted counterweight intended to facilitate the impression and return of the type. The type-bars fell upon a cushioned ring near the printing-point, a device

by which a degree of uniformity of impression was accomplished. The inventor claimed to be the first to produce a portable, keyed, type-bar typewriter, and that the Francis machine was the only one of the type-bar variety which printed before him; in some respects, however, his device resembles the Foucault machine of 1833, described above.

In 1881 Hall took out a patent for a typewriter upon a totally different plan. The peculiar feature of this machine is that in it the paper is at rest, while the printing apparatus moves about over it as it brings the required type to the printing-point. The paper is placed around a small rubber-covered roller, which is turned by a suitable ratchet and pawl at the left of the machine to accomplish line-spacing, and after leaving the feed-roll it passes over a flat metal bar wide enough to serve as a printing-platen. The printing-carriage is composed of two metal plates, one about three-eighths of an inch above the other, and is so adjusted that it may slide or turn upon a rack-rod which supports its rear edge. Attached to the top of the carriage, and engaging with this rack-rod, is a pinion containing a spring which drives the carriage. At the right of the carriage, and working into the grooves or notches of the rack-rod, are the feeding-dogs, which after each impression permit the carriage to move forward a letter-space. A flexible vulcanized-rubber type-plate is mounted upon a small frame just beneath the upper plate of the carriage. This frame is connected with the under surface of the upper plate by two pairs of parallel levers which permit its horizontal movement in a longitudinal or transverse direction, thus permitting any type upon the type-plate to be brought to a hole in the lower plate, large enough to permit of the printing of one type. The upper surface of the under plate is covered by a pad saturated with aniline ink, by which the types are inked. At the front edge of the frame upon which the type-plate is mounted, an arm extends beyond the edge of the plate and to this is rigidly attached an index-key which carries a peculiarly shaped pointer at its free end. Under this pointer is a vulcanite frame pierced with as many round holes as there are separate characters upon the type-plate, each hole disclosing its corresponding character printed upon a white surface beneath. The index-key pointer is placed in the hole which shows the type required. The motion requisite to do this also moves the type-plate so as to bring the corresponding type to the printing-center over the aperture in the lower plate. Pressure upon the key then depresses the whole of the printing-carriage upon its bearings, causing it to descend until the face of the type, by means of a small stud projecting downward through the upper plate just above the opening in the lower plate, is pressed upon the surface of the paper, leaving its imprint there. This ingenious machine does good work and has been much used, but lacks among other things the essential quality of speed.

Mr. Hall also invented the Century typewriter, a similar machine, except that the paper moves instead of the printing mechanism. There are 100 characters, ranged in ten rows of ten each, on a rubber or metal type-cylinder.

The *Crandall typewriter* is the invention of Lucien S. Crandall, and is covered by U. S. patents of 1881, 1886, 1888, and 1889. It is a rather compact machine, made entirely of metal, and has a slightly curved key-board of twenty-eight keys arranged in two banks. From this, by the aid of two shift-keys, eighty-four characters are controlled. The types are all arranged on a removable circular metal sleeve with fourteen faces, which revolves and slides upon a nearly vertical shaft. The paper is carried upon a cylindrical platen, and travels across the rear of the machine just behind the type-sleeve. The key-levers converge toward a common center in the rear of the machine, and control rotary and vertical movements of the type-sleeve. When the proper type has come into place for printing, the shaft of the type-sleeve is moved forward, bringing the type-face into contact with the inking-ribbon, forcing it against the paper and making the required imprint. The inking-ribbon, which is only five-eighths of an inch wide, falls back after each impression, leaving the line of writing in sight. The first model was provided with a variable spacing device, but this was abandoned when the machine was substantially remodeled in 1887, thus illustrating the fact that variable spacing is neither desirable nor practicable.

Mr. Crandall is also the inventor of the International typewriter, which has seventy-six type-bars, but only thirty-eight keys, each of the latter operating one or the other of two type-levers (and hence of two type-bars and types) according to the position of a shift-key.

The *Columbia typewriter* is the invention of Charles Spiro, of New York, and was first exhibited at the American Institute fair in New York in 1884. Mounted upon a metal base is a small carriage sliding in grooves cut lengthwise and carrying a revolving paper-cylinder governed by ratchet and pawl mechanism to provide letter-spacing. Just above the upper surface of the paper-cylinder is a vertical wheel with printers' type set in its periphery, and with a convenient handle by which it is turned. The type-wheel contains a bevel gear upon its left-hand side which engages in a similar gear upon the edge of a circular horizontal disk, the upper surface of which is marked with the letters and characters carried upon the type-wheel. An index is fastened to the center of the disk, and indicates the character upon the type-wheel which will be printed when the type-wheel is depressed. Inking is done from a pad located at the lower edge of the type-wheel. A double-case machine with two type-wheels shifting horizontally upon the line of the shaft was also made. The machine was also fitted to write music by substituting the characters of the musical notation upon the wheel. For a time there was a considerable demand for machines of this make.

The *Yost Typewriter*.—When G. W. N. Yost retired from the Caligraph enterprise he, in conjunction with others, devised the typewriter now known by his name and covered by a number of patents, chiefly those of 1885, 1888 (about which year the machine was first sold), and 1889. The type-bars (each carrying only one type) are compound levers, using what is known as the "grasshopper" movement, invented by a mechanic named Davidson. They are assembled around the inside of a circular frame, as in other machines, and move by an irregular path from the surface of an inking-pad placed in the upper portion of the type-basket toward a common center, when they enter a small metal guide intended to insure the exact alignment of type at the point of impression. The complex movement of the type-bar is secured by a link pivoted to the type-bar and also to a central post or table. Such a device requires the joints of the type-bar action to be loose instead of close-fitting, but it is claimed that the bad alignment which would naturally result therefrom is corrected by the central metal guide referred to, the invention of C. L. Driesslein. A similar principle was also employed in a typewriter invented by G. House, of Buffalo, N. Y., in 1865. The carriage of the Yost machine is of the ordinary pattern, but very light and narrow. As the connecting wires operate the type-bars they also operate upon a circular ring or universal bar which is placed in the lower part of the type-basket and is supported at its center. This in turn acts as a lever to move the dogs which vibrate from side to side of a double-toothed horizontal rack attached to the carriage, thus providing the letter-spacing.

The *Smith-Premier Typewriter*.—The parts of this machine which are of recent invention must be credited mainly to Alex. T. Brown, although it bears the name of L. C. Smith, its manufacturer. It is a type-bar machine, printing seventy-six characters by the single-type system. It was first put upon the market in 1889, but that model was withdrawn shortly afterward and replaced by another in 1890. The keyboard is rectangular and consists of seven rows of keys. The connection between the keys and the type-bars is made by a series of rocking-shafts journaled into the frame of the machine at front and back. Each of these rocking-shafts carries two short crank-arms—one at the front, by which it is attached to the vertical stem of the finger-key, and the other nearer to the center of the machine, by which the connecting-rod is operated. This device was invented by C. Latham Sholes in 1881, and his application for a patent was allowed, but he never took out the patent because of the objectionable character of the numerous frictional bearings which the mechanism involved, and the idea became public property. The type-bar of the Smith-Premier is of a peculiar crooked form, and delivers a somewhat indirect blow. The bearing, or hanger, upon which it is mounted is about $1\frac{1}{2}$ inches long, the great length being designed to secure better alignment, and the series of hangers is disposed diagonally upon the edge of the type-basket. This method of attaching the type-bars is found in the British patent to Bain and Wright, in 1841. The carriage consists of a cast-iron frame, which slides upon ball-bearings set in grooves. The carriage-frame does not lift, but the platen, which is also removable, is adapted to slide forward and bring the line of writing into view just above the scale which is fixed to the front portion of the

carriage. The letter-spacing is accomplished by means of a sliding plate, $9\frac{1}{4}$ inches long by $2\frac{1}{4}$ inches in width, fitted into the back of the frame at the base, and operating a bell-crank connected with the usual spacing-dogs and horizontal rack. Each of the finger-key rocker-shafts passes through a hole in this plate eccentric to its own axis, and when the key is pressed causes the plate to slide by means of a small stud or cam. The carriage is returned by a lever, as in other machines, but the line-spacing is done by automatic mechanism operated by the pressure of the carriage lever at the end of its return movement. The inking is done by a ribbon lying parallel with the cylinder. This moves transversely across the type-basket from front to rear of the machine as the keys are operated, and reverses automatically when the types strike near the edge of the ribbon. On the return a longitudinal motion is also imparted to the ribbon, so that the impressions are made in a new place. This machine also contains a novel feature in the shape of a circular brush mounted horizontally upon a vertical shaft, and resting just below the types when they are at rest. By means of a screw-motion, operated by a removable crank-handle, this brush is revolved over the faces of the types so as to clean them. A new model, called the No. 2, containing improved spacing mechanism and other details, was placed upon the market in 1895.

The Bar-lock typewriter is a type-bar machine of the downward-stroke order, invented by Charles Spiro, of New York. The keyboard has seventy-two keys of the ordinary pattern, arranged in six rows of twelve each, besides a space-key. The type-bars, each of which carries a single type, stand erect in a crescent-shaped double row behind an ornamental screen of ironwork erected between the keyboard and platen-roll, and strike down and away from the operator to the platen when the keys are depressed. The paper-cylinder, or platen-roll, is borne in a carriage of the usual form which travels across the rear of the machine. The impression is made through a narrow inked ribbon, which is automatically moved in and out of the line of writing. The carriage is moved step by step by the action of a universal bar underlying the key-levers in much the same manner as in the Remington. The typewriter takes its name from a peculiar arrangement intended to secure perfect alignment, and consisting of a semicircular frame bearing a row of short, pointed, phosphor-bronze pins, set perpendicularly so that every type-bar when it descends to the printing-point must pass between two of them. It is claimed that this device, in connection with the ball-and-socket joint which is used for the type-bar, so locks it into position that any serious derangement of the alignment is impossible. Another advantage claimed for the Bar-lock is the visibility of the work, notwithstanding the structures between the operator and the line of writing. This machine was at first sold only abroad, but it was placed on the American market in 1891. The machine is made in several sizes in order to accommodate different widths of paper, but the essential features are the same in all.

The National typewriter, manufactured in part under a patent issued to H. H. Unz in 1889, and in part under letters patent of 1885, was first placed upon the market about the year first named. It is an upward-stroke, type-bar machine, with the usual paper-carriage and a curved keyboard containing twenty-nine keys, including two shift-keys. Each type-bar carries three types. In the normal position the depression of a key carries the middle type to the printing-point. By depressing a shift-key the entire keyboard, together with the connecting-rods, type-bars, hangers, and types, is shifted forward or back to bring one of the other types to the printing-point. The lifting portion of the carriage-frame is fitted with a gravity pointer to indicate the printing-point. This machine is a good manifold, as the great length of its type-bars adds to the force of the blow, although it renders the touch of the keys somewhat heavier.

The Franklin typewriter, invented by Wellington P. Kilder, has a nearly semicircular keyboard, the keys being arranged in three rows around the front side of an upright shield, behind which stand the type-bars, which strike downward upon a common printing-point on the upper side of a cylinder of the usual pattern. The carriage is propelled by a spring encircling the shaft of a cog-wheel, which engages with a rack attached to the under side of the carriage. Each type-bar carries two types, and the platen is shifted to bring the printing-point from one to the other. Slotted guides are used to secure steadiness in the downward movement of the type-bars. Ink is furnished from a narrow ribbon which

automatically unwinds from one spool, passes over the printing-point, and is rewound upon another revolving on the same shaft. The machine weighs about 12 lb., and has had a limited sale.

The Densmore Typewriter.—The original devices of this machine are the inventions (chiefly) of Walter J. Barron, Amos Densmore (a brother of James Densmore), and Charles E. and M. G. Merritt. The machine has thirty-eight keys, placed according to the standard Remington arrangement. These, with the aid of a single shift-key, permit the writing of seventy-eight characters, as the type-bars, which are arranged in a basket as usual, carry each two types, and a few characters are formed by combinations of two types. The key-levers are of thin metal, giving the machine a more inelastic touch than the machines employing wood for this purpose. The connecting-rods are not directly attached to the type-bars, but to the ends of shorter subsidiary levers placed directly beneath them. A square eye is turned up at the end of each of these shorter bars and through this the type-bar proper passes, so that the type is raised to the common center whenever the key is depressed. The method of securing the hangers of the type-bars is peculiar to this machine. Each hanger has a small projection or shoulder which fits into a square hole mortised into the top plate of the machine near the edge of the type-opening. Each hanger, with its type-arm, is made with reference to the type it is to control, and numbered to show its particular position on the top plate. By this method the type-bars are readily placed in the machine; it is also claimed that permanent alignment is insured. The paper-carriage is hinged upon the back way-rod, and, as in the Remington, can be raised. The platen can also be raised in the carriage frame, and is also removable from the carriage. The inking-ribbon shifts from front to rear of the machine so as to bring every part of its width over the printing-center; a slow, continuous longitudinal motion is at the same time imparted to it by the action of two frames upon which the spools are mounted, and when the carriage is returned to begin a new line the ribbon is shifted lengthwise by about the width of one type, so that the next line of impressions will fall upon a fresh portion. When the ribbon is all wound upon one spool, the gear is automatically shifted to return it to the other by the same process. The machine was first sold in 1891.

The Williams typewriter is in part the invention of J. N. Williams, of Brooklyn, N. Y. Its keyboard contains only twenty-eight keys, but each type-bar carries three types, the printing-point being governed by shifting the platen. The alphabetical characters are arranged as in the Remington keyboard. The type-bars rest in a horizontal position upon the top of the frame and are arranged in two sections of fourteen each, between which the paper-carriage, carrying a cylindrical platen, moves from right to left. The impression is made upon the top of the cylinder, so that the line of writing is in sight of the operator. The depression of a key raises the type from the position in which it normally rests (in contact with an inked pad) and brings the face of the type down upon the surface of the paper. A central forked guide is provided at the printing-point, intended to prevent bad alignment. The machine is also fitted with a toothed rack in front of each section of type-bars to receive and hold each type-bar steady in printing position. The machine was placed upon the market in the latter part of 1891, and has been advertised and sold to some extent.

Other Typewriters.—Besides the machines described at length in this article, and those alluded to sufficiently in connection with others, there are a considerable number worthy of mention. The Dennis-Duplex typewriter was patented in 1890 by A. S. Dennis, of Des Moines, Ia.; it resembles the Remington or Caligraph in general, but contains 100 types and type-bars, with the keyboard divided into two sections, each containing all the lower-case letters, while the capitals and punctuation-marks are divided between them. The types corresponding to the two sections print at different centers one letter-space apart, and the machine is arranged to print two letters simultaneously. The Brooks typewriter has vertical type-bars arranged in a semicircle, and striking downward upon a platen placed between them and the keyboard. Each type-bar carries three types, with the middle one (lower case) printing normally, and the shift-keys move the platen so as to print the outside ones. The writing is in full sight of the operator. The Fitch machine embodied inventions of Eugene Fitch, of Des Moines, Ia., and W. H. Slocum, of Buffalo, N. Y. The type-bars, each

carrying three types, struck down, past an inking-wheel, upon a cylinder in the middle of the machine, and the writing was in sight. The Automatic typewriter was invented by E. M. Hamilton; it was of the type-bar variety, but was very compact, being only 11½ by 8 by 4 inches. The letter-spacing was variable, and the work resembled ordinary printed matter. The Daugherty typewriter is a type-bar machine with two types to the bar, but the shift is made by raising the type-bars instead of moving the paper. The key-levers are directly attached to the ends of the type-bars without the intervention of any connecting mechanism. The type-bars are arranged in an arc, and lie down flat over the key-levers, but when operated strike upward to a common center located by a vibratory guide. The line of writing is visible to the operator. The Munson typewriter is similar to the Hammond in principle, but differs in the method of controlling the movements of the type-sleeve. The Blickensderfer machine also belongs to the type-wheel class, but is more similar to the Crandall. The arrangement of the keyboard differs materially from the Remington, and is said to resemble that of a printer's case. The spacing after a word is performed automatically with the imprinting of its last letter. The Rapid typewriter, invented by Bernard Granville, of Chicago, in 1887, had straight, square, horizontal type-bars arranged radially with reference to the printing-point. The types were cut on the ends of the bars, at the proper angle so as to strike the paper squarely. The machine was operated by keys, and perfect alignment was to be secured through the close-fitting square holes through which each type-bar was carried. The device was a failure. The Boston typewriter was the invention of D. E. Kempter, of Boston, Mass. (patented in 1886); it resembled in principle the Columbia typewriter described above.

The "English" was an English machine somewhat resembling the Bar-lock. The Lasar was another down-stroke machine, originating in St. Louis, Mo. The Typograph was a machine with type-bars striking downward upon a flat platen from a semicircular type-basket. None of those are now in the market. The Maskelyne, Mercury, and Gardner typewriters are of English origin, unknown in the U. S. The last-named seeks to reduce the number of keys by writing one character by the use of two keys at one time, an arrangement which is unlikely to commend itself to practical users of writing-machines. The Westphalia and Hammonia are German machines, the latter being better and cheaper than the former. They are of the single-key order, the types being held in a sliding holder, and are slow; but they can print ten or twelve copies at once. Carbon paper is used in place of a ribbon or pad.

Toy Machines.—The popularity of the typewriter as it came into more general use caused a demand for cheaper machines. Inventors soon produced devices to meet such demand, and a large number of machines came upon the market, some of which, though incapable of great speed, did very good work. These are generally known as "toy" machines, and can hardly be considered competitors of the larger typewriters.

The Sun typewriter, one of the pioneers in this line, is the invention of L. S. Burrige and Newman R. Marshman. It was put upon the market in 1884, and met with a limited sale. Attached to a single key, or handle, is the type-holder, a straight bar with type cut upon its lower surface, sliding in guides above and at right angles to the paper-carriage, which is of the usual description, with mechanism for letter and line spacing. In close proximity to the type-holder is a fixed comb, or rack, bearing upon its upper surface an index of the characters contained in the type-holder, one to each notch in the rack. By bringing the key to the notch opposite the desired character, the proper type is brought into printing position. The type-holder is then pressed downward upon the surface of the paper. Inking is accomplished by small rollers, one on each side of the center of the type-holder, so that whichever way it moves the types are sufficiently inked. The Odell typewriter, first placed on sale in 1886, is similar in general design to the Sun, and seems to be a slight improvement. The type-holder is made with two faces instead of one, either being rocked into printing position at will, and hence the machine writes both capitals and small letters.

The People's typewriter, or Prouty typograph, was another very simple device, consisting of a carriage containing a sort of metal bow bearing characters electrotyped from ordinary printers' type, and hinged over a small rod

bearing the paper. It was of no practical value and soon disappeared. Its inventor, E. Prouty, of Chicago, also devised a typewriter containing a series of type-bars in a semicircular form placed horizontally and striking upward to a common center on a carriage of the usual type running across the rear of the machine. The machine now known as the People's typewriter, also the work of E. Prouty, was put on the market from Chicago about 1890, and has been sold to a limited extent. A horizontal type-wheel bearing two rows of characters upon its periphery revolves in front of the carriage—a small roller adapted to grasp the paper, and mounted upon a vibratory frame. The type-wheel is moved by a handle extending toward the front of the machine, and resting immediately above a semicircular index-plate by which the position of the type upon the wheel is indicated. The operation of the printing-key, at the left of the machine, serves to bring the platen smartly forward against the surface of the type-wheel, at the same time engaging a tooth or spur in a notch in a ratchet-wheel carried upon the type-wheel shaft, thus securing correct position of the type. Inking is performed by means of a ribbon which partially encircles the face of the type-wheel.

The World typewriter, another machine of this class, was invented by John Becker, of Boston (U. S. patent, 1886), and was first placed on the market in 1886. As a novelty it attracted much attention, and many of them were sold. A flat semicircular disk, carrying on its under side a segment of rubber with the type faces cast upon it, revolves horizontally upon top of a short post or stud. Toward the front of the machine extends a combined pointer and handle which operates the type-disk and also passes over a semicircular index containing all the characters to be found on the top plate. Upon pressing a key at the left of the type-disk the face of the type is pressed upon the surface of the paper, and at the same time the carriage is moved along one space automatically. The inking is done by a pad which lies beneath the disk, with an opening at the printing-point.

The Herrington typewriter was a toy patented in 1884 and put upon the market in 1886 by Millison & Herrington, of Wichita, Kansas. It consisted of a pair of ways upon which a type-wheel, bearing the characters arranged alphabetically upon a vulcanized rubber strip, moved over the paper, which was placed flat beneath. The wheel was operated by twirling a knob at the right-hand end of the axis, and ink was supplied by a small felt roller playing over the top of the wheel. A card index on the inner side of the wheel indicated the position of the letters.

The Merritt typewriter, the invention of C. E. and Mortimer G. Merritt, consists of a paper-carriage hinged at the rear of the machine, a type-holder (carrying loose metal type which are interchangeable) sliding to and fro in suitable ways, and an index-plate. By placing the index-handle over the desired type on the index-plate and depressing it, a pin is operated to bring the corresponding type up through a guide until it prints upon the paper, and a universal bar is depressed and moves the carriage forward automatically to the place for the next impression. A separate space-key, operated by the left hand, provides for spacing between words, and the platen is turned by a milled knob at its right to make line-spacing.

The Victor typewriter is the invention of C. E. Tilton, of Worcester, Mass., and Arthur I. Jacobs, of Hartford, Conn., and is covered by patents of 1889. It consists of a paper-carriage of the usual description moved by a rack and pawl mechanism, a vertical wheel bearing upon its rear face a thin metal disk containing the types, which are made of vulcanized rubber, a striker or hammer moved by a separate lever from the left of the machine, and an index handle or plate by which the position of the type-disk is directed. The impression is caused by throwing the hammer smartly forward through a toothed rack cut upon the edge of the wheel until it pushes the type forward and impresses it on the paper. To facilitate this, the edge of the disk is cut between the types so that each one stands by itself on a flexible lip, which serves also as a spring to retract the type enough to clear the paper. Two small pads, situated one on each side of the printing-point, furnish ink to the types as they pass over them. By means of a small projection on the printing-lever, it is made to engage the spacing-lever and move the carriage at the same time that an impression is made.

The name "Crown" has been applied to more than one typewriter. The first was patented in May and June, 1887, by A. G. Donnelly, and in some degree resembled the Hansen

writing-ball. A circular casing, much like an inverted bowl with perpendicular sides, was supported in an inclined position above a traveling paper-carriage of the usual design. Within it a series of type-bars were jointed in a circle, and adapted to strike downward upon a common center. The finger-keys were formed upon the upper ends of light rods, which were jointed to a collar upon the type-bars and projected upward in a circle through the casing. Each type-bar carried three type-faces, one upon each of three of the sides of a cube, so that a revolution of one-third upon its longitudinal axis in either direction brought another character downward into the printing position. This machine proved impracticable and was abandoned. The same name was adopted by Byron A. Brooks for a small machine which was on the market for a few years after 1888. This is solidly constructed for real service, although slow in operation. The printing is done by a metal type-wheel bearing characters in three rows upon its periphery, and carried upon a shaft inclined over the carriage, which is of the usual type. The front end of the type-wheel shaft also bears a gear-wheel meshing with the teeth of a straight rack which slides in ways across the front of the machine. The upper side of this rack carries a pointer, which passes over the surface of a celluloid index-plate bearing the characters found on the type-wheel. By sliding the pointer along the index-plate until it rests over any character, the type-wheel is rotated until the corresponding type is brought into the printing position. The impression is then made by depressing the type-wheel. A couple of shift-keys serve to move the type-wheel shaft in the direction of its axis so that a different row of type on the periphery of the wheel may be brought into position at will.

There are several other small machines upon the market under different names, but all working upon the same principles and having little practical value. Among such may be mentioned the Morris, McLaughlin, Simplex, Pearl, American, and Ingersolls.

Manifolding.—Copying-ink is generally used in typewriter ribbons and pads, so that reprints may be made by the use of the ordinary copying-press. By the use of carbon paper, interleaved with sheets of thin typewriter paper, several copies may be made on the typewriter at once.

As the the general use of the writing-machine increased, various attempts to widen its field of usefulness have been made by trying to adapt it to the work of writing in books. Several devices for this purpose have been invented, but none sufficiently practical to commend itself has yet appeared upon the market. A good deal of ingenuity has been expended in applying the principles of the successful machines to the solution of this problem, but as yet without success.

W. O. WYCKOFF and R. McKEAN JONES.

Typha: a genus of plants to which the CAT-TAIL (*q. v.*) belongs.

Typhlop'idæ [Mod. Lat., named from *Typhlops*, the typical genus, from Gr. τυφλώψ, blind; τυφλός, blind + ὤψ, eye], a family of serpents, characterized especially by the development of teeth in the upper jaw (and not in the lower), and therefore called *spanodontiæ* by Duméril and Bibron. They are worm-like animals, the scales are smooth and imbricated, and nearly alike all round; the head is short; above, it is covered by large scale-like plates; the eyes are minute; the nostrils between the post-rostral and labial plates; there is no apparent neck; the mouth is small and crescentiform; the anus is a transverse fissure near the posterior extremity. The skull has no ectopterygoid bones and no prefrontals; the rudiments of a pelvis are present, but no pubis. The family is represented by about half a dozen genera in various tropical countries.

Revised by F. A. LUCAS.

Typhoid Fever, called also **Typhus Abdominalis** and **Enteric Fever** [*typhoid* is from Gr. τυφώδης (contracted from *τυφοειδής), smoky, stupid (of persons in fever), typhoid, deriv. of τυφος, smoke, stupor; *enteric* is from Gr. έντερος, in the intestines, deriv. of έντερον, intestine]; an acute infectious fever which has a duration of about four weeks, and is characterized by continuous high fever, abdominal distension, diarrhoea, a rash on the skin, and great depression.

Causes.—Typhoid fever occurs in all parts of the world and affects all kinds of people. It generally attacks young persons, from fifteen to thirty years of age, but exceptionally is met with in infants or old persons. Spring and autumn are the seasons of its greatest prevalence. In most large communities it is endemic—that is, isolated cases are

constantly present—but under certain conditions local or widespread epidemics are met with.

The investigation of the specific course of typhoid fever was until recent years extremely difficult from the fact that clinicians had not learned to distinguish typhus fever from it. The credit of clearly establishing the points of distinction rests with William Gerhard, who prosecuted his studies in the Philadelphia Hospital. Since Gerhard's time it has become recognized that typhoid, unlike typhus fever, is not contagious—that is, it is not communicated directly from person to person in the ordinary intercourse. The infection in most, if not all, cases enters the alimentary tract with drinking-water, milk, or other food, directly or remotely contaminated by the intestinal discharges of persons ill with the disease. Exceptionally the virus may be directly conveyed to the mouth by unclean hands, or it may become dried and reach the nose or mouth through the air, eventually finding its way into the intestines. These facts are absolutely established by evidence of the most reliable character. The immediate cause is doubtless the bacillus described by Eberth, though there is much to be settled regarding the complete life history of this micro-organism. Certainly it does exist in enormous numbers in the intestines of persons suffering from typhoid fever, and in this disease alone.

The morbid changes in the body in typhoid fever are principally found in the lower part of the small intestines, where the Peyer's glands undergo swelling, necrosis, and, finally, deep ulceration. The spleen and the lymphatic glands of the abdominal cavity become enlarged, and the other organs of the body may suffer changes in consequence of continued fever.

The disease begins very gradually. At first the patient suffers with headache, backache, and unaccountable lassitude; frequently the nose bleeds, and sometimes colic and a little looseness of the bowels exists, though as a rule there is constipation. Gradually, day by day, the temperature rises, reaching a height of 103° or 104° F. in five or seven days. After this the fever remains elevated to about the same point, falling in the morning and rising again toward evening. The characteristic symptoms of the disease are noted in the second week of the disease and after that time. These are the regular fever, the great lassitude, the development of abdominal distention with tenderness over the seat of the ulcers in the ileum—that is, in the right side of the abdomen—and diarrhoea. In many cases, especially when the fever is decided, muttering or delirium, twitching of the muscles, and great prostration supervene. Stupor, and even complete coma, may occur. After about two weeks these symptoms gradually abate, the fever slowly descends, and a slow convalescence is established. About the seventh to the ninth day a rash is noted in the skin of the abdomen, consisting of small red spots, which appear in separate crops, and last but a few days, when they fade from view.

Many variations from this, which is the ordinary clinical course of the disease, are encountered. Sometimes there is scarcely any fever, or other signs of illness, and the case is spoken of as *walking typhoid*; again, the symptoms may be so intense that the case assumes a veritable *malignant* character. Fortunately, the latter are very rare. Minor variations in the symptoms, such as absence of the rash or of the diarrhoea, are quite common.

Death may occur from perforation of the intestines or hæmorrhage from deep ulceration; from slow exhaustion; or from various complications, as pneumonia, peritonitis, or the like. The mortality in typhoid fever varies greatly in different epidemics and at different periods of the same epidemic. Modern methods of treatment have lowered the death-rate very materially.

Treatment.—First and foremost in importance is proper nursing. Without this any treatment is seriously embarrassed. The patient must be confined to bed from the very first possible moment, in mild or severe cases alike; he must make no unnecessary physical exertion of any kind; and he must be given a diet which will be least irritating to the intestinal ulcers. Universal opinion has decided that diet to be milk, of which a quart to two quarts, diluted or undiluted, according to the digestive power, should be given an adult patient in the twenty-four hours. Sometimes eggs beaten in milk, broths, and similar food are better borne than milk.

The direct treatment of the disease is mainly concerned with the control of the fever. Remedies have been venerated as specifics to cut short the disease, or to hold it in control, but these claims have not been accepted by the medical

profession. It is very probable that no remedy has power to alter materially the course of this disease. The control of fever by cold water, however, is of most decided value in preventing the serious results of continued high temperature; and has certainly the most marked influence in ameliorating the intensity of all the symptoms. In this way it has in practice reduced the mortality from 15 or 20 per cent. to 1 or 6 per cent. Properly carried out, this treatment consists in the immersion of the patient in a bath of about 70° F. every few hours, if the temperature reaches a high point. The patient at first is apt to shiver and to complain, but after a few baths grows accustomed to their use. Unfortunately, in private practice it is difficult to find the facilities, and the friends are led by mistaken sympathy to object to what appears cruel treatment. The results of hospital treatment, as well as of the private practice of those who have persisted sufficiently to overcome the objections of friends, leave not the slightest doubt as to the value of this method. Cold sponging, the application of cold cloths and the like, are also useful, though less so than tub-bathing. Febrifuges are all to be avoided as far as possible on account of their depressive action. Remedies may be needed to control diarrhoea, to aid digestion, to relieve nervous excitement, and to combat untoward symptoms of other kinds. During convalescence the utmost care should be exercised to prevent intestinal irritation by a too early return to the use of solid food. Tonics may be needed. Frequently the patient's health is much better after than before an attack, but this is not always the case. Not rarely relapses occur immediately after the attack; but once the patient has completely recovered there is nearly always immunity from subsequent seizures. Now and then, however, instances are met with of second or even third attacks. See also the article FIFTH DISEASES.

WILLIAM PEPPER.

Typhon: See SET TYPHON.

Typhoon, ti-foon': a tropical cyclone, especially that of the China Sea. The storms first come in view in the southern part of this sea, and take a northeastern course, destroying shipping on whatever part is traversed by them and doing great damage on shore in the Philippine islands, Formosa, and even so far N. as Japan, and they are sometimes encountered far out on the Pacific Ocean on the latitudes of the latter country. They occur in late summer and in autumn and, except in minor details due to local geography, they are like the hurricanes of the West Indies and North Atlantic. The name typhoon is also frequently applied to similar great, intense storms of tropical origin in the southern hemisphere—about Samoa and the Fiji islands, and in the Indian Ocean about the Mascarenes. See HURRICANES. The center of a typhoon, round which the wind blows in circles, is usually a calm which varies in diameter from one-tenth to one-fifth of the storm-area. In the northern hemisphere the bearing of this center is always 8 points or 90 degrees to the right of the direction of the wind; for example, when the wind is N, the center bears E. In the right-hand half of the storm-disk the wind always changes to the right of the point from which it blows, while in the left half it changes to the left. When caught in such a storm the first change of wind will indicate to the careful seaman whether he is in the right half or the left half. If in the former it has been found that his safety lies in heaving-to on the starboard tack, and heading off from the center, but if in the left-hand half he will heave-to on the port tack and head toward the center. This is true of the northern hemisphere. In the southern hemisphere the direction in which the vessel will head when lying-to will be the reverse of this. Among the Chinese names for typhoon is *Kiu-fung*, which is defined by one authority as a "four-quarter wind," and by another as a "wind which blows from four sides at once."

MARK W. HARRINGTON.

Typhus Fever [*typhus* is Mod. Lat., from Gr. *τῆφος*, smoke, cloud, stupor arising from fever]: an intensely contagious disease, which is characterized by high fever, lasting ten days to two weeks, by a specific rash, and by great prostration. It occurs where squalor, destitution, and overcrowding abound, and has therefore been variously designated as ship-fever, jail-fever, camp-fever, and the like. In former centuries it was a common scourge, but is now almost limited to half-civilized countries and to the slums of great seaports. Local outbreaks are met with from time to time on ships, in jails, or other places of like character. The specific cause of the disease has not been discovered, though there is but little doubt that it is a micro-organism.

The onset of the disease is very abrupt. After a brief period of preliminary indisposition, or without such, the patient falls into a chill or convulsion, or is seized with vomiting; fever develops rapidly and rises to a high point, and the patient is tormented with violent pains in the head, back, and limbs. The pains and fever continue, strength is rapidly lost, and soon the patient sinks into a condition of stupor or delirium. The tongue is dry and coated; the breath is heavy and offensive; the skin dry and excessively hot, often pungent; the eyes are bloodshot. On the third to the fifth day an eruption of hæmorrhagic spots of dark red "mulberry" color appears in the skin and persists for some days, fading gradually. If the patient survives, about the tenth to the fourteenth day a sudden subsidence of the fever is likely to occur. So sudden is this crisis and so immediate the improvement in the patient's condition in many cases, that some authors have been led to recall the scriptural passage: "On such a day the fever left him and he was well." The mortality in typhus fever is sometimes extremely high, most cases dying of exhaustion, of high fever, or of some complications, such as pneumonia. The treatment simply consists in the control of the fever and in stimulation. Pain may require sedatives.

WILLIAM PEPPER.

Typography: See PRINTING.

Tyr [Icel. *Tjǫr*: O. Eng. *Tiw*; cf. O. H. Germ. *Zio*, Gr. *Ζεύς*, Lat. *Ju-* in *Jupiter*, *Diespiter*. See TUESDAY]: in Scandinavian mythology, a son of Odin. He is the bold god of war, and heroes pray to him for victory. When the gods were about to put the chain Gleipner on the Fenriswolf, and the latter refused to permit this to be done unless one of them laid his hand on the wolf's mouth as a pledge that no deceit was intended, the only god found willing to make this sacrifice of a hand was Tyr. The third day of the week is called after him, Icel. *Týrsdagr*, *Týsdagr*, Dan. *Tirsdag*, Eng. *Tuesday*. See SCANDINAVIAN MYTHOLOGY.

RASMUS B. ANDERSON.

Tyrannidae [Mod. Lat., named from *Tyrannus*, the typical genus, from Lat. *tyrannus*, tyrant]: a family of clamatorial birds containing the king-bird and related forms. They have ten primaries and twelve tail-feathers; the bill is hooked and flattened, and the bristles about the mouth are well developed. A characteristic feature is the "ex-aspidian" tarsus, the horny covering consisting of plates separated vertically on the inner side only. Although superficially resembling the Old World fly-catchers (*Muscicapidae*) in form and habits, they are very distinct and are confined to America, being most numerous in the tropics. See FLY-CATCHERS and KINGBIRD.

F. A. LUCAS.

Tyrant [(with *y* restored from Lat.) from O. Fr. *tiran*, *tiran* (with *t* by analogy of parties, in *-ant*) < Lat. *tyrannus* = Gr. *τύραννος*, absolute sovereign or ruler]: a term which, in ancient Greece, did not necessarily designate, as at present, a despotic and cruel ruler. The Greek tyrants were powerful citizens who by force or stratagem assumed the rulership of a state or city without lawful warrant. Sometimes, in seasons of political disturbance, the government of a *tyrannus* was highly beneficial to the state, commercially and socially. Some of the tyrants were men of wisdom and beneficence. But the natural tendency of such an unlawful exercise of power is toward oppression and injustice; hence at present the word tyrant designates a cruel and unjust ruler, whether a lawful king or a usurper.

Tyrant, in ornithology: any one of the TYRANNIDÆ (*q. v.*).

Tyrecon'nel, RICHARD TALBOT, Earl of; politician; b. in Leinster, Ireland, about 1625; descended from an ancient Norman family; became notorious for daring and unscrupulous adventures in London, on which account he was recommended to the exiled princes Charles and James as a suitable person to intrust with a scheme for the assassination of Cromwell; enjoyed great favor at court at the Restoration (1660), when, in order to enable the Duke of York to refuse to marry Anne Hyde, he made oath to personal knowledge of that lady's unfaithfulness to James; filled many posts of profit at court; was arrested and banished as a conspirator against Charles II. 1677; was created by James II., on his accession, Earl of Tyreconnel 1685, and commander of the army in Ireland 1686; dismissed English Protestant officers from the service, replacing them with Irish Roman Catholics; was made lord deputy of Ireland Jan., 1687; proceeded to labor for the repeal of the act of settlement and for the independence of Ireland under the protection of France; formed a large army of native Irish; invited James II. to

Ireland after the Revolution; received him at Cork and accompanied him to Dublin 1689; was present at the battle of the Boyne, but rendered little service; went to France Sept., 1690, and returned with French forces in the spring of 1691. D. at Limerick in Aug., 1691. His second wife was Frances Jennings, sister to the Duchess of Marlborough.

Tyre [Lat. *Tyrrus*, Gr. *Tyros*; cf. Heb. *Tsôr*, from Aram. *Tûr*, liter., a rock]; ancient city in Phœnicia, on the Mediterranean; 20 miles S. S. W. from Sidon. It was the wealthiest and most magnificent of the Phœnician cities, and sent out many colonies, of which Carthage was the most important. Hiram, King of Tyre, was the ally and friend of Solomon. It was besieged five years by Shalmaneser and thirteen years by Nebuchadnezzar. Alexander captured it after a siege of seven months (332 B. C.), when the garrison were put to death and 30,000 Tyrians sold as slaves. It was taken by the Saracens (636), by the crusaders (1144), by the Sultan of Egypt (1291), it being first abandoned by its inhabitants, and by Selim I. (1516). The foundation of Alexandria (332 B. C.) was a great injury to Tyre, and the discovery, almost 2,000 years later, of a passage to India by the Cape of Good Hope dealt the finishing blow to its prosperity. Ancient Tyre consisted of two parts, Palæo-Tyre on the mainland and Neo-Tyre on an island. The narrow sound between formed the harbor. The mole constructed by Alexander to the island has through alluvial deposits become an isthmus, and the former island is now a peninsula whereon the miserable modern village of Sour is situated. Numerous ancient remains jut through the soil, and for some distance among the waves foundations are seen. The latter are literally places "for the spreading of nets in the midst of the sea" (Ezek. xxvi. 5). Sour now exports only cotton, tobacco, charcoal, and millstones by the small and shallow harbor on the N. Pop. 4,500, more than half of whom are Mussulmans. E. A. GROSVENOR.

Tyree: See TIRÉE.

Tyrian Purple: a celebrated dye used by the ancients, and prepared extensively at Tyre from the shellfish *MUREX* (*g. v.*), from each of which only a minute quantity was obtained at an enormous cost; and hence this color became the symbol of imperial power. Tarentum, the modern *Taranto*, was one of the great murex-fisheries of the Romans, and there they had a number of dyeing establishments. With the decline of the Roman empire the employment of this color ceased. Purple is now obtained from vegetable and mineral sources. See ARCHIL and DYE-STUFFS.

Tyrnan, or **Tirnan** (Magyar, *Nagy-Szombat*): town; in the county of Pressburg, Hungary; 30 miles N. E. of Pressburg, on the Waag Valley Railway. It has several educational institutions, etc.; was formerly a place of some importance, and was known as Little Rome when the Hungarian primates lived here. The university founded in 1635 was removed in 1773 to Pesth. Pop. 10,830.

Tyrol, or **Tirol**, and **Vorarlberg**: province of the Austrian empire, the ancient *Rhætia*; bounded N. by Bavaria, W. by Switzerland, and S. by Italy. Area, 11,321 sq. miles. The country is mountainous throughout, traversed from W. to E. by three lofty chains of the Alps—the Tyrolese Alps in the north, forming the boundary toward Bavaria; the Trentine Alps in the south, on the Italian frontier; and in the middle the Rhaetian Alps, the highest of the three ranges, Mt. Ortler rising 12,812 feet and Gross-Glockner 12,457 feet. The valley between the Tyrolese and Rhaetian Alps is drained by the Inn, which flows through Bavaria to the Danube; the valley between the Rhaetian and Trentine Alps is drained partly by the Adige, an affluent of the Po, partly by the Drave, which flows through Carinthia to the Danube. Much of the surface is covered with perpetual snow, and glaciers descend to between 5,000 and 6,000 feet above the sea. Nearly 40 per cent. is covered with forests, and of the remainder most is pasture-ground. Only a small part is suitable for tillage, but that part is very carefully cultivated. Wheat, rye, oats, and barley are grown, though not enough for home consumption; in the gardens, vineyards, and orchards, mostly situated in the southern valleys, excellent wines, numerous mulberry-trees for the rearing of silkworms, and fine fruits, olives, and figs are raised. The chief industry of the people is the rearing of cattle, especially sheep and goats, which in the summer-time are driven to the pastures just below the snow-line. Salt and iron are produced, and various branches of manufactures are pursued, though mostly on a small scale.

The climate is severe in the north and west, but is mild and almost like that of Italy in the south. Canary and other singing birds are extensively raised and exported. Pop. (1890) 928,769, of whom nearly 60 per cent. speak German, the rest Italian or some Romance or Slavonic dialect. Capital, Innsbruck. Of the combined province, Vorarlberg occupies the northwestern corner, and has an area of only 1,007 sq. miles, with a population of 116,973 in 1890. Each element of the province has its own local government. The country was originally inhabited by the Rhaeti, a people with uncertain affinities. It was conquered by Drusus and Tiberius, and became thoroughly Romanized, but in 600 it was largely peopled by the Bajuvarii, a Teutonic tribe. In the thirteenth century a part of the province came into the hands of the Counts of Tirol (anc. *Periotes*), a district near Meran, but it became chiefly consolidated under the Counts of Meran and their descendants. On the failure of the male line the province was made over to the house of Hapsburg, to which it has since belonged, except during the period 1805-14, when it was in the possession of Bavaria. The inhabitants vigorously resisted the latter power, and were for a time successful in a revolt under the leadership of HOFFER (*g. v.*) in 1809. Revised by M. W. HARRINGTON.

Tyrone': an inland county of Ireland, in the province of Ulster. Area, 1,260 sq. miles. The surface is hilly, rising into mountains in the north and south, and declining to a level toward Lough Neagh, which forms part of the eastern boundary. The principal rivers are the Blackwater and the Foyle, with their tributaries. In the hilly districts the soil is sandy or gravelly; in the valleys it is more productive. Oats and potatoes are the common crops. A small coal-field is worked, and some manufactures of linens, woollens, whisky, earthenware, etc., are carried on, though on a limited scale. The principal towns are Strabane, Dungannon, Cookstown, and Omagh. Pop. (1891) 171,701, of whom 93,569 were Roman Catholics, 38,909 Episcopalians, and 33,710 Presbyterians.

Tyrone: borough (incorporated in 1857); Blair co., Pa.; on the Little Juniata river and three branches of the Penn. Railroad; 14 miles N. N. E. of Altoona, and 55 miles S. W. of Lock Haven (for location, see map of Pennsylvania, ref. 5-1). It contains 10 churches, 25 public schools, 3 parochial schools, a national bank with capital of \$100,000, a private bank, 3 building and loan associations, and a daily and 2 weekly newspapers. The borough has a large general trade with the surrounding country and extensive manufactories, including iron-works, railway-shops, paper-mill, flour-mills, boiler-works, foundry and machine-shops, planing-mills, brick-works, tannery, and box and candy factories. Pop. (1880) 2,678; (1890) 4,705; (1895) estimated, 7,000.

EDITOR OF "HERALD."

Tyrone, HUGH O'NEILL, Earl of; Irish rebel; son of an illegitimate son of the first Earl of Tyrone; b. in Ireland about 1550; commanded a troop of horse in the service of Queen Elizabeth in the war against the rebel Earl of Desmond 1579-83; received from the Irish Parliament in 1587 the title of Earl of Tyrone; obtained by a personal visit to the English court the restitution to himself of the confiscated estates of the rebel Shan O'Neill (d. 1567); maintained a correspondence with the English Government while conspiring against it; formed an alliance with Red Hugh, the chief of the O'Donnells, 1590; assumed the title of The O'Neill; offered the sovereignty of Ireland to Philip II. of Spain; defeated Sir John Norris, and was proclaimed a traitor 1597; defeated and killed Sir H. Bagnal at the Yellow Ford Aug. 14, 1598; concluded a truce with the Earl of Essex Sept. 8, 1599; retreated from Munster before Lord Deputy Mountjoy 1600; successfully invoked the aid of Spain, but was defeated with his Spanish allies in an attack upon Kinsale Dec., 1601, and took refuge in a stronghold near Lough Erne; surrendered to Mountjoy; renounced the title of The O'Neill; received a pardon 1602; presented himself to King James, and was confirmed in his earldom and estates 1603; was suspected in 1607 of being engaged in a new conspiracy, though the charge was probably false; proceeded to Brussels to invoke the protection of the Spanish Government, and spent the remainder of his life in obscurity and poverty, a pensioner of the King of Spain and of the pope. D. in Rome in 1616.

Tyrosine [from Gr. *τυρός*, cheese]: a nitrogenous substance (C₉H₁₁N₂O₂) formed by the decomposition of albuminoid bodies by acids, alkalis, and putrefaction. It was first obtained by decomposing casein with fusing potash. It can

also be prepared by boiling clippings of horn in dilute sulphuric acid and by concentration allowing the leucine and tyrosine to crystallize out; the latter is then separated by recrystallization. It occurs ready formed in the animal organism (in the spleen and the pancreas, and in the urine in cases of yellow atrophy of the liver; sometimes in the liver and bile of diseased persons). It occurs also in crayfish, caterpillars, spiders, etc., and in the vegetable kingdom, being found in the pumpkin and the white sprouts of vetch. Tyrosine crystallizes from an aqueous solution in slender silky needles, arranged in a stellate form. It dissolves in boiling water and in alcohol, but is insoluble in ether.

Tyrotaxicon: See CHEESE.

Tyrrhenia: See ETRURIA.

Tyrrhēnian Sea: the ancient *Mare Tyrrhenum*; that part of the Mediterranean which lies between the Italian mainland and the islands of Sardinia, Corsica, and Sicily.

Tyrtæus (in Gr. *Τυρταῖος*): Greek lyric poet; flourished at the time of the second Messenian war, in the latter half of the seventh century B. C. According to Attic tradition, he was a native of Aphidna, in Attica, a lame schoolmaster who was sent by the Athenians to Sparta when the Lacedæmonians, at the bidding of the Delphic oracle, asked the Athenians for help. The lameness is symbolic of the elegiac distich, one verse of which is shorter than the other, and schoolmaster is synonymous with poet. But the whole story is doubtless a late invention. The stirring elegies of Tyrtæus and his spirited marching songs (*ἐμπαρτήρια*) woke the Lacedæmonians to wiser counsels and higher courage, and made them victorious over their old foes. The fragments of his poems keep their primal fire, and his name has become typical for the warrior poet everywhere. Fragments in Bergk's *Poetæ Lyrici Græci* (4th ed.), vol. ii., pp. 8-22.

B. L. GILDERSLEEVE.

Tyrwhitt, ter'it, THOMAS, F. R. S.: classical scholar; b. in London, England, Mar. 29, 1730; educated at Eton; graduated at Oxford, 1750; became fellow of Merton College and Under-Secretary of State in the War Department 1756, and clerk to the House of Commons 1762; resigned the latter post 1768; devoted himself to literary criticism, and was appointed one of the curators of the British Museum in 1784. D. in London, Aug. 15, 1786. Among his works were *Observations on some Passages of Shakespeare* (1766); a celebrated edition of *Chaucer* (1773); critical dissertations on Babrius, Euripides, Aristophanes, and Strabo, and editions of the *Orphica*, of Isæus, and especially of Aristotle's *Poetics* (posthumous, 1794). He is best remembered, however, as the original editor of Rowley's *Poems*, to which he furnished a preface and glossary, and subsequently added an appendix showing them to have been written by Chatterton.

Revised by A. GUDEMAN.

Tyssens, PETER: historical and portrait painter; b. in Antwerp in 1624; d. in the same place between 1677 and 1679. Among his works may be mentioned *Apparition of Christ* and *Apparition of the Virgin*, in the Antwerp Museum, and *Adoration of the Host* in St. James's church, Antwerp.—His son PETER PAUL TYSENS (b. 1652) was also a painter. See Descamps, *Vies des Peintres Flamands*.

Tytler, ALEXANDER FRASER, Lord Woodhouselee: historical writer; son of William Tytler (1711-92); b. in Edinburgh, Scotland, Oct. 13, 1747; educated at Kensington and

at the High School and University of Edinburgh; was called to the bar 1770; appointed to the chair of History at the University of Edinburgh in 1780; became judge-advocate of Scotland 1790, lord of session, with the title of Woodhouselee, 1802, and a lord of justiciary 1811. He wrote, besides many other works, *Essay on the Principles of Translation* (1791; 3d ed. 1813); *The Elements of General History, Ancient and Modern* (2 vols., 1801); and *Lives of Lord Kames* (2 vols., 1807) and of Petrarch (1810). D. in Edinburgh, Jan. 5, 1813.

Tytler, PATRICK FRASER: historian and biographer; son of Alexander Fraser; b. in Edinburgh, Scotland, Aug. 30, 1791; educated at the High School and University of Edinburgh; studied law; was admitted into the faculty of advocates 1813; held for some years the office of king's counsel in exchequer, but ultimately devoted himself to biographical and historical researches, and received from 1844 a pension of £200 from the crown. D. at Great Malvern, England, Dec. 24, 1849. His principal works were *Lives of James Crichton of Cluny*, commonly called *The Admirable Crichton* (1819); *Sir Thomas Craig of Riccarton* (1823); *John Wickliff* (1826); *Scottish Worthies* (3 vols., 1832-33); *Sir Walter Raleigh* (1833); *King Henry the Eighth* (1837); *An Historical View of the Progress of Discovery on the Northern Coasts of America*, etc. (1832); and a *History of Scotland from 1149 to the Union of the Crowns in 1603* (Edinburgh, 9 vols., 1828-43; 5th ed. 10 vols., 1866), a work pronounced by Earl Stanhope and other critics "the standard history of Scotland." Like his grandfather, he was a staunch advocate of Mary Queen of Scots. See the memoir entitled *The Portrait of a Christian Gentleman*, by Rev. John W. Burgon (1859).

Tyumen: See TRUMEN.

Tzana: lake of Abyssinia. See DEMBEA.

Tzetzes, JOHANNES: Byzantine author; flourished during the last half of the twelfth century. The poems *Iliaca* (edited by Jacobs 1793 and Bekker 1816) and *Chiliades* (edited by Kiessling 1826) are his principal works. Dull, verbose, and pedantic, his commentaries on the classic poets are valuable for their extensive learning. His brother, ISAAC, was also a commentator on the classics.

E. A. G.

Tzschirner, tschēr'ner, HEINRICH GOTTLIEB: theologian; b. at Mittweida, Saxony, Nov. 14, 1778; studied theology at Leipzig; was appointed Professor of Theology at Wittenberg in 1805 and at Leipzig in 1809, and was elected superintendent at Leipzig in 1815, and prebendary of Meissen in 1818. D. in Leipzig, Feb. 17, 1828. He acquired great reputation as a preacher and by the firm and intelligent opposition he offered to the Roman Catholic reaction all around him. He was a moderate rationalist, and was a prominent man in his time. He wrote *Leben und Ende merkwürdiger Selbstmörder* (Weissenfels, 1805); *Geschichte der Apologetik* (Leipzig, vol. i., 1805; all published); and against Roman Catholicism. He is remembered mainly by his continuation of Schröckh's *Kirchengeschichte*, vols. ix. and x. (1810-12) and *Der Fall des Heidenthums*, the product of ten years of labor, and still quoted (posthumous, edited by C. W. Niedner, vol. i., 1829; all published). See his *Life*, by H. G. Tzschirner (1828).

Revised by S. M. JACKSON.

Tzŭ-Hwui: See CHINESE LANGUAGE.

U

: the twenty-first letter of the English alphabet.

Form.—The form U is derived through the Roman V from the Greek upsilon, V, a variant form of Y. As a sign for the vowel *u* this symbol was not used in the Semitic alphabets, but in the form Ψ appears as the sixth symbol in the Phoenician series, i. e. in the place afterward occupied by F, the Greek digamma. The Greek alphabet, in its effort to supply the Phoenician lack of vowel-signs, used the Ψ (= semi-vowel *w*) as a vowel, placing it at the end of the series, and left in its place as a consonant a form, F, differentiated out of the preceding sign Φ by the omission of one of the strokes. This addition of *upsilon* to the series in the place after *tau* occurred before the division of the Greek alphabets into groups, as this symbol, holding the twenty-third place, is characteristic of all the groups.

Name.—The common Greek name of the letter, *upsilon* (δ ψιλόν), "mere *u*," "single *u*," is not old, but dates from Byzantine times, and applies to the discrimination between the digraph *ou* and the single letter *u*, which at that time had come to be pronounced alike, viz., as *ü* or *i* in French. The old Greek name was δ . The English name *yoo* (phonet. *yū*) represents the Old French *ū* (< Lat. *ū*), with development of *y*-sound as in *use*, *cure*, *human*.

Sound.—The letter stands regularly for the sounds (1) *yu* (*yoo*), as in *mule*, *usage*, *inpage*, *value*, *circular*; (2) *oo*, as in *rule*, *rude*, *rural*; (3) *ou*, as in *bull*, *pull*, *put*; (4) *i* (*ai*), as in *murmur*, *urn*, *fur*; (5) *ü* (unrounded), as in *tub*, *bud*, *under*. It also has the sound of *i* in *busy*, *lettuce*, *minute*, and has the consonant value of *w* between *q* or *y* and a vowel, as in *quality*, *language*, *sanguine*. It is silent, e, g, in *biscuit*, *circuit*, *rogue*, *guess*, *build*.

Source.—The sound *yu* (*yoo*) has its main source in French *u*. The sound *oo* (*ü*), more frequently written with *oo*, is treated under O; so also the sound *ou*. The sound *ü* has the following main sources: (1) O. Eng. *ū* < Teuton. *ū*; as *sung* < O. Eng. *sungen*; Goth. *suggwans*; *spun* < *spunnen*; Goth. *spunnans*; *thunder* < *þunor*; (2) O. Eng. *ū* (< *ün*) < Teuton. *un*; as *us* < *ūs*; Germ. *uns*; (3) O. Eng. *ū* < Teuton., as *but* < *būtan*, cf. Goth. *ūt*; *thumb* < *þūma*, cf. Germ. *daumen*; (4) O. Eng. *ō* < Teuton. *ō*, as *must* < *mōste*, Goth. *gamōlan*; (5) O. Fr. *u*, as *suffer* < *suffre*, *butler* < *butele*.

Symbolism.—U = uranium (chemistry); U. C. = Upper Canada; U. S. = United States; U. S. N. = United States navy. See ABBREVIATIONS. BENJ. IDE WHEELER.

Uaupés: See RIO NEGRO (Brazil).

Uberti, FAZIO, degli: poet (proper name BONIFAZIO); b. at Pisa between 1305 and 1309; a member of the family of the Uberti, who in the thirteenth century had been the leaders of the Florentine Ghibellines; entered the service of the Scaligers and other noble families; wandered about much, even into France and Germany, leading a wild life until near his fortieth year. D. after 1368. His *Dittamondo*, composed after 1350 in imitation of Dante's *Divina Commedia*, is a poem in *terza rima*, in which he fancies himself guided about the world by the geographer Solinus, and instructed in the history of various places. It was not finished (1st ed. Vicenza, 1474). His lyrical poems, containing many pleasing love verses, have been edited by R. Renier: *Liriche edite e inedite di Fazio degli Uberti*, etc. (Florence, 1883). See Th. Paür, *Fazio degli Uberti, ein Epigone Dante's*, in *Neues Lausitzisches Magazin*, lxxvii., 2 ff.; article by Renier in *Giorn. di Filol. rom.*, iii. J. D. M. FORD.

Ucayali, oo-kañ-ya-lé: a river of Peru, one of the great southern tributaries of the Amazon, and by many regarded as its true head. It is formed by the union of the Mantaro, Apurimac, Vilcamayu, and Paucartambo, all of which rise on or near the eastern side of the western cordillera, and after flowing through the high sierra region break through the Andes in narrow cañons. The Mantaro, called in its upper course the Janja and Aneca-yacu, has its source in Lake Junin near the head-waters of the Marañon, and flows

at first S. E., turning abruptly N. and N. E. The Apurimac rises near 11° 30' S., S. E. of Cuzco, flows N. W., and joins the Mantaro after cutting through the Andes. The Vilcamayu rises in the Vilcanota cross range close to the Titiaca basin, and it receives the Paucartambo, which rises near the sources of the Madre de Dios. Collectively these rivers water the finest and most thickly settled part of Peru, and after passing the Andes all of them become navigable. In Peru the name Ucayali is given only to the united flood, which lies entirely in the lowlands and has a general northern course, though with many windings; the whole of it has been navigated by Tucker and others with small steamers, and its length is calculated at over 1,000 miles. Its course is through a forest-covered plain, and it is frequented only by rubber-gatherers and a few wild Indians; ultimately it must become the great eastern outlet of Peru. Entire length, with the Apurimac, nearly 1,500 miles. See Castelnau, *Expédition dans les parties centrales de l'Amérique du Sud* (vol. iv., 1851); the reports of Tucker; Löffler, in *Petermanns Mittheilungen* (1886, part i.). HERBERT H. SMITH.

Uccello, GÖT-CHELLÒ, PAOLO; painter; b. in Florence, Italy, in 1397. His family name was DOBO, but from his love of painting birds he was called *Uccello*. After practicing the goldsmith's art he became an assistant of Lorenzo Ghiberti at the time the latter was working on the doors of the baptistry at Florence. The frescoes Uccello painted in the cloisters of Sta. Maria Novella in Florence have been almost entirely effaced by time. A colossal equestrian portrait of Sir John Hawkwood in chiaroscuro in *terra verde* is in the Duomo of Florence; also some giants in the same method in the Casa dei Vitaliani at Padua, which Vasari tells us were much admired by Mantegna. Uccello was much devoted to geometry and perspective, but, according to Vasari, the study of these branches made him "more needy than famous." D. in Florence, Dec. 11, 1475. The Louvre possesses a picture on panel by Uccello containing portraits of Giotto, Donatello, Brunelleschi, Giovanni Manetti, and himself. The National Gallery also has pictures by this master. See Gaye, *Carleggio inedito d'Artisti* (vol. i., p. 146) and Milanesi's edition of Vasari's *Lives of the Painters*. W. J. STILLMAN.

Uchean Indians; a linguistic stock of North American Indians which must have been divided into many tribes living distant from one another at an early period, but of whose tribal names none has come down to us except that of Yuchee or Euchee. They were scattered through parts of South Carolina, Georgia, and Florida at the time of de Soto's expedition, and reached Alabama not earlier than 1529. The center of their early settlements appears to have been the lower Savannah river. In bodily size they are smaller than the Creeks, but lithe, active, and wiry. In settling private disputes they are the most pugnacious of the Indians S. of the Appalachian ridge, and, although members of the Creek confederacy, never were friendly to those tribes. In revenge for this the Creeks regarded them as slaves, and antagonize them even yet. Regarding their ancient customs and rites, they are more conservative than any other of the southern tribes. They attribute their origin directly to the sun; historically they never appear as acting in a body, but only as detached, a single tribe inhabiting a village on the lower Tallapoosa river, another on the Chattahoochee, three on Flint river and its side creeks, several on the Savannah river, on the water-course of Southern Georgia, and on the coast tracts of South Carolina. After 1835 they removed with the Creek Indians to the Indian Territory, where they are now settled S. of the Arkansas river to the number of over 600. See Bartram, *Travels through North and South Carolina*, etc. (Philadelphia, 1791, and later editions); Hawkins, *A Sketch of the Creek Country*, etc. (New York, 1818; Savannah, 1848). See INDIANS OF NORTH AMERICA.

U'dall, NICHOLAS; author and divine; b. in Hertfordshire, England, in 1505 or 1506; educated at Corpus Christi College, Oxford (graduated in 1524), where he became a fellow; wrote verses for the city of London pageant at the coronation of

Queen Anne Boleyn, May, 1533; took orders in the Church of England; was a zealous advocate of the Reformation; was master of Eton School 1534-43, where he was noted as a severe disciplinarian; published *Flores for Latin Spekyuge, Selected and Gathered out of Terence, and the same translated into Englysshe* (1533); wrote several Latin and English plays to be performed by his pupils, one of which, *Ralph Roister Doister*, probably produced as early as 1540, though not printed until 1565, is memorable as the earliest English comedy known to be extant. Udall was dismissed from the mastership of Eton in 1543 in consequence of having removed from the chapel some silver images—a proceeding for which he was charged with robbery by his Roman Catholic adversaries; was vicar of Braintree, Essex, 1537-44; entered the service of Queen Catharine Parr; obtained on the accession of Edward VI. the rectory of Calborne in the Isle of Wight; edited, with a dedication to the Queen Dowager Catharine, *The First Tome or Volume of the Paraphrase of Erasmus upon the New Testament* (1549), translated partly by himself, partly by the Princess Mary, afterward queen, whose tutor he seems to have been; became canon of Windsor 1551-56, and head master of Westminster School 1555, and wrote for the queen's entertainment various *Dialogues and Interludes*. D. at Windsor in Dec., 1556. He was author of several schoolbooks and of some poems, and translated Latin works of Peter Martyr and others. No copy of his *Ralph Roister Doister* was known to exist until 1818, when it was discovered and reprinted by Rev. Mr. Briggs; was again issued, with notes, by F. Marshall (1821), by Thomas White in his *Old English Drama* (1830), by William Durant Cooper (1847), who edited it for the Shakspeare Society, prefixing an elaborate *Life* of Udall, and by Arber in his series of *English Reprints* (1869). It was identified as the earliest English comedy (a distinction previously accorded to *Gammer Gurton's Needle*) by J. Payne Collier in his *History of English Dramatic Poetry* (1831), by means of a quotation from it found in the *Arte of Logique* (1551) of Sir Thomas Wilson. The name of Udall also occurs under the forms *Oudall, Doudall, Wodall, Uvedale, and Vuedale*. Revised by H. A. BEERS.

Udine, oo'dēe-nā (anc. *Vedunum*): capital of the province of Udine, Northern Italy; at the foot of the Alps, 354 feet above the sea, and 25 miles from the Adriatic (see map of Italy, ref. 2-E). It is nearly circular, handsomely built, with clean and commodious streets and large squares flanked with fine porticoes. It has many forges and foundries, and manufactures oils, matches, silk and cotton thread and tissues, dyes, leather, and furniture. The castle near the center of the city, now used for military purposes, was designed by G. Fontana, and occupies the site of a still earlier castle which was destroyed by an earthquake. The municipal palace, built in 1457, was damaged by fire in 1876, but has been restored, and is a very fine Gothic building, resembling the ducal palace of Venice and very rich in frescoes. The episcopal palace has frescoes by Giovanni da Udine. The Metropolitan (1236), injudiciously restored, except the west front, in 1706, contains some admirable pictures, and there are many other interesting churches. The Bartoliniana Library and that of the Casa di Florio are very rich. Udine first appears historically in the ninth century; was governed for a time by the patriarchs of Aquileia; was long the chief city of the duchy of Friuli, and formed an important portion of the Venetian republic when the latter fell. It is now an active center of industry and traffic. Pop. of comune (1893) 36,600. Revised by M. W. HARRINGTON.

Udine, GIOVANNI, da: painter; b. at Udine, Italy, Oct. 27, 1487, of a family bearing the name of Ricamatori, perhaps from their skill at embroidery. He studied at Venice with Giorgione; afterward went to Rome with an artist called il Morto da Feltre, who invented a new kind of grotesque decoration which Giovanni practiced also. In Rome he became an assistant to Raphael in the decoration of the loggie of the Vatican and the Sala dei Pontifici in the Vatican; he painted the musical instruments in Raphael's *Santa Cecilia*. He was the first to make grotesque decorations in stucco, and became famous for his graceful productions. After the sacking of Rome he wandered about in Italy, returning to his native city, whence Clement VII. called him to Rome again to paint the standards for the castle of S. Angelo. Rewarding the artist with a pension, Clement also sent him to Florence to work in the sacristy of San Lorenzo. During the time Giovanni was thus occupied the pope died, and Giovanni, disgusted with ill fortune, returned to Udine, where

he married and settled, executing works for his native city, also a chapel of Sta. Maria of Cividade. In the year 1550 he returned to Rome as a pilgrim, where Giorgio Vasari procured for him the renewal of the pension which Clement VII. had given, as he was then in great poverty. D. in Rome in 1564. W. J. STILLMAN.

Ueberweg, über-rech, FRIEDRICH: classical scholar; b. at Solingen, Rhenish Prussia, Jan. 22, 1826; studied at Göttingen and Berlin. In 1861 the Vienna Academy awarded him the first prize for his treatise entitled *Untersuchungen über die Echtheit und Zeitfolge Platonischer Schriften und über die Hauptmomente aus Plato's Leben*, a work which secured him a call to the chair of Philosophy at Königsberg, where he died June 7, 1871. He edited the *Poetics* of Aristotle with a German translation, but is chiefly noted as the author of a valuable *System der Logik*, and of a standard work on the *History of Philosophy from Thales to the Present* (3 vols., 1863; 7th ed., by M. Heinze, 1888) which, although primarily intended for students, embodies considerable original research. See *Friedrich Ueberweg*, by F. A. Lange (Berlin, 1871). ALFRED GUDEMAN.

Ufa: government of Eastern Russia; area, 47,112 sq. miles. It extends along the rivers Ufa and Belaia, which flow to the Ural, and is to a great extent covered by branches of the Ural Mountains, but the western part is a great plain extending to the Kama river. The ground is well supplied with forests, and the rich soil is largely devoted to agriculture, so that much grain is exported. Bee-keeping and cattle-raising are carried on, though the cattle are fewer than formerly. The climate is cold but healthful. Mining is an important branch of industry; gold, lead, copper, and especially iron, are mined in large quantities, and of superior quality. The transit trade between Europe and Asia, or rather between Nijnii-Novgorod and Bokhara, is important. Pop. (1890) 2,039,300. Capital, Ufa. Revised by M. W. HARRINGTON.

Ufa: capital of the government of Ufa, Eastern Russia; on the Ufa, at its influx in the Belaia; 200 miles N. of Orenburg (see map of Russia, ref. 7-11). It has several good educational institutions, some manufactures, and an active trade. Pop. (1888) 28,342.

Ugan'da: long famous as the most powerful native kingdom of the lake region of Central Africa; lying on the northern and western sides of Victoria Nyanza. Bordered on the E. by the Nile, its northern limit is, approximately, in the same latitude as Lake Gita. W. of Victoria Nyanza, it includes about half the territory between that lake and Lake Albert Edward, being limited on the S. by the Kagera river; also the Sesse archipelago and other islands in Victoria Nyanza. It consists of undulating uplands, in part well timbered, and so high above the sea that the climate is fairly salubrious, though under the equator. The soil is very fertile, and the plantations are devoted chiefly to the culture of the banana, plantain, maize, and yam, which form the larger part of the food-supplies, though beef, goat's flesh, and fish are also eaten. One family has reigned in Uganda for over three hundred years, and the king, though he has been shorn of almost all his authority by the British, who are now in possession, is still regarded with superstitious reverence by many of the peasantry. The people belong to the Bantu family of African tribes, and are much higher in intellectual development and civilization than any other Central or East Africans. They are fully clad, are skilled in brass, iron, and copper working, and were a prosperous and very numerous people when discovered by Speke (1862) and described by Stanley (1875). For a number of years after 1884 the country was greatly exhausted by desperate civil wars and by the attempt of the king, Mwanga, to extirpate Christianity by wholesale massacres. Christianity, however, has taken a firm hold upon the country, which is (1895) divided into three political and religious parties, the Mohammedans, Catholics, and Protestants. Peace is fairly well maintained only by means of a native military force in the service of Great Britain. The population is not over 500,000, less than half what it was at about 1875. The British Government decided (June, 1895) to build a railway from Mombasa, on the Indian Ocean, 800 miles away, and a preliminary survey has been made. The country is of great strategical importance, as it dominates Lake Victoria and controls the head-waters of the Nile. See Speke's *Journal of the Discovery of the Source of the Nile*; Stanley's *Through the Dark Continent*; Ashe's *Two Kings of Uganda*; and Stock's *The Story of Uganda*. C. C. ADAMS.

Uglitch': town; in the government of Yaroslav, Russia; on the right bank of the Volga; 60 miles W. S. W. of the city of Yaroslav; contains many fine buildings (see map of Russia, ref. 6-F). It has extensive tanneries and some other manufactories. Pop. (1888) 14,172.

Ugolino da Siena: a name borne by four painters, natives of Siena, living in the fourteenth century. Vasari tells us that one of them was an intimate friend of Stefano Fiorentino (nephew and pupil of Giotto). This Ugolino was much employed in Italy. He retained the Byzantine style, and followed Cimabue rather than Giotto; he is said to have painted the high altarpiece in Santa Croce of Florence, and other works there, also the altar-piece in Santa Maria Maggiore, and a Madonna in Or San Michele. Only the first mentioned of these works exists, and that one only in part and not in its original place, nor all its parts together. Two pictures in the National Gallery in London are supposed to be parts of its preella. See Vasari (Milanesi's edition, vol. 1.); *Catalogue of the National Gallery*, London (1885). W. J. STILLMAN.

U'grians: common name for a Finnish stock inhabiting parts of the government of Tobolsk, Siberia. They speak a primitive Finnic dialect, much mixed, however, with Tartar elements, and occupy a very low stage of civilization. They are nominally Christians, but their religion is really a mixture of Christianity and Shamanism. They are nomads, and hunting and fishing are their chief occupations.

Uhehe, oo-hā'hā: a warlike tribe of Africans occupying a considerable area between lat. 7 and 9 S. and lon. 35 and 37 E., on the middle Rucha and upper Uranga rivers. In 1891 they defeated with considerable loss of life a German expedition under Lieut. von Zaleski, and in 1892 sacked the German trading-station of Mpuapua, in the Usagara country, 50 miles N. of their usual limits. M. W. H.

Uhland, oo-lānt, LUDWIG: poet and scholar; b. at Tübingen, Germany, Apr. 26, 1787; studied law at the university of his native city; went to Paris in 1810 for the purpose of studying Old French and Old German manuscripts; practiced law in Stuttgart 1812-30; was elected to the Württemberg assembly in 1819; was appointed Professor of the German Language and Literature at Tübingen in 1830, but resigned in 1833; became a member of the national assembly of Frankfort-on-the-Main 1848; retired to private life; d. Nov. 13, 1862. Among the great lyric poets of Germany in the nineteenth century Uhland takes a foremost place. At the beginning of his poetic career he was deeply influenced by the romantic school, but he kept himself free from the fantastic extravagances of this school. While the latter looked upon the Middle Ages with a vague enthusiasm and an undue overestimation, Uhland's love for mediæval German life and poetry resulted from an intimate knowledge of both, which was based upon thorough studies. Whenever he, therefore, undertakes to revive the German antiquity in his poetry, his productions bear the stamp of truthfulness, besides being the works of a great poet schooled in the art of Goethe. Most of his lyric poetry can be compared only with Goethe's songs and the best of the Volkslied, and so perfectly did he know how to reproduce the spirit of the latter that many of his poems became folk-songs. As a writer of ballads he has few equals in German literature. But while these ballads, which are classic specimens of their kind, are full of dramatic power, his dramas, *Herzog Ernst* (1818) and *Ludwig der Bayer* (1819), though highly poetical in many passages, are lacking the true dramatic effect. During the latter part of his life Uhland devoted himself exclusively to scientific research in the fields of literature and mythology, and the results of his investigations are collected in the *Schriften zur Geschichte der Dichtung und Sage*, published after his death (8 vols., 1865-72). Among these the essay *Ueber das alt-französische Epos* (1812), the excellent biography of Walther von der Vogelweide (1822), the treatise *Ueber den Mythos von Thor* (1836), and the classical collection *Alle hoch- und niederdeutsche Volkslieder* (1844) may be mentioned especially. Equally great as a poet and scholar, Uhland also played a conspicuous and noble part in politics, and his activity in the latter field shows the same devotion, simplicity, and manliness which characterize his entire career. See Fr. Vischer, *Kritische Gänge*, iv., 97; H. v. Treitschke, *Historische und politische Aufsätze*; O. Juhn, *Ludwig Uhland* (Bonn, 1863); F. Notter, *Ludwig Uhland* (Stuttgart, 1863); *Ludwig Uhlands Leben, von seiner Wittve* (Stuttgart, 1874); H. Fischer, *Ludwig Uhland* (1887); Dederich,

Uhland als Dichter und Patriot (Gotha, 1886); E. Paulus, *Ludwig Uhland und seine Heimat* (Tübingen, 1887).

JULIUS GOEBEL.

Ulrich, JEAN JACQUES ALEXIS: general; b. at Pfalzburg, Lorraine, then in France, Feb. 15, 1802; educated at the Military Academy of St. Cyr, France; served in the campaign of 1823 in Spain; afterward in Africa; attained the rank of brigadier-general in 1852; served with distinction in the Crimean war, where he became general of division, and in Italy in 1859; became grand officer of the Legion of Honor in 1862; transferred to the reserve in 1867; resumed active service at beginning of war between France and Germany, and commanded at Strassburg. This important strategic point was ill fortified, and held but a small garrison. In Aug., 1870, it was invested by the Germans, who, upon Ulrich's refusal to surrender, began a destructive bombardment, in the course of which 200,000 projectiles were thrown against the city. Ulrich's brave resistance lasted till Sept. 27, 1870, when, convinced of its uselessness, he surrendered. For his services he was rewarded with the Grand Cross of the Legion of Honor. He is the author of *Documents relatifs au Siège de Strasbourg* (1872). D. at Passy, France, Oct. 9, 1886.

Ulrichsville: city (founded as Waterford in 1833, name changed in 1839); Tuscarawas co., O.; on the Stillwater creek, and the Cleve., Lorain and Wheel., and the Pats., Cin., Chi. and St. L. railways; 99 miles N. E. of Columbus, and 101 miles S. of Cleveland (for location, see map of Ohio, ref. 4-11). It is in an agricultural and wool-growing region, and has 6 churches, several public schools, electric street-railway, 2 private banks, 2 weekly newspapers, and manufactures of sewer-pipe, drain-tile, and fire-brick. Ulrichsville with the village of Dunnison adjoining practically form one city, with a local and suburban population of 8,000 to 10,000. Pop. (1880) 2,790; (1890) 3,842.

EDITOR OF "TUSCARAWAS CHRONICLE."

Uist, wist, North and South: two islands of the Outer Hebrides, belonging to Scotland. North Uist is 18 miles long and from 3 to 13 miles broad, with 3,371 inhabitants. South Uist is 20 miles long and 7 miles broad, with 3,825 inhabitants. Both islands are high and rocky, and ill suited for agriculture; fishing is the principal business.

Uitlanders: See the Appendix.

Ujiji, oo-jee jee: a place in Africa, consisting of a number of mud huts, and situated on the shore of Lake Tanganyika, in a district of the same name, in lat. 4 58 S., lon. 30 4 E. (see map of Africa, ref. 6-F). It became noted as the point where Stanley met Livingstone on Nov. 10, 1871.

Ujina: a port situated in the inland sea of Japan, close to the city of HIROSHIMA (*q. v.*) and to the naval station of Kure, where is located the Imperial Naval College, removed thither in 1890 from Tokio (see map of Japan, ref. 7-B). The port admits the largest vessels, and was the center of naval activity in the war with China in 1894-95. The court moved westward in the summer of 1894 to Hiroshima, as a safer and more convenient locality for directing warlike operations. J. M. DIXON.

Ukerewe, oo-keer-uu': native name for the great African lake called VICTORIA NYANZA (*q. v.*).

Ukiah: city (founded in 1857); capital of Mendocino co., Cal.; on the Russian river, and the San Fran. and N. Pac. Railway; 121 miles N. W. of San Francisco (for location, see map of California, ref. 5-B). It has a picturesque location; contains 3 public schools, a State bank with capital of \$250,000, a private bank, the Sacred Heart Convent of Mercy, and 2 weekly newspapers; and is engaged in agriculture, fruit, hop, and wool growing, lumbering, and stock-raising. Pop. (1880) 933; (1890) 1,627; (1895) estimated, 2,390.

EDITOR OF "REPUBLICAN PRESS."

Ukraine (the frontier-land): the name commonly given to that easternmost portion of Poland which, extending on both sides of the Dnieper along its middle course, and conquered by the Poles in 1320, formed the frontier of the Polish empire against the Tartars; it hardly ever signified a political division with precisely defined boundaries, but it soon became a matter of contention between Russia and Poland. In 1654 ten Cossack tribes settled on the eastern bank of the Dnieper, fell away from the Polish crown, and surrendered themselves to Russian authority. By the Treaty of Andrus-sow (1667), and finally by the Peace of Grzymalowski (1686), this territory was ceded by the Poles and annexed to Russia.

under the name of Russian Ukraine, or Little Russia. The rest of the country, situated on the western bank of the Dnieper, remained with Poland, under the name of Polish Ukraine, until the second division of Poland, when Russia took the whole and divided it into various governments.

Revised by M. W. HARRINGTON.

Ulcér [from Fr. *ulcère* < Lat. *ulcus, ulceris*, sore, ulcer; cf. Gr. *ἔλκος*, wound, sore, ulcer]: a localized disintegration on one of the external or internal surfaces. Two processes are concerned in ulceration: the molecular death of part of the surface involved, and inflammatory conditions at the base and sides. The causes of ulceration are those of inflammation, with an added element of poor reaction on the part of the tissue involved. Local injuries, as by pressure, foreign bodies, as splinters and the like, are the immediate exciting cause in external ulcers. Internally, as in ulcers of the mouth, stomach, or intestines, the immediate exciting cause is either injury by foreign bodies or by micro-organisms and decomposed secretions or other contents. To make the exciting causes spoken of operative to the production of an ulcer, diminution in the resisting power or reparative activity of the tissues is necessary. This explains the occurrence of ulcers on the lower extremities in old people when the veins are varicose and the circulation therefore sluggish; in the rectum in case of hemorrhoids; in anæmic, debilitated, or syphilitic subjects; in parts of the body exposed to constant wetting; and in tissues where the nerve tone is lowered, as in paralyzed parts.

The appearance of ulcers varies greatly in different cases. In general there is an irregular excavation, with a base covered with pus and showing small red elevations, the inflammatory granulations by which nature repairs the injury. According to the variations from this general appearance and from the greater or less tendency to heal there are described: (1) *indolent ulcers*, in which the base and edges are hard and healing is very slow; they are common on the legs of old people; (2) *irritable ulcers*, which are painful and bleed easily; (3) *inflamed ulcers*, in which from irritation active inflammation is evident; (4) *sloughing ulcers*; (5) *serpiginous ulcers*, in which there is a tendency to spread in a serpentine fashion; (6) *phagedemic ulcers*, in which great tissue destruction occurs; (7) *œdematous ulcers*, which are moist and boggy; and (8) *fungating ulcers*, in which the granulations in the floor of the ulcer grow excessively. Other terms, such as *specific, epitheliomatous*, and the like, are in use, but do not belong to the anatomical classification given above.

There are certain parts of the body specially liable to ulcer formation. Such are the lower part of the legs, the mouth, the stomach, the intestines (especially in typhoid fever and in tuberculosis), and the rectum.

The tendency of ulcers is to get well spontaneously. Nature is best assisted by cleanliness of the part, local or general tonic remedies to build up the reparative power, and stimulating applications to the ulcer, strapping, or incision when there is a tendency to indolence. WILLIAM PEPPER.

Ulema, oo-le-mā' [Arab., wise]: a plural term in Musliman countries including all persons learned in religious law. Till 1846 the ulema controlled all Mussulman education in Turkey. From them are chosen the cadis, mollahs, and imams. E. A. G.

Ulex: scientific name of FURZE (*q. v.*).

Ulfeldt, LEONORA CHRISTINA: prose-writer; b. at the palace of Frederiksberg, Denmark, July 18, 1621. She was a daughter of Christian IV. and Kirstine Munk, and was married in 1636 to Korfütz Ulfeldt, one of the most powerful of the Danish nobility. On the conviction, in 1663, of her husband of high treason, she fell a victim to the jealousy of the queen, Sophie Amalie, and was confined in the Blue Tower in Copenhagen until the death of the queen in 1685. During her imprisonment she wrote an account of her sufferings, *Jammers Minde* (The Memory of Grief), first published in 1869 by S. Birket Smith, who calls it "the most important Danish prose work of the seventeenth century." D. at Maribo cloister, Mar. 26, 1698. D. K. DODGE.

Ullas: See GOTHIC LANGUAGE.

Uliasutai, or **Uljassutai**: an important commercial station of Mongolia, in lat. 48° 22' N., lon. 97° E., on the line between the Russian frontier and Si-ngan-foo, capital of the Chinese province of Shensi, and principal dépôt for all goods destined for the markets of Central Asia (see map of China, ref. 1-F). It consists of a civil and a military quarter, the

latter occupied by the Chinese garrison, the former by inhabitants who are partly Chinese and partly Mongolian. The Mongolian nomads who visit the city during the fair live in tents.

Revised by M. W. HARRINGTON.

Ulmann, KARL: theologian; b. at Effenbach, Palatinate, Mar. 15, 1796; studied theology at Heidelberg, Tübingen, and Berlin; lived in friendly intercourse with Hegel and Daub; afterward with Schleiermacher and Neander; was appointed Professor of Theology at Heidelberg in 1821; founded in 1828, together with Umbreit, the *Theologische Studien und Kritiken*, which is still the principal representative of that school of German theology which believes in, and tries to work out, a complete reconciliation between Christianity and the modern culture; went as professor to Halle in 1829, but returned to Heidelberg in 1836; was made president of the chief ecclesiastical council of Baden in 1856, but resigned this office in 1861, and retired into private life. His principal writings are *Gregory of Nazianzus* (Darmstadt, 1825; 2d. ed. 1867; Eng. trans., London, 1851); *Historisch oder mythisch?* (Hamburg, 1838; directed against Strauss); *The Worship of Genius* (Hamburg, 1840; translated into English 1846); *Reformers before the Reformation* (2 vols., 1841; translated into English by Robert Menzies, Edinburgh, 2 vols., 1855); *Apologetic View of the Sinless Character of Jesus* (Jena, 1828; Eng. trans., Edinburgh, 1841; from 7th ed. [1863] 1870); *The Essence of Christianity* (Gotha, 1845; 4th ed. 1854; Eng. trans., London, 1860). See his *Life*, by W. Beyschlag (Gotha, 1866). D. at Carlsruhe, Jan. 12, 1865.

Revised by S. M. JACKSON.

Ulloa, ool-yō'ā, ANTONIO, de: naval officer and scientist; b. at Seville, Spain, Jan. 12, 1716. He early entered the navy, and in 1735 was appointed, with Jorge Juan, to accompany the French scientific expedition to Peru. (See LA COUDAMINE.) During a residence of nine years in that country, Ulloa and Juan made extensive surveys, and studied the history and social condition of the people. A secret report which they sent to the Spanish Government was published in English in 1826. It is of great historical importance, especially in showing many of the abuses which subsequently led to the revolution. Returning to Europe at the end of 1744, Ulloa was captured by a British cruiser, but was soon released. In 1748 he published, with Juan, *Relación histórica del viaje á la América meridional*, which has been translated into various languages, and is widely known. A second work relating to the expedition, *Noticias Americanas*, appeared in 1772. Ulloa became a leader of science in Spain, and founded the first metallurgical laboratory in the country, and the observatory at Cadiz. He was intrusted with several important offices, for which, however, he showed little aptitude. In 1766-68 he was governor of Louisiana. D. near Cadiz, July 3, 1795. H. H. S.

Ulloa, FRANCISCO, de: navigator; b. in Spain about 1485. He was with Cortés in Mexico, and in July, 1539, was placed in command of three vessels which left Acapulco to explore the Gulf of California. One ship was wrecked; with the others he penetrated to the head of the gulf, and, returning, coasted the western side of the peninsula of California, which had been supposed to be an island. The extant accounts of this voyage are confused and somewhat contradictory, but it is certain that Ulloa proved the peninsular form of Lower California. It is stated that he perished in a shipwreck, but another account says that he returned to Acapulco, and was murdered there soon after. H. H. S.

Ulloa y Pereira, -ee-pā-rā'ēe-rā, LUIS, de: poet; b. at Toro, Leon, Spain, in 1590; was a magistrate, but devoted himself also to literature, producing lyrical poems and several prose treatises. D. 1660. He is sometimes subject to the faults of the school of Gongora. *Rachel*, the best-known of his poems, treats the love-episode of Alfonso VIII. and a beautiful Jewess of Toledo. One of his prose pieces is a discourse in defense of the comedy (1659), at that time assailed by the clergy. See the *Obras de D. Luis de Ulloa: Prosas y Versos* (2d ed., Madrid, 1674). J. D. M. FORD.

Ulm: city; in the kingdom of Württemberg, Germany; at the influx of the Blau into the Danube, which here becomes navigable (see map of German Empire, ref. 7-B). It is 58 miles S. E. of Stuttgart, is fortified, and is a place of much interest to the tourist, on account of its many fine old buildings. Its cathedral (Protestant), begun in 1377 and carried on till 1494, then left unfinished till 1844, was completed in 1890. It is a magnificent edifice in Gothic style, 455 feet long, 186 feet broad, and 134 feet high, and contains

the largest organ in Germany. The open-work spire is the highest in the world (530 feet). The town has a great variety of manufactures, of which no single branch, however, is extensively developed, although its sweet bread is famous. On Oct. 17, 1805, Gen. Mack, at the head of an Austrian army of 30,000 men, here capitulated to Napoleon. Pop. (1895) 39,304.

Ulna'cea': See NETTLEWORKS and ELM.

Ulnic Acid and Ulinin: See HUMUS.

Ulna: See ARM, OSTEOLOGY, and SKELETON.

Ulphilas, or Ulfilas: See GOTHIC LANGUAGE.

Ulpia'nus, DOMITIUS: jurist, of Tyrian origin; b. about 170 A. D.; entered public life in Rome under Septimius Severus; obtained the greatest reputation as a jurist, and held various judicial offices under Septimius Severus and Caracalla; lost his influence and his offices under Elagabalus, but came again into power after the accession of Alexander Severus, but incurring the enmity of the pretorian guard, he was murdered by them in 228. Of his writings, which were very numerous and extensive, only fragments exist, but about one-third of the *Digest* of Justinian consists of excerpts from his books. The *Tituli ex Corpore Ulpiani*, generally called *Fragmēta Ulpiani*, was edited by Hugo (1834) and by Böcking (1845).

Revised by G. L. HENDRICKSON.

Utric, SAINT: bishop; b. at Augsburg about 890; d. July 4, 973. He came of noble parents, and having become a monk was in the line of promotion to the episcopacy, to which he attained in 923. As was customary, he combined worldly pomp with spiritual authority and acts of piety. He stirred up the people to a great fight by which they repelled the Magyars in 955. This caused him to be held in grateful esteem. He dispensed alms lavishly, built churches and monasteries, and did much to beautify Augsburg. He was very devout, and exerted strict discipline over his priests. He was particularly given to the worship of relics, and made long journeys to secure them. He resigned his see shortly before his death and died as a Benedictine monk. His retirement was considered a sin by the Council of Ingelheim (972). He enjoyed repute for holiness while he lived, and his first biographer, Gerhard, does not hesitate to ascribe miraculous power to him. Miraculous cures were wrought on his grave. His successor, on the strength of these statements, claimed that the whole Christian world should honor him. In Feb., 993, Pope John XV. issued a bull laying such an obligation upon Christendom—interesting as the first instance of a papal command raising a local saint into the company of saints of the Roman Catholic Church. Several writings have been falsely attributed to Utric, particularly a memorable rejoinder to the decree of a certain Pope Nicholas, who sought to enforce sacerdotal celibacy, which the author contends was going beyond Scripture. This was published by Flacius in his *Catologus testium veritatis, qui ante nostram ætatem reclarum Papæ* (Basel, 1556); best by Martene and Durand, *Amplissima collectio*, pp. 449-454, and translated An *epistle of moche learning, sent by saint Uldericus, Bisshoppe of Augusta, called Augsburg, unto Nicolas, Bysshoppe of Rome, the fyrst of that name: against the unmarried chastitie of pryestes* (London, 1550). But there was no pope of that name in the tenth century. For his biography, see Waitz, edition of Gerhard's biography in *Monumenta: Scriptores IV.*, pp. 377, seq.

SAMUEL MACAULEY JACKSON.

Utri'ei, HERMANN: philosopher; b. at Pforfen, Brandenburg, Mar. 23, 1806; studied law at Halle and Berlin, but devoted himself after 1829 exclusively to the study of philosophy, and was appointed Professor of Philosophy at the University of Halle in 1834. He wrote *Ueber Princip und Methode der Hegelschen Philosophie* (1841); *Grundprincip der Philosophie* (2 vols., 1845-46); *System der Logik* (1852); *Glauben und Wissen* (1858); *Gott und die Natur* (1862); *Gott und der Mensch* (1866; 2d ed. 1874); *Der Philosoph Strauss* (1873; translated by C. P. Krauth, 1874); *Ueber Shakespeare's dramatische Kunst* (1839; 3d ed. 1868; translated into English by A. J. W. Morrison, London, 1846). D. at Halle, Jan. 11, 1884.

Revised by J. M. BALDWIN.

Ulster: the northernmost of the four provinces into which Ireland is divided; borders N. and W. on the Atlantic and E. on the North Channel and the Irish Sea; area 8,613 sq. miles. The surface is greatly diversified; the west part is mountainous, some summits being over 2,000 feet high. The province contains the large loughs Neagh, Strangford,

and Erne. Pop. (1891) 1,619,814, of whom more than half are Protestants.

Ultramarine [from Lat. *ultra mare*, beyond the sea. So called because originally brought from Asia; cf. Span. *ultramarina*]; a blue pigment formerly obtained from lapis lazuli, a mineral containing silica, alumina, soda, lime, sulphuric acid, a little sulphur and iron, with a very little chlorine and water. It is found in Siberia, Transylvania, Persia, China, Tibet, Tartary, and the East Indies, and furnishes a beautiful and very durable pigment. The analysis of lapis lazuli led to the production of artificial ultramarine, a prize of 6,000 francs being offered in 1821 by the Société d'Encouragement of Paris for this purpose. It was awarded in 1828 to Guimet of Toulouse, who first produced it on a large scale, although Gimelin had shortly before made it by a process essentially the same as that now followed. Wagner (*Chemical Technology*) gives the following classification of the different methods followed: The sulphate or Glauber's salt ultramarine is prepared by intimately mixing 100 parts of dried kaolin, 83 to 100 parts of calcined Glauber's salt, and 17 of charcoal, or else 100 of kaolin, 41 of Glauber's salt, 41 of calcined soda, 17 of charcoal, and 13 of sulphur, and heating the mixture very strongly for seven to ten hours in fire-clay crucibles. The contents are then repeatedly treated with water, pulverized, washed, dried, ground, and sifted, furnishing green ultramarine, ready for the market. (See УЛТРОМЪ.) To convert it into blue ultramarine about 4 per cent. of sulphur is mixed with it, the whole roasted at a low temperature, with access of air, and this treatment repeated until the desired blue color is produced. The blue product is pulverized, washed, dried, and separated into different qualities. Soda ultramarine is either made with a mixture of soda and sulphate or with soda alone, as in the following mixture: kaolin 100, soda 100, charcoal 12, sulphur 60. The ignition is best performed in a reverberatory furnace, and the conversion into blue ultramarine in a large muffle, with addition of sulphur, the product being finer than the former. By increasing, within certain limits, the quantities of soda and sulphur, blue ultramarine may be at once obtained. Silica ultramarine is soda ultramarine prepared with kaolin which has received an addition of 5 to 10 per cent. of silica. It is at once obtained by calcination as blue ultramarine, withstands the action of alum, and has a violet tint.

Ultramarine is decomposed by the mineral acids, even dilute, with evolution of hydrogen sulphide. The natural ultramarine is far more durable, but the artificial is now very extensively employed as a pigment for calico-printing, coloring paper and cotton fabrics, and various other purposes for which smalt was formerly used. It should not be used for coloring candies. Sometimes it is mixed with chalk, kaolin, and barytes to make the tints lighter. Cobalt ultramarine is Thénard's blue. (See COBALT.) Yellow ultramarine is a name sometimes applied to barium chromate. Ultramarine ashes is a pale residue obtained in the preparation of native ultramarine. Ultramarine is largely manufactured in Germany, France, Belgium, and to some extent in England. Its manufacture is an important industry in the U. S., and according to the *Mineral Resources of the United States* for 1893 113,647 tons were produced in that year.

Revised by IRA REMSEN.

Ultramon'tanism [from Late Lat. *ultramontanus*, ultramontane; *ultra*, beyond + *montes*, mountains (i. e. the Alps), viz., generally in relation to France]; in the Roman Catholic Church the principles and tendency of those who desire rather to increase than to minimize the authority and power of the pope. The opposite tendency is known as Gallicanism. Not unfrequently, in the ardor of recent discussions, the genuine teachings of the Catholic Church have been classed as Ultramontanism.

JOHN J. KEANE.

Ultra Vi'res [Lat., beyond the powers]; a term applied to the contract of a corporation when it is beyond the powers conferred upon this artificial person by its charter and the general laws applicable thereto. The term is quite modern, having been introduced by Baron Bramwell as counsel in *East Anglian R. Co. vs. Eastern Counties R. Co.*, 11 Common Bench 775, in 1851. Since its adoption it has been employed in a variety of senses. It has been applied to authorized acts which the corporation has performed in an unauthorized manner. It has been applied to acts within the power of the corporation, but not within the authority of the officers or agents who have done them. Still again it has been applied to positively illegal acts of

corporations. The tendency of recent decisions, however, is to limit the term to the signification stated at the opening of this article.

Ultra Vires Contracts.—The general rule is that they are not enforceable. This rests upon three reasons: 1. The interest of the public that the corporation shall not transcend the powers granted. 2. The interest of the stockholders that the capital shall not be subjected to the risk of enterprises not contemplated by the charter, and therefore not authorized by the stockholders in subscribing for the stock. 3. The obligation of every one, entering into a contract with the corporation, to take notice of the legal limits of its powers. (*Railway Cos. vs. Keokuk Bridge Co.*, 131 U. S. 371.) So long as an *ultra vires* contract remains executory on both sides, neither party can maintain an action for its enforcement nor for damages for its breach. If it has been executed by one party, its *ultra vires* character is still a defense to the other, provided the latter has not received and retained the benefit of its performance. For example, a savings-bank gives an order to a broker for the purchase and sale of cotton futures. The broker buys, sustains a loss, and sues the bank for his commissions and loss. *Ultra vires* is a good defense. (*Jemison vs. Bank*, 122 N. Y. 135.) Had the bank received and retained the cotton, a different question would have been presented. In such a case, according to some authorities, the bank would have been liable on the contract, on the ground of ESTOPPEL (*q. v.*). "The basis upon which the enforcement of the contract in such cases rests is that the company is estopped from setting up its own unauthorized act, and its own incapacity to evade performance on its part after receiving the fruits of the bargain." (*Camden, etc., R. Co. vs. Mays Landing R. Co.*, 48 N. J. L. 530, 568.) According to other authorities, the bank would not have been liable on the contract, but would have been subject to a quasi-contractual obligation. This seems to be the better view. It was clearly and forcibly stated in *Central Transportation Co. vs. Pullman's Car Co.* (139 U. S. 24). "A contract *ultra vires* being unlawful and void, not because it is in itself immoral, but because the corporation by the law of its creation is incapable of making it, the courts, while refusing to maintain any action upon the unlawful contract, have always striven to do justice between the parties. . . . In such case, however, the action is not maintained upon the unlawful contract, nor according to its terms, but on an implied contract of the defendant to return, or, failing to do that, to make compensation for property or money which it has no right to retain." See Keener, *Quasi Contracts*, p. 272.

Torts committed by corporations are not within the doctrine of *ultra vires*. The U. S. Supreme Court has declared that it has been found necessary to hold corporations responsible for torts or quasi-criminal acts not strictly within their corporate authority, when done in their corporate name, and by officers competent to exercise corporate powers. (*Salt Lake City vs. Hollister*, 118 U. S. 256.) To permit the defense of *ultra vires* in such cases would be equivalent to a license to corporations to indulge in unlimited wrongdoing.

Restraining Ultra Vires Acts.—Suits for this purpose may be brought by stockholders or creditors. In some jurisdictions such suits may be instituted by the State, but in the absence of statutory authority therefor they will not be sustained unless some plain and sufficient public mischief be shown as a warrant for State interference. (*Attorney-General vs. Railway*, 11 Chancery Div. 449.) *Ultra vires* acts may be so deliberate and flagrant as to justify a forfeiture of the charter by the State. (*People vs. North River Sugar Refining Company*, 121 N. Y. 582.) For a full discussion of this subject, the reader is referred to Green's edition of Brice's *Ultra Vires*. FRANCIS M. BURDICK.

Ulugh (oo'loog) **Beg**: ruler and astronomer; b. in 1394; a grandson of Timur. He succeeded his father on the imperial throne of Persia in 1447, but was put to death in 1449 by his own son. He founded the observatory at Samarkand, encouraged the study of astronomy, was a diligent and accurate observer himself, and wrote several astronomical works in Arabic, which have been translated into Persian: into Latin by Greaves (London, 1650-52) and by Thomas Hyde (Oxford, 1665); into French by L. A. Sédillot (1846-53). An edition of his catalogue of stars appeared in the *Memoirs* of the Royal Astronomical Society, vol. xiii (1843).

U'pverstone: town; in Lancashire, England; on Morecambe Bay; 8 miles N. E. of Barrow-in-Furness (see map of

England, ref. 5-F). It manufactures different kinds of coarse woolen and linen fabrics, and exports considerable quantities of pig iron, bar iron, iron ore, limestone, and slate. Pop. (1891) 9,948.

U'lybuschew, Ulibischew, Ulibischeff, or Oulibicheff (*Ulybuschew* is the German mode of spelling the name), ALEXANDER DMITRIWICH, von: Russian musical critic; b. in 1795 in Dresden, where his father was Russian ambassador; descended from a Tartar family; studied at various German universities; served in the Russian army and subsequently entered the ministry of foreign affairs, but resigned his position in 1831 and lived on his estates near Nijnii Novgorod, devoting himself to the study of music. He wrote *Nouvelle Biographie de Mozart* (3 vols., Moscow, 1844) and *Beethoven, ses Critiques et ses Glossateurs* (Leipzig and Paris, 1857), both of which were translated into English. The latter was in reply to Lenz, who had attacked Ulybuschew for depreciating Beethoven. In Russian he wrote a great number of musical essays and criticisms in various periodicals, which exercised a great influence on the development of musical taste in Russia. D. at his residence Jan. 24 (Feb. 5), 1858.

Ulysses, or Ulixes: See ODYSSEUS.

Umatilla River: a stream which rises in the Blue Mountains of Oregon, flows W. and N. W., and empties into the Columbia river at Umatilla, on the boundary between Oregon and Washington; length about 150 miles.

Umba'gog, Lake: a body of water lying chiefly in the town of Errol, Coos co., N. H., but extending into Oxford co., Me., and there connecting with the most southerly of the Rangeley lakes. It is about 9 miles long and from 1 to 2 miles wide. It is in a wild and beautiful region, and owing to its fine trout is a famous resort in summer for fishermen.

Umbellifers, or Umbelliferae [*umbellifera* is Mod. Lat.; Lat. *umbella*, umbrella + *ferre*, bear, produce; named in allusion to the shape of the *umbels* or clusters of flowers and fruit]; a family of 1,400 species of dicotyledonous herbs, or rarely shrubs, abounding in both hemispheres, chiefly in cool regions. Most have hollow striated stems, and flowers in umbels, but these are not perfectly constant characters. Various as these plants are in aspect, it is difficult to define accurately their generic and specific distinctions. Among its useful plants are the carrot, parsnip, skirret, chervil, fennel, caraway, dill, coriander, anise, parsley, and celery. Some are useful in medicine, many being active poisons—the medicines conium, cicuta, assafetida, ammoniac, galbanum, etc.

Revised by CHARLES E. BESSEY.

Umbur [from Fr. *ombre*, short for *terre d'ombre*, trans. of Ital. *terra di ombra*, liter., shadow earth; *terra*, earth + *di*, of + *ombra*, shadow]; a mineral pigment formerly obtained from Umbria in Italy, but at present chiefly imported from the island of Cyprus. Small quantities of umbur are found in the U. S., chiefly in Pennsylvania. Its composition is: Silica, 13 per cent.; alumina, 5 per cent.; iron oxide, 48 per cent.; manganese oxide, 20 per cent.; water, 14 per cent.; being essentially a siliceous brown hematite. It forms brown or yellowish-brown masses, possessing a hardness of 1.5 to 2.5 and a specific gravity of 2.2; adheres to the tongue; shines when rubbed, and dissolves to some extent in hot hydrochloric acid, the solution giving the reaction of iron. When gently heated, water is expelled, and a dark-brown pigment termed *raw umbur* is formed; at a higher temperature it is completely dehydrated, and converted into a soft red-brown modification known as *burnt umbur*. The dark colors of these pigments depend upon the manganese. They are extensively used as oil and water-color pigments, and are often mixed with other colors.

Umbur, or Umbre: the *Scopus umbretta*, a bird of the heron family, better known as SHADOW-BIRD (*q. v.*).

Umberto I.: Italian form for HUBERT I. (*q. v.*).

Umbreit, oom brit, FRIEDRICH WILHELM KARL: theologian; b. at Sonneborn, Saxe-Gotha, Apr. 11, 1795; studied theology at Göttingen, and in 1820 was appointed Professor of Theology and Philosophy at Heidelberg, where he died Apr. 26, 1860. In connection with Ullmann he founded the *Theologische Studien und Kritiken* (1828); author of *Kommentar über die Sprüche Salomos* (1826), and *Kommentar über die Propheten des alten Testaments* (4 vols., 1841-46).

Umbrella-bird: a name given to certain of the cotingas (*Cotingidae*) belonging to the genus *Cephalopterus*, because they bear a large, recurved crest which seems to shade the

head like an umbrella. The most familiar species, *Cephalopterus ornatus*, has a long feathered wattle hanging from the lower part of the neck. It is nearly the size of a

The umbrella-bird.

crow and of a blue-black color. It inhabits the forests of Northern and Eastern South America. F. A. L.

Umbrellas and Parasols [*umbrella* is Lat. form of Ital. *ombrella*; Fr. *ombrelle*; Rouman. *umbré* < Lat. **umbrella*, dimin. of *umbra*, shade; *parasols* is from Fr. *parasol*; Ital. *parasole* < Lat. *para re*, prepare (in Romance langs., be ready, ward off) + *sol*, sun]; portable shades or canopies, capable of being folded; intended as shields against rain or sun. The umbrella is of ancient origin. The Egyptian and Ninevite sculptures, of the earliest dates, have representations of it, but only in connection with royalty. The umbrella was spread like a halo over the head of the monarch, whether in a chariot or in open-air feasts. The Chinese adopted it at an early period of their history, and were the only people who did not confine its use to the king and princes. With them, the man who was privileged to bear an umbrella was one of wealth and high position. The Japanese have used the umbrella ever since they established themselves in their island empire. The use of the umbrella or parasol is universal throughout India, but in Burma and Siam it is a mark of rank. In Barmia the umbrellas of the king were of white silk, and no other person was allowed to carry a white one. In some of the Hindu sculptures Vishnu is represented as visiting the infernal regions with an umbrella spread above his head. In Greece the umbrella or parasol was much used by women of rank, and there are allusions to it in the Greek poets. In Rome its use was confined to women and effeminate men who used it as a protection from the sun, and it was made substantially like those of the present. Thence it extended to the countries of Southern Europe and Northern Africa. In the Middle Ages its use among women was less common, but it was an emblem of rank in the Church. All the large churches, especially cathedral churches, owned an umbrella to be used in processions. The umbrella was introduced into England as early as the fourteenth century. The parasol came into use in France and England, probably from China, about the middle of the seventeenth century. The forms and the material indicate its Chinese origin, though it was used in Italy nearly seventy-five years earlier. In England it was carried by women as a protection from both the rain and the sun as early as 1700. Jonas Hanway, an eccentric traveler and philanthropist, is believed to have been the first man of note who carried one in the streets, and he encountered much ridicule for doing so. The umbrella in use at this time was made of oiled muslin or silk, sometimes of a tough oiled paper, and rarely, as in Hanway's case, of silk. It was generally very heavy. Improvements in its construction have made it light and graceful, and it is now universally used. Besides its hand-service, it is used for express-wagons, omnibuses, and carriages, where it takes the place of the leather carriage-top. Modifications of it are the parachute and the umbrella-tent.

The umbrella, in the general construction of its frame, has changed but little in thousands of years, though the materials used have been improved. Chinese frames, which have been largely the models of others, were made of bamboo and light but strong woods. In Europe the ribs were at first made of rattan or split bamboo, then of wood, usually white oak, afterward of whalebone. They are now made of the best steel (and often grooved) in the finer classes of goods, and of rattan in the cheaper. In the finest umbrellas the covering is of silk or of silk and cotton, while for the cheapest cotton alone is used. Waterproof materials, such as rubber, are also sometimes used. The paragon frame, in which the ribs and stretchers are grooved, has been improved by a slight bending inward of the ribs, so that when closed they fit compactly round the stick. Parasols are made like umbrellas, though occasionally lined, trimmed, or covered with lace, etc. The English market is the chief one for umbrellas, single manufacturers making millions of them in a year. Umbrellas have been made in the U. S. since 1802, and in considerable numbers since 1812, but except for the cheapest goods, the sticks, the ribs, the stretchers, and the coverings were imported. A large part of the silk, the steel ribs, and a large proportion of the sticks are still (1895) imported, though paying a heavy duty. The census of 1890 reported that there were in the U. S. that year 435 establishments for the manufacture of umbrellas and canes, employing 6,863 persons, paying wages during that year amounting to \$3,204,797, and producing \$13,771,927 worth of goods. During the fiscal year of 1894 umbrellas, parasols, and sunshades (together with sticks for the same) valued at \$86,305.75 were imported into the U. S. See *L'Umbrella, le Giant, le Manchon*, by Octave Uzanne (Paris, 1882).

Revised by MARCUS BENJAMIN.

Umbrella-shell [so called from its shape]; any gasteropod mollusc of the genus *Umbrella* (family *Pleurobranchidae*), which contains only three known living and two extinct species. The small, flattened umbrella-shaped shell covers only the more important organs, and the shell itself is often concealed by the mantle.

Umbrella-tree: a small tree of the magnolia family (*Magnolia tripetala*), found in the U. S. along the Allegheny Mountains from Pennsylvania to Kentucky. It has obovate-lanceolate leaves, pointed at both ends, and a rose-colored fruit. It takes its name from the fact of the leaves being crowded on the summit of the flowering branches in an umbrella-like circle. Revised by CHARLES E. BESSEY.

Um'bria: an ancient division of Italy, extending along the east side of the upper Tiber, and embracing the valleys formed by the smaller watercourses of the Apennines E. to Adriatic. In classical times the Tiber formed the western boundary between Umbria and Etruria, while the eastern border extended along the Adriatic from the Rubicon to the Æsis. The region contained no important towns, but was inhabited by a population devoted to agriculture and grazing, living in small hamlets. The inhabitants were related in race and language to the Sabine and Latin peoples to the south and west. For an account of their language and its relations, see ITALIC LANGUAGES. G. L. HENDERIKSON.

Um'bridae [Mod. Lat., named from *Um'bra*, the typical genus, from Lat. *um'bra*, a kind of fish, liter., shadow]; a family of haplousom fishes, represented in North America and Eastern Europe. In form they resemble the "killifishes" or "minnows" (*Cyprinodontidae*): the body is covered with moderately large scales; the lateral line is obsolete; the head is conic in profile, and covered with moderate scales like those on the body; the eyes are lateral; the opercular normal and unarmored; the mouth is moderate and has a lateral oblique cleft; the upper jaw is formed by the intermaxillaries as well as supramaxillaries; teeth are present on the jaws and palate; branchiostegal rays five or six; the dorsal fin has articulated and branched rays, and is above the ventrals; the anal is smaller and farther back than the dorsal; the ventrals abdominal and with six rays. The intestinal canal has a simple stomach and no pyloric caeca; the air-bladder is simple. The species of the family are from 3 to 5 inches long, and live in fresh and brackish water ponds and the waters in the eastern parts of Europe and many portions of the U. S. The European species is *Umbra croatica*; the American are *Umbra limi* and *Umbra pinnatifida*. The American species live, it may be said, in the mud, and patches of water which appear desolate. They may yield considerable numbers of this kind by being brought up and the bottom stirred up. Revised by F. A. LACOSTE.

Umlaut, oom lowt, or **Mutation** [*umlaut* is Germ., modification or reconstruction of a sound; cf. *unkleiden*, dress anew, *umarbeiten*, retouch, make over, etc.]: a technical term of Teutonic historical grammar denoting in its strictest application the influence exercised upon an accented syllable by the vowel *i* or its consonant *j* (*i*) in a following syllable. The application of the term has been extended to the parallel, though less common, phenomena, resulting from the influence of other vowels than *i*, so that it is possible to speak, e. g., of *i*-umlaut, *o*-umlaut, *u*-umlaut; but in its proper and original significance, and when left unqualified, the term applies to *i*-umlaut. The phenomena of *i*-umlaut belong to the separate life of the different Teutonic languages, and the laws of their occurrence must be stated separately for each branch, e. g. for O. Eng., for O. H. Germ. or M. H. Germ., for O. Norse, etc. In O. Eng. the action of these laws was in the main complete by the beginning of the eighth century A. D., having been in the sixth. Their chief results are the following: (1) *a*(*æ*) > *e*, *settan*: Goth. *satjan*; (2) *ā* > *ē*, *hāl*: Goth. *hails* versus *hālan* < **hālain*: Goth. *hailjan*: cf. Eng. *whole* versus *heal*—so Eng. *one* versus *any*, *lode* versus *lead*; (3) *o* > *y*, *gold* versus *gylden* < **goldin*, cf. Eng. *gild*, also *fox* versus *fixen*, *vizen*: *fore* versus *first*; *foal* versus *filly*, *born* versus *birth*; (4) *ō* > *ē*, *dōm*, judgment, versus *dēman*, to judge: Goth. *dōmjān*: cf. Eng. *doom* versus *deem*—also *goose* versus *geese*, *foot* versus *feet*, *tooth* versus *teeth*, *foad* versus *feed* (Goth. *fōdjan*), *book* versus *beech*, *blood* versus *bleed*, etc.; (5) *u* > *y*, *full* versus *fyllan* < **fullian*: Goth. *fulljan*: cf. Eng. *inch*, from Lat. *uncia*: *dung* versus *dingy*, *stunt* versus *stint*, *won* versus *winsome*; (6) *ū* > *y*, *cū*, cow versus *cj*, kine; cf. Eng. *mouse* versus *mice*, *louse* versus *lice*; (7) *ea* > *y* (*ie*, *i*), *eald*, old versus *ieldra*, elder; cf. Eng. *old* versus *elder*; (8) *ēa* > *y* (*ie*), *cēap* versus *cjpan* (*cēpan*); cf. Eng. *cheap* versus *keep*; (9) *eo*, *ēo* > *y*, *y* (*ie*, *ie*), *weorc*, work versus *uiercan*, to work. Similar results of umlaut in German are *gast* versus *gäste*, *lanum* versus *lāmmer*, *kraut* versus *krāuter*, *trost* versus *trōsten*, etc. The phenomena of umlaut do not differ in their essential character from the various forms of assimilation between syllables, which appear in other languages and elsewhere in Teutonic, receiving various names, as epenthesis, fracture (*Brechung*), vowel-assimilation, vowel-harmony, etc. See ABLAUT.

BENJ. IDE WHEELER.

Umnak, oom-naakh': one of the Aleutian islands, Alaska, the westernmost of the Fox islands group; in about lat. 53° N., lon. 168° 30' W.; 65 miles long and 10 miles broad at its broadest part; lying N. E. and S. W., and separated from Unalashka by the narrow Umnak Pass (5 miles wide). It is mountainous and bare, and the climate, though mild, is too cool for ordinary crops, except potatoes. The population is Aleut, very small, and mostly centered in the little village of Nikolski, of less than 300 inhabitants, on the west coast. The chief industries are fishing and sealing. The island has a ridge of mountains along its axis, culminating with the volcano of Vsevidoff, said to be 8,000 feet high, and which, though not active, occasionally smokes. Other volcanic peaks of the island are sometimes active, and in 1817 one of the northern peaks emitted such clouds of ashes as to cover the island several inches thick. The small volcanic island of Bogosloff, which appeared in 1796, is just N. and connected with Umnak by a reef. Many hot springs are known to exist on the island. In a small valley inland there are several, all boiling; one is said to rise and fall a distance of 2 feet four times an hour. Near Deep Bay, at the northeastern end, are several with temperatures ranging from lukewarm to boiling. Lignite, fossil-wood, and fire-clay have been noted on Umnak. The first recorded visit to the island was that of a Russian skipper named Nikiforoff in 1757.

MARK W. HARRINGTON.

Umritsir: another spelling of AMRITSIR (*q. v.*).

Unadilla: village; Otsego co., N. Y.; on the Susquehanna river, and the Del. and Hudson Railroad; 44 miles E. of Binghamton, and 95 miles S. W. of Albany (for location, see map of New York, ref. 5-H). It has a milk-condensing establishment, foundry, machine-shop, wagon-factory, four churches, high school, academy, a private bank, and a weekly newspaper. Pop. (1880) 922; (1890) 1,157; (1895) estimated, 1,500.

EDITOR OF "TIMES."

Unalashka, oon-ā-lāsh'kāā: an Alaskan island, middle one of the Fox islands, and second largest of the Aleutian chain; lying between the parallels 53° and 54° N. and the meridians 166° and 168° W.; about 75 miles long, 25 broad in its broadest part, mallet-shaped, mountainous, bare, and

treeless. The great Captain's Bay at the northern end is a common naval rendezvous. Population small, aggregated in a few small villages, of which by far the largest is Unalashka town (native *Iliuliuk*), near the head of Captain's Bay, and containing 307 inhabitants in 1890, mostly Aleuts, a few Russians and Americans. The only industries are fishing and sealing. The climate, though moderate, is too cool for the ordinary crops, except potatoes. The thermometer very rarely falls below zero at Iliuliuk, and very rarely passes 80 in summer. The grasses are very juicy and luxuriant. The mountains are volcanic, and Makushin, in the northwestern part of the island, 5,961 feet high, constantly smokes, and is occasionally in active eruption. Earthquakes in its vicinity are not rare. Metallic copper has been reported from Unalashka. The land fauna is poor in species and numbers. The black and silver foxes of the island, formerly much prized, are exterminated. Unalashka is one of the most important points in Alaska. Cave explorations show that the early inhabitants had developed a relatively considerable art, and tradition attributes to them unusual skill in whaling. Soloiroff and Glotoff, Russian adventurers, wintered there with a party in 1765-66, and then began a series of cruelties on the Aleuts which soon reduced them to a condition of helpless subserviency to Russian masters. In 1824 the cloud was lifted in part by the appearance of Father Veniaminoff, a noble and devoted missionary, the apostle of the Aleuts, who devoted himself to their well-being and education. Unalashka has been often visited by explorers and whalers, was long an administrative center, and is, after the Pribilof islands, the most important place W. of Kadiak.

MARK W. HARRINGTON.

Unau: the two-toed South American sloth (*q. v.*).

Uncas: an Indian sachem; b. in the Pequot settlement, Connecticut, about 1600. Originally a war-chief of the Pequods, he revolted against Sassacus, the sachem, in 1634; made friends with the whites, and became chief of the Mohegans. In 1637 he joined Mason's expedition against the Pequods, and was rewarded with some of their lands; made several treaties with the settlers in Massachusetts and Connecticut, and in 1643 joined them in a war against Miantonomo, the Narragansett sachem. In 1657 he was besieged in his stronghold on Connecticut river by the Narragansetts, but when on the point of starvation was relieved by Ensign Thomas Leffingwell, to whom it is said that he granted the land upon which Norwich now stands, although he subsequently sold it to others. Many complaints were made against him by other Indians, and in 1654 he was warned by the commissioners of the united colonies that he would not be protected in any unlawful, treacherous, or outrageous course. He was always on good terms with the whites. D. in 1683. See Stone, *Uncas and Miantonomo* (New York, 1842).

Uncial Letters [transl. of Late Lat. *lit'leræ uncia'les*, liter., inch letters, i. e. letters of considerable size; *uncial* is from Late Lat. *uncia'lis*, liter., of or pertaining to an inch, deriv. of *un'cia*, a twelfth part, ounce, inch]: a name used in palæography for the rounder characters which took the place of capitals in the manuscripts of the early Middle Ages. The angular capitals of the inscriptions could not be written with ease and speed on papyrus or parchment; and already in the first century A. D., in the Herculanean rolls and the wall-scratches and waxed tablets of Pompeii, the germs of a rounder script may be seen. By the fourth century this style was fully developed, and till the eighth the uncial was the prevailing hand of books. The letters which especially show the change are *a, d, e, h, m* (which then took on the forms so familiar in our small letters), and, in less degree, *g, q, t, u*. The name *uncial* is borrowed from St. Jerome, who censures the luxury of books written "*uncialibus ut vulgo aiunt litteris*"; though there is every reason to believe that he meant large letters in general. A style of writing, common from the fifth century, in which forms derived from the cursive hand of documents are mixed with uncials, is often known as half-uncial or semi-uncial.

The development of Greek handwriting was similar to that of Latin; and the name *uncial*, borrowed from Latin palæography, is applied also to the rounded Greek capitals which, appearing as early as the third century B. C., remained the current book-hand till the ninth century A. D. For specimens of Greek uncials, see under CODEX ALEXANDRINUS.

GEORGE L. BURR.

Unconscious States: states of mind considered as still mental when they are not present in consciousness or thought, as, for example, our memories when we have no occasion to

call them consciously to mind. The psychologists have found it a difficult question to decide whether such supposed modifications of mind have any right to be called mental at all when there is no trace of their actual presence in consciousness. The school of Herbart—a great German psychologist and philosopher—hold that nothing that the mind has once experienced can ever be entirely lost to it; but each such experience preserves its identity as a presentation or mental picture, although it becomes unconscious. The memory then of a thing or event once experienced is its literal recall from the sphere of the unconscious where it has been lying since its last appearance in consciousness. To this view the name "pigeon-hole theory" has been given, especially to the view that memories are stored away somewhere in the soul, of which the Herbartian theory is a refinement. In opposition to it many psychologists hold what is known as the "functional" theory, according to which the memories which at any time we are not thinking about at all, those which are not in consciousness however dimly, simply do not exist. The reappearance of a memory in consciousness is a new exhibition of the function involved in its original appearance. It is a new creation. It has not persisted since its earlier appearance. The only thing that has persisted is a tendency to have the same functional reinstatement again; and this tendency may be largely accounted for as an easier—because more habitual—stirring up of the brain processes which occur with this particular memory. Many striking facts have been discovered showing what the mind may do in apparent unconsciousness; but they seem all to be capable of explanation on the functional theory. See the *Psychologies* cited in the article PSYCHOLOGY, especially the works of James, Brentano, and Baldwin.

J. MARK BALDWIN.

Uction, Extreme: See EXTREME UCTION.

Underground Railways: railway lines built below the level of the streets of a city, partly in tunnels. The underground railways of London were begun in 1860, and in 1884 the inner circle, connecting the principal railway termini on the north side of the Thames, was completed; this is 13 miles long, with four tracks and twenty-seven stations. The Metropolitan District Railway forms an outer circle, with extensions leading to the suburbs. In these railways the cost of construction was extremely high, owing largely to the difficulties of tunneling and excavating without disturbing the foundations of buildings; it ranged from \$1,800,000 to \$2,500,000 per mile. The number of passengers carried on the inner circle is about 90,000,000 per year. The motive power is mainly steam, the exhaust steam and smoke being condensed in water-tanks during the passage through the tunnels. The City and South London line, opened in 1890, uses a system of electric traction; this is 3½ miles long, and runs under the Thames. Underground railways, to be operated by electricity, are proposed or under construction in Berlin, Paris, and other large cities.

The railway lines entering New York have an underground way along Fourth Avenue above Forty-second Street; the length of this is 4½ miles, and it was constructed in 1874 at a cost of \$6,400,000. Many projects for an underground line on Broadway have been worked out, and in 1871 a pneumatic road one block in length was constructed by way of trial. The difficulties of such construction are, however, surmountable only at very great expense, in consequence of the large number of sewer, water, steam, and gas pipes beneath the surface. An estimate made in 1894 gives the cost of the 2.85 miles S. of Fourteenth Street as \$12,150,000.

An underground belt-line in Baltimore, 7 miles long, was completed in 1892; it has four tunnels, the principal one being 8,350 feet in length. This was built to enable the Baltimore and Ohio Railroad to reach the central part of the city. Its cost was about \$1,000,000 per mile. See TUNNELS AND TUNNELING.

MASSFIELD MERRIMAN.

Underhill, JONAS: colonist; b. in Warwickshire, England, 1597; went to America with Winthrop in 1630; was a representative in the general court from Boston, and in 1637 was associated with Capt. Mason in command of the colony troops in the Pequot war. Banished from Boston on account of his religious opinions, he went to England, where in 1638 he published an account of the Pequot war in a work entitled *News from America*. Returning to America, he was in 1641 governor of Exeter and Dover (N. H.); removed to Stamford, Conn., and in 1646 to Plushing, L. I., and held a command in the war between the Dutch and the

Indians. In 1665 he was a delegate from Oyster Bay to the assembly at Hempstead, and in 1667 the Mantinence Indians gave him a tract of 150 acres of land on Long Island, which is still held by his descendants. D. at Oyster Bay, L. I., 1672.

Revised by F. M. COLBY.

Under-lease: See LANDLORD AND TENANT.

Understanding: the mental function of knowledge or intellect as contrasted with feeling and will. (See KNOWLEDGE.) The use of the word in this more general sense, which is in near accord with the popular use of it, is in contrast to its earlier philosophical meaning. The older view of the understanding considered it a higher faculty for the apprehension of the ideas. It was thus a kind of higher endowment for taking in abstract *a priori* truths, such as the ideas of God, immortality, freedom, etc., which come as a kind of revelation to this faculty without the admixture of error, the tentative formulations, etc., which necessarily belong to all the knowledge which rests upon experience. The current meaning given to the word in psychology is based upon the denial of the existence of any special human faculty for the apprehension of the abstract or universal. According to it all mental activity is alike in its nature and function. Abstract notions are due simply to the further exercise of the same function that gives the perception of concrete things. All knowledge is both abstract and concrete, both singular and universal; and all knowledge is dependent upon experience in exactly the same sense. So the word knowledge when properly defined covers the whole case; and other words, such as understanding, if used at all, simply become alternative or synonymous terms. J. M. B.

Underwood, LUCIEN MARCUS, Ph. D.; botanist; b. at New Woodstock, N. Y., Oct. 26, 1853; educated at Cazenovia Seminary and Syracuse University; Professor of Geology and Botany in Illinois Wesleyan University 1880-83; Professor of Biology in Syracuse University 1883-91; became Professor of Botany in De Pauw University 1891. He has published *Our Native Ferns and How to Study Them* (1881), revised as *Our Native Ferns and their Allies* (1882; 4th ed. 1893); *Descriptive Catalogue of North American Hepaticæ* (1884); *Hepaticæ* in the sixth edition of *Gray's Manual of Botany* (1890); besides many papers on similar subjects in the botanical journals. He prepared *An Illustrative Century of Fungi*, 100 specimens (1889), and *Hepaticæ Americanae*, 160 specimens (1887-93). C. E. B.

Undulatory Theory of Light: See LIGHT.

Unger, FRANZ: botanist; b. near Leutschach, Styria, Nov. 30, 1800; studied medicine at Prague and Vienna; practiced as a physician, but in 1836 was appointed Professor of Botany and director of the botanical garden at Gratz; removed in 1850 to Vienna; undertook extensive scientific journeys in Denmark, Sweden, and Norway, subsequently in Egypt and Syria. His principal works are *Anatomie und Physiologie der Pflanzen* (1855); *Versuch einer Geschichte der Pflanzenwelt* (1852); *Botanische Streifzüge auf dem Gebiete der Kulturgeschichte* (1857); *Genera et Species Plantarum Fossilium* (1850); *Iconographia Plantarum Fossilium* (1852); *Sylloge Plantarum Fossilium* (1860); *Die Fossile Flora von Sotzka* (1850); *Die Fossile Flora von Kumi in Eubœa* (1867). D. near Gratz, Feb. 13, 1870.

Revised by CHARLES E. BISSSEY.

Unger, JOSEPH: statesman and jurist; b. in Vienna, Austria, July 2, 1828; studied law in Vienna 1846-50; held a position in the university library at Vienna 1850-53; taught as privat doцент in 1853, in which year he was made Professor of Jurisprudence in the university at Prague, and in 1857 he was installed as Professor of Jurisprudence in the University of Vienna. Here he entered in the discussion of the political questions of the day, and in connection with the revival of the constitutional régime in Austria he published *Zur Lösung der ungarischen Frage*, in which he espoused the cause of the liberals. He was successively a member of the Landtag, Reichsrath, and cabinet, but retired from the cabinet in Feb., 1879, upon the reorganization of the ministry. In 1884 he was made president of the Supreme Court. As a jurist he has been most celebrated for his work in systematizing the laws of Austria, and his greatest works are *System des österreichischen allgemeinen Privatrechts* (L. I. 1829, 1856-59) and *Das österreichische Erbrecht* (L. I. 1842, 1864). Besides these he has written many other works, including *Die*

liche Natur der Inhaberpapiere (Leipzig, 1857); *Revidirter Entwurf eines bürgerlichen Gesetzbuchs für das Königreich Sachsen* (Leipzig, 1861); and (with Joseph Glaser) *Sammlung von civilrechtlichen Entscheidungen des obersten Gerichtshofs in Wien* (Vienna, 1859-85). F. STURGES ALLEN.

Un'gula [Mod. Lat., from Lat. *un'gula*, dimin. of *unguis*, nail, claw, talon, hoof. So called from its being like a horse's hoof in shape]: a segment of a volume. An ungula of a cone or cylinder is a portion of the cone or cylinder included between the base and an oblique plane intersecting the base. A spherical ungula is a portion of a sphere bounded by two semicircles meeting in a common diameter.

Ungula'ta [Mod. Lat., from Lat. *un'gula*, hoof]: a name applied in various senses to placental mammals having digits terminated by hoofs.

I. By Linnaeus the name was employed for all the hoofed mammals in contradistinction to the clawed and mutilate (finned) mammals. These, again, were differentiated into two orders—(1) *Pecora*, including all the ruminating forms, and (2) *Bellua*, embracing the equine and hippopotamine forms; *Rhinoceros* was referred to the *Glires* (rodents), and *Elephas* to the *Bruta* (chiefly edentates).

II. The errors of Linnaeus in his references of the genera *Rhinoceros* and *Elephas* were corrected by his successors, and all the true ungulate mammals were combined under the name *Ungulata* or hoofed quadrupeds.

III. By Cuvier (1817, etc.) the ungulate mammals were differentiated into two orders—(1) "les Pachydermes," equivalent to the *Bellua* of Linnaeus after the inclusion of *Rhinoceros* and *Elephas*, and (2) "les Ruminants," identical with the *Pecora* of Linnaeus. This classification for a long time prevailed, and was the one found in most of the popular works on natural history still longer.

IV. By de Blainville (in 1816) the group, under the name "les Unguligrades," was restricted to the ordinary hoofed quadrupeds, the elephants being isolated as the representatives of a distinct order named "les Gravigrades." The Unguligrades were in turn differentiated into two groups—(1) those with unpaired digits, embracing the normal pachyderms and equines, and (2) those with paired digits, including the snilline forms as well as the ruminants. The manatee was added, erroneously, as an anomalous form of the order. These modifications, except the last, constituted a very decided advance in classification. They, however, attracted but little attention till Owen (in 1840, etc.) revived the same views, and adopted the groups in question under other names. Accepting the division of ungulates as a natural whole, he divided it into three subordinate ones—(1) *Isodactyle* or *Artiodactyla*, answering to the paired-toed Unguligrades of de Blainville; (2) *Anisodactyle* or *Perissodactyla*, equivalent to the odd-toed Unguligrades of de Blainville; and (3) *Proboscidea*, identical with the Gravigrades of de Blainville. These three divisions were finally raised to ordinal rank by Owen.

V. By Huxley and later writers the living ungulate mammals have been mostly distinguished into three orders, characterized by placental as well as skeletal features. (1) The name *Ungulata* has been reserved for the bulk of the species, which have again been divided into the sub-orders *Perissodactyla* and *Artiodactyla*; (2) the term *Hyracoidea* has been introduced as an ordinal term by Huxley to cover a form (*Hyrax*) which had been confounded with the perissodactyle ungulates and approximated to the *Rhinoceros* by Cuvier and others; (3) the group *Proboscidea* has been accepted as another order.

VI. In addition to the recent forms of ungulate mammals, there are several extinct types which are also by some authors regarded as the representatives of other orders; such are the *Torodontia* of South America, the *Dinocerata* of North America, etc.

The order *Ungulata*, in the sense now generally used, is characterized as follows: The teeth are, archetypically, in full number (44), but often a number are suppressed; the molars have generally grinding surfaces, and are two- or three-rooted; the canines are very diversiform, generally rudimentary or wanting, sometimes (as in *Tragulidae*, *Suidae*, etc.) extremely developed; the incisors are, typically, six in each jaw, but often wanting entirely in the upper, and are implanted by simple roots and have incisorial crowns; the legs at their proximal joints (humerus and femur) are more or less inclosed in the common abdominal integument (least in the camels); the feet are upraised, and their palmar and plantar surfaces are invested in a hairy skin undistinguish-

able from the rest of the integument; the carpal bones are in two interlocking rows; the cuneiform narrow, and affording a diminished surface of attachment forward for the ulna (which is retrorse beside the radius); the unciform and lunar articulating with each other, and interposed between the cuneiform and magnum; the hind foot has the astragalus at its anterior portion scarcely deflected inward, and articulating more or less with the cuboid as well as navicular; the scaphoid and lunar are separate; the toes of all the feet are never more than four in number, and the terminal joints are invested in thick nails or "hoofs"; the brain is well developed, and the cerebrum covers more or less of the olfactory lobes and cerebellum; the placenta is non-deciduate; the rectal and generative apertures are well separated; the testes more or less exposed. The order thus defined embraces about 250 living species. The existing forms are grouped under two sub-orders and fourteen families, viz.: (1) *Artiodactyla*, with the families (1) *Camelidae*, (2) *Giraffidae*, (3) *Saigiidae*, (4) *Bovidae*, (5) *Antilocapridae*, (6) *Cervidae*, (7) *Tragulidae*, all of which are ruminants, and (8) *Phacochoeridae*, (9) *Suidae*, (10) *Dicotylidae*, and (11) *Hippopotamidae*, which are non-ruminants; and (11) *Perissodactyla*, with the families (12) *Equidae*, (13) *Rhinocerotidae*, and (14) *Tapiridae*. Of these, the second, third, seventh, eighth, ninth, eleventh, twelfth, and thirteenth are now peculiar to the Old World, and the fifth and tenth to the New World; but in ancient times the case was very different, the *Rhinocerotidae* and *Equidae* having abounded in North America in the Miocene epoch. A large number of extinct forms are now known which connect together types that are at present far removed. Among the most notable are the *Anoplotheriidae*, *Oreodontidae*, and *Hypoplatamidae*, which bridged the existing chasm between the ruminant and non-ruminant ungulates. These had fully developed upper incisors, combined with the characteristic double lunate-ridged molar teeth of the living ruminants, and thus on the one hand were related to the typical ruminants, and especially the *Tragulidae*, and on the other to the omnivorous artiodactyles, and perhaps most to the peccaries. Also to be noticed in this connection are *Orobippidae* and *Anchitheriidae*, as well as *Hipparion*, which form a series with the *Palaotheriidae*, and demonstrate the relation between the *Rhinocerotidae* and *Equidae* of the present epoch. The order was represented by typical examples as early as the beginning of the Eocene period, and undoubtedly very long before, although no remains of an earlier date have been yet discovered. Over twenty families, now entirely extinct, are known from their fossil remains. The order has therefore played a very important part in the earth's past history, and the extinct types already known outnumber the recent. Why certain of the forms formerly existent in America, but later confined to Africa and Asia, became extinct in the former, can scarcely be surmised, as when reintroduced (as have been the horse and hog) they multiply and flourish as much as in their native lands. The order is also noteworthy as furnishing by far the largest portion of the meat-food which man uses, as also the beasts of burden which he employs. Almost all the species—and, above all, the ruminants—are hunted or kept for the meat they yield, and even the perissodactyles—horse, rhinoceros, and especially tapir—are esteemed as food by some peoples. Beasts of draught and labor are obtained chiefly from the *Equidae* (horse and ass, etc.), the *Bovidae* (ox, buffalo, etc.), and *Cervidae* (reindeer). Their contributions in other ways are manifold; the most noteworthy are milk, hides, glue, etc. See the names of the different sub-orders and families, as well as the domesticated animals, and especially the article HORSE.

Revised by F. A. LUCAS.

Uniaxial Mica: See BIOTITE.

Unicorn [Lat. *ūnus*, one + *cornu*, horn]: described by various writers, from Ctesias, Aristotle, and Pliny down, as a horse-like creature with a straight horn in the middle of the forehead. Its figure occurs as a heraldic charge. The word *veem* in the Hebrew Bible, translated "unicorn" in the English version, denotes some horned creature, perhaps the buffalo.

Uniformity of Nature: the principle that there are no breaks in the operation of natural law. The principle has two great applications: (1) It underlies the formulation of all the so-called laws of nature, since the possibility of arguing from one or more observed facts in nature to other facts of the same kind which are not observed must rest upon the presumption that the sequences of events in nature are stable and regular. If a certain combination of

chemical elements takes place to-day under certain conditions, the chemist expects the same combination to take place under the same conditions to-morrow. And it does. So, on the basis of this uniformity, he announces the discovery as a fact which any other chemist can confirm.

(2) The second application of the principle is made in philosophy. It consists in the demand that uniformity shall be given due criticism, and its meaning in the world as a whole made out. This demand has led to various views, i. e. that uniformity is itself a hypothesis respecting nature, resting upon the experience that nature repeats her events; again, that uniformity is an inborn regulative principle of the human mind. The construing of uniformity, however, has been largely confined to external nature, mind and its events being held to present in free will a phenomenon which violates it. As to the merits of this position, see WILL. The rise of the evolution hypothesis has broken this tradition; the mind is treated as a natural thing and the science of its movements as involving the presuppositions of the natural sciences.

J. MARK BALDWIN.

Unigen'itus Bull [so called from its first word being Lat. *unigenitus*, only begotten]; a bull issued in 1713 by Pope Innocent VI. against 101 propositions contained in the *Reflexiones morales* of Pasquier Quesnel (1634-1719). This book had been proscribed by the pope in 1708, but the parliament objected to the prohibition of French books by any other authority than their own. But the king and the great majority of the French bishops were anxious for the pope to pronounce sentence on the subject. Of the 101 propositions condemned by the bull 43 concern grace, 28 treat of the theological virtues, and 30 deal with the Church, her discipline and sacraments. One of the propositions was condemned for holding that all love, except the supernatural love of God, is evil; another, that every prayer made by a sinner is sinful; another, that sinners should not hear Mass at all. No note was assigned to each proposition. Some are evidently not heretical, while others, if examined apart from the spirit which prompted them and the context in which they are found, are capable of a good sense. They have notes affixed only *in globo*, some as heretical, some as ill sounding, scandalous, etc. See A. Schill, *Die Constitution Unigenitus* (Freiburg in Breisgau, 1876). J. J. K.

Unimak, oon-i-maa'k; the easternmost and largest of the Aleutian islands; lying between 51 and 55 N. lat. and 161° and 165° W. lon.; nearly rectangular; about 50 miles long by 20 broad; separated from the Peninsula of Alaska by an impassable strait or lagoon called Isanotski or False Pass, which is said to be shoaling. The island is mountainous, rocky, treeless, and is less known and visited than the other large islands. Population, Aleut, very sparse; climate mild, but not favorable to ordinary crops because of the cool summer. Volcanic phenomena are very common, and Shishaldin, the best-known volcano, 8,955 feet high, is generally smoking and often emits flames. Sulphur is found in crevices on Shishaldin, and is reported in large fields near Programnoi village, at the western angle. MARK W. HARRINGTON.

Uninhabited Islands: See BONIN ISLANDS.

Union: town; Knox co., Me.; on the George's Valley Railroad; 13 miles N. W. of Rockland (for location, see map of Maine, ref. 9-10). It was settled in 1774 as Taylor Town, organized as the plantation of Sterlington in 1786, and incorporated under its present name the same year, and had part of its territory set off as the town of Washington in 1811. It contains the villages of Union, North Union, South Union, and East Union; has 2 churches, high school, 2 libraries, a weekly newspaper, and manufactories of carriages, furniture, organs, mowing-machines, and stoves; and is in an agricultural region. Pop. (1880) 1,548; (1890) 1,436.

Union Christian College: a coeducational institution at Merom, Ind., founded in 1859 by the denomination called Christians. It has a good working endowment, commodious buildings, and beautiful grounds. It offers thorough instruction in the classics, sciences, the Bible, pedagogy, music, business, and fine arts. The enrollment is steadily increasing from year to year. President, Rev. L. J. Aldrich, D. D.

Union City: city; Randolph co., Ind.; on the Cleve., Cin., Chi. and St. L. and the Pitts., Cin., Chi. and St. L. railways; 30 miles W. by N. of Piqua, and 84 miles N. E. of Indianapolis (for location, see map of Indiana, ref. 5-6). It is in a region abounding in walnut, oak, ash, hickory, and

other valuable woods; and has a public high school, 2 State banks with combined capital of \$180,000, a daily and 2 weekly newspapers, improved water-works, and several flour-mills and other manufactories. Pop. (1880) 2,475; (1890) 2,681.

Union City: village; Branch co., Mich.; on the St. Joseph river, and the Mich. Cent. Railroad; 11 miles N. W. of Coldwater, and 41 miles W. S. W. of Jackson (for location, see map of Michigan, ref. 8-1). It is the trade-center of a large agricultural region, and has a variety of manufactories; there are 2 national banks, capital \$100,000, and 2 weekly newspapers. Pop. (1880) 1,280; (1890) 1,156; (1894) 1,293.

Union City: borough; Erie co., Pa.; on the Erie, the Penn., and the W. N. Y. and Penn. railways; 26 miles S. E. of Erie (for location, see map of Pennsylvania, ref. 1 A). It is in an agricultural region; has 6 churches, a public high school, business college, co-operative trust company, gravity and Holly system of water-works, electric lights, and a weekly newspaper; and contains an oil-refinery, tannery, several flour-mills, and manufactories of barrels, carriages, furniture, pumps, and cabinet ware. Pop. (1880) 2,171; (1890) 2,261. EDITOR OF "TIMES."

Union City: town; capital of Obion co., Tenn.; on the Mobile and O. and the Nash., Chat. and St. L. railways; 151 miles W. by N. of Nashville, and 204 miles S. by E. of St. Louis (for location, see map of Tennessee, ref. 6-B). It is in an agricultural and stock-raising region, and has 6 churches for white people and 4 for colored, a public school for white children and one for colored, a training-school, 2 hotels, union railway station, electric lights, canning-works, 2 planing-mills, saw-mill, furniture, duck, spoke, and ice factories, a national bank with capital of \$50,000, a State bank with capital of \$50,000, and 2 weekly newspapers. Pop. (1880) 1,879; (1890) 3,441, with 500 in suburbs. EDITOR OF "DEMOCRAT."

Union College: an institution of learning at Schenectady, N. Y.; incorporated in 1795. It owes its name to the fact that it was founded by a union of several Christian denominations. In 1779 some 500 citizens of Northern and Eastern New York petitioned the Governor and Legislature for the establishment of a college in the city of Schenectady to be named after the first Governor, Clinton. The petition was denied, but in 1785 an academy was incorporated in Schenectady, and on Feb. 25, 1795, this academy became Union College, the charter of the college being the first one granted by the newly constituted board of regents of the State of New York. The first class, numbering three students, matriculated Oct. 19, 1795, when the Rev. John Blair Smith, D. D., assumed the office of president. Dr. Smith resigned in 1799, and was succeeded by Jonathan Edwards the younger, who died in 1801, and was followed by Rev. Jonathan Macey, D. D. In 1804 the Rev. Eliphalet Nott, then pastor of the First Presbyterian church at Albany, was elected president, and held the office until his death, in 1866, this being the longest presidential term in the history of colleges in the U. S. During Dr. Nott's presidency the college became one of the foremost educational institutions of the country. Many of the greatest scholars and educators were members of its faculty, among them Francis Wayland, afterward president of Brown University, Alonzo Potter, afterward Bishop of Pennsylvania, Taylor Lewis, Isaac W. Jackson, and William M. Gillespie. The number of students increased steadily until the outbreak of the civil war, when the college suffered greatly from the withdrawal of the large number of Southern students, and from the enlistment of a company of Northern undergraduates, who marched to the front under the command of the Professor of Modern Languages, Elias Peissner. Col. Peissner was killed at Chancellorsville; many of the students never returned from the war, and few returned to the college to graduate. Upon the death of Dr. Nott, Dr. Laurens P. Hickok, who had been vice-president for fourteen years, was elected president and served for two years. In 1869 he was succeeded by the Rev. Dr. Charles A. Aiken, and on his resignation, in 1871, the Rev. Dr. Eliphalet Nott Potter, son of Bishop Alonzo Potter and grandson of President Nott, became president. Under his administration the college made substantial progress. Endowments were increased, new buildings erected, the educational facilities enlarged, and the college advanced in numbers. In 1884 Dr. Potter resigned, and for four years James E. Johnson S. Landou was president *ad interim*. In 1888 Harrison E. Webster, LL. D., was elected president, and was followed in 1894 by the Rev. Dr. Andrew V. A. RAY.

1873 the Albany Law School, the Albany Medical College, and the Dudley Observatory were united with Union College to form Union University. In 1881 the Albany College of Pharmacy was established and incorporated as a department of the University. Union College was the first non-sectarian college in the U. S.; it was the first to introduce the study of the modern languages, the first to add a scientific course to the time-honored classical course; the first to recognize the importance of technical training, organizing a school of civil engineering in 1845. It also originated the fraternity system, and the oldest of the Greek-letter societies were founded here. It offers to students a choice of courses leading to the degrees of Bachelor of Arts, Bachelor of Philosophy, Bachelor of Science, and Bachelor of Engineering. A department of electrical engineering is now organizing, in co-operation with the General Electric Company, whose great shops are located at Schenectady. The faculty consists of twenty-eight members besides twelve regular and many occasional lecturers, and the students number (1894-95) 275. B. H. RIPTOX.

Union'idæ [Mod. Lat., named from *Unio*, the typical genus, from Lat. *unio*, a single large pearl, liter. oneness, unity. See OXTOX]: a group of bivalve (Lamellibranch) molluscs containing the so-called fresh-water clams and mussels, especially well developed in the U. S., where innumerable so-called species have been described. Each animal has a large foot, a short anal siphon, the branchial siphon present or absent. The shell is equivalve, closed by two adductor muscles. The hinge varies considerably, and the shell is internally nacreous. The fresh-water mussels are unfit for food, and their sole value lies in the pearly character of the shells, for they occasionally produce pearls of value. In Ohio, New Jersey, Wisconsin, and elsewhere in the U. S. many pearls have been found in such mussels, including some valued as high as \$2,000. Pearl-fishery was maintained for many years in Scotland, and pearls valued at £10,000 were obtained in the Tay in 1761-64. The industry is also carried on in Germany and China. The chief literature on the American species is Lea's *Synopsis of the Naiads* (1870) and his *Observations on the Genus Unio* (13 vols., 1827-73). The embryology has been studied by Rabl, *Jenaische Zeitschrift f. Naturwiss.*, vol. x. (1876), and Lillie, *Jour. Morphol.*, vol. x. (1895). J. S. KINGSLEY.

Union, La. laa-oon-yōn': seaport; in the southeastern part of Salvador, Central America; capital of a department of the same name; on an arm of the Gulf of Fonseca, called the Bay of La Union (see map of Central America, ref. 6-G). Most of the commerce of the eastern part of the republic centers here, and until recently it was the most important seaport of Salvador. The harbor is good, but the town is somewhat insalubrious. Pop. about 2,500. H. H. S.

Union Springs: town; capital of Bullock co., Ala.; on the Cent. Railroad of Ga.; 40 miles E. S. E. of Montgomery, and 55 miles W. S. W. of Columbus, Ga. (for location, see map of Alabama, ref. 5-E). It is an agricultural and fruit-growing region, and has a college for women, a male and female institute, an academy for males, several cotton-mills, 2 cottonseed-oil mills, 2 grist-mills, 3 gineries, canning and spoke and handle factories, a State bank with capital of \$70,000, an incorporated bank with capital of \$52,000, and a weekly newspaper. Pop. (1880) 1,862; (1890) 2,049; (1895) 2,349.

EDITOR OF "HERALD."

Union Theological Seminary in the City of New York: the corporate name of an institution for the training of students for the Christian ministry; at 700 Park avenue. According to the preamble to the constitution, it was the "design of the founders to provide a theological seminary in the midst of the greatest and most growing community in America, around which all men of moderate views and feelings, who desire to live free from party strife, and to stand aloof from all extremes of doctrinal speculation, practical radicalism, and ecclesiastical domination, may cordially and affectionately rally." The first board of directors was elected on Jan. 11, 1836; instruction began on Dec. 5, 1836, in the houses of the professors, and after Dec. 12, 1838, in the first home of the seminary at 9 University Place, where it remained till Sept., 1884, when it was removed to its present quarters. The seminary was incorporated by act of the New York Legislature on Mar. 27, 1839. Its board of directors is a self-perpetuating body. The charter specifies that "the government of the seminary shall at all times be vested in a board of directors," consisting of fourteen ministers and fourteen laymen, and that

"equal privileges of admission and instruction, with all the advantages of the institution, shall be allowed to students of every denomination of Christians." No denominational name appears in the charter. Although not under ecclesiastical control, it is a Presbyterian institution, and for some thirty years stood in intimate relations with the New School branch of the Presbyterian Church in the United States of America. During that period several of its professors were moderators of the General Assembly of the Church. After the reunion of the Old and New School branches of the Church in 1870, it granted to the General Assembly a veto power upon the appointment of its professors; but in 1892, in consequence of a difference touching the terms and scope of this veto, and on the ground that it had violated its charter and constitution in conceding such a power, the seminary terminated the agreement of 1870. By the provisions of the constitution it is required that the president of the faculty and the professors of systematic and practical theology shall be ordained ministers, and the adoption of the Westminster Confession of Faith is required of all members of the faculty and directory. In 1894-95 the curriculum was broadened by the introduction of optional and elective courses, and by the extension of the "seminar" method of instruction to an increased number of subjects. There are seven endowed professorships. Connected with the seminary are also three lecturerships: The Ely foundation, on *The Evidences of Christianity*; the Morse, on *The Relations of the Bible to the Sciences*; and the Willard Parker, for hygienic instruction. There are also endowed instructorships in vocal culture and music. The scholastic year extends from about Oct. 1 till the middle of May, divided into two terms by the holiday recess. The library contained in May, 1895, about 70,000 volumes, 28,000 pamphlets, and 186 manuscripts. Relations exist with Columbia College and the University of the City of New York, by which the students of the seminary are allowed post-graduate privileges in both these institutions, while members of the colleges may take part of the seminary course as special students. The whole number of students connected with the seminary from its foundation to the close of the year 1894-95 was 2,784, of whom 1,779 were graduates. The seminary confers no degrees, but grants diplomas to those who have pursued the full course.

Among the notable names of those (now deceased) who have been connected with the corps of instructors are Henry White, Edward Robinson, Thomas Harvey Skinner, Henry Boynton Smith, Roswell Dwight Hitchcock, William Adams, Philip Schaff, and William Greenough Thayer Shedd.

CHARLES R. GILLET.

Uniontown: borough; capital of Fayette co., Pa.; on the national pike and the Balt. and Ohio and the Penn. railways; 40 miles S. E. of Pittsburg (for location, see map of Pennsylvania, ref. 6-B). It is in an agricultural, coking, and iron-mining region; has natural gas, water-works, electric lights, electric street-railway, 2 national banks with combined capital of \$200,000, a State bank with capital of \$50,000, and a daily and 4 weekly newspapers; and contains 12 churches, 2 public-school buildings, stone court-house and jail, 2 glass-works, and steel and structural iron-works. The borough was laid out by Jacob Beeson in 1783, was first known as Beesontown, and was incorporated in 1796. Pop. (1880) 3,265; (1890) 6,359; (1895) estimated, 8,000.

W. F. ULERY.

Unionville: town (founded in 1853); capital of Putnam co., Mo.; on the Chi., Burl. and Kan. City Railway; 44 miles W. S. W. of Bloomfield, Ia., and 140 miles N. of Jefferson City (for location, see map of Missouri, ref. 1-F). It is in an agricultural and coal-mining region, and has 4 churches, 2 public-school buildings, 2 national banks with combined capital of \$100,000, and 3 weekly newspapers. Pop. (1880) 772; (1890) 1,118; (1895) estimated, 1,500.

EDITORS OF "PUTNAM COUNTY LEADER."

Unitarianism [deriv. of *unitary*, as if from Lat. **unitarius*, deriv. of *unitas*, unity, deriv. of *unus*, one]; in theology, the doctrine that God exists in one person only. This involves the denial of the doctrine of the Trinity and the divinity of Jesus Christ. The historical origin of the name is uncertain. Some have traced it to the Transylvanian Unit, a league of toleration between Roman Catholics, Calvinists, and Socinians. Ever since thinking man has been in the world there have been speculations about the Cause of all things—about its nature, or its action, or the mode of its existence. These speculations have always held to

one Being supreme, while they have been put into various forms—polytheism, trinity, or simple and indivisible unity. The tendency, however, in successive ages, has always been to the latter. In the Jewish and Christian systems this has come to be distinctly maintained; for the Trinity, at least while it is conceived of merely and abstractly as a mode of existence, has not been construed to be a denial of the Unity. It is impossible, perhaps, in strict thesis, to decide which of these views is true; for of the mode of the Divine Existence, if we presume to think upon it, we can not undertake to form any judgment; and it is not the business of this statement to argue for one or the other, but only to give an historical account of the latter—i. e. of Christian Unitarianism.

Judaism was undoubtedly unitarian, and it is held that Christianity was at the start. That the first disciples, who had passed one or two years in daily intercourse with their Master, should have thought of him as God, or, if they did, should have failed plainly and pre-eminently to teach this doctrine, is doubtless hard to believe. It is certain that the earliest churches of which we have any definite knowledge upon this point consisted in the mass, or at least in great numbers, of Unitarians. Believers in Christ at the beginning were simply denominated, as at Antioch, Christians, and doubtless continued to bear that common name; but the oldest body of Christians holding a distinctive faith upon the point in question—i. e. the Ebionites—were undoubtedly Unitarians; and the earliest Fathers, Justin Martyr, Tertullian, and Origen, while advocating their "Economy," the initial form of Trinity, evidently wrote in an apologetic strain, as if they felt that there was a great body of opinion against them; and Tertullian at the end of the second century complains of the mass of people—"idiota," he calls them—as obstinately opposed to the Economy. And later, Chrysostom and Athanasius undertake with considerable explanation to show why the apostles did not plainly teach the sublimer doctrine of the Economy or Trinity, the reason being that the people were not prepared to receive it. Gradually, however, the early Fathers, falling in with Platonic speculations, were tending to ideas of a Trinity, but it was not till the fourth or fifth century, as J. H. Newman has shown in his *Development of Christian Doctrine*, that the doctrine of the Trinity was completely formulated and established. And this continued for several centuries—except with the great Arian division, which was essentially unitarian—to be the settled orthodoxy of the Church, till in the sixteenth century Unitarianism was revived by the Socini.

Unitarianism in Europe.—Laelius and Faustus Socinus, uncle and nephew, were Italians of a noble family. It is the more remarkable that they should have been learned men and studious in the Scriptures, and that both should have broken off from the religion of their education and social position to embrace new and unpopular opinions—so unpopular and, indeed, dangerous to them, that they both found it expedient to leave, for their evidently honest convictions, their home and country. Laelius went to Switzerland, where he died in Zurich in 1562, after having gone to Germany and Poland and made visits of some length in those countries. After the death of his uncle Faustus resided in Basel, and spent some time in collecting and arranging the papers which Laelius had left to him, and then went to Transylvania, where, with the aid of the celebrated physician Blandrata, a number of Unitarian churches were formed and established. Thence he removed to Poland, and, marrying into a noble family and becoming settled in life, had leisure for study and wrote theological works, which are to be found in the *Fratres Poloni*. His opinions met with favor among the higher classes, with whom he was associated, and it appeared for a time as if he were likely to escape the usual fate of reformers. But his speculations gave offense to the lower classes; they rose against him, and that which happened to Priestley in Birmingham befell him: a mob broke into his house, tore him from a sick-bed, exposed him in the market-place, ransacked his dwelling, and destroyed his manuscripts; and he died near Cracow in 1604, a martyr to his faith. There is still left, however, in Hungary and Transylvania, a considerable body of Unitarians who inherit his faith, and by their character are doing signal honor to his memory. They have 106 churches, with parishes, numbering 60,000 persons. They have parish schools and schools of theology in which are professors who are discharging their duties with salaries scarcely able to support them.

In the British empire there are about 350 places of worship, of which fully 300 are in Great Britain. In Germany the speculations of many of her eminent theologians and critics have been in the direction of Unitarianism, without any formal separation from the Lutheran Church; while in France only the honored names of the Copernics, father and son, have been distinctly known in connection with it. In England its earliest confessors were men unknown to fame, but remarkable for their virtues—Thomas Firmin, a merchant of London, and well known as a friend of Archbishop Tillotson, and John Biddle, who set up in London the first Unitarian public worship known in England. He was a scholar bred at Oxford, who was able to expound and defend his opinions; who drew upon himself the attention of Parliament and of Cromwell, and of Archbishop Usher to convert him from his heresy; whom courts and judges pursued and hounded through five imprisonments, till on the sixth he died in a dungeon on Sept. 22, 1662, at the age of forty-seven. He was a man whose memory, for his unblemished probity, for his calmness and firmness, and for his cruel fate so bravely met, deserves to be remembered, and would do honor to the lineage of any body of men holding dear their opinions and their history.

Indeed, it is by a lineage of remarkable men that English Unitarianism has been most distinguished—in which are the names of Milton, Locke, and Sir Isaac Newton, William Penn, and Sir William Jones; and of authors such as Nathaniel Lardner, William Roseoe, Samuel Rogers, Charles Lamb, Priestley, Joseph Blanco White and his biographer, J. H. Thom, and James Martineau. The earlier of these were Arians in their Christology, the later Socinians—i. e. humanitarians. Richard Price, however, against whom Burke directed his *Reflections on the French Revolution*, held the Arian opinion in a Socinian generation. The works which have been written expressly in its defense are Emlyn's *Humble Inquiry* and Yates's *Vindication*, and many others. Some of the later writings even of the divine Watts show that although he did not come to any decided result he distrusted his theology and leaned to the Unitarian view. Penn wrote ably against the Trinity and its kindred doctrines in the *Sandy Foundation Shaken*, for which he was put in prison and when he came out sturdily said, "I have not budged a jot." There too, in prison, he wrote *No Cross, No Crown*, a work as remarkable as that other book written in prison, Boethius on *The Consolation of Philosophy*. Also to be mentioned among English Unitarians are Dr. Samuel Clarke, of a former day, Ricardo, the political economist, Sir John Bowring; and not the least to be honored, John Pounds, of Portsmouth, the founder of the ragged school; and of celebrated women, Joanna Baillie and Florence Nightingale.

In the U. S.—Boston, with its vicinity, may be called the birthplace of Unitarianism in America. The controversy which brought matters to that result in a good many churches there and elsewhere in New England, carried on by Dr. Noah Worcester, of Salem, and Prof. Moses Stuart, of Andover, on one side, and William E. Channing and Prof. Henry Ware, Sr., and Andrews Norton on the other, broke out in 1812. Just before, in 1810, Noah Worcester had published his *Bible News*. Nearly thirty years before Dr. James Freeman, of King's chapel, in Boston, had taken the same ground, and his congregation altered the Liturgy in accordance with his views. It was the first church in the U. S. that decidedly espoused the Unitarian faith, though many years before Jonathan Mayhew, pastor of the West church in Boston, was known as an Arian. In Boston and its vicinity also there were several distinguished laymen who took the same side, as the Presidents Adams, father and son, the celebrated jurist Theophilus Parsons, George Cabot, Nathaniel Bowditch the astronomer, Harrison Gray Otis, Daniel Webster, and others. As early as 1718 Dr. Ebenezer Gay, of Hingham, was settled, and became generally known as a Unitarian. In 1794 Dr. Priestley removed to the U. S., and though he was received with attention in Philadelphia, he chose to retire to Northumberland, Pa., to pursue his philosophical studies, where he also collected a small congregation for worship. Two years after a church was formed in Philadelphia, of which, in 1825, Dr. W. H. Furness became pastor. According to the census of 1840, there were in the U. S. 421 organizations and 67,744 members.

The American Unitarian Association was formed in Boston in 1825, chiefly for the publication and distribution of tracts and books. It has used its funds also to build churches and assist feeble ones, and to send out preachers

in the U. S.; for a number of years supported a missionary in India, the devoted Charles H. A. Dall, who did an excellent work there by his schools, by circulating books, and by publications of his own, and also through communication with the BRAHMA SOMAJ (*q. v.*) and its thousand congregations. Chunder Sen, their chief preacher and leader, visited England, and made a most favorable impression in London (as Rammohun Roy did before him) by his liberal and earnest inculcation of universal religious truth and virtue. Mozoomdar, the successor of Chunder Sen, has maintained relations of the liveliest sympathy with English and American Unitarians.

Tenets.—The first general convocation of the Unitarian clergy of America was held in New York in 1865, consisting of ministers and delegates from the churches; and on this occasion arose and was keenly debated the question about a creed. But the word met with no favor in the conference. With regard to the distinctive tenets of Unitarians, indeed, except that which the name indicates, it is less easy precisely to define them, because Unitarianism is an embodiment of principles—principles of reasoning and criticism—rather than a collection of institutes like the *Institutes of Calvin* or the *Confessions of Augsburg* and *Dort*, or the *Thirty-nine Articles* of the Church of England. Its history is a history of individual opinions, rather than of organizations, measures, or methods of action. It is biographical, not national. Heresies, as they are called, rather than creeds, are the forms it has taken. Protests rather than professions have marked it. It has been called by its opposers a system of negations, though it is to be considered that every negation implies an affirmation. The affirmations of the conference were—that every man has a perfect right to judge for himself, unbound by any set of articles; that while professing itself to be a Christian body, it left every one to decide for himself what Christianity itself is—i. e. without forfeiting his place in the body, to choose among the conflicting views of Christian doctrine and statement that which seemed to him to be true and right.

In fact, Unitarianism is characterized not so much as being a system of thought as a way of thinking; and *that* may be called, whether for praise or blame, the rational way. Religion it regards as addressing itself to reason and conscience alike, requiring of men to believe nothing which contradicts reason, and to do nothing which they have not ability to do. Human nature, in its view, is not a mass of helpless depravity, but is endowed with moral qualities which are capable of good, and which are to be educated to virtue and religion, just as truly as the mental powers are to be educated to knowledge and the highest intelligence. Human life is appointed to be the sphere of this culture, with all its toils, cares, trials, and sufferings—its natural affections and enjoyments also not to be crushed down, but intended to minister to the same end.

In short, the stand taken by Unitarianism is for nature, for human nature, for everything that God has made, as the manifestation of his will as truly as anything written in the Bible. This world, the world of nature and of life, does not lie under the curse of Adam's sin nor any other curse, but is ordained by infinite wisdom and goodness to be the field of human training for a life to come, whose allotments are to be in accordance with the law that "whatsoever a man soweth, that shall he also reap." Righteousness, and not dogma, is the everlasting condition of all welfare in this world and the next, and what needs to be done for religion is to free it from all falsehoods, from all substitutions of ceremony, profession, and sensational experience for truth and virtue, and thus to purify and rationalize it—to lift it up, not as a terror to men, but as friendship and help, as strength and comfort, as a joy and delight, and so to relieve it of the mystery or misery that it is to many. In fine, the ground taken by this Christian body is that substantially held by the Universalists and to which many other denominations are approaching, and is this—that Christianity is not a philosophy, but a divine power; that the acceptance of it is not the believing in a creed, but believing with the heart; that Jesus Christ himself in his life and death, all dogmatizing apart, is the embodiment of his religion; that he holds that supremacy in the beauty and power of his life which makes it, of all that has appeared upon earth, the fittest to be imitated and followed; and that he who comes nearest to that is the best Christian.

The growth of Unitarianism as an organized body has been more rapid since 1880 than at any time in its history

since the division of the New England Churches. In this growth New England has rivaled the Middle West, and the Pacific slope. The average opinions of the body have undergone a great change since Channing's death in 1842. Parker and Emerson are now equally revered with Channing as leaders of the faith. Its most radical but generally accepted criticism of the New Testament is James Martineau's *Seat of Authority in Religion*. Martineau is the acknowledged head of English philosophic thought, and his philosophical opinions attract to him many who find his critical opinions too destructive of the traditional beliefs.

United Armenians: those Armenian Christians who acknowledge the pope, the orthodox Armenians being called Gregorians. The Armenian Rite in the Roman Catholic Church has 1 patriarch and primate (in Cilicia), 4 archbishops (at Constantinople, Aleppo, Seleucia (or Diarbekir), and Lemberg), besides 2 *in partibus*, and 16 bishops. Their union took place 1316-34. They number some 100,000, of whom 78,000 are in Turkey and Persia (20,000 under the Archbishop of Constantinople, 56,000 under the Patriarch of Cilicia, and 1,000 in Mt. Lebanon), and the remainder in Austria-Hungary, Russian Caucasia, and Siberia. The United Armenians, amounting to about 4,000, who with Bishop Kuppelian left the Catholic Church in 1870, returned in 1879 and with him submitted to Leo XIII. See Silbernagl, *Kirchen des Orients*, and Hergenroether's article in Herder's *Kirchenlexikon*, edited by F. Kaulen.

United Baptists: See BAPTISTS.

United Brethren, or Unitas Fratrum: See MORAVIAN CHURCH.

United Brethren in Christ: a denomination of Protestant Christians which arose in the U. S. under the leadership of the Rev. Philip William Otterbein (1726-1813), a German missionary of the Reformed Church, and Martin Böhm. It is often confounded with the United Brethren (see MORAVIAN CHURCH). It dates from 1789, but its present name was not adopted until 1800; and the first general conference was held 1815. Their polity is a mixture of Methodism, Congregationalism, and Presbyterianism. They oppose Freemasonry and the manufacture, sale, and use of alcohol in drinks. Beginning with Germans exclusively, they have prospered greatly, especially in the Northwest and in Pennsylvania, but now less than 4 per cent. of their congregations use German in worship. Their confession of faith was adopted in 1889. They have an episcopal organization and sustain a publishing-house at Dayton, O. They support several colleges and seminaries. (See OTTERBEIN UNIVERSITY.) According to the statistics of 1893, they had 2,130 ministers, 4,188 organized churches, and 208,452 communicants. See their history in vol. xii. in *American Church History Series* (New York, 1894).

United Christians of St. Thomas: a body of East Indian Roman Catholics, chiefly found in Travancore, at the southern extremity of India. In 1599 the synod of Diamper (Udiamperur) compelled the ancient Church of St. Thomas Christians (see CHRISTIANS OF ST. THOMAS) to conform to the Church of Rome, conceding to them a modified Syrian rite. In 1653 nearly all fell away, but were soon after induced in great numbers to return, chiefly by the labors of the Barefooted Carmelites. At present more than half are of the Latin rite, but a portion retain the Oriental rite. They are chiefly in the vicariate apostolic of Verapoly (Latin rite), reported as having about 300 priests and 233,000 members. See Germann's *Die Kirche der Thomaschristen* (1877); Assemani, *Bibliotheca orientalis*, iv., p. 2; Silbernagl, *Kirchen des Orients*; G. B. Howard, *The Christians of St. Thomas, and their Liturgies*. Revised by J. J. KEANE.

United Copts: since 1741 the designation of a body of Roman Catholic Copts (native Egyptians) of the Eastern rite. They number (in Egypt) 12,000 or 13,000, and are under a vicar apostolic of their own rite, established (1784) by Pius VI. at Cairo. The United Copts are of two rites, the Egyptian and the Ethiopic or Abyssinian. According to the reports of Roman Catholic missionaries, the latter would appear to be the more numerous. Since 1879 there exists in Egypt a Coptic seminary under the charge of the Jesuits. Their missionaries are also educated at the Propaganda College, Rome. See Werner's *Orbis Terrarum Catholicus* (Freiburg, 1890). Revised by J. J. KEANE.

United Evangelical Church: the state church of Prussia; formed by the union of the Lutheran and Reformed bodies in 1817.

United Greek Church: a body of Roman Catholics of Eastern rite, who accept the papal supremacy and the doctrines of the Roman Church. Their secular clergy are allowed to marry, but only before ordination to deaconship. At any time thereafter they are forbidden to contract marriage under pain of deposition. Their rites are four in number—the Roumanian, the Ruthenian, the Bulgarian, and the Greek Melchite (Greeks of Syria, etc.). The Melchites proper are estimated to number from 75,000 to 100,000. The United Greeks of Bosnia and Herzegovina are about 265,000. In Austria there are over 2,500,000 United Greeks, mostly of Ruthenian rite, and in Hungary 1,500,000. There are some United Russian Greeks of Ruthenian rite in the ancient dioceses of Chelm and Minsk, and there are about 250,000 in Russian Poland, the remnant of those forced by violence to conform to the orthodox Russian Church in 1839. The few Catholic Bulgarians of European Turkey are found at Constantinople and scattered in small numbers through Thrace and Macedonia. The Greek Catholics of Poland numbered 388,223 in 1887. In Southern Italy and in Sicily there are a few Greek Catholics. See Silbernagl, *Kirchen des Orients*; the *Gerarchia Catholica* (1895); O. Werner, *S. J., Orbis Terrarum Catholicus* (1890). J. J. K.

United Irishmen: the name of an Irish political society formed to aid GRATTAN (*q. v.*) in carrying out his reforms. It was originally a peaceful organization, but about the year 1795, under the influence of THEOBALD WOLFE TONE (*q. v.*), it became active in fostering rebellion against the British Government. Tone was captured in 1798, but the rebellion was not put down till 1800, and was followed by the formation of the United Kingdom of Great Britain and Ireland.

United Kingdom of Great Britain and Ireland: the official designation of the British islands since the legislative union of Great Britain and Ireland in 1801. See GREAT BRITAIN, ENGLAND, IRELAND, SCOTLAND, and WALES.

United Methodist Free Churches: See METHODISM.

United Nestorians: a body of Roman Catholics of the Syrian rite, more often called CHALDEAN CHRISTIANS (*q. v.*), dating from 1553.

United Original Seceders: a Presbyterian sect of Scotland dating from 1820, when a number of ministers of the General Associate Synod refused to reunite with the Associate Synod. For an account of their origin, with recent statistics, etc., see PRESBYTERIAN CHURCH. W. J. B.

United Presbyterian Church of North America: a religious denomination which is the result of the union of several bodies. This makes its early history complex and fragmentary. It is the principal American representative of the Dissenting churches of Scotland. In 1751 the Reformed Presbytery of Scotland sent the Rev. John Cuthbertson to visit the Covenanters settled in Southeastern Pennsylvania; in 1773 two more ministers followed, and in Mar., 1774, they organized the Reformed Presbytery of America. In 1753 the Associate Synod of Scotland "missioned" Messrs. Gellatly and Arnot to those of their faith in the valley of the Susquehanna, and in November of the same year they organized the Associate Presbytery of Pennsylvania. Every Covenanter and Seceder, lay and clerical, in the country was a patriot, a large number entered the Revolutionary army, and when national independence was won they decided to establish a free church in a free state. As both parties held to the same standards and had been kept apart by the union of Church and state in the fatherland, they united Oct. 31, 1782, and formed the Associate Reformed Synod. Two Associate ministers and three or four congregations refused to go into this union, and, re-enforced from Scotland, continued their organization, which grew into a synod. This at the union of 1858 contained 230 ministers, 300 congregations, and 25,000 communicants. By new arrivals from Scotland the Covenanting Church was rebuilt, and has (1895) between 100 and 200 ministers. Instead of one church the union made three, and the Covenanters and Seceders continued to recognize a subordination to the mother churches in Scotland. The Associate Reformed Church prospered, and in 1804 formed a delegated General Synod, but as the church members were scattered from Boston to Georgia and W. to the Wabash, and the means of travel were slow and expensive, its meetings called for too

much money and time; so in 1822 it was dissolved and the Church fell apart into the independent but allied synods of New York, the West, and the South, and some twelve or fourteen disaffected ministers passed to the Presbyterian Church. All these synods, Associate and Associate Reformed, labored diligently in their respective spheres and were reasonably successful. Their principal field of labor was among those of Scotch-Irish descent, but they did what they could for others, and in addition to their home work they all undertook missionary work in foreign countries. Difficulties and prejudices gradually faded away and a yearning came year by year for closer union and co-operation. They were one in origin, one in faith, one in government, and one in worship, and there could be no sufficient reason why they should not be one in organization. In 1842 a movement was made toward a union, but the negotiations dragged on until May 26, 1858, when the Associate and Associate Reformed Synods, except that of the South, which stood aloof because of slavery, united in Pittsburg, Pa., and formed the United Presbyterian Church of North America. The terms of union were the Westminster standards, with the addition of a Testimony containing eighteen items, which it was thought were not sufficiently stated in the Confession. It holds strictly to the Calvinistic system of theology as set forth in the Westminster Confession, and practices restricted communion, requiring the same qualifications in strangers that it does in its own, and confines its praise service to a metrical version of the Psalms of the Bible. It has always insisted upon the most thorough education of its ministers, a collegiate course, and at least three years of theological training. In the latter it is indeed the pioneer in the U. S., for in 1794 the Associate Church established a theological school at Service, in Beaver co., Pa., under Dr. John Anderson. It was the first fully organized school of the kind in the U. S., with a salaried professor, prescribed curriculum, library, and dormitory. The Associate Reformed Church was also early in this field. In 1805 it opened in New York a theological seminary under the distinguished Dr. John M. Mason, with eight students. The United Church has under its care two theological seminaries with over a hundred students, seven colleges with more than 2,000 pupils, and several classical schools. It has maintained missions in Trinidad, Syria, China, India, and Egypt, but for the sake of efficiency has latterly concentrated all its force upon the last two. In the Punjab, in India, its mission embraces a synod with three presbyteries, 35 foreign missionaries, over 200 helpers, and 7,000 communicants, and a training-school for native ministers. In Egypt it has a presbytery, 38 foreign missionaries, 325 native helpers, congregations all along the Nile from Alexandria to Assuan, with over 4,000 members, and over 15,000 scholars in its day schools and 6,000 in the Sabbath-schools, and issues a religious newspaper in Arabic. Its home mission work is well organized, stretching from Boston to San Diego, and employing over 200 ministers. Its freedmen's board has large schools in several Southern States, and colleges at Knoxville, Tenn., and Norfolk, Va. It has a large publication house in Pittsburg, which sends forth all needed helps for Sabbath-schools and denominational purposes. The statistics of 1895 show 12 synods, 64 presbyteries, 900 ministers and licentiates, 938 congregations, 117,236 members, 104,000 Sabbath-school scholars, and contributions for all purposes \$1,400,000. JAMES B. SCULLER.

United Presbyterian Church of Scotland: a religious denomination, the third in size of the Presbyterian Churches in Scotland, formed in 1847 by the union of the United Secession Church and the Relief Church.

The larger of these two churches traces its origin back to 1733. The immediate occasion of this first secession from the Church of Scotland was the oppressive exercise of patronage in the "planting of vacant churches"—the dissatisfaction caused by this being intensified by the failure of the Church courts to check or punish what many regarded as grave errors in doctrine. In 1712 the right of patrons to present ministers to vacant congregations, of which they had been deprived in 1690, was restored to them by an act of Parliament; and in 1732 the little that had been left to the people of power, in certain circumstances, to elect their own ministers had been taken away by an act of Assembly, which made the elders and Protestant heritors jointly the electoral body in these cases. At the opening of the synod of Perth and Stirling, Oct. 18, 1732, the retiring moderator, Ebenezer Erskine, preached a sermon in which he set

mented on the recent act of Assembly and on other ecclesiastical proceedings in such terms as to bring upon him the censure of the Synod. He appealed, along with three others who adhered to him, to the General Assembly, but only to receive the rebuke of that court (May, 1733) in its turn. They thereupon tabled a protest against being thus wronged, avowing their purpose to preach the same doctrines and to testify against defections as before; and on Nov. 16 the commission of Assembly, to which their case had been referred as one of contumacy (although they were only availing themselves of their legitimate privilege of protest), loosed them from their charges and declared them to be no longer ministers of the Church. Against this sentence these ministers lodged a protestation, maintaining their right to continue the exercise of their ministry though compelled to make "a secession from the judicatories of the Church," and appealing to the "first free, faithful, and reforming General Assembly of the Church of Scotland." A few weeks later (Dec. 5, 1733) "The Four Brethren," as they were called, Ebenezer Erskine, William Wilson, Alexander Monierieff, and James Fisher, ministers at Stirling, Perth, Abernethy, and Kinlaven respectively, met in a cottage at Gairney Bridge, near Kinross, and after solemn deliberation constituted themselves into a presbytery. This is the point of departure of the new denomination. The Assembly of 1734 empowered the Synod to restore them to their charges, but the evils which they had complained of and for which they had suffered had not been removed, and they could not reside from their secession. Though associated as a presbytery, they "agreed that they would not be too sudden in proceeding to any acts of jurisdiction," and they acted generally with great moderation and caution; for instance, in the title of the "Act, Declaration, and Testimony" which they put forth in 1736 they designate themselves "some Ministers associate together for the exercise of Church-Government and Discipline in a presbyterial capacity." But it soon appeared that there was throughout the country a widespread and increasing sympathy with the attitude assumed by the seceding ministers and the views they expressed. Other ministers joined them; and a greater number, without seceding, openly expressed more or less agreement with them. Many of the people rallied round them, and they had to organize congregations and administer ordinances at the people's call. Upward of thirty seceding congregations had been formed when "The Four," with four others who had joined them, persisting in their secession, were eventually (May 15, 1740) deposed by the Assembly, and ejected from their churches, in which they had till then continued to preach.

"The Associate Presbytery," as the court of these associated ministers had been named, was converted into "The Associate Synod," Oct. 11, 1744, embracing the three Presbyteries of Edinburgh, Glasgow, and Dunfermline. Shortly after this an unhappy division took place, occasioned by Parliament in 1745 (doubtless on account of the Jacobite rising of that time) requiring all persons becoming burgesses in Edinburgh, Glasgow, and Perth to take the following oath: "I protest, before God and your Lordships, that I profess and allow with my heart the true religion presently professed within this realm, and authorized by the laws thereof; I shall abide thereat, and defend the same to my life's end, renouncing the Roman religion called Papistry." The taking of this oath was held by the one party to imply condonation, if not approval, of the still existing evils which had led to the secession, and was therefore not to be tolerated in members of their congregations; the other party denied the alleged implication, and held that the oath might warrantably be taken. The stern conscientiousness of all of them expressed itself in an extremely hot contention, and the separation known as 'The Breach' took place Apr. 9, 1747. Both parties claimed to be the true "Associate Synod," but those opposing the burgess oath came at a later period to call themselves the General Associate Synod. Popularly, however, they were spoken of as Burghers and Antiburghers, and the members of both denominations were ordinarily designated Seceders, especially by outsiders.

Thus separated, the two churches remained apart for upward of seventy years, a strong feeling of antagonism long existing between them. Toward the end of the century diversity of opinion arose in both Synods on the question of the relation of the civil magistrate to matters of religion, and both were divided into what were popularly called New Light and Old Light sections. The New Lights, corresponding to the "voluntaries" of later times, were largely

in the majority, and secessions of Old Lights took place—some nine congregations leaving the Burgher Synod in 1799 and four leaving the Antiburgher Synod in 1805. Steps were ultimately taken in the direction of union, and in 1820 the Associate and General Associate Synods united to form "The United Secession Church." The denomination thus incorporated grew and prospered during the twenty-seven years of its existence, taking a prominent part in the so-called voluntary controversy, and initiating and successfully prosecuting important missionary enterprises, but its history was otherwise uneventful.

The Relief Church dates from the formation of a presbytery by three ministers, two of whom had for a considerable time been pastors of ecclesiastically isolated congregations that had been formed in consequence of the intrusion of ministers into charges against the will of the people. Thomas Gillespie, minister at Dunfermline, often regarded as the founder of the Relief Church, had, when minister of the neighboring parish of Carnock, been deposed by the General Assembly of the Church of Scotland in 1752, because, with five other members of his presbytery, who were merely censured, he had refused to take part in inducting a minister at Inverkeithing in the face of the strenuous opposition of the parishioners. Thomas Boston, minister at Jedburgh (a son of the author of the well-known *Fourfold State*), had seceded from the Church of Scotland, in which he held a pastoral charge, to take the oversight of a congregation formed in Jedburgh by nearly all the people of the parish, dissatisfied by the enforced settlement of a minister. These two met at Colinsburgh, in Fifeshire, for the induction of Thomas Collier as pastor of a congregation formed there in 1760 by reclaimers against the settlement of a minister in the parish; and the three Thomases then organized "The Presbytery of Relief," Oct. 22, 1761, "for," as they expressed their purpose in their minute, "the relief of Christians oppressed in their Christian privileges." The Presbytery became "The Relief Synod," with subordinate presbyteries, in 1773. The name assumed by these dissenters was indicative of reaction against oppression. A distinctive feature of this church was liberty of "free communion." While Burghers and Antiburghers were mutually intolerant of attendance at the services of the rival denomination, "visible saints" who were not even Presbyterians were from 1773 permitted by the Relief Church to sit occasionally at times with their members at the Lord's Table.

The United Presbyterian Church (colloquially the "U. P." Church, its members similarly being called "U. P.'s"), in these its lines of ancestry and in its recent development, has been steadily progressive and increasingly prosperous. In 1820 the 154 Burgher congregations united with 129 of the 137 Antiburgher congregations to form the United Secession Church. On May 13, 1847, the Church was incorporated under its present name by the union of the entire number of the United Secession congregations (400) with 118 of the 136 Relief congregations. At the end of 1875 these 518 congregations had increased to 620, with 190,242 members; but in 1876 ninety-eight congregations in England, having over 20,000 members, were, by a friendly readjustment, made over to the Presbyterian Church of England, the religious body in that country which corresponds to and is in close connection with the Free Church of Scotland. At the end of 1894 the U. P. congregations numbered 578, with a membership of 190,950. The returns for 1894 give 848 Sabbath-schools, with 12,565 teachers and 106,682 scholars, and 810 ministers' and elders' classes, attended by 36,803 students. In the Church's foreign mission fields in Jamaica, Trinidad, Old Calabar, Kaffraria, India, China, and Japan 150 fully trained agents and about 750 native helpers are at work; 116 congregations have been formed, and 170 are in process of formation, the total membership being about 20,000. The total income of the Church in 1894 was £391,607, the income for congregational purposes being £262,837. There is a Theological Hall at Edinburgh, conducted by a principal and four professors.

The three large denominations in Scotland are separate, not on account of differences with regard to doctrine, or government, or mode of worship (in all of which, with some diversity of details, they are in substantial agreement), but as a result of the fact that the Church of Scotland is an established and endowed state Church. The United Presbyterian Church is a voluntary church; it is the belief of the vast majority of its members (although this is not a term of communion) that the civil magistrate, in his magisterial capacity, has nothing to do with matters of religion, that church

organizations should be independent alike of state support and of state patronage and control. It can not therefore unite with the Church of Scotland unless that church is dis-established and disendowed. The Free Church professes the belief that some kind of state connection is right, and may be obligatory; but practically its position, as shown by the action of a large majority of its members, differs but slightly from that of the United Presbyterian Church. Like the others, the United Presbyterian Church has as its standards, subordinate to the Scriptures, the Westminster Confession and the Larger and Shorter Catechisms, but adherence to these is professed in view of a Declaratory Act, passed in 1879, which, while reiterating the exception to these standards that the Church has long taken in the line of its "voluntaryism," gives an outline of the doctrines which the Church regards as embodying the substance of the faith, and allows liberty of judgment and of teaching in matters outside of these doctrines. The supreme court of the Church is not a general assembly, but a synod, under which there are twenty-nine presbyteries. Every one who is minister in a charge or is a "pastor emeritus" has a seat in the synod, as also has one representative elder from each congregation, such elder being preferably but not necessarily an elder in that congregation. The United Presbyterian Church was the first of the Presbyterian Churches in Scotland to permit the use of instrumental music in public worship (1872), and it has otherwise taken the lead in so-called "innovations." The Relief Synod sanctioned a collection of hymns in 1794 and another in 1833. The *United Presbyterian Hymn-book*, issued in 1852, considerably in advance of the Church of Scotland and Free Church collections, was superseded by a new book, the *Presbyterian Hymnal*, in 1877. The three Churches have for some time been acting in concert for the production of a common hymn-book, and in May, 1895, the joint committee appointed by them submitted to the three supreme courts the draft of a hymnal designed to be used in Presbyterian services generally.

Great seal of the U. S.

GEORGE M. ARTHUR.

United Provinces: the seven northern provinces of the NETHERLANDS (*q. v.*), united Jan. 23, 1579, at Utrecht, for mutual defense.

United Provinces of La Plata: See LA PLATA, UNITED PROVINCES OF, and ARGENTINE REPUBLIC.

United Secession Church: a religious body formed in Scotland in 1820 by a reunion of the Associate and General Associate Synods. In 1847 it was united to the present United Presbyterian Church. See PRESBYTERIAN CHURCH.

United Society of Believers: See SHAKERS.

United States: a federal republic composed (1897) of forty-five States, three organized Territories, and the District of Columbia, Indian Territory, and Alaska; capital, Washington, D. C.

GEOGRAPHICAL AND PHYSICAL.

The country consists of two detached portions: one, containing five-sixths of the area and over 99 per cent. of the population and wealth, occupies the middle portion of the North American continent, extending from lat. 24° 20' to 49° N., and from lon. 66° 48' to 124° 32' W. from Greenwich; the other portion, known as the Territory of Alaska, occupies the northwestern part of the continent, is very sparsely settled, and almost unexplored. The limits of the main body of the U. S. are as follows: The eastern boundary is the Atlantic coast. The northern, beginning at the eastern limit of Maine, extends up the St. Croix river, thence runs northward until it strikes the St. John river, which it follows around the northern end of Maine; then it runs along the highlands which separate the St. John river from the streams flowing into the St. Lawrence river, and follows them to the head of the Connecticut river. This stream serves as the boundary southward to the 45th parallel, along which it runs westward to the St. Lawrence river. It then follows this river, winding among its many islands, to Lake Ontario, passes through the Great Lakes and connecting streams to a point near the head of Lake Superior;

then leaving the lake, it follows a chain of small lakes and connecting streams to the Lake of the Woods, W. of which point it follows the 49th parallel to Puget Sound. The western coast is the western boundary of the country. On the south the line is formed by the Gulf of Mexico, the Rio Grande, and thence by a series of parallels and great circles

to the Pacific coast, which it reaches just S. of the city of San Diego. The boundaries of Alaska are as follows: Beginning at the southern point of Prince of Wales island, the line ascends Portland channel to the 56th parallel of N. latitude; thence runs parallel to the coast and 10 marine leagues inland therefrom as far as the point of intersection of the 141st meridian, thence along the 141st meridian to the Arctic Ocean. The western limit passes through a point in Bering Strait on the parallel of 65° 30' N. latitude, at its intersection by the meridian which passes midway between the islands of Krusenstern and Ratmanof, and proceeds due N. into the Arctic Ocean. The same limit, beginning at the same initial point, also proceeds in a course nearly S. W. through Bering Strait and Bering Sea, passing midway between the northwest point of the island of St. Lawrence and the southwest point of Cape Chonkaski to the meridian of 172; thence southwesterly, including the island of Attu and the Copper island of the Korandorski group in the North Pacific Ocean, to the meridian of 193, including the whole of the Aleutian islands E. of that meridian. The following tables summarize the extent of the ocean shoreline and of the land, lake, and river boundaries of the main portion of the country (the boundaries of Alaska, especially upon the seaboard, are not sufficiently well known to warrant giving similar measurements):

Physical Features.—The main body of the U. S. presents two great systems of uplift. One is in the East near the Atlantic coast, and is known as the Appalachian system; the other, much higher, broader and more complex, occupies the western third of the country, and is known as the Cordilleran system.

The Appalachians.—The Appalachian system extends from Canada southwesterly into Alabama. The base from which it rises, known as the Atlantic plain, has in New England an elevation of some 300 or 400 feet at the base of the mountains. Toward the southwest, this plain becomes broader, and at the foot of the mountains is much more elevated, rising in North Carolina to an altitude of about 1,000 feet. The northern part of the Appalachian system is sharply distinguished in character from the southern part. In New England and Northern New York—that is, E. of the Hudson river and N. of the Mohawk river—the system is represented by isolated groups of mountains and by north and south ridges. Of the former type are the Adirondacks of Northern New York, the White Mountains of New Hampshire, and the broken, irregular hills of Maine. Of the latter type are the Green Mountains of Vermont and the Berkshire Hills of Massachusetts. The most important of these in point of altitude are the White Mountains, which rise in the highest summit, Mt. Washington, to an altitude

of 6,293 feet, with several other summits in its immediate vicinity approaching 6,000 feet. (See WHITE MOUNTAINS.) Among the Adirondacks the dominant peak is Mt. Marcy, with an altitude of 5,379 feet. (See ADIRONDACK MOUNTAINS.) Among the Green Mountains the highest peaks are Mts. Killington and Mansfield, 4,380 and 4,389 feet respectively (see GREEN MOUNTAINS), and in the Berkshire Hills, Mt. Greylock, in the northwestern corner of Massachusetts, rises far above its fellows, with an altitude of 3,505 feet. In Maine the highest summit, so far as known, is Mt. Katahdin, elevation 5,200 feet. S. and W. of the Hudson river, extending through New York, Pennsylvania, Maryland, Virginia, West Virginia, the Carolinas, Eastern Kentucky, Tennessee, Northern Georgia, and Alabama, the Appalachian system presents a different type. The eastern member of the system, which fronts the Atlantic Plain, is known in Pennsylvania as South Mountain, and in the States farther S. as the Blue Ridge. This is throughout most of its course a single ridge, having an altitude in Pennsylvania of less than 1,000 feet. It rises at the gap cut by the Potomac river at Harper's Ferry to some 1,500 feet above sea-level, and farther S., in Central Virginia it reaches altitudes of 4,000 feet, as in Stonyman, 4,031, and the peaks of Otter, near Lynchburg, 4,001 feet. In North Carolina the character of this ridge changes. It becomes a plateau, with an escarpment to the S. E. and a gentle slope to the N. W., this escarpment having an average elevation of about 4,000 feet. Upon this escarpment and its western slope stand numerous ridges and groups of mountains trending, so far as any trend can be detected, in a northeast and southwest direction. They cover the western portion of North Carolina, extending slightly into Northern Georgia, and among them are found countless peaks exceeding 5,000 feet in altitude, while one short range, known as the Black Mountains, contains several peaks exceeding 6,000 feet. Among them is Mt. Mitchell, which, with an altitude of 6,688 feet, is the highest summit E. of the Rocky Mountains. W. of the Blue Ridge stretches from Pennsylvania to Alabama a broad valley—the Appalachian. It is intersected throughout its entire extent by ranges and ridges, each following the general direction of the valley. These ranges are narrow and abrupt in slope, with level tops extending for scores of miles, except where cut through here and there by water gaps. The streams generally follow the valleys between these ridges. In some places the water gaps are so frequent as to reduce the ridges to lines of knobs. Rising from this valley at its northwestern limit is an escarpment, known in Pennsylvania as the Allegheny Mountains, in Maryland and West Virginia as the Allegheny Front, and in Southwestern Virginia and Eastern Tennessee as the Cumberland Mountain. From the summit of this escarpment a plateau slopes gently to the N., terminating at the Allegheny and Ohio rivers, and limited farther S. by the Blue Grass Region of Kentucky and Tennessee. The escarpment ranges in altitude from 2,500 or 2,800 feet in Pennsylvania to 4,000 feet in West Virginia, diminishing again toward the southward. In most localities it is so deeply scored by streams that there is little except the skeleton of the plateau remaining, its form being that of a succession of abrupt ridges and gorges; the summits of the ridges are nearly all upon the same level, betraying the former altitude of the plateau. In some places, however, considerable areas of the summit have remained intact. This feature is known as the Allegheny plateau in New York, Pennsylvania, and West Virginia, and as the Cumberland plateau in Tennessee. It extends southward to Central Alabama, and dies away into the low country. See APPALACHIAN MOUNTAINS.

The Mississippi Valley.—Between the Appalachian system and the Rocky Mountains (*q. v.*) stretches a broad valley, the southern and much the greater portion of which is drained by the Mississippi river and other streams into the Gulf of Mexico, the northern portion into the Great Lakes, and a smaller area into Hudson Bay, by way of the Red River of the North. Speaking broadly, this country is a plain, but looking at it closely it presents irregularities of surface, many of which are significant. The northern portion, near the shore of the Great Lakes, especially upon the upper peninsula of Michigan, Northern Wisconsin, and Minnesota, has been greatly disturbed by the agency of the great continental glacier which in ancient times covered it. In certain regions this glacier eroded the surface, carrying off all the softer rock and leaving the harder and tougher portions standing in the form of miniature mountains, as Keweenaw Point and the Marquette iron range in Northern

Michigan. In other parts, especially farther S. and W., the glacier deposited material in the form of drumlins and moraines. In Southern Ohio and Indiana streams tributary to the Ohio river cut their courses deeply, leaving considerable relief in the form of bluffs. The Ohio, Mississippi, Missouri, and other streams are also bordered by high bluffs throughout much of their course. The greatest relief in the Mississippi valley is afforded by the Ozark Hills. These, like the Appalachian Mountains, present two different characters of surface. S. of the Arkansas river, in Western Arkansas and Southern Indian Territory, they consist of a group of narrow, abrupt ridges, which in spite of their serpentine course have a general E. and W. trend. They rise to altitudes of 2,500 to 3,000 feet above the sea. N. of the river the Ozark Hills consist of a plateau presenting an escarpment to the S., with a gentle slope N., the surface being deeply scored by streams. From the Mississippi and lower Missouri rivers the country rises gradually in a long incline over a breadth of more than 500 miles to the base of the Rocky Mountains. This great incline, known as the Great Plains, extends from the northern to the southern boundary of the country, and forms one of its grandest features. Its eastern base has an altitude ranging from sea-level to perhaps 2,000 feet, while at the base of the Rocky Mountains the plains range from 4,000 to 8,000 feet above the sea.

The Rocky Mountains.—This system is a part of the great Cordilleran mountain system which borders the Pacific coast through North and South America, extending from the Aleutian islands and Alaska through British Columbia, the U. S., Mexico, and the Central American republics, and thence, as the Andes, through South America to Cape Horn. In the U. S. this system has its greatest breadth and complexity. It extends from lon. 105 to 124°, and comprises an area which may be roughly estimated at one-third that of the country, or in the neighborhood of 1,000,000 sq. miles. The mountain ranges stand upon a plateau, the eastern slope of which is the Great Plains. This plateau has an altitude ranging from 4,000 to 10,000 feet, being highest in Colorado and diminishing in elevation to the N. and S. The great rivers here indicate by their courses the directions of slope of the plateau upon which the mountains stand. The region may be divided for purposes of description into a number of districts, the Stony Mountains, the Park Ranges, the Plateau region, the Great Basin, the Cascades and Sierra Nevada, the Pacific valley, and the Coast Ranges. The Stony Mountains form the eastern member of this system, fronting the plains in Montana, Idaho, and Wyoming. They consist of a number of ranges, generally parallel, and trending slightly W. of N. and E. of S. In Montana few of the peaks exceed 12,000 feet, while the general altitude of the ranges here is 9,000 or 10,000 feet. In Wyoming, one of the members of this sub-system, the Wind River Range, which separates the head of the Big Horn from Green river, rises to nearly 14,000 feet. In Southern Wyoming the Stony Mountains disappear, and are succeeded by a broad plateau having an average altitude of fully 8,000 feet. This break in the continuity of the ranges is traversed by the Union Pacific Railroad, so that the traveler by this route crosses most of the Rocky Mountain region without passing among mountains. In Southern Wyoming, near the Colorado boundary, the Park Ranges rise from the plateau, and in Colorado they reach their greatest altitude and complexity. Here are a score of mountains exceeding 14,000 feet in height, and hundreds exceeding 13,000 feet, and here also the plateau from which they spring attains its greatest altitude. In these high mountains are the head branches of the Platte, Rio Grande, Arkansas, and Grand rivers, the latter a fork of the Colorado river. Farther southward in New Mexico the ranges begin to die away, and in the neighborhood of Santa Fé their continuity disappears. In Utah there is a range which is in the nature of a spur from the Stony Mountains, known as the Wasatch Range. It extends S. along the eastern border of Great Salt Lake and its system of tributary lakes to the central part of the Territory.

Plateau Region.—The region drained by the Colorado is hardly paralleled on the earth. It consists of cañons and of plateaus whose surfaces are horizontal or but slightly inclined and terminated by cliffs. All streams flow in cañons—deep, narrow gorges with precipitous and even vertical walls. Besides those cut by living streams, there are many in which at ordinary times no water flows, so that in many places the plateau is a mere skeleton of narrow, flat ridges, separated by equally narrow, precipitous gorges. Of these cañons, the series which has been cut by the Colorado is the

most remarkable. It culminates in the Grand Cañon in Northern Arizona, which at its deepest part exceeds 6,000 feet. From summit to summit of the plateau the distance is in many places from 10 to 12 miles, the walls descending from top to bottom of the gorge by a series of precipitous steps.

The Great Basin.—W. of the Wasatch Range, comprising parts of Utah, Nevada, California, and Oregon, is a region which, owing to its deficient rainfall, has no natural system of drainage. It is, in fact, not a single basin, but a vast number of basins, most of which have no connection by drainage lines with other basins. The streams which flow down from the mountains on its expanse sink into the earth or are evaporated. This basin is intersected by many mountain ranges, trending generally parallel in a direction nearly N. and S. Their bases are buried deeply in the detritus worn down from their sides and deposited in the intervening valleys. The principal basins among the many which are found on its surface are those of the GREAT SALT LAKE (*q. v.*), at the west base of the Wasatch Range, and those of the Carson and Humboldt at the east base of the Sierra Nevada. See GREAT BASIN.

Cascades and Sierra.—Traversing Washington, Oregon, and California is a system of mountains known in its northern part as the Cascade Range and in the southern as the Sierra Nevada. The former is a volcanic plateau, from which rise numerous cones to altitudes of 12,000 to 14,440 feet. Among these are Mts. Rainier, Shasta, and Hood, 14,441, 14,350, and 11,225 feet respectively. (See CASCADE RANGE.) The Sierra Nevada rises with an abrupt, precipitous front to the E., and a long, deeply eroded slope to the W. The altitude, which in the northern part of California is perhaps 12,000 feet, increases southward until near its southern end it has many peaks from 14,000 to 15,000 feet. From this point it descends rapidly in altitude, swings around to the S., and joins with the Coast Ranges. (See SIERRA NEVADA.) W. of the Cascades and Sierra Nevada lies a long valley trending parallel to the coast, which in Washington is occupied partly by Puget Sound and several minor streams; in Oregon by the Willamette, Umpqua, and Rogue rivers, and in California by the Sacramento and its tributary, the San Joaquin. This valley is the great wheat-field of the Pacific coast. Separating it from the coast is a series of ranges and ridges, known collectively as the Coast Ranges. In Northwestern Washington a part of them are known as the Olympic Mountains, and exceed 8,000 feet. In Oregon these ranges are of little importance, but in Northwestern California they rise again to a considerable height. The system is broken through by the Bay of San Francisco, rises again to the S., and in Southern California reaches a height of 3,000 to 4,000 feet.

Altitude.—The mean elevation of the U. S., excluding Alaska, is about 2,500 feet. The areas of the different zones of elevation above sea-level are given in the following table:

Zones, feet.	Area, sq. m.	Zones, feet.	Area, sq. m.
0 to 100	200,510	1,000 to 2,000	629,596
100 to 500	388,305	2,000 to 3,000	262,635
500 to 1,000	515,770	3,000 to 4,000	182,800
		4,000 to 5,000	293,829
0 to 1,000	1,133,835	5,000 to 6,000	215,160
		6,000 to 7,000	159,515
1,000 to 1,500	396,080	7,000 to 8,000	93,104
1,500 to 2,000	240,516	8,000 to 9,000	39,000
		9,000 to 10,000	19,110
		Above 10,000	19,250

River Systems.—The river systems may be grouped into four grand divisions, viz., the Northern Lake, Atlantic, Gulf, and Pacific. The first consists of Lakes Superior, Michigan, Huron, Erie, and Ontario, together with their connecting and tributary streams, the water of which is poured by the St. Lawrence into the Atlantic Ocean. These lakes and the St. Lawrence river form a navigable system which is exceeded in the U. S. only by the Mississippi river and its tributaries, and bears an amount of traffic which in bulk is equaled by that of few waterways. From the mouth of the St. Lawrence to the head of Lake Superior is nearly 2,400 miles. The following table presents the area, dimensions, depth, and elevation of the Great Lakes:

LAKES.	Area, square miles.	Length, miles.	Breadth, miles.	Depth, feet.	Elevation, feet.
Lake Superior	31,200	412	167	1,008	602
Lake Huron	21,000	263	101	762	601
Lake Michigan	22,450	345	81	870	601
St. Clair	396	29	..	19	76
Erie	9,960	250	60	210	570
Ontario	7,240	100	51	78	27

With this system may be associated for convenience the Red River of the North, which drains a small area in Minnesota and the Dakotas northward through Lake Winnipeg into Hudson Bay. The entire system embraces 175,349 sq. miles of territory. See articles on the Great Lakes severally, NIAGARA FALLS, and ST. LAWRENCE RIVER AND GULF.

The second division comprises all those streams which flow E. and S. into the Atlantic, including all those E. of the Appalachian Mountains. These are all comparatively short streams, navigable only a short distance above their mouths. Among them are the Penobscot, Kennebec, Connecticut, Hudson, Delaware, Susquehanna, Potomac, Rappahannock, James, Roanoke, Neuse, Cape Fear, Pedee, Santee, Edisto, Savannah, Ogeechee, Altamaha, and St. Johns. The area of this division is estimated at 276,890 sq. miles. The third division embraces the Mississippi system, including the great river with all its tributaries, and also the streams of Western Georgia, Western Florida, Alabama, Mississippi, Louisiana, and Texas, which flow into the Gulf of Mexico. The total area of this division is 1,725,980 sq. miles, or more than half the territory of the U. S., excluding Alaska, and of this great area 1,240,039 sq. miles is drained by the Mississippi and its tributaries, the principal of which, with their several drainage areas, are as follows:

River.	Drainage area.
Missouri	527,155
Ohio	201,720
Arkansas	185,671
Red	89,970

Among other tributaries which elsewhere would be important, but are here of secondary importance, are the Minnesota, Des Moines, Illinois, and Yazoo. Of the rivers emptying directly into the Gulf the most important are the Suwanee, Appalachianicola, Mobile, Pearl, Sabine, Trinity, Brazos, Colorado of Texas, Nueces, and Rio Grande. (See MISSISSIPPI, MISSOURI, OHIO, etc., rivers.) The fourth division, that of the Pacific, has an area of 619,240 sq. miles. The principal rivers of this system are the Columbia, with its great branch, the Snake; the Sacramento; and the Colorado of the West. (See COLUMBIA, SACRAMENTO, and COLORADO rivers.) Besides the areas enumerated is to be considered the Great Basin, which has an area of 228,150 sq. miles.

Alaska.—The topographic features of Alaska are very simple. The Cordilleran system passes up through Canada, following the Pacific coast, and enters Alaska in its southeastern part. This portion of Alaska is entirely occupied by these mountains. Proceeding to the N. W., they hug the coast closely as it swings around to the W. and S. W., ultimately dropping into the sea, from which their summits emerge as the islands of the Aleutian Archipelago. Their greatest elevation in Alaskan territory, so far as definitely known, is Mt. St. Elias, 18,100 feet. N. of the Cordilleras is mainly a great plain, stretching northward to the Arctic Ocean. The great river is the Yukon, which, rising in the mountains of Southeastern Alaska and British Columbia, flows N. and then W. to the Bering Sea. In length and volume of water it ranks among the great rivers of the continent. See ALASKA and YUKON RIVER.

Geology.—The most ancient part of the U. S., from a geological point of view, is the northern portion of the Appalachian Mountains, together with the western portion of the Atlantic Plain in the Southern States, including the Blue Ridge. The eastern limit of this ancient Archaean region is indicated by the fall line on the rivers flowing to the Atlantic Ocean. At this point the rivers pass from ancient to recent rocks, from hard to soft rocks, and the point is marked by falls or rapids in the streams, which put an end to navigation from the sea and which have been utilized for water-power. This fall line is at Trenton on the Delaware, Philadelphia on the Schuylkill, Georgetown on the Potomac, Richmond on the James, Columbia on the Santee, and Augusta on the Savannah. Seaward from these points the surface rock is of Tertiary age, and these Tertiary beds, extending around the southern end of the Appalachian system and up the Mississippi valley to Cairo, occupy much of Arkansas and Texas, and all of Louisiana. The upper part of the Mississippi valley is occupied mainly by the Carboniferous, Devonian, and Silurian formations, the first being predominant. The Great Plains are more recent, being mainly covered by Cretaceous and Jura Trias. The Rocky Mountain region is one of extended and violent volcanic action. By the slow action of internal stresses and strains, the mountain ranges have been slowly upheaved, and violent action has resulted in the pouring forth of lava which has spread

over enormous tracts, as the Snake river plains of Idaho. Much of this work is recent, and in the Yellowstone Park in Wyoming the remains of its action are still visible in the form of thousands of hot springs and geysers. See GEOLOGY, and especially the geological maps of the U. S. accompanying that article; also the articles on the various geological periods, formations, and groups.

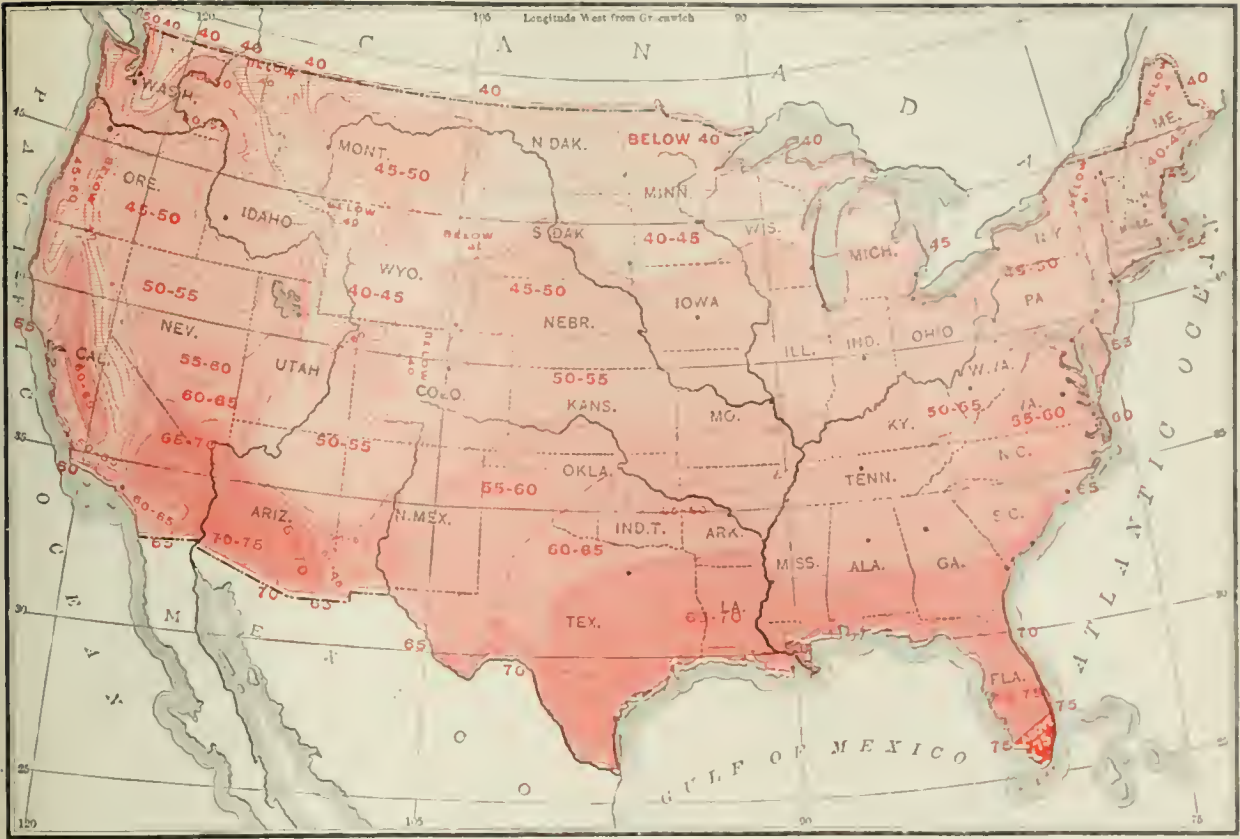

Climate.—The climate of the U. S. ranges widely in different parts, since the country stretches over twenty-four degrees of latitude and from sea-level to 15,000 feet elevation. With every variation of surface it possesses every variety of climate, from that of the tropics to that of the Arctic regions. It is at the same time one of the hottest and one of the coldest countries; one of the wettest and one of the driest.

Temperature.—The temperature ranges with the latitude and the altitude. Along the Gulf coast and on the lower Colorado the mean annual temperature is 75° F., thence it diminishes until at the northern boundary it falls below 40°, while on the high peaks of the Rocky Mountains it is far below freezing-point. The average annual temperature of the whole country is estimated at 53° F. In the eastern part, which has a moist climate and an ample rainfall, the range between summer and winter is not so great, but in the Rocky Mountain region, where the altitude is great and the climate arid, the range is extensive.

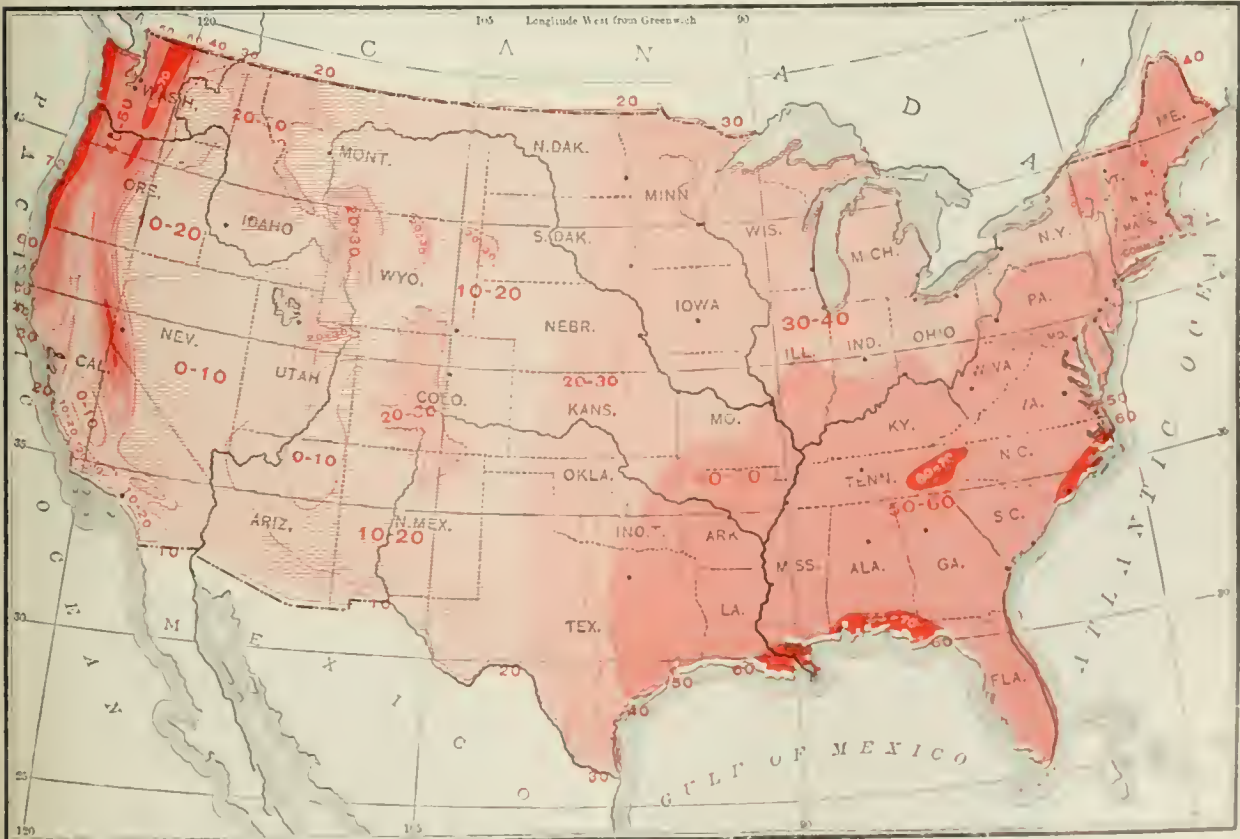

Rainfall.—The rainfall differs greatly in different sections. Over the eastern half it is abundant, over most of the western half it is scanty, and on the northern part of the Pacific coast it is often excessive. The South Atlantic and Gulf coasts receive an annual rainfall exceeding 60 inches; thence northward the precipitation diminishes gradually until about the Great Lakes it commonly does not exceed 30 inches. It diminishes also westward on the slope of the plains, and over most of the Rocky Mountain region it ranges from 10 to 20 inches, being naturally greater on the mountains and less on the valleys and plateaus. In the Great Basin and Southwestern Arizona it is commonly less than 10 inches, and in some localities for years no rain falls. On the northern Pacific coast the rainfall is very heavy, in some localities exceeding in certain years 100 inches, while in the Pacific valley in Oregon and Washington it commonly ranges from 40 to 50 inches. The average annual rainfall on the country as a whole is estimated at 26.7 inches. Over the eastern half of the country the winter rainfall exceeds the summer. The same is the case in so much higher degree on the Pacific coast that the winter is locally known as the rainy season and the summer as the dry season. In the Rocky Mountain region, however, these conditions are reversed. Of the scanty rainfall the greater part falls in summer, and the winter is practically dry, because in winter the ranges near the Pacific coast drain the moisture from the air-currents, while in summer these currents carry most of their moisture over these ranges and deposit it on the mountains and plateaus farther E. See CLIMATE and METEOROLOGY.

Flora.—The flora of the U. S., as might be inferred from the wide range of soil, topography, and climate, is both rich and varied. Tropic species are found in the extreme south, in Florida, Texas, California, and Arizona, and near the northern border and on the high mountains boreal species are found. Throughout the greater part of the country the species are those of the north temperate zone, and are, to a great extent, peculiar to North America. The whole number of indigenous species, exclusive of the lower cryptogams, probably amounts to 5,000, many of which have a wide range. The number of woody species is not less than 800, and over 400 are large enough to be called trees, 250 of which are common. Of the larger and more important, excluding all the smaller and rarer ones, and also those tropical forms found only along the extreme southern border, there are about 120 species in sufficient abundance to have economic importance. Twelve of these occur 200 feet high, and five or six are sometimes 300 or more feet. About 50 of the 120 species belong to the *Conifera*. Compared with Europe the local floras are poorer in the actual number of species but vastly richer in trees, many of which belong to older types. The hickories, sequoias, magnolias, liquidambar, sassafras, etc., so abundant or noteworthy in the New World, are only found fossil in the Old. The U. S. has contributed a few species to the useful plants of cultivation. Many valuable varieties of grasses have originated from native species. Near the Atlantic coast and along the southern borders European explorers found maize, squashes, tobacco, and other useful plants in cultivation among the Indians.

UNITED STATES.

Mean annual temperature in degrees Fahrenheit.

Mean annual rainfall in inches.

The forests are mainly confined to the eastern, well-watered portion of the country. The Atlantic States and those bordering the Gulf westward as far as Central Texas are mainly covered with heavy forests, except where cleared by man. This region includes many of the States of the Mississippi valley, its western limit following roughly the line between Oklahoma and Indian Territory and the western boundary of Missouri as far N. as the mouth of the Kansas river, whence it turns E., excludes the prairies of Northern Missouri, and passes across Southern Illinois, Northern Indiana, and Southern Wisconsin. In Minnesota the line may be said to follow the course of the Minnesota river, and near its head it turns N., following the eastern edge of the Red river valley to the Canadian border. This limit is not a definite line, but a broad belt of country, in which the forests gradually become thinner until they disappear. The plains are treeless, except a narrow belt along the watercourses, and are covered with grasses, grading in the more arid regions into artemesias and cacti. In the Rocky Mountain region, excepting in the extreme N. W., there are no forests, tree vegetation being found, as a rule, only upon the mountains. The valleys and plateaus are covered in the north with artemesias and other desert shrubs, and in the south with cacti, Spanish bayonet, and other plants peculiar to the desert. In Western Washington and Oregon and on some of the elevated plateaus and valleys of Western Montana, the rainfall is sufficient to induce forest growth. This is especially the case W. of the Cascade Range, where the rainfall is superabundant and the forests are luxuriant. It is estimated that altogether, allowing not only for those regions naturally devoid of forests, but those which have been cleared by man, 38 per cent. of the country, or a little over one-third, excluding Alaska, is covered with tree growth. In the low country bordering the Atlantic and Gulf plain the prevalent timber is pine, of various species; in the South the long-leaved, short-leaved, and loblolly pines, in the North the white pine. In the Appalachian Mountains and the upper Mississippi valley, broad-leaved, deciduous trees, oaks, chestnuts, walnuts, poplars, and cherry predominate; and about the lakes and generally in the northern part of the country, pines, firs, spruces, and larches are most abundant. In Western Washington and Oregon, and in the Coast Ranges and Sierra Nevada, the forests consist mainly of coniferous trees. In the latter regions the forest growth has its greatest development. In the Sierra are found the gigantic sequoia and sugar pines, and on the Coast Ranges are found redwoods. See FORESTRY and the names of individual trees.

Fauna.—In general, the fauna is the same as that of North America, which is especially rich in fresh-water forms, for the reason, doubtless, that North America has been a continent ever since the Carboniferous period. The species of vertebrata described number about 2,250, the principal of which may be classified as follows: Mammalia, 310; Aves, 756; Reptilia, 257; Batrachia, 101; Pisces, 816. The Mollusca found in rivers and lakes number 1,034 species; about 400 more are terrestrial and air-breathers; the marine species are very numerous, but nothing approaching a complete enumeration is possible. Of the number of species in the inferior division of the animal kingdom only the rudest estimates can be made. Of the larger quadrupeds, the buffalo, once extremely abundant on the plains and in the Rocky Mountain region, is now practically extinct. The elk or wapiti, several species of deer, and the antelope are still found in unsettled regions. The black cinnamon and grizzly bears are found away from the haunts of man, and on the plains and among the mountains wolves of several species are abundant.

POPULATION AND RACES.

The census of the U. S. is taken, under a provision of the Constitution, every ten years. The work is done under a superintendent, with headquarters in Washington. The country is divided into districts, of which at the census of 1890 there were 175, each under the control of a supervisor, who reported directly to the superintendent. Each supervisor's district was divided into a large number of enumeration districts, the estimated population of which was in no case greater than 4,000, and to each was assigned an enumerator. A house-to-house and farm-to-farm canvass was made in the month of June. The results are tabulated in the office in Washington. See CENSUS.

Population.—The population June 1, 1890, was 62,622,250, showing a rate of increase of about 25 per cent. in the ten

years preceding. This total does not include the population of Alaska, or Indians living on reservations or in tribal relations. Adding these the population closely approximated 63,000,000. The density of population, counting all the inhabitants and the entire area of the country, was 17.37 per square mile. The following table shows the population at each census, the rate of increase, and the average number of inhabitants per square mile:

CENSUS.	Popu- lation.	In- crease.	Density.
1790	3,929,211		4.75
1800	5,308,181	35.10	6.41
1810	7,239,881	36.38	8.62
1820	9,633,822	33.07	11.82
1830	12,869,020	33.75	16.25
1840	17,069,453	32.67	21.83
1850	23,191,876	35.87	27.74
1860	31,143,321	35.58	36.99
1870	38,558,371	23.63	46.70
1880	50,155,783	30.08	61.92
1890	62,622,250	24.86	77.37

The Settled Area.—Adopting the census definition of a settled country, that is, one which has a population of two or more to the square mile, the settled area in 1890 comprised nearly 2,000,000 square miles, or somewhat more than half the area of the entire country, and about two-thirds of its area, excluding Alaska. The following table shows the settled area at each census, and the proportion which it bore to the total area:

CENSUS.	Settled area, square miles.	Proportion of settled to total area, per cent.
1790	239,935	20
1800	365,708	37
1810	467,915	30
1820	598,717	25
1830	632,717	31
1840	807,262	39
1850	979,249	33
1860	1,194,754	39
1870	1,272,339	35
1880	1,569,570	44
1890	1,947,285	54

Center of Population.—The center of population is the center of gravity of the population, each individual being supposed to have the same weight and to press downward with a force proportional to his distance from that center. The movements of this point from census to census constitute a net resultant of all the movements of population. The following table, with the accompanying map, shows this movement since the first census. In a century the center has moved well into Indiana from a position near Baltimore, keeping all the time close to the 39th parallel:

CENSUS.	39° 16' 5" N. lat., 76° 11' 2" W. lon.
1790	39° 16' 5" N. lat., 76° 11' 2" W. lon.
1800	39 16 1
1810	39 11 5
1820	39 5 7
1830	38 57 9
1840	39 2 0
1850	38 50 0
1860	39 0 1
1870	39 12 0
1880	39 4 1
1890	39 11 9

Urban Population.—The urban population has increased at a much more rapid rate than the total population. In 1790 the inhabitants of cities of 8,000 or more constituted but 3 per cent. of the total population. In 1890 they constituted 29 per cent. The increase of the urban element is set forth in the following table:

CENSUS.	Urban population.	Proportion of urban to total population, per cent.
1790	131,472	3
1800	210,873	4
1810	356,920	5
1820	475,135	5
1830	861,509	7
1840	1,453,964	9
1850	2,897,586	12
1860	5,072,256	16
1870	8,071,875	21
1880	11,318,547	23
1890	18,284,787	29

The States containing the highest proportion of urban population are those of the North. More than half the population of the North Atlantic States is contained in cities of 8,000 or more inhabitants, while of the North Central States more than one-quarter are found in similar cities. Indeed, four-fifths of all the urban population of the country is found in the Northern States. In 1890 there were 28 cities containing 100,000 or more inhabitants each, and of these three—New York, Chicago, and Philadelphia—contained more than 1,000,000 inhabitants each. The following is a list of these cities, with their population:

CITIES OF OVER 100,000 POPULATION IN 1890.

New York.....	1,515,301	Detroit.....	205,876
Chicago.....	1,099,850	Milwaukee.....	204,468
Philadelphia.....	1,046,964	Newark.....	181,830
Brooklyn.....	806,343	Minneapolis.....	164,738
St. Louis.....	451,770	Jersey City.....	163,003
Boston.....	448,447	Louisville.....	161,129
Baltimore.....	434,439	Omaha.....	140,452
San Francisco.....	298,997	Rochester.....	133,806
Cincinnati.....	296,908	St. Paul.....	133,156
Cleveland.....	261,353	Kansas City.....	132,716
Buffalo.....	255,664	Providence.....	132,146
New Orleans.....	242,039	Denver.....	106,713
Pittsburg.....	238,617	Indianapolis.....	105,436
Washington.....	230,392	Allegheny.....	105,287

Size of Families.—The average number of persons to a family in 1890 was 4.93. The size of the family is diminishing slowly, but steadily, as shown by a comparison of this with the figures for previous censuses:

AVERAGE SIZE OF FAMILIES AT EACH CENSUS.

1850.....	5.55
1860.....	5.28
1870.....	5.09
1880.....	5.04
1890.....	4.93

The smallest families are found in the North Atlantic and Western States, and the largest in the Southern States.

Sex.—In 1890 51.21 per cent. of the population were males and 48.79 per cent. were females. In most of the Atlantic States the females exceeded the males in number, but in the remaining States males were in excess, and in the newer States of the Rocky Mountain region they were largely in excess. The general excess of males is due to immigration.

Race.—In 1890 the Negroes, including in that term all those of full or mixed blood, numbered 7,470,040, and the whites 54,983,968, the remainder of the population being made up of Chinese, Japanese, and citizen Indians. The proportion of the Negroes has steadily diminished during the century, being only about two-thirds as great in 1890 as in 1790.

WHITE AND COLORED AT EACH CENSUS.

CENSUS.	WHITE.		COLORED.*	
	Number.	Per cent.	Number.	Per cent.
1790.....	3,172,006	80.73	757,208	19.27
1800.....	4,366,446	81.13	1,002,037	18.87
1810.....	5,862,073	80.97	1,377,808	19.03
1820.....	7,802,166	81.61	1,771,656	18.39
1830.....	10,537,378	81.90	2,328,642	18.10
1840.....	14,195,805	83.17	2,873,648	16.83
1850.....	19,553,068	84.31	3,638,808	15.69
1860.....	26,922,537	85.62	4,520,784	14.38
1870.....	33,589,377	87.11	4,968,994	12.89
1880.....	43,402,970	86.54	6,752,813	13.46
1890.....	54,983,968	87.80	7,638,282	12.20

* Including Chinese, Japanese, and citizen Indians.

The colored were found mainly in the Southern States, seven-eighths of them living S. of Mason and Dixon's line, the Ohio river, and the southern boundary of Missouri. In these States, as a whole, they constituted nearly one-third of the entire population in 1890; in Louisiana they constituted one-half, and in Mississippi and South Carolina very nearly three-fifths. The Chinese population has remained unchanged in consequence of the enforcement of the Chinese Exclusion Act. In 1890 they numbered 107,745.

Nativity.—In 1890 there were 9,249,547 persons of foreign birth, leaving 53,372,703 natives, of whom 45,862,023 were native whites. The foreign born constituted 14.77 per cent. of the population.

The following table gives the numbers of the native, native white, and foreign-born elements since 1850, the year of the census in which statistics giving these particulars were first obtained:

NATIVITY OF THE POPULATION, 1850 TO 1890.

CENSUS.	Native.	Native white.		Foreign born.
		Native white.	Foreign born.	
1850.....	20,947,274	17,373,804	2,244,602	
1860.....	27,304,624	22,862,794	4,138,697	
1870.....	32,991,142	28,111,133	5,567,329	
1880.....	40,475,840	36,805,047	6,679,943	
1890.....	53,372,703	45,862,023	9,249,547	

The following table converts the above figures into percentages of the population:

CENSUS.	Native.	Native white.		Foreign born.
		Native white.	Foreign born.	
1850.....	90.32	73.24	9.68	
1860.....	86.84	73.46	13.16	
1870.....	85.56	72.91	14.44	
1880.....	86.68	73.56	13.32	
1890.....	85.23	73.24	14.77	

The source of the element of foreign birth is immigration from Europe, which has been exceedingly active for nearly half a century and particularly since 1880. Between 1880 and 1890 5,246,613 immigrants entered the U. S. The following table shows the immigration in each ten-year period since statistics were first obtained:

IMMIGRATION.

1821 to 1830.....	143,439
1831 to 1840.....	599,125
1841 to 1850.....	1,713,251
1851 to 1860.....	2,579,580
1861 to 1870.....	2,282,787
1871 to 1880.....	2,812,191
1881 to 1890.....	5,246,613

See IMMIGRATION and SOCIOLOGY.

The following table classifies the foreign born by the principal contributing nationalities:

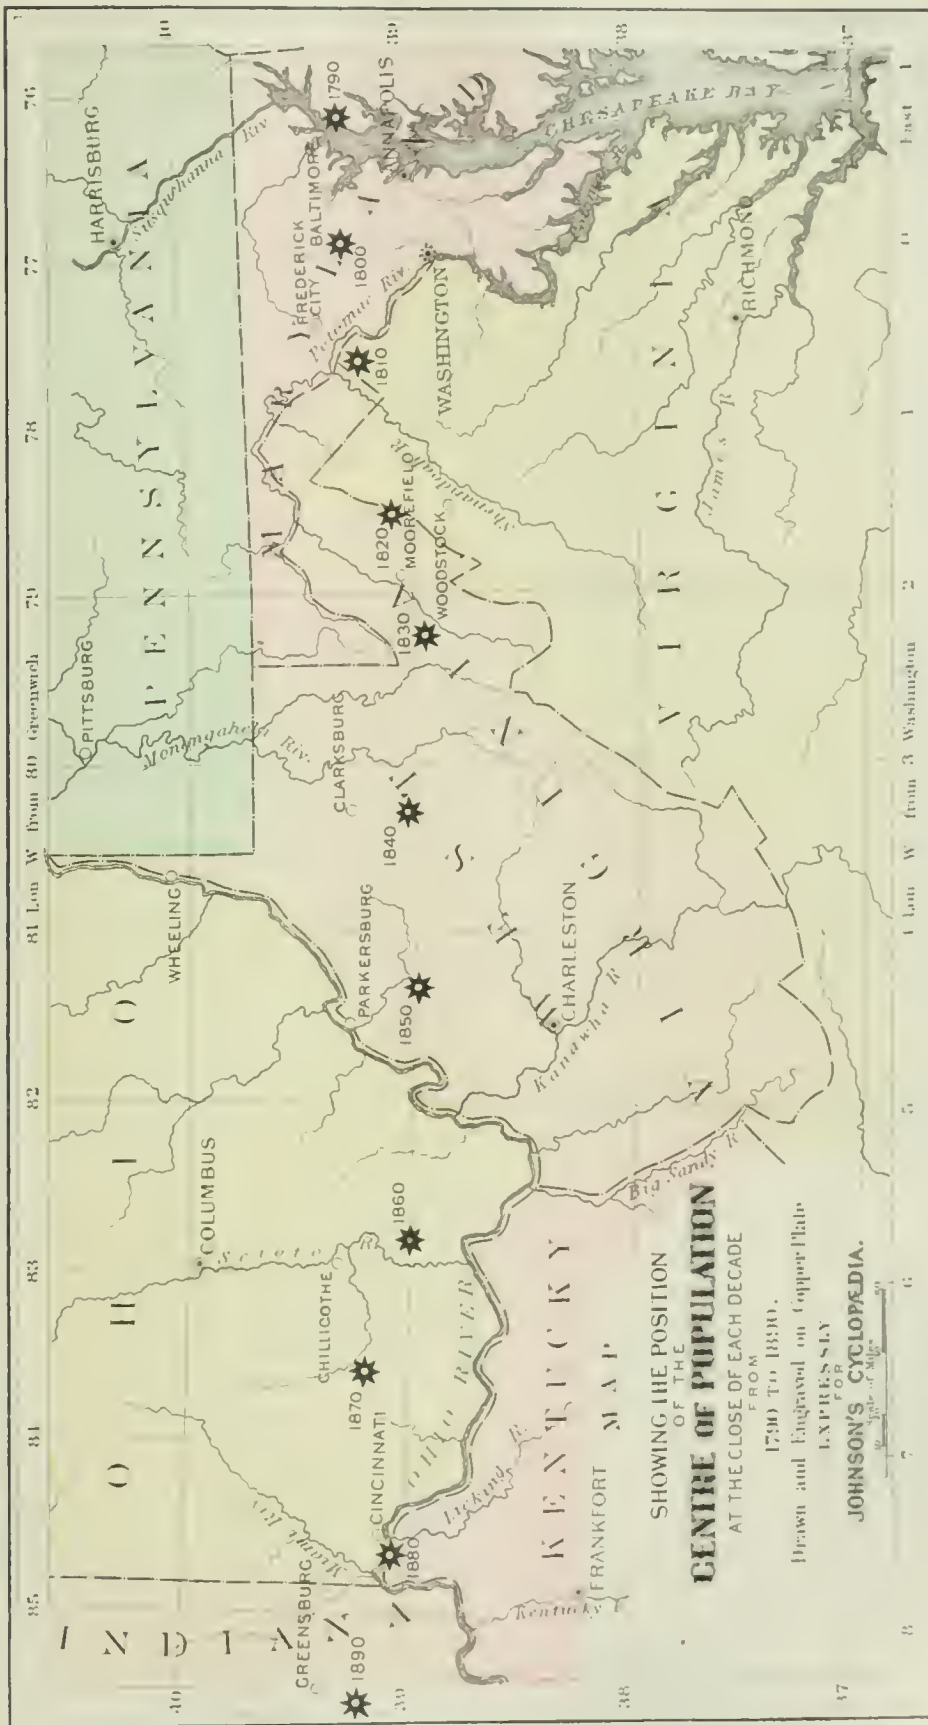

FOREIGN BORN, BY PRINCIPAL NATIONALITIES, 1890.

Germany.....	2,784,894
Ireland.....	1,871,468
England, Scotland, and Wales.....	1,251,397
Canada and Newfoundland.....	980,941
Norway, Sweden, and Denmark.....	933,349
Russia.....	182,645
Italy.....	182,580
Poland.....	147,440
Austria.....	133,271
Bohemia.....	118,106
France.....	113,174
China.....	106,462
Switzerland.....	104,069
Hungary.....	62,435

This element of foreign birth is found mainly in the Northern States, only a trifling number having gone into the Southern. With the exceptions of the Norwegians and Swedes the foreign element is found principally in the cities, where it is often in far higher proportion than is the native. The number of persons whose parents were of foreign birth, including the foreign born, was 20,263,902, constituting 32 per cent. or nearly one-third of the entire population. The distribution of this class is similar to that of the foreign born.

CONSTITUENTS OF THE POPULATION OF THE GREAT CITIES.

FRANKFORT

CENTRE OF POPULATION

nearly all of it being comprised in the Northern and Western States. The foreign element, including those born abroad as well as those whose parents were born abroad, is very large in the more northern States of the Mississippi valley and in certain New England States. In North Dakota only about one-fifth of the population was of native parentage, in Minnesota about one-fourth, and in Wisconsin a little more than one-fourth, while in twelve States less than half the people were of native parentage. A similar situation was developed in the great cities: the preceding table of the 28 cities which have more than 100,000 inhabitants shows the percentage of the various elements in the population of each.

Of the large foreign element of Cincinnati and Milwaukee, more than two-thirds are Germans. The Germans form a majority of the foreign element also in Louisville, Baltimore, St. Louis, Indianapolis, and Allegheny. In New York 33 per cent. of the foreign element consists of Germans and 30 per cent. of Irish. In Chicago 36 per cent. are Germans, 16 per cent. Irish, and 16 per cent. Scandinavians. In St. Paul 31 per cent. are Germans and 32 per cent. Scandinavians, and in Minneapolis 56 per cent. of the foreign born are Scandinavians.

The following table shows the population by States and Territories, and by nativity and race:

POPULATION BY NATIVITY AND RACE.

STATES AND TERRITORIES.	Total population.	White.	Colored.	Native.	Native white.	Foreign born.
Alabama	1,513,017	823,718	679,269	1,498,210	819,114	34,777
Arizona	59,620	55,580	1,040	49,825	38,117	18,795

Wisconsin	1,689,880	1,680,473	6,407	1,167,681	1,161,484	519,199
Wyoming	69,705	59,275	4,430	45,792	44,815	14,913

85,580,882 acres, or 133,720 sq. miles. The total Indian population, as returned by the census of 1890, was 249,273. Of these there were on reservations and under the control of the Indian office, 133,382. The Five Civilized Tribes in the Indian Territory, who are self-supporting, numbered as follows: Cherokees, 29,590; Chickasaws, 7,182; Choctaws, 14,379; Creeks, 14,632; Seminoles, 2,561—total, 68,344, of whom 52,065 were reported as Indians, including mixed bloods, the remainder being whites who had married into the tribes or colored citizens of the tribes. The Pueblo Indians of New Mexico numbered 8,278; the Six Nations of New York, 5,304; and the Eastern Cherokees of North Carolina, 2,885. Indians who had abandoned tribal relations and established themselves among the whites numbered 32,567. See INDIANS OF NORTH AMERICA.

Mortality.—The estimated death-rate of the population is 18 per 1,000. Among persons of foreign birth the rate is greater than this, and among the colored it is much greater, being in the cities very nearly double that of the whites. The rate in the cities is naturally very much greater than that in the rural districts, especially among young children. The most prevalent and fatal diseases are in the order mentioned: Consumption, which in 1890 was the cause of 11.6 per cent. of all deaths; pneumonia, 8.8 per cent.; diarrhical diseases, 8.5 per cent.; diphtheria and croup together, 4.8 per cent.; enteric fever, 3.1 per cent.; and malarial fever, 2.1 per cent. See also VITAL STATISTICS.

Dependents and Prisoners.—The number of insane in 1890 was 106,254, or 1,619 per 1,000,000 of inhabitants; feeble-minded, 95,571, or 1,526 per 1,000,000; deaf and dumb, 41,283 (659 per 1,000,000); blind, 50,411 (805 per 1,000,000); and prisoners, 83,329, of whom 75,924 were men and 6,405 were women. Of prisoners, 57,310 were white and 25,019 colored. Classifying them by nativity and race, and reducing the numbers to proportions of the total number of inhabitants, it appears that of white natives of native parentage 6 out of every 10,000 are prisoners; of white natives of foreign parentage, 13 out of every 10,000; of the foreign born, 17 out of every 10,000; and of the colored, 32 out of every 10,000. The number of paupers in almshouses was 73,015. Classifying these also by race and nativity, and obtaining the proportion between the number of paupers and the number of population of each race and nativity, it appears that 9 out of every 10,000 of the native whites were paupers; while the similar figures for the foreign born are 30 out of every 10,000; and of the colored, 9 out of every 10,000. The low proportion of paupers among the colored is probably due to the fact that there are few almshouses in the South. For other statistics, see the article VITAL STATISTICS.

PUBLIC LANDS.

Accessions of Territory.—The original limits of the U. S. extended on the W. to the Mississippi river, and on the S. to the 31st parallel. From time to time accessions of territory were made, as set forth and illustrated in the following map and table:

AREA OF ACQUIRED TERRITORY.

DATE.	Name.	Area, sq. m.
1803	Louisiana purchase	1,171,000
1821	Florida purchase	53,000
1845	Annexation of Texas	870,000
1848	Mexican cession	547,000
1853	Gadsden purchase	29,000
1867	Purchase of Alaska	570,000

Alaska, 32,052, of whom 4,298 are white.
Indian Territory, 179,321, of whom 50,055 are Indians and 109,384 are whites.

Indians.—Indians "not taxed"—i. e. in tribal relations—are excluded by the Constitution from the basis of political representation. The several tribes are regarded as domestic, dependent nations, governed by their own laws, yet subject to the sovereignty of the U. S.; having a right of occupancy in their lands, yet without the power to cede those lands except to the U. S. The policy of removing the Indians to lands W. of the Mississippi was inaugurated about 1825, and largely carried out in the twenty years following, especially with the Southern or Appalachian Indians—the Creeks, Choctaws, Chickasaws, Cherokees, and Seminoles. Besides the Indian Territory, other large reservations have been set apart for Indian occupation, especially in Montana and the Dakotas. The total area of these reservations was, in 1894,

Of the original territory much was unsettled, and was claimed by certain of the original States, their claims overlapping one another in a perplexing manner. As a simple method of settling these conflicting claims, these States ceded them to the U. S., and thus the U. S. became a large landowner. Each addition of territory has added to the Government's land holdings, with the exception of Texas.

(1) *Methods of Subdivision.*—In order to subdivide the lands into parcels convenient for disposal, they have been cut up into townships, sections, and quarter-sections, under a uniform system—a section comprising a square mile and a township 36 sq. miles. The method of survey is as follows: Starting from an initial point, selected arbitrarily, an east and west line, known as a base line, and a north and south line, known as a principal meridian, are run through it. At intervals of 24 miles on the principal meridian, lines are run east and west. These are known as standard parallels, or correction lines. At similar intervals of 24 miles on the base line, and on these standard parallels, lines are run N. 24 miles, to the next standard parallel. In this way the land is divided into tracts approximately 24 miles on a side. On account of the convergence of meridians, the tracts are not exact squares, but are narrower at the N. than at the S. These tracts are then divided into townships by lines following meridians and parallels, and the townships are divided into sections in a similar manner. The ranges, as the north and south tiers of townships are termed, are numbered E. and W. of the principal meridian, and the townships are numbered N. or S. of the base line. The sections are numbered within each township, beginning with the northeasternmost, running thence westward to the west line, the northwestern one being numbered 6, while that S. of it is 7, and thence the numbers increase to the E., then to the W. again, etc. For example, the southwest section of a township may be designated as Sec. 31, Twp. 4 N., R. 15 W. of the 6th Principal Meridian.

(2) *Methods of Disposal.*—The policy of the U. S. in disposing of its public lands has been to use them to aid in the extension of settlements and the development of its domain rather than for purposes of profit. Accordingly, liberal homestead and pre-emption laws (see **HOMESTEAD LAWS**) have been enacted, by which actual settlers can obtain land for little more than the cost of surveying it; grants have been made to railways to enable them to extend their lines into unsettled regions; and donations have been made for educational purposes. Apart from special grants, the public lands have been acquired by individuals in the following ways: (1) Under the Homestead Act, by which a tract of 80 acres at \$2.50 an acre (called double minimum land), or 160 acres at \$1.25, may be obtained through the payment of certain fees and commissions, ranging from \$7 to \$34, on condition that the applicant resides on and cultivates the land for five years; (2) under the Pre-emption Act, through which a person may, by entering at the appropriate land office a tract of 80 or 160 acres, secure a right to take the land at Government rates whenever it may be offered for sale (repealed in 1891); (3) by auction, whenever offered by proclamation of the President or by public notice from the general land office at Washington; (4) after a failure to sell by auction, the lands remain subject to purchase by what is called private entry at any subsequent period; (5) by timber-culture, or planting trees on 10 acres, one may obtain a patent for 160 acres free, at the end of three years (repealed in 1891); (6) by providing means of irrigation, settlers may take up a full section, 640 acres, of desert land.

Excluding Alaska, the entire area of the public lands may be estimated at 1,440,000,000 acres. Of this area the U. S. had, to July 1, 1894, disposed of 895,000,000 acres, leaving 545,000,000 acres still in its possession. The following table shows the principal items of disposition:

DISPOSITION OF PUBLIC LANDS.

	Acres.
Homesteads.....	147,000,000
Cash sales.....	224,000,000
Railway land grants patented.....	80,000,000
Swamp lands to States.....	70,000,000
Land bounties for military services.....	61,000,000

Of the remainder, a large part, say one-sixth, consists of Indian reservations; another large part, perhaps an equal proportion, has been granted to railways, but is not yet patented, since the conditions under which the grants were made have not been fulfilled; and a third large part, which it is impossible to estimate, has been filed on by settlers, but title has not yet passed.

PUBLIC IMPROVEMENTS.

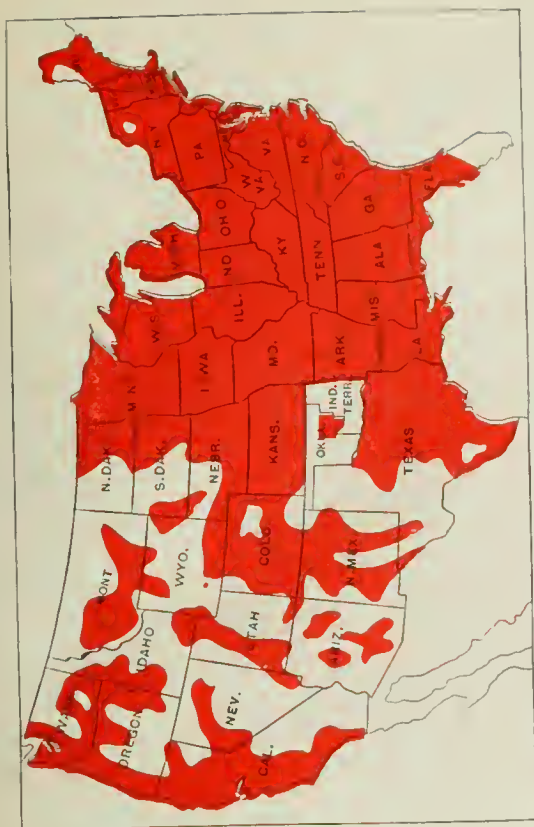

In the early part of the nineteenth century public improvements were made by the individual States. During this period many great works were undertaken and carried through by them. Among these is the Erie Canal, built by the State of New York, which is still one of the most important factors in transportation from the West, notwithstanding the development of railways. A number of canals were also built by Pennsylvania, Virginia, Ohio, and Indiana, but most of them are now merely matters of history. After 1820, or thereabouts, the general Government undertook public improvements, and constructed several wagon-roads, among them the great Cumberland road across the Appalachian Mountains. In 1850 it inaugurated a policy, since carried out on a large scale, of aiding in the construction of railways by grants of lands. The first railway to be so aided was the Illinois Central in Illinois. At first grants were made to the railways through the medium of the States; subsequently, however, the grants were made directly to the corporations. By these grants the construction of many of the roads of the far West was made possible. The lands were granted in alternate sections for a certain breadth on each side of the road, the Government retaining the other sections. As it often happened that certain lands within these belts had already passed into other ownership, indemnity strips were added outside of the grant—strips from which the companies could select land to indemnify themselves for such sections of the grant as had already passed from Government ownership. The price of the Government sections within the grant limits was immediately doubled, so that while the Government encouraged the building of railways by granting lands, it suffered no loss, the increased price being easily obtained on account of the facilities afforded by the railway for transportation. This policy of the Government has resulted in great good to the country by inducing rapid settlement. The total amount of land which had been so patented to railways in 1894 was 80,000,000 acres. In addition to these land grants, States and municipalities have made large subsidies to railways, usually in the form of subscriptions, either to bonds or to capital stock. In 1870 the general Government began making direct appropriations for river and harbor improvements in aid of navigation. The appropriation amounted in that year to the modest sum of \$2,000,000, but it increased, with a few setbacks, until in 1890 it was in excess of \$25,000,000. While these appropriations are in many instances unwise and the money is used in a wasteful manner, both upon unworthy objects and under bad plans, still many useful results have been attained; the navigation of the great rivers, the Ohio, Mississippi, and Missouri, has been greatly improved; the construction of the jetty system at the mouth of the Mississippi river has made New Orleans an important port and has given it an immense commerce; the construction of the canal at Sault St. Marie has connected the navigation of Lake Superior with that of the lower lakes; the entrances to many harbors have been deepened, and the shelter which they afforded has been improved by means of breakwaters. The U. S. maintains an admirable system of coast lighting, for details of which see **LIGHTHOUSE**. It also maintains an efficient life-saving service upon its coasts. See **LIFE-SAVING SERVICE**.

MEANS OF COMMUNICATION.

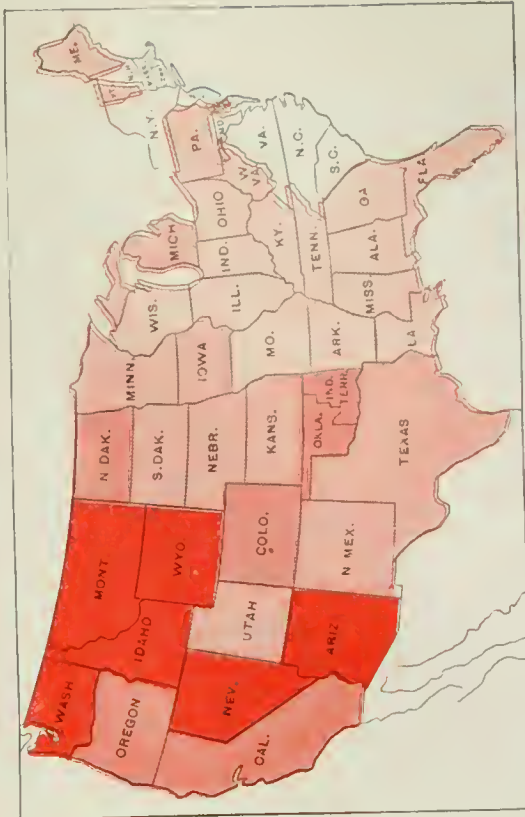

Railways.—At the close of 1893 there were in operation 177,753 miles of railway, the capital stock of which was \$5,080,032,904; funded debt, \$5,570,292,613; and floating debt, \$410,361,593. The total liabilities therefore, which may be regarded as representing the cost of the roads, are \$11,060,687,920. The average cost per mile for construction was \$63.021; the gross earnings, \$1,222,618,290, or 11.1 per cent. the cost of construction; the net earnings were \$364,591,109; and the dividends paid during the year \$95,337,681, which is 1.86 per cent. of the stock. The average rate of interest paid on the bonds and floating debt was 4.1 per cent. The number of passengers carried 1 mile was 15,246,711,952; average receipts per passenger per mile, 2.05 cents; amount of freight carried 1 mile, 90,552,087,290 tons; average receipts per ton per mile for freight, 0.89 cents. See **RAILWAYS, TUNNELS, etc.**

Rivers.—The rivers furnish a system of internal navigation of the highest importance. The system of the St. Lawrence river and the Great Lakes provides, with the aid of two canals, access from the ocean to the head of Lakes Superior and Michigan, in the heart of the continent, and

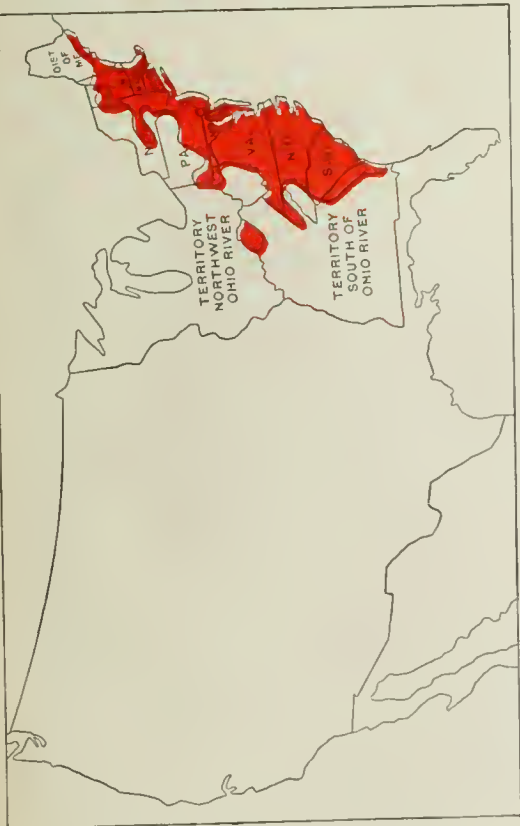

UNITED STATES.

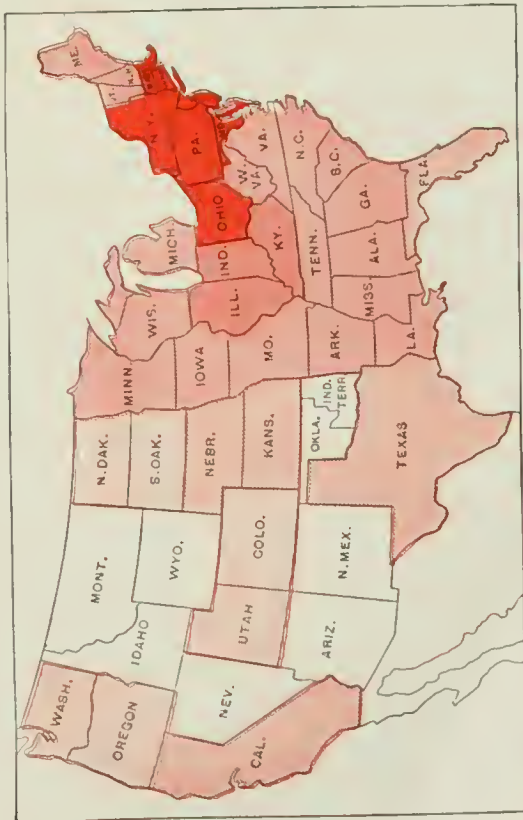

Settled area in 1890.

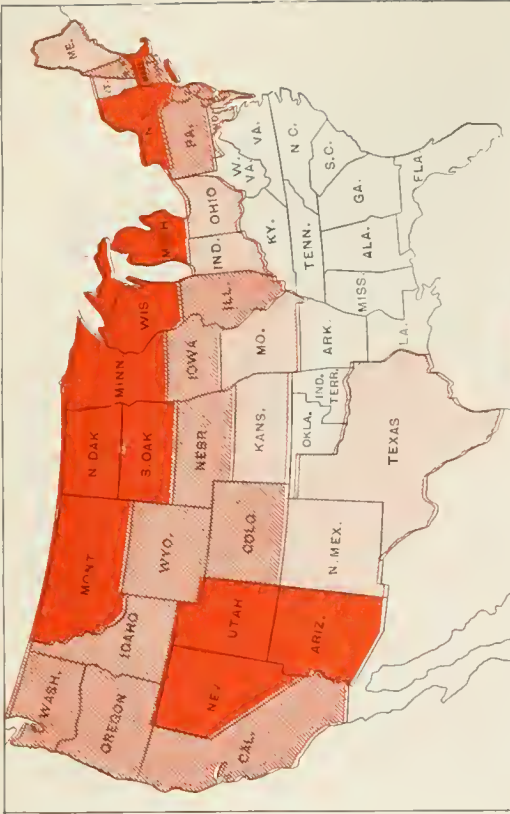

Distribution of population by sex (1890).

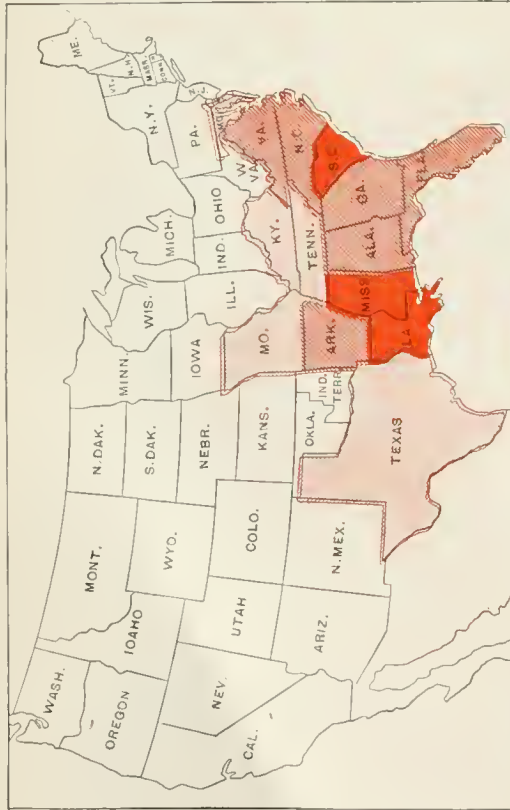

Settled area in 1790.

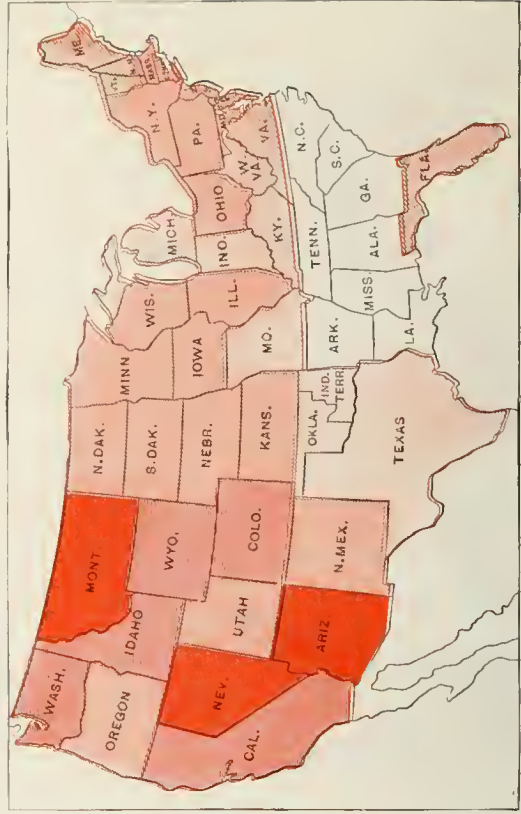

Density of population (1890).

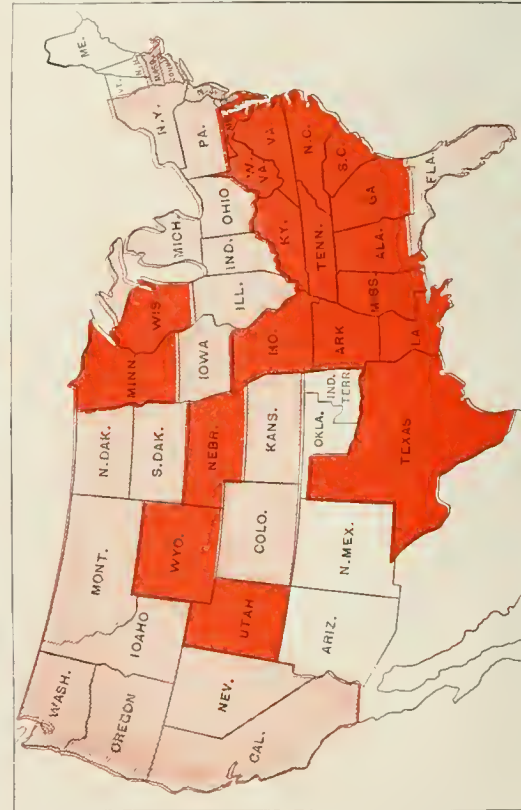

Proportion of foreign-born to total population (1890).

Proportion of colored persons to total population (1890).

Wealth (in dollars) per capita of the population (1890).

Average size of families (1890).

this is utilized yearly by nearly 1,000,000 tons of shipping. The rivers of the Atlantic Plain have but short navigable courses, ranging from 100 to 200 miles in length, as their navigability is stopped at the fall line. The Mississippi is the greatest artery of the country. The main stream is navigable, by the aid of a canal at Rock Island, Ill., to the Falls of St. Anthony at Minneapolis; the Ohio is navigable to Pittsburg; the Missouri at high water to Great Falls, Mont.; the Arkansas to Fort Smith, Ark.; the Red river to Shreveport, La. Besides these, many other branches of the great river are navigable for considerable distances, making it possible for river traffic to compete with railway transportation over a large part of the Mississippi valley.

Canals.—Prior to the construction of railways, many canals were built in the Eastern States, in part at State expense and in part by private corporations. The advent of the railway checked their construction, and has since induced the discontinuance of fully half of them. In 1890 the total mileage of canals in operation was 2,704, of which 2,598 miles were canals proper, and 106 miles slackwater navigation. The tonnage which passed through them in that year is given as 21,046,857. The gross income of the canals was \$3,900,000, and the expense of maintenance \$2,070,589, leaving a profit of \$1,829,425. See CANALS and articles on individual canals, such as the ERIE, ILLINOIS AND MICHIGAN, JAMES RIVER AND KANAWHA.

Postal Service.—The statistics of postal service for 1894 are as follows: Total number of post-offices, 69,805; extent of post routes, 454,746 miles, of which 169,768 was railway routes; revenue of the department, \$75,080,479; expenditure, \$84,324,414; deficit, \$9,243,935. See POSTAL SERVICE.

Telegraphs and Telephones.—The telegraph system is almost entirely in the hands of a single corporation, the Western Union Telegraph Company, which in 1894 had 21,166 offices, operated 190,303 miles of line, over which were strung 790,792 miles of wire, sent over 58,600,000 messages, and had receipts of \$21,900,000 and expenditures of \$16,000,000. (See TELEGRAPH.) The telephone business is almost entirely in the hands of a single company, which in 1894 had 838 exchanges and 237,186 subscribers, operated 353,480 miles of local and 154,106 miles of long-distance lines, and paid dividends amounting to \$3,339,156. See TELEPHONE.

INDUSTRIES.

Agriculture.—The latest statistics of agriculture which are reliable are from the U. S. census of 1890, and concern the crops of the preceding year. Up to and including the census of 1880 agriculture was in all respects the leading industry of the country. Returns from the census of 1890 indicate that while it was still the leading industry as regards the number of persons engaged in and supported by it, it had become secondary to manufactures in respect to the value of the product. Probably two-fifths of those engaged in profitable occupations among the population were engaged in agriculture, and a corresponding proportion of the total population were supported thereby. The value of agricultural products in 1890 was returned as \$2,460,000,000, the increase over corresponding figures for 1880 being at the rate of 11 per cent., a rate of increase very much less than that of the population. The estimated net value of manufactures in 1890 was a trifle over \$4,000,000,000, and the rate of increase in the value of the net product in the ten years preceding was slightly in excess of 100 per cent., a rate very much greater than that of the population. These facts indicate that the increase in population between 1880 and 1890 went in great measure to manufacturing industries rather than to those of agriculture. In 1890 the number of farms was 4,565,000, the rate of increase during the ten years preceding being but 14 per cent. The value of farms in 1890 was \$13,276,000,000; the rate of increase in the ten years preceding was 30 per cent., a rate greater than that of the number of farms and indicating an increased value per farm. Farming tools and machinery were valued at \$491,000,000. From 1850 to 1880 the average size of farms diminished from 203 to 134 acres. The census of 1890 showed a slight increase, the average size being 137 acres. The extent of improved or cultivated land in 1890 was 358,000,000 acres, or about 560,000 sq. miles, being about 18 per cent. of the area of the country, excluding Alaska. The proportion of cultivated land in the different States ranges very widely. It is highest in the States of Illinois and Iowa, where nearly three-fourths of the total area is cultivated, while in Ohio more than two-thirds and in Indiana three-fifths is under cultivation. In Southern New England about one-half the

area is cultivated. In the Southern States the proportion is about one-quarter of the total area, and in many of the States of the Cordilleran region less than 1 per cent. is as yet under cultivation.

The cotton crop is one of the most important, and as an export crop the most important, of all the products of agriculture. The crop of 1892, as appears from the estimates of the Agricultural Department, was the largest ever raised, comprising 9,038,707 bales, and that of 1893 was 7,493,000 bales. The crop of 1889, as shown by the census returns, was 7,434,687 bales. Cotton is produced mainly in the South Atlantic States S. of Virginia and in those bordering on the Gulf of Mexico, together with Arkansas. The following table shows the product in each of these States during the census year:

YIELD OF COTTON IN 1889, BY STATES.

State.	Bales.
Texas.....	1,470,353
Georgia.....	1,191,919
Mississippi.....	1,151,406
Alabama.....	915,414
South Carolina.....	746,798
Arkansas.....	691,423
Louisiana.....	659,583
North Carolina.....	336,245

About two-thirds of the cotton crop is exported, mainly to Great Britain, and most of the remainder is manufactured in New England. (See COTTON.) The wheat crop in 1894 was, according to the estimates of the Department of Agriculture, 460,000,000 bush.; in 1891, by the same authority, 612,000,000, the largest ever produced; and in 1889, by the census returns, 468,000,000. This crop is produced mainly in the Northern States of the Mississippi valley. One-third to one-fourth of the crop is annually exported. (See WHEAT.) Indian corn or maize is cultivated to an enormous extent and over a wide area, extending from the southern to the northern limits of the country. The greater proportion of the crop, however, is produced in the Middle States of the Mississippi valley, from Kentucky and Ohio westward to Kansas and Nebraska. The largest crop ever produced was that of 1889, which amounted to 2,122,073,463 bush. In 1891 the estimates of the Department of Agriculture reported a crop of only 1,213,000,000 bush. (See MAIZE.) Oats is a crop of great importance, and its cultivation is rapidly increasing. It is produced mainly in the Northern States of the Mississippi valley and about the Great Lakes. The product of 1889 was 809,000,000 bush. Since then it has fluctuated in different years, being in 1894, according to the estimates of the Department of Agriculture, 662,000,000 bush. (See OAT.) The product of rye in 1894 was 27,000,000 bush.; of barley 61,000,000; and of buckwheat 13,000,000. These are hardy crops and are produced mainly in the Northern States. The tobacco crop of 1894 was 407,000,000 lb.; in 1889, 488,000,000. Nearly half of it was produced in Kentucky, and this State, with Virginia, Ohio, North Carolina, Tennessee, and Pennsylvania, produced over 400,000,000 lb. It was raised to a greater or less extent in 42 of the States and Territories. (See TOBACCO.) The hay crop is one of the most valuable. See HAY.

The number of farm animals in 1895 was as follows:

Horses.....	15,893,318
Mules.....	2,323,108
Cows.....	16,504,629
Other cattle.....	34,364,216
Sheep.....	42,291,064
Swine.....	43,892,708

The value of live stock was estimated at \$1,818,000,000. See CATTLE, SHEEP, SWINE, etc.

The wool clip was estimated in 1894 at 278,000,000 lb. The sugar product of the same year was as follows, in millions of pounds.

Cane.....	611.2
Sorghum.....	0.9
Beet.....	45.2
Maple.....	7.6

See SUGAR.

Irrigation.—In the States and Territories of the Cordilleran region, with the exception of the northwestern part of California, Western Oregon, and Washington, irrigation is necessary for the successful prosecution of agriculture, owing to insufficient rainfall. This area includes about 1,250,000 sq. miles, or two-fifths of the total area of the country, excluding Alaska. The full utilization of the water resources of this region may possibly result in the reclamation of one-tenth of this area. In 1890, however, only about

one-half of 1 per cent. of the entire area had been thus reclaimed. See IRRIGATION.

Manufactures.—Manufactures, in respect to the value of products, constitute the leading industry of the U. S., and their importance is increasing more rapidly than that of agriculture. In 1890 the census returns showed that the number of manufacturing establishments having an annual product of more than \$500 each numbered 355,415; the capital employed in these establishments was \$6,139,000,000; the number of employeés was 4,712,622; and the total expenditure in wages was \$2,283,000,000, an average to the employeé of \$485, which may be assumed as the average yearly wage. The cost of the material used was \$5,162,000,000, and the gross value of the product \$9,372,000,000, showing a net product, after deducting the materials used, of \$4,210,000,000. All these figures show an enormous increase since 1880. The number of establishments increased 40 per cent.; capital, 121 per cent., showing a great increase in the average capital per establishment, and a consequent centralization of industries; wages, 131 per cent., being at a greater rate than the increase of capital; cost of material, 48 per cent.; and the value of products, 69 per cent. The manufacturing section is situated mainly in the North Atlantic States, spreading with diminishing importance westward, following closely the distribution of the urban population. About half of the manufactured product of 1890 came from the nine States included in the North Atlantic group, and about one-third from the North Central States. These two groups of States together produced fully 83 per cent. of all the manufactured product of the country. The principal branches of manufacture, as measured by the value of product in 1890, are set forth in the following table, which includes all those whose product exceeds \$50,000,000:

VALUE OF MANUFACTURED PRODUCTS.

Agricultural implements.....	\$81,000,000
Blacksmithing and wheelwrighting.....	54,000,000
Boots and shoes.....	256,000,000
Bakeries.....	128,000,000
Brick and tile manufactures.....	68,000,000
Butter and cheese.....	63,000,000
Carpentering.....	281,000,000
Carpets.....	50,000,000
Carriages and wagons.....	115,000,000
Cars, construction and repair.....	206,000,000
Chemicals.....	59,000,000
Clothing.....	503,000,000
Coffee and spice, roasting and grinding.....	75,000,000
Confectionery.....	56,000,000
Cotton goods.....	268,000,000
Flouring and grist mills.....	514,000,000
Foundries and machine-shops.....	413,000,000
Furniture.....	119,000,000
Glass.....	57,000,000
Hosiery and knit goods.....	67,000,000
Iron and steel.....	562,000,000
Leather.....	171,000,000
Liquors.....	200,000,000
Lumber products.....	587,000,000
Masonry, brick and stone.....	204,000,000
Painting and paper-hanging.....	74,000,000
Paper.....	74,000,000
Petroleum-refining.....	85,000,000
Plumbing and gasfitting.....	81,000,000
Printing and publishing.....	275,000,000
Silk manufactures.....	87,000,000
Slaughtering and meat-packing.....	565,000,000
Sugar-refining.....	123,000,000
Tin, copper, and sheet-iron working.....	67,000,000
Tobacco manufactures.....	195,000,000
Woolen goods.....	139,000,000
Worsted goods.....	79,000,000

See the articles FACTORIES AND FACTORY SYSTEM, STRIKES AND LOCKOUTS, COTTON MANUFACTURES, etc.

Patents.—In its patent system the U. S. is far in advance of any other country. During the year 1894 20,867 patents were issued. See PATENTS.

METALLIC PRODUCTS.

PRODUCTS.	Quantity.	Value.
Pig iron, long tons.....	7,124,502	\$84,810,426
Silver, troy ounces.....	60,000,000	77,575,757
Gold, troy ounces.....	1,739,081	35,950,000
Copper, pounds.....	337,416,848	32,054,601
Lead, short tons.....	163,982	11,839,500
Zinc, short tons.....	78,832	6,306,560
Quicksilver, flasks.....	30,164	1,108,527
Aluminium, pounds.....	339,629	266,903
Antimony, short tons.....	250	45,000
Nickel, pounds.....	49,399	27,197
Tin, pounds.....	8,938	1,788
Platinum, troy ounces.....	75	517
Total value of metallic products.....		\$249,981,866

NON-METALLIC MINERAL PRODUCTS.

PRODUCTS.	Quantity.	Value.
Bituminous coal, long tons.....	114,629,671	\$122,751,618
Pennsylvania anthracite, long tons.....	48,185,306	85,687,078
Lime, barrels.....	58,000,000	35,960,000
Building-stone.....		33,865,573
Petroleum, barrels.....	48,412,666	28,932,326
Natural gas.....		14,346,250
Clay (all except potter's clay).....		9,000,000
Cement, barrels.....	8,002,467	6,262,841
Mineral waters, gallons sold.....	23,544,495	4,346,734
Phosphate rock, long tons.....	941,368	4,136,070
Salt, barrels.....	11,816,772	4,054,668
Limestone for iron flux, long tons.....	3,958,055	2,374,833
Zinc white, short tons.....	24,059	1,804,420
Potter's clay, long tons.....	400,000	900,000
Gypsum, short tons.....	253,615	696,615
Borax, pounds.....	8,699,000	652,425
Mineral paints, short tons.....	37,714	530,284
Fibrous talc, short tons.....	35,861	403,436
Asphaltum, short tons.....	47,779	372,232
Pyrites, long tons.....	83,277	275,302
Precious stones.....		264,041
Soapstone, short tons.....	21,071	255,067
Corundum, short tons.....	1,713	142,225
Novaculite, pounds.....		135,173
Bromine, pounds.....	348,399	104,520
Mica, pounds.....	66,971	88,929
Barytes, short tons.....	28,970	88,506
Fluorspar, short tons.....	12,400	84,000
Feldspar, long tons.....	18,391	68,037
Manganese ore, long tons.....	7,718	66,614
Flint, long tons.....	29,671	63,792
Graphite, pounds.....	843,103	63,232
Sulphur, short tons.....	1,200	42,000
Marls, short tons.....	75,000	40,000
Infusorial earth, short tons.....		22,582
Chromic iron ore, long tons.....	1,450	21,750
Millstones.....		16,645
Cobalt oxide, pounds.....	8,422	10,346
Magnesite, short tons.....	704	7,040
Asbestos, short tons.....	50	2,500
Total value of non-metallic mineral products.....		\$358,839,804
Total value of metallic products.....		249,981,866
Estimated value of mineral products unspecified.....		1,000,000
Grand total.....		\$609,821,670

Mineral Production.—The preceding tables give the quantities and values of the metallic and non-metallic mineral products of the U. S. for the calendar year 1893, as estimated by the U. S. Geological Survey. For details regarding the distribution of the leading mineral products, see articles under their several heads.

Fisheries.—The fisheries of the U. S. form an important industry; in 1893 the exports alone amounted to over \$5,500,000, and the total value is over \$40,000,000. Nearly three-fourths of this comes from the Atlantic States, over 5 per cent. each from the Gulf States and from the Great Lakes, and nearly 15 per cent. from the Pacific States. In the last-named the salmon is the most important fish taken. See also the articles FISHERIES and FISHERY RELATIONS OF THE UNITED STATES.

COMMERCE.

The commerce of the U. S. is of enormous proportions, but by far the greater part of it is internal, consisting of an interchange of commodities from one part of the country to another. It is estimated that its internal trade is twenty-four times as great in volume as its external trade, and in value ten times as great. In 1895-96 the domestic exports had a value of \$863,200,487, and the total exports \$882,606,938; the imports a value of \$779,724,674. The principal items of export were raw material, consisting principally of agricultural products, as follows:

Article.	Value.
Cotton (raw).....	\$190,056,460
Breadstuffs.....	141,356,993
Meat and dairy products.....	131,503,590
Petroleum and products.....	62,383,403
Animals.....	41,840,969

The following are the principal items of import:

Article.	Value.
Sugar.....	\$89,986,017
Coffee.....	84,793,124
Tea.....	12,704,440
Silk goods.....	26,652,768
Woolen goods.....	53,494,400
Cotton manufactures.....	32,437,504
Manufactures of iron and steel.....	9,097,731

See COMMERCE AND INTERSTATE COMMERCE.

Shipping.—In 1890 the amount of shipping which sailed under the U. S. flag was 7,633,676 tons, including that

engaged in foreign trade and in domestic trade on the seacoast and Great Lakes, and on the rivers. Classified as above the tonnage was:

Vessels.	Tons.
Engaged in foreign trade	928,062
Coastwise trade	2,385,879
Lake trade	926,355
River traffic	3,393,380

In other words, only about one-eighth of the shipping was engaged in foreign traffic, the remaining seven-eighths being engaged in domestic trade, while fully two-fifths of the whole amount was engaged on the navigable rivers. The shipping may also be classified as follows:

Vessels.	Tons.
Steam-vessels	1,820,386
Sailing vessels	1,735,443
Unrigged vessels	4,017,847

This large class of unrigged vessels consists mainly of barges, largely employed upon the great navigable rivers, where a number of them are towed by tugs as a locomotive draws a train of freight-cars. They are of considerable capacity, averaging 500 tons each. The amount of freight moved by water in 1890 was 172,110,423 tons: the average length of journey is unknown, and therefore these figures can not be compared with transportation by rail, but it is probable that, measured in tonnage, water transportation is in volume about one-fourth that by rail, while measured by values it is doubtless much less, inasmuch as articles conveyed by water are commonly bulky and less costly.

Ship-building.—The statistics of ship-building for 1894 show that the total number constructed was 838, with a tonnage of 131,195, classified as follows:

Sailing vessels:	
Ships and barks	3
Schooners	253
Sloops, canal-boats, and barges	289
Steam-vessels	293
Total	838

Of the above, 39 vessels, with a tonnage of 51,470, were built of iron, the remainder being of wood. See SHIP-BUILDING.

Banks.—The number of national banks in 1894 was 3,755; their net earnings were \$22,192,422, and dividends \$22,101,910, being 3.3 per cent. of the capital stock. The following table sets forth the liabilities and assets of national banks in 1894:

LIABILITIES.

Capital	\$668,900,000
Surplus	245,200,000
Undivided profits	88,900,000
Circulation	172,300,000
Deposits	1,712,100,000
Due to banks	526,900,000
Other liabilities	29,600,000
Total	\$3,473,900,000

ASSETS.

Loans	\$2,007,100,000
Bonds for circulation	199,600,000
Other U. S. bonds	25,000,000
Stocks, bonds, etc.	193,500,000
Due from banks	399,300,000
Real estate	97,000,000
Specie	237,300,000
Legal-tender notes	139,500,000
National bank-notes	18,600,000
Clearing-house exchanges	88,500,000
U. S. certificates of deposit	45,100,000
Due from U. S. treasurer	9,000,000
Other sources	31,200,000
Total	\$3,473,900,000

The savings-banks numbered 1,025; had deposits amounting to \$1,777,900,000, and surplus of \$139,700,000; undivided profits \$26,000,000, and other liabilities \$37,100,000. There are also numerous banks in each State, operating under State charters or acts of incorporation, which report to the State authorities only. See BANK and SAVINGS-BANKS. See also articles on BUILDING AND LOAN ASSOCIATIONS, CLEARING-HOUSE, FIRE-INSURANCE, LIFE-INSURANCE, etc.

GOVERNMENT.

The government is based on the Constitution of Sept. 17, 1787, and amendments made thereto in the years 1791, 1798, 1804, 1865, 1868, and 1870. The electors of the most numerous branch of the several State legislatures are qualified voters either directly or indirectly in the States respectively for all elective officers of the Federal Government. All legislative powers are vested in a Congress, which consists of a Senate of two members from each State, elected by the Legislature thereof for six years, and a House of Representatives, the members of which are apportioned according to population, and elected by the people directly in districts for two years. Each State is entitled to at least one representative. The Constitution provided for a specific number of Representatives to the first Congress, but afterward the number was designated by a vote of Congress itself after each decennial census. Besides its ordinary legislative capacity, the Senate is vested with certain judicial functions, and its members constitute a high court of impeachment. No person can be convicted by this court unless on the concurrence of two-thirds of the Senators present, nor does judgment extend further than to removal from office and disqualification to hold a federal office thereafter. The House of Representatives has the sole power of impeachment. The executive power is vested in a President, who is elected by an electoral college chosen by popular vote, or by the legislatures of the States, the number of electors from each State being equal to the number of its Senators and Representatives in Congress. His term of office is four years, and he is eligible for re-election, but custom has pronounced against a third term. The electors forming the college are themselves chosen in the manner prescribed by

PRESIDENTS AND VICE-PRESIDENTS.

Term.	Presidents.	Vice-Presidents.	Held office.
1	George Washington, Virginia	John Adams, Massachusetts	Apr. 30, 1789, to Mar. 4, 1793

29	Benjamin Harrison, Indiana	Levi P. Morton, New York	" 1889, to " 1893
30	Grover Cleveland, New York	Adlai E. Stevenson, Illinois	" 1893, to " 1897
31	William McKinley, Ohio	Garret A. Hobart, New Jersey	" 1897

the laws of the several States, but an act of Congress provides that the presidential electors shall be all chosen upon the same day—viz., on Tuesday after the first Monday in November. (See ELECTORS.) A majority of the aggregate number of votes given is necessary to the election of President and Vice-President; and if none of the candidates has such a majority, then the election of President is determined by the House of Representatives from among the three candidates having the highest number of electoral votes, and that of the Vice-President by the Senate from among the two candidates having the highest number. In voting for President the vote is taken by States, the entire delegation from any State having but one vote. No person can be President or Vice-President who is not a native-born citizen. The President is commander-in-chief of the army and navy, and of the militia when in the service of the Union. With the concurrence of two-thirds of the Senate he has the power to make treaties, and to appoint civil and military officers. He has a veto on all laws passed by Congress, but so qualified that, notwithstanding his disapproval, any bill becomes a law on its being afterward approved of by two-thirds of both Houses of Congress. The President has a salary of \$50,000 a year, and the Executive Mansion at Washington for a residence during his official term. The Vice-President is *ex-officio* president of the Senate; and in case of the death, resignation, or other disability of the President the powers and duties of that office devolve upon him for the remainder of the term for which the President

had been elected. This provision of the Constitution came into operation for the first time in 1841, on the demise of William H. Harrison, who died one month after his inauguration, when John Tyler, the Vice-President, succeeded to the presidency. Vice-President Fillmore succeeded President Taylor. Vice-President Johnson succeeded President Lincoln in 1865, and Vice-President Arthur succeeded President Garfield in 1881. In case of the removal, death, resignation, or inability of both the President and the Vice-President, the Secretary of State is the first officer in the line of succession. See CONSTITUTION OF THE UNITED STATES, CONGRESS, LAW-MAKING, METHODS OF; and LEGISLATURES.

The administrative business of the nation is conducted by several high officers, of whom six have the title of secretary, and who form what is termed the cabinet, or advisory council, of the President. These are the Secretary of State, the Secretary of the Interior, the Secretary of the Treasury, the Secretary of War, the Secretary of the Navy, the Postmaster-General, the Attorney-General (the official law authority for advisement in administrative affairs), and the Secretary of Agriculture. They are appointed by the President, by and with the advice and consent of the Senate, and the several departments of the Government are under their direct control. (See the articles on the respective departments.) The following table gives the names and dates of appointment of those who have held the several offices since the adoption of the Constitution, although the Postmaster-General was not a member of the cabinet till 1829:

SECRETARIES OF STATE.

Thomas Jefferson, Va.	Sept. 26, 1789	Hugh S. Legaré, S. C.	May 9, 1843	James G. Blaine, Me.	Mar. 5, 1881
Edm. Randolph, Va.	Jan. 2, 1794	Abel P. Upshur, Va.	July 24, 1843	Fred. T. Frelinghuysen, N. J.	Dec. 12, 1881

* Previous to the election of 1804 each elector voted for two candidates for President; the one receiving the highest number of votes, if a majority, was declared elected President, and the next highest Vice-President.
 † Three States out of thirteen did not vote—viz., New York, which had not passed an electoral law, and North Carolina and Rhode Island, which had not adopted the Constitution.
 ‡ There having been a tie vote, the choice devolved upon the House of Representatives. A choice was made on the thirty-sixth ballot, which was as follows: Jefferson—Georgia, Kentucky, Maryland, New Jersey, New York, North Carolina, Pennsylvania, Tennessee, Vermont, and Virginia—10 States; Burr—Connecticut, Massachusetts, New Hampshire, and Rhode Island—4 States; Black—Delaware and South Carolina—2 States.

* No choice having been made by the electoral college, the election of a President devolved upon the House of Representatives, in accordance with a provision of the twelfth amendment to the Constitution. This directs that only the three candidates who stand highest in the electoral vote shall be voted for. A choice was made on the first ballot, which was as follows: Adams—Connecticut, Illinois, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Missouri, New Hampshire, New York, Ohio, Rhode Island, and Vermont—13 States; Jackson—Alabama, Indiana, Mississippi, New Jersey, Pennsylvania, South Carolina, and Tennessee—7 States; Crawford—Delaware, Georgia, North Carolina, and Virginia—4 States.

† No candidate having received a majority of the votes of the electoral college, the Senate elected R. M. Johnson Vice-President, who received 33 votes; Francis Granger received 16.

‡ Eleven States did not vote—viz., Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, and Virginia.

§ Three States did not vote—viz., Mississippi, Texas, and Virginia.

* In 1872 Horace Greeley, Democratic and Liberal-Republican candidate for President, having died before the electoral vote was cast, the Greeley electors voted as above for Thomas A. Hendricks in five States. Kentucky, Georgia, and Missouri cast 38 electoral votes for B. Gratz Brown, of Missouri, for President, Georgia 2 votes for Charles J. Jenkins, of Georgia, and Missouri 1 vote for David Davis, of Illinois; and 17 votes irregularly cast were not counted by Congress.

Courts.—The judicial powers of the U. S. are vested in a judicial tribunal of the Union, is composed of a chief justice and eight associate justices. One session is held annually at the capital, beginning on the first Monday in October and closing generally early in May. See Courts.

CHIEF JUSTICES AND DATES OF APPOINTMENT.

John Jay, N. Y.	Sept. 26, 1789	John Marshall, Va.	Jan. 27, 1801	Morrison R. Waite, O.	Jan. 21, 1874
John Rutledge, S. C.	July 1, 1795	Roger P. Taney, Md.	Dec. 28, 1835	Melville W. Fuller, Ill.	July 30, 1888
Oliver Ellsworth, Conn.	Mar. 4, 1796	Salmon P. Chase, O.	Dec. 6, 1864		

The circuit courts are held by a justice of the Supreme Court and the judge of the district in which the court sits, conjointly. The U. S. is divided into nine judicial circuits, in each of which a session is held twice a year.

CIRCUITS.

The district courts are held by the district judges alone. Each State forms one or more districts. There are, besides these, territorial courts, which are temporary, and lose that character whenever a Territory becomes a State. Each court has a clerk, an attorney, and a marshal. All judges of the U. S. courts are appointed by the President, by and with the advice and consent of the Senate, and hold their offices during good behavior. See COURTS.

Political Subdivisions—The political organization of the States is essentially similar to that of the general Government, the chief executive officer being the Governor. Legislative functions are carried on by a Legislature consisting of two

subdivided in various ways. The relative power reposed in the county government and in that of its subdivisions differs greatly in different States. In New England the counties are divided into towns or cities, and these towns and cities retain nearly all the powers of government not assumed by the States, the county being comparatively unimportant as a political division. In the northern States of the Mississippi valley the counties are, as a rule, divided into townships, and the powers are shared in almost equal proportion by these townships and the counties. In the Southern and most of the Western States, the subdivisions of the county are politically very feeble, nearly all the powers being held by the county government. These subdivisions bear various names, being known in Delaware as hundreds, in Maryland, Florida, and other States as election districts, in the Virginias and Kentucky as magisterial districts, in the Carolinas and Arkansas as townships, in Georgia as militia districts, in Alabama and Mississippi as beats, and in Louisiana as wards.

Various classes of municipalities are chartered in different States. Cities are chartered in all States, and in some all municipal incorporations are designated as cities of a certain class, as in Missouri, where four classes of cities are chartered. The New England city is simply a chartered

SUMMARY OF THE STATES AND TERRITORIES.

STATES AND TERRITORIES.	SETTLEMENT.		DATE OF ACT CREATING		Term of Government, years.	TERM OF LEGISLATURE, YEARS		Capital.

houses, similar to the Federal Congress, and the laws are enforced by a State judiciary. The government of the organized Territories is in part by the general Government and in part by the people. The President appoints the Governor and certain other territorial officers, while the Legislature is elected by the people of the Territory. The District of Columbia is governed directly by the general Government, the President appointing its executive, which consists of three commissioners. Its laws are made by Congress, and its judiciary is appointed by the President. Indian Territory and Alaska are unorganized Territories.

The States are divided into counties, which in the case of Louisiana are known as parishes, and the counties are

town. In some States cities are independent of the township organization, in others are subject to it. Some cities are independent of county organization, as Baltimore and St. Louis, and some comprise the entire county, as New York and San Francisco. In most of the States towns and villages are incorporated; in New Jersey and Pennsylvania boroughs are chartered; and in Ohio minor incorporations, known as hamlets, exist.

Altogether, there were, in 1890, nearly 45,000 distinct governments coexistent in the U. S., including the States, Territories, counties, townships, and other county subdivisions, and the various classes of municipal incorporations.

ARMY AND NAVY.

The army consists of 2,169 commissioned officers and 25,000 non-commissioned officers and privates. The organization is as follows:

DIVISIONS.	Commi-ssioned officers.	Non-commissioned officers and privates.
General staff.....	400	
Ordnance corps.....	58	450
Engineer corps.....	113	500
10 regiments of cavalry.....	432	6,050
5 regiments of artillery.....	289	3,675
25 regiments of infantry.....	877	14,135
Indian scouts, etc.....		2,300
Totals.....	2,169	25,000

See ARMY, MILITARY ACADEMIES, MACHINE AND RAPID-FIRE GUNS, MAGAZINE-GUNS, ARTILLERY, ORDNANCE, and SMALL-ARMS.

Militia.—Most of the States maintain an organized militia force. In 1893 this comprised 9,278 commissioned officers and 102,912 enlisted men, exclusive of the naval militia maintained by some of the maritime States. In 1895 this force comprised 226 officers and 2,706 men, with 13 practice-ships, assigned to as many States by the Federal Government.

Navy.—The naval force consists (1895) of 726 officers, 8,250 enlisted men and boys, and a Marine Corps of 2,177 officers and men. The U. S. has been engaged since 1884 in reconstructing its navy, and rates as fifth among naval powers. It has (1895) 6 armored battle-ships in commission or under construction and nearly completed, 2 armored cruisers, and 20 monitors, most of which are of an old type, and were constructed during the war of 1861-65. Of unarmored cruisers she has 3 of the first-rate, 11 second-rate, 9 third-rate (built in recent times), together with 3 gun-boats, and 7 torpedo-boats. There are also in commission 16 vessels, most of them of wood, and of old construction. See SHIPS OF WAR, NAVY, and NAVAL ACADEMIES.

Pensions.—There were expended in 1894 by the pension bureau \$140,772,163, making the total payments since 1861 on account of pensions \$1,717,275,718. The number of pensioners on the rolls was 969,544, of which 754,382 were invalid pensioners and 215,162 were widows and children.

FINANCE.

The total receipts for the year ending June 30, 1894, were \$372,802,498.29, derived from the following sources:

Source.	Amount.
Customs.....	\$131,818,530.62
Internal revenue.....	117,111,232.81
Postal service.....	75,080,479.04
Miscellaneous.....	18,792,255.82

The total disbursements for the year were \$442,605,758.87, the constituent items of which were:

Legislative.....	\$8,921,301.27
Executive, proper.....	138,935.48
State Department.....	1,842,245.26
Treasury Department (except int. on debt).....	59,557,915.45
Interest on public debt.....	27,841,405.64
War Department.....	56,841,758.51
Navy Department.....	32,090,058.46
Interior Department (except pensions).....	19,294,536.37
Pensions.....	141,177,284.96
Post-office Department.....	85,825,418.64
Department of Agriculture.....	2,704,118.11
Department of Labor.....	167,833.74
Department of Justice.....	283,398.00
Judicial.....	6,008,948.38

See FINANCE, TARIFFS, SUBSIDIES, PROTECTION, and FREE TRADE.

Circulation.—The total amount of money of all kinds in circulation in the country in 1894 was \$1,660,808,708, or \$24.33 per capita of estimated population, besides which there was in the U. S. treasury \$759,626,073, making the total amount of money in circulation and in the treasury \$2,420,434,781, or \$35.44 per capita. The following table classifies the currency as gold, silver, different kinds of paper, etc.:

GOLD:	
In treasury, including bullion.....	\$131,316,471
In circulation.....	405,976,730
Total.....	\$537,293,201
Certificates in treasury..... \$48,050	
In circulation.....	66,339,849
Total.....	\$114,389,899

SILVER:	
Silver dollars and bullion in treasury.....	\$495,435,370
Subsidiary coin in treasury.....	17,728,968
Total.....	\$513,164,338
Dollars in circulation..... \$52,561,992	
Subsidiary coin in circulation.....	58,510,957
Total.....	\$111,072,949
Certificates in treasury..... \$10,487,768	
In circulation.....	385,325,736
Total.....	\$395,813,504
PAPER:	
U. S. notes in treasury.....	\$80,091,414
In circulation.....	266,580,602
Total.....	\$346,672,016
National bank-notes in treasury..... \$6,635,044	
In circulation.....	200,219,743
Total.....	\$206,854,787
FRACTIONAL CURRENCY:	
In treasury.....	\$17,002,988
In circulation.....	134,681,429
Total.....	\$151,684,417

See the articles COINAGE, MINT, MONETARY STANDARDS, SILVER COINAGE, etc.

Public Debt.—The public debt, which, less cash in the treasury, amounted in 1866 to \$2,773,000,000, has been greatly reduced, and in 1894 amounted to only \$899,313,380, or \$13.17 per capita of the population. Of this amount, \$635,041,890 was interest-bearing, almost entirely at 4 per cent. The debts of States aggregated in 1890 \$228,997,389, showing a rapid reduction in the preceding ten years. The debts of counties amounted in the same year to about \$145,000,000, and that of municipalities to \$724,463,060, these classes showing a slight increase in the ten years preceding. See DEBT, PUBLIC.

Wealth.—The total assessed valuation of property in 1890 was \$25,473,173,418. On this there were levied taxes amounting to \$471,365,140. Of the total assessed valuation, \$18,956,556,675 was on real estate, and \$6,516,616,743 on personal property, being in the proportion of about three to one. The true valuation has been estimated at the time of each census since 1850 as follows:

CENSUS YEAR.	Estimated valuation.	Per capita.
1850.....	\$7,135,780,228	\$308
1860.....	16,159,616,068	514
1870.....	30,008,518,507	780
1880.....	43,642,090,000	870
1890.....	65,037,091,197	1,036

The following are the particular items of the estimate for 1890:

Real estate and improvements.....	\$30,544,544,333
Live stock, farm implements, and machinery.....	2,703,015,040
Mines, quarries, and products on hand.....	1,291,291,579
Gold and silver coin and bullion.....	1,158,774,948
Machinery of mills and products on hand, either raw or manufactured.....	3,058,583,441
Railways and equipment.....	8,085,407,323
Telegraphs, telephones, shipping, and canals.....	701,755,712
Miscellaneous.....	7,893,708,821
Total.....	\$65,037,091,197

RELIGION.

In the U. S. the utmost freedom regarding religious belief prevails, and this fact, coupled with the great diversity of the peoples and the independence and boldness of thought, has resulted in the existence of a most bewildering number of religious denominations, the principal of which, with the membership of each, are given in the following table:

Roman Catholic.....	6,257,871	German Evangel. Synod.....	187,432
Methodist.....	4,589,284	Latter-day Saints.....	196,125
Baptist.....	3,762,729	Evangelical Association.....	133,313
Presbyterian.....	1,278,332	Jews.....	130,106
Lutheran.....	1,231,072	Friends.....	107,308
Christian.....	714,773	Dunkards.....	73,795
Protestant Episcopal.....	540,509	Unitarian.....	67,749
Congregational.....	512,771	Adventist.....	60,491
Reformed.....	309,458	Universalist.....	44,094
United Brethren.....	225,158	Mennonite.....	44,741

As is seen, the Roman Catholic is the most powerful religious body. Its membership as reported represents the entire Roman Catholic population, as compared with the

communicant members of other denominations. It is derived from various sources widely dispersed over the country. In the Northeastern States it is made up largely of Irish and French-Canadian stock, while further West, along the shores of the Great Lakes, the Roman Catholics are principally French Canadians by birth or extraction. In Maryland they are the descendants of some of the early settlers; in Louisiana of the early French settlers; and in Texas, Arizona, New Mexico, and Southern California, the Mexican population is responsible for the strength of this denomination. The Methodist and Baptist denominations have the greatest strength in the Southern States, both among the white and colored, nearly all the colored race belonging to one or the other of them. The Presbyterians are found mainly in the Middle and Southern States and in the upper Mississippi valley. The Lutherans are a German denomination, and are found in their greatest strength wherever the German element predominates. The Christians are scattered widely over the country. The Episcopalians are found very largely in the Northeastern States, especially in New York, New Jersey, and Connecticut. The Congregationalists were formerly confined chiefly to New England, but since 1850 have increased rapidly in the Northwest. From the returns of the census of 1890 it is learned that the value of church property in 1890 was \$680,000,000; the number of clergymen, preachers, etc., 108,879; and the number of communicants 20,661,046—a trifle more than one-third the population of the country, and a half of that part of the population ten or more years of age.

EDUCATION.

Elementary education is mainly provided for by public schools. The number of children enrolled in all schools, public, private, and parochial, in 1890, was 14,373,670, of whom 12,967,468 were white and 1,416,202 colored. This is about 75 per cent. of the children of school age. Of the total number entered in all schools, about nine-tenths are in the public and the remainder in about equal proportions in private and parochial schools. The enrollment in the schools is much more nearly complete in the Northern than in the Southern States, and most complete of all in Kansas, where 94 per cent. of the children of school age are enrolled, while Maine and Ohio each enrolled 93 per cent. The total number of teachers was 363,935, of which a little more than one-third were males and a little less than two-thirds were females. The total expenditure for public schools was \$140,277,484, an average rate of \$17 per pupil in average attendance. The amount expended per pupil in the North was, as a rule, above this average, while that in the South was below it. Of schools for higher education, including universities and colleges, there were 476, employing 11,843 professors and instructors. Of these, 2,709 were employed in the preparatory departments, 6,263 in the collegiate, and 2,871 in the professional. Of students there were in the preparatory departments 45,188; the collegiate, 60,415; and the professional, 21,265—total, 126,868. The property, including buildings and grounds, productive funds, and other items, is in excess of \$220,000,000; the total income of all these institutions is \$15,365,612. See EDUCATION, SCHOOLS, COMMON SCHOOLS, COLLEGE, and UNIVERSITY.

The following is a general summary of statistics of professional schools for 1893-94:

CLASS OF SCHOOLS.	Schools.	Instructors.	Students.	Graduates.
Theological.....	147	963	7,658	1,462
Law.....	67	621	7,311	2,454
Medical.....	152	1,195	21,802	5,133
Dental.....	35	794	4,152	877
Pharmaceutical.....	35	283	3,658	988
Veterinary.....	8	118	554	171
Nurse training.....	66	...	2,710	970
Totals.....	510	6,974	47,845	12,055

Illiteracy.—The number of illiterates was reported in 1890 as 6,324,702. This is 13.3 per cent. of the population over ten years of age. The white illiterates comprised but 7.7 per cent. of all the whites over ten years of age, while the corresponding proportion for colored is 56.8 per cent. In 1880 70 per cent. of all the colored were illiterate, showing a rapid reduction of illiteracy among this race. Of the native white population ten years of age and over, 6.2 per cent. were illiterate, while among the foreign born the percentage of illiteracy was 13.1, being more than twice as great as among the native whites. Illiteracy is much greater

in the South than in the North. Among the native whites of the North, less than 3 per cent. are illiterate; among the native whites of the South the proportion is nearly 15 per cent. The State having the smallest proportion of illiterates among its entire population is Nebraska, with 3.1 per cent., and that having the largest is Louisiana, where 45.8 per cent. of the people are illiterates, due to the large proportion of colored population.

Periodicals.—According to Rowell, the total number of periodicals published in 1895 in the U. S. was 19,530. They were classified as follows by frequency of issue:

Weekly.....	14,096	Bi-weekly.....	79
Monthly.....	2,548	Bi-monthly.....	49
Daily.....	1,956	Tri-weekly.....	37
Semi-weekly.....	301	Tri-monthly.....	5
Semi-monthly.....	272	Semi-quarterly.....	5
Quarterly.....	182		

The total yearly issue of all periodicals is estimated at 3,481,610,000 copies, an average of 50 per inhabitant.

HISTORY.

The Colonial and Provincial Period.—The discovery of the North American continent by the Norsemen, the Spaniards, the English, and the French is sufficiently described under the titles VINLAND, NORUMBEGA, PONCE DE LEON, CABOT, SOTO, CHAMPLAIN, RALEIGH, SMITH, PURITANS, and the other explorers and settlers prominently connected with this early period. Under the names of the several States information concerning the settlement and colonization of particular localities will also be found. Results only can be considered here. The coming of the Norsemen in the tenth century left no permanent impression; and the only abiding influence of the discovery of Florida by the Spaniards was the Spanish claim to that territory, which was purchased by the U. S. in the nineteenth century. With the English and the French, however, the matter was very different. In a general way, it may be said that the English established permanent settlements along the coast-line from Florida to Nova Scotia, and claimed the territory extending indefinitely westward; while the French, taking the river St. Lawrence as the basis of their advances, pushed along the line of the Great Lakes and down to the mouth of the Mississippi. Thus English methods and institutions came to prevail in the eastern part of what is now the U. S., while the institutions of France established themselves in the North and West. It was inevitable that disputes concerning the boundary-lines should take place at an early day. The claims of the English and those of the French were quite irreconcilable. Both nations tried to establish lines of defense and attack along the lakes and on the Ohio river. The French were far more skillful than the English in dealing with the Indians, and consequently the Indians generally fought on the French side. King George's war (1744 and 1748) settled nothing, and the final trial of strength did not come until the French and Indian War (see FRENCH WAR), which was really a part of the SEVEN YEARS' WAR (*q. v.*), and extended from 1754 to 1763. While France was occupied in the great contest with Frederick the Great, Great Britain, which under the statesmanship of Pitt was enlisted on the other side, pushed the war in America to a definite conclusion. The defeat of MONTCALM by WOLFE (*q. v.*) and the consequent fall of Quebec Sept. 15, 1759, put the British in possession of all the territory E. of the Mississippi river.

While this long contest had been going on, the British colonies along the coast had been developing their institutions according to English methods. The colonial divisions were determined primarily by the charters received from the mother government; and as time advanced, the enterprise of the settlers and the liberality of the charters determined the size and prosperity of the respective colonies. Along the rivers and valleys colonization pushed in some regions slowly, in others rapidly, toward the West, so that at the time of the Revolutionary war each of the more important colonies S. of New England had established personal and political, as well as territorial, connections with the vast domain extending into the valley of the Mississippi. (See the article FRONTIER; also Roosevelt's *Winning of the West*.) In Virginia, the typical Southern colony, the charter retained large powers for the Governor, and gave few powers to the people. Not a little turbulence was the result. (See BACON'S REBELLION.) The part of the mother country was not skillfully played, and therefore when the troubles antecedent to the Revolution broke out Virginia was one of the foremost to urge a policy of vigorous resistance. South

Carolina was animated by a similar spirit. But it was in New England that the most advanced ideas prevailed. In Massachusetts and Connecticut the colonists were able for the most part to control and shape their own local and political affairs. Harvard College was founded within sixteen years after the first settlement at Plymouth, and only a little later a general school system was adopted. Similar provisions for a somewhat comprehensive system of education were adopted in Connecticut, and in the Dutch colony in New York. With many characteristics in common, the colonies had also many individual peculiarities, and thus it came about that each colony for itself built up on a basis of great liberality a system of social, educational, and political institutions that enabled it to contribute something to that great stock of political opinion which was at length embodied in the Federal Constitution. No government was ever more perfectly developed out of the past. Each colony grew up independently of the others, and so far as its charter permitted framed its government, in its own way, on the general model of British institutions. It was not strange, therefore, that when the colonies were forced to unite their interests in a common cause they brought to this service an amount of political experience and wisdom that has rarely been equalled. As the colonies derived the form and essence of their government from Great Britain, so the Federal Constitution was built out of materials furnished by the colonies.

Efforts to Unite the Colonies.—Although the political history of the U. S. begins in 1774, there had been several efforts to unite the colonies before that time. The mother country had provided no common government in which the colonies should take part, and the relations into which these occasionally entered under the stress of Dutch, French, and Indian wars were voluntary and transient. Planted along the Atlantic coast, each having its own harbors and river systems, the colonies had felt no drawings toward general union. To this statement of geographical independence an exception may seem to have existed in the case of Delaware and Pennsylvania, which, even after the legislative secession of 1703, continued under a common governor. With this possible exception no colony depended on the consent of any other for the exercise of any vital privilege. One or more of the colonies had taken advantage of superior harbors to tax the products of their neighbors going out through their ports; Connecticut and Massachusetts quarreled for a while (1647-50) over the dues levied by the former at Saybrook on goods destined for Springfield in the latter colony; Virginia and Maryland long maintained a dispute concerning their respective rights to the navigation of Chesapeake Bay and the Potomac river; while even the adoption of the Constitution has not wholly prevented controversy between New York, New Jersey, and Connecticut in the matter of the control of New York Bay, as in the case of the claim of certain patentees of New York to the monopoly of steam-navigation within those waters. But none of these issues was vital, while the exigencies of a common defense against the savages were held to be sufficiently met by an occasional common armament and joint expedition of two, three, or four contiguous colonies. One exception, indeed, is found. In 1643 the four colonies of Plymouth, Massachusetts Bay, Connecticut, and New Haven, which afterward formed two of the thirteen original States, united in a confederation, known as the United Colonies of New England, for defense against the savage tribes. In this confederation the four colonies, though very unequal in size and population, were to have equal power, but all war-expenses, which were to be a common charge, were to be apportioned according to the number of male inhabitants in each colony. Runaway servants and fugitives from justice were to be mutually delivered up, and the judgments of courts of law and probates of wills in each colony were to receive full faith and credit in every other. This confederation, thus limited in extent, had but a feeble existence, and expired after about half a century with the exigency in which it had its rise.

No other attempt at confederation was made until 1754, though in the interval colonies were temporarily or permanently consolidated by the crown, sometimes with and sometimes without their consent. In the year named a convention was held at Albany, New York, in view of the approaching hostilities with the French and Indians, and on the instance of the British Board of Trade. Commissioners were present from New York, Pennsylvania, Maryland, and the four New England colonies. Delegates were also present from the famous Six Nations of New

York. Under the leadership of Benjamin Franklin, a plan of permanent union for the colonies was adopted, to be dependent for effect on the sanction of the British Parliament. The scheme comprised a president-general, named and supported by the crown, and a council of forty-eight members, to be chosen every three years by the legislatures of the colonies. Each colony was to have representation in proportion to its contributions to the general cause, no colony, however, to have less than two or more than seven members of the council. The council was to undertake the common defense, apportioning quotas of men and money therefor, controlling the forces raised, and enacting ordinances of general interest. The president-general was to have a negative on all acts of the council and the appointment of all military officers. Civil officers were to be appointed by the council, with the consent of the president. This promising scheme was, however, rejected by the Board of Trade as conferring dangerous powers on the colonies, and by the colonies themselves as giving too much authority to the crown in matters which they had jealously reserved to themselves; so that the colonies had to sustain the ensuing war, which broke the power of France upon the continent, with no other concert than that derived from the voluntary concurrence of the several legislatures or executives.

The forces which thus for more than a century withstood union were not found alone in the indifference growing out of the natural independence which has been noted. There was also a decided repugnance, if not between individual colonies, between groups of colonies, arising out of differences in race, religion, and political institutions. New England was almost purely English; the populations of the middle colonies were most curiously and variously composed of a great number of nationalities. New England was chiefly Puritan; in the middle colonies the Quakers and Lutherans dominated; at the South, the Church of England had formally established its offices. But the repugnance caused by differences of race and religion was probably less than that due to differences in the political franchises and institutions of the several sections. The charter governments of New England (excepting New Hampshire) were in strong contrast to the proprietary governments of Maryland, Pennsylvania, and Delaware and the provincial governments of the South. The political habits and aptitudes which resulted were widely diverse, especially in respect to the forms in which political power was exercised and to the modes of taxation in use. Evidence abounds that the total effect of all these causes was to produce a strong disinclination to confederation among the colonies, and especially that the Episcopal and aristocratic prejudices against the leveling spirit of New England, and the Quaker opposition to war, to which the New England colonies were from the first exceedingly prone, constituted obstacles to union which no cause but the single one which actually brought the colonies together could for more than one generation have overcome.

Causes of the War of Independence.—In 1765 the general opposition to Grenville's Stamp Act led to a congress of delegates from nine colonies, appointed by various authority, which met at New York and formed a union for the purpose of resisting taxation by Parliament. This congress, however, assumed no powers of government: its proceedings were limited to deliberation and remonstrance, and the union expired with the repeal of the obnoxious law in 1766. In 1774, however, the opposition to Charles Townshend's measures for raising a British revenue within the colonies, inflamed by the stirring events at Boston—the "massacre" of 1770 and the "tea-party" of 1773—resulted in a congress of the colonies, which met at Philadelphia on Sept. 5. Twelve colonies were soon represented, Georgia being the exception. This congress was in reality an assemblage of committees. The colonies voted as entire bodies, casting single votes, the question of proportional representation being waived for the sake of harmony. The congress undertook to exercise no coercive powers. Separation from Great Britain was not then determined on, and was not even generally in contemplation. The important measures of the congress of 1774 were a declaration which based the rights of the colonies on the laws of nature, the principles of the British Constitution, and the several charters or compacts between the colonies and the crown, and denied expressly and completely the right of Parliament to tax the colonies, though recognizing the power of commercial regulation; and, second, non-importation and non-exportation agreements, the article tea being particularly named in the

former, while rice, the product of Carolina, was specially excepted from the prohibitions of the latter. The congress adjourned in October, recommending that another congress be held in 1775, should the grievances of the colonies not meanwhile have been redressed. During the winter which followed, rapid progress was made toward revolution in Massachusetts. The Governor, on the part of the crown, dissolved the General Assembly, and called new councilors into office by mandamus, under authority of an act of Parliament revoking so much of the charter of the colony as authorized the assembly to elect the council. The Governor's councilors were compelled by a show of popular violence to resign, while a new Assembly, elected by the people in defiance of an executive proclamation, met at Salem and resolved themselves into a provincial congress, whose recommendations had all the effect of law throughout the colony. On Apr. 19, 1775, occurred the battle of Lexington, an unforeseen collision between the royal troops marching to seize military stores at Concord and the militia and citizens.

The second Continental Congress met at Philadelphia on May 10, following. Most of the delegations had been chosen before the battle of Lexington, when armed resistance to the obnoxious acts of Parliament was not in contemplation. "They were," says Mr. Bancroft, "committees from twelve colonies, deputed to consult on measures of conciliation, with no means of resistance to oppression beyond a voluntary agreement for the suspension of importations from Great Britain. They formed no confederacy; they were not an executive government; they were not even a legislative body." Such, indeed, they were in theory; but the course of events threw upon this body of committees the duties of a revolutionary congress. Blood had been shed; the British troops were besieged in Boston by the militia of New England; Congress, by the necessity of the situation, became the organ of the common resistance. A Continental army was raised; a commander-in-chief, George Washington, of Virginia, was chosen, in whose commission the phrase "United Colonies" was first used; a Continental currency was created; a general treasury and post-office established; while the whole management of Indian affairs was assumed by Congress. Here we see most of the parts of government emerge. What, meanwhile, had become of the governments of the colonies? Much stress has been placed by some writers on the fact that the revolutionary governments of the colonies were generally not organized until after the Continental Congress had assumed powers of legislation, and had recommended the establishment of new governments in the several colonies. But no inference can justly be drawn from this fact adverse to the full political rights of each colony. The priority noted was a priority in time, not in logic. It was due to the urgent military necessity of the situation, and intimated no supremacy on the part of the Continental Congress. It is not conceivable that the latter body should have assumed to disregard the entity of a single colony, even the smallest, or have proceeded to do anything authoritatively in respect to the organization of colonial governments, or to take territory from one colony for the benefit of another. The colonies in no respect owed their existence or their political rights to the Continental Congress, which was their creature, the organ of their voluntary common action.

On June 17 was fought the battle of Bunker Hill, between the garrison of Boston and the besieging provincials. Though this action was not, as now, regarded as a substantial victory for the Americans, it did much to strengthen the purpose of resistance and to quicken the growth of revolutionary ideas. The progress of the popular mind of the colonies toward independence of Great Britain was hastened by the refusal of Parliament to receive the petition of Congress; by the bombardment of the town of Falmouth, now the city of Portland; by acts of Parliament prohibiting trade with the colonies and authorizing the capture of their vessels; and by the active impressment of seamen on the North American coast. The military operations of the autumn and winter had not been decisive. The expedition of Montgomery and Arnold against Canada had resulted disastrously; on the other hand, Washington had been appointed commander-in-chief of the Continental forces, and in consequence of the skill of his manœuvres the British garrison had been compelled to evacuate Boston. A British fleet had also been beaten off Charleston in the action at Fort Sullivan.

The War of Independence.—On June 7, 1776, a resolution of independence was introduced into the Continental Con-

gress by Richard Henry Lee, of Virginia, and referred to a committee consisting of John Adams, Thomas Jefferson, Benjamin Franklin, Roger Sherman, and Robert R. Livingston. The DECLARATION OF INDEPENDENCE (*q. v.*) was drawn by Jefferson, and on July 4, after slight modifications, was adopted and promulgated, the delegations being generally instructed to that end by the respective colonies. On the same day on which the committee was appointed to prepare the Declaration, a committee was appointed to prepare Articles of Confederation, it being fully recognized that independence of Great Britain necessitated union among the colonies, now become States. Yet this committee did not report a plan for confederation until Nov., 1777, nor were the Articles adopted by all the States before Mar. 1, 1781. During the whole of this period the States, united only by their free consent, were carrying on war with Great Britain at a distinct disadvantage by reason of the absence of authoritative government. This long delay in such an exigency affords a measure of the difficulties of union. One obstacle, however, additional to those previously mentioned, requires to be stated. Seven States, Massachusetts, Connecticut, New York, Virginia, South Carolina, North Carolina, and Georgia, owned or claimed considerable tracts of land to the W. of their present limits. The six other States objected to signing the Articles until these unoccupied lands, which were to be defended by the arms and resources of the Confederation, should be ceded for the benefit of the Confederation. This objection, however, was maintained with less vigor by some of these States than by others. Before the close of July, 1778, ten States had ratified the Articles. New Jersey acceded Nov. 26, 1778; Delaware May 5, 1779; Maryland remained out until Mar. 1, 1781. The contention of Maryland was that without such cession the States owning Western lands would pay their war expenses by sales of lands instead of by taxation; and, secondly, that when this Western territory should be settled, the communities there formed would become politically and socially the satellites of the States under whose laws and administration they had grown up. The contest was finally settled by the patriotic action of New York, which authorized (Feb. 19, 1780) its delegates to cede its Western lands. This action was accepted by Maryland as an earnest of what she had claimed, and she joined the Confederation as stated. Sooner or later all the landed States followed the example of New York—Virginia, 1784; Massachusetts, 1785; Connecticut, 1786; South Carolina, 1787; North Carolina, 1790; Georgia, 1802.

Meanwhile the war had been prosecuted without a government having coercive power. The States, when called upon by Congress for contributions of men and money, responded in their own time and way. The British troops under Sir William Howe defeated the American army on Long Island Aug. 27, 1776, and soon afterward occupied the city of New York and the country of the lower Hudson. Before the close of the year Washington had been obliged to retire beyond the Delaware river with a small, ill-provided army, but by the brilliant surprises of Trenton and Princeton the British were thrown back and New Jersey was largely recovered. During the summer of 1777 Sir William Howe transferred the greater part of his force by water to the neighborhood of Philadelphia, which city he captured, after defeating the American army on the Brandywine, Sept. 11. A bold attack by Washington on the British forces at Germantown (Oct. 4) was repulsed. At the North, however, the cause of independence found this year a better fortune. Gen. Burgoyne, in command of an army composed of British regulars, Hessians, Canadians, and Indians, in July captured Ticonderoga and Whitehall, and began a movement intended to gain possession of the Highlands of the Hudson, and by opening that river from its source to its mouth to isolate New England. The expedition, however, was wholly disastrous. A strong detachment of British was defeated by a militia force under Gen. Stark at Bennington Aug. 16, and in September Burgoyne was brought to bay near Saratoga, and after two severe actions (Sept. 19 and Oct. 7) was compelled to surrender (Oct. 17) to Gen. Gates. The battle of Saratoga has often with much reason been regarded as the turning-point or decisive battle of the war. If Burgoyne had succeeded, an open line of communication would probably have been established between Canada and New York, and New England would have been cut off from the possibility of giving active support to Washington. The failure of this brilliant project kept the colonies united and greatly embarrassed the British. Nor was this all. The victory at Saratoga gave great reputation

abroad to the American arms, and decided the French king to join in treaties of alliance and commerce with the U. S., which were signed in Paris in Feb., 1778. Meanwhile Washington had been reduced to straits in keeping the field against the British, and his army encountered the greatest hardships during the winter of 1777-78 at Valley Forge, a day's march N. of Philadelphia. The want of an authoritative government was severely felt in the slow and partial responses made by the States to the requisitions of the Congress. In this strait the issue of bills of credit was resorted to. The depreciation was of course rapid. Mar. 1, 1778, \$1 in specie exchanged for \$1.75 in paper; Sept. 1, for \$4; Mar. 1, 1779, for \$10; Sept. 1, for \$18; Mar. 18, 1780, for \$40; Dec. 1, for \$100; May 1, 1781, for \$200-\$500. During the operations of 1778 the co-operation of the French fleet under d'Estaing proved delusive, but the conduct of the British armies was ineffective; Sir Henry Clinton, who succeeded Howe, evacuated Philadelphia and retired on New York. During the movement an indecisive action was fought at Monmouth, the army of Washington remaining in possession of the field. The British forces still held Rhode Island, which they had occupied two years before. Toward the close of 1778 Sir Henry Clinton sent a force against the city of Savannah, which fell Dec. 29. This result turned toward the South the efforts of both armies. During the summer of 1779 the British overran the whole of Georgia, but were compelled to abandon Rhode Island in view of an expected expedition of the troops and fleets of France and Spain, the latter country having declared war against England in June. In September the Americans under Lincoln, assisted by the French fleet, made a futile attack on Savannah, being repulsed with heavy loss. In Apr., 1780, Clinton in person invested Charleston, which was held by Gen. Lincoln. The defense was weak, and the city was surrendered with the garrison in May; South Carolina was completely overrun, and Cornwallis, who was left in command by Clinton, threatened North Carolina. In this emergency troops were detached from the Northern army under the command of Gen. Gates, who was re-enforced by the militia of Virginia and North Carolina, but was routed with great loss at Camden, while the patriotic corps of Sumter, who since the conquest of South Carolina had not ceased to harass the British outposts, was destroyed by Tarleton on the banks of the Wateree. The three southernmost States were now held by the British, while to the disaster at the South was nearly added the capture of the strongholds on the Hudson through the treachery of Benedict Arnold. In October, however, a considerable detachment of the British army was destroyed by militia at King's Mountain, inducing Cornwallis to retire into South Carolina; and in December Gen. Greene arrived from the North, superseding Gates. The close of the year found Holland also in arms against Great Britain, though not taking part in the military operations in America.

The campaign of 1781 was destined virtually to close the war in favor of the Americans. Jan. 17 the British, under Col. Tarleton, were defeated at Cowpens, S. C., by Gen. Morgan; Mar. 15 a severe action was fought at Guilford Court-house between Greene and Cornwallis, by which the British, though they held the field, were so far weakened that they were compelled to retire; on Sept. 8 was fought the severe action of Eutaw Springs, in which the Americans had the advantage. The effect of these actions, combined with the activity of the American partisans under Marion, was to compel the abandonment of North Carolina and nearly all of South Carolina by the British, who were content to hold a few places by garrisons. Meanwhile Cornwallis, moving into Virginia with a view to forming a junction with Sir Henry Clinton, was hemmed in at Yorktown by the troops of Washington and Rochambeau, and after a siege of about three weeks was compelled to surrender his whole force, about 8,000 men, Oct. 19. The surrender of Cornwallis practically ended the war. No operations of importance followed. In July, 1782, the British evacuated Savannah; a preliminary treaty of peace was signed Nov. 30 of that year at Paris; Dec. 14 Charleston was evacuated; the definitive treaty was signed Sept. 3, 1783; New York was evacuated by the close of November; in December WASHINGTON (*q. v.*) resigned his commission as commander-in-chief.

The Confederation.—The Government which, as recited, had been brought into existence Mar. 2, 1781, remained in effect during two years of war and six years of peace. Its constitution is given in full under the title CONFEDERATION,

ARTICLES OF. It was early shown to be a hopeless failure. It had no coercive power over States or individuals. The Congress could not even command the attendance of its own members. In consequence, the States ordinarily neglected or refused to comply with the requisitions of Congress, and settled their disputes or contended over them without regard to the authority of the U. S.; while Congress itself sank to be, in the language of Mr. Curtis, "a feeble junta of about twenty persons," moving about from city to city as circumstances required.

On Feb. 21, 1787, Congress called upon the States to send delegates to a convention at Philadelphia for the purpose of revising the Articles of Confederation, "to render the Federal Constitution adequate to the exigencies of the Government and the preservation of the Union." The convention met in May, George Washington being president. Among the most eminent members were Benjamin Franklin, Alexander Hamilton, James Madison, Edmund Randolph, George Mason, James Wilson, Gouverneur Morris, John Rutledge, Charles C. Pinckney, Rufus King, and Roger Sherman. Rhode Island was not present by delegates. It was long doubtful whether the conflicting interests could be brought to agreement. The small States feared they would lose their identity; the large ones that they would be deprived of their superiority. This difficulty was settled by giving the small States equal representation in the Senate and the larger ones the advantage of representation in the House of Representatives on the basis of population. A still more difficult question was that of slavery, and it is safe to say that but for the spirit of concession on both sides, the North and the South could not have been brought into a single Union. Then there were radical differences of opinion as to the nature of the Government to be established. Hamilton desired a strong central power, while, at the other extreme, the followers of Jefferson insisted upon the recognition of State sovereignty. Both sides made concessions, and a final agreement was reached. The question, however, as to the relative authority of the Federal Government and the individual States was not conclusively determined. If it had been, it is hardly probable that the Constitution, even if adopted by a majority of the delegates, would have been ratified by the States. The convention was dissolved in September, having submitted a form of constitution essentially different from the Articles of Confederation. The main features of the plan of government thus proposed are given in this article under the title *Government*; see also the article CONSTITUTION OF THE UNITED STATES. The order of ratification by the conventions of the States was as follows: Delaware, Dec. 7, 1787, unanimously; Pennsylvania, the same day, by a vote of 46 to 23; New Jersey, Dec. 12, unanimously; Georgia, Jan. 2, 1788, unanimously; Connecticut, Jan. 9, by a large majority; Massachusetts, Feb. 7, 187 to 168; Maryland, Apr. 28, 63 to 11; South Carolina, May, by a large majority; New Hampshire, June 21, 57 to 46; Virginia, June 25, by a majority of 10; New York, July 26, 30 to 27. The ratification of nine States being sufficient, the new Government went into operation before Rhode Island and North Carolina had acceded, which they did shortly after. Ten amendments to the Constitution were immediately proposed and adopted, constituting a sort of Bill of Rights desired by some of the ratifying States.

Inauguration of the Federal Government.—The new Government was inaugurated, nominally, on Mar. 4, really on Apr. 6, 1789. George Washington, of Virginia, was found to have received the entire number of votes in the electoral college, and was declared President; John Adams, of Massachusetts, having received a plurality of second choices, was declared Vice-President. The cabinet was announced as follows: Thomas Jefferson, Secretary of State; Edmund Randolph, Attorney-General; Alexander Hamilton, Secretary of the Treasury; Henry Knox, Secretary of War. At the election party distinctions had not been formulated, though it was not to be doubted that the divisions of sentiment which had been developed in the constitutional convention would eventuate in the formation of parties under the Constitution. The cabinet even gave testimony to fundamental differences of political belief between North and South. Hamilton and Knox were pronounced advocates of what became known as Federalism; Jefferson and Randolph were strong asserters of those views of the powers of the general Government, and of its relations to the States, which characterized the Anti-Federalist party.

The Formation of Political Parties.—Two measures of Washington's first term especially promoted the division of

the country by party lines. These were the creation of a national bank by act of Congress, and the assumption by the U. S. of the war debts of the several States. The former measure was opposed in the cabinet by Jefferson and Randolph, and supported by Knox and Hamilton, the latter being the author of the scheme. Washington, who had strong Federal associations and proclivities, though disowning party obligations, gave the bill his approval. The bank went into operation in 1791, the charter having twenty years to run. The State debts were assumed in a limited amount (\$21,500,000) after an embittered contest in Congress, in which the party asserting the utmost fullness of national powers under the Constitution triumphed. During the administration of Washington the U. S. progressed steadily toward industrial and financial prosperity, and entered into diplomatic relations with several of the principal powers of Europe. War was, however, waged with the Miami confederation of the Ohio, over which, after two successive disasters to the armies under Gens. Harmer and St. Clair, Gen. Anthony Wayne, the hero of Stony Point in the Revolutionary war, won a decisive victory, which led to peace and the cession of nearly the whole of Ohio by the Miamis in 1795. No opposition was made to the re-election of Washington in 1793, but during his second term the antagonism of the Federalists and Anti-Federalists (now called Republicans) became intense. The Republicans sympathized strongly with the progress of the Revolution in France; and the more forward, incited by the acts and appeals of Genet, minister from France, strove to commit the U. S. to an active support of that cause, which the Federalists, who were popularly charged with English sympathies, as strongly opposed. The treaty negotiated by Chief Justice Jay as special envoy to England was resented by the Republicans as a surrender of American rights, and the debates thereon in Congress were marked by extraordinary bitterness. This treaty, while it secured the surrender of the posts in the Western territory held by Great Britain for twelve years in violation of the articles of the treaty of peace in 1783, left other questions open to remain the cause of alienation and dissatisfaction, to ripen many years later into war. The financial policy of Congress, which was controlled by the Federalists, also encountered much factious opposition from the Republicans, which culminated in 1794 in open rebellion against the whisky tax in Western Pennsylvania, only suppressed by the levy of the militia of Maryland and Pennsylvania. (See WHISKY REBELLION.) The increasing bitterness of feeling in the second term of Washington led to the disruption of his cabinet, in which the eminent statesmen who originally constituted it were finally replaced by Oliver Wolcott, Secretary of the Treasury; Timothy Pickering, of State; James McHenry, of War; Charles Lee, Attorney-General.

At the presidential election of 1797, Washington declining to be a candidate, Jefferson was supported by the Republicans and Adams by the Federalists. The latter was elected by a vote of 71 to 68. As the second choices of the Federalists were divided, Jefferson, receiving the highest number next to Adams, became, under the Constitution as it then was, the Vice-President and the leader of the opposition. Adams's administration was an unfortunate one throughout. He mistakenly retained Washington's secretaries, who either gave him no hearty support or intrigued against him in the interest of Hamilton. Adams was finally compelled to dismiss Pickering and McHenry. The President further alienated his own party by renewing negotiations with France after that power, deeming itself outraged by the Jay treaty with Great Britain, had ordered the U. S. minister out of her territory. Further than this, she had insulted the special envoys, Marshall, Pinckney, and Gerry, who had been sent to adjust the difficulties which threatened war between the two powers to the extent that both nations prepared for action, and captures and conflicts occurred on the ocean. In the U. S. the war-spirit ran so high among the Federalists, especially those who supported Hamilton, that the course of the President in dispatching other envoys on what was deemed insufficient evidence of the better disposition of France, provoked deep hostility to Adams, and was an important cause of his subsequent defeat. The embassy was, however, successful, and a treaty was concluded in 1800. But while Adams was thus alienating sections of his own natural supporters, the Federal party as a whole was sowing the wind from which it was to reap the whirlwind by the enactment in Congress, which that party still controlled, of the Alien and Sedition laws—acts authorizing the summary removal by the executive of sus-

pected aliens, and providing severe penalties for seditious publications. These measures, which were an excellent imitation of those by which Pitt was striving to keep down the growth of revolutionary sentiments in England, were resented as inconsistent with the genius of republican institutions, and led to the famous declarations of the right of nullification known as the Virginia and Kentucky Resolutions (see NULLIFICATION) of 1798-99, those of Virginia being drawn by Madison, those of Kentucky by Jefferson. During the preparations for war with France in 1798, the Navy Department was created, and Benjamin Stoddert, of Maryland, was appointed secretary. The policy of maintaining a large naval force had always been advocated by Adams from the earliest days of the Revolutionary war.

At the fourth presidential election Adams was defeated, receiving only 65 votes against 73 for Jefferson. As, however, Aaron Burr, the intended Vice-President, received also 73 votes, there being no designation on the ballots as to which should be President and which Vice-President, the election was thrown into the House of Representatives, where the States, in such an event, have equal power, each casting a single vote. After thirty-five ballots, in which the Federalists, in order to defeat Jefferson, who was peculiarly obnoxious to them, supported Aaron Burr, Jefferson received the votes of ten States and was elected; Mr. Burr became Vice-President. This contest led to the adoption of the 12th Amendment to the Constitution, which provided that the candidates for President and for Vice-President should be voted for separately.

Accession of Anti-Federalists.—The defeat of the Federalists had been decisive—so much so that Mr. Jefferson was accustomed to speak of "the revolution of 1800" in referring to the election of that year; and in 1804 Jefferson was re-elected, with George Clinton as Vice-President, the Federalist candidates receiving but 14 votes against 162. Jefferson's cabinet consisted of James Madison, Secretary of State; Samuel Dexter, of the Treasury; Henry Dearborn, of War; Benjamin Stoddert, of the Navy; and Levi Lincoln, Attorney-General. Dexter was afterward replaced by Albert Gallatin, and Stoddert by Robert Smith. Consistently with his theory of government, Jefferson sat and voted with the secretaries in cabinet session upon equal terms, so that the executive resembled a directory. The President and his cabinet were, however, perfectly harmonious, and the Republican party continued to gain power rapidly in every section. The principal measures and events of Jefferson's administration concerned the foreign relations of the U. S.

In 1801 war was declared against the U. S. by the Bey of Tripoli, to whom the U. S. had paid tribute for the privilege of navigating the Mediterranean. Hostilities continued with slight practical result, though much to the credit of the American navy, till peace was made in 1805. In 1803 Robert R. Livingston and James Monroe, as envoys of the U. S., concluded a treaty with Napoleon, by which the whole of the vast possessions of France W. of the Mississippi, embracing, as computed, 1,171,931 sq. miles, were ceded to the U. S. for about \$15,000,000. This purchase, admitted by Jefferson to have been made by a great stretch of constitutional authority, was a remarkable act of concession to the principles of the Federalists; but the immeasurable advantage to be gained by the undisputed possession of the Mississippi river and all the territory W. of it were enough to induce even Jefferson to set aside his doctrine of strict construction. This cession greatly exasperated Spain, who deemed her possession of Florida threatened thereby. Friendly relations between the two nations were interrupted, and some acts of hostility took place. In her desperate efforts to stay the progress of Napoleon, then fast overrunning the continent of Europe, Great Britain at that period exercised with unwonted severity her always disputed rights of search and impressment. Napoleon, seeking to effect the commercial isolation of Great Britain and the independence of continental Europe, issued successive decrees from Berlin, from Milan, and from Rambouillet. (See NAPOLEON.) These decrees, together with the retaliatory orders in council issued by Great Britain in 1807, were without a shadow of justification in the law of nations, and were peculiarly oppressive to American commerce. But while France and Great Britain were equally in the wrong as regarded their attitude toward the U. S. as a neutral power, the superior naval force of Great Britain rendered her course practically the more injurious. It was this view which constrained Jefferson and his successor more and more to overlook the wrongs done by France, and to seek to direct the public thought of the nation toward Eng-

land as the real enemy of the U. S., though at times the suggestion of a "three-cornered war" was made with more or less seriousness. In 1806 James Monroe and William Pinkney, as envoys, negotiated a treaty with Great Britain, by which it was sought to remove or reduce the points in dispute, but the treaty was rejected as insufficient by the President without reference to the Senate. In 1807 occurred the affair of the Chesapeake and the Leopard, which did much to arouse those feelings of exasperation which made war possible. A British frigate, in asserting the British claim to recover British seamen wherever found, attacked a U. S. public armed vessel in U. S. waters, and after compelling a surrender took off four seamen. Reparation for this act was delayed four years. In Dec., 1807, on the recommendation of the President, an embargo was declared by Congress, all vessels being prohibited from sailing for foreign ports, while the coastwise trade was placed under stringent restrictions. This policy was continued until Mar. 1, 1809, the commercial interests of the country suffering meanwhile the deepest distress. The blow fell with especial severity on New England, where the exasperation of the community was carried almost to the point of open resistance to the law. Three days after the repeal of the embargo—which, though still approved by the President, could no longer be sustained against the force of public feeling—Mr. Jefferson, having declined re-election, went out of office, leaving the settlement of the disputes with England to his successor, James Madison, of Virginia, who had long been his pupil in politics and his Secretary of State during the eight years of his administration. Mr. Madison, with George Clinton for Vice-President, had been elected in 1808 over the Federal candidates, Charles C. Pinckney and Rufus King, by a nearly three-fourths vote. The cabinet was constituted of Robert Smith, Secretary of State; Albert Gallatin, of the Treasury; William Eustis, of War; Paul Hamilton, of the Navy; Cesar A. Rodney, Attorney-General. For the embargo prohibiting all foreign trade were now substituted acts prohibiting trade with England and France, but containing provisions intended to induce one of those powers to seek a restoration of intercourse at the expense of the other. This policy of inviting the belligerents to bid against each other for the privilege of open trade with the U. S. was continued through three years, with the effect that France, after one ambiguous announcement—which the Republican party welcomed as satisfactory, while the Federal party and the British minister denounced it as insufficient and insincere—repealed her obnoxious decrees. Great Britain followed by a repeal of her orders in council; but five days before—viz., on June 18, 1812—Congress had declared war upon the recommendation of President Madison, who, though personally averse to extreme measures, was urged forward by younger men now rising into power, notably Henry Clay and John C. Calhoun. The arrival of the news of the repeal led to a renewal of negotiations, but the U. S. feared to give time for the strengthening of the fortifications of Canada, and hostilities commenced.

The War of 1812.—The war was to be fought upon the very issues which had been evaded in the Jay treaty of 1794, but the eighteen years that had elapsed had brought a great gain of numbers and resources to the U. S. The population had grown from 4,500,000 to 8,000,000, and the wealth of the nation had trebled or quadrupled in the interval. The number of States was now eighteen, Vermont having been admitted in 1791, Kentucky in 1792, Tennessee in 1796, Ohio in 1802, Louisiana in 1812. The war was fought on three faces—viz., along the lakes, on the North Atlantic shore, and along the Gulf of Mexico. It opened in the N. by the invasion of Canada from Detroit by Gen. Hull, Governor of the Territory of Michigan. In about a month Hull had surrendered his entire force without fighting, and Michigan and parts of Ohio were overrun by the British, whose progress was withstood by Gen. William Henry Harrison, who in the preceding year had earned distinction by defeating the Shawnees under their chief Tecumseh (*q. v.*) and his brother the Prophet. The campaign of 1813 gained little credit to the American arms. Gen. Jacob Brown successfully defended Sackett's Harbor, and Harrison routed the British and their savage allies on the Thames, killing Tecumseh; but other attempts at invasion by Wilkinson and Hampton resulted in disgraceful retreats, while the British overran Western New York and burned several towns in retaliation for the burning of Toronto (then York). In September, however, Lieut. OLIVER H. PERRY (*q. v.*), of the U. S. navy, in command of an extemporized fleet, de-

feated and captured the British squadron, giving the Americans complete control of Lake Erie. The campaign of 1814 witnessed a marked change. On the one hand, the British forces in Canada were heavily re-enforced by veteran troops from Europe; on the other, the American soldiery were acquiring discipline, and able young commanders were coming to the front. Under Jacob Brown and Winfield Scott the Americans won the victories of Chippewa and Bridge-water (or Lundy's Lane). On the other end of the Canada line the invasion of a powerful army under Sir George Prevost was defeated through the destruction, off Plattsburg, of the supporting squadron by an American fleet under MacDonough. This practically closed the war on the northern frontier. On the Atlantic coast the years 1812 and 1813 were marked by the gallant efforts of the six or eight U. S. frigates, and as many sloops of war, to sustain themselves against the numerous cruisers, and, later, the powerful fleets, of Great Britain. In spite of victories in single combat which reflected the highest credit on American seamanship and courage, the few armed vessels of the U. S. were one by one captured by superior force or blocked up in the northern harbors, and in 1814 the British fleets cruised without serious opposition along the whole coast, depre-dating and destroying at will, though American privateers still swarmed over the seas inflicting great damage upon British commerce. In Aug., 1814, a British army under Gen. Ross, supported by a powerful fleet under Admirals Cockburn and Cochrane, captured Washington after an insignificant conflict at Bladensburg, and burned the Capitol and the President's mansion. In September the same force attacked Baltimore, but both the army and the fleet were beaten off, Gen. Ross being killed at North Point. The third theater of war was at the Southwest. The Creeks of Alabama having taken up arms, Gen. Andrew Jackson with a body of Western levies invaded their country, and defeated them with great slaughter at Tohopeka in Mar., 1814, compelling the cession of the larger part of the Creek lands. In the summer of the same year a British party occupied Pensacola, then claimed by the Spaniards, and later assaulted unsuccessfully Fort Bowyer near Mobile. In December the British advanced to a formidable attack on New Orleans, and Jackson prepared for its defense. A night attack was made (Dec. 23) on the British camp, for which considerable effect has been claimed; but on Jan. 8, 1815, the British commander, Pakenham, advanced with a greatly superior force of Wellington's veterans against the U. S. lines, and was repulsed, he himself, his second in command, and 2,600 men falling in the attack, while the U. S. loss was less than 100. Never had a British army been so disastrously beaten. Meanwhile peace had already been concluded at Ghent, Dec. 24, 1814. By the articles of the treaty all conquests on both sides were to be restored, while the questions of search and impressment, concerning which the war had been begun, were not mentioned. See GHENT, TREATY OF.

The Rise of New Issues.—With the war of 1812-15 closed what may be called the first era of the political history of the U. S.—the era when the foreign relations of the country engrossed public attention. The second era, which extended from 1816 to 1843, was the era in which financial and industrial questions assumed supreme importance before the country, and gave purpose and passion to party. The war with Great Britain had, by cutting off the foreign supply, called into existence considerable manufactures of iron, of cotton, and of wool, which on the return of peace were threatened with destruction. Moreover, Great Britain had, by the corn-laws of 1815, set the example of attempting to stereotype war prices for the time of peace. At this time a strong impulse to protection came from the South, where the cotton-planting interest desired the creation of a home market. Upon the recommendation of President Madison, and under the leadership of Calhoun and Lowndes, of South Carolina, the first distinctively protective tariff of the U. S. was enacted in 1816. The charter of the first U. S. Bank had expired in 1811 without renewal. The second, with a capital of \$35,000,000, one-fifth owned by the Government, which had a corresponding share in the direction, was chartered by Congress, after a severe struggle, in 1816.

The course of the Federal party had been downward. At the elections of 1812 the imminence of war and the unpopularity of the Embargo and Non-intercourse Acts had given them a temporary strength, and at the election of that year they had polled 89 electoral votes for De Witt Clinton against 128 for Madison, with whom was elected Elbridge Gerry, of Massachusetts, as Vice-President. But the opposition of

the Federalists during the war, as shown in the refusal of the Federal governors of two States to allow their militia to march at the orders of the national executive, and in the holding of the HARTFORD CONVENTION (*q. v.*) in Dec., 1814, at which measures for restricting the authority of the general Government were discussed, and which was charged with being in the interest of a separate New England confederation, practically destroyed the party. At the election of 1816 James Monroe, of Virginia—who, upon the resignation of Robert Smith on the ground of his opposition to the war with Great Britain, had become Secretary of State in 1811—was elected President by 183 votes, against 34 Federal votes for Rufus King, all from the States of Massachusetts, Connecticut, and Delaware. At the election of 1820 Monroe received every electoral vote but one, and the so-called era of good feeling began, with party lines wholly obliterated. Daniel D. Tompkins, of New York, was chosen Vice-President. Mr. Monroe constituted the cabinet as follows: John Quincy Adams, Secretary of State; William H. Crawford, of the Treasury; John C. Calhoun, of War; Benjamin W. Crowninshield, of the Navy; William Wirt, Attorney-General. One of the earliest important events of Monroe's administration was Jackson's successful expedition against the Seminoles in 1818. This arose from depredations committed by the Indians residing in the Spanish territory of Florida upon the frontier settlements of Georgia and Alabama. Gen. E. P. Gaines, in command of U. S. troops at Fort Scott, attacked the Indians, who avenged themselves by a massacre of a body of whites on the Appalachicola river and threatened Gaines's garrison with superior forces. Jackson was ordered to take the field, and, believing that the outrages were incited by British subjects under the protection of the Spanish authorities, carried the war into Florida, captured the Spanish post of St. Mark's, and seized the persons of two British subjects, Arbuthnot and Ambrister, suspected of having incited the Indians against U. S. citizens. These men were court martialed, found guilty, and executed. This provoked much indignation in Great Britain and Spain. The Spanish minister protested against the invasion of Florida, but the U. S. Secretary of State, J. Q. Adams, fully sustained Jackson's conduct. Other noteworthy events of the administration were (1) the cession of Florida, embracing about 60,000 sq. miles, by Spain in 1819, for the sum of \$5,000,000; (2) the enunciation by the President, in his annual message in 1823, of the so-called MONROE DOCTRINE (*q. v.*)—that is, that all attempts of European governments to acquire new territory on the American continent, or to reconquer provinces that had achieved independence, would be regarded as hostile acts, the declaration being especially aimed at Spain, whose South American colonies had revolted, and had been acknowledged as republics by the U. S.; and (3) the enactment of the tariff of 1824, by which the system of protection to U. S. manufactures was extended and fortified. But the chief political measure was the Missouri Compromise. It was the era of new States. Indiana had been admitted in 1816, Mississippi in 1817, Illinois in 1818, and Alabama in 1819. After the preliminary steps had been taken for forming a State government in Alabama, Missouri applied for admission. Of the nine States already admitted since 1789, four had been free States, five slave States. It was now claimed to be the turn of the free States. Great opposition was made to the admission of Missouri with slavery; intense feeling became aroused North and South, and threats of disunion were loudly made. Various propositions for compromise were rejected, but the admission of Maine in 1820 as a free State, formed out of the territory of Massachusetts, prepared the way for an amicable adjustment, and a compromise was reached by which Missouri was admitted as a slave State, while slavery was for ever prohibited in all unorganized territory N. of 36° 30'. This was the first, and one of the most bitter, of the struggles relating to slavery under the Constitution.

At the presidential election of 1824 four candidates, all calling themselves Republicans, were voted for in the electoral college. Andrew Jackson, of Tennessee, received 99 votes; John Quincy Adams, of Massachusetts, 84; William H. Crawford, of Georgia, 41; Henry Clay, of Kentucky, 37. The election devolved upon the House of Representatives, whose choice was by the Constitution confined to the three highest candidates. Clay being thus thrown out, his friends united with those of Adams, and the latter was elected, receiving the votes of thirteen States, while seven voted for Jackson and four for Crawford. This unexpected alliance

of Clay and Adams, taken in connection with the appointment, which followed, of the former as Secretary of State, led to the charge of "a corrupt coalition," which was urged with great bitterness at the time, and was reiterated at a subsequent period, but appears not to have been justified by the facts. The correspondence of Clay, Jackson, and Buchanan, together with the speeches in Congress on the subject, form a conspicuous feature in the political literature of the U. S. The other members of the cabinet were Richard Rush, Secretary of the Treasury; James Barbour, of War; S. L. Southard, of the Navy; William Wirt, Attorney-General. The chief events and measures of Adams's administration were—1, the appointment, against violent opposition in Congress, of envoys to represent the U. S. at Panama in a proposed congress to be composed of representatives of the principal American states—a scheme in the spirit of the Monroe doctrine, but which was abandoned through, first, the death of the U. S. envoy, and subsequently through revolutions in Central America; 2, a controversy with the State of Georgia, arising out of the action of the general Government in protecting the Creek Indians against the efforts of the State authorities to extrude them under cover of a pretended treaty, during which Gov. Troup threatened open war and the State militia was embodied; 3, a series of complications, resulting, fortunately, in the negotiation of the Gallatin treaty, by which trade was opened between the U. S. and the British West Indies; and 4, the tariff of 1828 known as the "act of abominations" (see TARIFFS), by which the protective system instituted in 1816 and extended in 1824 was carried to a much higher point, the feeling of the sections on this question being now reversed—New England, under the lead of Daniel Webster, advocating high duties, while the South, under the lead of Calhoun, who was the virtual author of the tariff of 1816, denounced the existing system and its proposed extension as unconstitutional.

Adams, a former Federalist, and the son of a Federal President, had been elected President in 1824, the distinction of Federalist and Republican being no longer formally maintained. But grave differences of political feeling and of constitutional theory did not lose their power for want of names to characterize them. From the day of Adams's election he was the subject of unceasing attacks having in view his defeat in 1828. Especially in the Senate, where the ablest leaders were in opposition, was the war of resolutions, motions, and speeches most fiercely carried on. The President, on his side, instead of assuming the initiative, promptly occupying the field, and by the use of his power and patronage recruiting as largely as possible that as yet unnamed political entity which was to become known as the Whig party (see WHIG), sought to remain the President of the whole country. As a result, the opposition by its aggressiveness won over all the loose elements of the political field, especially among young men having no party traditions, and acquired at this time that power and cohesiveness which has characterized the DEMOCRATIC PARTY (*q. v.*). At this period the word "Democrat," which at an earlier date had been almost a term of offense, assumed by only the most advanced French sympathizers, had come to supplant the word "Republican." At the election of 1828, Adams, styling himself a National Republican, was defeated by Gen. Jackson, who received 178 out of 261 votes in the electoral college. Calhoun, who in 1824 had been elected Vice-President with Adams, was re-elected. The cabinet was constituted of Martin Van Buren, Secretary of State; Samuel D. Ingham, of the Treasury; John H. Eaton, of War; John Branch, of the Navy; John M. Berrien, Attorney-General. Heretofore, the Postmaster-General had not been a member of the cabinet, but Gen. Jackson now appointed William T. Barry Postmaster-General, with a seat at the council-board. Immediately, the maxim "to the victors belong the spoils" was put in force. Hundreds of removals from office took place in the first six months of this administration, and the civil service became, as it long remained, prostituted to the purposes of party. See CIVIL SERVICE AND CIVIL SERVICE REFORM.

The Southern States had been deeply dissatisfied with the tariff of 1828, having become convinced that a home market for their cotton crop was a matter of indifference, while the protection of cotton, woolen, and hempen goods, and of iron manufactures at the North was in no small degree at their expense. South Carolina and Georgia had, as States, formally protested against a tariff for protection as unconstitutional. In 1832 South Carolina held a convention

which proceeded to "nullify" the obnoxious acts as an invasion of the rights of the State. (See NULLIFICATION.) The ground of the "nullifiers" was that of the resolution of 1798-99—viz., that there being "no common judge" between the States and the nation (the office of the Supreme Court, in this regard being denied), each State remained the proper judge for itself both "of the fact of an infraction" of the terms of "the Federal compact" and "of the mode and measure of redress." The tariff acts were declared null and void, the collection of customs duties within South Carolina was prohibited, and the convention announced that any attempt by the U. S. to enforce such collection would be deemed a dissolution of the Union. It was in this emergency that Jackson issued his famous proclamation, drawn by Edward Livingston, who had succeeded Van Buren as Secretary of State, in which the rights and powers of the Government of the U. S. were asserted in the fullest degree. Everything portended war. The Governor of South Carolina put the State in a condition for defense, while U. S. troops were forwarded to re-enforce the garrison of Charleston. At this juncture Virginia offered her mediation, in the very act of doing so corroborating the position of South Carolina, that a State may assert itself, by its own agencies, against the general Government, instead of seeking redress and relief through the Supreme Court. At the same time, Henry Clay, in the Senate, appeared as the advocate of concession, and succeeded in carrying through the compromise tariff of 1833, by which the duties of 1828 were to be reduced in ten years, by a sliding scale, to a general rate of 20 per cent. This concession and the mediation of Virginia were accepted by South Carolina, and the ordinance of nullification was repealed.

The second Bank of the U. S., chartered, as has been said, in 1816, for twenty years, had still seven years to live when Gen. Jackson was inaugurated, but its doom was sealed. The President's hostility was shown in his first message, and the bill for recharter which passed Congress in 1832 was vetoed. In the face of favorable reports from the Treasury and from committees of both Houses of Congress, Gen. Jackson determined that the U. S. deposits should be withdrawn. This, however, by law, could be the act of the Secretary of the Treasury alone. Louis McLane, who had succeeded Ingham in the Treasury Department, and had shown himself moderately favorable to the bank, had opportunely been translated to the State Department. William J. Duane, who succeeded, refused to do the President's bidding in the matter of the deposits, and was replaced by Roger B. Taney, who had succeeded Berrien as Attorney-General in the general cabinet overturn of 1831. Taney did the task for which he was appointed, and in 1833 the Government deposits were placed in State banks. The U. S. Bank, as a national institution, had received its deathblow; after a brief struggle against the enmity of the administration, it accepted a charter from Pennsylvania, but after the great financial storm of 1837-39 it suspended specie payments (Feb., 1840), and soon afterward its affairs were wound up. The bank was charged by Gen. Jackson with many technical violations of its charter, with expending money for political purposes, and with using its vast power of discount with favoritism toward some and malignity toward others.

Gen. Jackson had been re-elected in 1832 by 219 electoral votes, against 49 for Henry Clay, of Kentucky, 11 for John Floyd, of Virginia, and 7 for William Wirt, of Maryland, the last-named being the candidate of the anti-Masonic party. Martin Van Buren, of New York, became Vice-President. For years, under the high tariff of 1824 and the higher one of 1828, together with the large sales of public lands, the revenue had been in excess of the ordinary expenditures by 25, 50, and even 100 per cent. As a result, the public debt, which at the close of the war in 1815 had amounted to 127,000,000, was rapidly reduced, and in 1835 was extinguished. This excess of revenue had proved a powerful weapon in the hands of the advocates of tariff reduction in the struggle of 1828-33. It now became a serious embarrassment to the administration. What to do with the surplus was the great question of 1833-36. In the latter year the monstrous expedient of depositing \$28,000,000 in the several State treasuries was resorted to. The division of this sum was according to population, although the money, having been largely raised by indirect taxation, had originally been contributed according to the consumption of taxed articles, which varied greatly among the several States and sections. The occurrence of the financial crisis in 1837 relieved the Government from any further embarrassment of this nature.

During the administration of President Jackson the two domestic questions of Masonry and slavery led to great agitation of the public mind. The abduction and presumed murder of Morgan in New York for betraying the secrets of the Masonic order led to the formation of an anti-Masonic party, which, however, proved unable to sustain itself in the face of a more exciting issue. No political party was yet formed adverse to slavery; but anti-slavery societies had commenced the agitation of the subject at the North and the "moral invasion of the South" through pamphlets and newspapers, leading to many riotous acts, and to efforts, through Congress and the administration of the post-office, to suppress the circulation of "incendiary documents." Two Indian wars—one (1832) known as the "Black Hawk war," against the Sacs and Foxes of the Northwest, the other (1835-39) against the Seminoles of Florida under their leader OSCEOLA (*q. v.*), extending later to the Creeks—had their origin in the prosecution of the policy started by President Monroe of removing the Indians W. of the Mississippi. In each the Indians were subdued, though in the latter case not without some dishonor to the U. S. on the score of treachery. The foreign policy of Gen. Jackson was throughout vigorous. Denmark, Naples, Spain, and Portugal satisfied claims of long standing for spoiliations on U. S. commerce, while France, after diplomatic complications which at one time threatened war, paid over \$5,000,000 on account of depredations committed more than thirty years before.

Gen. Jackson, though declining a third term in deference to the example of his predecessors, was able to determine the succession; and Martin Van Buren, of New York, was elected President in 1836, receiving 170 votes against a divided opposition—now known as the Whig party, corresponding in many features to the Federal party of the earlier time. William Henry Harrison, of Ohio, received 73 votes, Hugh L. White, of Tennessee, 26, Daniel Webster, of Massachusetts, 14, Willie P. Mangum 11. No one having received a majority of the votes for Vice-President, Richard M. Johnson, of Kentucky, was chosen by the Senate out of the two highest names on the list, this being the only occasion on which the Senate has been so called to act. Upon Van Buren's administration fell the financial distress which had been generated in the preceding administration, whether due, as the Whigs claimed, to the removal of protection from U. S. manufactures by the compromise tariff of 1833, to the shock given by the war on the bank, and the excess of worthless issues by the State banks when that great regulative institution was destroyed, or due, as the Democrats claimed, to the speculation induced by the operations of the bank before the deposits were withdrawn, which operations, in their opinion, justified that withdrawal. In May, 1837, the banks of New York and other cities suspended payment, and widespread bankruptcy ensued. A second and more severe commercial shock occurred in 1839. The ordinary agencies of trade and exchange were largely destroyed, industry was paralyzed, and the revenue of the Government fell sharply off. It was not until 1842 that prices and wages reached the minimum, and a revival of business with a restoration of confidence began. During the later years of this crisis eight States in whole or in part repudiated their obligations, either as to the interest or the principal. Except Lewis Cass, Secretary of War, Mr. Van Buren retained all the members of Gen. Jackson's latest cabinet—namely, John Forsyth, Secretary of State; Levi Woodbury, of the Treasury; Mahlon Dickerson, of the Navy; Benjamin F. Butler, Attorney-General; and Amos Kendall, Postmaster-General, though he subsequently made several changes. His Secretary of War was Joel R. Poinsett. The chief financial measure of Van Buren's administration was the establishment of the sub-treasury system, by which the public moneys were to be kept in Government offices until required for current expenses, instead of being kept in banks, State or national. This scheme was proposed in Mr. Van Buren's first annual message (1837), but not adopted till 1840, to be repealed the next year, when the Whigs came into power. A serious difficulty, threatening the peace of the U. S., arose from the acts of certain sympathizers with the insurrection which took place in Canada in 1837. A steamer (the *Caroline*) in this interest was destroyed in U. S. waters by a detachment of British troops, and the act avowed by the British Government as done in self-defense. Three years later a Canadian sheriff was arrested in New York on the charge of murdering a U. S. citizen who had perished on the *Caroline*, and tried by the State authorities against

the protest and threats of the British Government, which demanded his release on the ground that the act was done under its authority. Fortunately, the prisoner was acquitted on the evidence.

The long-continued financial and industrial distress of Van Buren's administration had lost the Democratic party, for the time, its hold on the country, and Gen. William Henry Harrison, of Ohio, with John Tyler, of Virginia, as Vice-President, was chosen in 1840 by 234 electoral votes, against 60 for Van Buren. At this time a "Liberty party" was formed in the anti-slavery interest, which polled about 7,000 of the nearly 2,500,000 votes cast. From the inauguration of the Government under the Constitution, the scheme of nominating candidates for the presidency and vice-presidency had been by a CAUCUS (*q. v.*) of the members of Congress of each party, but this had become discredited when the Republican party in 1824 repudiated the nomination of Crawford. By 1840 the scheme of national conventions, consisting of delegates chosen by the votes of the party throughout the U. S., had been fully established, and has continued the accepted method of nomination ever since. See NOMINATING CONVENTIONS.

The Whig party, having come into power on the issue of opposition to the sub-treasury and a demand for protection to American manufactures, repealed the sub-treasury—or, more properly, the independent treasury—act in 1841, and in 1842 enacted a tariff by which the existing duties were largely increased. But in other respects that party was doomed to disappointment. Gen. Harrison had scarcely constituted his cabinet when, within one month of his inauguration, he died. Tyler, who succeeded to the presidency, had never been a Whig, but had been selected by the Whigs for his antagonism to Van Buren, the leader of the Northern and more moderate wing of the Democratic party. His veto of a bill chartering a new national bank led to an open quarrel with the party which elected him, and to the resignation of the entire cabinet except Daniel Webster, Secretary of State. For his course in remaining in office Webster was severely blamed, but he was able afterward to point for his ample justification to the so-called Webster-Ashburton treaty, which he was then negotiating with England. By this treaty the claims of the U. S. in several important particulars were fully conceded, and every question in dispute between the two nations, excepting that relating to Oregon, was finally adjusted. For this much was due to Webster, much also to the logic of events. The thirteen States had become twenty-six (Arkansas having been admitted in 1836, Michigan in 1837, the first since Missouri in 1821), the four millions of people had become eighteen.

Texas and the Mexican War.—A motive was now found sufficient to restore the Democratic party to power. Texas had been largely colonized between 1821 and 1835 from the Southern States. In the latter year it revolted from Mexico, and the next year asserted independence, with the unquestioned purpose of ultimately joining the U. S. Independence in fact was soon achieved under the leadership of Houston, and Texas in 1837 offered herself for admission to the Union. The accession was desired by the Southern States, both on account of kinship and for the opportunity that would thus be afforded for extending slave-labor over new soil. The national instinct of territorial aggrandizement came to re-enforce these motives, especially in view of the probability that Great Britain or France might seek to become the protector of the republic. Throughout the administration of Van Buren the movement acquired but little headway. President Tyler, a man of strong Southern feelings, the only Senator who voted against the Force Bill for compelling the obedience of South Carolina in the nullification contest, warmly approved of annexation, and a treaty to that effect was negotiated by Calhoun in 1844, which was rejected by the Senate. The question thus became the principal issue in the election of that year. The Whigs, having their main strength at the North, opposed the annexation of Texas as being in the interest of slavery, and nominated Henry Clay, of Kentucky. The Democrats threw over Van Buren on account of his opposition to annexation, and nominated James K. Polk, of Tennessee, a strong advocate of that measure. Polk received 170 electoral votes, Clay 105; but before the inauguration of Mr. Polk a resolution for the incorporation of Texas was passed by Congress, signed by President Tyler, Mar. 1, 1845, and notice sent to the government of Texas on the last day of his administration. Florida and Iowa also came in as States about the same time.

President Polk formed his cabinet as follows: James Buchanan, Secretary of State; Robert J. Walker, of the Treasury; William L. Marey, of War; George Bancroft, of the Navy; Cave Johnson, Postmaster-General; John Y. Mason, Attorney-General. The annexation of Texas involved war, inasmuch as Texas and the U. S. claimed the territory to the Rio Grande, while the Mexican Government insisted that Texas only embraced the territory bounded by the river Nueces. Upon this issue hostilities commenced early in 1846. Congress voted men and money, and Gen. Zachary Taylor, commanding the forces on the Rio Grande, entered Mexico and fought the victorious battles of Palo Alto (May 8) and Resaca de la Palma (May 9), and, after being re-enforced by volunteers under Gens. Worth and Wool, captured Monterey Sept. 23. In February of the next year he was attacked in position at Buena Vista by a large Mexican force under the President, Santa Anna, who was repulsed with great loss, and retreated, leaving Taylor in full possession of the northeastern provinces.

Meanwhile New Mexico had been occupied by the U. S. troops, and an invasion of Chihuahua took place with partial success. At about the same time a band of Americans under Capt. John C. Fremont, of the U. S. army, declared the independence of California at Sonora July 4, 1846, and with the co-operation of a fleet under Com. Sloat, soon superseded by Stockton, succeeded in reducing that province. But the army which was to decide the issue of the war was gathering for a movement up the valley of Mexico. In Mar., 1847, Vera Cruz, long deemed impregnable, was reduced after three days' bombardment; and Gen. Winfield Scott, with about 10,000 troops, mainly regulars, commanded by Gens. Worth (who had been detached from Taylor's army), Pillow, Quitman, and Twiggs, moved on Cerro Gordo, where Santa Anna was posted with a superior force. This position was carried Apr. 18 and 19, but Gen. Scott awaited re-enforcements, having lost many men by the termination of their enlistments. In August he entered the valley of Mexico, which Santa Anna defended with 35,000 men. Sanguinary battles followed: Contreras, Aug. 19, 20; Churubusco, Aug. 20; Molino del Rey, Sept. 8; Chapultepec, Sept. 12, 13; and on Sept. 14 Gen. Scott, with 6,500 men, all that remained of the invading column, entered the city of Mexico. The capture of the Mexican capital practically concluded the war; and by the treaty of Guadalupe Hidalgo, Feb. 2, 1848, Mexico ceded the whole of Texas, New Mexico, and Upper California, while the U. S. paid \$15,000,000, besides assuming certain claims of its citizens against Mexico on account of long-continued depredations in the Gulf, which had been the subject of negotiations since 1837, to the amount of more than \$3,000,000. The U. S. subsequently (1850) paid Texas \$10,000,000 on account of her claims to territory not included within the limits of the State.

While war was waging with Mexico a rupture was threatened with Great Britain, on account of the conflicting claims to Oregon. The U. S. claimed as far N. as 54° 40'; Great Britain claimed the mouth of the Columbia. The territory in question had long been in joint occupation, but all attempts at compromise had failed. At the election of 1844 one of the watchwords of the Democratic party had been "Fifty-four Forty, or Fight!" and President Polk gave formal notice that the U. S. receded from the arrangements for joint occupation that had subsisted. At this serious juncture Great Britain offered terms which were accepted, by which the 49th parallel became the boundary-line of the U. S. on the N. W., while Vancouver's island was relinquished to Great Britain. The failure in the treaty to define the status of the smaller island of San Juan led to further complications, which were not settled till 1871.

The important financial measures of Polk's administration were the permanent re-establishment of the sub-treasury system in 1846, and the tariff of the same year, by which duties were largely reduced. The election of 1848 found a third party in the field. The Liberty party had polled about 7,000 votes in 1840, and over 60,000 in 1844. In Aug., 1848, a convention at Buffalo, comprising the members of the Liberty party, with others, many of them Democrats, and some Whigs, disaffected by the course of the old parties respecting slavery, put forward a declaration of principles, and presented as a candidate for the presidency Martin Van Buren, of New York, with Charles Francis Adams, of Massachusetts, for the vice-presidency. The new party succeeded in polling nearly 300,000 votes, though, as it carried no State, it cast no vote in the electoral college. Its leading principle was opposition to the extension of slavery into

new territory, and to the admission of new slave States out of territory already acquired. In all essentials its political doctrines were those which afterward led to the formation of the new REPUBLICAN PARTY (*q. v.*). Slavery was to be sectional, freedom national—slavery to be local and exceptional, to exist only where protected by the laws of States already members of the Union; freedom was to be the general law of the land. These principles were regarded as embodied in the Wilmot Proviso, a proposition offered in 1846 by DAVID WILMOT (*q. v.*), of Pennsylvania, in prospect of the acquisition of territory from Mexico through the war then waging. The Democrats, who had accomplished the annexation of Texas, and had conducted the Mexican war to its successful termination, nominated Lewis Cass, of Michigan. The Whigs nominated Gen. Zachary Taylor, of Louisiana, for President, and Millard Fillmore, of New York, for Vice-President, on a platform intended to conciliate the anti-slavery sentiment of the country. Taylor was elected by 163 votes against 127 for Cass. His cabinet consisted of John M. Clayton, Secretary of State; William M. Meredith, of the Treasury; George W. Crawford, of War; William B. Preston, of the Navy; Thomas Ewing, of the Interior (that office having just been created); Jacob Collamer, Postmaster-General; Reverdy Johnson, Attorney-General. A little more than a year after his inauguration—viz., on July 9, 1850—Gen. Taylor died; Mr. Fillmore succeeded to the presidency. The cabinet was entirely reconstructed, as follows: Daniel Webster, Secretary of State; Thomas Corwin, of the Treasury; Charles M. Conrad, of War; William A. Graham, of the Navy; A. H. H. Stuart, of the Interior; N. K. Hall, Postmaster-General; J. J. Crittenden, Attorney-General.

The Compromise of 1850.—Congress and the country were already in heated conflict, arising out of the proposed extension of slavery to the new territory acquired by the treaty with Mexico. California had in 1849 formed a constitution prohibiting slavery, and applied for admission as a State. The Southern State Rights party, led by Calhoun, demanded the rejection of California, as well as a guaranty, through an amendment to the Constitution, against the further proscription of slavery. New Mexico also appeared as an applicant for admission, while Texas made extensive claims upon the territory of New Mexico. In 1850 Henry Clay again appeared as a pacificator, proposing and carrying the Compromise measures of that year, by which, on the one hand, California was admitted without slavery and the slave-trade was prohibited within the District of Columbia, and, on the other hand, extensive concessions were made to Texas, and the rendition of fugitive slaves was sought to be secured by stringent provisions. As to Utah and New Mexico, the issue was for the time avoided by leaving them under territorial governments and remitting the question of slavery to the inhabitants. The series of measures containing these provisions and known as the Compromise of 1850 passed Congress, with the support of Webster, and were approved by Fillmore in September. The most important measures concerning the foreign relations of the U. S. in this administration were (1) the so-called filibustering expedition to wrest Cuba from Spain, which resulted in the capture and execution of many of the adventurers; and (2) the negotiation of a treaty with Japan by Com. Perry, who had entered the waters of that country with a fleet for that purpose.

The Slavery Question.—In the Constitution slavery, which had been introduced into the country as early as 1620, was treated as though it were of transient significance. In many of the Northern States it had already been abolished. In the South, however, owing largely to the invention of the cotton-gin, the raising of cotton by slaves soon became a very profitable industry. What, therefore, Washington and Jefferson regarded as a transient evil, to be eradicated at an early day, came to be strongly entrenched in what were believed to be the financial interests of the people. Instead of diminishing, the number of slaves increased, even after the lawful importation of slaves was discontinued. Meanwhile, in the North, a strong anti-slavery sentiment was developed. Though at first the sympathisers with the agitation were few, the number steadily increased. Anti-slavery papers, started by LUNDY and GARRISON (*qq. v.*), slowly but surely gained adherents. John Quincy Adams led the attack for the exclusion of slavery from the District of Columbia, and PHILLIPS (*q. v.*) aroused public opinion for the abolition of slavery from all parts of the country. Intense excitement and bitterness resulted. The people of the North were not generally in favor of interfering with slavery where it existed, believing that it was a domestic institution, which

under the Constitution could be dealt with only by the individual States. But they were intensely opposed to the introduction of slavery into territory where it did not already exist. They insisted, more-over, upon the right of agitation for the purpose of forming and moulding public opinion. The people of the South, on the other hand, insisted that as slavery was a domestic institution, the people of the North had no right to interfere with it, even by the promulgation of anti-slavery opinions. Anti-slavery books and papers, as far as possible, were excluded from the South. The publication of Mrs. Stowe's *Uncle Tom's Cabin*, in 1852 created a profound and almost universal impression in the North. By means of these conflicting opinions the gulf between the North and the South grew wider and wider. WILLIAM H. SEWARD (*q. v.*) in 1858 spoke of the subject as an "irrepressible conflict." The intensity of the strain was increased by the fact that many in the North refused to assist in the return of fugitive slaves. Some even assisted in the escape of slaves to Canada, where they could not be arrested and returned.

The election of 1852 found both the great political parties insisting on the Compromise of 1850 as "a finality." Many of the dissatisfied Democrats who had voted for Van Buren in 1848 had gone back to their party, and the popular vote of the Free-soil or Liberty party of 1852 was little more than half of that of the election previous. Gen. Scott, who had been nominated by the Whigs, was defeated, receiving but 42 electoral votes, all from four States, against 254 votes for Franklin Pierce, who, with William R. King, of Alabama, for Vice-President, had been nominated by the Democrats. President Pierce's cabinet consisted of William L. Marcy, Secretary of State; James Guthrie, of the Treasury; Jefferson Davis, of War; James C. Dobbin, of the Navy; Robert McClelland, of the Interior; James Campbell, Postmaster-General; Caleb Cushing, Attorney-General. In 1853 the U. S. acquired, by purchase from Mexico, the tract S. of the river Gila in Arizona and New Mexico, containing 45,535 sq. miles, known as the Gadsden purchase.

Early in 1854 Stephen A. Douglas, of Illinois, the most conspicuous of the younger leaders of the Democratic party, introduced into the Senate a bill for the organization of territorial governments in Kansas and Nebraska, preparatory to their admission as States. By the Missouri Compromise of 1820 slavery was to be forever excluded from that region, but the Kansas-Nebraska bill repealed this provision, leaving the question to be determined by the inhabitants themselves, under the principle advocated by Douglas, known as "squatter sovereignty." This most unwise and disastrous effort to open the burning question once more by making it possible for slavery to be introduced into Territories N. of the Compromise line, encountered earnest resistance from the Whigs and the few Free-soilers in Congress, and aroused intense indignation in many portions of the North. The bill was, however, firmly pressed, and became a law in May.

The Kansas War.—A contest at once began for the colonization of Kansas, the more southerly of the two Territories, active efforts being made in the free States to induce migration hostile to slavery, while the opposing party sought to secure Kansas both through immigration and through periodical raids from the border counties of Missouri. Violence was freely resorted to, and many undoubted wrongs were perpetrated by both parties. This struggle, which at times amounted to civil war, continued through the presidency of Pierce, and was bequeathed to his successor. The anti-slavery sentiment of the North was still further inflamed by a conference between the U. S. ministers to France, Spain, and Great Britain, which resulted in their issuing a circular known as the Ostend Manifesto, favoring the acquisition of Cuba in the interest of slavery, and by a violent assault made in 1856 by Preston S. Brooks, of South Carolina, for words spoken in debate, upon Senator Charles Sumner (see SUMNER, CHARLES), of Massachusetts, who with Chase, of Ohio (see CHASE, SALMON P.), and Seward, of New York, had led the opposition to the repeal of the Missouri Compromise. The Free-soil party of 1848 and 1852 now passed into the Republican party, which for the election of 1856 nominated John C. Frémont on a declaration of opposition to the extension of slavery into the Territories. So strong had become the sense of the inadequacy of the Whig party to offer resistance to the encroachments of the slavery propagandists that the popular vote for Frémont rose above 1,300,000. This, while nearly 500,000 short of the vote for Buchanan, the Democratic candidate, was yet 500,000 in excess of the

vote for Fillmore, the former President, who had been nominated by the Whigs. In the electoral college Buchanan received 174 votes, Fremont 114, Fillmore 8. This passage of the Whigs into the Republican party was assisted by a violent popular agitation in 1854 against the political influence of foreigners who had been naturalized as citizens of the U. S. These generally voted with the Democratic party. This agitation against foreign influence led to the formation of a secret political society known as the Native American order, more popularly as the KNOW-NOTHINGS (*q. v.*), which in 1854 carried several States and elected many members of Congress, but in 1856 fell away in the presence of the more exciting issue of slavery. On the last day of Pierce's administration (Mar. 3, 1857), a tariff bill passed Congress which greatly reduced the customs duties of 1846. Buchanan, who as U. S. minister to Great Britain had taken part in the Ostend conference, constituted his cabinet of Lewis Cass, Secretary of State; Howell Cobb, of the Treasury; John B. Floyd, of War; Isaac Toucey, of the Navy; Jacob Thompson, of the Interior; Aaron V. Brown, Postmaster-General; and Jeremiah S. Black, Attorney-General.

The troubles in Kansas still continued to agitate the entire country. In the struggle between the Free-State and the Slave-State parties the power of the administration was thrown in favor of the latter, and that party in Congress, in spite of the opposition of a minority of its members headed by Stephen A. Douglas, carried through a bill submitting to the people of Kansas for ratification the so-called Le-compton constitution, which had been framed by the pro-slavery party, constituting an unmistakable minority of the State. Meanwhile several of the Northern States passed acts intended to assert the personal liberty of their citizens against certain of the provisions of the Fugitive-slave laws, which were deemed unconstitutional, by securing a jury trial and the privilege of *habeas corpus* in the cases of alleged fugitives from service. On the other hand, the Supreme Court, of which Roger B. Taney, once Gen. Jackson's Attorney-General and Secretary of the Treasury, was chief justice, decided in the Dred Scott case in favor of the claim of the extreme Southern State Rights partisans, that the slaveholder should be allowed to carry his property with him anywhere under the protection of the Constitution. The question of slavery had now become the one question of national politics, and it was evident that, as the Whig party had been rent by the antagonisms developed by this issue, the Democratic party was to be likewise disrupted in the efforts of the Southern leaders to assert the nationality of slavery. The leader of the more conservative Democrats was Senator Douglas, by whose act in 1854 the question of slavery in the Territories had been reopened after the settlement of 1820. The approaching conflict of arms was intimated toward the close of Buchanan's administration by the attempt of John Brown (*q. v.*), formerly a leader of the Free-State party in the Kansas struggles, to seize the U. S. armory at Harper's Ferry, Va., for the carrying out of plans he had formed for the wholesale escape of the slaves of that region. After a brief success and a fierce resistance, Brown and his party were overcome by a detachment of U. S. troops, and were given up to the State authorities for trial and execution.

The disruption of the Democratic party, in consequence of the manner in which the issue of the nationality of slavery was pressed by the Southern wing, occurred at the national convention held at Charleston in Apr., 1860, for the nomination of Buchanan's successor, when the majority of the Southern delegates withdrew upon the passage of a resolution declaring that the constitutional status of slavery should be determined by the Supreme Court. In consequence of the secession, the convention was adjourned till June, when Douglas was nominated. The seceding delegates met later in convention and nominated John C. Breckenridge, of Kentucky, who had been Vice-President with Buchanan. A convention representing what was called the Constitutional Union party, embracing many former Whigs, with what was left of the Native American party, nominated John Bell, of Tennessee, with Edward Everett, of Massachusetts, for Vice-President. The Republican national convention nominated Abraham Lincoln, of Illinois, with Hannibal Hamlin, of Maine, for Vice-President, on a declaration of principles which, while leaving "inviolate the rights of the States, and especially the right of each State to order and control its own domestic institutions," made freedom "the normal condition of all the territory of the U. S." Douglas received 12 votes from Missouri and New

Jersey; Bell received 39 votes from Virginia, Kentucky, and Tennessee; Breckenridge received all the Southern votes remaining, 72 in number; Lincoln received all the Northern votes remaining, 180 in number, and was elected.

Among other events and measures of Buchanan's administration must be noted the expedition under Col. Albert S. Johnston against the Mormons in Utah, to assert the authority of the Government, which had been defied by Brigham Young; the admission of Minnesota as a State in 1858, and of Oregon in 1859; but particularly the commercial and financial crisis of 1857, which began in September with the failure of a large trust company in New York, producing a panic which spread rapidly, until in two or three weeks' time the banks had generally suspended and numerous failures, mainly commercial, had occurred. The recovery from the effects of this disaster was, however, very prompt, and no long suspension of industry resulted.

The Civil War.—The canvass preceding the election of LINCOLN (*q. v.*) had been highly exciting. Extensive preparations for conflict followed at the South, with a general arming and drilling of the population. The Southern leaders declared the election of a President pledged to oppose the extension of slavery to be a moral invasion of the slave States, and a violation of their constitutional rights. South Carolina led in secession in Dec., 1860; other slave States followed, and in February, 1861, their delegates met in convention at Montgomery, Ala., and framed a constitution for "the Confederate States of America." Jefferson Davis, of Mississippi, was chosen President, Alexander H. Stephens, of Georgia, Vice-President. Apr. 12 the troops of South Carolina opened fire on the U. S. garrison of Fort Sumter in Charleston harbor, which two days later surrendered. The news of actual conflict overcame alike the scruples of the Democrats at the North and of the Unionists at the South, and each section went into the war practically entire. Eleven States, with an aggregate population of 9,000,000, were arrayed against the Government. Kentucky, Maryland, and Delaware remained in the Union, though the first two furnished many soldiers to the Confederate armies.

Lincoln had been inaugurated on Mar. 4. His cabinet was constituted as follows: William H. Seward, Secretary of State; Salmon P. Chase, of the Treasury; Simon Cameron, of War; Gideon Welles, of the Navy; Caleb B. Smith, of the Interior; Montgomery Blair, Postmaster-General; Edward Bates, Attorney-General.

The day following the surrender of Sumter the President issued a call for 75,000 militia, which were put under arms in a surprisingly short time. The strong sympathy with secession in Baltimore led to an attack by a mob upon the Sixth Massachusetts Regiment, on the way to Washington, Apr. 19, in which several soldiers were killed. A military occupation of the city soon suppressed the rebellious sentiment, and the arriving militia took position along the Potomac in defense of Washington, already menaced by the Confederates. For an account of this and the other events of the civil war, see CONFEDERATE STATES.

The conduct of the civil war (1861-65) had been much embarrassed by fears of interference on the part of France and Great Britain. Such action was rendered more probable on the part of the latter power from the irritation caused by the seizure of Mason and Slidell, Confederate envoys to England and France, who were taken off the British vessel *Trent* by Capt. Wilkes, of the U. S. steamer *San Jacinto*, in Nov., 1861. War was averted by the release of the envoys on the demand of Great Britain. The occupation of Mexico by the European powers and the attempt to establish an empire by the aid of French troops (see MAXIMILIAN) were also regarded by the U. S. Government as a menace.

Perhaps in no war has the conduct of affairs been more affected by political exigencies. In 1862 and 1863 elections in several States went against the administration, and the necessity of resorting to a draft in the summer of 1863 led to riots in New York, which involved much loss of life and property, and required for their suppression considerable detachments from the army. (See DRAFT RIOTS.) The measures which were especially obnoxious were the suspension of the Habeas Corpus Act, the abolition of slavery in the District of Columbia and in the Territories, the enlistment of colored soldiers, and the proclamation of the President (Jan. 1, 1863), declaring free all persons held as slaves in all States and parts of States in rebellion.

In 1864 the Democrats nominated for the presidency Gen. George B. McClellan on a platform denouncing the arbitrary measures of the executive and declaring the war a

failure. Lincoln was renominated by the Republican party, and elected, with Andrew Johnson, of Tennessee, as Vice-President, by 212 votes against 21 for McClellan. On Apr. 14, 1865, a little more than a month after his reinauguration, President Lincoln was assassinated at Washington by J. Wilkes Booth. Booth was killed by his pursuers, and four of his accomplices were executed on the sentence of the military court. Vice-President Johnson succeeded to the presidency.

No one was criminally punished for participation in the war of secession. Jefferson Davis, President of the Confederacy, after the fall of Richmond, escaped southward, was captured in Georgia, placed on trial, and released on bail. Several successive amnesty proclamations of increasing scope were issued between May, 1865, and Dec., 1868, the last being universal. By proclamation of the President of the U. S. the civil war was declared at an end on Apr. 2, 1866.

The financial legislation of the war covered the issue, in 1862 and subsequently, of notes of the U. S., constituting a legal tender; the issue of interest-bearing bonds of several different descriptions; the establishment of the national banking system; the increase of customs duties from the low average under the tariff of 1857 to an average of nearly 50 per cent.; the imposition of a great variety of excise duties and a direct tax. (See the titles BANK, CURRENCY, and TARIFFS.) The ordinary expenditures of the Government which had to be thus provided for rose from \$60,000,000 in 1860 to \$1,217,000,000 in 1865.

Reconstruction.—The work of political reconstruction constitutes the great feature of the history of the U. S. from 1865 till the withdrawal of Federal troops from the Southern States in 1877. In 1863 fifty counties of Virginia W. of the Alleghenies were admitted to the Union as the State of West Virginia, being the thirty-fifth State, the required formal assent of Virginia thereto being given by a legislature gathered from a few counties adjacent to Washington. In Dec., 1863, a proclamation of the President provided for the re-establishment of civil government in any seceded State on the initiative of a number of qualified voters, not less than one-tenth of the number voting at the presidential election of 1860. Under this scheme governments were instituted in 1864 in Louisiana and Arkansas. In 1865 the 13th Amendment to the Constitution, abolishing slavery within the U. S. and all places subject to their jurisdiction, was ratified by three-fourths of the States, and was proclaimed by the Secretary of State Dec. 18. In 1865 provisional governors were appointed by the President in most of the Southern States, the regular army of the U. S. still remaining in occupation of the territory, though the volunteers had been disbanded. By these provisional governors conventions were to be called to place the several States in a position to resume their interrupted federal relations, the principal conditions being the repeal of the ordinances of secession, the repudiation of public debts incurred in aid of the Confederacy, and the abolition of slavery by the authority and as the act of the States themselves. Such conventions were held and ordinances passed, but the action was not satisfactory to the Republican party in Congress, with which President Johnson soon broke even more completely than President Tyler had broken with the Whig party in 1842. It was alleged by the Republican leaders that the Southern whites were seeking by stringent laws of apprenticeship and vagabondage to reduce the late slaves to a condition of virtual slavery. Congress therefore refused to admit the Senators and Representatives of the reorganized governments, and in April, by a two-thirds vote, passed over the President's veto, the Civil Rights Bill, intended to protect the freedmen, and enlarging the jurisdiction of the U. S. courts to this end. In June, 1865, the two houses of Congress proposed the 14th Amendment to the Constitution, which was subsequently ratified by the requisite number of States, and proclaimed July 28, 1868. This provides in its first section that all persons born or naturalized in the U. S., and subject to the jurisdiction thereof, shall be deemed to be citizens of the U. S. and of the State where they reside, and that no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the U. S.; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the law; and Congress is authorized to enforce these provisions by appropriate legislation. The second section of the amendment sought to induce the

States to confer the right of suffrage on the blacks by providing that otherwise the representation of any State should be diminished in the proportion which the excluded classes bore to the total population; but, inasmuch as a subsequent amendment conferred the right of suffrage without distinction of color and without reference to the choice of the States, this section of the 14th Amendment remains wholly without content. The third section prohibits certain classes of persons, participants in the rebellion, from holding office under the U. S. or any of them until such disability shall have been removed by a two-thirds vote of both houses of Congress. The fourth section provides that the validity of the public debt of the U. S. shall not be questioned, and that the U. S. or any of them shall never assume or pay any debt incurred in insurrection, or any claims for the loss or emancipation of any slave.

The antagonism between the President and the Republican majority in Congress gradually increased, until Congress, in Mar., 1867, passed over the veto the Tenure of Office Act, to limit the President's power of removal from office. In Feb., 1868, the President, in defiance of this law—which he deemed an unconstitutional invasion of the executive functions—designated Gen. Lorenzo Thomas, adjutant-general of the army, as Secretary of War *ad interim*, removing STANTON (*q. v.*) from the office. This led immediately to an impeachment of the President by the House of Representatives, which was tried by the Senate, the chief justice presiding. President Johnson was acquitted, the prosecution failing to secure a two-thirds vote for conviction. Secretary Stanton, resigning, was succeeded by Gen. John M. Schofield, and Attorney-General Stanbery, a little later, was succeeded by William M. Evarts, who had been of the President's counsel.

The presidential election approaching, Johnson failed of renomination by either party, the Democrats putting forward Horatio Seymour, formerly Governor of New York, the Republicans nominating Gen. U. S. Grant, with Schuyler Colfax, of Indiana, Speaker of the House of Representatives, for Vice-President. Grant and Colfax were elected, receiving 214 votes against 80 for their opponents; three States, Virginia, Texas, and Mississippi, were not admitted to the electoral college.

The accessions to the U. S. during Johnson's administration had been through the admission of Nebraska as the thirty-seventh State in 1867, Nevada having been admitted as the thirty-sixth State in 1866, and the purchase of Alaska from Russia for the sum of \$7,000,000. In Feb., 1869, just before the expiration of Johnson's term of office, the 15th Amendment to the Constitution was passed by Congress over the veto. This amendment provides that the rights of citizens of the U. S. to vote shall not be denied or abridged by the U. S., or by any State, on account of race, color, or previous condition of servitude. It received the ratification of the requisite number of States, and was proclaimed Mar. 30, 1870.

In President Grant's administration the office of the Attorney-General was enlarged to constitute the administrative department of justice, having supervision of U. S. district attorneys and marshals. All the States were restored to representation in Congress. Between 1869 and 1873 the tariff duties imposed during the war suffered considerable reductions, while the internal revenue duties were mainly abolished, except as to spirits and tobacco. The reform of the civil service was begun in this administration; but Congress failed to furnish the requisite means for carrying it on, and no great progress was made. The completion of the Union Pacific and Central Pacific railways, making a continuous line from the Missouri to the Pacific, was effected in 1869. Out of the connection of the Government with these roads arose much scandal from the alleged corruption of certain members of Congress, who were charged with receiving stock of the Credit Mobilier Company, which built the road. The charges were investigated by Congress in winter of 1872-73, with much injury to the reputation of several members.

During the presidential election of 1868, which was the first national election after the 15th Amendment to the Constitution, numerous outrages were perpetrated upon the colored people of several of the Southern States, and intimidation was largely exercised to restrain their political action. These acts were generally committed by masked men, supposed to belong to a widespread organization to which was popularly given the name KU-KLUX KLAN (*q. v.*) In Apr., 1871, an act was framed under the authority of the

14th Amendment to the Constitution, enlarging the jurisdiction of the U. S. courts for the punishment of such offenses.

In 1871 a treaty was negotiated at Washington between commissioners on the part of the U. S. and of Great Britain for the settlement of the Alabama and other claims against Great Britain arising out of the depredations of the Confederate cruisers built in England, and also for the adjustment of the conflicting claims of the two countries to the islands of the San Juan group between Vancouver's island and the continent on the Northwest. The latter were referred to the Emperor of Germany as arbitrator, who decided in favor of the U. S. The Alabama and kindred claims were referred to a tribunal to be convened at Geneva, consisting of five arbitrators, appointed, one each, by the President of the U. S., the Queen of England, the King of Italy, the President of the Swiss Confederation, and the Emperor of Brazil. The arbitrator on the part of the U. S. was Charles Francis Adams, who had been minister to Great Britain during the war. The tribunal assembled in Dec., 1871, and, after hearing the evidence and the arguments, awarded to the U. S. a gross sum of \$15,500,000, to be distributed by the Government. By the same treaty certain other claims, both of American citizens against the British Government and of British citizens against the Government of the U. S., were referred to a joint commission of three. The commissioner on the part of the U. S. was James S. Frazer. The commission met at Washington in Sept., 1871, and sat nearly two years, making a net award against the U. S. of about \$2,000,000. Another commission, provided for by the treaty for determining the disputed rights of navigation and fishing between Canada and the U. S., met at Halifax in 1877, and awarded \$5,500,000 to Great Britain.

The unsettled condition of affairs in Santo Domingo in 1869-71 led to propositions for its acquisition by the U. S., and the President appointed a commission to visit that territory and report respecting the state of society therein; which they did, but with no practical result.

As the presidential election of 1872 approached, considerable dissatisfaction was developed among a section of the Republican party in consequence of many alleged abuses of the public patronage, especially the manner in which the power of the administration had been used to sustain Republican ascendancy through Negro votes in the Southern States. In May a convention of Liberal Republicans met at Cincinnati and nominated Horace Greeley, of New York, for President. This nomination was ratified by the Democratic convention, though a very small section of the party repudiated the action and nominated Charles O'Connor, of New York. The Republicans in convention at Philadelphia renominated President Grant, with Henry Wilson, of Massachusetts, for Vice-President. The Republican ticket received the electoral vote of twenty-nine States—in all, 286 votes. The votes of Arkansas and Louisiana were thrown out for irregularities. The remaining six States, all late slave States, went Democratic, but Greeley having died before the assembling of the electoral college, this vote was scattered according to local preferences.

In Oct., 1873, the steamer *Virginius*, carrying the U. S. flag, and having on board munitions of war and recruits for the insurgents in Cuba, was captured by a Spanish armed vessel, and a number of the prisoners shot by the authorities in Cuba. War was anticipated, and considerable naval preparations were made by the U. S., but the lawless character of the *Virginius* was fully established, and friendly relations were restored, Spain paying a sum for the relief of the families of the victims.

In the same year there was a commercial crisis resulting in frequent and disastrous failures in business, owing to the unsatisfactory condition of the currency and the prevalent spirit of speculation. At the outbreak of the war a paper currency was issued in such quantity that at the close of the struggle the "greenback" dollar was greatly depreciated. Prices rose enormously and the spirit of speculation became general. It was the era of railway building. Enormous fortunes were made, and these enticed people into unsafe ventures. The commercial crisis that followed was laid at the door of the administration, and consequently the congressional elections of 1874 turned a Republican majority of sixty or seventy in the House of Representatives into a nearly equal Democratic majority. After the panic of 1873 both houses of Congress passed a bill for the further inflation of the currency, but this bill was vetoed by the President. Just before the incoming of the new House of Representatives,

Congress passed an act declaring that specie payments, which had been suspended early in the civil war, should be resumed by the U. S. on Jan. 1, 1879.

In the autumn of 1875 the elections in the States of Ohio and Pennsylvania were severely contested between the Democrats and the Republicans on the currency issue, popularly known as "hard money" or "soft money," the position taken by the former party being that the Resumption Act of 1875 was arbitrary, ineffective, and injurious to the industry of the country. Both these elections were carried by the Republicans. The Democrats coming into power in the House of Representatives for the first time in sixteen years, many investigations were made by special and standing committees into the conduct of affairs by the Republicans, and reports were made censuring the conduct of various cabinet officers and subordinate officials. On the report of a committee to examine the expenditures of the War Department, William W. Belknap was impeached as Secretary of War for corruption in the appointment of a post-tradership. The impeachment was tried by the Senate, and Mr. Belknap, who had resigned from office before the vote of impeachment, was acquitted, less than two-thirds voting for conviction.

In May, 1876, an international exhibition was opened at Philadelphia under the auspices of the U. S. Government, which made an appropriation of \$1,500,000 for the purpose, while the private, municipal, and State subscriptions aggregated several times that amount.

One of the features of President Grant's administration was the appointment of Indian agents upon the recommendation of the religious societies and missionary boards having the spiritual charge of the tribes. This did not, however, prevent three Indian wars. The first occurred with the Apaches in Arizona, who, after numerous depredations and massacres, were severely punished by Gen. Crook. A second with the Modocs, a small band under "Captain Jack," ranging in Southern Oregon and Northern California, began in 1873 with the massacre of Gen. Edward R. S. Canby while treating with the savages, and was closed by the utter destruction of the band after severe losses to the U. S. troops, from the diligent character of the lava-beds in which Captain Jack made his stand. The third began in 1876 with a large body of Sioux Indians under Sitting Bull in Montana, who refused to receive the terms of the Government and remain at the agencies established for them. In June Gen. George A. Custer moved against the hostile Sioux with a regiment of cavalry, and, dividing his command, advanced with five companies into the neighborhood of a camp of more than 2,000 warriors. Custer and his troops were surrounded and every man fell, no one remaining alive to tell the tale. The other companies of Custer's command were attacked by the Indians, but were saved by the arrival of Gen. Terry with a large body of infantry. Extensive preparations were at once made by the Government for punishing this band, and a formidable expedition under Gens. Crook and Terry was sent against them, but without important result.

On the approach of the presidential election of 1876 the Republican party in convention at Cincinnati nominated for President Rutherford B. Hayes, Governor of Ohio, with William A. Wheeler, of New York, for Vice-President. The Democratic convention nominated for President Samuel J. Tilden, Governor of New York, with Thomas A. Hendricks, Governor of Indiana, for Vice-President, on a platform demanding the repeal of the Resumption Act of 1875. The election that followed resulted in one of the greatest strains to which the Constitution was ever subjected. From South Carolina, Florida, Louisiana, and Oregon two sets of returns were sent in. In each of these States one set of the votes was entirely Republican, while the other set was entirely Democratic, except in Oregon, where two votes were Republican and one Democratic. If all these States should cast their entire vote for the Republican ticket Hayes would have 185 votes and Tilden 184. If even the odd Democratic vote of Oregon should be cast for Tilden he would have 185 votes and would be elected. The Senate was Republican and the House was Democratic, and therefore Congress could not agree on a method of counting the votes. It was finally decided that the disputed points should be submitted to a commission of five Senators, five Representatives, and five members of the Supreme Court. The commission had eight Republicans and seven Democrats. Every question was decided by a strict party vote, and consequently Hayes received 185 votes and was declared elected. The decision

was not announced until Mar. 2, two days before the inauguration. See PRESIDENTIAL ELECTORAL COMMISSION.

The administration of President Hayes was free from the scandals that had but recently prevailed. One of his first acts was to withdraw the Federal troops from the South and thus leave the Southern States to govern themselves. The period of reconstruction was closed by this act. In 1873 the Coinage Act had put an end to the free coinage of silver in the U. S. (See SILVER COINAGE IN THE U. S.) In 1878 the Bland Silver Bill, providing for the coinage of silver dollars of 412½ grains in quantities of not less than \$2,000,000, and not more than \$4,000,000 a month, became a law. In 1879 specie payment was resumed.

Beginnings of Civil Service Reform.—In 1880 James A. Garfield, the Republican candidate, was elected President and Chester A. Arthur Vice-President, Garfield receiving 214 electoral votes as against 155 east for the Democratic candidate, Gen. Hancock. No sooner was the result of the election known than the clamor for offices broke out with unwonted violence. Congress had given very meager support to the efforts of the Presidents to establish civil service reform (see CIVIL SERVICE AND CIVIL SERVICE REFORM), and the contributors to Garfield's success now claimed their reward. The President refused to comply with the demands of the Senators from New York in regard to the collectorship of the port of New York city, whereupon both Senators tendered their resignations to the New York Legislature. On July 2 the President was shot in a railway station in Washington by a man named Guiteau, who had failed to obtain a small office. After more than ten weeks of painful lingering the President died Sept. 19, and was succeeded by Vice-President Arthur. The horror of this great crime awakened the people to the evils of the "spoils system," and an act was soon passed for the reform of the civil service. The strength of the reform movement thus set on foot during the administration of President Arthur showed itself in the election of 1884. The candidates were the Republican leader JAMES G. BLAINE and the Democratic Governor of New York GROVER CLEVELAND (*qq. v.*). Many Republicans now identified with the reform movement refused to support Blaine, who received 182 electoral votes, while Cleveland received 219, and was therefore elected. The reform of the civil service continued to be slowly but surely advanced.

Financial Questions.—As the great questions involved in the civil war and the reconstruction of the Southern States were gradually settled, questions of finance assumed increasing importance. The pension laws for the assistance of veterans of the war made large and increasing demands on the treasury. The existing tariff laws were highly unsatisfactory to Cleveland's administration. The Walker tariff of 1846, enacted, for the most part, for revenue only, had continued, with modifications still further reducing the rates in 1857, till the outbreak of the war. The necessity of additional revenue and the advent to power of the Republican party, which had inherited the old Whig doctrines of a tariff for protection as well as revenue, led to the high protective Morrill acts of 1861 and 1862. These acts from time to time were modified, the modifications being often in the interest of higher protection. In 1887 President Cleveland made the question of the tariff the subject of his message to Congress. Advocating an abandonment of the protective policy, he urged the establishment of a revenue tariff which should tend toward the ultimate establishment of free trade. This message brought the tariff question into immediate prominence, and caused it to overshadow all other issues in the next election. The Republicans put forward as their candidate Benjamin Harrison, of Indiana, a grandson of President William Henry Harrison. Cleveland received 168 electoral votes and Harrison 233.

This popular indorsement of the principle of protection led to the enactment of the McKinley tariff of 1890, which largely increased the duty on certain articles and diminished it on others, all the provisions of the act being adjusted for the purpose of further emphasizing the principle of protection to American industries. At about the same time the pension laws were modified so as greatly to increase the demands upon the treasury from this source. In the meanwhile the operation of the Bland silver law had stimulated the development of mines and the production of silver, and this result had emphasized the popular call for a more liberal rate of coinage. The demand was met by the Sherman act, which provided for large monthly purchases of silver bullion. An attempt to pass what was commonly called the Force Bill, providing for Federal supervision of elections,

intensified political feeling. There were also unmistakable signs of financial uneasiness. The very rapid accumulation of silver in the treasury caused by the Bland and the Sherman acts awakened a financial distrust which was followed by a large balance of trade against the country, and the consequent embarrassment of large exports of gold. These several untoward facts contributed to the result of the election in 1892. Harrison and Cleveland were both renominated; Cleveland received 277 electoral votes, Harrison 145. The so-called People's Party cast 22 electoral votes. The House of Representatives became overwhelmingly Democratic, and the victorious party also obtained a slight majority in the Senate. Thus for the first time since the civil war the Democrats were placed in control of both the elective branches of the Government. During President Harrison's term, six new States—the two Dakotas, Wyoming, Montana, Idaho, and Washington—had been admitted to the Union. The census of 1890 showed that the Northwest had enormously increased in population and wealth during the preceding ten years. That the influence of this region had grown in corresponding measure was shown by the fact that, after a very warm contest between different cities for the World's Columbian Exposition of 1893, Congress decided that it should be held at Chicago.

The first important act of Cleveland's second administration was to call an extra session of Congress for the purpose of dealing with the financial situation. The exports of gold and the accumulations of silver were so great that the President earnestly recommended the repeal of the silver clause in the Sherman act. Congress adopted this recommendation, though only after a long discussion which disclosed a formidable faction or party that advocated the free coinage of silver. The repeal, however, did not avert the impending crisis. In view of an anticipated radical change in the tariff, the manufactures of the country fell into deep depression, and the rapid fall in the price of silver caused a very general wreck of industries in the mining States. The crash resulted in the suspension of many banks and the failure of many business houses. The Wilson Tariff Act, adopted in 1894, was far less radical as a measure for revenue only than the one the leaders of the party had advocated, for the reason that a few Democratic members of the Senate could not be brought to co-operate with their party colleagues. The act was a source of bitter disappointment to a majority of the people in many ways. It fell short of what the advocates of tariff reform desired, and it provided for a tax upon persons having incomes of more than \$4,000 a year. The opposition aroused by these two features of the measure and the continued financial depression led to overwhelming Republican victories throughout the country in Nov., 1894. The Senate was given a small Republican majority, while in the House of Representatives the victorious party had more than twice as many members as their opponents. On May 21, 1895, the Supreme Court, by a majority of five judges against four, declared those portions of the Wilson act which established an income tax invalid, on the ground that they provided for what is practically a "direct tax," in a manner not authorized by the Constitution. This decision by a majority of one in a court of nine judges is a most interesting and significant example of the authority of this branch of the Federal Government.

The presidential campaign of 1896 was characterized by great political tension, a remarkable sundering of party ties, and much anxiety in regard to its outcome, owing to the importance of the issues involved. The agitation in favor of the free coinage of silver at a ratio of 16 to 1 had become very aggressive, and at the national conventions overshadowed almost all other issues. The Republican convention, which met at St. Louis, Mo., June 18, nominated for the presidency William McKinley, of Ohio; for Vice-President Garret A. Hobart, of New Jersey, and declared in favor of the maintenance of the present gold standard, and against free silver except under international agreement. The adoption of this plank led at once to the withdrawal of Senator Teller and most of the delegates from the silver-producing States of the West. At the Democratic convention, held in Chicago, July 10, William J. Bryan, of Nebraska, was nominated for President, and Arthur Sewall, of Maine, for Vice-President, and free silver was made the paramount issue. No bolt occurred then, but later (Sept. 3) a large number of delegates representing the "sound-money" wing of the Democratic party met at Indianapolis under the name of the National Democratic party, adopted a simple platform, in which the maintenance of the present

gold standard was the principal plank. For President they nominated John M. Palmer, of Illinois, and for Vice-President Simon M. Buckner, of Kentucky. The People's (or Populist) party assembled in national convention at St. Louis, Mo., July 22, and nominated W. J. Bryan for President and Thomas E. Watson, of Georgia, for Vice-President. The principal plank in their platform demanded "the free and unlimited coinage of silver at the present legal ratio of 16 to 1, without waiting for the consent of foreign nations." The results of the elections are given on page 367.

United Syrians: in general, a body of Christians who together with the Chaldaeans, the Maronites, and the United St. Thomas Christians, comprise the Syrian rite in the Eastern rite of the Roman Catholic Church; more particularly, the converts from the Jacobite or Monophysite Church in Syria, usually known as Syrian Catholics. The United Syr-

ians have a patriarch at Aleppo, styled Patriarch of Antioch, and Archbishops of Aleppo, Babylon, Damascus, and Selenia, besides eleven bishops. They number about 30,000. They date from the sixteenth century, when (1546) one of their congregation was converted to the Catholic Church. In 1650 the Capuchins converted Aehigian, the Jacobite Bishop of Aleppo. The movement of conversion, however, dates chiefly from the end of the eighteenth century. The Patriarch of Aleppo has jurisdiction over the Syrian Catholics of Syria, Mesopotamia, and Egypt, but is himself immediately subject to the Propaganda and to the vicar-apostolic of Aleppo as apostolic delegate. See Silbernagl, *Kirchen des Orients*; *Hierarchia Catholica* for 1895; O. Werner, S. J., *Orbis Terrarum Catholicus*. Revised by J. J. KEANE.

Unities, THE DRAMATIC: fundamental principles supposed to appear in every artistic dramatic composition. As finally elaborated, the Unities were three in number—Unity of Action, Unity of Time (or of the Day), and Unity of Place. Insistence on the rigid observations of these principles is pre-eminently to be found in the French dramatists and critics of the seventeenth and eighteenth centuries, beginning with Corneille. These writers, however, believed that they were but restating laws that had governed the Greek and Latin dramas, and that had first been definitely formulated by Aristotle in his treatise on the *Poetics*. To this work, therefore, we must turn, if we would rightly understand the origin and meaning of the conceptions designated as the Dramatic Unities.

In the *Poetics* (which, it must be remembered, is not a completed work, but rather a series of not wholly harmonized notes and observations), Aristotle discusses at greatest length two forms of poetry—epic and dramatic. His method is at once inductive and synthetic. The materials used for induction were the Homeric poems and the already existing plays of the greatest Greek dramatists, Æschylus, Sophocles, and Euripides. The synthetic, or constructive, part of the treatment, on the other hand, was largely determined by the analogy that Aristotle felt to exist between art and nature, the creations of the poet and the living forms of the natural world. His observations on the drama, accordingly, need careful discrimination to avoid the confusion of generalizations derived from the limited forms of the drama known to him, with principles believed by him to exist of necessity in all successful works of art, by reason of the organic character of true artistic creation.

To this latter class of principles belongs the one form of dramatic unity that Aristotle most insists upon, and indeed alone treats as absolutely indispensable, namely, Unity of the Action (*πρᾶξις*). The one primal necessity of any organic form of life whatever is that it be clearly separated and distinguished from what is unbounded (*ἄπειρον*), undefined, indeterminate. It must be in itself one (*ἓν*), a whole (*ὅλον*). The various parts of it must belong functionally together; they must tend to a single total result or end (*τέλος*). Hence Aristotle's definition of tragedy (*Poetics*, ch. vii.): "Tragedy is an imitation of an action that is complete and whole and of a certain magnitude; for there may be a whole that is wanting in magnitude. A whole is that which has beginning, middle, and end. A beginning is that which does not itself follow anything by causal necessity, but after which something naturally is or comes to be. An end, on the contrary, is that which itself naturally follows some other thing, either by necessity or in the regular course of events, but has nothing following it. A middle is that which follows something, as some other thing follows it." These definitions have at first sight the appearance of too great obviousness, yet in them is really to be found Aristotle's whole theory of art. His "beginning," "middle," and "end" by no means express mere consecutiveness of events. Rather he indicates by them a certain body of fact, bounded and limited in contrast with the variety of fact in the universe, but at the same time tied together by the closest bonds of causality. As Lowell has excellently put it (*The Old English Dramatists*, p. 55): "In a play we not only expect a succession of scenes, but that each scene should lead, by a logic more or less stringent, if not to the next, at any rate to something that is to follow, and that all should contribute their fraction of impulse toward the inevitable catastrophe. That is to say, the structure should be organic, with a necessary and harmonious connection and relation of parts, and not merely mechanical, with an arbitrary or haphazard joining of

one part to another. It is in the former sense alone that any production can be called a work of art."

Of quite a different character is Aristotle's Unity of Time, in so far as he has formulated it at all. The necessities of the Greek stage were such that a dramatic story had to be told upon it in a highly concentrated form. The Athenian audience, furthermore, was in general perfectly familiar with the themes employed by the dramatists, and had not to be informed of all the long preliminaries that led up to the tragic situation. The development of character, too, which requires some lapse of time, was severely subordinated to the plot. As Aristotle says (*Poetics*, ch. vi.): "The Plot, then, is the first principle, and, as it were, the soul of tragedy; character holds the second place." Consequently, the best, though by no means all, of the Greek tragedies familiar to Aristotle depicted merely the brief final moment, the catastrophe, of the life of the hero. He was led, therefore, to make the empirical statement (*Poetics*, ch. iv.), that "tragedy endeavors, as far as possible, to confine itself to a single revolution of the sun, or but slightly to exceed this limit; whereas the epic action has no limits of time; . . . though at first the same freedom was admitted in tragedy, as in epic poetry." From this statement, and this alone, modern critics have derived the principle of Unity of Time.

Even less substantial is the Unity of Place. Aristotle does not mention it at all. Most of the existing Greek tragedies, to be sure, show it, probably because the chorus regularly consisted of onlookers whose character remained unchanged throughout the piece, and whose songs embodied the reflections of the community in which the tragic catastrophe was supposed to occur. This, however, is clearly an accidental feature of the Athenian drama, quite unconnected with any inner principle. In modern times it has chiefly been defended as a logical deduction from the Unity of Time, though the logic is far from close or compulsive.

The importance of the Unities in modern discussions of the drama is largely due to the exaggerated authority attributed during the Renaissance to all utterances of the classical world. It was in Italy, early in the sixteenth century, that Aristotle's *Poetics* began to be studied as the basis of the art of poetry. A Latin translation by G. Valla was printed in Venice in 1498, and the Aldine *editio princeps* of the Greek text appeared in 1508. These were followed by the Latin translations, Anon. (Venice, 1515), A. Pazzi (Venice, 1536); and the Italian versions of B. Segni (Florence, 1549), L. Castelvetro (Vienna, 1570), and A. Piccolomini (Venice, 1575). Besides these appeared Fr. Robortelli's *In librum Aristotelis de Arte Poetica explicationes* (Florence, 1548); V. Maggi's *In Aristotelis librum de Poetica explanationes* (Venice, 1550); and P. Vettori's *Commentationes in primum librum Aristotelis de Arte Poetarum* (Florence, 1560). The Italian criticism of the time fully reflects the great interest implied by these numerous versions and comments. By the end of the century no cultivated Italian ventured to doubt the authority of the principles Aristotle was supposed to have laid down. From Italy the discussion passed into France. In the middle of the same century Ronsard and his school, the Pléiade, in their eagerness to establish classicism in French literature, made much of the dicta of the treatise, though they but partially understood them and poorly applied them. The tragedies of Seneca, however, which alone among ancient plays they really knew, from their triviality and essentially literary rather than dramatic character, seemed to bear out fully Aristotle's principles. In the next century, the seventeenth, however, the doctrine of the Unities found an advocate in Corneille, who in his *Cid* gave the first example of a play in which they were strictly observed. The genius of Racine still more completely established their authority, and they held undisputed sway in France for nearly two hundred years. England and Germany (and to a less extent Spain) also submitted to their rule, and not till the romantic movement of the nineteenth century was their absoluteness called seriously into question.

The best discussion of the real meaning of Aristotle's principles is to be found in S. H. Butcher, *Aristotle's Theory of Poetry and Fine Art, with Critical Text and Translation of the Poetics* (London, 1895). Much of value is to be found in the notes of T. Twining, *Aristotle's Treatise on Poetry, translated with Notes* (London, 1789). For the discussion of the Unities by Corneille and his school, see the *Discours* of Corneille, especially *Discours III., Des trois Unités*. See also Heinrich Breiting, *Les unités d'Aristote avant le Cid de Corneille* (Geneva, 1879).

A. R. MARSH.

Units [*unit* is shortened from *unity*, from Lat. *unitas*, oneness, unity, deriv. of *unus*, one]: certain known quantities, of the same kind as the quantities to be measured, taken as standards of reference. The numerical value of a concrete quantity is the number of such units which the quantity contains. Every expression for a quantity consists, therefore, of two factors—the numeric and the unit. Thus 10 feet, 50 grammes, 30 seconds.

FUNDAMENTAL UNITS.

A system of units contains as many different ones as there are quantities to be measured; they may be quite arbitrary, but it is convenient to connect them together in such a manner that they may be defined in terms of three arbitrary or underived units. These are called *fundamental units* in distinction from all others, which in turn are called *derived units*. The fundamental units adopted in science are those of *length*, *mass*, and *time*. This particular selection is a matter of convenience, and rests upon several considerations which have properly determined their choice.

The standard unit of length in Great Britain is the imperial *yard*; in the U. S. it is the distance between the 27th and the 63d inch divisions of the Troughton scale. This at 59.6 C. is equal to the imperial yard. In France the unit of length is the *mètre des archives*. The standard of mass in Great Britain is the *avoirdupois pound*; in the U. S. it is the "troy pound of the mint," according to which the coinage of the U. S. is regulated. It is a certified copy of the lost imperial standard of 1758, and contains 5,760 grains. The *avoirdupois* pound adopted by the Treasury was derived from the troy pound and contains 7,000 grains. In France the unit of mass is the *kilogramme des archives*.

By act of Congress in 1866 the meter was defined to be 39.37 inches. The weights and measures of the metric system are lawful in the U. S., and the standards of length and mass are the "national prototypes" of the meter and the kilogramme, made by an international commission, and preserved at the Bureau of Weights and Measures in Washington. They were authorized by a metric convention which was signed at Paris by the representatives of seventeen governments on May 20, 1875. See WEIGHTS AND MEASURES.

The universal unit of time is the *second* of mean solar time. The C. G. S. or *centimeter-gramme-second* system is based upon the centimeter, the gramme, and the second as the fundamental units. It was proposed by the British Association for the Advancement of Science in 1861.

DERIVED UNITS.

A. *Mechanical*.—The derived units will be defined in the C. G. S. system. The corresponding units for any other system are easily derived from them.

The *unit of area*, the square centimeter, the area of a square with sides 1 cm. long; *unit volume*, the cubic centimeter, the volume of a cube with edges 1 cm. long; *unit velocity*, the velocity of a body moving through 1 cm. in 1 sec.; *unit of acceleration*, the acceleration which in 1 sec. produces an increase in velocity of 1 cm. a second; *unit force*, the *dyne*, or that force which acting on a mass of 1 gramme generates a velocity of 1 cm. per second (see DYNAMICS); *unit of work and energy*, the *erg*, the work done or the energy expended by 1 dyne through 1 cm.; *unit of power*, the power represented by the expenditure of 1 erg per second.

B. *Electrical and Magnetic*.—Electrical units are either electrostatic or electromagnetic. The electrostatic units are based upon the phenomenon of the attraction and repulsion between charges of electricity, the law of which was established by Coulomb. The electromagnetic units are based upon the phenomenon of the magnetic field produced by a current, and they are derived from the definition of unit magnetic pole. All electrical units may be defined in either system.

The *electrostatic units* are as follows: *Unit quantity*, the quantity which repels an equal and similar quantity at a distance of 1 cm. with a force of 1 dyne; *unit difference of potential* between two points, a difference such that 1 erg of work is expended in moving unit quantity from one point to the other; *unit current*, a current conveying unit quantity in 1 sec.; *unit capacity*, the capacity of a conductor which is charged to unit potential by unit quantity. See POTENTIAL.

The *electromagnetic units* are as follows: *Unit magnetic pole*, a magnetic pole which repels an equal and similar pole at a distance of 1 cm. with a force of 1 dyne; *unit magnetic*

field, a field in which unit pole is acted upon by a force of 1 dyne; *unit current*, a current which, flowing in a circle of 1 em. radius, produces at its center a magnetic field of 2π units; *unit magnetizing force*, a magnetizing force producing unit magnetic field, equivalent to $\frac{1}{2}\pi$ ampere-turns per centimeter length; *unit electromotive force* (E. M. F.), the electromotive force which does 1 erg of work per second when unit current is flowing; *unit resistance*, the resistance of a circuit in which unit E. M. F. produces unit current.

C. *Practical Units*.—Since some of the C. G. S. units are inconveniently large and others inconveniently small, the practical units are some multiple or sub-multiple of ten times the corresponding C. G. S. units of the electromagnetic system. The practical units defined by the International Electrical Congress at Chicago, 1893, are as follows: *Unit of resistance, the ohm*, represented by the resistance offered to an unvarying current by a column of mercury at the temperature of melting ice and 14.4521 grammes in mass, of a constant cross-sectional area, and 106.3 cm. in length; *unit of current, the ampere*, which is the practical equivalent of the unvarying current, which, when passed through a solution of silver nitrate in water, deposits silver at the rate of 0.001118 gm. per second; *unit of electromotive force, the volt*, or the E. M. F. that, steadily applied to a conductor whose resistance is 1 ohm, will produce a current of 1 ampere; it is equivalent to $\frac{1000}{107}$ of the E. M. F. of the Clark cell at a temperature of 15° C.; *unit of quantity, the coulomb*, which is the quantity transferred by 1 ampere in 1 sec.; *unit of capacity, the farad*, the capacity of a condenser charged to a potential of 1 volt by 1 coulomb; *unit of work, the joule*, the energy expended in 1 sec. by an ampere in an ohm; *unit of power, the watt*, the work done at the rate of 1 joule per second; *unit of induction, the henry*, the induction in a circuit when the E. M. F. induced is 1 volt while the inducing current varies at the rate of 1 ampere per second.

The relation between these practical units and the C. G. S. units is set forth in the following table:

PHYSICAL QUANTITY.	Practical unit.	RATIO OF PRACTICAL TO C. G. S. UNITS.	
		Electromagnetic.	Electrostatic.
Quantity.....	Coulomb.....	10^{-1}	3×10^9
Current.....	Ampere.....	10^{-1}	3×10^9
Electromotive force.....	Volt.....	10^8	$\frac{1}{3} \times 10^{-2}$
Resistance.....	Ohm.....	10^9	
Capacity.....	Farad.....	10^{-9}	9×10^{11}
Induction.....	Henry.....	10^9	
Work.....	Joule.....	10^7	
Power.....	Watt.....	10^7

Univer'salism [from Lat. *universalis*, of or belonging to all or to the whole, universal, deriv. of *universus*, all together, whole, entire, liter., turned into one; *unus*, one + *vertere, ver'sum*, turn]; in theology, the doctrine that all mankind will finally attain salvation. Stated more fully, the beliefs which constitute this doctrine are: that God is; that his infinite power, wisdom, and justice are modes of his essential nature, which is love; that he holds to man the relations of Creator and Father; that he is manifested through his works and providence; that he has disclosed through holy men, and especially through Jesus Christ, his character, will, and purpose as related to the duty and destiny of man; that he is continually working upon mankind through his cosmic and ethical forces, and by his Holy Spirit of truth, faith, hope, and love; and that thus guided and inspired, all his children will eventually clear themselves from evil and achieve perfected character with its resulting power, peace, and joy—so that a final moral harmony of the universe will be attained, and God will be all in all.

Man.—It is held by Universalists that man is not under the wrath and curse of God for the sins of his ancestors, but that he is under the difficulties and dangers of inherited and acquired incompleteness and defect; that his chief peril, the real, demonstrable hell into which he may fall, is degeneration—the failure to live up to his organic capacity; that the evils in which he is enmeshed are, however, challengers of his strength; that pain is the great stimulus of his energy—the prolonged birth-pang of his higher powers; and that his agonizing conflict with evil is but the fair price of perfected character and enduring life. Universalism emphasizes the importance of faith in man as the chief work of God and the

highest organism in the visible creation; and it contributes to the Christian creeds this new article of faith: "We believe that man is created in the spiritual image of God, and is capable of knowing and doing his will." It is affirmed that man is not a fallen being, a worm, a slave, a wreck, but a developing being who began low down and is on his way up, not a ruin, but a mine full of latent riches. His capacities are great, some of them are sublime; he is God's fellow-worker, co-operator, and agent, through whom the divine purposes are wrought out on earth. God furnishes the arena, the organism, the constant inspirations, but man does the work, and in doing it he develops the one thing which God does not create, namely—character. Universalism affirms the spiritual unity of the race, and the universality and essential ethical identity of all of God's revelations to man.

Salvation.—It is held that moral development is not confined to the present state of existence, but is continuous with the whole duration of man; that salvation consists in the formation of a character conformed to God's will; that such character can not be instantaneously acquired, nor produced in any other way than by the voluntary action of the individual; that rewards and punishments are aids to the development of character and not ends or finalities; that God's love is as clearly shown in penalty as in reward, since, by the return of his deeds upon his head, man is made aware that there is Somebody in the universe who cares which way he goes; that punishment is medicinal and corrective; that the remission of the penalties of voluntary disobedience would be unmerciful; that forgiveness does not involve such remission, but works a change in the attitude of the soul which enables the sinner to endure the consequences of his sin in such a way that they will ennoble, instead of degrade him. Universalism affirms that the revelation of the divine character through the Christ is the most potent awakener of the moral energy of men; that the chief function of the Church of Christ is to hold his ideal of life and character before men and assist them to attain it; that man can not find salvation by withdrawing from the sphere of life's appointed activities and duties, but that the great school of moral discipline and spiritual culture is to be found in the common personal relationships and ordinary pursuits of life.

The Bible.—The Universalist Confession of Faith says: "We believe that the Holy Scriptures of the Old and New Testaments contain a revelation of the character of God, and of the duty, interest, and final destination of mankind." It is held that the moral and spiritual content of the Bible constitutes a progressive revelation; that it is adapted to the successive stages of man's development; that, since a revelation must necessarily be intelligible to those to whom it is addressed, the Bible must be interpreted according to the present canons of historical criticism and in the terms of man's present understanding and conscience; that it contains a record of man's spiritual experience and moral growth through many ages under the tuition of God's Spirit; and that it stands pre-eminent in its power of communicating moral energy to the struggling souls of men.

Methods.—It is held that all moral transformation and growth is from within outward; that the incarnation of God in Christ is representative of the possibility of the indwelling of God's Spirit in all men; that every soul is capable of receiving that Spirit; that the entrance of the divine life into humanity is not an exceptional, official, or magical act, but a process whose laws can, to a large extent, be discerned and obeyed; and that repentance of sin, the worship of God, loyalty to the Christ, the service of men, the diligent discharge of humble duty, and the honoring of the common relationships of life, are all channels through which the soul may receive in ever-increasing measure that divine energy which lifts it out of the power of sin and sorrow, and forwards it on the way to perfection.

Resurrection and the Future Life.—It is held that the resurrection is experienced by each soul when, at the dissolution of the body, it enters upon a new order of existence. It is not conceived that death works any moral transformation, but that the soul enters the next state with just the spiritual character which it achieved on earth. It is believed that in the future life all the opportunities for further growth which the powers of the soul open to it will be accorded; that it will there be under the ministry of truth and love, until truth and love have wrought within and upon it their perfect work.

Historical.—Universalism in its essential features dates from a high antiquity in the Christian Church. It was

held by Clement of Alexandria (A. D. 190), by the great and learned Origen (A. D. 225), and a little later by Theodore of Mopsuestia, and others. When the Latin form of Christianity triumphed over the Greek form, and Rome gained supremacy, the doctrine of purgatory gradually superseded the Universalist belief in moral progress beyond death. In the rigors of the Reformation, the recoil from the abuses of the doctrine of purgatory took the form of a rigid denial of the possibility of any moral change after death. But through all this period Universalism had its isolated scholars and saints, and the reformed Christianity produced many able and devoted advocates of the universal hope, in Germany, France, and England. Universalism began its development in America in the last half of the seventeenth and the first half of the eighteenth centuries, through certain English and French Mystics, through the German Brethren, the Moravians, and through a few learned divines of the Episcopalian and Congregationalist bodies. John Murray came from England in 1770, and began to proclaim it openly. Its doctrines spread rapidly, but it acquired institutional power slowly. The organization of the Universalist branch of the Christian Church in America was accomplished in 1803, at Winchester, N. H., by the adoption of a confession of faith and the acquisition of a legal status. The Church now (1895) numbers more than 1,000 parishes, organized under forty State conventions and one general convention; owns church property worth over \$9,000,000, besides nearly \$4,000,000 invested in educational institutions, which comprise four colleges, one polytechnic institute, three divinity schools, and five seminaries and academies.

Universals [from Lat. *universalia*, neut. plur. of *universalis*, belonging to the whole, collective, general. See UNIVERSALISM]; a term used in various ways. Universals are either metaphysical, *universalia ante rem*, denoting the archetypal forms of things as far as they existed in the Divine Mind before the real things were created; or physical, *universalia in rem*, denoting the archetypal forms as far as they actually exist in things created; and finally logical, *universalia post rem*, denoting the archetypal forms as far as they are abstracted by the human intellect from the things. See REALISM, NOMINALISTS, and GENERALIZATION.

Revised by W. T. HARRIS.

Universe [from Lat. *universum*, all things, the universe, liter., neut. of *universus*, all together, whole, entire. See UNIVERSALISM]; a term employed to signify the grand and total aggregate of created things.

Regarding this aggregate as a material structure, it is, so far as we know, made up of what we familiarly call the heavenly bodies. Particulars respecting these bodies and the systems which they form are found in the articles ASTRONOMY, ASTEROID, COMETS, NEBULE, PLANET, SOLAR SYSTEM, STARS, and SUN. In this article is summed up what may be said of the whole creation.

When the telescope was pointed at the heavenly bodies, and the law and consequences of gravitation developed by Newton and his successors, the universe was, in thought, divided into two parts. There was first our solar system, composed of a definite number of bodies, of which the sun was much the greatest; and there was outside this system another, composed of countless stars, seemingly scattered through all space. The void space between the outermost planet and the nearer stars, which to the early astronomers seemed not very wide, became, as astronomical research was continued, of immeasurable extent. After Herschel explored the heavens with his great telescopes, it became continually clearer that our sun was in reality simply one of the millions of those shining bodies called stars. In other words, it became clear that the stars were suns. The natural outcome of this conception, aided by measures of parallax, was the conclusion that the distance between our sun and the nearer surrounding stars was perhaps no

greater than that which separated most of the stars from each other. Photometric measures, combined with determinations of the parallax of the stars, have shown that our sun is probably rather a small star, whose actual brightness is exceeded manifold by Sirius, and perhaps by a majority of the stars which stud the heavens. Our conclusion is that a being flying through the entire universe, and scanning its great bodies as he passed, would notice our sun merely as one among the millions of those bodies.

Lambert's Theory.—Even before all these conclusions were fully established, Lambert formed the sublimest conception of the universe that has yet entered into the mind of man. We see that our solar system is made up of a number of minor systems. Each of the latter is formed by a planet, with its attendant satellites, when it has any. Each of these systems revolves around the great central luminary, the sun, preserving its general form through all ages. So far as we can see, the solar system, as thus constituted, is fitted to endure forever. Should an inhabitant of the earth visit our system at the end of any number of aeons, the presumption is that he would still find all the planets revolving around the sun in their regular order, each with its attendant satellites, under the same laws which now direct their motions. The similarity of the stars to the sun being established, the presumption is that each of the former is the center of a system of planets. A number of the stars, each with its attendant planets, may revolve around some great unknown center, forming a system of yet higher order. Each cluster of stars was supposed to be such a system. All these clusters or systems which our telescopes can see may again revolve around a yet greater center. Thus Lambert reached the conception of a universal system including all created bodies, and fitted to endure forever without undergoing any change in its general arrangement.

The Stars Irregular in Motion.—Sublime though this conception is, it is not verified by modern research. Not only is there no evidence that the stars as a whole form an organized system of the kind we have described, but it is only in the exceptional cases of binary or ternary systems that two or three stars are seen to have any relation to each other. The proof is very simple. Were the stars thus aggregated into systems, we should see a certain regularity in their motions, by which we could form some idea of the center around which each revolved. But no such regularity can be detected. The general rule is that each star seems to be moving forward in a straight line entirely independent of the lines of motion of other stars. The only modification that this statement requires is that in many cases a number of stars in the same region of the heavens seem to have the same proper motion. Of these, we may say that they are moving through space together. But even in these cases there is no such orderly arrangement among them as there would be if they formed a system in any way like our solar system. If any orbit is being described, either by the individual stars or by star clusters, many thousands of years of observation will be required to make it out, and in all probability it would be found to be not an orbit of any definite form, but only an irregular curve, determined by the attraction of great numbers of other stars.

This view is still further strengthened by the widest generalization of modern science, that of the dissipation of energy. If we admit that the law of the conservation of energy and of the correlation of its different forms, which is established by our experiments and observations on the earth's surface as one of the most universal and far-reaching laws of nature, holds good throughout the whole universe, and in all time, then we must admit that the life of all the stars is finite; that at a certain time in the past, very long when measured by human life, yet not long when measured by geological ages, a time only a small number of millions or hundreds of millions of years back, the stars did not exist in their present form, but were great nebulous masses, filling the space now occupied by the universe. Looking forward, the same considerations lead us to the conclusion that before a system organized on the plan supposed by Lambert could make many revolutions, the heat and light of the component stars, which is their life, would come to an end. From this point of view, the motions among the stars are merely a continuation of the motions of the nebulous masses which originally formed them, modified in each case by the attraction, more or less great, of innumerable other stars.

The Universe probably Finite in Extent.—Assuming this

conclusion, two questions arise. First, is the universe of stars infinite in extent? Every addition to the power of our telescopes reveals new and probably more distant bodies. If this power were increased without limit, would we continually find yet more distant stars, without end, or would we at length reach a boundary to the whole system beyond which is only empty space? This question was answered both in the positive and negative by Kant, in one of his Antinomies. He proved both the positive and the negative by what seemed to him equally conclusive reasoning. The modern scientific philosopher would set aside both courses of reasoning as necessarily inconclusive, because the question is one of fact, which can be settled only by observation, and observations are not yet sufficiently comprehensive to settle it. We may, however, take a step toward doing so. Were an infinite number of stars scattered through space in such a way that every region of fixed size, however great, would in a general average contain one or more stars, then it can be shown by mathematical reasoning that these stars would fill the heavens with a blaze of light like that of the noonday sun. We may therefore say conclusively that either the universe, as we understand it, is finite in extent or that the light of the stars does not travel through infinite space. The former conclusion is that most in consonance with the ideas of modern science. But this does not prove that there is a boundary beyond which no stars exist. It shows the finitude only of the collection of stars, a few of which are within the reach of our telescopes. In the infinite depths beyond may lie other stars and systems without end.

Arrangement of the Stars and Nebulae.—Granting this conclusion, which is that the 50,000,000 of stars and the unknown masses of nebulae which are visible with the most powerful telescopes of our time form at least a considerable part of a system of stars scattered within a limited region of space, we meet the second question. Should a being view this collection of stars from a point outside of it, what form would it present? In other words, what is the actual arrangement of the stars and nebulae in space? This question we can partially answer. The great majority of stars visible with the telescope are seen in the region of the Milky Way. It follows that the great mass of stars which compose the universe are, so far as our telescopes show them, not arranged spherically, but rather form a flat disk; possibly a great number of them form a ring. Our sun appears to be situated nearer to the center of this ring than to its circumference. On the two sides of the disk or ring are scattered comparatively few stars, but a great number of nebulae. Adopting the modern views of cosmogony, these nebulae are ultimately to condense into stars. In this arrangement of a disk or ring of closely connected stars, with numerous scattered stars lying all around on each side and in the center, and nebulae arranged on either side, we have the closest approach to a system that modern science can yet see in the arrangement of the universe. S. NEWCOMB.

University: an institution for the promotion of higher education by means of instruction, the encouragement of literary and scientific investigation, the collection of books and apparatus, and the bestowal of degrees. The term has had a different meaning in different ages and in different countries. In Latin it conveyed some such idea as our word incorporation, the totality of a society formally organized by a recognized authority. The dictionaries give various illustrations, among them the phrase *Incolarum Oppidi Universitas*, the corporation of a city. From this meaning of the whole or entirety of a society the term became restricted to a body of masters and students associated for learning, and then it came to signify that all departments of knowledge were studied. It is true that in the Middle Ages the idea of a place for general education was expressed by *Studium Generale*, a seminary where higher studies were pursued in many fields. Denifle has discovered the use of this phrase in 1233-34; yet he has found a still earlier use of the word university in its modern academic sense. *Universitas Magistrorum* (interpreted by the words *Communio Magistrorum*) occurs in a rescript of Pope Innocent III. to the Parisians, dated in 1208-09; and a few years later, in 1221, the formal title appears in the statutes, *Nos, Universitas Magistrorum et Scholarium Parisiensium*. So it is safe to say that the word, in the sense of a society of scholars, dates from the early part of the thirteenth century. Amid the differences that have developed respecting the legitimate authority, scope, subdivision, statutes, and usages

of universities, one idea has never disappeared. Since their origin, universities have been organizations in which students were taught the highest branches of knowledge. Moreover, universities have been places where man's inheritance from the past has been preserved and interpreted to living generations. Independence of thought, habits of inquiry, investigation, and research, and the art of reasoning have been encouraged or developed within their walls—not always with fervor, it must be conceded, yet perpetually, according to the light of each passing age. The university, everywhere and always, has been a society of masters and scholars associated for the acquisition and advancement of knowledge. It may be more; it must be this.

As education has advanced, and especially as instruction has been provided in many technical branches which call for the ablest intellectual exertion, the word university has come to imply advanced instruction, given by superior teachers to well-qualified students, in very wide domains of knowledge. In almost every civilized land the work of a university is supposed to rest upon that of a preliminary or introductory college, gymnasium, or *lycée*. In the U. S. an unfortunate confusion has resulted from the occasional adoption of the term university by institutions which, however excellent in their work, represented a lower grade of instruction than that which is given in the best European and American universities.

Distinction between a College and a University.—The college is understood to be a place for the orderly training of youth in those elements of learning which should underlie all liberal and professional culture. Ordinarily the conferring of the bachelor's degree marks the conclusion of the college course. Often, but not necessarily, the college provides for the ecclesiastical and religious as well as the intellectual training of its scholars. Its scheme admits but little choice. Frequent daily drill in languages, mathematics, and science, with compulsory attendance and repeated formal examinations, is the discipline to which each student is submitted. Often (especially in France, England, and the U. S.) the students of this grade are provided with lodgings and sustenance by the college authorities. This work is simple, methodical, and comparatively inexpensive. It is everywhere understood and appreciated.

In the university, more advanced instruction is given to those who have already received a college training or its equivalent, and who afterward desire to concentrate their attention upon special departments of learning and research. Libraries, laboratories, and apparatus require to be liberally provided and maintained. The holders of professional chairs must be expected and encouraged to advance by positive researches the sciences to which they are devoted, and arrangements must be made in some way to publish and bring before the criticism of the world the results of such investigations. Primarily, instruction is the duty of the professor in a university as it is in a college; but university students should be so mature and so well trained as to exact from their teachers the most advanced instruction, and even to quicken and inspire by their appreciative responses the investigations which their professors undertake. Such work is costly and complex; it varies with time, place, and teacher; it may be remote from popular sympathy, and it is of course liable to be depreciated by the ignorant and thoughtless. Nevertheless it is by the influence of universities, with their comprehensive libraries, their costly instruments, their stimulating associations and helpful criticisms, and especially their great professors, indifferent to popular applause, superior to authoritative dicta, devoted to the discovery and revelation of truth, that knowledge has been promoted, and society released from the fetters of superstition and the trammels of ignorance, ever since the revival of letters.

The Idea of Liberal Studies.—We are not to suppose that universities did not exist in antiquity because this word, in its academic sense, is of mediæval origin. From the time of Aristotle and Plato until now the idea of "liberal" studies in distinction from those that are "practical" has been handed down. Thoughtful men have recognized the fact that many things must be learned without reference to their professional or technical profit. Intellectual strength, enjoyment, sagacity are worthy to be cultivated, quite as much as skill in turning one's knowledge to account. In modern times it is held that any study may be pursued either with freedom or in a restricted and narrow spirit, and consequently that a liberal education does not depend so much upon the subjects that are taught as upon the ways in which

they are taught. In the Middle Ages also, it may be said, methods were all in all; but the methods were anything but liberal. The written texts, even such inadequate texts as translations, commentaries, and glosses, were the ultimate appeal. Such an idea as that of scientific verification, or of reference to and dependence upon original sources of knowledge, in the modern sense, was rarely proposed; and those who suggested this method of establishing the truth were liable to be silenced by the portentous utterance, *Scriptum est*.

The doctrine of liberal studies is distinctly stated in the fourth and fifth books of Aristotle's *Politics* (cf. Weldon). Proceeding from the dictum that all life is divided into business and leisure, he says that "there is a certain education which our sons should receive, not as being practically useful nor as indispensable, but as liberal and noble"; and again, "the universal pursuit of utility is far from becoming to magnanimous and free spirits." From the time of the ancient Greeks different schedules of the liberal arts have been given. The number seven is first clearly indicated about the beginning of the sixth century by Martianus Capella, who enumerates grammar, dialectic, rhetoric, geometry, arithmetic, astronomy, and music. Of these, the three first named constitute the *trivium*; the four last named, the *quadrivium*. Cassiodorus (468-568) finds a suggestion of this mystical group in a verse of the book of Proverbs, which reads: "Wisdom hath builded her house. She hath hewn out her seven pillars." Much curious lore upon these points, collected by Prof. A. F. West in the Princeton College *Bulletin* (1890), is reproduced in Davidson's *Aristotle and the Ancient Educational Ideals*. Gradually the trivium and the quadrivium were crystallized in educational systems. The fourteenth and fifteenth chapters of the second book of Dante's *Convito* illustrate the scope of liberal studies in his time. The seven sciences of the trivium and the quadrivium are here represented as like unto the seven heavens. To the eighth sphere, the starry heaven, physics, and metaphysics correspond; to the ninth, moral science; and to the tenth or quiet heaven, divine science or theology. Davidson has reduced these ideas to a formal schedule in the appendix of his *Aristotle*, and he adds the remark that here we have the culmination of the ancient and mediæval systems of education. The schedule is worth reproducing as a significant landmark, for "Dante," says Lowell, "was a mystic, with a very practical turn of mind; a Platonist by nature, an Aristotelian by training."

To the modern student the liberal arts of the early Christian centuries and of the Middle Ages present a very restricted domain, especially when compared with the modern encyclopædia of knowledge or with the needs of civilized society. The enlargement of the idea of liberality, the foundation of modern progress, was closely associated with the organization of universities. It may not be easy to determine which was the cause or which was the effect. Did the universities evoke freedom, or did liberal thought create universities? There was action and reaction. A great step forward was taken when medicine, law, and theology found a place by the side of philosophy, as subjects of the highest educational value. Thenceforward they have been exclusively considered as the liberal or learned professions, until recently. In the nineteenth century the liberal arts include scores of subjects which during previous ages had not entered the minds of men, except perhaps in the most rudimentary form, and liberal professions are no longer limited to the primitive three.

The Immediate Precursors of Modern Universities.—While in general terms the origin of modern universities is dated from Salerno, Bologna, and Paris, in the twelfth and thirteenth centuries, yet the beginnings of these and kindred institutions are lost in the obscure past. We may as-

sume that there has never been a period in the history of civilization without arrangements for the advancement and dissemination of knowledge, corresponding with what in modern times is called the university. Babylon, Heliopolis, Athens, Alexandria, each must have been a seat of higher learning. Nor were they alone. So in Western and Southern Europe, certainly from the time of Charlemagne, there were schools of more or less dignity in courts, cathedrals, monasteries. For example, in France, at the beginning of the twelfth century, three religious schools were famous, those of Paris, Laon, and Chartres. William of Champeaux opened a school of logic in Paris in 1109, and was followed by his brilliant pupil Abelard (1079-1142), *cui soli patuit scibile quidquid erat*, whose lectures were heard by throngs of hearers. Laon won its distinction under Anselm, the "Doctor of Doctors," and his brother Ralph. The school at Chartres became famous at an earlier period under Fulbert, a pupil of Gerbert. Its fame was still greater under the lead of Bernard Sylvester, of whose methods of instruction an account is handed down by John of Salisbury. (Consult Poole's *Illustrations of Mediæval Thought*, where abundant references are given to original sources of information.) As to the subjects studied in these schools of the Church, we have very good records which have been well arranged and condensed in the work of Mullinger on the University of Cambridge. An abstract of his statements will here be given.

Under Gregory the Great (590-604) the Church rested on the authority of the three fathers, Ambrose, Jerome, and Augustine. From the first, she derived her conception of sacerdotal authority; from the second, her attachment to monasticism; from the third, her dogmatic theology. In Augustine, and especially in his work entitled *De Civitate Dei*, may be found the key to the belief and practice of the Church in the Middle Ages. In face of the destruction of Rome, he proclaimed the dominion of a new city, the New Jerusalem. A sublime theocracy was to supersede the rule of the Cæsars. Under Charlemagne (742-814), in the circle where Alcuin taught the mysteries of logic and grammar, there is evidence of a spirit very different from that of Gregory, and in advance of the ecclesiastical ideas of the time. For example, steps were taken for the collection and revision of manuscripts. But these higher aspirations soon ceased. Only here and there the lamp of learning shone with no uncertain light—for example, at Ferrières, where Lupus was bishop. As the twelfth century approached instruction was almost entirely founded on the writings of Martianus Capella and Boethius (non-Christian writers) and of Orosius, Cassiodorus, and Isidorus (Christian writers), all of them compilers from Greek and Roman authors. Other books were read, but these works were the usual school-books. The histories of Orosius (about 416), a kind of abstract of the *De Civitate*, formed a somber treatise, full of wars, plagues, famines, and other tokens of the wrath of God. Through the allegorical treatise of Martianus Capella, *De nuptiis Philologie et Mercurii, et de septem Artibus liberalibus*, the modern universities inherited their notions of the trivium and quadrivium. To this far from contemptible curriculum we must be careful not to attach our modern conceptions. To Boethius (475-524) is due the transmission of that element of purely Greek thought which was during seven centuries nearly the sole remaining tradition of the Aristotelian philosophy, although the Aristotle of Western Europe, from the sixth to the thirteenth century, was simply Aristotle the logician. Of Cassiodorus (468-568) there was a meager manual of education, *De Artibus liberalium litterarum*. The *Origines* of Isidorus (d. 636) constitute a kind of encyclopædia, a laborious collection of such fragments of knowledge as were still discoverable.

Two conclusions are based upon this study: that the literature from the seventh century to the tenth was scanty in the extreme, and what learning existed was almost exclusively possessed by the clergy.

Those who wish to prosecute the inquiry further will be aided by a reference to the writings of Gerbert, better known as Pope Sylvester II. (about 991), printed (1867) in a critical edition edited by Olleris. A list of the authors upon whom he commented in his school at Rheims, before he was chosen to the holy see, has been preserved by his pupil Richerus, and it indicates instruction remarkable in thoroughness and extent.

Certainly, from Abelard to Aquinas, Aristotle ruled the university world—not the original Aristotle, but his lineal descendant, bearing his name and exhibiting his characteristics, often modified and attenuated, yet not so altered as

to lose the original qualities. A couplet of Godfredus de S. Victor, quoted by Denifle, illustrates the reverence for the writings of the Stagyrte in the mediæval universities:

Omnis hinc excluditur, omnis est abiectus
Qui non Aristotelis venit armis tectus.

It is not uncommon to hear the studies of the Schoolmen spoken of with contempt, but it should never be forgotten that their aim was to establish correct habits of reasoning. By the precepts and example of Aristotle, logic was taught. This logic was often employed upon questions rightly called trivial. Time was wasted upon fruitless inquiries. But as years rolled on and new generations arose, the Aristotelian habit, directed to new themes, emancipated the mind and led the way to the modern advancement of knowledge.

Although the data are vague, precedence in the list of modern universities is generally accorded to Salerno, where medicine was taught at a very early period. In the ninth century Salerno was spoken of as *Civitas Hippocratica*; to the eleventh century a poem is attributed, which bears the title *Flos Medicinæ Scholæ Salerni*; and there are statutes regulating the school which belong to the year 1231. During the next quarter of a century there are many evidences of the importance of the school. In the face of political changes, Salerno continued to be a seat of medical science until the time of Napoleon's interference. The influence exerted by the Saracens upon the school of Salerno, "their legitimate offspring," as Gibbon calls it, would be a most interesting line of research.

The Universities of Bologna and Paris.—Respecting the early days of the Universities of Bologna and Paris, the antiquaries have brought together so many curious particulars that it is difficult to separate the important from the secondary. It is easy, however, to see that usages, regulations, titles, phrases still in academic vogue, even in the new world, go back to the beginnings of these institutions. Indeed it is hardly possible to understand the unwritten laws by which modern universities are governed without reference to their historic basis. Nevertheless the main utility of such investigations is found in a revelation of the long and wearisome steps by which the human race has been advancing in its searches after truth. It has taken fully seven centuries for the most civilized nations of mankind to establish the proper relations of literature and science to a liberal education, and the most efficient methods of promoting learning. At certain periods the universities have even seemed to hinder the advancement of knowledge and the appreciation of literature; nevertheless, as a general rule, their influence, direct and indirect, has perpetuated the study of the great writers of antiquity and the great leaders of human thought; their influence also, especially during the last century, has favored the employment of scientific methods.

The exact date when the university was organized in Bologna is of little importance compared with the fact that the Roman law was there introduced as a subject of study by a teacher who had the power of attracting and inspiring large companies of students. The influence of Irenæus (d. 1118) was soon and strongly felt far beyond Italy. All historians of this period recognize the fact that the emancipation of the human mind, and also the development of the modern state, were largely due to this revival of interest in the *Corpus Juris Civilis*. For example, James Bryce says, "It can not be doubted that, in Germany and in England, a body of customary Teutonic law would have grown up had it not been for the notion that since the German monarch was the legitimate successor of Justinian, the *corpus juris* must be binding on all his subjects."

Paris shares with Bologna the honors of priority. As Bologna was renowned for the study of law, Paris was distinguished for its attention to theology and the liberal arts, while the student of medicine resorted to Salerno and a little later to Montpellier. There was a saying, "Italy has the pope, Germany the emperor, France the university." The usages and example of Paris were followed in England and in Germany, and indirectly at least in other countries.

The publications of Father Denifle reveal the condition of affairs in the University of Paris during the thirteenth century in minute details. It is amusing to read the original papers thus brought together, and observe how exactly human nature then corresponds with human nature now. There are the same jealousies, ambitions, difficulties, strifes, and victories. If a writer with the skill of Froude would do for this mass of documents what he has done for the correspondence of Erasmus, a volume of even greater interest

might be forthcoming. Meanwhile, as much of this material is unknown to the general reader, a few illustrations will here be given, for it is certain that but few will have the patience to go through this great repository. Those who wish for a briefer story will find an excellent article, by Rev. H. Rashdall, in the *English Historical Review* for 1886, the conclusions of which were reached by independent studies.

Thus, for example, there are questions of prerogative or jurisdiction between the chancellor or external authority, representative of the Church, and the rector or intramural representative of the teaching body. The faculty of theology dispute the power of the rector. In the faculty of medicine there is a quarrel about the election of deans and examiners. There are the rudiments of a "curriculum," prescribing what books may be read and what may not be read, particularly on holy days. We have indications of trouble between gown and town, the students and the night-watchmen. Academic degrees and titles are abused, and must be protected. Especially, unauthorized persons must not practice medicine. Surgeons and apothecaries must keep to their own special departments. Expulsion from the university is a penalty for continued neglect of studies. Masters of arts must not dictate their lectures. Fees are to be made proportionate to the time of residence. Students must be punctual at their meals, and may be punished for misconduct. Presents to the chancellor, on receipt of a license from him, are not allowed. Steps are taken by the university to control the sale of books. Heresy must be stamped out by vigorous measures. Certain teachers who hold to the doctrine of the Trinity in an unacceptable form are burned at the stake—a *seculo migraverunt* is their eulphonic epitaph. These citations are taken here and there from papers that are dated between the middle of the thirteenth and the middle of the fourteenth centuries. Only one more extract will be given, and this will show that academic boasting is not the invention of the nineteenth century. A paper that belongs to the end of the fourteenth century, attributed to Gerson, but, according to Denifle, more probably the work of another, begins with this laudation of the University of Paris:

"Just as the University of Paris is prior in origin, so, too, in glory and dignity it has always surpassed all others. Some derive it from Rome, others from Athens, others from Egypt. Some even trace it to the prophets, while others find its origin in paradise, either that earthly paradise where the knowledge of things divine and things human is said to have been infused into Adam, or that heavenly paradise, where, if we are to believe the poets, Minerva, goddess of wisdom, sprung from the head of Jove. The Wise One himself, as if in agreement with them, has asserted that 'Wisdom was sent down from heaven' (Wisdom, ix., 10), and elsewhere (Eccles. xxiv. 5) that it 'proceeded out of the mouth of the Most High,' and 'was an image of his goodness' (Wisdom, vii., 26). Without, however, continuing this discussion we know this for certain, that the other seats of learning derived their origin from Paris, it being as it were a living fountain, which, dividing into four faculties like so many rivers, irrigates the whole surface of the earth with the waters of learning. I know, indeed, that other schools contribute in no small degree to the store of learning, and that they are by no means without reputation, each one being strong in its particular branches; but ours embraces all in its more ample bosom, so that there are some who think that it was from this fact that the Parisian school got the distinctive name of 'university,' because it has accumulated within itself the particular prerogatives and branches of learning of the individual schools. In philosophy, metaphysics, and theology it surpasses all others, even as in brilliancy the sun surpasses the moon. To use the words of Maro, it is a British whale among dolphins." The quotation, however, is not from Vergil, but from the tenth satire of Juvenal, v., 14.

The Universities of Paris and Bologna were the gradual evolution of the times. Not the Church nor the state, but students following the lectures of masters made the first universities. The associations or societies of students at Bologna, called *universitates*, more than four of them at one time, were in fact akin to guilds of craftsmen, combinations of those whose pursuits were similar, for mutual protection and advantage. Like confederations arose in other seats of learning, as at Vercelli and Padua. So in Paris (probably after the example of Bologna) four "nations" were constituted, including both teachers and pupils—namely, the French, Picard, Norman, and English "nations,"

each of these terms having a very broad territorial significance. These constituted the faculty of arts. Presently the faculties of medicine, canon law, and theology were grouped around the faculty of arts, which was in a certain sense tributary to the three other faculties.

With respect to the inner life of the university, Mullinger has pointed out the differences between Bologna and Paris. In the former, instruction was entirely professional, designed to prepare the student for a definite and practical career in after life; in the latter, it was sought to provide a general mental training, and to attract the learner to studies which were speculative rather than practical. In the sequel, the less mercenary spirit in which Paris cultivated knowledge added immensely to her influence and reputation.

The Rapid Spread of Universities in the Thirteenth and Fourteenth Centuries.—It is now time to consider the spread of universities. When their importance was perceived, pope and emperor, cities and sovereigns, rivaled one another in efforts to establish seats of learning. Consequently, including Bologna and Paris, fifty-five high schools were initiated prior to 1400, some of them destined indeed to premature death, but most of them surviving at the end of the century. A group of a dozen schools (Macerata, Lyons, Brescia, Messina, Palermo, Vienne, Palma, Rheims, Todi, Pistoja, Mantua, and Parma) may be passed by as wrongly called universities. Nine grew into universities by usage and privileges—namely, Salerno, Oxford, Orleans, Angers, Padua, Vercelli, Reggio, Modena, Vicenza. Sixteen establishments were based upon papal charters—that of the papal court, Rome, Pisa, Ferrara, Toulouse, Montpellier, Avignon, Cahors, Grenoble, Cambridge, Valladolid, Heidelberg, Cologne, Erfurt, Fünfkirchen, and Buda. A group of ten institutions received imperial or other civil charters—Arezzo, Sienna, Naples, Treviso, Orange, Palencia, Salamanca, Seville, Lérida, Illesca. The fourth group, nine in number, received both papal and civil authority—Perpignan, Lisbon, Perugia, Florence, Piacenza, Pavia, Prague, Vienna, Craeow. Finally, nine projected universities did not come into being—Perino, Verona, Orvieto, Pamiers, Dublin, Valencia, Alcalá, Geneva, and Lucca. Such an exhibit justifies the statement that the thirteenth and fourteenth centuries are the epoch of university foundations.

The Rise of the German Universities.—If Germany was not the original seat of the modern university, it has certainly been its most congenial home. Paulsen has arranged by periods the names of those institutions in which the German language is employed for instruction, thus including the Austrian universities and some of the Swiss. The first period is prior to the invention of printing; the second prior to the Reformation; the third is the period of religious wars, when denominational universities dependent on the state and Church came into being—Marburg, Königsberg, Jena, Giessen, etc., on the Protestant side, and Würzburg, Gratz, Innsbruck, etc., on the Catholic side. The fourth period, covering the last two centuries, is naturally divided into an earlier epoch (that of Halle, Göttingen, Erlangen, etc.), and a later, which has seen the ascendancy of Berlin, Bonn, Munich, and the rejuvenated Strassburg.

In the following table, taken from Paulsen, the figures indicate the date of foundation, and in certain cases the date of suppression, or of transference to a new site:

<i>First Period.</i>	<i>Third Period.</i>
Prague (Austrian), 1348.	Marburg, 1527.
Vienna (Austrian), 1365.	Königsberg, 1544.
Heidelberg, 1385.	Dillingen, 1549-1803.
Cologne, 1388-1794.	Jena, 1558.
Erfurt, 1392-1816.	Braunsberg, 1568; reorganized, 1818.
Leipzig, 1409.	Helmstädt, 1576-1809.
Rostock, 1419.	Olmütz (Austrian), 1581-1855; now a theological faculty.
	Würzburg, 1582.
	Gratz (Austrian), 1585.
	Giessen, 1607.
	Paderborn, 1615-1818.
	Strassburg, 1621; newly founded, 1872.
	Rinteln, 1621-1809.
	Aldorf, 1622-1807.
	Sulzburg (Austrian), 1623-1810.
	Osnabrück, 1630-1633.
	Bamberg, 1648-1803.

Herborn, 1654; converted into a theological seminary, 1818.

Duisburg, 1655-1818.

Kiel, 1665.

Innsbruck (Austrian), 1672.

Fourth Period.

Halle, 1694.

Breslau, 1702; re-organized, 1811.

Göttingen, 1737.

Erlangen, 1743.

Münster, 1780.

Berlin, 1809.

Bonn, 1818.

Munich, 1826.

Zurich (Swiss), 1832.

Berne (Swiss), 1834.

Czernowitz (Austrian), 1875.

Freiburg (Swiss), 1889 (lectures partly in German, partly in French).

Spread of Universities through Europe, etc.—The University of Oxford was modeled upon that of Paris. Like that of its antecedent, its origin is obscure, and its early years show the influence of many subtle forces rather than the impulse of the crown or the Church. Certain monastic schools, St. Frideswyde and Oseney, are supposed to have been the nucleus of the university. Vacarius, a follower of Irnerius, brought from Bologna to Oxford the knowledge of the Roman law, and previously (1133) Robert Pullen had arrived from Paris and lectured upon the Bible. In the twelfth century Giraldus Cambrensis describes Oxford as a place where "the clergy in England chiefly flourished and excelled in clerical lore." Early in the thirteenth century large numbers of students migrated from Paris to Oxford and Cambridge. In the year 1257 the Oxford authorities speak of theirs as a school second only to Paris. The earliest colleges were University (1249), Baliol (1263), and Merton (1264).

The University of Cambridge is a little younger than that of Oxford. In the twelfth century there were probably schools connected with the Church of St. Giles. In 1224 the Franciscans came, and half a century later the Dominicans. In 1231 and 1233 there are indications that the university is an organized body with a chancellor at its head, and in 1318 a formal recognition of the place as a *studium generale* is received from the pope. The earliest colleges are Peterhouse (1286), Michaelhouse and King's Hall (1326), Pembroke (1347), Gonville (1348), Trinity Hall (1350), Corpus Christi (1352).

The modern universities in England are Durham (1657; revived in 1831), London (1825; reorganized in 1836), and Victoria (chartered in 1880).

There are four universities in Scotland—St. Andrews (1411), Glasgow (1453), Aberdeen (1494), Edinburgh (1582).

In Ireland the leading university is that of Dublin, commonly known as Trinity College, Dublin, founded in 1591. The Royal University (1880), which is chiefly an examining body akin to the University of London, comprises also the Queen's colleges of Belfast, Cork, and Galway, which were formerly associated in the Queen's University. The Catholic University (1854) is in Dublin, and St. Patrick's College at Maynooth was founded in 1795 for the education of priests.

Where British colonization and conquest have gone—in Canada, Australia, New Zealand, India—universities of the English type have been established. Among the higher institutions in Canada the most important are the University of Toronto (1828), the McGill University in Montreal (1821), Laval University in Quebec (1852), Dalhousie University in Halifax (1820), and Queen's University in Kingston (1841). In Australia there are the Universities of Adelaide, Sydney, and Melbourne. New Zealand has its university. India has five institutions for superior instruction under English auspices. The University of Tokio in Japan, an establishment of great promise, is based upon the observation of German, English, and American experience.

In France, the antiquity of Montpellier comes next to Paris. Its six hundredth anniversary was celebrated in 1890. As far back as 1181 medical instruction was there given, and a faculty of jurisprudence was instituted before the close of the twelfth century. Pope Nicholas IV. gave Montpellier a charter in 1289. Toulouse in 1233 received a charter recognizing it as a *studium generale*, and Orleans not far from the same time. As already stated, the universities of Angers, Avignon, Cahors, Grenoble, Perpignan, and Orange (the two last named having but a nominal existence) were established before the end of the thirteenth century. In the course of the Revolution (1793) the ancient universities of France were suppressed, together with the professional faculties. In their place, when Napoleon assumed the rule of centralization, the University of France was instituted by a decree of Mar. 17, 1808, as a central

authority, which should control nearly all the higher institutions of learning in the country. "Academies" took the place of "universities." The Collège de France, founded in 1530 (spared by the Convention and restored in 1831), the École Polytechnique (begun in 1794), and the École Pratique des Hautes Études (instituted in 1868), with other foundations, supplement the faculties in Paris, and amid many political changes, have maintained their autonomy and their distinctive characteristics. The name of one of the oldest colleges in the University of Paris, the Sorbonne, has been perpetuated since its foundation in 1250 until the present time, and the magnificent buildings recently constructed in Paris as a home for the liberal arts bear the name of the New Sorbonne.

For many years past a movement has been in progress tending toward the revival of the ancient foundations, or, in other words, for the transformation of the existing "faculties" into universities. In 1875 a law was passed relative to the liberty of superior instruction, and in accordance therewith the Roman Catholics began university work at Paris, Lille, and Angers. This law made provision for future legislation in the interest of still greater reforms. Such legislation was actually proposed in 1890 by M. Bourgeois, then Minister of Public Instruction. In the meanwhile the Government had been actively engaged in the improvement of the buildings and apparatus devoted to higher education in different cities. The New Sorbonne illustrates this activity. So in other seats of learning, where, until recently, only lecture-halls were found, laboratories for instruction and research, cabinets, libraries, studies, and conference-halls have been provided by liberal expenditures. The provisions for retaining governmental supervision while certain powers are transferred to the local universities proved to be a difficult problem. The number of students has rapidly increased as better opportunities have been offered them. See a paper on *Education in France*, by A. T. Smith, in *Report of United States Commissioner of Education for 1891-92*.

The other states of Northern Europe—Russia, Sweden, Norway, Denmark, Holland, Belgium, and Switzerland—maintain their universities very much in accordance with German models. In the south of Europe, Spain followed Italy in the early establishment of universities, among which, for nearly five centuries, from the thirteenth to the eighteenth, Salamanca was the most distinguished. Madrid is now frequented by a large number of students. Coimbra, in Portugal, is flourishing. In recent years the universities of Italy—sixteen of them pertaining to the state, and four being free from governmental control—have shown new life. In Greece the University of Athens (1837) has acquired distinction.

Attendance upon European Universities.—The list of universities given in *Minerva* for 1894-95 includes 129 names, besides the 16 faculties of France, 63 colleges or academic institutions of a high rank, and 7 examining bodies more or less akin to the University of London. Of those enrolled as universities, 64 have an attendance of more than 1,000 students each, and 48 others are attended by more than 500 students each. The largest numbers are found in Paris, 10,643; Berlin, 8,343 (of whom 4,735 are "hearers"); Madrid, 5,867 (of whom 2,906 are "hearers"); Vienna, 4,856 (of whom 3,913 are "hearers"); Naples, 4,822 (of whom 4,732 are "hearers"). The number attributed to Oxford is 3,222, and to Cambridge 3,156.

Universities in the U. S.—Higher education in the U. S. was at first promoted by simple colleges. Harvard, Yale, and William and Mary were based upon the conception of the college as it existed within the universities of Oxford and Cambridge in the early part of the seventeenth century. Columbia, Princeton, Rutgers, Brown, Williams, Bowdoin, Union, and scores of other institutions were formed substantially upon the model of Harvard and Yale. At the beginning of the nineteenth century broader ideas prevailed. Professional schools of law, medicine, and theology were grafted upon the original stock, or were founded in close proximity to existing colleges. In the middle of the nineteenth century schools of science (Lawrence, Sheffield, Chandler, etc.) were inaugurated. Still the name "university" was very cautiously employed.

The organization of the University of Virginia, in 1826, brought new methods forward. Thomas Jefferson was familiar with the continental ideas of universities, and he introduced many of their features, which were quite distinct from those of the English colleges. With the opening of

the Northwest separate States were persuaded to give their name and their funds to the foundation of universities; and at a still later period the so-called agricultural college grant gave to scientific education all over the land a new impulse.

Thus it may be seen that the universities of the U. S. may be arranged in four groups: First, those which are the outgrowth of the early colleges, like Harvard, Yale, Columbia, etc.; second, those which have been founded by some of the separate States of the Union, like Michigan, Wisconsin, Minnesota, California, Virginia, South Carolina, Georgia, etc.; third, private foundations, like Cornell, Johns Hopkins, Leland Stanford, Tulane; and fourth, ecclesiastical universities, as in Chicago, Washington, Evanston, Sewanee, etc. Although the administration of these institutions may appear to differ widely, yet within the walls, the courses of instruction, the methods of discipline, and the terms of promotion will be found quite similar. The differences that exist are due rather to differences of income than to differences of aims. The hope is sometimes expressed that the attempt will be made to give emphasis in each strong institution to particular branches of learning, philology, natural science, mathematics, etc., but no such tendency is yet manifest. Each institution, so far as its means will permit, endeavors to cover just as wide a range as possible.

Four distinct periods are also to be noticed in the development of universities in the U. S. In colonial days, until the Revolution, the English college was the simple form by which higher education was promoted. Next came a period early in the nineteenth century, when professional schools of medicine, law, and theology were instituted—sometimes in close connection with the older colleges, and often quite independently. A third period began in the middle of the nineteenth century, when scientific schools and technological institutes were devoted to the advancement of pure and applied science. In the fourth period opportunities of study and for investigation and for publication have been given far beyond those ever offered in previous days.

In the city of Washington, at the present moment, we may see the different forces of society at work upon the university problem. Since the early part of the nineteenth century the national capital has been the seat of the Columbian University, a private corporation, which has been largely controlled by one religious denomination. It includes schools of law, medicine, science, and the liberal arts. For reasons which need not here be discussed it has not acquired that distinction among universities of the U. S. which might have been expected from its relations to the seat of government. Consequently, the demand has sprung up for a national university, to be established in Washington and endowed by the Government. Able men have worked together in the advocacy of this idea. Bills have been repeatedly introduced in the Congress, and have passed through one or more of the requisite stages of legislation, but final action has not been taken. While this discussion has been in progress, the Roman Catholics have begun a university at the capital, having secured for it a large tract of land, upon which commodious halls have been constructed. Faculties of theology and philosophy have been organized, students assembled, and publications of a scientific character have appeared. It is a remarkable fact that the authority of this foundation proceeds from the see of Rome, being embodied in a papal decree issued by Leo XIII. Closely coincident with the action of the Roman Catholics is that of the Methodists. Under the auspices of leading members of this denomination, a charter has been secured, land acquired, and plans matured for the American University. Thus we have in Washington a Roman Catholic, a Methodist, and a Baptist university, with the possibility that a national university will be added to the number.

Existing Forms of European Universities.—The existing forms of university organization in Europe may be arranged in these groups:

1. The most common is the German type, which has these characteristics: The authority, the ultimate direction, rests with the government of each state. Students are presumed to have received a good preliminary training in the gymnasium, or in some corresponding institution. The philosophical faculty usually includes the chairs devoted to language, literature, history, philosophy, mathematics, physical and natural sciences. Sometimes there is a division, as, for example, in Munich, where the political sciences are attributed to a separate faculty, and the philosophical faculty is divided into two sections: (a) philosophy, philology, and history; (b) mathematics and natural sciences.

Many students pursue for a time a course of philosophical studies, though their chief interests are elsewhere. Three other faculties are grouped around the philosophical—namely, law, medicine, and theology. Laboratories and institutes for special subjects are growing up under the university control. Technical schools are for the most part regarded as without the pale. This type prevails in Germany, Austria, Holland, Belgium, Scandinavia, Russia, and Switzerland. The prevalence of this form of organization induced the remark of a distinguished German professor, that there is not as yet in the U. S. a single university in the sense attached to the word by Europeans.

2. The French type was established under Napoleon by the decree of Mar. 17, 1808. The ancient universities had been suppressed. In their place nearly all institutions of learning, from the lowest to the highest, were constituted the University of France. The ministry of Public Instruction, aided by a council, controls everything. This council includes five directors of (a) superior, (b) secondary, and (c) primary education; (d) of the office of secretary and comptroller; and (e) of the fine arts. The educational system of France is divided into academies. At the head of each is a rector, named by the minister, who directs in his domain the three grades of instruction—primary, secondary, and superior. A vigorous movement is in progress to restore to the ancient universities—Montpellier, Lyons, etc.—their former prerogatives and prestige. The law of 1880 (Feb. 27) so far reorganized the university councils that the inner forces, the teaching forces, have now a greater share in the government. By this law the Conseil Supérieur has become the representative of the intellectual and scientific interests of the country.

The nearest approach to the French idea in the U. S. is the University of the State of New York, the regents of which exercise a limited control over all universities, colleges, academies, and schools which are organized by the laws or charters of the State.

3. The two great English universities, Oxford and Cambridge, have preserved more of the ancient forms. They are groups of colleges, associated in a university, each retaining independence in the holding of property and in the training of youth. Above the colleges are the authorities of the university by whom degrees are conferred, professors appointed, and regulations of general importance prescribed and enforced. By various boards and syndicates the teachers of kindred subjects are brought into close co-operation with one another, and by their college enrollment the students are divided into distinct companies and subjected to tutorial discipline and instruction. Of recent years the colleges have united in the establishment and maintenance of professorships, the instruction of which may be accessible to all members of the university, and, under certain regulations, to others who are qualified to attend. In 1880 a charter was given to the Victoria University, the official title of a group of colleges, of which Owens College, at Manchester, is the leader.

4. The University of London is unique. It exists as an examining body, having the power to confer academic degrees upon students who have conformed to certain definite requirements. The examinations of this body have been conducted with so much accuracy and skill that diplomas thus secured have a very high value as certificates of proficiency; but they afford little evidence of the possession of such an academic spirit as is usually produced by residence in a well-developed university. Measures are now in progress for the organization of a teaching university in London, and a voluminous report upon the subject has been presented to Parliament.

Dominant Subjects of Study.—Far more interesting than a statistical, chronological, or territorial account of universities is the story of the subjects that have successively come into prominence, especially in the faculty of philosophy or the liberal arts. We have seen how, at Salerno and Montpellier, medical science was fostered, at Bologna the study of law, and at Paris theology and scholastic philosophy. The intense enthusiasm exhibited by the Schoolmen never reached a higher point than it did in the lecture-rooms of Abélard (1079-1142), but for two centuries afterward the discussions of the Nominalists and the Realists were vigorous and absorbing. It is hard to appreciate the importance attached to the distinctions of these acute dialecticians, except by bearing in mind that philosophy and theology were closely interlocked (as they are still), and that the doctrine of the real presence of Christ in the Eucharist turned largely

upon the meaning of the word *real* and the nature of abstract existences. "Are abstract terms words only, or are there physical beings corresponding to every abstract term?" Aristotle was at the bottom of all this dialectic. The *Sentences* of Peter Lombard (d. 1164) applied the principles of the Stagyrte to Christian doctrines, and remained for a long period the manual of theological students. In St. Thomas Aquinas, "the angelic doctor" (1227-74), mediæval philosophy bore its richest fruit. He was unwearied, says a recent Roman Catholic writer, in laying stress upon the fundamental principle that between the truths of reason and the truths of revelation, when rightly understood, there is neither divergence nor discord. It is for this reason that he still retains his ascendancy. His writings, republished by the Vatican in a sumptuous edition, are commended by Leo XIII., in the encyclical *Æterni Patris* of 1879, to renewed and earnest study. "Gently enriched as he was with the science of God and the science of man, he is likened to the sun, for he warmed the whole earth with the fire of his holiness and filled the whole earth with the splendor of his teaching." (Cf. *Aristotle, etc.*, by Brother Azarias.) A Protestant historian (Flint, *Phil. Hist.*) emphasizes the fact that St. Thomas recognized "progress to be a universal law of things, and all knowledge to be progressive." This comes very near to the modern law of continuity, and the more recent doctrines of evolution. Whatever repugnance to the scholastic philosophy may be felt, no mistake will be made if we remember what has already been said, that to its indirect influence may be attributed the ascendancy of reason above authority which has characterized the modern era, and of which the end is not yet.

Roger Bacon (1214-92) was one of the most able of educational reformers. He advocated a study of Greek, Hebrew, and Arabic, but to mathematics, divine mathesis, he gave the highest place. It was long indeed before such views were prevalent. The mathematics of his time were rudimentary indeed. Geometry held its place, but we are told that the student seldom crossed the *pons asinorum*. In the early days of the Universities of Prague, Vienna, and Leipzig, as well as in Paris, provision was made for the study of mathematics, but not until the discoveries of Newton and Leibnitz was there an adequate recognition of the value or even of the significance of mathematical thought, and it was not until the nineteenth century that the dignity and possibilities of this science were discovered.

The revival of letters in the last half of the fifteenth century quickly made its influence felt in the universities. The migration of Eastern scholars to the West, consequent upon the capture of Constantinople by the Turks (1453), was of great significance, for they brought to Italy knowledge and appreciation of Greek letters. The invention of printing (about 1454) and the production by the Aldi (1490-1597) and other enlightened printers of the great works of antiquity were likewise events the potency of which can not be estimated. A century earlier Petrarch (1304-74) had given an impulse to the study of classical literature, especially Latin, and the collection of manuscripts by Guarino, Filelfo, Aurispia, and Poggio established the reign of the humanities. Classical learning was ascendant. There was "a resurrection," as Symonds has said, "of the mightiest spirits of the past." It took a long while for Greek literature to win its place. The annals of Cambridge show what hostility the new education encountered. Latin was the tongue of the Church, of the received Scriptures, of current theology and philosophy. It was a sanctified language—but Greek! That was the language of heresy. Reuchlin, at Basel, brought forward the Greek text of Aristotle, and was vehemently assailed by the seniors of the university, who declared that to give instruction in the opinions of schismatic Greeks was contrary to the faith and an idea only to be scouted (Mullinger). Oxford was more hostile than Cambridge to Greek, a circumstance which led Erasmus to begin his career as a teacher of Greek in England in Cambridge. Slowly but surely the battle was won, and Greek and Latin letters have ever since had their place in every university. Their effects are seen in all departments of modern literature.

The exact observation of natural phenomena and the performance of physical experiments, chief factors in the advancement of modern science, have only recently found a place in the domain of university instruction. But now they receive almost everywhere abundant encouragement. Let the programme of any flourishing university of this day be compared with that of the most expanded university 100 years ago, and the change will seem marvelous. A great

advance was made when Liebig, at Giessen, introduced the laboratory as an agent in university instruction. The methods of instruction and research first employed in chemistry have been carried into other sciences—physics, anatomy, physiology, pathology, botany, zoology, geology, mineralogy. The example of the laboratory methods has even been felt in literary, philological, and historical studies, where the critical scrutiny of original authorities is generally encouraged, in "seminaries." The comparative method of investigation has been fruitful. Indeed the historian Freeman has said that "the discovery of the comparative method in philology, in mythology—let me add, in politics and history and the whole range of human thought—marks a stage in the progress of the human mind at least as great and memorable as the revival of Greek and Latin learning." To Bopp is due the honor of initiating the study of comparative grammar, and to Stein and Ranke the encouragement of *Quellenforschung*, an investigation of the sources of historical literature.

The Functions of a University.—It may now be well to enumerate some of the principal functions of a university at the end of the nineteenth century. In the first place, it adheres to its original task of instruction. Youth, fitted by previous studies to follow the highest attainments of human thought, are encouraged to do so by teachers who have won distinction in the various branches of knowledge which they profess. It is by this quality that universities are distinguished from academies and learned societies, which are associations of scholars for their mutual benefit and for the promotion of knowledge, but without any reference to the training of youth. Universities are also distinguished from colleges, the object of which is to provide a preparation for life or to lay foundations for the subsequent study of law, medicine, theology, and innumerable modern vocations, including those of the teacher and investigator.

2. It is the duty of universities to perpetuate all the best achievements of mankind in former ages, to provide for the study of the languages, literature, religions, laws, philosophies, customs of antiquity, so that nothing that the human race has achieved may be lost sight of. Everything that illustrates the experiences of our race or its endeavors to establish good social conditions and to promote the highest intellectual and moral progress should be taught in a university. Especially in these days should the study of comparative religion and comparative politics be encouraged, the sources from which have sprung the modern ideas of government and religion. Literatures remote from those of modern Europe, by their antiquity or by their appearance in Oriental countries, are not to be neglected.

3. It is another function of universities to extend the borders of knowledge, especially to investigate, with the newer methods of research, and with the co-operation of scholars in every part of the world, the phenomena of nature. Such researches begin with an extension of the field of mathematics. Astronomy, physics, dynamics, logic, follow closely. Chemistry stands next. The functions of living organisms in health and disease, animal and vegetable, open wide domains. The structure of the earth and the processes by which it has been brought into its present form are another field of observation. The laws of climate are closely connected with those of geology. Then there is the wide range of economic and financial laws and the study of those subtle processes by which social institutions have been organized and established.

4. For the prosecution of such work universities must form large collections of books, works of art, coins, specimens in natural history, maps, scientific apparatus, and instruments of precision. It is not essential that such collections should belong to the corporate body known as the university, but every company of scholars must have the easiest possible access to literary and scientific collections, to laboratories, observatories, museums, cabinets, and libraries.

5. It is an important function of universities to bestow, upon suitable evidence, certificates, academic titles, and licenses, both in the liberal arts and in the various departments of professional activity. It is quite time that in the U. S. there should be a rehabilitation of degrees. They have been brought into ridicule partly by multiplying such distinctions and partly by bestowing them unworthily. In Europe academic diplomas convey many rights and privileges of an important social character. They are guarded both by law and by public opinion. In the U. S. degrees are awarded with unfortunate freedom by any institution which bears the chartered name of a college. It may be as

difficult to limit this power as to limit the suffrage, but every step taken in that direction is to be commended.

6. It is the business of universities to disseminate as widely as possible by means of publications, perhaps also by popular lectures, the knowledge of which its members are the possessors and guardians. There is danger that college publications will be regarded as advertisements of the institution from which they proceed, and not as the means of conveying to the highest scientific and literary courts of the world, the results of original work. Nevertheless the principle holds good that the members of a university are bound to bring before the public the results of their study.

7. Another function of the university is to discover and encourage unusual talent, not merely by offering to needy students of merit financial support, but by recognizing and encouraging the rare abilities which appear alike among the poor and among the rich.

8. From what has been said it is apparent that universities should uphold the highest standards of professional learning, in law, medicine, theology, in education, in investigation, and in scientific service.

9. In the future development of American universities, the possibility and desirability of co-operation and federation should be considered. In every large city the forces which are working together for the promotion of culture should, by some process or another, be brought into a state not of passive friendliness, but of active co-operation. James Bryce explains the structure of the American Federation by a reference to the federal system as it long existed in the Universities of Oxford and Cambridge. The Universities of Harvard and Yale are largely the federation of separate foundations. Columbia College, in New York, is becoming the central point of many local institutions devoted to medicine, pedagogics, natural history, and the fine arts. In California the State University has its seat at Berkeley, with certain of its departments in San Francisco and the Lick Observatory scores of miles away. In New Orleans, around the foundation made by Tulane, several institutions are grouped. The three great libraries in the city of New York, the Astor, Lenox, and the Tilden, have come under one administration. All these signs are encouraging. They look toward the promotion of independence in special directions, with an obligation to respect and help on what is done in other institutions. Dr. S. S. Laws, in the U. S. Commissioner's *Report for 1891-92*, advocates, as Dr. James McCosh suggested long ago, the federation of the colleges of a State under the leadership of a State university.

Conclusion.—The German authority already quoted, Dr. Paulsen, surveying the field outside of Germany, makes this significant remark: "Thus far the greatest measure of success has perhaps been reached by some of the most prominent American universities in their efforts to carry out the German principle of the union of scientific investigation and scientific teaching." But lest this encouraging word should be too grateful, it may be well to temper it with a warning from another German, Dr. Conrad, who wisely says that "what is wanted in American higher education is not so much quantity as quality. There exist centers at least sufficiently numerous for the teaching of the higher subjects; the teaching given is sufficiently cheap; it is much valued, and affects a large proportion of the population. In these respects America may seem to resemble Germany and Scotland rather than England, where the lower middle and poorer classes remain outside the sphere of university influence. But there are still few among the transatlantic universities—and this applies to Canada no less than to the U. S.—which have an adequate staff of professors, which duly recognize the less popular subjects, which have expanded their old curriculum or evolved new curricula so as to keep pace with the recent development of the sciences, the moral, political, economic, and philological, as well as the natural sciences."

Dr. Stanley Hall, in an article in the *Academy*, 1891-92, expresses the opinion that "the last quarter of this century will be remarkable hereafter as the educational era in the world's history"; and he adds that "universities have become the leading question of our age. Their patronage is the chief glory of the modern state, and their discoveries now kindle the brightest lights upon the Muses' sacred hill."

For further information on the subject of universities, the reader should consult the writings of the four investigators whose statements have been freely quoted in the body of this article—Prof. J. B. Mullinger, of the University of Cambridge, England; Prof. Paulsen, of the University of Berlin;

Prof. Conrad, of the University of Halle; and the Rev. Father Denifle, O. P., who is one of the archivists of the Vatican. They represent respectively English, German, and French university history. In the *Report* of the U. S. Commissioner of Education for 1891-92, translations, by L. R. Klemm, of the papers by Paulsen and Conrad are given.

The modern interest in the origin of universities is due, in no small degree, to the learned historian of the Roman law, Friedrich C. Von Savigny, one of the early professors in the University of Berlin. His first volume was printed in 1815, and the last in 1832. President Woolsey, in *The New Englander*, has given to American readers a careful estimate and abstract of the university chapters. But since Savigny a flood of light has been thrown upon the subject by special volumes devoted to particular foundations—for example, Bologna, Paris, Oxford, Cambridge, Montpellier, Freiburg, Edinburgh, Dublin, Heidelberg, Vienna, Basel, Erfurt, Leipzig, and Louvain.

Perry's translation of Paulsen's study of the *Organization of German Universities*, introduced by N. M. Butler (New York, 1894), supplemented by the English translation, introduced by J. Bryce, of Conrad's *German Universities during the Last Fifty Years* (1889), and compared with the impressions of an English critic, M. Arnold, *Schools and Universities of the Continent* (1868), and of an American observer, J. M. Hart, will give a good impression of the condition and methods of German institutions. For the earliest period, Denifle's *Entstehung d. Univ. des Mittelalters bis 1400* is almost indispensable, but it has not been translated.

The three volumes in quarto, *Cartularium Universitatis Parisiensis* (Paris, 1893-94), edited by Father Denifle, with extended and learned annotations, is an inexhaustible mine of information respecting the origin of the University of Paris, and incidentally of its kindred elsewhere. For the period that it covers it supersedes all other histories of that great foundation in Paris which was known as "the mother of universities." The writings of J. Bass Mullinger not only give the early history of the University of Cambridge, but exhibit the relations of the great English universities to the progress of learning and education on the Continent. To the student of English and American education these discriminating volumes, with a smaller book by the same author on the University of Cambridge in the sixteenth century, will be found instructive. For this period a part of Froude's *Erasmus* is suggestive.

During many years Huber's *English Universities*, translated by F. W. Newman (1843), was a standard. For Oxford, Anthony à Wood's *Athenæ Oxonienses* will always be an important book; see also Lyte's *History of the University to 1530* (1886), Brodrick's *History of the University* (1886), Andrew Lang's *Historical and Descriptive Notes* (1890), A. Clark's *Colleges of Oxford* (1891), *Oxford and Oxford Life*, by J. Wells, and the *City of Oxford*, by Boase. In addition to the works of Mullinger, already cited, which give the history of Cambridge to the accession of Charles I. (2 vols., 1873 and 1884), reference should be made to the *Architectural History of the University of Cambridge*, by Willis and Clark (4 vols., 1886). There are two books by Americans who have studied in Cambridge—*Five Years in an English University*, by C. A. Bristed (1852), and *On the Cam*, by William Everett (1866). The histories of separate colleges in Oxford and Cambridge should also be consulted. Grant's *History of the University of Edinburgh*, prepared for the tercentenary celebration, is admirable.

The lectures of S. S. Laurie on the *Rise of Universities*, Sir William Hamilton's *Discourses*, Wordworth's *Schola Academica*, Mark Pattison's *Suggestions on Academic Organization*, various essays of Prof. Goldwin Smith, H. Rashdall on the *Universities of the Middle Ages*, Cardinal Newman on the *Idea of the University*, and the voluminous blue books of the British Government, including one on the *Evidence taken by the Gresham Commission* (1894), may be read with profit by those who are concerned in the organization and administration of American universities. For the U. S. the best sources of information are the inaugural speeches of college presidents and the annual reports of colleges and universities, with some special articles to be found in various journals of education edited by H. Barnard, N. Murray Butler, and G. Stanley Hall. Valuable contributions to American educational history are found in the series of monographs edited by Herbert B. Adams and issued by the U. S. bureau of education, each one of which is devoted to the higher education of a particular State. About twenty of these have been issued (1895). D. C. GILMAN.

University Extension: an educational movement, the main idea of which is to furnish teaching by university instructors to those who, for any reason, can not reside at the universities. The term extension may, in this connection, be interpreted as meaning both (1) the extension of university activities beyond university premises, and (2) the extension of university studies beyond the period of youth and throughout adult life. Its constituency is the large class of people, itself made up of all classes, in the towns and cities, who wish to read and study under such direction as colleges and universities can give through the living teacher. It has been termed the school for adults, the university of the busy. In the words of Prof. James Stuart, of London, at whose suggestion this work was first organized, it is an attempt "to bring the universities and the people together." It is not, however, to be understood as designed for those only "who can not come to the universities," if that be interpreted to mean those who have never had and never can have the advantages of resident study. It is rather one form of education for adults of every class, and finds among its constituents (1) college graduates who desire to continue courses of reading and study in their favorite subjects; (2) teachers who wish university instruction and direction both as to method and as to subject-matter; (3) those who seek relief from the routine of business and toil; (4) parents who desire to be closer intellectual companions with their children in the schools; (5) those who desire to be better informed upon matters pertaining directly to citizenship, such as political science, history, social science; and all, in general, who desire such stimulus and instruction as may thus be enjoyed. Whatever may have been the original design as to the precise class for whom this form of instruction was intended, it may now be said to contemplate as wide a variety of constituents as society itself presents, attempting in every practicable way to bring the teaching resources of universities within reach of those outside the universities for the enrichment of life and the improvement of culture.

Method.—University teaching is thus extended principally by three methods: (1) By lectures at intervals of one or two weeks, conducted by the university instructor, with special aids for student work in the interval; (2) by correspondence, lesson-sheets being prepared and mailed to the student, with detailed instructions how to proceed, and with test exercises for work; (3) by means of classes organized in the city or the suburbs about the university itself, which classes are taught by the university instructor in the same subjects and by the same methods as classes upon the university premises. Usually the second and third varieties of university extension instruction are sought by those who, while they can not become residents at the universities, desire to pursue courses exactly parallel with those pursued in the universities themselves, either because they find such courses especially adapted to their present needs or because they wish university recognition with a view to subsequent residence study. The method first described, however, is that usually denoted by the term university extension, and is especially suited, not to those who desire to pursue, as non-resident students, the courses laid down in the curricula of universities, but rather to those in every walk of life who desire a broader view of those subjects taught in the universities, a knowledge of which is essential to general culture and intelligent citizenship.

The distinctive features of university extension lectures are (1) the connected series instead of the single lecture, and (2) the aids to student work already referred to. These consist of (a) the syllabus or printed outline of the lecture, which is furnished to each member of the audience or class; (b) references for reading designated by the lecturer; (c) the traveling library, a collection of books especially bearing upon the subjects discussed; (d) the review-hour in connection with each lecture, affording opportunity for familiar discussion, and for question and answer between the instructor and the audience; (e) the written paper upon topics suggested by the lecturer and designated in the syllabus. The performance of all work is voluntary with the student, it being open to all who so desire to do nothing further than attend the lectures. The lecturer gives instruction in six or twelve lectures at intervals of one or two weeks. The lecture usually lasts one hour. Its aim is to interest the hearer, and to give him a working knowledge of the subject, such as will stimulate his desire for further knowledge and will guide him in his thinking and reading. After or before the lecture-hour the lecturer reviews and discusses the preceding lecture with such of his hearers as desire this. In this

exercise use is made of such written papers as members of the audience may have furnished to the lecturer. Usually a large proportion of the lecture audience remains to the review-hour. Those attending the lectures thus have the opportunity, the use of which is entirely voluntary, of reading some or all the works assigned, and further of writing for examination and comment short papers on designated topics, and so of suggesting the basis for general discussion at the review. Usage varies in the different colleges as to the recognition accorded to those who do the work. In some cases a certificate of readings performed and written exercises rendered is given to the student in the name of the university. In the case of courses of twelve lectures, where the nature of the course permits it, the student who performs all the designated work and takes the university examination is, by some institutions, allowed credit as a non-resident student of the university, and this credit stands in his favor if he at any time becomes a resident student.

Obviously not all subjects of study are equally adapted to teaching by university extension lectures. This is especially true of subjects that can be pursued best in laboratories, as well as the direct teaching of languages and mathematics. However, owing both to the nature of the subjects as they lend themselves to this kind of teaching and to the desires of the people, the subjects especially demanded are literature, history, sociology, economics, political science, and certain phases of biblical study. Geology, chemistry, and biology have received considerable attention, and the study of the history of art and art criticism is also successfully carried on in this manner.

Organization.—The organization of the university extension center is comparatively simple. Two or three persons interested in securing such an organization for their town or neighborhood usually procure university extension literature from any college engaged in the work, and proceed to interest first of all a few persons of public spirit and general influence in the community. Through these interest in the subject may easily be spread until it becomes practicable to secure a general meeting representative of the various elements in the town. Sometimes a representative from the university is present to give a specimen lecture, and to explain briefly and simply the nature of the work, answer any questions that may arise, and give such advice as may be needed. As soon as the interest warrants it, steps are taken to form a simple organization consisting usually of a president, secretary, treasurer, and local committee. A choice of lecturer and course is then made, a canvass for tickets proceeds, and in due time the work begins. Circulars of information explaining all practical details are commonly furnished on application by the institutions engaged in this work.

History.—As a differentiated and organized form of educational activity university extension was first recognized in 1873, when "the University of Cambridge (England), at the instance of James Stuart [then fellow and lecturer of Trinity College, and now (1895) member of Parliament], offered to supply the towns of England with capable instructors in the various departments of knowledge, under the supervision and with the sanction of the university itself." As early as 1867 Prof. Stuart had been invited by a company of ladies in the north of England to give them a lecture on teaching.* He replied that, "as a thing is often best described by showing a piece of it," he would prefer to give them a course of lectures, in which he would attempt to teach something. The thought prompting Prof. Stuart in sending this reply was the very germ of university extension methods—namely, that the single lecture should be replaced by the series of lectures on a given subject, occurring at intervals, and that these lectures were to be distinctively teaching lectures. The lectures by Prof. Stuart constitute really the beginning of university extension, and they clearly display the evolution of the special features of this kind of instruction—namely, the syllabus, the weekly paper, and the review. Prof. Stuart says that he received the idea of the syllabus from Prof. Ferrier, of St. Andrews, who had used the syllabus in his own classes as a means of indicating to his students what sort of notes he desired them to take. Prof. Stuart found that oral questioning of his audience was not in all respects satisfactory, and asked his hearers to write short papers upon various topics connected with the lectures and mail them to him. At the following meeting these papers were commented upon as their contents seemed to

demand. The origin of the so-called class or review-hour is interesting. One of the managers of the Crewe Railway works asked Prof. Stuart in 1867 if he would give a lecture to the workmen. He accepted the invitation, and spoke on the subject of meteors. The lecture received unusual and gratuitous advertisement by copious showers of meteors that fell the evening before, and was so acceptable that the men requested him to give them a course. When Prof. Stuart came for the second lecture he found a number of his hearers gathered about some diagrams that had been left in the hall, discussing them with much interest. The result was that he was asked if he would come to the hall somewhat earlier than the time for the beginning of the lecture, to explain and further discuss these illustrations. This gave him an idea of the so-called "class" or review, which is a feature of the university extension lecture. Soon after this Prof. Stuart gave similar courses, accompanied by the features described, in Leeds, Sheffield, Manchester, and Liverpool, so that when, in 1873, the university took up the work its characteristic features were well developed.

All conditions were favorable for the success of the movement. The great and rich towns, with few exceptions (Manchester had a college), were practically untouched by university influence. The two great universities of England were utilized by a small fraction of the population. The general diffusion of easily accessible free schools and institutions of all grades, so familiar in the U. S., was unknown in England. The idea of establishing teaching posts or "centers" for university teaching in the towns met with eager response. Centers were first established in the autumn of 1873 in Nottingham, Derby, and Leicester, and since that time the system has been an integral part of the university's work. In 1876 the London Society for the Extension of University Teaching was formed for the purpose of carrying on this work in the metropolis. In 1878 the University of Oxford engaged in the work, but for a time abandoned it. That university, however, resumed it in 1885, and has carried it on successfully ever since.

The first direct efforts to introduce this form of teaching into the U. S. were made in 1887 by persons connected with Johns Hopkins University.* The subject was first publicly presented to the American Library Association at their meeting in Sept., 1887. It was at once taken up in a practical way by J. N. Larned, superintendent of the Buffalo Library. Mr. Larned secured the services of Edward W. Bemis, a graduate student of the Johns Hopkins University, and by him twelve lectures were delivered, at intervals of one week, upon *Economic Questions of the Day*. The regular English university extension system was followed. The first formal organization of the work on a large scale, however, was effected in 1890 within and about Philadelphia through the exertions of Provost William Pepper and his associates in the University of Pennsylvania. George Henderson was sent by them to England, and made a valuable report on the English movement. The name of the first organization was the Philadelphia Society for the Extension of University Teaching. The society was soon reorganized on a larger scale, and was called the American Society for the Extension of University Teaching. This society has continued its work vigorously and successfully until the present time (1895), and has formed the most considerable central organization for the work in the eastern part of the U. S.† The University of New York took up the work, and organized it on a large scale in the spring of 1891. The Legislature appropriated \$10,000 for the purpose of organization. In the autumn of 1891 the Chicago Society for University Extension was formed. It drew its lecturers from a number of allied colleges, including the Universities of Illinois, Wisconsin, Indiana, the Northwestern University at Evanston, Ill., Lake Forest University, Illinois, Beloit College, and Wabash College. Other central organizations for prosecuting this work were formed at Brown University, Bowdoin College, Colby University, Colgate, Rutgers, the Universities of Cincinnati, Michigan, Minnesota, Iowa, Missouri, Kansas, and California. The most noteworthy step, however, in the development of this work in connection with a university in distinction from an organization like the Philadelphia society was taken when, at the organization of the University of Chicago, which opened in Oct., 1892, a distinct division of the university was equipped for the prosecution of the work of university extension. A separate faculty

* See article by Prof. Herbert B. Adams, *The Forum* (July, 1891).

† See Sadler, *The Development of University Extension* (Philadelphia, 1892).

† See pamphlet entitled *Review of the Work of the American Society, etc.*, E. J. James (1895).

was selected for this work, a special set of administrative officers was chosen to organize and direct it, and special offices were set apart and equipped for the business involved. The administrative staff consists of a director and five secretaries of departments—the departments, namely, of lecture-study, correspondence-study, and class-study, library, and district organization and training. This organization has been substantially continued until the present, and has been found essential to the prosecution of the work as conceived and planned.* The results of the efforts of some of these organizations are partially shown in tables below. It may be added, however, that the work attained so great importance as a form of education that a special congress on university extension was held among the world's congresses at Chicago in the summer of 1893, and the twenty-first anniversary of university extension was celebrated by a congress of workers from every part of the world assembled in London in June, 1894.

Early Promoters.—Names forever to be associated with the beginnings of this work are those of Prof. James Stuart; university magnates like Bishops Westcott and G. F. Browne, (Cambridge), and the Right Hon. Arthur Acland (Oxford), Minister of Education in Lord Rosebery's government; organizers like Dr. R. D. Roberts and T. J. Lawrence (Cambridge), and M. E. Sadler (Oxford); men of reputation in the lecturing field, like Dr. R. G. Moulton (Cambridge), Rev. T. Hudson Shaw (Oxford), Churton Collins (London). It is right to mention also names of distinguished local organizers, like those of Dr. Paton, of Nottingham, and Miss Jessie D. Montgomery, of Exeter. The name of Dr. Moulton belongs to both Great Britain and the U. S.; under the auspices of the Philadelphia organization at its initiation, and subsequently of the University of Chicago, he has had perhaps a larger share than any other individual in representing university extension before the people of the U. S.

The Movement in Great Britain and in the United States.—The motives for the extension of university teaching and the constituency which responds to this movement have thus

the U. S., on the other hand, it would be more correct to say that the universities have reached out, and have entered into co-operation with all classes of persons outside of their own premises, not so much for the enlightenment of the uneducated as to meet the demands of intelligent people of every class for co-operation in the interests of the intellectual life of the country at large. In Great Britain one peculiar result of university extension has been the establishment of so-called university extension colleges, the best examples of which are at Reading and at Exeter. In the U. S. such a result as this would be quite impossible, since the latter country has been filled with free high schools, academies, institutes, and small colleges from the earliest colonial times.

Results.—The chief central organizations for the prosecution of university extension are those of Cambridge, Oxford, and London in England, and of Philadelphia (the American Society for the Extension of University Teaching), Albany (University of the State of New York), Rutgers College, at New Brunswick, N. J., and Chicago (the University of Chicago) in the U. S. The University of Wisconsin is organizing a separate department for this purpose.

The following statements, necessarily somewhat incomplete, will convey an idea of the results of the attempts to extend university teaching: Cambridge, England, reports (for 1893-94) 137 courses given, with an average total attendance for that season of 10,600; Oxford, 223 courses, 23,500 attendance; London, 152 centers, 15,150 attendance; Philadelphia reports (1894-95) 91 active centers, at which 126 courses have been given, with a total (estimated) attendance of 20,000. The extension department of the University of the State of New York reports (1894-95) 20 active centers, at which 31 courses have been given, with a total attendance at the lectures of 50,489; Rutgers (1894-95) reports 19 centers, at which 14 courses have been given, with a total attendance of 1,518. The University of Chicago makes the following report of the three departments of university extension work, as developed since Oct., 1892, at which date the university began its work:

TABULATED STATEMENT OF THE WORK OF THE UNIVERSITY EXTENSION, 1892-95.

* No courses offered.

far been somewhat different in Great Britain from what they have been in the U. S. In the former country there has been a much more keenly felt need for bringing educational advantages within reach of the people. College education has been by no means so generally diffused among the people of Great Britain as among those of the U. S. Among wage-earners in England there is a much larger class of men of good intelligence who earnestly desire educational advantages, which formerly have been beyond their reach. Further, in the English schools there is a large number of "pupil-teachers" who are able, by attending university extension courses and taking examinations, to make direct progress toward gaining their full teachers' certificates. These circumstances and others which they imply have made for university extension in England a constituency to which, in a sense, it may be said the universities have reached down. In

NATHANIEL BUTLER.

University of the South: an institution at Sewanee, Tenn., founded by Leonidas Polk, Bishop of Louisiana, and chartered in 1858. Its cornerstone was laid in 1860, but buildings and endowments (\$300,000) were swept away by the civil war. The domain of 10,000 acres was saved from lapsing by the planting of a small school by Bishop Quintard of Tennessee in 1868. In 1870 a collegiate department was added, in 1873 a theological department was opened, in 1892 a medical, and in 1893 a law department. The growth of the institution has been steady in spite of its lack of endowment. The faculty in 1894 numbered thirty-eight professors and instructors, the students 300. The bishops and three elected representatives of fifteen dioceses of the Protestant Episcopal Church in the Southern States constitute the board of trustees. The administrative head is the vice-chancellor, B. Lawton Wiggins, M. A. The tone of the institution is conservative and English. *The Sewanee Review* is the literary organ of the university. B. LAWTON WIGGINS.

University of the State of New York: an organization including all incorporated institutions of academic and higher education in New York, with the State Library, State Museum, and such other libraries, museums, or other institutions for higher education in the State as may be admitted by the regents to the university. It was incorporated May 1, 1784; reorganized Apr. 13, 1787; had its powers enlarged and its laws revised and consolidated June 15, 1889, and Apr. 27, 1892. Its object is, in all proper ways, to encourage and promote academic and higher education throughout the State.

Besides the State Library and State Museum there are in the university (1895) 466 institutions—381 academies and high schools, and 85 degree-conferring and professional institutions, viz.: 21 colleges of arts and science for men, 8 for women, and 5 for men and women, 7 law schools, 18 medical schools, 3 schools of pharmacy, 12 theological schools, 1 polytechnic, and 10 special institutions. Of these, 1 college of arts and science, 1 medical college, 4 theological schools, 2 law schools, and 1 special school confer no degrees.

The 18 medical schools include 1 homœopathic, 1 eclectic, 2 for women, 1 of dentistry, 2 veterinary, and 1 post-graduate college. Of the 12 schools of theology 3 are Baptist, 2 Presbyterian, 1 each Lutheran, Episcopal, Universalist, Christian, Roman Catholic, German Lutheran, and Reformed. The 10 special schools (except the Dudley Observatory, which is part of Union University), include only institutions with degree-conferring powers, though to show the full facilities of the State many institutions doing similar work should be included in this list. The law ranks as "colleges" only those with degree-conferring powers. These include 2 pop-

ular institutions (Chautauqua and Pratt Institute), 3 pedagogic colleges, 1 each of art, music, and magnetics. While there are in the State 76 institutions in which degrees may be earned, there are only 55 degree-conferring bodies, as in a university or a college having a professional school attached a single board of trustees confers all degrees. Columbia thus confers degrees in the arts, science, law, and medicine. Union confers degrees in law, medicine, and pharmacy; the University of the City of New York in law, medicine, theology, and pedagogy; St. Lawrence and Alfred Universities in theology; Cornell in law, pharmacy, and engineering; Syracuse in medicine and art; Niagara in law, medicine, and theology.

The powers of the university are vested in twenty-three regents, including the Governor, Lieutenant-Governor, Secretary of State, and Superintendent of Public Instruction, *ex officio*. Regents are elected by the two houses of the State legislature in joint session, in the same manner as Senators of the U. S., and serve without salary and for life.

The regents have power to incorporate, and to alter or repeal the charters of colleges, academies, libraries, museums, or other educational institutions belonging to the university; to distribute to them all funds granted by the State for their use; to inspect their workings and require annual reports under oath of their presiding officers; to establish examinations as to attainments in learning; and confer on successful candidates suitable certificates, diplomas, and degrees, and to confer honorary degrees.

They apportion annually an academic fund of \$106,000, a part for buying books and apparatus for academies and high schools raising an equal amount for the same purpose, and the balance on the basis of attendance and of the regents' examinations.

The regents meet regularly on the second Thursday of February and the second Wednesday in December. Numerous special meetings are held as called by the chancellor or on request of five regents.

The university convocation of the regents and the officers of institutions belonging to the university, for consideration of subjects of mutual interest, is held annually at the Capitol in Albany usually on the first Wednesday, Thursday, and Friday after July 4.

The work of the university is divided into five departments:

1. *Executive*—including incorporations, supervision, inspection, reports, finances, and all other work not assigned to another department.

2. *Examinations*—including preliminary, law student, medical student, academic, higher law, medical, library, and any other examinations conducted by the regents.

3. *Extension*—including the work of extending more widely opportunities and facilities for education to adults and others unable to attend the ordinary institutions of higher education.

4. *State Library*—including public libraries department, duplicate department, library school, and all other library interests intrusted to the regents.

5. *State Museum*—including the work of State geologist, palæontologist, economic geologist, botanist, entomologist, and zoölogist, together with all other scientific interests of the university.

Libraries.—Besides the State Library of over 160,000 volumes, which is open daily throughout the year, except Sundays, from 8 A. M. to 10 P. M., there are eight other libraries of more than 3,000 volumes each—i. e. those of the Albany Female Academy, Albany Institute, Medical College, High School, St. Agnes's School, Court of Appeals, Normal College, and of the Young Men's Association, the last having nearly 20,000 volumes.

MELVIL DEWEY.

University Settlements: homes in the poorer quarters of a city, where educated men and women may live in daily personal contact with the working people. Here they may identify themselves as citizens with all the public interests of their neighborhood, may co-operate with their neighbors in every effort for the common good, and share with them, in the spirit of friendship, the fruit and inspiration of their wider opportunities.

No definite date can be assigned for the origin of the university settlement movement. The establishment in London of the Working Men's College, in 1860, by Frederick Denison Maurice, and the beginning of the university extension movement from Cambridge in 1867, were among the early expressions of the spirit that later was to produce

the settlement. The essential idea of settlement work—the establishing of the *home* among the poor—had its rise at Oxford. In 1867 Edward Denison, an Oxford man of wealth and position, went to John Richard Green, the English historian, then vicar of St. Philips, at Stepney, in London, and asked an opportunity to live and work in his parish. Denison lived but a short time, and left his work still in the form of an experiment. During the time of his residence in the East End he discussed with a few friends plans for the social elevation of the poor, and the idea of the university settlement was then evolved, but no steps were taken for beginning the work. In 1875 Arnold Toynbee, tutor to the Indian civil service students at Oxford, decided to spend his summer vacation at Whitechapel, London. This he did for several successive summers, becoming an intellectual leader among the working men of the vicinity. After his death, as a memorial to him, his friends at Oxford determined to secure a hall at the East End, where, through university extension and other methods, it was designed to give the working men of the neighborhood the benefit of education. It was due to the influence of Samuel A. Barnett, vicar of St. Jude's, in Whitechapel, that this original plan was enlarged, and in addition to the lecture-hall a settlement for university men, Toynbee Hall, was established. It began its work in Whitechapel in 1885, with Mr. Barnett as warden. The movement was rapid in its development, and within a few years settlements were started in various districts in London and in several of the cities of Scotland, and in 1887 the founding in New York city of the Neighborhood Guild, which in 1891 came under the control of the University Settlement Society, marked the beginning of the settlement movement in the U. S.

Methods of Working.—The most vital part of the work of a settlement is the expression, in the widest measure, of a wise friendship toward its neighborhood. This attitude results in many opportunities for usefulness that can not be classified. The definitely organized efforts of every settlement are mainly social, educational, and civic. In a neighborhood where overcrowding and poverty have destroyed the best social life, the settlement seeks to be a social center. It provides entertainments, organizes clubs, and in general constitutes itself a meeting-ground for the people of the neighborhood. Among the people who spend their days in toil there is the greatest need of elevating relaxation. In offering them the hospitality of a home of refinement and culture, the settlement helps to satisfy this need. Much work is done for the children through books, music, pictures, and story-telling; every attempt is made to brighten their lives and awaken in them a desire for better things. The settlement also attempts to bring together in social intercourse all classes of society, with the hope that, through the better mutual understanding and wider sympathies that must result, aid may be given toward the solution of economic and civic problems. In its educational work a settlement aims to give a fuller life and broader sympathies, rather than any technical perfection. Toynbee Hall, London, and Hull House, Chicago, are "outposts" of university extension, and all settlements have undertaken some work of this kind. The settlement exists not only as an education for the neighborhood, but as a school for the workers, many of whom take part in the work with a view to study and investigation, in order to obtain accurate data with regard to the problems of poverty. In the settlements in general an earnest enthusiasm is felt for gaining and promulgating a right understanding of the aims and methods of the labor movement. When no definite attitude is taken toward the movement a general sympathy is accorded it, and in many settlements active work is done in organizing unions and giving them support. The first duty of a settlement-worker is to fulfill the offices of a good citizen. As far as possible the resident takes an active part in local government, and serves on committees and boards appointed to look after the health, education, and general well-being of the neighborhood. In this way important service is rendered in a community where unsuitable laws often go unchanged in the absence of intelligent criticism, and good laws are badly administered because of the lack of wise direction.

The settlements are generally supported by associations formed for that purpose. These organizations do not attempt to control the work to any extent. The management of each settlement is delegated to a local committee or to the resident workers. The head worker is in direct charge of the settlement, and is free to plan and develop its activities. The service is voluntary, each resident worker paying

part of the current expenses of the house. The head worker only receives a salary. The expenses of the clubs, classes, etc., are usually paid by the members. The character and scope of the work are determined largely by the tastes and ability of the residents, and by the needs of the neighborhood.

Leading Settlements.—The leading English settlements are in London. Among them are Toynbee Hall, Oxford House, the Woman's University Settlement, Mayfield House, and Mansfield House. In Scotland settlement-work has been undertaken in both Glasgow and Edinburgh.

In the U. S. the increase in the number of settlements has been rapid. At the present time (1895) they exist in New York city, Brooklyn, Buffalo, Jersey City, Boston, Hartford, Philadelphia, Cleveland, Cincinnati, Pittsburgh, St. Louis, and San Francisco. Among the leading settlements in the U. S. are the University and College Settlement in New York city, Hull House in Chicago (which, however, designates itself a social rather than a college or university settlement), Philadelphia College Settlement, Denison House and Andover House, Boston.

The movement has also spread to India, where there is a missionary university settlement in Bombay.

ADA S. WOOLFOLK.

Unlawful Assembly: See RIOT.

Unleavened Bread, Feast of: See PASSOVER.

Unst: the northernmost of the SHETLAND ISLANDS (*q. v.*).

Unterwalden, oon'ter-raäl-den: canton of Switzerland, bordering N. on Lake Lucerne; area, 295 sq. miles. It is surrounded and traversed by mountain ranges, forming two long, narrow valleys which open toward Lake Lucerne. There are several other minor lakes in the canton. The surface is rarely level enough for agriculture, but the forests are extensive and rich in timber. Apples, pears, and chestnuts are raised in great quantities and of excellent quality. Cattle-breeding and dairy-farming are the chief employments, cheese and timber the principal exports. Pop. 27,581, who are Roman Catholics and speak German. Unterwalden is divided into two semi-cantons, having certain federal relations in common, but their local governments separate. Obwalden, or Upper Unterwalden, has an area of 183 sq. miles; pop. (1888) 15,043. Nidwalden has an area of 112 sq. miles; pop. (1888) 12,538.

Revised by M. W. HARRINGTON.

Unwin, WILLIAM CAWTHORNE, F. R. S.: engineer; b. at Coggeshall, Essex, England, 1838; educated at the City of London School; served an apprenticeship in the works of Sir William Fairbairn at Manchester 1855-62; instructor at the Royal School of Naval Architecture, South Kensington, 1868-72; Professor of Mechanical and Hydraulic Engineering, Royal Indian Engineering College, Cooper's Hill, 1872-84; Professor of Engineering, Central Institution of the City and Guilds Institute, South Kensington, 1884-. His principal works are *Wrought-Iron Bridges and Roofs* (1869); *The Elements of Machine Design* (1877; 11th ed. 1890-91); and *The Testing of Materials of Construction* (1888).

Unyoro: one of the largest of the native states of inner Africa. It is N. and N. W. of Uganda, which separates it from Victoria Nyanza, and it lies between Lake Gita on the E. and Albert Nyanza on the W. It is an elevated, fertile, and populous country, whose king, a great slave raider and trader, has been much opposed to the introduction of white influences. His power was much weakened by the war upon him (1893-94) by the British native forces from Uganda, and the country is likely soon to be brought entirely under the control of Great Britain. The inhabitants (Wanyoro) are farmers and cattle-raisers. Polygamy is common. The military organization is inferior to that of Uganda, and the Wanyoro have generally been worsted in their many wars with the Waganda.

C. C. ADAMS.

Upanishads [Sansk.]: a group of over 100 mystical treatises, mostly in prose, attached to the Brāhmanas or ritualistic precepts which form the second division of the Veda. They contain the beginnings of Hindu philosophy, and cast aside matters of rites and ceremony to deal with the mysteries of creation and existence. See the article SANSKRIT LITERATURE; Monier-Williams, *Indian Wisdom* (4th ed. London, 1895); and vols. i. and xv. of the *Sacred Books of the East*, edited by Max Müller (Oxford, 1879, 1884).

Upas [from Malay *ūpas* in *pūhn-ūpas*, upas-tree, liter., poison-tree; *pūhn*, tree + *ūpas*, poison]: a tree indigenous

to the forests of Java, where it is called *Bohun upas*; the scientific name is *Antiaris toxicaria*. The viscid juice of the plant dries into a resinous mass termed by the Javanese *antiar*. This exudation is extremely poisonous, and when introduced into the circulation of an animal death speedily ensues. The stories of the early travelers respecting the pernicious character of exhalations from the foliage of this tree are believed to be gross exaggerations. Specimens of the plant are cultivated in the conservatories of all large botanic gardens. The plant belongs to the bread-fruit family. The leaves are ovate or obovate, 4 or 5 inches long and conspicuously veined. The minute flowers are monœcious. The fruit is drupaceous. Other species of *Antiaris* are known to be innocuous.

Upcott, WILLIAM; historian and bibliographer; b. in Oxfordshire, England, in June, 1779; served an apprenticeship to a London bookseller; became purchasing agent for several book-collectors, and on the foundation of the London Institution in the Old Jewry, 1806, was appointed sub-librarian, the celebrated Porson being librarian. He made the most extensive known collection of autographs, which comprised more than 36,000 letters; was the discoverer and first editor of Evelyn's *Memoirs*; furnished most of the originals for the publication of the *State Letters* (1820) of Henry Hyde, second Earl of Clarendon, and Ralph Thoresby's *Diary and Correspondence* (4 vols., 1830-32); wrote a continuation of Edmund Carter's *History of the County of Cambridge* (1819), and a considerable part of a *Biographical Dictionary of Living Authors of Great Britain and Ireland* (1816), and published *A Bibliographical Account of the Principal Works relating to English Topography* (3 vols., 1818). He resigned his position at the London Institution 1834. D. at Islington, Sept. 23, 1845. His collection of autographs was dispersed at auction in 1846, but a large part was secured by the British Museum. Revised by H. A. BEERS.

Uppfold, GEORGE, M. D., D. D., LL. D.; bishop; b. at Shemley Green, near Guildford, England, May 7, 1796; taken by his parents to the U. S. 1802, the family settling at Albany, N. Y.; graduated at Union College 1814, and in medicine in New York 1816; commenced practice at Albany, but soon entered upon the study of theology; was ordained in the Protestant Episcopal Church 1818; was minister at Lansingburg, N. Y., 1818-20; rector of St. Luke's, New York, 1820-28, being also assistant minister of Trinity church 1821-25; rector of St. Thomas's church, New York, 1828-31, and of Trinity church, Pittsburg, Pa., 1832-50; and was consecrated Bishop of Indiana Dec., 1849. D. in Indianapolis, Ind., Aug. 26, 1872.

Upham, CHARLES WENTWORTH; clergyman and author; b. at St. John, New Brunswick, May 4, 1802; son of a loyalist refugee, judge of the supreme court of the province; graduated at Harvard College 1821, at Cambridge Divinity School 1824; colleague of John Prince, pastor of the First church in Salem, 1824-44; left the profession on account of bronchial weakness; edited *The Christian Register* 1845-46; traveled and lectured as agent of the Massachusetts board of education; was elected mayor of Salem; was member of the Massachusetts House of Representatives in 1849, of the State Senate 1850-51, of the national Congress from the Sixth District 1854-55; State Senator 1858, Representative 1859-60. During his ministry, which fell in controversial times, Mr. Upham made his mark as a writer by his *Letters on the Logos* (1828) and *Prophecy as an Evidence of Christianity* (1835), both written in the Unitarian interest. The *Lectures on Witchcraft, comprising a History of the Salem Delusion of 1692*, afterward, in 1867, rewritten and expanded into an elaborate work (in 2 vols.) appeared in 1831. Mr. Upham was a diligent student of New England times and men. For Sparks's *American Biography* he wrote the *Life of Sir Henry Yane* (1835). In 1856 appeared from his pen the *Life, Letters, and Public Services of John Charles Fremont*. His last work was a *Memoir of Timothy Pickering* (4 vols., 1867-72). D. in Salem, Mass., June 15, 1875.

Upham, THOMAS COGSWELL, D. D.; educator and author; b. at Deerfield, N. H., Jan. 30, 1799; graduated at Dartmouth College 1818, and at Andover Theological Seminary 1821; became assistant teacher of Hebrew in the seminary, and translated Jahn's *Biblical Archaeology*; in 1823 was ordained pastor of the Congregational church in Rochester, N. H.; in 1825 was chosen Professor of Mental and Moral Philosophy in Bowdoin College. His principal works are *Manual of Peace* (1830); *Philosophical and Practical Treatise on the Will* (Portland, 1834); *Elements of Mental Phi-*

losophy (1839; abridged ed. 1864); *Outlines of Disordered and Imperfect Mental Action* (New York, 1840); *Life of Faith* (1848); *Treatise on the Divine Union* (Boston, 1851; London, 1858); *Religious Maxims* (2d ed. Philadelphia, 1854); *Method of Prayer* (London, 1859); and *Christ in the Soul* (210 hymns, New York, 1873). D. in New York, Apr. 2, 1872. Revised by G. P. FISHER.

Upington, Sir THOMAS, K. C. M. G., Q. C.; jurist and statesman; b. in County Cork, Ireland, Oct. 28, 1844; educated at Cloyne Diocesan School and Trinity College, Dublin, where he took the degree of M. A.; called to the Irish bar 1867; became secretary to Lord O'Hagan, Lord Chancellor of Ireland; settled at the Cape of Good Hope 1874; elected member of the Legislature for the division of Colesberg 1878; Attorney-General for the colony 1878-81; elected leader of the opposition in the Cape Parliament; Prime Minister of the Cape Colony 1884-86; Attorney-General 1886-90; appointed a puisne judge in the Supreme Court at the Cape 1892; is one of her Majesty's counsel for the Cape, and as lieutenant-colonel commands a volunteer regiment in Cape Town.

Upjohn, RICHARD; architect; b. in England, Jan. 22, 1802. He became a cabinet-maker and builder first in England, and followed that trade afterward in the U. S., having settled in New Bedford, Mass., about 1829, and in Boston a few years later. As trained architects were rare in the U. S. at that time, he was employed occasionally on minor pieces of architectural designing, and afterward built St. John's church in Bangor, Me. The iron fence around Boston Common, with its entrance gate-ways, was put up from his designs. Trinity church, New York, was to be rebuilt in 1839, and Mr. Upjohn's designs for the new structure were accepted. The building was not finished until 1846. It was built with unusual care and great expense for the time, and its design was studied from the English Perpendicular, adapted with considerable skill. In connection with the Church of The Holy Trinity in Brooklyn, built about the same time by another architect, it established the character of American churches for a number of years. The tower and spire were especially notable, not only for their general architectural merit, but also because of the great height of the steeple (285 feet), a height not reached for many years by any other building in the U. S. After this many other churches were built by this architect, one of the most successful being Trinity chapel, belonging to the same foundation as Trinity church, and completed about 1856. This is a study in English Gothic of an earlier style than that of Trinity church, highly decorated, and of unusual solidity and excellence of construction. The Church of the Ascension, in Fifth Avenue; University Place Presbyterian church, and the Church of the Holy Communion—all in New York city; several churches in Brooklyn; St. Stephen's at Providence; St. Paul's at Buffalo; St. Paul's at Baltimore; and a number in other parts of the country were built by Mr. Upjohn. He built also a number of country-houses, in many of which there is considerable architectural character, much beyond what was usual at the time of their erection; also Trinity building in New York, and the Corn Exchange Bank, which was replaced in 1893 by a sixteen-story building. His latest important building was St. Thomas's church, at Fifth Avenue and Fifty-third Street, New York, finished in 1870. The exterior of this church is remarkable for its tower capped by a lantern instead of spire. Mr. Upjohn was president of the American Institute of Architects while it was a New York society merely, from 1857 till about 1868, and was then the president of the enlarged and nationalized institute until 1876. D. at Garrison's, Putnam co., N. Y., Aug. 16, 1878. RUSSELL STURGIS.

Upolu': an island of SAMOA (*q. v.*).

Upper Alton: city; Madison co., Ill.; on the Burl. Route and the Chi. and Alton railways; 2 miles N. of Alton (for location, see map of Illinois, ref. 8-D). It is the seat of Shurtleff College (Baptist, opened in 1827, chartered in 1835), which at the end of 1893 had 19 professors and instructors, 269 students, 26 scholarships, 2 endowed professorships, and 10,000 volumes in its library. The city has an attractive public park, street-railway, manufactory of roof-tile, and 2 monthly periodicals. Pop. (1880) 1,534; (1890) 1,803.

Upper Peru (Span. *Alto Peru*): one of the colonial names for the country now called BOLIVIA (*q. v.*).

Upper Sandusky: village; capital of Wyandot co., O.; on the Sandusky river, and the Col., Hock, Val. and Tol. and

the Penn. railways; 17 miles W. of Bucyrus, and 60 miles S. of Toledo (for location, see map of Ohio, ref. 3-E). It contains foundries, machine-shops, carriage-factories, a national bank with capital of \$105,000, and a daily, 2 semi-weekly, and 2 weekly newspapers. Pop. (1880) 3,540; (1890) 3,572.

EDITOR OF "UNION."

Upsala: town of Sweden; 45 miles N. W. of Stockholm; has a beautiful cathedral and a flourishing university (see map of Norway and Sweden, ref. 10-G). The cathedral was built between 1289 and 1435, and is 370 feet long, 128 feet broad, and 92 feet high. Its interior is magnificent and richly decorated, but its exterior has suffered much from fire. Among its relics are the silver shrine of St. Eric, the tomb of Gustavus Vasa, the monument of Linnaeus, etc. The university was founded in 1477 by Sten Sture, developed rapidly, produced a great number of illustrious scholars, and at times exercised a decisive influence on Swedish civilization. It has about 2,000 students and its library contains over 250,000 volumes. Pop. (1895) 21,428.

Revised by M. W. HARRINGTON.

Upshur, ABEL PARKER: cabinet officer; b. in Northampton co., Va., June 17, 1790; studied law under William Wirt at Richmond, where he practiced 1810-24; was representative in the Legislature, and in 1826 was appointed a judge of the general court; in 1829 was a member of the State constitutional convention, and in 1841 was appointed Secretary of the Navy, but after Webster's resignation was made Secretary of State in 1843. In politics he belonged to the pro-slavery party, and was in full accord with President Tyler's policy of annexing Texas. He was killed by the bursting of a gun on board the U. S. steamer Princeton on the Potomac river, Feb. 28, 1844. He published several essays, reviews, and addresses, and an *Inquiry into the Nature and Character of our Federal Government* (1840).

Upsilonism: See CZECH LITERATURE.

Upton, ANSON JUDD, D. D., LL. D.: educator; b. in Philadelphia, Pa., Nov. 7, 1823; A. B., Hamilton College, 1843; A. M. 1846; D. D. 1870; LL. D., Union, 1880; tutor, Hamilton College 1845-49; Adjunct Professor of Rhetoric and Moral Philosophy 1849-53; Professor of Logic and Rhetoric 1853-70; Professor of Sacred Rhetoric and Pastoral Theology, Auburn Theological Seminary, 1880-87; professor emeritus since 1887; ordained to the ministry (Presbyterian) Jan. 29, 1868, at Rome, N. Y.; pastor Second Presbyterian Church, Albany, N. Y., 1870-80; trustee Hamilton College 1872-74; regent University of the State of New York 1874; elected vice-chancellor of the University of the State of New York 1890, and chancellor 1892; member Presbyterian General Assembly 1871, 1877, 1884; delegate to Evangelical Alliance, Belfast, Ireland, 1884; author of numerous educational and collegiate addresses, sermons, and articles in periodicals. C. H. THURBER.

Upton: town (incorporated in 1735); Worcester co., Mass.; on the Grafton and Upton Railroad; 13 miles S. E. of Worcester, and 33 miles W. S. W. of Boston (for location, see map of Massachusetts, ref. 3-G). It contains the villages of Upton Centre and West Upton; has Congregational, Unitarian, Methodist Episcopal, and Roman Catholic churches, high school, seven public schools, and a public library; and is principally engaged in the manufacture of straw hats. Pop. (1880) 2,023; (1890) 1,878; (1895) 2,150.

Upton, EMORY: soldier; b. at Batavia, N. Y., Aug. 27, 1839; graduated at the U. S. Military Academy, May, 1861, and commissioned second lieutenant of artillery; served in the Manassas campaign, engaged in the battles of Blackburn Ford and Bull Run, where he was wounded. In the Peninsular campaign of 1862 he commanded his battery at Yorktown, Gaines's Mill, and Glendale; in command of artillery brigade at South Mountain and Antietam; appointed colonel 121st New York Volunteers, Oct., 1862, and engaged at Fredericksburg, Salem Heights, Gettysburg, and was in command of a brigade during the subsequent Rapidan campaign. In the Richmond campaign of 1864 he led his brigade (Sixth Corps) through the Wilderness battles to the front of Petersburg, particularly distinguishing himself at Spotsylvania Court-house; transferred with his corps to the Shenandoah July, 1864, he was wounded at Opequon Sept. 19, while in command of a division. Returning to duty in December, he was assigned to a division of cavalry in the West, and was engaged in the expedition into Alabama and Georgia in the spring of 1865 resulting in the capture of Selma, Columbus, etc. Mustered out of the vol-

unteer service Apr., 1866, he was in July transferred to the Twenty-fifth Infantry with rank of lieutenant-colonel, and engaged in perfecting a *System of Infantry Tactics*, which was adopted in Aug., 1867, for the use of the army and militia of the U. S. He was transferred to the Eighteenth Infantry in 1869, and to the First Artillery 1870; was commandant of cadets at West Point 1870-75; on professional duty in Asia and Europe 1875-77; commanded several artillery posts, and was on the board to codify army regulations 1878-81. He received the brevets from major to major-general in the U. S. army. D. in San Francisco, Cal., Mar. 15, 1881. See his *Life and Letters*, by Prof. P. S. Michie (New York, 1885). Revised by JAMES MERCUR.

Upton, GEORGE PUTNAM: journalist and musicographer; b. at Roxbury, Mass., Oct. 25, 1834; educated at Brown University, Providence, R. I., graduating in 1854; went to Chicago and entered upon a journalistic career. In 1862 he became connected with *The Chicago Tribune*, and was its music critic until 1882. He has published *Women in Music* (1882); *The Standard Operas* (1885); *The Standard Oratorios* (1886); *The Standard Cantatas* (1887); *The Standard Symphonies* (1888); and has translated several of Mohl's *Lives of Eminent Musicians*, all of which were published in Chicago. D. E. H.

Uppū'ida [Mod. Lat., named from *Uppū*, the typical genus, from Lat. *u'ppū*, hoopoe; cf. Gr. *ἰππύς*]: a family of birds typified by the common hoopoe of Europe, characterized by a desmognathous palate, perforate episternal process, pointed mandibrium, and spinal feather-tract forked on the upper back. The singing apparatus is lacking. On account of its peculiarities the family is considered as representing a distinct sub-order, having its nearest relations with the hornbills. See HOOPOE. F. A. L.

Urabá, Gulf of: See DARIEN, GULF OF.

Uraemia: a condition resulting from the imperfect action of the kidneys, whereby substances which would normally be excreted are retained in the blood. It occurs especially in cases of Bright's disease; the symptoms are headache, convulsions, delirium, nausea, etc.

Uraga, oo-raang'áa: a port of Japan; at the western entrance to the Bay of Tokio (see map of Japan, ref. 6-E). The town is built on both sides of a narrow fiord-like harbor, which are connected by a bridge and a ferry. Formerly all junks entering the bay were stopped for inspection here. Uraga is associated with the opening up of the empire, for it was here that Commodore Perry cast anchor July 8, 1853, when sent by President Fillmore with a letter for the emperor. The place has daily steam communication with the capital, the journey taking four hours; and is noted for the production of *midzu-ame*, a sweetmeat resembling barley-sugar. It is a minor naval dépôt and has a naval gunnery school. Pop. (1895) 12,719. J. M. DIXON.

Ural: river of Russia, which rises in the Ural Mountains, flows S., forming the boundary between Europe and Asia, and enters the Caspian Sea after a course of 930 miles. It is not navigable on account of sandbanks, but is very rich in the finest kinds of fish, particularly near its mouth, where the Cossacks have important fisheries. Its delta is very large, and is still increasing.

Ural-Altaic Languages: See LANGUAGE.

Uralian Emerald: See GARNET.

Ural Mountains: a range of plateaus rising from 3,000 to 5,000 feet, and with a breadth of from 16 to 66 miles. They begin in the Arctic Ocean, in lat. 70° N., and stretch southward to lat. 50° N., forming the natural boundary between Europe and Asia. They are rich in gold, platinum, copper, iron, and other ores. Of precious stones, beryl, topaz, amethyst, and diamonds are found; coal is abundant. The Obdorsk Mountains branch off from the middle chain of the Ural Mountains in lat. 62° N., and extend 500 miles N. N. W. Revised by M. W. HARRINGTON.

Uralsk': province of Russia; at the southern end of the Ural Mountains, on the Ural river, and N. E. of the Caspian Sea (see map of Russia, ref. 7-1). It lies partly in Europe, but is essentially Asiatic, and is one of the provinces of the general government of the Kirghiz steppe. It is chiefly dry steppe and desert, and much of it is below sea-level. Area, 139,168 sq. miles. Pop. (1889) 559,552. The capital, Uralsk, is near the northern border, on the Ural river, is well built, and has a fine trade in fish, hides, tallow, grain, and imported goods. Pop. (1890) 26,034. M. W. H.

Ura'nia [= Lat. = Gr. *Οὐρανία*, liter., the Heavenly One, fem. of *οὐρανός*, of the sky or heaven, deriv. of *οὐρανός*, sky, heaven]: in Grecian mythology, one of the nine Muses, the goddess of astronomy, and a daughter of Zeus and Mnemosyne. She was generally represented as holding a celestial globe in the one hand and pointing at it with the other.

Uranine: the sodium salt, $C_{20}H_{10}Na_2O_8$, of fluorescein. Its yellow solution exhibits the most wonderful fluorescence, which is instantly destroyed by acidulating it: for this reason it has been recommended as an indicator in volumetric analysis. See **PHTHALIC ACID**.

Uraninite, or **Pitchblende**: a pitch-black mineral with a specific gravity of 9.5. It is found at Joachimstal, Bohemia, in sufficient quantity for commercial purposes; also in Cornwall, England, and other localities. In addition to uranoso-uranic oxide (U_3O_8) it contains lead sulphide, silica, lime, etc., and from 1 to 2.5 per cent. of a gas which was first supposed to be nitrogen, but in 1895 was shown to be a mixture of the gases argon and helium.

Uranium [Mod. Lat., named from the planet *Uranus*]: a name given by Klaproth in 1789 to a metal whose oxide he discovered in the mineral called *pitchblende* (*uraninite* of Dana), which contains from 40 to 90 per cent. of the oxide U_3O_8 . It was not until as late as 1840, however, that metallic uranium was first discovered by Peligot, who had previously passed for the metal having been ascertained by him to be the dioxide, UO_2 . There are a large number of mineral species that contain uranium, but the only one occurring in sufficient quantity to be available for the extraction of uranic compounds is pitchblende. In the U. S. it is found as *coracite*, on the north side of Lake Superior, and as *autunite*, on the Schuylkill above Philadelphia.

To obtain uranium compounds from pitchblende it is ground and washed to remove impurities, roasted to remove sulphur and arsenic, and dissolved in nitric acid, evaporated then to dryness, which decomposes the ferric nitrate. Water dissolves from the dried mass little but the pure uranic nitrate, which is further purified by crystallization, and several recrystallizations when required perfectly pure. From this salt the pure oxide, U_3O_8 , may be obtained by ignition alone, and the dioxide, UO_2 , by ignition with reducing agents, and the tetrachloride, UCl_4 , by heating with charcoal in chlorine gas. The metal was obtained by Peligot from the tetrachloride by heating with metallic potassium or sodium. It is hard, but somewhat malleable, and can be scratched by a file. The maximum density was 18.68; the color approached that of iron. It tarnishes to a yellowish color in air. It takes fire, when in powder, at a temperature of about 500° F., burning brightly to U_3O_8 , of a dark-green color. It does not decompose water in the cold, but evolves hydrogen with dilute acids, dissolving with a green color. It combines directly with sulphur and chlorine. *Uranium nitrate*, or *uranyl nitrate*, is one of the commonest commercial compounds of uranium. In the usual method of preparation of uranium oxide from pitchblende, the uranium is first obtained as this nitrate, which has the formula $UO_2(NO_3)_2$. *Sodium uranate*, $Na_2U_2O_7$, is a fine yellow powder which is manufactured on a large scale and sold under the name *uranium yellow*, as a pigment for glass, etc. *Ammonium uranate*, $(NH_4)_2U_2O_7$, is also manufactured on a large scale. Uranium compounds impart to glass a greenish-yellow fluorescent color. Revised by IRA REMSEN.

Ura'nus [= Lat. = Gr. *Οὐρανός*, liter., sky, heaven]: in Grecian mythology, the son of Gaia, the earth, and by her the father of the Titans, Cyclopes, Hundred-handed, etc. He hated his children, and confined them in Tartarus, but on the instigation of Gaia, Cronus, the youngest of them, overthrew and dethroned him. See **GAIA** and **ZEUS**.

Revised by J. R. S. STERRETT.

Uranus [= Mod. Lat., named from the Greek deity *Uranus* = *οὐρανός*, heaven]: the seventh planet in order of distance from the sun, and, with the exception of Neptune alone, the outermost member of the planetary family. Uranus travels at a mean distance of 1,753,869,000 miles from the sun, but, its orbit being considerably eccentric, its greatest distance, 1,835,561,000 miles, exceeds its least distance, 1,672,177,000 miles, by nearly 163,400,000 miles, or not much less (relatively) than the entire span of the earth's orbit. Since the earth's mean distance from the sun is 91,430,000 miles, the opposition distance of Uranus varies from about 1,744,100,000 miles to about 1,581,700,000 miles; and as the planet is farther from the sun in the former than in the lat-

ter case, and therefore less brightly illuminated, there arises a considerable variation in the apparent brightness of Uranus. In fact, Uranus is more favorably situated for telescopic study when in opposition near perihelion than when in opposition near aphelion, in the proportion of $(17,441)^2 \times (18,356)^2 : (15,817)^2 \times (16,723)^2$, or nearly as 3 to 2 (more exactly as 63 to 43). The eccentricity of the orbit of Uranus is 0.0466. The planet completes a sidereal revolution in 30686.8208 days, or in 84 years and 6.5 days. Its synodical period is 369.656 days, exceeding a year by little more than four days. The inclination of the orbit to the ecliptic is about 46.5'. The mean diameter of Uranus is estimated at about 33,000 miles; the compression of the globe is not known. Its volume exceeds the earth's about seventy-four times, but its mean density is so small (0.17—the earth's as 1) that its mass exceeds that of the earth only about twelve and a half times. It has been said that Uranus rotates on its axis in nine and a half hours, but no reliance can be placed on the assertion, as the most powerful telescopes fail to show any clearly defined markings on this distant globe. Uranus was discovered by Sir William Herschel Mar. 13, 1781, when he was examining the small stars in the neighborhood of η Geminorum. He was led by the apparent size of a star in this region to suspect that it was a faint comet. Examining the object with higher powers, and finding its disk enlarged (which would not have been the case with a fixed star), he was confirmed in this suspicion. But soon after the discovery had been announced the mathematicians who had undertaken the calculation of the stranger's orbit found the path to be an ellipse of moderate eccentricity, and concluded that the new orb was a member of the planetary family. This was placed beyond doubt before long; and in 1787 two satellites were discovered whose motions indicated that the supposed comet had a mass many times exceeding that of our earth. Herschel proposed to call the new planet *Georgium Sidus*, in honor of George III. Continental astronomers for a long time called it *Herschel*, but the name *Uranus*, suggested by Bode, of Berlin, is now universally adopted by astronomers.

Satellites of Uranus.—Uranus is attended by four satellites. The two brighter ones were discovered by Sir William Herschel, who afterward thought that he had discovered four more, so that until the middle of the nineteenth century Uranus was considered to have six satellites in all. But Lassell, of England, in pointing his great reflectors on Uranus, announced that these four additional satellites had no existence, but that two very minute ones circulated between Uranus and the bright ones. It is now established that Uranus has these four satellites, and no others have so far been discovered. Their times of revolution are shown in the following table:

ELEMENTS OF URANUS'S SATELLITES.

NAME.	Sidereal revolution.	Mean distance in
		radii of Uranus.
	<i>d. h. m.</i>	
Ariel.....	2 12 28	7.44
Umbriel.....	4 3 27	10.37
Titania.....	8 16 55	17.01
Oberon.....	13 11 6	22.75

Revised by S. NEWCOMB.

Urari: another spelling for **CURARI** (*q. v.*).

Ura'shima Taro: in Japanese folk-lore, a legendary personage, incidents in whose story furnish frequent themes for art treatment. He is the Rip Van Winkle of Japan. A fisherboy, he was caught in a storm and rescued by a goddess who rode upon a large tortoise. Mounting beside her, he descended to the bottom of the sea, and was royally entertained in a magnificent palace. After seven days he wished to return, and his request was granted. But he found that he had been centuries away. The story is told at length in Griffis, *The Mikado's Empire*, and in Chamberlain, *Classical Poetry of Japan*. J. M. DIXON.

U'rates, or **Lithates** [*urates* is deriv. of *uric*; see **URIC ACID**; *lithates* is deriv. of *lithic*, deriv. of *lithium*; see **LITHIUM**]: compounds of uric acid with bases. Both neutral and acid urates of most metals are known. They are sparingly soluble in water, but dissolve in warm alkaline solutions and in solution of borax. The acid ammonium, sodium, and calcium urates are frequent ingredients of **URINARY CALCULI AND DEPOSITS** (*q. v.*), the proportion of the calcium salt, however, being very small. The lithium is the most soluble of the urates; for this reason lithia-water is sometimes used as

a remedy for gout and for superabundance of uric acid in the system. Ammonium urate is occasionally applied medicinally, in chronic cutaneous affections, in the form of an ointment; but urates should be taken internally very cautiously, as they may give rise to the formation of oxalic acid in the urine. Revised by IRA REMSEN.

Urban (Lat. *Urbanus*): the name of eight popes. (1) **URBAN I.** (about 222-230), son of Pontianus, a Roman noble; a martyr, according to somewhat doubtful authority.—(2) **URBAN II.**, Otho de Lagny (1088-99); b. at Châtillon-sur-Marne, in France, about 1012; was successively a disciple of St. Bruno, canon of Rheims, and monk of Cluny, where Gregory VII. made his acquaintance. This pope invited him to Rome, made him cardinal and Bishop of Ostia, employed him as his legate in Germany, and on his death-bed named him among those worthy of the succession, which in fact became his after the short reign of Victor III. (1086-87). The main object of Urban's life was the continuation of the policy of Gregory VII. against the lay investitures, simony, and priestly concubinage. Henry IV. and the anti-pope Guibert of Ravenna (Clement III.) maintained for a long time possession of all or part of the city of Rome, and much of Urban's life was spent outside the city. In the eleven years of his pontificate he bore up manfully against the emperor, helped in turn by the rebellion of the latter's son Conrad, by the marriage of the Countess Mathilda to Welf, the son of the Duke of Bavaria, by King Roger of Sicily, and by the first crusaders. (See **CRUSADE** and **PETER THE HERMIT**.) Urban held a number of councils in Southern Italy for the reformation of manners and the maintenance of the independence of the holy see, notably that of Bari, at which St. Anselm of Canterbury assisted and aided in the refutation of the Greek arguments against the Latin doctrine concerning the procession of the Holy Ghost from the Father and the Son. Urban died in Rome, July 29, 1099, fourteen days after the capture of Jerusalem.—**URBAN III.**, Umberto Crivelli (1185-87), a native of Milan. His short and stormy pontificate is chiefly noted for the struggle with Frederick Barbarossa, whom he was about to excommunicate when death surprised him at Ferrara, Oct. 20, 1187.—**URBAN IV.**, Jacques Pantaléon (1261-64), a Frenchman; son of a shoemaker; became canon of Liège, Bishop of Verdun, and Patriarch of Jerusalem. He carried on the long papal struggle against the Hohenstaufen in Southern Italy and Sicily, and made over these possessions to the house of Anjou, by inviting Charles of Anjou to take the place of the untractable King Manfred. Urban endeavored to bring about the union of the Latin and Greek Churches; he also established for all Christendom the feast of Corpus Christi, first celebrated at Orvieto, June 19, 1264. Urban died at Orvieto, Oct. 2, 1264.—**URBAN V.**, Guillaume Grimoard (1362-70); a Benedictine monk; distinguished professor of canon law and Scripture; abbot of St. Victor at Marseilles, and papal legate. Yielding to the necessities of the situation and to the entreaties of such persons as Petrarch and St. Bridget of Sweden, he returned from Avignon to Rome Oct. 16, 1367, and ended the long exile of the popes. But his passionate love for France drew him back again to Avignon, where he died Dec. 16, 1370. He was a mild-mannered, studious man, the friend of scholars, and founder of a school of medicine at Montpellier.—**URBAN VI.**, Bartolommeo Prignano (1378-89); Archbishop of Bari; elected Apr. 8, 1378, to succeed Gregory XI., a Frenchman, who, it is said, had been meditating a return to Avignon. Shortly after his election the French cardinals, dissatisfied with his zeal and somewhat harsh manners, took flight to Anagni, and there elected anti-pope Cardinal Robert of Geneva (Clement VII., 1378-94). They claimed that the Roman people had forced them by violence to elect Urban, but it is sure that they assisted at his authorization, at his consistories, and asked favors from him. Thus the papacy was divided, and the great schism of the West inaugurated, which filled all Christendom with woe. The hasty, impetuous temperament of Urban did not aid matters; his latter days were embittered by the ill success of his plans in the kingdom of Naples and by the conspiracy of his own cardinals, who tried to create a kind of tutorship for him, but paid for it with death or imprisonment. D. in Rome, Oct. 15, 1389.—**URBAN VII.**, John Baptist Castagna (1590); Archbishop of Rossano, cardinal, and legate to Spain; d. after a reign of thirteen days Sept. 28, 1590.—**URBAN VIII.**, Maffeo Barberini (1623-44); built the Collegium Urbanum, or College of the Propaganda; established the Vatican Seminary;

gave its final shape to the bull *In Cena Domini*; increased and strengthened the fortifications of Rome; gave to the cardinals the title of eminence; regulated the number of feasts of obligation; inherited the state of Urbino by extinction of the Della Rovere family; issued an emended breviary, in which the ancient Christian style in the hymns was replaced by classic exactness of metre. He has been accused of excessive nepotism, and of furtherance of French interests in the Thirty Years' war. To his pontificate belongs also the condemnation of Galileo by the Congregation of the Holy Office. See *Les pièces du procès de Galileo*, by H. de l'Épinois (Paris, 1877), and Ward, *Copernicanism and Pope Paul V.* (*Dublin Review*, 1871). D. in Rome, July 29, 1644. Urban was a man of polished manners and literary tastes, and was personally gentle and refined. JOHN J. KEANE.

Urban'a: city; capital of Champaign co., Ill.; on the Cleve., Cin., Chi. and St. L., the Ill. Cent., and the Wabash railways; 31 miles W. of Danville, and 50 miles E. S. E. of Bloomington (for location, see map of Illinois, ref. 6-F). It is in an agricultural and mineral region; is the seat of the University of Illinois; and has a national bank (capital \$50,000), a private bank, and a weekly paper. Pop. (1880) 2,942; (1890) 3,511. EDITOR OF "CHAMPAIGN COUNTY HERALD."

Urban'a: city; capital of Champaign co., O.; on the Cleve., Cin., Chi. and St. L., the Erie, and the Pitts., Cin., Chi., and St. L. railways; 46 miles W. of Columbus, and 100 miles N. of Cincinnati (for location, see map of Ohio, ref. 5-D). It is in an agricultural region, and is the seat of Urbana University (New Church, chartered in 1850). It contains a high-school building that cost \$125,000, a public library, a soldiers' monument in the center of Monument Square, 3 national banks with combined capital of \$300,000, 5 building and loan associations, and a daily and 3 weekly papers. The business interests include the shops of the U. S. Rolling Stock Company, machine-works, agricultural-implement works, tannery, carriage and wagon shops, stove-foundry, woolen-mill, water-wheel works, and straw-board, furniture and table, broom, and shoe factories. Pop. (1880) 6,252; (1890) 6,510. EDITOR OF "TIMES-CITIZEN."

Urbino (anc. *Urbium Hortense*): an old town in the province of Urbino, Italy; on two steep and lofty hills of the Umbrian chain, between the Metauro and the Foglia; about 25 miles S. W. of Pesaro (see map of Italy, ref. 4-E). The walls were erected by the celebrated mathematician Federigo Commandini, and the town was afterward further strengthened with a castle and towers by the lords of Montefeltro (1213). The large cathedral is of the seventeenth century, the ancient church on this site having been destroyed by an earthquake. The ducal palace (begun 1447) is a noble edifice in the early Renaissance style, and, besides much striking medieval ornament, contains ancient inscriptions and bas-reliefs of great interest. Several of the private palaces possess rare artistic treasures, especially that of the Staccoli Castracane, where there is a fine collection of the famous ceramics of Urbino, Casteldurante, and Gubbio. The modest house in which the painter Raphael Sanzio was born (1483) is now used as a town museum. There is a free university, founded in 1564. Urbino is among the most ancient cities of Italy, acquired the rights of Roman citizenship in 89 B. C., and suffered many vicissitudes during the breaking up of the Roman empire. It recovered some importance in the early part of the thirteenth century, but the first who assumed the title of Duke of Urbino was Federico di Montefeltro (1474), and he and his immediate successors, as wise and virtuous as they were prosperous, made Urbino famous in the history of the mediæval world. In 1508 the duchy passed to the Della Rovere house; in 1631 it became the direct property of the Church, and so remained, with the brief exception of the French domination, till united to the kingdom of Italy. Urbino is distinguished for the number of remarkable men to whom it has given birth, and for the general intelligence and activity of its citizens. Both agricultural and manufacturing industries are flourishing. Pop., with the commune, 17,230.

Urchin-fish, or Porepupine-fish: See **DIODON**.

Ure, yur. **ANDREW**, M. D., F. R. S.: chemist; b. in Glasgow, Scotland, May 17, 1778; educated at the Universities of Glasgow and Edinburgh, where he also graduated in medicine; became Professor of Chemistry at the Andersonian Institution at Glasgow 1804, and director of the Glasgow Observatory 1809; removed to London 1830; was appointed

analytical chemist to the board of customs 1834; and successfully applied chemical discoveries to the arts and to manufactures. He was the author of *A New Systematic Table of the Materia Medica* (1813); *A Dictionary of Chemistry* (2 vols., 1821; republished in the U. S. by Dr. Robert Hare and Dr. Franklin Baehle, Philadelphia, 1821)—a work which was the undisputed standard for several years; *A New System of Geology* (1829); *The Philosophy of Manufactures* (1835); *The Cotton Manufacture of Great Britain* (2 vols., 1836; new ed. 1861); and *A Dictionary of Arts, Manufactures, and Mines* (1837), which was rewritten and enlarged by Dr. Robert Hunt (3 vols., 1859-60; 7th ed., 4 vols., 1875-78). D. in London, Jan. 2, 1857.

Urea [Mod. Lat., from Gr. *οὔρον*, urine; cf. URINE, etc.]: an isomer of ammonium cyanate, first obtained by Rouelle in 1773, afterward in a state of greater purity by Fourcroy and Vauquelin in 1799. It is an essential constituent of the urine of mammiferous animals, particularly of the Carnivora, but is also found in that of birds and of Amphibia. Urea also occurs, to some extent, in human blood and perspiration, in the vitreous humor of the eye, and in the lymph and chyle of various animals. It is the chief outlet for the oxidized nitrogen of the tissues of the system, a healthy adult excreting more than an ounce daily. It is not formed in the kidneys, which appear merely to separate it from the blood in which it is pre-existent. Urea may be formed artificially in several ways, but its preparation by the action of cyanic acid on ammonia (discovered by Wöhler in 1828) possesses special interest as being the first synthetic formation of an organic compound:

It is also obtained from cyanamide (CN₂H₂) by the addition of one equivalent of water, and by the decomposition of numerous complex organic compounds, such as creatin, guanin, and URIC ACID (*q. v.*); likewise by the action of carbonyl chloride (COCl₂) on ammonia; but in the laboratory it is usually prepared either from urine or by the evaporation of a solution of ammonium cyanate. In the former process the urine is evaporated to dryness on the water-bath, and the residual mass exhausted with alcohol, which is evaporated to dryness. The second residue is then extracted with pure alcohol, which, upon evaporation, leaves the urea in a slightly colored state. In another method the urine is concentrated by evaporation, and nitric or oxalic acid added, by which a precipitate of urea nitrate or oxalate is formed, from which the urea is obtained by decomposition with barium or calcium carbonate, filtering the solution, and purifying the urea by repeated recrystallization from alcohol. Urea is, however, most readily and abundantly prepared from ammonium cyanate in the following manner: Potassium cyanate is first formed by heating a mixture of 56 parts of carefully dried potassium ferrocyanide and 28 parts of dry manganese dioxide to dull redness. The residue, when cold, is treated with cold water, and 41 parts of ammonium sulphate are added, when ammonium cyanate and potassium sulphate are formed. The solution is then evaporated, and treated with hot alcohol, from which, on cooling, the urea crystallizes out.

Urea crystallizes in colorless striated prisms, which fuse at 248° F., but are decomposed at a higher temperature. Its specific gravity is 1.30. It is very soluble in water and in hot alcohol, but is nearly insoluble in ether. Its solution possesses a neutral reaction and a cooling bitter taste. When heated in a sealed tube to about 284° F., urea combines with two molecules of water, and is converted into ammonium carbonate, CH₄N₂O + 2H₂O = (H₄N)₂CO₃. The same change takes place when urine is exposed to the air, owing to the action of micrococci (*micrococcus uree*). It is to the formation of ammonium carbonate that the alkaline reaction of stale urine is due. When it is heated above its melting-point, biuret (C₂O₂H₂N₂) and cyanuric acid (C₃O₃H₃N₃) are formed, with evolution of ammonia. Urea combines with acids, forming crystalline compounds, and also with metallic oxides, such as those of mercury and silver. Numerous substitution-derivatives of urea (*compound ureas*) have also been obtained. For the quantitative estimation of urea in urine, see URINE. Revised by IRA REMSEN.

Uredin'ea, or **Uredines** [Mod. Lat., named from *Ure'do* (a form or stage of development of the Uredineae, and formerly considered a genus), from Lat. *ure'do*, burning, blast, blight, deriv. of *u'rere*, burn]: an order of minute parasitic fungi popularly known as the RUSTS (*q. v.*). They consist

of branching colorless threads which penetrate the tissues of their hosts (flowering plants or, rarely, ferns), eventually producing their characteristic rust-colored spores. About 1,500 species are known to botanists, all falling within the family *Uredinaceae*, and divided among about a dozen genera, the more important of which are *Uromyces*, *Puccinia*, *Gymnosporangium*, and *Phragmidium*. C. E. BESSEY.

Ure'ter [Mod. Lat., from Gr. *οὐρητήρ*, urethra, ureter, deriv. of *οὔρειν*, urinate, deriv. of *οὔρον*, urine]: the excretory duct of the kidney. In man it is a cylindrical membranous tube about 17 inches long, and as large as a goosequill, passing from the pelvis of the kidney to the base of the bladder. It has a fibrous (or outer), a muscular, and a mucous (or inner) coat. Each kidney normally has a distinct ureter.

Ure'thra [Mod. Lat., from Gr. *οὐρήθρα*, the passage for urine, deriv. of *οὔρειν*, urinate, deriv. of *οὔρον*, urine]: the name of the membranous canal by which the urine is emptied from the bladder. In the female it is but a short passage opening below the clitoris. In the male it is a canal of about 8 to 9 inches in length, and of a somewhat complicated structure, conducting not only the urine, but also the semen. Going from the bladder outward, the urethra is divided into three parts: (1) the prostatic part, surrounded by the prostatic gland, in which (part) are the openings of the seminal ducts; (2) the membranaceous part, 8 to 10 lines long; and (3) the cavernous or spongy part, surrounded by the spongy tissues of the penis. The caliber of the urethral canal is different in the different parts and different individuals, and ranges from 3 to 7 lines in diameter, the orifice being the narrowest part. The urethra is lined throughout with a delicate coating of mucous membrane, which is a direct continuation of that of the bladder. For obstructions of the urethra, see STRICTURE. Revised by W. PEPPER.

Urfah: See ORFA.

Urga [palace], the Russian name of the Mongolian **Bogdo-Kuren** or **Da-Kuren** [holy camp]: the capital of Northern Mongolia; on the Tola, in lat. 47° 58' N., lon. 106½° E., at an elevation of 4,370 feet, between Kiachta and Peking, on the principal caravan route between Russia and China (see map of Asia, ref. 3-G). Urga consists, like all Mongolian towns, of a Mongolian and a Chinese quarter. The latter, which contains the fort, is also called *Mai-mai-chin* (trading-place), and stands 2½ miles from Bogdo-Kuren. Bogdo-Kuren contains large Buddhist monasteries and temples, and is the seat of the supreme Mongolian Kutuktu, who is considered the terrestrial representative of Buddha, and ranks in holiness next to the Dalai lama of Lhassa and the Panchen Kinpoche of Shigatse, both in Tibet. The monasteries are extensive structures of stone, and contain numerous shrines and relics, which are subjects of the deepest veneration; the occupants, the monks, are called *tama*, and number about 10,000. The custom is not to bury the dead, but to leave them, in accordance with Buddhist doctrines, to be devoured by the dogs and birds of prey; only those of priests and princes are interred. The Mongols settled here belong to the Khalka tribe. During summer, numerous pilgrims from all parts of Mongolia gather to the city, and a brisk trade springs up. The unit of value was formerly the tea-brick, but this has given way to Chinese cash. Tea, mixed with cows' blood, was moulded into the form of bricks, and from twelve to fifteen such bricks were paid for a sheep, or from 120 to 150 for a camel. The surrounding country has a South Siberian character; the mean temperature of the year is 25.70° F.; the number of rainy or snowy days is forty-one. A Russian consul is stationed here, with a small detachment of Cossacks for his protection. Russian merchants and scholars often visit Urga, and undertake from here extensive journeys into Northern Mongolia. Pop. about 30,000. Revised by M. W. HARRINGTON.

Uri: one of the forest cantons of Switzerland, bordering N. on Lake Lucerne, and having St. Gothard on its southern frontier. Area, 415 sq. miles. It consists of one valley, enclosed by lofty mountains and traversed by the Reuss. Rearing cattle and dairy-farming are the principal employments. Pop. (1894) 17,249, who are Roman Catholics and speak German. Chief town, Altorf. It was one of the three original cantons of Switzerland. M. W. H.

Uria, or **Hyria**: an inland city of ancient Calabria, in Southern Italy; situated on the Applan Road, about midway between Brundisium and Tarentum. Herodotus represents it as having been the metropolis of the Messapians, founded by a colony of Cretans on their return from Sicily.

Uric Acid, or Lithic Acid [*uric* is from Gr. *ὄρον*, urine; *lithic*, i. e. pertaining to the formation of stone or uric acid concretions in the bladder, etc., is from Gr. *λίθος*, of a stone or stones, deriv. of *λίθος*, stone]; a substance first discovered by Scheele in 1776, and subsequently more thoroughly investigated by Wöhler and Liebig in 1838; formula, $C_5N_3H_4O_6$. Later Adolf Bayer gave attention to the uric group of compounds; and Emil Fischer finally solved the problem of the chemical constitution of uric acid. Uric acid occurs in a small proportion in human urine, but is much more abundantly contained in the excretions of insects, land-reptiles, and birds, usually as the ammoniac salt. It is extensively found in the guano-beds of the Pacific islands, also in the form of ammonium urate, and is said to be contained in the human spleen, liver, and lungs; also in the blood, which latter, in certain diseases, as gout, contains a very considerable amount; indeed, in persons suffering from gout it often accumulates around the joints, forming what are commonly but incorrectly termed "chalk-stones," which consist chiefly of sodium urate. When secreted in excess, it is discharged by the kidneys, and is deposited from the urine as *red gravel*, or it accumulates in the bladder and forms a constituent of URINARY CALCULI (q. v.).

Uric acid is most advantageously prepared from the dried urine of serpents, by dissolving the powdered mass in a large quantity of boiling water, to which caustic potash enough to dissolve all the acid is added, and heating until ammoniacal vapors cease. The fluid is then filtered, and the potassium urate decomposed by hydrochloric acid, uric acid appearing in minute white crystals. It can also be obtained by boiling guano with a weak borax solution, whereby a solution of sodium urate is formed, from which the uric acid is precipitated by hydrochloric acid. Uric acid crystallizes in small white rhombic prisms; but if slowly deposited from a dilute solution, it frequently separates in large crystals containing two molecules of water; when obtained from animal fluids, its crystalline form is often very much modified. It is almost insoluble in water, requiring 10,000 parts of cold water, and is quite insoluble in alcohol and in ether. It dissolves in concentrated sulphuric acid, from which it is precipitated in a hydrated form by the addition of water. When dry uric acid is heated, it is decomposed without fusion, and hydrocyanic acid is evolved, a sublimate, consisting of cyanuric acid, urea, with ammonium cyanate and carbonate, being formed.

The most remarkable property of uric acid is the facility with which it is altered by oxidizing agents, such as nitric acid, plumbic dioxide, etc., and transformed into numerous well-defined crystalline compounds, some of which, however, are obtained from the immediate products of oxidation by the action of reducing agents, acids, and alkalies. More than thirty of these compounds (many of which are termed *ureides*) have been prepared, including the following: *alloxan*, *alloxantin*, *uramil*, *allantoin*, *glycoluril*, *muresside*; also the acids *urazonic*, *barbituric*, *biouric*, *thio-uric*, *oxaluric*, *parabanic*, and *meso-calic*. Uric acid has been synthetically produced.

Uric acid is dibasic, and forms both normal and acid salts. (See URATES.) Its presence can often be recognized with the aid of the microscope by its peculiar crystalline structure—rhombic tablets, frequently associated with dumb-bell-shaped crystals. When moistened with nitric acid and gently heated, a residue is obtained, which, upon treatment with ammonia, assumes a fine violet-red color (*muresside*), and when treated with potassium hydroxide acquires a violet-blue color (*potassium purpurate*). It may also be detected by dissolving in sodium carbonate, and placing a drop of the solution on paper moistened with silver nitrate, upon which it produces a brown spot, caused by the reduction of the silver. (For the quantitative estimation of uric acid in urine, see URINE.) One of the uric acid series (*muresside*) was formerly used in cotton-dyeing. Revised by IRA REMSEN.

Urim and Thummim [*Urim* = Heb. *urim*, plur. of *ur*, flame, fire; cf. *ur*, light; *Thummim* is from Heb. *tummim*, plur. of *tōm*, perfection, truth, deriv. of *tāmam*, be perfect]; sacred symbols of the high priest of Israel given at Sinai (Ex. xxviii. 30), but lost forever at the destruction of the first temple (Ez. ii. 63; Neh. vii. 65). They were two objects placed in a pocket behind the breastplate of the high priest, and used to cast lots or to receive answers to questions and thus determine the divine will. It is not known just how the divine will was learned. In the Septuagint translation of 1 Sam. xiv. 41 the following descrip-

tion of their use occurs, and this is the clearest knowledge we have: "And Saul said, Lord God of Israel, why hast thou not answered thy servant to-day? If I or Jonathan my son has sinned, then Lord God of Israel give 'light'; but if it be thy people Israel who have sinned, then give 'right.'" The questions to be answered by the Urim and Thummim were public and not private, and only the high priest could use them.

Revised by S. M. JACKSON.

Urinary Calculi and Deposits: Urine in disease often deposits on standing various kinds of sediments, which differ in properties and composition according to the causes which induce their formation. Both morphological and chemical bodies are thus separated. The former class includes such substances as blood, pus, epithelial cells, etc.; to the latter class belong urates, uric acid, phosphates, calcic oxalates and carbonates, hippuric acid, cystin, leucin, xanthin, tyrosin, etc. Perhaps the most common urinary sediment is that known as *interstitial* or *brick-dust deposit*. It occurs in health when active perspiration or free movement of the bowels renders the urine concentrated. It is a constant symptom in conditions of excessive urinary acidity as in gout. As a rule, the deposit occurs when the urine cools, and it may be redissolved by heat. In cases of disease, however, the urates and also uric acid may be present as deposit in the urine at the moment it is voided. If small masses are voided they are spoken of as gravel; if larger masses, as calculi or stones. Uric acid and urate stones are especially prone to form in the pelvis of the kidney. They are red in color, and fuse on platinum foil without leaving a residue. The same conditions which occasion urates in the urine frequently cause calcium oxalate also to appear. The latter may be due likewise to certain vegetables and fruits rich in oxalates, and is then less significant. Oxalate calculi are usually formed in the pelvis of the kidney; they are generally tuberculated, or of a mulberry appearance, and on fusing them a residue of calcium carbonate remains on the foil. Phosphates may appear in the urine as a whitish sediment, or, when ammoniacal decomposition has taken place, triple phosphates (ammonium-magnesium phosphate). These may cause the white or mixed phosphatic calculi in the bladder. They fuse in the blowpipe and are soluble in acids. Other calculi are rare, such as those composed of xanthin, cystin, calcium carbonate, and others.

Calculi are liable to cause serious obstructions to the flow of urine, and also severe inflammatory conditions of the pelvis of the kidney and of the bladder, where they most commonly occur. It is to be remarked, however, that the inflammatory conditions may in the first place cause the calculi by favoring the deposit of the urinary salts, and that the calculi afterward aggravate the original trouble.

Once formed, medication probably has no power to dissolve calculi. Occasionally they break spontaneously, and are discharged as fragments. Their formation is often preventable by careful medication, the use of waters, and care in diet, exercise, etc. Their removal when necessary involves cutting, crushing, and other operations. See LITHOTOMY.

WILLIAM PEPPER.

Urinary Organs: See KIDNEY and HISTOLOGY.

Urine [viâ O. Fr. from Lat. *urina*, urine; cf. Gr. *ὄρον*, urine; Sanskr. *vâr*, water; Icel. *ur*, drizzling rain]; an excrementitious fluid excreted by the kidneys. Urine in health possesses a light amber color, a slight acid reaction, a peculiar odor, and a bitter saline taste. During the process of digestion it sometimes acquires an alkaline reaction. It has a sp. gr. of 1.024, but this also changes with the diet and state of health of the individual. It becomes more strongly alkaline on standing, owing to ammoniacal decomposition. (See UREA.) The urine excreted in the morning has a different composition from that passed in the evening, which has absorbed various substances taken into the stomach during the day. An average sample of healthy human urine has the following composition:

In 1,000 parts, water = 956.80 parts.

In 100 parts of solid matter:

Urea	33.00
Uric acid	0.86
Alcoholic extract	29.03
Aqueous	5.80
Vesical mucus	0.37
Sodium chloride	16.73
Phosphoric pentoxide	1.91
Sulphuric trioxide	3.94
Fixed salts	0.19
Lime	0.28
Magnesia	4.47
Potash	0.12
Soda	

Besides the constituents named, the following compounds are occasionally contained in healthy urine, usually in minute quantities: iron, ammonia, sugar, xanthin, creatin, creatinin, and lactic, succinic, oxalic, formic, phenylic, and hippuric acids. Free gases also occur: In 100 cubic cm. of urine, Plauer found 0.87 nitrogen, 0.06 oxygen, 4.54 free and 2.07 combined carbonic acid. Certain pigments, the composition of which is uncertain, are likewise present. There are a number of pigment matters in the urine, of which the most important is urobilin. Indigo-blue appears to be a product of the decomposition of other pigments, as it occurs in urine which has been exposed to the air for some time. Among the other bodies said to be contained in urine may be mentioned certain ferments and albuminoid matters, casein, leucin, tyrosin, taurin, acetone, and taurocholic, glycocholic, and cholic acids, which latter are present only in the abnormal or diseased excretion. The acidity of urine is due to the presence of acid sodium phosphates, and hippuric and other acids. Numerous substances appear to pass unchanged through the urine, such as many alkaline salts and numerous compounds of metals, alkaloids and organic acids, while others suffer a partial or complete transformation; thus malic acid is converted into succinic acid; sulphites and sulphides are changed into sulphates; tannic acid is converted into gallic acid; benzoic acid is transformed into hippuric acid; iodine changes to alkaline iodides; potassium ferrocyanide to the ferriocyanide; and indigo-blue is reduced to indigo-white. In the disease diabetes a large amount of grape-sugar (glucose) is contained in the urine, owing to an incomplete digestion of the food, sometimes in the proportion of over a pound in the liquid voided during twenty-four hours. Small amounts of glucose occasionally appear in the urine in health or in persons not suffering with diabetes. In ALBUMINURIA (*q. v.*) a large quantity of albumin is secreted, the formation of which is due to a lack of secretive power on the part of the kidneys.

ANALYSIS OF URINE.—Urea may be determined in a variety of ways. *Liebig's volumetric method* is executed as follows: Dissolve 100 grammes of pure mercury in 500 grammes of nitric acid, evaporate to a sirup, add a little nitric acid, and dilute to 1,400 cubic cm.; this forms the standard mercury solution, 1 cubic cm. of which is equal to 1 centigramme of urea. Its strength should be actually determined by estimating a known weight of urea in the manner described further on. A baryta solution is next prepared by mixing 2 volumes of baryta-water and 1 volume of a solution of barium nitrate, both saturated in the cold; 15 cubic cm. of this baryta mixture is then added to 30 cubic cm. of the urine to be tested; the liquid is well stirred, and then filtered through dry paper; 15 cubic cm. of the filtrate (= 10 cubic cm. of the original urine) is then measured off in a beaker-glass, and the standard mercury solution is slowly added from a burette as long as any precipitation occurs, the precise end of the operation being determined by adding a drop of the mixture to a solution of sodium carbonate contained in a watch-glass, when a distinct yellow color should be produced. The number of cubic centimeters of the mercury solution used is read off, each cubic cm. indicating 1 centigramme of urea in the 10 cubic cm. of urine. In this method the presence of an excess of urea and of sodium chloride affects the accuracy of the result, and renders a correction of the figures obtained necessary. *Davey's method* consists in adding a small quantity of the urine to a graduated glass tube filled one-third with mercury, completely filling the tube with sodium hypochlorite, and immersing it in an inverted position in a concentrated solution of sodium chloride, in which position it is allowed to remain for several hours, after which the quantity of gas (nitrogen) evolved is read off: 1.549 cubic inches of nitrogen at 60° F. = 1 grain of urea. A modification of this method in which sodium hypobromite is used is more useful.

Uric acid is roughly determined by adding to about 200 cubic cm. of the urine 10 cubic cm. of hydrochloric acid, and allowing the mixture to stand for two days, when the precipitate formed is collected on a smaller filter, washed, dried, and weighed. Care should be taken not to use more than about 30 cubic cm. of water in washing the precipitate, as otherwise a partial solution of the uric acid is to be feared; and all albumin present should at first be removed by coagulation with dilute acetic acid, in which case this acid, in a concentrated form, should be employed as the precipitant of the uric acid.

Sugar (glucose) is estimated by its reducing action on a boiling cuprie solution in presence of an alkali, or it can

also be determined by adding a small quantity of yeast to the urine, and measuring the amount of carbonic acid formed by the fermentation of the sugar. *Albumin* is separated by heating the urine to boiling, and adding a few drops of nitric acid until complete coagulation takes place. *Chlorides* may be estimated by a volumetric method (as with silver and potassium dichromate solutions); *ammonia* by placing 20 cubic cm. of the urine in a shallow dish, over which is placed a similar vessel containing 10 cubic cm. of a standard solution of sulphuric acid; 10 cubic cm. of milk of lime is then added to the urine, and an air-tight bell-jar is placed over the whole. In two days the ammonia will have been absorbed by the acid, and is estimated by titrating and comparing the residual acidity with that of the standard acid.

Revised by WILLIAM PEPPER.

Urine, Retention of: See RETENTION OF URINE.

Urinometer [*urine* + Gr. *μέτρον*, measure]; an instrument used in the determination of the specific gravity of URINE (*q. v.*). It consists merely of an ordinary hydrometer, in which the scale runs from 1.000 to the limits of density of urine, 1.060 or 1.070.

Urinous Fermentation: See FERMENTATION.

Urmia, or Urmia: town; in the province of Azerbaijan, Persia (see map of Persia and Arabia, ref. 1-1^b); on an elevated plain 12 miles W. of Lake Urmia. It is well built, and is in a densely peopled and well-cultivated district, which by European travelers has often been compared with Lombardy. The Protestant mission has here a very prosperous station, with a printing-press, which has issued over 3,000 volumes in the old and new Syriac languages. The station has several native preachers and teachers. Pop. estimated at from 25,000 to 50,000.

Urmia or Urmia, Lake: in the province of Azerbaijan, Persia; 64 miles S. W. of Tabriz; covers an area of 1,420 sq. miles, and is 4,000 feet above sea-level. It receives several large rivers, but has no outlet. Its waters are so impregnated with saline substances that neither fish nor molluscs can live in it.

Urochorda: a name sometimes given the TUNICATA (*q. v.*) in allusion to the fact that the notochord is restricted to the caudal region.

Urode'la, or Urodeles [from Gr. *οὐρά*, tail + *δῆλος*, evident]; one of the subdivisions or "orders" of AMPHIBIA (*q. v.*), often called *Gradientia* in allusion to their walking as opposed to the jumping gait of the frogs and toads, the *Salientia* of systematists. The urodeles have an elongate body terminated by a long tail which is flattened in the aquatic forms, rounded in the terrestrial species. In all forms (except *Siren*, which has no hind legs) the body is supported on two pairs of limbs, but in several species these are small, and show a tendency toward degeneration in the diminution in number of digits from the typical four fingers and five toes. In the larval stages respiration is effected by external gills upon the sides of the neck, and in a few forms (*Perennibranchiata*) these are retained throughout life. In others they entirely disappear, and the gill slits on the sides of the neck may remain open (*Derotremata*) or entirely close (*Caducibranchiata*). In these latter respiration has been supposed to take place by lungs, but recently it has been shown that in a few species lungs are never developed, and that in all stages all traces of a trachea or windpipe are lacking. Most of the urodeles lay their eggs in water, but *Amphiuma* wraps the long strings of eggs about her, thus recalling the habits of several of the frogs and toads. It is to be noted that Cope has restricted the order Urodele on skeletal characters, taking from it the *Siren*, *Proteus*, and *Necturus*, and adding to it the CECILIDÆ (*q. v.*).

The classification of the urodeles is yet in an unsatisfactory condition. One scheme has been outlined above; a second divides them into *Ichthyodea* and *Salamandrina*, according as eyelids are absent or present; while Cope arranges the ten families which he recognizes in four groups based upon peculiarities of skull and vertebral column. There are about 100 species known from the whole world, the order being best represented in North America. Among the more interesting forms may be mentioned the common salamander of the Eastern U. S., *Diemyctylus viridescens*, in which two stages occur originally described as distinct genera. The first, after leaving the water, is red, and indicates a period of sexual immaturity; it later enters the water, changes its shape slightly, becomes an olive green, and is then sexually mature. Later no change occurs.

Among the species of *Amblystoma* the larval branchiate condition is retained until the animal becomes of considerable size, and these larvae were long known as a distinct genus, *Siredon*, and in some cases these larvae were capable of sexual reproduction without the assumption of the adult characters. The axolotl of the Lake of Mexico is apparently a *Siredon* stage of some *Amblystoma*, but its transformation into the adult has never been witnessed, the many records of such change being in reality made upon another species, *Siredon lichenoides*, the young of *Amblystoma mavortium*. In the *Salamandra atra* of the Alps the young are born alive. In the oviduct with the developing young are other eggs which serve as nourishment. The young before birth have very large gills, but these are entirely absorbed before birth. A strange feature is found in the Spanish *Pleurodeles*, where the ends of the ribs penetrate the skin, protruding as a series of spines along either side.

LITERATURE.—Cope, *Batrachia of North America*, *Bulletin U. S. Nat. Museum* No. 34 (1889); Boulenger, *Catalogue of the Batrachia Gradiventia in the British Museum* (London, 1883). J. S. KINGSLEY.

Uropelethidae [Mod. Lat., named from *Uropeleth*, the typical genus; Gr. *οὐρά*, tail + *πέλας*, shield]; a family of snakes. The body is cylindrical, the head short and pointed, with no apparent neck; the eyes are very small; the cleft of the mouth is comparatively narrow; teeth are in both jaws, but none on the palate; there are no rudiments of posterior extremities; the tail is short and blunt, and has a naked terminal shield of keeled scales. The family is composed of several genera, mostly confined to the East Indies and the Philippine islands. F. A. L.

Urpethite: See WAX.

Urquhart, ūrk'art, DAVID; political writer; b. at Bracklanwell, County Cromarty, Scotland, in 1805; educated at St. John's College, Oxford; entered the diplomatic service; traveled extensively in the East; was secretary of legation at Constantinople 1835-36; resigned that post in consequence of his opposition to Lord Palmerston's Eastern policy, which he denounced as subservient to the ambitious views of Russia; made a vigorous warfare upon that policy in the press for several years, and continued it in Parliament, where he sat as a Conservative member for Stafford 1847-52. D. in Naples, May 16, 1877. His writings did much to foster jealousy and suspicion of Russia's Eastern policy. Among them may be mentioned *England, France, Russia, and Turkey* (1835); *The Spirit of the East, a Journal of Travels through Roumeli* (2 vols., 1838); *Diplomatic Transactions in Central Asia* (1840); *The Progress of Russia in the West, North, and South* (1853); *Letters and Essays on Russian Aggressions* (1853); *Recent Events in the East* (1854).

Urquiza, oor-kee-thā, JUSTO JOSÉ, de; general and politician; b. near Concepcion del Uruguay (now in Entre Rios, Argentine Republic), Mar. 19, 1800. He received a rudimentary education at Buenos Ayres, became a clerk and a country storekeeper, and gradually acquired great influence over the *gauchos*. From 1835 to 1842 each province fell, practically, into the hands of a dictator, who in most cases was more or less subservient to Rosas, the dictator of Buenos Ayres. As leader of the federalist party, Urquiza became the chief power in Entre Rios, and he was elected governor in 1846. His rule was irresponsible and was directed mainly toward his own aggrandizement. He acquired great wealth, but by wise management was generally able to maintain peace and prosperity while cementing his power. In 1844-45, as an ally of Rosas and Oribe, he marched into Uruguay with 4,000 men, and defeated Rivera at the battle of India Muerta Mar. 28, 1845. He was also successful in a war with the unitarian faction which had risen to power in Corrientes. When the dictatorship of Rosas threatened the autonomy of the provinces, Urquiza turned against him and in 1851 joined with Brazil and the government of Montevideo. Marching into Uruguay, he compelled Oribe to capitulate Oct. 8, 1851. The allied forces then invaded Buenos Ayres, and Rosas was defeated and overthrown at the battle of Monte-Caseros Feb. 3, 1852. Urquiza was proclaimed provisional dictator, and the provinces, except Buenos Ayres, having adopted a federal constitution, he was elected president of the Argentine Confederation for the term of six years beginning in May, 1853. By his victory over Mitre at Cepeda Oct. 23, 1859, he compelled Buenos Ayres to join the confederation. At the end of his presidential term he took command of the army against Buenos Ayres, which had revolted. Mitre defeated him at Pavon Sept. 17, 1861, and the federalist con-

stitution was abandoned for the unitarian one now in force. Urquiza retired to Entre Rios where he continued to exercise a semi-dictatorial power, though nominally subject to the central government. He refused to take part in the Paraguayan war. On Apr. 11, 1870, a band of political opponents murdered him on his estate near Concepcion.

HERBERT H. SMITH.

Ursa Major [=Lat., liter., Greater Bear]: the first of Ptolemy's northern constellations, including the fine group of seven stars known as Charles's Wain, the Dipper, or the Butcher's Cleaver, near the north pole, formerly called also *Septentriones* (likewise *Septempriones*) and the Plow.

Ursa Minor [=Lat., liter., Lesser Bear]: one of Ptolemy's northern constellations, containing the North Star (*Polaris*) and the group anciently known as Cynosura, the Dog's Tail. *Polaris* is a star of the second magnitude. About 15 from it is another equal star, β *Ursæ Minoris*. In the latitude of the Northern U. S. neither of these stars ever sets. S. N.

Ursidae [Mod. Lat., named from *Ursus*, the typical genus, from Lat. *ur-sus*, bear; cf. Gr. *ἄρκτος*; Sanskr. *ṛkṣa-*, bear]; a family of carnivorous mammals embracing the bears. These have the body heavy, the hair abundant, the muzzle more or less pointed, the feet plantigrade, and each with five digits fully developed, armed with sharp non-retractile claws; the teeth in adult 36 to 42 (M. $\frac{3}{2}$, P. M. $\frac{4}{2}$ (2), C. $\frac{1}{1}$, I. $\frac{3}{3}$ (3) \times 2); last true molar of the upper jaw is oblong and exceeds the first; the last premolar of the upper jaw, as well as the succeeding true molars, is tubercular; the first true molar in the lower jaw is narrow, but longest; the second oblong and broader. The family is widely distributed, and has representatives in the extreme arctic regions as well as in the temperate and torrid zones—in America, Europe, and Asia, and in the north of Africa. About fifteen species are known, which have been distributed by recent systematists under six genera—viz., *Thalarchos* (polar bear), *Ursus* (ordinary bears), *Tremarctos* (South American), *Helarctos* (Indian, etc.), *Melursus* (the *Ursus labiatus* of India), and *Fluoropoda* (Tibetan): the last two are very distinct; the others closely related. See also BEAR.

Ursua, ūr-soo'-ūā, or **Orsua**, PEDRO, de; soldier; b. at Ursua, Navarre, about 1510. He joined a Spanish expedition to New Granada; was governor of that country 1545-46 and subsequently led two expeditions to the E. and N. E. of Bogotá, in search of El Dorado. Pamplona and other towns now in Santander were founded by him. In 1555-57 he commanded a force against the Cimarrones or fugitive slaves of the Isthmus of Panama, and completely subdued them. In 1559 the Viceroy of Peru placed him in command of an expedition, the avowed object of which was to find and conquer the reported "kingdom" of the Omaguas, on the upper Amazon; secretly, the viceroy's purpose was to get rid of the turbulent soldiers who had been drawn to Peru by the civil wars, and in this he was successful, several hundred of them enlisting for the expedition. Ursua assumed the title of governor of Omagua and El Dorado; he embarked on the Moyobamba in Sept., 1560, and descended the Ueuyali to the Amazon. There a conspiracy was formed against him by LOPE DE AGUIRRE (*q. v.*) and others, and he was murdered at Machiparo, Jan. 4, 1561. H. H. S.

Ursula, SAINT: See URSULINES.

Ursulines [deriv. of *Ursula* (see below), liter., dimin. of Lat. *ur-sa*, bear]; an order of celibate women in the Roman Catholic Church, named in honor of St. Ursula, who, according to legend, suffered martyrdom in the third, fourth, or fifth century, being massacred, together with her army of virgins, by the Huns near Cologne. The order was founded by St. Angela Merici of Brescia, who in 1537 became its first superior. In 1544 Paul III. approved the order, and Gregory XIII. and Clement VIII. gave it their sanction. St. Charles Borromeo was another powerful friend of the Ursulines. They have houses in various countries, and are chiefly devoted to the training of girls.

Uruguay, Span. pron. ū-ro-ŕ-ŕ-gwī (officially, *República Oriental del Uruguay*, formerly *Cisplatine Republic* or *Estado Oriental*): the smallest of the South American republics; in the southeastern part of the continent and

entirely in the south temperate zone; bounded N. by Brazil, E. by the Atlantic and Brazil, S. by the Rio de la Plata, and W. by the Uruguay river, separating it from the Argentine Republic. Area, 72,170 sq. miles.

Physical Features.—The general surface is rolling or hilly, with many ridges crossing in different directions. In the central and northern parts some of these are over 1,500 feet high. Bordering the Uruguay there are fertile plains resembling the pampas of the Argentine, and near the Atlantic are extensive swamps and lagoons, separated from the ocean by wide sand-dunes. Most of the land is open prairie; the largest areas of forest are in the western part. Besides the Uruguay and Plata, the only important river is the Negro, which flows to the Uruguay and is navigable for small vessels in its lower course. Lake Miri, on the north-eastern frontier, is entirely included in Brazil, but furnishes an outlet to the N. for the Uruguayan territory bordering on it. Uruguay has no good natural harbors. The best is that of Montevideo, on the Plata, where elaborate improvements have been planned. Maldonado, at the extreme southeast angle of the coast, is protected only by a projecting point, but it is much used for a shelter during storms. A few rocky islands in the Plata belong to Uruguay; Flores, one of these, is the quarantine station. The climate is temperate and healthful; the winter months (May to October) are marked by a lower but not unpleasantly cold temperature, with occasional light snows and severe southerly storms called *pamperos*; rains are abundant almost all the year.

Natural Products; Industries.—Gold is washed on a small scale; there are fine marbles, much used for building at Montevideo, and agates and fossil woods are exported to Germany. Other minerals, including coal, are reported, but their richness has probably been exaggerated. The soil in many places is very fertile; wheat and fruits (apples, pears, quinces, etc.) are extensively grown, especially in the valley of the Uruguay. But the principal and almost the only prominent industry is stock-raising, for which the land is especially adapted. In 1890 there were 5,281,000 cattle, 360,000 horses, and 13,760,000 sheep, the latter rapidly increasing in numbers. Much of the land is held in large estates on which the cattle run almost wild; nearly all the small land-holdings are in the agricultural districts settled by recent immigrants. Subsidiary to the grazing industry are many *sabaderos*, where jerked beef is prepared, one or two condensed-meat factories, and a few tanneries.

Communication.—The common roads are generally bad; the ordinary vehicles are huge, squeaking, two-wheeled carts, each drawn by several yokes of oxen. Diligences, drawn by mules, are much used. In some of the more remote districts traveling is still somewhat dangerous, owing to brigands. Uruguay has now several railways, most of them radiating from Montevideo and one crossing the country to the Brazilian frontier; in 1892 the aggregate length open for traffic was 974 miles. There is a fairly good interior system of telegraphs and cable communication with Europe and the U. S.

Commerce is very active, the exports exceeding \$25,000,000 and the imports \$30,000,000 annually. Nearly all of this is carried on foreign vessels, the Uruguayan merchant marine being small. The principal exports are wool, hides, bone-ash, tallow, frozen, salted, and condensed meats, wheat, and fruits. The trade is mainly with Great Britain (about one-third), France, Belgium, and Brazil. The imports from the U. S. were valued in 1890 at \$3,210,112, but have since fallen off; the exports to that country reach about \$2,000,000 annually. The standard of value is the *peso fuerte* or dollar, equal to \$1.0352 in U. S. currency; no gold and little silver are coined, but gold coins of other countries circulate freely, their value being fixed by law. Government paper, and to a certain extent bank-notes, fluctuate in value. The metric system of weights and measures has been legalized, but the old Spanish standards are still in general use.

Population.—In 1892 this was 728,447. The native population embraces a small educated and wealthy class, but the great mass, especially in the grazing districts, is of the mixed race called *Gauchos* (*q. v.*); owing to their roving and turbulent disposition these people readily follow any revolutionary leader. For many years a steady stream of immigration, mainly from Italy, Spain, and Brazil, has added a laborious and useful class to the population. In 1890 about two-fifths of the inhabitants were of foreign birth, and they held over half of the wealth; commerce is almost entirely controlled by foreign merchants. All the culture and much of the wealth are gathered at Montevideo,

the capital and only large city. In the frequent civil wars Montevideo has generally been held by one party and the interior by the other.

Government, Religion, Education.—Uruguay is a centralized or unitarian republic, divided, for administrative purposes, into nineteen departments. Congress consists of two houses; these, in joint session, elect the president for a term of four years, and he is ineligible for re-election during the two following terms. The established religion is the Roman Catholic, but the Church receives only a small subvention, and all other sects are tolerated. Primary education is compulsory; in 1892 there were 904 public and private schools. Montevideo has a national university, school of arts and trades, museum, etc. The army, on a peace footing, consists of 3,500 men, and the navy is insignificant. On June 30, 1893, the entire internal and foreign debt, according to an official statement, was \$103,820,489. The finances are in bad condition, the revenue (mainly derived from customs duties) being constantly less than the expenditure if the service of the debt is included. By an arrangement with bondholders, made in 1892, the interest on the foreign debt was reduced one-half.

History.—Of all the South American countries Uruguay was the last settled by Europeans. This was partly owing to the fierce character of the Charruas and other Indian tribes near the coast, though the interior was inhabited by the pacific Guaranys. In 1624 the mission of Santo Domingo de Soriano was founded on the Rio Negro. Portugal claimed all the land N. of the Plata, and in 1680 established Colonia de Sacramento, a fortified post, nearly opposite Buenos Ayres; this was repeatedly besieged, and was alternately held by the Portuguese and Spanish until its final cession to the latter in 1778. Portuguese who had fortified the bay of Montevideo were driven out in 1726, and the city was founded soon after. It became the capital of the country and the residence of governors who, after 1776, were subordinate to the viceroy at Buenos Ayres; in 1807 the city was taken by the British, but it was soon evacuated. The revolution of 1810 in Buenos Ayres quickly spread to the *gauchos* of Uruguay, but a strong Spanish force held Montevideo until 1814. The country remained in a disordered state under the irresponsible government of Artigas, a *gaucho* leader. Depredations on the northern frontier gave a pretext for the interference of the Portuguese, who still claimed this region as a part of Brazil. After a desultory war of several years, Artigas was driven out and Uruguay was annexed to Brazil as the Cisplatine state (later, when Brazil became independent, the Cisplatine province). Revolts, encouraged by Buenos Ayres, broke out in 1825, and were finally successful in 1828, when both Brazil and Buenos Ayres recognized the independence of Uruguay. The political parties, *Blancos* and *Colorados*, speedily plunged the republic into fresh civil wars, alternately seizing the presidency. Rosas, dictator of Buenos Ayres from 1835, wished to extend his power into Uruguay; and Montevideo was the special object of his hatred because it sheltered the numerous fugitives from his tyranny, and, profiting by his narrow commercial policy, was rapidly absorbing the trade of the Platine region. He therefore espoused the cause of Oribe, the revolted chief of the Blancos, who, thus aided, held most of the interior from 1842 to 1851, besieging Montevideo at intervals; this period is known as the Nine Years' Siege. Brazil and Entre Rios at length interfered, Oribe was forced to capitulate in 1851, and Rosas was overthrown soon after. In 1862, the Blancos being in power, ex-President Flores led a revolt of the Colorados, and was eventually supported by Brazil, which had unsatisfied claims against the regular government. Thus aided, Flores took Montevideo and became president in 1865. Lopez, dictator of Paraguay, made this affair the pretext for a war on Brazil, in which Uruguay and the Argentine engaged as allies of the latter country. This war, one of the most bloody ever known in South America, was ended by the death of Lopez in 1870. From that year until 1876 Uruguay had several civil wars. Since then the country has been comparatively quiet and prosperous, and it is probable that the extension of railways will furnish a check to the dangerous *gaucho* class. In 1890-91 there was a sharp financial crisis.

HERBERT H. SMITH.

Uruguay: a river of South America; rises on the western slope of the Brazilian Coast Range, on the confines of Santa Catharina and Rio Grande do Sul; flows W. between those two states, then S. W. between Rio Grande do Sul and the Argentine Republic, and finally S. between Uruguay and the Argentine, and empties into the Rio de la Plata, which is the estuary of the Paraná and Uruguay combined. The upper portion is called the Pelotas, and locally the Uruguay is said to be formed by the junction of the Pelotas and Canoas. It is essentially a highland river like the São Francisco and upper Paraná; the only extensive flood-plains are on the western side near its mouth, and the river brings down comparatively little sediment. The valley is varied with hills, and contains much forest, especially in its upper portion, which is an almost unknown wilderness; lower down there are extensive grassy plains suitable for grazing, and from about lat. 29° S. there are numerous stock-farms and some considerable towns. As a means of communication the Uruguay is important, though much inferior to the Paraná. Large steamers ascend to Paysandú, in Uruguay, about 150 miles from the Plata, and small ones to Salto, 50 miles farther. At this point there is a fall, but beyond it barges are used for 300 miles, and a considerable part of the trade of Western Rio Grande do Sul takes this channel. The exports by the river are hides, cattle, meat, etc. Whole length of the Uruguay and Pelotas, over 1,100 miles. Toward the mouth the river is 7 or 8 miles wide, but divided by islands. The annual flood in September or October attains 20 and occasionally 40 feet. The principal affluents are the Ibicuy, in Rio Grande do Sul, the Quaraim or Cuareim, forming part of the boundary between Brazil and Uruguay, and the Rio Negro in the latter country.

HERBERT H. SMITH.

Uruguay: a city of Argentina. See CONCEPCION DEL URUGUAY.

Uruguayana, oo-roo-gwi-aa naã: a town of Rio Grande do Sul, Brazil; on the river Uruguay, near the southwestern angle of the state, and connected with Pelotas and Montevideo by railway. It is the center of the grazing industry of Western Rio Grande do Sul, and has an important river trade. Here, on Sept. 18, 1865, the Paraguayan invading army of 6,000 men surrendered to the allies, who were commanded by the Emperor of Brazil, President Mitre of the Argentine Republic, and President Flores of Uruguay. Pop. (1894) about 6,000, and rapidly increasing. H. H. S.

Urumia: town and lake of Persia. See URMIA.

Urumtsi: city of Central Asia, with a population estimated at 40,000; at the northern foot of the Tien Shan Mountains (see map of China, ref. 2-D). It became the capital of the Chinese Mongolian province of the same name, and in 1862 it formed the center of the Dungan rebellion. In the commerce of Central Asia, Urumtsi formerly occupied the same position as Nijni-Novgorod in that of Eastern Russia. Goods from Russia, Turkistan, Persia, and Kashmir flowed to this place, numerous merchants' offices and Chinese banks were established here, and by its well-stocked magazines Urumtsi held a perpetual fair. But the uncertainty consequent on the Dungan rebellion put an end to this traffic. Dungan, a corruption of *Tangut*, is the name of the 4,000,000 Mussulmans of Turkish-Tartarian descent who inhabit the northern provinces of China, and who on account of the enormous taxes rose in revolt in Shen-si in 1862, and pushed into Southern Mongolia, where they took Urumtsi.

Revised by M. W. HARRINGTON.

Urus [= Lat., from Teuton.; cf. O. H. Germ. *ūr*: leel. *ūr*: O. Eng. *ūr* > Eng. *oure* (obs.), aurochs; cf. also O. H. Germ. *urohsa* (*ūr*+*ohsa*, ox) > Mod. Germ. *querochs*, whence Eng. *aurochs*]: a wild ox, the *Bos primigenius*, now extinct, although mentioned by Caesar as inhabiting the forests of Germany, and, so late as the sixteenth century, an object of the chase. It was very large, with a flat forehead, and spread of horns of 4 feet or more. Judging from the remains, it was domesticated by the Swiss lake-dwellers, and the modern Scotch cattle, and possibly the CHILLINGHAM CATTLE (*q. v.*), are its direct descendants. See also the article AUROCHS.

F. A. LUCAS.

Usage: the habitual practice of a person, a class, a trade, or a community. The term is used often interchangeably with custom. Strictly speaking, however, custom is a usage which has acquired the force of law. For example, the custom of merchants allowing days of grace on a bill of exchange or promissory note has long been a part of English

common law. A custom need not be proved; judges will take judicial cognizance of it, and contracting parties can not plead ignorance of it. On the other hand, a usage must be proved by the party whose case depends upon its existence. It may be established by the evidence of one witness if his means of knowledge and his credibility are satisfactory.

A usage may be proved for the purpose of adding a term to a written contract or to give a special meaning to its language. This is allowed on the theory that the parties did not mean to express in writing the whole of their agreement, but contracted with reference to the usage in question. It is assumed that the parties knew of the usage. Hence if either of them can show that he had neither knowledge nor notice of the usage it can not affect him. Moreover, it can influence the construction of the contract only when it is, in the opinion of the court, not unreasonable, is not contrary to the positive rules of law, and is not inconsistent with the clear provisions of the contract. In other words, a usage is competent to explain or annex incidents to a contract, but not to contradict its express terms. For a full treatment of the subject, the reader is referred to Clarke's edition of *Brown's Usages and Customs*; Lawson, *Usages and Customs*.

FRANCIS M. BURDEK.

Usamba'ra: the mountainous northeastern part of German East Africa, separated from the Indian Ocean by a low coastal plain. Coffee and cotton are successfully raised in this district, and a railway is (1895) being built to connect Tanga, the chief port, with these upland plantations. The climate is fairly healthful.

C. C. A.

Useup', or Scop'ia (lookout): town; in the vilayet of Kossova, European Turkey; on the Vardar (see map of Turkey, ref. 3-B). It is on the Salonica-Mitrovitzka Railway, and is the proposed point of junction of the South Danubian railway system. Besides being the residence of the provincial governor it is the seat of a Greek archbishop. It manufactures leather and has a large transit trade. Pop. 13,000.

E. A. G.

Use: See USES.

Use and Occupation: Whenever the land or building belonging to one person is occupied by another, either under an express agreement or under such circumstances that the law will infer an agreement, but without any stipulation as to the amount of rent, the owner may recover from the tenant such compensation in the nature of rent as the occupation is reasonably worth. The action under these circumstances is said to be for the "use and occupation of the premises." The right to recover is based upon the notion that the possession was taken and held in pursuance of a contract, express or implied, and the action is brought upon the tenant's implied promise to pay. If, therefore, the entry is tortious, and the land is held adversely and not in subordination to the owner's right, no action for use and occupation can be maintained, since no promise can be inferred. The remedy of the owner in that case is an action for damages resulting from the unlawful trespass. See LANDLORD AND TENANT.

Revised by G. W. KIRCHWEY.

Usedom, oo'ze-dōm: a low, irregular, and little productive island belonging to Prussia; situated at the mouth of the Oder, between the Baltic and the Stettiner Haff; area, 157 sq. miles. On its northeastern shore is the port of Swinemünde.

Usener, HERMANN: classical scholar; b. at Weilburg, Germany, Oct. 23, 1834; studied under Ritschl at Bonn, in Heidelberg, Göttingen, and Munich; teacher at the Berlin Joachimsthaler Gymnasium in 1858; professor extraordinary at Berne in 1861; ordinary professor in Greifswald 1863, whence he was called to Bonn in 1866. Among his many famous writings are *Analecta Theophrastea* (1858); *Alexandri Aphrodisiensis Problemata* (1859); *Scholia in Lucanum* (1869); *Anecdota Holderi. Ein Beitrag zur Geschichte Roms in ostgothischer Zeit* (1877); *Legenden der heiligen Pelagia* (1879); *Altgriechischer Versbau* (1887); *Epicaura*, the standard work on the subject (1887); *Religionsgeschichtliche Untersuchungen* (1889); *Theodoros u. Kyrillos; der heilige Theodosios* (1890); *Unser Platonert* (1892); *Die Unterlage des Laertius Diogenes* (Berlin Acad. publications, 1892); and numerous penetrating treatises, published in *Rheinisches Museum*, university programmes, and elsewhere. He also edited Kayser's *Homeriche Abhandlungen* (Leipzig, 1881) and J. Bernays's *Gesammelte Werke* (2 vols., Berlin, 1885).

ALFRED GUEDEMAN.

User'tesen, or Usertsen: the name of three kings of the twelfth Egyptian dynasty, who with Amenemhat I.—IV. composed one of the most notable royal families in Egyptian history. Their period was one of great brilliancy, and its special chronology is as exactly determinable as any in Egyptian annals. It succeeds a period of anarchy and the rule of petty princes, but it gradually grew to a degree of power unequalled except under Thothmes III. of the eighteenth and Ramses II. of the nineteenth dynasty. The excellence of its artistic work was surprising, and is contrasted vividly with that of later times, particularly in the instances where its monuments were usurped by the degenerate Meneptah, of the nineteenth dynasty.

Usertesens I. (Kheper-ka-ra, the Sesonchosis of Manetho) was for ten years associated with Amenemhat I. as co-regent. It is probable that the latter came to the throne at advanced age, and that the administration of affairs, at first foreign and later domestic as well, early fell into the hands of Usertesens I. His total reign covered about forty years, and he succeeded in strengthening the strong government established previously. In his earlier years he waged war with the Libyans and with the Ethiopians. In Sinai he opened the mines that had been worked under the earlier dynasties; at Tanis he built temples and erected several statues, which have come down to us, showing great fineness of work and excellence of execution and finish; he erected a temple to Osiris at Abydos: worked the quarries of Hammamat; adorned the temple at Koptos; built a temple at Heliopolis, whose only remnant is the solitary obelisk now *in situ*. A broken obelisk at Begig in the Fayûm shows that he was also busy in this region, which was the scene of much active labor on the part of his successors. During the last two years of his reign Amenemhat II., his son, was associated with him.

Usertesens II. (Kha-kheper-ra, the Sesostriis of Manetho) succeeded Amenemhat II. and enjoyed a long reign, supposed by Petrie to have covered thirty-nine years. The entire uncertainty as to the chronology of the dynasty falls upon this reign, and the length of it is uncertain. The highest monumental record is of the tenth year, but Manetho assigns forty-eight years to him. His pyramid is that at Ithahun, at the mouth of the Fayûm. It has as a core a mass of native rock, in which the sepulchral chambers and passages were cut, and it was composed of brick with a facing of limestone. Unlike other similar structures, it has two entrances on the south side, apparently to perplex would-be robbers. But one of them was discovered by workmen of Ramses II., and the contents were then rifled. The houses of the workmen at Kahun even now cover 18 acres, and their remains were mistaken by Lepsius for the ruins of the labyrinth.

Usertesens III. (Kha-ka-u-ra, the Lachares of Manetho), the following king, built as his mausoleum the northerly brick pyramid at Dahshur, adopting a plan for the deposit of funerals different from any previous method. Subterranean passageways were excavated around the base of the structure with adjacent chambers in which the mummies were placed. The pyramid was explored by de Morgan in 1894. Usertesens III. also built temples at Tanis, Bubastis, and elsewhere in the Delta region, but he is best known on account of the expeditions which he led into Nubia. In order to facilitate transportation to the southward, he caused a canal to be constructed around the first cataract of the Nile. In his eighth year he built forts and temples at Semneh and Kummeh, 30 miles S. of the second cataract, erected several stele there, and prohibited the passage of Negroes northward except for the purpose of trade. Under him Egypt entered upon the policy of foreign conquest, which reached its climax during the eighteenth and nineteenth dynasties. His reign lasted thirty-eight years. His successor, Amenemhat III., devoted himself to internal improvements, regulated the flow of the Nile by means of dams erected to control the flow of water into and out of the Fayûm (Lake Mœris), which is supposed by some authorities to have constituted a large inland sea at that time. From the lake he reclaimed certain portions, and on them built his pyramid at Hawara and also the neighboring labyrinth.

CHARLES R. GILLET.

Uses [viâ O. Fr. from Lat. *usus*, a using, use, deriv. of *uti*, *usus*, to use]; in law, rights, recognized only in equity, to the possession and enjoyment of real estate, the legal title to which is vested in another. At an early day the English ecclesiastics, in order to avoid the Statutes of Mortmain,

which forbade them to take or hold lands in England (see **MORTMAIN**), contrived a plan whereby they might enjoy all the benefits of ownership without taking or holding the forbidden title. The land was conveyed by the donor to some person in the ordinary manner, but the conveyance was accompanied with the direction—which might be contained in the deed, or *charter*, of feoffment, or which might be a mere oral declaration of intention—that the grantee should hold the land to the use, or to the benefit (*ad usum* or *ad opus*), of a designated person or corporation. Originally the obligation and duty thus imposed upon the person to whom the land was conveyed—that he should be seized of the land, but for the benefit of another; that he should have the legal title, but that another should be allowed to enter upon and enjoy the land—was purely conscientious and could be enforced, if at all, only by the power which resided in the Church. There is no doubt that in very many cases a partial or complete deprivation of spiritual rights and privileges, and in some cases the infliction of temporal pains as well, awaited the *feoffee to uses* who was disposed to rest upon his legal rights and to ignore the intention with which the land was conveyed to him. As early as the reign of Richard II., however, the indefinite sanctions of the Church had been re-enforced by the growing jurisdiction of the chancellor, who, himself usually an ecclesiastic, was the natural custodian of the king's power to enforce even conscientious and extra-legal obligations. The courts of common law knew nothing of all this. If the chancellor chose to hold men to the performance of pious duties undertaken by them, he might do so; but nevertheless the title, the property, was effectually vested in the feoffee, who was, notwithstanding the uses, the only one possessing any legal interest. Meanwhile, however, the court of chancery enforced the trust that had been imposed on the feoffee, and regarded the beneficiary, or *cestui que use*, as the real owner, entitled to the possession, profits, and complete control of the land. This was the "use."

From this time on the practice of conveying lands to uses, even as between private and non-religious persons, grew apace. It was of the utmost convenience to all sorts and conditions of men and, even more, of women. Not only the religious houses, but also married women and aliens—who were equally incapacitated from holding lands at common law—might be the beneficiaries of uses. Moreover, being utterly unknown to the common law, not being an estate or interest in lands, the use was of course entirely free from the vexatious and burdensome incidents and restraints of tenure as it existed at common law. It could be devised by will, and conveyed without any public delivery of possession (*livery of seisin*), while it would yet descend to the heir, if not otherwise disposed of, just as the legal title descended at common law. The *cestui que use* was not, under the feudal régime, liable to perform the service of military duty, nor could he be called upon for "aids" or "reliefs," nor was he subject to the feudal exactions of "wardship" or "marriage." (See **TENURE**.) It is therefore not to be wondered at that the system of conveying lands to be held "to uses" became exceedingly prevalent, nor, on the other hand, that it was in the highest degree obnoxious to the king and the other great landowners. Several ineffectual attempts were made by Parliament to remedy this anomalous and, as it was considered, mischievous state of affairs, and these attempts finally culminated in that drastic effort of legislation, the Statute of Uses, passed in the twenty-seventh year of Henry VIII. (A. D. 1535). This celebrated enactment provided, in substance, that whenever lands should be conveyed in fee to one person for the use or benefit of another, the complete title, legal and equitable, should at once vest in the latter, free from any use, and that no interest whatever should attach to the former. "The object of the statute was, by joining the possession or seisin to the use and interest (or, in other words, by providing that all the estate which would by the common law have passed to the grantee to uses should instantly be taken out of him and vested in *cestui que use*), to annihilate altogether the distinction between the legal and beneficial ownership, to make the ostensible tenant in every case also the legal tenant, liable to his lord for feudal dues and services, etc." But so far as this, its main object, was concerned, the statute was almost a complete failure. It did not have the effect of abolishing uses; it did not, except to a very limited extent, restore to the lord his feudal dues. Partly in consequence of the looseness with which the statute was drawn, partly as a result of a long and ingenious

process of judicial construction of its terms, the courts of equity were not long in reviving the system of uses under the name of "trusts." In that form and under that designation this system has continued with great vigor and success to the present day, when it is the chief ornament of the equity tribunals. See TRUSTS.

The statute, however, in so far as it was allowed to operate, had another and wholly unanticipated effect. By virtue of the fact that the practice of conveying lands to uses continued unabated, and the further fact that the statute "executed" certain of these uses, i. e. converted them into legal estates, the courts of common law at once acquired jurisdiction over a vast number of new interests in land. This species of legal estate, being created "by way of use," was allowed by the common-law tribunals to retain in large measure the form and character which had been impressed upon it in equity before it had acquired legal recognition. The equity tribunals had recognized uses which bore no analogy to estates as they existed at common law and which were, indeed, repugnant to the common-law system. Thus it was an inflexible rule of that system that no future estate could arise, or be "limited," except as a "remainder" or "reversion," and it was a characteristic of these estates that the remainder or reversion must be immediately consequent upon some prior estate less than a fee simple. Thus a limitation to A for life, with remainder to B after the death of A, would be good; but a limitation of a future interest to B, to take effect a year or even a day after A's death, would be bad as a remainder. But there was no reason why the court of chancery should not enforce a use to arise at any time in the future, whether it was supported by a precedent use or not. Hence arose those varieties of future interests known as "springing" and "shifting uses," and when the courts of common law took jurisdiction of executed uses under the statute, they preserved these new and useful forms of estates under those names, and added them permanently to the older body of common-law limitations. It was in this indirect and unintended way that the English law of real property was revolutionized and brought into conformity with modern conditions. The new methods of conveyancing introduced by virtue of this transformation persisted for three hundred years, until abolished by statute in England and the U. S. See BARGAIN AND SALE.

Uses, under that name and as a separate system, no longer exist, all conveyances "by way of use" being referred either to the jurisdiction of equity as trusts or to the common-law limitations of real property, as above described. The whole system as thus developed and altered, together with the Statute of Uses, forms a part of the jurisprudence of the U. S., except in a few jurisdictions where it has been expressly abolished by statute.

The learning of uses is somewhat refined and abstruse, and has engaged the attention of many of the ablest minds at the English bar. Perhaps the most elaborate treatises are those of Sir Francis Bacon (*Reading upon the Statute of Uses*) and Lord Chief Baron Gilbert (*Law of Uses and Trusts*). The various authoritative works on real property and conveyancing contain satisfactory statements of the system and its influence upon the law of property. The best modern authorities for that purpose are Leake, *Digest of the Law of Property in Land*, and Digby, *History of the Law of Real Property*. The older treatises of Littleton, Coke, Blackstone, Lord St. Leonard (*Handy Book of Property Law*) and Preston (on *Conveyancing* and on *Estates*) should also be consulted. The *History of English Law* by Pollock and Maitland contains a valuable note (vol. ii., pp. 224, 231) on the origin of uses. GEORGE W. KIRCHWEY.

Uses, Charitable: See CHARITABLE USES.

Ush'ant (Fr. *Ouessant*): the largest of a group of islands of the same name, off the coast of Brittany, France; belonging to the department of Finisterre. Area, 20 sq. miles. It is fertile, and has about 2,300 inhabitants, engaged in the rearing of cattle and in fisheries.

Ussher, or Usher, JAMES, D. D.: archbishop; b. in Dublin, Ireland, Jan. 4, 1580, or 1581; educated at Trinity College, Dublin, where he became a fellow 1600; took orders in the Church of England 1601; became chancellor of the Cathedral of St. Patrick about 1604; was Professor of Divinity at the University of Dublin 1607-20; drew up the Articles of Faith of the Irish Church 1615; became Bishop of Meath 1620, Archbishop of Armagh and Primate of Ireland 1624-25; had his house destroyed by the Irish rebels 1641, while visiting England, in which country he thenceforth remained;

was given by Charles I. the temporalities of the vacant see of Carlisle, which made him practically the bishop, and as such he acted, and was preacher of Lincoln's Inn, London, 1647-54, residing chiefly at Oxford. D. at Reigate, Surrey, England, Mar. 21, 1656, and by order of Cromwell was buried with great magnificence in Westminster Abbey. He was the author of numerous theological treatises, mostly in Latin, of which a complete edition was published by the University of Dublin (17 vols., 1847-64), with a *Life* by Rev. C. R. Elrington. His *Annals Veteris et Novi Testamenti* (2 vols., 1650-54) contains a scheme of biblical chronology, since printed in the margin of the Authorized Version of the Bible and generally adopted by English and continental historians, though now admitted to be inexact. Another *Life*, with that of John Selden, was written by Dr. John Aikin (1811). His library now belongs to Trinity College, Dublin. He was a learned antiquarian, and the Epistles of Polycarp and Ignatius were first published by him. He was twice elected by the Long Parliament to the Westminster Assembly of Divines, but from loyalty to the king did not attend. He prepared the Irish Articles of Religion (1645), and proposed a system of reduced episcopacy as a compromise between Episcopals and Presbyterians.

Revised by S. M. JACKSON.

Ustilagin'æ: See SMUTS.

Usufruct: See SERVITUDES.

Usumaciu'ta: a river of Guatemala and Mexico; formed by the union of several branches which drain the northwestern half of the former country; flowing with a general northwesterly but very crooked course, and joining, in Tabasco, the Grijalva, through which it reaches the Gulf of Mexico. Length about 400 miles. The lower part is navigable, and is connected by channels with the Bay of Campeche and the Laguna de Terminos. By the treaty of 1882 the upper Usumacinta, with its principal head, was agreed upon as part of the boundary between Mexico and Guatemala. After a survey, Guatemala claimed that the Salinas was the head; Mexico claimed that this was the Río de la Pasión, which would extend her territory at one point so far E. as nearly to cut Guatemala in two. This question nearly led to a war in the early part of 1895. The disputed territory is mainly covered with forest. H. H. S.

Usury [*usury* is from O. Fr. *usure* < Lat. *usu'ra*, use, usury, interest, deriv. of *uti, usus*, use]: "When money is lent on a contract to receive not only the principal sum again, but also an increase by way of compensation for the use," the increase "is called interest by those who think it lawful, and usury by those who do not so." (Blackstone's *Commentaries*, 2, 454.) The term is now applied to the taking of an illegal rate of interest. For the early English statutes on this subject, see the article on INTEREST. Its economic bearings are considered in the article on POLITICAL ECONOMY, under the heading *Government Interference with Industry*. All usury laws in England were repealed in 1854, and the example has been followed to some extent in the U. S. Most of the States, however, prescribe a lawful rate of interest, and subject the taker of any excess to punishment as a criminal, as well as to the forfeiture of a part or the whole of the principal and lawful interest. In order to have a case of usury there must be a loan or forbearance of money. Hence one who buys negotiable instruments, bonds, or mortgages, or other choses in actions for less than their face value does not engage in a usurious transaction. (*Cram vs. Hendricks*, 7 Wendell (N. Y.) 569.) In many jurisdictions, however, it is held that the buyer of accommodation paper is a mere lender of money, and hence if he pays less than the face and legal discount the transaction is usurious. This doctrine is based on the view that the paper has no legal inception when delivered by the accommodating to the accommodated party, but takes its inception from its delivery to the buyer. (*Claffin vs. Boorum*, 122 N. Y. 385.) Corrupt intention is essential to usury. From this it follows, on the one hand, that whatever may be the form of the transaction, however cunning may be the devices for evading the statute, if the parties have in effect bargained for the loan or forbearance of money at a prohibited rate of interest, the transaction is under astutery ban; on the other hand, if an illegal rate of interest is agreed upon or paid by mutual mistake, the statute is not violated, but the mistake may be corrected and the agreement really intended by the parties enforced. A valuable compilation of the modern statutes upon this subject is contained in Perley's *Law of Interest* (Boston, 1893).

FRANCIS M. BURDICK.

Utah: one of the States of the U. S. of North America (Western group); the thirty-second admitted to the Union. Capital, Salt Lake City.

Location and Area.—It extends from lat. 37° to 42° N., and from lon. 32° to 37° W. from Washington; is bounded

Territorial seal of Utah.

N. by Idaho and Wyoming, E. by Wyoming and Colorado, S. by Arizona, and W. by Nevada. Greatest length, about 350 miles; greatest width, nearly 300 miles. Area, according to the U. S. census 1890, 84,970 sq. miles (54,380,800 acres), of which 2,780 sq. miles are water surface; or, according to the U. S. Surveyor-General for Utah, 84,476 sq. miles.

Physical Features.—Utah is traversed N. and S. by one great range of mountains, the Wasatch, and there are several minor ranges, as the Deep Creek, Oquirrh, and San Francisco in the west, and the Roan or Book, the La Salle, the Sierra Abajo, and the Orejas del Oso in the east and southeast, all extending in the same general direction. There is also one great transverse range running E. from the Wasatch to the Rocky Mountains, along the northeast boundary. E. of the Wasatch Range the water flows into the Du Chesne, Green, Uinta, Price, Grand, White, Dirty Devil, San Juan, and San Rafael rivers, reaching the Pacific Ocean through the Colorado river and Gulf of California. W. of the Wasatch Mountains the waters, for the most part, flow into the Great Salt Lake, though there are several fresh-water lakes and "sinks" S. of the Salt Lake valley which receive the flows from the mountain rivers and streams. The Wasatch and Uinta Mountains are high and rocky, broken and furrowed into cañons and deep gorges. Some of their peaks reach an elevation of 14,000 feet. The other ranges are lower and less rugged. The only rivers of importance within Utah are the Green and the Grand, forming the Colorado. The others are little more than mountain streams, some of them of considerable volume in the spring and early summer, but receding or disappearing entirely later in the season. The rivers named have formed deep cañons or ravines, ranging in depth from 500 to 4,000 feet, the stream at many places being inaccessible. E. of the Wasatch Range the country is broken and rough, consisting of mountain spurs, high plateaus, and arid mesas, the soil being hard and clayey and generally weak. W. of the Wasatch there is a succession of valleys, extending N. and S. These vary in length from 1 to 40 miles, and in width from 1 to 15 or 18 miles. The valleys and mesas range in elevation from 4,000 to 7,000 feet. W. of the GREAT SALT LAKE (*q. v.*) is a vast alkaline desert, 100 miles in length and 40 miles in width. The chief fresh-water lakes are Bear Lake, 18 by 8 miles, in the extreme northeast corner; Utah Lake, 24 by 10 miles, in the central part; and Sevier Lake, 25 by 5 miles, in the southwest.

Soil and Productions.—In the main the soil is arid and much of it alkaline, some sections being so strongly impregnated with the salts as to render its reclamation impracticable. The soil of the valleys is sedimentary, gravelly, clayey, and sandy; that of the mesas is generally hard clay or rocky. However, the land is not, as a rule, difficult of reclamation where water for irrigation can be obtained, and with sufficient water the soil is extremely fertile. Agriculture is entirely dependent upon artificial irrigation, the rainfall being so slight and uncertain as to put reliance on it out of question. Weeks and sometimes months pass with-

out a shower. In the valleys rain is infrequent and light from May until October. The result has been the development of an extensive system of reservoirs, canals, and ditches for irrigation purposes. The chief agricultural products are wheat, oats, barley, Indian corn, peas and potatoes, beets, and carrots; of fruits, there are apples, peaches, plums, apricots, cherries, grapes, etc. Vast quantities of dried fruits are regularly shipped to the East. Though the mountains and more elevated valleys are not susceptible of cultivation, they produce succulent grasses, thus providing excellent ranges for live stock in summer, and in the southern part good ranges also in winter.

The State census report of 1895 shows that in 1894 (there were in Utah 19,816 farms with 467,162 acres under cultivation (of which 89.36 per cent. was irrigated), and 294,725 acres under pasture and fenced. The number of laborers employed on these farms was 5,960, and the wages paid them amounted to \$1,015,366.

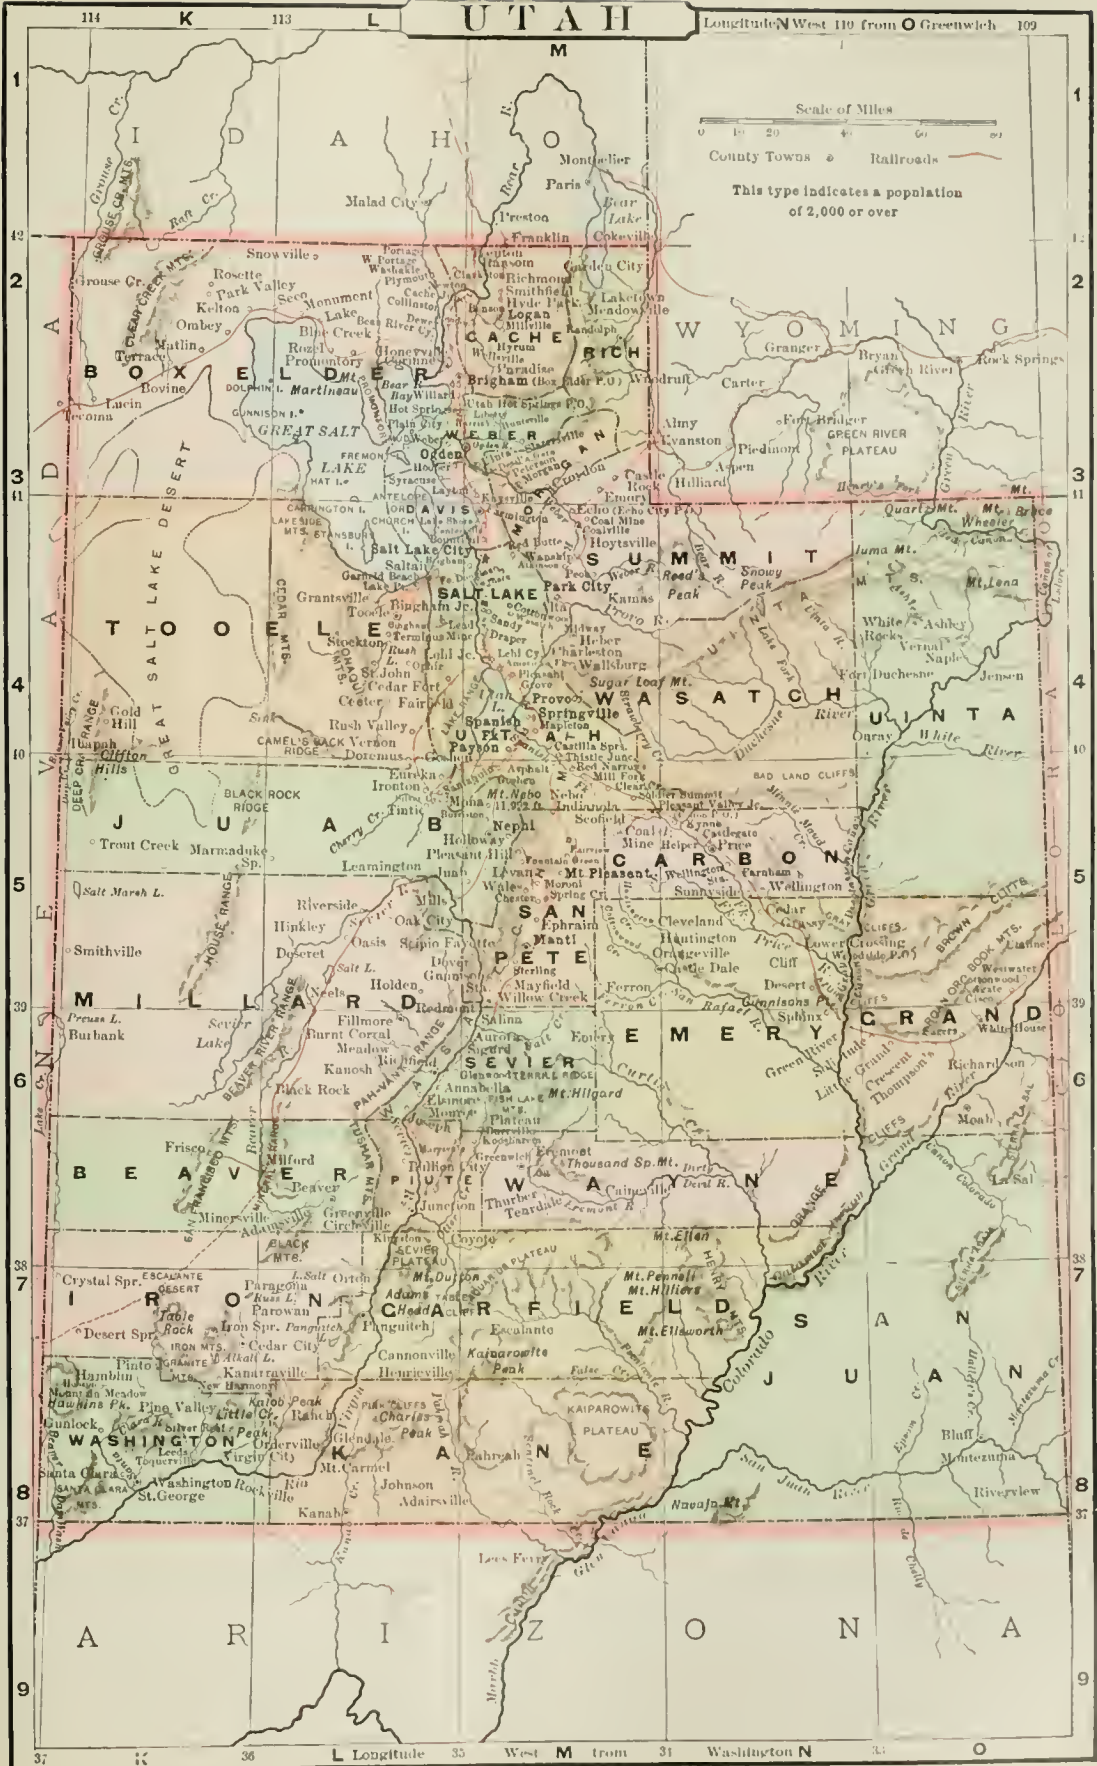

The following table from the State census of 1895 shows the acreage, yield, and value of the principal crops for the year 1894:

CROPS, ETC.	Acreage.	Yield.	Value.
Wheat.....	144,717	3,113,073 bush.	\$1,440,096
Corn.....	13,893	260,697 "	151,433
Oats.....	49,334	1,387,710 "	470,658
Barley.....	8,754	271,866 "	100,207
Rye.....	3,791	42,352 "	20,094
Lucerne.....	163,544	462,459 tons	1,851,639
Hay.....	89,255	133,646 "	604,399
Potatoes.....	13,526	1,649,239 bush.	522,855
Beets.....	3,056	38,015 tons	166,714
Other products.....	4,801	10,506 "	177,792
Apples.....	4,543	377,935 bush.	146,761
Pears.....	524	27,261 "	18,832
Peaches.....	1,086	154,772 "	82,107
Plums.....	754	36,814 "	19,845
Apricots.....	351	21,234 "	10,272
Small fruits.....	747	618,317 lb.	12,777
Grapes.....	1,046,768 "

The live stock consisted of 60,595 milch cows; other cattle, 238,974; swine (over six months old), 47,703; sheep, 2,422,802; goats, 2,966; horses, 99,895; mules, 1,308; and asses, 835.

Minerals.—Next to agriculture the chief industry is mining. Gold, silver, lead, copper, iron, and zinc ores exist in large quantities and in various parts of Utah, and extensive measures of coal are found in Summit and Uinta Counties in the northeast, Sanpete, Carbon, Sevier, and Emery Counties in the central and eastern sections, and in Iron County in the south. The most extensive ledges of iron are in Iron County, though both hematite and magnetic ores exist in other districts. Silver is found in very nearly all the mountains from one end of Utah to the other. The principal gold deposits, whether in placer or in quartz, are in the Oquirrh Mountains, S. W. of Salt Lake City; in the Tintic Mountains, Juab County; in the Camp Floyd district of Tooele County; and along the Green and Colorado rivers. The chief silver-lead mining districts are Park City, Summit County; Tintic, Dugway, and Fish Springs, Juab County; Ophir and Deep creek, Tooele County; Big and Little Cottonwood, Salt Lake County; San Francisco, Beaver County; and Ohio, Piute County. A superior quality of onyx has been found on the west shore of Utah Lake. In addition to the minerals named there are extensive beds of sulphur in Beaver County, alum, borax, gypsum, rock-salt, and asphaltum, the last-mentioned being used largely for paving streets in Salt Lake City. It is also being shipped to Eastern cities. The following is a summary of the mineral production in 1894: Gold, 56,427 fine oz., value \$1,128,540; silver, 6,659,798 oz., value \$4,193,674; unrefined lead, 55,551,663 lb., value \$888,826; refined lead, 202,500 lb., value \$62,977; and copper, 1,066,160 lb., value \$53,308. Computing the gold and silver at their mint value, and the other metals at their value at the seaboard, shows the total metallic product to have been equal to \$11,631,402. Of GILSONITE or asphaltum (not reported in 1894) 3,200 tons, value \$90,000, were mined; salt, 108,570 barrels, value \$30,075; and sandstone to the value of \$136,462.

Climate.—The climate is mild and equable in the valleys, but extremely cold in the winter in the mountains. In the south the snowfall is light. In the northern and middle sections snows come in November and continue until March, or even later, though the depth is seldom great, except in the mountains, where snow is perpetual. The temperature rarely reaches zero in the valleys, and seldom goes above 95°.

The accompanying table shows the mean temperature and the rainfall at the station of the Utah Weather Service, Salt Lake City, during 1894:

MONTHS.	Mean temperature.	Precipitation.	MONTHS.	Mean temperature.	Precipitation.
January.....	29° F.	1.31 in.	July.....	75 F.	.82 in.
February.....	26	.83	August.....	75	.87
March.....	41	1.73	September.....	61	2.87
April.....	48	1.67	October.....	53	1.01
May.....	61	1.22	November.....	46	.28
June.....	64	1.38	December.....	31	1.28

Divisions.—For administrative purposes Utah is divided into twenty-seven counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTIES.	*Ref.	Pop. 1890.	Pop. 1895.	COUNTY-TOWNS.	Pop. 1895.
Beaver.....	7-K	3,340	3,791	Beaver.....	2,043

* Reference for location of counties, see map of Utah.
 † Organized since 1890.

Principal Cities and Towns, with Population for 1895.—Salt Lake City, 48,076; Ogden, 15,828; Provo City, 5,992; Logan, 5,756; Park City, 4,491; Springville, 3,168; Mt. Pleasant, 2,481; Spanish Fork, 3,157; Brigham, 2,722; Payson, 2,135; and Nephi, 2,515.

Population and Races.—In 1850, 11,380; 1860, 40,273; 1870, 86,786; 1880, 143,963; 1890, 207,905; 1895, 247,321—of whom 194,825 were native born, 52,499 foreign born, 126,803 males, 120,521 females, 245,985 whites, 571 colored, and 768 Chinese.

Industries and Business Interests.—Manufactures were early stimulated by the necessities of the people, owing to the distance from manufacturing centers and the cost of transporting goods by ox and horse teams from the Missouri river. Before the advent of railways woolen and cotton mills, tanneries, foundries, and machine-shops had been established and were in successful operation, and most of these industries have been developed since in greater or less degree. The State census of 1895 shows that during 1894 880 manufacturing establishments were in operation. The aggregate capital was \$5,476,246; 5,054 persons were employed, to whom \$2,027,118 was paid in wages. The establishments used materials that cost \$2,640,038, and turned out goods valued at \$6,678,118. There is an extensive woolen-mill at Provo City, another at Salt Lake City, one at Beaver, and a fourth at Brigham. A large beet-sugar factory is in successful operation at Lehi. There are numerous silver-lead smelters and gold and silver reduction-mills in the Salt Lake valley and in the mining districts, most of the gold, silver, and lead ores produced in Utah being reduced at home. At Salt Lake City is a copper reduction and manufacturing plant which cost over \$500,000, and near the city are extensive lead-refining and pipe works.

Finance.—The revenue from the territorial and school tax in 1893 was \$575,574, and the estimated true value of taxable property \$115,114,842. The assessed valuations in 1894 were: Real property, \$49,131,679; improvements, \$19,819,969; personal property, \$18,780,242; and railways, telegraphs, and telephones, \$11,771,352, making a total of \$99,503,242.

Banking.—At the end of the fiscal year 1893-94 there were 39 banking institutions of all kinds, with aggregate capital of \$5,011,800, and deposits, \$9,266,569. There were also 6 building and loan associations, with 3,672 shareholders and 43,054 shares in force.

Post-offices and Periodicals.—In Jan., 1895, there were 296 post-offices, of which 7 were presidential (1 first-class, 1 second-class, 5 third-class) and 289 fourth-class; 78 were money-order offices, and 3 were limited money-order offices. The newspapers and periodicals (1894) comprised 10 daily, 7 semi-weekly, 34 weekly, 5 semi-monthly, and 8 monthly publications—total, 64.

Means of Communication.—The northern and middle divisions are well supplied with railways. The Union and Central Pacific cross Utah from east to west; the Rio Grande Western, connecting with the Colorado system of roads on the eastern border, extends to Ogden; the Union Pacific operates a north and south line from Frisco, 236 miles S. of Salt Lake City, into Idaho, Montana, and Oregon; and there are short lines running from Salt Lake City and the trunk roads into the mining districts, as the Utah Central to Park City, 31 miles; the Echo and Park City, 28 miles; the Tintic mining-district branches of the Union Pacific and Rio Grande Western, the Sanpete valley, and the Sevier valley branches. In 1894 the mileage of railways of 4 ft. 8½ in. gauge was 1,207; of 3-foot gauge, 140; total mileage, 1,347. There were also 72 miles of street-railway, principally in Salt Lake City, Ogden, and Provo City.

Churches.—The majority of the people are Mormons, or Latter-day Saints, as they call themselves. They own numerous and many of them large, costly, and imposing church edifices, called temples, tabernacles, stake-houses, chapels, and meeting-houses. The temples, of which there are four magnificent structures, viz., at Salt Lake City, Logan, Manti, and St. George, are not used for public services, but in them are performed the secret rites of the church. None but members are permitted to enter these buildings. The tabernacles and other church buildings number about 200, with a seating capacity of 75,000, and are for public worship. Among the other denominations which have organizations in Utah, most of them having church edifices and resident ministers in the cities, are the Advent, Baptist, Roman Catholic, Christian, Christian Scientist, Congregational, Disciples of Christ, Jewish, Lutherans, Methodist Episcopal, African Methodist, Presbyterian, Protestant Episcopal, Salvation Army, and Spiritualist.

Schools.—Utah has an excellent system of free schools, supported by general and local taxation, and good schools are maintained for nine or ten months of the year. Besides the public schools there are many mission and private schools, the former maintained by the evangelical churches. The University of Utah, at Salt Lake City, is supported by direct appropriation from the State treasury, and the Agricultural College at Logan is supported in part by the State and in part by the U. S. Both are free in the matter of tuition. The general school taxes amount to about \$360,000 per annum, and in addition to this are the sums raised from special levies in the districts.

Libraries.—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Utah had 9 libraries, containing 37,993 bound volumes and 5,473 pamphlets. The libraries were classified as follows: General, 6; school, 2; society, 1.

Charitable, Reformatory, and Penal Institutions.—The penitentiary at Salt Lake City belongs to the U. S., and is maintained and controlled by the Federal authority. There is a reform school for youth at Ogden, and an asylum for the insane at Provo. With the exception of a few of the sparsely settled, each county has a jail. Salt Lake, Weber, Cache, and Utah Counties have each a house and farm for the indigent.

Political Organization.—The government of the State is that provided in the constitutional convention held at Salt Lake, May 4-6, 1895, ratified by the people at the general election, and approved by the President of the U. S. in his proclamation admitting Utah to the Union Jan. 4, 1896. The legislative branch consists of a Senate of eighteen members and a House of Representatives of forty-five members, both chosen for two years, and holding sessions biennially. They are all chosen by popular vote, men and women over twenty-one years of age having equal electoral rights. The Governor, Secretary of State, State Treasurer, Attorney-General, and Superintendent of Public Instruction are elected for four years and must reside at the seat of government

during their term of office. As compensation the Governor and Secretary of State each receive \$2,000 per annum, the State Auditor, the Attorney-General, and the Superintendent of Public Instruction \$1,500, and the State Treasurer \$1,000. The judicial power of the State is vested in the Senate, a Supreme Court of three members, each of whom receives \$3,000 per annum, seven district courts, and justices of the peace. Education is free and unsectarian and open to all the children of the State. Polygamous or plural marriages are prohibited, but absolute freedom of conscience is guaranteed. The public debt must not exceed \$200,000 over and above the territorial indebtedness assumed by the State.

History.—Utah was settled by the Mormons in 1847, when it was Mexican territory. Owing to the impossibility of living at peace in Missouri and Illinois, Brigham Young, the president of the church, led his people W. into the wilderness, the first band, numbering 143, arriving in the Salt Lake valley July 24, 1847. Since then Utah has been the gathering-place and headquarters of the Mormon people. For two years there was no secular government. In 1849 a constitution was formulated and the provisional government of the state of Deseret went into operation with a full quota of state officials. In 1850 Utah was organized into a Territory of the U. S., but the new government did not go into effect until the following year. An unfortunate incident in the history of Utah was the Mountain Meadow massacre, in which 120 men, women, and children were murdered by a band of Indians under Mormon leadership Sept. 15, 1857. A party of emigrants, numbering about 140, were passing through Utah on their way to California when they were suddenly attacked at Mountain Meadow in the northern part of Washington County. Though taken completely by surprise they kept their assailants at bay for five days, but were induced by two of the Mormons, John D. Lee and Isaac Haight, to lay down their arms and return to the East on the understanding that their lives would be spared. Guided by Lee and Haight the emigrants started on their return journey, but the attack was renewed from an ambush, and all but seventeen were killed. For many years the crime was charged to the Indians, but the complicity of the Mormons was brought to light in 1874, and an investigation was ordered by the U. S. Government. Lee was arrested and tried for the offense in 1875, and on Mar. 23, 1877, was executed at the place where the massacre was committed. In 1857 the U. S. Government sent an army into Utah, it being alleged that the Mormon leaders were assuming and exercising power and authority unlawfully, and interfering with the administration of justice by the Federal courts. The Mormon militia was mobilized, and, opposing the army on the eastern border, prevented the troops from reaching Salt Lake valley until the spring of 1858. There was no actual collision between the opposing forces, but the militia burned some Government supply-trains, and so hampered and annoyed the troops as to prevent an advance beyond Fort Bridger on the eastern border. In 1862 Congress passed a bill to punish those guilty of polygamy, yet for years thereafter little effort was made to enforce the law. In 1882 another and more drastic act was passed against the practice, which had been continued openly until that time, and in 1887 Congress passed a bill greatly restricting suffrage and escheating most of the vast property of the Mormon church, including both real estate and personalty. The act of 1882 was the work of Senator George F. Edmunds, and was upheld by the Supreme Court in decisions that were rendered in 1884 in a series of five cases. From 1885 to 1890 there was persistent warfare against the polygamists in the courts, and in Oct., 1890, after more than 1,100 of their men had served terms in the penitentiary, the people voted in general conference to sustain the proclamation or "manifesto" issued a month previously by their president, discontinuing the practice of polygamy.

BYRON GROO.

Utah Lake: the largest body of fresh water in Utah; N. lat. 40° 15', W. lon. (from Greenwich) 111° 45'. Its altitude above the sea is 4,500 feet; its length from N. to S. is 25 miles; its extreme width 13 miles; its area 150 sq. miles. The valley in which it lies is part of a great trough formed by the uplift of the Wasatch range of mountains at the E. and the Oquirrh, Lake, and Tintic ranges at the W. The eastern range is the loftier, and all the tributaries of the lake come from that side. Corn creek, Hobbie creek, and the American Fork rise in the Wasatch Mountains, but the Spanish Fork and Provo river head to the E. of the range, and pass through it in deep defiles. Its outlet is the river JORDAN (*q. v.*). The water contains .00030 of mineral matter, of which .00018 is calcium sulphate. G. K. G.

Ute Indians: See SHOSHONEAN INDIANS.

Uterine Diseases [*uterine* is from Lat. *uterus*, womb]: diseases of the womb or uterus (including also the derangements of its various appendages); the so-called "female diseases." Diseases of this kind are comparatively infrequent in the women of aboriginal and savage tribes, and in civilized races among the women of rural districts who labor, are much in the open air, and are free from artificial and debilitating habits of dress and living. The predisposing causes of a majority of all uterine diseases are the constant recurrence of the menstrual periods during the greater part of adult life, the complications and sequelæ of child-bearing, and the intimate nervous and vascular sympathy which connects the uterus with every other part of a woman's organism. The uterus itself is subject to congestion and to inflammation from many causes, as suppressed menstruation, catching colds, falls, blows upon the abdomen. Congestion and inflammation are indicated by a sense of fullness, weight, warmth, and pain, with tenderness on pressure in the lower part of the abdomen, especially in standing or walking. The disease may be limited to the inner mucous membrane, to the body of the organ, or the exterior investing loose tissue, or rarely it may involve all. The term metritis denotes inflammation of the body proper of the organ, endo-metritis of the mucous interior, perimetritis of the surrounding tissues. This tissue, when extensively inflamed, is often infiltrated with new plastic matter, the product of the vascular engorgement, and this, becoming set, fixes the uterus for a time, so that it is rigid and immovable—a condition termed pelvic peritonitis. This loose tissue is occasionally the seat of profuse hamorrhage from a ruptured vessel, as in lifting, jumping, or falling. The effused blood gravitates in the pelvis, and the blood-tumor, termed pelvic hamatocele, often presents in the vagina.

The normal uterus is a symmetrical organ, with a straight axis, and the cavity of its body and neck slightly open; its normal position is that of slight anteversion, or upright and from above inclining slightly backward. But attacks of congestion and inflammation change its shape, size, symmetry, and position. Thus, either from external pressure or adhesions, or from softening or thickening of its own walls, it may be drawn down, backward, forward, or to either side; the organ as a whole may be tilted, giving rise to version, or the body may be bent on the neck, a condition termed flexion. According to the direction which the displacement or deformity of the uterus takes, it is called anteversion, retroversion, right and left lateral version, and ante flexion, retroflexion, and right and left lateral flexion. Flexions of the uterus are a common cause of dysmenorrhœa, or difficult and painful menstruation, since by the bending of the uterus its canal is bent and constricted, and the free escape of menstrual blood is prevented; this flexion of the uterine canal is also a cause of sterility, since seminal elements can not enter the organ and produce conception. Whenever the uterus is enlarged, as by congestion or inflammation, is the seat of a polypus or tumor, or is pressed down by growths in the cavity of the abdomen, and also whenever in debilitated persons its ligaments and outside supports are weakened and relaxed, it tends to gravitate below its natural position in the pelvis, and even to project from the body. This falling of the womb is termed prolapse, and, when extreme, procidentia. The lower end of the uterus, the neck or cervix, is often ulcerated as the result of congestion, inflammation, contact of its end with the floor of the pelvis, and the irritation of the acrid mucus discharged in endo-metritis. Tumors may develop within the cavity of the uterus, in the substance of its walls, or upon its outer surface, either beneath its serous coverings or loosely attached by pedicles. The uterus is often the seat of cancer, especially at the "change of life." The

ovaries are subject to congestion, inflammation, hemorrhage, and intense neuralgia. The fibrous framework of these organs may increase and develop fibrous tumors; but especially frequent and important are ovarian cysts. The ovisea becomes distended with fluid in order to rupture and eject the ovule; it is then filled by the serum of the coagulated blood from the hemorrhage consequent upon the rupture. The ovisea is liable to fill, and by a process of vascular activity and growth in its wall become a cyst of greater or less size; cysts may be present of small size and in numbers, never attracting attention, or reversely, grow either by secretion or dropsical transudation to contain 10, 20, 60, or more pounds of serous fluid. Such ovarian cysts may be single sacs, or be divided by partitions into compartments. The latter are more common, the single-celled cysts springing rather from the parovarium, a remnant of fetal life. The vagina is frequently the seat of catarrhal inflammations, causing a discharge termed *LEUCORRŒA* (*q. v.*). It may also be acutely inflamed (vaginitis), or it may be the seat of ulcers, and also of spasm, with or without pain, a condition termed vaginismus. This passage is, very exceptionally, anatomically defective, being wholly or partially wanting or constricted. The most common of all uterine diseases are merely functional derangements or irregularities of menstruation. By amenorrhœa is understood absence of menstruation; dysmenorrhœa is characterized by pain, sickness, and deficient flow at the period; and menorrhœgia is a prolonged and excessive menstrual flow, or persistent loss of blood from the uterus, as when cancer or polypus exists. In the treatment and cure of uterine diseases correct diagnosis is essential at the outset. Most of them are benefited by use of general tonics, by rest, corrected habits, and by supporting the abdominal viscera; but many are not even alleviated by these general measures. Physical exploration, both manual and by aid of the speculum, will often reveal an unsuspected disease, and point to the special topical treatment or surgical procedure which is the essential means of cure.

Revised by WILLIAM PEPPER.

U'tica: an ancient city of Africa; on the river Bagradas, near its entrance into the Mediterranean, occupying the site of the modern village of Duar. When Carthage was taken and destroyed by the Romans, Utica rose in importance and became the capital of the Roman province. The remains of its temples, amphitheater, and aqueduct show that it must have been a magnificent place. In the latter part of the seventh century it was taken and destroyed by the Arabs.

Utica: city; capital of Oneida co., N. Y.; on the Mohawk river, the Erie Canal, and the Del., Lack, and W., the N. Y. Cent. and Hud. R., the N. Y., Ont. and W., the Rome, Water, and Ogdens, the Utica, Ch. and Susquehanna Val., and the W. Shore railways; 53 miles E. of Syracuse, and 96 miles W. of Albany (for location, see map of New York, ref. 4-H). It is built on the slope of a hill, about 500 feet above sea-level, and has 13 public squares and parks with fountains and other adornments. The surrounding country is devoted principally to dairying. General agriculture and the cultivation of roses are carried on extensively. The city is the chief cheese-market in Central New York. Water is supplied by a private corporation having a capital of \$500,000. There are 74 miles of mains and a reservoir with a daily capacity of 4,000,000 gal. Utica is lighted by gas and electricity, and has a system of electric street-railway with over 25 miles of track. The public buildings include a U. S. Government building, city-hall, a State armory, public library, and Y. M. C. A. building. Forest Hill Cemetery is a place of much artistic beauty.

Churches, Schools, and Charities.—There are 47 churches, divided denominationally as follows: Protestant Episcopal, 7; Presbyterian, 6; Roman Catholic, 6; Methodist Episcopal, 5; Evangelical Lutheran (German), 5; Baptist, 4; Welsh, 3; Evangelical Lutheran (English), 2; Congregational, 2; Moravian, 2; Universalist, 2; Jewish, 2; and Reformed, 1. The total estimated value of church property is \$1,562,500, and the total church membership is 28,135. The public schools have an enrollment of 7,705 pupils, and in 1894 cost for maintenance \$124,047. There are 22 ward schools, a training-school with a normal department, and an academy for higher education. Of private schools there are 14, at the head of which is Mrs. Piatt's female seminary. The charitable institutions number 16, and include the State, City, St. Luke's, Homœopathic, and Paxton hospitals, Home for the Homeless, Home for the Aged, Utica Orphan Asylum, St. Vincent's Protectory, and a Masonic Home. The

benevolent institutions have real estate valued at over \$1,500,000. Utica is known as the "City of Charities."

Business Interests.—The census returns of 1890 showed that 473 manufacturing establishments in Utica reported. These represented 72 industries, had \$12,257,855 capital, employed 11,416 persons, paid \$3,335,130 for wages and \$6,582,234 for materials, and had a combined output valued at \$13,205,572. The principal industries, according to amount of capital employed, were the manufacture of cotton goods, \$2,894,859; men's clothing, \$2,655,888; and boots and shoes, \$753,932. In 1895 the value of the manufacturing output was estimated at over \$17,000,000. The cotton and woolen mills in the city use upward of 30,000 bales of cotton annually, and the New York Mills, $3\frac{1}{2}$ miles distant, use about 8,500 bales. The annual output of beer is over 94,000 barrels. Other manufactures are canned goods, furnaces, iron pipe, furniture, agricultural implements, steam-gauges, oilcloth, varnish, hosiery, trunks, and gas fixtures. In 1895 there were 4 national banks with combined capital of \$1,500,000, 2 State banks with capital of \$325,000, and a savings-bank with surplus of \$1,103,722 and deposits of \$5,543,764; and 3 daily, 2 semi-weekly, 7 weekly, and 6 monthly periodicals.

History.—The site of the city was known in early days as Old Fort Schuyler, from the fort or block-house erected at the fording-place over the Mohawk river, near the present intersection of Second Street and the railway. The site was taken from a tract of 22,000 acres given by the king to William Crosby, the colonial governor, in 1734, which became known as Crosby's manor. The place was settled by immigrants from England and New England; was incorporated as a village Apr. 3, 1798; and was chartered as a city Feb. 13, 1832. Pop. (1880) 33,914; (1890) 44,007; (1895) estimated, 53,000.

CHARLES S. SYMONDS.

Utilitarianism [from Lat. *utilitas*, usefulness, profit, deriv. of *utilis*, useful, deriv. of *uti*, to use]: the doctrine that the object of all moral conduct is to subserv utility. The theory has played historically a great rôle in the development of ethical thought. It began in the Greek moralists, who identified the supreme good—the *Summum Bonum*—with happiness. In modern times the name of utilitarianism has been England, where the school of English utilitarians has pressed the theory with great force and refined it with great ingenuity. The British development may be said to have begun with Locke, although Locke's influence was exerted rather through the general bearings of his philosophy than through his direct ethical teachings. Then follow the names of Hobbes, Hume, James Mill, John Stuart Mill, Bentham, Bain, Spencer, Stephen, and Sidgwick.

The doctrine itself has passed through several interesting phases, all inspired by the criticism of the intuitional moralists, who argued that the most conspicuous thing about moral conduct is just the fact that it is disinterested—i. e. not done with view to utility. The postulate of "general utility," or "the greatest good of the greatest number," came to be substituted for the happiness of the private individual; and in this way Bentham and the elder Mill sought to do justice to the demand that morality should have an altruistic ingredient. The point is made in opposition to such a formulation of the ethical end that there is no way of telling what the greatest happiness of the greatest number is except by judging of the happiness of the individual.

Another attempt to put utilitarianism above the criticism of being egoistic is that of Stuart Mill, who distinguished between the lower or more physical enjoyments to which the word "pleasure" applies and the higher or more spiritual to which the word "happiness" should be restricted. It is in recognition, in the main, of this distinction that the school of utilitarian thinkers is divided into two wings—i. e. the Hedonists, or lower-pleasure men, and the higher-pleasure men called Eudæmonists. Mill's distinction is open, however, to the criticism often brought against it that it affords no criterion of distinction between the two classes of enjoyments. For to distinguish between them on grounds other than those of utility is to give up the utility formula.

Yet a further turn has been given to the discussion by those—notably Leslie Stephen—who have endeavored to save the utility doctrine by a view of society which makes the "organic development" of "social tissue" the ultimate end of human progress, and endeavors to show that under this conception all of the earlier formulas may be brought. Writers who still consent to call themselves utilitarian are seeking to work out on some such basis of social and political theory a new and more adequate view.

The need of a reconstruction in view of the newer work in social psychology is emphasized by the advances in the theory of evolution and its application of social problems. The critical point in the historical development of utilitarianism, as indeed of all ethical theories, has been the uncertainty attaching to the relation of the individual's welfare and happiness to that of society and the race. So long as no social psychology existed it was impossible to tell how far the gratification of self might tend to subserve the larger utilities of society also. Is there a real antagonism between egoism and altruism?—between the welfare of the individual and that of the social organism of which the individual is an integral part? How can there be such a conflict if it be true, as the evolution doctrine declares, that both are incidents of a common progress? It may well be—and this is what current theories are beginning to teach—that the evolution of the individual could never have taken on a social phase or have acquired its own highest plane, if the very statement of its goal had not come to include those social values which in their operation subvert, and in their presence in consciousness conceal, the more individualistic sources from which they sprang. On some such basis as this it may yet come to pass that a new utilitarianism may be erected upon these very instincts of social and anti-egoistic value to which the opponents of the older utilitarianism made their appeal.

The later adherents of idealistic philosophy have seen in a measure the value of a deeper synthesis of doctrines on this subject, and have tried to work out a formula. In their phrase "self-realization" is the ethical end, and the definition of self-realization is made wide enough to include the altruistic impulse. Here we may class Green in England, and his later representative, Edward Caird, together with the general school of thinkers who follow in the footsteps of Hegel. They have failed, however, to work out a consistent concrete statement, being generally led astray by verbal and logical distinctions. Their work, while aiming at a profounder grounding of egoism and altruism in race progress, has had no adequate social psychology to rest upon. See MORAL PHILOSOPHY, HEDONISM, and INTUITIONALISM.

J. MARK BALDWIN.

Utopia [= Mod. Lat., liter., nowhere; Gr. οὐ, not + τόπος, place]; an imaginary island, the abode of a people free from care, folly, and the common miseries of life, described by Sir Thomas More in his political romance *De Optimo Reipublice Statu, deque Nova Insula Utopia* (Louvain, Antwerp, and Paris, 1516); translated from the Latin by Robynson (1551; 2d ed. 1556; reprinted 1880), by Burnet (1683), and by Cayley (1808).

Utraquists: a Hussite sect, deriving their name from the fact that they demanded the Lord's Supper administered to them *sub utraque specie*—that is, in both bread and wine. They were also called Calixtines, from *calix*, chalice. The execution of Huss at Constance created an immense excitement in Bohemia, and brought about a complete breach between his adherents and the Church of Rome. In the so-called Four Articles of Prague the Utraquists set forth their demands—freedom of preaching, communion under both kinds, the reduction of the clergy to apostolic poverty, and severe punishment of all open sins. The war was very bloody, but successful; and it was simply the internal split in the Utraquist party which finally gave the victory to the Romanists. By the compacts of Iglau the pope yielded only the one point of the Prague articles, communion under both kinds.

Revised by S. M. JACKSON.

Utrecht, *yu'treht*: province of the Netherlands, bounded N. by the *Zuyder-Zee* and S. by the Rhine and Leek; area, 534 sq. miles. The surface is diversified by low hills along the Rhine, the soil is very fertile, and the climate drier and brighter than in the other provinces. Wheat, barley, oats, and tobacco are extensively cultivated; cattle and sheep are reared; and several branches of manufactures, such as the making of tiles, bricks, and pottery, are practiced on a large scale. Pop. (1893) 232,316, of whom about 30 per cent. are Roman Catholics and the rest Protestants.

Utrecht: capital of the province of Utrecht; on the Old Rhine, where the Vecht branches off from it, 23 miles S. S. E. of Amsterdam (see map of Holland and Belgium, ref. 6-F). It is strongly fortified, is well built, traversed by canals, and

surrounded with finely planted promenades, has two cathedrals, and, among other educational institutions, a celebrated university, founded in 1634, with which are connected a botanical garden, a chemical laboratory, an observatory, and different museums and scientific collections. Its manufactures of plush, velvet, and carpets, of leather, soap, salt, and brandy, of metal ware and cigars, are very extensive, and it carries on an active trade in grain, cattle, and its own manufactures. It is probably the oldest town of the Netherlands, called by the Romans *Trajectum ad Rhenum* or *Utrajectum*, from which latter appellation its present name is derived. Here the fusion between the seven provinces which formed the Dutch republic was organized in 1579, and here the treaty was signed (Apr. 11, 1713) between France, England, Holland, Prussia, Portugal, and Savoy, which ended the war of the Spanish succession. Pop. (1893) 91,070.

Revised by M. W. HARRINGTON.

Utre'ra: town; in the province of Seville, Spain (see map of Spain, ref. 19-D). It is well built and pleasant; has several oil-mills and manufactures of soap, leather, and pottery; and is in a rich and beautiful district, famous for its excellent horses and ferocious bulls. Pop. 15,000.

Utriclea'ria: a genus of plants represented by the BLADDERWORT (*g. v.*). See also INSECTIVOROUS PLANTS.

Uttara-mīmāṃsā: See MĪMĀNSĀ and VEDĀNTA.

Uvalde: town; capital of Uvalde co., Tex.; on the S. Pac. Railroad; 92 miles W. by S. of San Antonio (for location, see map of Texas, ref. 5-F). It is in an agricultural, asphalt-mining, and stock-raising region, and has 7 churches, separate public schools for white and colored children, Leona Springs, several sawmills, a national bank (capital \$50,000), a private bank, and 2 weekly papers. Pop. (1880) 794; (1890) 1,265; (1895) estimated, 2,000. EDITOR OF "NEWS."

Uvic Acid: See RACEMIC ACID.

Uvula: See PALATE.

Uxbridge: post-village, Ontario County, Ontario, Canada; on Black river, and Midland Division of Grand Trunk Railway; 43 miles N. N. E. of Toronto (see map of Ontario, ref. 4-E). It has important manufactures of iron castings, engines, mill-machinery, plows, axes, leather, woollens, and other articles. Pop. (1891) 2,023.

Uxbridge: town; Worcester co., Mass.; on the Blackstone river, and the N. Y., N. H. and Hart. Railroad; 20 miles S. E. of Worcester (for location, see map of Massachusetts, ref. 3-F). It contains the villages of Uxbridge, Uxbridge Center, North Uxbridge, Calumet, Hecla, Wheelock's, Scott's, and Rivulet; was formerly the western part of Mendon; was set off and incorporated under its present name in 1727, and its northern part was set off under the name of Northbridge in 1772. There are 5 churches, 18 public schools, free public library, several cotton and woolen mills, a national bank with capital of \$100,000, a savings-bank, and a weekly newspaper. Pop. (1880) 3,111; (1890) 3,408; (1895) 3,546. EDITOR OF "COMPENDIUM."

Uxmal, *oosh-maal*: a ruined city of Yucatan, 40 miles S. of Merida (see map of Mexico, ref. 7-I). The remains are the most extensive in Mexico, covering an area of several square miles; but most of them are so nearly destroyed that little beyond their ground plan is recognizable. Those in better preservation are apparently temples, standing on low truncated pyramids, and built of cyclopean masonry faced with dressed and sculptured stone. One, known as the Casa del Gobernador, is 320 feet long. Many of the sculptures are elaborate and curious, and all the work is markedly different from that of Copan and Palenque. There are no idols. Uxmal has been frequently visited by archaeologists. It is said to have been occupied by the Mayas at the time of the Conquest, and even as late as 1673; but its origin is unknown. See CENTRAL AMERICAN ANTIQUITIES. II. II. S.

Uzbegs, or **Uzbecks**: a people of mixed Turkish blood inhabiting nearly all parts of Turkestan, where they are the dominant race. Intellectually and morally, they are the superiors of those about them. They are zealous Mohammedans, partly non-nomadic, and pride themselves on their culture and civilization. In 1862 the Chinese Uzbegs revolted from China, and under Yakub Beg founded a Mohammedan empire, with 1,000,000 inhabitants and 740,000 sq. miles of territory. At his death, in 1877, his empire became subject to China. Revised by M. W. HARRINGTON.

Uzziah: See AZARIAH.

V

: the twenty-second letter of the English alphabet.

Form.—V and U, which until the seventeenth century were used interchangeably as signs for both vowel *u* and consonant *v*, are merely two variant forms of the original Roman V (see under U). The Roman V had a consonant value (= *v* in *veat*), as well as a vowel value (= *u* in *rule*). Now, when Latin consonant *-u* became in Old French *v*, i. e. like *v* in Eng. *vile*, the symbol was left unchanged; hence the symbol *v* (*u*) came to have the quite distinctive values of *u* as in *rule* and *v* as in *vile*, and with these values it was adopted into Middle English orthography. The Old English had used for the sound *v* in native words the symbol *f*, which was thus forced to do double duty, both as *f* and *v*; cf. O. Eng. *findan*, find, and *ofer*, over.

Name.—The name *vee* (phonetic, *vī*) is modern, being evidently constructed on the analogy of the names for *b*, *c*, *d*, *e*, *g*, *p*, *t*; similarly the modern name for *z*.

Sound.—It denotes a voiced labio-dental spirant, produced by passing voiced breath between the lower lip and the edges of the upper front teeth. Only the addition of voice distinguishes it from the sound of *f*.

Sources.—The main sources of the sound are: (1) Teutonic *v* (bilabial, i. e. *b*). All English words beginning with *v*, with the exception of *vul*, *vane*, *vixen*, are of foreign origin, mostly French. The three exceptions are loan-words from a southern English dialect, in which O. Eng. *f* became *v*; *vul* < O. Eng. *fal*; Germ. *fuss*; *vane* < O. Eng. *fauu*; Germ. *fahne*; *vixen* < O. Eng. *fyren*; Germ. *füchsin*. Teutonic *v* (*b*) was represented in O. Eng. by *f*, being thus indistinguishable from Teuton. *f*. Teutonic *v* (*b*) has the following main sources: (a) Indo-Eur. *bh*; cf. Eng. *weave* < O. Eng. *wefan*, Gr. *ὑπάνω*; *calves*, plur. of *calf* < O. Eng. *cealf*; Germ. *kalb*, Sanskr. *gārbha-*, offspring; *love* < O. Eng. *lufa*; Germ. *liebe*, Sanskr. *lubh-*, Lat. *lubet*. (b) Indo-Eur. *p* between voiced sounds and not preceded by accent; Eng. *over* < O. Eng. *ofer*; Germ. *über*, Sanskr. *ūpāri*, Gr. *ὑπερ*. (c) Indo-Eur. *q*; *five* < O. Eng. *fiif*; Germ. *fünf*; Goth. *fimf* < Indo-Eur. *pēnq̥*; Gr. *πέντε*, Sanskr. *pāñca*; *wolves*, plur. of *wolf* < O. Eng. *wulf*; Goth. *wulfs*, Gr. *λύκος*, Sanskr. *vṛka-*.

(2) In loan-words from early French; cf. *vain*, Fr. *vain* < Lat. *vanus*; *veal*, O. Fr. *veil* < Lat. *vittellus*; *verb*, Fr. *verbu* < Lat. *verbum*; *vine*, Fr. *vigne* < Lat. *vinea*; Eng. *wine* came into O. Eng. direct from Latin before Latin *v* (*w*) changed from *w* to *v*; *poverty*, O. Fr. *poverté* < Lat. *paupertas*; *receive*, Fr. *recevoir* < Lat. *recipere*.

BENJ. IDE WHEELER.

Vaca, ALVAR NUÑEZ CABEZA, de; explorer; b. in Estremadura, Spain, in 1507; went to Florida in 1527 in the expedition of Pineda de Narváez, and after an unsuccessful land journey, again took ship, sailed along the northern coast of the Gulf, and was cast ashore at Matagorda Bay. After six years of captivity among the Indians, he met three other survivors of the expedition, with whom he journeyed westward, and followed the course of a large river, probably the Rio Grande, until he fell in with some Spanish explorers on the river Petatlan and was conducted to a town in Sinaloa. Authorities disagree as to the route taken by the four travelers, some holding that it lay through New Mexico, others tracing it through Southern Texas, Chihuahua, and Sonora. Some identify a large stream crossed by de Vaca on his westward journey with the Mississippi, and give the credit of its discovery to him instead of de Soto.

The kingdom of Cibola, the country of the civilized Puehlos, is thought to have been first visited by de Vaca and his men. A joint report of their travels, given by them on arriving at Santo Domingo, is contained in Oviedo's *Historia general y natural de Indias*. De Vaca returned to Spain in 1537, but was soon afterward appointed administrator of La Plata and went to Paraguay, of which country he was the first explorer. Arrested in 1544 on the charge of one of his subordinates, he was sent to Spain and condemned to exile in Africa. He was pardoned after eight years, and lived at Seville till his death, which occurred in 1564. De Vaca published an account of his adventures in 1542. It was reprinted at Valladolid in 1555, and in Barcia's collection of narratives in 1749 under the title of *Naufragios de Alvar Nuñez de Vaca*. An English version is given by Purchas in his *Pilgrims*. See also a literal translation by Buckingham Smith (Washington, 1857 and 1871).

Vaca de Castro, CRISTÓVAL; administrator; b. in Leon, Spain, in 1492. He was a lawyer and a judge of the audience of Valladolid; in 1540 he was sent to Peru to inquire into alleged abuses there, and with authority to act as governor in case of Pizarro's death. Crossing the Isthmus of Panama he narrowly escaped shipwreck in the Pacific, and finally disembarked on the coast of New Granada, purposing to proceed by land. At Popayan (July, 1541) he learned of the assassination of Pizarro and the rebellion of Almagro "the Youth." He at once assumed command, was joined by Benalcázar and others, marched through Quito to Lima, and on Sept. 16, 1542, defeated Almagro, who was captured and executed. He remained at the head of affairs until the arrival, in May, 1544, of Viceroy Vela. The latter, suspecting him of conspiracy, imprisoned him on a vessel in Callao harbor. He prevailed on the captain to sail to Panama, whence he went to Spain. There he was again imprisoned, and was only exonerated after eleven years. D. in 1562.

HERBERT H. SMITH.

Va'caville; town and village; Solano co., Cal.; on the South. Pac. Co.'s railway; 30 miles S. W. of Sacramento, 60 miles N. E. of San Francisco (for location, see map of California, ref. 6-4). It is in an agricultural and fruit-growing region, is the seat of the California Normal and Scientific School, and has a State bank with capital of \$100,000, and a weekly newspaper. Pop. (1880) town, 1,299; village, 361; (1890) town, 2,712; village, 725.

Vaccination [deriv. of *vaccine*, from Lat. *vaccīnus*, of a cow, deriv. of *vaccū*, cow]; (1) in a narrow sense, the inoculation of an individual with the virus of cowpox, thus conferring protection against smallpox; (2) in a broader sense, the inoculation of an individual with any mild virus calculated to produce protection against malignant disease. The former use of the term is the common one, and this article treats only of the vaccination designed to prevent smallpox. It was observed that on the udders of cows an eruption was frequently seen which infected the hands of the milkers. Pustules were produced on the hands, and sometimes changed into painful sores; other parts of the body became affected, and sometimes there was extensive disturbance of the general system. The remarkable fact was discovered that persons who had passed through this disease were protected from the pure smallpox. In Scotland, England, and Holstein in the eighteenth century inoculations were made by certain persons among the laity with the contents of the pustules from the udders of cows. In the year 1781 a milkmaid who had the cowpox went to London and there in the inoculation hospital attempts were made to inoculate her with smallpox, but without success. In the medical circles of the metropolis this did not excite much attention, and it remained for a country physician, EDWARD JENNER (*q. v.*), to see its general scientific importance and to make it useful to mankind.

Jenner's Experiments.—Jenner inoculated people who had gone through with the cowpox with the virus of smallpox, and in all cases without result. Many of the persons inoculated had had the cowpox many years before, one of them fifty-

three years before, and from this Jenner concluded, although improperly, that this protection against smallpox lasted for a lifetime. On May 14, 1796, Jenner made his first vaccination. He vaccinated an eight-year-old child on the arm by making two superficial incisions, in which he placed the contents of a pustule of cowpox which had developed on the hand of a milkmaid. After this healed on the arm of the boy, he inoculated him in numerous places on the body with the contents of smallpox pustules, but without success. In this way he proved that when the cowpox was conveyed to man by inoculation it carried with it protective material. He wrote a treatise on his experiments and the results he had obtained, and sent it to the Royal College of Physicians in London to make the facts generally known, but the manuscript was returned to him with a letter by no means flattering. In 1798 he inoculated a boy with the contents of the pustule of a cow, and by successive inoculations from the boy he propagated the virus through four generations, thus showing that the virus of the cowpox did not lose its efficiency when carried through different individuals. Jenner afterward settled in London, where he published a treatise, giving the results of his experiments, which has become world renowned; it excited the greatest attention, and his experiments were repeated on a large scale. In the year 1801 10,000 persons were vaccinated by him and other physicians in England, and on more than half of them experiments were tried which proved that the method was entirely successful as a preventive of smallpox.

Utility of Vaccination.—In 1857 the British Parliament received answers from 542 physicians to questions which were asked them in reference to the utility of vaccination, and only two of these spoke against it. Nothing proves this utility more clearly than the statistics obtained. Especially instructive are those which Flinzer compiled respecting the epidemic in Chemnitz which prevailed in 1870-71. At this time in the town there were 64,255 inhabitants, of whom 53,891, or 83.87 per cent., were vaccinated, 5,712, or 8.89 per cent., were unvaccinated, and 4,652, or 7.24 per cent., had had the smallpox before. Of those vaccinated 953, or 1.77 per cent., became affected with smallpox, and of the unvaccinated 2,643, or 46.3 per cent., had the disease. In the vaccinated the mortality from the disease was 0.73 per cent., and in the unprotected it was 9.16 per cent. In general, the danger of infection is six times as great, and the mortality 68 times as great, in the unvaccinated as in the vaccinated. Statistics derived from the civil population are in general not so instructive as those derived from armies, where vaccination is usually more carefully performed and where statistics can be more accurately collected. During the Franco-German war (1870-71) there was in France a widespread epidemic of smallpox, but the German army lost during the campaign only 450 cases, or 58 men to the 100,000; in the French army, however, where vaccination was not carefully carried out, the number of deaths from smallpox was 23,400. It is known that the first idea of Jenner in regard to the duration of the protection conferred by vaccination was an erroneous one. It is positive that there is a certain degree of protection which lasts during the entire life of the individual, and which in many cases is absolute, but in other cases the protection gradually declines from the date of vaccination, and in general we can say that the period of protection lasts about ten years. The best results are always obtained by repeating the vaccination every ten years from the first time. When the disease appears after vaccination, it runs a relatively limited course, similar to that of varioloid or modified smallpox. The numerous mortality-rates which have been collected show that the mortality due to smallpox depends greatly upon the number and the clearness of the scars left by vaccination. In the Stockwell smallpox hospital in London, of 703 cases without vaccination scars 47½ per cent. died; of 516 with an imperfect scar 25 per cent. died; of 632 with a good scar 5⅓ per cent. died; of 677 with two good scars 1⅓ per cent. died; of 301 with three good scars 2⅓ per cent. died; of 249 with four or more good scars 1⅓ per cent. died. From the statistics of Marson, which cover 6,000 cases, the mortality among those with the scars of several vaccinations was only 0.55 per cent.

Action of the Virus Described.—The susceptibility of an unvaccinated individual to the vaccine virus is almost an absolute one; there is usually a slight primary reaction in the place vaccinated which lasts until the end of the second day. On the third day a little nodule develops, and on the fifth day this begins to change into a small vesicle which gradually enlarges. On the seventh day this vesicle

reaches the limit of its development; it is then surrounded by a reddened edge, and is of a pearly color with a central yellowish or brownish depression marking the place of vaccination. Sections made through the vesicle show a fan-like structure when examined through the microscope. There are numerous radiating branches going from the skin to the surface of the vesicle, which holds a fluid called lymph in its meshes. This is a clear, slightly yellowish opalescent fluid; a microscopic examination shows that it contains red and white blood corpuscles, small masses of fibrin, refractive globules, and usually some micro-organisms. On the eighth day the contents of the vesicle somewhat change. The vesicle opens and the lymph has a purulent character. By and by the brown spot which appeared in the middle of the vesicle extends over the entire surface, and the vesicle becomes changed into a brown crust with a central depression. After three or four weeks the crust falls off and a scar appears in its place. In the beginning this is red and superficial; it becomes deeper in the course of time, and whiter than the surrounding skin. The base of the scar often has a reticular appearance. The depressions in the scar take the place of hair follicles which have been destroyed. Along with this local affection there is more or less general affection of the body; there is considerable irritation and itching of the spot; the neighboring lymph glands are often enlarged, and there is a slight rise in the temperature of the body. There are some disadvantages connected with vaccination, but these are not necessarily dependent upon it, and are the result of its performance by inexperienced or careless persons. There is sometimes an extensive gangrenous inflammation extending from the spot of vaccination; in other cases there may be severe inflammation of the glands in the axilla, with suppuration, or in other cases an erysipelas extending from the spot of vaccination to neighboring parts. Of especial importance are the very few cases in which syphilis has been conveyed by vaccination. There have been collected in the whole history of smallpox records of fifty such cases with about 700 cases of retransference of the disease. When this number is divided among the millions vaccinated, it is easily seen that the danger must be a very slight one. All of these disadvantages connected with vaccination can be easily avoided. In the first place the danger of syphilis is always avoided by using the animal virus, and in general at the present time in civilized lands this is the only virus which is used. The other infections, the extensive inflammations, etc., are due to inoculation with various micro-organisms at the time when the vaccination is performed. For this the person performing the vaccination is frequently directly culpable by using dirty instruments.

Method of Vaccinating.—The method ordinarily used in procuring the lymph is to inoculate young heifers with the virus of cowpox. The place selected for the inoculation is on the mamma; when the vesicles are fully formed and before the stage of pustule formation is reached incisions are made in the vesicles and small ivory points are dipped into the fluid, or it may be drawn up in capillary tubes. When ivory points are used the lymph on them is allowed to dry, and they may then be kept for an almost indefinite time. In performing the operation the skin on the spot selected, which is usually the shoulder or upper part of the arm, should be carefully cleansed, and then with a perfectly clean instrument the epidermis should be gently scraped off over a small space, which need not be larger than an eighth of an inch square. As soon as the moist deeper layers of the skin are reached the ivory point containing the virus should be rubbed over the spot, and the small wound allowed to dry.

Notwithstanding the evidence from all sides as to the efficacy of vaccination as a protection from smallpox, there have not been wanting opponents to the procedure. It is impossible for any one with any acquaintance at all with the nature of the evidence, and with any appreciation of the value of evidence generally, to see on what grounds the position of these enemies to society is based. See the article IMMUNITY in regard to the way in which immunity by vaccination and inoculation is produced.

W. T. COUNCILMAN.

Vaccin'ium: a genus of plants to which the WHORTLE-BERRY (*q. v.*) belongs.

Vacuum [= Lat., liter., neut. of *vacuus*, empty, void]; a void; a portion of space which contains no matter. The definition implies a condition which it is impracticable to fulfill altogether, but the physicist is able to approach almost indefinitely near to the fulfillment. The ordinary mechanical

air-pumps cease working before the pressure is reduced to $\frac{1}{1000}$ of an atmosphere, but by means of mercury vacuum pumps of the type designed by Sprengel it is possible, as is explained in the article PNEUMATICS (*q. v.*), to obtain an exhaustion of $\frac{1}{1000000}$. In the same article is an account of the method of measuring such high vacua. By the addition of chemical and other processes for getting rid of the traces of vapor which remain, even after the action of the mercury-pump has reached its limit, it is possible to attain to still higher degrees of exhaustion. Thus Crookes, Rood, Bidwell, and others describe vacua of from $\frac{1}{100000000}$ to $\frac{1}{200000000}$ of an atmosphere. The properties of gases at such low pressures are of great interest. A high vacuum is, for example, the best of insulators against the passage of heat. Dewar made use of this property in preparing a vial of liquid oxygen for transportation. The liquid, which boils at -196° C., was placed in a double flask. The inner vial was coated with a mirroring surface of mercury (frozen) to protect the contents from radiation. Between the walls of the inner and outer flasks the pressure was reduced to a very small quantity. In this manner, without further shield against heat conduction, the oxygen was carried with but little loss from London to Oxford, a distance of 63 miles. The phenomena which occur when an electric discharge takes place through an exhausted receiver afford further illustrations of the importance of the study of partial vacua. A difference of electrical potential which is capable of sending sparks through only a few millimeters of air at ordinary pressure will cause a discharge through many centimeters when the pressure is reduced to a few thousandths of an atmosphere. The form of the discharge varies in the most striking and beautiful manner as the degree of exhaustion increases. (See ELECTRIC DISCHARGE, ELECTRICITY, and GEISLER'S TUBES.) At a pressure somewhat less than $\frac{1}{10000}$ atmosphere the discharge through the vacuum changes its form altogether, and a series of remarkable effects follow which have been studied by Crookes. The electrical discharge at these low pressures develops luminescence of the solids in its path, varying with the nature of the material. The phenomenon is known as the Crookes effect. Finally, at the very highest attenuations the discharge *in vacuo* ceases altogether. These partial and approximative vacua of the physicist never entirely meet the definition of that complete void the possibility of the existence of which used to form a subject of debate among the earlier philosophers. By virtue of the varied phenomena which they present, however, they are of much greater importance, from all standpoints excepting that of the metaphysician.

E. L. NICHOLS.

Vaga, PERINO, del; painter; b. in Florence, June 28, 1500. His family name was Buonaccorsi. He was adopted by an artist called Andrea dei Ceri, who took him from a druggist whom he served as assistant. Recognizing the boy's great gifts, he placed him with Ghirlandajo, whose best pupil he soon became. He was afterward taken to Rome by a mediocre painter called Vaga, who engaged him to help him in his work. In Rome he studied ancient art, became one of the best draughtsman of his day, and was chosen by Raphael to execute, together with Giovanni da Udine and Giulio Romano, his designs for the stucco and arabesque decorations of the loggias of the Vatican. He was also commissioned to decorate the great hall of the Appartamento Borgia and the house of the archbishops of Cyprus, and executed other works, till he was driven from the city by the plague. He took refuge in Florence, where the Carthusians commissioned him to execute an important work for them which he designed, but was unable to carry out on account of the plague that broke out in Florence. In 1525 Perino was in Rome and married Catharine, the sister of Giovanni Francesco Fattore, a brother artist. It was at that time he painted *The Birth of Eve* in the Church of San Marcello. The sacking of Rome obliged him again to wander with his wife and child. After trouble and imprisonment he arrived in Genoa, where Prince Doria became his patron, and employed him to decorate his palace beyond the gate of St. Thomas. On his return to Rome he restored many of Raphael's works and received innumerable orders, but much of his later work is inferior, owing to many commissions which led him to employ incompetent assistants. The Sala Reale in the Vatican, begun under Paul III., from whom he received a regular salary, is his greatest work. He died in Rome, Oct. 14, 1547, worn out by overwork and dissipation.

W. J. S.

Vagan'tes, Vagi Schola'res, or Go'liards: wandering clerks of the Middle Ages. The class was a large one and contained persons of the most diverse characters—students roaming from university to university, clergy willingly or unwillingly unprovided with benefices, and even mere buffoons and popular entertainers who had happened to obtain something of Latinity at some monastic or cathedral school, and who used their uncertain connection with the Church as a means to keep them out of the hands of the secular authorities. At a very early period the obvious opportunities for abuse in such a wandering and unattached life brought upon the Vagantes the denunciations of the councils of the Church. Like the modern tramp, who is in a sense their degenerate descendant, they became the terror of the communities into which they came. The lawlessness of their lives, too often unpunished, owing to their ready assertion of their right of clergy, brought discredit upon the whole body of the latter. They seem to have grown particularly prevalent during the twelfth and thirteenth centuries, the period when the great European universities were coming into being. France and England were the countries in which they most flourished; but they were to be found in great numbers also in Germany, Italy, Spain, and even Bohemia. At last the Church became thoroughly aroused, and by severe measures cut off from itself all those among the Vagantes who refused to regulate their lives. With the end of the thirteenth century they ceased to exist as a distinct clerical class.

The most interesting and important matter connected with the Vagantes, or Goliards, is the Latin poetry produced by them. Of this a considerable amount has come down to us. Though written by clerks, it is thoroughly profane in its character for the most part, and contrasts strangely with the hymns and other poetry of the Church. They seem to have studied Latinity only that they might use the amorous ideas and mythology of the Roman poets. They imitated, too, though in Latin, the verses of their contemporaries, the troubadours and trouveres. Often their praises of wine, women, and song reached an almost inconceivable cynicism. They did not limit themselves, however, to these subjects. They were violent haters, as well as too ardent lovers; and many of their poems are devoted to denunciations of their enemies, the monks and the professedly well-regulated clergy, whose vices they castigated unsparingly.

A curious development of the activity of the Vagantes was the institution among them of a kind of mock order, after the manner of the orders of monks. They chose as their patron saint Goliath, probably because of the similarity of his name to *Goliardi* (a derivative, perhaps, of the French *gaillard*, gay, merry). They had mock rites and ceremonies, all parodies of those of the Church. They had a kind of pope, known as *primas vagorum*, or *Archipoetu*, or simply *Goliath*. They had forms of initiation into the order. In short, they made their ribald lives the parody of the lives of the regular clergy. And so it came to pass that the very word *goliardus* meant, as in Chaucer (*Prol.*, v. 560), a loose and ribald fellow.

BIBLIOGRAPHY.—Collections of Goliardic poetry are to be found in J. Grimm and A. Schmeller, *Latvische Gedichte des X. und XI. Jahrhunderts* (Göttingen, 1838); *Carmina Burana*, ed. by J. A. Schmeller (Stuttgart, 1847; new ed. 1883); T. Wright, *The Latin Poems commonly attributed to Walter Mapes* (London, 1841); E. du Ménil, *Poésies populaires latines antérieures au XII^e siècle* (Paris, 1843), *Poésies populaires latines du moyen âge* (Paris, 1847), and *Poésies inédites du moyen âge* (Paris, 1854); F. Novati, *Carmina mediæ ævi* (Florence, 1883). For English translations see J. A. Symonds's *Wine, Women, and Song* (London, 1884). Vagrants and Vagrancy: terms which, in their most general sense, mean "wanderers" and "wandering"; but as used in legal works and statutes they have come to designate various classes of disorderly persons who can not be brought within any definite classification. They can be properly indicated only by giving in effect the statutes which treat of them. In all civilized countries there is more or less regulation of vagrancy by law according as the conditions giving rise to the necessity for such regulation exist or are absent. For this same reason the laws of each country must be adapted to the suppression of that species of vagrancy which is found to be most detrimental to the public welfare, so that no general classification of the laws upon this subject can be given. Thus in the U. S. the laws regulating the subject vary widely both as to the kind of vagrancy intended to be suppressed and as to the severity of punishment inflicted upon vagrants. In the U. S. the term "tramp" is in general use as equivalent to vagrant in its general sense of a wandering disorderly person, or one wandering about without any visible means of support; but vagrant in its wider sense is applied to many classes of persons who would not be termed tramps. In England vagrancy has been a subject of regulation by law for many centuries, and the laws there in force now apply (by extending acts) to Scotland as well as Ireland and Wales. Owing to the gradual development of these laws and the varied conditions to which they are intended to apply, their history and present state will serve as a good illustration of the general treatment of the subject by the laws of other countries. Generally speaking, the class of mendicant vagrants is more freely tolerated in European countries than in the U. S.

Outline of English Vagrancy Laws.—The first vagrancy laws of England grew out of an attempt to regulate labor by requiring laborers to continue to reside in a given place, and labor there for the wages ordinarily given. In 1349 and 1350 when the institution of serfdom was breaking down and a rise in laborers' wages was taking place consequent to the pestilence of the black death, the Statutes of Labourers (two in number) were passed, for the purpose of checking this rise in wages, and, as has been suggested, to provide a kind of substitute for serfdom. These statutes not only regulated the wages of laborers and mechanics, but confined them to their existing places of residence, compelling them to work for any one who should request convenient service of them, and to take only the customary rate of wages, and fixing the wages of the most important classes of mechanics. These statutes were for 200 years confirmed, amended, and extended or modified on several occasions. The rigorous execution of their provisions was insured by giving wide authority on all the matters dealt with to the county and borough justices and police magistrates. Vagrancy, or wandering, then became a crime, since if a man of this class went out of his own hundred or specified territory, even to look for work, he became a vagrant and a criminal. Many statutes were passed in the time of Richard II. referring to the number of persons who wandered about the country and committed all sorts of crimes, leaving their masters and associating in bands to overawe the authorities. The last of these statutes provided that "it is ordained and assented to restrain the malice of divers people, feitors, and wandering from place to place, running in the country more abundantly than they were wont in times passed, that from henceforth the justices of assizes in their sessions, the justices of peace, and the sheriffs in every county shall have power to inquire of all vagabonds and feitors and their offenses and upon them do all the law demandeth."

In 1388 an elaborate statute was passed (12 Rich. II.) containing many provisions as to laborers' wages and justices, and providing that no servant should leave the hundred in which he dwelt without a letter patent from the king, stating the cause of his going and the time of his return, and anyone found wandering without such a letter was to be put in the stocks and kept till he found surety to return to his service. In another chapter a distinction is made between beggars "able to labor" and "beggars impotent to serve," and this act is the first to recognize a distinction between the impotent and the able-bodied poor.

In the reign of Henry V. a remarkable act was passed which states that "the servants and laborers of the shires of the realm do flee from county to county, because they would not be justified by the ordinances and statutes by the law for them made, to the great damage of the gentlemen and others to whom they should serve because that the said

ordinances and statutes for them ordained be not executed in every shire." It empowered justices of the peace to "send their writs for such fugitive laborers to every sheriff in the realm of England" who were to take them and send them back to the place whence they came, and it also gave justices of the peace "power to examine as well all manner of laborers and servants, and their masters as artificers," and punish them upon their confession.

The next important act relative to this subject was that of 22 Henry VIII., c. 12, passed in 1530. It imposed very severe penalties on vagrants. The impotent poor were to be licensed to beg within certain limits, and begging without a license was punishable by whipping. Vagrants able to labor were to be stripped naked, tied to a cart's tail, and whipped through the town till bloody, and then sent back to labor, being liable to more whipping if they failed to go directly home. People pretending to knowledge in "palmistry or other crafty science," and some others of a like character, were to be whipped two days together for the first offense, and for the second to be scourged two days, be put upon the pillory the third day from 9 till 11 A. M., and to have an ear cut off, and for the third offense the same penalty; the other ear being cut off. Various other provisions were also contained in the statute providing for the punishment by whipping or mutilation of other classes of vagrants.

In 1547 all these statutes were repealed, as not being sufficiently severe, by 1 Edw. VI., c. 2, which provided for the arrest as vagabonds of loitering and idle wanderers, or those who ran away from their work. As punishment they were to be branded with a V, and given as slaves for two years to any one demanding them, and they were to be fed on bread and water and refuse meat, and each was to be caused to work in such labor "how vile soever it be as he shall be put unto by beating, chaining, or otherwise." If he ran away he was to be branded with the letter S, and adjudged a slave for life, and upon running away again he was to be hanged. Two years later, in 1549, this barbarous act was repealed and the acts of Henry VIII. were revived, and in 1552 these latter were confirmed, but licenses to beg were permitted to be given.

In 1572 all these statutes were repealed by an act which provided that all beggars should be "grievously whipped, and burnt through the gristle of the right ear" for a first offense, and be guilty of a felony for a second. In 1597 was passed the famous statute 39 Eliz., c. 4, which remained in force, with some changes, for over a century. It provided for the erection of houses of correction for the reception of rogues, vagabonds, and sturdy beggars till either put to work or banished; and ordained that any such persons found begging, wandering, or misordering themselves should be stripped naked to the waist and whipped in public till bloody, and then sent to their birthplace by a fixed route (being whipped upon every deviation from it), to be taken to the house of correction, and there kept till employed or banished.

This act defines rogues and vagabonds not by any general characteristic, but by an enumeration of a large number of classes—persons either disturbing the good order of the community or considered detrimental to society. "All persons calling themselves scholars going about begging; all seafaring men pretending losses of their ships and goods on the sea; all idle persons going about either begging or using any subtle craft, or unlawful games and plays, or feigning to have knowledge in physiognomy, palmistry, or other like crafty science, or pretending that they can tell destinies, fortunes, or such other fantastical imaginations; all fencees, bear-wards, common players, and minstrels; all jugglers, tinkers, and petty chapmen; all wandering persons and common laborers, able in body and refusing to work for the wages commonly given; all persons delivered out of gaols that beg for their fees or travel begging; all persons that wander abroad begging, pretending losses by fire or otherwise; and all persons pretending themselves to be Egyptians (i. e. gypsies)" were included in the list.

Various minor amendments and additions to this act were made up to 1713, when all laws relating to rogues and vagabonds were repealed, and the act of 1597 re-enacted with a few omissions.

In 1744, after various repealing and amending acts, a comprehensive act was passed, which is largely the basis of all subsequent legislation in Great Britain on this subject. It distinguished three classes of offenders—(1) idle and disorderly persons, (2) rogues and vagabonds, and (3) incorrigible

ble rogues, and made minute provisions as to their arrest, return to their place of settlement, and punishment.

The act (5 Geo. IV., c. 83) which is still in force was passed in 1824, after the act of 1744 had been amended (1792) and repealed (1822). The act of 1824 (amended and made applicable to Scotland by 34 and 35 Viet., c. 112, section 15) repealed all prior acts and greatly enlarged the list of persons classed as rogues and vagabonds, including with subsequent amendments under those terms almost all persons who prowl about apparently with an unlawful purpose. This act provides for the punishment as vagrants of (1) idle and disorderly persons, (2) rogues and vagabonds, (3) incorrigible rogues, and provides that the first class shall be imprisoned with hard labor for any term not exceeding one month, the second class for any term not exceeding three months, and the third class till the next general or quarter sessions of the peace, when the offender may be further imprisoned with hard labor for a year, and if a male may be whipped.

In the U. S. vagrants were so comparatively few in numbers, and so generally harmless in character, that prior to the civil war the subject of the regulation of vagrancy received but little public attention. Subsequently, however, owing partly to the effects of the disbandment of the armies and the scattering of the numerous camp-followers through the country, partly to the hard times of 1873 and later, and partly to the various changes of condition accompanying and resulting from the growth of the country and the increase of population and of the numbers of immigrants, vagrants, and especially those of the class commonly designated as tramps, increased so largely in numbers, and became so much more vicious and dangerous in character, that many rural homes became unsafe for women and children, and cases of violence and crime became not uncommon along their routes of travel—which are fairly well fixed—even in villages of considerable size. The evil became so great as to attract much public attention, and resulted in the enactment generally in the U. S. of vagrancy laws much more stringent and comprehensive than those which had previously existed, the larger part of them dating subsequent to the year 1878. Nearly all the States followed to a large extent the English system of vagrancy laws, with local variations made for the sake of greater efficiency or to meet the requirements of local conditions. The States most troubled by tramps and wandering vagrants generally were those through which the great railway lines extended. The State of New Jersey passed very stringent repressive laws, as well as Pennsylvania. The latter, which was one of the first to attempt the suppression of the tramp evil, furnished the groundwork for the laws of many other States, so far as they differ from those of England.

The General Vagrancy Act of Pennsylvania was passed in 1876, and included under the title of vagrancy a large number of wandering and disorderly persons, being more general in its terms than the English vagrancy statutes; but in 1879 an act was passed distinguishing a *tramp* from a *vagrant*, in general, as being "any person going about from place to place begging, asking, or subsisting upon charity, and for the purpose of acquiring money or a living, and who shall have no fixed place of residence or lawful occupation in the county or city in which he shall be arrested"; and by this act such persons are made liable to imprisonment by separate and solitary confinement at labor, in the county jail or workhouse, for not more than twelve months, while vagrants in general are liable only to labor on a county farm, or upon the roads or highways, or in a house of correction, poorhouse, workhouse, or common jail, for a term of not less than thirty days and not more than six months.

The passage of severe laws in one State was followed by a migration to others less severe in their laws, and these States in turn increased the stringency of their laws until such laws became general throughout most of the U. S. One of the most effective, but much criticised, measures was that providing for the punishment of vagrants by compelling them to work in chain gangs upon the roads or in breaking stone. The constitution of the State of California provided for the public whipping of tramps, and a determined, but unsuccessful, effort was made in Wisconsin to enact a law for the whipping of tramps.

The enforcement of vagrancy laws is more or less lax in a given locality according to the social, political, and economical conditions which make vagrants more or less objectionable. The severities of the old laws of England have been largely done away with, partly because it has come to

be recognized that here, as with other crimes, excessive severity is not proportionally, if at all, a greater deterrent; and partly because it is recognized, as the result of advances in economical and sociological knowledge, that vagrancy is due to social and economical conditions, the removal of which is the true remedy.

F. STURGES ALLEN.

Vagus Nerve, or Par Vagum [Lat.; *par*, pair + *va gum*, neut. of *vagus*, wandering]; the more usual name for the tenth cranial nerve of vertebrates, called in human anatomy PNEUMOGASTRIC NERVE (*q. v.*). It acquires its greatest development in the aquatic vertebrates, where it supplies the frequently extensively developed lateral line system of sensory organs.

J. S. K.

Vahlen, JOHANNES: classical scholar; b. at Bonn, Germany, Sept. 28, 1830; studied under Ritschl; privat docent at Bonn, 1854; professor extraordinary in Breslau, 1856; ordinary professor in Freiburg 1858, but called to Vienna in the same year. In 1874 he became Haupt's successor at Berlin. His work is chiefly devoted to Aristotle and early Latin. He edited Ennius and Naevius (1854); Lachmann's *Lucretius* (1876); Haupt's *Catullus Tibullus and Propertius* (4th ed. 1879); Haupt's *Horace* (5th ed. 1885); O. Jahn's *Longinus's Περὶ Ἱψῶς* (2d ed. 1885); Koch's *Seneca* (1879); Cicero's *De legibus* (2d ed. 1883); Plautus's *Menachmi* (1882); Aristotle's *Poetics* (3d ed. 1885), with a commentary, *Beiträge zu Aristoteles Poetik* (4 pts., Vienna, 1865-67), the standard works on the subject; and *Lorenzo Valla* (2d ed. 1870). Besides very numerous treatises of permanent value on Aristotle, Alcidas, Ovid, Propertius, Ennius, etc., he is also the author of the anonymous semi-annual pro-mia of the University of Berlin (since 1874), dealing with Greek and Latin texts in a way which stamps them as perfect models of critical and hermeneutical exegesis.

A. G.

Vāṛeshika (vā-i-shāshī cō-kaū) **Philosophy**: one of the six systems of Brahmanical philosophy. These systems form three pairs, and each member of these several pairs stands in especially close relation with its mate: to wit, the MĪMĀṆSĀ with the VEDĀNTA; the SĀṆKHYA with the YOGA; and the VĀṠESHĪKA with the NYĀYA PHILOSOPHY (see these articles). The last two, which teach the evolution of the world from atoms and are distinguished from the rest by a rigorous classification of the fundamental logical conceptions, are usually fused together in the philosophical literature of India and treated as one. On this account Occidental scholars for some time confused the doctrines of the Vāṛeshika with those of the Nyāya, and only recently has it become possible to determine the contents of the two systems in their original and distinct individuality. The Vāṛeshika system is undoubtedly of greater antiquity than the Nyāya, although, indeed, the opposite opinion prevailed until recently. There is good reason for referring the Brahma-sūtras or Sūtras of the VEDĀNTA (*q. v.*) to the beginning of our era or to a time slightly anterior. Since the Brahma-sūtras themselves contain (ii. 2. 12-17) a distinct polemic against the doctrines of the Vāṛeshika, we are justified in referring the origin of the Vāṛeshika system to a time prior, but not long prior, to the birth of Christ. At the close of the passage just cited we find the interesting remark that the Vāṛeshika is not really worthy of any serious consideration because nobody accepts it, a slight which, if well founded, stands in surprising contrast with the fact of the great popularity of the system in India in later times. On the other hand, the system can not be so old as to permit its derivation from the atomistic doctrines of Leucippus and DEMOCRITUS (*q. v.*), although, when we consider the other manifold correspondences between India and Greek philosophy, there is often a great probability of historical connection and of derivation from India.

The name of the founder of the Vāṛeshika system is said to be Kaṇḍa, that is, *Kaṇa* + *ada*, or Atom-eater; and, since the Hindus have the habit of giving to the same person several appellations which are different in form but yet etymologically of identical signification, he is also called *Kaṇa-bhuj* and *Kaṇa-bhāksha*, both also meaning Atom-eater. It is likely that this was originally a mere nickname which was chosen in allusion to the character of the system, and which, after coming into general vogue, displaced the real name of the founder.

The strength of the system lies in its establishment of the six categories (*padārtha*), under which, according to Kaṇḍa, everything existent can be subsumed. Nevertheless, Kaṇḍa does not restrict himself to the establishment of his categories; he endeavors rather in their discussion to solve the most varied problems of existence and of thought, and there-

by to arrive at a comprehensive philosophical view of the world. The categories or predicaments are as follows: 1, Substance (*dravya*); 2, quality (*guṇa*); 3, motion or action (*karman*); 4, community or generality (*sāmānya*); 5, difference or particularity (*vīśeṣa*); and, 6, intimate relation or inherence (*samavāya*). These notions are very precisely defined and are disposed under various subdivisions.

1. Under the category of substance are placed earth (i. e. all organic bodies, and all inorganic matter except the other elements), water, light, air, ether, time, space, soul, and the organ of thought. It seems surprising to us that the Vāiṣeṣhika should account space and time to be substances; but we must bear in mind that in this system "substance" means nothing more than that which possesses quality or motion and which is the immediate cause of a phenomenon. The difficult question of the nature of space and time, of which Kant was the first to give the definitive solution, is treated throughout the Indic philosophies only incidentally and as a subordinate matter. The Sāṅkhya has gone furthest in its treatment, and declares space and time to be two qualities of the eternal primeval matter considered as a unit. The discussion of the category of substance gives Kaṇāda opportunity to develop his theory of the origination of the world from atoms (*anu, paramānu, kaṇa*). The atoms of earth, water, light, air, and ether are eternal and uncreated; and although they themselves have no extension, yet their heterogeneous nature results, when they are combined with one another, in their extension and visibility. Even an aggregate of three atoms (*try-anuka*), or, according to some teachers, of three double-atoms (*dvya-anuka*), possesses a certain extension and is visible as the mote (*trasa-reṇu*) in the sunbeam. This whole theory is stoutly contested in the Vedānta and Sāṅkhya works, and upon the same ground—namely, that if the single atoms have no extension, then also an aggregation thereof can have no extension, inasmuch as every attribute of a product is conditioned by a similar attribute of its material cause.

2. The category of quality embraces color, taste, smell, feel (and especially temperature), number, quantity, or extension, individuality, conjunction, disjunction, priority, posteriority, intelligence, pleasure, pain, desire, aversion, and volition. Čaikaramiṅga, in his comment on the Vāiṣeṣhika-sūtras, i. 1. 6, enlarges Kaṇāda's list of seventeen by the addition of seven others, which, although virtually included in the aforesaid seventeen, are yet, he opines, worthy of especial mention. These are: gravity, fluidity, visciduity, sound (the especial quality of the element ether), after-effect (*saiṃskāra*), merit, and demerit. The *saiṃskāra* manifests itself (a) as the continuance of a motion in consequence of a given impulse, (b) as elasticity, and (c) as memory. This enumeration, as is evident, contains not only qualities of matter, but also such as have to do with spirit. In this connection accordingly Kaṇāda is led to develop his psychology. In opposition to the Sāṅkhyans and Vedāntists, who hold that the soul is devoid of qualities, the Vāiṣeṣhika system maintains that the spiritual qualities belong directly to the soul. The soul is without beginning and without end and all-pervasive, and is thus free from the bonds of space and time. If now the soul came immediately or directly into connection with the objects of cognition, it would follow that all objects would present themselves simultaneously to consciousness. Kaṇāda explains why this is not the case by assuming an organ of thought, the *manas* or inner sense, with which the soul stands in the closest connection. It is only through the mediation of this *manas* that the soul takes cognizance not only of external things, but also of its own qualities. The *manas* is eternal like the soul; but, in contrast with the soul, the *manas* is an atom, and as such it is capable of comprehending only a single object in any given instant. For the cognition of eternal things there is need of the co-operation of the corporeal senses with the *manas*. These senses, according to the Vāiṣeṣhika, are not modifications of consciousness, but are material; and are formed of the five elements: the hearing consists of ether; the sight, of light; the taste, of water; the sense of feeling consists of air; and the sense of smell consists of earth.

3 and 4 and 5. The varieties of the third and fourth categories, that is (3) of motion or action and (4) of community or generality, are of small significance. The fifth category, difference or particularity, on the other hand, is of importance, inasmuch as it plays so great a part in the explanation of the origination of the world from atoms. And, accordingly, the name of the system, "Vāiṣeṣhika," is derived from the Sanskrit word for "difference," which is *vīśeṣa*.

6. Of especial interest is the sixth category, inherence or intimate relation. It does great credit to Kaṇāda and his acumen that he has set it up. This notion is sharply distinguished from that of connection (*saiṃyuga*), which is occasional or accidental, and not indissoluble, and which appears as one of the varieties of the category of quality. Inherence is the relation which exists, for example, between a thing and its qualities, between a whole and its parts, between every object and the general idea which is connected with it, between motion and the thing which is moving, between the species and the genus. It is remarkable that this important notion has found no acceptance among the adherents of the other systems in India excepting those of the Nyāya.

7. Later teachers of the Vāiṣeṣhika system have added to the six categories a seventh, to wit, non-existence or negation (*abhāva*), which has exercised a portentous influence upon the development of logical investigation. This category too is divided, with genuine Indic subtlety, into the four varieties of prior, posterior, conditioned, and absolute non-existence. Prior non-existence is what we should call in positive terms "future existence." For posterior non-existence we should say "past existence." Conditioned or reciprocal non-existence is the relation subsisting between two non-identical things (e. g. a jar is not cloth). Absolute non-existence is usually exemplified by the impossibility of fire in water.

The ultimate purpose of the Vāiṣeṣhika philosophy, like that of other Brahmanical systems, is the release of the souls from the distressing round of existences; and as the one and only means of attaining such release, the system recognizes the right knowledge of all that is knowable, which knowledge it is the aim of the system to teach. The Vāiṣeṣhika-sūtras constitute the principal treatise of this school; and they have been edited, with the commentary of Čaikaramiṅga, and with another commentary written by the editor himself, by Javanārāyaṇa Tarkapañcāna, in the *Bibliotheca Indica* (Calcutta, 1861). The Sūtras were translated into German, with comments, by Eduard Röver, in the *Zeitschrift der deutschen morgenländischen Gesellschaft*, xxi. and xxii.; and into English, with copious extracts from the commentators, by A. E. Gough (Benares, 1873).

RICHARD GARBE. Translated by C. R. LANMAN.

Vail, THOMAS HUBBARD, S. T. D., LL. D.: bishop; b. at Richmond, Va., of New England parents, Oct. 21, 1812. He graduated at Washington (now Trinity) College in 1831, and at the General Theological Seminary in 1835; ordained deacon in St. Mark's church, New Canaan, Conn., June 29, 1835; ordained priest in Grace church, Boston, Mass., Jan. 6, 1837. During the three months following his ordination to the diaconate he officiated in St. James's church, Philadelphia. After this he acted temporarily as assistant to Rev. J. M. Wainwright, then rector of St. Paul's church, Boston. Under Dr. Wainwright's direction he went to Worcester, Mass., and organized All Saints' church. In 1837 he became the rector of Christ's church, Cambridge; in 1839 of St. John's church, Essex, Conn.; and in 1844 of Christ church, Westery, R. I., where he remained fourteen years, during which time he was a deputy to the General Convention from the diocese of Rhode Island, and also a member of the standing committee. In Dec., 1857, he returned to Massachusetts, and became the rector of St. Thomas's church, Taunton; and in 1863 he became the rector of Trinity church, Muscatine, Ia. He was consecrated first Bishop of Kansas in Trinity church, Muscatine, Ia., Dec. 15, 1864. He published an edition of Rev. Augustus F. Lyte's *Buds of Spring*, with memoir and additional poems of his own (Boston, 1838), and wrote *Plan and Outline, with selections of books, under many heads, of a Public Library in Rhode Island* (1838); *Hannah, a Sacred Drama* (Boston, 1839); and *The Comprehensive Church* (1841; 3d ed., 1883). He also delivered and published a number of occasional sermons, and a volume of his charges and episcopal addresses has been published since his death. He was president and founder of Bethany College, Topeka, Kan. The twentieth anniversary of his episcopate was celebrated at Topeka in 1885. D. at Bryn Mawr, Pa., Oct. 6, 1889.

Vail, WILLIAM BERRIAN: member of Canadian Privy Council; b. in Sussex Vale, New Brunswick, Dec. 20, 1823, and educated there. He represented Digby in the Nova Scotia Assembly in 1867-74, and during that period was a member of the executive council and provincial secretary, and sat for the same county in the Canadian Parliament in

1874-78 and 1882-87. He became a member of the Privy Council, and was appointed Minister of Militia and Defense Sept. 30, 1874, and retained this portfolio until 1878, when he retired with the Mackenzie administration. N. M.

Vaillant, Le: See LEVAILLANT, FRANÇOIS.

Vaish'navas [from Sanskr. *Vaiṣṇava*-, liter., masc. adj. of or pertaining to Vishnu, deriv. of *Vishnu*-, Vishnu]: a Hindu sect whose peculiar patron and most especial object of veneration is Vishnu, the second person of the Indian Trimūrti. The sect is itself subdivided into almost innumerable smaller sects, all of which are bound together by the one idea—that, above all other gods of the Hindu pantheon, Vishnu stands supreme. Roughly speaking, these sects of Vaishnavas may be classed as the "Northerners" and the "Southerners," according to the *ipsissima verba* of Hindu theology. But the tone of Vaishnava opinions is constantly changing, and we find the so-called Northerners constantly contending nowadays, in the Deccan and extreme south of India, with the Southerners. So, in reality, no hard and fast line can be drawn, and no grouping of the hundreds of sects comprising the Vaishnava sect can be satisfactorily made. The term *Vaishnava* is as elastic as that of Christian. Even the mark on the Vaishnava's forehead, which is shaped like a trident, can not invariably be depended upon. One sect prolongs the central prong, so to speak, of the trident to the tip of the nose, and holds that it is necessary to salvation that this should be done. The opposing sect stops short at the eyebrows. Many a bloody feud between Vaishnavas has arisen on account of this one controversy. Then some of the sectarian marks differ in the thickness of the lines; and even that, in the watchful eye of a scrupulous Hindu, is of immense importance. So are also the necklaces and rosaries, the forms of the garments worn, and, above all, the sacred initiatory formulas.

The distinctive mark of the Northerners is formed by two white perpendicular streaks, or two streaks converging like the lines of a V from the roots of the hair, across the forehead, to the eyebrows. These streaks are of powdered sandal-wood made into an adhesive paste. From between the eyebrows another white streak is drawn, connecting the lower portion of the V to the tip of the nose, thus making the mark resemble a Y. Some of these sectaries make the line along the nose stop at the middle of its ridge. The distinctive mark of the Southerners consists of two white lines of chalk, perpendicular and parallel, from the roots of the hair to the eyebrows, with a streak of similar color joining the base of the lines, and running at right angles to them above the nose. In the middle, between the two perpendicular white lines, is drawn, parallel with them, a line of red paste composed of turmeric and lime, or simple red chalk.

The Northern Vaishnavas number more than 45,000,000. Two out of three Vaishnavas in Bengal are of this sect. They believe that faith in Vishnu will save more swiftly, surely, and effectually than works can. The virtues of pious meditation and abstraction are not to be compared to the virtues of belief. Knowledge is of little account; faith is all in all. It is good to subjugate the passions, to practice the *yoga*, to give alms, to be of a mind filled with clarity, to call on the sacred name, to wear the sacred symbols on the person, to be honorable, virtuous, and meek; but faith is the sole and supreme fount of salvation. And yet these mild Hindus, who worship the Preserver, and believe that by belief alone in the nine-times-incarnate One they shall attain heaven, tell their brethren of the Rāmānūja sect that the latter can not be saved unless they lengthen the middle stroke on their foreheads to the tip of their noses! The Rāmānūjas naturally reply that the performance of this lengthening of the line as a requisite for salvation is in itself a "work," so that the Northerners are inconsistent with regard to their avowed creed. In older days these theological disputes used to lead to exhibitions of physical force. Temples used to be hurled down, cities depopulated, women and innocent children butchered—all to prove whether the distinctive central mark of a Vaishnava's forehead should stop at his eyebrows or whether it should elongate itself to the root of his nose!

But, after all, the Northerners must be considered the most liberal. They are the Protestants of Vaishnava theology. They insist on faith as the supreme requisite. They are not so ground down by usages and multitudinous formulas as are the Rāmānūjas. The latter are more in the hands of their priests; the former own as their great high priest conscience. The Northerners adhere as much as possible to the

simplest tie which can possibly bind them to the worship of Vishnu as a distinctive connecting link—that is, the repetition of the name of the god in the person of the greatest of his avatārs, Krishna! Only repeat this, and worship is complete, and all ceremonial observances are wholly needless.

The Southern Vaishnavas are especially fond of worshipping Lakshmi, the consort of Vishnu. No Vaishnava of Southern India will allow any one to look on his food while he is eating it. A look would be pollution, and he at once would treat it as ordure and bury it out of sight. He believes that Vishnu is the spring, center, foundation, cause, and creator of all. Matter and spirit unite in him as God and as the Incarnate. In Southern India the Rāmānūja Vaishnavas number many tens of millions, and their temples are among the most splendid in India.

The *Vallabha-Āchāryas* are a strong, well-organized sect of Vaishnavas of Central India. Their head priests are called *mahārājas*. The votaries of this sect are bound to reverence their teacher as God. It is said, "The priest or mahārājah is Vishnu himself; he is Krishna incarnate; the true believer must bestow on the priest his body-organs of sense, life, heart, faculties, wife, house, family, property, and all his own self."

The *Madhvā-Āchārya* sect number many adherents, especially in the Telugu country. They believe in Vishnu as the great invisible First Spirit, the Prime Cause, the Originator of the Universal, the primeval Sole and Supreme, perfectly good, omnipotent, and of nature totally indescribable. This sect brand themselves with Vaishnava symbolic emblems as a preventive against schism. As a part of their worship they demand that virtue shall be invariably practiced, alms freely offered, truth always told, and that kindness and protection and courtesy be shown to all men, especially strangers. They deny the doctrine of absorption, and so differ in a vital point of doctrine from a large number of their co-religionists. Brahma, they believe, grew out of a lotus, which itself grew out of Vishnu's navel. Their idea of heaven is that of final liberation from future births, and sharing with Vishnu in every respect the glories and felicities of his heaven. The true believer, after ascending thither, will not only be perfectly happy, but will be endued with omnipotence. The sacred color of this sect is a deep saffron. Their supreme authority is the Veda. Their priests pretend to strict asceticism.

The *Kabir Panthis* are a very numerous sect in Northern and Central India. They are strict Unitarians, believing in one sole Creator of the universe, perfect in holiness, omnipotence, irresistible, yet with corporeal form. All that is good in earth resembles him. The perfect man after death shares equally with Vishnu his perfection of character, blissfulness, and power. Indeed, God and man are identical. The whole visible creation is also God, begot by the female form, *Māya*, created by God, to relieve his loneliness and give birth to nature. They are very careful to teach that pure morality is the highest good and the way to God. Of all Vaishnavas they are certainly regarded as being most liberal.

Vaish'navism: the doctrines and practices of the VAISHNAVAS (*q. v.*).

Vaisya: See CASTE.

Valais *vālā* (Ger. *Wallis*): canton of Switzerland; bounded N. by the cantons of Vaud and Berne, E. by Uri, Ticino, and Italy, S. by Italy, and W. by France. It consists of one valley inclosed by the Bernese and Pennine Alps, which are the highest mountains of Europe, and traversed by the Rhône, which at the western extremity of the valley enters the Lake of Geneva. Area, 2,027 sq. miles. Cattle-rearing and dairy husbandry are the chief occupations; at the bottom of the valley, where the summer heat is intense and the ground along the river level and fertile, wheat, wine, fine fruits, and excellent vegetables are cultivated with success. Capital, Sion or Sitten. Pop. of canton (1893) 103,236, of whom about 75,000 speak French, 15,000 German, and the rest Italian. They are nearly all Roman Catholics.

Revised by M. W. HAARINGTON.

Valatie: village; Kinderhook town, Columbia co., N. Y.; on the Kinder, and Hudson Railway; 16 miles S. by E. of Albany (for location, see map of New York, ref. 5-3). It is at the junction of Kinderhook creek and the outlet of Kinderhook Lake; is principally engaged in the manufacture of paper and cotton, woolen, and tin goods; does its banking in Kinderhook, and has a weekly newspaper. Pop. (1880) 1,775; (1890) 1,437.

Valckenaer, vaal-ke-nāar, LODEWIJK KASPAR; Greek scholar; b. at Leeuwarden, Holland, June 7, 1715; studied in Franeker and Leyden; Professor of Greek at Franeker 1741. In 1776 he was called to Leyden as the successor of his teacher, Hemsterhusius. D. at Leyden, Holland, Mar. 14, 1785. Valckenaer was one of the greatest classical scholars of modern times, and many of his contributions have a permanent value. His editions of the *Phænissæ* (4th ed. 1824, 2 vols.) and the *Hippolytus* of Euripides, containing the famous *Diatribe in Euripidis perdituram fabularum fragmenta* (1768; 1823, 2 vols.), and of Theocritus, Bion, and Moschus (1781), mark an epoch in the critical and literary study of these poets. He also edited Homer's *Iliad* with the scholia (1747), and the fragments of Callimachus (published by Luzac, 1799). But his masterpiece is probably the *Diatribe de Aristobulo* (published posthumously by Luzac, 1806), in which the literary forgeries perpetrated by Alexandrian scholars are exposed. His *Opuscula critica* was published in 2 vols., 1809, and *Selecta ex scholiis Valckenarii* (2 vols.) in 1817. See Wyttenbach, *Vita D. Ruhkenii*, pp. 175-181; Bergman, *Memoria Valckenarii* (Utrecht, 1874). ALFRED GUEDEMAN.

Valdegamas, MARQUES DE: See DONOSO CORTÉS.

Val del Bove: See ETNA.

Valdepeñas, vāal-dā-pān'yaas: town; in the province of Ciudad Real, Spain; 140 miles by rail S. by E. of Madrid (see map of Spain, ref. 16-F). It is celebrated for its red wine, which is one of the best produced in Spain. Pop. (1887) 15,404.

Valdés, vāal-dās', ALFONSO and JUAN, de: twin brothers; reformers; b. at Cuena, Spain, about 1500, of a noble and wealthy family. ALFONSO became private secretary to Charles V. and was present at the Diet of Worms 1521, at which Luther appeared, and also at the Diet of Augsburg 1530. He took the same stand as Erasmus toward the Reformation—applauding it so far as it was an attack upon the corruptions of the Church and having friendly relations with its leaders, but having no appreciation of it as a spiritual movement. He lived at the court of Brussels, but died in Vienna, Oct., 1532. In 1527 he wrote a dialogue called *Lactantius*, descriptive of the sacking of Rome by the Constable de Bourbon, and in it he exposed the ecclesiastical evils of the times. This was reprinted at Madrid in 1850.—JUAN entered the imperial service in Spain, later was in that of the pope in Rome, Bologna, Naples, and other places. But he imbibed Reformation principles, produced a Spanish translation of Paul's Epistles, with a commentary, and numerous minor writings, all giving expression to his new views. He died in Naples in 1541, where he had lived a few years and where he gathered a little band which numbered Peter Martyr, Bernardino Ochino, Vittoria Colonna, and Giulia Gonzaga. They were accused by the Inquisition of having formed a sect called Valdesians, and some of his followers were put to death and others had to take refuge in foreign countries. The books of Valdés and his influence upon religious thought had fallen into almost complete oblivion, when his memory was revived by an English Quaker, Benjamin B. Wiffen (see *Bibliotheca Wiffeniana, Spanish Reformers*, by E. Böhmer, London, 1874; Eng. trans. of his *Christian Alphabet*, 1860; *Considerations*, 1865; *Spiritual Milk*, 1882; *Commentary on Matthew*, 1882), who began in 1848 the publication of a series of *Reformistas Antiguos Españoles*, which extended to 20 vols., and included, besides works of Tomas Carrasco and Dr. Juan Perez, several by Valdés, viz., *Dos Diálogos* (1850); *Zinelo y Diez Consideraciones* (1550; reprinted 1855); *Alfabeto Cristiano*, from the Italian edition of 1546, with two modern translations in Spanish and English (1861); *Diálogo de la Lengua* (1546; reprinted 1860); and *La Epístola de San Pablo á los Romanos y la I á los Corintios, ambas traducidas y comentadas* (1556; reprinted 1856). The second of these works had been translated into French and Dutch, and had appeared in an English version by Nicholas Ferrar, with the title *Considerations on a Religious Life* (Oxford, 1638). Wiffen also published *The Life and Writings of Juan de Valdés, otherwise Valdesso, Spanish Reformer in the Sixteenth Century* (1865), with a translation from the Italian of his *Hundred and Ten Considerations* by John T. Betts. Valdés was not a Lutheran, nor did he question any doctrine of the Church, his title to the name of reformer resting upon his comprehensive spiritual fellowship with all genuine Christians. See an elaborate article on the Valdés brothers by E. Böhmer in Herzog's *Real-Encyclopädie für*

protestantische Theologie und Kirche, and the same writer's *Cenni Biografici sui Fratelli Giovanni e Alfonso di Valdesso* (1861).

Revised by S. M. JACKSON.

Valdez, MELENDEZ: See MELENDEZ VALDEZ.

Valdivia: a province of Chile, in the southern part, between Cautin and Llanquihue; extending from the Pacific to the crest of the Andes. Area, 8,315 sq. miles. The greater part consists of plains and rolling or hilly lands between the Andes and the lower Coast Range; portions near the mountains are well wooded. Until recently this region was held by the Araucanian Indians, the Government maintaining only a few posts. It is now rapidly developing as a grazing district. Pop. (1892) estimated, 62,020. Valdivia, the capital, is on the Calla-Calla river, near its mouth; its port is known as the Corral (see map of South America, ref. 9-C). It was founded as a frontier fort by Pedro de Valdivia in 1551; passed through many vicissitudes in the wars with the Araucanians, and was taken and destroyed by them in 1599, but was rebuilt in 1644. Later it was strongly fortified. During the latter part of the war for independence it was the last stronghold of the Spaniards; the patriots under Cochrane captured it by a brilliant assault lasting three days, Feb. 2-4, 1820. The harbor is well sheltered; the exports are cattle, hides, lumber, etc. Pop. about 9,000, including many Germans. H. H. S.

Valdivia, PEDRO, de: conqueror of Chile; b. near La Serena, Estremadura, Spain, about 1498. He served as a soldier in Flanders, and under Charles V. in Italy. In 1534 he went to Venezuela, where he distinguished himself in various expeditions; later, it would appear, he was in Mexico, whence, in 1536, he passed to Peru in response to Pizarro's urgent call for re-enforcements against the Indians. He fought for Pizarro against Almagro, and took a prominent part in the defeat of the latter at Las Salinas. Chile had been granted to Almagro, who had made a fruitless expedition into it. After Almagro's death Charles V. intrusted the conquest of that country to an incompetent favorite, Pedro Sanchez de Hoz. On his arrival in Peru, Pizarro associated Valdivia with him, and by a subsequent arrangement Valdivia assumed the entire command. The force collected comprised 150 Spanish soldiers and several thousand Indians. It left Cuzco in Mar., 1540, and marched southward by the Atacama desert; in the valley of Mapocho a large force of Indians was defeated, and on Feb. 12, 1541, Valdivia founded Santiago. The Spaniards were repeatedly attacked by Indians, and were reduced to great straits, being cut off from Peru and almost starving. By the enterprise and bravery of a soldier, Gabriel Monroy, tidings of the situation were sent to Cuzco, and strong re-enforcements arrived in Dec., 1543. Thereafter the colony prospered. Valparaiso was founded in Sept., 1544, the coast was explored southward, and in 1546 Valdivia pushed into the Araucanian country to the Biobío river, defeating the Indians in a great battle. When tidings reached Chile of the rebellion of Gonzalo Pizarro in Peru, Valdivia left the command with Villagra and went to the aid of the royalist leader, Gasca, 1547-49. He took a leading part in the defeat of Pizarro, and was rewarded by a commission as governor of Chile. On his return he made several expeditions against the Araucanians, and to keep them in check founded Concepcion, Oct., 1550, and Valdivia and other posts in 1551-52. In Dec., 1553, there was a great uprising of the Indians, who laid siege to one of the new forts, Tucapel. Valdivia hurried to its relief with fifty horsemen, was attacked and defeated by the Araucanians, captured, and killed soon after, probably on Jan. 1, 1554. HERBERT H. SMITH.

Valdivieso, vāal-dēe-vēe-ā'sō, or **Valdivielso**, José, de: Spanish dramatist who flourished during the first half of the seventeenth century; was a cleric attached to the cathedral of Toledo, and seems to have stood in close relations to Cervantes and Lope de Vega. His dramas, which are all religious, were published as *Doce autos sacramentales y dos comedias divinas* (Toledo, 1622). They were performed, and apparently enjoyed some popularity, which Tiecknor would ascribe to the social position of the author rather than to any great merit in the plays themselves. Among their themes are such as *The Prodigal Son*; *Psyche and Cupid*, treated from the Christian standpoint; *The Tree of Life* and the *Angel Guardian*, both allegorical. Besides the dramas he composed a number of religious poems. Two are of considerable extent, the one devoted to St. Joseph, and the other written in honor of the Blessed Virgin.

J. D. M. FORD.

Valdos'ta: town (founded in 1860); capital of Lowndes co., Ga.; on the Ga. So. and Fla. and the Sav. Fla. and West. railways; 155 miles S. by E. of Macon, 157 miles S. W. of Savannah (for location, see map of Georgia, ref. 7-11). It is in an agricultural region, and has 6 churches, a collegiate institute for white pupils, 3 schools for colored children, a national bank with capital of \$50,000, 2 State banks with combined capital of \$250,000, and 2 weekly newspapers. The principal products of the region are cotton, sugar-cane, rice, corn, fruit, and sweet potatoes, and the town has important factories. The assessed valuation of property is \$2,200,000. Pop. (1880) 1,515; (1890) 2,854; (1895) estimated, 5,500. **EDITOR OF "TIMES."**

Yale, vaa'lee, or Ale: in Scandinavian mythology, a son of Odin and Rind. He was brave in war; a most skillful wielder of the bow. In the Scandinavian mythology there is also a son of Loke and Sigyn called Vale. Loke's son Vale is a brother of Nare. **R. B. A.**

Valeggio sul Mincio, vaa-led jō-sool-min'chyō: town; in the province of Verona, Italy; about 54 miles E. of Villafranca; on the Mincio, affluent of the Po (see map of Italy, ref. 3-D). Within the town there are some noteworthy public and private buildings, and also some valuable works of art. Near Valeggio sul Mincio may be seen the ruins of the famous bridge of Borghetto (rather a causeway), erected (1393) by Gian Galeazzo to divert the Mincio from Mantua and thus reduce the place by famine. It was here also that on June 24, 1866, the Austrians defeated the Italians in the disastrous battle of Custozza. Pop. 2,110.

Valence (in chemistry): See CHEMISTRY.

Valence, vaa'laän's' (anc. *Ventia*, later *Valentina*): capital of the department of Drôme, France; on the left bank of the Rhône; 65 miles S. of Lyons (see map of France, ref. 7-II). It is an old town, with narrow, crooked streets, but not unattractive. Its manufactures of silks, cotton goods, glassware, leather, gloves, etc., are flourishing, and its trade in wine and of the produce of the vicinity is brisk. It has a cathedral, founded in 212, containing the monument, with bust, by Canova, of Pius VI, who died here, and it has a museum of natural history and a collection of antiquities. Pop. (1891) 22,947.

Valen'cia, or Valencia: a small island on the southwestern coast of Ireland, belonging to the county of Kerry; noted as the station of the two transatlantic submarine cables connecting Great Britain and Newfoundland. It is 5 miles long and 2 miles broad.

Valencia: a former kingdom of Spain, bordering on the Mediterranean and between Catalonia in the N. and Murcia in the S.; is divided into the three provinces of Valencia, Alicante, and Castellon de la Plana. From the eighth to the thirteenth century it was occupied by the Moors, and from the eleventh century to 1238 it was an independent Moorish kingdom. It is the best cultivated and most productive part of Spain. Nowhere in Europe are manuring and irrigation carried to such perfection as on the terraces of Valencia, where in some places the soil yields several harvests a year. Besides the common Spanish products, rice is grown here in sufficient quantity to supply all Spain; sugar also is cultivated. The country is watered by the Júcar, Requena, and Guadalaviar, and contains iron, lead, copper, cinnabar, cobalt, and coal. The lagoons on the coast, especially that of Albufera, are rich in sea-fowl and fish. The inhabitants, in whom a strong mixture of Moorish blood is apparent, are industrious, and, next to Catalonia, Valencia is the chief manufacturing part of Spain.

Valencia: capital of the province of Valencia, Spain; on the Guadalaviar, near its mouth in the Mediterranean; 200 miles by rail S. W. of Barcelona (see map of Spain, ref. 16-1). Until 1871 it was surrounded by picturesque walls, the gateways of which remain. The houses are neat and substantially built; the squares, though small, are elegant; the streets, though crooked and narrow, are clean, well paved, and well lighted; while in the modern quarters there are broad and handsome thoroughfares. The whole city is a pleasant and enterprising place, the center of a fertile district, and the seat of an extensive trade and manufactures. Its cathedral, begun in 1262, is a vast edifice containing many excellent pictures. Its university is a well-endowed and well-attended institution, and has a good library. Its manufactures of silk, tobacco, sackcloth, and pottery are celebrated, and its export trade in grain, rice, oil, wine, almonds, figs, and oranges is very considerable. The huerta or garden

surrounding the city comprises an area of about 40 sq. miles, and resembles an immense orchard, in which the citron, orange, palm, and mulberry grow luxuriantly. Pop. (1887) 170,763. **Revised by M. W. HARRINGTON.**

Valencia: capital and largest city of the state of Carabobo, Venezuela; beautifully situated in the Aragua valley, 2 miles W. of the Lake of Valencia or Tacarigua, and 24 S. of its port, Puerto Cabello (45 miles by railway); 1,824 feet above the sea (see map of South America, ref. 1-C). It is the third city of Venezuela in size and importance, and is the commercial center of a large region, exporting cacao, coffee, sugar, hides, etc.; the surrounding plantations are noted for their richness. The town is regularly laid out, has handsome parks and squares, and is lighted by electricity; it is a bishop's see, has a cathedral, national college, etc. The climate is warm (mean 77 F.). Near the city are celebrated springs in which the temperature approaches the boiling-point. Valencia was founded in 1555, or before Caracas. During the war for independence it was alternately held by the royalists and patriots. On the plain of Carabobo, S. of it, Bolivar gained the victories of May 28, 1814, and June 24, 1821, the latter deciding the independence of Venezuela. The first Venezuelan congress met here after the separation from Colombia. Pop. (1888) 38,654. Lake Valencia is 30 miles long and navigable, but is little used for commerce. It has several inhabited islands. **HERBERT H. SMITH.**

Valencia, DUKE OF: See NARVAEZ, RAMON MARIA.

Valenciennes, vaa'laän'si-en': town; in the department of Nord, France; on the Scheldt; 155 miles N. E. of Paris (see map of France, ref. 2-G). It is fortified and defended by a citadel on an island in the river, and contains a modern Gothic church, and a town-hall surmounted by a square campanile. It was a residence of the Merovingian kings. It carries on a brisk trade in its own manufactures, which are varied and extensive. Sugar-refineries, dye-houses, bleaching establishments, and spinning and weaving factories are in operation. Laces and fine woven fabrics are made, and, being in the center of a rich coal-field, it has numerous foundries, rolling-mills, and machine-shops. Pop. (1894) 24,520. **Revised by M. W. HARRINGTON.**

Valenciennes, ACHILLE: anatomist and surgeon; b. in Paris, Aug. 9, 1794; studied natural science; became Professor of Anatomy at the Normal School in 1830; was the collaborator of Cuvier in his ichthyological studies; succeeded Geoffroy Saint-Hilaire in the Academy of Sciences. Besides a number of monographs and minor essays in various scientific journals, he wrote *Histoire naturelle des Mollusques, des Annélides et des Zonophytes* (1833). His most celebrated work, however, is *Histoire Naturelle des Poissons* (1829-49). This was begun in conjunction with Cuvier, after whose death it was carried on by Valenciennes, who left it incomplete, although he had extended it to twenty-two volumes. D. in Paris, Apr. 14, 1865.

Revised by F. A. LUCAS.

Valens: Roman Emperor of the East, 364-378 A. D., appointed by his brother VALENTINIAN I. (q. v.). A considerable part of the reign of Valens was devoted to the question of the Eastern boundary, but resulted in no definite settlement of it. In 376 the Goths were allowed to cross the Danube with a view to settling there peaceably, but they were treated with such perfidy and negligence of conditions by the representatives of the emperor that they sought restitution by force. After some reverses they defeated the Roman army, led by Valens, in the battle of Adrianople, in which the emperor lost his life. The Goths were thus permanently established S. of the Danube. **G. L. H.**

Valentia: See VALENCIA.

Valentine, MILTON, D. D., LL. D.: theologian; b. near Uniontown, Md., Jan. 1, 1825; graduated at Pennsylvania College (Gettysburg) 1850, and at the Lutheran Theological Seminary (Gettysburg) 1852; ordained to the ministry of the Lutheran Church Oct. 4, 1852; preached in Winchester, Va., 1853-54, and in Greensburg and Adamsburg, Pa., 1854-55; principal of Emaus Institute, Middletown, Pa., 1855-59; pastor of St. Matthew's church, Reading, Pa., 1859-66; became Professor of Ecclesiastical History at 1 Church Polity in the Lutheran Theological Seminary 1866; president of Pennsylvania College 1868-84; since Sept. 24, 1884, Professor of Didactic Theology and chairman of the faculty in the Lutheran Theological Seminary; author of *The Relation of the Family to the Church: Justification*

Faith; The Dynamics of Success; Knowledge by Service; Truth's Testimony to its Servants; Is the Lord's Day only a Human Institution? Absolute Christianity; Natural Theology, or Rational Theism (Chicago); and of numerous articles in the *Evangelical Review*, *Lutheran Quarterly*, *Homiletic Review*, *Magazine of Christian Literature*, *Quarterly Review of the Evangelical Lutheran Church*, of which he was co-ordinate editor 1871-76.

Valentine's Day, Saint: Feb. 14, observed in commemoration of St. Valentinus, a Christian martyr, who was decapitated in 270 A. D., during the Claudian persecution at Rome. The custom of sending valentines (sentimental or comic love-messages, often in rhyme, and adorned with ornamental or grotesque devices) is a very ancient one. Some tell us that on this day the birds select their mates; others trace the custom to the Roman Luperalia (Feb. 15), when similar practices were observed. Traces of the custom have been detected among the observances of the northern pagans of ancient Europe. Hence it is not probable that the tradition ascribing its origin to a commemoration of the loving and charitable disposition of St. Valentinus is the true origin of the observation.

Valentinian: the name of three Roman emperors. VALENTINIAN I. (364-375) was an officer under Julian and Jovian, and had risen to a prominent position when, on the sudden death of Jovian, he was raised to the imperial dignity by the officers of the army, at Nicæa. He made his brother VALENS (*q. v.*) Emperor of the East, and proceeded to Italy. He was a man of military talent, and a laborious and prudent administrator. His reign was chiefly occupied with campaigns in defense of the borders, and for a time he checked the inroads of the barbarians by successful operations in various parts of the empire—Britain, Africa, and the Germanic frontier. His favorite residence was Treves. He was succeeded by his sons Gratian and VALENTINIAN II., an infant of four at the time of his father's death. During the brief life of this emperor the imperial power rested in the hands of Gratian, until his death (383 A. D.), and afterward virtually in the hands of THEODOSIUS (*q. v.*), Emperor of the East. He died in 392 A. D.—VALENTINIAN III. (425-455), a son of Constantius and Placidia, the sister of Honorius, was only six years old when his uncle, Theodosius II., Emperor of the East, established him as Emperor of the West. His mother, who governed in his name, was entirely under the control of the clergy, and the empire suffered severely from the rivalry between Bonifacius and Aëtius. In spite of the great military ability of the latter, who defeated Attila at Châlons-sur-Marne in 451, the West Roman empire now began to crumble. Most of Africa fell into the hands of the Vandals; Britain was entirely given up; Merida in Spain was taken by the Suevi; and along the Rhine and the Danube one strong outpost after another was lost. In 450 Placidia died, and in 454 the emperor killed Aëtius with his own hand, jealous of his merits and afraid of his power. In the following year, however, Valentinian himself was murdered by Petronius Maximus on the Campus Martius in the midst of a great crowd which looked on with indifference.

Revised by G. L. HENDRICKSON.

Valentinians: a Gnostic sect founded by Valentinus, supposed to have been an Egyptian by birth. He lived in Alexandria and Cyprus, and taught in Rome from 140 to 160. Of all the Gnostic systems, that of Valentinus was the most elaborate and the most interesting, and it was still further developed by his pupils, among whom were Ptolemæus, Secundus, Heracleon, Axionius, and others. In this system the great mythological apparatus which the Gnostics employed is spiritualized, transformed into speculative elements, personifications of ideas, etc., and permeated with Christian ideas in regard to the love of the Father and the desire for communion with the Father. With this character of the system it was natural that the Valentinians should enter into a much closer connection with the pagan religions than any of the other Gnostic sects, as they considered paganism not as an aberration of the human mind, but as a divinely ordained preparative to Christianity. The principal source of knowledge of this sect is Irenæus, *Adversus Hæreses*.

Revised by S. M. JACKSON.

Valentinois, Duchess of: See DIANE DE POITIERS.

Valen'za (anc. *Forum Fulvii Valentinum*): town; in the province of Alessandria, Northern Italy; on the right bank of the Po; 9 miles by rail N. of the city of Alessandria (see map of Italy, ref. 3-B). It was formerly a place of

great strength, but its walls and fortifications were destroyed in 1805 by Bonaparte. The inhabitants are engaged in agricultural and manufacturing industries, and popular education receives considerable attention. Pop. 6,500.

Valera y Alcalá-Galiano, vā-lā'ra'-ee-āl-kā-lā'gā-li-aa-nō, JUAN: statesman, novelist, and critic; b. at Cabra, near Cordova, Spain, Oct. 18, 1824. Of distinguished family, he was destined at first for jurisprudence; but he turned to diplomacy, and went as secretary of legation to Naples, Lisbon, Rio de Janeiro, Dresden, and St. Petersburg. Finding himself out of sympathy with the government of O'Donnell, he returned to Spain and became collaborator on the journal *El Contemporáneo*, the organ of the leader of the opposition, at that time Alvarada. In 1859 he was elected deputy, and soon after, Alvarada having succeeded O'Donnell, he became Minister of Commerce and Agriculture. When Narvaez came to power he lost his office, but a little later, O'Donnell having once more prevailed by the aid of a liberal programme, he was sent as ambassador to Frankfort. Here he remained till 1866. Returning to Spain, he took a prominent part in the revolution of 1868. He was twice Minister of Education under the new régime, and was one of the deputation that offered the throne to Amadeo of Savoy, Duke of Aosta, in 1870. Though a liberal, he did not sympathize with the effort to establish a republic which succeeded Amadeo's short reign. Upon the re-establishment of the monarchy in the person of Alfonso XII., he was again employed in the diplomatic service of Spain, going as ambassador to Lisbon, Washington, and Brussels. Returning once more to Spain, he was made senator and member of the Council of State. He is also a member of the Spanish Academy, and of many other literary and scientific bodies.

Though thus eminent in public affairs, the lasting fame of Valera will be mainly due to his work as a man of letters. His wide knowledge of the world, his acquaintance with the best thought of many countries, his cosmopolitan sympathies, make him notable; but, above all, his style—the most delicate, subtle, gay, and delightful to be found in any modern Spanish writer—insures him a high place in the literary history of his country. His literary *début*, apart from some scattered contributions to periodicals, was made in the volume *Poesías* (1858). Some of these poems show great felicity of expression; but prose was to be the true medium of his utterance. He began in the latter with criticism, and there appeared a succession of critical articles from his pen, which in 1864 he collected in the volume *Estudios críticos sobre literatura, política, y costumbres de nuestros días*. An ampler collection was *Disertaciones y juicios literarios* (1882), and this has been followed by *Nuevos estudios críticos* (1888); *Cartas americanas* (1889); and *Nuevas cartas americanas* (1890). Valera has obtained still greater success, however, as a novelist, and his *Pepito Jiménez* (1874); *Las ilusiones del doctor Faustino* (1876); *El comendador Mendoza* (1877); *Pasare de listo* (1878); and *Doña Luz* (1878) are perhaps the most widely known and most frequently translated of all recent Spanish novels. In the short tale he has been no less fortunate, and several of the pieces in his collected *Cuentos, diálogos, y fantasías* (1882; new ed. 1887) are already, and deservedly, classics. There is also much that is extremely felicitous in his *Tentativas dramáticas* (1878; 3d ed. 1880). He is also the author of a translation into Spanish of Count von Schack's *Poesie und Kunst der Araber in Spanien und Sicilien*. The best collected edition of Valera's works is to be found in the *Colección de Escritores Castellanos* (7 vols., Madrid, 1886-90).

A. R. MARSH.

Valerian [viâ O. Fr., from Late Lat. *valeria'na*, valerian, appar. from some person named *Valerius*]: a plant of the genus *Valeriana* (family *Valerianaceæ*). The most important species is *V. officinalis*, the root of which is used in medicine. This plant, called also the "great wild valerian," is a native of Europe, but is cultivated also in the U. S., in Vermont, New Hampshire, and New York. It is an herbaceous perennial plant, the stem being erect and round, rising from 2 to 4 feet, and bearing small white flowers in terminal panicles. The fruit is a capsule containing a single oblong seed. The root consists of an upright root-stock about as thick as the little finger, from which spring numerous slender cylindrical rootlets about 3 or 4 inches in length. This root, though nearly odorless when fresh, develops a strong and peculiar smell upon drying. The taste is somewhat bitter, acrid, and disagreeable. The important ingredient of the drug is a pale-greenish volatile oil (oil of valerian), which is present in the proportion of from 1½ to 2

per cent. This oil, when fresh, has but little smell, but on exposure it slowly acidifies, becomes yellow and thick, and acquires a strong valerian smell. There is developed a peculiar acid. (See VALERIC ACID.) This acid combines with bases to form soluble salts, which retain to a certain degree the odor of the acid. The active principle of valerian root is the volatile oil. This, in experiments upon animals, is found to deaden feebly the reflex excitability of the spinal cord. Upon man, preparations of valerian sometimes reduce undue nervous irritability, and are therefore resorted to in affections characterized by this condition, such as hysteria, chorea, and milder forms of so-called nervousness. The valerianates of ammonium, quinine, and zinc are official medicines, but their effect is inferior to that of the oil or preparations of the root. A curious property of valerian is the attraction of its smell for cats. These animals seem to sniff the plant from a long distance, and are said to be excited to a kind of frenzy by it, during which they display strong sexual excitement.

Revised by H. A. HARE.

Valerian: Roman emperor from 253 to 260 A. D. His reign was unimportant, and he did little to check the dissolution of the empire. In an expedition against the Persians he was captured, and died several years afterward in captivity.

G. L. H.

Valerianos, Apostolos: See PECA, JUAN, de.

Valerie or Valerianic Acid [*valerie* (or *valerianic*) is deriv. of *valerian*, from the root of which inactive valeric acid is obtained]; a compound first obtained in 1817 by Chévreul from the fat of a dolphin, *Delphinium phocæna*, and by Grote in 1830 from the essential oil of VALERIAN (*q. v.*). It is also called *delphinic acid*, *phocænic acid*, and *butyrylcarbonic acid*. Its formula is $C_{11}H_{16}O_2$. In the vegetable kingdom it occurs in the berries of *Viburnum opulus*, in the angelica-root, in the root of *Athamantia oreoselinum*, and in the bark of the elder-tree; in the animal kingdom it is found in numerous animal oils and in the products of the oxidation of oleic acid and other fats. It is likewise contained in decayed cheese. The acid can be obtained by passing the vapor of amylic alcohol through a tube filled with a mixture of lime and soda, and heated to 400° F., and decomposing the sodium valerate produced by the distillation with sulphuric acid; but the best method for its preparation consists in the oxidation of amylic alcohol, which is accomplished by gradually adding a mixture of the alcohol and concentrated sulphuric acid to a solution of potassium dichromate, and heating the liquid in a flask provided with an inverted condenser, after which the liquid is distilled, and the distillate neutralized with sodium carbonate. The amylic valerate contained in the distillate is next removed by distillation, and the residue of sodium valerate is dissolved in water and distilled with sulphuric acid, when a fluid passes over consisting of an aqueous solution of valeric acid mixed with a hydrated acid containing 1 equivalent of water, from which it can be separated by redistillation. Valeric acid forms a limpid, colorless oil, possessing a sour, burning taste and a powerful odor, resembling that of valerian-root, also like that of rancid cheese and butyric acid. It has a sp. gr. of 0.955 at 32° F., remains liquid at 0° F., and boils at 317° F., the density of its vapor being 3.66. If the active modification of amylic alcohol is used for its preparation, the resulting acid exerts a rotatory power on polarized light. Valeric acid is sparingly soluble in water, but dissolves in all proportions in alcohol and in ether; also in concentrated acetic acid. It unites with water, forming a definite hydrate, $C_3H_{10}O_2 \cdot H_2O$, which is also produced upon decomposing a valerate with strong sulphuric acid. This hydrate is also oily, but it possesses a lower boiling-point than the anhydrous acid. When a mixture of calcium formate and valerate is submitted to dry distillation, *valeral* or *valeraldehyde* ($C_3H_{10}O$) is formed, this compound being also produced by the partial oxidation of amylic alcohol. Valeric acid is related to amylic alcohol in the same way as acetic acid is to ethylic or common alcohol, valeral being the compound corresponding to ordinary aldehyde. It is a monobasic acid, and forms neutral (also a few acid and basic) salts, which are obtained by direct saturation. The valerates are odorless when dry, but if moistened or treated with dilute sulphuric acid, they emit the characteristic and unpleasant odor of valeric acid; with the exception of silver and mercury valerates, they are soluble in water. Besides the form of valeric acid described, two other modifications have been obtained—one by the oxidation of normal amylic alcohol, the other from tertiary butylic alcohol.

Valerius Antias: a Roman historian of the first century B. C. who was one of the chief sources of Livy. His voluminous history in at least seventy-five books, covering the period from the founding of the city down to Sulla, was characterized by great exaggeration. For the fragments, see H. Peter, *Historicorum Romanorum Fragmenta* (Leipzig, 1883).

M. W.

Valerius Flaccus, GAIUS: See FLACCUS, GAIUS VALERIUS.

Valerius Maximus: a compiler of a large collection of historical anecdotes, *Factorum et Dictorum memorabilium Libri IX*, dedicated to the Emperor Tiberius, which is still extant, as well as two epitomes of it made about the fifth century by Julius Paris and Januarius Nepotianus. During the Middle Ages the book, which is not without value to the student of history and antiquities, was much read and highly esteemed; there were fourteen distinct editions of it before 1490. Critical editions have been given by Hase (Paris, 1822), Kempf (Berlin, 1854, and Leipzig, 1888), and Hahn (Leipzig, 1865). There is an English translation by W. Speed (London, 1678).

Revised by M. WARREN.

Valerius Probus: See PROBUS, MARCUS VALERIUS.

Valetta: capital of the island of Malta; on a rocky promontory of the northeastern coast which forms two large, deep, and safe harbors (see map of Italy, ref. 11-F). These harbors, as well as the whole city, are strongly fortified by lines of works, mostly hewn into the rock, and defended by forts, of which St. Elmo, on the extremity of the promontory, is the most important. On account of its harbors and fortifications, Valetta has been made the station of the British fleet in the Mediterranean, and it is regularly visited by all steamers crossing this sea. Thus it became a point of great military and commercial importance, and although it has no manufactures and no natural resources, it is still increasing. It was named after its founder, Valette, Grand-master of the Knights of St. John, who defended it against the Turks in 1565. In the cathedral and palace are many interesting monuments from the times of the Knights of St. John. Valetta also has a university and a public library, both of which were founded by the knights. Pop. (1891), with the suburbs, 62,152. Revised by M. W. HARRINGTON.

Valette, vañ let, JEAN PARISOT, de la; soldier; b. in 1494 in Toulouse, France; entered very early the order of St. John, and distinguished himself so much that in 1557 he was chosen grand-master of the order. In this rank he fought the Turks with great effect, and finally roused the wrath of the Sultan Suleiman to such a pitch that he determined to annihilate the order. Accordingly, a magnificent Turkish armament, consisting of over 150 vessels of war and 30,000 select troops, appeared off the coast of Malta before the fortifications of Valette on May 18, 1565, and a most memorable siege began. La Valette had between 8,000 and 9,000 men, but of these only 700 were knights; the rest were militia, the inhabitants of the island. With this force he resisted the furious attacks of the Turks until Sept. 8, when the number of his men had dwindled down to 600, and when the Viceroy of Naples arrived with re-enforcements. The Turks embarked; once more, however, they returned, but were completely routed and driven off. La Valette died in Valetta, Aug. 21, 1568.

Revised by F. M. COLBY.

Valgius Rufus: a Roman poet, friend of Horace, who was consul 12 B. C. He wrote not only elegies and epigrams, but also rhetorical, grammatical, and botanical treatises. For the scanty poetical fragments, see Baehrens, *Fragmenta Poet. Rom.* (Leipzig, 1886).

M. W.

Valhal [from the Icelandic *Valhöl*, which means the hall of the slain; written also VALHALLA and WALHALLA (*q. v.*); in Scandinavian mythology, the most important and the most magnificent hall in Asgard, where Odin receives and welcomes the gods and all the *einherjes*, that is to say, the brave warriors, who fall on the field of battle. Valhal is large and resplendent with gold; spears support its ceiling; it is roofed with shields, and coats-of-mail adorn its benches. Swords serve the purpose of fire, and, according to the *Elder Edda*, it has 640 doors, each of which is so wide that 960 *einherjes* may enter side by side. Outside of Valhal stands the shining grove Ghaser, the leaves of which are of red gold. The heroes in Valhal eat flesh from the boar Sæhrimmer. This boar is cooked every morning and becomes whole again every night. The she-goat Heidrun stands above Valhal and feeds on the leaves of the famous tree Lerad, and from the teats of the she-goat flows mead in such abundance that every day a bowl, large enough to hold more than would

suffice for all the heroes, is filled with it. And still more wonderful is what is told of the stag Eikthyrner, which also stands over Valhal and feeds upon the leaves of the same tree. While he is feeding so many drops fall from his antlers down into Hvergelmer that they furnish sufficient water for the thirty-six rivers that issuing thence flow twelve to the abodes of the gods, twelve to the abodes of men, and twelve to Nifheim. See *The Prose Edda*, under EDDA, and SCANDINAVIAN MYTHOLOGY. RASMUS B. ANDERSON.

Valkyries, *vǫl-keer yáz* [from the Icelandic *Valkyrjur*, i. e. choosers of the slain]: maidens sent out by the god of war Odin to every battle-field to make choice of those who are to be slain and to turn the tide of battle. They are also called VALMAIDS (*valmeyjar*). The youngest of the norms, Skuld, also rides forth to choose the slain and turn the combat. The Valkyries serve in Valhal, where they bear the drink, take care of the drinking-horns, and wait upon the table. More than a dozen Valkyries are named in the *Elder Edda*. In the old sagas there are accounts of loves between Valkyries and earthly heroes, but such connections were not happy, being always followed by the premature death of the hero. See *The Prose Edda*, under EDDA. R. B. A.

Valla, LAURENTIUS (*Lorenzo della Valle*): humanist; b. in Italy in 1407, probably in Piacenza (though he delighted to call himself *Romanus*); educated in Rome by Lionardo Bruni and Anrispa; itinerant Professor of Rhetoric, Philosophy, and Classical Languages in Pavia, Milan, Genoa, Ferrara, and Mantua; was called to Naples by Alfonso V. in 1442. Owing to his denial of the apostolic authorship of the *Symbolum Apostolicum* and other equally heterodox demonstrations, he was accused of heresy and saved from death at the hands of the Inquisition only by the intervention of his patron, the king. Thereafter he was in Rome holding various important offices under Nicholas V. and Calixtus III., having also been appointed Professor of Rhetoric in Rome in 1450, where he died Aug. 1, 1457. In intellectual ability and lasting influence Valla is perhaps the greatest among his great humanist contemporaries. His audacity in combating long-cherished traditions in literary criticism no less than in religion made his life one of continual warfare and bitter controversy. His very first essay, a comparison between Cicero and Quintilian, to the great disparagement of the former, brought down upon him all the Cicero idolaters of the time, with Poggio at their head. Among the classical and theological writings of Valla only a few can be mentioned here. His Latin translations of Herodotus and Thucydides were justly celebrated, but his masterpiece is the *Elegantia Latina* (1444; 59th ed. 1536). It was for centuries the standard work on Latin style, a kind of court of appeals of correct usage. With its appearance the Latin language may be said to have ceased to be a living tongue. His *Adnotationes* to the New Testament, in which the Vulgate was for the first time subjected to a comparison with the Greek original, was re-edited by Erasmus, and the famous treatise *De falso credita et ementita Constantini Donatione* (1440) was republished by Ulrich von Hutten and dedicated to the pope. Cf. Joh. Vahlen, *Lorenzo Valla* (1870, 2d ed.) and *Laurentii Valla opuscula tria* (1870); G. Voigt, *Wiederbelebung des classischen Alterthums* (vol. i.); J. A. Symonds, *Renaissance in Italy*; Ch. Nisard, *Les gladiateurs de la République des lettres aux XI^e, XII^e, XIII^e siècles* (1860); Mancini, *Laurentius Valla*; and M. Wolff, *Laurentius Valla, sein Leben und seine Werke* (Leipzig, 1893). ALFRED GUDEMAN.

Valladolid': capital of the province of Valladolid, Spain; on the Piserga; 150 miles by rail N. W. of Madrid (see map of Spain, ref. 14-E). It communicates by the Duero and a vast system of canals with the Atlantic and the interior. It is on a plateau, 2,100 feet above the level of the sea, and noticeable on account of its healthful and genial climate. The surrounding district is very fertile and has abundant water for purposes of irrigation. The city was from the beginning of the fifteenth century till 1560 the capital of the Spanish empire, and had at that time over 100,000 inhabitants. It was adorned by Charles V. and Philip II. with many magnificent buildings. After the removal of the royal residence to Madrid, it fell into decay, and many of its buildings were much damaged by the French soldiery under the occupation in 1810. Its manufactures of silk, yarn, perfumery, pottery, paper, and leather have been enlarged and its trade has increased. Its university was founded in 1346, and in 1894 had 900 students. It is celebrated as a school of jurisprudence. Pop. (1887) 62,018. Revised by M. W. HARRINGTON.

Valladolid: See COMAYAGUA and MORELIA.

Vallanc'ey, CHARLES, LL. D. (originally *Vallence*): antiquarian writer; b. in England in 1722; entered the Royal Engineers and attained the rank of general in 1803; was stationed several years in Gibraltar, but for the most of his life in Ireland. D. in Dublin in Aug., 1812. He was an earnest but over-ardent student of the Irish language and Irish antiquities, and aimed ever at results which in the present advanced knowledge of philological principles appear most fantastic. Besides translations of two engineering treatises from the French, he produced the *Collectanea de Rebus Hibernicis* (6 vols., 1770-1804), consisting of antiquarian researches, etc.; an *Essay on the Antiquity of the Irish Language, etc.* (1772); a *Grammar of the Ibero-Celtic or Irish Language, with an Essay on the Celtic Language* (1773); an *Essay towards illustrating the Ancient History of the Britannie Isles* (1786); the *Ancient History of Ireland proved from the Sanscrit Books of the Braminus of India* (1797). He also reprinted an excerpt from the *Collectanea*, the *Vindication of the Ancient Kingdom of Ireland*, and issued a *Prospectus of a Dictionary of the Language of the Aire Coti or Ancient Irish, compared with the Language of the Cuti, or Ancient Persians, etc.* Revised by J. D. M. FORD.

Vallan'digham, CLEMENT LAIRD: politician; b. at New Lisbon, O., July 29, 1820; received an academic education and taught school; studied law, and was admitted to the bar in 1842; was member of the Ohio Legislature 1845-46; edited the *Dayton Empire* 1847-49, after which he devoted himself especially to politics. He was elected a representative in Congress in 1857, and re-elected for two subsequent terms. He was especially active in opposing the measures of the national Government in carrying on the civil war. Failing of re-election in 1863, he returned to Ohio, where at public gatherings he denounced the Government with great vehemence; was arrested by order of Gen. Burnside, who commanded the department of the Ohio; tried by court martial in Cincinnati and sentenced to close confinement during the war—a sentence which President Lincoln commuted to banishment beyond the lines. Dissatisfied with his reception by the Confederates, he made his way to Bermuda, thence to Canada, and while there was nominated by the Democratic party as Governor of Ohio, but was defeated by more than 100,000 votes. He soon returned to Ohio, was not molested, and in 1864 was an active member of the national Democratic convention at Chicago. D. at Lebanon, O., by the accidental discharge of a pistol in his own hands, June 17, 1871.

Vallauri, *vǫal-low'réé*, TOMMASO: classical scholar; b. at Chiusa di Cuneo, Italy, Jan. 23, 1805; studied in Turin and was appointed professor at the university there in 1843; a very prolific author and one of the foremost of modern Italian philologists, and distinguished for his elegant Latin style. Among his works are editions of Horace, Cicero's orations, Sallust, Curtius, and several plays of Plautus; *Historia critica litterarum Latinarum* (13th ed. 1888); *Epitome historie Græcæ* (10th ed. 1887); *Epitome historie Romanæ* (5th ed. 1876); *Storia della poesia in Piemonte* (2 vols., 1841); *Storia della università degli studi del Piemonte* (3 vols., 2d ed. 1875); *Opuscula varia* (1875 and 1876). See his *Autobiography* (Turin, 1879). A. G.

Vallejo, *vaa-lá'ho*: city; Solano co., Cal.; on an arm of San Pablo Bay, opposite Mare island navy-yard, and on the S. Pac. Railroad; 26 miles N. E. of San Francisco (for location, see map of California, ref. 7-C). It is in an agricultural region; has a spacious harbor; and contains water, gas and electric-light plants, a State bank with capital of \$95,000, 2 daily and 2 weekly newspapers, public library, orphan asylum, shipyards, terra-cotta works, iron-foundries, and machine-shops. Large quantities of grain are shipped from this point. Pop. (1880) 5,987; (1890) 6,343; (1895) estimated, 7,500. EDITOR OF "EVENING CHRONICLE."

Valentine, BENJAMIN BENNATON: journalist and author; b. in London, England, Sept. 7, 1843; educated in Birmingham; studied for the English bar; traveled extensively; was one of the founders of *Puck* and its editor 1877-84; has been connected editorially with various New York newspapers; is a dramatic critic of *The New York Herald*; author of *The Fitznoodle Papers* (1882); *Fitznoodle in America* (1885); *The Lost Train* (1894); and other stories, besides several dramas, of which *Lord Fitznoodle* met with considerable success.

Valle'ria, ALWINA (full name *Alvina Valleria Lohmann*): opera-singer; b. in Baltimore, Md., Oct. 12, 1848; studied at the Royal Academy of Music, London, where she made her first appearance June 2, 1871. She sang in Italian opera in St. Petersburg, Milan, various German cities, London, and New York. From 1882 till 1886 she was with the Carl Rosa English Opera Company, creating the parts of Nadeschda in Goring Thomas's opera of that name and Margarida in Mackenzie's *Troubadour*. In 1877 she was married to R. H. P. Hutchinson, of Husband's Bosworth, near Rugby, England. D. E. HERVEY.

Valle y Caviedes, vaal yā-ee-kaā-vē-ā dās, JUAN, del: satirical poet; b. at Lima, Peru, in 1652. He inherited a considerable fortune, and was in Spain 1672-75; subsequently he led a very dissipated life, and at one time was forced to keep a small shop for a living. Grief caused by the loss of his wife plunged him into fresh excesses, and he died in Lima in 1692. He is known only for his *Diente de Parnaso*, first published in 1874. It is a biting satire directed against physicians, and is regarded as one of the most notable poems of its kind in Spanish. H. H. S.

Valley City: village; capital of Barnes co., N. D.; on the Cheyenne river, and the Minn., St. P. and St. Ste. M. and the U. Pac. railways; 14 miles E. of Sauborn, and 58 miles W. of Fargo (for location, see map of North Dakota, ref. 3-F). It is in an agricultural, dairying, and stock-raising region, and contains the State Normal School, a national bank with capital of \$50,000, and a monthly and four weekly periodicals. Pop. (1880) 302; (1890) 1,089.

Valley Falls: city; Jefferson co., Kan.; on the Delaware river, and the Atch., Top. and S. Fc., the Kan. City, N. W., and the Union Pac. railways; 25 miles N. E. of Topeka, and 35 miles W. of Leavenworth (for location, see map of Kansas, ref. 4-1). It is in an agricultural region; has excellent water-power, which is utilized by several mills and factories; and contains a large grain elevator, a State bank with capital of \$10,000, 2 private banks, and 2 weekly newspapers. Pop. (1880) 1,016; (1890) 1,180; (1895) 1,172.

Valleyfield: a town in Beauharnois County, Quebec, Canada; near the head of the Beauharnois Canal, built to avoid the rapids on the St. Lawrence; 6 miles from Coteau Landing, which is on the northern side of the river, and 38 miles from Montreal (see map of Quebec, ref. 5-B). The Grand Trunk Railway connects Valleyfield with Montreal by the Victoria Bridge route, the Canada Atlantic crosses the river here by a magnificent bridge, and the N. Y. Cent. and Hud. Riv. Railroad has a branch ending at Valleyfield. The water-power is extensive and profitably utilized by a cotton-mill, that employs 1,500 people. The place is the residence of a Roman Catholic bishop. Besides the cathedral there are several fine public buildings, including a handsome school-house. Pop. (1891) 5,516. J. M. HARRER.

Valley Forge: village; Schuylkill township, Chester co., Pa.; on the Schuylkill river, and the Phila. and Read. Railroad; 4 miles S. E. of Phoenixville, 24 miles W. of Philadelphia (for location, see map of Pennsylvania, ref. 6-1). It was here that the American army under Washington encamped from the middle of Dec., 1777, till June 18, 1778, when it started in pursuit of the British across New Jersey. Washington selected the place for winter quarters in order to protect the Congress which, on the occupation of Philadelphia by the British, had adjourned from that city to York. It was here also that Baron Steuben assumed the office of inspector-general of the army, and that Washington announced, May 6, 1778, the treaty of alliance with France. The American troops numbered about 11,000, of whom only about half were fit for active service, and all suffered severely from cold and hunger during the winter. Steps have been taken to secure the site of the encampment for a national reservation.

Valleys: lowlands partly or wholly surrounded by uplands. The term is sometimes used (1) in a broad sense so as to include all depressions of the land surface, not excepting the narrow gorges of streams, but is more commonly restricted to (2) depressions of considerable size with bottoms of gentle slope as compared to the sides. It is also applied to (3) the catchment areas of streams, and in this sense is synonymous with basins. Under the first meaning, gorge, cañon, glen, dale, crater, etc., are subordinate varieties, and the term *valley proper* is ordinarily used to designate the type covered by the second meaning. In this article the second definition is assumed. Valleys exhibit great variety

in configuration, climate, vegetation, structure, and physical history. They rival plains in adaptation to the needs of man, and as they abound in all parts of the earth they hold a large share of the human population.

The student of physical geography, watching the gradual washing down of slopes by rains and rivers, observes that the whole surface of the land would be reduced to a monotonous plain if there were no compensatory agencies whose work tended toward diversity of surface. The agencies which initiate diversity are of two types, both operating beneath the surface. By diastrophic forces the earth's crust is wrinkled or fractured and thus thrown into ridges; by volcanic forces molten rock is made to issue at the surface and build up mountains and tables. The depressions between mountains thus constructed are valleys, and yet other valleys are hollowed out of uplifted plateaus by the action of streams of water or streams of ice. Valleys may thus be classified according to mode of origin as diastrophic, volcanic, aqueous, and glacial. The physiographic processes to which they owe their origin are described in GEOLOGY and PHYSIOGRAPHY (qq. v.).

Diastrophic Valleys.—When a portion of the earth's crust having a plain surface is subjected to powerful forces acting from one side, its compression results in the production of a series of wrinkles on the surface, and the plain is replaced by a parallel system of ridges and valleys. The valleys may sometimes be depressed below the original level of the plain, but ordinarily their depression is only relative as compared to the adjacent ridges, and they are actually somewhat lifted. If the deformation were rapidly produced the valley sides would be smooth and even; but in all known instances the change of form has been so gradual that the bounding ridges have been deeply carved by streams during the period of their uplifting, and the valley walls are consequently irregular, with many salients and re-entrants. The origin of the valley is therefore not fully revealed by its configuration, but requires for its determination a study of the rock structures. Valleys of this simple type exist in the Jura Mountains of Europe, but are unknown in North America. Often the compressive forces, instead of merely flexing the rocks, break them into huge blocks, which are so displaced as to produce ridges and valleys at the surface. Sometimes the fractures are vertical, and the blocks are unevenly lifted; sometimes the fractures are somewhat oblique, and each block is tilted so as to have one edge lower than the other; sometimes the fractures are highly inclined, and one block is made to slide over another. Thus the greatest diversity of configuration is produced, and the resulting valleys may be long narrow troughs or comparatively short and broad. As a rule, one or more of the valley walls is cliff-like, but such original character may be destroyed by contemporary erosion. The U. S. affords many examples. The great valley of California, caused by the uplift of the Sierra Nevada at the E. and the Coast Ranges at the W., is 400 miles in length and 50 or 60 in width. Its bottom is a great plain leveled by the spreading of detritus washed down from the adjacent mountains, especially from the Sierra, which is lofty and broad. In the region of the Desert Ranges, which occupy the greater part of Nevada, Arizona, and New Mexico, parallel narrow mountain ridges stand 20 or 30 miles apart and divide the land into a great number of valleys. The detritus eroded from the mountains is received by the valleys and has been accumulated to great depth, so that all the down-thrown blocks, as well as the lower margins of the tilted blocks, are buried from sight. Rainfall in that region is small, and comparatively little of the drainage finds its way to the ocean. During periods of storm many of the valleys hold temporary lakes by which the detritus is spread in level plains, and from these valley floors alluvial slopes rise, at first gently and then more steeply, to the mountain bases. Other valleys, lying somewhat higher and discharging their storm waters to lower neighbors, are traversed midway by water channels, usually dry, from which long alluvial slopes rise to the bordering mountains. In the Rocky Mountains of Colorado, and to a certain extent in the mountains of Montana and Northern Idaho, the valley troughs lie so high that their bottoms are still more thoroughly drained, and from these most of the alluvium is carried away, so that the valley floors are narrow.

Volcanic Valleys.—Where eruption takes place from many vents in the same district, the accumulation of the ejected material is apt to be irregular, and among its heaps valleys are sometimes inclosed. The San José valley of Costa Rica

is of this type. Large craters, due either to explosion or subsidence, occasionally assume the character of valleys. The Val del Bove, on the flank of Mt. Etna, is believed to be an explosion crater, and the Asosan valley of Japan, described by Milne, is probably a crater of subsidence.

Aqueous Valleys.—As soon as any mountain ridge or plateau is lifted above the surrounding plain, its erosion is begun by the streams which flow from it or across it. Those streams whose original directions coincide with the slopes produced by the uplift have their grades increased, and are thus stimulated to erosive activity; they cut their channels deeper, and their courses are soon so far below the general level that they can not easily be diverted. Streams flowing in such directions that the newly created slopes diminish their grades have their erosive power impaired. They are diverted to new courses unless they have great volume, in which case they may hold their places, sawing deep cuts through the upland as it rises. The diverted streams also begin the work of trenching along their new courses; and thus the whole drainage system of the rising tract comes to flow in gorges. When uplift ceases the streams continue to deepen the gorges, but after a time the work of other agents acquires greater relative importance. The walls of the gorges are attacked by frost and various other agencies that break up rocks, the fragments are washed into the streams and carried away, and thus the walls recede and assume gentler slopes. The slopes become gentlest near the streams, so that the V representing the cross profile of the gorge is converted into a shallow U. The reduction of the slopes lowers the crests of the ridges between the streams and especially between the minor tributaries. At the same time the main streams, losing the power to cut downward as they approach BASE LEVEL (*q. v.*), work laterally and develop flood-plains. Thus the gorges are converted into valleys. The position of each valley is determined by the position of its stream, and the valley is coextensive with that part of the stream basin which lies within the uplifted tract. Its perfect development depends on uniformity of rock texture, and as such uniformity rarely characterizes a great uplifted mass, the type is not readily illustrated by large examples. The processes of disintegration are resisted so much more stubbornly by some rocks than by others that in most cases the widening of a gorge proceeds at very different rates in different parts, and the valley phase is not reached everywhere at once. Most long streams traversing uplifted tracts pass from gorge to valley and from valley to gorge in alternation, each valley having its position determined in part by the stream, but chiefly by the presence of yielding rocks. The rivers of the Appalachian region have this general character, crossing sandstone and crystalline formations in narrow gorges and being bordered by valleys where the formations are of shale or limestone. The influence of rock texture is felt in yet another way. The divide between two streams is attacked by the storm rills tributary to both, and the rills having the steeper grade work the faster, enlarging the catchment basin of their stream. Thus all streams strive for territory. If contesting streams are equal in volume, length, etc., and traverse rocks of the same sort, their common boundary is stable; but if one of them encounters rocks of exceptional resistance its downcutting is retarded, its head-water grades become low, and its rival encroaches on its territory. (See *Migration of Divides* under RIVERS.) The general result of such encroachments is that small streams cease to cross hard rocks, resistant ledges come to be occupied by divides, and the outcrops of yielding rocks come to be occupied by streams and their valleys. Where an extensive tract of yielding rock is surrounded by more resistant formations, the readjustment of drainage may leave more than one stream valley within the tract, but in such case the divides between the stream valleys are low, and they constitute collectively a great valley coextensive with the yielding rock. The great Appalachian valley, extending from New York to Alabama, is of this type, the determining rock being a limestone which is rapidly degraded by solution.

Glacial Valleys.—Streams of ice also have power to make valleys by eroding soft rocks and leaving hard, but it is not easy to discover one which they have initiated. The valleys in which ice-work is recognized were temporarily occupied by glaciers in the Pleistocene period, but most or all of them had been previously occupied by rivers. Nevertheless the mountain glaciers were important valley-makers, for they broadened the bottoms of their channels and thus converted gorges into valleys. Yosemite, the mountain val-

leys of Tuolumne, Kern, and King rivers of California, and the Scottish glens were thus transformed by glacial erosion. See GLACIERS AND PLEISTOCENE PERIOD. G. K. GILBERT.

Vallisneria [named in honor of Antonio Vallisneri (1661-1730), an Italian botanist]: a genus of plants of the family *Hydrocharitaceæ*.

V. spiralis, a water or marsh plant common in the U. S. and in the south of Europe, is remarkable for its curious process of fecundation. The fertile or pistillate plants put up long, spirally twisted flower-stalks, which allow the flowers to float upon the surface; but the male flowers are held to the bottom by their short stems. Accordingly,

when the proper time for fertilization comes, the sterile or staminate flowers break their stems, rise, float upon the surface, and shed their pollen around the fertile flowers. The

Vallisneria spiralis—staminate and pistillate.

spiral stems of the latter (which are from 1 to 4 feet long) then contract and draw the fertilized germ under water, where it is perfected. The plant is abundant in Chesapeake Bay, where it is called wild celery, and upon its roots the canvas-back duck feeds. Other species are found in Australia, etc.

Revised by CHARLES E. BESSEY.

Valloubro'sa [Ital.; *valle*, valley + *ombrosa*, fem. of *ombroso*, shady]: a former Benedictine monastery in a valley of the Apennines, 15 miles E. from Florence. It was founded by St. John Gualbert in 1039. The present noble buildings were erected in 1638. This ancient and celebrated establishment acquired great wealth, but in 1869 it was suppressed by the Italian Government, which converted the buildings into a royal school of forestry. The order was the first to introduce lay brothers.

Valmore, vâl'môr'. MARCELINE FÉLICITÉ JOSÈPHE DESBORDES; actress and author; b. at Donai, department of Nord, France, June 20, 1785; was educated in Guadeloupe; made her first appearance on the stage as a singer after her return to France; married the tragedian Valmore in 1817; left the stage subsequently, and devoted herself to literature. She published several volumes of poems, *Élégies et Romances* (1818); *Élégies* (1824); *Les Pleurs* (1833); *Pauvres Fleurs* (1839); also several novels, including *L'Atelier d'un Peintre* (2 vols., 1833); *Le Salon de Lady Betty* (2 vols., 1836). See Sainte-Benue, *Madame Desbordes-Valmore* (1870; translated into English by Harriet W. Preston, Boston, 1872). D. in Paris, July 23, 1859. Revised by B. B. VALLENTINE.

Valmy, vâl'mee'. FRANÇOIS CHRISTOPHE KELLERMANN, Duke of: general; b. near Rothenburg, in Bavaria, May 28, 1735; served in the Seven Years' war, and was *maréchal-de-camp* when the French Revolution broke out in 1789. In 1791 he became general of the army of Alsace, and in the following year commanded the army of the Moselle. After joining Dumouriez he gave battle to the allies at Valmy (Sept. 20), where he gained one of the most important victories of this period. It secured France from invasion, and enabled the Convention to go on with its radical measures. Kellermann, being a moderate republican, was arrested in 1793 on suspicion of being lukewarm in the service of the Convention, and not taking vigorous measures against the city of Lyons, which he had been ordered to reduce. He remained in prison until the Thermidor reactionary revolution in 1794. After the first Italian campaign was well under way (1795), the Directory purposed to send Kellermann to share with Napoleon the responsibilities of the command, but the latter refused to go, saying that one bad general was better than two good ones. Kellermann commanded the army of the Alps, but found little opportunity to distinguish himself. In 1804 Napoleon made him Duke of Valmy, but in 1814 Kellermann voted for his deposition, and supported the restored Bourbons, who confirmed his title of duke, and made him a peer of France. D. Sept. 12, 1820. His son, FRANÇOIS ÉTIENNE KELLERMANN, Duke

of Valmy (1770-1835), is noted especially for his brilliant cavalry charge at the battle of Marengo in 1800. He also distinguished himself at Austerlitz and in the Waterloo campaign.

Valois, *va'l'wain'*: the name of a dynasty of France (1328-1589), so called from the ancient county of Valois, constituting a part of the present departments of Oise and Aisne. In 1285 Philip III. gave the county of Valois to his younger son, Charles (b. 1270; d. 1325), and when the direct line of the Capetian dynasty died out in 1328 with Charles IV., the eldest son of this Charles of Valois ascended the French throne under the name of Philip VI., and founded the dynasty of Valois. In direct succession from father to son the crown was borne by John the Good (1350-64), Charles V. (1364-80), Charles VI. (1380-1422), Charles VII. (1422-61), Louis XI. (1461-83), and Charles VIII. (1483-98), Charles VIII. having no male heirs, the crown fell to Louis XII. (1498-1515), the representative of the nearest collateral line, a grandson of Duke Louis of Orleans, the younger brother of Charles VI. As Louis XII. also died without male issue, the succession devolved once more upon a collateral line, and Francis I., a great-grandson of Duke Louis of Orleans, through his younger son, Charles of Angoulême, ascended the throne (1515-47). He was succeeded by his son, Henry II. (1547-59), who was married to Catherine de' Medici, and he again by his three sons—Francis II. (1559-60), Charles IX. (1560-74), and Henry III. (1574-89), with whom all the male lines of the house of Valois died out, and the French crown fell to the house of Bourbon, descending from Robert, the younger brother of Philip III., and represented by Henry IV., King of Navarre. The most prominent events during the reign of the house of Valois were the HUNDRED YEARS' WAR (*q. v.*) with England, the wars of conquest in Italy, and finally the civil or religious wars. Philip VI. ascended the throne, according to Salic law, as the nearest male heir of the Capet family, but his right was disputed by the English king, Edward III., who claimed the French throne for himself as a son of Isabel, daughter of Philip IV., arguing that the Salic law, although it excluded females from the succession, did not prevent them from transmitting a legitimate claim to their male heirs. Charles VII. finally succeeded in driving the English out of the country, but the English kings continued to bear the title of Kings of France up to George III. The Italian wars began under Charles VIII. with his conquest of Naples in 1495. Charles of Valois, the founder of the family, was first married to Margaret of Anjou-Sicily, by whom he obtained the counties of Anjou and Maine, and some very slender claims on the kingdom of the Two Sicilies. As his second wife he married Catherine of Courtenay, by whom he obtained some still thinner claims on the Byzantine empire, and he actually assumed the title of Emperor of Constantinople. On the basis of these claims, Charles VIII., two centuries later, invaded Naples, and meditated an attack upon the Turks from there. It was the idea of a world-empire, the ghost of the Roman empire, which haunted him. The last three kings of the house of Valois, the sons of Catherine de' Medici, were ruled by their mother, who in this way retained the supreme power in her control. The civil and religious wars were not the work of the Valois; they originated in Rome and the Escorial. See HUGUENOTS; also the biographical articles on the various kings. Revised by F. M. COLBY.

Valois, CHARLES, de: See ANGOULÊME, CHARLES DE VALOIS, DUKE d'.

Valparaiso, *vál-pá-ri-zō* (Span. pron. *vál-pá-ra-ee'sō*): a city and port of Chile, and the most important seaport of the Pacific coast of South America: on a bay in lat. 33° 1' S.; 68 miles (116 miles by rail) W. N. W. of Santiago (see map of South America, ref. 8-4). The harbor is commodious, but it is open to northerly storms; a breakwater and other improvements have been projected, and are completed in part. Originally, the town was on a strip of flat land fronting the water, and now occupied by the business portions; beyond this it has spread up the hillsides in many charming suburbs, the residences of the richer class; and Viña del Mar, a little to the E., is a noted seaside resort. Valparaiso is substantially built, clean, and pleasant, but it has few notable buildings. It is almost exclusively a commercial city, greatly surpassing Santiago in this respect. In 1890, 1,270 vessels entered the port, representing a tonnage of over 1,200,000. There is a large foreign population, and much of the trade is in the hands of British merchants. Most of the imports and a large part of the exports of Chile

pass through Valparaiso. The Government maintains here a naval arsenal, a naval school, etc., and the port is strongly fortified. There is cable communication with the northern coast and the U. S. Valparaiso was founded in Sept., 1514, was several times sacked by English and Dutch corsairs in the sixteenth century, and has suffered greatly from earthquakes and fires. On Mar. 31, 1866, it was bombarded by a Spanish fleet. The concluding battles of the civil war of 1891 were fought in its vicinity, and it was taken and partly sacked by the congressional troops Aug. 28. Pop. (1890) about 150,000. It is the capital of the province of Valparaiso, which has an area of 1,637 sq. miles and a population (1891) of 218,990. HEICURT H. SMITH.

Valparaiso: city; capital of Porter co., Ind.; on the Chi. and Gr. Trunk, the N. Y., Chi. and St. L., and the Penn. railways; 22 miles S. W. of La Porte, and 44 miles E. of Chicago (for location, see map of Indiana, ref. 2-C). It is in an agricultural region; contains the Northern Indiana Normal School, 6 churches, 2 large public-school buildings, 2 national banks with combined capital of \$150,000, a State bank with capital of \$35,000, and 2 daily and 3 weekly newspapers; and has an iron-foundry, machine-shops, and Iceland moss and self-winding clock factories. Pop. (1880) 4,461; (1890) 5,090; (1895) estimated, 7,000.

EDITOR OF "MESSENGER."

Valpy, ABRAHAM JOHN: classical scholar; b. at Reading, England, about 1787; educated at Pembroke College, Oxford; began business in London as a publisher and bookseller about 1808; was the publisher of several of the works of his uncle Edward and of his brother Frederick; originated *The Classical Journal* (1810) and *The Museum* (1822-25); brought out Barker's edition of Stephens's *Thesaurus* (8 vols., 1815-25); *The Family Classical Library, a Series of English Translations*, etc. (52 vols., 1830-34); and a magnificently illustrated *Shakspeare* (15 vols., 1832-34); but the most valuable of his literary enterprises is his *Variorum* edition of the *Latin Classics* (141 vols., 1819-30). D. in London, Nov. 19, 1854. Revised by ALFRED GUDMAN.

Value: See POLITICAL ECONOMY.

Valued Policy Laws: See FIRE-INSURANCE (*Insurance Legislation*).

Valve [= Fr. < Lat. *val'va*, leaf of a double door, plur. *val'va*, folding-doors]: a cover to an aperture in a fluid-containing vessel, or a movable piece, like a door or gate, in a tube, so fitted as to permit when open, or to prevent when shut, the passage of a liquid, vapor, or gas into, from, or through the vessel or pipe.

Valves may be classified according to the method by which they are operated, as (1) by hand; (2) by independent mechanism; (3) by the motion of the machine which they regulate, such as a steam-engine; (4) by the action of the fluid, as safety-valves. They may also be classified with regard to the relative motion of the valve and its seat, as flap-valves, which rotate in opening; lift or puppet valves, which rise perpendicularly to the seat; and sliding-valves, which open parallel to the seat. They are also sometimes distinguished by the form of the moving part of the valve, as piston-valves, disk-valves, ball-valves, etc.

Probably the most ancient form of valve is the leather flap-valve, commonly used in small pumps, as shown at A, Fig. 1. The leather may be stiffened by a piece of wood or metal, as shown in the cut, one edge being left unstiffened to form the hinge. The rim of the aperture on which the valve rests when shut is called the valve-seat, and the portion of the valve which rests on the seat is called the face. Another form of valve, shown at B, Fig. 1, is called the disk-valve; this is a simple disk, frequently an annular disk, of metal, leather, or some other substance, which opens by a slight vertical lift. Both of these valves are automatic in their action—that is, they are moved by the motion of the liquid or gas

FIG. 1.

in the pump. The piston or bucket being raised, the pressure of the fluid in the chamber above B keeps it closed, while the suction or partial vacuum formed in the chamber beneath B causes the flap-valve, A, to open. When the bucket is lowered the flap-valve shuts and the pressure beneath B then becoming greater than the pressure above it, B opens, allowing the fluid to pass through the bucket. A flap-valve made entirely of metal is frequently used, as in the check-valve (Fig. 2). This is used to allow water to

flow from A to B, when the pressure at A is greater than that at B, and to prevent the flow in the reverse direction when the pressure at B is the greater.

Fig. 3 is a steam stop-valve. This is a disk-valve placed upon a spin-

FIG. 2.

FIG. 3.

dle, which is operated by a screw and hand-wheel. The smooth portion of the spindle to the left of the screwed portion passes through a packed stuffing-box, which prevents the leakage of steam around the spindle. A common form of valve for water-pipes, called a gate-valve, is shown in Fig. 4. The gate is a flat plate which slides in a grooved casing placed transversely to the axis of the pipe. A special form of gate-valve is shown in Fig. 5. In this there are two plates which are tightly

FIG. 4.

FIG. 5.

wedged against the circular valve-seats by the action of the screw after it has been rotated far enough to bring the plates into position opposite the seats. Fig. 6 is an air-valve for water-pipes, intended to be placed on a line of pipe to allow air to enter when the water is being drawn off, and to permit air to escape when the pipe is being refilled with water. When the pressure is on the pipe and the water enters and fills the chamber, A, it causes the float, C, to rise and close the disk above it against the valve-seat

FIG. 6.

FIG. 7.

at E. One of the most common forms of valve for pipes of all kinds is the globe-valve, Fig. 7, so called from the globular form of its casing. The valve shown in the cut is provided with a renewable disk of soft metal, asbestos, or packing of some kind, shown in dark shading, which makes a tight joint upon the valve-seat. Fig. 8 is known as an angle-valve. It is like the globe-valve, but the entrance and discharge are at right angles.

A common form of valve for pipes is called a cock; this consists of a slightly tapered plug, fitting accurately, and

rotating in a similarly tapered casing, placed transversely to the pipe, a hole being cut through opposite sides of the casing in the direction of the flow of the liquid, and a hole of the same size being cut in the plug. When the plug is so turned that its hole is in line with the holes in the casing the cock is open, and when it is placed so as to be at right angles to them the cock is shut. Fig. 9 shows a variety of this cock known as a three-way cock, which allows

FIG. 8.

FIG. 9.

the liquid to flow in any one of three different directions, according to the position of the plug. Fig. 10 is a cross-section of a three-way cock. The six shaded portions in the casing are plugs of asbestos packing which prevent leakage. This cock will open and close as follows: From port 1 to port 2, closing port 3; or port 1 to port 3, closing port 2; or port 2 to port 3, closing port 1. It will also close all three ports, and close any port before opening the other. All three ports can never be opened at one time.

FIG. 10.

The form of valve commonly used in steam-engine cylinders is known as the plain slide-valve, or D-valve, shown in Fig. 11. A is the valve which is moved to and fro on its seat by the valve-rod, B, which passes steam-tight through the stuffing-box, C. D is the steam-chest, E and F the steam-ports, and G the exhaust-port. These ports are cast with the body of the engine cylinder. In its central position, as shown, the valve covers both steam-ports. If the valve be moved to the left, so that the edge at A uncovers the opening to the port F, the inside edge of the other end of the valve will uncover E and establish a passage through the hollow portion of the valve, from E to G. The steam from the main steam-pipe then entering the steam-chest, D, will pass through the port F into the cylinder, driving the piston to the left, while the exhaust steam from the other side of the piston will pass through the ports E and G to the exhaust-pipe, not shown, with which G connects.

FIG. 11.

FIG. 12.

FIG. 13.

In order that the opening of the steam-port may be increased without increasing the travel of the valve, the D-valve is sometimes cast hollow, with an open passage through

its back, as shown in Fig. 12. This is known in the U. S. as the Allen valve, and in Great Britain as the Trick-ported valve.

FIG. 14.

It will be observed that while in the position shown in the cut, the valve being supposed to be moving to the right, there is as yet no opening for steam into the left-hand port from the left edge of the valve, but there is already an opening into this port from the other end of the valve through the back passage. The valve shown in Fig. 12 is also a balanced valve—that is, the pressure

FIG. 15.

in the steam-chest, which in the ordinary D-valve holds the valve down on its seat with great pressure, and in large valves is the cause of considerable loss of power by reason of the friction it occasions, is in this valve to a large extent relieved by means of the device shown on the back of the valve, which excludes the steam from the space between the back of the valve and the cover of the steam-chest.

Another form of valve which is frequently used for steam-engines, and which is perfectly balanced, is the piston-valve, shown in Fig. 13. It is essentially a slide-valve, but the valve faces and seats being cylindrical, and the ports extending entirely around the casing, the pressure of steam is equalized on all sides.

Fig. 14 is a partially balanced disk-valve. The water or steam enters between the two valves, and the upper one having a greater area than the lower, the pressure of the inflowing fluid will tend to cause the valve to rise. If the two disks were of the same area the valve would be perfectly balanced. In the cut the disks are shown as pistons, which slide past their seats. In steam-engine valves of this general form the valves rest upon their seats, and the valve is then called a "double-beat" valve.

FIG. 16.

Fig. 15 is an external view of the common lever safety-valve. The valve is a disk with a conical edge, resting on a conical seat. The disk is held to its seat by the pressure of a weight acting on a lever, as shown. In the spring-loaded safety-valve, Fig. 16, the pressure of a spring is

substituted for the weight and lever. In the particular form of valve shown in the cut, known as the "Pop" safety-valve, the valve has two seats, one of larger area than the other. When the pressure of steam has become sufficiently great to raise the valve when acting only on the smaller area, the valve opens, but immediately the pressure acts on the larger area and keeps the valve open until the pressure is reduced to such a point that acting on the larger area it will no longer overcome the pressure of the spring. For other forms of valve, see PNEUMATICS, PUMP, STEAM-HAMMER, and STEAM-ENGINE. For the valves of the circulation, see HEART and VEINS.

WM. KENT.

Vambéry, vaam'bā-rōe, ARMINIUS (or HERMAN): traveler and Oriental scholar; b. at Szerdahely, near Pressburg, Hungary, Mar. 19, 1832; spent his youth in poverty, but while serving an apprenticeship studied European and Asiatic languages in Pressburg and Vienna; later was private tutor in Slavonia and in Pesth. Linguistically well equipped, he went to Constantinople, where he acquired the Turkish language, and became so thoroughly imbued with the Turkish mode of thought that he was able, with the assistance of the Academy of Pesth, to undertake a journey of exploration

into Turkestan, disguised as an Oriental dervish, in 1862. He arrived in Khiva in June, 1863, visited Bokhara and Samarkand, and returned to Persia by way of Herat. After his return to Europe, Vambéry published an account of his journey, which was the first of the kind ever undertaken by a European, in English and German (Leipzig, 1865; 2d ed. 1873), and was at once called to the chair of Oriental Languages in the University of Pesth. His *Ungarische Sprachstudien* (Leipzig, 1867) is the standard work on the Eastern Turkish language. He edited *Kadalku-Bilik*, the Uigurian work, in which the oldest linguistic monument of the Turks is preserved, and wrote *Hungarian-Turkish Word-Comparisons* and an *Etymological Dictionary of the Turco-Tartar Languages* (Leipzig, 1878). His fame rests chiefly upon his geographical, historical, and political works on the Orient: *Travels in Persia* (Leipzig, 1867); *Sketches of Central Asia* (Leipzig, 1868); *History of Bokhara and Transoxania* (Stuttgart, 1872); *Central Asia and the Anglo-Russian Frontier Question* (Leipzig, 1873); *Islam in the Nineteenth Century* (Leipzig, 1875); *Sittenbibler aus dem Morgenlande* (Berlin, 1876); *Primitive Civilization of the Turco-Tartar Peoples* (Leipzig, 1878); *Origin of the Magyars* (Leipzig, 1882); *The Turkish Nation* (Leipzig, 1885); *The Scheibaniade* (an Uzbek epos in 10,000 verses, Budapest, 1885); *Der Zukunftskampf um Indien* (Vienna, 1886); *The Story of Hungary* (in the Story of the Nations Series, New York, 1886).

HERMANN SCHOENFELD.

Vampire [= Fr., from Servian *vampir*; Russ. *vampirū*]; according to a superstition still existing among the lower classes in Hungary, Servia, Roumania, and the Christian population of the Balkan peninsula, a kind of ghost which during the night leaves the grave and maintains a semblance of life by sucking the warm blood of living men and women. It is probable that this superstition originated from the ancient myth of the *lamie*, but it was much strengthened by the belief, common in the Middle Ages all through the Greek Church, that the bodies of those who died under the ban of the Church were kept alive by the devil, and by him sent out to ruin their friends and relatives. Early in the eighteenth century a vampire panic spread over Servia and Hungary, and thence into Germany. Thousands of graves were opened, and corpses which looked suspicious were fastened with nails and bolts to the ground, that they should not wander any more. Among the Wallachs it is still customary to drive a nail through the head of the corpse into the bottom of the coffin.

Vampire Bat: See BAT.

Van (anc. *Semirannacerta*): town; in the vilayet of Van, Asiatic Turkey (see map of Turkey, ref. 5-1). It is 5,200 feet above the level of the sea, on Lake Van, a salt-water lake with an area of 1,550 sq. miles. Above the city rises a vast rock on which are extensive ruins and many cuneiform inscriptions. Carpets and coarse cotton fabrics are manufactured. Pop. 30,000.

E. A. G.

Vanadium [Mod. Lat., from Icel. *Vanadís*, a surname of the Scandinavian goddess Freya]; a chemical element, a metal discovered in 1801 by the chemist Del Rio in a Mexican lead ore, now called *vanadinite*, and named by him *erythronium*; but erythronium was for twenty-nine years a doubtful element, being imagined by many chemists, including its discoverer, to be identical with chromium. In 1830 Sefström, however, found it again in some commercial bar iron, and called it *vanadium*—a name which still stands. Wöhler first pointed out that Sefström's supposed new element was the erythronium of Del Rio. In 1831 Berzelius described a number of vanadium compounds, and concluded that the metal yielded an acid-forming trioxide like chromium and molybdenum. In 1867 Roscoe discovered that the supposed vanadium of Berzelius was either an oxide or a nitride—a discovery which changed the whole aspect of this element and of its chemical relations, developing the fact that vanadium is closely related to phosphorus and arsenic. Vanadium occurs as an essential constituent of several mineral species, *docheulite* and *deseulzite* being vanadates of lead, *vanadinite* being lead vanadate, *volverthite* being a copper vanadate, *psittacinite*, a lead and copper vanadate, etc. At Granite Creek, Eldorado co., Cal., in a gold mine, Dr. James Blake, of San Francisco, found a dark-green mica which he supposed to contain chromium largely, but Dr. Genth showed it to contain vanadium, and this interesting vanadium mica was named *roscoelite*, by Dr. Blake, after the chemist Roscoe. Metallic vanadium was obtained by Roscoe by long-continued ignition of the dichloride VCl₂, in hydrogen gas,

as a metallic powder of a grayish-white color. Its equivalent weight is 51.3. Its density at 15 C. is 5.5. Vanadium forms five oxides, in exact parallelism with those of nitrogen— V_2O , V_2O_2 , V_2O_3 , V_2O_4 , V_2O_5 , of which the last is the most important. Thus, the pentoxide, V_2O_5 , forms salts, known as vanadates, which are analogous to the phosphates. Certain vanadium salts yield an intensely permanent black color, hence their application in the manufacture of inks and for dyeing.

Revised by IRA REMSEN.

Van Bommel, EUGÈNE: author; b. at Ghent, Belgium, Apr. 16, 1824; studied at Brussels; attracted much attention by his *Mémoire sur la Langue et la Poésie provençales* (1846); in 1849 was made Professor of French Literature in the University of Brussels. Among his works were *Voyage à travers champs* (1847); *L'Harmonie des Passions humaines* (1855); *Histoire de Saint Josse-ten-Noode* (1863); and the novel *Dom Placide: Mémoires du dernier Moine de l'Abbaye de Villers* (1876). D. in Brussels, Aug. 19, 1880.

Revised by A. G. CANFIELD.

Van Beneden, PIERRE JOSEPH: zoölogist; b. at Malines, Belgium, Dec. 19, 1801; studied medicine and natural science; was appointed keeper at the museum of natural history at Louvain, and afterward also Professor of Zoölogy in the university. He published *Manuel d'Anatomie comparée* (3 vols., 1852); *Mémoire sur les Vers intestinaux* (1858); *Recherches sur les Hirudinées et les Trématodes marins* (1863); *Recherches sur la Faune littorale de Belgique* (1869); *Ostéographie des Cétarés Vivants et Fossiles* (1868-77), and numerous smaller papers. D. at Louvain, Jan. 8, 1894.—**EDOUARD VAN BENEDEX**, son of the foregoing, was born at Louvain, Mar. 5, 1846. He became Professor of Zoölogy in the University of Liège and has published numerous papers upon the fertilization of the egg and the development of Tunicates; founded and is editor of *Archives de Biologie*.

Revised by J. S. KINGSLEY.

Vanbrugh, vān-broo', Sir JOHN: architect and dramatist; b. probably at Chester, England, in 1666; was of Flemish descent; received a liberal education, partly in France; entered the French army as ensign, and rose to the rank of captain; became in 1695 secretary to the commission for completing Greenwich Hospital; devoted himself to literature and to the profession of an architect; brought out with great success the comedies *The Relapse* (1697), written as a sequel to Cibber's *Love's Last Shift*, and the *Provoked Wife* (1698), which exposed him to the charge of indecency and profanity strongly pressed by Jeremy Collier; wrote, in consequence, his highly moral comedy *Esop* (1699), partly from the French of Boursault, afterward recast by Garriek; produced an adaptation of Fletcher's *Pilgrim* (1700); made in 1702 the architectural designs for Castle Howard, Yorkshire, the seat of the Earl of Carlisle; became ClarendieuX king-at-arms 1703; undertook, in connection with Congreve and the actor Betterton, the construction of a large theater in the Haymarket (1705), which proved a failure from defective acoustic properties; was for a short time manager of the Haymarket; produced there his *Confederacy* (1705), a witty but highly immoral comedy, and three adaptations from Molière; was the architect of the Palace of Blenheim, built by order of Parliament for the Duke of Marlborough—a task which occupied him for several years (1706-15) and involved him in a quarrel with the duchess; built several edifices of minor importance; was knighted and made comptroller of the royal works 1714, and surveyor of the works at Greenwich Hospital 1716. D. in London, Mar. 26, 1726. His last play, left unfinished, *The Journey to London*, was completed by Colley Cibber under the title *The Provoked Husband*. His comedies, ten in number, are admitted to be well written and to contain life-like pictures of the times. They lack the brilliancy of Congreve's dialogue, but excel in mastery of situation and realistic handling of character and manners; and, except for their coarseness, resemble Molière's plays more closely than do the works of Vanbrugh's English contemporaries. His comedies were edited with a biographical notice by Leigh Hunt, in connection with the plays of Congreve, Wycherley, and Farquhar (London, 1840), a volume which gave occasion to Macaulay's characteristic essay on *The Comic Dramatists of the Restoration*.

Revised by H. A. BEERS.

Van Buren: city; capital of Crawford co., Ark.; on the Arkansas river, and the St. L. and San Fran. and the St. L., Iron Mt. and S. railways; 9 miles N. E. of Fort Smith, 145 miles W. of Little Rock (for location, see map of Arkansas, ref. 2-A). It has 2 public schools, several saw and

planing mills and cotton-gins, wagon, cigar, and ice factories, foundry, and fruit-canneries, 2 State banks with combined capital of \$200,000, and a daily and 4 weekly newspapers. Pop. (1880) 1,029; (1890) 2,291; (1895) estimated, 4,650.

EDITOR OF "VENTURE."

Van Buren: town (incorporated in 1881); Aroostook co., Me.; on the St. John river, and the Canadian Pac. Railway; 75 miles N. of Houlton, the county-seat (for location, see map of Maine, ref. 2-F). It is connected by stage lines with Fort Fairfield and Fort Kent, and contains a Roman Catholic Church, St. Mary's College, and the Convent of the Good Shepherd. Pop. (1880) 1,110; (1890) 1,168.

Van Buren, MARTIN: the eighth President of the U. S.; b. at Kinderhook, N. Y., Dec. 5, 1782. He began the study of law at the age of fourteen, and took an active part in politics before he had reached the age of twenty; in 1812 was elected to the State Senate; was attorney-general 1815-19, and in 1816 a State Senator for a second time. In 1818 he reorganized the State Democracy, and became a member of a small clique of politicians known as the "Albany regency," which held control of the State for a score of years. In 1821 he was chosen a member of the convention for revising the State constitution, in which he advocated an extension of the franchise, but opposed universal suffrage, and also favored the proposal that colored persons in order to vote should have freehold property to the amount of \$250. In this year he was also elected U. S. Senator, and at the conclusion of his term, in 1827, was re-elected, but resigned in the following year, having been chosen Governor of the State. In Mar., 1829, he was appointed by President Jackson Secretary of State, but resigned in Apr., 1831, and during the recess of Congress was appointed minister to England, whither he proceeded in September. The Senate, when convened in December, refused to ratify the appointment, mainly on the ground that Mr. Van Buren, while Secretary of State, had foisted domestic party questions into his foreign diplomacy. In May, 1832, he was nominated as the Democratic candidate for Vice-President, and elected in the following November. In 1836 he was elected President, receiving a majority of the popular vote and 170 electoral votes out of 294, Gen. William Henry Harrison receiving 73. The opening of his administration was at a time of severe financial difficulty, which resulted in the suspension of specie payments by the banks and in the crisis of 1837-39, and the President urged the adoption of the independent treasury system, which was twice passed in the Senate and defeated in the House, but finally became a law near the close of his administration. Another important measure was the passage of a pre-emption law, giving actual settlers the preference in the purchase of public lands. Early in the administration occurred the insurrectionary movement in Canada, which was encouraged and aided by U. S. citizens on the borders. The President issued two proclamations against this violation of treaties, and sent a military force to the frontier to maintain order. The question of slavery began to assume great prominence in national politics, and after an elaborate anti-slavery speech by William Slade, of Vermont, in the House of Representatives, the Southern members withdrew for a separate consultation, at which Robert B. Rhett, of South Carolina, proposed to declare it expedient that the Union should be dissolved; but the matter was tided over by the passage of a resolution that no petitions or papers relating to slavery should be in any way considered or acted upon. In the presidential election of 1840 Mr. Van Buren was nominated without opposition as the Democratic candidate, William H. Harrison being the candidate of the Whig party. The Democrats carried only seven States, and out of 294 electoral votes only 60 were for Mr. Van Buren. The Whig popular majority, however, was not large, the elections in many of the States being very close. In 1844 Mr. Van Buren was proposed as the Democratic candidate for the presidency, and a majority of the delegates to the nominating convention were in his favor, but owing to his opposition to the proposed annexation of Texas he could not secure the requisite vote of two-thirds; his name was at length withdrawn by his friends, and Polk received the nomination, and was elected. In 1848 Lewis Cass was the regular Democratic candidate; a schism, however, sprang up in the party upon the question of the permission of slavery in the newly acquired territory, and a portion of the party, taking the name of "Free-soilers," nominated Van Buren; they drew away sufficient votes to secure the election of Gen. Taylor, the Whig candidate. In

accepting the nomination Van Buren declared his full assent to the anti-slavery principles of the platform. The convention declared that Congress "had no more power to make a slave than to make a king," and that it was the duty of the national Government to relieve itself "of all responsibility for the existence or continuance of slavery wherever the Government possessed constitutional authority to legislate on that subject." After this, Van Buren retired to his estate at Kinderhook, where the remainder of his life was passed, with the exception of a European tour in 1853-54. D. at Kinderhook, July 24, 1862. He left a MS., which was edited and published by his sons, entitled *An Inquiry into the Origin and Course of Political Parties in the United States* (1867). See Von Holst, *Constitutional History of the United States*; the *Life*, by Edward M. Shepard, in the American Statesmen Series (1888); and George Bancroft, *Martin Van Buren to the end of his Public Career* (1889).

Revised by F. M. COLBY.

Van Buren, WILLIAM HOLMES, M. D., LL. D.: surgeon; b. in New York, Apr. 5, 1819, of a family of famous physicians; educated at Yale College; graduated in medicine at the University of Pennsylvania in 1840; was assistant surgeon U. S. army 1840-41; settled in New York in 1845. On the organization of Bellevue Hospital, in New York, in 1847, he was made one of its surgical staff, in 1849 he became surgeon of St. Vincent's Hospital, and in 1852 he succeeded Granville S. Pattison in the chair of Anatomy in the medical department of the University of the City of New York, which he resigned in 1866 to accept the chair of Surgery in Bellevue Hospital Medical College. His reputation as a surgeon was won in a great measure during his occupancy of these positions. His success in operative surgery gave him a national reputation, which was subsequently enhanced by his contributions to medical literature. Besides his *Contributions to Practical Surgery*, published in 1865, he translated Bernard and Huette's *Operative Surgery* and Morel's *Histology*, and was a frequent contributor to the current medical literature. D. in New York, Mar. 25, 1883.

Revised by S. T. ARMSTRONG.

Vance, ZEBULON BAIRD: U. S. Senator; b. in Buncombe co., N. C., May 13, 1830; educated in Washington College, Tennessee, and in the University of North Carolina; studied law, and was admitted to the bar in 1853; established himself at Asheville, N. C.; and in 1854 was elected to the State Legislature; in 1858 was elected a Representative in Congress, to fill a vacancy occasioned by the resignation of Thomas L. Clingman, and was re-elected in 1859. He was originally opposed to secession, but when the civil war broke out took the side of his State, raised a company of soldiers, and soon after was chosen colonel of the Twenty-sixth North Carolina Regiment. In 1862, while serving in the field, he was elected Governor, and was re-elected in 1864; in 1870 was elected to the U. S. Senate, but was not allowed to take his seat, and resigned in 1872; returned to the practice of law at Charlotte; in 1876 was elected Governor; was elected U. S. Senator in 1879, and re-elected in 1884 and 1890. D. in Washington, D. C., Apr. 14, 1894.

Vanceburg: town; capital of Lewis co., Ky.; on the Ohio river, and the Ches. and Ohio Railway; 20 miles W. of Portsmouth, O. (for location, see map of Kentucky, ref. 2-J). It is in an agricultural, fruit-growing, and lumbering region; contains the Riverside Seminary, a State bank with capital of \$25,000, and a weekly newspaper; and is principally engaged in quarrying and the manufacture of flour, feed, hubs, spokes, staves, and leather. Pop. (1880) 1,095; (1890) 1,110. Editor of "SCN."

Van Cortlandt, PHILIP: soldier; a descendant of Oloff or Oliver Stevens van Cortlandt (1600-84), one of the most prominent of the early settlers of New Netherlands; b. at Cortlandt manor, Westchester co., N. Y., Sept. 1, 1749; became a land surveyor, and at the opening of the war of the Revolution was made lieutenant-colonel, and in 1776 colonel. He served in the battle of Stillwater, and against the Indians on the frontier in 1778; commanded a regiment under La Fayette, and was made brigadier-general for gallant conduct at the siege of Yorktown. He was a member of the court that tried Gen. Arnold for improper conduct at Philadelphia, and was in favor of cashiering him. Van Cortlandt was a member of the New York Assembly in 1788-90, of the State convention of 1788 by which the Constitution of the U. S. was adopted, State Senator 1791-94, and Representative in Congress 1793-1809. He was appointed to accompany La Fayette in his tour through the U. S. in 1824. The latter

part of his life was spent at his manor in Westchester co., N. Y., where he died Nov. 5, 1831. Revised by F. M. COLBY.

Vancouver: city; New Westminster district, British Columbia, Canada; on Burrard Inlet, and the Canadian Pacific Railway; 12 miles N. of New Westminster, and about 85 miles N. by E. of Victoria, the capital of the province (for location, see map of Canada, ref. 8 D). It is the largest city on the mainland of British Columbia, is a seaport of the province, and is connected with New Westminster by electric railway and with Victoria by mail-steamer. The city is laid out on the U. S. block system, with wide streets lighted by electricity and paved with bituminous rock. Stanley Park, at the entrance to the harbor, has a beautiful location on a promontory, with an excellent 8-mile driveway along the water's edge. There are 4 Church of England, 4 Presbyterian, 3 Methodist, 2 Baptist, 2 Congregational, and Roman Catholic churches, Salvation Army barracks, and a branch of the Y. M. C. A.; 3 public schools, City Hospital, Roman Catholic Hospital, St. Luke's Home, several orphanages, 4 chartered banks, and a semi-monthly, a monthly, 2 daily and 2 weekly periodicals. In 1894 the city had a ratable property valuation of \$18,301,184; revenue, \$484,781; expenditure, \$406,008; and debt, \$1,926,451. Of the principal buildings, the post-office, the Bank of Montreal, and the Bank of British North America are built of stone from a quarry a few miles distant. The city is the west terminus of the railway, and has regular mail-steamer communication with China, Japan, and Australia. It has large and varied lumber interests, railway construction and repair shops, foundry and iron-works, sugar-refinery, and pork-packing works. Vancouver was laid out, totally destroyed by fire, and rebuilt in 1886, and has an area of more than 15 sq. miles. Pop. (1891) 13,685; (1895) estimated, 18,000. ARTHUR P. JUDGE.

Vancouver: city; capital of Clarke co., Wash.; on the Columbia river; 6 miles above the mouth of the Willamette river, and 6 miles N. of Portland, Ore. (for location, see map of Washington, ref. 7-C). It is one of the oldest cities in the Northwest, having been founded by the Hudson Bay Company in 1828. Fort Vancouver, the headquarters of the department of the Columbia, and one of the finest military stations W. of the Mississippi, is located here. The city contains St. James's College (Roman Catholic, opened in 1856, chartered in 1887), a national bank with capital of \$100,000, a State bank with capital of \$50,000, and four weekly newspapers, and is principally engaged in lumbering, dairying, and fruit-growing. Pop. (1880) 1,722; (1890) 3,545; (1895) estimated, 4,500. Editor of "COLUMBIAN."

Vancouver Island: an island in the Pacific Ocean, named after the navigator George Vancouver (1758-98). It forms part of the province of British Columbia, being separated from the mainland by Queen Charlotte Sound, Johnstone Sound, and the Strait of Georgia, and lies between lat. 48° 20' and 50° 53' N., and lon. 123° 17' and 128° 28' W. Area between 15,000 and 16,000 sq. miles. Throughout the length of the island there extends a ridge of bare and rocky mountains averaging 3,000 feet in height, rising in its highest peak, Mt. Arrowsmith, to 5,900 feet. The coasts of the island, especially the west, are much indented with narrow fiords, marked by steep rocky cliffs and promontories interspersed with strips of pebbly beaches and sheltered nooks with fine harbors, notably those of Esquimalt, San Juan, Alberni Canal, Hesquiat, Pachena, and Quatsino. The northern and southern extremities of the island are comparatively flat, and the most settled portions are in the south, where Victoria is, and around the coal regions of Nanaimo on the east coast. There are no navigable rivers, and the streams, which are mountain torrents in winter and nearly dry in summer, run very short and rapid courses.

The climate in many respects resembles that of Great Britain, being modified by the arctic currents that flow down along the coasts. The winter is generally open, mild, and wet; the spring is later, and the summer hotter and drier than in England. The average maximum temperature is about 83 and the minimum 22 F. The larger portion of the island is unsuited for agriculture, being little better than bare rock. The most general crops are wheat, oats, barley, and all sorts of vegetables. Fruit-culture is also being developed successfully. The principal mountain range has been found to contain in many places gold, silver, iron, copper, lead, and other metals. In the vicinity of Albert gold-bearing quartz-ledges contain gold in paying quantities. Marble of a very fine quality has been discovered. Coal

is abundant, especially around the town of Nanaimo and to the N. of it. The panther, bear, and wolf are found in the forests; two kinds of deer, grouse, quail, pheasants, and other wild fowl abundant, and the many lakes are full of fish. Extensive banks lie off the southwest coast well stocked with cod, halibut, whiting, sturgeon, and herring, and deep-sea fishing is becoming one of the main industries of the island, together with the lumber industries, ship-building, and coal-mining. The population in 1891 was 37,000. The capital is Victoria (*q. v.*). The island was discovered in 1592 by Juan de Fuca, was visited in 1792 by Capt. Vancouver, and was ceded to Great Britain by treaty with the U. S. in 1846. In 1848 it was leased to the Hudson Bay Company by the crown for ten years, and was an independent crown colony till 1866, when it was united with the mainland of British Columbia as the colony of British Columbia. It sends fourteen members to the Provincial Legislature.

J. STUART YATES.

Vanda'lia: city; capital of Fayette co., Ill.; on the Kaskaskia river, and the Ill. Cent. and the Vandalia Line railways; 62 miles S. by W. of Decatur, 68 miles E. N. E. of St. Louis, Mo. (for location, see map of Illinois, ref. 8-E). It is in a hard-wood timber region; was formerly the capital of the State, and has 6 churches, 2 public-school buildings, a State bank with capital of \$100,000, a private bank, three weekly newspapers, and manufactories of brick-making machines, paper, flour, woolen goods, plows, carriages and wagons, and chairs. Pop. (1880) 2,056; (1890) 2,144.

EDITOR OF "LEADER."

Vandals: an ancient pure Germanic race belonging to the large group of Gothic tribes. The theory of their Sarmatian origin and Safarik's opinion that they were a Slavonic-German-Celtic race have been conclusively refuted. They were divided into the Asdingian and Silingian sections, and occupied in the second century the upper Oder, the Riesengebirge (*Montes Vandalici*), and the Sudeten, approximately the present province of Silesia (which derived its name from the Silingi). During the Marcomannic wars with Marcus Aurelius (161-180 A. D.) the Asdingi were allies of the Quadi and Marcomanni in Dacia, while the Silingi migrated westward about 280, and located on the Middle Main. The former were partly destroyed by the Gothic king Geberic(h) in a battle on the Maros river, where their king, Wisumar, was slain; the remnants were permitted by Constantine the Great to settle in Pannonia about 334. Allied with the Sævi and Alani, and reunited with the Silingi, they suddenly invaded Gaul in 406, under their king, Godigisel (*Годигиселос*), and under his son Gunderic(h) they crossed the passes of the Pyrenees into Spain in 409. After severe wars against the Visigoth king Wallia (415-418), and a victory over the Roman *magister militum* Castinus (422), the Vandals founded in the southern part of the country (ancient *Bætica*), an independent kingdom, *Vandalitia*, now Andalusia. Gunderic was succeeded by his illegitimate brother Genseric or Geiseric in 427. Two years later Bonifacius, governor of the Roman province of Africa, slighted by the emperor's mother, Placidia, the imperial regent in Ravenna, called the Vandals to Africa. Genseric crossed the Strait of Gibraltar with about 80,000 persons, of whom 50,000 were warriors. Meanwhile Bonifacius, through the good services of St. Augustine, had become reconciled to the Emperor Valentinian III., and ordered the Vandals out of the country. But Genseric, an Arian Christian, aided by the Arian Donatists and the Barbary tribes, defeated Bonifacius and conquered the whole of the northern coast of Africa as far as Tunis, broke the peace concluded with the Romans in 434, and five years later took Carthage and made it the capital of the Vandal kingdom. He developed a powerful fleet, with which he conquered the Balears, Corsica, Sardinia, and Western Sicily, invaded Italy, and in 455 he captured and sacked Rome, and carried away nearly all its movable wealth to Carthage. Genseric held out against both the Western and Eastern Roman emperors, but died in 477. The Vandal kingdom began to decline, under his successors, Hunneric (477-484), Guntamund (484-496), and Thrasamund (496-523), all of whom exasperated their orthodox Roman subjects by bloody persecutions, while Hilderic (523-530), by favoring the Romans and the orthodox Church, alienated his Vandal subjects, and was dethroned by Gelimer, his uncle. The Byzantine emperor Justinian I. sent an army to Africa under Belisarius, who defeated Gelimer at Tricamarum, about 20 miles from Carthage, Dec., 533, and carried him to Constantinople to adorn his triumph. Most of the surviving Vandal warriors were

drafted into the imperial army and disappeared in the wars against Persia, while others were absorbed in Africa by the Roman and Berber natives. See, further, Procopius, *De Bello Vandalico*; Papencordt, *Geschichte der Vandalischen Herrschaft in Africa* (Berlin, 1837); Felix Dahn, *Könige der Germanen, I.*, with excellent bibliography (Munich and Würzburg, 1861); Th. Hodgkin, *Italy and her Invaders* (vols. ii. and iii.).
HERMANN SCHÖNFELD.

Vandamme, vañ'daam', DOMINIQUE JOSEPH, Count of Hungenin; b. at Cassel, department of Nord, France, Nov. 5, 1771; entered the French army in 1788, and served in a regiment in Martinique, but returned in 1790, and organized in 1792 a volunteer regiment, the so-called *chasseurs du Mont-Cassel*, at the head of which he distinguished himself so greatly that in 1793 he was made a brigadier-general. In 1799 he was made a general of division, fought with great distinction at Austerlitz and Eekmühl, and was made a count, but took no part in the Russian campaign of 1812 on account of a conflict with Jerome. In 1813 he commanded the corps which from Lower Saxony was destined to penetrate into Bohemia in pursuit of the allied army, which had been defeated at Dresden, Aug. 27, but at Kulm he was surrounded, defeated, and compelled to surrender with 10,000 men and eighty-one guns, Aug. 30. He was taken as a prisoner to Russia, but restored to liberty in 1814. During the Hundred Days he joined Napoleon, fought at Ligny and Waterloo, and led the army back to the walls of Paris. During the second Restoration he was banished from France, lived for a time in the U. S., returned to France in 1824, and died in Cassel, July 15, 1830. See Du Casse, *Le général Vandamme et sa correspondance* (Paris, 1870). Revised by F. M. COLBY.

Van den Eekhout: See ECKHOUT, GERBRAND VAN DEN.

Vanderbilt, CORNELIUS; financier and capitalist, called Commodore; b. near Stapleton, Staten Island, N. Y., May 27, 1794, the son of a farmer. He early learned to manage a sail-boat, and at the age of sixteen purchased one for himself, with which he carried passengers and produce between New York and Staten Island. He invested his profits in similar enterprises, and soon had interests in many boats, schooners, and sloops engaged in transportation in the vicinity of New York. In 1817 he became captain of a steamer that ran between New York and New Brunswick, N. J., and in 1827 leased a ferry that ran to Elizabeth, N. J. Later he became interested in lines that ran up the Hudson, and also in lines to various points on Long Island Sound. Soon after the discovery of gold in California he put into operation a line of steamers that made rapid time by transferring its passengers across the Isthmus of Nicaragua, and in this enterprise he accumulated a fortune of \$10,000,000. When British vessels were withdrawn from ocean traffic on account of the Crimean war, he established a line to Havre, France, but he soon began to dispose of his shipping interests to invest in railways. In 1863 he purchased a large portion of the stock of the New York and Harlem Railroad, and later secured the Hudson River Railroad, after which the New York Central passed into his control, and he became its president in 1867. Under his management the efficiency of these railways was greatly increased and the service improved. In 1869 he effected the consolidation of the New York Central and the Hudson River lines, and later, by purchasing an interest in the Lake Shore, the Canada Southern, and Michigan Central, extended his system to Chicago. He contributed \$1,000,000 to found Vanderbilt University, and gave \$50,000 to establish the Church of the Strangers in New York; also in 1863 he presented his finest steamship, the *Vanderbilt*, to the U. S. Government, for which Congress voted him a gold medal. His fortune was estimated at \$100,000,000. D. in New York, Jan. 4, 1877. The bulk of his fortune was left to his son WILLIAM HENRY (b. in New Brunswick, N. J., May 8, 1821), who as a boy and as a young man was compelled to make his own way, owing to an unbelief in his abilities by his father. Later he was given the receivership of the Staten Island Railroad, which he conducted with such skill that he was placed in charge of the business management of the railway ventures that the elder Vanderbilt became interested in. In 1864 he was made a vice-president of the Hudson River Railroad, and later of the New York Central. On the death of his father he became president of these railways, and also of the Lake Shore and the Michigan Central, all of which offices he resigned on May 4, 1883. Meanwhile, in various ways he had secured control of the Chicago and Northwestern, and of the Cleveland, Columbus, Cincinnati and Indianapolis Railroad, by means of which he secured a

connection with St. Louis, also of the New York, Chicago and St. Louis (the Nickel Plate) and the West Shore, two roads built to compete with the New York Central system. Besides many other generous gifts, Mr. Vanderbilt gave \$200,000 to Vanderbilt University; paid the expenses of the removal of the obelisk from Egypt to Central Park, New York; and gave \$500,000 for the erection of the buildings of the College of Physicians and Surgeons, D. in New York, Dec. 8, 1885. The great fortune that he inherited from his father was largely increased, and after leaving \$10,000,000 to each of his eight children, and \$1,000,000 to charity, the remainder was left to the management of his two elder sons, CORNELIUS (b. Nov. 27, 1843) and WILLIAM KISSAM (b. Dec. 12, 1849). The former succeeded him in the presidency of the New York Central and the latter in the same office in the Lake Shore Railway. Both have contributed largely to various philanthropic purposes, and with the two younger brothers, FREDERICK WILLIAM and GEORGE WASHINGTON, contributed in 1895 \$200,000 for the enlargement of the Vanderbilt Clinic in memory of their father, as well as \$150,000 for the enlargement of the building of the College of Physicians and Surgeons. Their residences in New York and Newport are noted for their architectural beauty. The country residence, Biltmore, of George W. Vanderbilt, near Asheville, N. C., is the finest country-seat of a private citizen in the U. S. Rosa Bonheur's *Horse Fair* was a gift, among others, to the Metropolitan Museum of Art, by Cornelius Vanderbilt.

MARCUS BENJAMIN.

Vanderbilt University: an institution of learning at Nashville, Tenn.; in part the outgrowth of a general movement for higher education throughout the Methodist Episcopal Church South. In response to special calls a convention met in Memphis, Jan. 24, 1872, composed of delegates from Tennessee, Alabama, Mississippi, Louisiana, and Arkansas. A general plan for a university was adopted, a board of trust nominated, and shortly afterward a charter secured, under the title of the Central University of the Methodist Episcopal Church South. The efforts to raise the necessary funds met with little success, and the enterprise seemed doomed to failure, when the elder Cornelius Vanderbilt, of New York, made through Bishop McTyeire an offer of \$500,000. In recognition of this handsome gift, the name was changed to Vanderbilt University. Mr. Vanderbilt afterward increased his donation to \$1,000,000; his son, William H. Vanderbilt, made donations at various times aggregating \$450,000, and Cornelius Vanderbilt, a grandson of the founder, made a donation of \$30,000. The university is organized in seven distinct departments—academic, biblical, law, medical, pharmaceutical, dental, engineering. The chancellor is James H. Kirkland, Ph. D., LL. D. Each department has its faculty of instruction, charged with its special management. The board of trust is self-perpetuating and consists of thirty-one members. The bishops of the Methodist Episcopal Church South, and the chancellor of the university are, *ex officio*, members of the board. The other members are elected for a term of eight years. The first president of the board was Bishop Holland N. McTyeire, whose guiding hand was felt in every detail of the university life until his death on Feb. 15, 1889. The growth of the university has been constant and rapid. The attendance for the year 1894-95 was as follows: Academic, graduate, 30; undergraduate, 177; biblical, 71; engineering, 44; law, 37; medical, 190; dental, 136; pharmaceutical, 30. Teachers of all grades, 68. J. H. KIRKLAND.

Van der Goes, van 'der-Ahoos', HUGO: painter; a disciple of Van Eyck; b. at Ghent, Belgium, probably about 1405; painted mostly religious subjects, and is said to have ended his life as a monk in the monastery of Rodendale, near Brussels. His most celebrated pictures are a *Birth of Christ*, in the Church of Santa Maria Nuova, Florence; a *Crucifixion*, in the Church of St. James, Bruges; and a *St. John*, in the Pinakothek of Munich, bearing his name and the date 1472.

Van der Heyden or Heijden, -hī'den, JAN: painter; b. at Gorkum, Holland, in 1637; lived mostly in Amsterdam; acquired great fame as a painter of landscapes and city prospects, and received a pension from the Government for his improvements of street-lamps and fire-engines. D. in Amsterdam, Sept. 28, 1712. His principal pictures are of architectural subjects—views in cities such as Amsterdam. There are pictures by him in most of the great galleries of Europe. The figures in his landscapes were often painted by Adrian Vandervelde.

Van der Hoeven, -hoo'ven, JAN: naturalist; b. in Rotterdam, Holland, Feb. 9, 1801; studied medicine and the natural sciences at the University of Leyden, and practiced medicine at Rotterdam; in 1826 became Professor Extraordinary and nine years later Ordinary Professor of Zoölogy at the University of Leyden, and in 1858 was appointed director of the Royal Museum of Natural History. His published papers, mostly on zoölogy, are numerous; his best-known work is the manual of zoölogy, *Handboek der Dierkunde* (Leyden, 1827-33; entirely remodeled in 1846), which was translated into several languages. Other important papers are *Mémoire sur le genre Orithorhynque* (Isis, 1821, vi., p. 634); *Tabula Regni Animalis, additis Classium Ordinumque characteribus* (Leyden, 1828); *Contributions to the Knowledge of the Animal Nautibus pompilius* (Transactions of the Zoölogical Society, London, 1851, vol. iv., 1). Besides these may be mentioned various papers on insects, on *Sieboldia marima*, *Limulus*, and *Lepidosteus*. D. at Leyden, Mar. 10, 1868.

F. A. LUCAS.

Van'derlyu, JOHN: painter; b. at Kingston, Ulster co., N. Y., Oct. 15, 1776; attracted the attention of Aaron Burr, who invited him to New York and received him into his house. He received instruction from Stuart, and in 1796 went to Europe through the assistance of Burr, where he remained five years. He came back to the U. S. in 1801, but returned to Europe in 1803, remaining until 1815; made many admirable copies from the old masters; painted the picture of *Marius seated amid the Ruins of Carthage*, which gained the Louvre gold medal in 1808, *The Murder of Jane McCrea by the Indians*, and other original works, which gave him a high reputation. Returning to the U. S., he painted the portraits of Calhoun, Clinton, Madison, Monroe, Jackson, and other distinguished men. In 1832 he was commissioned to paint a full-length portrait of Washington for the hall of the House of Representatives, and in 1839 was commissioned to paint the *Landing of Columbus* for the Rotunda of the Capitol. The later years of Vanderyn's life were passed in poverty. D. at Kingston, N. Y., Sept. 23, 1852.

Revised by RUSSELL STURGIS.

Van der Meer, JAN, the elder: painter; b. at Haarlem, Holland, about 1625 or 1628; painted landscapes with animals and sea-pieces, and held various positions in the civil service. D. in Haarlem about 1685.—His son, JAN VAN DER MEER, the younger, b. at Haarlem about 1660, received instruction first from his father, afterward from Berghem, and acquired a great reputation as a painter of landscapes and marine battles. His best picture is a *View of the Rhine*. D. at Haarlem about 1704. His paintings and his father's are very rare outside of the Netherlands.

Van der Meulen, -mū'len, ANTOINE FRANÇOIS: painter; b. in Brussels, Belgium, 1634; received his first instruction in painting from Peter Snayers; was invited to France by Colbert through the influence of Lebrun, and appointed designer at the Gobelins manufactures; attracted attention by his talent for battle-pieces, and accompanied Louis XIV. in several campaigns; was elected a member of the Academy in 1673. Among his most celebrated pictures are the *Entrance of Louis XIV. into Arras* and the *Siege of Maas-tricht*. D. in Paris, Oct. 15, 1690.

Van der Stucken, FRANK: composer and conductor; b. at Fredericksburg, Tex., Oct. 15, 1858; studied in Antwerp under Benoit and in Leipzig. After completing his studies he made an artistic tour of Europe and returned to the U. S. in 1883, becoming the leader of the Arion Society of New York, and in 1887 leader of the Arion of Newark. These places he resigned in 1895 to become leader of the orchestra in Cincinnati. He has frequently conducted concerts and festivals, and has composed many excellent works, vocal and instrumental, which have been successfully performed both at home and in Europe.

D. E. H.

Vandervelde, more strictly Van de Velde, WILLEM, the Elder: painter; b. at Leyden, Holland, in 1610; was educated as a sailor, but early attracted great attention by his drawings of sea-views; was sent by the Dutch Government to accompany Admiral de Ruyter, and acquired great reputation by his sketches of manœuvres, engagements, etc.; was invited to England in 1675 by Charles II., who made him court painter of sea-fights and gave him a pension of £100 a year. D. in London in 1693.—WILLEM VANDERVELDE, the Younger, b. in Amsterdam in 1633, succeeded his father as marine painter to the King of England, and attained great fame. Many of his pictures are in England; the gallery at

Bridgewater House is rich in them. D. in London, Apr. 6, 1707. There is confusion between the works of the two painters.

Revised by RUSSELL STURGIS.

Van Diemen's Land: a former name for TASMANIA (*q. v.*).

Van Dorn, EARL: soldier; b. near Port Gibson, Miss., Sept. 17, 1820; graduated at the U. S. Military Academy in 1842; promoted first lieutenant in 1847; served in the Mexican war, and was breveted as captain and major for gallant conduct at Cerro Gordo, Contreras, and Chapultepec, and was wounded in the final assault upon the city of Mexico; was secretary of the military asylum at Paseagoula, Miss., 1853-55, was subsequently employed in scouting in Texas, led an expedition against the Comanches in 1858, and was severely wounded at Washita Village, Ind. Terr., Oct. 1, 1858; promoted major Second Cavalry, June, 1860. In January, 1861, he resigned and entered the Confederate army as colonel, taking command of a regiment of Texan volunteers; early in 1861 he captured the steamer *Star of the West* at Indianola, and soon after received the surrender of Maj. Sibley and of Col. Reeve, with thirteen companies of U. S. infantry. He rose to the rank of major-general, and in Jan., 1862, was placed in command of the Trans-Mississippi district; was defeated at Pea Ridge; was transferred to the army of the Mississippi and commanded at the battle of Corinth, where he was defeated. D. at Spring Hill, Tenn., May 8, 1863.

Revised by JAMES MERCUR.

Vandyke, SIR ANTHONY, originally ANTHON or ANTHONIE van Dyck: painter; b. in Antwerp, Belgium, Mar. 22, 1599. He was apprenticed as a boy to Henry van Balen, but by the time he was twenty he had become a pupil of Rubens, and later his assistant. As early as 1620 his name appears as an artist of reputation on his own account, as well as the leading assistant of Rubens. In that year he made a short visit to England. In 1623 and later he traveled in Italy, and seems to have been especially attracted by the Venetian school. His style in the early part of his short career, though evidently founded on the work of Rubens, is yet modified by his study of the Venetian pictures, in that he gives to his figures a dignity and a certain grace of outline and pose which Rubens hardly reaches. About 1627 Vandyke returned to Antwerp, and until 1632 he seems to have made that city or The Hague his place of residence, although it is probable that he went to England at least once during that time. There was abundant employment for him in the Netherlands. Rubens, indeed, was the recognized chief of all painters in the north of Europe; but there was room for others as well, and there must have been many persons ready to prefer the somewhat reserved and quiescent dignity of Vandyke's design to the more energetic and headlong composition of Rubens. In 1632 Vandyke settled in England. He received a pension, the title of painter-in-ordinary to the king, and knighthood, all so soon after his arrival in England that it seems as if promises had been made to him in advance. In 1636 he married Lady Mary Ruthven, a granddaughter of the Earl of Gowrie, and although his employment in England was mainly upon portraiture, that was probably not because of any supposed deficiency in the artist, but because in England at this time, as later, there was little demand for any other kind of painting. Twice, at least, he went to the Continent in search of important decorative work, but failed to receive the commission sought for. Toward the close of 1641 he again went to the Continent and was at work in Paris when his health gave way entirely; he returned at once to England, and died in London, Dec. 9, 1641.

The great number of large and very elaborate portraits by Vandyke, so designed and arranged that they are to be classified with the ideal works of most painters, has caused his religious and miscellaneous pictures to be somewhat overlooked. There are in the Louvre a splendid *Virgin and Child*, with *Portraits of the Donors*, a *Dead Christ mourned by the Virgin*, and a *Martyrdom of St. Sebastian*; and besides these the famous *Portrait of Charles I.*, with his page and horse in the background, the portrait group of the *Children of Charles I.*, the *Equestrian Portrait of the Marquis of Moncada*, and eight or ten other portraits. The pictures in this one gallery give a fair idea of the range of Vandyke's art, for the portrait of King Charles and that of his children are each of them worked up from the mere acquirements of portrait art to very stately compositions indeed, while, on the other hand, the *Virgin and Child* named above contains the life-size portraits of the two

donors, carefully painted and put in the foreground, while the *Virgin and Child* are treated with a freedom of design which suggests the practiced portraitist. In the National Gallery of London is a splendid picture called *The Portrait of Rubens*, which is known to have belonged to Sir Joshua Reynolds, and to have been much admired by him; also an *Equestrian Portrait of Charles I.*, bought from the Duke of Marlborough for £17,000, an historical picture called the *Emperor Theodosius and St. Ambrose*, and several single portraits. At The Hague is a particularly fine *Portrait of a Painter*. In Antwerp, in the Museum, is a large *Crucifixion* and a *Descent from the Cross* of great merit, and in the Church of St. Jacques another and still finer *Crucifixion*. Still another *Crucifixion* is in the Cathedral of Mechlin. In the Dresden Gallery is a large *St. Jerome*, a *Danaë*, and a number of portraits, among which is a large one of *Charles I. of England*, dated 1637. These are but a few of the very large number of good Vandykes which are distributed through the collections of Europe. In the Metropolitan Museum of New York there are two portraits of great value. Vandyke made a number of etched portraits of artists of his time. Of most of these he engraved the head only, and the prints taken from the plates before the dress, etc., were added by Houbraken or others as considered very valuable.

RUSSELL STURGIS.

Van Dyke, HENRY, D. D.: clergyman and author; b. at Germantown, Pa., Nov. 10, 1852, son of Rev. Henry J. Van Dyke; educated at Brooklyn Polytechnic Institute, Princeton College and Seminary, and University of Berlin; pastor of the United Congregational church, Newport, R. I., 1879-82; since 1882 of the Brick Presbyterian church, New York; preacher at Harvard University 1890-92; and Lyman Beecher lecturer at Yale Seminary 1895-96. Dr. Van Dyke has published *The Reality of Religion* (New York and London, 1884); *The Story of the Psalms* (New York and London, 1887); *The National Sin of Literary Piracy* (New York, 1888); *The Poetry of Tennyson* (New York and London, 1889; 5th rev. ed. 1894); *God and Little Children* (New York, 1890); *Straight Sermons: To Young Men and Other Human Beings* (New York and London, 1893); *The Bible as It is* (New York, 1893); *The Christ Child in Art: A Study of Interpretation* (1894); *The People Responsible for the Character of their Rulers* (New York, 1895); and *Responsive Readings* (Boston, 1895).

C. K. HOYT.

Van Dyke, HENRY JACKSON, D. D.: minister; b. at Abingdon, Pa., Mar. 2, 1822; educated at the University of Pennsylvania and Princeton Seminary; pastor of the Presbyterian churches—First, Bridgeton, N. J., 1845-52; Germantown, Pa., 1852-53; Second, Brooklyn, N. Y., 1853-91; moderator of the General Assembly at Brooklyn 1876. D. in Brooklyn, May 25, 1891. A *Memorial Volume* was published by Randolph (1892). Dr. Van Dyke published *The Lord's Prayer* (New York) and *The Church: Her Ministry and Sacraments*, Stone lectures (New York, 1890).

C. K. HOYT.

Van Dyke, JOHN CHARLES, L. H. D.: art critic; b. at New Brunswick, N. J., Apr. 21, 1856; studied in Columbia College and in art centers of Europe; admitted to the New York bar in 1877; has been librarian of Sage Library, New Brunswick, since 1878; is Professor of the History of Art in Rutgers College; has been university lecturer at Princeton, Harvard, Columbia, and other institutions. Prof. Van Dyke has written for several New York dailies and art reviews, is editor of the series *College Histories of Art*, and has published *Books and How to Use them* (New York, 1883); *Principles of Art* (New York, 1887); *How to Judge a Picture* (New York, 1888); *Serious Art in America* (New York, 1889); *Art for Art's Sake* (New York, 1893); and *History of Painting* (New York, 1894).

C. K. HOYT.

Vane, CHARLES WILLIAM STEWART: See LONDONDERRY, MARQUIS OF.

Vane, SIR HENRY: statesman; b. at Hadlow, Kent, England, in 1612, son of Sir Henry (1589-1654), who was Secretary of State to Charles I.; educated at Westminster School, and entered as gentleman commoner Magdalen College, Oxford, about 1628, but before matriculation renounced the Church of England and refused to take the oath of allegiance; traveled in France and Holland, and completed his education at Geneva, where he became a Puritan and a republican; went to Massachusetts Bay in 1635; was chosen governor for the year 1636, but, having favored religious toleration and taken the part of Anne Hutchinson, lost much of his popularity, and was not re-elected; returned to England in

Aug., 1637; was knighted, elected to Parliament, and made joint-treasurer of the navy 1640; took part in the impeachment of Strafford; became sole treasurer of the navy 1642; was a zealous supporter of Parliament in the civil war; gave up to that body the fees of his office, at that time very lucrative, and was influential in securing the adoption of the "Solemn League and Covenant"; enabled Roger Williams to obtain the Rhode Island charter 1643; was a promoter of the "Self-denying Ordinance" 1644; served during the war on important parliamentary commissions; opposed the terms of settlement offered by Charles in 1648; was a member of the Westminster Assembly and a leader of the Independents in Parliament, but opposed Cromwell's arbitrary course; and after the forcible dissolution of the Rump Parliament in 1653 retired to his estate of Raby Castle, where he wrote religious treatises and political pamphlets, one of which led to an imprisonment of four months in Carisbrooke Castle by order of Cromwell Mar., 1656; remained in opposition until the death of the Protector, when he was chosen to Parliament; became the leader of the republican party, and endeavored without success to mould the Commonwealth to his ideas of government; was one of the twenty persons excepted from the act of general pardon and oblivion passed at the Restoration; was sent to the Tower, and afterward to other prisons, remaining two years in a castle in the Scilly islands, occupied in theological studies and writing; was tried for high treason before the court of king's bench June 2, 1662; was unjustly convicted and sentenced to be hanged, and, in violation of a promise made by Charles, was beheaded on Tower Hill, June 14, 1662. His theological writings are pitched in so high a strain of mysticism as to be almost unintelligible to ordinary readers, but are said by Sir James Mackintosh to "display astonishing powers"; and the same writer ranks Vane as "one of the most profound minds that ever existed—not inferior, perhaps, to Bacon." His son was knighted by King Charles, and raised to the peerage by King William, under the title of Lord Barnard of Barnard Castle. Sir Henry Vane's religious views were millenarian, and gave rise to a small circle of disciples known as Vanists. His *Life* has been written by George Sikes (1662); Charles W. Upham, in Sparks's series of biographies (1st series, vol. iv.); John Forster (in *Statesmen of the Commonwealth*, 1840); and James K. Hosmer (1888). Revised by F. M. COLBY.

Vanilla [= Mod. Lat., from Span. *vainilla*, vanilla bean or pod, vanilla, liter., dimin. of *vaina*, sheath, pod; Fr. *gaine* < Lat. *vaginā*, sheath]; the fruit of the *Vanilla planifolia* and of the *Vanilla aromatica*, climbing orchidaceous plants (tribe *Neottieae*), natives of Mexico and Brazil. *V. planifolia* is cultivated in several tropical countries. The pods are from 6 to 12 inches in length, contain many minute black seeds, possess a very pleasant odor, and are often incrustated with needle-shaped crystals of *vanillin*, their aromatic constituent. They also contain an iron-greening tannin, a fatty oil, and a resin. *Vanillin* ($C_8H_{10}O_2$),

the odorous principle of vanilla, was first considered identical with benzoic and then with cinnamic acid. Its individuality was recognized by Bley in 1858 and by Stokkebye in 1864, who assigned to it the incorrect name *vanillic acid* and the composition $C_{17}H_{22}O_{16}$. It is obtained by mixing the alcoholic extract of vanilla with water until a fluid of a sirupy consistence is formed, agitating with ether, evaporating the ether, treating the residual mass with boiling water, again evaporating,

Vanilla planifolia.

and purifying the crystals formed by solution and filtration through animal charcoal. It forms long colorless prisms

which are nearly insoluble in cold water, but dissolve in hot water, in alcohol, and in ether, the alcoholic solution possessing a feeble acid reaction. *Vanillin* fuses at about 176° F., sublimes at above 300° F., and can be distilled with the vapor of water. It is prepared artificially by a number of methods. When fused with sodium hydroxide, *vanillin* is converted into *protocatechuic acid*, with formation of carbon dioxide and water; if treated with hydrochloric acid, methyl chloride and *protocatechuic aldehyde* are formed. *Vanillic acid* ($C_8H_8O_4$) has been obtained synthetically from *coniferin* ($C_{10}H_{12}O_6$) by oxidation with potassium permanganate, also by removing one methyl group from *dimethyl-protocatechuic acid*. It appears, therefore, to be *mono-methyl-protocatechuic acid*. By heating a mixture of calcium vanillate and formate, *vanillin*—which is really the aldehyde of *vanillic acid*—is formed. When *vanillin* is treated with nitric acid, *oxalic acid* is produced. *Vanilla* is chiefly used for flavoring chocolate, confectionery, perfumery, etc., and in medicine. Revised by IRA REMSEN.

Vanini, van-neen'nee, LUCILIO, OR, as he afterward called himself in his writings, JULIUS CÆSAR; freethinker; b. at Taurisano, near Naples, about 1585; studied philosophy, theology, and natural science at Rome and Padua; took holy orders; taught at Geneva, Paris, and Lyons; visited England; published in 1615 at Lyons his *Amphitheatrum Æternæ Providentiæ*, which, although an argument against atheism, made him suspected of being a freethinker; published next year at Paris his dialogues, *De Admirandis Naturæ, Regiæ Deoque Mortalium, Arcanis*, which was burned by order of the Sorbonne; removed to Toulouse, and began to teach, but was accused of atheism, sentenced to death by the Parliament, and burned at the stake the same day the sentence was given, Feb. 19, 1619. See David Durand, *La Vie et les Sentiments de L. Vanini* (Rotterdam, 1717), and *Œuvres philosophiques de Vanini*, by Roussetot (Paris, 1841).

Vanishing Fraction: a fraction that reduces to 0 for a particular value of the variable which enters it. The general method of treating such cases depends on a principle of the differential calculus. The rule is as follows: Differentiate the numerator of the fraction for a new numerator, and the denominator for a new denominator; then in the resulting fraction substitute the special value of the variable. If the result is 0, repeat the operation, and continue the repetition till a result is found which does not reduce to 0; the final result is the required value.

Vanishing Point: See PERSPECTIVE.

Van Lennep, HENRY JOHN, D. D.; missionary; b. at Smyrna, Mar. 18, 1815; member of a distinguished Dutch family of scholars and writers; graduated at Amherst 1837; studied theology at Andover for a year; was foreign missionary in the Turkish empire 1839-69, during most of this time connected with collegiate and theological institutions in Constantinople, Smyrna, and Tocat. He traveled extensively, and became familiar with most of the Oriental languages, so that he could read and write in ten different dialects and preach extempore in five. Cataract, resulting in the loss of his sight, compelled his return to the U. S. in 1869, and afterward he devoted himself to literary labors and to education, becoming Professor of Natural Science, Greek, and Modern Languages in Ingham University, Le Roy, N. Y., 1876, and principal of Sedgwick Institute, Great Barrington, Mass., 1878, where he died Jan. 11, 1889. He was the author of *Travels in Asia Minor* (2 vols., London, 1870); *Bible Lands* (New York, 1875); and *Ten Days among the Greek Brigands* (Boston, 1874).

Van Lennep, JACOB; See LENNep, JACOB, van.

Vanloo' or Van Loo, JEAN BAPTISTE; painter; b. at Aix, France, 1684. His father, himself an artist, taught him from a very early age, and made him copy the works of eminent masters. In 1706 he married in Toulon the daughter of an advocate, and was painting in the Dominican church there a picture of a *Holy Family* while Victor Amadeus, Duke of Savoy, was besieging the town. After this he spent five years at Aix, working in churches and painting portraits. In 1712 he went to Nice, where he painted the portraits of the Prince of Monaco's daughters, then went to Genoa and Turin, where the Duke of Saxony and Prince Carignan became his patrons. The latter sent him to Rome at his expense. He painted a *Flagellation*

there in Sta. Maria in Monticelli, and was after this summoned to Paris by Prince Carignan, who commissioned him to paint subjects from the *Metamorphoses* of Ovid and a *Triumph of Galatea*. Vanloo was especially successful in portraiture. He painted from memory a head of Louis XV., which pleased the king so well that he ordered a full length immediately. He was elected member of the French Academy in 1731, and presented the picture of *Diana and Endymion* on this occasion. A picture to commemorate the birth of the dauphin being a great success, he was further elected as adjunct professor by the Academy in 1733 and full professor in 1735. He afterward visited England, where he received innumerable commissions and honors, but after a stay of four years had to leave that country on account of his health. He died at Aix soon after his return, on Nov. 19, 1745.—CHARLES ANDRÉ VANLOO (1705-65) was brother to Jean Baptiste. He also practiced painting, and was his brother's assistant, besides producing original works, including a *Marriage of the Virgin*, now in the Louvre.—LOUIS MICHEL and CHARLES PHILIPPE AMADIE were sons of the famous Vanloo, and his pupils. W. J. S.

Van Marcke, ÉMILE: landscape and animal painter; b. at Sèvres, France, Aug. 20, 1827; pupil of Troyon. He received medals at the Salons of 1867, 1869, and 1870, and a first-class medal at the Paris Exposition of 1878; became a member of the Legion of Honor 1872. D. at Hyères, France, Dec. 24, 1890. His work is thoroughly meritorious, excellent in respect of technical qualities, strong in color and composition. It does not resemble that of his master, as has often been said of it, in the sense that it is in imitation of Troyon, but it does not rival it in any way. W. A. C.

Van Mildert, WILLIAM, D. D.: bishop and author; b. in London in 1765; educated at Queen's College, Oxford; took orders in the Church of England; became rector of St. Mary-le-Bow, London, 1796; preacher of Lincoln's Inn 1812, and Regius Professor of Divinity at Oxford 1813; Bishop of Llandaff Mar., 1819, dean of St. Paul's, London, 1820, and Bishop of Durham Mar., 1826; author of *An Historical View of the Rise and Progress of Infidelity* (2 vols., 1806; 5th ed. 1838), with copious and learned notes, being the Boyle lectures for the years 1802-05; *An Inquiry into the General Principles of Scripture Interpretation* (Oxford, 1815), being the Bampton lectures for 1814; and *Sermons on Several Occasions* (1838), preceded by a *Memoir* by Cornelius Ives. He edited the complete *Works of Daniel Waterland, D. D.* (10 vols., 1823), and prefixed an elaborate *Review of the Author's Life and Writings* (1823). D. at the episcopal palace of Bishop-Auckland, Feb. 21, 1836.

Revised by S. M. JACKSON.

Vannes, van: town; in the department of Morbihan, France; at the mouth of the Vannes; 10 miles from the sea (see map of France, ref. 4-C). It has a cathedral and a museum, and carries on a varied manufacturing industry. Pop. (1891) 19,625.

Van Ness, CORNELIUS PETER, LL. D.: jurist; b. at Kinderhook, N. Y., Jan. 26, 1782; studied law; practiced successfully in Burlington, Vt.; was U. S. district attorney 1809-13; representative in the Legislature 1818-21; commissioner for the settlement of the boundaries between the U. S. and Great Britain 1818-21; collector of the port of Burlington 1815-18; chief justice of Vermont 1821-23; Governor of the State 1823-26; minister to Spain 1829-37; and collector of the port of New York 1844-45. D. in Philadelphia, Dec. 15, 1852.

Van Ostade: See OSTADE, ADRIAN, van.

Van Rensselaer, HENRY KILLIAN: soldier; b. near Albany, N. Y., in 1744; commanded a New York regiment during the war of the Revolution; in July, 1777, was attacked near Fort Anne by a large force, which he repelled, but learning that the strong position of Ticonderoga had been abandoned by Gen. St. Clair, he withdrew. He was present at the engagements which in the following October led to the surrender of Burgoyne, in which he was severely wounded. Toward the close of the war serious disputes occurred between the authorities of New York and New Hampshire in respect to the jurisdiction of what were known as the "New Hampshire grants," and a mutiny broke out in Van Rens-

selae's regiment, which was quelled only by the intervention of Washington. He afterward rose to the rank of general of militia. D. at Greenbush, N. Y., Sept. 9, 1816.

Van Rensselaer, STEPHEN: statesman; known as "the patroon"; b. in New York, Nov. 1, 1765; was the fifth in descent from Killian van Rensselaer, the original patroon or proprietor of a large tract of land on the Hudson river granted by the States-General of Holland; graduated at Harvard College in 1782; was member of the Assembly in 1789; was chosen to the State Senate in 1790; became Lieutenant-Governor in 1795; and was a leader of the Federalists in New York State for several years. In 1810 he was appointed one of the commissioners to explore the proposed line for a canal from Lake Erie to the Hudson, and to report upon the feasibility of its construction, and from 1816 to his death one of the canal commissioners. He was in command of the State militia at the beginning of the war of 1812, and directed the unsuccessful assault upon Queenston Heights. In 1819 he was chosen one of the regents of the New York University, of which he was subsequently chancellor; in 1821-23 instituted the geological surveys of New York, which were executed wholly at his cost by Amos Eaton, and in 1824 established at Troy a scientific school for the instruction of teachers, which was incorporated in 1826 as the Rensselaer Institute, half the current expenses being for some time defrayed by him. He was a Representative in Congress 1823-29, and it was by his casting vote in the New York delegation that John Quincy Adams was made President of the U. S. D. in Albany, Jan. 26, 1839. He published *A Geological and Agricultural Survey of the District adjoining the Erie Canal* (1824).

Revised by F. M. COLBY.

Van Sant'voord, GEORGE: lawyer and *littérateur*; b. at Belleville, N. J., Dec. 8, 1819; graduated at Union College in 1841, holding a high position for scholarship and belles-lettres; studied law at Kinderhook, and was admitted to the bar in 1844; removed the same year to Lafayette, Ind.; during a two years' residence here published *The Indiana Justice: a Treatise on the Jurisdiction, Authority, and Duty of Justices of the Peace in Civil and Criminal Cases*, a standard work in that department; returned to Kinderhook in 1846, and pursued his profession there for five years, when he formed a law-partnership with David L. Seymour, of Troy, N. Y., to which place he afterward removed; was elected to the State Assembly in 1852 and in 1856; was district attorney for Rensselaer County from 1860 until Mar. 6, 1863, when he was killed in a railway accident at East Albany. He was a man of great literary activity, and besides other works and articles published *Principles of Pleading in Civil Actions under the New York Code of Procedure* (1852); *A Treatise on Practice in the Supreme Court of the State of New York in Equity Actions* (1860-62); *Life of Algernon Sydney* (2d ed. 1853); *Lives of the Chief Justices of the Supreme Court of the United States* (1854; bringing the record down to the closing years of Chief Justice Taney's service on the bench); and from time to time in the *Democratic Review*, monographs on *Calhoun*, *Sir Henry Vane*, *Oliver Cromwell*, *Carnot*, *Robespierre*, *Vergnaud*, *Danton*, etc.
